Vol. 89 Thursday,
No. 91 May 9, 2024

Pages 39531–40358

OFFICE OF THE FEDERAL REGISTER

The **FEDERAL REGISTER** (ISSN 0097–6326) is published daily, Monday through Friday, except official holidays, by the Office of the Federal Register, National Archives and Records Administration, under the Federal Register Act (44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). The Superintendent of Documents, U.S. Government Publishing Office, is the exclusive distributor of the official edition. Periodicals postage is paid at Washington, DC.

The **FEDERAL REGISTER** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders, Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress, and other Federal agency documents of public interest.

Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless the issuing agency requests earlier filing. For a list of documents currently on file for public inspection, see *www.federalregister.gov.*

The seal of the National Archives and Records Administration authenticates the Federal Register as the official serial publication established under the Federal Register Act. Under 44 U.S.C. 1507, the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** is published in paper and on 24x microfiche. It is also available online at no charge at *www.govinfo.gov*, a service of the U.S. Government Publishing Office.

The online edition of the **Federal Register** is issued under the authority of the Administrative Committee of the Federal Register as the official legal equivalent of the paper and microfiche editions (44 U.S.C. 4101 and 1 CFR 5.10). It is updated by 6:00 a.m. each day the **Federal Register** is published and includes both text and graphics from Volume 1, 1 (March 14, 1936) forward. For more information, contact the GPO Customer Contact Center, U.S. Government Publishing Office. Phone 202-512-1800 or 866-512-1800 (toll free). E-mail, *gpocusthelp.com.*

The annual subscription price for the **Federal Register** paper edition is $860 plus postage, or $929, for a combined **Federal Register, Federal Register** Index and List of CFR Sections Affected (LSA) subscription; the microfiche edition of the **Federal Register** including the **Federal Register** Index and LSA is $330, plus postage. Six month subscriptions are available for one-half the annual rate. The prevailing postal rates will be applied to orders according to the delivery method requested. The price of a single copy of the daily **Federal Register,** including postage, is based on the number of pages: $11 for an issue containing less than 200 pages; $22 for an issue containing 200 to 400 pages; and $33 for an issue containing more than 400 pages. Single issues of the microfiche edition may be purchased for $3 per copy, including postage. Remit check or money order, made payable to the Superintendent of Documents, or charge to your GPO Deposit Account, VISA, MasterCard, American Express, or Discover. Mail to: U.S. Government Publishing Office—New Orders, P.O. Box 979050, St. Louis, MO 63197-9000; or call toll free 1-866-512-1800, DC area 202-512-1800; or go to the U.S. Government Online Bookstore site, see *bookstore.gpo.gov.*

There are no restrictions on the republication of material appearing in the **Federal Register.**

How To Cite This Publication: Use the volume number and the page number. Example: 89 FR 12345.

Postmaster: Send address changes to the Superintendent of Documents, Federal Register, U.S. Government Publishing Office, Washington, DC 20402, along with the entire mailing label from the last issue received.

Presidential Documents

Title 3—

The President

Proclamation 10745 of May 2, 2024

Boundary Enlargement of the Berryessa Snow Mountain National Monument

By the President of the United States of America

A Proclamation

Through Proclamation 9298 of July 10, 2015, President Obama established the Berryessa Snow Mountain National Monument (monument) to protect an array of spectacular historic, cultural, geologic, and ecological resources in the heart of northern California's Inner Coast Range. Straddling the eastern edge of the monument boundary, Molok Luyuk—which means ''Condor Ridge'' in the language of the Patwin people—is a striking 11-mile north-to-south ridgeline that is sacred to the Patwin people and contains a mosaic of historic objects and rare natural communities supported by the unique geologic and hydrologic features of the area. The ridgeline, also known as Walker Ridge, is flanked by chaparral-covered canyons, serpentinite outcroppings, oak and cypress woodlands, and spring-fed meadows. Lands within the Molok Luyuk area show evidence of occupation by Indigenous peoples for more than 10,000 years. The historical significance of Molok Luyuk contributes to its cultural and spiritual significance to the Patwin people, and many other Indigenous peoples from northern California also have ties to the area, including the Pomo, Lake Miwok, Yuki, and Nomlaki. While much of the western slope of the ridge was designated as part of the monument by Proclamation 9298, expanding the monument's eastern boundary to include the full Molok Luyuk area—from the ridgeline to the point where the foothills recede into the flatlands of Bear Valley—will protect additional objects of scientific and historic interest and enable holistic management of a culturally significant landscape.

Since time immemorial, Molok Luyuk has held a deep cultural significance for Tribal Nations of the Patwin people, including the Yocha Dehe Wintun Nation, the Kletsel Dehe Band of Wintun Indians, and the Cachil Dehe Band of Wintun Indians. Their history is connected to Molok Luyuk and their lifeways are intertwined with the features, plants, and wildlife of the expansion area. The name Molok Luyuk recalls a time when condors were a common sight soaring above the ridge, and the Patwin people would often celebrate them with dances and ceremonies. On a clear day, the highest points of Molok Luyuk offer a commanding view of the surrounding rugged and undeveloped landscape, encompassing Mount Shasta to the north, Mount Tamalpais to the southwest, and Sutter Buttes to the east. This viewshed, and particularly the view of the sun rising over Sutter Buttes, is central to the Patwin origin story and connected the Patwin communities that once lived in the hills of Molok Luyuk and beyond with the River Patwin communities that populated Bear Valley, which lies just to the east, before they were displaced by trappers, ranchers, and miners. The expansion area includes sites of historic and ceremonial importance to members of all three Patwin Nations along the ridgeline and around its numerous natural springs.

The area around Molok Luyuk has long contained numerous objects of scientific and historic interest. Molok Luyuk played an important role in providing for the sustenance of the Patwin communities that were once found in the area. Occupants of nearby villages made seasonal forays to the ridge and flanks of Molok Luyuk in search of manzanita berries, clover,

gray pine nuts, acorns, bulbs, and tubers, as well as to hunt elk and deer. Evidence of this cultural story marks the landscape today through numerous lithic scatters—sites containing ancient tools, tool fragments, and lithic flakes from tool production and maintenance—found along Molok Luyuk and around the area's cold springs. These scatter sites, which in some cases date back thousands of years, likely represent hunting and gathering camps and sites used by generations of Indigenous people for ceremonial purposes. Artifacts from these sites include obsidian tools made from sources in the region.

Trails once crossed and stretched out from the ridgeline. These trails, which ran atop the ridge and just inside the northern and southern boundaries of the expansion area, are important to the history of how Patwin communities were connected to other Indigenous communities in northern California. For instance, they enabled cultural exchanges among Indigenous people in the region, connected villages, and facilitated access to seasonal camps and ceremonial sites. Knowledge of the trails lives within Patwin oral history and cultural expertise and has been documented in ethnographic studies. Some trails were part of a larger interregional network by which other northern California Indigenous peoples would access Molok Luyuk and the healing hot springs that today lie on private land just to the south of the expansion area.

A tumultuous geologic history underpins the expansion area's diverse ecological communities. The backbone of Molok Luyuk is an ophiolite formed by unusual ultramafic rocks. Serpentinite, as this rock is more commonly known, was originally formed deep within the Earth's mantle and eventually thrust upward through the forces of plate tectonics. The landscape is subtly marked by the smoky gray-green of serpentine rocks and their derivative soils. Rare serpentine soils resulting from eroded serpentinite dominate the ridgeline and eastern flank of Molok Luyuk. These soils have unusually high levels of magnesium and iron and very low levels of nutrients, such as calcium and phosphorus, that are critical for the survival of most plants. This soil chemistry imposed evolutionary pressure resulting in a profusion of unique species and habitats that are inhospitable to non-native species that may dominate elsewhere.

Protecting serpentine soils like those found in the expansion area is essential to the preservation of California's endemic and rare plant life. While serpentine soils occur on less than 1.5 percent of California's land base, they are home to nearly 15 percent of California endemic species and nearly 11 percent of its rare plant taxa. Consistent with this State-wide data, the great majority of special-status plant taxa within the Molok Luyuk area occur primarily on serpentine soils.

Molok Luyuk's diverse topography and geology, which also include sandstone and shale, create the conditions for its 13 distinct plant communities, 9 of which spring from serpentine soils. These habitats include serpentine and non-serpentine chaparral, McNab and Sargent cypress and blue and live oak woodlands, serpentine riparian woodland, native wildflower fields, and serpentine seeps. This diversity of plants and plant communities provided the wide array of foods, tools, and medicines that the Patwin gathered from Molok Luyuk. Nearly 500 native California plant taxa have been identified within the expansion area, including at least 38 different special-status plant taxa. The expansion area also includes suitable habitat for another 30 special-status plants that have been documented in the surrounding area. Numerous studies—particularly those focused on species that grow on serpentine soils—have made use of botanical samples from the expansion area, and protecting these rare and sensitive plants will preserve opportunities for important future botanical research.

Brilliant fields of native wildflowers and bunchgrasses are scattered throughout Molok Luyuk. Springtime brings a kaleidoscopic display of butter-yellow golden fairy lantern, flame-like woolly Indian paintbrush, and brilliant orange starbursts of flame ragwort, all of which are native species that thrive in

the area's serpentine meadows. The delicate violet flowers of the Indian Valley brodiaea, a bulbiferous perennial herb that is listed as a State of California endangered species, can also be found tucked into serpentine seeps. Throughout the summer, the small white flowers of the drymary dwarf flax, a Bureau of Land Management (BLM) sensitive species that is endemic to California, are widespread on Molok Luyuk's higher elevation serpentine slopes.

Unusual serpentine wetlands occur along Molok Luyuk, as well as on downslope benches and along Highway 20 near the Colusa-Lake county line. Many of these wetlands are fed by the numerous seeps and springs scattered across the area, which are of critical importance to the area's botanical richness. These include Barrel Springs in the northeastern portion of the expansion area, Cold Spring near the center of the ridgeline, and Til Jones and Eaton Springs in the south, along with numerous other unnamed springs. Protecting these springs, and the wetlands they feed, is critical to preserving the rare and endemic species that thrive within the monument and expansion area—and to preserving opportunities for future scientific study.

Despite substantial fragmentation due to fires in 2008 and 2018, McNab cypress woodland, a California-designated sensitive natural community that is vulnerable at both the global and State scales, dominates portions of the northern, higher elevations. In addition to being a rare and vulnerable natural community of scientific interest, the McNab cypress, for which these woodlands are named, have been used for Patwin ceremonies and medicines for generations and continue to be used today.

A wide variety of mammals, birds, reptiles, and amphibians use or make their homes in Molok Luyuk. More than 80 species of birds have been recorded in the area, including 18 special-status species. Both bald and golden eagles can be observed gliding through the sky above Molok Luyuk. Foothill yellow-legged frogs, a BLM sensitive species, can be found in lower-elevation streams within the expansion area. Members of the oldest free-ranging tule elk herd in California also reside within the expansion area. Tule elk, which are endemic to California, had vanished from the wild until a formerly captive herd was released in 1922 in Colusa County. Other wildlife species that make their homes in Molok Luyuk include black-tail deer, black bear, coyote, bobcat, gopher snake, and western rattlesnake. The slopes of Molok Luyuk provide an avenue for wildlife to move from the lower elevations of Bear Valley to the higher elevation of the ridgeline. Conserving this expansion area will fortify protection for the critical north-south migration corridor provided by the existing monument.

As night falls over Molok Luyuk, other residents of the area emerge. At least 14 species of bats occur in the area, including the western red bat, pallid bat, and Townsend's big-eared bat, each of which is a California Species of Special Concern. The night skies through which they fly are remarkably unmarred by light pollution, which can disturb many species of bats as well as other mammals and birds, and provide increasingly rare and extraordinary stargazing opportunities to those who venture out after sunset.

In light of threats, including impacts from climate change, increased recreational use, and development potential, expanding the boundaries of the Berryessa Snow Mountain National Monument to protect the area described above will preserve a diverse array of natural and scientific resources and cultural and historic legacy sites, ensuring that the scientific and historic values of this area endure for the benefit of all Americans. The expansion area contains numerous objects of historic and scientific interest, and it also provides opportunities for those who seek out places of beauty and botanical wonder, whether through hiking, hunting, scenic driving, camping, wildflower viewing, or lying under a vast expanse of undimmed starry sky.

WHEREAS, section 320301 of title 54, United States Code (the ''Antiquities Act''), authorizes the President, in his discretion, to declare by public proclamation historic landmarks, historic and prehistoric structures, and other objects of historic or scientific interest that are situated upon the lands owned or controlled by the Federal Government to be national monuments, and to reserve as a part thereof parcels of land, the limits of which shall be confined to the smallest area compatible with the proper care and management of the objects to be protected; and

WHEREAS, I find that each of the objects identified above, and objects of the type identified above within the area described herein, are objects of historic or scientific interest in need of protection under section 320301 of title 54, United States Code, regardless of whether they are expressly identified as an object of historic or scientific interest in the text of this proclamation; and

WHEREAS, I find that there are threats to the objects identified in this proclamation, and in the absence of a reservation under the Antiquities Act, the objects identified in this proclamation are not adequately protected by applicable law or administrative designations, thus making a national monument designation and reservation necessary to protect the objects of historic and scientific interest identified above for current and future generations; and

WHEREAS, I find that the boundaries of the monument reserved by this proclamation represent the smallest area compatible with the proper care and management of the objects of scientific or historic interest identified above, as required by the Antiquities Act; and

WHEREAS, it is in the public interest to ensure the preservation, restoration, and protection of the objects of scientific and historic interest identified above;

NOW, THEREFORE, I, JOSEPH R. BIDEN JR., President of the United States of America, by the authority vested in me by section 320301 of title 54, United States Code, hereby proclaim the objects identified above that are situated upon lands and interests in lands owned or controlled by the Federal Government to be part of the Berryessa Snow Mountain National Monument and, for the purpose of protecting those objects, reserve as part thereof all lands and interests in lands that are owned or controlled by the Federal Government within the boundaries described on the accompanying map, which is attached hereto and forms a part of this proclamation. The reserved Federal lands and interests in lands within the expansion area encompass approximately 13,696 acres. As a result of the distribution of the objects throughout the area, the boundaries described on the accompanying map are confined to the smallest area compatible with the proper care and management of the objects of historic or scientific interest identified above.

Nothing in this proclamation shall change the management of the areas protected under Proclamation 9298. The terms, conditions, and management direction provided by Proclamation 9298, including any term limiting the construction or effect of Proclamation 9298, are incorporated by reference and shall apply to the area reserved by this proclamation except to the extent that they are inconsistent with a provision in this proclamation.

All Federal lands and interests in lands described on the accompanying map are hereby appropriated and withdrawn from all forms of entry, location, selection, sale, or other disposition under the public land laws; from location, entry, and patent under the mining laws; and from disposition under all laws relating to mineral and geothermal leasing, other than by exchange that facilitates the remediation, monitoring, or reclamation of historic mining operations under applicable law or otherwise furthers the protective purposes of the monument.

The enlargement of the boundary is subject to valid existing rights. If the Federal Government subsequently acquires any lands or interests in lands

not currently owned or controlled by the Federal Government within the boundaries described on the accompanying map, such lands and interests in lands shall be reserved as a part of the monument, and objects of the type identified above that are situated upon those lands and interests in lands shall be part of the monument, upon acquisition of ownership or control by the Federal Government.

The Secretary of the Interior (Secretary), through the BLM, shall manage the expansion area pursuant to applicable legal authorities, as a unit of the National Landscape Conservation System, and in accordance with the terms, conditions, and management direction provided by this proclamation and, as described above, those provided by Proclamation 9298.

For purposes of protecting and restoring the objects identified above, the Secretary shall include the lands within the expansion area in the management plan for the monument provided for in Proclamation 9298. The Secretary shall promulgate such rules and regulations for the management of the expansion area as deemed appropriate.

Consistent with the direction in Proclamation 9298, in recognition of the importance of Tribal participation in the care and management of the objects identified above, and to ensure that management decisions are informed by and reflect Tribal expertise and Indigenous Knowledge, the Secretary shall explore entering into one or more memoranda of understanding with interested Tribal Nations to set forth terms, pursuant to applicable laws, regulations, and policies, for co-stewardship of the expansion area, as well as for educational and other outreach efforts regarding the history of the Tribal Nations in the area and the name Molok Luyuk.

In order to reflect the historic, spiritual, and cultural significance of Molok Luyuk to the Patwin Tribes as discussed throughout this proclamation, the geographic feature identified in the Federal Geographic Names Information System as Feature 237183 shall be renamed Molok Luyuk. The Secretary and the Board of Geographic Names shall take any necessary and appropriate steps to make this change in the Geographic Names Information System. Except as necessary for the care and management of the objects identified above, no new rights-of-way shall be authorized within the area reserved by this proclamation.

The Secretary shall issue a travel management plan that authorizes motorized and non-motorized mechanized vehicle use, including mountain biking, so long as such use is consistent with the care and management of the objects identified above. Further, the Secretary shall monitor motorized and non-motorized mechanized vehicle use and designated roads and trails to ensure proper care and management of the objects identified above.

The Secretary shall evaluate opportunities to enter into one or more agreements with governments, including State, local, and Tribal, regarding protection of the objects identified above during wildland fire prevention and response efforts.

If any provision of this proclamation, including its application to a particular parcel of land, is held to be invalid, the remainder of this proclamation and its application to other parcels of land shall not be affected thereby.

Nothing in this proclamation shall be deemed to revoke any existing withdrawal, reservation, or appropriation; however, the monument shall be the dominant reservation.

Warning is hereby given to all unauthorized persons not to appropriate, injure, destroy, or remove any feature of the monument and not to locate or settle upon any of the lands thereof.

IN WITNESS WHEREOF, I have hereunto set my hand this second day of May, in the year of our Lord two thousand twenty-four, and of the Independence of the United States of America the two hundred and forty-eighth.

Rules and Regulations

Federal Register
Vol. 89, No. 91
Thursday, May 9, 2024

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.

The Code of Federal Regulations is sold by the Superintendent of Documents.

DEPARTMENT OF AGRICULTURE

Commodity Credit Corporation

7 CFR Part 1430

RIN 0560–AI66

[Docket No. FSA–2024–0001]

Dairy Margin Coverage Production History Adjustment and Program Extension; Correction

AGENCY: Commodity Credit Corporation (CCC) and Farm Service Agency (FSA), Department of Agriculture (USDA).

ACTION: Final rule; technical correction.

SUMMARY: CCC and FSA are making a technical correction to the Dairy Margin Coverage (DMC) regulations published on February 27, 2024. The technical correction will apply to the 2024 DMC coverage election period to allow dairy operations that dissolved prior to or during the 2024 DMC coverage election period the opportunity to enroll in 2024 DMC for the days they marketed milk in the 2024 calendar year.

DATES:

Effective: May 9, 2024.

Application deadline for dissolved dairies to apply for DMC: May 23, 2024.

FOR FURTHER INFORMATION CONTACT: Douglas Kilgore; telephone: (717) 887–0963; email: *douglas.e.kilgore@usda.gov.* Individuals who require alternative means of communication should contact the USDA TARGET Center at (202) 720–2600 (voice and text telephone (TTY)) or dial 711 for Telecommunications Relay Service (both voice and text telephone users can initiate this call from any telephone).

SUPPLEMENTARY INFORMATION:

Correction

FSA announced changes made to DMC in a final rule on February 27, 2024 (89 FR 14372–14376). FSA inadvertently omitted a modification in 7 CFR 1430.403 to allow dairy operations that dissolved in the 2024 calendar year prior to or during the 2024 DMC coverage election period, the opportunity to enroll in 2024 DMC for the days the dairy operations were still in business and commercially marketing milk.

This technical correction amends the DMC regulation in 7 CFR 1430.403(a)(1) by inserting ''and 2024'' to address the unintentional exclusion of dairy operations that dissolved and stopped commercially marketing milk in the 2024 calendar year at any time before or during the DMC 2024 enrollment period that began on February 2, 2024, and ends on April 29, 2024.

Under the February 27, 2024, final rule, to be approved for enrollment in DMC, participating dairy operations must certify that they are commercially marketing milk at the time of application for DMC. Most DMC annual enrollment periods occur before the start of the coverage year. However, DMC changes authorized by the Further Continuing Appropriations and Other Extensions Act, 2024 (Pub. L. 118–22) required that a regulatory amendment to DMC be published before the coverage election period for 2024 could begin. As a result, some dairy operations that were marketing milk early in 2024, but then dissolved, were not eligible for 2024 DMC for the days they marketed milk in 2024.

The technical correction to the rule is consistent with how dissolved dairy operations were treated during coverage election periods that did not begin before the start of the applicable DMC coverage year in the past. For example, in 2019, when the 2019 DMC coverage election period was delayed until mid-year, provisions were provided in the rule to allow dairy operations that dissolved in the 2019 calendar year prior to or during the 2019 coverage election period the opportunity to enroll in 2019 DMC and receive benefits for the days they were commercially marketing milk. This technical correction provides dissolved dairy operations the opportunity to enroll in 2024 DMC under provisions consistent with 2019 DMC implementation. This is also consistent with the Congressional intention that DMC be available to eligible dairy operations as of the start of the 2024 calendar year, as illustrated by section 102(g) of Title I of Division B of the Further Continuing Appropriations and Other Extensions Act, 2024, which provides for the extension of DMC, among other provisions, to be effective as of September 30, 2023.

To enroll, you must send your application for 2024 DMC to the administrative county FSA office serving the dairy operation. Participating dairy operations that dissolved in the 2024 calendar year prior to or during the 2024 DMC coverage election period may apply for DMC. The deadline for dissolved dairies to apply for DMC is May 23, 2024. This application is to enroll in 2024 DMC for the days the dissolved dairy operation was still in business and commercially marketing milk.

USDA Non-Discrimination Policy

In accordance with Federal civil rights law and USDA civil rights regulations and policies, USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family or parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Individuals who require alternative means of communication for program information (for example, braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or USDA TARGET Center at (202) 720–2600 (voice and text telephone (TTY)) or dial 711 for Telecommunications Relay Service (both voice and text telephone users can initiate this call from any telephone). Additionally, program information may be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD–3027, found online at *https://www.usda.gov/oascr/how-to-file-a-program-discrimination-complaint* and at any USDA office or write a letter addressed to USDA and provide in the letter all the information requested in the form. To request a copy of the

complaint form, call (866) 632–9992. Submit your completed form or letter to USDA by: (1) mail to: U.S. Department of Agriculture, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue SW, Washington, DC 20250–9410; (2) fax: (202) 690–7442; or (3) email: *program.intake@usda.gov.*

USDA is an equal opportunity provider, employer, and lender.

List of Subjects in 7 CFR Part 1430

Dairy products, Fraud, Penalties, Price support programs, Reporting and recordkeeping requirements.

For the reasons discussed above, CCC amends 7 CFR part 1430 as follows:

PART 1430—DAIRY PRODUCTS

■ 1. The authority citation for part 1430 continues to read as follows:

Authority: 7 U.S.C. 9051–9060 and 9071 and 15 U.S.C. 714b and 714c.

Subpart D—Dairy Margin Coverage Program

§ 1430.403 [Amended]

■ 2. In § 1430.403, amend paragraph (a)(1) by removing the year ''2019'' and adding ''2019 and 2024'' in its place.

Zach Ducheneaux,

Administrator, Farm Service Agency, and Executive Vice President, Commodity Credit Corporation.

Animal and Plant Health Inspection Service

9 CFR Parts 71, 77, 78, and 86

[Docket No. APHIS–2021–0020]

RIN 0579–AE64

Use of Electronic Identification Eartags as Official Identification in Cattle and Bison

AGENCY: Animal and Plant Health Inspection Service, USDA.

ACTION: Final rule.

SUMMARY: We are amending the animal disease traceability regulations to require that eartags applied on or after a date 180 days after publication in the **Federal Register** of this final rule be both visually and electronically readable in order to be recognized for use as official eartags for interstate movement of cattle and bison covered under the regulations. We are also clarifying certain record retention and record access requirements and revising some requirements pertaining to slaughter cattle. These changes will enhance the ability of Tribal, State and Federal officials, private veterinarians, and livestock producers to quickly respond to high-impact diseases currently existing in the United States, as well as foreign animal diseases that threaten the viability of the U.S. cattle and bison industries.

DATES: This rule is effective November 5, 2024.

FOR FURTHER INFORMATION CONTACT: Dr. Alexander K. Turner, Acting Director, Animal Disease Traceability and Veterinary Accreditation Center, Strategy and Policy, VS, APHIS, 2150 Centre Ave., Building B, Fort Collins, CO 80526; (970) 494–7353.

SUPPLEMENTARY INFORMATION:

Background

Under the Animal Health Protection Act (AHPA, 7 U.S.C. 8301 *et seq.*), the Secretary of Agriculture has the authority to issue orders and regulations to prevent the introduction into the United States and the dissemination within the United States of any pest or disease of livestock. Within the U.S. Department of Agriculture (USDA), the Animal and Plant Health Inspection Service (APHIS) has primary regulatory responsibility to prevent, control, and eradicate communicable diseases of livestock in the United States. Knowing where diseased and at-risk animals are, where they have been, and when, is indispensable in emergency response and in ongoing disease control and eradication programs.

The animal disease traceability regulations, which were set forth in a final rule [1] published on January 9, 2013 (78 FR 2040–2075, Docket No. APHIS–2009–0091) and are contained in 9 CFR part 86, provide the requirements for identification and documentation for certain classes of cattle and bison to move interstate. These regulations establish minimum national official identification and documentation requirements for the traceability of livestock moving interstate. The species covered in the regulations include cattle and bison (sexually intact and 18 months of age or older, all female dairy cattle of any age and male dairy cattle born after March 11, 2013, cattle and bison of any age used for rodeo or recreational events, and cattle and bison of any age used for shows or exhibitions), sheep and goats, swine, horses and other equids, captive cervids (*e.g.,* deer and elk), and poultry.

Under the regulations, official identification devices or methods are determined by the APHIS Administrator. An ''official identification device or method'' is defined in § 86.1 of the regulations as ''[a] means approved by the Administrator of applying an official identification number to an animal of a specific species or associating an official identification number with an animal or group of animals of a specific species or otherwise officially identifying an animal or group of animals.''

One of the approved identification methods for cattle and bison covered by part 86 is an official eartag. An official eartag is defined in § 86.1 of the regulations as ''[a]n identification tag approved by APHIS that bears an official identification number for individual animals. Beginning March 11, 2014, all official eartags manufactured must bear an official eartag shield. Beginning March 11, 2015, all official eartags applied to animals must bear an official eartag shield. The design, size, shape, color, and other characteristics of the official eartag will depend on the needs of the users, subject to the approval of the Administrator. The official eartag must be tamper-resistant and have a high retention rate in the animal.'' The other methods of official identification of cattle and bison include ''[b]rands registered with a recognized brand inspection authority and accompanied by an official brand inspection certificate, when agreed to by the shipping and receiving State or Tribal animal health authorities; or [t]attoos and other identification methods acceptable to a breed association for registration purposes, accompanied by a breed registration certificate, when agreed to by the shipping and receiving State or Tribal animal health authorities; or Group/lot identification when a group/lot identification number (GIN) may be used.'' 9 CFR 86.4(a)(1)(ii) through (iv).

Historically, APHIS has used metal, non-electronic identification (EID) tags for animal identification in disease programs for many decades and has approved both non-EID and radio frequency identification (RFID, a form of EID) tags for use as official eartags in cattle and bison since 2008.

Since the enactment of the animal disease traceability regulations, APHIS has worked with stakeholders to enhance its traceability capacity within the Animal Disease Traceability (ADT) program. In January 2017, APHIS staff officers met with State officials and

[1] To view the final rule, supporting documents, and comments we received, go to: *https://www.regulations.gov/docket/APHIS-2009-0091.*

APHIS Veterinary Services field officers to gather input on what was working well in the traceability program and what gaps remained. A report of our findings was published in April 2017 (*https://www.aphis.usda.gov/traceability/downloads/adt-assessment.pdf*). Among other findings, the report discussed gaps in tracing animals due to the challenges of reading and recording numbers from non-EID eartags. A similar gap identified was the need for greater efficiency in collecting Animal Identification Numbers (AINs) or other official identification numbers of individual animals at slaughter and removing those identification numbers from future tracing efforts. Eliminating this gap was determined not to be feasible with visual-only eartags, but could be achieved with EID eartags.

On April 4, 2017, we published in the **Federal Register** (82 FR 16336, Docket No. APHIS–2017–0016) a notice [2] announcing a series of public meetings aimed at soliciting comment on the animal disease traceability program. A total of nine public meetings were hosted by APHIS between April and July of that year, and an additional meeting was hosted by the Kansas Department of Agriculture. As discussed in the April 2017 notice, the purpose of the meetings paralleled the prior discussion with State officials and APHIS field officers: to ''hear from the public about the successes and challenges of the current ADT framework.'' We specifically solicited attendance from cattle and bison industry members, as well as impacted States and Tribes.

The notice and meetings generated 462 written public comments. A working group composed of State and Federal officials, formed in March of 2017 to plan and attend the public meetings, was further tasked with listening to the discussions and preparing a final report summarizing input from the meetings and proposing directions to address gaps in the traceability system. The report was presented at the National Institute for Animal Agriculture fall public forum in September of 2017 and published in April of 2018 (*https://www.aphis.usda.gov/publications/animal_health/adt-summary-program-review.pdf*).

During the remainder of 2017, 2018, and 2019, APHIS personnel frequently met with stakeholders to discuss questions and topics that arose during the 2017 outreach meetings. In addition to individual and industry organization meetings, APHIS officers met with State officials as well as industry stakeholders at national public forums including the United States Animal Health Association and the National Institute for Animal Agriculture forum.

During this period, cattle and bison organizations provided significant and ongoing input on the animal disease traceability program. Although not everyone agreed, many stakeholders commented that electronic records and electronic identification were of significant value and were needed to protect the industry from diseases with potential for high economic impacts.

While APHIS focuses on interstate movement of livestock, States and Tribal Nations remain responsible for the traceability of livestock within their jurisdictions. APHIS partners with State veterinary officials each year to test the performance of States' animal disease traceability systems with regard to the interstate movement of cattle and bison covered under 9 CFR part 86. (Tribes are free to request such test exercises on a voluntary basis and APHIS will report to the Tribes the results of any such exercise. At this time, Tribes have not requested such test exercises.) Results of these test exercises can be viewed on APHIS' traceability web page.[3] The results indicate that when State veterinary officials are provided an identification number from an animal that has been identified with an official identification eartag, whether non-EID (*e.g.,* metal or plastic) or electronic, and the number has been entered accurately into a data system, States on average can trace animals to any one of these four locations in less than 1 hour: the State where an animal was officially identified, the location in-State where an animal was officially identified, the State from which an animal was shipped out of, and the location in-State that an animal was shipped out-of-State from. However, lengthy times or failed traces in the test exercises resulted when numbers from non-EID tags were transcribed inaccurately, movement records were not readily available, or information was only retrievable from labor-intensive paper filing systems. We believe electronic tags and electronic record systems provide a significant advantage over non-EID tags and paper record systems, or systems that involve manual entry of tag numbers, by enabling rapid and accurate reading and recording of tag numbers and retrieval of traceability information.

In support of greater efficiency in traceability and in furtherance of the above-listed program goals, on July 6, 2020, we published in the **Federal Register** (85 FR 40184–40185, Docket No. APHIS–2020–0022) a notice [4] in which we announced our proposal to approve only RFID tags as the official eartag for use in interstate movement of cattle and bison that are covered under the regulations. Specifically, the notice proposed that:

- Beginning January 1, 2022, USDA would no longer approve vendors to use the official USDA shield in production of visual eartags or other eartags that do not have RFID components.
- On January 1, 2023, RFID tags would become the only identification devices approved as an official eartag for cattle and bison pursuant to § 86.4(a)(1)(i).
- For cattle and bison that have official USDA visual (metal) tags in place before January 1, 2023, APHIS would recognize the visual (metal) tag as an official identification device for the life of the animal.

The 2020 notice further clarified that we were proposing no changes to the regulations pertaining to, nor proposing to restrict the use of, other official identification methods authorized by 9 CFR 86.4(a)(1)(ii) through (iv) (such as the use of tattoos and brands when accepted by State veterinary officials in the sending and receiving States).

We solicited comments on the 2020 notice for 90 days ending on October 5, 2020. We received 935 comments by that date from industry groups, producers, veterinarians, State departments of agriculture, and individuals.

Many of the commenters representing industry organizations and State department of agriculture regulatory officials were supportive of the transition and agreed with APHIS that RFID allowed for greater efficiency than non-electronic means of identification and furthered the goals of the ADT program with regard to animal traceability. We also received many comments expressing opposition to the proposal. These commenters expressed concern about issues including perceived costs, retention time on the animals of RFID eartags, as well as our legal authority under the Administrative Procedure Act (5 U.S.C. 500 *et seq.*) to change the eartag requirements using a

[2] To view the notice, go to: *https://www.regulations.gov/document/APHIS-2017-0016-0001.*

[3] See ADT Trace Performance Metric Report 2013–2022. *https://www.aphis.usda.gov/traceability/downloads/adt-trace-perf-report-2013-2022.pdf.*

[4] To view the notice, supporting documents, and comments we received, go to: *https://www.regulations.gov/document/APHIS-2020-0022-0001.*

notice-based procedure rather than rulemaking.

After reviewing the comments on the July 2020 notice, we determined that withdrawing our recognition of visual-only (non-EID) eartags as official eartags for cattle and bison moving interstate would constitute a change in the application of our regulatory requirements of sufficient magnitude to merit rulemaking rather than the notice-based process we originally envisioned. We also determined that the goal of maximizing transparency and public participation would also best be served through rulemaking in this instance. Therefore, on March 23, 2021, we issued a stakeholder announcement indicating that we would not finalize the 2020 notice, and that we ''would use the rulemaking process for further action related to the proposal.'' [5]

To that end, on January 19, 2023, we published in the **Federal Register** (88 FR 3320–3330, Docket No. APHIS–2021–0020) a proposal [6] to amend the animal disease traceability regulations to require that eartags applied on or after a date 6 months (180 days) after publication in the **Federal Register** of a final rule be both visually and electronically readable in order to be recognized for use as official eartags for interstate movement of cattle and bison covered under the regulations. The proposed rule differed from the 2020 notice in that we referred to electronic identification (EID) tags rather than to RFID tags to recognize the permissibility of other electronically readable technology, in addition to RFID technology, should it become available in the future. We also proposed several other changes to part 86 aimed at clarifying the regulations, including revising the definition of dairy cattle, amending certain provisions pertaining to recordkeeping, and revising certain requirements pertaining to slaughter cattle. We began soliciting comments concerning the proposal for 60 days, ending March 20, 2023, and in response to several requests by commenters, we extended [7] the comment period by 30 days to April 19, 2023.

We received 2,006 comments by the extended date. The comments were from industry groups, producers, veterinarians, State departments of agriculture, and individuals.

Similar to the response to the notice published on July 6, 2020,[8] many of the commenters representing industry organizations and State departments of agriculture regulatory officials were supportive of the proposed rule and agreed that EID furthered the goals of the ADT program with regard to animal traceability. We also received many comments expressing opposition to our proposal. Our responses to those comments are provided below, organized by topic.

General Comments

Several commenters stated that our proposed rule would not improve animal disease traceability because an insufficient number of animals are covered under the proposed rule. These commenters noted that USDA has stated that a participation rate of 70 percent of the nation's cattle herd would be necessary for an ADT program to be effective.

Having a higher percentage of the nation's cattle population officially identified would certainly be a benefit to a robust ADT program, but our focus in this rulemaking is to continue to enhance our ability to respond quickly to high-impact diseases of livestock within the constraints of the animal classes and movements that are currently required to have official identification and the animal classes and movements that are currently exempted.

The source [9] cited by the commenters was the 2009 Congressional testimony of Dr. John Clifford, a former APHIS Deputy Administrator for Veterinary Services. Dr. Clifford was testifying about what measures were in place to survey for and respond to the possible introduction of high-risk foreign animal diseases (FADs) into the United States. His comments should be viewed through that lens and understood to mean that, in order to be fully prepared for a possible incursion of an FAD, an estimated 70 percent [10] of animals of a specific species/sector would need to be traceable. At the time of his testimony, Dr. Clifford estimated that 25 percent of the nation's beef cattle herd participated in the USDA's National Animal Identification System (a voluntary system that prefigured the current ADT program). The higher the number of animals that are traceable, the higher the likelihood that we are able to trace any particular instance of disease and effectively respond.

These statements do not preclude APHIS from taking measures, such as our proposed rule, to move closer to that stated objective, nor do they contradict our claim that our proposal would improve the efficacy of our current ADT program. For the reasons outlined in the proposed rule and summarized above in this document, requiring EID for eartags will improve our ability to trace the cattle and bison that are currently required to have official identification and that meet this requirement with eartags.

A commenter stated that our proposed rule would not improve ADT because our proposal included no measure to solve problems with paper records by, for example, requiring the digitization of paper records used in disease traceback investigations.

We are making no change in response to the commenter. While the regulations do not require the digitization of paper records, APHIS has elsewhere encouraged the use of electronic recordkeeping through efforts such as targeted funding to State and Tribal animal health officials operating under an ADT cooperative agreement to support their electronic recordkeeping systems and maintain their internal databases used for animal disease traceability. Cooperators have used this funding in a variety of ways, including providing accredited veterinarians and livestock markets with free EID readers. Partly as a result of these efforts, electronic interstate certificate of veterinary inspections (ICVIs) are readily available now and frequently used. Moreover, our proposal included editing language in the definition of *interstate certificate of veterinary inspection (ICVI)* in § 86.1 to clarify that electronic ICVIs may be used as an alternative to paper ICVIs. Our intention with respect to this change was to continue to encourage electronic recordkeeping in order to further alleviate the potential problems caused by paper records. However, because electronic ICVIs may sometimes be impracticable for the regulated community, we are not requiring the use of electronic ICVIs.

A commenter stated that typos were not a legitimate basis for major Federal action and claimed that APHIS was suggesting that ranchers ''are doing sloppy work.''

[7] The comment extension notice was published on March 20, 2023 (88 FR 16576, Docket No. APHIS–2021–0020).

[8] See footnote 4.

[9] *https://www.usda.gov/sites/default/files/documents/5_5_09_Clifford_Dep_Admin_for_Vet_Services_APHIS_National_Animal_ID.pdf.*

[10] More recently, a 2018 World Perspectives study commissioned by the National Cattlemen's Beef Association estimated that a window of 45 percent to 90 percent, with a midpoint of 68 percent, is needed for traceability to have ''national significance.'' (''Comprehensive Feasibility Study: U.S. Beef Cattle Identification and Traceability Systems.'' World Perspectives, Inc. 2018.)

Transcription errors in animal location and movement documents have the potential to significantly impede trace investigations. APHIS recognizes that producers and others who complete these documents typically take care in producing the documents; however, reading and transcribing tag identifiers by hand, especially National Uniform Eartagging System (NUES) tags that may be obstructed with debris or worn down, is a process that is inherently subject to human error. Errors can occur at the level of writing, reviewing, or completing movement documents, and an error in recording a single digit can have major impacts on a trace.

Some commenters stated that APHIS has failed to articulate the need for the proposed EID requirement, as the current ADT program has proven adequate. One of these commenters cited examples of successful disease outbreak control of bovine tuberculosis (TB) in Michigan; mad cow disease in Washington in 2003; and foot-and-mouth disease (FMD) in California in 1929.

Successes in the past do not mean EID is unnecessary. As explained in the proposed rule and summarized earlier in this document, APHIS partners with State veterinary officials each year to test the performance of States' animal disease traceability systems. Results of these test exercises currently show that when State veterinary officials are provided an identification number from an animal that has been identified with an official identification tag, either metal or EID, that has been entered accurately into a data system, over half of States can trace animals to any one of four locations in less than 1 hour (these four locations are: the State where an animal was tagged, the location in-State where an animal was tagged, the State from which an animal was shipped out of, and the location in-State that an animal was shipped out-of-State from). However, lengthy times in the trace test exercises resulted when numbers from visual (metal) tags were transcribed inaccurately, movement records were not readily available, or information was only retrievable from labor-intensive paper filing systems. EID tags and electronic record systems thus provide significant advantage over other forms of official identification to rapidly and accurately read and record tag numbers and retrieve traceability information.

As for the examples cited by the commenter, Michigan was unable to regain TB-free status in the vast majority of the State until improvements to its traceability program were made following the State's implementation of the mandatory use of RFID ear tags in cattle and bison in 2007. Michigan faces a unique challenge in eradicating bovine TB, as the disease is endemic in free-ranging white-tailed deer present in specific areas of Michigan, and the disease can be transmitted between deer and cattle. Because of this, Michigan maintains a split-state status for TB: the State is divided into a Modified Accredited Zone and Accredited Free areas.[11] International trading partners and States have required Michigan to maintain a robust traceability program to continue to allow animals to move internationally or to other States from the Accredited Free areas of Michigan. Utilizing mandatory RFID tags in this traceability program allows immediate uploading of accurate records to the Michigan Department of Agriculture and Rural Development's system, which in turn allows Michigan to show their trading partners proof of where animals have been within the State, and helps to guarantee rapid response in the event of an animal disease emergency.

In addition to allowing for more rapid tracing of animals into and out of TB-positive herds, the mandatory RFID tagging requirement allows Michigan to provide real-time animal movement data for animals leaving the Modified Accredited Zone. This program allows State and Federal animal health officials to trace potentially exposed herds within hours, as opposed to days or weeks, saving both time and money. TB traces in Michigan are linked to source and exposed herds more accurately, which reduces the number of additional herds impacted by quarantine and testing. We believe Michigan's experience further supports our contention that increased use of EID eartags nationwide will improve APHIS's animal disease traceability program.

Regarding the 1929 outbreak of FMD in California, historically, cattle movement in the United States was much smaller. Animals today can be transported quickly and easily across State lines, allowing for a much more rapid and uncontrolled spread of disease. While the United States was fortunate to contain the disease in 1929, containing an outbreak would be far more difficult today. Moreover, the cost of containment, eradication, and the loss of export markets would far outweigh the cost of EID tags.

Regarding the 2003 case of bovine spongiform encephalopathy (BSE, ''mad cow disease'') in Washington, the diseased cow was traceable to Canada. The United States was unable to trace all the cows in the diseased cow's cohort, leading to suspicion that more cows with BSE existed in the United States, which resulted in negative impacts to cattle prices and export markets that lasted several years.[12] We consider this further support for improving the animal disease traceability program, as we believe that a more effective and efficient animal disease traceability program may have prevented those impacts.

As we have previously stated, in order to be fully prepared for a possible incursion of a high-risk FAD, an estimated 70 percent of each species/sector would need to be traceable. To be an effective tool for disease control, the traceability must be successful to the source of the disease and exposed animals within the time window of the particular disease's exposure and transmission parameters. This rulemaking furthers this goal.

Some commenters claimed that the ADT program's goal to trace an animal from birth to death in less than 24 hours was flawed, as birth-to-death traceability is not needed for fast-moving diseases such as FMD. The commenter suggested that the program need only trace where the infected animal has been in the last few days. The commenters also claimed that slow-moving diseases such as TB do not require rapid traceback.

The ADT program does not have a goal of tracing an animal from birth to death in less than 24 hours; the ADT program's goal is to be able to trace animals' movements completely and as rapidly as necessary to contain the disease in question, which depends on the speed of disease transmission.

Traceability is necessary for controlling both fast-moving diseases, like FMD, as well as slower-moving diseases, like TB and brucellosis. In both cases, speed of data retrieval and information sharing is important for efficiently and effectively completing a trace investigation. Responders can better identify animals that may have come in contact with an affected animal, which sometimes can number in the thousands or tens of thousands, implement mitigation strategies, and thereby minimize the economic impact of outbreaks to the industry. This speed of information retrieval and sharing is

[11] The Modified Accredited Zone is currently comprised of 4 counties; the State's remaining 79 counties are Accredited Free areas (*https://www.michigan.gov/mdard/animals/diseases/bovine-tuberculosis*).

[12] Coffey, B., Mintert, J., Fox, J.A., Schroeder, T.C. and Valentin, L., 2005. The economic impact of BSE on the US beef industry: product value losses, regulatory costs, and consumer reactions. Kansas State University Agricultural Experiment Station and Cooperative Extension Service, MF–2678.

enhanced when electronic identification and recordkeeping methods are utilized.

A commenter stated that use of EID eartags would not be enough to help control a potential FMD outbreak, and that prevention should be the first line of defense.

APHIS agrees that a response to FMD in the United States would require a multifactorial approach. As explained in Dr. Clifford's 2009 testimony [13] before Congress, APHIS' response plan includes specific emergency response guidelines; coordination with Departments and Agencies that will support and partner with USDA in emergency response; rapid response teams stationed around the country; access to personnel through the International Animal Health Emergency Response Corps; the National Veterinary Stockpile; and guidelines regarding the use of FMD vaccine.

Moreover, while prevention and biosecurity are necessary first-line defenses, we do not agree that they are sufficient risk mitigation strategies alone. EID eartags will make the process of tracing infected and exposed animals more efficient and will improve our implementation of mitigations, like tracing animals forward or utilizing vaccination or regionalization strategies. EID would be critical to reopening export markets closed as a result of an FMD outbreak, as the rapid tracing afforded by EID would help the United States demonstrate freedom from disease and disposition of all infected and exposed animals.

A commenter stated that early diagnosis and good animal husbandry are more important to disease control than ADT, as evidenced by the failure of EID to prevent the porcine epidemic diarrhea (PED) outbreak of 2013.

While we agree that good animal husbandry is important for preventing disease and that early diagnosis can help prevent its spread, this does not negate the importance of an ADT program, which can help us contain potentially devastating disease outbreaks before they can do substantial damage.

The commenter is correct that electronic identification of swine moving interstate would not have materially impacted the spread of PED. However, this is due to the nature of the disease and swine industry practices, rather than a failure of EID identification. The primary mechanism of PED spread was through fomites (*e.g.,* pig feed, trucks, etc.) and not animal-to-animal contact where tracing would have been of greater benefit. In contrast, diseases of cattle and bison, such as TB, brucellosis, and FMD, often are transmitted by animal-to-animal contact and, when the cattle or bison are moving in interstate commerce, the diseases can rapidly damage the cattle and bison industry in multiple States.

Some commenters disagreed that our proposal would address animal disease outbreaks because they claimed the risk of outbreaks of diseases of livestock originates from people crossing the border into the United States. Commenters specifically cited the risk of human-to-animal transmission of TB.

The commenter's claim that disease outbreaks of TB in cattle and bison are largely the result of zoonosis, and exposure to infected humans is not supported by data. Information from APHIS' National Tuberculosis Eradication Program indicates that TB is usually spread through the purchase of infected animals or exposure to infected cattle or wildlife. While human-to-animal transmission of TB may periodically occur, genomic testing shows the incidence to be low.

Some commenters disagreed that our proposal would address livestock disease outbreaks because they claimed the risk of livestock disease outbreaks originates from imported cattle and beef. The commenters suggested that APHIS focus its efforts on restricting imports to prevent the introduction of livestock disease rather than improving ADT.

This rulemaking is limited in scope to improving our national animal disease traceability program; restrictions on the importation of live animals and animal products are outside of its scope. We note that, under our regulations in 9 CFR part 93, APHIS only allows the importation of live animals from countries that meet certain freedom from disease testing requirements. Under 9 CFR part 94, APHIS similarly restricts the importation of animal products based on the animal disease status of the exporting region. Animals and animal products that do not meet these requirements may not be imported into the United States.

A commenter stated that the proposed rule does not mention biosecurity and, therefore, is not focused on disease prevention.

We agree with the commenter that biosecurity is important to preventing disease and encourage producers to follow biosecurity practices. The commenter is correct that this final rule is not focused on disease prevention. As acknowledged in the proposed rule, the intent of the proposed rule was not to prevent disease epidemics. Rather, it would facilitate containing disease outbreaks before they can do substantial damage to the U.S. cattle and bison industries. This final rule is specifically focused on improving our ability to trace animals accurately and rapidly in order to prevent that potential damage.

Many commenters who opposed the proposed EID tag requirement based their opposition on issues related to food safety. Commenters stated that the majority of food-borne illnesses in meat are the result of practices at the slaughterhouse and in processing and handling. Since animal identification programs end at the time of slaughter, commenters argued that requiring EID tags on cattle will not increase food safety.

Within the USDA, food safety of meat and meat food products falls under the purview of the Food Safety and Inspection Service (FSIS). APHIS does not have statutory authority to regulate for food safety. The EID eartag requirement is intended to facilitate animal disease traceability, thereby improving our ability to trace outbreaks of diseases of livestock in live animals and more efficiently control or eradicate these diseases. This is consistent with our statutory authority under the AHPA.

It was further stated that, to address food safety and animal disease, APHIS should increase oversight and testing at the large meat processing plants. The commenters felt that would be more effective in preventing the spread of disease than requiring EID eartags.

As noted above, FSIS is a separate agency of USDA that regulates the slaughter and processing of meat and meat food products. APHIS does not provide oversight of the slaughter or processing operations; however, APHIS conducts surveillance for domestic animal diseases, such as brucellosis and TB, and some foreign animal diseases in certain species through slaughter surveillance. APHIS regularly evaluates its slaughter surveillance programs for efficacy; however, we disagree with the commenter that more stringent oversight of such facilities would prove more effective than requiring EID tags. Slaughter facilities are a terminal point, and cattle and bison may pass through multiple intermediate locations and commingle with animals from other premises and of other health statuses prior to slaughter. In the event of a disease outbreak, addressing this possible intermediate movement requires rapid and accurate traceability of all potentially affected livestock.

Some commenters asked us to reinstate mandatory country of origin labeling (COOL) in order to have a successful traceability program. Some commenters asked whether we intended

[13] See footnote 9.

to use EID tags for the purposes of COOL.

COOL pertains to the labeling of food products and is not related to APHIS' animal disease traceability program. Moreover, COOL was never under APHIS' purview, but under the purview of the Agricultural Marketing Service (AMS).

Some commenters expressed their support for the continued exemption of cattle under 18 months of age from official identification requirements.

The regulations will continue to exempt most feeder cattle (beef cattle less than 18 months of age) from official identification requirements.

A commenter stated that ADT should only apply to breeding cattle or cattle in interstate commerce. Conversely, other commenters recommended that we apply the EID tag requirement to all cattle and/or that all cattle should be tagged at birth or before being sold, as this would improve our ability to locate diseased animals and lessen the effects of a disease outbreak. Some of these commenters added that this issue should be addressed in a separate rulemaking.

We will consider the commenters' recommendations in the future; however, changing the type of cattle needing official identification is outside the scope of this rulemaking. Should APHIS decide to change the type of cattle that require official identification in the future, this process would occur through rulemaking that would solicit public comment.

Some commenters expressed concern about APHIS expanding ADT requirements to encompass other types of cattle in the future.

This rulemaking is only intended to address the transition to EID official eartags for cattle and bison that are currently required to have official identification.

Some commenters expressed confusion regarding whether the EID tag requirement applied to their animals. Commenters provided various examples of beef cattle that do not move interstate, or that moved interstate but were less than 18 months of age. It was stated that the rule would require producers to tag their direct-to-slaughter cows and bulls. Similarly, two commenters requested that we exclude small producers from the EID eartag requirements in order to reduce burden on these entities.

This final rule does not change the types of animals to which official identification requirements apply, nor does it change the categories of animals that are exempted from official identification requirements. Under the current regulations in § 86.4(b), which this final rule does not change, the following categories of cattle and bison are subject to official identification requirements for interstate movement: all sexually intact cattle and bison 18 months of age or over; all female dairy cattle of any age and all male dairy cattle born after March 11, 2013; cattle and bison of any age used for rodeo or recreational events; and cattle and bison of any age used for shows or exhibitions. Cattle and bison are exempted from official identification requirements if they are going directly to slaughter.

Because of these strictures, many small entities have cattle that are excluded from the requirement currently, including many of the commenters who asked whether the rule applies to them. Beef feeder cattle under 18 months of age are not subject to the identification requirements. Direct-to-slaughter cattle, including cull cattle, are not subject to the identification requirements. Cattle and bison that do not move interstate are not subject to the identification requirements, unless required by APHIS program disease regulations in 9 CFR subchapter C.

Some commenters stated that when the new EID tag requirement goes into effect, we should continue to exempt animals moved between States on pasture-to-pasture movement permits, *i.e.,* commuter herd agreements, from the requirements for official identification.

The EID tag requirement does not change the categories of animals that are subject to, or exempted from, the requirements for official identification.

Under a commuter herd agreement between a livestock owner and State or Tribal animal health officials, cattle and bison may be moved interstate between two premises, without a change of ownership in the course of normal livestock operations, subject to the conditions of the agreement. The regulations in § 86.4 provide for interstate movement of commuter herds under commuter herd agreements. See 9 CFR 86.4(b)(1)(i)(A). The EID tag requirement does not affect those regulations and, therefore, does not have any implications for the interstate movement of commuter herds.

A commenter stated that animals involved in private treaty sales for the purpose of breeding should be exempt from EID tag requirements when moved interstate.

This comment is outside the scope of this rulemaking. Per § 86.2(b), no person may move covered livestock interstate or receive livestock moved interstate unless all requirements of part 86 are met. Private treaty sales of breeding cattle are required to meet these requirements, including official identification and an ICVI.

A commenter stated that allowing animals to move through a livestock facility to a slaughter establishment where a backtag can be applied, in accordance with § 86.4(b)(1)(ii)(B), leaves a potential gap in traceability to the premises of origin.

Section 86.4(b)(1)(ii) refers to a situation in which cattle are exempted from the requirement for official identification. Exemptions from the requirement for official identification are outside the scope of this rulemaking.

A commenter stated that finalizing this proposed rule would ''invite limitless incremental regulation from other agencies.''

The commenter's stated supposition for this statement is that this rulemaking represents a concerted effort by the Federal Government, as a whole, to wrest livestock management decisions from individual producers. APHIS has no intent to do so, nor is it aware of any such effort.

The same commenter opined that the rule could be used by APHIS as a basis for incremental further expansion of the ADT program, citing, as purportedly analogous examples, requirements by the Security and Exchange Commission regarding environmental, social, and governance reporting, and policies by the Food and Drug Administration regarding the use of antibiotics in livestock.

APHIS has no authority over the regulatory actions and policies of other agencies. However, as noted above, the proposed rule is a distinct action meant, primarily, to change the official eartag requirements for cattle and bison covered by the ADT regulations in order to improve its emergency response and ongoing disease control and eradication programs. The proposed rule is not intended as part of a suite of interlocking, incremental regulatory changes to the regulations, and any possible future revisions to the regulations would be through proposed rules with the opportunity for public comment.

Some commenters, while generally supporting the use of EID eartags for official identification of cattle and bison, believed that such use should be voluntary rather than a requirement.

The use of EID official eartags has been voluntary for many years. In our view, and as stated above, continuing to allow the use of EID eartags by producers on a voluntary basis will not provide the degree of enhancement to our traceability capacity that is needed

for optimal animal disease investigation and control.

We also received a number of comments regarding the public comment period and outreach efforts related to this rulemaking. A few commenters stated that more stakeholder outreach was needed. Some commenters stated that APHIS ignored previous stakeholder outreach in drafting our proposed rule. Some commenters requested an extension of the comment period, ranging from 30 days to 90 days, to allow more time for public input.

We extended the comment period for the proposed rule by 30 days, which we consider appropriate given our prior outreach efforts to stakeholders. We disagree that our outreach efforts were inadequate or that the feedback received during our outreach efforts was ignored. As stated in the proposed rule and summarized earlier in this document, outreach included meetings with State officials and APHIS Veterinary Services field officers; nine public meetings that solicited attendance from cattle and bison industry members, as well as impacted States and Tribes; the July 2020 notice seeking public comment for 90 days; as well as the January 2023 proposed rule, which solicited comment for a total of 90 days. All input and comments received from these efforts were considered when drafting this rulemaking.

Effective Date and Implementation

Some commenters advocated grandfathering in existing eartags, *i.e.,* recognizing visual tags, such as National Uniform Eartagging System eartags, as official eartags for animals tagged with them prior to November 5, 2024, the effective date of the EID tag requirement.

We agree with these commenters. As we noted in the proposed rule, visual eartags applied to animals prior to November 5, 2024 will be recognized as official eartags for the life of the animal.

Some commenters expressed concern about the effective date of November 5, 2024, stating that 6 months was a relatively short amount of time to notify producers of the new requirements and for producers to meet the EID tag requirement. Other commenters expressed support for our proposed timeline.

We believe that an effective date of November 5, 2024 provides sufficient time for stakeholders to comply with the new requirements. APHIS has engaged in extensive outreach efforts regarding the use of EID eartags, as summarized earlier in this document, and it has ensured that the new requirements will only apply to eartags applied to animals after the effective date.

Two commenters stated that implementation of the proposed rule would be difficult due to a general labor shortage.

We note that producers may apply official eartags to their animals themselves. Whether producers have tags applied to their animals at approved tagging sites, apply tags to their animals themselves, or hire labor to apply tags to their animals, we do not believe there is more labor involved in the application of EID eartags as opposed to applying eartags that are only visually readable.

Multiple commenters expressed concern about potential shortages of EID tags in light of supply chain and manufacturing challenges. Some commenters mentioned that EID tags are often backordered or that there are high wait times for EID tag orders. Some commenters recommended we create a contingency plan in the event EID tags required by this rulemaking are not available once the final rule goes into effect.

APHIS ADT staff have had frequent conversations with manufacturers of official devices and have been assured that manufacturing and shipping capacity is adequate for the projected number of cattle requiring official identification for interstate movement.

APHIS is aware of supply chain and manufacturing disruptions due to the COVID–19 pandemic, but these issues have been resolved. APHIS is also aware of long wait times due to customization or brand preferences that are desired by the producer, but the regulations do not require such customizations or that any specific brand be used. We do not believe either of these issues indicate that a current shortage exists or that a future shortage is likely, and the commenters have not provided any additional evidence of reasonably foreseeable supply chain issues.

Finally, as discussed in further detail later in this document, we believe that the streamlining changes we proposed to the approval process for new EID devices will help insulate against unforeseen supply chain disruptions.

Definitions (§ 86.1)

In § 86.1, we proposed to revise the definitions of *approved tagging site, dairy cattle, interstate certificate of veterinary inspection (ICVI),* and *official eartag.* We also proposed to add a new definition for *Official Animal Identification Device Standards (OAIDS).* Comments we received for each of the revisions and addition to § 86.1 are addressed below.

Approved Tagging Site

The current regulations define an *approved tagging site* as ''A premises, authorized by APHIS, State, or Tribal animal health officials, where livestock may be officially identified on behalf of their owner or the person in possession, care, or control of the animals when they are brought to the premises.'' In order to offer greater clarity regarding the nature of an approved tagging site by specifying that such sites are where official identification tags are physically applied to animals, we proposed to revise this definition to read as follows: ''A premises, authorized by APHIS, State, or Tribal animal health officials, where livestock without official identification may be transferred to have official identification applied on behalf of their owner or the person in possession, care, or control of the animals when they are brought to the premises.''

One commenter, while expressing support, suggested we also revise the definition to require the physical address of the originating premises to be recorded alongside the animal's official identification number in order to address a purported ambiguity in the current regulations. The commenter stated that, occasionally, livestock exempt from the official identification requirements for interstate movement by § 86.4(b)(1)(i)(C) that arrive to an approved tagging site only have their official identification numbers recorded with the physical address of their originating premises if they receive their official identification at the tagging site, while, for livestock that arrive already bearing official identification and only have backtags applied at the tagging site, no record is made of their originating premises.

We are making no change in response to this comment. Cattle moving interstate, whether or not already bearing official identification, must be accompanied by an ICVI or alternative movement document. (See § 86.5(a).) These records contain the physical address of the animal's originating premises. Therefore, in both scenarios referenced by the commenter, records correlating the animal's official identification number to their originating premises already exist, and we do not agree that the definition of *approved tagging site* is an appropriate place to reference these records requirements.

However, if States or Tribes wish to require an approved tagging site to complete this additional recordkeeping, they could do so as part of their State or Tribal agreements for authorizing an

approved tagging site, as requirements for approved tagging sites may vary according to the relevant authority.

One commenter asked whether a ranch was considered an approved tagging site and, if so, whether this involved an approval process. Another commenter asked how a location can become an approved tagging site.

Per the definition of *approved tagging site,* approved tagging sites may be authorized by State, Federal, or Tribal animal health officials. Individual States maintain lists of the approved tagging sites in their State. The commenters are encouraged to contact the appropriate animal health official in their area [14] to receive a list of approved tagging sites in their State, as well as information regarding becoming an approved tagging site. Requirements for approved tagging sites may vary depending on the relevant authority.

A commenter stated that the process for becoming an approved tagging site should be consistent with the process for becoming a Secondary Tagging Site for the Agriculture Marketing Service Process Verified Program.

We are making no change in response to the comment, as approved tagging sites, as defined in § 86.1 are not related to Process Verified Programs. As mentioned above, approved tagging sites may be authorized by State, Federal, or Tribal animal health officials. Accordingly, the requirements for authorizing an approved tagging site may vary depending on the relevant authority.

One commenter asked whether all in-State general auction markets were approved tagging sites.

No. In-State general auction markets may become approved tagging sites if authorized as such by APHIS, State, or Tribal animal health officials.

Dairy Cattle

The current definition for *dairy cattle* reads, ''All cattle, regardless of age or sex or current use, that are of a breed(s) used to produce milk or other dairy products for human consumption, including, but not limited to, Ayrshire, Brown Swiss, Holstein, Jersey, Guernsey, Milking Shorthorn, and Red and Whites.'' We proposed to add to this definition cattle that are reared under the same management practices as purebred dairy cattle. The definition in the proposed rule read: ''All cattle, regardless of age or sex, breed, or current use, that are born on a dairy farm or are of a breed(s) used to produce milk or other dairy products for human consumption, or cross bred calves of any breed that are born to dairy cattle including, but not limited to, Ayrshire, Brown Swiss, Holstein, Jersey, Guernsey, Milking Shorthorn, and Red and Whites.'' Commenters raised concerns that caused us to further revise this definition, which we discuss later in this document.

We also proposed changes throughout part 86 to align the regulations with this revised definition. This included revising § 86.4(b)(1)(iii)(B) to include the offspring of dairy cattle in the list of cattle subject to the official identification requirements, as well as revising § 86.5(c)(7)(ii) to require that the official identification numbers of all dairy cattle, regardless of whether the dairy cattle are sexually intact, must be recorded on ICVIs.

Multiple commenters expressed their support for the revised definition for *dairy cattle* presented in the proposed rule, stating that the revision would help eliminate confusion and ambiguity.

We agree with the commenters. Eliminating ambiguity in the definition will help ensure that all dairy cattle, which have an increased risk of disease, meet the appropriate requirements for official identification and movement documentation.

A commenter requested we clarify whether our proposed revision intends to capture beef animals ''born on a dairy farm,'' and, if so, requested that we clarify that these animals would be required to have official identification if moved interstate. The commenter also noted that compliance challenges may present themselves in situations where an animal's farm of birth is unknown.

The increased disease risk relevant to animals born on a dairy farm that we discussed in the proposed rule applies specifically to beef/dairy cross bred cattle born on a dairy farm. We agree with the commenter that the phrase ''born on a dairy farm'' is unclear, as it may give the false impression that it applies to beef animals born on a dairy farm that are not beef/dairy cross bred animals. Therefore, we are revising our proposal to address this potential confusion. The revised definition of *dairy cattle* will read as follows: ''All cattle, regardless of age or sex or current use, that are of a breed(s) or offspring of a breed used to produce milk or other dairy products for human consumption, including, but not limited to, Ayrshire, Brown Swiss, Holstein, Jersey, Guernsey, Milking Shorthorn, and Red and Whites.''

Some commenters, while expressing their support for a revised definition, asked us to replace the phrase ''cross bred calves of any breed'' in the revised definition presented in the proposed rule with the phrase ''cross bred cattle of any breed'' to further eliminate confusion regarding to which animals the definition applies.

The commenters are correct that we intended to capture cross bred cattle of any age, rather than only calves, in our proposed revised definition. We believe the modification to the proposed definition provided above addresses these commenters' concern.

One commenter asked whether the change to the *dairy cattle* definition would apply across all Federal regulations administered by APHIS. The commenter stated that consistency in definitions would prevent discrepancy and aid enforcement.

In the proposed rule, we proposed to revise definitions in 9 CFR parts 71, 77, and 78 to correspond with the changes to the definitions that we proposed for part 86. While we accounted for the definitions of *official eartag* and *interstate certificate of veterinary inspection (ICVI),* we erroneously neglected to account for the definition of *dairy cattle,* which the commenter correctly points out is also used in part 78. Therefore, we will revise the definition of *dairy cattle* in part 78 to correspond with the change to the definition made in part 86.

Some commenters disagreed with our proposed revised definition, arguing that there is no increased risk of disease transmission from cattle that are reared under the same management practices as purebred dairy cattle.

We disagree with the commenters. As stated in the proposed rule, dairy farm management practices, such as pooling colostrum from multiple cows for many calves, commingling calves at different locations during their lifetimes, and movement to many destinations, result in a higher risk of disease transmission. Beef/dairy crosses born on dairy farms are likely to be exposed to these practices, especially in early life; therefore, they are at an increased risk of disease transmission.

Two commenters stated that our revised definition would discourage producers from including beef/dairy cross bred calves as part of their operations.

The commenter provided no evidence to support this claim. We also note that APHIS' operational guidance has consistently held that beef/dairy cross bred cattle fall under the definition of dairy cattle, and are therefore already required to have official identification; our change to the dairy cattle definition codifies this longstanding guidance

[14] Contact information for State animal health officials (SAHOs) may be found at: *https://www.usaha.org/saho.*

regarding how to interpret the regulations.

Interstate Certificate of Veterinary Inspection (ICVI)

We proposed to add editorial and formatting changes to the definition of *interstate certificate of veterinary inspection (ICVI)* to clarify that electronic ICVIs may be used.

A commenter stated that APHIS should require the recording of official identification on ICVIs at the most specific applicable level. The commenter opined that official individual animal identification numbers should be recorded on ICVIs even when animals are identified using a group/lot identification number (GIN).

We are making no changes in response to the comment. A GIN is used to uniquely identify a unit of animals of the same species that is managed as one group throughout the preharvest production chain. Animals identified using a GIN are not required to have the GIN, or any additional animal identification number, affixed to them. Instead, the GIN is recorded on documents accompanying the animals as they move interstate. Because these animals move as a unit, a GIN provides sufficient information to identify the animals in the event of a trace. We also note that cattle and bison typically do not move on GINs due to the current industry structure within the United States.

A commenter asked us to clarify in the definition of *ICVI* that accredited veterinarians who issue ICVIs must be licensed and accredited in the State of origin of the animal requiring documentation, as the current definition only requires that issuing veterinarians are licensed in State of origin and federally accredited.

We are making no changes in response to the commenter, as we do not agree that the definition of *ICVI* is an appropriate place to state the regulations and standards relevant to accredited veterinarians. The commenter is incorrect that the definition of *ICVI* lists licensure or accreditation requirements for veterinarians. Requirements for licensure and accreditation for veterinarians are covered in 9 CFR part 161.

Official Animal Identification Device Standards (OAIDS)

We proposed to add a definition of *Official Animal Identification Device Standards (OAIDS)* to replace the Animal Disease Traceability General Standards document. The proposed OAIDS, like the existing Standards document, provides guidelines, technical standards, and specifications for tag manufacturers requesting APHIS approval of new official identification devices. As stated in the proposed rule, in addition to edits corresponding to changes proposed to the regulations, changes to the document include the following:

- Accepting EID device testing equivalent to International Committee for Animal Recording (ICAR) testing and allowing APHIS to consider requests, on a case-by-case basis, for approval of alternative field trials or eartags with previously generated verifiable data if equivalency to the standards is demonstrated;
- Modifying the field trial requirements by reducing timelines for the three approval statuses (trial: from 0–12 months to 0–6 months; preliminary: from 12–24 months to 6–12 months; and conditional: from 24–36 months to 12–36 months), reducing the number of required field trial locations (from at least 6 to at least 2), and reducing the number of cattle and bison required for field trials (from a minimum of 1500 to a minimum of 300); and
- Reducing the timeframe before allowing unlimited sales of devices from a minimum of 24 months to a minimum of 12 months if devices meet the required performance standards.

Numerous commenters expressed support for this addition and the changes we proposed to make to the document. These commenters noted that streamlining the approval process for EID devices will ensure availability of tags, insulate against supply chain disruptions, and help facilitate the introduction of new technologies.

We agree with the commenters. As stated in the proposed rule, our changes are meant to encourage manufacturers to seek APHIS approval of new official identification devices.

One commenter expressed concern regarding reducing the timeframe before allowing unlimited sales of a device from 24 months to 12 months, stating that this could compromise assurance of the devices' quality and longevity.

We are making no changes in response to the commenter. Tag retention, durability, safety, and efficacy are of utmost importance to APHIS. Our approval process for EID eartags continues to require testing and field trials or performance data that ensure the eartags meet the required standards. We note the benchmark of unlimited sales is conditional and does not constitute full approval. The timeframe for full approval will remain 36 months (30 for swine); prior to full approval, manufacturers are required to have a mechanism in place to collect and report tag failure data to APHIS.

We believe that the tag standards listed in the OAIDS, including the aforementioned 12-month timeframe for unlimited sales, will maintain a high standard of quality without discouraging manufacturers from applying for official status. As we noted in the proposed rule, we determined that requiring manufacturers to wait 24 months before allowing unlimited sales of a device that met the required performance standards could have been inhibiting manufacturers from seeking APHIS approval.

One commenter stated that the proposed changes to the OAIDS render the proposed rule a major rule, as the document allows for ''regulatory flexibility.''

Under the Congressional Review Act (CRA), major/non-major designations occur at the final rule stage and are the purview of the Office of Management and Budget based on an assessment of expected annual costs associated with the rule. APHIS has no discretion to label the rule major or not major under the CRA. However, we note that the commenter's stated basis for considering the rule major does not align with the criteria in the CRA, which is whether the rule is likely to result in (1) an annual effect on the economy of $100,000,000 or more; (2) a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions; or (3) significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic and export markets. 5 U.S.C. 804(2).

Two commenters stated we should reduce the required lifespan of a device to 3 years from 10 years. One commenter stated 3 years was sufficient because the typical lifespan for beef cattle going to slaughter is 18–24 months. The other commenter stated a 10-year requirement was a hindrance to the adoption of future technologies.

The commenters are incorrect that the requirements specify that tags should have a lifespan of 10 years. The OAIDS states that a tag is expected to remain on an animal in a physically functional state for the animal's expected lifetime, which, for cattle and bison, is up to 15 years.

We disagree with the commenters that tags should only have a lifespan of 3 years. Cattle and bison under 18 months of age and cattle and bison going

directly to slaughter are exempt from the requirements for official identification, rendering their example irrelevant. Moreover, a device that only functions for 3 years would add burdensome costs to producers, as they would need to replace tags more frequently. It would also make record retention and tracing more difficult, especially for longer-lived animals, as the animals would be associated with a different identification number every 3 years.

Official Eartag

The current definition of official eartag reads, ''An identification tag approved by APHIS that bears an official identification number for individual animals. Beginning March 11, 2014, all official eartags manufactured must bear an official eartag shield. Beginning March 11, 2015, all official eartags applied to animals must bear an official eartag shield. The design, size, shape, color, and other characteristics of the official eartag will depend on the needs of the users, subject to the approval of the Administrator. The official eartag must be tamper-resistant and have a high retention rate in the animal.'' We proposed to revise this definition to remove language referencing the 2014 and 2015 dates, which are no longer relevant. Our proposed revised definition reads as follows: ''An identification tag approved by APHIS that bears an official identification number for individual animals. The design, size, shape, color, and other characteristics of the official eartag will depend on the needs of the users, subject to the approval of the Administrator. The official eartag must be tamper-resistant and have a high retention rate in the animal.''

One commenter asked that we establish a standard for a ''high retention rate'' to aid State officials in enforcement.

Retention rates required for approved EID tags have already been established in the former Animal Disease Traceability General Standards document and are included in the OAIDS. For cattle and bison, device loss rates must not exceed 1 percent annually or 3 percent in a 3-year period.

Additional Definitions

One commenter asked us to define the term *premises,* as one of the dictionary definitions for ''premises'' necessitates a deed.

We are making no changes in response to the commenter, as we believe the regulations are sufficiently clear that a premises in part 86 relates to a geographical location, not a deed. For example, the definition of a *premises identification number (PIN)* in § 86.1 describes a premises as ''a geographically distinct location.''

Recordkeeping Requirements (§ 86.3)

Section 86.3 addresses recordkeeping requirements for official identification. Current § 86.3(a) states that any State, Tribe, accredited veterinarian, or other person or entity who distributes official identification devices must maintain for 5 years a record of the names and addresses of anyone to whom the devices were distributed. We proposed to add a requirement to that paragraph that official identification device distribution records must be entered by the person distributing the devices into the Tribal, State, or Federal databases designated by APHIS.

We also proposed to add a new paragraph (b), which would state that records of official identification devices applied by a federally accredited veterinarian to a client's animal must be recorded in a readily accessible record system to help ensure such records are available to APHIS for traceback investigations.

Finally, we proposed to add a new paragraph (d), stating that records required under paragraphs (a) through (c) of § 86.3 must be maintained by the responsible person or entity and be of sufficient accuracy, quality, and completeness to demonstrate compliance with all conditions and requirements under part 86. The proposed new paragraph further required that APHIS be allowed access to all records during normal business hours, to include visual inspection and reproduction (*e.g.,* photocopying, digital reproduction), and the responsible person or entity must submit to APHIS all reports and notices containing the information specified within 48 hours of receipt of request for records.

Two commenters asked us to amend § 86.3(a) to allow the person distributing EID eartags to provide records to a State official, via a spreadsheet, and the State official to enter the records into a State or Federal database.

We are making no changes in response to the commenter, as we interpret our proposed change to § 86.3(a) as written to already allow for the arrangement described by the commenter. A person who provides records to a State official to enter into a State or Federal database would fulfill the requirement of entering the official identification device distribution records into an acceptable database.

Two commenters asked us to amend § 86.3(b) (redesignated in our proposal as § 86.3(c)) to read, ''Approved livestock facilities must keep any ICVIs or alternate documentation that is required by this part for covered livestock to enter the facility through interstate movement'' rather than ''Approved livestock facilities must keep any ICVIs or alternate documentation that is required by this part for the interstate movement of covered livestock that enter the facility.'' The commenters stated that this change would clarify that this requirement is pertains to livestock moving to the market from out-of-state, rather than moving from the market to an out-of-state facility.

We are making no change in response to the commenter, as we believe the regulations as written are sufficiently clear that this paragraph refers to livestock that enter an approved livestock facility from out of state.

One commenter stated that the proposed rule was not specific enough about who was responsible for recordkeeping. The commenter asked whether the responsible party was the veterinarian, producer, or tag distributor.

We disagree that these requirements are not sufficiently specific. In our proposed rule, § 86.3(a) specifies that any State, Tribe, accredited veterinarian, or other person or entity who distributes official identification devices is responsible for maintaining records of the names and addresses of anyone to whom the devices were distributed. In other words, the recordkeeping requirements of § 86.3(a) apply to whoever distributes the official identification device in any one transaction, whether that be a State, Tribe, accredited veterinarian, or other person or entity. We also note that a producer applying official identification devices to their own animals, but not distributing the official identification devices to anyone else, does not fall under § 86.3(a).

In our proposed rule, § 86.3(c) specifies that approved livestock facilities are responsible for keeping ICVIs or alternate documentation that is required by part 86 for the interstate movement of covered livestock that enter the facility.

Two commenters stated that we should amend proposed § 86.3(d) to place the responsibility for ensuring ''accuracy, quality, completeness'' of an ICVI on the veterinarian who created the ICVI, not the approved livestock facility that maintains the document.

The commenters have misinterpreted the regulations. Contrary to the commenters' implication, § 86.3(d) does not specifically or exclusively place

responsibility for the accuracy, quality, and completeness of ICVIs on approved livestock facilities. Section 86.3(d) requires ''the responsible person or entity'' to maintain records required under § 86.3(a) through (c) and to ensure that they are accurate, of quality, and complete. Multiple persons or entities may bear this responsibility. Standards for accredited veterinarians in 9 CFR part 161 stipulate that accredited veterinarians cannot issue documents unless they have been ''accurately and fully completed'' (9 CFR 161.4). This standard applies to ICVIs or alternative documentation referred to in § 86.3(c). The approved livestock market maintaining ICVIs or alternative documentation as required by § 86.3(c) is responsible for providing accurate information, such as information regarding which animals have been sold and to whom, to a veterinarian creating ICVIs for animals leaving the facility. Ensuring the continued accuracy, quality, and completeness is also a part of the proper maintenance of records and is not a standard limited to their creation.

Some commenters asked us to shorten the 48-hour timeframe for entities to submit to APHIS all requested records to 24 hours, stating that 48 hours was too long. Other commenters asked us to increase this timeframe to 72 hours, as many livestock markets operate 1 day each week and may not have the staff availability to meet the 48-hour requirement and to align with the potential 72-hour national stop movement order for livestock transport.

We believe that 48 hours is a reasonable compromise. While animal traces should occur as quickly as possible, 24 hours may not be practical for some markets, due to staffing and availability constraints. The 72 hours cited by commenters refers to a potential emergency response for highly contagious disease outbreaks, in which all animal movement would be stopped for 72 hours. This potential order should not affect the ability to provide information necessary for a trace, and it would be disadvantageous to delay tracing until the order were lifted, as the delay may inhibit the speed of our response to a disease threat.

One commenter asked whether training on database use will be provided to those responsible for recordkeeping.

We are unsure to which database the commenter is referring. The proposed rule referred to three different types of recordkeeping: (1) for recordkeeping of device distribution, APHIS provides training for APHIS databases such as the Animal Identification Management System (AIMS); (2) for recordkeeping of applying official ID, accredited veterinarians may use AIMS or various medical record systems and receive training from their vendors; (3) finally, State officials maintain records of ICVIs and tag distributions in the State's regulatory database for which APHIS does not provide training.

One commenter asked what would happen to records if an individual, such as an accredited veterinarian, responsible for recordkeeping went out of business.

Tag distributors must maintain records in accordance with § 86.3, whether or not their business is still in service.

One commenter asked us to include the specific requirements of recordkeeping in the final rule, rather than in the OAIDS, to increase compliance.

We are making no changes in response to the commenter. Apart from streamlining the approval process of new EID tags and applying changes corresponding to this rulemaking, the OAIDS contains the same information as the previous iteration of the document, titled the Animal Disease Traceability General Standards document. As we have not historically experienced problems due to the location of the information contained within the Standards document, we do not have reason to believe that the OAIDS is an unsuitable location for the information contained therein.

One commenter asked us to add a time requirement of 48 hours for entering records of distributed devices into an acceptable database.

As we have not experienced problems with the timely entrance of distribution records into a database, we disagree that specifying a time requirement in the regulations is necessary. The entry into a database should occur immediately upon distributing the tags, because the tags may be applied upon receipt to an animal for immediate movement.

One commenter asked whether a producer who applied tags to their animals themselves would be responsible for the recordkeeping requirement in § 86.3.

No. Under § 86.3(a), a person distributing tags must maintain for 5 years a record of the names and addresses of anyone to whom the devices were distributed. If a producer is applying tags to their own animals and not distributing tags to another person, this requirement does not apply to them.

One commenter stated that they would prefer if States had consistent forms for submitting recordkeeping information regarding EID tag distribution to States.

This is outside the scope of this rulemaking. APHIS does not mandate the type of form States must use for this recordkeeping.

Finally, in reviewing the proposed rule while drafting this final rule, we noticed that our proposed § 86.3(a) incorrectly omitted mention of distribution records kept by large producer organizations that redistribute tags to their members in their own databases. In order to prevent the interpretation that this will no longer be permissible, we are amending the second sentence of this paragraph to state that identification device distribution records must be entered by the person distributing the devices into the Tribal, State, Federal, or other database acceptable to each government entity.

Official Identification for Cattle and Bison (§ 86.4)

Section 86.4 concerns official documentation required for different species. As discussed earlier in this document, we proposed to revise § 86.4(a)(1)(i) to add the requirement that, beginning November 5, 2024, all official eartags sold for or applied to cattle and bison must be readable both visually and electronically.

Some commenters stated that allowing EID tags to be visually readable will fail to reduce, or will actually increase, human error as individuals would be transcribing 15-digit, rather than 9-digit, identification numbers, thus negating the intent of the rule.

We disagree that requiring EID tags to be visually readable will increase the likelihood of human error. The 15-digit identification numbers of the AIN numbering system currently used for all approved EID eartags begin with the same 6 digits: 840003. The first 3 digits of an AIN comprise the country code, which, for the United States, is 840. The following 3 digits, 003, signal that the animal has been identified using a sequential numbering system from a start number of 003,000,000,000. As a result, an individual visually reading an EID tag would only read 9 unique characters (the characters following 840003). These characters are comprised solely of numbers, whereas the 9-digit NUES numbers are alpha-numeric. Moreover, EID eartags have readability standards, while metal tags with NUES numbers do not. These include larger font size and color contrast. Given these comparisons of AIN numbers and NUES numbers, it is our view that transcription error is not likely to significantly increase from the current

state when relying on visual read of the eartag; if anything, several factors should make it easier, not harder, to transcribe the tag number. However, the use of EID tags would allow for an electronic read of the tag if a transcription error were believed to have occurred.

Some commenters asked for clarification about whether using brands as official identification would continue to be acceptable. Others stated that EID eartags should not replace brands as a means of official identification.

We proposed no changes to the regulations pertaining to, nor did we propose to restrict the use of, other methods of official identification for cattle and bison authorized by the regulations, which include ''brands registered with a recognized brand inspection authority and accompanied by an official brand inspection certificate, when agreed to by the shipping and receiving State or Tribal animal health authorities'' (9 CFR 86.4(a)).

Some commenters expressed preference for brands over eartags, claiming the former to be a more effective and reliable means of identification.

As stated above, this rulemaking does not discontinue brands as an official means of animal identification for cattle and bison. Brands registered with a recognized brand inspection authority and accompanied by an official brand inspection certificate remain an official means of identification for cattle and bison, if agreed upon by the shipping and receiving State.

Some commenters expressed concern about the retention rates of EID eartags that may fall off the animal or may be relatively easy to remove.

We do not agree that tag retention is a greater issue for EID tags than metal tags. APHIS-approved official identification tags undergo rigorous testing and trials to assure a retention rate of 99 percent (a loss of no more than 1 percent per year) and are intended for the life of the animal. While data on retention rates of metal NUES tags is lacking, field experience and anecdotal observation from regulators at the State and Federal level suggest that the retention rate of these metal tags is lower than our required retention rate of EID eartags. As one commenter mentioned, metal tags are not immune from potential problems, including tag loss, illegibility, and infection.

Almost all reported retention issues with EID tags are due to user error or use of unofficial tags intended for use for a shorter duration in feedlot cattle.

Regarding removal, it is unlawful to intentionally remove any official identification under current regulations in part 86. We proposed no change to this regulation.

A commenter interested in selling alternative identification devices that use Bluetooth and GPS technology stated that RFID tags are unreliable and subject to fraudulent use.

As stated above, approved official identification tags undergo rigorous testing and field trials to ensure they meet our high standards for efficacy. The regulations prohibit the fraudulent use and recording of official identification. Sections 86.3 and 86.4(d) and (f) outline requirements regarding recordkeeping, removal, and sale or transfer of devices.

Two commenters asked for an explanation of the protocol for replacing lost EID eartags.

Procedures for replacing any lost official identification devices are outlined in § 86.4(d) and remain unchanged as a result of this rulemaking.

Two commenters asked whether tags can be applied to animals directly by producers, or whether tags must be applied at approved tagging sites. One of these commenters stated that it should be permissible for producers to apply tags themselves.

Current regulations do not stipulate that the tags can only be applied at approved tagging sites. If a producer desires, they may purchase tags directly from a vendor and apply the tags to their own animals. In this case, the producer has no recordkeeping requirement regarding tag distribution.

Some commenters expressed concern that tags produced in foreign countries may compromise national security. Commenters also expressed concern that foreign-sourced tags could increase the vulnerability of the United States to supply chain sabotage.

Commenters provided no evidence to support the contentions that tags produced in foreign countries may ''compromise national security'' or increase the vulnerability of the United States to ''supply chain sabotage.'' However, all APHIS purchasing is compliant with all Federal contracting laws and regulations and with the Buy American Act (41 U.S.C. 8301–8303). This has always been true of contract purchasing by APHIS for the Animal Disease Traceability Program.

One commenter stated that PINs should not be a requirement to acquire and apply EID tags as that information can be gathered on other documents, such as health certificates.

The PIN is defined in 9 CFR 86.1 as a nationally unique number assigned by a State, Tribal, and/or Federal animal health authority to a premises that is, in the judgment of the State, Tribal, and/or Federal animal health authority a geographically distinct location from other premises. All currently approved EID eartags (RFID AIN ''840'' eartags) are associated with a PIN or a State location identification number (LID), inasmuch as a PIN or a LID is required for purchase of the tags (as stated in the OAIDS). A PIN is the numerical equivalent of a 911 postal address or a GPS number. A LID is the State-managed equivalent for producers who prefer to have the State store their information, rather than the Federal Government.

The commenter did not explain their specific concerns regarding PINs. That being said, we note that a PIN or LID is associated with the location where cattle are tagged, rather than the location of the cattle owner. Cattle may move to new locations that may have different PINs, LIDs, or new owners at will, but the PIN or LID associated with the location where the tag was placed on the animals remains specific to that location, thus facilitating traceback of the animals to that location when needed.

Health certificates cannot substitute for a PIN number because although information on health certificates include the location where the animal was loaded for interstate movement and destination location; they do not necessarily provide the location where a tag was placed on the animal.

Multiple commenters agreed with our decision to use language in the regulations to keep EID technology-neutral. Other commenters expressed support for their various preferred identification technologies, which included UHF, biometric, Bluetooth, and satellite geolocation. Commenters also asked whether high frequency or low frequency RFID tags would be the required or recommended standard.

We are neither requiring nor recommending any one type of EID eartag over another. Maintaining technological neutrality in the regulations will allow APHIS to adapt to technological developments and conduct animal disease traceability as rapidly and accurately as possible. So long as devices meet the standards, including for retention and safety, laid out in the OAIDS, and are readable both electronically and visually, they may be approved for use by APHIS. Producers will be able to decide which approved technology works best for them, based on their individual circumstances.

Some commenters stated that EID infrastructure should also support non-ADT uses.

EID infrastructure already supports non-ADT uses. For example, many dairies use EID tags to tie individual animals to production and management records. That information is separate from and not collected by the ADT program.

One commenter asked whether, in the event of an emergency, State departments of agriculture would be able to use orange EID tags typically used for heifer calves for other animals.

States are free to distribute any color of EID tag that is available. While orange tags are typically reserved for brucellosis vaccinates, this is not a requirement in the regulations.

Two commenters expressed concern regarding the purported difficulty of applying EID eartags. The commenters mentioned the difficulty of organizing tags not packed in sequential order and applying tags in cold conditions, as well as risk of fatigue and trauma to the hands.

The OAIDS provides guidance for packaging eartags, and states that packaging must maintain the tags in sequential order. The commenters do not provide evidence to support the implication that applying EID eartags is significantly more difficult in cold conditions or prone to causing fatigue and trauma to the hands than applying metal eartags or other forms of approved official identification, such as brands.

One commenter stated that the USDA should target tag distribution to cattle newly subject to the revised definition of *dairy cattle,* as it now includes beef/dairy cross bred cattle.

As noted in the economic analysis that accompanied the proposed rule, historically, APHIS has instructed dairy cattle operations that beef/dairy cross bred cattle should follow the same traceability regulatory requirements as purebred dairy cattle. Thus, official identification requirements applied to these animals prior to the implementation of this final rule and no targeted distribution is necessary.

One commenter stated that we should maintain the current use of AIN Device Managers to distribute official identification.

This final rule makes no changes to the current use of AIN Device Managers. Individuals may continue to distribute AIN devices by becoming AIN Device Managers. More information regarding this process can be found in the OAIDS.

One commenter volunteered to be a tag distributor for bison producers.

The commenter may reference the OAIDS document for further information on how to become an AIN Device Manager and distribute tags.

Several commenters stated that the regulations should specify that only 840-series, and not 900-series, EID tags may be used as official identification on domestic cattle because 900-series tags are not unique in their official identification. 840-series tags refer to EID eartags that begin with the prefix ''840'' and are manufactured using the AIN numbering system for the official identification of individual animals born in the United States. 900-series tags refer to eartags that begin with the prefix ''900,'' and are not manufactured for the official identification of individual animals in the United States, but are sometimes used by producers for individual livestock management purposes.

We believe the regulations already address the commenters' concern about the need for nationally unique numbers. Per the definition of official eartag, an official eartag is an identification tag that bears an official identification number. The regulations state that an official identification number is a nationally unique number that is permanently associated with an animal and adheres to the NUES system, AIN system, location-based number system, flock-based number system, or any other numbering system approved by the Administrator for the official identification of animals.

Currently, all APHIS-approved EID eartags available for domestic animals are manufactured using the 840-series AIN numbering system. 900-series tags do not meet the definition of an official eartag, as they do not bear an official identification number. Although 900-series tags may be suitable for non-ADT uses, they are not approved for use as official ID for animals born in the United States.

We disagree that the regulations should require the use of any specific numbering system. As stated in the proposed rule, this flexibility will allow for the possibility that different numbering systems may be developed and used in the future on EID eartags. Additionally, situations may arise that require the use of official ID that is not an 840-series tag. For example, cattle not born in the United States may have official identification from the country of origin or an alternate official ID approved by APHIS to designate a non-U.S. born animal. The NUES numbering system is also allowed under the regulations for official tags. Because NUES eartags applied to animals before November 5, 2024 will still be recognized as official for the lifetime of those animals, the NUES numbering format will still be in use for some time after that.

Several commenters encouraged the USDA to allow the use of all currently used EID tags as official identification for ADT purposes. Two commenters specifically asked that we allow 900-series tags to be used for official identification, as these tags are already used by some producers.

We disagree with the commenters. Nine hundred-series EID eartags currently used by producers for livestock management purposes do not fulfil the requirements of EID eartags approved by APHIS for official identification purposes. APHIS approves the use of EID eartags for official identification that meet certain standards for durability, efficacy, and safety. These standards are essential to ensuring that methods of official identification meet industry needs and are retained and effective for the purpose of traceability.

A 900-series tag could provide traceability for a single movement; however, because the tag is not associated with an official identification number, the initial distribution location and additional movements would not be tracked or readily available for officials performing disease traces. Additionally, other characteristics of the 900-series tags make them unsuitable for traceability. For example, it is illegal to remove 840-series tags, while there is no regulation preventing the removal, replacement, or reuse of 900-series tags.

One commenter asked whether official ID tags can be reused after the death of an animal.

Tags cannot be reused. A requirement of official identification tags is that they are unique and not reusable. This prohibition prevents an animal in a disease trace from being confused with another animal that should not be included in the trace.

One commenter stated that the proposed rule did not address the problem of retiring eartags of dead livestock and asked about protocol in such situations.

The commenter is correct that this proposal does not address tag retirement protocols. Expired cattle generally do not pose a high disease threat, although a lack of tag retirement data can pose challenges in disease traces if the final disposition of the animal is unknown. Retiring tags may become more feasible once EID is more commonly used for official identification. As this rulemaking would increase the use of EID, it may allow us to address this issue in the future.

Some commenters stated that electric and magnetic fields (EMFs) emitted by

RFID technology have the potential to harm humans and animals.

We do not agree with this comment. RFID tags are passive devices and do not emit EMFs. The Food and Drug Administration is not aware of any adverse health effects associated with RFID technology.

Several commenters asked us to require a specific placement and color for EID eartags for the sake of simplicity and uniformity.

The commenters do not provide evidence of the potential benefits of adding such a requirement. APHIS-approved official identification eartags are available in multiple colors from several manufacturers and vendors. The color orange is typically reserved by manufacturers for official EID tags to be used in official calfhood vaccinates for brucellosis, although the regulations do not require this. Otherwise, the color of the tags is at the owner's discretion. The placement of official RFID tags is recommended in the left ear, but there is no such regulatory requirement, and the tags may be placed in either ear at the owner's discretion.

One commenter stated that they have encountered problems finding the identity of cattle with EID eartags, as they were unable to obtain identifying information from the State about a stray bull found on a ranch that had an 840-series eartag for identification.

Producer data confidentiality is highly valued and protected. Availability of identifying information is limited to regulatory officials for the purpose of disease tracing activities and not available to the general public.

Several commenters asked that we address the issue of imported cattle that have lost their eartags. One of these commenters stated that they have encountered difficulties due to being unable to apply an 840-series tag to imported cattle that have lost their eartags.

It is not possible to tag animals born outside of the United States with 840-series tags as 840 is the country code for the United States. We recognize this is an issue and are working to provide an acceptable EID alternative for imported cattle that lose their official identification. However, this is outside the scope of this rulemaking.

Some commenters stated that branding as a method of official identification should be phased out, citing animal welfare concerns. One commenter stated that brands should not be used for animal disease traceability, but rather restricted to use for proof of ownership.

The scope of this rulemaking is limited to official eartags for cattle and bison. Other authorized forms of official identification, including branding, are outside the scope of this rulemaking.

One commenter stated that ''male'' parts of RFID tags should be more readily available from manufacturers, as these parts can fail.

APHIS is not aware of issues specific to ''male'' ends of RFID tags. APHIS recommends that anyone encountering such issues contact the relevant tag distributor or manufacturers, as manufacturers are required to report tag issues to APHIS.

Movement Within Slaughter Channels

The existing regulations in § 86.4(b)(1)(ii) allow cattle to move interstate to an approved livestock market and then to slaughter or directly to slaughter without official identification. Current § 86.4(b)(1)(ii)(C) stipulates that the cattle or bison must be identified if held for more than 3 days. The existing regulations are silent on identification requirements for slaughter cattle or bison that are not held at slaughter or held at slaughter for 3 or fewer days and then move to a new location.

To address this potential gap in traceability, we proposed to add paragraph (b)(1)(ii)(D) to § 86.4 to read as follows: ''Cattle and bison leaving a slaughter establishment may only be moved to another recognized slaughter establishment or approved feedlot and can only be sold/re-sold as slaughter cattle and must be accompanied by an owner-shipper statement in accordance with § 86.5(c)(1). Information listed on the owner-shipper statement must include the name and address of the slaughter establishment from which the animals left, the official identification numbers, as defined in § 86.1, correlated with the USDA backtag number (if available), the name of the destination slaughter establishment, or approved feedlot (as defined in 9 CFR 77.5) to which the animals are being shipped.''

This paragraph clarifies that the animals must stay within the intended terminal slaughter channels but may be moved to an additional slaughter plant or approved feedlot with appropriate documentation and identification.

Two commenters expressed their support for this proposed change, noting that it would expedite disease tracking.

Two commenters recommended improvements to the proposed new language in § 86.4(b)(1)(ii)(D) to allow cattle and bison leaving a slaughter establishment to be moved to a USDA-approved livestock auction (in addition to another slaughter establishment or feedlot).

We disagree with the commenters. Proposed paragraph § 86.4 (b)(1)(ii)(D) clarifies that animals may only move to another slaughter establishment or approved feedlot, with appropriate documentation and identification, and must remain in a terminal market. If animals were allowed to move from a slaughter facility to a livestock market for resale outside of the slaughter channel without official identification, they could circumvent the traceability regulations required for animals that would otherwise move interstate to a market, and thus become untraceable.

Multiple commenters asked us to add a definition of *slaughter channels* in order to provide clear regulations about other movements of cattle, including slaughter channel cattle not moving from points of sale to slaughter facilities in a timely manner; slaughter channel cattle being diverted from slaughter channels; and slaughter cattle moving to unapproved feed yards and holding pens. One commenter asked us to replace the phrase ''slaughter facility'' in § 86.4 with the term ''slaughter channel'' to clarify that livestock located anywhere in a slaughter channel are subject to the additional health and traceability requirements of the proposed rule.

We disagree with the commenters that a definition of *slaughter channel,* or a replacement of the term ''slaughter facility'' with the term ''slaughter channel,'' is needed, because any movement not specifically described as an exemption in § 86.4 requires the animals to meet all requirements for official identification. This includes the examples provided by the commenter if the cattle involved do not meet the requirements for the exemptions.

EID in Use of More Than One Official Eartag

Section 86.4(c) concerns situations in which the use of more than one official eartag is allowed. We proposed to remove references to visual-only eartags in this section.

Specifically, current paragraph (c)(3) of § 86.4 allows the application of a radio frequency identification or visual-only tag eartag with an animal identification number (AIN) having an 840 prefix to animals already tagged with NUES tags and/or brucellosis vaccination eartags. Because visual-only eartags will no longer be allowed as official identification under part 86, we proposed to revise this paragraph to state that a visually and electronically readable official eartag may be applied to animals currently identified with non-EID official eartags or vaccination tags.

We also proposed to remove § 86.4(c)(4), which states that a brucellosis vaccination visual eartag with a NUES number may be applied to an animal that is already officially identified with one or more official eartags. As a result of this rulemaking, the visual, *i.e.,* non-EID, brucellosis NUES tag would no longer be allowed as official identification under part 86, which eliminates the need for the paragraph.

A commenter expressed confusion about whether and why it was possible for an animal to have multiple forms of official identification.

Section 86.4(c) allows for the use of more than one official eartag in certain situations when the need to maintain the identity of an animal is intensified, such as for export shipments, quarantined herds, field trials, experiments, or disease surveys. Multiple forms of official identification are also allowed if an individual wishes to apply a visually and electronically readable official eartag to an animal that is currently identified with non-EID official eartags or vaccination tags. Our proposed rule did not include changes to the situations in which an animal is allowed multiple forms of official identification. To mitigate identification challenges associated with these situations, additional recordkeeping is required in these instances to ensure that adequate traceability is maintained.

Data Security

Many commenters expressed concerns related to data security and confidentiality. Commenters sought clarity about what data APHIS would collect when the requirement is implemented, where the data would be stored, and with whom it would be shared.

Commenters did not elaborate on their specific data concerns in great detail. APHIS takes care to protect personally identifiable information (PII) and proprietary business information in its recordkeeping, in compliance with the Privacy Act of 1974 (5 U.S.C. 552a).[15] Moreover, an EID tag is encoded with a number but no owner-specific information (*e.g.,* a number that identifies the animal, such as 840 001 018 932 052 or 42CXP9965).

We also note that APHIS and State animal disease traceability databases are not public databases. They are accessible only to Federal and State officials who meet strict permissions and security requirements; therefore, proprietary information will not be available to competitors or unauthorized individuals.

Some commenters expressed the view that producer information should be exempt from Freedom of Information Act (FOIA; 5 U.S.C. 552) requirements, in order to preserve the confidentiality of that information for producers.

We are making no change in response to the comments, as APHIS does not have the authority to define or redefine exemptions to FOIA. We can only apply FOIA consistent with the statute and caselaw.

That being said, we believe that there are adequate provisions in the law for the protection of confidential producer data. Some commenters appear to have the misconception that all information in Federal databases is available on request; however, FOIA and the Privacy Act each provide substantial protections for producer information, including the protection of financial and personal identifying information. Under FOIA, Exemption 4 protects trade secrets or commercial or financial information that is confidential or privileged; and Exemption 6 protects information that, if disclosed, would invade another individual's personal privacy. The Privacy Act protects personal information held by the Federal Government by preventing unauthorized disclosures of such information. Individuals also have the right to review such information, request corrections, and be informed of any disclosures. FOIA facilitates these processes.

Some commenters stated that the proposed rule does not adequately protect producers' data from potential cyberattacks or security breaches.

The commenters did not provide details regarding their specific concerns regarding these hypothetical threats. Both State and Federal databases undergo extensive security testing, restrictions, and permission for access to assure that only authorized individuals may access data. Both APHIS and States employ substantial teams of security and information technology experts to assure data security and integrity.

Commenters expressed differing views regarding where to keep animal identification data collected as a result of this rulemaking. Some commenters stated that a ''government'' or ''national'' database was needed, others stated that data should be held in State databases and shared with Federal officials when needed, while others stated that data should be kept in private databases to protect confidentiality.

Animal traceability data and disease information are kept in various Federal as well as State databases, with as-needed access restricted to the State and Federal officials responsible for managing high-impact diseases of the cattle industry. Device distribution records may also be stored in databases kept by producer organizations redistributing tags. As noted earlier, State and Federal databases undergo extensive security testing, restrictions, and permission for access, and both APHIS and State agencies employ teams of security and information technology experts to ensure data integrity and security.

One commenter stated that producers should have access to records of the animals produced on their farm after the animals leave the farm.

We disagree with the commenter, as this would compromise producer data confidentiality. Availability of information stored in APHIS and State animal disease traceability databases is limited to regulatory officials for the purpose of disease tracing activities.

One commenter stated that data integrity needs to be maintained when tags are retired and then reused.

Tags used for official identification are not reused.

One commenter stated that RFID technology can elicit and transmit information from clothing, appliances, and vehicles, placing personal information at risk.

The commenter provides no evidence to support this claim. RFID tags that are currently approved for official use by APHIS are passive tags. A passive tag is powered only by the reader emitting a radio signal, which allows the antenna within the tag to emit a signal back to the reader. There is no active power source within the tag, and the tag is unable to emit any signal without first being exposed to an RFID reader. There are no batteries associated with passive RFID tags.

Some commenters stated that data collection should be minimal, and access to it should be limited to animal disease traceability purposes.

APHIS agrees. Data collection required by this final rule is limited to the necessary information for adequate animal disease traceability. Access to animal traceability data and disease information kept in Federal and State databases is restricted to the State and Federal officials responsible for managing high-impact diseases of the cattle industry.

One commenter recommended APHIS make improvements to information

[15] See the systems of records notice for the animal disease traceability program, found at *https://www.regulations.gov/document/APHIS-2011-0057-0001.*

database systems to facilitate sharing of data between agencies.

The commenter did not detail specific improvements they believe should be made. Enhanced sharing of electronic information with appropriate permissions is one of the ADT program's goals. In the past, we have supported this goal by efforts such as funding electronic databases through cooperative agreements, and we intend to continue doing so as funding allows.

One commenter stated that the software available from APHIS is not user-friendly and asked us to provide software that will better meet the requirements of this rule.

We are unsure to what software the commenter is referring.

Legal Issues

A commenter stated that APHIS lacks authority to require the use of EID eartags, as the requirement does not directly and actively detect, control, or eradicate pests or diseases, nor is it an operation or measure such as ''drawing of blood and diagnostic testing'' authorized by 7 U.S.C. 8308.

The legal basis for this rulemaking is the AHPA, under 7 U.S.C. 8305, by which the Secretary of Agriculture may restrict the movement in interstate commerce of any animal, article, or means of conveyance if the Secretary determines that the restriction is necessary to prevent the introduction into or dissemination within the United States of any pest or disease of livestock. This authority is not limited to, as the commenter implies, the examples of ''drawing of blood and diagnostic testing of animals'' under 7 U.S.C. 8308. Moreover, 7 U.S.C. 8308 supports, rather than undercuts, this rulemaking; it provides the agency authority to ''carry out operations and measures to detect, control, or eradicate any pest or disease of livestock,'' including but not limited to diagnostic testing. Tracking via EID eartags is plainly a measure for these activities; it inherently facilitates them by allowing APHIS to quickly and easily identify livestock for the detection, control, or eradication of any livestock pest or disease.

One of these commenters further stated that APHIS lacked the authority to require EID tags because this requirement is not a valid prohibition or restriction in interstate commerce authorized by 7 U.S.C. 8305.

We disagree with the commenter. The Secretary of Agriculture is authorized by 7 U.S.C. 8305 to prohibit or restrict the movement in interstate commerce of any animal, article, or means of conveyance if the Secretary determines that the prohibition or restriction is necessary to prevent the introduction or dissemination of any pest or disease of livestock. The ADT program helps prevent the dissemination of disease by helping minimize the effects of disease outbreaks through restrictions, such as the EID eartag requirement, that the agency has determined are necessary for efficient livestock tracing.

We also note that this final rule does not require producers to purchase and affix EID eartags to their cattle as the only acceptable official identification device or method to meet the official identification requirements for interstate movement; the regulations continue to list eartags as one of several forms of authorized official identification, which also include tattoos and brands when accepted by State officials in the sending and receiving States.

Several commenters stated that the proposed rule violates the Tenth Amendment as certain States have codified into State law their own options for animal identification.

The Tenth Amendment provides that ''powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.'' Regulating interstate commerce, which includes the interstate movement of animals, is a power delegated to Congress as an enumerated power under the Commerce Clause of the Constitution. Exercising this enumerated power through the AHPA, Congress has delegated to the Secretary of Agriculture the authority to restrict the movement in interstate commerce of any animal or article necessary to prevent the introduction into or dissemination within the United States of any pest or disease of livestock. The Tenth Amendment does not refute APHIS' authority to restrict the interstate movement of animals for this purpose and, in turn, displace a State's exercise of its regulatory power.

Two commenters stated that this rulemaking violated the intent of Article 1, Section 8, of the Constitution. One of these commenters stated that the USDA was falsely asserting that Congress has delegated and granted it broad powers which are implied, plenary, and inherent. The commenter noted that Congress has not mandated an electronic animal identification scheme, and therefore APHIS lacks the authority to impose one.

We did not assert that Congress has granted the USDA ''broad powers which are implied, plenary and inherent.'' Under the AHPA, Congress has delegated authority to the Secretary of Agriculture to promulgate regulations to prevent the introduction into the United States and the dissemination within the United States of any pest or disease of livestock. This rulemaking is consistent with Congress's clear, intelligible directive to protect animal health because it is intended to prevent the introduction and dissemination of livestock pests or diseases by improving the existing ADT program. USDA has issued this rulemaking based on Congress's grant of clear authority to it, not based on some implied or vague powers. Additionally, electronic animal identification represents a logical, modest update to the ADT program that is within USDA's mandate to implement.

Two commenters stated that this rulemaking violates the Fourth Amendment. One of these commenters stated that this was because requiring EID eartags constituted ''unconstitutionally seizing the cattle producers [sic] value-added information without compensation.'' The commenter also alleged that the rulemaking violates the Fifth Amendment because the ''value-added information associated with the mandatory EID eartags further constitutes the private property of the owner of the cattle.''

The requirement for official EID tags does not involve seizing a producer's value-added information. Some producers use EID eartags to participate in value-added verification programs overseen by the AMS. Producers may, but are not required, to use official EID eartags to participate in these verification programs and, alternatively, may also use 900-series tags. The premiums producers are paid for cattle participating in these verification programs are a result of the specific management practices required by said programs. While information regarding such management practices may be correlated with an animal's EID number, this information is kept in the hands of the producer; the producer's possession or use of the information is not interfered with at all, and, in any event, this information is not the same as the information collected for animal disease traceability purposes that is kept in State and Federal databases. Information correlated with an animal's EID number kept in State and Federal databases is limited to information necessary for disease tracing.

A commenter stated that this rulemaking violated Executive Orders 14005 and 14017 by requiring producers to purchase EID eartags manufactured in China. Another commenter stated that this rulemaking should adhere to Executive Order 14005 and be made in the United States.

Executive Orders 14005 and 14017 apply only to Federal Government purchases. APHIS abides by the Executive Orders and complies with the Buy American Act (41 U.S.C. 8301–8303).

We also note that this rulemaking does not stipulate that producers must purchase eartags made in a foreign country. APHIS approves official EID tags by any manufacturer, foreign or domestic, that fulfils the rigorous criteria listed in the OAIDS. Additionally, as noted earlier, eartags are one of several forms of authorized official identification. Producers who do not wish to use eartags may use another form of authorized official identification, such as tattoos and brands when accepted by State officials in the sending and receiving States.

Cost and Fairness

Many commenters opposed the proposed rule because of their belief that the cost of purchasing EID tags placed an undue financial burden on producers, particularly small farmers and ranchers. Commenters also claimed that these costs to producers would fuel consolidation in the livestock industry.

We do not agree with these comments regarding the magnitude of costs to the domestic cattle and bison industry, and do not think this rulemaking will result in further consolidation of the cattle industry. The commenters who raised these concerns often based them on the belief that official identification would be required for all or most cattle and bison regardless of whether they enter interstate commerce. Official identification is not required for all cattle or bison. Under the current regulations in § 86.4(b), which this final rule does not change, the following categories of cattle and bison are subject to official identification requirements for interstate movement: all sexually intact cattle and bison 18 months of age or over; all female dairy cattle of any age and all male dairy cattle born after March 11, 2013; cattle and bison of any age used for rodeo or recreational events; and cattle and bison of any age used for shows or exhibitions. Cattle and bison are exempted from official identification requirements if they are going directly to slaughter. Thus, large categories of cattle, such as feeder cattle or cull cattle going to slaughter, are not subject to the identification requirements. In addition, cattle and bison only require official identification under the regulations if they move interstate or are in Federal or State disease programs. Accordingly, many small producers will be exempted because they never move cattle interstate, so their cattle do not require official identification.

While we acknowledge the commenters' concern over consolidation of the cattle industry, we disagree that an EID tag requirement would cause consolidation. Data from USDA's National Agricultural Statistics Service reflect consolidation as a broader trend in the cattle industry that is present in both States that have and States that have not implemented a State-specific EID tag requirement.

That being said, we acknowledge that producers may at some point have to assume costs associated with purchasing EID tags as a result of this rulemaking. Accordingly, we have prepared a regulatory impact analysis (RIA) that estimates aggregate annual costs to the domestic cattle and bison industry as a result of the rule. The analysis estimates, conservatively, that 11 million cattle and bison are tagged with visual official identification per year to fulfill official identification requirements under the regulations. This number represents approximately 11 percent to 12 percent of the cattle and bison in the domestic inventory. We estimate that these are the average percentages of cattle that would be required to have EID tags instead of visual-only tags each year under this rule. The cost is estimated to be approximately $26.1 million, assuming no Federal funding is provided. (APHIS has historically provided funding for EID eartags and intends to continue doing so as long as funding is available. Funding is discussed in greater detail later in this document.) This equates to an average cost of $30.45 per cattle or bison operation each year; or based on total industry cash receipts from 2021, approximately 2.5 cents per $100 (0.025 percent).

The RIA also articulates the benefits of increased traceability that were previously identified in the economic analysis that accompanied the 2013 final rule establishing the regulations, particularly the foregone liabilities when traceability is not quick or accurate, and delineates how EID furthers the aims of efficient and accurate traceability that undergird the regulations. The RIA for this final rule is available on *Regulations.gov* as a supporting document for this final rule, as well as by contacting the individual listed below **FOR FURTHER INFORMATION CONTACT**. For reasons discussed in the 2013 economic analysis and the RIA that accompanies this final rule, it has been and continues to be APHIS' position that the benefits associated with timely and accurate animal traceability significantly outweigh costs to regulated entities.

Many commenters stated that the rule unfairly favors large corporations over small producers. It was stated that small producers would have to pay more to comply with the regulations than large operations due to bulk discounts offered by EID tag manufacturers. Other commenters stated that large corporations were favored because they are allowed to use GINs to officially identify their animals.

The commenters are correct that many EID tag manufacturers currently offer lower rates for EID tags bought in bulk. The calculations for the average price of an EID tag in the RIA factor in these price differences. As noted previously, most small producers will not be affected by this rulemaking because they do not move their cattle interstate. Small producers that are affected by this rulemaking may consider creative ways to capitalize on bulk discounts for EID tags, such as cooperative buying. These would be individual business decisions based on producer's unique circumstances. We also note that, while APHIS cannot commit to long-term funding for EID tags because the availability of Federal funding in future fiscal years is dependent on annual Congressional appropriations and USDA–APHIS budgetary priorities, APHIS has provided these tags free of charge since 2020. Funding for EID eartags is discussed in greater detail later in this document.

This rulemaking does not change the regulations regarding the use of GINs. Methods of official identification other than official eartags are outside the scope of this rulemaking.

Some commenters stated that this rulemaking would force small operations out of the livestock market and thus undermine the resiliency of the nation's food system.

We disagree that an EID requirement undermines efforts to build and maintain a resilient food supply. For the reasons discussed earlier in this document, many small producers will not be affected by this rulemaking. A resilient food supply relies on the health and wellbeing of our nation's livestock, which is the intended outcome of an effective and efficient ADT system.

Some commenters stated that this rulemaking is designed to benefit export markets by making it easier for companies to ''ship products around the world'' or by protecting international trade markets, at the expense of small producers who will bear the cost of the rulemaking.

We acknowledge possible benefits to export markets and trade associated

with domestic animal disease traceability and EID—these are referenced in the RIA that accompanies this final rule. We disagree, however, that this final rule is intended to directly benefit cattle and bison exporters. This final rule pertains to interstate movement of cattle and bison, not the export of cattle and bison, and foreign markets are free to set their own import requirements. While it is true that many of these requirements currently include EID, that is not within APHIS' purview. Furthermore, options already exist for exporters to meet any such requirements; many exporters currently use third-party verification programs under the purview of AMS to comply with traceability requirements of export markets.

Commenters stated that costs to producers extended beyond the cost of EID tags, and included infrastructure such as EID readers, software, and labor. A commenter stated that this rulemaking would require additional labor for accredited veterinarians to enter data into a database, the cost of which would be passed on to producers. It was stated that our RIA was flawed because it did not take these costs into account.

We disagree with the commenters. The official identification requirement does not require the producer to have hardware (readers) or software (computer systems). Readers and software are not required because each EID tag also has a visual component. The tag number is imprinted on the plastic shell containing the EID portion of the tag. The tags can thus be used in the same manner as visual tags by producers who do not wish to invest in tag-reading hardware and software.

We disagree that this final rule requires producers to incur additional labor costs related to application of tags because the regulations already require the placement of official identification. The EID requirement only changes the type of eartag that must be used for cattle that require official identification and that are officially identified using eartags. The labor involved in applying a metal NUES eartag should not be any more burdensome than the labor involved in applying an EID eartag.

Likewise, this final rule imposes no new requirement for accredited veterinarians to enter data into a database. Accredited veterinarians may continue collecting the information already required by the regulations in their medical records in the same way they currently do, so long as the records are retrievable when a disease outbreak occurs. Costs passed on to the producer should only reflect the difference in the cost of tags because this final rule does not require any additional labor.

Some commenters stated that APHIS should acknowledge that EID tags are meant to be read electronically and update the RIA to account for the cost of readers.

APHIS disagrees that EID tags are meant to be read only electronically. As explained above, EID tags must be readable both electronically and visually. To ensure the visual readability of eartags, the OAIDS requires that EID tags be readable from 30 inches with 20/20 vision, while there was no readability standard for metal NUES tags.

Two commenters stated that mandatory EID may increase corporate control over the livestock industry by giving packers more information about how animals are produced.

APHIS-approved official eartags only encode the 15-digit animal identification number. They do not encode any producer information.

Many commenters noted that APHIS has provided funding for EID eartags in the past and stated that the agency should commit to continuing this funding. Some commenters specified that funding should be provided for at least the first 2 years after the final rule's implementation. Commenters also stated that APHIS should provide funding for necessary equipment and related costs, such as readers, data management systems, and labor.

Since 2020, APHIS has provided funding for EID eartags, as well as readers and ear taggers. Since the availability of Federal funding in future fiscal years is dependent on annual Congressional appropriations and USDA–APHIS budgetary priorities, a long-term commitment to this funding is not possible. We intend to continue to provide assistance as long as funding is available. However, in the absence of Federal funding, producers would have to assume costs associated with purchasing EID tags. For this reason, we have prepared an assessment that estimates annual aggregate costs to the domestic cattle and bison industry associated with this rule.

As noted earlier, this final rule does not require producers or livestock markets to have electronic reading equipment or additional data management systems, because the official EID tags must be readable visually as well as electronically. Producers may continue using EID eartags the same way they currently use non-EID, visual-only eartags.

Finally, for the reasons discussed earlier in this document, we disagree that this rulemaking will cause producers to incur additional labor costs. The application of an EID eartag should not result in more labor costs than the application of a non-EID eartag.

Two commenters stated that the USDA should continue funding States via cooperative agreements. A commenter stated that funding for States to support ADT infrastructure should be increased.

This final rule does not impact the ADT annual cooperative agreements with States, Territories, or Tribes. We note that this funding is separate from the additional funding that APHIS has provided since 2020 to support EID tags and infrastructure. APHIS intends to provide funding for EID eartags and infrastructure for as long as funding is available, but we are unable to commit to multi-year funding for the reasons discussed above.

Two commenters stated that the RIA was inaccurate in its statement that the cost of tags would increase from $3.3 million annually (the estimated cost of metal NUES tags) to $29.3 million annually (the estimated cost of EID tags), as APHIS has been providing metal NUES tags to producers at no cost.

The commenter is correct that APHIS has provided NUES eartags at no cost to producers. The commenter fails to acknowledge, however, that APHIS has also been providing EID tags at no cost to producers since 2020. The estimates in the RIA take into account that funding for neither type of tag has been guaranteed in the past, nor can funding for EID tags be guaranteed in the future, as this funding depends on each year's Agency budget and competing disease priorities.

Two commenters stated that the estimates for the annual cost of EID eartags in the RIA were flawed because they only accounted for costs to animals currently being identified by non-EID tags. The commenters stated that the estimated number of affected animals did not consider animals currently tagged with EID tags, or animals that are required to have official identification but are not in compliance with the regulations.

Cattle and bison already identified with official EID eartags are already in compliance with this final rule, and therefore would not incur new expenses as a result of it. While we recognize that some people may not comply with the current regulations regarding official identification, we have no means of estimating their number. We also note that people currently not in compliance with the regulations are unlikely to begin complying as a result of this rulemaking, and therefore would not

increase demand for official identification tags.

A commenter stated that the RIA does not include information about the estimated economic impact for individual operations.

The commenter is incorrect. The RIA states that, assuming the Federal Government does not provide tags free of charge in the future, the average cost per operation to purchase EID eartags would range from $26.24 to $29.45 for FDX eartags, and from $31.13 to $34.73 for HDX eartags.

A commenter stated that our cost estimates did not consider costs incurred for livestock moved interstate after purchased at an in-State general auction market. The commenter asked whether the buyer would be charged for the cost of eartags or be required to place official eartags on the animals they purchased.

Under the current regulations in § 86.4(b), which this final rule does not change, cattle and bison that are required to have official identification must be officially identified prior to interstate movement unless they are exempted from the requirement for official identification. Animal classes and movements that currently require official identification will continue to require official identification, while animal classes and movements exempted from the official identification requirements will continue to be exempted.

A commenter stated that we should adjust the estimate of impacted cattle in the RIA to account for the expanded definition of dairy cattle.

We disagree with the commenter. APHIS has not expanded the definition of dairy cattle. The change to the definition of *dairy cattle* is a codification of guidance that APHIS has consistently given to producers and State animal health officials, and not a change in policy. Beef/dairy cross breeds should already be officially identified. We have no indication of noncompliance or controversy surrounding this policy. Assuming regulated parties are in compliance, beef/dairy crosses are already accounted for in our estimate of 11 million impacted cattle.

We acknowledge the possibility that there may be cattle producers that did not consider their beef/dairy cross breeds to be dairy cattle, and were alerted to our interpretation of the definition of dairy cattle to encompass beef/dairy cross breeds by this rulemaking. However, as we have no indicators of widespread noncompliance, we expect this scenario to be rare and expect the number of cattle to be affected by it to be de minimis.

A commenter asked why the RIA did not report on tracing exercises using branded cattle.

While the regulations allow the use of brands to fulfil the requirements for official identification if agreed upon by sending and receiving States, brands do not uniquely identify an animal and are not intended for animal traceability. Brands are not unique outside of local areas, are currently only used in 14 States, and are not systematically recorded in national databases. For these reasons, tracing exercises are restricted to animals identified with AIN 840-numbered tags and NUES tags.

A commenter suggested further cost-benefit analysis to assess the impact on cattle and bison producers while ensuring maximum expansion of ADT capability.

The commenter did not specify what they believe our analysis is lacking. We believe the RIA comprehensively assesses the costs and benefits of this rule.

Some commenters disagreed with our estimation that the number of impacted cattle would be 11 million. A commenter stated that, previously, the USDA estimated that the final rule would impact 30 million cattle that cross State lines annually. Another commenter stated that many State identification programs are tied to the Federal system, and therefore even cattle that do not cross State lines would be impacted by this rulemaking.

The commenter is mistaken that we previously estimated this rulemaking would impact 30 million cattle, and the commenter provides no source for this figure. Our estimate of 11 million cattle is based on the number of official identification tags that have been used in previous years. Many animals that move interstate are exempt from official identification requirements, such as beef cattle under 18 months of age, and animals going to slaughter or to an approved livestock market.

Regarding the concern about State identification programs, APHIS is unaware of any intrastate movement requirements that may mimic Federal regulations. Moreover, intrastate movement regulations are beyond our jurisdiction.

A commenter stated that the RIA uses outdated 15-year-old data to determine that many small entities would not be affected because most small entities market through local auctions. The commenter stated that this is no longer necessarily the case, as small entities have increased their use of online livestock video auctions and alternative livestock marketing channels that would require the use of an EID tag. The commenter also stated that market consolidation has reduced the available number of livestock auctions, forcing some small producers to market outside their state.

The RIA uses NAHMS data from 2008 as well as from 2017 to determine that small operations are less likely to move cattle interstate. Data from the 2008 NAHMS report indicated that 82 percent to 88 percent of beef cattle were marketed through general auction markets. These markets tend to be in-state auctions or out-of-state APHIS approved markets, for which official identification is not required. Data from the 2017 NAHMS report further indicated that small operations were most likely to use auction markets, while larger producers used auctions as well as other marketing channels. Although the published literature on small sized farms moving cattle interstate is scarce, we believe the data from these reports are still applicable and relevant. We are not aware of any significant change in marketing practices for small producers.

Furthermore, we disagree with the commenter that small producers are forced to market out of State due to market consolidation, as the number of APHIS-approved livestock markets has increased steadily each year. In 2013, when the ADT rule was implemented, there were 703 active APHIS-approved markets; today there are 1,310.

A commenter stated that a calculated benefit of $30 million per year is inaccurate, as the calculation is based on incorrect assumptions that EID eartags will reduce the time to detect an outbreak, reduce herd surveillance costs, improve practices that identify diseased cattle, and reduce the probability of countries imposing trade restrictions because of a disease outbreak in cattle.

APHIS would like to clarify the commentor's misunderstanding. Thirty million dollars was our estimate of the additional cost of EID tags; we assessed, but did not quantify, expected benefits.

Although use of EID would not reduce the time it takes to initially detect a disease or conduct surveillance, EID reduces the time to find diseased and exposed animals. APHIS disease investigations are often concluded through quarantine and testing or depopulation of cattle herds when the animal of interest is not identifiable, which incurs costs for livestock producers as well as APHIS. As explained in the RIA, when outbreaks of livestock diseases occur, the use of EID eartags can help limit their size and

scope, thus reducing the number of animals that are depopulated, the impact to producers and communities, and the probability that trade restrictions are imposed. Additionally, rapid containment of foreign animal diseases and identification of affected, exposed, and vaccinated animals will expedite the return of export markets, should they close in the event of a disease outbreak.

A commenter stated that, because only approximately eight manufacturers have had their EID eartags approved for official use by APHIS, this rulemaking creates an oligopoly of eartag manufacturers on which producers are forced to rely.

This rulemaking does not in any way restrict new manufacturers from applying for approval of their eartags for use as official identification. In fact, changes proposed in this rulemaking streamline the approval process for new EID devices in order to encourage new manufacturers to enter the market. APHIS will continue to approve official identification tags from new companies that are in compliance with our regulations.

A commenter stated that producers need assurance that eartags and related infrastructure will be available at a reasonable price.

APHIS will continue to approve eartags for official identification. As noted earlier, this final rule does not require the use of infrastructure, such as readers, because tags are required to have a visual component.

A commenter asked us to include an assessment of biometric tools for official identification that have the potential to reduce costs per head of cattle.

The RIA includes in its assessment the types of EID eartags that are currently approved for use, which include FDX and HDX RFID tags. APHIS would consider any type of alternate EID methods that are supported by credible research.

Two commenters stated that future new EID technologies mentioned in the proposed rule could result in higher costs for producers.

The RIA estimated costs to producers based on EID technology available and approved for use today, which is currently limited to RFID. In the proposed rule, we stated that we refer to EID, rather than RFID, tags in the regulations in order to allow for other electronically readable technology, should it become available in the future. Just as referring to EID would not limit official eartags to the technology available today, it would also not limit official eartags to a hypothetical higher-cost technology available in the future. Maintaining technological neutrality in the regulations provides flexibility for the regulated community to choose the technology that best meets their individual needs, cost being one consideration.

Some commenters stated that ADT raises fear of market manipulation by multinational packing corporations or the government.

The commenters did not elaborate on their specific concerns regarding market manipulation and provided no supporting evidence of this hypothetical situation. As discussed earlier in this document, APHIS protects personally identifiable information (PII) and proprietary business information in its recordkeeping.

A commenter stated that the requirement for ICVIs is an added expense.

The commenter is incorrect. Cattle and bison to which official identification requirements apply are already required to be accompanied by an ICVI or alternate movement document before moving interstate. We did not propose to substantively change any regulations pertaining to ICVIs. Rather, we proposed to make an editorial change to the definition of ICVIs to account for the use of electronic ICVIs in addition to paper ones.

A commenter stated that this rulemaking will result in the elimination of incentive programs that encourage producers to adopt EID, which may have been the only way some producers could afford the technology.

We believe that the ''incentive programs'' to which the commenter is referring are the verification programs overseen by AMS. We disagree that this rulemaking will necessarily eliminate these verification programs. Verification programs can fulfill trading partners' requirements for traceability from birth to slaughter as well as additional recordkeeping requirements for exported cattle. Because the current regulations and this rulemaking do not fulfil these requirements, we expect continued need for verification programs.

Miscellaneous

There were a number of comments that did not fall into any of the categories listed above.

A commenter asked for clarification on the meaning of preemption language in § 86.8 and the preemption language mentioned in the proposed rule relevant to Executive Order 12899 (sic).

Section 86.8 provides that States and Tribes may not specify an official identification device or method for interstate movement if the regulations allow for multiple devices or methods, nor may a receiving State or Tribe impose requirements that would require the shipping State or Tribe to develop a particular type of system or alter an existing system in order to meet the requirements. There was no Executive Order 12899 language in the proposed rule; however, we believe the commenter is referring to Executive Order 12988, which was referenced, and transposed the numbers. The 12988 language in the preamble of the proposed rule, in contrast, has the effect of stating that, if finalized, State laws that conflict with the specific provisions of this rulemaking would be preempted. For example, a State's animal identification regulations could not continue to allow for non-EID forms of official identification of cattle and bison that are subject to the ADT regulations.

We emphasize that the regulations in part 86 apply only to interstate movement; States may develop their own official identification requirements for intrastate movement that apply after an animal arrives from a shipping State or may otherwise impose in-State requirements for the cattle once the movement has occurred.

The same commenter asked whether a State could impose official identification importation requirements for classes of animals otherwise exempt in the ADT rule.

The final rule [16] that established § 86.8 indicated that States may require the official identification of classes of animals that are exempt under our regulations, provided that the receiving State's requirement does not require the shipping State to develop a particular type of system or alter an existing system.

The same commenter asked whether a State could restrict the types of official identification devices required for imported animals when the ADT rule permits additional approved methods of identification for the species, such as restricting the use of GINs for the movement of pigs and instead requiring individual animal IDs. The commenter asked us to amend the regulations to allow a State to impose these additional requirements if they are not currently permissible.

Because the current regulations allow for group or lot identification as a means of official identification, restricting the use of GINs and requiring individual animal ID for pigs, or cattle or bison as applicable to this rulemaking, is prohibited under § 86.8.

[16] See footnote 1.

Amending § 86.8 as requested is outside the scope of this rulemaking, and one of the amendments requested by the commenter goes against the stated aims of the ADT program.

Finally, the same commenter asked us to explain the enabling legislation for § 86.8.

The enabling legislation for § 86.8 is the AHPA.

Two commenters stated that this rulemaking would reduce the speed of commerce. Conversely, another commenter stated that EID allows for the collection of animal movement data at the speed of commerce.

We disagree with the commenters who stated the rule would reduce the speed of commerce. EID and electronic records have the potential to increase the efficiency and speed of routine operations in the cattle and bison industry. EID tags allow staff to read animals' identification numbers without having to restrain or handle the cattle or bison. For cattle or bison requiring ICVIs, electronic tags also allow veterinarians to rapidly and accurately complete health certificates and movement documentation without slowing the speed of commerce.

One commenter asked that we amend § 86.5(c)(7)(i) to require that the official identification numbers of cattle and bison are recorded during the transfer from an approved livestock facility directly to a recognized slaughtering establishment.

We will consider the commenters' suggestion; however, this is outside the scope of this rulemaking.

One commenter asked us to state that forms used for interstate poultry movement must meet the same accuracy and clarity criteria that pertain to ICVIs for poultry and other species.

We will consider the commenters' suggestion; however, this is outside the scope of this rulemaking.

One commenter asked us to create a standardized ICVI form.

This is outside the scope of this rulemaking. We note that all ICVI forms are required to contain the same information, which is listed under the definition of *interstate certificate of veterinary inspection (ICVI)* in § 86.1.

One commenter stated that this rulemaking could reduce the use of the brucellosis vaccine because the use of EID tags would double the cost of brucellosis vaccination.

APHIS requires brucellosis vaccination for cattle in the Greater Yellowstone Area. Cattle that are vaccinated for brucellosis are required to have official identification and currently use metal official NUES tags. While we acknowledge that EID tags are more expensive than metal NUES tags, and discuss these differences in cost in the RIA, we disagree with, and the commenter provides no evidence to support, the speculation that these costs would discourage compliance with the requirement for brucellosis vaccination.

Some commenters asked us to remove the requirement to tattoo animals that receive the brucellosis vaccine because correct placement of an EID eartag makes tattoo placement difficult.

We disagree with the commenters that EID tag placement interferes with brucellosis tattoo placement. While official EID tags may be placed in either ear, the recommended placement is the left ear to avoid interference with the brucellosis tattoo, which is required on the right ear.

One commenter stated that additional education regarding proper tag application and retention for veterinarians and producers is necessary.

APHIS agrees that education assists in proper tag application and increased tag retention. We support education through efforts such as cooperative agreements and outreach and intend to continue such efforts as funding allows.

One commenter asked for guidance stating that exports from the United States to Canada will clearly state requirements for use of an approved indicator with the International Organization for Standardization (ISO) 11784.

The final rule does not pertain to the export of livestock. Requirements for exported livestock are found in 9 CFR part 91.

One commenter asked us to establish performance standards for the retention of backtags referenced in § 86.4(b)(1)(i)(C).

Backtags are not methods of official identification but are mentioned in § 86.4(b)(1)(i)(C), in the context of an exemption for cattle and bison that are moved interstate from the requirement of official identification if certain conditions are met. The existing regulations require that backtags used to fulfil this exemption must ''ensure that the identity of the animal is accurately maintained until tagging.'' We believe this adequately addresses the required performance of backtags used in this context.

Two commenters stated that the use of alternative movement records should be increased, and that these alternative movement records could be created by a veterinarian or their designee, but APHIS should not require an inspection or attestation of health by a veterinarian.

The existing regulations in § 86.5(a) already provide for alternatives to the ICVI for animals moving interstate. Alternate documentation requires an agreement between both shipping and receiving States to be considered official movement documentation. The current regulations do not specify that an alternative movement document requires an inspection or attestation of health by a veterinarian.

Two commenters stated that the USDA and States should target enforcement of ADT requirements beyond fixed-facility livestock auction markets to avoid incentivizing direct selling outside of markets.

We do not believe this rulemaking will incentivize direct selling outside of markets. Compliance with the regulations in 9 CFR part 86 is required for animals subject to these regulations, regardless of whether the animal is sold through a livestock market or a private sale. Accredited veterinarians responsible for inspection and interstate movement of animals are subject to the same requirements and face the same sanctions for noncompliance, regardless of whether they work for or from a market or private treaty sale. Accredited veterinarians must submit copies of the documentation (ICVI or alternate movement documents) to the origin and destination State official within 7 days of inspecting the animal, and they must complete this documentation accurately and completely. Accredited veterinarians that are non-compliant are subject to sanctions including monetary penalties, loss of accreditation, and, in some cases, criminal penalties.

A commenter asked whether there will be civil or criminal penalties for not adhering to the requirements of the final rule.

The AHPA lists criminal and civil penalties relevant to violating the requirements of the regulations in section 8313. Changes to the regulations do not impact the Act.

Some commenters stated that this rulemaking could subject cattle producers to liability, should the animal bearing their EID eartag contract a disease after the animal is sold or should food safety issues arise in meatpacking plants.

Under this rulemaking, producers are not liable for disease infection after an animal leaves their premises. The EID requirement thus has no known implications for producer liability.

One commenter claimed that the reason behind requiring EID for eartags is the Global Roundtable for Sustainable Beef.

The commenter provided no evidence to support this claim. As explained in the proposed rule and earlier in this document, the purpose of this action is

to improve our animal disease traceability program's ability to trace animals accurately and rapidly in order to aid us in disease response.

Several commenters requested that APHIS seek equivalency from trading partners by requiring imported cattle to have EID.

The scope of this rulemaking is limited to requirements for domestic cattle in interstate commerce. New requirements for imported cattle would require a separate rulemaking.

Some commenters stated that the ADT program needs to be compatible with the general traceability principles of the World Organization for Animal Health (WOAH).

We are unsure of what specific principles the commenters are referring to. However, we note that, as a WOAH member country, the United States contributes to development of, and complies with, the guidelines that the member countries develop.

Finally, we note that we are making non-substantive editorial changes to the OAIDS to improve clarity, readability, and accuracy. This includes changes such as reordering information, removing duplicative information, and removing broken links. It also includes editing to a paragraph explaining which criteria manufacturers must meet for low-frequency devices. The edits remove a sentence stating that substantial sales data or approval in another country may be considered in lieu of International Committee on Animal Recording's (ICAR) materials/environmental testing. We are making this edit because sales data or approval in another country may not be an adequate substitute for ICAR testing, and we do not have a standard for what ''substantial sales data'' means. The revised OAIDS is published alongside this final rule.

Therefore, for the reasons given in the proposed rule and in this document, we are adopting the proposed rule as a final rule, with the changes discussed in this document.

Executive Orders 12866, 13563, and Regulatory Flexibility Act

This final rule has been determined to be significant for the purposes of Executive Order 12866, as amended by Executive Order 14094, ''Modernizing Regulatory Review,'' and, therefore, has been reviewed by the Office of Management and Budget.

We have prepared an economic analysis for this final rule. The economic analysis provides a cost-benefit analysis, as required by Executive Orders 12866 and 13563, which direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. The economic analysis also examines the potential economic effects of this final rule on small entities, as required by the Regulatory Flexibility Act. The economic analysis is summarized below. Copies of the full analysis are available on the *Regulations.gov* website (see footnote 6 in this document for a link to *Regulations.gov*) or by contacting the person listed under **FOR FURTHER INFORMATION CONTACT**.

We are amending the animal disease traceability regulations to recognize only eartags that are both visually and electronically readable as official eartags for use for interstate movement of cattle and bison that are covered under the regulations. We are also clarifying certain record retention and record access requirements. These changes will enhance the ability of State, Federal, and private veterinarians, and livestock producers, to quickly respond to high-impact diseases currently existing in the United States, as well as foreign animal diseases that threaten the viability of the U.S. cattle and bison industries. The benefits of animal disease traceability include enhancing the ability of the United States to regionalize and compartmentalize animal health issues, minimizing the costs of disease outbreaks, and enabling the reestablishment of foreign and domestic market access with minimum delay following an animal disease event.

APHIS conducted a cost-benefit analysis to determine how the transition to electronic identification (EID) tags will affect the cattle and bison industries. Our analysis suggests that approximately 11 million cattle are currently tagged with official non-EID eartags per year. The rule will not change the number of cattle tagged, but it will increase the estimated average annual cost of purchasing tags by approximately $26.1 million dollars per year, or $30.39 per cattle or bison operation. As noted in APHIS' cost-benefit analysis, the cost of purchasing new tags is the only additional costs APHIS has determined will be imposed on producers, regardless of whether they currently own electronic reading equipment.

We began soliciting comments concerning the proposal for 60 days, ending March 20, 2023. In response to several requests by commenters, we extended the comment period by 30 days, to April 19, 2023. We received 2,006 comments from industry groups, producers, veterinarians, State departments of agriculture, and individuals. While many of these comments were in support of the proposed rule, we did receive concerns regarding the economic impacts of this rule. Comments included concerns regarding the potential additional costs of having to adhere to the new EID technology, beyond the cost of the EID tags, along with concerns that this rulemaking will disproportionately impact small businesses. We have evaluated these concerns carefully and, while the new EID tags will increase the costs of identifying certain cattle and bison as outlined in this analysis, we have found the other concerns to be unsubstantiated, which we discuss in the cost section of this analysis.

Radio frequency identification (RFID) technology, a type of electronic identification, has been available in the livestock industry for many years. APHIS has evaluated the cost structure of current RFID technologies, commonly known as FDX and HDX. Both technologies work well and have similar qualities. This report describes the cost structure of these EID eartags. We provide 10 years of historic population levels for cattle and bison in order to provide the reader with a range of cost estimates based upon a fluctuating cattle and bison population.

EID eartags are a vital component to efficient and accurate traceability of cattle and bison. It benefits stakeholders by significantly reducing the numbers of animals and response time involved in a disease investigation.

One of the most significant benefits of the rule will be the enhanced ability of the United States to regionalize and compartmentalize animal disease outbreaks. Regionalization is the concept of separating subpopulations of animals to maintain a specific health status in one or more disease-free regions or zones. This risk-based process can help to mitigate the adverse economic effects of a disease outbreak. Traceability of animals is necessary to form these zones that facilitate reestablishment of foreign and domestic market access with minimum delay in the wake of an animal disease event. The use of EID eartags can significantly reduce the amount of time it takes animal health officials to complete a trace investigation, which involves knowing where diseased and potentially exposed animals are, and where they have been. Animals that may have come

in contact with an affected animal can number in the thousands or tens of thousands. Transitioning from visual to electronic identification devices may significantly reduce the time it takes animal health officials conducting a trace to scan animals in a herd during a disease response. The more efficiently and effectively animal health officials can complete a trace, the faster we can regionalize and compartmentalize animal disease outbreaks in order to mitigate adverse economic impacts. Having an EID system in place will, therefore, minimize not only the spread of disease but also the trade impacts an outbreak may have.

Executive Order 12372

This program/activity is listed in the Catalog of Federal Domestic Assistance under No. 10.025 and is subject to Executive Order 12372, which requires intergovernmental consultation with State and local officials. (See 2 CFR chapter IV.)

Executive Order 12988

This final rule has been reviewed under Executive Order 12988, Civil Justice Reform. This rule: (1) Preempts all State and local laws and regulations that are in conflict with this rule; (2) has no retroactive effect; and (3) does not require administrative proceedings before parties may file suit in court challenging this rule.

Executive Order 13175

This final rule has been reviewed in accordance with the requirements of Executive Order 13175, ''Consultation and Coordination with Indian Tribal Governments.'' Executive Order 13175 requires Federal agencies to consult and coordinate with Tribes on a government-to-government basis on policies that have tribal implications, including regulations, legislative comments or proposed legislation, and other policy statements or actions that have substantial direct effects on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes or on the distribution of power and responsibilities between the Federal Government and Indian Tribes.

APHIS has determined that Executive Order 13175 is applicable to this rulemaking and that therefore consultation is required, as this final rule may affect one or more Tribes and the cost associated with managing cattle and bison herds. To raise awareness of this rulemaking, APHIS hosted an informational webinar to Tribal nations on October 27, 2021, to notify Tribes of this rulemaking and solicit consultation. On May 18, 2022, the APHIS Office of National Tribal Liaison sent letters to all 574 Tribal Leaders inviting them to attend an upcoming Tribal listening session. The listening session was held on June 23, 2022. Sixteen individuals attended, and we did not receive feedback that substantively affected the development of this rulemaking. APHIS will work with the Office of Tribal Relations to ensure that additional outreach occurs in 2024. If a Tribe requests consultation, APHIS will coordinate with the Office of Tribal Relations to ensure that meaningful consultation occurs.

Paperwork Reduction Act

In accordance with section 3507(d) of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*), the reporting, recordkeeping, and third-party disclosure requirements described in this final rule are currently approved by the Office of Management and Budget (OMB) under OMB control number 0579–0327. The categories of burden and numbers haven't changed as a result of this rule. The last approval from 2021 (*https://www.regulations.gov/document/APHIS-2021-0056-0001*) is still accurate.

E-Government Act Compliance

The Animal and Plant Health Inspection Service is committed to compliance with the EGovernment Act to promote the use of the internet and other information technologies, to provide increased opportunities for citizen access to Government information and services, and for other purposes. For information pertinent to E-Government Act compliance related to this final rule, please contact Mr. Joseph Moxey, APHIS' Paperwork Reduction Act Coordinator, at (301) 851–2533.

Congressional Review Act

Pursuant to subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996 (also known as the Congressional Review Act, 5 U.S.C. 801 *et seq.*) OIRA has determined that this rule does not meet the criteria set forth in 5 U.S.C. 804(2).

Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104.4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, tribal governments, and the private sector. Under section 101 of the UMRA, APHIS generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with ''Federal mandates'' that may result in expenditures by State, local, or tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. When such a statement is needed for a rule, section 205 of the UMRA generally requires APHIS to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, more cost-effective, or least burdensome alternative that achieves the objectives of the rule.

This rule contains no Federal mandates (under the regulatory provisions of title II of the UMRA) that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. Thus, this rule is not subject to the requirements of sections 202 and 205 of the UMRA.

List of Subjects

9 CFR Part 71

Animal diseases, Livestock, Poultry and poultry products, Quarantine, Reporting and recordkeeping requirements, Transportation.

9 CFR Part 77

Animal diseases, Bison, Cattle, Reporting and recordkeeping requirements, Transportation, Tuberculosis.

9 CFR Part 78

Animal diseases, Bison, Cattle, Quarantine, Reporting and recordkeeping requirements, Swine, Transportation.

9 CFR Part 86

Animal diseases, Bison, Cattle, Livestock, Reporting and recordkeeping requirements.

For the reasons stated in the preamble, APHIS amends 9 CFR parts 71, 77, 78, and 86 as follows:

PART 71—GENERAL PROVISIONS

■ 1. The authority citation for part 71 continues to read as follows:

Authority: 7 U.S.C. 8301–8317; 7 CFR 2.22, 2.80, and 371.4.

■ 2. Amend § 71.1 by revising the definition of ''Official eartag'' to read as follows:

§ 71.1 Definitions.

* * * * *

Official eartag. An identification tag approved by APHIS that bears an official identification number for individual animals. The design, size, shape, color, and other characteristics of the official eartag will depend on the needs of the users, subject to the

approval of the Administrator. The official eartag must be tamper-resistant and have a high retention rate in the animal.

* * * * *

PART 77—TUBERCULOSIS

■ 3. The authority citation for part 77 continues to read as follows:

Authority: 7 U.S.C. 8301–8317; 7 CFR 2.22, 2.80, and 371.4.

■ 4. Amend § 77.2, by revising the definitions of ''Interstate certificate of veterinary inspection (ICVI)'' and ''Official eartag'' to read as follows:

§ 77.2 Definitions.

* * * * *

Interstate certificate of veterinary inspection (ICVI). An official document issued by a Federal, State, Tribal, or accredited veterinarian certifying the inspection of animals in preparation for interstate movement.

(1) The ICVI must show:

(i) The species of animals covered by the ICVI;

(ii) The number of animals covered by the ICVI;

(iii) The purpose for which the animals are to be moved;

(iv) The address at which the animals were loaded for interstate movement;

(v) The address to which the animals are destined; and

(vi) The names of the consignor and the consignee, and their addresses if different from the address at which the animals were loaded or the address to which the animals are destined.

(vii) Additionally, unless the species-specific requirements for ICVIs provide an exception, the ICVI must list the official identification number of each animal, except as provided in paragraph (2) of this definition, or group of animals moved that is required to be officially identified, or, if an alternative form of identification has been agreed upon by the sending and receiving States, the ICVI must include a record of that identification. If animals moving under a GIN also have individual official identification, only the GIN must be listed on the ICVI. An ICVI may not be issued for any animal that is not officially identified, if official identification is required. If the animals are not required by the regulations to be officially identified, the ICVI must state the exemption that applies (*e.g.,* the cattle and bison do not belong to one of the classes of cattle and bison to which the official identification requirements of this part apply). If the animals are required to be officially identified but the identification number does not have to be recorded on the ICVI, the ICVI must state that all animals to be moved under the ICVI are officially identified.

(2) As an alternative to recording individual animal identification on an ICVI, if agreed to by the receiving State or Tribe, another document may be attached to provide this information, but only under the following conditions:

(i) The document must be a State form or APHIS form that requires individual identification of animals, or a printout of official identification numbers generated by computer or other means;

(ii) A legible copy of the document must be attached to the original and each copy of the ICVI;

(iii) Each copy of the document must identify each animal to be moved with the ICVI. The document must not contain any information pertaining to other animals; and

(iv) The following information must be included in the identification column on the original and each copy of the ICVI:

(A) The name of the document; and

(B) Either the unique serial number on the document or both the name of the person who prepared the document and the date the document was signed.

* * * * *

Official eartag. An identification tag approved by APHIS that bears an official identification number for individual animals. The design, size, shape, color, and other characteristics of the official eartag will depend on the needs of the users, subject to the approval of the Administrator. The official eartag must be tamper-resistant and have a high retention rate in the animal.

* * * * *

PART 78—BRUCELLOSIS

■ 5. The authority citation for part 78 continues to read as follows:

Authority: 7 U.S.C. 8301–8317; 7 CFR 2.22, 2.80, and 371.4.

■ 6. Amend § 78.1 by revising the definitions of ''Dairy cattle'', ''Interstate certificate of veterinary inspection (ICVI)'', and ''Official eartag'' to read as follows:

§ 78.1 Definitions.

* * * * *

Dairy cattle. All cattle, regardless of age or sex or current use, that are of a breed(s) or offspring of a breed used to produce milk or other dairy products for human consumption, including, but not limited to, Ayrshire, Brown Swiss, Holstein, Jersey, Guernsey, Milking Shorthorn, and Red and Whites.

* * * * *

Interstate certificate of veterinary inspection (ICVI). An official document issued by a Federal, State, Tribal, or accredited veterinarian certifying the inspection of animals in preparation for interstate movement.

(1) The ICVI must show:

(i) The species of animals covered by the ICVI;

(ii) The number of animals covered by the ICVI;

(iii) The purpose for which the animals are to be moved;

(iv) The address at which the animals were loaded for interstate movement;

(v) The address to which the animals are destined; and

(vi) The names of the consignor and the consignee and their addresses if different from the address at which the animals were loaded or the address to which the animals are destined.

(vii) Additionally, unless the species-specific requirements for ICVIs provide an exception, the ICVI must list the official identification number of each animal, except as provided in paragraph (2) of this definition, or group of animals moved that is required to be officially identified, or, if an alternative form of identification has been agreed upon by the sending and receiving States, the ICVI must include a record of that identification. If animals moving under a GIN also have individual official identification, only the GIN must be listed on the ICVI. An ICVI may not be issued for any animal that is not officially identified, if official identification is required. If the animals are not required by the regulations to be officially identified, the ICVI must state the exemption that applies (*e.g.,* the cattle and bison do not belong to one of the classes of cattle and bison to which the official identification requirements of this part apply). If the animals are required to be officially identified but the identification number does not have to be recorded on the ICVI, the ICVI must state that all animals to be moved under the ICVI are officially identified.

(2) As an alternative to recording individual animal identification on an ICVI, if agreed to by the receiving State or Tribe, another document may be attached to provide this information, but only under the following conditions:

(i) The document must be a Tribal or State form or APHIS form that requires individual identification of animals, or a printout of official identification numbers generated by computer or other means;

(ii) A legible copy of the document must be attached to the original and each copy of the ICVI;

(iii) Each copy of the document must identify each animal to be moved with the ICVI. The document must not

contain any information pertaining to other animals; and

(iv) The following information must be included in the identification column on the original and each copy of the ICVI:

(A) The name of the document; and

(B) Either the unique serial number on the document or both the name of the person who prepared the document and the date the document was signed.

* * * * *

Official eartag. An identification tag approved by APHIS that bears an official identification number for individual animals. The design, size, shape, color, and other characteristics of the official eartag will depend on the needs of the users, subject to the approval of the Administrator. The official eartag must be tamper-resistant and have a high retention rate in the animal.

* * * * *

PART 86—ANIMAL DISEASE TRACEABILITY

■ 7. The authority citation for part 86 continues to read as follows:

Authority: 7 U.S.C. 8301–8317; 7 CFR 2.22, 2.80, and 371.4.

■ 8. Amend § 86.1 by:

■ a. Revising the definitions of ''Approved tagging site'', ''Dairy cattle'', and ''Interstate certificate of veterinary inspection (ICVI)'';

■ b. Adding in alphabetical order the definition for ''Official Animal Identification Device Standards (OAIDS)'';

■ c. Revising the definition of ''Official eartag''; and

■ d. Adding an OMB citation at the end of the section.

The revisions and additions read as follows:

§ 86.1 Definitions.

* * * * *

Approved tagging site. A premises, authorized by APHIS, State, or Tribal animal health officials, where livestock without official identification may be transferred to have official identification applied on behalf of their owner or the person in possession, care, or control of the animals when they are brought to the premises.

* * * * *

Dairy cattle. All cattle, regardless of age or sex or current use, that are of a breed(s) or offspring of a breed used to produce milk or other dairy products for human consumption, including, but not limited to, Ayrshire, Brown Swiss, Holstein, Jersey, Guernsey, Milking Shorthorn, and Red and Whites.

* * * * *

Interstate certificate of veterinary inspection (ICVI). An official document issued by a Federal, State, or Tribal government, or an accredited veterinarian, certifying the inspection of animals in preparation for interstate movement.

(1) The ICVI must show:

(i) The species of animals covered by the ICVI;

(ii) The number of animals covered by the ICVI;

(iii) The purpose for which the animals are to be moved;

(iv) The address at which the animals were loaded for interstate movement;

(v) The address to which the animals are destined; and

(vi) The names of the consignor and the consignee and their addresses if different from the address at which the animals were loaded or the address to which the animals are destined.

(vii) Additionally, unless the species-specific requirements for ICVIs provide an exception, the ICVI must list the official identification number of each animal, except as provided in paragraph (2) of this definition, or group of animals moved that is required to be officially identified, or, if an alternative form of identification has been agreed upon by the sending and receiving States, the ICVI must include a record of that identification. If animals moving under a GIN also have individual official identification, only the GIN must be listed on the ICVI. An ICVI may not be issued for any animal that is not officially identified if official identification is required. If the animals are not required by the regulations to be officially identified, the ICVI must state the exemption that applies (*e.g.,* the cattle and bison do not belong to one of the classes of cattle and bison to which the official identification requirements of this part apply). If the animals are required to be officially identified but the identification number does not have to be recorded on the ICVI, the ICVI must state that all animals to be moved under the ICVI are officially identified.

(2) As an alternative to recording individual animal identification on an ICVI, if agreed to by the receiving State or Tribe, another document may be attached to provide this information, but only under the following conditions:

(i) The document must be a State form or APHIS form that requires individual identification of animals, or a printout of official identification numbers generated by computer or other means;

(ii) A legible copy of the document must be attached to the original and each copy of the ICVI;

(iii) Each copy of the document must identify each animal to be moved with the ICVI. The document must not contain any information pertaining to other animals; and

(iv) The following information must be included in the identification column on the original and each copy of the ICVI:

(A) The name of the document; and

(B) Either the unique serial number on the document or both the name of the person who prepared the document and the date the document was signed.

* * * * *

Official Animal Identification Device Standards (OAIDS). A document providing further information regarding the official identification device recordkeeping requirements of this part, and technical descriptions, specifications, and details under which APHIS would approve identification devices for official use. Updates or modifications to the Standards document will be announced to the public by means of a notice published in the **Federal Register**.

Official eartag. An identification tag approved by APHIS that bears an official identification number for individual animals. The design, size, shape, color, and other characteristics of the official eartag will depend on the needs of the users, subject to the approval of the Administrator. The official eartag must be tamper-resistant and have a high retention rate in the animal.

* * * * *

(Approved by the Office of Management and Budget under control number 0579–0327)

■ 9. Revise § 86.2 to add an OMB citation at the end of the section to read as follows:

§ 86.2 General requirements for traceability.

* * * * *

(Approved by the Office of Management and Budget under control number 0579–0327)

■ 10. Revise § 86.3 to read as follows:

§ 86.3 Recordkeeping requirements.

(a) Any State, Tribe, accredited veterinarian, or other person or entity who distributes official identification devices must maintain for 5 years a record of the names and addresses of anyone to whom the devices were distributed. Official identification device distribution records must be entered by the person distributing the devices into the Tribal, State, Federal, or other database acceptable to each government entity. Additional guidance on meeting these recordkeeping requirements is found in the OAIDS.

(b) Records of official identification devices applied by a federally

accredited veterinarian to a client animal must be kept in a readily accessible record system.

(c) Approved livestock facilities must keep any ICVIs or alternate documentation that is required by this part for the interstate movement of covered livestock that enter the facility on or after March 11, 2013. For poultry and swine, such documents must be kept for at least 2 years, and for cattle and bison, sheep and goats, cervids, and equids, 5 years.

(d) Records required under paragraphs (a) through (c) of this section must be maintained by the responsible person or entity and must be of sufficient accuracy, quality, and completeness to demonstrate compliance with all conditions and requirements under this part. During normal business hours, APHIS must be allowed access to all records, to include visual inspection and reproduction (*e.g.,* photocopying, digital reproduction). The responsible person or entity must submit to APHIS all reports and notices containing the information specified within 48 hours of receipt of request, or earlier if warranted by an emergency disease response.

(Approved by the Office of Management and Budget under control number 0579–0327)

■ 11. Amend § 86.4 by:
■ a. Revising paragraphs (a) introductory text and (a)(1)(i);
■ b. In paragraphs (a)(2)(i) and (iv), removing the word ''equine'' and adding in its place the word ''equid'' wherever it appears;
■ c. In paragraph (a)(2)(iii), removing the words ''to the equine'' and adding in their place the words ''into the equid'';
■ d. In paragraph (a)(2)(v), removing the word ''equines'' and adding in its place the word ''equids'';
■ e. Adding paragraph (b)(1)(ii)(D);
■ f. Revising paragraphs (b)(1)(iii)(B), (b)(4) introductory text, and (c)(3);
■ g. Removing paragraph (c)(4);
■ h. Revising paragraphs (e)(1)(iii) and (iv);
■ i. Adding in paragraph (e)(2)(iv) the words ''or other EID'' between the words ''RFID'' and ''eartag''; and
■ j. Adding an OMB citation at the end of the section.

The additions and revisions read as follows:

§ 86.4 Official identification.

(a) *Official identification devices and methods.* The Administrator has approved the following official identification devices or methods for the species listed. The Administrator may authorize the use of additional devices or methods for a specific species if he or she determines that such additional devices or methods will provide for adequate traceability. Additional guidance on official identification devices, methods, and the approval process is found in the Official Animal Identification Device Standards (OAIDS) document.

(1) * * *

(i) For an official eartag, beginning November 5, 2024, all official eartags sold for or applied to cattle and bison must be readable both visually and electronically (EID);

* * * * *

(b) * * *

(1) * * *

(ii) * * *

(D) Cattle and bison leaving a slaughter establishment may only be moved to another recognized slaughter establishment or approved feedlot and can only be sold/re-sold as slaughter cattle, and they must be accompanied by an owner-shipper statement in accordance with § 86.5(c)(1). Information listed on the document must include the name and address of the slaughter establishment from which the animals left, the official identification numbers, as defined in § 86.1, correlated with the USDA backtag number (if available), the name of the destination slaughter establishment, or approved feedlot (as defined in § 77.5 of this subchapter) to which the animals are being shipped.

(iii) * * *

(B) All dairy cattle;

* * * * *

(4) *Horses and other equids.* Horses and other equids moving interstate must be officially identified prior to the interstate movement, using an official identification device or method listed in paragraph (a)(2) of this section unless:

* * * * *

(c) * * *

(3) A visually and electronically readable eartag may be applied to an animal that is already officially identified with one or more non-EID official eartags and/or a non-EID official vaccination eartag used for brucellosis. The person applying the new visually and electronically readable eartag must record the date the eartag is applied to the animal and the official identification numbers of both official eartags and must maintain those records for 5 years.

* * * * *

(e) * * *

(1) * * *

(iii) Malfunction of the electronic component of an electronically readable (EID) device; or

(iv) Incompatibility or inoperability of the electronic component of an EID device with the management system or unacceptable functionality of the management system due to use of an EID device.

* * * * *

(Approved by the Office of Management and Budget under control number 0579–0327)

■ 12. Revise § 86.5 to read as follows:

§ 86.5 Documentation requirements for interstate movement of covered livestock.

(a) *Responsible persons and required documentation.* The persons responsible for animals leaving a premises for interstate movement must ensure that the animals are accompanied by an interstate certificate of veterinary inspection (ICVI) or other document required by this part for the interstate movement of animals.

(b) *Forwarding of documents.* (1) The APHIS representative, State or Tribal representative, or accredited veterinarian issuing an ICVI or other document required for the interstate movement of animals under this part, must forward a copy of the ICVI or other document to the State or Tribal animal health official of the State or Tribe of origin within 7 calendar days from the date on which the ICVI or other document is issued. The State or Tribal animal health official in the State or Tribe of origin must forward a copy of the ICVI or other document to the State or Tribal animal health official in the State or Tribe of destination within 7 calendar days from date on which the ICVI or other document is received.

(2) The animal health official or accredited veterinarian issuing or receiving an ICVI or other interstate movement document in accordance with paragraph (b)(1) of this section must keep a copy of the ICVI or alternate documentation. For poultry and swine, such documents must be kept for at least 2 years, and for cattle and bison, sheep and goats, cervids, and equine species, 5 years.

(c) *Cattle and bison.* Cattle and bison moved interstate must be accompanied by an ICVI unless:

(1) They are moved directly to a recognized slaughtering establishment, or directly to an approved livestock facility and then directly to a recognized slaughtering establishment, and they are accompanied by an owner-shipper statement.

(2) They are moved directly to an approved livestock facility with an owner-shipper statement and do not move interstate from the facility unless accompanied by an ICVI.

(3) They are moved from the farm of origin for veterinary medical examination or treatment and returned

to the farm of origin without change in ownership.

(4) They are moved directly from one State through another State and back to the original State.

(5) They are moved as a commuter herd with a copy of the commuter herd agreement or other document, as agreed to by the States or Tribes involved in the movement.

(6) Additionally, cattle and bison may be moved between shipping and receiving States or Tribes with documentation other than an ICVI, *e.g.,* a brand inspection certificate, as agreed upon by animal health officials in the shipping and receiving States or Tribes.

(7) The official identification number of cattle or bison must be recorded on the ICVI or alternate documentation unless:

(i) The cattle or bison are moved from an approved livestock facility directly to a recognized slaughtering establishment; or

(ii) The cattle and bison are sexually intact cattle or bison under 18 months of age or steers or spayed heifers; except that this paragraph (c)(7)(ii) does not apply to dairy cattle of any age or to cattle or bison used for rodeo, exhibition, or recreational purposes.

(d) *Horses and other equine species.* Horses and other equine species moved interstate must be accompanied by an ICVI unless:

(1) They are used as the mode of transportation (horseback, horse and buggy) for travel to another location and then return direct to the original location; or

(2) They are moved from the farm or stable for veterinary medical examination or treatment and returned to the same location without change in ownership; or

(3) They are moved directly from a location in one State through another State to a second location in the original State.

(4) Additionally, equids may be moved between shipping and receiving States or Tribes with documentation other than an ICVI, *e.g.,* an equine infectious anemia test chart, as agreed to by the shipping and receiving States or Tribes involved in the movement.

(5) Equids moving commercially to slaughter must be accompanied by documentation in accordance with part 88 of this subchapter. Equine infectious anemia reactors moving interstate must be accompanied by documentation as required by part 75 of this subchapter.

(e) *Poultry.* Poultry moved interstate must be accompanied by an ICVI unless:

(1) They are from a flock participating in the National Poultry Improvement Plan (NPIP) and are accompanied by the documentation required under the NPIP regulations (parts 145 through 147 of this chapter) for participation in that program; or

(2) They are moved directly to a recognized slaughtering or rendering establishment; or

(3) They are moved from the farm of origin for veterinary medical examination, treatment, or diagnostic purposes and either returned to the farm of origin without change in ownership or euthanized and disposed of at the veterinary facility; or

(4) They are moved directly from one State through another State and back to the original State; or

(5) They are moved between shipping and receiving States or Tribes with a VS Form 9–3 or documentation other than an ICVI, as agreed upon by animal health officials in the shipping and receiving States or Tribes; or

(6) They are moved under permit in accordance with part 82 of this subchapter.

(f) *Sheep and goats.* Sheep and goats moved interstate must be accompanied by documentation as required by part 79 of this subchapter.

(g) *Swine.* Swine moved interstate must be accompanied by documentation in accordance with § 71.19 of this subchapter or, if applicable, with part 85 of this subchapter.

(h) *Captive cervids.* Captive cervids moved interstate must be accompanied by documentation as required by part 77 of this subchapter.

(Approved by the Office of Management and Budget under control number 0579–0327)

Done in Washington, DC, this 26th day of April 2024.

Jennifer Moffitt,

Under Secretary for Marketing and Regulatory Programs.

[FR Doc. 2024–09717 Filed 5–8–24; 8:45 am]

BILLING CODE 3410–34–P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 25

[Docket No. FAA–2024–0566; Special Conditions No. 25–861–SC]

Special Conditions: The Boeing Model 737–8 Airplane; Dynamic Test Requirements for Single-Occupant Oblique Seats With 3-Point Seat Belt With Pretensioner

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final special conditions; request for comments.

SUMMARY: These special conditions are issued for The Boeing Company (Boeing) Model 737–8 series airplane. This airplane, as modified by HAECO Cabin Solutions, LLC. (HAECO), will have a novel or unusual design feature when compared to the state of technology envisioned in the airworthiness standards for transport-category airplanes. This design feature is single-occupant oblique (side-facing) seats equipped with a 3-point seat belt with pretensioner. The applicable airworthiness regulations do not contain adequate or appropriate safety standards for this design feature. These special conditions contain the additional safety standards that the Administrator considers necessary to establish a level of safety equivalent to that established by the existing airworthiness standards.

DATES: This action is effective on HAECO on May 9, 2024. Send comments on or before June 24, 2024.

ADDRESSES: Send comments identified by Docket No. FAA–2024–0566 using any of the following methods:

- *Federal eRegulations Portal:* Go to *www.regulations.gov* and follow the online instructions for sending your comments electronically.
- *Mail:* Send comments to Docket Operations, M–30, U.S. Department of Transportation, 1200 New Jersey Avenue SE, Room W12–140, West Building Ground Floor, Washington, DC 20590–0001.
- *Hand Delivery or Courier:* Take comments to Docket Operations in Room W12–140 of the West Building Ground Floor at 1200 New Jersey Avenue SE, Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.
- *Fax:* Fax comments to Docket Operations at 202–493–2251.

Docket: Background documents or comments received may be read at *www.regulations.gov* at any time. Follow the online instructions for accessing the docket or go to Docket Operations in Room W12–140 of the West Building Ground Floor at 1200 New Jersey Avenue SE, Washington, DC, between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: John Shelden, Cabin Safety Section, AIR–624, Technical Policy Branch, Policy and Standards Division, Aircraft Certification Service, Federal Aviation Administration, 2200 South 216th Street, Des Moines, Washington 98198; telephone and fax (206) 231–3214; email *john.shelden@faa.gov.*

SUPPLEMENTARY INFORMATION: The substance of these special conditions has been published in the **Federal**

Register for public comment in several prior instances with no substantive comments received. Therefore, the FAA finds, pursuant to 14 CFR 11.38(b), that new comments are unlikely, and notice and comment prior to this publication are unnecessary.

Privacy

Except for Confidential Business Information (CBI) as described in the following paragraph, and other information as described in title 14, Code of Federal Regulations (14 CFR) 11.35, the FAA will post all comments received without change to *www.regulations.gov,* including any personal information you provide. The FAA will also post a report summarizing each substantive verbal contact received about these special conditions.

Confidential Business Information

Confidential Business Information (CBI) is commercial or financial information that is both customarily and actually treated as private by its owner. Under the Freedom of Information Act (FOIA) (5 U.S.C. 552), CBI is exempt from public disclosure. If your comments responsive to this notice contain commercial or financial information that is customarily treated as private, that you actually treat as private, and that is relevant or responsive to this notice, it is important that you clearly designate the submitted comments as CBI. Please mark each page of your submission containing CBI as ''PROPIN.'' The FAA will treat such marked submissions as confidential under the FOIA, and the indicated comments will not be placed in the public docket of these proposed special conditions. Send submissions containing CBI to the individual listed in the For Further Information Contact section below. Comments the FAA receives, which are not specifically designated as CBI, will be placed in the public docket for these proposed special conditions.

Comments Invited

The FAA invites interested people to take part in this rulemaking by sending written comments, data, or views. The most helpful comments reference a specific portion of the special conditions, explain the reason for any recommended change, and include supporting data.

The FAA will consider all comments received by the closing date for comments. The FAA may change these special conditions based on the comments received.

Background

On December 20, 2022, HAECO applied for a supplemental type certificate for the installation of oblique (side-facing) passenger seats that incorporate a 3-point restraint with pretensioner system in Boeing Model 737–8 series airplanes. The Boeing Model 737–8 series airplane is a twin-engine, transport category airplane with a maximum passenger capacity of 189, and a maximum takeoff weight of approximately 182,200 pounds.

Type Certification Basis

Under the provisions of title 14, Code of Federal Regulations (14 CFR) 21.101, HAECO must show that the Model 737–8 series airplane, as changed, continue to meet the applicable provisions of the regulations listed in Type Certificate No. A16WE, or the applicable regulations in effect on the date of application for the change, except for earlier amendments as agreed upon by the FAA.

If the Administrator finds that the applicable airworthiness regulations (*e.g.,* 14 CFR part 25) do not contain adequate or appropriate safety standards for the Boeing Model 737–8 series airplane because of a novel or unusual design feature, special conditions are prescribed under the provisions of § 21.16.

Special conditions are initially applicable to the model for which they are issued. Should the type certificate for that model be amended later to include any other model that incorporates the same novel or unusual design feature, or should any other model already included on the same type certificate be modified to incorporate the same novel or unusual design feature, the special conditions would also apply to the other model under § 21.101.

In addition to the applicable airworthiness regulations and special conditions, the Boeing Model 737–8 series airplane must comply with the exhaust-emission requirements of 14 CFR part 34, and the noise-certification requirements of 14 CFR part 36.

The FAA issues special conditions, as defined in 14 CFR 11.19, in accordance with § 11.38, and they become part of the type certification basis under § 21.101.

Novel or Unusual Design Features

The Boeing Model 737–8 series airplane, as modified by HAECO, will incorporate a novel or unusual design feature which is the installation of oblique (side-facing) passenger seats, which may include a 3-point restraint system with pretensioner. These oblique seats may be installed at an angle of 18 to 45 degrees to the aircraft centerline and have surrounding furniture that introduces occupant alignment and loading concerns.

Discussion

Title 14, Code of Federal Regulations (14 CFR) 25.785(d) requires that each occupant of a seat that makes more than an 18 degree angle with the vertical plane containing the airplane centerline must be protected from head injury by a safety belt and an energy absorbing rest that will support the arms, shoulders, head, and spine, or by a safety belt and shoulder harness that will prevent the head from contacting any injurious object.

The proposed Boeing Model 737–8 airplane seat installation is novel in that the current requirements do not adequately address protection of the occupant's neck and spine for seating configurations that are positioned at angles greater than 18 degrees up to and including 45 degrees from the airplane centerline. The installation of passenger seats at angles of 18 to 45 degrees to the airplane centerline is unique due to the seat/occupant interface with the surrounding furniture that introduces occupant alignment/loading concerns with or without the installation of a 3-point restraint system.

In order to provide a level of safety that is equivalent to that afforded to occupants of forward and aft facing seating, additional airworthiness standards, in the form of new special conditions, are necessary.

The FAA has been conducting and sponsoring research on appropriate injury criteria for oblique (side-facing) seat installations. To reflect current research findings, the FAA issued Policy Statement PS–AIR–25–27, ''Technical Criteria for Approving Side-Facing Seats,'' dated July 11, 2018, which defines injury criteria for oblique seats.

FAA-sponsored research has found that an un-restrained flailing of the upper torso, even when the pelvis and torso are nearly aligned, can produce serious spinal and torso injuries. At lower impact severities, even with significant misalignment between the torso and pelvis, these injuries did not occur. Tests with an FAA H–III anthropomorphic test dummy (ATD) have identified a level of lumbar spinal tension corresponding to the no-injury impact severity. This level of tension is included as a limit in the special conditions. The spine tension limit selected is conservative with respect to other aviation injury criteria since it

corresponds to a no-injury loading condition.

Other restraint systems have been used to comply with the occupant injury criteria of § 25.562(c)(5). For instance, shoulder harnesses have been widely used on flight-attendant seats, flight-deck seats, in business jets, and in general-aviation airplanes to reduce occupant head injury in the event of an emergency landing. Special conditions, pertinent regulations, and published guidance relate to other restraint systems. However, the use of pretensioners in the restraint system on transport-airplane seats is a novel design.

Pretensioner technology involves a step-change in loading experienced by the occupant for impacts below and above that at which the device deploys, because activation of the shoulder harness, at the point at which the pretensioner engages, interrupts upper-torso excursion. Such excursion could result in the head-injury criteria (HIC) being higher at an intermediate impact condition than that resulting from the maximum impact condition corresponding to the test conditions specified in § 25.562. See condition 7 in these special conditions.

The ideal triangular maximum-severity pulse is defined in Advisory Circular (AC) 25.562–1B, ''Dynamic Evaluation of Seat Restraint Systems and Occupant Protection on Transport Airplanes''. For the evaluation and testing of less-severe pulses for purposes of assessing the effectiveness of the pretensioner setting, a similar triangular pulse should be used with acceleration, rise time, and velocity change scaled accordingly. The magnitude of the required pulse should not deviate below the ideal pulse by more than 0.5g until 1.33 t1 is reached, where t1 represents the time interval between 0 and t1 on the referenced pulse shape, as shown in AC 25.562–1B. This is an acceptable method of compliance to the test requirements of the special conditions.

Additionally, the pretensioner might not provide protection, after actuation, during secondary impacts. Therefore, the case where a small impact is followed by a large impact should be addressed. If the minimum deceleration severity at which the pretensioner is set to deploy is unnecessarily low, the protection offered by the pretensioner may be lost by the time a second, larger impact occurs.

The existing special conditions for Boeing Model 737–8 series airplane oblique seat installations do not address oblique seats with 3-point restraint systems equipped with pretensioners. Therefore, the proposed configuration requires special conditions.

Conditions 1 through 7 address occupant protection in consideration of the oblique-facing seats. Conditions 8 through 10 ensure that the pretensioner system activates when intended and protects a range of occupants under various accident conditions. Conditions 11 through 16 address maintenance and reliability of the pretensioner system, including any outside influences on the mechanism, to ensure it functions as intended.

These special conditions contain the additional safety standards that the Administrator considers necessary to establish a level of safety equivalent to that established by the existing airworthiness standards.

Applicability

As discussed above, these special conditions are applicable to the Boeing Model 737–8 series airplane, modified by HAECO. Should HAECO apply at a later date for a supplemental type certificate to modify any other model included on Type Certificate No. A16WE to incorporate the same novel or unusual design feature, these special conditions would apply to that model as well.

Conclusion

This action affects only a certain novel or unusual design feature on one model series of airplanes. It is not a rule of general applicability and affects only the applicant who applied to the FAA for approval of these features on the airplane.

List of Subjects in 14 CFR Part 25

Aircraft, Aviation safety, Reporting and recordkeeping requirements.

Authority Citation

The authority citation for these special conditions is as follows:

Authority: 49 U.S.C. 106(f), 106(g), 40113, 44701, 44702, and 44704.

The Special Conditions

Accordingly, pursuant to the authority delegated to me by the Administrator, the following special conditions are issued as part of the type certification basis for The Boeing Company Model 737–8 series airplanes, modified by HAECO.

In addition to the requirements of § 25.562, passenger seats installed at an angle between 18 degrees and 45 degrees from the aircraft centerline must meet the following conditions:

1. Body-to-Wall/Furnishing Contact

If a seat is installed aft of a structure (*e.g.,* interior wall or furnishings) that does not provide a homogenous contact surface for the expected range of occupants and yaw angles, then additional analysis and tests may be required to demonstrate that the injury criteria are met for the area that an occupant could contact. For example, if, in addition to a pretensioner restraint system, an airbag device is present, different yaw angles could result in different airbag device performance, then additional analysis or separate tests may be necessary to evaluate performance.

2. Neck Injury Criteria

The seating system must protect the occupant from experiencing serious neck injury. In addition to a pretensioner restraint system, if an airbag device also is present, the assessment of neck injury must be conducted with the airbag device activated, unless there is reason to also consider that the neck injury potential would be higher for impacts below the airbag-device deployment threshold.

(a) The Nij (calculated in accordance with 49 CFR 571.208) must be below 1.0, where

Nij = Fz/Fzc + My/Myc, and Nij critical values are:

(1) Fzc = 1530 lbs. for tension
(2) Fzc = 1385 lbs. for compression
(3) Myc = 229 lb-ft in flexion
(4) Myc = 100 lb-ft in extension

(b) In addition, peak Fz must be below 937 lbs. in tension and 899 lbs. in compression.

(c) Rotation of the head about its vertical axis relative to the torso is limited to 105 degrees in either direction from forward facing.

(d) The neck must not impact any surface that would produce concentrated loading on the neck.

3. Spine and Torso Injury Criteria

(a) The lumbar spine tension (Fz) cannot exceed 1200 lbs.

(b) Significant concentrated loading on the occupant's spine, in the area between the pelvis and shoulders during impact, including rebound, is not acceptable. During this type of contact, the interval for any rearward (X direction) acceleration exceeding 20g must be less than 3 milliseconds as measured by the thoracic instrumentation specified in 49 CFR part 572, subpart E filtered in accordance with SAE International (SAE) recommended practice J211/1, ''Instrumentation for Impact Test—Part 1—Electronic Instrumentation.''

(c) The occupant must not interact with the armrest or other seat components in any manner significantly different than would be expected for a forward-facing seat installation.

4. Pelvis Criteria

Any part of the load-bearing portion of the bottom of the ATD pelvis must not translate beyond the edges of the seat bottom seat-cushion supporting structure.

5. Femur Criteria

Axial rotation of the upper leg (about the z-axis of the femur per SAE Recommended Practice J211/1) must be limited to 35 degrees from the nominal seated position. Evaluation during rebound does not need to be considered.

6. ATD and Test Conditions

Longitudinal tests conducted to measure the injury criteria above must be performed with the FAA Hybrid III ATD, as described in SAE 1999–01–1609, ''A Lumbar Spine Modification to the Hybrid III ATD for Aircraft Seat Tests.'' The tests must be conducted with an undeformed floor, at the most-critical yaw cases for injury, and with all lateral structural supports (*e.g.,* armrests or walls) installed.

Note: HAECO must demonstrate that the installation of seats via plinths or pallets meets all applicable requirements. Compliance with the guidance contained in Policy Memorandum PS–ANM–100–2000–00123, ''Guidance for Demonstrating Compliance with Seat Dynamic Testing for Plinths and Pallets,'' dated February 2, 2000, is acceptable to the FAA.

7. Head Injury Criteria (HIC)

The HIC value must not exceed 1000 at any condition at which the pretensioner does or does not deploy, up to the maximum severity pulse that corresponds to the test conditions specified in § 25.562. Tests must be performed to demonstrate this, taking into account any necessary tolerances for deployment.

8. Protection During Secondary Impacts

The pretensioner activation setting must be demonstrated to maximize the probability of the protection being available when needed, considering secondary impacts.

9. Protection of Occupants Other Than 50th Percentile

Protection of occupants for a range of stature from a 2-year-old child to a 95th percentile male must be shown. For shoulder harnesses that include pretensioners, protection of occupants other than a 50th percentile male may be shown by test or analysis. In addition, the pretensioner must not introduce a hazard to passengers due to the following seat configurations:

(a) The seat occupant is holding an infant.

(b) The seat occupant is a child in a child-restraint device.

(c) The seat occupant is a pregnant woman.

10. Occupants Adopting the Brace Position

Occupants in the traditional brace position when the pretensioner activates must not experience adverse effects from the pretensioner activation.

11. Inadvertent Pretensioner Actuation

(a) The probability of inadvertent pretensioner actuation must be shown to be extremely remote (*i.e.,* average probability per flight hour of less than 10^{-7}).

(b) The system must be shown not susceptible to inadvertent pretensioner actuation because of wear and tear, or inertia loads resulting from in-flight or ground maneuvers likely to be experienced in service.

(c) The seated occupant must not be seriously injured because of inadvertent pretensioner actuation.

(d) Inadvertent pretensioner activation must not cause a hazard to the airplane, nor cause serious injury to anyone who may be positioned close to the retractor or belt (*e.g.,* seated in an adjacent seat or standing adjacent to the seat).

12. Availability of the Pretensioner Function Prior to Flight

The design must provide means for a crewmember to verify the availability of the pretensioner function prior to each flight, or the probability of failure of the pretensioner function must be demonstrated to be extremely remote (*i.e.,* average probability per flight hour of less than 10^{-7}), between inspection intervals.

13. Incorrect Seat Belt Orientation

The system design must ensure that any incorrect orientation (twisting) of the seat belt does not compromise the pretensioner protection function.

14. Contamination Protection

The pretensioner mechanisms and controls must be protected from external contamination associated with that which could occur on or around passenger seating.

15. Prevention of Hazards

The pretensioner system must not induce a hazard to passengers in case of fire, nor create a fire hazard, if activated.

16. Functionality After Loss of Power

The system must function properly after loss of normal airplane electrical power, and after a transverse separation in the fuselage at the most critical location. A separation at the location of the system does not have to be considered.

Issued in Kansas City, Missouri, on May 3, 2024.

Patrick R. Mullen,

Manager, Technical Policy Branch, Policy and Standards Division, Aircraft Certification Service.

BILLING CODE 4910–13–P

FEDERAL MARITIME COMMISSION

46 CFR Part 541

[Docket No. FMC–2022–0066]

RIN 3072–AC90

Demurrage and Detention Billing Requirements; Correction

AGENCY: Federal Maritime Commission.

ACTION: Final rule; correction.

SUMMARY: This document corrects the preamble to a final rule published in the **Federal Register** on February 26, 2024, concerning demurrage and detention billing requirements. This correction provides information regarding situations in which vessel-operating common carriers (VOCCs) enter into written contracts with motor carriers that use containers in the transportation of goods.

DATES: This action is effective on May 9, 2024.

ADDRESSES: To view background documents or comments received, you may use the Federal eRulemaking Portal at *www.regulations.gov* under Docket No. FMC–2022–0066.

FOR FURTHER INFORMATION CONTACT: David Eng, Secretary; Phone: (202) 523–5725; Email: *secretary@fmc.gov.*

SUPPLEMENTARY INFORMATION: The Commission notes that it has received several inquiries concerning a possible discrepancy between the rule text and one paragraph in the preamble, found at page 14336.[1] The Commission

[1] ''In regard to the second comment, there seems to be a misunderstanding on the commenter's part about the rule's applicability. As discussed in the NPRM, a primary purpose of this rule is to stop demurrage and detention invoices from being sent to parties who did not negotiate contract terms with the billing party. That concern is not present where a motor carrier has directly contracted with a VOCC. Nothing in this rule, either in the proposed

Continued

appreciates these inquiries as they reflect the strong interest within the shipping industry in ensuring compliance with applicable regulations. These inquiries have helped this clarification issue well before the rule goes into effect on May 28, 2024.

In the preamble, the Commission responded to a comment requesting that we amend the definition of ''billed party'' to address situations in which vessel-operating common carriers (VOCCs) enter into written contracts with motor carriers that use containers in the transportation of goods. The Commission responded by declining to adopt this proposed change, and we now reiterate that conclusion—demurrage and detention should be billed to either the person for whose account the billing party provided ocean transportation or storage of cargo and who contracted with the billing party for the ocean transportation or storage of cargo, or the consignee.

The Commission's explanation in the preamble was intended to further explain that the rule only addresses carrier-trucker relationships on through bills of lading. The Commission meant this to be understood in the context of its statement that ''the FMC's jurisdiction, and thus this rule, would apply only to cargo moved inland under a through bill of lading and contracts between a VOCC [and] a motor carrier not based on a through bill of lading would likely be outside the scope of this rule.'' We further did not intend the paragraph to suggest that there is an exception to the rule's clear direction regarding who may be a ''billed party''. However, we now see that the inadvertent inclusion of certain language renders this comment response ambiguous, and we take this opportunity to clarify our intention by correcting the language in the preamble.

Accordingly, in FR Doc. 2024–02926, on page 14336, in the third column, the paragraph beginning with ''In regard to . . .'' is corrected to read as follows:

''In regard to the second comment, the rule makes clear that demurrage and detention invoices can only be issued to either the person for whose account the billing party provided ocean transportation or storage of cargo and who contracted with the billing party for the ocean transportation or storage of cargo, or the consignee. As discussed in the NPRM, a primary purpose of this rule is to stop demurrage and detention invoices from being sent to parties who did not negotiate contract terms for ocean transportation or storage of cargo with the billing party. When a VOCC issues a detention or demurrage invoice, the VOCC must comply with the requirements of part 541. However, in our response to this specific comment, we presume that the FMC's jurisdiction would apply only to cargo moved inland under a through bill of lading, and that contracts between a VOCC and a motor carrier not based on a through bill of lading would likely be outside the scope of this rule.''

By the Commission.

Dated: May 3, 2024.

David Eng,

Secretary.

[FR Doc. 2024–10136 Filed 5–8–24; 8:45 am]

BILLING CODE 6730–02–P

or final version, prohibits a VOCC from issuing a demurrage or detention invoice to a motor carrier when a contractual relationship exists between the VOCC and the motor carrier for the motor carrier to provide carriage or storage of goods to the VOCC. The definition of ''billed party'' is intentionally broad to capture any party to whom a detention or demurrage invoice is issued. When a VOCC issues a detention or demurrage invoice to a motor carrier, the VOCC must comply with the requirements of part 541. The Commission has jurisdiction over common carriers, marine terminal operators (MTOs), and ocean transportation intermediaries (OTIs), including over through transportation. Without knowing the particulars of the hypothetical, in this situation, presumably the FMC's jurisdiction, and thus this rule, would apply only to cargo moved inland under a through bill of lading and contracts between a VOCC. A motor carrier not based on a through bill of lading would likely be outside the scope of this rule.''

DEPARTMENT OF TRANSPORTATION

Pipeline and Hazardous Materials Safety Administration

49 CFR Parts 171, 172, 173, 175, 176, 178, and 180

[Docket No. PHMSA–2021–0092 (HM–215Q)]

RIN 2137–AF57

Hazardous Materials: Harmonization With International Standards; Correction

AGENCY: Pipeline and Hazardous Materials Safety Administration (PHMSA), Department of Transportation (DOT).

ACTION: Final rule; correction.

SUMMARY: The Pipeline and Hazardous Materials Safety Administration is correcting a final rule that was published in the **Federal Register** on April 10, 2024. The final rule was published to maintain alignment with international regulations and standards by adopting various amendments, including changes to proper shipping names, hazard classes, packing groups, special provisions, packaging authorizations, air transport quantity limitations, and vessel stowage requirements. The corrections address several errors to the hazardous material entries in the hazardous materials table.

DATES: This correction is effective May 10, 2024.

FOR FURTHER INFORMATION CONTACT: Steven Andrews, Standards and Rulemaking, or Candace Casey, Standards and Rulemaking, at 202–366–8553, Pipeline and Hazardous Materials Safety Administration, U.S. Department of Transportation, 1200 New Jersey Avenue SE, East Building, 2nd Floor, Washington, DC 20590–0001.

SUPPLEMENTARY INFORMATION:

I. Background and Need for Technical Corrections

On April 10, 2024, the Pipeline and Hazardous Materials Safety Administration (PHMSA) published a final rule in the **Federal Register** entitled ''Hazardous Materials: Harmonization with International Standards.'' [1] In the final rule, the amendatory instruction 19c for the revision of Table 4 to paragraph (g) in § 173.225 should have read: ''In newly designated Table 4 to paragraph (g), under UN No. 3109, and above ''tert-Butyl hydroperoxide, not more than 72% with water'' add an entry for ''tert-Butyl hydroperoxide, not more than 56% with diluent type B[2]'' and revise the Notes after newly designated table 4 to paragraph (g) to read as follows.'' The publication of this correction is needed to ensure that the final rule's amendment of Table 4 to paragraph (g) of § 173.225—which the amendment is effective May 10, 2024—will read as intended.

Additionally, changes in the final rule included numerous amendments to the § 172.101 Hazardous Materials Table (HMT). Unfortunately, the amendments to a few of the table entries introduced new unintended errors that PHMSA is correcting in this notice. The unintended errors are summarized below.

• *UN3548, Articles containing miscellaneous dangerous goods, n.o.s.:* In HM–215Q, PHMSA revised the entry ''UN3548, Articles containing miscellaneous dangerous goods, n.o.s.'' to add Special Provision A224 to Column 7. Special Provision A224 allows for the transport of large articles containing a non-flammable, non-toxic gas or environmentally hazardous substances on both passenger aircraft and cargo aircraft only under certain conditions. As a part of this HM–215Q revision, PHMSA inadvertently removed label code ''9'' from Column 6. Label Code ''9'' in Column 6 is necessary to ensure Class 9 labels are placed on packages shipped under

[1] 89 FR 25434 (Apr. 10, 2024).

''UN3548, Articles containing miscellaneous dangerous goods, n.o.s.'' To meet the original intent of HM–215Q to harmonize with international standards, PHMSA is correcting this error in this notice. *See* ''Section III. Corrections.''

• *UN3538, Articles containing non-flammable, non-toxic gas, n.o.s.:* In HM–215Q, PHMSA revised the entry ''UN3538, Articles containing non-flammable, non-toxic gas, n.o.s.,'' to add Special Provision A225 to Column 7. Special Provision A225 allows for the transport of large articles containing a non-flammable, non-toxic gas or environmentally hazardous substances on both passenger aircraft and cargo aircraft only under certain conditions. As a part of this revision, PHMSA inadvertently removed the ''G'' from Column 1 of the ''UN3538, Articles containing non-flammable, non-toxic gas, n.o.s.'' entry. The ''G'' in Column 1 identifies proper shipping names for which one or more technical names of the hazardous material must be entered in parentheses, in association with the basic description. To meet the original intent of HM–215Q to harmonize with international standards, PHMSA is correcting this error in this notice. *See* ''Section III. Corrections.''

• *UN2922, Corrosive liquids, toxic, n.o.s.:* In HM–215Q, PHMSA made a revision to the entry ''UN2922, Corrosive liquid, toxic, n.o.s.'' to add Special Provision A4 to Column 7. Special Provision A4 addresses liquids and solids in PG I that also pose an inhalation toxicity hazard by limiting or prohibiting their transportation on aircraft. As written, the regulatory instructions in HM–215Q might inadvertently remove the PG II and III entries for ''UN2922, Corrosive liquid, toxic, n.o.s.'' Therefore, the regulatory instruction needs to be revised to ensure that PG II and III for ''UN2922, Corrosive liquid, toxic, n.o.s.'' are not deleted from the HMT. To meet the original intent of HM–215Q to harmonize with international standards, PHMSA is correcting this error in this notice. *See* ''Section III. Corrections.''

• *UN2923, Corrosive solids, toxic, n.o.s.:* In HM–215Q, PHMSA made a revision to the entry ''UN2923, Corrosive solids, toxic, n.o.s.'' to add Special Provision A5 to Column 7. Special Provision A5 addresses liquids and solids in PG I that also pose an inhalation toxicity hazard by limiting or prohibiting their transportation on aircraft. As written, the regulatory instruction for the HMT might inadvertently remove the PG II and III entries for ''UN2923, Corrosive solids, toxic, n.o.s.'' Therefore, the regulatory instructions need to be revised to ensure that PG II and III for ''UN2923, Corrosive solids, toxic, n.o.s.'' are not deleted from the HMT. To meet the original intent of HM–215Q to harmonize with international standards, PHMSA is correcting this error in this notice. *See* ''Section III. Corrections.''

• *UN0512, Detonators, electronic programmable for blasting:* In HM–215Q, PHMSA made a revision to the entry ''UN0512, Detonators, electronic programmable for blasting.'' In the 2022 HM–215P final rule, PHMSA added three new entries for electronic detonators to distinguish them from electric detonators, which have different functioning characteristics but similar regulatory provisions for their transport and incorrectly assigned an obsolete special provision, Special Provision 103. In HM–215Q, PHMSA removed the reference to Special Provision 103 in Column 7 for UN0512 and replaced it with Special Provision 148 consistent with the entry of UN0255. However, in making this revision in HM–215Q, PHMSA inadvertently made the word ''electronic'' in ''UN0512, Detonators, electronic programmable for blasting'' in italics. Proper shipping names listed in the HMT are limited to those shown in Roman type (not italics). To meet the original intent of HM–215Q to harmonize with international standards, PHMSA is correcting this error in this notice. *See* ''Section III. Corrections.''

• *UN3148, Water-reactive liquid, n.o.s.:* In HM–215Q, PHMSA made corrections to multiple HMT entries that were inadvertently modified in previous rulemakings. Specifically, for the PG II and III entries for ''UN3129, Water-reactive liquid, corrosive, n.o.s.'' and ''UN3148, Water-reactive liquid, n.o.s.,'' the references to the exceptions in § 173.151 in Column 8A were removed and replaced with the word ''None.'' In doing so however, PHMSA inadvertently made revisions to the PG II entry for ''UN3148, Water-reactive liquid, n.o.s.,'' that were not intended. This includes inadvertent revisions to columns 7, 8B, 8C, 9A, and 9B for the PG II entry for ''UN3148, Water-reactive liquid, n.o.s.'' To meet the original intent of HM–215Q to harmonize with international standards, PHMSA is correcting this error in this notice. *See* ''Section III. Corrections.''

II. Regulatory Analyses and Notices

A. Statutory/Legal Authority

Statutory authority for this notice's corrections to the final rule, as with the final rule itself, is provided by the Federal hazardous materials transportation law (49 U.S.C. 5101 *et seq.*). The Secretary delegated the authority granted in the Federal hazardous materials transportation law to the PHMSA Administrator at 49 CFR 1.97(b).

PHMSA finds it has good cause to make the technical corrections herein without notice and comment pursuant to Section 553(b) of the Administrative Procedure Act (APA, 5 U.S.C. 551, *et seq.*). Section 553(b)(B) of the APA provides that, when an agency for good cause finds that notice and public procedure are impracticable, unnecessary, or contrary to the public interest, the agency may issue a rule without providing notice and an opportunity for public comment. As explained above, the corrections here consists of technical correction to amend the amendatory instruction 19c. to § 173.225 which (as published in the **Federal Register**) inadvertently would not make a necessary revision to an entry in Table 4 to paragraph (g), as well as cure inadvertent omissions of current HMT fields. The publication of these corrections are needed to ensure that § 173.225 and the HMT continue to read as intended; these technical corrections make no substantive changes to the final rule but merely facilitate its implementation. Because the final rule is the product of an extensive administrative record with numerous opportunities—including through written comments—for public comment, PHMSA finds that additional comment on the technical corrections herein is unnecessary.

The May 10, 2024, effective date of the corrections contained in this notice is authorized under both Section 553(d)(1) and (3) of the APA. Section 553(d)(1) provides that a rule should take effect ''not less than 30 days'' after publication in the **Federal Register** except for ''a substantive rule which grants or recognizes an exemption or relieves a restriction,'' while Section 553(d)(3) allows for earlier effectiveness for good cause found by the agency and published within the rule. 5 U.S.C. 553(d)(1), (3). ''The purpose of the thirty-day waiting period is to give affected parties a reasonable time to adjust their behavior before the final rule takes effect.'' *Omnipoint Corp.* v. *F.C.C.,* 78 F.3d 620, 630 (D.C. Cir. 1996). Since this final rule has not yet taken effect, the impact on affected parties is minimal and such parties will not be adversely impacted by the shortened period before the corrections become effective. The correction of amendatory instruction 19c. ensures that the intended regulatory language at Table 4 to paragraph (g) in § 173.225 will be codified in regulation, and other

corrections restore HMT fields that could be inadvertently deleted by the final rule; in accordance with 5 U.S.C. 553(d)(1), those corrections will be effective May 10, 2024. Moreover, PHMSA finds that good cause under Section 553(d)(3) supports making the revisions effective May 10, 2024, because the corrections contained in this notice are entirely consistent with the final rule—which itself was published in April 2024—and help promote timely compliance with the final rule's requirements before its May 10, 2024, effective date.

B. Executive Order 12866 and 14094, and DOT Regulatory Policies and Procedures

These corrections have been evaluated in accordance with existing policies and procedures and are not considered significant under Executive Order 12866 (''Regulatory Planning and Review''),[2] Executive Order 14094 (''Modernizing Regulatory Review''),[3] and DOT Order 2100.6A (''Rulemaking and Guidance Procedures''); therefore, this notice has not been reviewed by the Office of Management and Budget (OMB) under Executive Order 12866. PHMSA finds that the technical corrections herein (in all respects consistent with the final rule) neither impose incremental compliance costs nor adversely affect safety. Overall, PHMSA expects any impacts on the expected costs and benefits of the final rule will be negligible.

C. Executive Order 13132

PHMSA has analyzed these corrections in accordance with the principles and criteria contained in Executive Order 13132 (''Federalism'')[4] and the Presidential memorandum (''Preemption'') that was published in the **Federal Register** on May 22, 2009.[5] Executive Order 13132 requires agencies to assure meaningful and timely input by state and local officials in the development of regulatory policies that may have ''substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.'' The technical corrections herein are consistent with, and merely facilitate compliance with, the final rule, and do not have any substantial direct effect on the states, the relationship between the national government and the States, or the distribution of power and responsibilities among the various levels of government beyond what was accounted for in the final rule. This notice does not contain any provision that imposes any substantial direct compliance costs on state and local governments, nor any new provision that preempts state law. Therefore, the consultation and funding requirements of Executive Order 13132 do not apply.

D. Executive Order 13175

These corrections were analyzed in accordance with the principles and criteria contained in Executive Order 13175 (''Consultation and Coordination with Indian Tribal Governments'')[6] and DOT Order 5301.1A (''Department of Transportation Tribal Consultation Policies and Procedures''). Executive Order 13175 and DOT Order 5301.1A require DOT Operating Administrations to assure meaningful and timely input from Native American tribal government representatives in the development of rules that significantly or uniquely affect tribal communities by imposing ''substantial direct compliance costs'' or ''substantial direct effects'' on such communities, or the relationship and distribution of power between the Federal Government and Native American tribes. Because the technical corrections herein do not have Tribal implications or impose substantial direct compliance costs on Indian Tribal governments, the funding and consultation requirements of Executive Order 13175 do not apply.

E. Regulatory Flexibility Act, Executive Order 13272, and DOT Policies and Procedures

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires agencies to review regulations to assess their impact on small entities unless the agency head certifies that a rulemaking will not have a significant economic impact on a substantial number of small entities including small businesses, not-for-profit organizations that are independently owned and operated and are not dominant in their fields, and governmental jurisdictions with populations under 50,000. The Regulatory Flexibility Act directs agencies to establish exceptions and differing compliance standards for small businesses, where possible to do so and still meet the objectives of applicable regulatory statutes. Executive Order 13272 (''Proper Consideration of Small Entities in Agency Rulemaking'')[7] requires agencies to establish procedures and policies to promote compliance with the Regulatory Flexibility Act and to ''thoroughly review draft rules to assess and take appropriate account of the potential impact'' of the rules on small businesses, governmental jurisdictions, and small organizations. The DOT posts its implementing guidance on a dedicated web page.[8]

This corrections document was—like the final rule—developed in accordance with Executive Order 13272 and with DOT's procedures and policies to promote compliance with the Regulatory Flexibility Act to ensure that potential impacts of draft rules on small entities are properly considered. These corrections—like the final rule—facilitate the transportation of hazardous materials in international commerce by providing consistency with international standards. Those corrections apply to offerors and carriers of hazardous materials, some of whom are small entities, such as chemical manufacturers, users, and suppliers; and packaging manufacturers, distributors, and training companies. As discussed at length in the regulatory impact analysis (RIA) that accompanied the final rule and was posted in the rulemaking docket, the amendments in the final rule should result in net cost savings that will ease the regulatory compliance burden for those and other entities engaged in domestic and international commerce, including trans-border shipments within North America. Additionally, the changes in the final rule will relieve U.S. companies—including small entities competing in foreign markets—from the burden of complying with a dual system of regulations. Therefore, PHMSA expects that these corrections—like the amendments in the final rule—will not have a significant economic impact on a substantial number of small entities. Because the technical corrections herein will impose no new incremental compliance costs, PHMSA understands the analysis in the RIA remains unchanged.

F. Paperwork Reduction Act

The corrections in this notice impose no new or revised information collection requirements beyond those discussed in the final rule.

G. Unfunded Mandates Reform Act of 1995

PHMSA analyzed the corrections in this notice under the factors in the

[2] 58 FR 51735 (Oct. 4, 1993).

[3] 88 FR 21879 (April 11, 2023).

[4] 64 FR 43255 (Aug. 10, 1999).

[5] 74 FR 24693 (May 22, 2009).

[6] 65 FR 67249 (Nov. 9, 2000).

[7] 67 FR 53461 (Aug. 16, 2002).

[8] DOT, ''Rulemaking Requirements Related to Small Entities,'' *https://www.transportation.gov/regulations/rulemaking-requirements-concerning-small-entities* (last accessed June 17, 2021).

Unfunded Mandates Reform Act of 1995 (UMRA, 2 U.S.C. 1501 *et seq.*) and determined that the corrections to the final rule herein do not impose enforceable duties on state, local, or tribal governments or on the private sector of $100 million or more, adjusted for inflation, in any one year. PHMSA prepared an analysis of the UMRA considerations in the final RIA for the final rule, which is available in the docket for the rulemaking. Because the corrections herein will impose no new incremental compliance costs, PHMSA understands the analysis in that UMRA discussion for the final rule remains unchanged.

H. Environmental Assessment

The National Environmental Policy Act of 1969 (NEPA, 42 U.S.C. 4321 *et seq.*) requires federal agencies to prepare a detailed statement on major Federal actions significantly affecting the quality of the human environment. PHMSA analyzed the final rule in accordance with NEPA, implementing Council on Environmental Quality regulations (40 CFR parts 1500–1508), and DOT implementing policies (DOT Order 5610.1C, ''Procedures for Considering Environmental Impacts'') and determined the final rule would have not significantly impact on the human environment. The corrections to the final rule in this notice have no effect on PHMSA's earlier NEPA analysis as they are consistent, and merely facilitate compliance with, the final rule.

I. Privacy Act

In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov,* as described in the system of records notice (DOT/ALL–14 FDMS), which can be reviewed at *www.dot.gov/privacy.*

J. Executive Order 13609 and International Trade Analysis

Under Executive Order 13609 (''Promoting International Regulatory Cooperation''),[9] agencies must consider whether the impacts associated with significant variations between domestic and international regulatory approaches are unnecessary or may impair the ability of American business to export and compete internationally. In meeting shared challenges involving health, safety, labor, security, environmental, and other issues, international regulatory cooperation can identify approaches that are at least as protective as those that are or would be adopted in the absence of such cooperation. International regulatory cooperation can also reduce, eliminate, or prevent unnecessary differences in regulatory requirements. The corrections to the final rule in this notice do not impact international trade.

K. National Technology Transfer and Advancement Act

The National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) directs federal agencies to use voluntary consensus standards in their regulatory activities unless doing so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.,* specification of materials, test methods, or performance requirements) that are developed or adopted by voluntary consensus standard bodies. The final rule involved multiple voluntary consensus standards which were discussed at length in the discussion on § 171.7. The corrections herein do not change the final rule's analysis.

L. Executive Order 13211

Executive Order 13211 (''Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use'') [10] requires federal agencies to prepare a Statement of Energy Effects for any ''significant energy action.'' The corrections herein do not invoke any issues under Executive Order 13211.

M. Cybersecurity and Executive Order 14028

Executive Order 14028 (''Improving the Nation's Cybersecurity'') [11] directed the federal government to improve its efforts to identify, deter, and respond to ''persistent and increasingly sophisticated malicious cyber campaigns.'' The corrections herein do not invoke any cybersecurity issues.

N. Severability

These corrections do not present any issues with severability.

III. Corrections

PHMSA makes corrections to the regulatory text of the final rule document. PHMSA is correctly revising the § 172.101 HMT entries for the hazardous materials discussed above in Section I. Additionally, PHMSA is correcting the amendatory instruction 19c.

■ In FR Doc. 2024–06956, appearing on page 25434 in the **Federal Register** of Wednesday, April 10, 2024, the following corrections are made:

■ a. On page 25474, revise the entry for ''Articles containing miscellaneous dangerous goods, n.o.s.'';

■ b. On page 25474, revise the entry for ''Articles containing non-flammable, non-toxic gas, n.o.s.'';

■ c. On page 25474, revise the entry for ''Corrosive liquids, toxic, n.o.s.'';

■ d. On page 25474, add seven stars in between the ''Corrosive liquids, toxic, n.o.s.'' entry and the ''Corrosive solids, toxic, n.o.s.'' entry;

■ e. On page 25474, revise the entry for ''Corrosive solids, toxic, n.o.s.'';

■ f. On page 25474, revise the entry for ''Detonators, electronic programmable for blasting''; and

■ g. On page 25475, revise the entry for ''Water-reactive liquid, n.o.s.''.

The corrections read as follows:

BILLING CODE 4910–60–C

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

50 CFR Part 679

[Docket No. 240227–0061; RTID 0648–XD692]

Fisheries of the Exclusive Economic Zone Off Alaska; Pacific Cod by Vessels Using Jig Gear in the Central Regulatory Area of the Gulf of Alaska

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Temporary rule; closure.

SUMMARY: NMFS is prohibiting directed fishing for Pacific cod by vessels using jig gear in the Central Regulatory Area of the Gulf of Alaska (GOA). This action is necessary to prevent exceeding the A season allowance of the 2024 total allowable catch (TAC) of Pacific cod by vessels using jig gear in the Central Regulatory Area of the GOA.

DATES: Effective 1200 hours, Alaska local time (A.l.t.), May 6, 2024, through 1200 hours, A.l.t., June 10, 2024.

FOR FURTHER INFORMATION CONTACT: Abby Jahn, 907–586–7416.

SUPPLEMENTARY INFORMATION: NMFS manages the groundfish fishery in the GOA exclusive economic zone according to the Fishery Management Plan for Groundfish of the Gulf of Alaska (FMP) prepared by the North Pacific Fishery Management Council under authority of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act). Regulations governing fishing by U.S. vessels in accordance with the FMP appear at subpart H of 50 CFR part 600 and 50 CFR part 679.

The A season allowance of the 2024 Pacific cod TAC apportioned to vessels using jig gear in the Central Regulatory Area of the GOA is 185 metric tons (mt) as established by the final 2024 and 2025 harvest specifications for groundfish in the GOA (89 FR 15484, March 4, 2024).

In accordance with § 679.20(d)(1)(i), the Regional Administrator has determined that the A season allowance of the 2024 Pacific cod TAC apportioned to vessels using jig gear in the Central Regulatory Area of the GOA will soon be reached. Therefore, the Regional Administrator is establishing a directed fishing allowance of 93 mt and is setting aside the remaining 0 mt as bycatch to support other anticipated groundfish fisheries. In accordance with § 679.20(d)(1)(iii), the Regional Administrator finds that this directed fishing allowance has been reached. Consequently, NMFS is prohibiting directed fishing for Pacific cod by vessels using jig gear in the Central Regulatory Area of the GOA.

While this closure is effective, the maximum retainable amounts at § 679.20(e) and (f) apply at any time during a trip.

Classification

NMFS issues this action pursuant to section 305(d) of the Magnuson-Stevens Act. This action is required by 50 CFR part 679, which was issued pursuant to section 304(b), and is exempt from review under Executive Order 12866.

Pursuant to 5 U.S.C. 553(b)(B), there is good cause to waive prior notice and an opportunity for public comment on this action, as notice and comment would be impracticable and contrary to the public interest, as it would prevent NMFS from responding to the most recent fisheries data in a timely fashion, and would delay the closure of Pacific cod by vessels using jig gear in the Central Regulatory Area of the GOA. NMFS was unable to publish a notice providing time for public comment because the most recent, relevant data only became available as of May 3, 2024.

The Assistant Administrator for Fisheries, NOAA also finds good cause to waive the 30-day delay in the effective date of this action under 5 U.S.C. 553(d)(3). This finding is based upon the reasons provided above for waiver of prior notice and opportunity for public comment.

Authority: 16 U.S.C. 1801 *et seq.*

Dated: May 6, 2024.

Karen H. Abrams,

Acting Director, Office of Sustainable Fisheries, National Marine Fisheries Service.

[FR Doc. 2024–10151 Filed 5–6–24; 4:15 pm]

BILLING CODE 3510–22–P

Proposed Rules

Federal Register
Vol. 89, No. 91
Thursday, May 9, 2024

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

33 CFR Part 165

[Docket Number USCG–2024–0396]

RIN 1625–AA87

Security Zone, Lake Erie, Mentor (Mentor Headlands), Ohio

AGENCY: Coast Guard, DHS.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Coast Guard is proposing to establish a temporary security zone for certain waters of Lake Erie off Mentor Headlands Beach State Park, Mentor, Ohio. This action is necessary to provide offshore security for motion picture production activity on the Mentor Headlands Beach from June 17 through June 18, and June 20 through June 21, 2024. This proposed rulemaking would prohibit persons and vessels from entering this security zone unless authorized by the Captain of the Port Sector Eastern Great Lakes or a designated representative. We invite your comments on this proposed rulemaking.

DATES: Comments and related material must be received by the Coast Guard on or before June 10, 2024.

ADDRESSES: You may submit comments identified by docket number USCG–2024–0396 using the Federal Decision-Making Portal at *https://www.regulations.gov.* See the ''Public Participation and Request for Comments'' portion of the **SUPPLEMENTARY INFORMATION** section for further instructions on submitting comments. This notice of proposed rulemaking with its plain-language, 100-word-or-less proposed rule summary will be available in this same docket.

FOR FURTHER INFORMATION CONTACT: If you have questions about this proposed rulemaking, contact Cody Mayrer with the U.S. Coast Guard Marine Safety Unit Cleveland's Waterways Management Division; via telephone at 216–937–0111, or by email at *D09-SMB-MSUCLEVELAND-WWM@uscg.mil.*

SUPPLEMENTARY INFORMATION:

I. Table of Abbreviations

CFR Code of Federal Regulations
DHS Department of Homeland Security
FR Federal Register
NPRM Notice of proposed rulemaking
§ Section
U.S.C. United States Code

II. Background, Purpose, and Legal Basis

On February 27, 2024, S&K Productions notified the U.S. Coast Guard that it will be filming a motion picture on the Mentor Headlands Beach State Park in Mentor, Ohio from June 17 through June 18, and from June 20 through June 21, 2024, with rain dates of June 24–28, 2024. The Captain of the Port Sector Eastern Great Lakes (COTP) has determined that a security zone covering certain navigable waters of Lake Erie is needed to protect life and property during the S&K Productions' filming of project ''Genesis''.

The purpose of this rulemaking is to ensure offshore security of the film production personnel, sets, and equipment during production activity. The Coast Guard is proposing this rulemaking under its authority granted in 46 U.S.C. 70034.

III. Discussion of Proposed Rule

The COTP is proposing to establish the following security zone covering certain navigable waters of Lake Erie off the Mentor Headlands, Mentor, Ohio. The duration and location of this zone is intended to protect personnel, sets, and equipment during the S&K Productions' filming project. The zone may require enforcement beyond the stated times if the filming runs into unforeseen delays. Rain dates have been designated for June 24–28, 2024. No vessel or person would be permitted to enter the security zone listed directly below without permission from the COTP or a designated representative. The regulatory text we are proposing appears at the end of this document.

The boundary of the 500-yard offshore security zone from the Mentor Headlands Beach State Park forms a rectangle with the four corners of the polygon located in the following coordinates:

(1) 41°45′17″ N, 081°17′41″ W;
(2) 41°45′27″ N, 081°17′57″ W;
(3) 41°46′18″ N, 081°17′02″ W; and
(4) 41°46′01″ N, 081°16′49″ W (NAD 83).

IV. Regulatory Analyses

We developed this proposed rule after considering numerous statutes and Executive orders related to rulemaking. Below we summarize our analyses based on a number of these statutes and Executive orders, and we discuss First Amendment rights of protestors.

A. Regulatory Planning and Review

Executive Orders 12866 and 13563 direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits. This NPRM has not been designated a ''significant regulatory action,'' under section 3(f) of Executive Order 12866, as amended by Executive Order 14094 (Modernizing Regulatory Review). Accordingly, the NPRM has not been reviewed by the Office of Management and Budget (OMB).

This regulatory action determination is based on is based on size, location, and duration of the proposed rule. These security zone would restrict navigation through Lake Erie offshore of the Mentor Headlands Beach State Park for 13 hours each day, for a total of four days. 52 hours in all.

B. Impact on Small Entities

The Regulatory Flexibility Act of 1980, 5 U.S.C. 601–612, as amended, requires Federal agencies to consider the potential impact of regulations on small entities during rulemaking. The term ''small entities'' comprises small businesses, not-for-profit organizations that are independently owned and operated and are not dominant in their fields, and governmental jurisdictions with populations of less than 50,000. The Coast Guard certifies under 5 U.S.C. 605(b) that this proposed rule would not have a significant economic impact on a substantial number of small entities.

While some owners or operators of vessels intending to transit the security zone may be small entities, for the reasons stated in section IV.A above, this proposed rule would not have a significant economic impact on any vessel owner or operator.

If you think that your business, organization, or governmental

jurisdiction qualifies as a small entity and that this proposed rule would have a significant economic impact on it, please submit a comment (see **ADDRESSES**) explaining why you think it qualifies and how and to what degree this rule would economically affect it.

Under section 213(a) of the Small Business Regulatory Enforcement Fairness Act of 1996 (Pub. L. 104–121), we want to assist small entities in understanding this proposed rule. If the proposed rule would affect your small business, organization, or governmental jurisdiction and you have questions concerning its provisions or options for compliance, please call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section. The Coast Guard will not retaliate against small entities that question or complain about this proposed rule or any policy or action of the Coast Guard.

C. Collection of Information

This proposed rule would not call for a new collection of information under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520).

D. Federalism and Indian Tribal Governments

A rule has implications for federalism under Executive Order 13132 (Federalism), if it has a substantial direct effect on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. We have analyzed this proposed rule under that Order and have determined that it is consistent with the fundamental federalism principles and preemption requirements described in Executive Order 13132.

Also, this proposed rule does not have tribal implications under Executive Order 13175 (Consultation and Coordination with Indian Tribal Governments) because it would not have a substantial direct effect on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes. If you believe this proposed rule has implications for federalism or Indian tribes, please call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

E. Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1531–1538) requires Federal agencies to assess the effects of their discretionary regulatory actions. In particular, the Act addresses actions that may result in the expenditure by a State, local, or tribal government, in the aggregate, or by the private sector of $100,000,000 (adjusted for inflation) or more in any one year. Though this proposed rule would not result in such an expenditure, we do discuss the potential effects of this proposed rule elsewhere in this preamble.

F. Environment

We have analyzed this proposed rule under Department of Homeland Security Directive 023–01, Rev. 1, associated implementing instructions, and Environmental Planning COMDTINST 5090.1 (series), which guide the Coast Guard in complying with the National Environmental Policy Act of 1969 (42 U.S.C. 4321–4370f), and have made a preliminary determination that this action is one of a category of actions that do not individually or cumulatively have a significant effect on the human environment. This proposed rule involves a security zone offshore of the Mentor Headlands State Park Beach lasting 13 hours each day for a total of four days. Normally such actions are categorically excluded from further review under paragraph L60a of Appendix A, Table 1 of DHS Instruction Manual 023–01–001–01, Rev. 1. A preliminary Record of Environmental Consideration supporting this determination is available in the docket. For instructions on locating the docket, see the **ADDRESSES** section of this preamble. We seek any comments or information that may lead to the discovery of a significant environmental impact from this proposed rule.

G. Protest Activities

The Coast Guard respects the First Amendment rights of protesters. Protesters are asked to call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section to coordinate protest activities so that your message can be received without jeopardizing the safety or security of people, places, or vessels.

V. Public Participation and Request for Comments

We view public participation as essential to effective rulemaking and will consider all comments and material received during the comment period. Your comment can help shape the outcome of this rulemaking. If you submit a comment, please include the docket number for this rulemaking, indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation.

Submitting comments. We encourage you to submit comments through the Federal Decision-Making Portal at *https://www.regulations.gov.* To do so, go to *https://www.regulations.gov,* type USCG–2024–0396 in the search box and click ''Search.'' Next, look for this document in the Search Results column, and click on it. Then click on the Comment option. If you cannot submit your material by using *https://www.regulations.gov,* call or email the person in the **FOR FURTHER INFORMATION CONTACT** section of this proposed rule for alternate instructions.

Viewing material in docket. To view documents mentioned in this proposed rule as being available in the docket, find the docket as described in the previous paragraph, and then select ''Supporting & Related Material'' in the Document Type column. Public comments will also be placed in our online docket and can be viewed by following instructions on the *https://www.regulations.gov* Frequently Asked Questions web page. Also, if you click on the Dockets tab and then the proposed rule, you should see a ''Subscribe'' option for email alerts. The option will notify you when comments are posted, or a final rule is published.

We review all comments received, but we will only post comments that address the topic of the proposed rule. We may choose not to post off-topic, inappropriate, or duplicate comments that we receive.

Personal information. We accept anonymous comments. Comments we post to *https://www.regulations.gov* will include any personal information you have provided. For more about privacy and submissions to the docket in response to this document, see DHS's eRulemaking System of Records notice (85 FR 14226, March 11, 2020).

List of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Reporting and recordkeeping requirements, Security measures, Waterways.

For the reasons discussed in the preamble, the Coast Guard is proposing to amend 33 CFR part 165 as follows:

PART 165—REGULATED NAVIGATION AREAS AND LIMITED ACCESS AREAS

■ 1. The authority citation for part 165 continues to read as follows:

Authority: 46 U.S.C. 70034, 70051; 70124, 33 CFR 1.05–1, 6.04–1, 6.04–6, and 160.5; Department of Homeland Security Delegation No. 00170.1, Revision No. 01.3.

■ 2. Add § 165.T09–0396 to read as follows:

§ 165.T09–0396 Security Zone; Mentor Headlands Beach, Mentor, Ohio.

(a) *Location.* The following area is a security zone: Mentor, OH. All U.S. waters of Lake Erie out to 500-yards from the shoreline at Mentor Headlands Beach State Park within a rectangle of which the four corners of the polygon are located in the following positions:

(1) 41°45′17″ N, 081°17′41″ W;

(2) 41°45′27″ N, 081°17′57″ W;

(3) 41°46′18″ N, 081°17′02″ W; and

(4) 41°46′01″ N, 081°16′49″ W (NAD 83).

(b) *Definitions*—(1) *Official Patrol Vessel* means a Coast Guard Patrol Commander, including a Coast Guard coxswain, petty officer, or other officer operating a Coast Guard vessel and a Federal, State, and local officer designated by or assisting the Captain of the Port Sector Eastern Great Lakes (COTP) in the enforcement of the regulations in this section.

(2) *Spectator* means all persons and vessels not registered with the production company as participants or official patrol vessels.

(3) *Rain date* refers to an alternate date and/or time in which the safety zone would be enforced in the event of inclement weather.

(c) *Regulations.* (1) The Coast Guard may patrol the security zone area under the direction of a designated Coast Guard Patrol Commander. The Patrol Commander may be contacted on Channel 16 VHF–FM (156.8 MHz) by the call sign ''PATCOM.''

(2) All persons and vessels not registered with the production company or official patrol vessels are considered spectators. The ''official patrol vessels'' consist of any Coast Guard, state or local law enforcement and production company provided vessels designated or assigned by the COTP Sector Eastern Great Lakes, to patrol the security zone.

(3) Spectator vessels desiring to transit the regulated area may do so only with prior approval of the Patrol Commander and when so directed by that officer and will be operated at a no wake speed in a manner which will not endanger anyone directly involved with the production or any other craft.

(4) No spectator shall anchor, block, loiter, or impede the through transit of official patrol vessels in the regulated area during the effective dates and times, unless cleared for entry by or through an official patrol vessel.

(5) The Patrol Commander may forbid and control the movement of all vessels in the regulated area. When hailed or signaled by an official patrol vessel, a vessel shall come to an immediate stop and comply with the directions given. Failure to do so may result in expulsion from the area, citation for failure to comply, or both.

(6) Any spectator vessel may anchor outside the regulated areas specified in this chapter, but may not anchor in, block, or loiter in a navigable channel.

(7) The Patrol Commander may terminate the filming or the operation of any vessel at any time it is deemed necessary for the protection of life and/or property.

(8) The Patrol Commander will terminate enforcement of the special regulations at the conclusion of the event.

(d) *Enforcement period.* This section will be enforced from 6:30 a.m. through 7:30 p.m. on June 17 through June 18, 2024, and from 2:30 p.m. through 3:30 a.m. on June 20 through June 21, 2024. Rain dates have been identified as June 24–28, 2024. Times of enforcement should these rain dates be necessary will be advertised through Local Notice to Mariners and Broadcast Notice to Mariners.

Dated: May 3, 2024.

S.M. Murray,

Commander, U.S. Coast Guard, Acting Captain of the Port Eastern Great Lakes.

DEPARTMENT OF AGRICULTURE

Commodity Credit Corporation

[Docket ID FSA–2024–0003]

Notice of Funds Availability; Organic Certification Cost Share Program (OCCSP)

AGENCY: Commodity Credit Corporation and Farm Service Agency, USDA.

ACTION: Notification of funding availability.

SUMMARY: The Farm Service Agency (FSA), on behalf of the Commodity Credit Corporation, is issuing this notice to announce the availability of cost share assistance through OCCSP for fiscal year (FY) 2024. FSA is giving the opportunity for State Agencies to apply for grant agreements to administrator the OCCSP program to establish agreements to provide cost share assistance to eligible producers and handlers and for producers and handlers to apply for OCCSP payment at FSA county office.

DATES: *Applications for State Agency Agreements:* FSA will accept applications from State Agencies to administer OCCSP for FY 2024 between the period of May 13, 2024, and October 31, 2024.

Producer and Handler Applications: FSA county offices will accept applications for OCCSP from producers and handlers for FY 2024 until October 31, 2024.

FOR FURTHER INFORMATION CONTACT: Chris Vazquez; telephone: (202) 923–1585; email: *christopher.vazquez@usda.gov.* Individuals who require alternative means for communication should contact the USDA Target Center at (202) 720–2600 (voice and text telephone (TTY)) or dial 711 for Telecommunications Relay service (both voice and text telephone users can initiate this call from any telephone).

SUPPLEMENTARY INFORMATION:

Background

OCCSP provides cost share assistance to producers and handlers of agricultural products for the costs of obtaining or maintaining organic certification under the National Organic Program (NOP).[1] The purpose of this NOFA is to announce the funding availability and application periods for FY 2024.

OCCSP is funded through two authorizations: (1) National Organic Certification Cost Share Program (National OCCSP) funds, and (2) Agricultural Management Assistance (AMA) funds. Section 102 of the Further Continuing Appropriations and Other Extensions Act, 2024 (Pub. L. 118–22) amended the Farm Security and Rural Investment Act of 2002 (7 U.S.C. 6523(d)(1)(C)) to provide $8 million[2] in National OCCSP funding for FY 2024. In addition, approximately $1.5 million in National OCCSP funding remains available from prior years. An additional $1 million[3] in AMA funding is authorized for each FY. (7 U.S.C. 1524).

On April 29, 2019, FSA published a notice in the **Federal Register** announcing general eligibility and administrative provisions for OCCSP for FY 2019 through 2023 (84 FR 17997–17999). For FY 2024, FSA will administer OCCSP according to the provisions that were applicable for FY 2019 through 2023, providing cost share assistance for 75 percent of an applicant's eligible expenses, up to $750 per scope, which is the maximum amount allowed by law.[4] Cost share assistance is provided on a first come, first served basis, until all available funds are obligated.

As in previous years, FSA will accept applications through FSA county offices and also partner with participating State agencies to administer the program through grant agreements.

Application Period for State Agencies and How To Submit an Application

FSA will accept applications from State Agencies from May 13, 2024, through October 31. 2024. To administer OCCSP for FY 2024, State Agencies must submit an Application for Federal Assistance (Standard Form 424 and 424A) electronically via *Grants.gov* (*https://www.grants.gov*) and enter into a grant agreement with FSA. State Agencies will refer to the Fiscal Year 2024 Full Notice of Funding Opportunity Announcement on *Grants.gov* for additional application requirements. For information on how to use *Grants.gov*, please access *https://www.grants.gov/applicants.*

Application Period for Producers and Handlers and How To Submit an Application

Producers and handlers may submit applications for eligible costs incurred in FY 2024 (the period of October 1, 2023, through September 30, 2024) to their FSA county office until October 31, 2024. The FSA county office locator is available in the ''Find Your Local Service Center'' section on *https://www.farmers.gov.*

Participating State Agencies will establish their own application process and deadlines, as specified in their grant agreements, and producers and handlers must submit an application package according to the instructions provided by the State Agency. A list of participating State Agencies will be available at *https://www.fsa.usda.gov/programs-and-services/occsp* after their agreements with FSA are finalized.

---

[1] USDA's Agricultural Marketing Service (AMS) administers the NOP, which was established under the Organic Foods Production Act of 1990 (7 U.S.C. 6501–6524). Information about organic standards, the certification process, and additional resources for organic producers is available at *https://www.farmers.gov/your-business/organic.* More information about OCCSP is available at *https://www.fsa.usda.gov/programs-and-services/occsp/index.*

[2] After sequestration of 5.7 percent, $7,544,000 in National OCCSP funding is available for FY 2024.

[3] After sequestration of 5.7 percent, $943,000 in AMA funding is available for FY 2024.

[4] On August 10, 2020, FSA announced in the **Federal Register** that the maximum amount of cost share for FY 2020 through 2023 would be 50 percent of an applicant's eligible expenses, up to $500 per scope, due to the limited amount of funding available and expected participation rates. (85 FR 48149–48150). For FY 2020 through 2022, FSA also provided cost share for eligible organic and transitional certification and education expenses through the Organic and Transitional Education and Certification Program (OTECP) in response to economic challenges due to the COVID–19 pandemic that made obtaining and renewing USDA organic certification financially challenging for many operations. On May 10, 2023, FSA announced that OCCSP funding was available for FY 2023 to increase the amount of cost share to 75 percent of eligible costs, up to $750 per scope. (See *https://www.usda.gov/media/press-releases/2023/05/10/usda-announces-new-steps-enhance-organic-markets-and-support.*)

Paperwork Reduction Act Requirements

There are no changes to the information collection request for OCCSP that has been approved by the Office of Management and Budget (OMB) under the Paperwork Reduction Act. The OMB control number for the approval is 0560–0289.

Environmental Review

The environmental impacts have been considered in a manner consistent with the provisions of the National Environmental Policy Act (NEPA, 42 U.S.C. 4321–4347), the regulations of the Council on Environmental Quality (40 CFR parts 1500–1508), and the FSA regulation for compliance with NEPA (7 CFR part 799). The purpose of OCCSP is to provide cost share assistance to producers and handlers of agricultural products in obtaining organic certification. This NOFA merely announces funding availability and program deadlines for the 2024 program year. FSA is not making substantive changes to OCCSP.

As such, the Categorical Exclusions found at 7 CFR part 799.31 apply, specifically 7 CFR 799.31(b)(6)(iii) (that is, financial assistance to supplement income). No Extraordinary Circumstances (7 CFR 799.33) exist. As such, FSA has determined that this NOFA does not constitute a major Federal action that would significantly affect the quality of the human environment, individually or cumulatively. Therefore, FSA will not prepare an environmental assessment or environmental impact statement for this administrative action and this NOFA serves as documentation of the programmatic environmental compliance decision.

Federal Assistance Programs

The title and number of the Federal assistance program, as found in the Assistance Listings, to which this document applies are 10.171, Organic Certification Cost Share Program (OCCSP).

USDA Non-Discrimination Policy

In accordance with Federal civil rights law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family or parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Individuals who require alternative means of communication for program information (for example, braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or the USDA TARGET Center at (202) 720–2600 (voice and text telephone (TTY)) or dial 711 for Telecommunications Relay Service (both voice and text telephone users can initiate this call from any telephone). Additionally, program information may be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD–3027, found online at *https://www.usda.gov/oascr/how-to-file-a-program-discrimination-complaint* and at any USDA office or write a letter addressed to USDA and provide in the letter all the information requested in the form. To request a copy of the complaint form, call (866) 632–9992. Submit your completed form or letter to USDA by: (1) mail to: U.S. Department of Agriculture, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue SW, Washington, DC 20250–9410; (2) fax: (202) 690–7442; or (3) email: *program.intake@usda.gov.*

USDA is an equal opportunity provider, employer, and lender.

Zach Ducheneaux,

Administrator, Farm Service Agency and Executive Vice President, Commodity Credit Corporation.

BILLING CODE 3410–E2–P

DEPARTMENT OF AGRICULTURE

Rural Housing Service

[Docket No.: RHS–24–MFH–0010]

Notice of Solicitation of Applications for Section 514 Off-Farm Labor Housing Loans and Section 516 Off-Farm Labor Housing Grants for New Construction for Fiscal Year 2024; Correction

AGENCY: Rural Housing Service, USDA.

ACTION: Notice of solicitation of applications (NOSA); correction.

SUMMARY: The Rural Housing Service (RHS or Agency), a Rural Development (RD) agency of the United States Department of Agriculture (USDA), is correcting a notice of solicitation of applications (NOSA) that published in the **Federal Register** on April 19, 2024, entitled, ''Notice of Solicitation of Applications for Section 514 Off-Farm Labor Housing Loans and Section 516 Off-Farm Labor Housing Grants for New Construction for Fiscal Year 2024.'' The notice described the methods used to distribute funds, the pre-application and final application process, and submission requirements. The purpose of this document is to correct the inadvertent errors to the commitment letter requirements published in the **Federal Register** on April 19, 2024.

DATES: May 9, 2024.

FOR FURTHER INFORMATION CONTACT: Jonathan Bell, Branch Director, Processing and Report Review Branch, Production and Preservation Division, Multifamily Housing Programs, Rural Development, United States Department of Agriculture, via email: *MFHprocessing1@usda.gov* or telephone: (202) 205–9217.

SUPPLEMENTARY INFORMATION:

Correction

In the **Federal Register** of April 19, 2024, in FR Doc. 2024–08155 (89 FR 28717), on page 28725, in the first column in the first paragraph (ii), correct the paragraph to read:

ii. All applications that propose the use of any leveraged funds should submit commitment letters with their application, if available. If the applicant is unable to secure third-party firm commitment letters within the twelve-month time frame, as specified in the award commitment, the application will be deemed incomplete, the award letter will be considered null and void, and the applicant will be notified in writing that the application will be rejected.

Joaquin Altoro,

Administrator, Rural Housing Service.

BILLING CODE 3410–XV–P

COMMISSION ON CIVIL RIGHTS

Notice of Public Meeting of the Hawai'i Advisory Committee

AGENCY: U.S. Commission on Civil Rights.

ACTION: Notice of webinar public forum.

SUMMARY: Notice is hereby given, pursuant to the provisions of the rules and regulations of the U.S. Commission on Civil Rights (Commission) and the Federal Advisory Committee Act (FACA), that the Hawai'i Advisory Committee (Committee) to the U.S.

Commission on Civil Rights will convene by ZoomGov on Wednesday, May 29, 2024, from 6 p.m. to 7 p.m. HST, is to collect public comment from impacted individuals who have lived experiences related to the Committee's project.

DATES: Wednesday, May 29, 2024, from 6 p.m.–7 p.m. Hawai'i standard time.

ADDRESSES: The meeting will be held via Zoom Webinar.

Registration Link (Audio/Visual): https://www.zoomgov.com/webinar/register/WN_u92J41dkRP-3CWlqnXs15w.

Join by Phone (Audio Only): (833) 435–1820 USA Toll Free; Webinar ID: 161 099 6483.

FOR FURTHER INFORMATION CONTACT: Kayla Fajota, Designated Federal Officer (DFO) at *kfajota@usccr.gov* or (434) 515–2395.

SUPPLEMENTARY INFORMATION: Committee meetings are available to the public through the videoconference link above. Any interested member of the public may listen to the meeting. An open comment period will be provided to allow members of the public to make a statement as time allows. Per the Federal Advisory Committee Act, public minutes of the meeting will include a list of persons who are present at the meeting. If joining via phone, callers can expect to incur regular charges for calls they initiate over wireless lines, according to their wireless plan. The Commission will not refund any incurred charges. Closed captions will be provided for individuals who are deaf, hard of hearing, or who have certain cognitive or learning impairments. To request additional accommodations, please email Angelica Trevino, Support Services Specialists, at *atrevino@usccr.gov* at least 10 business days prior to the meeting.

Members of the public are entitled to make comments during the open period at the end of the meeting. Members of the public may also submit written comments; the comments must be received in the Regional Programs Unit within 30 days following the meeting. Written comments may be emailed to Kayla Fajota (DFO) at *kfajota@usccr.gov.*

Records generated from this meeting may be inspected and reproduced at the Regional Programs Coordination Unit Office, as they become available, both before and after the meeting. Records of the meetings will be available via *www.facadatabase.gov* under the Commission on Civil Rights, Hawai'i Advisory Committee link. Persons interested in the work of this Committee are directed to the Commission's website, *http://www.usccr.gov,* or may contact the Regional Programs Coordination Unit at *atrevino@usccr.gov.*

Agenda:

I. Welcome and Roll Call
II. Chair Remarks
III. Public Comment
IV. Next Steps
V. Adjournment

Dated: May 6, 2024.

David Mussatt,

Supervisory Chief, Regional Programs Unit.

DEPARTMENT OF COMMERCE

Bureau of Industry and Security

Emerging Technology Technical Advisory Committee; Notice of Partially Closed Meeting

The Emerging Technology Technical Advisory Committee (ETTAC) will meet on May 23 and 24, 2024, at 9:00 a.m.-3:00 p.m., (Eastern Daylight Time) in the Herbert C. Hoover Building, Room 3884, 1401 Constitution Avenue NW, Washington, DC (enter through Main Entrance on 14th Street between Constitution and Pennsylvania Avenues). The Committee's primary focus is the identification of emerging and foundational technologies that may be developed over a period of five to ten years with potential dual-use applications as early as possible in their developmental stages both within the United States and abroad, and any other matters relating to actions designed to carry out the policy set forth in Section 1752(1)(A) of the Export Control Reform Act. The purpose of the meeting is to have Committee members and U.S. Government representatives mutually review updated technical data and policy-driving information that has been gathered.

Agenda

May 23, 2024

Open Session

1. Opening remarks by the Chairman, Opening remarks by the Bureau of Industry and Security
2. Opening remarks by BIS Export Administration Leadership
3. Department of Commerce Updates
4. Regulations Update
5. Office of Science and Technology Policy Critical and Emerging Technologies List 2024 Updates
6. Emerging Technology Committee Updates
7. Additional Guest Speakers/ Presentations by the Public

May 24, 2024

Closed Session

8. Discussion of matters determined to be exempt from the open meeting and public participation requirements found in sections 1009(a)(1) and 1009(a)(3) of the Federal Advisory Committee Act (FACA) (5 U.S.C. 1001–1014). The exemption is authorized by section 1009(d) of the FACA, which permits the closure of advisory committee meetings, or portions thereof, if the head of the agency to which the advisory committee reports determines such meetings may be closed to the public in accordance with subsection (c) of the Government in the Sunshine Act (5 U.S.C. 552b(c)). In this case, the applicable provisions of 5 U.S.C. 552b(c) are subsection 552b(c)(4), which permits closure to protect trade secrets and commercial or financial information that is privileged or confidential, and subsection 552b(c)(9)(B), which permits closure to protect information that would be likely to significantly frustrate implementation of a proposed agency action were it to be disclosed prematurely. The closed session of the meeting will involve committee discussions and guidance regarding U.S. Government strategies and policies.

The open session will be accessible via teleconference. To join the conference, submit inquiries to Ms. Yvette Springer at *Yvette.Springer@bis.doc.gov* no later than May 16, 2024.

A limited number of seats will be available for the public session. Reservations are not accepted.

To the extent that time permits, members of the public may present oral statements to the Committee. The public may submit written statements at any time before or after the meeting. However, to facilitate distribution of materials to the Committee members, the Committee suggests that members of the public forward their materials prior to the meeting to Ms. Springer via email.

The Deputy Assistant Secretary for Administration Performing the non-exclusive functions and duties of the Chief Financial Officer with the concurrence of the delegate of the General Counsel, formally determined on April 29, 2024, pursuant to 5 U.S.C. 1009(d)), that the portion of the meeting dealing with pre-decisional changes to the Commerce Control List and the U.S. export control policies shall be exempt from the provisions relating to public meetings found in 5 U.S.C. 1009(a)(1) and 1009(a)(3). The remaining portions of the meeting will be open to the public.

For more information, contact Ms. Springer via email.

Yvette Springer,

Committee Liaison Officer.

Hydrofluorocarbon Blends From the People's Republic of China: Preliminary Results and Partial Rescission of Antidumping Duty Administrative Review; 2022–2023

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: The U.S. Department of Commerce (Commerce) preliminarily determines that no companies under review qualify for a separate rate and that these companies are, therefore, considered to be part of the People's Republic of China (China)-wide entity. Additionally, Commerce is partially rescinding this review with respect to: companies for which all review requests were timely withdrawn; and a company with no entries of subject merchandise during the period of review (POR), August 1, 2022, through July 31, 2023. Interested parties are invited to comment on these preliminary results.

DATES: Applicable May 9, 2024.

FOR FURTHER INFORMATION CONTACT: Melissa Porpotage, AD/CVD Operations, Office IX, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230; telephone: (202) 482–1413.

SUPPLEMENTARY INFORMATION:

Background

On August 2, 2023, Commerce published a notice of opportunity to request an administrative review of the antidumping duty order on hydrofluorocarbon (HFC) blends from China.[1] Commerce received timely requests for an administrative review from the American HFC Coalition (the petitioner), and two Chinese companies. On October 18, 2023, Commerce published in the **Federal Register** a notice of initiation of an administrative review of the *Order* for the period August 1, 2022, through July 31, 2023, covering 19 companies, in accordance with section 751(a) of the Tariff Act of 1930, as amended (the Act) and 19 CFR 351.221(c)(1)(i).[2]

On December 4 and 8, 2023, the two Chinese companies that requested their own reviews, Zhejiang Sanmei Chemical Ind. Co., Ltd. (Zhejiang Sanmei) and ICool Chemical Co., Ltd. (ICool Chemical), filed timely withdrawals of their respective review requests.[3] On January 16, 2024, the petitioner filed a timely withdrawal of its review request for Zhejiang Sanmei.[4] Therefore, because all review requests for Zhejiang Sanmei and ICool Chemical have been withdrawn, Commerce is rescinding the review for these the two companies, as discussed below.

Finally, on January 16, 2024, we issued a memorandum notifying interested parties of our intent to rescind the review of certain companies subject to the review because they had no suspended entries during the POR.[5] We received no comments from interested parties on our intent to rescind.

Respondent Selection

On October 25, 2023, Commerce released U.S. Customs and Border Protection (CBP) entry data in order to select respondents for individual examination.[6] On November 1, 2023, we received comments regarding respondent selection from the petitioner.[7] However, we did not select any mandatory respondents for individual examination because only Zhejiang Sanmei and ICool Chemical timely filed separate rate applications and were, therefore, eligible for individual examination. However, as noted above, we are rescinding this review for Zhejiang Sanmei and ICool Chemical. No other company under review timely filed a separate rate application and/or certification; therefore, no company remaining under review is eligible for individual examination.[8] As such, there is no decision memorandum accompanying this notice.

Scope of the Order

The products subject to the *Order* are HFC blends. HFC blends covered by the scope are R–404A, a zeotropic mixture consisting of 52 percent 1,1,1-Trifluoroethane, 44 percent Pentafluoroethane, and 4 percent 1,1,1,2-Tetrafluoroethane; R–407A, a zeotropic mixture of 20 percent Difluoromethane, 40 percent Pentafluoroethane, and 40 percent 1,1,1,2-Tetrafluoroethane; R–407C, a zeotropic mixture of 23 percent Difluoromethane, 25 percent Pentafluoroethane, and 52 percent 1,1,1,2-Tetrafluoroethane; R–410A, a zeotropic mixture of 50 percent Difluoromethane and 50 percent Pentafluoroethane; and R–507A, an azeotropic mixture of 50 percent Pentafluoroethane and 50 percent 1,1,1-Trifluoroethane also known as R–507. The foregoing percentages are nominal percentages by weight. Actual percentages of single component refrigerants by weight may vary by plus or minus two percent points from the nominal percentage identified above.[9]

Any blend that includes an HFC component other than R–32, R–125, R–143a, or R–134a is excluded from the scope of the *Order.*

Excluded from the *Order* are blends of refrigerant chemicals that include products other than HFCs, such as

[9] R–404A is sold under various trade names, including Forane® 404A, Genetron® 404A, Solkane® 404A, Klea® 404A, and Suva®404A. R–407A is sold under various trade names, including Forane® 407A, Solkane® 407A, Klea®407A, and Suva®407A. R–407C is sold under various trade names, including Forane® 407C, Genetron® 407C, Solkane® 407C, Klea® 407C and Suva® 407C. R–410A is sold under various trade names, including EcoFluor R410, Forane® 410A, Genetron® R410A and AZ–20, Solkane® 410A, Klea® 410A, Suva® 410A, and Puron®. R–507A is sold under various trade names, including Forane® 507, Solkane® 507, Klea®507, Genetron®AZ–50, and Suva®507. R–32 is sold under various trade names, including Solkane®32, Forane®32, and Klea®32. R–125 is sold under various trade names, including Solkane®125, Klea®125, Genetron®125, and Forane®125. R–143a is sold under various trade names, including Solkane®143a, Genetron®143a, and Forane®125.

blends including chlorofluorocarbons (CFCs), hydrochlorofluorocarbons (HCFCs), hydrocarbons (HCs), or hydrofluoroolefins (HFOs).

Also excluded from the *Order* are patented HFC blends, including, but not limited to, ISCEON® blends, including MO99™ (R–438A), MO79 (R–422A), MO59 (R–417A), MO49Plus™ (R–437A) and MO29™ (R–4 22D), Genetron® PerformaxTM LT (R–407F), Choice® R–421A, and Choice® R–421B.

HFC blends covered by the scope of the *Order* are currently classified in the Harmonized Tariff Schedule of the United States (HTSUS) at subheadings 3827.61.0000, 3827.63.0000, 3827.64.0000, 3827.65.0000, 3827.68.0000, 3827.69.0000. Although the HTSUS subheadings are provided for convenience and customs purposes, the written description of the scope is dispositive.[10]

Rescission of Administrative Review, In Part

Pursuant to 19 CFR 351.213(d)(1), Commerce will rescind an administrative review, in whole or in part, if the party that requested the review withdraws its request within 90 days of the publication of the notice of initiation of the requested review. Because interested parties withdrew all requests for administrative review of Zhejiang Sanmei and ICool Chemical within 90 days of the date of publication of the *Initiation Notice,* Commerce is rescinding this review with respect to these companies, in accordance with 19 CFR 351.213(d)(1).

Moreover, Commerce notified all interested parties of its intent to rescind this administrative review for companies with an existing separate rate because there were no reviewable, suspended entries from these companies during the POR.[11] No interested party submitted comments. Therefore, in the absence of any suspended entries of subject merchandise from Zhejiang Yonghe Refrigerant Co., Ltd. (Zhejiang Yonghe) during the POR, we are rescinding this administrative review for Zhejiang Yonghe in accordance with 19 CFR 351.213(d)(3). However, we are not rescinding this administrative review for Daikin Fluorochemicals (China) Co., Ltd., a company that was also listed in the Intent to Rescind Memorandum, because this company subsequently lost its eligibility for a separate rate.[12]

China-Wide Entity

In accordance with Commerce's policy, the China-wide entity will not be under review unless a party specifically requests, or Commerce self-initiates, a review of the entity.[13] Because no party requested a review of the China-wide entity, the entity is not under review and the entity's rate of 216.37 percent is not subject to change.[14]

Preliminary Results of Review

Commerce finds that, because none of the remaining companies under review submitted a timely separate rate application or certification, none of these companies has established its eligibility for a separate rate. Therefore, we consider the companies listed in the appendix to be part of the China-wide entity for these preliminary results, and thus, subject to the China-wide entity rate.

Disclosure and Public Comment

Normally, Commerce discloses to interested parties the calculations performed in connection with the preliminary results within five days of any public announcement or, if there is no public announcement, within five days of the date of publication of the notice of preliminary results in the **Federal Register**, in accordance with 19 CFR 351.224(b). However, because Commerce preliminarily determined that each of the companies listed in the appendix is part of the China-wide entity, there are no calculations to disclose.

Interested parties may submit case briefs to Commerce no later than 30 days after the date of publication of this notice.[15] Rebuttal briefs, limited to issues raised in the case briefs, may be filed no later than five days after the deadline for filing case briefs.[16] Interested parties who submit case briefs or rebuttal briefs in this proceeding must submit: (1) a table of contents listing each issue; and (2) a table of authorities.[17]

As provided under 19 CFR 351.309(c)(2) and (d)(2), in prior proceedings we have encouraged interested parties to provide an executive summary of their briefs that should be limited to five pages total, including footnotes. In this review, we instead request that interested parties provide at the beginning of their briefs a public executive summary for each issue raised in their briefs.[18] Further, we request that interested parties limit their public executive summary of each issue to no more than 450 words, not including citations. We intend to use the public executive summaries as the basis of the comment summaries included in the issues and decision memorandum that will accompany the final results in this administrative review. We request that interested parties include footnotes for relevant citations in the public executive summary of each issue. Note that Commerce has amended certain of its requirements pertaining to the service of documents in 19 CFR 351.303(f).[19]

Pursuant to 19 CFR 351.310(c), interested parties who wish to request a hearing must submit a written request to the Assistant Secretary for Enforcement and Compliance, filed electronically via ACCESS. Requests should contain: (1) the party's name, address, and telephone number; (2) the number of participants; and (3) a list of issues to be discussed. Issues raised in the hearing will be limited to those raised in the respective case briefs. An electronically filed hearing request must be received successfully in its entirety by Commerce's electronic records system, ACCESS, by 5:00 p.m. Eastern Time within 30 days after the date of publication of this notice. If a request for a hearing is made, Commerce will inform parties of the scheduled date for the hearing.[20]

Assessment Rates

Pursuant to section 751(a)(2)(A) of the Act and 19 CFR 351.212(b)(1), Commerce will determine, and CBP shall assess, antidumping duties on all appropriate entries of subject merchandise covered by this review. For the companies for which Commerce is rescinding this administrative review, Commerce will instruct CBP to assess antidumping duties on all appropriate entries at a rate equal to the cash deposit of estimated antidumping duties required at the time of entry, or withdrawal from warehouse, for consumption, during the period August

[10] *See Order,* 81 FR at 55436–37.

[11] *See* Intent to Rescind Memorandum.

[12] *See Hydrofluorocarbon Blends from the People's Republic of China: Final Results of Antidumping Duty Administrative Review; 2021–2022,* 89 FR 16724, 16726 (March 8, 2024).

[13] *See Antidumping Proceedings: Announcement of Change in Department Practice for Respondent Selection in Antidumping Duty Proceedings and Conditional Review of the Nonmarket Economy Entity in NME Antidumping Duty Proceedings,* 78 FR 65963 (November 4, 2013).

[14] *See Order,* 81 FR at 55438.

[15] *See* 19 CFR 351.309(c); *see also* 19 CFR 351.303 (for general filing requirements).

[16] *See* 19 CFR 351.309(d); *see also Administrative Protective Order, Service, and Other Procedures in Antidumping and Countervailing Duty Proceedings*,88 FR 67069, 67077 (September 29, 2023) (*APO and Service Final Rule*).

[17] *See* 19 CFR 351.309(c)(2) and (d)(2).

[18] We use the term ''issue'' here to describe an argument that Commerce would normally address in a comment of the Issues and Decision Memorandum.

[19] *See APO and Service Final Rule,* 88 FR at 67069.

[20] *See* 19 CFR 351.310(d).

1, 2022, through July 31, 2023, in accordance with 19 CFR 351.212(c)(1)(i). Commerce intends to issue assessment instructions to CBP regarding these entries no earlier than 35 days after the date of publication of this notice in the **Federal Register**.

If we continue to treat the companies identified in the appendix as part of the China-wide entity in the final results, we will instruct CBP to apply an *ad valorem* assessment rate of 216.37 percent to all entries of subject merchandise during the POR which were produced and/or exported by those companies. For the China-wide entity, Commerce intends to issue assessment instructions to CBP no earlier than 35 days after the date of publication of the final results of this review in the **Federal Register**. If a timely summons is filed at the U.S. Court of International Trade, the assessment instructions will direct CBP not to liquidate relevant entries until the time for parties to file a request for a statutory injunction has expired (*i.e.,* within 90 days of publication). The final results of this review shall be the basis for the assessment of antidumping duties on entries of merchandise covered by the final results of this review and for future deposits of estimated duties, where applicable.

Cash Deposit Requirements

The following cash deposit requirements will be effective upon publication of the final results of this administrative review for shipments of the subject merchandise from China entered, or withdrawn from warehouse, for consumption on or after the publication date, as provided by sections 751(a)(2)(C) of the Act: (1) for previously investigated or reviewed Chinese and non-Chinese exporters not discussed above that have separate rates, the cash deposit rate will continue to be equal to the exporter-specific weighted-average dumping margin published of the most recently-completed segment of this proceeding; (2) for all Chinese exporters of subject merchandise that have not been found to be entitled to a separate rate, the cash deposit rate will be the rate for the China-wide entity, 216.37 percent; and (3) for all non-Chinese exporters of subject merchandise which have not received their own rate, the cash deposit rate will be the rate applicable to the Chinese exporter that supplied that non-Chinese exporter. These cash deposit requirements, when imposed, shall remain in effect until further notice.

Final Results of Review

Unless otherwise extended, Commerce intends to issue the final results of this administrative review, including the results of its analysis of issues raised by the parties in the written comments, within 120 days of publication of these preliminary results in the **Federal Register**, pursuant to section 751(a)(3)(A) of the Act and 19 CFR 351.213(h)(1).

Notification to Importers

This notice also serves as a preliminary reminder to importers of their responsibility under 19 CFR 351.402(f)(2) to file a certificate regarding the reimbursement of antidumping duties prior to liquidation of the relevant entries during this review period. Failure to comply with this requirement could result in Commerce's presumption that reimbursement of antidumping duties occurred and the subsequent assessment of double antidumping duties.

Notification to Interested Parties

These preliminary results are issued and published in accordance with sections 751(a)(1)(B) and 777(i)(1) of the Act and 19 CFR 351.221(b)(4).

Dated: May 2, 2024.

Ryan Majerus,

Deputy Assistant Secretary for Policy and Negotiations, performing the non-exclusive functions and duties of the Assistant Secretary for Enforcement and Compliance.

Certain Hot-Rolled Steel Flat Products From Japan: Final Results of Antidumping Duty Administrative Review; 2021–2022

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: The U.S. Department of Commerce (Commerce) determines that one of the two producers/exporters of hot-rolled steel flat products (hot-rolled steel) from Japan, Nippon Steel Corporation (NSC), sold subject merchandise in the United States at prices below normal value during the period of review (POR) October 1, 2021, through September 30, 2022.

DATES: Applicable May 9, 2024.

FOR FURTHER INFORMATION CONTACT: Jun Jack Zhao or Myrna Lobo, AD/CVD Operations, Office VII, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230; telephone: (202) 482–1396 and (202) 482–2371, respectively.

SUPPLEMENTARY INFORMATION:

Background

On November 6, 2023, Commerce published the preliminary results of this review in the **Federal Register** and invited interested parties to comment.[1] Between December 6 and 13, 2023, Commerce received timely filed briefs and rebuttal briefs from NSC[2] and Nucor Corporation (the petitioner).[3] On February 22, 2024, we extended the deadline for the final results, in accordance with section 751(a)(3)(A) of the Tariff Act of 1930, as amended (the

Act), and 19 CFR 351.213(h)(2) until May 3, 2024.[4]

For a complete summary of the events that have occurred since Commerce published the *Preliminary Results,* as well as a full discussion of the issues raised by parties for these final results, *see* the Issues and Decision Memorandum.[5] Commerce conducted this review in accordance with section 751(a) of the Act.

Scope of the Order [6]

The merchandise covered by the *Order* is certain hot-rolled steel flat products. For a complete description of the scope of the *Order, see* the Issues and Decision Memorandum.

Analysis of Comments Received

We addressed all issues raised in the case and rebuttal briefs in the Issues and Decision Memorandum, which is hereby adopted with this notice. The issues are identified in the appendix to this notice. The Issues and Decision Memorandum is a public document and is on file electronically via Enforcement and Compliance's Antidumping and Countervailing Duty Centralized Electronic Service System (ACCESS). ACCESS is available to registered users at *https://access.trade.gov.* In addition, a complete version of the Issues and Decision Memorandum can be accessed directly at *https://access.trade.gov/public/FRNoticesListLayout.aspx.*

Changes Since the Preliminary Results

Based on our review and analysis of the comments received from parties, we did not make changes to NSC's and Tokyo Steel Manufacturing Co., Ltd.'s (Tokyo Steel) preliminary results margin calculations. For a discussion of these changes, *see* the Issues and Decision Memorandum.

Final Results of Review

Commerce determines that the following weighted-average dumping margins exist for the period October 1, 2021, through September 30, 2022:

Producer/exporter	Weighted-average dumping margin (percent)
Nippon Steel Corporation/Nippon Steel Nisshin Co., Ltd./Nippon Steel Trading Corporation [7]	1.39
Tokyo Steel Manufacturing Co., Ltd.	0.00

Disclosure

Normally, Commerce discloses to interested parties the calculations performed in final results within five days of any public announcement or, if there is no public announcement, within five days of the date of publication of the notice of final results in the **Federal Register**, in accordance with 19 CFR 351.224(b). However, because Commerce did not make any change to the *Preliminary Results,* there are no calculations to disclose.

Assessment

Commerce intends to issue assessment instructions to U.S. Customs and Border Protection (CBP) no earlier than 35 days after the date of publication of the final results of this review in the **Federal Register**. If a timely summons is filed at the U.S. Court of International Trade, the assessment instructions will direct CBP not to liquidate relevant entries until the time for parties to file a request for a statutory injunction has expired (*i.e.,* within 90 days of publication).

Where the respondent reported reliable entered values, we calculated importer- (or customer-) specific *ad valorem* rates by aggregating the dumping margins calculated for all U.S. sales to each importer (or customer) and dividing this amount by the total entered value of the sales to each importer (or customer).[8] Where Commerce calculated a weighted-average dumping margin by dividing the total amount of dumping for reviewed sales to that party by the total sales quantity associated with those transactions, Commerce will direct CBP to assess importer- (or customer-) specific assessment rates based on the resulting per-unit rates.[9] Where an importer- (or customer-) specific *ad valorem* or per-unit rate is greater than *de minimis* (*i.e.,* 0.50 percent), Commerce will instruct CBP to collect the appropriate duties at the time of liquidation.[10] Where an importer- (or customer-) specific *ad valorem* or per-unit rate is zero or *de minimis,* Commerce will instruct CBP to liquidate appropriate entries without regard to antidumping duties.[11]

Consistent with Commerce's assessment practice, for entries of subject merchandise during the POR produced by NSC or Tokyo Steel for which the producer did not know that its merchandise was destined for the United States, we will instruct CBP to liquidate unreviewed entries at the all-others rate if there is no rate for the intermediate company(ies) involved in the transaction.[12]

Cash Deposit Requirements

The following cash deposit requirements will be effective for all shipments of subject merchandise entered, or withdrawn from warehouse, for consumption on or after the publication date of the final results of this administrative review, as provided for by section 751(a)(2)(C) of the Act: (1) the cash deposit rates for the companies listed in these final results will be equal

[5] *See* Memorandum, ''Issues and Decision Memorandum for the Final Results of the Administrative Review of the Antidumping Duty Order on Certain Hot-Rolled Steel Flat Products from Japan; 2021–2022,'' dated concurrently with, and hereby adopted by, this notice (Issues and Decision Memorandum).

[6] *See Certain Hot-Rolled Steel Flat Products from Australia, Brazil, Japan, the Republic of Korea, the Netherlands, the Republic of Turkey, and the United Kingdom: Amended Final Affirmative Antidumping Determinations for Australia, the Republic of Korea, and the Republic of Turkey and Antidumping Duty Orders,* 81 FR 67962 (October 3, 2016) (*Order*).

[7] Commerce found in a changed circumstances review that NSC, Nippon Steel Nisshin Co., Ltd., and Nippon Steel Trading Corporation are affiliated companies that should be treated as a single entity and as the successor-in-interest to Nippon Steel & Sumitomo Metal Corporation, Nisshin Steel Co., Ltd., and Nippon Steel & Sumikin Bussan Corporation, respectively. *See Certain Hot-Rolled Steel Flat Products from Japan: Notice of Final Results of Antidumping Duty Changed Circumstances Review,* 84 FR 46713 (September 5, 2019). Because there is no information on the record of this administrative review that would lead us to revisit this determination, we are continuing to treat these companies as part of a single entity for the purposes of this administrative review.

[9] *Id.*

[10] *Id.*

[11] *See* 19 CFR 351.106(c)(2).

[12] For a full discussion of this practice, *see Antidumping and Countervailing Duty Proceedings: Assessment of Antidumping Duties,* 68 FR 23954 (May 6, 2003).

to the weighted-average dumping margins established in the final results of this review; (2) for merchandise exported by producers or exporters not covered in this review but covered in a prior segment of this proceeding, the cash deposit rate will continue to be the company-specific rate published for the most recently completed segment in which the company was reviewed; (3) if the exporter is not a firm covered in this review or the original less-than-fair-value (LTFV) investigation, but the producer is, the cash deposit rate will be the rate established for the most recently completed segment of this proceeding for the producer of the subject merchandise; and (4) the cash deposit rate for all other producers or exporters will continue to be 5.58 percent,[13] the all-others rate established in the LTFV investigation. These cash deposit requirements, when imposed, shall remain in effect until further notice.

Notification to Importers

This notice serves as a final reminder to importers of their responsibility under 19 CFR 351.402(f)(2) to file a certificate regarding the reimbursement of antidumping duties prior to liquidation of the relevant entries during this POR. Failure to comply with this requirement could result in the presumption that reimbursement of antidumping duties occurred and the subsequent assessment of double antidumping duties.

Administrative Protective Order

This notice also serves as a reminder to parties subject to an administrative protective order (APO) of their responsibility concerning the destruction of proprietary information disclosed under APO in accordance with 19 CFR 351.305(a)(3). Timely written notification of the return or destruction of APO materials or conversion to judicial protective order is hereby requested. Failure to comply with the regulations and terms of an APO is a sanctionable violation.

Notification to Interested Parties

We are issuing and publishing these results in accordance with sections 751(a)(1) and 777(i)(1) of the Act and 19 CFR 351.213(h) and 351.221(b)(5) of Commerce's regulations.

Dated: May 3, 2024.

Ryan Majerus,

Deputy Assistant Secretary for Policy and Negotiations, performing the non-exclusive functions and duties of the Assistant Secretary for Enforcement and Compliance.

International Trade Administration

[A–489–849]

Certain Paper Shopping Bags From the Republic of Türkiye: Antidumping Duty Order

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: Based on affirmative final determinations by the U.S. Department of Commerce (Commerce) and the U.S. International Trade Commission (ITC), Commerce is issuing an antidumping duty order on certain paper shopping bags (paper shopping bags) from the Republic of Türkiye (Türkiye).

DATES: Applicable May 9, 2024.

FOR FURTHER INFORMATION CONTACT: Luke Caruso, AD/CVD Operations, Office IV, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230; telephone: (202) 482–2081.

SUPPLEMENTARY INFORMATION:

Background

On March 18, 2024, Commerce published in the **Federal Register** its affirmative final determination in the less-than-fair-value (LTFV) investigation of paper shopping bags from Türkiye.[1] On May 3, 2024, Commerce published in the **Federal Register** a correction of the *Final Determination*.[2] Pursuant to section 735(d) of the Tariff Act of 1930, as amended (the Act), on May 2, 2024, the ITC notified Commerce of its affirmative final determination that an industry in the United States is materially injured, within the meaning of section 735(b)(1)(A)(i) of the Act, by reason of imports of paper shopping bags from Türkiye that are sold in the United States at LTFV.[3]

Scope of the Order

The products covered by this order are paper shopping bags from Türkiye. For a complete description of the scope of this order, *see* the appendix to this notice.

Antidumping Duty Order

Based on the above-referenced affirmative final determinations, in accordance with sections 735(c)(2) and 736 of the Act, Commerce is issuing this antidumping duty order. Moreover, because the ITC determined that U.S. imports of paper shopping bags from Türkiye are materially injuring a U.S. industry, unliquidated entries of such merchandise from Türkiye, entered or withdrawn from warehouse for consumption, as described below, are subject to the assessment of antidumping duties.

Therefore, in accordance with section 736(a)(1) of the Act, Commerce will direct U.S. Customs and Border Protection (CBP) to assess, upon further instruction by Commerce, antidumping duties equal to the amount by which the normal value of the merchandise exceeds the export price or constructed export price of the merchandise, for all relevant entries of paper shopping bags from Türkiye. With the exception of entries occurring after expiration of the provisional measures period, but before publication of the ITC's final affirmative injury determination, as further described below, antidumping duties will be assessed on unliquidated U.S. entries of paper shopping bags from Türkiye entered, or withdrawn from warehouse, for consumption on or after January 3, 2024, the date of publication of the *Preliminary Determination* in this investigation in the **Federal Register**.[4]

[13] *See Certain Hot-Rolled Steel Flat Products from Japan: Final Determination of Sales at Less Than Fair Value and Final Affirmative Determination of Critical Circumstances,* 81 FR 53409 (August 12, 2016).

[2] *See Certain Paper Shopping Bags from the Republic of Türkiye: Final Affirmative Determination of Sales at Less Than Fair Value; Correction,* 89 FR 36753 (May 3, 2024).

[3] *See* ITC's Letter, Investigation No. 731–TA–1626 (Final), dated May 2, 2024.

[4] *See Certain Paper Shopping Bags from the Republic of Turkey: Preliminary Affirmative Determination of Sales at Less Than Fair Value,* 89 FR 339 (January 3, 2024) (*Preliminary Determination*).

Continuation of Suspension of Liquidation

Except as noted in the ''Provisional Measures'' section of this notice below, in accordance with section 736 of the Act, Commerce will instruct CBP to continue to suspend liquidation of all relevant entries of paper shopping bags from Türkiye. These instructions suspending liquidation will remain in effect until further notice.

Commerce will also instruct CBP to require cash deposits at a rate equal to the estimated weighted-average dumping margins listed in the table below. Accordingly, effective on the date of publication in the **Federal Register** of the notice of the ITC's affirmative final injury determination, CBP will require, at the same time as importers would normally deposit estimated duties on subject merchandise, a cash deposit at the rate equal to the relevant estimated weighted-average dumping margins listed in the table below. The all-others rate applies to all producers or exporters not specifically listed.

Estimated Weighted-Average Dumping Margins

The estimated weighted-average dumping margins for this antidumping duty order are as follows:

Exporter or producer	Estimated weighted-average dumping margin (percent)
Artpack Kagit Ambalaj Anonim Sirketi	*47.56
Oztas Ambalaj Sanayi ve Ticaret A.S	*47.56
Babet Kagitsilik	*47.56
Bati Kraft Torba Ambalaj	*47.56
BFT Packaging	*47.56
Cicupack Ambalaj	*47.56
Ekopack Kagit Ambalaj	*47.56
Elhadefler A.S	*47.56
Esda Pack Ambalaj	*47.56
Haypack Ambalaj	*47.56
Jefira Global Dis	*47.56
Kahramanmaraş Kağıt Sanayi ve Ticaret Anonim Şirketi	*47.56
Multi Kraft Ambalaj	*47.56
Rad Tekstil	*47.56
Suleyman Tabak Kagitcilik	*47.56
Sunvision Tekstil	*47.56
Yildez Paper Bag Ambalaj Pazarlama	*47.56
All Others	26.32

*Rate based on the application of adverse facts available.

Provisional Measures

Section 733(d) of the Act states that suspension of liquidation pursuant to an affirmative preliminary determination may not remain in effect for more than four months, except where exporters representing a significant proportion of exports of the subject merchandise request that Commerce extend the four-month period to no more than six months.

Commerce published the *Preliminary Determination* in this investigation on January 3, 2024. Commerce did not extend the deadline for issuing its final determination in this investigation, which it published in the **Federal Register** on March 18, 2024. Therefore, the four-month period beginning on the date of publication of the *Preliminary Determination* ended on May 1, 2024.

Consequently, in accordance with section 733(d) of the Act, Commerce will instruct CBP to terminate the suspension of liquidation, and to liquidate, without regard to antidumping duties, unliquidated U.S. entries of paper shopping bags from Türkiye entered, or withdrawn from warehouse, for consumption after May 1, 2024, the final day on which the provisional measures were in effect, through the day preceding the date of publication of the ITC's affirmative final injury determination in the **Federal Register**. Suspension of liquidation and the collection of cash deposits will resume on the date of publication of the ITC's affirmative final injury determination in the **Federal Register**.

Establishment of the Annual Inquiry Service Lists

On September 20, 2021, Commerce published the final rule titled *Regulations to Improve Administration and Enforcement of Antidumping and Countervailing Duty Laws* in the **Federal Register**.[5] On September 27, 2021, Commerce published a notification titled *Scope Ruling Application; Annual Inquiry Service List; and Informational Sessions* in the **Federal Register**.[6] The *Final Rule* and *Procedural Guidance* provide that Commerce will maintain an annual inquiry service list for each order or suspended investigation, and any interested party submitting a scope ruling application or request for circumvention inquiry shall serve a copy of the application or request on the persons on the annual inquiry service list for that order, as well as any companion order covering the same merchandise from the same country of origin.[7]

In accordance with the *Procedural Guidance,* for orders published in the **Federal Register** after November 4, 2021, Commerce will create an annual inquiry service list segment in Commerce's online e-filing and document management system, Antidumping and Countervailing Duty Electronic Service System (ACCESS), available at *https://access.trade.gov,* within five business days of publication of the notice of the order. Each annual inquiry service list will be maintained in ACCESS, under each case number, and under a specific segment type

[5] *See Regulations to Improve Administration and Enforcement of Antidumping and Countervailing Duty Laws,* 86 FR 52300 (September 20, 2021) (*Final Rule*).

[6] *See Scope Ruling Application; Annual Inquiry Service List; and Informational Sessions,* 86 FR 53205 (September 27, 2021) (*Procedural Guidance*).

[7] *Id.*

called ''AISL-Annual Inquiry Service List.'' [8]

Interested parties who wish to be added to the annual inquiry service list for an order must submit an entry of appearance in the annual inquiry service list segment in ACCESS for the order within 30 days after the date of publication of the order in the **Federal Register**. For ease of administration, Commerce requests that a law firm with more than one attorney representing an interested party in an order designate a lead attorney to be included on the annual inquiry service list. Commerce will finalize the annual inquiry service list within five business days thereafter. As mentioned in the *Procedural Guidance,* the new annual inquiry service list will be in place until the following year, when the *Opportunity Notice* for the anniversary month of the order is published in the **Federal Register**.

Commerce may update an annual inquiry service list at any time, as needed, based on interested parties' amendments to their entries of appearance to remove, or otherwise modify, their list of members and representatives, or to update contact information. Changes or announcements pertaining to these procedures will be posted to the ACCESS website at *https://access.trade.gov.*

Special Instructions for Petitioners and Foreign Governments

In the *Final Rule,* Commerce stated that, ''after an initial request and placement on the annual inquiry service list, both petitioners and foreign governments will automatically be placed on the annual inquiry service list in the years that follow.'' [9] Accordingly, as stated above, the petitioners and foreign governments should submit their initial entry of appearance after publication of this notice in the **Federal Register** in order to appear in the first annual inquiry service list for those orders for which they qualify as an interested party. Pursuant to 19 CFR 351.225(n)(3), the petitioners and foreign governments will not need to resubmit their entries of appearance each year to continue to be included on the annual inquiry service list. However, the petitioners and foreign governments are responsible for making amendments to their entries of appearance during the annual update to the annual inquiry service list in accordance with the procedures described above.

Notification to Interested Parties

This notice constitutes the antidumping duty order with respect to paper shopping bags from Türkiye, pursuant to section 736(a) of the Act. Interested parties can find a list of antidumping duty orders currently in effect at *https://enforcement.trade.gov/stats/iastats1.html.*

This antidumping duty order is issued and published in accordance with section 736(a) of the Act and 19 CFR 351.211(b).

Dated: May 6, 2024.

Ryan Majerus,

Deputy Assistant Secretary for Policy and Negotiations, performing the non-exclusive functions and duties of the Assistant Secretary for Enforcement and Compliance.

Appendix

Scope of the Order

The products within the scope of the order are paper shopping bags with handles of any type, regardless of whether there is any printing, regardless of how the top edges are finished (*e.g.,* folded, serrated, or otherwise finished), regardless of color, and regardless of whether the top edges contain adhesive or other material for sealing closed. Subject paper shopping bags have a width of at least 4.5 inches and depth of at least 2.5 inches.

Paper shopping bags typically are made of kraft paper but can be made from any type of cellulose fiber, paperboard, or pressboard with a basis weight less than 300 grams per square meter (GSM).

A non-exhaustive illustrative list of the types of handles on shopping bags covered by the scope include handles made from any materials such as twisted paper, flat paper, yarn, ribbon, rope, string, or plastic, as well as die-cut handles (whether the punchout is fully removed or partially attached as a flap). Excluded from the scope are:

- Paper sacks or bags that are of a ⅙ or 1/7 barrel size (*i.e.,* 11.5–12.5 inches in width, 6.5–7.5 inches in depth, and 13.5–17.5 inches in height) with flat paper handles or die-cut handles;
- Paper sacks or bags with die-cut handles, a grams per square meter paper weight of less than 86 GSM, and a height of less than 11.5 inches; and
- Paper sacks or bags (i) with non-paper handles made wholly of woven ribbon or other similar woven fabric [1] and (ii) that are finished with folded tops or for which tied knots or t-bar aglets (made of wood, metal, or plastic) are used to secure the handles to the bags.

The above-referenced dimensions are provided for paper bags in the opened position. The height of the bag is the distance from the bottom fold edge to the top edge (*i.e.,* excluding the height of handles that extend above the top edge). The depth of the bag is the distance from the front of the bag edge to the back of the bag edge (typically measured at the bottom of the bag). The width of the bag is measured from the left to the right edges of the front and back panels (upon which the handles typically are located).

This merchandise is currently classifiable under Harmonized Tariff Schedule of the United States (HTSUS) subheadings 4819.30.0040 and 4819.40.0040. The HTSUS subheadings are provided for convenience and customs purposes only; the written description of the scope is dispositive.

[FR Doc. 2024–10253 Filed 5–8–24; 8:45 am]

BILLING CODE 3510–DS–P

[8] This segment will be combined with the ACCESS Segment Specific Information (SSI) field which will display the month in which the notice of the order or suspended investigation was published in the **Federal Register**, also known as the anniversary month. For example, for an order under case number A–000–000 that was published in the **Federal Register** in January, the relevant segment and SSI combination will appear in ACCESS as ''AISL-January Anniversary.'' Note that there will be only one annual inquiry service list segment per case number, and the anniversary month will be pre-populated in ACCESS.

[9] *See Final Rule,* 86 FR 52335.

[1] Paper sacks or bags with handles made of braided or twisted materials, such as rope or cord, do not qualify for this exclusion.

International Trade Administration

Quarterly Update to Annual Listing of Foreign Government Subsidies on Articles of Cheese Subject to an In-Quota Rate of Duty

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

DATES: Applicable May 9, 2024.

FOR FURTHER INFORMATION CONTACT: Samuel Brummitt, AD/CVD Operations, Office III, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 1401 Constitution Ave. NW, Washington, DC 20230, telephone: (202) 482–7851.

SUPPLEMENTARY INFORMATION: On April 19, 2024 the U.S. Department of Commerce (Commerce), pursuant to section 702(h) of the Trade Agreements Act of 1979 (as amended) (the Act), published the quarterly update to the annual listing of foreign government subsidies on articles of cheese subject to an in-quota rate of duty covering the period July 1, 2023, through September 30, 2023.[1] In the *Third Quarter 2023 Update,* we requested that any party that had information on foreign government subsidy programs that benefited articles of cheese subject to an in-quota rate of duty submit such information to Commerce.[2] We received

[1] *See Quarterly Update to Annual Listing of Foreign Government Subsidies on Articles of Cheese Subject to an In-Quota Rate of Duty,* 89 FR 28745 (April 19, 2023) (*Third Quarter 2023 Update*).

[2] *Id.*

no comments, information, or requests for consultation from any party.

Pursuant to section 702(h) of the Act, we hereby provide Commerce's update of subsidies on articles of cheese that were imported during the period October 1, 2023, through December 31, 2023. The appendix to this notice lists the country, the subsidy program or programs, and the gross and net amounts of each subsidy for which information is currently available.

Commerce will incorporate additional programs which are found to constitute subsidies, and additional information on the subsidy programs listed, as the information is developed. Commerce encourages any person having information on foreign government subsidy programs which benefit articles of cheese subject to an in-quota rate of duty to submit such information in writing through the Federal eRulemaking Portal at *https://www.regulations.gov,* Docket No. ITA–2020–0005, ''Quarterly Update to Cheese Subject to an In-Quota Rate of Duty.'' The materials in the docket will not be edited to remove identifying or contact information, and Commerce cautions against including any information in an electronic submission that the submitter does not want publicly disclosed. Attachments to electronic comments will be accepted in Microsoft Word, Excel, or Adobe PDF formats only. All comments should be addressed to the Assistant Secretary for Enforcement and Compliance, U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230.

This determination and notice are in accordance with section 702(a) of the Act.

Dated: May 3, 2024.

Ryan Majerus,

Deputy Assistant Secretary for Policy and Negotiations, performing the non-exclusive functions and duties of the Assistant Secretary for Enforcement and Compliance.

Agency Information Collection Activities; Submission to the Office of Management and Budget (OMB) for Review and Approval; Comment Request; Southeast Region Vessel and Gear Identification Requirements

AGENCY: National Marine Fisheries Service (NMFS), Commerce.

ACTION: Notice of information collection; request for comments.

SUMMARY: The Department of Commerce, in accordance with the Paperwork Reduction Act of 1995 (PRA), invites the general public and other Federal agencies to comment on proposed and continuing information collections, which helps us assess the impact of our information collection requirements and minimize the public's reporting burden. The purpose of this notice is to allow for 60 days of public comment preceding submission of the collection to the Office of Management and Budget (OMB).

DATES: To ensure consideration, comments regarding this proposed information collection must be received by July 8, 2024.

ADDRESSES: Interested persons are invited to submit written comments to Adrienne Thomas, NOAA PRA Officer, at *noaa.pra@noaa.gov.* Please reference OMB Control Number 0648–0358 in the subject line of your comments. All comments received are part of the public record and will generally be posted on *https://www.regulations.gov* without change. Do not submit confidential business information or otherwise sensitive or protected information.

FOR FURTHER INFORMATION CONTACT: Requests for additional information or specific questions related to collection activities should be directed to Adam Bailey, NMFS, Southeast Regional Office, Sustainable Fisheries Division, 263 13th Avenue South, St. Petersburg, FL 33701, telephone: 727–824–5305, email: *adam.bailey@noaa.gov.*

SUPPLEMENTARY INFORMATION:

I. Abstract

NMFS proposes to extend the information collection under OMB Control Number 0648–0358 without change. The NMFS Southeast Region manages domestic fisheries in the U.S. exclusive economic zone of the Caribbean, Gulf of Mexico, and South Atlantic regions under multiple fishery management plans (FMPs). The regional fishery management councils prepared the FMPs pursuant to the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act). NMFS implements the FMPs through regulations located at 50 CFR part 622.

The regulations located at 50 CFR part 622 form the basis for the information collection requirements that are currently approved under OMB Control Number 0648–0358, Southeast Region Vessel and Gear Identification Requirements. NMFS has no immediate plans to change identification requirements for fishing vessels or gear in 50 CFR part 622.

Regulations at 50 CFR part 622 require that all federally permitted fishing vessels must be marked with some form of identification. A vessel's official number, under most regulations, must be displayed on the port and starboard sides of the deckhouse or hull, and on the weather deck. In addition, regulations for certain fisheries also require the display of the assigned color code for the vessel. The official number and color code identify each vessel and

[3] Defined in 19 U.S.C. 1677(5).≤

[4] Defined in 19 U.S.C. 1677(6).

[5] The 27 member states of the European Union are: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, and Sweden.

should be visible at distance from the sea and in the air. These markings provide law enforcement personnel with a means to monitor fishing, at-sea processing, and other related activities, and to determine whether observed activities on the vessel are in accordance with those authorized for that vessel. NMFS, the United States Coast Guard, and other marine agencies use the identifying official number in monitoring compliance, issuing violations, prosecutions, and other enforcement actions. Vessels that are authorized for particular fisheries are readily identified and gear violations are more readily prosecuted, thereby enabling for more cost-effective enforcement.

In addition to vessel marking, requirements that fishing gear be marked are essential to facilitate enforcement. The ability to link fishing gear to the vessel owner is crucial to enforcement of regulations issued under the authority of the Magnuson-Stevens Act. The marking of fishing gear is also valuable in actions concerning damage, loss, and civil proceedings. The requirements imposed on U.S. fisheries in the southeast region apply to aquacultured live rock; golden crab traps; spiny lobster traps and buoys; black sea bass pots, buoys, and buoy lines; Spanish mackerel gillnet buoys; and buoy gear.

II. Method of Collection

Markings, such as numbers, are placed directly on fishing vessels and gear.

III. Data

OMB Control Number: 0648–0358.

Form Number(s): None.

Type of Review: Regular submission—extension of a current information collection.

Affected Public: Businesses or other for-profit organizations.

Estimated Number of Respondents: 10,031.

Estimated Time Per Response: Vessel marking: 75 minutes. Gear marking: aquacultured live rocks, 10 seconds each; golden crab traps, 2 minutes each; spiny lobster traps and buoys, 7 minutes each; black sea bass pots, buoys, and buoy lines, 16 minutes each; and Spanish mackerel gillnet buoys, 20 minutes each; and buoy gear, 10 minutes each.

Estimated Total Annual Burden Hours: 40,335.

Estimated Total Annual Cost to Public: $544,752 in recordkeeping and reporting costs.

Respondent's Obligation: Mandatory.

Legal Authority: Magnuson-Stevens Act, 16 U.S.C. 1801 *et seq.*

IV. Request for Comments

We are soliciting public comments to: (a) Evaluate whether the proposed information collection is necessary for the proper functions of the Department, including whether the information will have practical utility; (b) Evaluate the accuracy of our estimate of the time and cost burden for this proposed collection, including the validity of the methodology and assumptions used; (c) Evaluate ways to enhance the quality, utility, and clarity of the information to be collected; and (d) Minimize the reporting burden on those who are to respond, including the use of automated collection techniques or other forms of information technology.

Comments that you submit in response to this notice are a matter of public record. We will include or summarize each comment in our request to OMB to approve this information collection review. Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment, including your personal identifying information, may be made publicly available at any time. While you may ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Sheleen Dumas,

Department PRA Clearance Officer, Office of the Under Secretary for Economic Affairs, Commerce Department.

BILLING CODE 3510–22–P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

Agency Information Collection Activities; Submission to the Office of Management and Budget (OMB) for Review and Approval; Comment Request; Application for Appointment in the NOAA Commissioned Officer Corps

AGENCY: National Oceanic & Atmospheric Administration (NOAA), Commerce.

ACTION: Notice of information collection, request for comment.

SUMMARY: The Department of Commerce, in accordance with the Paperwork Reduction Act of 1995 (PRA), invites the general public and other Federal agencies to comment on proposed, and continuing information collections, which helps us assess the impact of our information collection requirements and minimize the public's reporting burden. The purpose of this notice is to allow for 60 days of public comment preceding submission of the collection to OMB.

DATES: To ensure consideration, comments regarding this proposed information collection must be received on or before July 8, 2024.

ADDRESSES: Interested persons are invited to submit written comments to Adrienne Thomas, NOAA PRA Officer, at *NOAA.PRA@noaa.gov.* Please reference OMB Control Number 0648–0047 in the subject line of your comments. Do not submit Confidential Business Information or otherwise sensitive or protected information.

FOR FURTHER INFORMATION CONTACT: Requests for additional information or specific questions related to collection activities should be directed to LCDR Andrew Reynaga, Chief, NOAA Corps Recruiting Branch, (301) 713–7727, or *chief.noaacorps.recruiting@noaa.gov.*

SUPPLEMENTARY INFORMATION:

I. Abstract

This is a request for revision and extension of an existing information collection.

The NOAA Commissioned Officer Corps is the uniformed service of the National Oceanic and Atmospheric Administration (NOAA), a bureau of the United States Department of Commerce. Officers serve under Senate-confirmed appointments and Presidential commissions (33 U.S.C. chapter 17, subchapter 1, sections 853 and 854). The NOAA Corps provides a cadre of professionals trained in engineering, earth sciences, oceanography, meteorology, fisheries science, and other related disciplines who serve their country by supporting NOAA's mission of surveying the Earth's oceans, coasts, and atmosphere to ensure the economic and physical well-being of the Nation.

NOAA Corps officers operate vessels and aircraft engaged in scientific missions and serve in leadership positions throughout NOAA. Persons wishing to apply for an appointment in the NOAA Commissioned Officer Corps must complete an application package, including NOAA Form 56–42, at least three letters of recommendation, a resume, and official transcripts. A personal interview must also be conducted. Eligibility requirements include a bachelor's degree with at least 48 credit hours of science, engineering,

math, or other disciplines related to NOAA's mission, excellent health, and normal color vision with uncorrected visual acuity no worse than 20/400 in each eye (correctable to 20/20).

The revision includes updates that reflect the current status of the NOAA Corps. This includes amending the essay questions and updating the instructions to reflect a new direct-to-aviation recruitment model. NOAA Form 56–80A is a required summary of Aviation experience for those applying to become NOAA Aviators. Members of the public who wish to apply to the Direct-to-Aviation NOAA Corps program are required to complete NF 56–80A.

II. Method of Collection

Applicants must utilize the online E-recruit electronic application to complete and digitally submit the forms, including the Direct-to-Aviation Summary for NOAA Corps. An in-person interview is also required.

III. Data

OMB Control Number: 0648–0047.

Form Number(s): NOAA 56–42, NOAA 56–42A, and NOAA Form 56–80A.

Type of Review: Regular submission. Revision and extension of an existing information collection.

Affected Public: Individuals.

Estimated Number of Respondents: 300.

Estimated Time per Response: Written applications, 2 hours; interviews, 5 hours; references, 15 minutes; and Direct to Aviation Summary form, 10 minutes.

Estimated Total Annual Burden Hours: 2,425.

Estimated Total Annual Cost to Public: $21,750.

Respondent's Obligation: Required to Obtain or Retain Benefits.

Legal Authority: 33 U.S.C. chapter 17, subchapter 1, sections 853 and 854.

IV. Request for Comments

We are soliciting public comments to permit the Department/Bureau to: (a) Evaluate whether the proposed information collection is necessary for the proper functions of the Department, including whether the information will have practical utility; (b) Evaluate the accuracy of our estimate of the time and cost burden for this proposed collection, including the validity of the methodology and assumptions used; (c) Evaluate ways to enhance the quality, utility, and clarity of the information to be collected; and (d) Minimize the reporting burden on those who are to respond, including the use of automated collection techniques or other forms of information technology.

Comments that you submit in response to this notice are a matter of public record. We will include or summarize each comment in our request to OMB to approve this ICR. Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you may ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Sheleen Dumas,

Department PRA Clearance Officer, Office of the Under Secretary for Economic Affairs, Commerce Department.

Takes of Marine Mammals Incidental to Specified Activities; Taking Marine Mammals Incidental to Sitka Seaplane Base Construction

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; issuance of two incidental harassment authorizations.

SUMMARY: In accordance with the regulations implementing the Marine Mammal Protection Act (MMPA) as amended, notification is hereby given that NMFS has issued two consecutive incidental harassment authorizations (IHAs) to City and Borough of Sitka (CBS) to incidentally harass marine mammals during construction activities associated with the CBS' Sitka Seaplane Base project, in Sitka, Alaska.

DATES: The authorizations are effective from July 1, 2024 through June 30, 2025 and July 1, 2025 through June 30, 2026.

ADDRESSES: Electronic copies of the application and supporting documents, as well as a list of the references cited in this document, may be obtained online at: *https://www.fisheries.noaa.gov/action/incidental-take-authorization-city-and-borough-sitkas-seaplane-base-construction-activities.* In case of problems accessing these documents, please call the contact listed below.

FOR FURTHER INFORMATION CONTACT: Jenna Harlacher, Office of Protected Resources, NMFS, (301) 427–8401.

SUPPLEMENTARY INFORMATION:

Background

The MMPA prohibits the ''take'' of marine mammals, with certain exceptions. Sections 101(a)(5)(A) and (D) of the MMPA (16 U.S.C. 1361 *et seq.*) direct the Secretary of Commerce (as delegated to NMFS) to allow, upon request, the incidental, but not intentional, taking of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if certain findings are made and either regulations are proposed or, if the taking is limited to harassment, a notice of a proposed IHA is provided to the public for review.

Authorization for incidental takings shall be granted if NMFS finds that the taking will have a negligible impact on the species or stock(s) and will not have an unmitigable adverse impact on the availability of the species or stock(s) for taking for subsistence uses (where relevant). Further, NMFS must prescribe the permissible methods of taking and other ''means of effecting the least practicable adverse impact'' on the affected species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of the species or stocks for taking for certain subsistence uses (referred to in shorthand as ''mitigation''); and requirements pertaining to the mitigation, monitoring and reporting of the takings are set forth. The definitions of all applicable MMPA statutory terms cited above are included in the relevant sections below.

Summary of Request

On September 1, 2023, NMFS received a request from CBS for two IHAs to take marine mammals incidental to the Sitka seaplane base construction project in Sitka, Alaska, over the course of 2 years. Following NMFS' review of the application and a revised version, CBS submitted a final version on November 15, 2023. The application was deemed adequate and complete on December 1, 2023. The notice of proposed IHAs published for public comment on January 11, 2024 (89 FR 1884). For both IHAs, CBS's request is for take of seven species of marine mammals by Level B harassment and, for a subset of three of these species, Level A harassment. Neither CBS nor

NMFS expect serious injury or mortality to result from this activity and, therefore, IHAs are appropriate.

Description of Activity

CBS plans to replace the existing seaplane base in the Sitka Channel in Sitka, Alaska. The purpose of this project is to construct a new seaplane base, which would address existing capacity, safety, and condition deficiencies for critical seaplane operations, and for all seaplanes to transit the Sitka Chanel more safely. The planned location of the new seaplane base in the Sitka Channel is located on the northern shore of Japonski Island in the Sitka Sound. Over the course of 2 years spanning July 2024–June 2025 and July 2025–June 2026, CBS would use a variety of methods, including vibratory and impact pile driving, and down-the-hole (DTH) drilling to install and remove piles.

Phase I would involve the installation and removal of temporary piles, and the installation of permanent piles. During Phase I, 10 16-inch (in, 0.4 meter (m)) and 16 24-in (0.6 m) permanent steel piles would be installed. The installation and removal of 12 temporary 16-in (0.4 m) steel pipe piles would be completed to support permanent pile installation. Vibratory hammers, impact hammers, and DTH drilling would be used for the installation and removal of the piles (table 1). The installation and removal of temporary piles would be conducted using impact and vibratory hammers. All permanent piles would be initially installed with a vibratory hammer. After vibratory driving, piles would be socketed into the bedrock with DTH drilling equipment. Finally, piles would be driven the final few inches of embedment with an impact hammer.

Phase II similarly would involve the installation and removal of temporary piles, and the installation of permanent piles. During Phase II six 24-in (0.6 m) steel piles would be installed. The installation and removal of six temporary 16-in (0.4 m) steel pipe piles would be completed to support the permanent pile installation. As in Phase I, vibratory hammers, impact hammers, and DTH drilling would be used for the installation and removal of the piles (table 2). The installation and removal of temporary piles would be conducted using impact and vibratory hammers. All permanent piles would be initially installed with a vibratory hammer. After vibratory driving, piles would be socketed into the bedrock with DTH drilling equipment. Finally, piles would be driven the final few inches of embedment with an impact hammer.

A further detailed description of the planned construction project is provided in the **Federal Register** notice for the proposed IHAs (89 FR 1884, January 11, 2024). Since that time, no changes have been made to the planned activities. Therefore, a detailed description is not provided here. Please refer to that **Federal Register** notice for the description of the specified activity. Mitigation, monitoring, and reporting measures are described in detail later in this document (please see Mitigation and Monitoring and Reporting).

Comments and Responses

A notice of NMFS' proposal to issue two consecutive IHAs to CBS was published in the **Federal Register** on January 11, 2024 (89 FR 1884). That notice described, in detail, CBS' activity, the marine mammal species that may be affected by the activity, and the anticipated effects on marine mammals. During that 30-day public comment period, no comments were received.

Changes From the Proposed IHAs for Final IHAs

Changes were made between publication of the notice of proposed IHAs and this notice of final IHAs. Changes have been made to correct typographical errors and inconsistences in the high frequency shutdown zones in both the Phase I and Phase II IHAs to reflect the correct shutdown zones included in the proposed **Federal Register** notice.

Description of Marine Mammals in the Area of Specified Activities

Sections 3 and 4 of the application summarize available information regarding status and trends, distribution and habitat preferences, and behavior and life history of the potentially affected species. NMFS fully considered all of this information, and we refer the reader to these descriptions, instead of reprinting the information. Additional information regarding population trends and threats may be found in NMFS' Stock Assessment Reports (SARs; *https://www.fisheries.noaa.gov/national/marine-mammal-protection/marine-mammal-stock-assessments*) and more general information about these species (*e.g.,* physical and behavioral descriptions) may be found on NMFS' website (*https://www.fisheries.noaa.gov/find-species*).

Table 1 lists all species or stocks for which take is expected and authorized for this activity and summarizes information related to the population or stock, including regulatory status under the MMPA and Endangered Species Act (ESA) and potential biological removal (PBR), where known. PBR is defined by the MMPA as the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population (as described in NMFS' SARs). While no serious injury or mortality is anticipated or authorized here, PBR and annual serious injury and mortality from anthropogenic sources are included here as gross indicators of the status of the species or stocks and other threats.

Marine mammal abundance estimates presented in this document represent the total number of individuals that make up a given stock or the total number estimated within a particular study or survey area. NMFS' stock abundance estimates for most species represent the total estimate of individuals within the geographic area, if known, that comprises that stock. For some species, this geographic area may extend beyond U.S. waters. All managed stocks in this region are assessed in NMFS' U.S. Alaska Marine Mammal SARs. All values presented in table 1 are the most recent available final SAR at the time of publication of NMFS' proposed IHAs and are available online at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/marine-mammal-stock-assessments.*

TABLE 1—SPECIES LIKELY IMPACTED BY THE SPECIFIED ACTIVITIES

Common name	Scientific name	Stock	ESA/ MMPA status; strategic (Y/N) [1]	Stock abundance (CV, N_{min}, most recent abundance survey) [2]	PBR	Annual M/SI [3]
Order Cetartiodactyla—Cetacea—Superfamily Mysticeti (baleen whales)						
Family Balaenopteridae (rorquals):						
Humpback Whale	*Megaptera novaeangliae*	Hawai'i	-,-,N	11,278 (0.56, 7,265, 2020).	127	27
		Mexico-North Pacific	T,D,Y	N/A (N/A, N/A, 2006)	UND	0.6
Minke Whale	*Balaenoptera acutorostrata*	Alaska	-,-,N	N/A (N/A, N/A, 2018)		0
Family Eschrichtiidae:						
Gray Whale	*Eschrichtius robustus*	Eastern North Pacific	-,-,N	26,960 (0.05, 25,849, 2016).	801	131
Superfamily Odontoceti (toothed whales, dolphins, and porpoises)						
Family Delphinidae:						
Killer whale	*Orca orcinus*	Northern Resident	-,-,N	302 (N/A, 302, 2018)	2.2	0.2
		Alaska Resident	-,-,N	1,920 (N/A, 1,920, 2019)	19	1.3
		Gulf of Alaska/Aleutian Islands/ Bering Sea Transient.	-,-,N	587 (N/A, 587, 2012)	5.9	0.8
		West Coast Transient	-,-,N	349 (N/A, 349, 2018)	3.5	0.4
Family Phocoenidae (porpoises):						
Harbor porpoise	*Phocoena phocoena*	Northern Southeast Alaska	-,-,N	1,619 (0.26, 1,250, 2019)	13	5.6
Order Carnivora—Superfamily Pinnipedia						
Family Otariidae (eared seals and sea lions):						
Steller sea lion	*Eumetopias jubatus*	Western Stock	E,D,Y	52,932 (N/A, 52,932, 2019).	318	254
		Eastern Stock	-,-,N	43,201 (N/A, 43,201, 2017).	2,592	112
Family Phocidae (earless seals):						
Harbor seal	*Phoca vituline richardii*	Sitka/Chatham	-,-,N	13,289 (N/A, 11,883, 2015).	356	77

[1] ESA status: Endangered (E), Threatened (T)/MMPA status: Depleted (D). A dash (-) indicates that the species is not listed under the ESA or designated as depleted under the MMPA. Under the MMPA, a strategic stock is one for which the level of direct human-caused mortality exceeds PBR or which is determined to be declining and likely to be listed under the ESA within the foreseeable future. Any species or stock listed under the ESA is automatically designated under the MMPA as depleted and as a strategic stock.

[2] NMFS marine mammal SARs online at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/marine-mammal-stock-assessment-reports* CV is coefficient of variation; N_{min} is the minimum estimate of stock abundance.

[3] These values, found in NMFS's SARs, represent annual levels of human-caused mortality plus serious injury from all sources combined (*e.g.,* commercial fisheries, ship strike). Annual M/SI often cannot be determined precisely and is in some cases presented as a minimum value or range.

As indicated above, all 7 species (with 12 managed stocks) in table 1 temporally and spatially co-occur with the activity to the degree that take is reasonably likely to occur. All species that could potentially occur in the action area are included in table 8 of the IHA application. While northern fur seal, Pacific white-sided dolphin, Dall's porpoise, North Pacific right whale, sperm whale, fin whale, and Cuvier's beaked whale have been documented in or near Sitka Sound and Sitka Channel, the temporal and/or spatial occurrence of these species is such that take is not expected to occur, and they are not discussed further beyond the explanation provided here. These species are all considered to be rare (no sightings in recent years) or very rare (no local knowledge of sightings within the project vicinity) within Sitka Sound or near the action area. The take of these species has not been requested nor is authorized and these species are not considered further in this document. Additionally, the Northern Sea Otter may be found in Sitka Sound. However, the Northern Sea Otter are managed by the U.S. Fish and Wildlife Service and are not considered further in this document.

A detailed description of the species likely to be affected by CBS' construction project, were provided in the **Federal Register** notice for the proposed IHAs (89 FR 1884, January 11, 2024). Since that time, we are not aware of any changes in the status of these species and stocks; therefore, detailed descriptions are not provided here. Please refer to the **Federal Register** notice for these descriptions. Please also refer to the NMFS website (*https://www.fisheries.noaa.gov/find-species*) for generalized species descriptions.

Marine Mammal Hearing

Hearing is the most important sensory modality for marine mammals underwater, and exposure to anthropogenic sound can have deleterious effects. To appropriately assess the potential effects of exposure to sound, it is necessary to understand the frequency ranges marine mammals are able to hear. Not all marine mammal species have equal hearing capabilities (*e.g.,* Richardson *et al.,* 1995; Wartzok and Ketten, 1999; Au and Hastings, 2008). To reflect this, Southall *et al.* (2007, 2019) recommended that marine mammals be divided into hearing groups based on directly measured (behavioral or auditory evoked potential techniques) or estimated hearing ranges (behavioral response data, anatomical modeling, *etc.*). Note that no direct measurements of hearing ability have been successfully completed for mysticetes (*i.e.,* low-frequency cetaceans). Subsequently, NMFS (2018) described generalized hearing ranges for these marine mammal hearing groups. Generalized hearing ranges were chosen based on the approximately 65 decibel (dB) threshold from the normalized composite audiograms, with the

exception for lower limits for low-frequency cetaceans where the lower bound was deemed to be biologically implausible and the lower bound from Southall *et al.* (2007) retained. Marine mammal hearing groups and their associated hearing ranges are provided in table 2.

TABLE 2—MARINE MAMMAL HEARING GROUPS

[NMFS, 2018]

Hearing group	Generalized hearing range *
Low-frequency (LF) cetaceans (baleen whales)	7 Hz to 35 kilohertz (kHz).
Mid-frequency (MF) cetaceans (dolphins, toothed whales, beaked whales, bottlenose whales)	150 Hz to 160 kHz.
High-frequency (HF) cetaceans (true porpoises, *Kogia,* river dolphins, Cephalorhynchid, *Lagenorhynchus cruciger* & *L. australis*).	275 Hz to 160 kHz.
Phocid pinnipeds (PW) (underwater) (true seals)	50 Hz to 86 kHz.
Otariid pinnipeds (OW) (underwater) (sea lions and fur seals)	60 Hz to 39 kHz.

* Represents the generalized hearing range for the entire group as a composite (*i.e.,* all species within the group), where individual species' hearing ranges are typically not as broad. Generalized hearing range chosen based on ~65 dB threshold from normalized composite audiogram, with the exception for lower limits for LF cetaceans (Southall *et al.* 2007) and PW pinniped (approximation).

The pinniped functional hearing group was modified from Southall *et al.* (2007) on the basis of data indicating that phocid species have consistently demonstrated an extended frequency range of hearing compared to otariids, especially in the higher frequency range (Hemilä *et al.,* 2006; Kastelein *et al.,* 2009; Reichmuth *et al.,* 2013).

For more detail concerning these groups and associated frequency ranges, please see NMFS (2018) for a review of available information.

Potential Effects of Specified Activities on Marine Mammals and Their Habitat

The effects of underwater noise from CBS' pile driving activities have the potential to result in behavioral harassment of marine mammals in the vicinity of the project area. The notice of the proposed IHAs (89 FR 1884, January 11, 2024) included a discussion of the effects of anthropogenic noise on marine mammals and the potential effects of under noise from CBS' pile driving activities on marine mammals and their habitat. Please refer to the notice of the proposed IHAs (89 FR 1884, January 11, 2024) for that information and analysis, which is not repeated here.

Estimated Take of Marine Mammals

This section provides an estimate of the number of incidental takes authorized through the IHAs, which will inform NMFS' consideration of ''small numbers,'' and the negligible impact determinations.

Harassment is the only type of take expected to result from these activities. Except with respect to certain activities not pertinent here, section 3(18) of the MMPA defines ''harassment'' as any act of pursuit, torment, or annoyance, which (i) has the potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering (Level B harassment).

Authorized takes would primarily be by Level B harassment, as vibratory or impact pile driving and DTH drilling has the potential to result in disruption of behavioral patterns for individual marine mammals. There is also some potential for auditory injury (Level A harassment) to result, primarily for harbor porpoise, harbor seals and Steller sea lions. Harbor porpoise have larger predicted auditory injury zones and due to their small size, they could enter the Level A harassment zone and remain undetected for sufficient duration to incur auditory injury. While Steller sea lion do not have large Level A harassment zones, they are frequently sighted in the project area and therefor have some potential for auditory injury. Additionally harbor seals have larger Level A harassment zones and are common in the action area, and therefore have potential for auditory injury. Auditory injury is unlikely to occur for all other species, based on the unlikelihood of the species in the action area and the smaller Level A harassment zones. The mitigation and monitoring measures are expected to minimize the severity of the taking to the extent practicable.

As described previously, no serious injury or mortality is anticipated or authorized for this activity. Below we describe how the take numbers are estimated.

For acoustic impacts, generally speaking, we estimate take by considering: (1) acoustic thresholds above which NMFS believes the best available science indicates marine mammals will be behaviorally harassed or incur some degree of permanent hearing impairment; (2) the area or volume of water that will be ensonified above these levels in a day; (3) the density or occurrence of marine mammals within these ensonified areas; and (4) the number of days of activities. We note that while these factors can contribute to a basic calculation to provide an initial prediction of potential takes, additional information that can qualitatively inform take estimates is also sometimes available (*e.g.,* previous monitoring results or average group size). Below, we describe the factors considered here in more detail and present the take estimates.

Acoustic Thresholds

NMFS recommends the use of acoustic thresholds that identify the received level of underwater sound above which exposed marine mammals would be reasonably expected to be behaviorally harassed (equated to Level B harassment) or to incur permanent threshold shift (PTS) of some degree (equated to Level A harassment).

Level B Harassment—Though significantly driven by received level, the onset of behavioral disturbance from anthropogenic noise exposure is also informed to varying degrees by other factors related to the source or exposure context (*e.g.,* frequency, predictability, duty cycle, duration of the exposure, signal-to-noise ratio, distance to the source), the environment (*e.g.,* bathymetry, other noises in the area, predators in the area), and the receiving animals (hearing, motivation, experience, demography, life stage, depth) and can be difficult to predict (*e.g.,* Southall *et al.,* 2007, 2021; Ellison *et al.,* 2012). Based on what the available science indicates and the practical need to use a threshold based on a metric that is both predictable and measurable for most activities, NMFS typically uses a generalized acoustic

threshold based on received level to estimate the onset of behavioral harassment. NMFS generally predicts that marine mammals are likely to be behaviorally harassed in a manner considered to be Level B harassment when exposed to underwater anthropogenic noise above root-mean-squared pressure received levels (RMS SPL) of 120 dB (referenced to 1 micropascal (re 1 µPa)) for continuous (*e.g.,* vibratory pile driving, drilling) and above RMS SPL 160 dB re 1 µPa for non-explosive impulsive (*e.g.,* seismic airguns) or intermittent (*e.g.,* scientific sonar) sources. Generally speaking, Level B harassment take estimates based on these behavioral harassment thresholds are expected to include any likely takes by temporary threshold shift (TTS) as, in most cases, the likelihood of TTS occurs at distances from the source less than those at which behavioral harassment is likely. TTS of a sufficient degree can manifest as behavioral harassment, as reduced hearing sensitivity and the potential reduced opportunities to detect important signals (conspecific communication, predators, prey) may result in changes in behavior patterns that would not otherwise occur.

CBS's planned activity includes the use of continuous (vibratory hammer and DTH drilling) and impulsive (DTH drilling and impact pile driving) sources, and therefore the RMS SPL thresholds of 120 and 160 dB re 1 µPa are applicable.

Level A Harassment—NMFS' Technical Guidance for Assessing the Effects of Anthropogenic Sound on Marine Mammal Hearing (Version 2.0) (Technical Guidance, 2018) identifies dual criteria to assess auditory injury (Level A harassment) to five different marine mammal groups (based on hearing sensitivity) as a result of exposure to noise from two different types of sources (impulsive or non-impulsive). CBS's planned activity includes the use of impulsive (impact pile driving and DTH drilling) and non-impulsive (vibratory hammer and DTH drilling) sources.

These thresholds are provided in the table below. The references, analysis, and methodology used in the development of the thresholds are described in NMFS' 2018 Technical Guidance, which may be accessed at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/marine-mammal-acoustic-technical-guidance.*

TABLE 3—THRESHOLDS IDENTIFYING THE ONSET OF PERMANENT THRESHOLD SHIFT

Hearing group	PTS onset acoustic thresholds * (received level)	
	Impulsive	Non-impulsive
Low-Frequency (LF) Cetaceans	*Cell 1:* $L_{pk,flat}$: 219 dB; $L_{E,LF,24h}$: 183 dB	*Cell 2:* $L_{E,LF,24h}$: 199 dB.
Mid-Frequency (MF) Cetaceans	*Cell 3:* $L_{pk,flat}$: 230 dB; $L_{E,MF,24h}$: 185 dB	*Cell 4:* $L_{E,MF,24h}$: 198 dB.
High-Frequency (HF) Cetaceans	*Cell 5:* $L_{pk,flat}$: 202 dB; $L_{E,HF,24h}$: 155 dB	*Cell 6:* $L_{E,HF,24h}$: 173 dB.
Phocid Pinnipeds (PW) (Underwater)	*Cell 7:* $L_{pk,flat}$: 218 dB; $L_{E,PW,24h}$: 185 dB	*Cell 8:* $L_{E,PW,24h}$: 201 dB.
Otariid Pinnipeds (OW) (Underwater)	*Cell 9:* $L_{pk,flat}$: 232 dB; $L_{E,OW,24h}$: 203 dB	*Cell 10:* $L_{E,OW,24h}$: 219 dB.

* Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.

Note: Peak sound pressure (L_{pk}) has a reference value of 1 µPa, and cumulative sound exposure level (L_E) has a reference value of 1µPa^{2}s. In this table, thresholds are abbreviated to reflect American National Standards Institute standards (ANSI, 2013). However, peak sound pressure is defined by ANSI as incorporating frequency weighting, which is not the intent for this Technical Guidance. Hence, the subscript ''flat'' is being included to indicate peak sound pressure should be flat weighted or unweighted within the generalized hearing range. The subscript associated with cumulative sound exposure level thresholds indicates the designated marine mammal auditory weighting function (LF, MF, and HF cetaceans, and PW and OW pinnipeds) and that the recommended accumulation period is 24 hours. The cumulative sound exposure level thresholds could be exceeded in a multitude of ways (*i.e.,* varying exposure levels and durations, duty cycle). When possible, it is valuable for action proponents to indicate the conditions under which these acoustic thresholds will be exceeded.

Ensonified Area

Here, we describe operational and environmental parameters of the activity that are used in estimating the area ensonified above the acoustic thresholds, including source levels and transmission loss coefficient.

The sound field in the project area is the existing background noise plus additional construction noise from the project. Marine mammals are expected to be affected via sound generated by the primary components of the project (*i.e.,* impact pile driving, vibratory pile driving and removal, and DTH).

In order to calculate distances to the Level A harassment and Level B harassment thresholds for the methods and piles being used in this project, NMFS used acoustic monitoring data from other locations to develop source levels for the various pile types, sizes and methods (table 4). This analysis uses practical spreading loss, a standard assumption regarding sound propagation for similar environments, to estimate transmission of sound through water. For this analysis, the transmission loss factor of 15 (4.5 dB per doubling of distance) is used. A weighting adjustment factor of 2.5 or 2, a standard default value for vibratory pile driving and removal or impact driving and DTH respectively, were used to calculate Level A harassment areas.

NMFS recommends treating DTH systems as both impulsive and continuous, non-impulsive sound source types simultaneously. Thus, impulsive thresholds are used to evaluate Level A harassment, and continuous thresholds are used to evaluate Level B harassment. With regards to DTH mono-hammers, NMFS recommends proxy levels for Level A harassment based on available data regarding DTH systems of similar sized piles and holes (Denes *et al.,* 2019; Guan and Miner, 2020; Reyff and Heyvaert, 2019; Reyff, 2020; Heyvaert and Reyff, 2021).

TABLE 4—ESTIMATES UNDERWATER PROXY SOURCE LEVEL FOR PILE INSTALLATION AND REMOVAL

Method and pile type	Sound source at 10 meters			Source
Vibratory Hammer	dB rms			
16 in	161			NAVFAC 2015.
24 in	161			NAVFAC 2015.
DTH Drill	dB rms	dB SEL	dB peak	
16 in	167	146	172	Heyvaert and Reyff 2021, Guan and Miner 2020.
24 in	167	159	184	Heyvaert and Reyff 2021.
Impact Hammer	dB rms	dB SEL	dB peak	
16 in	185	175	200	Caltrans 2020.
24 in	190	177	203	Caltrans 2015.

Level B Harassment Zones

Transmission loss (TL) is the decrease in acoustic intensity as an acoustic pressure wave propagates out from a source. TL parameters vary with frequency, temperature, sea conditions, current, source and receiver depth, water depth, water chemistry, and bottom composition and topography. The general formula for underwater TL is:

$TL = B * \log_{10} (R_1/R_2)$,

Where:

TL = transmission loss in dB
B = transmission loss coefficient; for practical spreading equals 15
R_1 = the distance of the modeled SPL from the driven pile, and
R_2 = the distance from the driven pile of the initial measurement.

The recommended TL coefficient for most nearshore environments is the practical spreading value of 15. This value results in an expected propagation environment that would lie between spherical and cylindrical spreading loss conditions, which is the most appropriate assumption for CBS's planned underwater activities. The Level B harassment zones and approximate amount of area ensonified for the underwater activities are shown in table 5.

Level A Harassment Zones

The ensonified area associated with Level A harassment is more technically challenging to predict due to the need to account for a duration component. Therefore, NMFS developed an optional User Spreadsheet tool to accompany the Technical Guidance that can be used to relatively simply predict an isopleth distance for use in conjunction with marine mammal density or occurrence to help predict potential takes. We note that because of some of the assumptions included in the methods underlying this optional tool, we anticipate that the resulting isopleth estimates are typically going to be overestimates of some degree, which may result in an overestimate of potential take by Level A harassment. However, this optional tool offers the best way to estimate isopleth distances when more sophisticated modeling methods are not available or practical. For stationary sources such as pile installation or removal, the optional User Spreadsheet tool predicts the distance at which, if a marine mammal remained at that distance for the duration of the activity, it would be expected to incur PTS. The isopleths generated by the User Spreadsheet used the same TL coefficient as the Level B harassment zone calculations (*i.e.,* the practical spreading value of 15). Inputs used in the User Spreadsheet (*e.g.,* number of piles per day, duration and/or strikes per pile) are presented in tables 1 and 2. The maximum RMS SPL, sound exposure level (SEL), and resulting isopleths are reported in tables 4 and 5.

TABLE 5—LEVEL A AND LEVEL B HARASSMENT ISOPLETHS FOR PILE DRIVING ACTIVITIES

Activity	Level A isopleth (m)					Level B isopleth (m)

[1] The calculated Level B harassment zone is 13,594 m. However, the farthest distance that sound will transmit from the source is 8,500 m before transmission is stopped by landmasses.

Marine Mammal Occurrence

In this section we provide information about the occurrence of marine mammals, including density or other relevant information which will inform the take calculations.

Daily occurrence probability of each marine mammal species in the action area is based on consultation with previous monitoring reports, local researchers and marine professionals. Occurrence probability estimates are based on conservative density approximations for each species and factor in historic data of occurrence, seasonality, and group size in Sitka Sound and Sitka Channel. A summary of species occurrence is shown in table 6. To accurately describe species occurrence near the action area, marine mammals were described as either common (species sighted consistently during all monitoring efforts in the project vicinity, assume one to two groups per day), frequent (species sighted with some consistency during most monitoring efforts in the project vicinity, assume one group per week), or infrequent (species sighted occasionally during a few monitoring efforts in the project vicinity, assume one group per 2 weeks).

TABLE 6—ESTIMATED OCCURRENCE OF GROUP SIGHTINGS OF MARINE MAMMAL SPECIES

Species	Frequency	Average group size	Expected occurrence
Humpback whale	Frequent	3.4	1 group/week.
Minke whale [1]	Infrequent	3.5	1 group/2 weeks.
Gray whale	Infrequent	3.5	1 group/2 weeks.
Killer whale	Frequent	6.6	1 group/week.
Harbor porpoise	Infrequent	5.0	1 group/2 weeks.
Harbor seal [2]	Common	2.1	1–2 groups/day.
Steller sea lion [2]	Common	2.0	1–2 groups/day.

[1] Minke whale considered rare in Sitka Channel, but to be conservative they are treated as infrequent for take estimation as there is a small likelihood they could be in the area during the activity.
[2] Likelihood of one group/day in the Level A harassment zone and likelihood of two groups/day in the level B harassment zone.

Take Estimation

Here we describe how the information provided above is synthesized to produce a quantitative estimate of the take that is reasonably likely to occur and authorized.

For the total underwater take estimate, the daily occurrence probability for a species was multiplied by the estimated group size and by the number of days of each type of pile driving activity. Group size is based on the best available published research for these species and their presence in the action area.

Estimated take = Group size × Groups per day × Days of pile driving activity

Take by Level A harassment is anticipated for Steller sea lions and harbor seals. Although Steller sea lion Level A harassment zones are small, as previously discussed they are known to spend extended periods of time within the breakwaters in Sitka sound and in the project area. Harbor seals are also common in the project area and although their Level A harassment zones are farther from the project area, CBS has requested a maximum shutdown zone of 125 m for harbor seals and therefor there is likelihood for take by Level A harassment of harbor seals. Take by Level A harassment is also requested for harbor porpoise. We require a maximum shutdown zone for high frequency species of 300 m in this case and therefor there is likelihood for some take by Level A harassment. Even though they are not as common within the breakwaters, their Level A harassment zone extends beyond the breakwaters and they are elusive in nature. The take by Level A harassment for both pinniped species are based on a lower daily occurrence rate based on the frequency of sightings within the smaller Level A harassment zone of the breakwaters (table 6).

Additionally, for species that are large and/or infrequent (gray whale, minke whale, humpback whale, and harbor porpoise) in Sitka Sound and are unlikely to be within the breakwaters where the action will take place, take by Level B harassment is only anticipated to occur incidental to vibratory and DTH methods, given the larger Level B harassment zones which will extend beyond the breakwaters. Anticipated take by Level A harassment for harbor seal and harbor porpoise would likely occur only incidental to impact pile driving and DTH drilling, and anticipated take of Steller sea lion by Level A harassment would likely occur only incidental to DTH drilling, due to

the larger Level A harassment zones for these activities. See table 5.

TABLE 7—TAKE OF MARINE MAMMALS BY LEVEL A AND LEVEL B HARASSMENT AND PERCENT OF STOCK TO BE TAKEN

Species	Stock	Phase 1			Phase 2		
		Level A	Level B	Percent of stock	Level A	Level B	Percent of stock
Humpback whale [1]	Hawai'i	0	11	0.1	0	4*	0
	Mexico-North Pacific [2]	0	0	0	0	0	0
Gray Whale	Eastern North Pacific	0	6	0	0	*4	0
Minke Whale	Alaska	0	6	NA	0	*4	NA
Killer whale	West Coast Transients	0	3	0.9	0	1	0.3
	Gulf, Aleutian, Bering Transient	0	6	0.9	0	2	0.3
	Northern Resident	0	3	0.9	0	1	0.3
	Alaska Resident	0	18	0.9	0	6	0.3
Harbor porpoise	Northern Southeast Alaska	*5	8	0.9	*5	*5	0.7
Harbor seal	Sitka/Chatham Alaska	48	130	1.3	13	38	0.4
Steller sea lion	Eastern US	16	121	0.3	6	35	0.1
	Western US	0	3	0	0	*2	0

[1] Take estimates are weighted based on calculated percentages of population for each distinct stock, assuming animals present would follow same probability of presence in project area. Humpback whale probability by stock based on Southeast Alaska estimates from NMFS 2021 (98 percent Hawaii distinct population segment (DPS); 2 percent Mexico DPS).

[2] ESA listed Mexico humpback whales take calculation resulted in less than 0.5 takes, therefore no takes are anticipated or authorized.

* Where calculated take was less than the average group size, the take was rounded up to a group size as that is likely what would be encountered.

Mitigation

In order to issue an IHA under section 101(a)(5)(D) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to the activity, and other means of effecting the least practicable impact on the species or stock and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of the species or stock for taking for certain subsistence uses. NMFS regulations require applicants for incidental take authorizations to include information about the availability and feasibility (economic and technological) of equipment, methods, and manner of conducting the activity or other means of effecting the least practicable adverse impact upon the affected species or stocks, and their habitat (50 CFR 216.104(a)(11)).

In evaluating how mitigation may or may not be appropriate to ensure the least practicable adverse impact on species or stocks and their habitat, as well as subsistence uses where applicable, NMFS considers two primary factors:

(1) The manner in which, and the degree to which, the successful implementation of the measure(s) is expected to reduce impacts to marine mammals, marine mammal species or stocks, and their habitat, as well as subsistence uses. This considers the nature of the potential adverse impact being mitigated (likelihood, scope, range). It further considers the likelihood that the measure will be effective if implemented (probability of accomplishing the mitigating result if implemented as planned), the likelihood of effective implementation (probability implemented as planned); and

(2) The practicability of the measures for applicant implementation, which may consider such things as cost, and impact on operations.

Mitigation Measures

For each IHA, CBS must follow mitigation measures as specified below:

- Ensure that construction supervisors and crews, the monitoring team, and relevant CBS staff are trained prior to the start of all pile driving and DTH drilling activity, so that responsibilities, communication procedures, monitoring protocols, and operational procedures are clearly understood. New personnel joining during the project must be trained prior to commencing work;
- Employ Protected Species Observers (PSOs) and establish monitoring locations as described in the application and the IHA. The Holder must monitor the project area to the maximum extent possible based on the required number of PSOs, required monitoring locations, and environmental conditions. For all pile driving and removal at least one PSO must be used. The PSO will be stationed as close to the activity as possible;
- The placement of the PSOs during all pile driving and removal and DTH drilling activities will ensure that the entire shutdown zone is visible during pile installation;
- Monitoring must take place from 30 minutes prior to initiation of pile driving or DTH drilling activity (*i.e.,* pre-clearance monitoring) through 30 minutes post-completion of pile driving or DTH drilling activity;
- Pre-start clearance monitoring must be conducted during periods of visibility sufficient for the lead PSO to determine that the shutdown zones indicated in table 10 are clear of marine mammals. Pile driving and DTH drilling may commence following 30 minutes of observation when the determination is made that the shutdown zones are clear of marine mammals;
- CBS must use soft start techniques when impact pile driving. Soft start requires contractors to provide an initial set of three strikes at reduced energy, followed by a 30-second waiting period, then two subsequent reduced-energy strike sets. A soft start must be implemented at the start of each day's impact pile driving and at any time following cessation of impact pile driving for a period of 30 minutes or longer; and
- If a marine mammal is observed entering or within the shutdown zones indicated in table 10, pile driving and DTH drilling must be delayed or halted. If pile driving is delayed or halted due to the presence of a marine mammal, the activity may not commence or resume until either the animal has voluntarily exited and been visually confirmed beyond the shutdown zone (table 11) or 15 minutes have passed without re-detection of the animal.

As planned by the applicant, in water activities will take place only between civil dawn and civil dusk when PSOs can effectively monitor for the presence of marine mammals; during conditions with a Beaufort sea state of four or less. Pile driving and DTH drilling may continue for up to 30 minutes after sunset during evening civil twilight, as necessary to secure a pile for safety prior to demobilization during this time.

The length of the post-activity monitoring period may be reduced if darkness precludes visibility of the shutdown and monitoring zones.

Shutdown Zones

CBS will establish shutdown zones for all pile driving and DTH drilling activities. The purpose of a shutdown zone is generally to define an area within which shutdown of the activity would occur upon sighting of a marine mammal (or in anticipation of an animal entering the defined area). Shutdown zones would be based upon the Level A harassment isopleth for each pile size/type and driving method where applicable, as shown in table 10.

For in-water heavy machinery activities other than pile driving, if a marine mammal comes within 10 m, work will stop and vessels will reduce speed to the minimum level required to maintain steerage and safe working conditions. A 10 m shutdown zone serves to protect marine mammals from physical interactions with project vessels during pile driving and other construction activities, such as barge positioning or drilling. If an activity is delayed or halted due to the presence of a marine mammal, the activity may not commence or resume until either the animal has voluntarily exited and been visually confirmed beyond the shutdown zone indicated in table 10 or 15 minutes have passed without re-detection of the animal. Construction activities must be halted upon observation of a species for which incidental take is not authorized or a species for which incidental take has been authorized but the authorized number of takes has been met entering or within the harassment zone.

All marine mammals will be monitored in the Level B harassment zones and throughout the area as far as visual monitoring can take place. If a marine mammal enters the Level B harassment zone, construction activities including in-water work will continue and the animal's presence within the estimated harassment zone will be documented.

CBS would also establish shutdown zones for all marine mammals for which take has not been authorized or for which incidental take has been authorized but the authorized number of takes has been met. These zones are equivalent to the Level B harassment zones for each activity. If a marine mammal species not covered under this IHA enters the shutdown zone, all in-water activities will cease until the animal leaves the zone or has not been observed for at least 15 minutes, and NMFS will be notified about species and precautions taken. Pile driving will proceed if the non-IHA species is observed to leave the Level B harassment zone or if 15 minutes have passed since the last observation.

If shutdown and/or clearance procedures would result in an imminent safety concern, as determined by CBS or its designated officials, the in-water activity will be allowed to continue until the safety concern has been addressed, and the animal will be continuously monitored.

TABLE 8—SHUTDOWN AND MONITORING ZONES

Activity	Level A isopleth (m)					Level B isopleth (m)
	LF	MF	HF [2]	Phocids [1]	Otariids	
Vibratory Pile Removal/Installation						
Phase I:

16-in temp install	235	10	275	125	10	465
16-in perm install	235	10	275	125	10	465
24-in perm install	315	20	300	125	20	1,000
Phase II:						
16-in temp install	235	10	275	125	10	465
24-in perm install	315	20	300	125	20	1,000

[1] Maximum shutdown for phocids is reduced to 125 m as they are a common species within the breakwaters of Sitka Sound.
[2] Maximum shutdown for high frequency species is reduced to 300 m, given the difficulty observing harbor porpoise at greater distances.

Protected Species Observers

The placement of PSOs during all construction activities (described in the Monitoring and Reporting section) would ensure that the entire shutdown zone is visible. Should environmental conditions deteriorate such that the entire shutdown zone would not be visible (*e.g.,* fog, heavy rain), pile driving would be delayed until the PSO is confident marine mammals within the shutdown zone could be detected.

PSOs would monitor the full shutdown zones and the remaining Level A harassment and the Level B harassment zones to the extent practicable. Monitoring zones provide utility for observing by establishing monitoring protocols for areas adjacent to the shutdown zones. Monitoring zones enable observers to be aware of and communicate the presence of marine mammals in the project areas outside the shutdown zones and thus prepare for a potential cessation of activity should the animal enter the shutdown zone.

Pre-Activity Monitoring

Prior to the start of daily in-water construction activity, or whenever a break in pile driving or DTH drilling of 30 minutes or longer occurs, PSOs would observe the shutdown and monitoring zones for a period of 30 minutes. The shutdown zone would be considered cleared when a marine mammal has not been observed within the zone for that 30-minute period. If a marine mammal is observed within the shutdown zones listed in table 10, pile driving activity would be delayed or halted. If work ceases for more than 30 minutes, the pre-activity monitoring of the shutdown zones would commence. A determination that the shutdown zone is clear must be made during a period of good visibility (*i.e.,* the entire shutdown zone and surrounding waters must be visible to the naked eye).

Soft-Start Procedures

Soft-start procedures provide additional protection to marine mammals by providing warning and/or giving marine mammals a chance to leave the area prior to the hammer operating at full capacity. For impact pile driving, contractors would be required to provide an initial set of three strikes from the hammer at reduced energy, followed by a 30-second waiting period, then two subsequent reduced-energy strike sets. Soft-start would be implemented at the start of each day's impact pile driving and at any time following cessation of impact pile driving for a period of 30 minutes or longer.

Based on our evaluation of the applicant's measures NMFS has determined that the mitigation measures provide the means of effecting the least practicable impact on the affected species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance.

Monitoring and Reporting

In order to issue an IHA for an activity, section 101(a)(5)(D) of the MMPA states that NMFS must set forth requirements pertaining to the monitoring and reporting of such taking. The MMPA implementing regulations at 50 CFR 216.104(a)(13) indicate that requests for authorizations must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present while conducting the activities. Effective reporting is critical both to compliance as well as ensuring that the most value is obtained from the required monitoring.

Monitoring and reporting requirements prescribed by NMFS should contribute to improved understanding of one or more of the following:

- Occurrence of marine mammal species or stocks in the area in which take is anticipated (*e.g.,* presence, abundance, distribution, density);
- Nature, scope, or context of likely marine mammal exposure to potential stressors/impacts (individual or cumulative, acute or chronic), through better understanding of: (1) action or environment (*e.g.,* source characterization, propagation, ambient noise); (2) affected species (*e.g.,* life history, dive patterns); (3) co-occurrence of marine mammal species with the activity; or (4) biological or behavioral context of exposure (*e.g.,* age, calving or feeding areas);
- Individual marine mammal responses (behavioral or physiological) to acoustic stressors (acute, chronic, or cumulative), other stressors, or cumulative impacts from multiple stressors;
- How anticipated responses to stressors impact either: (1) long-term fitness and survival of individual marine mammals; or (2) populations, species, or stocks;
- Effects on marine mammal habitat (*e.g.,* marine mammal prey species, acoustic habitat, or other important physical components of marine mammal habitat); and
- Mitigation and monitoring effectiveness.

Visual Monitoring

Marine mammal monitoring must be conducted in accordance with the conditions in this section and the IHA. Marine mammal monitoring during pile driving activities would be conducted by PSOs meeting NMFS' following requirements:

- PSOs must be independent of the activity contractor (for example, employed by a subcontractor) and have no other assigned tasks during monitoring periods;
- At least one PSO would have prior experience performing the duties of a PSO during construction activity pursuant to a NMFS-issued incidental take authorization;
- Other PSOs may substitute education (degree in biological science or related field) or training for experience; and
- Where a team of three or more PSOs is required, a lead observer or monitoring coordinator would be designated. The lead observer would be required to have prior experience working as a marine mammal observer during construction.

PSOs should have the following additional qualifications:

- Ability to conduct field observations and collect data according to assigned protocols;
- Experience or training in the field identification of marine mammals, including the identification of behaviors;
- Sufficient training, orientation, or experience with the construction operation to provide for personal safety during observations;
- Writing skills sufficient to prepare a report of observations including but not limited to the number and species of marine mammals observed; dates and times when in-water construction activities were conducted; dates, times and reason for implementation of mitigation (or why mitigation was not implemented when required); and marine mammal behavior; and
- Ability to communicate orally, by radio or in person, with project personnel to provide real-time information on marine mammals observed in the area as necessary.

- CBS must employ up to five PSOs depending on the size of the monitoring and shutdown zones. A minimum of two PSOs (including the lead PSO) must be assigned to the active pile driving location to monitor the shutdown zones and as much of the Level B harassment zones as possible.
- CBS must establish monitoring locations with the best views of monitoring zones as described in the IHA and Monitoring Plan posted on our website.
- Up to four monitors will be used at a time depending on the size of the monitoring area. PSOs would be deployed in strategic locations around the area of potential effects at all times during in-water pile driving and removal. PSOs will be positioned at

locations that provide full views of the monitoring zones and the Level A harassment Shutdown Zones. All PSOs would have access to high-quality binoculars, range finders to monitor distances, and a compass to record bearing to animals as well as radios or cells phones for maintaining contact with work crews.

- Up to four PSOs will be stationed at the following locations: the project site, Sandy Beach Day use site, O'Connell lightering float, and Whale Park.

Monitoring would be conducted 30 minutes before, during, and 30 minutes after all in water construction activities. In addition, PSOs would record all incidents of marine mammal occurrence, regardless of distance from activity, and would document any behavioral reactions in concert with distance from piles being driven or removed. Pile driving activities include the time to install or remove a single pile or series of piles, as long as the time elapsed between uses of the pile driving equipment is no more than 30 minutes.

CBS shall conduct briefings between construction supervisors and crews, PSOs, CBS staff prior to the start of all pile driving activities and when new personnel join the work. These briefings would explain responsibilities, communication procedures, marine mammal monitoring protocol, and operational procedures.

Reporting

A draft marine mammal monitoring report will be submitted to NMFS within 90 days after the completion of pile driving and removal activities for each IHA, or 60 days prior to a requested date of issuance from any future IHAs for projects at the same location, whichever comes first. The report will include an overall description of work completed, a narrative regarding marine mammal sightings, and associated PSO data sheets. Specifically, the report must include:

- Dates and times (begin and end) of all marine mammal monitoring;
- Construction activities occurring during each daily observation period, including the number and type of piles driven or removed and by what method (*i.e.,* impact, vibratory, or DTH drilling) and the total equipment duration for vibratory removal for each pile or total number of strikes for each pile (impact driving);
- PSO locations during marine mammal monitoring;
- Environmental conditions during monitoring periods (at beginning and end of PSO shift and whenever conditions change significantly), including Beaufort sea state and any other relevant weather conditions including cloud cover, fog, sun glare, and overall visibility to the horizon, and estimated observable distance;
- Upon observation of a marine mammal, the following information:
- Name of PSO who sighted the animal(s) and PSO location and activity at the time of sighting;
- Time of sighting;
- Identification of the animal(s) (*e.g.,* genus/species, lowest possible taxonomic level, or unidentifiable), PSO confidence in identification, and the composition of the group if there is a mix of species;
- Distance and bearing of each marine mammal observed relative to the pile being driven for each sightings (if pile driving was occurring at time of sighting);
- Estimated number of animals (min/max/best estimate);
- Estimated number of animals by cohort (adults, juveniles, neonates, group composition, sex class, *etc.*);
- Animal's closest point of approach and estimated time spent within the harassment zone;
- Description of any marine mammal behavioral observations (*e.g.,* observed behaviors such as feeding or traveling), including an assessment of behavioral responses thought to have resulted from the activity (*e.g.,* no response or changes in behavioral state such as ceasing feeding, changing direction, flushing, or breaching);
- Number of marine mammals detected within the harassment zones and shutdown zones; by species; and
- Detailed information about any implementation of any mitigation triggered (*e.g.,* shutdowns and delays), a description of specific actions that ensured, and resulting changes in behavior of the animal(s), if any.

If no comments are received from NMFS within 30 days, the draft reports will constitute the final reports. If comments are received, a final report addressing NMFS comments must be submitted within 30 days after receipt of comments.

Reporting Injured or Dead Marine Mammals

In the event that personnel involved in the construction activities discover an injured or dead marine mammal, the IHA-holder must immediately cease the specified activities and report the incident to the Office of Protected Resources (OPR) (*PR.ITP.MonitoringReports@noaa.gov*), NMFS and to the Alaska Regional Stranding Coordinator as soon as feasible. If the death or injury was clearly caused by the specified activity, CBS must immediately cease the specified activities until NMFS is able to review the circumstances of the incident and determine what, if any, additional measures are appropriate to ensure compliance with the terms of the IHA. The IHA-holder must not resume their activities until notified by NMFS. The report must include the following information:

- Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable);
- Species identification (if known) or description of the animal(s) involved;
- Condition of the animal(s) (including carcass condition if the animal is dead);
- Observed behaviors of the animal(s), if alive;
- If available, photographs or video footage of the animal(s); and
- General circumstances under which the animal was discovered.

Negligible Impact Analysis and Determination

NMFS has defined negligible impact as an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival (50 CFR 216.103). A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (*i.e.,* population-level effects). An estimate of the number of takes alone is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be ''taken'' through harassment, NMFS considers other factors, such as the likely nature of any impacts or responses (*e.g.,* intensity, duration), the context of any impacts or responses (*e.g.,* critical reproductive time or location, foraging impacts affecting energetics), as well as effects on habitat, and the likely effectiveness of the mitigation. We also assess the number, intensity, and context of estimated takes by evaluating this information relative to population status. Consistent with the 1989 preamble for NMFS' implementing regulations (54 FR 40338, September 29, 1989), the impacts from other past and ongoing anthropogenic activities are incorporated into this analysis via their impacts on the baseline (*e.g.,* as reflected in the regulatory status of the species, population size and growth rate where known, ongoing sources of

human-caused mortality, or ambient noise levels).

To avoid repetition, the discussion of our analysis applies to all species listed in table 3, given that the anticipated effects of this activity on these different marine mammal stocks are expected to be similar. There is little information about the nature or severity of the impacts, or the size, status, or structure of any of these species or stocks that would lead to a different analysis for this activity. In addition, because both the number and nature of the estimated takes anticipated to occur are identical in Phase I and II, the analysis below applies to both of the IHAs.

Pile driving and DTH drilling activities associated with the project, as outlined previously, have the potential to disturb or displace marine mammals. Specifically, the specified activities may result in take, in the form of Level B harassment and, for some species, Level A harassment from underwater sounds generated by pile driving and DTH drilling. Potential takes could occur if individuals are present in the ensonified zone when these activities are underway.

No serious injury or mortality would be expected, even in the absence of required mitigation measures, given the nature of the activities. Further, no take by Level A harassment is anticipated for killer whales, humpback whales, gray whales, or minke whales due to the application of planned mitigation measures, such as shutdown zones that encompass the Level A harassment zones for the species, the rarity of the species near the action area, and the small Level A harassment zones (for killer whales only). The potential for harassment would be minimized through the construction method and the implementation of the planned mitigation measures (see Mitigation section).

Take by Level A harassment is authorized for three species (harbor porpoise, Steller sea lion, and harbor seal) as the Level A harassment isopleths exceed the size of the shutdown zones for specific construction scenarios, the Level A harassment zones are large, and/or the species is frequent near the action area. Therefore, there is the possibility that an animal could enter a Level A harassment zone and remain within that zone for a duration long enough to incur PTS. Level A harassment of these species is therefore authorized. Any take by Level A harassment is expected to arise from, at most, a small degree of PTS (*i.e.,* minor degradation of hearing capabilities within regions of hearing that align most completely with the energy produced by impact pile driving such as the low-frequency region below 2 kHz), not severe hearing impairment or impairment within the ranges of greatest hearing sensitivity. Animals would need to be exposed to higher levels and/or longer duration than are expected to occur here in order to incur any more than a small degree of PTS.

Further, the amount of take authorized by Level A harassment is very low for the marine mammal stocks and species. If hearing impairment occurs, it is most likely that the affected animal would lose only a few decibels in its hearing sensitivity. Due to the small degree anticipated, any PTS potential incurred would not be expected to affect the reproductive success or survival of any individuals, much less result in adverse impacts on the species or stock.

The Level A harassment zones identified in table 7 are based upon an animal exposed to pile driving or DTH drilling of several piles per day (six piles per day for vibratory removal and installation, four piles per day of impact driving, and two piles per day of DTH drilling). Given the short duration to impact drive or vibratory install or remove, or use DTH drilling, each pile and break between pile installations (to reset equipment and move piles into place), an animal would have to remain within the area estimated to be ensonified above the Level A harassment threshold for multiple hours. This is highly unlikely given marine mammal movement patterns in the area. If an animal was exposed to accumulated sound energy, the resulting PTS would likely be small (*e.g.,* PTS onset) at lower frequencies where pile driving energy is concentrated, and unlikely to result in impacts to individual fitness, reproduction, or survival.

Additionally, some subset of the individuals that are behaviorally harassed could also simultaneously incur some small degree of TTS for a short duration of time. However, since the hearing sensitivity of individuals that incur TTS is expected to recover completely within minutes to hours, it is unlikely that the brief hearing impairment would affect the individual's long-term ability to forage and communicate with conspecifics, and would therefore not likely impact reproduction or survival of any individual marine mammal, let alone adversely affect rates of recruitment or survival of the species or stock.

The nature of the pile driving project precludes the likelihood of serious injury or mortality. For all species and stocks, take would occur within a limited, confined area (adjacent to the project site) of the stock's range. The intensity and duration of take by Level A and Level B harassment would be minimized through use of mitigation measures described herein. Further, the amount of take authorized is extremely small when compared to stock abundance.

Behavioral responses of marine mammals to pile driving, pile removals, and DTH drilling in Sitka Channel and the surrounding Sitka Sound are expected to be mild, short term, and temporary. Marine mammals within the Level B harassment zones may not show any visual cues they are disturbed by activities or they could become alert, avoid the area, leave the area, or display other mild responses that are not observable such as changes in vocalization patterns. Given that pile driving, pile removal, and DTH drilling are temporary activities and effects would cease when equipment is not operating, any harassment occurring would be temporary. Additionally, many of the species present in the region would only be present temporarily based on seasonal patterns or during transit between other habitats. These species would be exposed to even smaller periods of noise-generating activity, further decreasing the impacts.

Nearly all inland waters of southeast Alaska, including Sitka Sound, are included in the southeast Alaska humpback whale feeding Biologically Important Area (BIA) (Wild *et al.,* 2023), though humpback whale distribution in southeast Alaska varies by season and waterway (Dahlheim *et al.,* 2009). Humpback whales could be present within Sitka Sound year round, however the action area is within the breakwaters where humpback whales are not commonly found and therefore, the BIA is not expected to be affected. Therefore, the planned project is not expected to have significant adverse effects on the foraging of humpback whales.

Sitka Sound is also within a gray whale migratory corridor BIA (Wild *et al.,* 2023). Construction is expected to occur while the BIA is active during the southbound migration (November to January) and northbound migration (March to May). The Sound is also a Gray whale feeding BIA. Construction is expected to overlap with the feeding BIA (March to June). However, as noted for humpback whales, project activities will only overlap seasonally in the gray whale migratory and feeding BIAs, and the overall 2 year project (Phase I and Phase II) is expected to occur over just 40 in-water workdays, further reducing the temporal overlap with the BIAs.

Additionally, the area of the feeding BIA in which impacts of the planned project may occur is small relative to both the overall area of the BIA and the overall area of suitable gray whale habitat outside of this BIA. The area of Sitka Sound affected by this project is also small relative to the rest of the Sound, such that it allows animals within the migratory corridor to still utilize Sitka Sound without necessarily being disturbed by the construction. Specifically, all Level A harassment isopleths for gray whale are within the breakwaters where gray whales are not expected. Therefore, take of gray whales using the feeding and migratory BIAs is not expected to impact feeding or migratory behavior and, therefore, would not impact reproduction or survivorship.

As noted previously, since January 1, 2019, elevated gray whale strandings have occurred along the west coast of North America from Mexico through Alaska. The event has been declared an unusual mortality event (UME), though a cause has not yet been determined. While six takes by Level B harassment in phase I and four takes by Level B harassment in phase II of gray whale are authorized for each year this is an extremely small portion of the stock (<1 percent), and CBS will be required to implement a shutdown zone that includes the entire Level A harassment zone for low-frequency cetaceans such as gray whales.

The same regions are also a part of the Western DPS Steller sea lion ESA critical habitat. While Steller sea lions are common in the project area, there are no essential physical and biological habitat features, such as haulouts or rookeries, within the project area. The nearest haulout is approximately 25 kilometers away from the project area. Therefore, the project is not expected to have significant adverse effects on the critical habitat of Western DPS Steller sea lions. No areas of specific biological importance (*e.g.,* ESA critical habitat, other BIAs, or other areas) for any other species are known to co-occur with the project area.

In addition, it is unlikely that minor noise effects in a small, localized area of habitat would have any effect on each stock's ability to recover. In combination, we believe that these factors, as well as the available body of evidence from other similar activities, demonstrate that the potential effects of the specified activities would have only minor, short-term effects on individuals. The specified activities are not expected to impact rates of recruitment or survival and would therefore not result in population-level impacts.

In summary and as described above, the following factors primarily support our determination that the impacts resulting from this activity are not expected to adversely affect any of the species or stocks through effects on annual rates of recruitment or survival:

- No serious injury or mortality is anticipated or authorized;
- Level A harassment would be very small amounts and of low degree;
- Level A harassment takes of only harbor porpoise, Steller sea lions and harbor seals;
- For all species, the Sitka Sound and channel are a very small and peripheral part of their range;
- Anticipated takes by Level B harassment are relatively low for all stocks. Level B harassment would be primarily in the form of behavioral disturbance, resulting in avoidance of the project areas around where impact or vibratory pile driving is occurring, with some low-level TTS that may limit the detection of acoustic cues for relatively brief amounts of time in relatively confined footprints of the activities;
- Effects on species that serve as prey for marine mammals from the activities are expected to be short-term and, therefore, any associated impacts on marine mammal feeding are not expected to result in significant or long-term consequences for individuals, or to accrue to adverse impacts on their populations;
- The ensonified areas are very small relative to the overall habitat ranges of all species and stocks, and would not adversely affect ESA-designated critical habitat for any species or any areas of known biological importance;
- The lack of anticipated significant or long-term negative effects to marine mammal habitat; and
- CBS would implement mitigation measures including soft-starts and shutdown zones to minimize the numbers of marine mammals exposed to injurious levels of sound, and to ensure that take by Level A harassment is, at most, a small degree of PTS.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the monitoring and mitigation measures, NMFS finds that the total marine mammal take, specific to each of the 2 consecutive years of planned activity, would have a negligible impact on all affected marine mammal species or stocks.

Small Numbers

As noted previously, only take of small numbers of marine mammals may be authorized under sections 101(a)(5)(A) and (D) of the MMPA for specified activities other than military readiness activities. The MMPA does not define small numbers and so, in practice, where estimated numbers are available, NMFS compares the number of individuals taken to the most appropriate estimation of abundance of the relevant species or stock in our determination of whether an authorization is limited to small numbers of marine mammals. When the predicted number of individuals to be taken is fewer than one-third of the species or stock abundance, the take is considered to be of small numbers. Additionally, other qualitative factors may be considered in the analysis, such as the temporal or spatial scale of the activities.

The amount of take NMFS authorized, for each of the 2 consecutive years of the activity, is below one third of the estimated stock abundance for all species (in fact, take of individuals is less than 2 percent of the abundance of the affected stocks, see table 9). This is likely a conservative estimate because we assume all takes are of different individual animals, which is likely not the case. Some individuals may return multiple times in a day, but PSOs would count them as separate takes if they cannot be individually identified.

There is no current or historical estimate of the Alaska minke whale stock, but there are known to be over 1,000 minke whales in the Gulf of Alaska (Muto *et al.,* 2018), so the 10 takes by Level B harassment over the 2 years of the project duration is small relative to estimated survey abundance, even if each take occurred to a new individual. Additionally, the range of the Alaska stock of minke whales is extensive, stretching from the Canadian Pacific coast to the Chukchi Sea, and CBS's project would only impact a small portion of this range.

Based on the analysis contained herein of the planned activity (including the mitigation and monitoring measures) and the anticipated take of marine mammals, NMFS finds that, for each of the two IHAs, small numbers of marine mammals would be taken relative to the population size of the affected species or stocks.

Unmitigable Adverse Impact Analysis and Determination

In order to issue an IHA, NMFS must find that the specified activity will not have an ''unmitigable adverse impact''

on the subsistence uses of the affected marine mammal species or stocks by Alaskan Natives. NMFS has defined ''unmitigable adverse impact'' in 50 CFR 216.103 as an impact resulting from the specified activity: (1) That is likely to reduce the availability of the species to a level insufficient for a harvest to meet subsistence needs by: (i) Causing the marine mammals to abandon or avoid hunting areas; (ii) Directly displacing subsistence users; or (iii) Placing physical barriers between the marine mammals and the subsistence hunters; and (2) That cannot be sufficiently mitigated by other measures to increase the availability of marine mammals to allow subsistence needs to be met.

Sitka Channel and other nearby areas are within the traditional territory of the Sheetʻká Kwáan. Alaska natives have traditionally harvested marine mammals in Sitka, however today a majority of the subsistence harvest is of species other than marine mammals. Alaska Department Fish and Game reported that in 2013, around 11 percent of Sitka households used subsistence-caught marine mammals (ADF&G, 2023), however this is the most recent data available and there has not been a survey since.

The project is not likely to adversely impact the availability of any marine mammal species or stocks that are commonly used for subsistence purposes or impact subsistence harvest of marine mammals in the region because:

- There is no recent recorded subsistence harvest of marine mammals in the area;
- Construction activities are temporary and localized primarily within Sitka Channel;
- Construction will not take place during the herring spawning season when subsistence species are more active;
- Mitigation measures will be implemented to minimize disturbance of marine mammals in the action area; and
- The project will not result in significant changes to availability of subsistence resources.

Based on the description of the specified activity, the measures described to minimize adverse effects on the availability of marine mammals for subsistence purposes, and the mitigation and monitoring measures; NMFS has determined that, specific to each of the 2 consecutive years of planned activity, there will not be an unmitigable adverse impact on subsistence uses from CBS's activities.

Endangered Species Act

There are two marine mammals (western DPS Steller sea lion and Mexico- North Pacific DPS humpback whale) with the potential to occur in the project area that are listed as endangered or threatened under the ESA. The NMFS Alaska Regional Office issued a Biological Opinion under section 7 of the ESA on the issuance of two IHAs to CBS under section 101(a)(5)(D) of the MMPA by the NMFS OPR. The Biological Opinion concluded that this action is not likely to jeopardize the continued existence of either DPS. In addition, the action authorized no take of the Mexico- North Pacific DPS humpback whale and is not likely to adversely affect any critical habitat.

National Environmental Policy Act

To comply with the National Environmental Policy Act of 1969 (NEPA; 42 U.S.C. 4321 *et seq.*) and NOAA Administrative Order (NAO) 216–6A, NMFS must review our action (*i.e.,* the issuance of an IHA) with respect to potential impacts on the human environment.

This action is consistent with categories of activities identified in Categorical Exclusion B4 (IHAs with no anticipated serious injury or mortality) of the Companion Manual for NAO 216–6A, which do not individually or cumulatively have the potential for significant impacts on the quality of the human environment and for which we have not identified any extraordinary circumstances that would preclude this categorical exclusion. Accordingly, NMFS has determined that the issuance of these IHAs qualifies to be categorically excluded from further NEPA review.

Authorization

NMFS has issued two consecutive IHAs to CBS for conducting Seaplane Base construction in Sitka, Alaska, starting in July 2024 for Phase I and July 2025 for Phase II, provided the previously mentioned mitigation, monitoring, and reporting requirements are incorporated. The issued IHAs can be found at: *https://www.fisheries.noaa.gov/action/incidental-take-authorization-city-and-borough-sitkas-seaplane-base-construction-activities.*

Dated: May 6, 2024.

Kimberly Damon-Randall,

Director, Office of Protected Resources, National Marine Fisheries Service.

BILLING CODE 3510–22–P

CORPORATION FOR NATIONAL AND COMMUNITY SERVICE

Agency Information Collection Activities; Comment Request; Applicant Operational and Financial Survey

AGENCY: Corporation for National and Community Service.

ACTION: Notice of information collection; request for comment.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995, the Corporation for National and Community Service (operating as AmeriCorps) is proposing to renew an information collection.

DATES: Written comments must be submitted to the individual and office listed in the **ADDRESSES** section by July 8, 2024.

ADDRESSES: You may submit comments, identified by the title of the information collection activity, by any of the following methods:

(1) Electronically through *www.regulations.gov* (preferred method)

(2) By mail sent to: AmeriCorps, Attention Alex Delaney, 250 E Street SW, Washington, DC, 20525.

(3) By hand delivery or by courier to the AmeriCorps mailroom at the mail address given in paragraph (2) above, between 9 a.m. and 4 p.m. Eastern Time, Monday through Friday, except Federal holidays.

Comments submitted in response to this notice may be made available to the public through *regulations.gov*. For this reason, please do not include in your comments information of a confidential nature, such as sensitive personal information or proprietary information. If you send an email comment, your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the internet. Please note that responses to this public comment request containing any routine notice about the confidentiality of the communication will be treated as public comment that may be made available to the public, notwithstanding the inclusion of the routine notice.

FOR FURTHER INFORMATION CONTACT: Alex Delaney, 202–528–2705, or by email at *ADelaney@americorps.gov*.

SUPPLEMENTARY INFORMATION: *Title of Collection:* Applicant Operational and Financial Survey.

OMB Control Number: 3045–0102.

Type of Review: Renewal.

Respondents/Affected Public: Businesses and Organizations.

Total Estimated Number of Annual Responses: 1500.

Total Estimated Number of Annual Burden Hours: 3000.

Abstract: This information collection consists of the questions applicants answer related to operational and financial management when applying for grant funding for a new project or performance period. It is not required for grant continuation or renewal applicants. Applicants respond to the questions included in these instructions when applying for funding in certain grant competitions. AmeriCorps will use the information collection to support pre-award risk assessment of applicants for grant funding. AmeriCorps also seeks to continue using the currently approved information collection until the revised information collection is approved by OMB. The currently approved information collection is due to expire on September 30, 2024.

Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval. Comments are invited on: (a) Whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden of the collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology; and (e) estimates of capital or start-up costs and costs of operation, maintenance, and purchase of services to provide information. Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; to develop, acquire, install and utilize technology and systems for the purpose of collecting, validating and verifying information, processing and maintaining information, and disclosing and providing information; to train personnel and to be able to respond to a collection of information, to search data sources, to complete and review the collection of information; and to transmit or otherwise disclose the information. All written comments will be available for public inspection on *regulations.gov*.

Caroline B. Fernandez,

Director, Office of Monitoring.

BILLING CODE 6050–28–P

U.S. International Development Finance Corporation

Notice of Public Hearing

AGENCY: U.S. International Development Finance Corporation.

ACTION: Announcement of public hearing.

SUMMARY: The Board of Directors of U.S. International Development Finance Corporation (DFC), in accordance with the Better Utilization of Investments Leading to Development (BUILD) Act of 2018, will hold a public hearing to provide an opportunity for stakeholders to present their views. Those wishing to attend, present at, or submit a written statement to the Board prior to the public hearing must provide advance notice to the agency as detailed below.

DATES: 2:00 p.m. EST, Wednesday, June 5, 2024.

ADDRESSES: The public hearing will take place virtually. Access information will be provided at the time of attendee registration.

Registration: To attend, present at, or submit a written statement to the Board prior to the public hearing, individuals must notify DFC Acting Deputy Corporate Secretary Abigail Wade at *corporate.secretary@dfc.gov* at by 5:00 p.m. EST, Tuesday, May 28, 2024.

Notices of intent to attend or present at the public hearing must include the individual's name, title, organization, address, email address, phone number, and a concise summary of the subject matter to be presented. Oral presentations may not exceed five minutes and may be reduced proportionately, if necessary, to afford all participants an opportunity to be heard.

Written statements submitted to the Board prior to the public hearing must include the individual's name, title, organization, address, email address, and phone number. Statements must be typewritten, double-spaced, and less than ten pages in length.

Deborah Papadopoulos,

Records Management Specialist.

[FR Doc. 2024–10139 Filed 5–8–24; 8:45 am]

BILLING CODE 3210–02–P

DEPARTMENT OF DEFENSE

Department of the Air Force

Notice of Intent To Prepare an Environmental Impact Statement for the 492nd Special Operations Wing Beddown at Davis-Monthan Air Force Base, Arizona

AGENCY: Department of the Air Force, lead Agency, Department of Defense.

ACTION: Notice of Intent.

SUMMARY: The Department of the Air Force (DAF) is issuing this Notice of Intent (NOI), in accordance with the National Environmental Policy Act (NEPA), to prepare an environmental impact statement (EIS) to evaluate the potential environmental impacts associated with transformation of the 492nd Special Operations Wing (492 SOW) into an Air Force Special Operations Command (AFSOC) Power Projection Wing (PPW) at Davis-Monthan Air Force Base (AFB), Arizona. This PPW would include the 492 SOW, the 6th and 319th Special Operations Squadrons, an MC–130J squadron, activation of an Intelligence Squadron (IS) under the Air Combat Command (ACC) 361st Intelligence, Surveillance, and Reconnaissance Group (361 ISRG), and Special Tactics and Special Operations Theater Air Operations Squadrons. The beddown of the 492 SOW is planned as a replacement mission for the A–10 aircraft at Davis-Monthan as they retire. There will likely be a short-term temporary overlap of the 492 SOW mission with the A–10s until their retirement is complete.

DATES: A public scoping period will take place starting from the date of this NOI publication in the **Federal Register** and will last for 30 days. Comments will be accepted at any time during the environmental impact analysis process; however, to ensure the DAF has sufficient time to consider public scoping comments during preparation of the Draft EIS, please submit comments within the 30-day scoping period.

The DAF invites the public, stakeholders, and other interested parties to attend the public scoping meeting. The in-person scoping meeting will be held on May 30 at the Tucson Convention Center, 260 S. Church Ave., Tucson, Arizona 85701. The in-person scoping meeting will take place from 5:30 p.m. to 7:30 p.m. local time. A virtual scoping meeting is scheduled for June 4 at 5:30 p.m. local time. Information on how to attend the virtual scoping meeting is available on the project website (*www.492sow-beddown-eis.com*). The scoping meetings will

provide an opportunity for attendees to learn more about the Proposed Action and Alternative and provide an early and open process to assist the DAF in determining the scope of issues for analysis in the EIS, including identifying significant environmental issues and eliminating from further study non-significant issues. Project team members will be available to answer questions and there will also be an opportunity to provide written comments. Scoping meeting notification and scoping materials will be provided in English and Spanish.

The Notice of Availability (NOA) of the Draft EIS is anticipated in the late Fall of 2024 and the NOA for the Final EIS is anticipated in the Summer of 2025. A decision could be made no earlier than 30 days after the Final EIS.

ADDRESSES: The project website (*www.492sow-beddown-eis.com*) provides information related to the EIS, such as environmental documents, schedule, and project details, as well as a comment form. Comments may be submitted via the website comment form, emailed to *afcec.czn.nepacenter@us.af.mil,* or mailed to 492 SOW Beddown EIS, 13397 Lakefront Drive; Suite 100 Earth City, MO 63045. Members of the public who want to receive future mailings informing them of the availability of the Draft EIS and Final EIS are encouraged to submit a comment that includes their name and email or postal mailing address. For other inquiries, please contact Mr. Nick Post, NEPA Project Manager at *afcec.czn.nepacenter@us.af.mil* or 1–210–925–3516.

SUPPLEMENTARY INFORMATION: The purpose for the DAF's Proposed Action is to create co-located AFSOC and ACC units that have the resources required to optimize the DAF special operations and special warfare forces to support the National Defense Strategy (NDS) while maximizing AFSOC's capabilities as a power projection wing that provides United States Special Operations Command and combatant commands specialized airpower against the entire range of threats to the United States and our allies/partners. The need for the proposed action stems from 2023 AFSOC strategic guidance, which aligns with the 2022 NDS. The strategic guidance emphasizes that the AFSOC mission is to enable the joint force by delivering AFSOC mission capabilities across the spectrum of competition and conflict. A new IS, as a geographically separated unit under ACC's 361 ISRG, is needed to continue to provide ACC direct support to the AFSOC mission. As AFSOC aircraft relocate to Davis-Monthan AFB, Arizona, the ACC cryptologic operators, analysts, and mission support personnel that currently support those aircraft and missions would need to remain co-located. The unique capabilities of the ACC IS would be critical to the success of the 492 SOW mission. This action is needed because the global security environment has fundamentally changed. In response to the changing nature of threats to the United States, AFSOC needs to accelerate transformation to properly prepare, prevent, and prevail against any adversary in today's complex and uncertain operational environment.

The DAF has identified a Proposed Action Alternative and the No Action Alternative to be carried forward for analysis in the EIS. Under the Proposed Action, the DAF would transform the 492 SOW into an AFSOC's PPW at Davis-Monthan AFB, Arizona. This PPW would include the 492 SOW, the 6th and 319th Special Operations Squadrons, an MC–130J squadron, activation of an IS as a geographically separated unit under the ACC 361 ISRG, and Special Tactics and Special Operations Theater Air Operations Squadrons. The Proposed Action would include the construction, renovation and demolition of facilities at Davis-Monthan AFB, as necessary to support the 492 SOW beddown. AFSOC aircrews would use airspace over areas in Southern Arizona and Southern New Mexico including special use airspace. No new special use airspace would be created and there would be no modifications to existing special use airspace as part of the Proposed Action Alternative.

Under the No Action Alternative, the 492 SOW beddown would not occur at Davis-Monthan AFB and there would be no new AFSOC mission personnel or ACC IS personnel at Davis Monthan AFB.

Potential impacts may include impacts to land use, airspace management, safety, noise, hazardous materials and waste, physical resources (including soil and water resources), air quality, transportation, socioeconomics, and environmental justice as well as potential impacts to cultural and biological resources due to ground disturbing activities.

Potential permits that could be required include, but are not limited to, Section 404 of the Clean Water Act, Clean Air Act, General Construction, and a National Pollutant Discharge Elimination System permit.

Scoping and Agency Coordination: Consultation will include, but not necessarily be limited to, consultation under Section 7 of the Endangered Species Act and consultation under Section 106 of the National Historic Preservation Act, to include consultation with federally recognized Native American Tribes. The DAF will determine the scope of the analysis by soliciting comments from interested local, state, and federally elected officials and agencies, federally recognized Native American tribes, as well as interested members of the public. Comments are requested on identification of potential alternatives, information, and analyses relevant to the Proposed Action.

Tommy W. Lee,

Acting Air Force Federal Register Liaison Officer.

BILLING CODE 3911–44–P

DEPARTMENT OF DEFENSE

Office of the Secretary

Defense Health Board; Notice of Federal Advisory Committee Meeting

AGENCY: Under Secretary of Defense for Personnel and Readiness, Department Defense (DoD).

ACTION: Notice of Federal advisory committee meeting.

SUMMARY: The DoD is publishing this notice to announce that the following Federal Advisory Committee meeting of the Defense Health Board (DHB) will take place.

DATES: Open to the public Tuesday, June 4, 2024 from 12:00 p.m. to 5:30 p.m. Eastern Daylight Time (EDT).

ADDRESSES: The meeting will be held virtually. To participate in the meeting, see the Meeting Accessibility section for instructions.

FOR FURTHER INFORMATION CONTACT: CAPT Shawn Clausen, 703–275–6060 (voice), *shawn.s.clausen.mil@health.mil* (email). Mailing address is 7700 Arlington Boulevard, Suite 5101, Falls Church, Virginia 22042. Website: *https://www.health.mil/dhb.* The most up-to-date changes to the meeting agenda can be found on the website.

SUPPLEMENTARY INFORMATION: This meeting is being held under the provisions of chapter 10 of title 5, United States Code (U.S.C.) (commonly known as the ''Federal Advisory Committee Act'' or ''FACA''), 5 U.S.C. 552b (commonly known as the ''Government in the Sunshine Act''), and 41 CFR 102–3.140 and 102–3.150.

Availability of Materials for the Meeting: Additional information,

including the agenda, is available on the DHB website, *https://www.health.mil/dhb*. A copy of the agenda or any updates to the agenda for the June 4, 2024, meeting will be available on the DHB website. Any other materials presented in the meeting may also be obtained at the meeting.

Purpose of the Meeting: The DHB provides independent advice and recommendations to maximize the safety and quality of, as well as access to, health care for DoD health care beneficiaries. The purpose of the meeting is to provide progress updates on specific tasks before the DHB. In addition, the DHB will receive information briefings on current issues related to military medicine.

Agenda: The DHB anticipates receiving updates from the DHB Public Health Subcommittee's tasking on Effective Public Health Communication Strategies with DoD personnel and the DHB Trauma and Injury Subcommittee's tasking on Prolonged Theater Care. The DHB also anticipates receiving briefings about the National Center for Disaster Medicine and Public Health and the Health of the Force Report.

Meeting Accessibility: Pursuant to 5 U.S.C. 552b and 41 CFR 102–3.140 through 102–3.165, this meeting is open to the public from 12:00 p.m. to 5:30 p.m. on June 4, 2024. The meeting will be held by videoconference/teleconference. The number of participants is limited and is on a first-come basis. All members of the public who wish to participate must register by emailing their name, rank/title, and organization/company to *dha.dhb@health.mil* or by contacting Dr. Clarice Waters at (703) 275–6003 no later than Tuesday, May 28, 2024. Once registered, participant access information will be provided.

Special Accommodations: Individuals requiring special accommodations to access the public meeting should contact Dr. Clarice Waters at (703) 275–6003 at least five (5) business days prior to the meeting so that appropriate arrangements can be made.

Written Statements: Any member of the public wishing to provide comments to the DHB related to its current taskings or mission may do so at any time in accordance with section 10(a)(3) of the FACA, 41 CFR 102–3.105(j) and 102–3.140, and the procedures described in this notice. Written statements may be submitted to the DHB's Designated Federal Officer (DFO), CAPT Clausen, at *shawn.s.clausen.mil@health.mil.* Supporting documentation may also be included, to establish the appropriate historical context and to provide any necessary background information. If the written statement is not received at least five (5) business days prior to the meeting, the DFO may choose to postpone consideration of the statement until the next open meeting. The DFO will review all timely submissions with the DHB President and ensure they are provided to members of the DHB before the meeting that is subject to this notice. After reviewing the written comments, the President and the DFO may choose to invite the submitter to orally present their issue during an open portion of this meeting or at a future meeting.

Dated: May 6, 2024.

Aaron T. Siegel,

Alternate OSD Federal Register Liaison Officer, Department of Defense.

BILLING CODE 6001–FR–P

DEPARTMENT OF DEFENSE

Department of the Navy

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

Notice of Intent To Prepare an Environmental Impact Statement for Pacific Missile Range Facility and Kōkeʻe Park Geophysical Observatory Real Estate

AGENCY: Department of the Navy (DON), Department of Defense (DoD), and National Aeronautics and Space Administration (NASA).

ACTION: Notice.

SUMMARY: Pursuant to the National Environmental Policy Act (NEPA) of 1969 and regulations implemented by the Council on Environmental Quality, the Department of the Navy (DON) and National Aeronautics and Space Administration (NASA), the DON and NASA announce their intent to prepare an Environmental Impact Statement (EIS) to evaluate the potential environmental effects associated with the continued long-term DoD use of 8,348 acres of State lands on Kauai, Hawaii for operational continuity and sustainment (in support of continued military training, testing, and facility operations) at the Pacific Missile Range Facility (PMRF), and the continued long-term NASA use of 23 acres of State lands on Kauaʻi, Hawaii in support of continued operations (including measurements of the Earth's rotation and local land motion) at Kōkeʻe Park Geophysical Observatory (KPGO).

DATES: The 40-day public scoping period begins on May 8, 2024, and extends to June 17, 2024. Comments must be postmarked or submitted electronically via the project website no later than 11:59 p.m. Hawaii Standard Time (HST) on June 17, 2024 for consideration in the Draft EIS.

Public scoping meetings are planned as follows:

- June 4, 2024, from 5:00–8:00 p.m. HST at Kauaʻi Veterans Center, 3215 Kauaʻi Veterans Memorial Highway, Līhuʻe
- June 5, 2024, from 5:00–8:00 p.m. HST at Kekaha Neighborhood Center, 8130 Elepaio Road, Kekaha
- June 6, 2024, from 5:00–8:00 p.m. HST at Sheraton Coconut Beach Resort, 650 Aleka Loop, Kapaʻa

The purpose of the scoping period is to provide the public with information related to the Proposed Action, its purpose and need, environmental resources to be analyzed in the EIS, the NEPA and HEPA process, consultation under NHPA, and public involvement opportunities. The DON and NASA are providing a web-based platform, as well as public scoping meetings for the public to learn about the Proposed Action and alternatives and to provide scoping comments. Comments must be postmarked or submitted electronically via the website no later than 11:59 p.m. HST on June 17, 2024 for consideration in the Draft EIS.

ADDRESSES: The DON and NASA invite all interested parties to submit scoping comments on the EIS or information regarding historic properties or Section 106 consulting party interest through the project website at *http://www.PMRF-KPGO-EIS.com* or by mail to: Naval Facilities Engineering Systems Command, Hawaii, Environmental OPHEV2, Attention: PMRF and KPGO RE EIS Project Manager, Ms. Kerry Wells, 400 Marshall Road, Building X–11, Pearl Harbor, HI 96860.

FOR FURTHER INFORMATION CONTACT:

DON: Commander, Navy Region Hawaii, Attn: Mr. Danny Hayes, Environmental Public Affairs Specialist, by telephone (808–473–0662) or email (*danny.r.bxhayes6.civ@us.navy.mil*).

NASA: Shari A. Miller, NASA; EIS Project Manager, by telephone (757–824–2327) or email (*Shari.A.Miller@nasa.gov*).

SUPPLEMENTARY INFORMATION:

As the proposed action involves State lands, the EIS will be a joint NEPA, Hawaii Environmental Policy Act (HEPA) (as governed by Hawaii Revised Statutes [HRS] chapter 343), and Hawaii Administrative Rules (HAR) section 11–200.1 (implementing HRS chapter 343) document; therefore, the public scoping processes will run concurrently and will jointly meet NEPA and HEPA

requirements. The DON and NASA are initiating a 40-day public scoping process to receive comments on the scope of the EIS including identification of potential alternatives and environmental concerns, information and analyses relevant to the Proposed Action, issues the public would like to see addressed in the EIS, and the project's potential to affect historic properties pursuant to section 106 of the National Historic Preservation Act (NHPA) of 1966. DON's action proponent for this proposal is Commander, Navy Region Hawaii.

The DON's purpose for the Proposed Action is to maintain long-term DoD use of 8,348 acres of State lands (including leaseholds and easement lands) on Kaua'i, Hawaii for operational continuity and sustainment of the military readiness mission. NASA's purpose for the Proposed Action is to maintain long-term use of 23 acres of State land on Kaua'i, Hawaii for continued operations of KPGO. The Proposed Action is needed because the existing real estate agreements are set to expire between 2027 and 2030. Preserving the long-term DoD and NASA use of these State lands is critical for military readiness, continuation of ongoing military training and testing, and maintaining data collection efforts of global significance. It also ensures the continued conservation management by the DON and NASA of natural and cultural resources on these lands.

For the Hawaii Department of Land and Natural Resources (DLNR), in addition to its role as the lessor of State lands, the proposed real estate action presents an opportunity for the agency to secure a revenue source to support its management of public lands and associated environmental and conservation programs. Fees from leases and easements are put into a State fund as required by law.

By ensuring continued DON and NASA operations on Kaua'i, the real estate action would also preserve local jobs and income for the residents of Kaua'i, financially contribute to the overall economic well-being of Kaua'i, and maintain continued conservation management of natural and cultural resources on State lands at no cost to the State of Hawaii.

The DON and NASA have identified two preliminary action alternatives to carry forward for analysis in the EIS, along with the No Action Alternative.

Alternative 1 (Succeeding Current Real Estate Agreements): The DON and NASA would apply to DLNR for new long-term real estate agreements in the same manner and for the same uses as the current leases and easements.

Alternative 2 (Fee Simple Acquisition of Current Real Estate Agreements for Leaseholds): The DON and NASA would pursue fee simple acquisition of 700 acres (684—DON, 16—NASA) of leaseholds, and otherwise obtain use of the remaining acreage as described in Alternative 1.

Alternative 3 (No Action Alternative): The DON and NASA would not seek any real estate agreements for the State lands on Kaua'i after expiration of the leases and easements between 2027 to 2030. The current real estate agreements for 8,348 acres with the DON and 23 acres with NASA would expire. All existing infrastructure would be removed, or abandoned in place (as determined by the existing real estate agreements), from the DON and NASA leased and easement lands.

Consistent with Council on Environmental Quality regulations and HAR section 11–200.1–24(b), the scope of the analysis for the alternatives in this EIS is proportionate to the potential for environmental impacts. The following 13 resources have a potential for impacts and are analyzed in this EIS: archaeological and historic resources, cultural practices, biological resources, land use, socioeconomics, environmental justice, water resources, utilities, public health and safety, air quality and greenhouse gases, transportation, hazardous materials and wastes, and visual resources. The EIS will analyze measures that would avoid, minimize, or mitigate environmental effects. The DON and NASA will conduct coordination, consultation, and permitting activities required by the NHPA, the Endangered Species Act, the Clean Water Act, the Coastal Zone Management Act, Hawaii Revised Statues chapter 183C and HAR chapter 13–5, HAR chapter 6E, and other laws and regulations determined to be applicable to the project.

This EIS will satisfy both Federal and State of Hawaii requirements and provide the necessary analyses to allow the DON, NASA, and DLNR to consider the environmental effects of the Proposed Action and alternatives as part of their decision-making. The DON and NASA encourages Federal, State, and local agencies, and interested persons to provide comments concerning the alternatives proposed for study and environmental issues for analysis in the EIS, as well as to identify specific environmental resources the DON and NASA should consider when developing the Draft EIS. The DON and NASA will prepare the Draft EIS and will include analyses of potential effects to the resources the DON, NASA, and the commenting public have identified. All comments received during the public scoping period will be considered during EIS preparation.

Comments must be postmarked or submitted electronically by email to *info@PMRF-KPGO-EIS.com,* and/or electronically through the EIS website at *www.PMRF-KPGO-EIS.com.* Comments must be posted by 11:59 p.m. HST on June 17, 2024.

After the scoping period, the DON and NASA will develop the Draft EIS. The DON and NASA intend to release the Draft EIS in summer of 2025, the Final EIS in spring of 2026, with a Record of Decision signed in late spring of 2026.

Dated: May 6, 2024.

Emily A. Pellegrino,

Program Analyst, Directives and Regulatory Team, National Aeronautics and Space Administration.

BILLING CODE 3810–FF–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

Combined Notice of Filings #1

Take notice that the Commission received the following electric rate filings:

Docket Numbers: ER23–2764–004.

Applicants: Northeastern Power & Gas, LLC.

Description: Tariff Amendment: Amendment to 12 to be effective 9/25/2023.

Filed Date: 5/3/24.

Accession Number: 20240503–5171.

Comment Date: 5 p.m. ET 5/24/24.

Docket Numbers: ER24–1420–001.

Applicants: Sierra Estrella Energy Storage LLC.

Description: Tariff Amendment: Response to Deficiency Letter to be effective 3/18/2024.

Filed Date: 5/3/24.

Accession Number: 20240503–5097.

Comment Date: 5 p.m. ET 5/24/24.

Docket Numbers: ER24–1421–001.

Applicants: Superstition Energy Storage LLC.

Description: Tariff Amendment: Superstition Energy Storage LLC submits tariff filing per 35.17(b): Response to Deficiency Letter to be effective 3/18/2024.

Filed Date: 5/3/24.

Accession Number: 20240503–5098.

Comment Date: 5 p.m. ET 5/24/24.

Docket Numbers: ER24–1933–000.

Applicants: AEP Texas Inc.

Description: § 205(d) Rate Filing: AEPTX-Ray Ranch Solar 1st Amended Generation Interconnection Agreement to be effective 4/9/2024.

Filed Date: 5/2/24

Accession Number: 20240502–5150.

Comment Date: 5 p.m. ET 5/23/24.

Docket Numbers: ER24–1934–000.

Applicants: PJM Interconnection, L.L.C.

Description: § 205(d) Rate Filing: Original NSA, Service Agreement No. 7239; AB2–135 to be effective 7/2/2024.

Filed Date: 5/2/24.

Accession Number: 20240502–5160.

Comment Date: 5 p.m. ET 5/23/24.

Docket Numbers: ER24–1935–000.

Applicants: Public Service Company of New Mexico.

Description: § 205(d) Rate Filing: 5th Revised NTUA/NOA Agreements to be effective 5/1/2024.

Filed Date: 5/2/24.

Accession Number: 20240502–5169.

Comment Date: 5 p.m. ET 5/23/24

Docket Numbers: ER24–1936–000.

Applicants: Southwest Power Pool, Inc.

Description: § 205(d) Rate Filing: Tariff Clean-Up Filing Effective 20240604 to be effective 6/4/2024.

Filed Date: 5/3/24.

Accession Number: 20240503–5058.

Comment Date: 5 p.m. ET 5/24/24.

Docket Numbers: ER24–1937–000.

Applicants: PJM Interconnection, L.L.C.

Description: § 205(d) Rate Filing: Original NSA, Service Agreement No. 7240; AC2–061 to be effective 7/3/2024.

Filed Date: 5/3/24

Accession Number: 20240503–5079

Comment Date: 5 p.m. ET 5/24/24.

Docket Numbers: ER24–1938–000.

Applicants: PJM Interconnection, L.L.C.

Description: § 205(d) Rate Filing: Amendment to IISA No. 5885 & ICSA No. 6969, AF1–123_AF1–124_AF1–125 to be effective 7/3/2024.

Filed Date: 5/3/24.

Accession Number: 20240503–5088.

Comment Date: 5 p.m. ET 5/24/24.

Docket Numbers: ER24–1939–000.

Applicants: Midcontinent Independent System Operator, Inc.

Description: § 205(d) Rate Filing: 2024–05–03_True Up of Module B 29.2 to be effective 7/11/2025.

Filed Date: 5/3/24.

Accession Number: 20240503–5101.

Comment Date: 5 p.m. ET 5/24/24

Docket Numbers: ER24–1940–000.

Applicants: Public Service Company of Colorado.

Description: § 205(d) Rate Filing: 2024–05–03 TSGT—COM—Boone-Huckleberry—733 to be effective 7/3/2024.

Filed Date: 5/3/24.

Accession Number: 20240503–5129.

Comment Date: 5 p.m. ET 5/24/24

Docket Numbers: ER24–1941–000.

Applicants: Liberty County Solar Project, LLC.

Description: Baseline eTariff Filing: Application for Market Based Rate Authority to be effective 5/4/2024.

Filed Date: 5/3/24.

Accession Number: 20240503–5139.

Comment Date: 5 p.m. ET 5/24/24.

Docket Numbers: ER24–1942–000.

Applicants: PJM Interconnection, L.L.C.

Description: § 205(d) Rate Filing: Ministerial Clean-Up Filing for Tariff, Schedule 12-Appx, Appx A & Appx C to be effective 1/1/2024.

Filed Date: 5/3/24.

Accession Number: 20240503–5144.

Comment Date: 5 p.m. ET 5/24/24.

The filings are accessible in the Commission's eLibrary system (*https://elibrary.ferc.gov/idmws/search/fercgensearch.asp*) by querying the docket number.

Any person desiring to intervene, to protest, or to answer a complaint in any of the above proceedings must file in accordance with Rules 211, 214, or 206 of the Commission's Regulations (18 CFR 385.211, 385.214, or 385.206) on or before 5:00 p.m. Eastern time on the specified comment date. Protests may be considered, but intervention is necessary to become a party to the proceeding.

eFiling is encouraged. More detailed information relating to filing requirements, interventions, protests, service, and qualifying facilities filings can be found at: *http://www.ferc.gov/docs-filing/efiling/filing-req.pdf.* For other information, call (866) 208–3676 (toll free). For TTY, call (202) 502–8659.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502–6595 or *OPP@ferc.gov.*

Dated: May 3, 2024.

Debbie-Anne A. Reese,

Acting Secretary.

BILLING CODE 6717–01–P

ENVIRONMENTAL PROTECTION AGENCY

[FRL 11953–01–OA]

Extension of Deadline for Nominations to Historically Black Colleges and Universities and Minority Serving Institutions Advisory Council

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of extension of deadline.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is extending the deadline for nominations for the Historically Black Colleges and Universities and Minority Serving Institutions Advisory Council pursuant to the authority of the Federal Advisory Committee Act (FACA), as amended. The Historically Black Colleges and Universities and Minority Serving Institutions Advisory Council (HBCU–MSI AC) is a Federal advisory committee chartered under the Federal Advisory Committee Act. The HBCU–MSI AC was created in 2023 by the United States Environmental Protection Agency's Office of Public Engagement and Environmental Education at the direction of the Administrator of EPA. Implementing authority was delegated to the Administrator of EPA. The HBCU–MSI AC provides independent advice and recommendations to the Administrator of the Environmental Protection Agency (EPA) on how to leverage Historically Black Colleges and Universities and Minority Serving Institutions to help diversify the agency's workforce and nurture the next generation of environmental leaders and ensure that these vital institutions of higher learning have the resources and support to continue to thrive for generations to come. MSIs are institutions of higher education that serve minority populations and include HBCUs, Hispanic-Serving Institutions (HSIs), Tribal Colleges and Universities (TCUs), and Asian American and Pacific Islander Serving Institutions (AAPISIs).

DATES: EPA originally posted a solicitation for applications to the HBCU–MSI AC on March 25, 2024, (89 FR 20651) with an original deadline of May 8, 2024. EPA has determined that an extension of the original deadline is warranted. EPA will consider applications received by June 22, 2024, for potential selection to the inaugural HBCU–MSI AC. Applications received after this date may be considered by EPA as appropriate and when vacancies become available. If you have already submitted an application, EPA will consider your application and there is no need to re-apply.

ADDRESSES: Individuals who are interested in being considered for the HBCU–MSI AC must submit their contact information, a resume or CV and statement of interest electronically via email to Pradnya Bhandari at *HBCU-MSI.AC@epa.gov,* with the subject line HBCU–MSI AC, COMMITTEE APPLICATION PACKAGE 2024 for (Name of Nominee).

FOR FURTHER INFORMATION CONTACT: Pradnya Bhandari, Designated Federal Officer, Office of Public Engagement and Environmental Education, *HBCU-MSI.AC@epa.gov,* telephone 919–937–1989.

SUPPLEMENTARY INFORMATION: Please note that this notice is to extend the initial deadline for applications to the HBCU–MSI AC. The original notice was published on March 25, 2024 (89 FR 20651), and stated that the original deadline to receive applications was May 8, 2024. EPA has determined that an extension to this deadline is warranted. Accordingly, EPA will consider all applications received by June 24, 2024, for potential selection to the inaugural HBCU–MSI AC. Applications received after this date may be considered by MBDA as appropriate and when vacancies become available. If you have already submitted an application, EPA will consider your application and there is no need to re-apply.

The Historically Black Colleges and Universities and Minority Serving Institutions Advisory Council (HBCU–MSI AC) is a federal advisory committee chartered under the Federal Advisory Committee Act, Public Law 92–463. The HBCU–MSI AC was created in 2023 by the United States Environmental Protection Agency's Office of Public Engagement and Environmental Education at the direction of the Administrator of EPA. Implementing authority was delegated to the Administrator of EPA. The HBCU–MSI AC provides independent advice and recommendations to the Administrator of the Environmental Protection Agency (EPA) on how to leverage Historically Black Colleges and Universities and Minority Serving Institutions to help diversify the agency's workforce and nurture the next generation of environmental leaders and ensure that these vital institutions of higher learning have the resources and support to continue to thrive for generations to come. MSIs are institutions of higher education that serve minority populations and include HBCUs, Hispanic-Serving Institutions (HSIs), Tribal Colleges and Universities (TCUs), and Asian American and Pacific Islander Serving Institutions (AAPISIs).

The HBCU–MSI AC is part of a comprehensive effort to advance equity in economic and educational opportunities for all Americans while protecting human health and the environment. Members are appointed by the EPA Administrator for a two-year term. The HBCU–MSI AC expects to meet approximately two to three times a year for in-person, virtual or hybrid meetings, subject to the availability of appropriations. Members serve on the committee in a voluntary capacity. Although we are unable to offer compensation or an honorarium, members may receive travel and per diem allowances, according to applicable Federal travel regulations and the agency's budget. To learn more about HBCU–MSI AC, please visit *https://www.epa.gov/faca/historically-black-colleges-and-universities-and-minority-serving-institutions-advisory.*

The EPA is seeking nominations from a variety of sectors including but not limited to representatives from business and industry, academia, non-governmental organizations, and local, county, and Tribal governments that have experience working at or in partnership with HBCUs and/or MSIs. According to the mandates of FACA, committees are required to support diversity across a broad range of constituencies, sectors, and groups.

In accordance with Executive Order 14035 (June 25, 2021) and consistent with law, EPA values and welcomes opportunities to increase diversity, equity, inclusion, and accessibility on its Federal advisory committees. EPA's Federal advisory committees strive to have a workforce that reflects the diversity of the American people.

The following criteria will be used to evaluate applicants:

- The HBCU–MSI AC will be composed of approximately 15–20 members who will generally serve as Representative members of non-federal interests appointed by the Administrator of EPA.
- Members must have a strong affiliation with HBCUs and/or MSIs or the communities represented and served by HBCUs and/or MSIs, including through education, work, or partnerships.
- Members must demonstrate a knowledge of the student continuum from college to career, preferably through related experience with HBCUs and/or MSIs. In selecting members, EPA will consider candidates from business and industry, academic institutions, State, local and Tribal governments, public interest groups, environmental organizations, service groups, and more. In determining a fair spread across categories, no more than 60% of the advisory committee can come from a single categorical entity.
- Members must demonstrate notable commitment to environmental issues with extensive involvement, knowledge, or engagement with relevant material and/or affected communities.
- Members must demonstrate a working knowledge of Federal, State, and local government operations and systems.
- Members must demonstrate a notable commitment to Diversity, Equity, Inclusion and Accessibility, including for underserved communities.
- Members must demonstrate an ability to work in a consensus building process with a wide range of representative from diverse constituencies.
- Members must be able to contribute approximately 10 to 15 hours per month to HBCU–MSI AC activities, including the attendance at meetings and participating in the development of advice letters/reports and other material.
- Members must demonstrate potential for active and constructive involvement in HBCU–MSI AC work.

How to Submit Applications: Any interested person or organization may apply to be considered for an appointment to serve on the Historically Black Colleges and Universities and Minority Serving Institutions Advisory Council.

- Applications must include:

(1) contact information as outlined below:

Applicants must provide their: full legal name, preferred name if applicable, pronouns, date of birth, current home address, and phone number.

(2) resume or curriculum vitae (CV)

(3) statement of interest explaining why you would like to serve on this committee:

The statement of interest should describe how the nominee's background, knowledge, and experience would add value to the committee's work, and how the individual's qualifications would contribute to the overall diversity of the Historically Black Colleges and Universities and Minority Serving Institutions Advisory Council. To help the Agency in evaluating the effectiveness of its outreach efforts, please include in the statement of interest how you learned of this opportunity.

Please be aware that EPA's policy is that, unless otherwise prescribed by statute, members generally are appointed for a two-year term. For appointment consideration, interested nominees should submit the application materials electronically via email to Pradnya Bhandari at *HBCU-MSI.AC@epa.gov,* with the subject line HBCU–MSI AC, COMMITTEE APPLICATION PACKAGE 2024 for (Name of Nominee).

Jessica Loya,

Deputy Associate Administrator, Office of Public Engagement, Office of Public Engagement and Environmental Education, Office of the Administrator.

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

[FRL–11937–01–OMS]

Good Neighbor Environmental Board

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of meeting.

SUMMARY: Under the Federal Advisory Committee Act, the Environmental Protection Agency (EPA) gives notice of a public meeting of the Good Neighbor Environmental Board (GNEB). The purpose of this meeting is for the board to discuss and approve its next charge topic(s) for the GNEB 21st report.

DATES: May 29, 2024, from 11:00 a.m.–3:00 p.m. (EST). A copy of the agenda will be posted at *www.epa.gov/faca/gneb.*

The meeting will be held virtually and in-person at the U.S. Environmental Protection Agency (EPA) headquarters located at 1200 Pennsylvania Avenue NW, Washington, DC 20460. The meeting is open to the public with limited access available on a first-come, first-served basis. Members of the public wishing to participate should contact Eugene Green at *green.eugene@epa.gov* by May 22nd.

Requests to make oral comments or submit written public comments to the board, should also be directed to Eugene Green at least five business days prior to the meeting. Requests for accessibility and/or accommodations for individuals with disabilities should be directed to Eugene Green at the phone number or email address listed below. To ensure adequate time for processing, please make requests for accommodations at least 10 business days prior to the meeting.

FOR FURTHER INFORMATION CONTACT: For information regarding the GNEB meeting, please contact Eugene Green at (202) 564–2432 or via email at *green.eugene@epa.gov.*

SUPPLEMENTARY INFORMATION: The GNEB is an independent federal advisory committee chartered under the Federal Advisory Committee Act, Public Law 92–463. Its mission is to advise the President and Congress of the United States on good neighbor practices along the U.S. border with Mexico. Its recommendations are focused on environmental infrastructure needs within the U.S. states contiguous to Mexico.

Dated: May 3, 2024.

Eugene Green,

Program Analyst.

[EPA–R10–RCRA–2023–0638; FRL–11886–01–R10]

Idaho: Notice of Determination of Adequacy of Idaho's Research, Development and Demonstration Permit Provisions for Municipal Solid Waste Landfills

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: The Environmental Protection Agency (EPA) is approving Idaho's modification to its approved Municipal Solid Waste Landfill (MSWLF) permit program. On March 22, 2004, the EPA issued final regulations allowing Research, Development, and Demonstration (RD&D) permits to be issued to certain MSWLFs by approved states. On September 14, 2023, the Idaho Department of Environmental Quality submitted an application to the EPA seeking Federal approval of its RD&D requirements. The EPA has reviewed the application and determined it to be adequate.

DATES: This determination of adequacy will become effective July 8, 2024 without further notice unless the EPA receives adverse comments on or before July 8, 2024. If adverse comments are received, the EPA will review the comments and publish another **Federal Register** document responding to the comments and will either affirm or revise its initial decision.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–R10–RCRA–2023–0638, at *https://www.regulations.gov.* Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from regulations.gov. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.,* on the Web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *https://www.epa.gov/dockets/commenting-epa-dockets.*

FOR FURTHER INFORMATION CONTACT: Domenic Calabro, U.S. EPA Region 10, 1200 6th Avenue, Suite 155, Seattle, WA 98101, (206) 553–6640, *calabro.domenic@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. Background

On March 22, 2004, the EPA issued a final rule amending the Municipal Solid Waste Landfill (MSWLF) criteria in the Code of Federal Regulations (CFR) at 40 CFR part 258 to allow for Research, Development and Demonstration (RD&D) permits (69 FR 13242). That rule allows for variances from specified criteria for a limited period of time, to be implemented through state-issued RD&D permits. RD&D permits are available only in states with approved MSWLF permit programs that have been modified to incorporate RD&D permit authority.

While states are not required to adopt this provision, those states that are interested in providing RD&D permits to owners and operators of MSWLFs must seek approval from the EPA before issuing such permits. Approval procedures for new provisions of 40 CFR part 258 are outlined in 40 CFR 239.12.

On September 21, 1993, the EPA published a final rule approving Idaho's MSWLF permit program (65 FR 453). On September 14, 2023, the Idaho Department of Environmental Quality applied for approval of its RD&D permit provisions, codified at Idaho Code 39–7421, Idaho Solid Waste Facilities Act.

II. Decision

After a thorough review of Idaho's revision package, the EPA determined that Idaho's RD&D permit provisions, as set out in Idaho Code 39–7421, Idaho Solid Waste Facilities Act, are adequate to ensure compliance with the Federal criteria as set out in 40 CFR 258.4.

*Authority:*This action is issued under the authority of sections 2002, 4005 and 4010(c) of the Solid Waste Disposal Act, as amended, 42 U.S.C. 6912, 6945 and 6949(a).

Dated: May 3, 2024.

Casey Sixkiller,

Regional Administrator, Region 10.

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060–0496; FR ID 217978]

Information Collection Being Reviewed by the Federal Communications Commission Under Delegated Authority

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995, the Federal Communications Commission (FCC or the Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collection. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission's burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the PRA that does not display a valid Office of Management and Budget (OMB) control number.

DATES: Written PRA comments should be submitted on or before July 8, 2024. If you anticipate that you will be submitting comments, but find it difficult to do so within the period of time allowed by this notice, you should advise the contact listed below as soon as possible.

ADDRESSES: Direct all PRA comments to Nicole Ongele, FCC, via email *PRA@fcc.gov* and to *nicole.ongele@fcc.gov.*

FOR FURTHER INFORMATION CONTACT: For additional information about the information collection, contact Nicole Ongele, (202) 418–2991.

SUPPLEMENTARY INFORMATION:

OMB Control Number: 3060–0496.

Title: ARMIS Operating Data Report, FCC Report 43–08.

Type of Review: Extension of a currently approved collection.

Respondents: Business or other for-profit entities.

Number of Respondents and Responses: 49 respondents; 49 responses.

Estimated Time per Response: 8 hours.

Frequency of Response: Annual reporting requirement.

Obligation to Respond: Mandatory. Statutory authority for this information collection is contained in 47 U.S.C. 219 and 220 of the Communications Act of 1934, as amended.

Total Annual Burden: 392 hours.

Total Annual Cost: No cost.

Needs and Uses: The information contained in FCC Report 43–08 has helped the Commission fulfill its regulatory responsibilities. Automated reporting of these data greatly enhances the Commission's ability to process and analyze the extensive amounts of data provided in the reports. Automating and organizing data submitted to the Commission facilitate the timely and efficient analysis of revenue requirements, rates of return and price caps, and provide an improved basis for auditing and other oversight functions. Automated reporting also enhances the Commission's ability to quantify the effects of policy proposals. The Commission has granted all carriers forbearance from many of the requirements of ARMIS 43–08 conditioned on approval of a data retention compliance plan and continued submission of certain ARMIS 43–08 data related to access lines in service to customers.

Federal Communications Commission.

Marlene Dortch,

Secretary, Office of the Secretary.

FEDERAL RESERVE SYSTEM

Formations of, Acquisitions by, and Mergers of Bank Holding Companies

The companies listed in this notice have applied to the Board for approval, pursuant to the Bank Holding Company Act of 1956 (12 U.S.C. 1841 *et seq.*) (BHC Act), Regulation Y (12 CFR part 225), and all other applicable statutes and regulations to become a bank holding company and/or to acquire the assets or the ownership of, control of, or the power to vote shares of a bank or bank holding company and all of the banks and nonbanking companies owned by the bank holding company, including the companies listed below.

The public portions of the applications listed below, as well as other related filings required by the Board, if any, are available for immediate inspection at the Federal Reserve Bank(s) indicated below and at the offices of the Board of Governors. This information may also be obtained on an expedited basis, upon request, by contacting the appropriate Federal Reserve Bank and from the Board's Freedom of Information Office at *https://www.federalreserve.gov/foia/request.htm.* Interested persons may express their views in writing on the standards enumerated in the BHC Act (12 U.S.C. 1842(c)).

Comments received are subject to public disclosure. In general, comments received will be made available without change and will not be modified to remove personal or business information including confidential, contact, or other identifying information. Comments should not include any information such as confidential information that would not be appropriate for public disclosure.

Comments regarding each of these applications must be received at the Reserve Bank indicated or the offices of the Board of Governors, Ann E. Misback, Secretary of the Board, 20th Street and Constitution Avenue NW, Washington, DC 20551–0001, not later than June 10, 2024.

A. Federal Reserve Bank of Chicago (Colette A. Fried, Assistant Vice President) 230 South LaSalle Street, Chicago, Illinois 60690–1414. Comments can also be sent electronically to *Comments.applications@chi.frb.org:*

1. *Wintrust Financial Corporation, Rosemont, Illinois;* to merge with Macatawa Bank Corporation, and thereby indirectly acquire Macatawa Bank, both of Holland, Michigan.

Board of Governors of the Federal Reserve System.

FEDERAL RESERVE SYSTEM

[Docket No. OP–1831]

Expansion of Fedwire® Funds Service and National Settlement Service Operating Hours

AGENCY: Board of Governors of the Federal Reserve System.

ACTION: Request for comment.

SUMMARY: The Board of Governors of the Federal Reserve System (Board) is seeking input on a proposal to expand the operating hours of the Fedwire® Funds Service and the National Settlement Service (NSS). The Board proposes to expand the operating hours of the Fedwire Funds Service to 22 hours per day, 7 days per week, every day of the year (22x7x365) and to correspondingly expand the operating hours of NSS, with NSS closing 30 minutes earlier than the Fedwire Funds Service. At this time, the Board is not considering expanding operating hours for the Fedwire Securities Service. The Board requests comments on the potential benefits, risks, and implementation considerations of the proposal.

DATES: Comments on the proposed actions must be received on or before July 8, 2024.

ADDRESSES: You may submit comments, identified by Docket No. OP–1831, by any of the following methods:

- *Agency website: http://www.federalreserve.gov.* Follow the instructions for submitting comments at *http://www.federalreserve.gov/generalinfo/foia/ProposedRegs.cfm.*
- *Email: regs.comments@federalreserve.gov.* Include docket number in the subject line of the message.
- *FAX:* (202) 452–3819 or (202) 452–3102.
- *Mail:* Ann Misback, Secretary, Board of Governors of the Federal Reserve System, 20th Street and Constitution Avenue, NW, Washington, DC 20551.

All public comments will be made available on the Board's website at *http://www.federalreserve.gov/generalinfo/foia/ProposedRegs.cfm* as submitted, unless modified for technical reasons or to remove personally identifiable information at the

commenter's request. Accordingly, comments will not be edited to remove any identifying or contact information. Public comments may also be viewed electronically or in paper in Room 146, 1709 New York Avenue NW, Washington, DC 20006, between 9:00 a.m. and 5:00 p.m. eastern time (ET) on weekdays.

FOR FURTHER INFORMATION CONTACT: Mark Magro, Manager, Division of Reserve Bank Operations and Payment Systems (202–452–3944); Ann Sun, Lead Financial Institution Policy Analyst, Division of Reserve Bank Operations and Payment Systems (202–912–7938); or Gavin Smith, Senior Counsel, Legal Division (202 452–3474); or Corinne Milliken Van Ness, Senior Counsel, Legal Division (202–452–2421), Board of Governors of the Federal Reserve System. For users of Telecommunications Device for the Deaf (TDD), contact (202–263–4869.)

SUPPLEMENTARY INFORMATION:

I. Background

The Federal Reserve has a long-standing policy objective to foster a safe and efficient U.S. payment system. The Federal Reserve advances its objectives for the payment system through, among other things, the Federal Reserve Banks' (Reserve Banks) operation of two large-value payment services: the Fedwire® Funds Service and NSS.[1] The Fedwire Funds Service is a real-time gross settlement (RTGS) service that allows participating financial institutions (participants) to send and receive individual electronic funds transfers up to one penny less than $10 billion in value that are immediate to participants, final, and irrevocable. NSS is a multilateral settlement service that allows for immediate, final, and irrevocable settlement of obligations that arise from private-sector clearing arrangements, such as check clearinghouses, a private-sector ACH network, and securities settlement systems.[2] Together, these services, alongside a large-value payment service operated by the private sector, provide the backbone for the nation's payment system and thereby support a significant amount of economic activity in the United States, including large-value domestic financial market transactions, the U.S. dollar leg of many cross-border transactions, and private-sector payment clearing arrangements.[3]

The Federal Reserve has consistently improved its payment services to meet the evolving needs of the U.S. economy. As technological advancements and globalization of commerce continue to drive change in the large-value payment landscape, the Board believes that expanding the availability of the Fedwire Funds Service and NSS would enhance the safety and efficiency of the U.S. payment system by extending the hours in which settlement in risk-free central bank money can occur.[4] Thus, the Board is proposing to expand the operating hours of the Fedwire Funds Service to 22 hours per day, 7 days per week, every day of the year and to expand the operating hours of NSS correspondingly, with NSS closing 30 minutes earlier than the Fedwire Funds Service.[5] The Board recognizes that a significant expansion in operations for large-value payments in the short term might pose burdensome technical and operational changes at a time when the industry will also be adjusting to the new ISO® 20022 message format for large-value payments and instant payment services.[6] Therefore, the Board proposes that the expansion to 22x7x365 would be implemented no sooner than two years after the migration of the Fedwire Funds Service to the ISO 20022 standard, scheduled for March 2025. The final implementation timeline for 22x7x365 will be determined based on input from this request for comment, among other relevant considerations.

The Board is seeking comment on the potential benefits, risks, costs, and other considerations of expanded hours for the Fedwire Funds Service and NSS, as described in Section II. The Board is also requesting comment on implementation considerations, as described in Section III. As noted, the Board is not considering expanding operating hours for the Fedwire Securities Service at this time.

II. Proposed Action

A. Proposal

The Board proposes to expand the operating hours of Fedwire Funds Service to 22x7x365 and to correspondingly expand the operating hours of NSS. It is anticipated that if the proposal is adopted NSS would continue to close at 6:30 p.m. ET, 30 minutes prior to the close of Fedwire Funds Service at 7:00 p.m. ET. Both services will maintain their current opening time of 9:00 p.m. ET of the preceding calendar day for the proposed weekend operating days. Table 1 summarizes the proposed changes to operating hours for the Fedwire Funds Service and NSS.

[1] ''Fedwire'' is a registered service mark of the Federal Reserve Banks.

[2] Settlement files submitted to NSS can be for an amount up to one penny less than $10 trillion; each entry in a settlement file can be for an amount up to one penny less than $100 billion.

[3] The private-sector large-value payment service is CHIPS®, which is owned and operated by The Clearing House Payments Company L.L.C. (TCH). ''CHIPS'' is a registered service mark of TCH. While the Fedwire Funds Service supports large-value payments (often referred to as ''wholesale'' payments), not all payments sent through the Fedwire Funds Service would be considered large value. For example, while the average value of a payment in 2023 on the Fedwire Funds Service was $5.625 million, the median value was approximately $19,000. In general, smaller-value, general purpose payments sent by consumers and businesses are made using services designed for smaller value (''retail'') transactions such as the Reserve Banks' check clearing and automated clearinghouse (ACH) services, and the FedNow® Service for instant payments. ''FedNow'' is a registered service mark of the Federal Reserve Banks.

[4] Central bank money is a liability of the central bank that can be used for settlement purposes and is considered free of credit and liquidity risks. Central bank money has traditionally taken two forms: cash and reserve balances held by eligible financial institutions at the central bank.

[5] Fedwire Funds Service is currently open from 9:00 p.m. ET of the preceding calendar day to 7:00 p.m. ET, five days per week, Monday through Friday excluding holidays observed by the Reserve Banks. NSS is open from 9:00 p.m. to 6:30 p.m. ET, five days per week, Monday through Friday excluding holidays observed by the Reserve Banks. The Federal Reserve has historically provided at least 30 minutes between the close of NSS and the close of the Fedwire Funds Service, recognizing that the Fedwire Funds Service is the primary alternative for orderly and efficient settlement of bilateral obligations in case a settlement arrangement is unable to complete its multilateral settlement through NSS.

[6] ''ISO'' is a registered service mark of the International Organization for Standardization.

For example, the FedNow Service, which was launched in July 2023, is an instant payments service. Instant payments allow consumers and businesses to send and receive funds from their accounts at banks and credit unions in real time, any time of day, any day of the year, with immediate funds availability to receivers.

TABLE 1—PROPOSED CHANGES TO OPERATING HOURS FOR THE FEDWIRE FUNDS SERVICE AND NSS

	Current operating hours	Proposed operating hours
Fedwire Funds Service[7]	9:00 p.m. ET–7:00 p.m. ET, Monday–Friday, excluding holidays.	9:00 p.m. ET–7:00 p.m. ET, every day.
NSS[8]	9:00 p.m. ET–6:30 p.m. ET, Monday–Friday, excluding holidays.	9:00 p.m. ET–6:30 p.m. ET, every day.

B. Rationale for Proposal

The Federal Reserve has expanded operating hours for the Fedwire Funds Service and NSS over time in response to changing market conditions and industry demand. Most recently, the Board received public comments on expanded hours for the Fedwire Funds Service and NSS in response to **Federal Register** notices related to the development of the FedNow Service.[9] Certain commenters indicated that expanded hours would provide a means for participants in retail instant payment services to manage liquidity needs related to instant payment activity on a round-the-clock basis.[10] To address this industry input and meet FedNow Service implementation timelines, the Board determined that liquidity management transfer functionality should be provided within the FedNow Service at the time of its launch in July 2023. However, the Board indicated it would continue to explore expanded hours for the Fedwire Funds Service and NSS, given the broad benefits that expanded hours could provide to financial markets and the payment systems and market infrastructures that support those markets.[11] Subsequently, in a 2022 notice regarding the implementation of the ISO 20022 format for the Fedwire Funds Service, the Board indicated that the Reserve Banks would conduct engagement with industry stakeholders as part of its analysis of expanded operating hours for the Fedwire Funds Service and NSS.[12]

The Reserve Banks conducted this engagement through outreach sessions with a broad range of stakeholders, including large global financial institutions, small and mid-sized banks in different regions, and nonbanks and service providers, to better understand the needs and concerns of industry. While these industry outreach sessions were informal and not as comprehensive as an information collection conducted through the broader **Federal Register** notice process, stakeholders raised several initial themes. Overall, industry stakeholders that are active in global payments markets expressed strong support for an expansion of Fedwire Funds Service and NSS operating hours up to 24x7x365, stating that expanded hours would enhance the ability of cross-border payments and international commerce to be conducted in U.S. dollars and help preserve the status of the U.S. dollar as the preferred currency for global settlements.[13] In addition, industry stakeholders noted that while 24x7x365 operating hours would be an ideal state in the longer term, other payment system improvement initiatives should be prioritized ahead of an expansion, including implementation of the new FedNow Service for instant payments and ISO 20022 migration of the Fedwire Funds Service. In general, these stakeholders noted that shifting large-value payment operations to full 24x7x365, with no downtime to accommodate system changes and other operational activities, would be challenging to implement in the shorter term.[14]

Smaller banks provided differing perspectives on the benefits of Fedwire Funds Service and NSS expanded hours, with some institutions expressing a lack of pressing need and business case compared with the level of investment required to operate on a 24x7x365 basis. Other institutions saw value in expanded hours to provide increased flexibility in operating hours among West Coast banks or to maximize time available to recover from an operational issue on the same business day. Overall, smaller banks noted the importance of maintaining optionality to participate in Fedwire Funds Service and NSS operating hours such that banks are not required to operate or otherwise maintain staff during expanded hours.

Concurrent with the Federal Reserve's consideration of expanded operating hours for the Fedwire Funds Service and NSS, the international community has been advancing initiatives to improve the cost, speed, accessibility, and transparency of cross-border payments. In 2020, the G20 leaders endorsed the Roadmap for Enhancing Cross-Border Payments, which set out a series of ''building blocks'' to address the frictions underlying the challenges associated with cross-border payments.[15] Building Block 12 focused on extending and aligning the operating hours of existing payment infrastructures and arrangements across jurisdictions, particularly RTGS systems. Cross-jurisdiction alignment could speed up cross-border payments, improve liquidity management, and reduce settlement risk, among other benefits.[16] Global alignment of large-value RTGS system operating hours has been a driver of past expansions for the

[7] The Fedwire Funds Service begins processing online payment orders beginning at 9:00 p.m. ET on the preceding calendar day. The Fedwire Funds Service begins processing online nonvalue messages at 8:35 p.m. ET on the preceding calendar day. The cutoff time for special account messages is 5:00 p.m. ET, the cutoff time for customer messages is 6:45 p.m. ET, and the cutoff time for bank messages is 7:00 p.m. ET. The Fedwire Funds Service closes at 7:00 p.m. ET.

[8] The file processing window for NSS begins at 9:00 p.m. ET on the preceding calendar day and closes at 6:30 p.m. ET.

[9] *See* 83 FR 57351 (Nov. 15, 2018) and 84 FR 39297 (Aug. 9, 2019).

[10] The 24x7x365 nature of instant payments requires banks to have sufficient liquidity to settle instant payments at any time, any day of the week. As a result, banks need a method to fund accounts used to settle instant payment transactions during hours when large-value payment services are not currently open. See 83 FR 57351 (Nov. 15, 2018).

[11] *See* 84 FR 39297 (Aug. 9, 2019). The Board indicated that further analysis was needed to evaluate fully the relevant operational, risk, and policy considerations of expanded Fedwire Funds Service and NSS operating hours.

[12] *See* 87 FR 64217 (Oct. 24, 2022).

[13] Certain industry stakeholders have also expressed these views via the industry-led Payments Risk Committee. *See Payments Risk Committee: Fedwire Expanded Hours Whitepaper,* available at *https://www.newyorkfed.org/medialibrary/microsites/prc/files/2021/prc-fedwire-expanded-hours-considerations-white-paper.*

[14] In outreach sessions, industry stakeholders indicated that the elimination of downtime between the close and open of the Fedwire Funds Service and NSS could pose a more significant challenge than expanding operating hours into the weekend.

[15] See *Financial Stability Board: Enhancing Cross-border Payments: Stage 3 Roadmap* available at *https://www.fsb.org/wp-content/uploads/P131020-1.pdf.* See also *Financial Stability Board: Enhancing Cross-border Payments: Stage 1 report to the G20* available at *https://www.fsb.org/wp-content/uploads/P090420-1.pdf* which discusses key frictions in cross-border payments.

[16] In February 2023, the Financial Stability Board published an updated and prioritized Roadmap centered on three priority themes, which includes the extension and alignment of the operating hours of key payment systems. Available at *https://www.fsb.org/2023/02/g20-roadmap-for-enhancing-cross-border-payments-priority-actions-for-achieving-the-g20-targets/.*

Fedwire Funds Service because of the risk-reducing benefits.[17] Though the gaps in operating hours between the Fedwire Funds Service and other RTGS systems have decreased over time, gaps still remain, in particular during weekend hours. Expanding the operating hours of the Fedwire Funds Service and NSS into the weekend would be consistent with the broader G20 agenda and would be consistent with the actions of other central banks that are considering or have already expanded operating hours for their large-value payment services.[18]

Also, the Federal Reserve recognizes that payment infrastructure needs to evolve to support commerce that is increasingly being conducted outside traditional business hours. Expanded hours for the Fedwire Funds Service and NSS alongside the FedNow Service would bring the benefits of near round-the-clock payments for large-value, wholesale payments, such as multi-million dollar business invoices, real estate transactions, and insurance payouts, ensuring that the evolution of commerce is supported across retail and wholesale infrastructures.[19]

C. Analysis of Options for Expanded Hours

While 24x7x365 operating hours for the Fedwire Funds Service and NSS remains a possibility in the longer term, the Board recognizes that the shift to full round-the-clock operations, with no downtime in operations to complete end-of-day processing or implement system upgrades for large-value payment services, may pose challenges in the shorter term. The Board considered multiple alternatives to the proposed 22x7x365, including the addition of a short weekend window of operating hours on Saturday and/or Sunday; 22 hours per day, 6 days per week; 24 hours per day, 5 days per week; and 24x7x365 operating hours. Overall, the Board believes that expanding to 22x7x365 could achieve many of the benefits of 24x7x365 hours while giving the industry and Reserve Banks time to adjust technology and operations for potential future expansions of operating hours of the Fedwire Funds Service and NSS. Participation in expanded hours would be voluntary. The Board is proposing to extend the current 22x5 Fedwire Funds Service and NSS operating hours to 22x7x365 no sooner than two years after the implementation of the ISO 20022 message format for the Fedwire Funds Service, scheduled for March 2025. (See Section III for a further discussion on implementation considerations).

A key reason for considering a 22x7x365 expansion of Fedwire Funds Service and NSS operating hours is a faster and less costly implementation than a full 24x7x365 expansion, which would help achieve the Board's safety and efficiency policy objectives for large-value payments in the nearer term. In addition, industry feedback to date underscored that investment in technical infrastructure modernization for participants to accommodate round-the-clock availability would pose challenges that could be reduced by a shorter move to 22x7x365 operating hours.

An expansion of Fedwire Funds Service and NSS operating hours to 22x7x365 could also reduce costs and risks to the industry and the Federal Reserve relative to an expansion to 24x7x365 operations. For example, an expansion to 22x7x365 operating hours could allow participants to gradually adapt to seven-day operations for wholesale payments, which could reduce operational risks. Additionally, lessons learned from the expansion could be applied to the potential future development of full 24x7x365 operations for the Fedwire Funds Service and NSS.

D. Benefits, Costs, Risks, and Other Considerations

1. Benefits

Expanding current Fedwire Funds Service and NSS operating hours from five to seven days per week, each day of the year, could improve the safety and efficiency of both domestic and global large-value U.S. dollar payments. Domestically, expanded hours could allow systemically important financial market utilities (FMUs) (that is, a large-value payment service, securities and derivatives clearinghouses, and securities settlement services) and retail payment arrangements (that is, check clearinghouses, an ACH network, and an instant payment service) that leverage the Fedwire Funds Service and/or NSS to have broader options for settlement of time-critical payments.[20] Settlement outside of traditional windows could reduce credit risk in certain FMUs and retail payment arrangements by narrowing the time gap between the creation of payment obligations and the discharge of those obligations in final funds, thereby reducing the potential for spillover effects in the financial system from settlement disruptions. To the extent that FMUs and retail payment arrangements operate outside of traditional windows, these firms could have the option to receive or send funds in central bank money seven days per week, potentially improving their operational efficiency or reducing the build-up of credit risk on days when Fedwire Funds Service and NSS are not currently operating. Expanded hours might also spur new or enhanced private-sector payment solutions that leverage the Fedwire Funds Service and/or NSS, or enable financial market trading and lending activity that previously could not be supported during weekend hours.[21] Finally, as noted above, expanded hours for the Fedwire Funds Service and NSS alongside the FedNow Service would bring the benefits of near round-the-clock payments for large-value consumer and business payments, such

[17] *See* 59 FR 8981 (Feb. 24, 1994). Foreign exchange settlement risk is also commonly known as ''Herstatt risk.'' The name comes from an episode in which a German bank, the Herstatt Bank, was closed by its supervisor after the bank had received deutsche mark payments for foreign exchange transactions, but before it provided U.S. dollars to its counterparties in those transactions. Overlap in central bank services operating hours can mitigate foreign exchange settlement risk by providing an opportunity to shorten the time between the settlement of both legs of a foreign exchange transaction, including enabling simultaneous settlement.

[18] A number of central banks, such as those in Mexico and South Africa, have operated 24x7x365 large-value payment services for some time. Other central banks, including those in India and Switzerland, operate at near 24x7x365. In the United Kingdom, the Bank of England has announced that its next-generation large-value payment service will be capable of near 24x7x365 operations by 2024. The Bank of England will consider extending the operating hours of its large-value payment service in line with the industry's demand. *See* the Bank of England's Roadmap for Real-Time Gross Settlement service beyond 2024, available at *https://www.bankofengland.co.uk/paper/2022/roadmap-for-real-time-gross-settlement-service-beyond-2024.*

[19] The FedNow Service supports real-time, immediate end-to-end instant payments between end user senders and receivers, with immediate funds availability to receivers. The Fedwire Funds Service supports large-value payments that are either between banks only or intended for end-user receivers, with no immediate funds availability requirement for payments to end user receivers.

[20] Currently, the FedNow Service provides liquidity management transfer capability for FedNow participants and participants in a private-sector instant payment service to transfer funds to support instant payment liquidity needs during certain hours including when the Fedwire Funds Service is closed. While the hours of liquidity management transfers in FedNow might be adjusted if Fedwire Funds Service hours are expanded, transfers would remain available during the two-hour Fedwire Funds Service closure.

[21] *See the Committee on Payments and Market Infrastructures final report* ''*Extending and aligning operating hours for cross-border payments,*'' *available at https://www.bis.org/cpmi/publ/d203.pdf.*

as multi-million dollar business invoices, real estate transactions, and insurance payouts.

Expanded hours would also facilitate greater overlap and reduced gaps between the operating hours of the Fedwire Funds Service/NSS and key large-value payment services in other jurisdictions. This overlap and reduction in gaps would support more efficient cross-border payments through faster settlement and improved liquidity management. For example, some industry feedback highlighted the value of Sunday operating hours to support payment flows in the Middle East and North Africa region. Increased overlap in operating hours could provide more opportunities to settle cross-currency payments simultaneously via new or existing payment-versus-payment mechanisms and arrangements, thereby reducing settlement risk and potentially allowing for greater transparency in global foreign exchange (FX) markets.[22] Increased overlap and reduced gaps in operating hours could also speed up settlement of large-value corporate trade payments made through correspondent arrangements by reducing or eliminating the time gap between the U.S. leg of a payment and the leg of the payment in a foreign jurisdiction. Expanded operating hours would be consistent with the actions of other central banks, some of which have already undertaken an expansion of operating hours for their large-value payment services by targeting near or full 24x7x365 operations or by considering or positioning themselves for future expansion.[23]

2. Costs and Risks

The potential benefits of expanding Fedwire Funds Service and NSS operating hours to 22x7x365 need to be weighed against potential costs and risks. Expanded hours would require operational and technical changes that would impose costs on the Reserve Banks and on institutions that participate in the Fedwire Funds Service and NSS. The magnitude of costs would vary by institution. Some institutions have cited the potential for significant costs related to upgrades of legacy infrastructure, as well as increased staffing, to support expanded hours. Others have indicated that costs would be more incremental because their institutions could build on existing infrastructure that they use to support 24x7x365 instant payments. The Board is seeking comment on the cost burden to industry stakeholders of moving to 22x7x365 operations, as well as costs related to potential 24x7x365 operations in the future. Reserve Bank costs are discussed in Section 3.a.

In addition to the potential financial impact, extending current operating hours to every day of the year could generate additional risks to participants, the Reserve Banks, and the U.S. financial system more broadly.[24] For example, transferring funds to meet potential rapid deposit outflows during weekends and holidays could exacerbate liquidity issues for a bank in crisis. This risk could have financial stability implications if large deposit outflows experienced by a single participant created contagion to other participants.

The two-hour window between 7:00 p.m. and 9:00 p.m. ET on Saturday and Sunday under the Board's proposal to expanded hours would serve as a pause in transferring funds to meet deposit outflows.[25] Participants experiencing outflows could potentially utilize this time period to implement liquidity and risk management measures to address outflows. The Board is seeking comments on the likelihood that expanding Fedwire Funds Service and NSS hours would exacerbate liquidity risks arising from deposit outflows, as well as any additional risk controls that would be needed during expanded hours. Relatedly, the Board recognizes that participants' ability to access funding during expanded weekend and holiday hours will be important and seeks comments on the potential benefits and costs of extending discount window operations.

Expanded operating hours could also potentially increase operational and financial risks to participants and the Reserve Banks by expanding the time during which cyber-attacks or other operational disruptions could take place. While these risks are not new to the financial sector, the Board is seeking to understand the industry's readiness to manage these types of risks on a near round-the-clock basis.

3. Other Policy Considerations

The proposed expansion of operating hours to 22x7x365 would constitute major enhancements to the Fedwire Funds Service and NSS. Under longstanding Board policy, any potential new payment service or major enhancements to an existing service must meet the following criteria: (a) the Federal Reserve must expect to achieve full cost recovery of costs over the long run, (b) the Federal Reserve must expect that its providing the service will yield a clear public benefit, and (c) the service should be one that other providers alone cannot be expected to provide with reasonable effectiveness, scope, and equity.[26] An analysis of these criteria is set forth below.

a. Cost Recovery

Section 11A of the Federal Reserve Act, as added by the Monetary Control Act of 1980, requires that fees for Federal Reserve Bank payment services be set in accordance with the principle that, over the long run, those fees recover the costs of providing the services.[27] In addition, Board policy specifies that each major service category offered by the Federal Reserve must separately satisfy the cost recovery objective of the Monetary Control Act: in the long run, aggregate revenues should match costs.[28]

Initial analysis suggests that over the long run, the Reserve Banks would be able to recover the costs associated with the proposed 22x7x365 expanded operating hours. Discussions with industry stakeholders about the need for expanded hours to support cross-border activity, innovative use cases, and additional settlement opportunities for systemically important and large-value transactions support the assumption that, over time, expanding Fedwire Funds Service and NSS hours would generate increases in volume and revenue. The Reserve Banks completed a cost estimate analysis that included

[22] As explored in the ''Committee on Payments and Market Infrastructures final report: Extending and aligning operating hours for cross-border payments'', expansion of large-value payment system operating hours would also add to the current global settlement window (*i.e.,* the time period during which the largest number of large-value RTGS systems are simultaneously operating).

[23] See footnote 20 regarding Mexico, South Africa, India, Switzerland and the United Kingdom, for example.

[24] It is anticipated that not all participants may choose to participate in the expanded weekend hours at launch. Please see section III.B. for a discussion of optional participation in a 22x7x365 operating environment of the Fedwire Funds Service and NSS.

[25] See Section II.A. Proposal for the proposed operating hours on Saturday and Sunday.

[26] *See* Board of Governors of the Federal Reserve System, ''The Federal Reserve in the Payments System,'' (issued 1984; revised 1990). Available at Federal Reserve Board—Policies: The Federal Reserve in the Payments System.

[27] Specifically, section 11A provides that, ''[o]ver the long run, fees shall be established on the basis of all direct and indirect costs actually incurred in providing the Federal Reserve services priced, including interest on items credited prior to actual collection, overhead, and an allocation of imputed costs which takes into account the taxes that would have been paid and the return on capital that would have been provided had the services been furnished by a private business firm, except that the pricing principles shall give due regard to competitive factors and the provision of an adequate level of such services nationwide.'' 12 U.S.C. 248a.

[28] *See* ''The Federal Reserve in the Payments System,'' *supra* note 28.

system changes and additional staffing during the weekends. The Reserve Banks expect these costs would be offset by increased revenue, subject to various factors such as the competitive and/or economic environment in future years, new product enhancement opportunities, and potential Fedwire Funds Service and NSS pricing changes. In addition, Reserve Bank operational costs may be lower for expanded hours due to efficiency gains that could arise from leveraging operations and customer support staff that are already in place for the FedNow Service. The Board will conduct a full analysis of long-term cost recovery impacts to the Fedwire Funds Service and NSS based on input received on the proposal.

b. Public Benefit

The Board believes the expansion of operating hours for the Fedwire Funds Service and NSS could have several important safety and efficiency benefits. From a domestic perspective, expanded hours could reduce credit risk and improve safety in the financial system by narrowing the time gap between the creation of payment obligations and the discharge of those obligations in final funds, improve operational efficiency in FMUs and retail payment arrangements, and spur innovations in large-value payments such as weekend interbank lending markets. From an international perspective, expanded hours would increase overlap and reduce gaps between the operating hours of the Fedwire Funds Service and NSS and other key large-value real time gross settlement systems internationally and would support greater efficiency in cross-border payments. Please see previous section II.D.1. for a full discussion of potential benefits.

c. Other Providers

Board policy also requires that for any new service or major service change, the service should be one that other providers alone cannot be expected to provide with reasonable effectiveness, scope, and equity.[29] Today, to provide final settlement, the private-sector large-value payment service relies on the Fedwire Funds Service to support its settlement process. Thus, this service would likely not be able to effectively expand its operating hours without a similar expansion in the operating hours of the Fedwire Funds Service. In terms of scope and equity, today the Fedwire Funds Service and NSS are broadly accessible to eligible financial institutions across the country on equal terms.[30] Thus, the Federal Reserve could offer financial institutions similarly broad access to expanded operating hours.

III. Implementation Considerations

This section describes (A) the potential timeline for an expansion of the Fedwire Funds Service and NSS operating hours from 22x5 to 22x7x365, and considerations that will inform the final timeline, (B) considerations for optional participation in a 22x7x365 operating environment, (C) other potential enhancements to the Fedwire Funds Service and NSS, and (D) the availability of the discount window.

A. Timeline for Proposal

The implementation timeline for the expansion of operating hours to 22x7x365 and potentially to 24x7x365 in the future will depend on many factors, including the operational and technical challenges to the Federal Reserve and participants of implementing and adopting potential operating hours expansions, industry preferences related to timing, demand for 22x7x365 and 24x7x365 operating hours among participants, and interdependencies with other developments in the payments landscape. Should the Board decide to proceed with the proposed expansion to 22x7x365, it will consider these and other factors before determining the final timeline.

Based on initial industry outreach conducted after the 2022 **Federal Register** notice for the implementation of the ISO 20022 standard for the Fedwire Funds Service, there is broad consensus from stakeholders that expanding Fedwire Funds Service and NSS operating hours should not occur until after the implementation of the ISO 20022 standard for the Fedwire Funds Service scheduled for March 2025. Initial analysis suggests an expansion of Fedwire Funds Service and NSS operating hours to 22x7x365 could potentially be achieved no sooner than two years after the implementation of the ISO 20022 message format for the Fedwire Funds Service. As a result, if public comments in response to this notice indicate support for the proposed expansion to 22x7x365 operating hours for the Fedwire Funds Service and NSS, the Federal Reserve would expand operating hours to 22x7x365 no sooner than 2027.

In determining an implementation timeline for 22x7x365 operating hours, the Board will consider feedback received in response to this notice, including whether an interim step short of 22x7x365 would be desirable. Key feedback areas will include the extent to which participants would benefit from weekend operating hours for the Fedwire Funds Service and NSS being made available as soon as practicable, and the extent to which participants may need to adjust their staffing, internal systems, and processes to take advantage of weekend operating hours. Furthermore, the eventual timeline will also reflect interdependencies between the development and adoption of expanded operating hours for the Fedwire Funds Service and NSS and other initiatives.

An expansion to full 24x7x365 operating hours for the Fedwire Funds Service and NSS is a possibility in the future. The Board is interested in collecting feedback from industry on constraints, preferences, and demand related to full 24x7x365 operating hours. If the Board does propose to expand operating hours further to 24x7x365, it would seek public comment in a separate proposal.

B. Considerations for Optional Participation in a 22x7x365 Operating Environment of the Fedwire Funds Service and NSS

In alignment with current service terms and in response to industry feedback from smaller institutions, participation in proposed 22x7x365 operating hours for the Fedwire Funds Service and NSS would be optional. Currently, a Fedwire Funds Service participant, for example, may decide not to be open to process payment orders sent to it over the Fedwire Funds Service during overnight hours. Similarly, an institution that participates in a private-sector clearing arrangement for which transactions are settled through NSS may be allowed under the rules of the clearing arrangement (i) not to send or receive transactions using the clearing arrangement during overnight hours (and thus not trigger any settlement obligations) or (ii) to instruct the agent for the NSS settlement arrangement not to include any debit or credit entries for the institution or other institutions for which it settles in any settlement files submitted to NSS during that time.[31]

[29] *See* ''The Federal Reserve in the Payments System,'' *supra* note 28.

[30] Depository institutions may access these services either directly (settling transactions in their Federal Reserve account) or indirectly (through another depository institution that acts as a correspondent bank for the institution).

[31] Only institutions that are settlers in an NSS settlement arrangement may settle debit or credit entries in an NSS settlement file. Settlers may settle debit or credit entries for their own account or on behalf of other institutions that participate in the

The Board believes the optionality should be maintained during any expanded hours.

If a participant chooses not to operate during some or all potential weekend and holiday operating hours of the Fedwire Funds Service, the participant might continue to receive payment orders through the Fedwire Funds Service, just as some participants today receive payment orders while they are not operating during overnight hours. If a participant chooses not to operate during the weekend or on a holiday, it would not be required to take action on any payment orders sent to it during those days if they are not funds-transfer business days for the participant. Alternatively, if a participant wishes to operate only during part of the weekend and holiday operating hours, it may set cutoff or closing times for its funds-transfer business day, after which it would not be required to take action on a payment order sent to it until its next funds-transfer business day.[32] For NSS, if a participant does not settle transactions through the NSS settlement arrangement during weekend or holiday operating hours, it may be unable to send or receive transactions through the private-sector clearing arrangement during that time depending on the rules of the clearing arrangement.

Although optionality with respect to participation in a 22x7x365 operating environment may allow some participants to avoid certain costs associated with an expansion in operating hours of the Fedwire Funds Service and NSS, it may also present certain challenges. For example, a participant that chooses not to operate (that is, send payments), but continues to receive payments in its master account during certain Fedwire Funds Service operating hours, could become a source of trapped liquidity, which could lead to the participant's counterparties implementing liquidity management measures such as restricting payments to the participant while they are offline.[33] Further, such optionality could, over time, hinder broad adoption of expanded hours across the participant base, which could limit the full benefits of 22x7x365 Fedwire Funds Service and NSS. Notwithstanding these considerations, the Board is not contemplating a change to the participation model for Fedwire Funds Service and NSS.

C. Potential Other Enhancements to Fedwire Funds Service and NSS

While this notice focuses on the proposal to expand operating hours to 22x7x365, the Board recognizes there may be other enhancements to the Fedwire Funds Service and NSS that could be considered in the context of or in addition to expanded hours. For example, the possibility of a new participant directory feature that potentially provides a listing of participants open for transactions and at which times has been raised by participants. Other potential service enhancements center around further access to information, such as the improved ability for institutions to track payments from sender to beneficiary, and application programming interfaces (APIs) to access payments-related data. In addition, some institutions have raised the possibility of improved fraud controls or screening capabilities. Finally, a significant undertaking could entail the addition of a liquidity savings mechanism for the Fedwire Funds Service.[34] The Board is seeking to understand such functionality considerations and others, including the priority institutions place on their development, particularly in relation to expanding operating hours.

D. Availability of the Discount Window

The Board recognizes banks' ability to access funding during expanded weekend and holiday hours will be important and seeks comments on the need for discount window operations to support expanded hours.[35] The Board stated in its 2019 notice related to the development of the FedNow Service that the Federal Reserve would conduct analysis on extending discount window operations to make overnight credit available on weekends and holidays. Subsequently, in its 2020 notice announcing the details of the FedNow Service, the Board noted that the need for overnight credit on weekend and holidays was expected to be limited initially, and the hours during which discount window loans could be originated would remain unchanged.[36] This perspective was influenced by the expected low volumes for a new service as well as by the lower dollar value of FedNow Service transactions.

The Board recognizes that the combination of the FedNow Service maturing in the coming years and the Board's proposal to expand Fedwire Funds Service and NSS operating hours, with limits of one penny less than $10 billion per payment order and one penny less than $10 trillion per settlement file, respectively, will increase the importance of accessing liquidity on weekends and holidays. The Board is seeking comment on the potential demand for liquidity via the discount window during expanded hours for the Fedwire Funds Service and NSS and whether its availability during certain defined hours on weekends and holidays would affect industry views on expanded hours.

IV. Expanded Hours Impact on the Payment System Risk Policy (PSR Policy)

Part II of the PSR policy governs the provision of intraday credit (also known as daylight overdrafts) to institutions with accounts at the Reserve Banks and outlines the methods that Reserve Banks use to control credit risk associated with providing intraday credit.[37] Intraday credit supports the smooth functioning of the payment system by supplying temporary liquidity in order to cover shortages in institutions' account that can result when the timing of payment inflows and outflows are not balanced. To be eligible for intraday credit, the PSR policy requires that an institution be ''financially healthy'' and have regular access to the discount window. Reserve Banks monitor financial and supervisory developments to determine an institution's eligibility for intraday credit and have several tools to control credit risk to Reserve Banks, including caps on intraday credit, incentivizing or in some cases requiring collateral, and the ability to monitor the institution's account balance in real time and reject Fedwire Funds Service or NSS transactions.

The PSR policy allows for access to intraday credit up to 24x7x365. Therefore, if the Federal Reserve expands the operating hours of the Fedwire Funds Service and NSS, those institutions eligible to access intraday credit and electing to use the services would have access to intraday credit during the expanded hours. Reserve

private-sector clearing arrangement. Settlers must have their own master account.

[32] *See* 12 CFR part 210, app. A, § 4A–106, 4A–302(a)(1), 4A–404.

[33] However, participants face this same challenge in the current operating environment of the Fedwire Funds Service and NSS, which provides similar optionality in participation.

[34] A liquidity savings mechanism can be defined as a queuing arrangement for payments, which conditions the release of queued payments on the receipt of offsetting or partially offsetting payments, and as a result economizes on the use of participants' cash balances.

[35] Discount window office hours vary by district, but typically begin at 8:00 or 8:30 a.m. local time and end when the Fedwire Funds Service closes at 7:00 p.m. ET.

[36] *See* 85 FR 48522 (August 11, 2020) Liquidity management transfer functionality was included as a core part of the FedNow Service at the time of its launch.

[37] The PSR policy is available at *https://www.federalreserve.gov/paymentsystems/psr_about.htm.*

Banks would continue to use the same general framework to monitor institutions and control credit risk as they use in the current operating environment. Further, if the Federal Reserve expands Fedwire Funds Service and NSS hours, the Board would continue to expect that institutions manage their master accounts in compliance with the Board's Payment System Risk Policy and other Federal Reserve policies, including to avoid overnight overdrafts.[38]

If the Board finalizes this proposal to expand operating hours for the Fedwire Funds Service and NSS, it would also make any necessary updates to existing policies as well, including the PSR policy.

V. Exclusion of the Fedwire Securities Service

At this time, the Board is not considering expanding operating hours for the Fedwire Securities Service.[39] The Board does not expect the proposed expansion of Fedwire Funds Service and NSS operating hours to create significant changes in secured lending, derivatives markets, or other market activity that would necessitate expanded operating hours for the Fedwire Securities Service in the near term. In part, this is because the aggregate value of transfers during current off-hours for the large-value payment services will likely be relatively low at the outset and thus unlikely to result in increased demand for securities transfers during those hours. It is possible that expanded hours for the Fedwire Funds Service and NSS could influence markets in the longer-term, which could in turn increase demand for the Fedwire Securities Service during current off-hours.

The Board understands that expanding operating hours for the Fedwire Securities Service will require greater study and coordination with other FMUs, services, and institutions that are typically open alongside the service, such as securities pricing services and repurchase agreement service providers. The Board will continue to monitor activity in securities markets and seek feedback from institutions to determine whether to pursue in the future an expansion of Fedwire Securities Service operating hours.

VI. Competitive Impact Analysis

Board policy requires that the Board conduct a competitive impact analysis when considering changes to a service. The policy requires the Board to first determine whether there will be a direct and material adverse effect on the ability of other service providers to compete effectively with the Federal Reserve in providing similar services and then, if such an adverse effect is identified, to determine if that effect is due to differing legal powers or the Federal Reserve's dominant market position deriving from such legal differences. Next, if such legal differences exist, then the proposed change would be further evaluated to assess its benefits and the proposal could be modified.[40]

The Board believes that an expansion of Fedwire Funds Service and NSS operating hours would not have a direct and material adverse effect on the ability of other service providers to compete effectively with the Federal Reserve. In particular, the Federal Reserve provides the only large-value payment services in the United States that allow settlement in central bank money. The main private-sector provider of large-value payment services and a number of depository institutions offered comments on a previous **Federal Register** notice noting that they would benefit from an expansion of Fedwire Funds Service operating hours.[41] These organizations indicated that an expansion of Fedwire Funds Service operating hours would improve efficiency and reduce risk in conducting U.S. dollar payments and settlements and would support private-sector payments efforts in the United States. For instance, expanding Fedwire Funds Service operating hours could improve liquidity risk management for payment systems that rely on the Fedwire Funds Service for prefunding (for example, a private-sector instant payment service, a large-value payment service, and a foreign exchange settlement system). Accordingly, an expansion of Fedwire Funds Service and NSS operating hours is not expected to adversely impact any other service provider that competes with Federal Reserve payment services and could instead support their efficiency and resilience.

VII. Request for Comment

The Board requests public comment on the entire proposal, and specifically on the following questions:

1. What are the primary benefits to the banking industry, financial markets, and broader economy from an expansion to 22x7x365 Fedwire Funds Service and NSS operating hours? What are the primary benefits to your institution?

2. What will be the primary sources of demand for expanded hours for the Fedwire Funds Service and NSS, from 22x5 to 22x7x365? What types of transactions or institutions are most likely to generate demand for the ability to make payments during weekend hours? What additional use cases could be satisfied with the expansion to full 24x7x365 operating hours? Would they represent sources of new and additional volume that could flow over the Fedwire Funds Service, a shift of

[38] To minimize Reserve Bank exposure to overnight overdrafts, the Board charges a penalty fee to discourage institutions from incurring overnight overdrafts. See part III of the PSR policy. An institution would incur an overnight overdraft on each calendar day that its account balance is negative at 7:00 p.m. ET, which is the close of the business day. All institutions, regardless of the Reserve Bank payment services that they use, will incur an overnight overdraft penalty charge for each calendar day, including weekends and holidays, that an overnight overdraft is outstanding.

[39] The Fedwire Securities Service is currently open for transfers between participants from 8:30 a.m. ET until 3:30 p.m. ET Monday through Friday, excluding holidays observed by the Reserve Banks. In addition, Fedwire Securities Service participants may reposition securities between their own securities accounts from 8:30 a.m. ET until 7:00 p.m. ET on those same weekdays.

[40] *See* The Federal Reserve in the Payments System (issued 1984; revised 1990), Federal Reserve Regulatory Service 9–1558. The policy states, ''The Board will also conduct a competitive impact analysis when considering an operational or legal change, such as a change to a price or service, or a change to Regulation J, if that change would have a direct and material adverse effect on the ability of other service providers to compete effectively with the Federal Reserve in providing similar services due to differing legal powers or constraints or due to a dominant market position of the Federal Reserve deriving from such legal differences. All operational or legal changes having a substantial effect on payments-system participants will be subject to a competitive-impact analysis, even if competitive effects are not apparent on the face of the proposal. In conducting the competitive-impact analysis, the Board would first determine whether the proposal has a direct and material adverse effect on the ability of other service providers to compete effectively with the Federal Reserve in providing similar services. Second, if such an adverse effect on the ability to compete is identified, the Board would then ascertain whether the adverse effect was due to legal differences or due to a dominant market position deriving from such legal differences. Third, if it is determined that legal differences or a dominant market position deriving from such legal differences exist, then the proposed change would be further evaluated to assess its benefits, such as contributing to payments-system efficiency or integrity or other Board objectives, and to determine whether the proposal's objectives could be reasonably achieved with a lesser or no adverse competitive impact. Fourth, the Board would then either modify the proposal to lessen or eliminate the adverse impact on competitors' ability to compete or determine that the payments-system objectives may not be reasonably achieved if the proposal were modified. If reasonable modifications would not mitigate the adverse effect, the Board would then determine whether the anticipated benefits were significant enough to proceed with the change even though it may adversely affect the ability of other service providers to compete with the Federal Reserve in that service.''

[41] *See* comment letters submitted to the ''Potential Federal Reserve Actions to Support Interbank Settlement of Faster Payments, Request for Comment,'' 83 FR 57351.

existing volume over the service, or both?

3. How might expanded operating hours of the Fedwire Funds Service and NSS support private-sector innovation?

4. How does the existence of the FedNow Service affect your views of the benefits of expanded hours for the Fedwire Funds Service and NSS? How do you anticipate using these services in the future?

5. Do you prefer an interim expansion of operating hours before moving to 22x7x365? If so, what operating hours for the Fedwire Funds Service and NSS would be most useful for your institution? What considerations factor into your preference?

6. What is your preferred timeline for a potential expansion of Fedwire Funds Service and NSS operating hours to 22x7x365? What considerations factor into your preference (for example, demand, time to implement changes, adjustments to staffing and internal systems, other major industry milestones or payment system improvements)?

7. Are you interested in full 24x7x365 operating hours for Fedwire Funds Service and NSS? If so, what is your preferred time frame for such an expansion of operating hours? What considerations factor into your preference?

8. What costs and risks would arise for the banking industry, financial markets, and broader economy from an expansion to 22x7x365 of Fedwire Funds Service and NSS operating hours? What are the costs and risks to your institution? What is the estimated incremental cost on a percentage basis to support 22x7x365 operating hours for the Fedwire Funds Service and NSS? What are the implications for competitiveness?

9. What are the ways in which benefits, costs, or risks of 22x7x365 Fedwire Funds Service and NSS could vary for different types of market participants (for example, for smaller institutions, non-traditional participants, or participants in particular time zones)?

10. Are there infrastructure-related market conditions or barriers (for example, the availability of short-term funding markets over the weekend) that may prevent or reduce your firm's ability to fully achieve the potential benefits of 22x7x365 operating hours for the Fedwire Funds Service and NSS? If so, what are they? What steps might the industry and/or Federal Reserve take to remove such barriers?

11. The Federal Reserve plans to maintain the ability to opt out of expanded hours. How would the optionality with respect to participating in a 22x7x365 operating hours environment of the Fedwire Funds Service and NSS, as described in this notice, benefit or challenge your institution or the broader industry? What steps might the Federal Reserve take to augment potential benefits? What steps might the Federal Reserve take to mitigate potential costs and risks?

12. How does your institution anticipate managing liquidity needs in an expanded hours environment? Is the availability of discount window loan originations on weekends and holidays a prerequisite for expanded operating hours for the Fedwire Funds Service and NSS? If so, should the discount window be available 22x7x365, or alternatively, during certain defined hours on weekends and holidays? During what hours should discount window loan originations be available?

13. What effects, if any, on funding market activity should be taken into account when considering the expansion of operating hours for the Fedwire Funds Service and NSS? Would the expansion of operating hours for the Fedwire Funds Service and NSS affect existing wholesale funding markets, including the repurchase market? Do you expect wholesale funding market activity to occur on weekends and holidays?

14. Describe any other enhancements or initiatives that the Reserve Banks should consider in addition to, or in the context of, expanded hours for the Fedwire Funds Service and NSS. How would such potential enhancements be used in the context of expanded hours? Are there any potential service enhancements that should be prioritized ahead of expanded hours?

15. Please describe any other consideration that you believe should be taken into account as the Board contemplates expansion of operating hours for the Fedwire Funds Service and NSS.

By order of the Board of Governors of the Federal Reserve System.

Ann E. Misback,

Secretary of the Board.

BILLING CODE 6210–01–P

GENERAL SERVICES ADMINISTRATION

[Notice–IEB–2024–05; Docket No. 2024–0002; Sequence No. 23]

Privacy Act of 1974; System of Records

AGENCY: General Services Administration (GSA).

ACTION: Notice of a modified system of records.

SUMMARY: GSA proposes to modify a system of records subject to the Privacy Act of 1974, as amended. The system of records was established to collect and maintain records needed by the Office of Inspections to carry out its responsibilities pursuant to the Inspector General Act of 1978, as amended. The Office of Inspector General (OIG) is statutorily directed to provide leadership and coordination and recommend policies for activities relating to programs and operations of the General Services Administration, to promote economy, efficiency, and effectiveness in the administration of such programs and operations, and to prevent and detect fraud, waste, and abuse in such programs and operations. Accordingly, the records in this system are used in the course of inspections and evaluations, and other special projects as determined by the Inspector General. The previously published notice is being revised to add four new routine uses and make changes to update the System Of Records Notice (SORN).

DATES: Submit comments on or before June 10, 2024.

ADDRESSES: Comments may be submitted to the Federal eRulemaking Portal, *http://www.regulations.gov.* Submit comments by searching for GSA/ADM–25, Inspection Case Files.

FOR FURTHER INFORMATION CONTACT: Call or email Richard Speidel, Chief Privacy Officer at 202–969–5830 and *gsa.privacyact@gsa.gov.*

SUPPLEMENTARY INFORMATION: GSA proposes to modify a system of records subject to the Privacy Act of 1974, 5 U.S.C. 552a. GSA intends to add four new routine uses that are consistent with the purposes of this system of records.

GSA proposes adding a routine use (routine use ''o'') and revising routine use ''p'' to reflect the current Office of Management and Budget (OMB) breach response guidance in M–17–12, Preparing for and Responding to a Breach of Personally Identifiable Information.

The Inspector General Empowerment Act of 2016 (IGEA), 5 U.S.C. 406(j), exempts certain computerized data comparisons performed by or in coordination with Inspectors General from the Computer Matching and Privacy Protection Act of 1988, Pub. L. 100–503. GSA proposes adding a new routine use (routine use ''r'') to clarify that the GSA Office of Inspector General (OIG) has authority to compare OIG records contained in the system with the records of other Federal agencies and non-Federal records.

GSA also proposes adding two additional routine uses. The first is a new routine use (routine use ''s'') to permit disclosures to the Office of Personnel Management (OPM), Government Accountability Office (GAO) and the Office of Management and Budget (OMB) in accordance with their responsibilities for evaluating Federal programs. The second is a routine use (routine use ''t'') to allow GSA OIG to disclose pertinent records in any legal proceeding before a court or administrative body where GSA or GSA OIG is a party.

Additionally, GSA is making changes to the SORN to update the information in the SORN. In addition to making minor technical and administrative corrections and changes to format, GSA proposes: (1) updating the system location to include secure servers maintained by third-party secure providers to support the procurement of solutions or processes that may require the support of third-party service providers; (2) changing the name of the system of record; (3) providing a new description of the purpose of the SORN to better summarize the purpose of this system of records; (4) updating the categories of records in the system and the records source categories; (5) adding a section for the categories of individuals covered by the system; (6) updating the location of electronic records, record storage and safeguarding procedures to reflect new technology and procedures used to protect government records; and (7) changing the notification, access, and amendment procedures to align with the corresponding GSA Code of Federal Regulations. The proposed revisions are compatible with the purpose of this system of record.

Richard Speidel,

Chief Privacy Officer,Office of the Deputy Chief Information Officer, General Services Administration.

SYSTEM NAME AND NUMBER:

Inspection Case Files, GSA/ADM–25.

SECURITY CLASSIFICATION:

Unclassified.

SYSTEM LOCATION:

The system is maintained electronically and in paper form at the GSA Office of Inspector General, 1800 F Street NW, Washington, DC 20405. Original and duplicate systems may exist, in whole or in part, at secure sites and on secure servers maintained by third-party service providers for the GSA OIG. These systems are FedRAMP Moderate compliant and have all applicable Federal Information Security Modernization Act (FISMA), Federal Information Processing Standards (FIPS), and security controls as applicable.

SYSTEM MANAGER(S):

Director, Information Technology of the Office of Inspector General, General Services Administration (JPM), 1800 F Street, NW, Washington, DC 20405.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

General authority to maintain the system is contained in the Inspector General Act of 1978, as amended, 5 U.S.C. 401–424.

PURPOSE(S) OF THE SYSTEM:

The OIG maintains this system of records to carry out its responsibilities pursuant to the Inspector General Act of 1978, as amended. The OIG is statutorily directed to provide leadership and coordination and recommend policies for activities relating to programs and operations of the General Services Administration, to promote economy, efficiency, and effectiveness in the administration of such programs and operations, and to prevent and detect fraud, waste, and abuse in such programs and operations. Accordingly, the records in this system are used in the course of inspections and evaluations, and other special projects as determined by the Inspector General.

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

The system contains records pertaining to present and former GSA and OIG employees, applicants for employment with GSA and GSA OIG, individuals who have filed a complaint with GSA or GSA OIG, individuals who have provided information to inspections and evaluations, government contractors and employees of government contractors, and individuals referenced in potential or actual cases and matters being examined by the Office of Inspections.

CATEGORIES OF RECORDS IN THE SYSTEM:

Inspection files contain information such as name, date, place of birth, contact information, social security number, experience, work-history, and other material that is used in GSA OIG inspections, evaluations, and operations.

RECORD SOURCE CATEGORIES:

Records are collected from other systems, individuals and their representatives, present and former GSA and OIG employees, witnesses, complainants, other Federal and State agencies, non-Federal entities, data services, employers, references, co-workers, government contractors, educational institutions, and public sources.

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND PURPOSES OF SUCH USES:

In addition to other disclosures generally permitted under subsection (b) of the Privacy Act of 1974, 5 U.S.C. 552a(b), the GSA OIG may disclose records for the following routine uses:

a. A record of any case in which there is an indication of a violation or potential violation of law, whether civil, criminal, or regulatory in nature, may be disseminated to the appropriate Federal, State, local, or foreign agency charged with the responsibility for investigating or prosecuting such a violation or charged with enforcing or implementing the law.

b. A record may be disclosed to a Federal, State, local, or foreign agency or to an individual or organization in the course of investigating a potential or actual violation of any law, whether civil, criminal, or regulatory in nature, or during the course of a trial or hearing or the preparing for a trial or hearing for such a violation, if there is reason to believe that such agency, individual, or organization possesses information relating to the investigation, and disclosing the information is reasonably necessary to elicit such information or to obtain the cooperation of a witness or an informant.

c. A record relating to a case or matter may be disclosed in an appropriate Federal, State, local, or foreign court or grand jury proceeding in accordance with established constitutional, substantive, or procedural law or practice, even when the agency is not a party to the litigation.

d. A record relating to a case or matter may be disclosed to an actual or potential party or to his or her attorney for the purpose of negotiation or discussion on matters such as settlement of the case or matter, plea-

bargaining, or informal discovery proceedings.

e. A record relating to a case or matter that has been referred by an agency for investigation, prosecution, or enforcement or that involves a case or matter within the jurisdiction of any agency may be disclosed to the agency to notify it of the status of the case or matter or of any decision or determination that has been made or to make such other inquiries and reports as are necessary during the processing of the case or matter.

f. A record relating to a case or matter may be disclosed to a foreign country pursuant to an international treaty or convention entered into and ratified by the United States, or to an Executive agreement.

g. A record may be disclosed to a Federal, State, local, foreign, or international law enforcement agency to assist in crime prevention and detection or to provide leads for investigation.

h. A record may be disclosed to a Federal, State, local, foreign, Tribal, or other public authority in response to its request in connection with the assignment, hiring or retention of an individual and/or employee, or disciplinary or other administrative action concerning an employee, the issuance or revocation of a security clearance, the reporting of an investigation of an individual and/or employee, or the award of a contract, grant, or other benefit by the requesting agency, to the extent that the information relates to the requesting agency's decision on the matter.

i. A record may be disclosed to news media and the public in order to provide information related to an inspection or evaluation when the Inspector General determines there exists a legitimate public interest, unless the Inspector General determines that release of the specific information in the context of a particular case would constitute an unwarranted invasion of personal privacy.

j. A record may be disclosed to an appeal, grievance, hearing, or complaint examiner; an equal opportunity investigator, arbitrator, or mediator; and/or an exclusive representative or other person authorized to investigate or settle a grievance, complaint, or appeal filed by an individual who is the subject of the record.

k. A record may be disclosed as a routine use to a Member of Congress or to a congressional staff member in response to an inquiry of the congressional office made at the request of the person who is the subject of the record.

l. Information may be disclosed at any stage of the legislative coordination and clearance process to the Office of Management and Budget (OMB) for reviewing private relief legislation as set forth in OMB Circular No. A–19.

m. A record may be disclosed: (a) to an expert, a consultant, or contractor of GSA or GSA OIG engaged in a duty related to an agency function to the extent necessary to perform the function; and (b) to a physician to conduct a fitness-for-duty examination of a GSA or GSA OIG officer or employee.

n. A record may be disclosed to any official charged with the responsibility to conduct qualitative assessment reviews of internal safeguards and management procedures employed in inspection operations. This disclosure category includes members of the Council of the Inspectors General on Integrity and Efficiency and officials and administrative staff within their chain of command, as well as authorized officials of the Department of Justice and the Federal Bureau of Investigation.

o. To appropriate agencies, entities, and persons when (1) GSA and/or GSA OIG suspects or has confirmed that there has been a breach of the system of records; (2) GSA and/or GSA OIG has determined that as a result of the suspected or confirmed breach there is a risk of harm to individuals, GSA and/or GSA OIG (including its information systems, programs, and operations), the Federal Government, or national security; and (3) the disclosure made to such agencies, entities, and persons is reasonably necessary to assist in connection with GSA's and/or GSA OIG's efforts to respond to the suspected or confirmed breach or to prevent, minimize, or remedy such harm.

p. To another Federal agency or Federal entity, when GSA and/or GSA OIG determines that information from this system of records is reasonably necessary to assist the recipient agency or entity in (1) responding to a suspected or confirmed breach or (2) preventing, minimizing, or remedying the risk of harm to individuals, the recipient agency or entity (including its information systems, programs, and operations), the Federal Government, or national security, resulting from a suspected or confirmed breach.

q. To the National Archives and Records Administration (NARA) for records management purposes.

r. A record may be disclosed to compare such record with records in other Federal agencies' systems of records or to non-Federal records.

s. To the Office of Personnel Management (OPM), the Office of Management and Budget (OMB), and the Government Accountability Office (GAO) in accordance with their responsibilities for evaluating Federal programs.

t. In any legal proceeding, where pertinent, to which GSA or GSA OIG is a party before a court or administrative body.

POLICIES AND PRACTICES FOR STORAGE OF RECORDS:

Electronic records and backups are stored on secure servers and accessed only by authorized personnel, in accordance with GSA OIG IT Security Policy. Paper files are stored in locked rooms or filing cabinets with access limited to authorized personnel.

POLICIES AND PRACTICES FOR RETRIEVAL OF RECORDS:

System records are retrievable by searching for information in the case file, including but not limited to, name of an individual, case name, case number, or social security number.

POLICIES AND PRACTICES FOR RETENTION AND DISPOSAL OF RECORDS:

System records are retained and disposed of according to GSA's records maintenance and disposition schedules and the requirements of the National Archives and Records Administration.

ADMINISTRATIVE, TECHNICAL, AND PHYSICAL SAFEGUARDS:

Records in the system are protected from unauthorized access and misuse through a combination of administrative, technical, and physical security measures. Administrative measures include but are not limited to policies that limit system access to individuals within an agency with a legitimate business need, and regular review of security procedures and best practices to enhance security. Technical measures include but are not limited to system design that allows authorized system users access only to data for which they are responsible per FISMA requirements; required use of strong passwords that are frequently changed; and use of encryption for certain data transfers using current FIPS compliant protocols. Physical security measures include but are not limited to the use of data centers which meet government requirements for storage of sensitive data. Paper files are stored in locked rooms or filing cabinets and can only be accessed by authorized users.

RECORD ACCESS PROCEDURES:

This system of records is exempt from certain notification, access, and

amendment procedures of the Privacy Act, as described below. However, GSA OIG will consider individual requests to determine whether or not information may be released. If an individual wishes to access any record pertaining to him or her in the system, that individual should consult the GSA's Privacy Act implementation rules available at 41 CFR part 105–64.2.

CONTESTING RECORD PROCEDURES:

If an individual wishes to contest the content of any record pertaining to him or her in the system, that individual should consult the GSA's Privacy Act implementation rules available at 41 CFR part 105–64.4.

NOTIFICATION PROCEDURES:

Individuals seeking notification of any records about themselves contained in this system of records should contact the system manager at the address above. Follow the procedures on accessing records in 41 CFR part 105–64, subpart 105–64.2 to request such notification.

EXEMPTIONS PROMULGATED FOR THE SYSTEM:

a. In accordance with 5 U.S.C. 552a(j), this system of records is exempt from all provisions of the Privacy Act of 1974 with the exception of subsections (b); (c)(1) and (2); (e)(4)(A) through (F); (e)(6), (7), (9), (10), and (11); and (i) of the Act, to the extent that information in the system pertains to the enforcement of criminal laws, including police efforts to prevent, control, or reduce crime or to apprehend criminals; to the activities of prosecutors, courts, and correctional, probation, pardon, or parole authorities; and to (a) information compiled for the purpose of identifying individual criminal offenders and alleged offenders and consisting only of identifying data and notations of arrests, the nature and disposition of criminal charges, sentencing, confinement, release, and parole and probation status; (b) information compiled for the purpose of a criminal investigation, including reports of informants and investigators, that is associated with an identifiable individual; or (c) reports of enforcement of the criminal laws, from arrest or indictment through release from supervision. This system is exempted to maintain the efficacy and integrity of the Office of Inspector General's law enforcement function.

In accordance with 5 U.S.C. 552a(k), this system of records is exempt from subsections (c)(3); (d); (e)(1); (e)(4)(G), (H), and (I); and (f) of the Privacy Act of 1974 to the extent that the system consists of investigatory material compiled for law enforcement purposes, other than material within the scope of 5 U.S.C. 552a(j). However, if an individual is denied any right, privilege, or benefit to which the individual would otherwise be eligible as a result of the maintenance of such material, such material shall be provided to such individual, except to the extent that the disclosure of such material would reveal the identity of a source who furnished information to the government under an express promise that the identity of the source would be held in confidence, or, prior to the effective date of the Act, under an implied promise that the identity of the source would be held in confidence; and

b. To the extent the system consists of investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information, but only to the extent that the disclosure of such material would reveal the identity of a source who furnished information to the government under an express promise that the identity of the source would be held in confidence, or, prior to the effective date of the Act, under an implied promise that the identity of the source would be held in confidence.

This system has been exempted to maintain the efficacy and integrity of lawful investigations conducted pursuant to the Office of Inspector General's law enforcement responsibilities and responsibilities in the areas of Federal employment, government contracts, and access to security classified information.

HISTORY:

This notice revises the previously published notice (73 FR 22383, April 25, 2008).

BILLING CODE 6820–AB–P

GENERAL SERVICES ADMINISTRATION

[Notice–IEB–2024–04; Docket No. 2024–0002; Sequence No. 22]

Privacy Act of 1974; System of Records

AGENCY: General Services Administration

ACTION: Notice of a modified system of records.

SUMMARY: GSA proposes to modify a system of records subject to the Privacy Act of 1974, as amended. The previously published notice is being revised to add two new routine uses, make law enforcement records held within the system exempt from the access and amendment provisions of the Privacy Act, and make changes to update the System of Records Notice (SORN).

DATES: Submit comments on or before June 10, 2024.

ADDRESSES: Comments may be submitted to the Federal eRulemaking Portal, *http://www.regulations.gov.* Submit comments by searching for GSA/ADM–26, Office of Inspector General Counsel Files.

FOR FURTHER INFORMATION CONTACT: Call or email Richard Speidel, Chief Privacy Officer at 202–969–5830 and *gsa.privacyact@gsa.gov.*

SUPPLEMENTARY INFORMATION: GSA proposes to modify the SORN for the Office of Inspector General Counsel Files subject to the Privacy Act of 1974, 5 U.S.C. 552a. GSA intends to add two new routine uses that are consistent with the purpose of this system of records.

GSA proposes adding a routine use (routine use ''j'') and revising routine use ''i'' to reflect the current Office of Management and Budget (OMB) breach response guidance in M–17–12, Preparing for and Responding to a Breach of Personally Identifiable Information.

The Inspector General Empowerment Act of 2016 (IGEA), 5 U.S.C. 406(j), exempts certain computerized data comparisons performed by or in coordination with Inspectors General from the Computer Matching and Privacy Protection Act of 1988, Pub. L. 100–503. GSA proposes adding a new routine use (routine use ''n'') to clarify that the GSA Office of Inspector General (OIG) has authority to compare OIG records contained in the system with the records of other Federal agencies and non-Federal records. GSA is also updating the SORN to make law enforcement records contained in the system exempt from the access and amendment provisions of the Privacy Act, consistent with the other two OIG SORNs, which are listed as GSA/ADM–24 and GSA/ADM–25.

In addition to making minor technical and administrative corrections and changes to format, GSA proposes: (1) updating the system location to include secure servers maintained by third-party secure providers to support the procurement of solutions or processes that may require the support of third-party service providers; (2) updating the categories of individuals covered by the system; (3) adding additional detail to the categories of records in the system

and the record source categories; and (4) changing the notification, access, and amendment procedures to align with the corresponding GSA Code of Federal Regulations. The proposed revisions are compatible with the purpose of this system of record.

The Inspector General Act of 1978 (as amended 5 U.S.C. 401–424) established the GSA OIG to conduct and supervise audits and investigations relating to the programs and operations of GSA. Within the GSA OIG, the responsibilities of the Office of Counsel to the Inspector General include (1) providing legal services to the OIG on GSA programs and operations, administrative law issues, and criminal procedure, (2) representing the OIG in assisting the Department of Justice (DOJ) with litigation, including settlement of cases arising under the False Claims Act, (3) representing the OIG in personnel actions, and (4) responding to requests submitted to the OIG, including under the Freedom of Information Act (FOIA) and Privacy Act. The Office of Inspector General Counsel Files provide for the collection of information to track, manage, and process False Claims Act complaints, administrative actions including personnel matters, FOIA and Privacy Act requests, and other administrative and litigation matters handled by the Office of Counsel to the Inspector General.

Richard Speidel,

Chief Privacy Officer,Office of the Deputy Chief Information Officer, General Services Administration.

SYSTEM NAME AND NUMBER:

Office of Inspector General Counsel Files, GSA/ADM–26.

SECURITY CLASSIFICATION:

Unclassified.

SYSTEM LOCATION:

The system is maintained electronically and in paper form in the Office of Counsel to the Inspector General (OIG/JC). Original and duplicate systems may exist, in whole or in part, at secure sites and on secure servers maintained by third-party service providers for the GSA OIG. These systems are FedRAMP Moderate compliant and have all applicable Federal Information Security Modernization Act (FISMA), Federal Information Processing Standards (FIPS), and security controls as applicable.

SYSTEM MANAGER(S):

Director, Information Technology of the Office of Inspector General (JPM), 1800 F Street NW, Washington, DC 20405.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

General authority to maintain the system is contained in the Inspector General Act of 1978, as amended, 5 U.S.C. 401–424.

PURPOSE(S) OF THE SYSTEM:

The records in this system are maintained for the purpose of providing representational and advisory legal services to the OIG.

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

The system contains records related to individuals involved in litigation with the United States, or the OIG, officials, or components of the OIG; individuals involved in administrative proceedings before the OIG, to which the OIG is a party or in which the OIG has an interest; individuals suspected of violations of criminal and civil statutes or regulations or GSA policies, procedures, or directives; individuals who have filed a FOIA request, Privacy Act request, or FOIA or Privacy Act appeal; individuals involved in negotiations, claims, or disputes with the OIG; present and former employees of GSA and the OIG; individuals who have submitted a complaint or allegation to the OIG; and individuals referenced in potential or actual cases and matters under the jurisdiction of the Office of Counsel to the Inspector General.

CATEGORIES OF RECORDS IN THE SYSTEM:

The system contains information needed by the Office of Counsel to the Inspector General to represent and advise the OIG. Records in this system pertain to a broad variety of matters under the jurisdiction of the Office of Counsel, including but not limited to civil, criminal, and administrative actions, personnel matters, correspondence, special projects, and FOIA and Privacy Act requests and appeals. Records may include but are not limited to: name, social security number, addresses, phone numbers, email addresses, birth date, financial information, work history, medical records, or employment records. The system may also contain other records such as: case history files, copies of applicable laws, working papers of attorneys, testimony of witnesses, correspondence, accident reports, pleadings, affidavits, litigation reports, financial data, and other material that is used as a basis for providing legal advice.

RECORD SOURCE CATEGORIES:

Records are collected from other systems, individuals and their representatives, present and former GSA and OIG employees, complainants, informants, witnesses, government contractors, law enforcement agencies, other government agencies, State agencies, credit bureaus, data services, employers, references, educational institutions, public sources, and entities involved in an administrative matter, claim or litigation.

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND PURPOSES OF SUCH USES:

In addition to other disclosures generally permitted under subsection (b) of the Privacy Act of 1974, 5 U.S.C. 552a(b), the GSA OIG may disclose records for the following routine uses:

a. A record of any case in which there is an indication of a violation or potential violation of law, whether civil, criminal, or regulatory in nature, may be disseminated to the appropriate Federal, State, local, or foreign agency charged with the responsibility for investigating or prosecuting such a violation or charged with enforcing or implementing the law.

b. A record may be disclosed to a Federal, State, local, or foreign agency or to an individual or organization in the course of investigating a potential or actual violation of any law, whether civil, criminal, or regulatory in nature, or during the course of a trial or hearing or the preparation for a trial or hearing for such a violation, if there is reason to believe that such agency, individual, or organization possesses information relating to the investigation, and disclosing the information is reasonably necessary to elicit such information or to obtain the cooperation of a witness or an informant.

c. A record relating to a case or matter may be disclosed in an appropriate Federal, State, local, or foreign court or grand jury proceeding in accordance with established constitutional, substantive, or procedural law or practice, even when the agency is not a party to the litigation.

d. A record relating to a case or matter may be disclosed to an actual or potential party or to his or her attorney for the purpose of negotiation or discussion on matters such as settlement of the case or matter, plea-bargaining, or informal discovery proceedings.

e. A record may be disclosed to a Federal, State, local, foreign, Tribal, or other public authority in response to its request in connection with the assignment, hiring or retention of an

individual and/or employee, or disciplinary or other administrative action concerning an employee, the issuance or revocation of a security clearance, the reporting of an investigation of an individual and/or employee, or the letting of a contract, or the award of a contract, grant, or other benefit by the requesting agency, to the extent that the information relates to the requesting agency's decision on the matter.

f. A record may be disclosed to an appeal, grievance, hearing, or complaint examiner; an equal opportunity investigator, arbitrator, or mediator; and/or an exclusive representative or other person authorized to investigate or settle a grievance, complaint, or appeal filed by an individual who is the subject of the record.

g. A record may be disclosed as a routine use to a Member of Congress or to a congressional staff member in response to an inquiry of the congressional office made at the request of the person who is the subject of the record.

h. A record may be disclosed: (a) to an expert, a consultant, or contractor of GSA or GSA OIG engaged in a duty related to an agency function to the extent necessary to perform the function; and (b) to a physician to conduct a fitness-for-duty examination of a GSA or GSA OIG officer or employee.

i. To appropriate agencies, entities, and persons when (1) GSA and/or GSA OIG suspects or has confirmed that there has been a breach of the system of records; (2) GSA and/or GSA OIG has determined that as a result of the suspected or confirmed breach there is a risk of harm to individuals, GSA and/or GSA OIG (including its information systems, programs, and operations), the Federal Government, or national security; and (3) the disclosure made to such agencies, entities, and persons is reasonably necessary to assist in connection with GSA's and/or GSA OIG's efforts to respond to the suspected or confirmed breach or to prevent, minimize, or remedy such harm.

j. To another Federal agency or Federal entity, when GSA and/or GSA OIG determines that information from this system of records is reasonably necessary to assist the recipient agency or entity in (1) responding to a suspected or confirmed breach or (2) preventing, minimizing, or remedying the risk of harm to individuals, the recipient agency or entity (including its information systems, programs, and operations), the Federal Government, or national security, resulting from a suspected or confirmed breach.

k. In any legal proceeding, where pertinent, to which GSA, GSA OIG, a GSA employee, a GSA OIG employee, or the United States or other entity of the United States government is a party before a court or administrative body.

l. To the Office of Personnel Management (OPM), the Office of Management and Budget (OMB), and the Government Accountability Office (GAO) in accordance with their responsibilities for evaluating Federal programs.

m. To the National Archives and Records Administration (NARA) for records management purposes.

n. A record may be disclosed to compare such record with records in other Federal agencies' systems of records or to non-Federal records.

POLICIES AND PRACTICES FOR STORAGE OF RECORDS:

Electronic records and backups are stored on secure servers and accessed only by authorized personnel, in accordance with GSA OIG IT Security Policy. Paper files are stored in locked rooms or filing cabinets with access limited to authorized personnel.

POLICIES AND PRACTICES FOR RETRIEVAL OF RECORDS:

System records are retrievable by searching against information in the record pertaining to an individual, key word, case description, file number, or case title.

POLICIES AND PRACTICES FOR RETENTION AND DISPOSAL OF RECORDS:

System records are retained and disposed of according to GSA records maintenance and disposition schedules and the requirements of the National Archives and Records Administration.

ADMINISTRATIVE, TECHNICAL, AND PHYSICAL SAFEGUARDS

Records in the system are protected from unauthorized access and misuse through a combination of administrative, technical, and physical security measures. Administrative measures include but are not limited to policies that limit system access to individuals within an agency with a legitimate business need, and regular review of security procedures and best practices to enhance security. Technical measures include but are not limited to system design that allows authorized system users access only to data for which they are responsible per FISMA requirements; required use of strong passwords that are frequently changed; and use of encryption for certain data transfers using current FIPS compliant protocols. Physical security measures include but are not limited to the use of data centers which meet government requirements for storage of sensitive data. Paper files are stored in locked rooms or filing cabinets and can only be accessed by authorized users.

RECORD ACCESS PROCEDURES:

This system of records is exempt from certain notification, access, and amendment procedures of the Privacy Act, as described below. However, GSA OIG will consider individual requests to determine whether or not information may be released. If an individual wishes to access any record pertaining to him or her in the system, that individual should consult the GSA's Privacy Act implementation rules available at 41 CFR part 105–64.2.

CONTESTING RECORD PROCEDURES:

If an individual wishes to contest the content of any record pertaining to him or her in the system, that individual should consult the GSA's Privacy Act implementation rules available at 41 CFR part 105–64.4.

NOTIFICATION PROCEDURES:

Individuals seeking notification of any records about themselves contained in this system of records should contact the system manager at the address above. Follow the procedures on accessing records in 41 CFR part 105–64, subpart 105–64.2 to request such notification.

EXEMPTIONS PROMULGATED FOR THE SYSTEM:

a. In accordance with 5 U.S.C. 552a(j), this system of records is exempt from all provisions of the Privacy Act of 1974 with the exception of subsections (b); (c)(1) and (2); (e)(4)(A) through (F); (e)(6), (7), (9), (10), and (11); and (i) of the Act, to the extent that information in the system pertains to the enforcement of criminal laws, including police efforts to prevent, control, or reduce crime or to apprehend criminals; to the activities of prosecutors, courts, and correctional, probation, pardon, or parole authorities; and to (a) information compiled for the purpose of identifying individual criminal offenders and alleged offenders and consisting only of identifying data and notations of arrests, the nature and disposition of criminal charges, sentencing, confinement, release, and parole and probation status; (b) information compiled for the purpose of a criminal investigation, including reports of informants and investigators, that is associated with an identifiable individual; or (c) reports of enforcement of the criminal laws, from arrest or indictment through release from supervision. This system is exempted to

maintain the efficacy and integrity of the Office of Inspector General's law enforcement function.

In accordance with 5 U.S.C. 552a(k), this system of records is exempt from subsections (c)(3); (d); (e)(1); (e)(4)(G), (H), and (I); and (f) of the Privacy Act of 1974 to the extent that the system consists of investigatory material compiled for law enforcement purposes, other than material within the scope of 5 U.S.C. 552a(j). However, if an individual is denied any right, privilege, or benefit to which the individual would otherwise be eligible as a result of the maintenance of such material, such material shall be provided to such individual, except to the extent that the disclosure of such material would reveal the identity of a source who furnished information to the government under an express promise that the identity of the source would be held in confidence, or, prior to the effective date of the Act, under an implied promise that the identity of the source would be held in confidence; and

b. To the extent the system consists of investigatory material compiled solely for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment, military service, Federal contracts, or access to classified information, but only to the extent that the disclosure of such material would reveal the identity of a source who furnished information to the government under an express promise that the identity of the source would be held in confidence, or, prior to the effective date of the Act, under an implied promise that the identity of the source would be held in confidence.

This system has been exempted to maintain the efficacy and integrity of lawful investigations conducted pursuant to the Office of Inspector General's law enforcement responsibilities and responsibilities in the areas of Federal employment, government contracts, and access to security classified information.

HISTORY:

This notice revises the previously published notice (76 FR 56763, September 14, 2011).

BILLING CODE 6820–AB–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Administration for Community Living

Availability of Program Application Instructions for MIPPA Program Funds

AGENCY: Administration for Community Living, HHS.

ACTION: Notice.

Title: Medicare Improvements for Patients and Providers Act: State Applications for Medicare Low-Income Benefit Programs Enrollment Outreach and Assistance.

Announcement Type: Initial.

Statutory Authority: 42 U.S.C. 1395b–3 note.

Catalog of Federal Domestic Assistance (CFDA) Number: 93.071.

DATES: The deadline date for the submission of MIPPA Program State Plans is 11:59 p.m. (ET) on July 8, 2024.

SUPPLEMENTARY INFORMATION:

Funding Opportunity Description

The Medicare Improvement for Patients and Providers Act (MIPPA) program supports states and tribes through grants to provide outreach and assistance to Medicare beneficiaries with limited incomes and assets. MIPPA state grantees help educate beneficiaries about the Low-Income Subsidy (LIS) program for Medicare Part D, Medicare Savings Programs (MSPs), and Medicare Preventive Services while also providing one-on-one assistance to eligible Medicare beneficiaries to help them apply for benefit programs that help lower the costs of their Medicare premiums and deductibles. These funds will allow agencies to provide enhanced outreach to eligible Medicare beneficiaries regarding their preventive, wellness, and limited income benefits; application assistance to individuals who may be eligible for LIS or MSPs; and outreach activities aimed at preventing disease and promoting wellness.

Applicant plans should go above and beyond those regular activities planned in response to other funding sources. ACL will accept only one application for each Priority Area per state. If an agency is eligible for more than one MIPPA Priority Area, the agency may combine their responses into one comprehensive application.

Eligibility Criteria and Other Requirements. MIPPA state funding is limited to state agencies by Priority Area:

- *Priority Area 1—State Health Insurance Assistance Program (SHIP):* SHIP grant recipients or (SHIP-designated state agencies)
- *Priority Area 2—Area Agencies on Aging (AAAs):* State Units on Aging (SUA) (or SUA-designated state agencies)
- *Priority Area 3—Aging and Disability Resource Centers (ADRCs):* Agencies that are established ADRCs (or designated state agency serving as the No Wrong Door lead)

I. Award Information

1. Funding Instrument Type

These awards will be made in the form of cooperative agreements to agencies for each MIPPA Priority Area:

Priority Area 1—SHIP: Grants to state agencies (State Units on Aging or State Departments of Insurance) that administer the SHIP to provide enhanced outreach to eligible Medicare beneficiaries regarding their preventive, wellness, and limited income benefits; application assistance to individuals who may be eligible for LIS or MSPs; and outreach activities aimed at preventing disease and promoting wellness.

Priority Area 2—AAA: Grants to state agencies for AAA programs to provide enhanced outreach to eligible Medicare beneficiaries regarding their preventive, wellness, and limited income benefits; application assistance to individuals who may be eligible for LIS or MSPs; and outreach activities aimed at preventing disease and promoting wellness.

Priority Area 3—ADRC: Aging and Disability Resource Center Programs (ADRC): Grants to agencies that are established ADRCs to provide outreach regarding Medicare Part D benefits related to LIS and MSPs and conduct outreach activities aimed at preventing disease and promoting wellness.

2. Anticipated Total Priority Area Funding

ACL intends to make available, under this program announcement, grant awards for the three MIPPA Priority Areas. Funding will be distributed through a formula as identified in statute. ACL will fund total project periods of up to one year contingent upon availability of federal funds.

- *Priority Area 1—SHIP:* $16.5 million in FY 2024
- *Priority Area 2—AAA:* $17.9 million in FY 2024
- *Priority Area 3—ADRC:* $9.8 million in FY 2024

II. Eligibility Criteria and Other Requirements

1. Eligible entities for this award are state agencies that administer the following:

• *Priority Area 1—SHIP:* Only existing SHIP grant recipients or (SHIP-designated state agencies) are eligible to apply.

• *Priority Area 2—AAA:* Only State Units on Aging (SUA) (or SUA-designated state agencies) are eligible to apply.

• *Priority Area 3—ADRC:* Only agencies that are established ADRCs (or designated state agency serving as the No Wrong Door lead) are eligible to apply.

Eligibility may change if future funding is available.

2. No Match or Cost Sharing is required.

3. Unique Entry ID Number

Unique Entity ID: All grant applicants must obtain and keep current a Unique Entity ID (UEI). On April 4, 2022, the unique entity identifier used across the federal government changed from the DUNS Number to the Unique Entity ID (generated by *SAM.gov*). The Unique Entity ID is a 12-character alphanumeric ID assigned to an entity by *SAM.gov*. The UEI is viewable in your *SAM.gov* entity registration record.

4. Intergovernmental Review

Executive Order 12372, Intergovernmental Review of Federal Programs, is not applicable to these grant applications.

III. Submission Information

1. Application Kit/Program Instructions are available at *www.grantsolutions.gov.* Instructions for completing the application kit will be available on the site.

2. Submission Dates and Times.

To receive consideration, applications must be submitted by 11:59 p.m. (ET) on July 8, 2024, through *www.GrantSolutions.gov.*

IV. Agency Contact

Direct inquiries regarding programmatic issues to: Margaret Flowers, Phone: 202.795.7315, Email: *Margaret.Flowers@acl.hhs.gov.*

Dated: May 5, 2024.

Alison Barkoff,

Principal Deputy Administrator for the Administration for Community Living, performing the delegable duties of the Administrator and the Assistant Secretary for Aging.

BILLING CODE 4154–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Administration for Community Living

Announcing the Intent To Award a Single-Source Supplement for the National Falls Prevention Resource Center

AGENCY: Administration for Community Living. HHS.

ACTION: Notice.

SUMMARY: The Administration for Community Living (ACL) announces the intent to award a single-source supplement to the current cooperative agreement held by the National Council on Aging (NCOA) for the National Falls Prevention Resource Center. The purpose of this program is to advance the development and expansion of technical assistance, education, and resources to increase public awareness about the risk of falls and how to prevent them; increase the number of older adults and adults with disabilities who participate in evidence-based community falls prevention programs; and support the integration and sustainability of evidence-based falls prevention programs within community integrated health networks.

DATES: The period of performance for this award will be August 1, 2021, to July 31, 2026.

FOR FURTHER INFORMATION CONTACT: For further information or comments regarding this program supplement, contact Donna Bethge, U.S. Department of Health and Human Services, Administration for Community Living, Administration on Aging, Office of Nutrition and Health Promotion Programs, 202–795–7659, email *donna.bethge@acl.hhs.gov.*

SUPPLEMENTARY INFORMATION: The purpose of this supplement is to:

• provide further development of leaders in the falls prevention network through continuation of the fellowship program to focus on systems change to reduce falls, falls risk factors, and fall related injuries to ultimately improve the lives of older adults and save health care dollars; and

• augment innovative falls prevention projects that cultivate and leverage collaborations with traditional and new partners to address one or more of the recommendations included in the National Falls Prevention Action Plan that will be updated as a result of the National Falls Prevention Summit in September 2024.

The administrative supplement for FY 2024 will be in the amount of $440,402, bringing the total award for FY 2024 to $1,440,402.

The additional funding will not be used to begin new projects, but it will be used to enhance existing efforts. The grantee will continue to provide appropriate, quality falls prevention resources, increase public awareness about falls prevention and the risk of falls, support the implementation of evidence-based falls prevention programs, and seek new opportunities to embed falls prevention evidence-based programs in the community.

Program Name: National Falls Prevention Resource Center.

Recipient: National Council on Aging (NCOA).

Period of Performance: The supplement award will be issued for the fourth year of a five-year project period of August 1, 2021, to July 31, 2026.

Total Award Amount: $1,440,402 in FY 2024.

Award Type: Cooperative Agreement Supplement.

Basis for Award: National Council on Aging (NCOA) is currently funded to carry out the objectives of this project through its current cooperative agreement entitled, National Falls Prevention Resource Center for the period of August 1, 2021, through July 31, 2026. Since the project's implementation, the grantee has made satisfactory progress toward its approved work plan. The supplement will enable the grantee to carry their work even further, enhancing the support they provide to the Aging Network Falls Prevention Providers. The additional funding will not be used to begin new projects or activities, but rather to enhance efforts.

NCOA is uniquely positioned to complete the work called for under this project. They have an already established infrastructure and are a known and trusted organization in the Aging Network. Prior to this current award, NCOA competed and was twice awarded the National Falls Prevention Resource Center for the past eight (8) years. They have an established presence within the Aging Network. They have a comprehensive, interactive web-based repository (*https://ncoa.org/professionals/health/center-for-healthy-aging/national-falls-prevention-resource-center*) with tools and resources, including—best practices tip sheets, program and fidelity guidance, Falls Prevention Awareness Week toolkit, educational webinars, Grand Rounds recordings, articles covering topics from program implementation through sustainability, resource hubs, policy and practice models, the Falls Free Checkup online screening tool and

they maintain the national falls prevention database. Under this current award period, they are providing technical assistance and educational opportunities for the Aging Network's Falls Prevention efforts, including workgroups, webinars, and live trainings. They collaborate nationally with state falls prevention collaboratives and host the annual Age + Action Conference, a grantee gathering to explore solutions to ensure equitable aging for all, connecting with colleagues, sharing innovative ideas, and discussing policy solutions that can be achieved together on behalf of older adults. They have reached thousands of providers using their comprehensive database of SUAs, AAAs, and other Falls Prevention Program stakeholders. In addition, they have developed partnerships with organizations, universities, and other entities to provide technical assistance, education, and support for the Aging Network.

Establishing an entirely new grant project at this time would be potentially disruptive to the current work already well under way. More importantly, it could cause confusion among the Aging Network Falls Prevention Program Providers and stakeholders, which could have a negative effect on training, implementation, and support opportunities. If this supplement were not provided, the project would be unable to address the significant unmet needs of the Aging Network Falls Prevention Program.

Statutory Authority: The Older Americans Act of 1965, section 411, as amended (42 U.S.C. 3032); and the Patient Protection and Affordable Care Act, 42 U.S.C. 300u–11.

Dated: May 6, 2024.

Allison Barkoff,

Principal Deputy Administrator for the Administration for Community Living, performing the delegable duties of the Administrator and the Assistant Secretary for Aging.

BILLING CODE 4140–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

Notice To Announce the Significant Changes to the NIH Grants Policy Statement for Fiscal Year 2024

AGENCY: National Institutes of Health, HHS.

ACTION: Notice.

SUMMARY: The National Institutes of Health (NIH) announces publication of the updated significant changes that have already been made to the NIH Grants Policy Statement (GPS) in fiscal year 2023 that will be reflected in the GPS for fiscal year 2024. The NIH GPS provides both up-to-date policy guidance that serves as NIH standard terms and conditions of award for all NIH grants and cooperative agreements, and extensive guidance to those who are interested in pursuing NIH grants. This update incorporates significant changes for FY 2024, such as new and modified requirements, clarifies certain policies, and implements changes in statutes, regulations, and policies that have been implemented through appropriate legal

and/or policy processes (*e.g.,* **Federal Register** Notices, where appropriate) since the previous version of the NIHGPS dated December 2022.

DATES: The significant changes to the revised NIH GPS for Fiscal Year 2024 is now available for viewing.

ADDRESSES: Please visit our website to view the updated Significant Changes for Fiscal Year 2024 and NIH GPS at *https://grants.nih.gov/policy/nihgps/index.htm.*

FOR FURTHER INFORMATION CONTACT: Xanthia James, Director, Division of Grants Policy, Office of Policy for Extramural Research Administration, NIH, Rockledge I, Suite 350, Bethesda, MD 20817. Email: *Xanthia.James@nih.gov.* Phone number: (301) 435–0949.

SUPPLEMENTARY INFORMATION: This update is applicable to all NIH grants and cooperative agreements with budget periods beginning on or after October 1, 2023. This update supersedes, in its entirety, the NIH GPS dated December 2022. Previous versions of the NIH GPS remain applicable as standard terms and conditions of award for all NIH grants and cooperative agreements with budget periods that began prior to October 1, 2023. This update incorporates new and modified requirements, clarifies certain policies, and implements changes in statutes, regulations, and policies that have been implemented through appropriate legal and/or policy processes since the previous version of the NIH GPS dated December 2022. The current version of the NIH GPS, in both HTML and PDF formats, as well as previous versions of the NIH GPS and documents summarizing significant changes implemented with each revision, are available at *https://grants.nih.gov/policy/nihgps/index.htm.*

As noted in NOT–OD–24–069 *https://grants.nih.gov/grants/guide/notice-files/NOT-OD-24-069.html,* the Office of Management and Budget (OMB) has issued updates to 2 CFR part 200, with an implementation date of October 1, 2024. NIH will include the changes to 2 CFR part 200 in the FY 2025 release of the NIH GPS, in line with the implementation date set by OMB.

Dated: May 1, 2024.

Lawrence Tabak,

Principal Deputy Director, National Institutes of Health.

BILLING CODE 4140–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

Division of Program Coordination, Planning, and Strategic Initiatives, Office of the Director Notice of Proposed Reorganization

AGENCY: National Institutes of Health, HHS.

ACTION: Notice.

SUMMARY: The Division of Program Coordination, Planning, and Strategic Initiatives (DPCPSI) in the Office of the Director, National Institutes of Health (NIH) is seeking public comment regarding its proposal to transfer the *All of Us* (ALL) Research Program and Environmental influences on Child Health Outcomes (ECHO) Program from the Immediate Office of the NIH Director to DPCPSI in the Office of the Director, NIH. The program offices in DPCPSI share a common mission of identifying emerging scientific opportunities, rising public health challenges, or scientific knowledge gaps that deserve special emphasis. The proposed reorganization would align the important offices with offices having similar NIH-wide functions.

DATES: Any interested person may file written comments by sending an email to *DPCPSIreorgcomments@nih.gov* by 11:59 p.m. ET on June 14, 2024. The statement should include the individual's name, and when applicable, professional affiliation.

ADDRESSES: The following email address has been established for comments on the reorganization: *DPCPSIreorgcomments@nih.gov.*

FOR FURTHER INFORMATION CONTACT: Betina Orezzoli at *DPCPSIreorgcomments@nih.gov* or 301–402–9852.

SUPPLEMENTARY INFORMATION: This notice is pursuant to the NIH Reform Act of 2006 (42 U.S.C.281 (d)(4)), DPCPSI will launch public website information at *https://dpcpsi.nih.gov/proposed-reorg-allofus-echo-transfer* to further encourage public discussion of the proposal to reorganize. The public is encouraged to email *DPCPSIreorgcomments@nih.gov* for comments and questions.

Dated: May 3, 2024.

Lawrence A. Tabak,

Principal Deputy Director, National Institutes of Health.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

Request for Information (RFI): Inviting Input Regarding NIDCD's Research Directions in Global Health

AGENCY: National Institutes of Health, HHS.

ACTION: Request for Information.

SUMMARY: The National Institute on Deafness and Other Communication Disorders (NIDCD), National Institutes of Health (NIH) invites input from all interested parties (individuals or groups) on NIDCD's future research directions in Global Health defined for this RFI as international collaboration among researchers in all countries to improve health. NIDCD requests input specifically focused on the NIDCD mission of advancing the science of communication to improve lives.

DATES: Comments will be accepted through July 2, 2024.

ADDRESSES: All responses to this RFI must be submitted electronically via the web-based form at: *https://www.nidcd.nih.gov/nidcd-global-health-rfi-form.* Please include the Notice number in the subject line of your response. Responses to this RFI are voluntary and may be submitted anonymously. You may voluntarily include your name and contact information with your response. If you choose to provide NIH with this information, NIH will not share your name and contact information outside NIH unless required by law.

Other than your name and contact information, please do not include any personally identifiable information or any information that you do not wish to make public. Proprietary, classified, confidential, or sensitive information should not be included in your response. The US Government will use the information submitted in response to this RFI at its discretion. Other than your name and contact information, the Government reserves the right to use any submitted information on public websites, in reports, in summaries of the state of the science, in any possible resultant solicitation(s), grant(s), or cooperative agreement(s), or in the development of future funding opportunities. This RFI is for informational and planning purposes only and is not a solicitation for applications or an obligation on the part of the Government to provide support for any ideas identified in response to it. Please note that the Government will not pay for the preparation of any

information submitted or for use of that information.

FOR FURTHER INFORMATION CONTACT: Specific questions regarding the NIDCD RFI should be directed to: Lana Shekim, Ph.D., Global Health Coordinator National Institute on Deafness and Other Communication Disorders (NIDCD), Phone: 240–723–0306, *NIDCDGlobalHealthRFI@nidcd.nih.gov*.

SUPPLEMENTARY INFORMATION: This notice is in accordance with 42 U.S.C. 285m, of the Public Health Service Act, as amended. The NIDCD's mission is to support research and training on the normal and disordered processes of hearing, balance, taste, smell, voice, speech, and language. Our vision is to advance the science of communication to improve lives. In pursuit of its mission and as outlined in the 2023–2027 Strategic Plan *https://www.nidcd.nih.gov/about/strategic-plans,* NIDCD supports basic, translational, and clinical research on hearing, balance, taste, smell, voice, speech and language. One of the cross-cutting priorities listed in the strategic plan is to participate in international research to improve global health through reducing the burden of hearing loss and communication disorders in the US and around the globe. For more information about current international initiatives related to the NIDCD mission visit *https://www.nidcd.nih.gov/research/global-health*.

International collaboration has a long history at NIDCD in both its intramural laboratories and its support of extramural research, with such research leading to discoveries and advances in knowledge, for example the identification of deafness and stuttering gene variations, and improvements in Brain-Computer Interfaces (BCI) for Communication. A notable example of successful translational research from the hearing program is the development of cochlear implant which resulted from collaboration among multiple scientific disciplines working in the US and collaborating across borders.

NIDCD, like other NIH Institutes, funds highly meritorious research throughout the world, both through direct awards to non-U.S. institutions and indirectly through awards to U.S. institutions. NIDCD is interested in advancing knowledge by strengthening our engagement across the globe in all settings, whether highly resourced or under resourced. By resources, we do not mean just financial resources and include availability of human capital and infrastructure. Reducing the burden of deafness and communication disorders requires a diverse work force that includes physicians, namely otolaryngologists, audiologists, speech-language pathologists, nurses, neuroscientists, psychologists, epidemiologists and many other health and educational professionals. Clinical care may be medical, surgical, pharmacologic or behavioral. Availability of professionals and especially research scientists is uneven within countries and across regions of the world. In the case of communication disorders, knowledge of the language in the area and the culture are essential for effective evaluation and treatment, especially for speech, language and hearing assessment and behavioral intervention.

Recognizing that health is a fundamental human right, so is the right to communicate. NIDCD seeks mutuality of purpose in establishing partnerships across the world to re-imagine a more equitable world.

Information Requested

NIDCD seeks input from a broad array of interested parties, including (but not limited to) people with lived experience or family members, research organizations, academic institutions, multilateral organizations, community organizations, professional societies, businesses, health services organizations, other government agencies and those receiving funding or employed by NIH. NIDCD welcomes thoughts about the appropriateness of the topics below, potential benefits or challenges, suggestions and examples of existing or potential partnerships and any other topic respondents believe is relevant for NIDCD to consider.

Capacity Building: Develop, maintain and renew scientific research capacity of individuals to build future leaders of research in under-resourced and underserved areas in the US and abroad. Addressing current challenges requires a critical mass of capable clinician-scientists and basic scientists that know the language in any given country and understand the cultural and social context.

Strategic partnerships: Build and strengthen strategic partnerships with other NIH Institutes and Centers, other US Government agencies, research funding agencies of other countries, foundations and industry. Doing so would increase strength and sustainability and create synergy for greater public good.

Dissemination and Implementation Research (DIR): Support research and research training in dissemination and implementation research and improve its impact on the health and health care of populations, by fostering rapid integration of research, practice and policy.

WHO Rehabilitation 2030: Advance research on rehabilitation of disorders of voice, speech, language, hearing, balance, taste and smell by promoting transdisciplinary collaboration among researchers funded by NIH Institutes and other US federal agencies working to promote the World Health Organization (WHO) initiative ''Rehabilitation 2030'' *https://www.who.int/initiatives/rehabilitation-2030.*

World Regions: Select regions in the world, continents, or countries, based on opportunities they provide for largest impact, *i.e.,* shared regional language, population size, unique health system, social practice that influences genetic X environmental interaction, availability of research infrastructure or existing partnerships to build on or link to others.

Solutions to Global Workforce Challenges: Work to reduce the brain drain of researchers and health professionals from under resourced areas to highly resourced areas by creating innovative programs that harness the experience and skills of research clinicians across diasporas and engage them in their regions of origin.

We look forward to your input and hope that you will share this RFI opportunity with your colleagues.

Dated: May 3, 2024.

Lisa J. Portnoy,

Acting Executive Officer, National Institute on Deafness and Other Communication Disorders, National Institutes of Health.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

Request for Information on the Development of the Fiscal Years 2026–2030 NIH-Wide Strategic Plan for Sexual & Gender Minority Health Research

AGENCY: National Institutes of Health, HHS.

ACTION: Request for information.

SUMMARY: Through this Request for Information (RFI), the Sexual & Gender Minority Research Office (SGMRO) in the Division of Program Coordination, Planning, and Strategic Initiatives (DPCPSI), Office of the Director (OD), National Institutes of Health (NIH), invites feedback from the scientific research community, clinical practice

communities, patient and family advocates, scientific or professional organizations, federal partners, internal NIH stakeholders, and other interested constituents on the development of the Fiscal Years 2026–2030 NIH-Wide Strategic Plan for Sexual and Gender Minority Health Research. This plan will describe future directions in sexual and gender minority (SGM) health and research to optimize NIH's research investments.

DATES: The SGMRO's RFI is open for public comment for a period of 60 days. Comments must be received on or before 11:59:59 p.m. ET, June 26, 2024, to ensure consideration. After the public comment period has closed, comments received by SGMRO will be considered in a timely manner for the development of the Fiscal Years 2026–2030 NIH-Wide Strategic Plan for SGM Health Research.

How To Submit a Response

All responses should be submitted electronically at the RFI submission website, *https://rfi.grants.nih.gov/?s=660c63fa171bc46e9c038e92,* by 11:59:59 p.m. (ET) on June 26, 2024. You will receive an electronic confirmation acknowledging receipt of your response.

FOR FURTHER INFORMATION CONTACT: Irene Avila, Ph.D., Assistant Director, Sexual & Gender Minority Research Office (SGMRO), *SGMRO@nih.gov*, (301) 594–9701.

SUPPLEMENTARY INFORMATION:

Background: ''Sexual and gender minority'' is an umbrella term that includes, but is not limited to, individuals who identify as lesbian, gay, bisexual, asexual, transgender, Two-Spirit, queer, and/or intersex. Individuals with same-sex or -gender attractions or behaviors and those with variations in sex characteristics are also included. These populations also encompass those who do not self-identify with one of these terms but whose sexual orientation, gender identity or expression, or reproductive development is characterized by non-binary constructs of sexual orientation, gender, and/or sex.

The Sexual and Gender Minority Research Office (SGMRO) at *https://dpcpsi.nih.gov/sgmro* coordinates sexual and gender minority (SGM)–related research and activities by working directly with the National Institutes of Health (NIH) Institutes, Centers, and Offices. The Office was officially established in September 2015 within the NIH Division of Program Coordination, Planning, and Strategic Initiatives in the Office of the Director.

This **Federal Register** notice is in accordance with the 21st Century Cures Act, requiring NIH to regularly update their strategic plans. In 2020, NIH launched its Strategic Plan to Advance Research on the Health and Well-being of Sexual and Gender Minorities, Fiscal Years (FY) 2021–2025 at *https://dpcpsi.nih.gov/sites/default/files/SGMStrategicPlan_2021_2025.pdf.* The current strategic plan is NIH's second strategic plan focused on SGM health research and has provided the NIH with a framework to improve the health of SGM populations through increased research and support of scientists conducting SGM health-related research. In January 2023, SGMRO published a mid-course review at *https://dpcpsi.nih.gov/sites/default/files/2023-09/SGMRO-StrategicPlan-MidCourseReview-Report-5-508.pdf* of the current NIH SGM strategic plan that provided recommendations to support further progress on the goals described therein. To establish NIH priorities in SGM health-related research for the next five years, SGMRO requests input from SGM health, research, and related communities in refining the goals of the FY26–FY30 strategic plan.

Request for Comment on the NIH-Wide SGM Health Research Strategic Plan FY26—FY30: NIH is developing a strategic plan to advance SGM research in FY26–FY30. This RFI invites input from interested parties throughout the scientific research, advocacy, and clinical practice communities, federal partners, those employed by the Department of Health and Human Services (HHS) and NIH or at institutions receiving NIH support as well as the general public, regarding the below topics for the NIH-Wide Strategic Plan for SGM Health Research. This input is a valuable component in developing the SGM health research strategic plan, and the community's time and consideration are appreciated. NIH seeks comments and/or suggestions from all interested parties on the following topics:

- The highest priority needs, and emerging areas of opportunity related to SGM health research at NIH.
- Actions that NIH should prioritize to advance SGM health-related research.
- Partnerships NIH should pursue, both inside and outside of government, to advance SGM health-related research.
- Any other relevant topics that NIH should consider when developing the next NIH-Wide strategic plan for SGM health research.

NIH encourages organizations (*e.g.,* patient advocacy groups, professional organizations) to submit a single response reflective of the views of the organization or membership as a whole. Responses to this RFI are voluntary. Do not include any proprietary, classified, confidential, trade secret, or sensitive information in your response. The responses will be reviewed by NIH staff, and individual feedback will not be provided to any responder. The Government will use the information submitted in response to this RFI at its discretion. The Government reserves the right to use any submitted information on public NIH websites; in reports; in summaries of the state of the science; in any possible resultant solicitation(s), grant(s), or cooperative agreement(s); or in the development of future funding opportunity announcements.

This RFI is for information and planning purposes only and should not be construed as a solicitation for applications or proposals, or as an obligation in any way on the part of the United States Federal Government, NIH, or individual NIH Institutes, Centers, and Offices to provide support for any ideas identified in response to it. The Federal Government will not pay for the preparation of any information submitted or for the Government's use of such information.

No basis for claims against the U.S. Government shall arise as a result of a response to this RFI or from the Government's use of such information. Additionally, the Government cannot guarantee the confidentiality of the information provided.

Dated: May 2, 2024.

Lawrence A. Tabak,

Principal Deputy Director, National Institutes of Health.

[DOI–2024–0004; FF10T03000 190 FXGO16601025020]

Privacy Act of 1974; System of Records

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Rescindment of system of records notices.

SUMMARY: The Department of the Interior (DOI) is issuing a public notice of its intent to rescind six U.S. Fish and Wildlife Service (FWS) Privacy Act systems of records notices (SORNs), INTERIOR/FWS–5, National Wildlife Refuge Special Use Permits, INTERIOR/FWS–7, Water Development Project

and/or Effluent Discharge Permit Application Review, INTERIOR/FWS–10, National Fish Hatchery Special Use Permits, INTERIOR/FWS–20, Investigative Case File System, INTERIOR/FWS–22, U.S. Deputy Game Warden, and INTERIOR/FWS–30, Marine Mammals Management, Marking, Tagging and Reporting Program. These SORNs have been superseded by a Department-wide or FWS SORN. This rescindment will eliminate unnecessary duplicate notices and promote the overall streamlining and management of DOI Privacy Act systems of records.

DATES: These changes take effect on May 9, 2024.

ADDRESSES: You may send comments identified by docket number [DOI–2024–0004] by any of the following methods:

- *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions for sending comments.
- *Email: DOI_Privacy@ios.doi.gov.* Include docket number [DOI–2024–0004] in the subject line of the message.
- *U.S. mail or hand-delivery:* Teri Barnett, Departmental Privacy Officer, U.S. Department of the Interior, 1849 C Street NW, Room 7112, Washington, DC 20240.

Instructions: All submissions received must include the agency name and docket number [DOI–2024–0004]. All comments received will be posted without change to *http://www.regulations.gov,* including any personal information provided.

Docket: For access to the docket to read background documents or comments received, go to *http://www.regulations.gov.*

You should be aware your entire comment including your personally identifiable information, such as your address, phone number, email address, or any other personal information in your comment, may be made publicly available at any time. While you may request to withhold your personally identifiable information from public review, we cannot guarantee we will be able to do so.

FOR FURTHER INFORMATION CONTACT: Jennifer Schmidt, Associate Privacy Officer, U.S. Fish and Wildlife Service, 5275 Leesburg Pike, MS: IRTM Falls Church, VA 22041–3803, *FWS_Privacy@fws.gov* or (703) 358–2291.

SUPPLEMENTARY INFORMATION: Pursuant to the provisions of the Privacy Act of 1974, as amended, DOI is rescinding the following six FWS SORNs from its system of records inventory. FWS consolidated all permits systems of records under the INTERIOR/FWS–21, Permits System, SORN. FWS also determined during a routine review that the two law enforcement SORNs were superseded by a Department-wide law enforcement SORN, INTERIOR/DOI–10, DOI Law Enforcement Records Management System (LE RMS). Therefore, DOI is rescinding these FWS SORNs to avoid duplication in accordance with the Office of Management and Budget (OMB) Circular A–108, *Federal Agency Responsibilities for Review, Reporting, and Publication under the Privacy Act.*

- INTERIOR/FWS–5, National Wildlife Refuge Special Use Permits. The records in this system were migrated to and are maintained under the consolidated permits system, INTERIOR/FWS–21, Permits System, 89 FR 2230 (January 12, 2024).
- INTERIOR/FWS–7, Water Development Project and/or Effluent Discharge Permit Application Review. The records in this system were migrated to and are maintained under the consolidated permits system, INTERIOR/FWS–21, Permits System, 89 FR 2230 (January 12, 2024).
- INTERIOR/FWS–10, National Fish Hatchery Special Use Permits. The records in this system were migrated to and are maintained under the consolidated permits system, INTERIOR/FWS–21, Permits System, 89 FR 2230 (January 12, 2024).
- INTERIOR/FWS–20, Investigative Case File System. This system supported records of FWS law enforcement activities that are maintained under the Department-wide law enforcement SORN, INTERIOR/DOI–10, DOI Law Enforcement Records Management System (LE RMS), 89 FR 1594 (January 10, 2024).
- INTERIOR/FWS–22, U.S. Deputy Game Warden. This system supported records of FWS law enforcement activities that are maintained under the Department-wide law enforcement SORN, INTERIOR/DOI–10, DOI Law Enforcement Records Management System (LE RMS), 89 FR 1594 (January 10, 2024).
- INTERIOR/FWS–30, Marine Mammals Management, Marking, Tagging and Reporting Program. The records in this system were migrated to and are maintained under the consolidated permits system, INTERIOR/FWS–21, Permits System, 89 FR 2230 (January 12, 2024).

Rescinding these SORNs will have no adverse impacts on individuals as the records previously maintained on FWS permitting activities are covered under the consolidated INTERIOR/FWS–21, Permits System, SORN. FWS law enforcement records are maintained under the published Department-wide law enforcement SORN, INTERIOR/DOI–10, DOI Law Enforcement Records Management System (LE RMS). These rescindments will eliminate unnecessary duplicate notices and promote the overall streamlining and management of DOI Privacy Act systems of records in accordance with the Privacy Act of 1974 and OMB Circular A–108, *Federal Agency Responsibilities for Review, Reporting, and Publication under the Privacy Act.*

HEARTH Act Approval of Nisqually Indian Tribe Residential Leasing Ordinance

AGENCY: Bureau of Indian Affairs, Interior.

ACTION: Notice.

SUMMARY: The Bureau of Indian Affairs (BIA) approved the Nisqually Indian Tribe Residential Leasing Ordinance under the Helping Expedite and Advance Responsible Tribal Homeownership Act of 2012 (HEARTH Act). With this approval, the Tribe is authorized to enter into residential leases without further BIA approval.

DATES: BIA issued the approval on May 2, 2024.

FOR FURTHER INFORMATION CONTACT: Ms. Carla Clark, Bureau of Indian Affairs, Division of Real Estate Services, 1001 Indian School Road NW, Albuquerque, NM 87104, *carla.clark@bia.gov,* (702) 484–3233.

SUPPLEMENTARY INFORMATION:

I. Summary of the HEARTH Act

The HEARTH Act makes a voluntary, alternative land leasing process available to Tribes, by amending the Indian Long-Term Leasing Act of 1955, 25 U.S.C. 415. The HEARTH Act authorizes Tribes to negotiate and enter into business leases of Tribal trust lands with a primary term of 25 years, and up to two renewal terms of 25 years each, without the approval of the Secretary of the Interior (Secretary). The HEARTH Act also authorizes Tribes to enter into leases for residential, recreational, religious or educational purposes for a primary term of up to 75 years without the approval of the Secretary. Participating Tribes develop Tribal Leasing regulations, including an environmental review process, and then must obtain the Secretary's approval of those regulations prior to entering into leases. The HEARTH Act requires the Secretary to approve Tribal regulations if the Tribal regulations are consistent with the Department of the Interior's (Department) leasing regulations at 25 CFR part 162 and provide for an environmental review process that meets requirements set forth in the HEARTH Act. This notice announces that the Secretary, through the Assistant Secretary—Indian Affairs, has approved the Tribal regulations for the Nisqually Indian Tribe.

II. Federal Preemption of State and Local Taxes

The Department's regulations governing the surface leasing of trust and restricted Indian lands specify that, subject to applicable Federal law, permanent improvements on leased land, leasehold or possessory interests, and activities under the lease are not subject to State and local taxation and may be subject to taxation by the Indian Tribe with jurisdiction. *See* 25 CFR162.017. As explained further in the preamble to the final regulations, the Federal government has a strong interest in promoting economic development, self-determination, and Tribal sovereignty. 77 FR 72440, 72447–48 (December 5, 2012). The principles supporting the Federal preemption of State law in the field of Indian leasing and the taxation of lease-related interests and activities applies with equal force to leases entered into under Tribal leasing regulations approved by the Federal government pursuant to the HEARTH Act.

Section 5 of the Indian Reorganization Act, 25 U.S.C. 5108, preempts State and local taxation of permanent improvements on trust land. *Confederated Tribes of the Chehalis Reservation* v. *Thurston County,* 724 F.3d 1153, 1157 (9th Cir. 2013) (citing *Mescalero Apache Tribe* v. *Jones,* 411 U.S. 145 (1973)). Similarly, 25 U.S.C. 5108 preempts State taxation of rent payments by a lessee for leased trust lands, because ''tax on the payment of rent is indistinguishable from an impermissible tax on the land.'' *See Seminole Tribe of Florida* v. *Stranburg,* 799 F.3d 1324, 1331, n.8 (11th Cir. 2015). In addition, as explained in the preamble to the revised leasing regulations at 25 CFR part 162, Federal courts have applied a balancing test to determine whether State and local taxation of non-Indians on the reservation is preempted. *White Mountain Apache Tribe* v. *Bracker,* 448 U.S. 136, 143 (1980). The *Bracker* balancing test, which is conducted against a backdrop of ''traditional notions of Indian self- government,'' requires a particularized examination of the relevant State, Federal, and Tribal interests. We hereby adopt the *Bracker* analysis from the preamble to the surface leasing regulations, 77 FR at 72447–48, as supplemented by the analysis below.

The strong Federal and Tribal interests against State and local taxation of improvements, leaseholds, and activities on land leased under the Department's leasing regulations apply equally to improvements, leaseholds, and activities on land leased pursuant to Tribal leasing regulations approved under the HEARTH Act. Congress's overarching intent was to ''allow Tribes to exercise greater control over their own land, support self-determination, and eliminate bureaucratic delays that stand in the way of homeownership and economic development in Tribal communities.'' 158 Cong. Rec. H. 2682 (May 15, 2012). The HEARTH Act was intended to afford Tribes ''flexibility to adapt lease terms to suit [their] business and cultural needs'' and to ''enable [Tribes] to approve leases quickly and efficiently.'' H. Rep. 112–427 at 6 (2012).

Assessment of State and local taxes would obstruct these express Federal policies supporting Tribal economic development and self-determination, and also threaten substantial Tribal interests in effective Tribal government, economic self-sufficiency, and territorial autonomy. *See Michigan* v. *Bay Mills Indian Community,* 572 U.S. 782, 810 (2014) (Sotomayor, J., concurring) (determining that ''[a] key goal of the Federal Government is to render Tribes more self-sufficient, and better positioned to fund their own sovereign functions, rather than relying on Federal funding''). The additional costs of State and local taxation have a chilling effect on potential lessees, as well as on a Tribe that, as a result, might refrain from exercising its own sovereign right to impose a Tribal tax to support its infrastructure needs. *See id.* at 810–11 (finding that State and local taxes greatly discourage Tribes from raising tax revenue from the same sources because the imposition of double taxation would impede Tribal economic growth).

Similar to BIA's surface leasing regulations, Tribal regulations under the HEARTH Act pervasively cover all aspects of leasing. *See* 25 U.S.C. 415(h)(3)(B)(i) (requiring Tribal regulations be consistent with BIA surface leasing regulations). Furthermore, the Federal government remains involved in the Tribal land leasing process by approving the Tribal leasing regulations in the first instance and providing technical assistance, upon request by a Tribe, for the development of an environmental review process. The Secretary also retains authority to take any necessary actions to remedy violations of a lease or of the Tribal regulations, including terminating the lease or rescinding approval of the Tribal regulations and reassuming lease approval responsibilities. Moreover, the Secretary continues to review, approve, and monitor individual Indian land leases

and other types of leases not covered under the Tribal regulations according to the 25 CFR part 162.

Accordingly, the Federal and Tribal interests weigh heavily in favor of preemption of State and local taxes on lease-related activities and interests, regardless of whether the lease is governed by Tribal leasing regulations or 25 CFR part 162. Improvements, activities, and leasehold or possessory interests may be subject to taxation by the Nisqually Indian Tribe.

Bryan Newland,

Assistant Secretary—Indian Affairs.

HEARTH Act Approval of Confederated Tribes of the Warm Springs Reservation of Oregon Amended Business Leasing Ordinance

AGENCY: Bureau of Indian Affairs, Interior.

ACTION: Notice.

SUMMARY: The Bureau of Indian Affairs (BIA) approved the Confederated Tribes of the Warm Springs Reservation of Oregon Amended Business Leasing Ordinance under the Helping Expedite and Advance Responsible Tribal Homeownership Act of 2012 (HEARTH Act). With this approval, the Tribe is authorized to enter into business, wind and solar, and wind energy evaluation leases without further BIA approval.

DATES: BIA issued the approval on May 2, 2024.

FOR FURTHER INFORMATION CONTACT: Ms. Carla Clark, Bureau of Indian Affairs, Division of Real Estate Services, 1001 Indian School Road NW, Albuquerque, NM 87104, *carla.clark@bia.gov,* (702) 484–3233.

SUPPLEMENTARY INFORMATION:

I. Summary of the HEARTH Act

The HEARTH Act makes a voluntary, alternative land leasing process available to Tribes, by amending the Indian Long-Term Leasing Act of 1955, 25 U.S.C. 415. The HEARTH Act authorizes Tribes to negotiate and enter into business leases of Tribal trust lands with a primary term of 25 years, and up to two renewal terms of 25 years each, without the approval of the Secretary of the Interior (Secretary). The HEARTH Act also authorizes Tribes to enter into leases for residential, recreational, religious or educational purposes for a primary term of up to 75 years without the approval of the Secretary. Participating Tribes develop Tribal Leasing regulations, including an environmental review process, and then must obtain the Secretary's approval of those regulations prior to entering into leases. The HEARTH Act requires the Secretary to approve Tribal regulations if the Tribal regulations are consistent with the Department of the Interior's (Department) leasing regulations at 25 CFR part 162 and provide for an environmental review process that meets requirements set forth in the HEARTH Act. This notice announces that the Secretary, through the Assistant Secretary—Indian Affairs, has approved the Tribal regulations for the Confederated Tribes of the Warm Springs Reservation of Oregon.

II. Federal Preemption of State and Local Taxes

The Department's regulations governing the surface leasing of trust and restricted Indian lands specify that, subject to applicable Federal law, permanent improvements on leased land, leasehold or possessory interests, and activities under the lease are not subject to State and local taxation and may be subject to taxation by the Indian Tribe with jurisdiction. *See* 25 CFR 162.017. As explained further in the preamble to the final regulations, the Federal government has a strong interest in promoting economic development, self-determination, and Tribal sovereignty. 77 FR 72440, 72447–48 (December 5, 2012). The principles supporting the Federal preemption of State law in the field of Indian leasing and the taxation of lease-related interests and activities applies with equal force to leases entered into under Tribal leasing regulations approved by the Federal government pursuant to the HEARTH Act.

Section 5 of the Indian Reorganization Act (IRA), 25 U.S.C. 5108, preempts State and local taxation of permanent improvements on trust land. *Confederated Tribes of the Chehalis Reservation* v. *Thurston County,* 724 F.3d 1153, 1157 (9th Cir. 2013) (citing *Mescalero Apache Tribe* v. *Jones,* 411 U.S. 145 (1973)). Similarly, 25 U.S.C 5108 preempts State taxation of rent payments by a lessee for leased trust lands, because ''tax on the payment of rent is indistinguishable from an impermissible tax on the land.'' *See Seminole Tribe of Florida* v. *Stranburg,* 799 F.3d 1324, 1331, n.8 (11th Cir. 2015). In addition, as explained in the preamble to the revised leasing regulations at 25 CFR part 162, Federal courts have applied a balancing test to determine whether State and local taxation of non-Indians on the reservation is preempted. *White Mountain Apache Tribe* v. *Bracker,* 448 U.S. 136, 143 (1980). The *Bracker* balancing test, which is conducted against a backdrop of ''traditional notions of Indian self-government,'' requires a particularized examination of the relevant State, Federal, and Tribal interests. We hereby adopt the *Bracker* analysis from the preamble to the surface leasing regulations, 77 FR at 72447–48, as supplemented by the analysis below.

The strong Federal and Tribal interests against State and local taxation of improvements, leaseholds, and activities on land leased under the Department's leasing regulations apply equally to improvements, leaseholds, and activities on land leased pursuant to Tribal leasing regulations approved under the HEARTH Act. Congress's overarching intent was to ''allow Tribes to exercise greater control over their own land, support self-determination, and eliminate bureaucratic delays that stand in the way of homeownership and economic development in Tribal communities.'' 158 Cong. Rec. H. 2682 (May 15, 2012). The HEARTH Act was intended to afford Tribes ''flexibility to adapt lease terms to suit [their] business and cultural needs'' and to ''enable [Tribes] to approve leases quickly and efficiently.'' H. Rep. 112–427 at 6 (2012).

Assessment of State and local taxes would obstruct these express Federal policies supporting Tribal economic development and self-determination, and also threaten substantial Tribal interests in effective Tribal government, economic self-sufficiency, and territorial autonomy. *See Michigan* v. *Bay Mills Indian Community,* 572 U.S. 782, 810 (2014) (Sotomayor, J., concurring) (determining that ''[a] key goal of the Federal Government is to render Tribes more self-sufficient, and better positioned to fund their own sovereign functions, rather than relying on Federal funding''). The additional costs of State and local taxation have a chilling effect on potential lessees, as well as on a Tribe that, as a result, might refrain from exercising its own sovereign right to impose a Tribal tax to support its infrastructure needs. *See id.* at 810–11 (finding that State and local taxes greatly discourage Tribes from raising tax revenue from the same sources because the imposition of double taxation would impede Tribal economic growth).

Similar to BIA's surface leasing regulations, Tribal regulations under the HEARTH Act pervasively cover all aspects of leasing. *See* 25 U.S.C. 415(h)(3)(B)(i) (requiring Tribal regulations be consistent with BIA surface leasing regulations). Furthermore, the Federal government remains involved in the Tribal land leasing process by approving the Tribal leasing regulations in the first instance and providing technical assistance, upon request by a Tribe, for the development of an environmental review process. The Secretary also retains authority to take any necessary actions to remedy violations of a lease or of the Tribal regulations, including terminating the lease or rescinding approval of the Tribal regulations and reassuming lease approval responsibilities. Moreover, the Secretary continues to review, approve, and monitor individual Indian land leases and other types of leases not covered under the Tribal regulations according to 25 CFR part 162.

Accordingly, the Federal and Tribal interests weigh heavily in favor of preemption of State and local taxes on lease-related activities and interests, regardless of whether the lease is governed by Tribal leasing regulations or 25 CFR part 162. Improvements, activities, and leasehold or possessory interests may be subject to taxation by the Confederated Tribes of the Warm Springs Reservation of Oregon.

BILLING CODE 4337–15–P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[BLM_CA_FRN_MO4500174427]

Notice of New Recreation Fees on Public Lands in Humboldt, Trinity, and Shasta Counties, CA

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of new recreation fees.

SUMMARY: Pursuant to the Federal Lands Recreation Enhancement Act, the Northern California District Office of the Bureau of Land Management (BLM) is providing notice that the Arcata Field Office, King Range National Conservation Area (NCA) is implementing a new Individual Special Recreation Permit (ISRP) fee for overnight use in the King Range Wilderness, and the Redding Field Office is implementing a new fee for overnight camping at Steiner Flat Campground and Ohl Olsen Campground.

DATES: The new fees at the King Range NCA and Ohl Olsen Campground will take effect November 12, 2024, and the new fees at the Steiner Flat campground will take effect when the upgrades listed in this notice are complete or November 12, 2024, whichever is later.

ADDRESSES: Please send comments to the BLM Northern California District Office, 6640 Lockheed Dr. Redding, California 96002, or by email at *BLM_CA_Web_RE@blm.gov.*

FOR FURTHER INFORMATION CONTACT: Public Affairs Officer Joseph J. Fontana, telephone: 530–260–0189; email: *jfontana@blm.gov.* Individuals in the United States who are deaf, deafblind, hard of hearing, or have a speech disability may dial 711 (TTY, TDD, or TeleBraille) to access telecommunications relay services. Individuals outside the United States should use the relay services offered within their country to make international calls to contact Mr. Fontana in the United States.

SUPPLEMENTARY INFORMATION: Fees help ensure that those who recreate on public lands make a greater, but reasonable, contribution toward protecting and enhancing those opportunities than those who do not utilize recreation opportunities. Information about the use of the fee revenues will be posted at one or more kiosks within the fee areas annually.

King Range NCA

The BLM will implement a fee of $12 per person per overnight trip (maximum stay per trip is 14 days) in the King Range Wilderness. There will be no fee for children 16 and under and no fee for day use.

The King Range NCA encompasses 68,000 acres of public lands along 35 miles of coastline, draws people from all over the world to visit the ''Lost Coast'' of California, and offers one of the only coastal backpacking opportunities in the contiguous United States. Providing safety and trip planning support for visitors is important due to the unique safety issues associated with a coastal wilderness environment, including the influence of tides, waves, and storms.

The King Range NCA is managed as a ''Special Area'' and is a component of the BLM's National Landscape Conservation System. Special Areas are defined as areas officially designated by statute, Presidential decree, or Secretarial order and include components of the National Wilderness Preservation System. The 2005 King Range NCA Resource Management Plan directed the BLM to establish visitor carrying capacities, a permit system, and a fee schedule for overnight backcountry use. Since 2017, overnight visitation in the King Range Wilderness has been managed with a free ISRP issued through *www.recreation.gov.*

In accordance with the BLM recreation fee program policy, the King Range NCA developed a business plan in 2023 to establish future management goals and priorities to determine how the BLM intends to use fees to improve and maintain visitor services. As discussed in the business plan, the ISRP fee for overnight visitation in the King Range Wilderness is consistent with other established fee sites for similar areas. The BLM has notified and involved the public throughout this process and released the draft business plan for a public comment period from April 21 to May 22, 2023. The BLM presented the proposed project and the results of the public comment period to the Northern California Resource Advisory Council (RAC) on October 26, 2023. The RAC supported the fees as provided in the business plan.

Redding Field Office

The BLM will implement a new $15 fee for overnight camping at Steiner Flat Campground, located near Douglas City, California, along the Trinity River. The campground will be upgraded to include the following amenities: toilets, trash service, increased park ranger and law enforcement presence, and campsites with campfire rings, tables, bear-proof food storage boxes, and tent pads. The upgraded amenities will help reduce environmental impacts and improve the experience for those using the site. Fees will begin when all the amenities are available in the campground or 6 months after this notice is published, whichever is later.

Ohl Olsen Campground is a group-use campground near Shasta Lake City, California, in the Chappie-Shasta Off-Highway-Vehicle Area. The BLM will implement a new fee of $60 per night for the lower site (maximum of 30 people) and $80 per night for the upper site (maximum of 50 people).

In accordance with the BLM recreation fee program policy, the Redding Field Office finalized a business plan in 2023 to establish future management goals and priorities for the recreation fee program. As discussed in the business plan, the overnight camping fees for Steiner Flat Campground and Ohl Olsen Campground are consistent with other established fee sites for similar areas

and services. The BLM has notified and involved the public throughout this process and released the draft business plan for a public comment period from October 4 to November 2, 2021. The BLM presented the proposed project and the results of the public comment period to the Northern California RAC on October 26, 2023. The RAC supported the fees as provided in the business plan.

(Authority: 16 U.S.C. 6803(b).)

Elizabeth Meyer-Shields,

Deputy State Director, Natural Resources.

Privacy Act of 1974; System of Records

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of a modified system of records.

SUMMARY: Pursuant to the provisions of the Privacy Act of 1974, as amended, the Department of the Interior (DOI) is issuing a public notice of its intent to modify the Bureau of Land Management (BLM) Privacy Act system of records, INTERIOR/BLM–16, Timber Sale Information System (TSIS). DOI is publishing this revised system of records notice (SORN) to change the system name to INTERIOR/BLM–16, Forest Resources Information System (FRIS), to provide organizational clarification related to the overall management of the forest resources program and to update all sections of the notice in accordance with the Office of Management and Budget (OMB) policy. This modified system will be included in DOI's inventory of record systems.

DATES: This modified system will be effective upon publication. New or modified routine uses will be effective June 10, 2024. Submit comments on or before June 10, 2024.

ADDRESSES: You may send comments identified by docket number [DOI–2023–0025] by any of the following methods:

- *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions for sending comments.
- *Email: DOI_Privacy@ios.doi.gov.* Include docket number [DOI–2023–0025] in the subject line of the message.
- *U.S. mail or hand-delivery:* Teri Barnett, Departmental Privacy Officer, U.S. Department of the Interior, 1849 C Street NW, Room 7112, Washington, DC 20240.

Instructions: All submissions received must include the agency name and docket number [DOI–2023–0025]. All comments received will be posted without change to *http://www.regulations.gov,* including any personal information provided.

Docket: For access to the docket to read background documents or comments received, go to *http://www.regulations.gov.*

FOR FURTHER INFORMATION CONTACT: Ashanti Murphy-Jones, Acting Associate Privacy Officer, Bureau of Land Management, 1849 C Street NW, Room No. 5644, Washington, DC 20240, *blm_wo_privacy@blm.gov* or (202) 365–1429.

SUPPLEMENTARY INFORMATION:

I. Background

BLM maintains the INTERIOR/BLM–16, Timber Sale Information System (TSIS), system of records to support the management and tracking of forest resources, including timber sale, accounting, management, and activity tracking; stewardship contract management and activity; and special consolidated reporting. Each of these modules provide direct support to the BLM mission goals related to managing the use of forest and woodland products in the Public Domain (PD) and in the Oregon and California Grant Lands (O&C).

DOI is publishing this revised notice to change the system name from INTERIOR/BLM–16, Timber Sale Information System (TSIS), to INTERIOR/BLM–16, Forest Resources Information System (FRIS), to provide organizational clarification for the overall forest resources program. DOI is also adding a new purpose section to describe the primary purpose of FRIS; updating the system location to reflect a move to a DOI data center and the cloud environment; updating the system manager section, authorities for maintenance of the system, and the records source categories section to provide additional clarification on individual sources of information; updating the policies and practices for retention of records section to clarify the records retention schedule; updating safeguards to protect records; and providing an updated description on the retrieval of records. DOI is further expanding the categories of individuals to provide clarification on the individuals covered by the system and the categories of records to reflect additional types of records that are maintained in the system; and updating the records access, contesting record, and notification procedures to provide guidance on how individuals may submit requests under the Privacy Act. This notice also reorganizes the sections and updates section titles in accordance with OMB Circular A–108, *Federal Agency Responsibilities for Review, Reporting, and Publication under the Privacy Act.*

The existing routine uses are being updated from a numeric to alphabetic list and are being modified to provide clarity and transparency and reflect updates consistent with standard DOI routine uses. Additionally, DOI is proposing new routine uses to facilitate sharing of information with agencies and organizations to promote the integrity of the records in the system or carry out a statutory responsibility of the DOI or Federal government.

Routine use A was slightly modified to further clarify disclosures to the Department of Justice (DOJ) or other Federal agencies, when necessary, in relation to litigation or judicial hearings. Routine use B was modified to clarify disclosures to a congressional office to respond to or resolve an individual's request made to that office. Routine use H was slightly modified to include sharing of information with territorial government agencies in response to court orders or for discovery purposes related to litigation. Routine use I was modified to include grantees and shared service providers to facilitate sharing of information when authorized and necessary to perform services on DOI's behalf. Modified routine use J allows DOI and BLM to share information with appropriate Federal agencies or entities when reasonably necessary to respond to a breach of PII and to prevent, minimize, or remedy the risk of harm to individuals or the Federal government in accordance with OMB Memorandum M–17–12, *Preparing for and Responding to a Breach of Personally Identifiable Information.* Routine use N was modified to clarify sharing with the news media and the public where there is a legitimate public interest or in support of a legitimate law enforcement or public safety function.

Proposed routine use C facilitates sharing of information with the Executive Office of the President to resolve issues concerning individuals' records. BLM is removing the former routine use 13 for disclosure to consumer reporting agencies and has included that notice at the end of this section.

Pursuant to the Privacy Act, 5 U.S.C. 552a(b)(12), DOI may disclose

information from this system to consumer reporting agencies as defined in the Fair Credit Reporting Act (15 U.S.C. 1681a(f)) or the Federal Claims Collection Act of 1966 (31 U.S.C. 3701(a)(3)) to aid in the collection of outstanding debts owed to the Federal Government.

II. Privacy Act

The Privacy Act of 1974, as amended, embodies fair information practice principles in a statutory framework governing how Federal agencies collect, maintain, use, and disseminate individuals' records. The Privacy Act applies to records about individuals that are maintained in a ''system of records.'' A ''system of records'' is a group of any records under the control of an agency from which information is retrieved by the name of an individual or by some identifying number, symbol, or other identifying information assigned to the individual. The Privacy Act defines an individual as a United States citizen or lawful permanent resident. Individuals may request access to their own records that are maintained in a system of records in the possession or under the control of DOI by complying with DOI Privacy Act regulations at 43 CFR part 2, subpart K, and following the procedures outlined in the Records Access, Contesting Record, and Notification Procedures sections of this notice.

The Privacy Act requires each agency to publish in the **Federal Register** a description denoting the existence and character of each system of records that the agency maintains, and the routine uses of each system. The INTERIOR/BLM–16, Forest Resources Information System (FRIS), SORN is published in its entirety below. In accordance with 5 U.S.C. 552a(r), DOI has provided a report of this system of records to the OMB and to Congress.

III. Public Participation

You should be aware your entire comment including your personally identifiable information, such as your address, phone number, email address, or any other personal information in your comment, may be made publicly available at any time. While you may request to withhold your personally identifiable information from public review, we cannot guarantee we will be able to do so.

SYSTEM NAME AND NUMBER:

INTERIOR/BLM–16, Forest Resources Information System (FRIS).

SECURITY CLASSIFICATION:

Unclassified.

SYSTEM LOCATION:

Records are maintained at National Operations Center, Bureau of Land Management, U.S. Department of the Interior, 6th Avenue & Kipling Boulevard, Denver Federal Center, Building 50, Denver, Colorado 80225. Records may also be located in a cloud location managed by the DOI.

SYSTEM MANAGER(S):

Deputy State Director, Division of Resources, Lands, and Minerals (OR930), Oregon State Office, Bureau of Land Management, U.S. Department of the Interior, P.O. Box 2965, Portland, OR 97208.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

Exportation of unprocessed timber from Federal lands, 16 U.S.C. 617; Mineral Materials Act of 1947, 30 U.S.C. 601; Oregon and California Revested Lands Sustained Yield Management Act of 1937, 43 U.S.C. 2601; Healthy Forests Restoration Act of 2003, Public Law 108–148; Agricultural Act of 2014, Public Law 113–79.

PURPOSE(S) OF THE SYSTEM:

The primary purpose of FRIS is to track and record BLM's Forest management lifecycle activity. FRIS provides users with a suite of computational tools and procedures for managing activities associated with the management of forest resources. FRIS provides the tools for managing BLM timber sale contracts; special forest product permits, stewardship contracting process, non-contracted forest depletions, forest treatment spatial extents, pre/post contract forest inventory, timber volumes and appraisals, protest appeals, forest trespass activity, and reports.

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

The categories of the individuals covered in the system include members of the public entering a forestry products contract with BLM or individual appellants associated with a forestry management decision. These include timber purchasers/contractors (*i.e.,* individual, partnership, corporate); contact person(s) for timber purchaser/contractor; permittees (*i.e.,* individual or contractor) of special forest products; and appellant (*i.e.,* individual or organization) of forestry management decision.

This system contains records concerning corporations and other business entities, which are not subject to the Privacy Act. However, records pertaining to individuals acting on behalf of corporations and other business entities may reflect personal information that may be maintained in this system of records.

CATEGORIES OF RECORDS IN THE SYSTEM:

The system contains records related to the management of forest resources. The records contain BLM timber sale contracts, special forest product permits, stewardship contracting process, non-contracted forest depletions, forest treatment spatial extents, pre/post contract forest inventory, timber volumes and appraisals, protest, appeals, forest trespass activity, and reports.

These records for purchaser contracts include business name, address, and designated representatives, timber quantity, contract price, BLM assigned contract number, and information on debts owed to BLM because of defective payments. These documents also contain the BLM contractor officer's name and title.

For permits issued to the public, the information may include individuals name, citizenship, personal email address, mailing/home address, personal phone numbers, driver's license, vehicle information, license plate information, and description of the material purchased.

RECORD SOURCE CATEGORIES:

The sources of information in the system include purchasers, purchasers' contracts, and holders of forest product permits, which can be collected on the FRIS public facing website, in person at a BLM facility, or from an authorized BLM Contracting Officer.

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND PURPOSES OF SUCH USES:

In addition to those disclosures generally permitted under 5 U.S.C. 552a(b) of the Privacy Act, all or a portion of the records or information contained in this system may be disclosed outside DOI as a routine use pursuant to 5 U.S.C. 552a(b)(3) as follows:

A. To the Department of Justice (DOJ), including Offices of the U.S. Attorneys, or other Federal agency conducting litigation or in proceedings before any court, adjudicative, or administrative body when it is relevant or necessary to the litigation and one of the following is a party to the litigation or has an interest in such litigation:

(1) DOI or any component of DOI;

(2) Any other Federal agency appearing before the Office of Hearings and Appeals;

(3) Any DOI employee or former employee acting in his or her official capacity;

(4) Any DOI employee or former employee acting in his or her individual capacity if DOI or DOJ has agreed to represent that employee or pay for private representation of the employee; or

(5) The U.S. Government or any agency thereof, when DOJ determines that DOI is likely to be affected by the proceeding.

B. To a congressional office when requesting information on behalf of, and at the request of, the individual who is the subject of the record.

C. To the Executive Office of the President in response to an inquiry from that office made at the request of the subject of a record or a third party on that person's behalf, or for a purpose compatible with the reason for which the records are collected or maintained.

D. To any criminal, civil, or regulatory law enforcement authority (whether Federal, State, territorial, local, or Tribal or foreign) when a record, either alone or in conjunction with other information, indicates a violation or potential violation of law—criminal, civil, or regulatory in nature, and the disclosure is compatible with the purpose for which the records were compiled.

E. To an official of another Federal agency to provide information needed in the performance of official duties related to reconciling or reconstructing data files or to enable that agency to respond to an inquiry by the individual to whom the record pertains.

F. To Federal, State, territorial, local, Tribal, or foreign agencies that have requested information relevant or necessary to the hiring, firing, or retention of an employee or contractor, or the issuance of a security clearance, license, contract, grant or other benefit, when the disclosure is compatible with the purpose for which the records were compiled.

G. To representatives of the National Archives and Records Administration to conduct records management inspections under the authority of 44 U.S.C. 2904 and 2906.

H. To State, territorial, and local governments and Tribal organizations or their representatives to provide information needed in response to court order and/or discovery purposes related to litigation, when the disclosure is compatible with the purpose for which the records were compiled.

I. To an expert, consultant, grantee, shared service provider, or contractor (including employees of the contractor) of DOI that performs services requiring access to these records on DOI's behalf to carry out the purposes of the system.

J. To appropriate agencies, entities, and persons when:

(1) DOI suspects or has confirmed that there has been a breach of the system of records;

(2) DOI has determined that as a result of the suspected or confirmed breach, there is a risk of harm to individuals, DOI (including its information systems, programs, and operations), the Federal government, or national security; and

(3) the disclosure made to such agencies, entities, and persons is reasonably necessary to assist in connection with DOI's efforts to respond to the suspected or confirmed breach or to prevent, minimize, or remedy such harm.

K. To another Federal agency or Federal entity, when DOI determines that information from this system of records is reasonably necessary to assist the recipient agency or entity in:

(1) responding to a suspected or confirmed breach; or

(2) preventing, minimizing, or remedying the risk of harm to individuals, the recipient agency or entity (including its information systems, programs, and operations), the Federal Government, or national security, resulting from a suspected or confirmed breach.

L. To the Office of Management and Budget (OMB) during the coordination and clearance process in connection with legislative affairs as mandated by OMB Circular A–19.

M. To the Department of the Treasury to recover debts owed to the United States.

N. To the news media and the public, with the approval of the Public Affairs Officer in consultation with counsel and the Senior Agency Official for Privacy, where there exists a legitimate public interest in the disclosure of the information, except to the extent it is determined that release of the specific information in the context of a particular case would constitute an unwarranted invasion of personal privacy.

POLICIES AND PRACTICES FOR STORAGE OF RECORDS:

Paper records are contained in file folders stored within locked file cabinets. Electronic records are stored on disk, system hard drive, tape, or other appropriate media.

POLICIES AND PRACTICES FOR RETRIEVAL OF RECORDS:

Records may be retrieved by permit or contract number, name, purchaser or permittee name, address, email, and phone number.

POLICIES AND PRACTICES FOR RETENTION AND DISPOSAL OF RECORDS:

Records in this system are retained in accordance with NARA procedures and Department Records Schedule (DRS)/General Records Schedule (GRS)/BLM Records Retention Catalog, under 4/6g(1), Forest Resource Information System. This schedule has been approved by NARA under Job Number N1–049–09–3, 1a. The records disposition is permanent. A copy of the master file is transferred to NARA along with the technical documentation in accordance with 36 CFR 1235.44–50. Thereafter, a copy transfers every 5 years along with the current technical documentation.

ADMINISTRATIVE, TECHNICAL, AND PHYSICAL SAFEGUARDS:

The records contained in this system are safeguarded in accordance with 43 CFR 2.226 and other applicable security and privacy rules and policies. During normal hours of operation, paper records are maintained in secure cabinets and/or in secure file rooms under the control of authorized personnel.

Computerized records systems follow the National Institute of Standards and Technology privacy and security standards as developed to comply with the Privacy Act of 1974, as amended, 5 U.S.C. 552a; Paperwork Reduction Act of 1995, 44 U.S.C. 3501 *et seq.;* Federal Information Security Modernization Act of 2014, 44 U.S.C. 3551 *et seq.;* and the Federal Information Processing Standards 199: Standards for Security Categorization of Federal Information and Information Systems. Security controls include user identification, passwords, multi-factor authentication, database permissions, firewalls, audit logs, and network system security monitoring, and software controls.

Access to records in the system is limited to authorized personnel who have a need to access the records in the performance of their official duties, and each user's access is restricted to only the functions and data necessary to perform that person's job responsibilities. System administrators and authorized users are trained and required to follow established internal security protocols and must complete all security, privacy, and records management training and sign the DOI Rules of Behavior. A Privacy Impact Assessment was completed for the associated information systems to ensure that Privacy Act requirements are met, and appropriate privacy controls were implemented to safeguard the personally identifiable information contained in the systems.

RECORD ACCESS PROCEDURES:

An individual requesting access to their records should send a written inquiry to the applicable System Manager identified above. DOI forms and instructions for submitting a Privacy Act request may be obtained from the DOI Privacy Act Requests website at *https://www.doi.gov/privacy/privacy-act-requests.* The request must include a general description of the records sought and the requester's full name, current address, and sufficient identifying information such as date of birth or other information required for verification of the requester's identity. The request must be signed and dated and be either notarized or submitted under penalty of perjury in accordance with 28 U.S.C. 1746. Requests submitted by mail must be clearly marked ''PRIVACY ACT REQUEST FOR ACCESS'' on both the envelope and letter. A request for access must meet the requirements of 43 CFR 2.238.

CONTESTING RECORD PROCEDURES:

An individual requesting amendment of their records should send a written request to the applicable System Manager as identified above. DOI instructions for submitting a request for amendment of records are available on the DOI Privacy Act Requests website at *https://www.doi.gov/privacy/privacy-act-requests.* The request must clearly identify the records for which amendment is being sought, the reasons for requesting the amendment, and the proposed amendment to the record. The request must include the requester's full name, current address, and sufficient identifying information such as date of birth or other information required for verification of the requester's identity. The request must be signed and dated and be either notarized or submitted under penalty of perjury in accordance with 28 U.S.C. 1746. Requests submitted by mail must be clearly marked ''PRIVACY ACT REQUEST FOR AMENDMENT'' on both the envelope and letter. A request for amendment must meet the requirements of 43 CFR 2.246.

NOTIFICATION PROCEDURES:

An individual requesting notification of the existence of records about them should send a written inquiry to the applicable System Manager as identified above. DOI instructions for submitting a request for notification are available on the DOI Privacy Act Requests website at *https://www.doi.gov/privacy/privacy-act-requests.* The request must include a general description of the records and the requester's full name, current address, and sufficient identifying information such as date of birth or other information required for verification of the requester's identity. The request must be signed and dated and be either notarized or submitted under penalty of perjury in accordance with 28 U.S.C. 1746. Requests submitted by mail must be clearly marked ''PRIVACY ACT INQUIRY'' on both the envelope and letter. A request for notification must meet the requirements of 43 CFR 2.235.

EXEMPTIONS PROMULGATED FOR THE SYSTEM:

None.

HISTORY:

75 FR 3919 (January 25, 2010), modification published at 86 FR 50156 (September 7, 2021).

Teri Barnett,

Departmental Privacy Officer, U.S. Department of the Interior.

BILLING CODE 4130–84–P

DEPARTMENT OF THE INTERIOR

National Park Service

[NPS–WASO–NAGPRA–NPS0037882; PPWOCRADN0–PCU00RP14.R50000]

Notice of Intended Repatriation: California State University, Sacramento, Sacramento, CA

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the California State University, Sacramento intends to repatriate certain cultural items that meet the definition of sacred objects or objects of cultural patrimony and that have a cultural affiliation with the Indian Tribes or Native Hawaiian organizations in this notice.

DATES: Repatriation of the cultural items in this notice may occur on or after June 10, 2024.

ADDRESSES: Dr. Mark Wheeler, Senior Advisor to President Luke Wood, California State University, Sacramento, 6000 J Street Sacramento, CA 95819, telephone (916) 460–0490, email *mark.wheeler@csus.edu.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the California State University, Sacramento, and additional information on the determinations in this notice, including the results of consultation, can be found in the summary or related records. The National Park Service is not responsible for the determinations in this notice.

Abstract of Information Available

A total of 311 cultural items have been requested for repatriation.

In 1964–71, Stephen Humphreys, a student at Sacramento State College, conducted extensive surveys and excavations in the region between Oroville and Paradise in Butte County, California. Humphries surfaced collected from CA–BUT–60 (Vine Rockshelter), BUT–61 (Bow Shaft Rockshelter), BUT–303 (Gold Flat #1), and BUT–304 (Gold Flat #2). The 15 objects of cultural patrimony from BUT–60 are flaked stone tools and a steatite vessel. The three sacred objects are perishable botanical remains. The 69 objects of cultural patrimony from CA–BUT–61 are flaked and modified stone objects; the 53 sacred objects are pigment, worked wood and bone objects, glass and shell beads, crystals, and animal remains. The 171 objects of cultural patrimony from BUT–303/304 are modified stone, ground stone, flaked stone, unmodified stone, and animal remains. An unknown number of objects may be missing from the collection, and California State University, Sacramento continues to look for them.

Determinations

The California State University, Sacramento has determined that:

- The 56 sacred objects described in this notice are specific ceremonial objects needed by a traditional Native American religious leader for present-day adherents to practice traditional Native American religion, according to the Native American traditional knowledge of a lineal descendant, Indian Tribe, or Native Hawaiian organization.
- The 255 objects of cultural patrimony described in this notice have ongoing historical, traditional, or cultural importance central to the Native American group, including any constituent sub-group (such as a band, clan, lineage, ceremonial society, or other subdivision), according to the Native American traditional knowledge of an Indian Tribe or Native Hawaiian organization.
- There is a reasonable connection between the cultural items described in this notice and the Mechoopda Indian Tribe of Chico Rancheria, California.

Requests for Repatriation

Additional, written requests for repatriation of the cultural items in this

notice must be sent to the authorized representative identified in this notice under **ADDRESSES**. Requests for repatriation may be submitted by any lineal descendant, Indian Tribe, or Native Hawaiian organization not identified in this notice who shows, by a preponderance of the evidence, that the requestor is a lineal descendant or a culturally affiliated Indian Tribe or Native Hawaiian organization.

Repatriation of the cultural items in this notice to a requestor may occur on or after June 10, 2024. If competing requests for repatriation are received, the California State University, Sacramento must determine the most appropriate requestor prior to repatriation. Requests for joint repatriation of the cultural items are considered a single request and not competing requests. The California State University, Sacramento is responsible for sending a copy of this notice to the Indian Tribes and Native Hawaiian organizations identified in this notice and to any other consulting parties.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3004 and the implementing regulations, 43 CFR 10.9.

Dated: April 30, 2024.

Melanie O'Brien,

Manager, National NAGPRA Program.

Notice of Intended Repatriation: Oakland Museum of California, Oakland, CA

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the Oakland Museum of California (OMCA) intends to repatriate certain cultural items that meet the definition of objects of cultural patrimony and that have a cultural affiliation with the Indian Tribes or Native Hawaiian organizations in this notice.

DATES: Repatriation of the cultural items in this notice may occur on or after June 10, 2024.

ADDRESSES: Anna Bunting, Oakland Museum of California, 1000 Oak Street, Oakland, CA 94607, telephone (510) 318–8493, email *nagpra@museumca.org.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the Oakland Museum of California, and additional information on the determinations in this notice, including the results of consultation, can be found in the summary or related records. The National Park Service is not responsible for the determinations in this notice.

Abstract of Information Available

A total of 259 cultural items or lots of items, represented by 188 catalog numbers, have been requested for repatriation. The 259 objects of cultural patrimony are 76 baskets, three rattles, nine awls, 12 yo-koli, two soap root brushes, seven lithics, six netted bags, one pictograph, one flute, one smoking pipe, one turtle charm, one singing bow, four gambling bones, four cooking sticks/tools, three meat drying poles, two fire drills, one root digger, one cloak, one ear ornament, three hair pins, two headnets, one headdress, one necklace, four tremblers, 18 magnesite beads, 31 acorn woodpecker scalps, and 63 lots or individual items of raw or processed natural materials (*i.e.* acorns and acorn meal; basket material; tumpline and cord; seeds, nuts and berries; eel meat, salmon eggs, grasshoppers, bark, medicinal roots, herbs, mushrooms, tobacco, deer sinew and brain, clam shell, maize).

All of the items on this claim were acquired by Charles P. Wilcomb during various 'collecting trips' that he undertook while he was the Curator of the Oakland Public Museum (OPM). All of the items requested for repatriation were donated to the OPM by either Charles P. Wilcomb, or by his daughter, Miss Louise Wilcomb, after his death in 1915. The Oakland Public Museum and its collections were merged into the Oakland Museum of California in 1969.

Twenty-four of the items were collected during Wilcomb's September 29–November 28, 1911, collecting trip. They were acquired by the Oakland Public Museum on December 11, 1911. Wilcomb collected these items from the following sources: Dr. Indian Jim's wife and Captain John Chinaman's wife in Bald Rock, Butte County; and Kittie George, Billy Williams, and an unnamed old woman at Camp Creek and Dogwood Rancheria, Butte County.

One hundred and fifty-four of the items were collected during Wilcomb's November 24–December 27, 1913 collecting trip. They were acquired by the Oakland Public Museum on January 7, 1914. Wilcomb collected these items from the following sources: Hood Smith's wife (Cleo Martin Smith), Johnny Johnson's wife (Cordelia Martin Johnson), and an unnamed old woman in Brush Creek, Butte Co.; Fanny Wagner, Old Woman Maggie, Rose Edward, an unnamed old woman, and an unnamed individual at Ed Wagner's Camp, Hunter's Ravine, Plumas Co.; John Kennedy at Middle Fork, Feather River, Butte Co.; Dick Harris and his wife (Emeline Harry) at Dick Harris camp, Beau Creek, Butte Co (Dick Harris- listed in OPM ledgers- is a misspelling of Dick Harry, and Beau Creek is a misspelling of Bean Creek); Henry Flinn at Bald Rock, Butte Co; An unnamed individual at Berry Creek, Butte Co.; From the old council house near Sulphur Springs, Berry Creek, Butte Co.

Eighty-one of the items were donated to the Oakland Public Museum on December 7, 1915 by Wilcomb's daughter, Louise Wilcomb, after her father's death in 1915. All of the items on this list were most likely collected sometime between 1911 and 1915 when Wilcomb was going on extensive collecting trips to Maidu ancestral territory. These items are noted as coming from the following locations: Brush Creek, Butte Co.; Bean Creek, Butte Co.; Buckshot Johnson at Dogwood Creek, Feather River Canyon, Butte Co.; Berry Creek, Butte Co. (including Bald Rock, Sulphur Springs, Beau Creek); Pulga, Feather River Canyon, Butte Co.; Hunter's Ravine, Butte Co; Stanfield Hill, Butte Co.; Billy Day camp, Sulphur Springs, Butte Co.; Big Meadows, Plumas Co.

Two of the items included in the 1915 acquisition do not have collection location information. One of these items is a rattle that is very similar to another rattle being requested for repatriation that came from Dick Harris's camp. OMCA institutional records note that these two rattles were most likely ''made by the same group of people, and perhaps by the same person.'' The other item with no collection location information is a lot of *Yo-Koli,* however, as this item was originally cataloged in 1915 using the Konkow name (*yo-koli*) it is assumed to have come from Butte County.

Information provided by the Tribe indicates that Berry Creek Rancheria of Maidu Indians of California is culturally affiliated with the items and places associated with this claim. In 2007, random testing of OMCA's basket collection was conducted using pXRF technology. Three baskets included in

this request for repatriation were tested at that time with positive results for mercury and negative results for arsenic. Two other baskets included on this request for repatriation were tested at that time, with negative results for both mercury and arsenic.

Determinations

The Oakland Museum of California has determined that:

- The 259 objects of cultural patrimony described in this notice have ongoing historical, traditional, or cultural importance central to the Native American group, including any constituent sub-group (such as a band, clan, lineage, ceremonial society, or other subdivision), according to the Native American traditional knowledge of an Indian Tribe or Native Hawaiian organization.
- There is a reasonable connection between the cultural items described in this notice and the Berry Creek Rancheria of Maidu Indians of California.

Requests for Repatriation

Additional, written requests for repatriation of the cultural items in this notice must be sent to the authorized representative identified in this notice under **ADDRESSES**. Requests for repatriation may be submitted by any lineal descendant, Indian Tribe, or Native Hawaiian organization not identified in this notice who shows, by a preponderance of the evidence, that the requestor is a lineal descendant or a culturally affiliated Indian Tribe or Native Hawaiian organization.

Repatriation of the cultural items in this notice to a requestor may occur on or after June 10, 2024. If competing requests for repatriation are received, the Oakland Museum of California must determine the most appropriate requestor prior to repatriation. Requests for joint repatriation of the cultural items are considered a single request and not competing requests. The Oakland Museum of California is responsible for sending a copy of this notice to the Indian Tribes and Native Hawaiian organizations identified in this notice and to any other consulting parties.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3004 and the implementing regulations, 43 CFR 10.9.

Dated: April 30, 2024.

[NPS–WASO–NAGPRA–NPS0037883; PPWOCRADN0–PCU00RP14.R50000]

Notice of Intended Repatriation: Gilcrease Museum, Tulsa, OK

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the Gilcrease Museum intends to repatriate a certain cultural item that meets the definition of a sacred object/object of cultural patrimony and that has a cultural affiliation with the Indian Tribes or Native Hawaiian organizations in this notice.

DATES: Repatriation of the cultural item in this notice may occur on or after June 10, 2024.

ADDRESSES: Laura Bryant, Gilcrease Museum, 800 S Tucker Drive, Tulsa, OK 74104, telephone (918) 596–2747, email *laura-bryant@utulsa.edu.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the Gilcrease Museum, and additional information on the determinations in this notice, including the results of consultation, can be found in the summary or related records. The National Park Service is not responsible for the determinations in this notice.

Abstract of Information Available

A total of one cultural item has been requested for repatriation. The one sacred object/object of cultural patrimony is a pipe stem. This stem is connected to Chief Walking Rain and was purchased by Frank Engles from Edward Payne's estate in Illinois. Thomas Gilcrease purchased Frank Engles's collection in 1950 and transferred his collection to the City of Tulsa's Gilcrease Museum in 1955.

Determinations

The Gilcrease Museum has determined that:

- The one sacred object/object of cultural patrimony described in this notice is, according to the Native American traditional knowledge of an Indian Tribe or Native Hawaiian organization, specific ceremonial objects needed by a traditional Native American religious leader for present-day adherents to practice traditional Native American religion, and have ongoing historical, traditional, or cultural importance central to the Native American group, including any constituent sub-group (such as a band, clan, lineage, ceremonial society, or other subdivision).
- There is a reasonable connection between the cultural item described in this notice and the Iowa Tribe of Kansas and Nebraska.

Requests for Repatriation

Additional, written requests for repatriation of the cultural item in this notice must be sent to the authorized representative identified in this notice under **ADDRESSES**. Requests for repatriation may be submitted by any lineal descendant, Indian Tribe, or Native Hawaiian organization not identified in this notice who shows, by a preponderance of the evidence, that the requestor is a lineal descendant or a culturally affiliated Indian Tribe or Native Hawaiian organization.

Repatriation of the cultural item in this notice to a requestor may occur on or after June 10, 2024. If competing requests for repatriation are received, the Gilcrease Museum must determine the most appropriate requestor prior to repatriation. Requests for joint repatriation of the cultural item are considered a single request and not competing requests. The Gilcrease Museum is responsible for sending a copy of this notice to the Indian Tribes and Native Hawaiian organizations identified in this notice and to any other consulting parties.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3004 and the implementing regulations, 43 CFR 10.9.

[NPS–WASO–NAGPRA–NPS0037885; PPWOCRADN0–PCU00RP14.R50000]

Notice of Intended Disposition: Arizona Army National Guard, Papago Park Miliary Reservation, Phoenix, AZ

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the Arizona Army National Guard intends to carry out the disposition of human

remains, associated funerary objects, unassociated funerary objects, sacred objects, or objects of cultural patrimony removed from Federal or Tribal lands to the lineal descendants, Indian Tribe, or Native Hawaiian organization with priority for disposition in this notice.

DATES: Disposition of the human remains or cultural items in this notice may occur on or after June 10, 2024. If no claim for disposition is received by May 9, 2025, the human remains or cultural items in this notice will become unclaimed human remains or cultural items.

ADDRESSES: Shelby Manney, Deputy Environmental Programs Manager, Departments of the Army and the Air Force, Joint Force Headquarters-Arizona, Arizona Army National Guard, 5636 East McDowell Road, Phoenix, AZ 85008, telephone (602) 267–2740, email *manneys@emo.azdema.gov* and *shelby.a.manney.nfg@army.mil.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the Arizona Army National Guard, and additional information on the human remains or cultural items in this notice, including the results of consultation, can be found in the related records. The National Park Service is not responsible for the identifications in this notice.

Abstract of Information Available

Based on the information available, the one object of cultural patrimony is a ceramic bowl. On May 15, 2020, the object of cultural patrimony was removed from Papago Park Military Reservation located in Phoenix, Maricopa County, Arizona. During an archaeological site condition assessment, the object was found moved from its documented location by unknown persons. Due to the potential for theft or damage, in consultation with the Indian Tribes, the Arizona Army National Guard recovered and housed the object of cultural patrimony until final disposition.

Determinations

The Arizona Army National Guard has determined that:

- The one object of cultural patrimony described in this notice has ongoing historical, traditional, or cultural importance central to the Native American group, including any constituent sub-group (such as a band, clan, lineage, ceremonial society, or other subdivision), according to the Native American traditional knowledge of an Indian Tribe or Native Hawaiian organization.
- A relationship of shared group identity can be reasonably traced between the object of cultural patrimony and the Gila River Indian Community of the Gila River Indian Reservation, Arizona, and the Salt River Pima-Maricopa Indian Community of the Salt River Reservation, Arizona.

Claims for Disposition

Written claims for disposition of the human remains or cultural items in this notice must be sent to the appropriate official identified in this notice under **ADDRESSES**. If no claim for disposition is received by May 9, 2025, the human remains or cultural items in this notice will become unclaimed human remains or cultural items. Claims for disposition may be submitted by:

1. Any lineal descendant, Indian Tribe, or Native Hawaiian organization identified in this notice.
2. Any lineal descendant, Indian Tribe, or Native Hawaiian organization not identified in this notice who shows, by a preponderance of the evidence, that they have priority for disposition.

Disposition of the human remains or cultural items in this notice may occur on or after June 10, 2024. If competing claims for disposition are received, the Arizona Army National Guard must determine the most appropriate claimant prior to disposition. Requests for joint disposition of the human remains or cultural items are considered a single request and not competing requests. The Arizona Army National Guard is responsible for sending a copy of this notice to the lineal descendants, Indian Tribes, and Native Hawaiian organizations identified in this notice and to any other consulting parties.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3002, and the implementing regulations, 43 CFR 10.7.

Dated: April 30, 2024.

Notice of Inventory Completion: Peabody Museum of Archaeology and Ethnology, Harvard University, Cambridge, MA

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the Peabody Museum of Archaeology and Ethnology, Harvard University (PMAE) has completed an inventory of human remains and has determined that there is a cultural affiliation between the human remains and Indian Tribes or Native Hawaiian organizations in this notice. The human remains were collected at the Sherman Institute, Riverside County, CA.

DATES: Repatriation of the human remains in this notice may occur on or after June 10, 2024.

ADDRESSES: Jane Pickering, Peabody Museum of Archaeology and Ethnology, Harvard University, 11 Divinity Avenue, Cambridge, MA 02138, telephone (617) 496–2374, email *jpickering@fas.harvard.edu.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the PMAE, and additional information on the determinations in this notice, including the results of consultation, can be found in the inventory or related records. The National Park Service is not responsible for the determinations in this notice.

Abstract of Information Available

Based on the information available, human remains representing, at minimum, one individual was collected at the Sherman Institute, Riverside County, CA. The human remains are hair clippings collected from one individual who was recorded as being 19 years old and identified as ''Puyallup.'' Samuel H. Gilliam took the hair clippings at the Sherman Institute between 1930 and 1933. Gilliam sent the hair clippings to George Woodbury, who donated the hair clippings to the PMAE in 1935. No associated funerary objects are present.

Cultural Affiliation

Based on the information available and the results of consultation, cultural affiliation is clearly identified by the information available about the human remains described in this notice.

Determinations

The PMAE has determined that:

- The human remains described in this notice represent the physical remains of one individual of Native American ancestry.
- There is a reasonable connection between the human remains described

in this notice and the Puyallup Tribe of the Puyallup Reservation.

Requests for Repatriation

Written requests for repatriation of the human remains in this notice must be sent to the Responsible Official identified in **ADDRESSES**. Requests for repatriation may be submitted by:

1. Any one or more of the Indian Tribes or Native Hawaiian organizations identified in this notice.

2. Any lineal descendant, Indian Tribe, or Native Hawaiian organization not identified in this notice who shows, by a preponderance of the evidence, that the requestor is a lineal descendant or a culturally affiliated Indian Tribe or Native Hawaiian organization.

Repatriation of the human remains in this notice to a requestor may occur on or after June 10, 2024. If competing requests for repatriation are received, the PMAE must determine the most appropriate requestor prior to repatriation. Requests for joint repatriation of the human remains are considered a single request and not competing requests. The PMAE is responsible for sending a copy of this notice to the Indian Tribe identified in this notice.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3003, and the implementing regulations, 43 CFR 10.10.

Dated: April 30, 2024.

Notice of Intended Repatriation: Gilcrease Museum, Tulsa, OK

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the Gilcrease Museum intends to repatriate certain cultural items that meet the definition of unassociated funerary objects and that have a cultural affiliation with the Indian Tribes or Native Hawaiian organizations in this notice.

DATES: Repatriation of the cultural items in this notice may occur on or after June 10, 2024.

ADDRESSES: Laura Bryant, Gilcrease Museum, 800 S Tucker Drive, Tulsa, OK 74104, telephone (918) 596–2747, email *laura-bryant@utulsa.edu.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the Gilcrease Museum, and additional information on the determinations in this notice, including the results of consultation, can be found in the summary or related records. The National Park Service is not responsible for the determinations in this notice.

Abstract of Information Available

A total of 17 cultural items have been requested for repatriation. The 17 unassociated funerary objects are four lots of ceramic vessels, 11 lots of ceramic sherds and partially restored vessels, one lot of worked lithics, and one lot of gar scales. These were removed from the Banks Site in Crittenden County, AR by Frank Soday in the mid-20th century. The Soday collection was purchased by the Thomas Gilcrease Association and then donated to the Museum in 1982.

A total of two cultural items have been requested for repatriation. The two unassociated funerary objects are two lots of ceramic vessels. These were removed from the Cherry Valley site in Cross County, AR by Frank Soday in the mid-20th century.

A total of two cultural items have been requested for repatriation. The two unassociated funerary objects are one lot of ceramic vessels and one lot of worked shell, including ear plugs and gorget. These were removed from Rose Mound in Cross County, AR, by Dr. C.A. Self in 1936. Harry Lemley acquired the items from Dr. Self in 1936 and sold his collection to Thomas Gilcrease in 1955.

A total of two cultural items have been requested for repatriation. The two unassociated funerary objects are one lot of ceramic vessels and one lot of bone tools. These were removed from the Shawnee Village Site (3MS7) in Mississippi County, AR, by Carroll Snider, Dr. J.K. Hampson, and W.A. McKay. Harry Lemley acquired these items in 1932 and 1936 and sold his collection to Thomas Gilcrease in 1955.

A total of 30 cultural items have been requested for repatriation. The 30 unassociated funerary objects are two lots of ceramic vessels, 17 lots of sherds, one lot of daub, eight lots of worked lithics, one lot of ceramic pipe bowls and beads, and one lot of shell. These were removed from the Stott Site in Poinsett County, Arkansas likely by Elbert Hawkins in the 1970s.

Determinations

The Gilcrease Museum has determined that:

- The 53 unassociated funerary objects described in this notice are reasonably believed to have been placed intentionally with or near human remains, and are connected, either at the time of death or later as part of the death rite or ceremony of a Native American culture according to the Native American traditional knowledge of a lineal descendant, Indian Tribe, or Native Hawaiian organization. The unassociated funerary objects have been identified by a preponderance of the evidence as related to human remains, specific individuals, or families, or removed from a specific burial site or burial area of an individual or individuals with cultural affiliation to an Indian Tribe or Native Hawaiian organization.
- There is a reasonable connection between the cultural items described in this notice and the Quapaw Nation.

Requests for Repatriation

Additional, written requests for repatriation of the cultural items in this notice must be sent to the authorized representative identified in this notice under **ADDRESSES**. Requests for repatriation may be submitted by any lineal descendant, Indian Tribe, or Native Hawaiian organization not identified in this notice who shows, by a preponderance of the evidence, that the requestor is a lineal descendant or a culturally affiliated Indian Tribe or Native Hawaiian organization.

Repatriation of the cultural items in this notice to a requestor may occur on or after June 10, 2024. If competing requests for repatriation are received, the Gilcrease Museum must determine the most appropriate requestor prior to repatriation. Requests for joint repatriation of the cultural items are considered a single request and not competing requests. The Gilcrease Museum is responsible for sending a copy of this notice to the Indian Tribes and Native Hawaiian organizations identified in this notice and to any other consulting parties.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3004 and the implementing regulations, 43 CFR 10.9.

Notice of Inventory Completion: Peabody Museum of Archaeology and Ethnology, Harvard University, Cambridge, MA

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the Peabody Museum of Archaeology and Ethnology, Harvard University (PMAE) has completed an inventory of human remains and has determined that there are known lineal descendants connected to the human remains in this notice.

DATES: Repatriation of the human remains in this notice may occur on or after June 10, 2024.

ADDRESSES: Jane Pickering, Peabody Museum of Archaeology and Ethnology, Harvard University, 11 Divinity Avenue, Cambridge, MA 02138, telephone (617) 496–2374, email *jpickering@fas.harvard.edu.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the PMAE, and additional information on the determinations in this notice, including the results of consultation, can be found in the inventory or related records. The National Park Service is not responsible for the determinations in this notice.

Abstract of Information Available

Based on the information available, human remains representing one individual have been reasonably identified. The human remains were collected at the U.S. Indian Vocational School, Albuquerque, Bernalillo County, NM, and are hair clippings collected from one individual, Harrison Jackson, who was recorded as being 15 years old and identified as ''Walapai.'' Reuben Perry took the hair clippings at the U.S. Indian Vocational School between 1930 and 1933. Perry sent the hair clippings to George Woodbury, who donated the hair clippings to the PMAE in 1935. No associated funerary objects are present.

Lineal Descendant

Based on the information available and the results of consultation, a lineal descendant is connected to the human remains described in this notice.

Determinations

The PMAE has determined that:

- The human remains described in this notice represent the physical remains of one individual of Native American ancestry.
- Lucille J. Watahomigie is connected to the human remains described in this notice.

Requests for Repatriation

Written requests for repatriation of the human remains in this notice must be sent to the authorized representative identified in this notice under **ADDRESSES**. Requests for repatriation may be submitted by:

1. The known lineal descendant connected to the human remains.
2. Any other lineal descendant not identified who shows, by a preponderance of the evidence, that the requestor is a lineal descendant.

Repatriation of the human remains in this notice to a requestor may occur on or after June 10, 2024. If competing requests for repatriation are received, the PMAE must determine the most appropriate requestor prior to repatriation. The PMAE is responsible for sending a copy of this notice to the lineal descendant and any other consulting parties.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3003, and the implementing regulations, 43 CFR 10.10.

Dated: April 30, 2024.

Notice of Inventory Completion: California State University, Sacramento, Sacramento, CA

AGENCY: National Park Service, Interior.

ACTION: Notice.

SUMMARY: In accordance with the Native American Graves Protection and Repatriation Act (NAGPRA), the California State University, Sacramento has completed an inventory of human remains and associated funerary objects and has determined that there is a cultural affiliation between the human remains and associated funerary objects and Indian Tribes or Native Hawaiian organizations in this notice.

DATES: Repatriation of the human remains and associated funerary objects in this notice may occur on or after June 10, 2024.

ADDRESSES: Dr. Mark Wheeler, Senior Advisor to President Luke Wood, California State University, Sacramento, 6000 J Street, Sacramento, CA 95819, telephone (916) 460–0490, email *mark.wheeler@csus.edu.*

SUPPLEMENTARY INFORMATION: This notice is published as part of the National Park Service's administrative responsibilities under NAGPRA. The determinations in this notice are the sole responsibility of the California State University, Sacramento, and additional information on the determinations in this notice, including the results of consultation, can be found in the inventory or related records. The National Park Service is not responsible for the determinations in this notice.

Abstract of Information Available

In 1964–71, Stephen Humphreys, a student at Sacramento State College, conducted extensive surveys and excavations in the region between Oroville and Paradise in Butte County, California.

Human remains representing, at minimum, two individuals were removed from CA–BUT–301 (Kathy's Rockshelter). The 52,341 associated funerary objects from the site include baked clay objects; faunal and floral remains; flaked and ground stone objects; modified bone, shell, stone, and wood objects; basketry and cordage, thermally altered rock; quartz crystals; unmodified stones; pigment; historic materials (worked glass, buttons, beads and textiles), and soils.

Human remains representing, at minimum, three individuals were removed from CA–BUT–302 (Fox Site). The 4,324 associated funerary objects from the site include baked clay objects; faunal and floral remains; flaked and ground stone objects; modified bone, shell and stone; quartz crystals; unmodified stone; and soils.

Human remains representing, at minimum, four individuals were removed from CA–BUT–669 (Kendall's Rockshelter). The 4,754 associated funerary objects from the site include baked clay objects; faunal and floral remains; flaked and ground stone objects; modified bone, shell and stone; quartz crystals; unmodified stone; pigment; historic material (worked glass, buttons); and ash and soils. An unknown number of objects may be missing from the collection, and California State University, Sacramento continues to look for them.

Cultural Affiliation

Based on the information available and the results of consultation, cultural affiliation is clearly identified by the information available about the human remains and associated funerary objects described in this notice.

Determinations

The California State University, Sacramento has determined that:

- The human remains described in this notice represent the physical remains of nine individuals of Native American ancestry.
- The 61,419 objects described in this notice are reasonably believed to have been placed intentionally with or near individual human remains at the time of death or later as part of the death rite or ceremony.
- There is a reasonable connection between the human remains and associated funerary objects described in this notice and the Berry Creek Rancheria of Maidu Indians of California; Enterprise Rancheria of Maidu Indians of California; Greenville Rancheria; Mechoopda Indian Tribe of Chico Rancheria, California; and the Mooretown Rancheria of Maidu Indians of California.

Requests for Repatriation

Written requests for repatriation of the human remains and associated funerary objects in this notice must be sent to the authorized representative identified in this notice under **ADDRESSES**. Requests for repatriation may be submitted by:

1. Any one or more of the Indian Tribes or Native Hawaiian organizations identified in this notice.
2. Any lineal descendant, Indian Tribe, or Native Hawaiian organization not identified in this notice who shows, by a preponderance of the evidence, that the requestor is a lineal descendant or a culturally affiliated Indian Tribe or Native Hawaiian organization.

Repatriation of the human remains and associated funerary objects in this notice to a requestor may occur on or after June 10, 2024. If competing requests for repatriation are received, the California State University, Sacramento must determine the most appropriate requestor prior to repatriation. Requests for joint repatriation of the human remains and associated funerary objects are considered a single request and not competing requests. The California State University, Sacramento is responsible for sending a copy of this notice to the Indian Tribes and Native Hawaiian organizations identified in this notice.

Authority: Native American Graves Protection and Repatriation Act, 25 U.S.C. 3003, and the implementing regulations, 43 CFR 10.10.

Dated: April 30, 2024.

BILLING CODE P

DEPARTMENT OF LABOR

Employment and Training Administration

Agency Information Collection Activities; Comment Request; Unemployment Insurance (UI) Title XII Advances and Voluntary Repayment Process

ACTION: Notice.

SUMMARY: The Department of Labor's (DOL) Employment and Training Administration (ETA) is soliciting comments concerning a proposed extension for the authority to conduct the information collection request (ICR) titled, ''Unemployment Insurance (UI) Title XII Advances and Voluntary Repayment Process.'' This comment request is part of continuing Departmental efforts to reduce paperwork and respondent burden in accordance with the Paperwork Reduction Act of 1995 (PRA).

DATES: Consideration will be given to all written comments received by July 8, 2024.

ADDRESSES: A copy of this ICR with applicable supporting documentation, including a description of the likely respondents, proposed frequency of response, and estimated total burden, may be obtained free by contacting Joe Williams by telephone at (202) 693–2928 (this is not a toll-free number), or by email at *Williams.Joseph@dol.gov.* For persons with a hearing or speech disability who need assistance to use the telephone system, please dial 711 to access telecommunications relay services.

Submit written comments about, or requests for a copy of, this ICR by mail or courier to the U.S. Department of Labor, Employment and Training Administration, Office of Unemployment Insurance, Room S–4524, Constitution Avenue NW, Washington, DC 20210; by email: *Williams.Joseph@dol.gov*; or by fax (202) 693–3975.

FOR FURTHER INFORMATION CONTACT: Cynthia Greene by telephone at (202) 693–2724 (this is not a toll-free number) or by email at *Cynthia.Greene@dol.gov.*

SUPPLEMENTARY INFORMATION: DOL, as part of continuing efforts to reduce paperwork and respondent burden, conducts a pre-clearance consultation program to provide the general public and Federal agencies an opportunity to comment on proposed and/or continuing collections of information before submitting them to the Office of Management and Budget (OMB) for final approval. This program helps to ensure requested data can be provided in the desired format, reporting burden (time and financial resources) is minimized, collection instruments are clearly understood, and the impact of collection requirements can be properly assessed.

Title XII, section 1201 of the Social Security Act (SSA), 42 U.S.C. 1321, provides for advances to states from the Federal Unemployment Account (FUA). The law further outlines specific requirements to be met by a state requesting an advance:

- The Governor or designee must apply for the advance;
- The application must cover a three-month period and the Secretary of Labor (Secretary) must be furnished with estimates of the amounts needed in each month of the three-month period;
- The application must be made on such forms and shall contain such information and data (fiscal and otherwise) concerning the operation and administration of the state unemployment compensation law as the Secretary deems necessary or relevant to the performance of his or her duties under this title;
- The amount required by any state for the payment of compensation in any month shall be determined with due allowance for contingencies and taking into account all other amounts that will be available in the state's unemployment fund for the payment of compensation in such month; and
- The term ''compensation'' means cash benefits payable to individuals with respect to their unemployment exclusive of expenses of administration.

Section 1202 (a) of the SSA provides that the Governor of any state may at any time request that funds be transferred from the account of such state to the FUA in repayment of part or all of the balance of advances made to such state under section 1201. These applications and repayments may be requested by an individual designated for that authority in writing by the Governor. The SSA, sections 1201 and 1202(a), authorize this information collection.

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless it is approved by OMB under the PRA and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject to penalty for failing to comply with a collection of information that does not display a valid Control Number. See 5 CFR 1320.5(a) and 1320.6.

Interested parties are encouraged to provide comments to the contact shown in the **ADDRESSES** section. Comments must be written to receive consideration, and they will be summarized and included in the request for OMB approval of the final ICR. In order to help ensure appropriate consideration, comments should mention OMB control number 1205–0199.

Submitted comments will also be a matter of public record for this ICR and posted on the internet, without redaction. DOL encourages commenters not to include personally identifiable information, confidential business data, or other sensitive statements/information in any comments.

DOL is particularly interested in comments that:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the Agency, including whether the information will have practical utility;
- Evaluate the accuracy of the Agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, (*e.g.,* permitting electronic submission of responses).

Agency: DOL–ETA.

Type of Review: Extension without changes.

Title of Collection: Unemployment Insurance (UI) Title XII Advances and Voluntary Repayment Process.

Form: Not Applicable.

OMB Control Number: 1205–0199.

Affected Public: State Workforce Agencies.

Estimated Number of Respondents: 4.

Frequency: Varies.

Total Estimated Annual Responses: 4.

Estimated Average Time per Response: 1 hour.

Estimated Total Annual Burden Hours: 4 hours.

Total Estimated Annual Other Cost Burden: $0.

Authority: 44 U.S.C. 3506(c)(2)(A).

José Javier Rodríguez,

Assistant Secretary for Employment and Training, Labor.

DEPARTMENT OF LABOR

Employment and Training Administration

Agency Information Collection Activities; Comment Request; Characteristics of the Insured Unemployed

ACTION: Notice.

SUMMARY: The Department of Labor's (DOL) Employment and Training Administration (ETA) is soliciting comments concerning a proposed extension for the authority to conduct the information collection request (ICR) titled, ''Characteristics of the Insured Unemployed.'' This comment request is part of continuing Departmental efforts to reduce paperwork and respondent burden in accordance with the Paperwork Reduction Act of 1995 (PRA).

DATES: Consideration will be given to all written comments received by July 8, 2024.

ADDRESSES: A copy of this ICR with applicable supporting documentation, including a description of the likely respondents, proposed frequency of response, and estimated total burden, may be obtained free by contacting Rachel Beistel by telephone at 202–693–2736 (this is not a toll-free number) or by email at *beistel.rachel@dol.gov*. For persons with a hearing or speech disability who need assistance to use the telephone system, please dial 711 to access telecommunications relay services.

Submit written comments about, or requests for a copy of, this ICR by mail or courier to the U.S. Department of Labor, Employment and Training Administration, Office of Unemployment Insurance Room S–4519, 200 Constitution Ave NW, Washington, DC 20210; by email: *beistel.rachel@dol.gov*; or by fax 202–693–3975.

FOR FURTHER INFORMATION CONTACT: Rachel Beistel by telephone at 202–693–2736 (this is not a toll-free number) or by email at *beistel.rachel@dol.gov.*

SUPPLEMENTARY INFORMATION: DOL, as part of continuing efforts to reduce paperwork and respondent burden, conducts a pre-clearance consultation program to provide the general public and Federal agencies an opportunity to comment on proposed and/or continuing collections of information before submitting them to the Office of Management and Budget (OMB) for final approval. This program helps to ensure requested data can be provided in the desired format, reporting burden (time and financial resources) is minimized, collection instruments are clearly understood, and the impact of collection requirements can be properly assessed.

Section 303(a)(6) of the Social Security Act specifies that for State UI programs to be certified to receive administrative funding from the Federal government, the State's law must include provisions for ''making of such reports . . . as the Secretary of Labor may from time to time require, and compliance with such provisions as the Secretary may from time to time find necessary to assure the correctness and verification of such reports.'' DOL considers the proposed changes and updates to the ETA 203 report to be one of those ''provisions . . . necessary to assure the correctness and verification'' of the reports submitted by states. ETA is proposing changes to the ETA 203 to update and expand terms and definitions in the race and ethnicity categories to adhere to updated guidance/changes set out in the Office of Management and Budget's (OMB) Revisions to its Statistical Policy Directive No. 15: Standards for Maintaining, Collecting, and Presenting Federal Data on Race and Ethnicity,[1] which became effective on March 29, 2024. Also, adding ''Another Gender Identity/Non-binary/X'' as a response option will make the data collection consistent with the U.S. State Department's passport guidelines. These changes will capture characteristics that better reflect society and the UI population across demographic groups. For example, race and ethnicity will be combined into one question and reporting category to decrease confusion by respondents; a separate race and/or ethnicity category will be added (''Middle Eastern or North African''); and ''other'' will be removed from ''Native Hawaiian or Pacific Islander.'' In addition to collecting age, industry, and occupation information, the revised ETA 203 report would also collect information on a claimant's primary language, self-identified disability status, level of educational attainment, and base period wages. ETA proposes adding these categories to increase understanding of interactions between socio-economic characteristics and unemployment insurance receipt, and to inform state UI programs managers about possible needs in areas such as translation services. These categories and the specific terms proposed were identified after examining data studied, collected, or used by the U.S. Department of State, the U.S. Census Bureau, and Bureau of Labor Statistics. An individual's refusal to disclose claimant demographic information will *not* impact eligibility determinations. Also, any responses collected and information provided will be treated as confidential. This data will not be shared beyond aggregate reporting to ETA and any demographic information associated with a specific claimant or employer will be masked or hidden from state agency staff. Furthermore, disclosure of demographic information is voluntary and a non-response to questions will continue to be reported as ''Information Not Available'' or INA.

The Government Performance and Results Act of 1993 (GPRA) requires Federal agencies to develop annual and strategic performance plans that establish performance goals, have concrete indicators of the extent that goals are achieved, and set performance targets. Each year, the agency is to issue a report that ''evaluate[s] the performance plan for the current fiscal year relative to the performance achieved toward the performance goals in the fiscal year covered by the report.'' DOL emphasizes the importance of complete and accurate information for program monitoring and improving program performance ''. . . as a framework for agencies to communicate progress in achieving their missions.'' (OMB Circular A–11, Section 15.5). The Social Security Act, Section 303(a)(6), authorizes this information collection.

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless it is approved by OMB under the PRA and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject to penalty for failing to comply with a collection of information that does not display a valid Control Number. *See* 5 CFR 1320.5(a) and 1320.6.

Interested parties are encouraged to provide comments to the contact shown in the **ADDRESSES** section. Comments must be written to receive consideration, and they will be summarized and included in the request for OMB approval of the final ICR. In

[1] *https://www.govinfo.gov/content/pkg/FR-2024-03-29/pdf/2024-06469.pdf.*

order to help ensure appropriate consideration, comments should mention OMB control number 1205–0009.

Submitted comments will also be a matter of public record for this ICR and posted on the internet, without redaction. DOL encourages commenters not to include personally identifiable information, confidential business data, or other sensitive statements/information in any comments.

DOL is particularly interested in comments that:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the Agency, including whether the information will have practical utility;
- Evaluate the accuracy of the Agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, (*e.g.,* permitting electronic submission of responses).

BILLING CODE 4510–FW–P

DEPARTMENT OF LABOR

Employment and Training Administration

Program Year (PY) 2024 Workforce Innovation and Opportunity Act (WIOA) Title I Allotments; PY 2024 Title III Wagner-Peyser Act Employment Service Allotments and PY 2024 Workforce Information Grants

AGENCY: Employment and Training Administration, Labor.

ACTION: Notice.

SUMMARY: This notice announces allotments for PY 2024 for WIOA Title I Youth, Adult, and Dislocated Worker Activities programs; allotments for Employment Service (ES) activities under the Wagner-Peyser Act for PY 2024, and the allotments of Workforce Information Grants to States for PY 2024. WIOA allotments for states and the state allotments for the Wagner-Peyser Act ES are based on formulas defined in their respective statutes. WIOA requires allotments for the Outlying Areas to be competitively awarded rather than based on a formula determined by the Secretary of Labor (Secretary) as occurred under the Workforce Investment Act (WIA). However, for PY 2024, the Further Consolidated Appropriations Act, 2024 waives the competition requirement, and the Secretary is using the discretionary formula rationale and methodology for allocating PY 2024 funds for the Outlying Areas (American Samoa, Guam, the Commonwealth of the Northern Mariana Islands, the Republic of Palau, and the United States Virgin Islands) that was published in the **Federal Register** (Feb. 17, 2000). WIOA specifically included the Republic of Palau as an Outlying Area, except during any period for which the Secretary of Labor and the Secretary of Education determine that a Compact of Free Association is in effect and contains provisions for training and education assistance prohibiting the assistance provided under WIOA; no such determinations prohibiting assistance have been made. The formula that the Department of Labor (Department) used for PY 2024 is the same formula used in PY 2023 and is described in the section on Youth Activities program allotments. The Department invites comments only on the formula used to allot funds to the Outlying Areas.

DATES: The Department must receive comments on the formula used to allot funds to the Outlying Areas by June 10, 2024.

ADDRESSES: Questions on this notice can be submitted to the Employment and Training Administration, Office of Workforce Investment, 200 Constitution Ave. NW, Room S4209, Washington, DC 20210, Attention: Heather Fleck, Unit Chief, (202) 693–2956. Heather Fleck's email is *Fleck.Heather@dol.gov.* If you are deaf, hard of hearing, or have a speech disability, please dial 7–1–1 to access telecommunications relay services.

Commenters are advised that mail delivery in the Washington area may be delayed due to security concerns. The Department will receive hand-delivered comments at the above address. All overnight mail will be considered hand-delivered and must be received at the designated place by the date specified above. Please be advised that there may be a delay between when the mail is delivered to the building and when the relevant person receives it.

Comments: The Department will retain all comments on this notice and will release them upon request via email to any member of the public. The Department also will make all the comments it receives available for public inspection by appointment during normal business hours at the above address. If you need assistance to review the comments, the Department will provide you with appropriate aids such as readers or print magnifiers. The Department will make copies of this notice available, upon request, in large print, Braille, and electronic file. The Department also will consider providing the notice in other formats upon request. To schedule an appointment to review the comments and/or obtain the notice in an alternative format, contact Ms. Fleck using the information provided above. The Department will retain all comments received without making any changes to the comments, including any personal information provided. The Department therefore cautions commenters not to include their personal information such as Social Security Numbers, personal addresses, telephone numbers, and email addresses in their comments; this information would be released with the comment if the comments are requested. It is the commenter's responsibility to safeguard his or her information.

FOR FURTHER INFORMATION CONTACT: WIOA Youth Activities allotments—Sara Hastings at (202) 693–3599; WIOA Adult and Dislocated Worker Activities and ES allotments—Heather Fleck at (202) 693–2956; Workforce Information Grant allotments—Donald Haughton at (202) 693–2784. If you are deaf, hard of hearing, or have a speech disability,

please dial 7–1–1 to access telecommunications relay services.

SUPPLEMENTARY INFORMATION: The Department is announcing WIOA allotments for PY 2024 for Youth Activities, Adult and Dislocated Worker Activities, Wagner-Peyser Act PY 2024 allotments, and PY 2024 Workforce Information Grant allotments. This notice provides information on the amount of funds available during PY 2024 to states with an approved WIOA Combined or Unified State Plan, and information regarding allotments to the Outlying Areas.

On March 23, 2024, the Further Consolidated Appropriations Act, 2024, Pub. L. 118–47 was signed into law (''the Act''). The Act, Division D, title I, sections 106(b) and 107 of the Act allows the Secretary of Labor (Secretary) to set aside up to 0.5 percent of each discretionary appropriation for activities related to program integrity and 0.75 percent of most operating funds for evaluations. For 2024, as authorized by the Act, the Department has set aside $8,322,000 of the Training and Employment Services (TES) and $2,190,000 of the State Unemployment Insurance and Employment Services Operations (SUIESO) appropriations impacted in this FRN for these activities. ETA reserved these funds from the WIOA Adult, Youth, Dislocated Worker, Wagner-Peyser Act Employment Service, and Workforce Information Grant program budgets. Any funds not utilized for these reserve activities will be provided to the states. We also have attached tables listing the PY 2024 allotments for programs under WIOA Title I Youth Activities (Table A), Adult and Dislocated Workers Employment and Training Activities (Tables B and C, respectively), and the PY 2024 Wagner-Peyser Act allotments (Table D). We also have attached the PY 2024 Workforce Information Grant table (Table E) and the total WIOA Youth, Adult and Dislocated Worker funding for Outlying Areas (Table F).

Youth Activities Allotments. The appropriated level for PY 2024 for WIOA Youth Activities totals $948,130,000. After reducing the appropriation by $3,131,000 for set asides authorized by the Act and reserving $925,200 for Migrant and Seasonal Farmworker (MSFW) Youth, $944,073,800 is available for Youth Activities. Table A includes a breakdown of the Youth Activities program allotments for PY 2024 and provides a comparison of these allotments to PY 2023 Youth Activities allotments for all States and Outlying Areas. The WIOA Youth formula has a section in WIOA for a reservation for Migrant and Seasonal Farmworker (MSFW) Youth if the appropriation exceeds $925,000,000. Per WIOA 127(a)(1), ETA reserved 4 percent ($925,200) of the excess amount for MSFW Youth. For the Native American Youth program, the total amount available is 1.5 percent of the total amount for Youth Activities (after set asides authorized by the Act) after the MSFW Youth reservation (in accordance with WIOA section 127). The total funding available for the Outlying Areas was reserved at 0.25 percent of the amount appropriated for Youth Activities (after set asides authorized by the Act) after the amount reserved for MSFW Youth and Native American Youth (in accordance with WIOA section 127(b)(1)(B)(i)). On December 17, 2003, Pub. L. 108–188, the Compact of Free Association Amendments Act of 2003 (''the Compact''), was signed into law. The Compact specified that the Republic of Palau remained eligible for WIA Title I funding. See 48 U.S.C 1921d(f)(1)(B)(ix). WIOA sec. 512(g)(1) updated the Compact to refer to WIOA funding. The National Defense Authorization Act for Fiscal Year 2018 (Division A, Title XII, subtitle F, section 1259C(c) of Pub. L. 115–91) authorized WIOA Title I funding to the Republic of Palau through FY 2024.

Under WIA, the Secretary had discretion for determining the methodology for distributing funds to all Outlying Areas. Under WIOA the Secretary must award the funds through a competitive process. However, for PY 2024, the Further Consolidated Appropriations Act, 2024 waives the competition requirement regarding funding to Outlying Areas (*e.g.,* American Samoa, Guam, the Commonwealth of the Northern Mariana Islands, the Republic of Palau, and the United States Virgin Islands). For PY 2024, the Department used the same methodology used since PY 2000 (*i.e.,* we distribute funds among the Outlying Areas by formula based on relative share of the number of unemployed, a minimum of 90 percent of the prior year allotment percentage, a $75,000 minimum, and a 130 percent stop gain of the prior year share). For the relative share calculation in PY 2024, the Department continued to use the data obtained from the 2020 Census for American Samoa, Guam, the Commonwealth of the Northern Mariana Islands, and the United States Virgin Islands. For the Republic of Palau, the Department used data from Palau's 2020 Census. The Department will accept comments on this methodology. The Act additionally allows Outlying Areas to submit a single application according to the requirements established by the Secretary for a consolidated grant for Adult, Youth, and Dislocated Worker funds. Subject to approval of the grant application and other reporting requirements of the Secretary, the Act allows Outlying Areas receiving a consolidated grant to use those funds interchangeably between Adult, Youth, and Dislocated Worker programs or activities. Table F includes the total Youth, Adult and Dislocated Worker funding for Outlying Areas.

After the Department calculated the amount for the MSFW Youth, Outlying Areas and the Native American program, the amount available for PY 2024 allotments to the states is $927,587,911. This total amount is below the required $1 billion threshold specified in WIOA sec. 127(b)(1)(C)(iv)(IV); therefore, the Department did not apply the WIOA additional minimum provisions. Instead, as required by WIOA, the minimums of 90 percent of the prior year allotment percentage and 0.25 percent state minimum floor apply. WIOA also provides that no state may receive an allotment that is more than 130 percent of the allotment percentage for the state for the previous year. The three data factors required by WIOA sec. 127(b)(1)(C)(ii) for the PY 2024 Youth Activities state formula allotments are, summarized slightly, as follows:

(1) The average number of unemployed individuals in Areas of Substantial Unemployment (ASUs) for the 12-month period, July 2022–June 2023 in each state compared to the total number of unemployed individuals in ASUs in all states;

(2) Number of excess unemployed individuals or excess unemployed individuals in ASUs (depending on which is higher) averages for the same 12-month period used for ASU unemployed data compared to the total excess unemployed individuals or ASU excess number in all states; and

(3) Number of disadvantaged youth (age 16 to 21, excluding college students not in the workforce and military) from special tabulations of data from the American Community Survey (ACS), which the Department obtained from the Census Bureau in each state compared to the total number of disadvantaged youth in all states. ETA obtained updated data for use in PY 2023 and the same data was used in PY 2024. The Census Bureau collected the data used in the special tabulations for disadvantaged youth between January 1, 2016–December 31, 2020.

For purposes of identifying ASUs for the Youth Activities allotment formula, the Department continued to use the data made available by BLS (as described in the Local Area Unemployment Statistics (LAUS) Technical Memorandum No. S–23–12). For purposes of determining the number of disadvantaged youth, the Department used the special tabulations of ACS data available at: *https://www.dol.gov/agencies/eta/budget/formula/disadvantagedyouthadults.* See TEGL No. 01–23 for further information.

Adult Employment and Training Activities Allotments. The total appropriated funds for Adult Activities in PY 2024 is $885,649,000. After reducing the appropriated amount by $2,351,000 for set asides authorized by the Act, $883,298,000 remains for Adult Activities, of which $881,089,755 is for states and $2,208,245 is for Outlying Areas. Table B shows the PY 2024 Adult Employment and Training Activities allotments and a state-by-state comparison of the PY 2024 allotments to PY 2023 allotments.

In accordance with WIOA, the Department reserved the total available for the Outlying Areas at 0.25 percent of the full amount appropriated for Adult Activities (after set asides authorized by the Act). As discussed in the Youth Activities section above, in PY 2024 the Department will distribute the Adult Activities funding for the Outlying Areas, using the same principles, formula, and data as used for outlying areas for Youth Activities. The Department will accept comments on this methodology. After determining the amount for the Outlying Areas, the Department used the statutory formula to distribute the remaining amount available for allotments to the states. The Department did not apply the WIOA minimum provisions for the PY 2024 allotments because the total amount available for the states was below the $960 million threshold required for Adult Activities in WIOA sec. 132(b)(1)(B)(iv)(IV). Instead, as required by WIOA, the minimums of 90 percent of the prior year allotment percentage and 0.25 percent state minimum floor apply. WIOA also provides that no state may receive an allotment that is more than 130 percent of the allotment percentage for the state for the previous year. The three formula data factors for the Adult Activities program are the same as those used for the Youth Activities formula, except the Department used data for the number of disadvantaged adults (age 22 to 72, excluding college students not in the workforce and military).

Dislocated Worker Employment and Training Activities Allotments. The amount appropriated for Dislocated Worker activities in PY 2024 totals $1,396,412,000. The total appropriation includes formula funds for the states, while the National Reserve is used for National Dislocated Worker Grants, technical assistance and training, demonstration projects, Workforce Opportunity for Rural Communities, Community College Grants, and the Outlying Areas' Dislocated Worker allotments. After reducing the appropriated amount by $2,840,000 for set asides authorized by the Act, a total of $1,393,572,000 remains available for Dislocated Worker activities. The amount available for Outlying Areas is $3,483,930, leaving $297,375,070 for the National Reserve and a total of $1,092,713,000 available for states. Table C shows the PY 2024 Dislocated Worker activities allotments and a state-by-state comparison of the PY 2024 allotments to PY 2023 allotments.

Similar to the Adult Activities program, the Department reserved the total available for the Outlying Areas at 0.25 percent of the full amount appropriated for Dislocated Worker Activities (after set asides authorized by the Act). Similar to Youth and Adult funds, instead of competition, in PY 2024 the Department will use the same *pro rata* share as the areas received for the PY 2024 WIOA Adult Activities program to distribute the Outlying Areas' Dislocated Worker funds, the same methodology used in PY 2023. The Department will accept comments on this methodology.

The three data factors required in WIOA sec. 132(b)(2)(B)(ii) for the PY 2024 Dislocated Worker state formula allotments are, summarized slightly, as follows:

(1) Relative number of unemployed individuals in each state, compared to the total number of unemployed individuals in all states, for the 12-month period, October 2022–September 2023;

(2) Relative number of excess unemployed individuals in each state, compared to the total excess number of unemployed individuals in all states, for the 12-month period, October 2022–September 2023; and

(3) Relative number of long-term unemployed individuals in each state, compared to the total number of long-term unemployed individuals in all states, for the 12-month period, October 2022–September 2023.

In PY 2024, under WIOA the Dislocated Worker formula uses minimum and maximum provisions. No state may receive an allotment that is less than 90 percent of the state's prior year allotment percentage (stop loss) or more than 130 percent of the state's prior year allotment percentage (stop gain).

Wagner-Peyser Act ES Allotments. The appropriated level for PY 2024 for ES grants totals $675,052,000. After reducing the appropriated amount by $2,159,000 for set asides authorized by the Act, $672,893,000 is available for ES grants. After determining the funding for Guam and the United States Virgin Islands, the Department calculated allotments to states using the formula set forth at section 6 of the Wagner-Peyser Act (29 U.S.C. 49e). The Department based PY 2024 formula allotments on each state's share of calendar year 2023 monthly averages of the civilian labor force (CLF) and unemployment. Section 6(b)(4) of the Wagner-Peyser Act requires the Secretary to set aside up to three percent of the total funds available for ES to ensure that each state will have sufficient resources to maintain statewide ES activities. In accordance with this provision, the Department included the three percent set aside funds in this total allotment. The Department distributed the set-aside funds in two steps to states that have experienced a reduction in their relative share of the total resources available this year from their relative share of the total resources available the previous year. In Step 1, states that have a CLF below one million and are also below the median CLF density were maintained at 100 percent of their relative share of prior year resources. ETA calculated the median CLF density based on CLF data provided by the BLS for calendar year 2023. The Department distributed all remaining set-aside funds on a *pro-rata* basis in Step 2 to all other states experiencing reductions in relative share from the prior year but not meeting the size and density criteria for Step 1. The distribution of ES funds (Table D) includes $671,252,721 for states, as well as $1,640,279 for Outlying Areas.

Section 7(a) of the Wagner-Peyser Act (49 U.S.C. 49f(a)) authorizes states to use 90 percent of funds allotted to a state for labor exchange services and other career services such as job search and placement services to job seekers; appropriate recruitment services for employers; program evaluations; developing and providing labor market and occupational information; developing management information systems; and administering the work test for unemployment insurance claimants. Section 7(b) of the Wagner-Peyser Act states that 10 percent of the

total sums allotted to each state must be reserved for use by the Governor to provide performance incentives for public ES offices and programs, provide services for groups with special needs, and to provide for the extra costs of exemplary models for delivering services of the type described in section 7(a) and models for enhancing professional development and career advancement opportunities of state agency staff.

To provide services such as outreach to MSFWs, State Monitor Advocate (SMA) responsibilities, and others, State Workforce Agencies, (SWAs) must use Wagner-Peyser Act ES funding to provide employment services to migrant and seasonal farmworkers (MSFW), which are described at 20 CFR 651, 653, 654, and 658.

Workforce Information Grants Allotments. Total PY 2024 funding for Workforce Information Grants allotments to states is $32,000,000. After reducing the total by $31,000 for set asides authorized by the Act, $31,969,000 is available for Workforce Information Grants. Table E contains the allotment figures for each state and Outlying Area. The Department distributes the funds by administrative formula, with a reserve of $176,726 for Guam and the United States Virgin Islands. Guam and the United States Virgin Islands allotment amounts are partially based on CLF data. The Department distributes the remaining funds to the states with 40 percent distributed equally to all states and 60 percent distributed based on each state's share of CLF for the 12 months ending September 2023.

BILLING CODE P

DEPARTMENT OF LABOR

Agency Information Collection Activities; Submission for OMB Review; Comment Request; Requirements of a Bona Fide Thrift or Savings Plan and Requirements of a Bona Fide Profit-Sharing Plan or Trust

ACTION: Notice of availability; request for comments.

SUMMARY: The Department of Labor (DOL) is submitting this Wage and Hour Division (WHD)-sponsored information collection request (ICR) to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995 (PRA). Public comments on the ICR are invited.

DATES: The OMB will consider all written comments that the agency receives on or before June 10, 2024.

ADDRESSES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to *www.reginfo.gov/public/do/PRAMain*. Find this particular information collection by selecting ''Currently under 30-day Review—Open for Public Comments'' or by using the search function.

FOR FURTHER INFORMATION CONTACT: Michelle Neary by telephone at 202–693–6312, or by email at *DOL_PRA_PUBLIC@dol.gov*.

SUPPLEMENTARY INFORMATION: This information collection applies to employers claiming the overtime exemption available under section 7(e)(3)(b) of the Fair Labor Standards Act. Specifically, in calculating an employee's regular rate of pay, an employer need not include contributions made to a bona fide thrift or savings plan or a bona fide profit-sharing plan or trust—as defined in 29 CFR parts 547 and 549. Employers are required to communicate, or make available to the employees, the terms of the bona fide thrift or savings plan and bona fide profit-sharing plan or trust, and retain certain records. For additional substantive information about this ICR, see the related notice published in the **Federal Register** on December 20, 2023 (88 FR 88126).

Comments are invited on: (1) whether the collection of information is necessary for the proper performance of the functions of the Department, including whether the information will have practical utility; (2) if the information will be processed and used in a timely manner; (3) the accuracy of the agency's estimates of the burden and cost of the collection of information, including the validity of the methodology and assumptions used; (4) ways to enhance the quality, utility and clarity of the information collection; and (5) ways to minimize the burden of the collection of information on those who are to respond, including the use of automated collection techniques or other forms of information technology.

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless the OMB approves it and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject to penalty for failing to comply with a collection of information that does not display a valid OMB Control Number. *See* 5 CFR 1320.5(a) and 1320.6.

DOL seeks PRA authorization for this information collection for three (3) years. OMB authorization for an ICR cannot be for more than three (3) years without renewal. The DOL notes that information collection requirements submitted to the OMB for existing ICRs receive a month-to-month extension while they undergo review.

Agency: DOL–WHD.

Title of Collection: Requirements of a Bona Fide Thrift or Savings Plan and Requirements of a Bona Fide Profit-Sharing Plan or Trust.

OMB Control Number: 1235–0013.

Affected Public: Private Sector—Businesses or other for-profits; Farms; Not-for-profit institutions.

Total Estimated Number of Respondents: 3,254,524.

Total Estimated Number of Responses: 4,393,607.

Total Estimated Annual Time Burden: 2,441 hours.

Total Estimated Annual Other Costs Burden: $0.

(Authority: 44 U.S.C. 3507(a)(1)(D))

Michelle Neary,

Senior Paperwork Reduction Act Analyst.

BILLING CODE 4510–27–P

DEPARTMENT OF LABOR

Agency Information Collection Activities; Submission for OMB Review; Comment Request; Excavations (Design of Cave-In Protection Systems)

ACTION: Notice of availability; request for comments.

SUMMARY: The Department of Labor (DOL) is submitting this Occupational Safety & Health Administration (OSHA)-sponsored information collection request (ICR) to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995 (PRA). Public comments on the ICR are invited.

DATES: The OMB will consider all written comments that the agency receives on or before June 10, 2024.

ADDRESSES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to *www.reginfo.gov/public/do/PRAMain.* Find this particular information collection by selecting ''Currently under 30-day Review—Open for Public Comments'' or by using the search function.

FOR FURTHER INFORMATION CONTACT: Nicole Bouchet by telephone at 202–693–0213, or by email at *DOL_PRA_PUBLIC@dol.gov.*

SUPPLEMENTARY INFORMATION: Design of cave-in protection systems are needed by employers in the construction industry and OSHA compliance officers to ensure that cave-in protection systems are designed, installed, and used in a manner to protect workers adequately. For additional substantive information about this ICR, see the related notice published in the **Federal Register** on February 23, 2024 (89 FR 13750).

Comments are invited on: (1) whether the collection of information is necessary for the proper performance of the functions of the Department, including whether the information will have practical utility; (2) the accuracy of the agency's estimates of the burden and cost of the collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility and clarity of the information collection; and (4) ways to minimize the burden of the collection of information on those who are to respond, including the use of automated collection techniques or other forms of information technology.

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless the OMB approves it and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject to penalty for failing to comply with a collection of information that does not display a valid OMB Control Number. *See* 5 CFR 1320.5(a) and 1320.6.

DOL seeks PRA authorization for this information collection for three (3) years. OMB authorization for an ICR cannot be for more than three (3) years without renewal. The DOL notes that information collection requirements submitted to the OMB for existing ICRs receive a month-to-month extension while they undergo review.

Agency: DOL–OSHA.

Title of Collection: Excavations (Design of Cave-in Protection Systems).

OMB Control Number: 1218–0137.

Affected Public: Private Sector—Businesses or other for-profits.

Total Estimated Number of Respondents: 1,144,081.

Total Estimated Number of Responses: 22,697.

Total Estimated Annual Time Burden: 22,697 hours.

Total Estimated Annual Other Costs Burden: $430,152.

(Authority: 44 U.S.C. 3507(a)(1)(D))

Nicole Bouchet,

Certifying Official.

BILLING CODE 4510–26–P

NATIONAL CREDIT UNION ADMINISTRATION

Renewal of Agency Information Collection of a Previously Approved Collection; Request for Comments

AGENCY: National Credit Union Administration (NCUA).

ACTION: Notice of submission to the Office of Management and Budget.

SUMMARY: As required by the Paperwork Reduction Act of 1995, The National Credit Union Administration (NCUA) is submitting the following extensions and revisions of currently approved collections to the Office of Management and Budget (OMB) for renewal.

DATES: Written comments should be received on or before June 10, 2024 to be assured consideration.

ADDRESSES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to *www.reginfo.gov/public/do/PRAMain.* Find this particular information collection by selecting ''Currently under 30-day Review—Open for Public Comments'' or by using the search function.

FOR FURTHER INFORMATION CONTACT: Copies of the submission may be obtained by contacting Dacia Rogers at (703) 718–1155, emailing *PRAComments@ncua.gov,* or viewing the entire information collection request at *www.reginfo.gov.*

SUPPLEMENTARY INFORMATION:

OMB Number: 3133–0165.

Title: Fair Credit Reporting (FCRA); Regulation V and 12 CFR 717.

Type of Review: Revision of a currently approved collection.

Abstract: As required under the Fair Credit Reporting Act, federal credit unions must give consumers an opportunity to opt out from the credit union's sharing of information covered by FCRA, which is other than transaction and experience information, before communicating such information to its affiliates.

Affected Public: Private Sector: Not-for-profit institutions.

Estimated Number of Respondents: 2,869.

Estimated Number of Responses per Respondent: 112.0467

Estimated Total Annual Responses: 321,462.

Estimated Hours per Response: 0.767835.

Estimated Total Annual Burden Hours: 246,830.

Reason for Change: The number of respondents decreased and the estimated annual burden hours decreased.

Request for Comments: Comments submitted in response to this notice will be summarized and included in the request for Office of Management and Budget approval. All comments will become a matter of public record. The public is invited to submit comments concerning: (a) whether the collection of information is necessary for the proper performance of the function of the agency, including whether the information will have practical utility; (b) the accuracy of the agency's estimate of the burden of the collection of information, including the validity of the methodology and assumptions used; (c) ways to enhance the quality, utility,

and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of the information on the respondents, including the use of automated collection techniques or other forms of information technology.

By the National Credit Union Administration Board.

Melane Conyers-Ausbrooks,

Secretary of the Board.

NATIONAL FOUNDATION ON THE ARTS AND THE HUMANITIES

Institute of Museum and Library Services

Submission for OMB Review, Comment Request, Proposed Collection: 2025–2027 IMLS National Leadership Grants for Libraries and Laura Bush 21st Century Librarian Program Notices of Funding Opportunity

AGENCY: Institute of Museum and Library Services, National Foundation on the Arts and the Humanities.

ACTION: Submission for OMB review, comment request, collection of information.

SUMMARY: The Institute of Museum and Library Services (IMLS) announces the following information collection has been submitted to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act. This program helps to ensure that requested data can be provided in the desired format, reporting burden (time and financial resources) is minimized, collection instruments are clearly understood, and the impact of collection requirements on respondents can be properly assessed. The purpose of this Notice is to solicit comments concerning two grant programs targeting the needs of libraries and their communities nationwide: IMLS National Leadership Grants for Libraries and the IMLS Laura Bush 21st Century Librarian Program.

DATES: Written comments must be submitted to the office listed in the **ADDRESSES** section below on or before June 08, 2024.

ADDRESSES: Written comments and recommendations for proposed information collection requests should be sent within 30 days of publication of this Notice to *www.reginfo.gov/public/do/PRAMain*. Find this particular information collection request by selecting ''Institute of Museum and Library Services'' under ''Currently Under Review;'' then check ''Only Show ICR for Public Comment'' checkbox. Once you have found this information collection request, select ''Comment,'' and enter or upload your comment and information. Alternatively, please mail your written comments to Office of Information and Regulatory Affairs, Attn.: OMB Desk Officer for Education, Office of Management and Budget, Room 10235, Washington, DC 20503, or call (202) 395–7316.

FOR FURTHER INFORMATION CONTACT: Anthony D. Smith, Acting Deputy Director, Office of Library Services, Institute of Museum and Library Services, 955 L'Enfant Plaza North SW, Suite 4000, Washington, DC 20024–2135. Mr. Smith can be reached by telephone at 202–653–4716, or by email at *asmith@imls.gov*. Office hours are from 8:30 a.m. to 5 p.m., E.T., Monday through Friday, except Federal holidays. Persons who are deaf or hard of hearing (TTY users) can contact IMLS at 202–207–7858 via 711 for TTY-Based Telecommunications Relay Service.

SUPPLEMENTARY INFORMATION: IMLS is the primary source of federal support for the nation's libraries and museums. We advance, support, and empower America's museums, libraries, and related organizations through grant making, research, and policy development. To learn more, visit *www.imls.gov.*

Current Actions: The IMLS National Leadership Grants for Libraries Program supports projects that enhance the quality of library and archive services nationwide by advancing theory and practice and by generating results such as new tools, research findings, models, services, practices, or collaborative approaches that can be widely used, adapted, scaled, or replicated to extend the benefits of federal investment.

The IMLS Laura Bush 21st Century Librarian Program supports developing a diverse workforce of librarians to better meet the changing learning and information needs of the American public by enhancing the training and professional development of library and archives professionals; developing faculty and library leaders; and recruiting, educating, and retaining the next generation of library and archives professionals.

This action is to renew the content, forms, and instructions for the two Notices of Funding Opportunity for the next three years (FY25–FY27).

OMB is particularly interested in comments that help the agency to:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology (*e.g.,* permitting electronic submission of responses).

The 60-Day Notice was published in the **Federal Register** on February 27, 2024 (89 FR 14525) (Document Number 2024–03983). We received and replied to one comment in response to this Notice. A copy of the proposed information collection request can be obtained by contacting the individual listed in the **FOR FURTHER INFORMATION CONTACT** section of this notice.

Agency: Institute of Museum and Library Services.

Title: 2025–2027 IMLS National Leadership Grants for Libraries and Laura Bush 21st Century Librarian Program Notices of Funding Opportunity.

OMB Control Number: 3137–0091.

Agency Number: 3137.

Affected Public: Library applicants.

Total Number of Respondents: 400.

Frequency of Response: Once per request.

Average Hours Per Response: 45.

Total Estimated Number of Burden Hours: 18,000.

Total Annual Cost Burden: $560,520.

Total Annual Federal Costs: $90,783.

Dated: May 3, 2024.

NATIONAL SCIENCE FOUNDATION

Committee on Equal Opportunities in Science and Engineering; Notice of Meeting

In accordance with the Federal Advisory Committee Act (Pub. L. 92–463, as amended), the National Science

Foundation (NSF) announces the following meeting:

Name and Committee Code: Committee on Equal Opportunities in Science and Engineering (CEOSE) (#1173) (Virtual)

Date and Time:

June 13, 2024; 1:00 p.m.–5:30 p.m.

June 14, 2024; 10:00 a.m.–4:00 p.m.

Place: National Science Foundation, 2415 Eisenhower Avenue, Alexandria, VA 22314 (Virtual).

Meeting Registration: Virtual attendance information will be forthcoming on the CEOSE website at: *http://www.nsf.gov/od/oia/activities/ceose/index.jsp.*

Type of Meeting: Open.

Contact Person: Dr. Bernice Anderson, Senior Advisor and CEOSE Executive Secretary, Office of Integrative Activities (OIA), National Science Foundation, 2415 Eisenhower Avenue, Alexandria, VA 22314. Contact Information: Phone: 703–292–8040, Email: *banderso@nsf.gov.*

Minutes: Meeting minutes and other information may be obtained from the CEOSE Executive Secretary at the above address or from the CEOSE website at: *http://www.nsf.gov/od/oia/activities/ceose/index.jsp.*

Purpose of Meeting: To study data, programs, policies, and other information pertinent to the National Science Foundation and to provide advice and recommendations concerning broadening participation in science and engineering.

Agenda: CEOSE Agenda-at-a-Glance.

Day 1: June 13, 2024

1:00 p.m.–1:30 p.m. Opening, Welcome, Introduction
1:30 p.m.–2:00 p.m. Presentation: Report of the CEOSE Executive Liaison
2:30 p.m.–3:00 p.m. NSF Supporting Native Communities: Part II
3:00 p.m.–3:15 p.m. *Break*
3:15 p.m.–4:30 p.m. Presentation: NSB/NSF Commission on Merit Review
4:30 p.m.–5:30 p.m. Discussion: Reports of the CEOSE AC Liaisons

Day 2: June 14, 2024

10:00 a.m.–10:15 a.m. Opening Remarks
10:15 a.m.–11:15 a.m. Work Session for Writing Te a.m.s of the 2023–2024 CEOSE Report
11:15 a.m.–12:00 p.m. Briefing: NSF EBJ INCLUDES Initiative
12:00 p.m.–1:30 p.m. Working Lunch: Topics/Advice to Share with NSF Senior Leadership
1:30 p.m.–2:00 p.m. Discussion with NSF Leadership
2:00 p.m.–2:15 p.m. *Break*
2:15 p.m.–3:30 p.m. Panel: STEM Accessibility
3:30 p.m.–3:45 p.m. Discussion: 2023–2024 CEOSE Report to Congress
3:45 p.m.–4:00 p.m. Announcements, Closing Remarks, Adjournment

Dated: May 3, 2024.

Crystal Robinson,

Committee Management Officer.

NATIONAL SCIENCE FOUNDATION

Astronomy and Astrophysics Advisory Committee; Notice of Meeting

In accordance with the Federal Advisory Committee Act (Pub. L. 92–463, as amended), the National Science Foundation (NSF) announces the following meeting:

Name and Committee Code: Astronomy and Astrophysics Advisory Committee (#13883) (Virtual).

Date and Time: June 6, 2024; 9:30 a.m.–4:00 p.m.; June 7, 2024, 9:30 a.m.–4:00 p.m.

Place: National Science Foundation, 2415 Eisenhower Avenue, Room W2190, Alexandria, VA 22314/Virtual.

Attendance information for the meeting will be forthcoming on the advisory committee website at: *https://www.nsf.gov/mps/ast/aaac.jsp.*

Type of Meeting: Open.

Contact Person: Dr. Daniel Fabrycky, Program Director, Division of Astronomical Sciences, Suite W 9176, National Science Foundation, 2415 Eisenhower Avenue, Alexandria, VA 22314; Telephone: 703–292–8490.

Purpose of Meeting: To provide advice and recommendations to the National Science Foundation (NSF), the National Aeronautics and Space Administration (NASA) and the U.S. Department of Energy (DOE) on issues within the field of astronomy and astrophysics that are of mutual interest and concern to the agencies. To prepare the annual report.

Agenda: To hear presentations of current programming by representatives from NSF, NASA, DOE and other agencies relevant to astronomy and astrophysics; to discuss current and potential areas of cooperation between the agencies; to formulate recommendations for continued and new areas of cooperation and mechanisms for achieving them.

Dated: May 3, 2024.

Crystal Robinson,

Committee Management Officer.

BILLING CODE 7555–01–P

NATIONAL SCIENCE FOUNDATION

Advisory Committee for Social, Behavioral & Economic Sciences; Notice of Meeting

In accordance with the Federal Advisory Committee Act (Pub. L. 92–463, as amended), the National Science Foundation (NSF) announces the following meeting:

Name and Committee Code: Advisory Committee for Social, Behavioral & Economic Sciences (SBE) (#1171) (Hybrid).

Date and Time: June 6–7, 2024, 10:00 a.m.–4:00 p.m. (Eastern).

Place:

NSF, 2415 Eisenhower Avenue, Room W 2230, Alexandria, VA 22314 (In-Person and Virtual).

The meeting will be held in a hybrid format, with some Advisory Committee members participating in person and others participating virtually. For members of NSF and the external community, livestreaming and registration links will be available through the following page: *https://new.nsf.gov/sbe/advisory-committee.*

Type of Meeting: Open.

Contact Persons: Kurt DeSoto, National Science Foundation, 2415 Eisenhower Avenue, Alexandria, VA 22314; Telephone: 703–292–8700.

Purpose of Meeting: To provide advice, recommendations and counsel on major goals and policies pertaining to SBE programs and activities.

Agenda:

- Welcome, Introductions, Approval of Previous Advisory Committee (AC) Meeting Summary, and Preview of Agenda
- Directorate for Social, Behavioral, and Economic Sciences (SBE) Update
- Discussion on the National Secure Data Service Demonstration and the National Artificial Intelligence Research Resource Pilot
- SBE Contributions to Building a Resilient Planet and Committee Discussion
- SBE Contributions to Creating Opportunities Everywhere and Committee Discussion
- New AC Member Presentation
- Advisory Committee on Environmental Research and Education Update
- Meeting with NSF Leadership
- Wrap-up, Assignments, Closing Remarks

Dated: May 6, 2024.

Crystal Robinson,

Committee Management Officer.

BILLING CODE 7555–01–P

NUCLEAR REGULATORY COMMISSION

[Docket No. 70–7033; NRC–2024–0061]

Global Laser Enrichment, LLC.; New Headquarters; Environmental Assessment and Finding of No Significant Impact

AGENCY: Nuclear Regulatory Commission.

ACTION: Notice; issuance.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) staff is considering approval of a revision to the program cyber security plan (PCSP) held by Global Laser Enrichment, LLC (GLE) to extend the classified network to a new headquarters building. The NRC staff is issuing an environmental assessment (EA) and finding of no significant impact (FONSI) associated with the proposed revisions.

DATES: The EA and FONSI referenced in this document are available on May 9, 2024.

ADDRESSES: Please refer to Docket ID NRC–2024–0061 when contacting the NRC about the availability of information regarding this document. You may obtain publicly available information related to this document using any of the following methods:

- *Federal Rulemaking website:* Go to *https://www.regulations.gov* and search for Docket ID NRC–2024–0061. Address questions about Docket IDs in *Regulations.gov* to Stacy Schumann; telephone: 301–415–0624; email: *Stacy.Schumann@nrc.gov.* For technical questions, contact the individual listed in the ''For Further Information Contact'' section of this document.
- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly available documents online in the ADAMS Public Documents collection at *https://www.nrc.gov/reading-rm/adams.html.* To begin the search, select ''Begin Web-based ADAMS Search.'' For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, at 301–415–4737, or by email to *PDR.Resource@nrc.gov.* For the convenience of the reader, instructions about obtaining materials referenced in this document are provided in the ''Availability of Documents'' section. Individuals seeking access to Official Use Only information should contact Matthew Bartlett, using the contact information below.
- *NRC's PDR:* The PDR, where you may examine and order copies of publicly available documents, is open by appointment. To make an appointment to visit the PDR, please send an email to *PDR.Resource@nrc.gov* or call 1–800–397–4209 or 301–415–4737, between 8 a.m. and 4 p.m. eastern time (ET), Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Matthew Bartlett, Office of Nuclear Material Safety and Safeguards, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001, telephone: 301–415–7154; email: *Matthew.Bartlett@nrc.gov.*

SUPPLEMENTARY INFORMATION:

I. Introduction

The NRC staff is considering the approval of an update to a PCSP held by GLE for operations at a new headquarters, located in Wilmington, NC, approximately 6.2 miles from GLE's existing test loop facility. Therefore, as required by section 51.21 of title 10 of the *Code of Federal Regulations* (10 CFR), ''Criteria for and identification of licensing and regulatory actions requiring environmental assessments,'' the NRC staff has prepared an EA that analyzes the environmental effects of the proposed action. Based on the results of the EA and in accordance with 10 CFR 51.31(a), the NRC staff is issuing a FONSI for the proposed update to the PCSP.

Approval of the updated PCSP would allow for the incorporation of classified systems at the new headquarters building into the existing GLE authorization to operate a classified network. The request for approval of an updated PCSP was submitted September 21, 2023, and updated November 13, 2023. The NRC staff is also considering the approval of a separate but related request for issuance of a facility clearance under 10 CFR part 95 for GLE's new headquarters building, published in the **Federal Register** on April 29, 2024 (89 FR 33404).

II. Environmental Assessment

Description of the Proposed Action

The proposed action would allow GLE to extend the classified computer network to a new headquarters location approximately 6.2 miles from the test loop. As proposed, GLE would continue to possess, use, and store classified matter at its test loop facility and would also possess, use, and store classified matter at the new headquarters location under the revised PCSP. GLE operates a test loop for industrialization of the uranium enrichment process that uses separation of isotopes by laser excitation. Although GLE has an NRC-issued facility security clearance for the test loop facility under 10 CFR part 95 for protection of classified matter, the facility's operations, safety, and safeguards programs are authorized under the Global Nuclear Fuel—America license SNM–1097.

Need for the Proposed Action

The proposed action would allow GLE to extend the classified computer network to a new headquarters location to facilitate further research and development potentially leading to the industrialization of the laser enrichment process. The proposed NRC staff approval of the updated PCSP would add approval for the possession and use of classified matter at the new headquarters location.

Environmental Impacts of the Proposed Action

The NRC staff has assessed the potential environmental impacts from GLE's updated PCSP. The classified systems at the headquarters building will include appropriate controls for the protection of classified matter. These headquarter systems will facilitate the exchange of classified matter with the test loop facility but will have no operational or environmental impacts on the test loop. The NRC staff evaluated the potential for impacts at the GLE headquarters facility from the proposed action, which involves only changes to information systems. The NRC staff concluded that the proposed action will cause no significant change in the types of or significant increase in the amounts of any effluents that may be released offsite, that there will be no significant increase in individual or cumulative occupational radiation exposure, that there will be no significant construction impact, and that there will be no significant increase in the potential for or consequences from radiological accidents. The NRC staff assessed the impacts of the proposed action on land use; historical and cultural resources; visual and scenic resources; climatology, meteorology and air quality; geology, minerals, and soils; water resources; ecological resources; socioeconomics; noise; traffic and transportation; public and occupational health and safety; and waste management and concluded that the proposed action would have no significant environmental impacts on these resource areas. The NRC staff

determined that there are no cumulative impacts associated with the proposed action.

Environmental Impacts of the Alternatives to the Proposed Action

As an alternative to the proposed action, the staff considered denial of the proposed action (*i.e.,* the ''no-action'' alternative). Under this alternative, GLE would not be granted approval of the updated cyber security plan. Denial of the proposed action would result in GLE being unable to conduct operations related to classified matter at its headquarters location. GLE would continue its current operations at the test loop facility. The NRC staff concluded that environmental impacts from the no-action alternative would not be significant.

Agencies and Persons Consulted

The Endangered Species Act (ESA) was enacted to prevent further decline of endangered and threatened species and restore those species and their critical habitat. Section 7 of the ESA requires Federal agencies to consult with the U.S. Fish and Wildlife Service or the National Marine Fisheries Service, as appropriate, regarding actions that may affect listed species or designated critical habitats. The NRC staff has determined that the proposed action would have no effect on threatened or endangered species or critical habitat. Therefore, consultation under section 7 of the ESA is not required.

Section 106 of the National Historic Preservation Act (NHPA) requires Federal agencies to consider the effects of their undertakings on historic properties. As stated in the NHPA, historic properties are any prehistoric or historic district, site, building, structure, or object included in or eligible for inclusion in the National Register of Historic Places. The NRC staff has determined that the undertaking is a type of activity that does not have the potential to cause effects on any historic properties that may be present. Therefore, in accordance with 36 CFR 800.3(a)(1), the NRC has no further obligations under section 106 of the NHPA.

III. Finding of No Significant Impact

GLE has requested approval of its updated PCSP. The NRC staff has prepared an EA as part of its review of the proposed action. The proposed action would have no significant radiological or non-radiological impacts to environmental resources. This FONSI incorporates by reference the EA in Section II of this notice. On the basis of this EA, the NRC staff concludes that the proposed action will not have a significant effect on the quality of the human environment. Accordingly, the NRC has determined not to prepare an environmental impact statement.

IV. Availability of Documents

The documents identified in the following table are available to interested persons through one or more of the following methods, as indicated.

Document description	ADAMS Accession No.
Approval of Updates to the Global Laser Enrichment LLC Standard Practice, Procedure Plan and Transportation Plan, to Support the New, Off-Site Headquarters Building, dated May 1, 2024.	ML24037A127
Submission of Global Laser Enrichment, LLC Cyber Security Plan Incorporating Coverage for the new GLE Headquarters, dated September 21, 2023.	ML23283A247
Submission of Global Laser Enrichment Program Cyber Security Plan Incorporating Coverage for the new GLE Headquarters updated PCSP, dated November 13, 2023.	ML23335A135

Dated: May 5, 2024.

For the Nuclear Regulatory Commission.

Samantha Lav,

Chief, Fuel Facilities Licensing Branch, Division of Fuel Management, Office of Nuclear Material Safety and Safeguards.

[FR Doc. 2024–10124 Filed 5–8–24; 8:45 am]

BILLING CODE 7590–01–P

PENSION BENEFIT GUARANTY CORPORATION

Proposed Submission of Information Collection for OMB Review; Comment Request; Mergers and Transfers Between Multiemployer Plans

AGENCY: Pension Benefit Guaranty Corporation.

ACTION: Notice of intent to request extension of OMB approval of information collection.

SUMMARY: The Pension Benefit Guaranty Corporation (PBGC) intends to request that the Office of Management and Budget (OMB) extend approval, under the Paperwork Reduction Act, of a collection of information contained in PBGC's regulation on Mergers and Transfers Between Multiemployer Plans. This notice informs the public of PBGC's intent and solicits public comment on the collection of information.

DATES: Comments must be submitted on or before July 8, 2024.

ADDRESSES: Comments may be submitted by any of the following methods:

- *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions for submitting comments.
- *Email: paperwork.comments@pbgc.gov.* Refer to OMB control number 1212–0022 in the subject line.
- *Mail or Hand Delivery:* Regulatory Affairs Division, Office of the General Counsel, Pension Benefit Guaranty Corporation, 445 12th Street SW, Washington, DC 20024–2101.

Commenters are strongly encouraged to submit comments electronically. Commenters who submit comments on paper by mail should allow sufficient time for mailed comments to be received before the close of the comment period.

All submissions received must include the agency's name (Pension Benefit Guaranty Corporation, or PBGC) and refer to OMB control number 1212–0022. All comments received will be posted without change to PBGC's website, *www.pbgc.gov,* including any personal information provided. Do not submit comments that include any personally identifiable information or confidential business information.

Copies of the collection of information may be obtained without charge by writing to the Disclosure Division, (*disclosure@pbgc.gov*), Office of the General Counsel, Pension Benefit Guaranty Corporation, 445 12th Street SW, Washington, DC 20024–2101; or, calling 202–229–4040 during normal business hours. If you are deaf or hard of hearing, or have a speech disability, please dial 7–1–1 to access telecommunications relay services.

FOR FURTHER INFORMATION CONTACT: Monica O'Donnell (*odonnell.monica@pbgc.gov*), Attorney, Regulatory Affairs Division, Office of the General Counsel, Pension Benefit Guaranty Corporation, 445 12th Street SW, Washington DC 20024–2101; 202–229–8706. If you are

deaf or hard of hearing, or have a speech disability, please dial 7–1–1 to access telecommunications relay services.

SUPPLEMENTARY INFORMATION: Section 4231(a) and (b) of the Employee Retirement Income Security Act of 1974 (ERISA) requires plans that are involved in a merger or transfer to give PBGC 120 days notice of the transaction and provides that if PBGC determines that specified requirements are satisfied, the transaction will be deemed not to be in violation of ERISA section 406(a) or (b)(2) (dealing with prohibited transactions).

PBGC's regulation on Mergers and Transfers Between Multiemployer Plans (29 CFR part 4231) sets forth the procedures for giving notice of a merger or transfer under section 4231 and for requesting a compliance determination. The regulations specify the information that must be included in a merger or transfer notice. A request for a compliance determination must provide additional information to enable PBGC to make an explicit finding that the merger/transfer requirements have been satisfied.

Section 4231(e) of ERISA clarifies PBGC's authority to facilitate a merger (a ''facilitated merger'') of two or more multiemployer plans if certain statutory requirements are met. For purposes of section 4231(e), ''facilitation'' may include training, technical assistance, mediation, communication with stakeholders, and support with related requests to other government agencies. In addition, subject to the requirements of section 4231(e)(2), PBGC may provide financial assistance (within the meaning of section 4261 of ERISA) to facilitate a merger (a ''financial assistance merger'') it determines is necessary to enable one or more of the plans involved to avoid or postpone insolvency. PBGC's regulations specify the information requirements for a voluntary request for a facilitated merger under section 4231(e) of ERISA, including a financial assistance merger.

PBGC uses information submitted by plan sponsors under the regulation to determine whether mergers and transfers conform to the requirements of ERISA section 4231 and the regulation.

The collection of information under the regulation has been approved by OMB under control number 1212–0022 (expires October 31, 2024). PBGC intends to request that OMB extend approval of the collection for 3 years. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

PBGC estimates that there are 15 transactions each year (excluding financial assistance mergers). The estimated annual burden of the collection of information for 15 transactions (excluding financial assistance mergers) is 15 fund office hours and $74,400 in contractor costs for work by attorneys and actuaries. PBGC further estimates that there is one request each year for a financial assistance merger. The annual burden of the collection of information for financial assistance mergers is 10 fund office hours and $36,000 in contractor costs. The total annual burden of the collection of information is approximately 25 fund office hours and $110,400 in contractor costs.

PBGC is soliciting public comments to—

- Evaluate whether the proposed collection of information is necessary for the proper

performance of the functions of the agency, including whether the information will have practical utility;

- Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodologies and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.,* permitting electronic submission of responses.

Issued in Washington, DC.

Hilary Duke,

Assistant General Counsel for Regulatory Affairs, Pension Benefit Guaranty Corporation.

New Postal Products

AGENCY: Postal Regulatory Commission.

ACTION: Notice.

SUMMARY: The Commission is noticing a recent Postal Service filing for the Commission's consideration concerning a negotiated service agreement. This notice informs the public of the filing, invites public comment, and takes other administrative steps.

DATES: *Comments are due:* May 13, 2024.

ADDRESSES: Submit comments electronically via the Commission's Filing Online system at *http://www.prc.gov.* Those who cannot submit comments electronically should contact the person identified in the **FOR FURTHER INFORMATION CONTACT** section by telephone for advice on filing alternatives.

FOR FURTHER INFORMATION CONTACT: David A. Trissell, General Counsel, at 202–789–6820.

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Introduction
II. Docketed Proceeding(s)

I. Introduction

The Commission gives notice that the Postal Service filed request(s) for the Commission to consider matters related to negotiated service agreement(s). The request(s) may propose the addition or removal of a negotiated service agreement from the Market Dominant or the Competitive product list, or the modification of an existing product currently appearing on the Market Dominant or the Competitive product list.

Section II identifies the docket number(s) associated with each Postal Service request, the title of each Postal Service request, the request's acceptance date, and the authority cited by the Postal Service for each request. For each request, the Commission appoints an officer of the Commission to represent the interests of the general public in the proceeding, pursuant to 39 U.S.C. 505 (Public Representative). Section II also establishes comment deadline(s) pertaining to each request.

The public portions of the Postal Service's request(s) can be accessed via the Commission's website (*http://www.prc.gov*). Non-public portions of the Postal Service's request(s), if any, can be accessed through compliance with the requirements of 39 CFR 3011.301.[1]

The Commission invites comments on whether the Postal Service's request(s) in the captioned docket(s) are consistent with the policies of title 39. For request(s) that the Postal Service states concern Market Dominant product(s),

[1] *See* Docket No. RM2018–3, Order Adopting Final Rules Relating to Non-Public Information, June 27, 2018, Attachment A at 19–22 (Order No. 4679).

applicable statutory and regulatory requirements include 39 U.S.C. 3622, 39 U.S.C. 3642, 39 CFR part 3030, and 39 CFR part 3040, subpart B. For request(s) that the Postal Service states concern Competitive product(s), applicable statutory and regulatory requirements include 39 U.S.C. 3632, 39 U.S.C. 3633, 39 U.S.C. 3642, 39 CFR part 3035, and 39 CFR part 3040, subpart B. Comment deadline(s) for each request appear in section II.

II. Docketed Proceeding(s)

1. *Docket No(s).:* MC2024–267 and CP2024–273; *Filing Title:* USPS Request to Add Priority Mail & USPS Ground Advantage Contract 240 to Competitive Product List and Notice of Filing Materials Under Seal; *Filing Acceptance Date:* May 3, 2024; *Filing Authority:* 39 U.S.C. 3642, 39 CFR 3040.130 through 3040.135, and 39 CFR 3035.105; *Public Representative:* Jennaca D. Upperman; *Comments Due:* May 13, 2024.

2. *Docket No(s).:* MC2024–268 and CP2024–274; *Filing Title:* USPS Request to Add Priority Mail & USPS Ground Advantage Contract 241 to Competitive Product List and Notice of Filing Materials Under Seal; *Filing Acceptance Date:* May 3, 2024; *Filing Authority:* 39 U.S.C. 3642, 39 CFR 3040.130 through 3040.135, and 39 CFR 3035.105; *Public Representative:* Jennaca D. Upperman; *Comments Due:* May 13, 2024.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–100060; File No. SR–Phlx–2024–18]

Self-Regulatory Organizations; Nasdaq PHLX LLC; Notice of Filing and Immediate Effectiveness of Proposed Rule Change To Amend Its Fee Schedule at Equity 7, Section 3 To Implement a Market Data Revenue Rebate Program

May 3, 2024.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (''Act''),[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on April 25, 2024, Nasdaq PHLX LLC (''Phlx'' or ''Exchange'') filed with the Securities and Exchange Commission (''SEC'' or ''Commission'') the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to amend its fee schedule at Equity 7, Section 3 to implement a Market Data Revenue Rebate program, as described further below.

The text of the proposed rule change is available on the Exchange's website at *https://listingcenter.nasdaq.com/rulebook/phlx/rules,* at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend its fee schedule at Equity 7, Section 3 to adopt a Market Data Revenue (''MDR'') Rebate program for Nasdaq PSX.[3] In sum, the proposed MDR Rebate program calls for 40% of MDR that exceeds fixed thresholds in any one of two pools (''Excess MDR'') to be shared with PSX Participants in proportion to their respective eligible quoting activity in Tape A and C securities, as described further below. The proposed MDR Rebate program is designed to improve displayed liquidity and promote order flow to the Exchange by offering an incentive for market participants to quote on the Exchange.

Background

The Securities Information Processors (''SIPs''), which include the Unlisted Trading Privileges and the Consolidated Tape Association, collect fees from

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

[3] The Exchange initially filed the proposed pricing change on April 1, 2024 (SR–Phlx–2024–16). On April 15, 2024, the Exchange withdrew that filing and submitted SR–Phlx–2024–17. On April 25, 2024, the Exchange withdrew that filing and submitted this filing.

subscribers for trade and quote tape data received from trading centers and reporting facilities, such as the Exchange (collectively ''SIP Participants''). After deducting the cost of operating each tape, the profits are allocated among the SIP Participants on a quarterly basis, according to a complex set of calculations that consider estimates of anticipated MDR, adjustments to comport to actual MDR from previous quarters and a non-linear aggregation of total trading and quoting activity in Tape A, B and C securities in attributing MDR to each SIP Participant. Based on these calculations, the SIPs provide MDR payments to each SIP Participant during the first month of each quarter for trade and quote data from the previous calendar quarter, which are subject to adjustment through subsequent quarterly payments. These payments can be divided into six pools (*i.e.,* trade and quote activity in Tape A, B and C securities).

Proposed PSX MDR Rebate Program

As the Exchange does not currently share MDR with Participants, the Exchange now proposes to implement a PSX MDR Rebate program to share MDR attributed to quote activity only by adopting a PSX MDR Rebate program in Equity 7, Section 3.

Specifically, proposed Section (a) provides that, assuming that the requirements of this PSX MDR Rebate Section are met, a PSX Participant may receive a quarterly MDR rebate in proportion to the PSX Participant's quoting of displayed orders in Tape A and C securities from the previous calendar quarter (''MDR Rebate''), as described further in Section (e).

Proposed Section (b) provides that, to qualify for the MDR Rebate, a PSX Participant must quote at the National Best Bid or Offer (''NBBO'') at least 25% of the time during Market Hours in an average of at least 250 securities for Tape A securities or at least 300 securities for Tape C securities through the PSX Participant's MPID. A PSX Participant is considered to be quoting at the NBBO if the PSX Participant's MPID quotes a displayed order of at least 100 shares in the security and prices the order at either the national best bid or the national best offer or both the national best bid and offer for the security. To qualify for the MDR Rebate, the PSX Participant must meet the requirement for an average of at least 250 securities for Tape A securities or at least 300 securities for Tape C securities per day over the course of the quarter.

Proposed Section (c) provides that MDR will be calculated separately for quotes in each Tape A and C security, for a total of two MDR pools. If the MDR received by the Exchange in any given pool exceeds the following thresholds in any given calendar quarter, 40% of such excess MDR will be payable to PSX Participants in proportion to their respective quoting of displayed orders in that pool:

Tape A	Tape C
$110,000	$200,000

The proposed thresholds were selected based on historical data of PSX's quoting revenue from Q2 2023–Q4 2023. The dollar values represent the amount of MDR that must be paid to the Exchange by the SIPs before the Excess MDR would be eligible for distribution.

The Exchange proposes to adopt two of the six MDR pools utilized by the SIPs, excluding the pools for trading activity and the pool for quoting activity in Tape B, and attributing the proposed MDR Rebates to PSX Participants for quote activity in Tapes A and C. Currently, PSX Participants are most actively quoting Tape B securities on PSX. The Exchange proposes to establish the MDR Rebates for quoting activity in Tapes A and C because the Exchange wants to encourage increased quoting at the NBBO for Tapes A and C.

Section (d) provides a *de minimis* requirement that states that a PSX Participant will not receive an MDR Rebate in any calendar quarter in which the total MDR Rebate attributed to the PSX Participant is less than $500. If a PSX Participant is eligible for MDR Rebates from both pools, the PSX Participant will be eligible to receive an MDR rebate equal to the sum of the rebates. However, if the sum of the rebates is less than $500, the PSX Participant will not receive a payment and the rebate will be kept by the Exchange. The purpose of the *de minimis* requirement is to encourage significant quote activity and for the Exchange to avoid having to pay PSX Participants for *de minimis* Excess MDR.[4]

In attributing eligible quote activity to PSX Participants, the Exchange proposes to utilize a set of calculations similar to those used by the SIPs in allocating MDR to SIP Participants. Section (e) of the proposed rule language describes the steps for calculating MDR Rebates:

Step 1. Calculate, on a daily basis (per MPID), the product of three factors: number of shares in the quotation, the duration of the quotation at the NBBO (for both the bid and the offer), and the price of the security.

Step 2. For each security, sum the daily values from Step 1 across the quarter, the sum of which represents the PSX Participant's quote credits (per MPID) in each security.

Step 3. For each security, sum all PSX Participants' quote credits to obtain the total quote credits available per security.

Step 4. Divide each PSX Participant's quote credits (per MPID) (from Step 2) into the total quote credits available per security (from Step 3) to obtain a Participant's percentage of the security they are quoting (per MPID).

Step 5. Calculate the income allocation weight for each security based on the share of revenue allocated to the symbol by the SIP that quarter.

Step 6. For each security, multiply a PSX Participant's percentage of security they are quoting (per MPID) (from Step 4) by the income allocation weight of the security (from Step 5).

Step 7. For each PSX Participant's MPID, sum the values calculated in Step 6 across all securities in the pool (*i.e.,* in the same Tape) to obtain the PSX Participant's allocation percentage for the excess MDR in the pool.

Step 8. For each PSX Participant with eligible quote activity in the pool, multiply the PSX Participant's allocation percentage (from Step 7) by the excess MDR in the pool to determine the dollar amount of the PSX Participant's MDR Rebate in the pool.

As for calculating the pool of funds from which MDR Rebates will be paid, unlike the SIPs, the Exchange will derive MDR Rebate allocation from a fixed value that will not be subject to adjustment (*i.e.,* the amount of MDR actually received by the Exchange on a quarterly basis). This avoids the problem of having to adjust MDR rebates that have already been paid to PSX Participants to comport to adjustments to MDR made by the SIPs.[5]

The following *Example,* which the Exchange provides in the proposed rule language, illustrates how Excess MDR will be calculated and distributed:

Step 1. On the first day of the quarter, PSX Participant A earns 59,000 quote

[4] For example, it would be unduly burdensome to the Exchange to calculate and pay MDR Rebates to PSX Participants if the total Excess MDR of all the pools was $4000 and ten PSX Participants were each attributed $400 in rebates.

[5] For example, if MDR paid to the Exchange was less than anticipated in Q3 2024 due to an adjustment to the MDR paid to the Exchange in Q2 2024 (*i.e.,* actual MDR in Q2 fell short of estimates), the Exchange will not recoup the difference from the PSX Participants that had been paid the Q2 MDR Rebate. Instead, the MDR Rebate for Q3 will be calculated based on the actual MDR paid to the Exchange in Q3.

credits in MPID 1 for Security X (a Tape C security): 59 seconds x $10 x 100 shares.

Step 2. Assume PSX Participant A earns 4,000,000 quote credits for Security X in MPID 1 after summing its daily quote credits across the quarter.

Step 3. Assume there are five PSX Participants (*i.e.,* Participants A, B, C, D and E) that had eligible quote activity in Security X during the quarter. The quarterly quote credits for Security X are as follows:

Participant	Security X Quote Credits
A	4,000,000
B	1,000,000
C	3,500,000
D	2,500,000
E	5,000,000
Total	16,000,000

Step 4. PSX Participant A's percentage of Security X it quoted is 25%: 4,000,000/16,000,000.

Step 5. Assume the SIP allocated revenue of $360,000 to Security X for the quarter and $36,000,000 to all securities in the Tape C pool for the quarter. The income allocation weight for security X is 1%: $360,000/ $36,000,000.

Step 6. PSX Participant A's allocation percentage for the excess MDR in Security X in MPID 1 is 0.25%: 25% x 1%.

Step 7. Assume, after summing the allocation percentage calculated in Step 6 across all securities in the Tape C pool, PSX Participant A's allocation percentage is 2.5% in MPID 1.

Step 8. Assume PSX Participant A quoted at the NBBO at least 25% of the time during Market Hours in an average of at least 300 securities in Tape C through MPID 1, in accordance with section (b) above.

The following table represents the proposed MDR pool thresholds:

Tape A	Tape C
$110,000	$200,000

Under this Example, assume that the quarterly MDR paid to the Exchange is apportioned as follows:

Tape A	Tape C
$110,000	$350,000

Under this Example, the Tape C pool has excess MDR in the amount of $150,000. However, the Tape A pool has no excess MDR because the actual MDR received in the Tape A pool was equal to its $110,000 threshold. Thus, PSX Participants may be paid MDR Rebates for attributed eligible quoting activity from 40% of the excess MDR in the Tape C pool, which is $60,000.

The attributed MDR for PSX Participant A in MPID 1 is $1,500: 2.5% × 60,000. Sincethe attributed MDR is greater than $500, PSX Participant A would receive an MDRpayment in the amount of $1,500.

2. Statutory Basis

The Exchange believes that its proposal is consistent with Section 6(b) of the Act,[6] in general, and furthers the objectives of Sections 6(b)(4) and 6(b)(5) of the Act,[7] in particular, in that it provides for the equitable allocation of reasonable dues, fees and other charges among members and issuers and other persons using any facility, and is not designed to permit unfair discrimination between customers, issuers, brokers, or dealers.

The Exchange's proposed changes to its schedule of credits are reasonable in several respects. As a threshold matter, the Exchange is subject to significant competitive forces in the market for equity securities transaction services that constrain its pricing determinations in that market. The fact that this market is competitive has long been recognized by the courts. In *NetCoalition* v. *Securities and Exchange Commission,* the D.C. Circuit stated as follows: ''[n]o one disputes that competition for order flow is 'fierce.' . . . As the SEC explained, '[i]n the U.S. national market system, buyers and sellers of securities, and the broker-dealers that act as their order-routing agents, have a wide range of choices of where to route orders for execution'; [and] 'no exchange can afford to take its market share percentages for granted' because 'no exchange possesses a monopoly, regulatory or otherwise, in the execution of order flow from broker dealers'. . ..'' [8]

The Commission and the courts have repeatedly expressed their preference for competition over regulatory intervention in determining prices, products, and services in the securities markets. In Regulation NMS, while adopting a series of steps to improve the current market model, the Commission highlighted the importance of market forces in determining prices and SRO revenues and, also, recognized that current regulation of the market system ''has been remarkably successful in promoting market competition in its broader forms that are most important to investors and listed companies.'' [9]

Numerous indicia demonstrate the competitive nature of this market. For example, clear substitutes to the Exchange exist in the market for equity security transaction services. The Exchange is only one of several equity venues to which market participants may direct their order flow. Competing equity exchanges offer similar tiered pricing structures to that of the Exchange, including schedules of rebates and fees that apply based upon members achieving certain volume thresholds.

Within this environment, market participants can freely and often do shift their order flow among the Exchange and competing venues in response to changes in their respective pricing schedules. As such, the proposal represents a reasonable attempt by the Exchange to increase its liquidity and market share relative to its competitors.

The Exchange believes it is reasonable, equitable, and not unfairly discriminatory for the Exchange to adopt a PSX MDR Rebate program that provides for sharing of Excess MDR with PSX Participants in proportion to their respective eligible quoting activity in Tape A and C securities, as described above. The Exchange believes the proposal is reasonable as it will provide an incentive for PSX Participants to increase quoting in displayed liquidity in Tape A and C securities on the Exchange. An increase in displayed liquidity and order flow to the Exchange will, in turn, improve the quality of the market and increase its attractiveness to existing and prospective participants. In addition, the proposal is equitable and not unfairly discriminatory as the proposal would equitably allocate MDR Rebates among PSX Participants by paying MDR Rebates according to the total quoting activity in Tape A and C securities attributable to a PSX Participant in any given calendar quarter. The MDR Rebates are available to all PSX Participants.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition not necessary or appropriate in furtherance of the purposes of the Act.

[6] 15 U.S.C. 78f(b).

[7] 15 U.S.C. 78f(b)(4) and (5).

[8] *NetCoalition* v. *SEC,* 615 F.3d 525, 539 (D.C. Cir. 2010) (quoting Securities Exchange Act Release No. 59039 (December 2, 2008), 73 FR 74770, 74782–83 (December 9, 2008) (SR–NYSEArca–2006–21)).

[9] Securities Exchange Act Release No. 51808 (June 9, 2005), 70 FR 37496, 37499 (June 29, 2005) (''Regulation NMS Adopting Release'').

Intramarket Competition

The Exchange does not believe that its proposal will place any category of Exchange participant at a competitive disadvantage.

As noted above, the Exchange's proposal is intended to have market-improving effects, by increasing displayed liquidity and order flow to the Exchange, to the benefit of all participants. The Exchange notes that its participants are free to trade on other venues to the extent they believe that the proposal is not attractive. As one can observe by looking at any market share chart, price competition between exchanges is fierce, with liquidity and market share moving freely between exchanges in reaction to fee and credit changes.

Intermarket Competition

In terms of inter-market competition, the Exchange notes that it operates in a highly competitive market in which market participants can readily favor competing venues if they deem fee levels at a particular venue to be excessive, or rebate opportunities available at other venues to be more favorable. In such an environment, the Exchange must continually adjust its credits and fees to remain competitive with other exchanges and with alternative trading systems that have been exempted from compliance with the statutory standards applicable to exchanges. Because competitors are free to modify their own credits and fees in response, and because market participants may readily adjust their order routing practices, the Exchange believes that the degree to which credit or fee changes in this market may impose any burden on competition is extremely limited. The proposal is reflective of this competition.

Even the largest U.S. equities exchange by volume has less than 20% market share, which in most markets could hardly be categorized as having enough market power to burden competition. Moreover, as noted above, price competition between exchanges is fierce, with liquidity and market share moving freely between exchanges in reaction to fee and credit changes. This is in addition to free flow of order flow to and among off-exchange venues which comprises upwards of 50% of industry volume.

In sum, if the change proposed herein is unattractive to market participants, it is likely that the Exchange will lose market share as a result. Accordingly, the Exchange does not believe that the proposed change will impair the ability of members or competing order execution venues to maintain their competitive standing in the financial markets.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were either solicited or received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

The foregoing rule change has become effective pursuant to Section 19(b)(3)(A)(ii) of the Act.[10]

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is: (i) necessary or appropriate in the public interest; (ii) for the protection of investors; or (iii) otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings to determine whether the proposed rule should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (*https://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov.* Please include file number SR–Phlx–2024–18 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549–1090.

All submissions should refer to file number SR–Phlx–2024–18. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (*https://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. Do not include personal identifiable information in submissions; you should submit only information that you wish to make available publicly. We may redact in part or withhold entirely from publication submitted material that is obscene or subject to copyright protection. All submissions should refer to file number SR–Phlx–2024–18, and should be submitted on or before May 30, 2024.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[11]

J. Matthew DeLesDernier,

Deputy Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–100061; File No. SR–Phlx–2024–22]

Self-Regulatory Organizations; Nasdaq PHLX LLC; Notice of Filing and Immediate Effectiveness of Proposed Rule Change To Amend the Trade Now Order Attribute, at Equity 4, Rule 3301B and Rule 3301A

May 3, 2024.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (''Act''),[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on April 30, 2024, Nasdaq PHLX LLC (''Phlx'' or ''Exchange'') filed with the Securities and Exchange Commission (''SEC'' or ''Commission'') the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to amend the Trade Now Order Attribute, at Equity 4, Rule 3301B,[3] as well as to make conforming changes to Rule 3301A, as described further below.

The text of the proposed rule change is available on the Exchange's website at *https://listingcenter.nasdaq.com/rulebook/phlx/rules,* at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend Rule 3301B(l), which governs the Trade Now Order Attribute.[4] Under the Exchange's rules, as amended by SR-Phlx-2023–43,[5] Trade Now is an Attribute that allows a resting Order ''that becomes locked or crossed, as applicable, at its non-displayed price by the posted price of an incoming Displayed Order or a Midpoint Peg Post-Only Order to execute against the locking or crossing Order(s) as a liquidity taker automatically.'' The Exchange proposes to amend this rule text to state instead that Trade Now allows ''a resting Order that is locked or crossed, as applicable, at its non-displayed price by the posted price of an incoming Displayed Order or a Midpoint Peg Post-Only Order or another Order or Orders (where such locking or crossing Order(s) or the order with Trade Now satisfies a Minimum Quantity condition) to execute against a locking or crossing Order(s) as a liquidity taker automatically, when such Orders become marketable.'' These proposed amendments serve several purposes.

First, the proposed amended text broadens the scope of the Rule so that it provides for Trade Now to also activate in circumstances where Orders possessing the Trade Now Order Attribute cannot execute at the point of initial interaction due to a Minimum Quantity condition[6] on the resting Order. The existing rule text suggests that Trade Now will activate only where it can do so immediately upon interaction with an incoming Displayed Order or a Midpoint Peg Post-Only Order, rather than after waiting for any conditions that preclude immediate execution from occurring. Under the proposed amendment, Trade Now would activate and execute against the locking or crossing Orders when the Minimum Quantity condition that prevented the immediate execution is satisfied, provided that the other requirements for activation of Trade Now functionality remain satisfied at that time.[7]

This proposed amendment enables Trade Now to better achieve its underlying purpose—which is to help clear the Exchange Book of locking or crossing orders. The Exchange perceives no logical basis to preclude activation of Trade Now when two (or more) Orders meet the conditions for activation, but for the fact that one of them has a Minimum Quantity condition that precluded it from executing (immediately upon entry and/or against subsequent incoming contra-side orders). Provided that the conditions for Trade Now to activate remain satisfied as of the time when the Orders become marketable, the Exchange believes that it is logical and consistent with the purpose of Trade Now for these Orders to execute such locking or crossing orders when the Minimum Quantity condition can be satisfied because doing so will help clear the Order Book of locked and crossed orders.

An example of a scenario in which the proposed amendment would apply is when an Order with Trade Now has a Minimum Quantity condition that a locking or crossing Order cannot initially satisfy. By way of illustration, assume that Participant A enters Order 1, which is a Displayed Order to sell 100 shares of XYZ at $10.00. Participant B then enters Order 2, which is a Non-Displayed Trade Now order to buy 200 shares of XYZ at $10.00, with a Minimum Quantity requirement of 200 shares. Order 2 will not automatically remove Order 1 due to the Minimum Quantity requirement. Participant C thereafter enters Order 3, which is a Non-Displayed Order to sell 100 shares of XYZ at $10.00. Under the existing Rule, Order 2 would not remove Order 3 using Trade Now due to the Minimum Quantity requirement of Order 2. Under the proposed amended Rule text, however, Trade Now would be activated for Order 2, and it would remove both Orders 1 and 3.

Similarly, the amendment would apply when it is an incoming locking Order, or a resting locking Order, that has a Minimum Quantity condition which the Order with Trade Now cannot satisfy immediately. In this scenario, assume that Participant A enters Order 1, which is a Non-Displayed Order to sell 300 shares of XYZ at $10.00, with a Minimum Quantity requirement of 200 shares. Participant B then enters Order 2, which is a Non-Displayed Order with Trade Now to buy 100 shares of XYZ at $10.00. Under the existing Rule, Order 2 will lock Order 1 but not execute due to the Minimum Quantity requirement associated with Order 1. If Participant C thereafter enters Order 3, which is another Displayed Order to buy 200 shares of XYZ at $10.00, then under the existing Rule, Order 3 will execute against Order 1 upon receipt, but Order 2 will not use Trade Now to trade against the remaining shares of Order 1. Under the proposal, however, once Order 3 is entered, it will execute against Order 1, satisfying the Minimum Quantity requirement of Order 1 and reducing the remaining size of Order 1 to 100 shares. At this point, Order 2 is capable of executing against the reduced size of Order 1. Order 2 will activate Trade Now, execute against Order 1, and clear the locked book.

In addition to the above, the proposed amendments to Rule 3301B(l), along

[3] References herein to Phlx Rules in the 3000 Series shall mean Rules in Phlx Equity 4.

[4] An ''Order Attribute'' is a further set of variable instructions that may be associated with an Order to further define how it will behave with respect to pricing, execution, and/or posting to the Exchange Book when submitted to the Exchange. *See id.*

[5] *See* Securities Exchange Act Release No. 34–98377 (September 13, 2023); 88 FR 64504 (September 19, 2023) (SR–Phlx–2023–43).

[6] Pursuant to Rule 3301B(e), ''Minimum Quantity'' is an Order Attribute that allows a Participant to provide that an Order will not execute unless a specified minimum quantity of shares can be obtained. The Rule provides for two types of Minimum Quantity Attributes: one in which a participant specifies that the condition may be satisfied by execution against one or more orders with an aggregate size of at least the minimum quantity; and another in which the condition must be satisfied by execution against one or more Orders, each of which must have a size of at least the minimum quantity. *Id.* This proposed rule change concerns the first of these two alternatives.

[7] The Proposal also replaces the word ''becomes'' with ''is'' in the existing phrase ''resting Order that becomes locked or crossed, as applicable, at its non-displayed price'' to accommodate the fact that, with the proposed amendment, Trade Now could activate after an Order with Trade Now becomes locked if it is not marketable at that initial point in time.

with corresponding amendments to Rule 3301A(b)(4) and (6), would discontinue the applicability of Trade Now to Midpoint Peg Post-Only Orders and Post-Only Orders.[8] The Exchange proposes to eliminate the applicability of Trade Now to these two Order Types because Trade Now is incompatible with the designs of these Order Types. In other words, Midpoint Peg Post-Only Orders and Post-Only Orders are liquidity-adding Order Types, whereas Orders with Trade Now are designed to be liquidity taking Orders. Because of this incompatibility, the Exchange finds that market participants rarely, as a practical matter, select Trade Now for their Midpoint Peg Post-Only Orders or their Post-Only Orders. Insofar as Trade Now serves no apparent utility as an Attribute of these Order Types, the Exchange proposes to eliminate its applicability thereto.

Lastly, the Exchange proposes to modify existing language in the Rule which states that only an incoming Displayed Order whose displayed price locks or crosses a resting Order with Trade Now at its non-displayed price, or an incoming Midpoint Peg Post-Only Order, will trigger the Trade Now functionality. The proposed Rule amendment broadens this text to also provide for another Order (including a Displayed or a Non-Displayed Order) whose price locks or crosses a resting Order with Trade Now to trigger Trade Now where the resting Order with Trade Now has a Minimum Quantity condition that the incoming Order (either itself, or in aggregate with other resting Orders) satisfies. The purpose of this new language is to account for the fact that a non-Displayed incoming Order, in addition to a Displayed incoming Order, can lock or cross a resting Order with Trade Now if it satisfies the Minimum Quantity condition of the resting Trade Now Order. The proposed amended Rule text also accounts for scenarios in which the Order with Trade Now does not possess a Minimum Quantity condition, but instead, the incoming locking/crossing Order or another resting locking/crossing Order possesses the Minimum Quantity Attribute, and the Minimum Quantity condition is reduced such that the Order with Trade Now becomes able to satisfy the condition. The proposed amendments would provide for Trade Now to activate in these scenarios as well.

The Exchange will publish an Equity Trader Alert at least seven days prior to implementing the proposed amendments.

2. Statutory Basis

The Exchange believes that its proposal is consistent with Section 6(b) of the Act,[9] in general, and further the objectives of Section 6(b)(5) of the Act,[10] in particular, in that it is designed to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general to protect investors and the public interest.

Specifically, the Exchange believes that it is consistent with the Act to amend the Exchange's Trade Now Rule to allow for Trade Now to activate, not only immediately upon receipt of a locking or crossing contra Displayed or Midpoint Peg Post-Only Order, but also at such time when the Order with Trade Now become marketable, if it was not marketable initially due to a Minimum Quantity Condition. The Exchange believes that the proposed behavior is consistent with the underlying intent of Trade Now, which is to help to clear the Exchange's Order Book of locking and crossing Orders. The Exchange perceives no logical basis to preclude activation of Trade Now when two Orders meet the conditions for activation, but for the fact that one of them is not marketable, and thus cannot interact with the other one immediately upon entry. Provided that the conditions for Trade Now to activate remain satisfied as of the time when the Orders become marketable, the Exchange believes that these Orders should execute automatically at that time. Moreover, the Exchange believes that the proposed behavior is consistent with the expectations of market participants for Trade Now functionality.

In addition to the above, it is also consistent with the Act to amend Rule 3301B(l), along with Rule 3301A(b)(4) and (6), to discontinue the applicability of Trade Now to Midpoint Peg Post-Only Orders and Post-Only Orders. As noted above, the Exchange proposes to eliminate the applicability of Trade Now to these two Order Types because Trade Now, which classifies an Order as a liquidity taker, is incompatible with the designs of these Order Types as liquidity maker Orders. Insofar as Trade Now serves no apparent utility as an Attribute of these Order Types, it is reasonable and in the interests of the markets and investors to eliminate its applicability thereto.

Lastly, the Exchange believes it is consistent with the Act to modify existing language in the Rule which states that only an incoming Displayed Order whose displayed price locks or crosses a resting Order with Trade Now at its non-displayed price, or an incoming Midpoint Peg Post-Only Order, will trigger the Trade Now functionality. As stated above, the proposed Rule amendment broadens this text to also provide for another Order (including a Displayed or a Non-Displayed Order) whose price locks or crosses a resting Order with Trade Now to trigger Trade Now where the resting Order with Trade Now has a Minimum Quantity condition that the incoming Order satisfies. This new language would account for the fact that a non-Displayed incoming Order, in addition to a Displayed incoming Order, can lock or cross a resting Order with Trade Now if it satisfies the Minimum Quantity condition. The proposed amended Rule text also accounts for scenarios in which the Order with Trade Now does not possess a Minimum Quantity condition, but instead, the incoming locking/crossing Order or another resting locking/crossing Order possesses the Minimum Quantity Attribute, and the Minimum Quantity condition is reduced such that the Order with Trade Now becomes able to satisfy the condition. The proposed amendments would provide for Trade Now to activate in these scenarios as well. Again, no purpose is served by excluding these scenarios from triggering Trade Now. To the contrary, including them would further the purpose of Trade Now, which is to aid in the clearing the Exchange's Order Book of locked and crossing Orders.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule changes will impose any burden on competition not necessary or appropriate in furtherance of the purposes of the Act. Although the proposal will broaden the applicability of Trade Now, the Exchange neither intends nor perceives that this rule change will have any significant impact on competition other than to make the Exchange's Trade Now Attribute more useful for participants, and thus the Exchange a more attractive venue in which to trade. Even as amended, Trade Now will remain an optional functionality that the Exchange offers at no charge, and which may be used equally by similarly-situated participants.

[8] The existing rule text of Rule 3301B(l) expressly applies Trade Now to Midpoint Peg Post-Only Orders, and implicitly applies Trade Now to Post-Only Orders by virtue of Trade Now's applicability to Displayed Orders (Post-Only Orders are Displayed).

[9] 15 U.S.C. 78f(b).

[10] 15 U.S.C. 78f(b)(5).

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were either solicited or received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A)(iii) of the Act[11] and subparagraph (f)(6) of Rule 19b–4 thereunder.[12]

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings to determine whether the proposed rule should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (*https://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov.* Please include file number SR–Phlx–2024–22 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549–1090.

All submissions should refer to file number SR-Phlx-2024–22. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (*https://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. Do not include personal identifiable information in submissions; you should submit only information that you wish to make available publicly. We may redact in part or withhold entirely from publication submitted material that is obscene or subject to copyright protection. All submissions should refer to file number SR-Phlx-2024–22, and should be submitted on or before May 30, 2024.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[13]

J. Matthew DeLesDernier,

Deputy Secretary.

Self-Regulatory Organizations; Nasdaq BX, Inc.; Notice of Filing and Immediate Effectiveness of Proposed Rule Change To Amend the Trade Now Order Attribute at Equity 4, Rule 4702 and Make Conforming Changes to Rule 4703

May 3, 2024.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (''Act''),[1] and Rule 19b–4 thereunder,[2] notice is hereby given that on April 26, 2024, Nasdaq BX, Inc. (''BX'' or ''Exchange'') filed with the Securities and Exchange Commission (''SEC'' or ''Commission'') the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

[1] 15 U.S.C. 78s(b)(1).

[2] 17 CFR 240.19b–4.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to amend the Trade Now Order Attribute, at Equity 4, Rule 4702,[3] as well as to make conforming changes to Rule 4703, as described further below.

The text of the proposed rule change is available on the Exchange's website at *https://listingcenter.nasdaq.com/rulebook/nasdaq/rules,* at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to amend Rule 4703(l), which governs the Trade Now Order Attribute.[4] Under the Exchange's rules, as amended by SR–BX–2022–015,[5] Trade Now is an Attribute that allows a resting Order ''that becomes locked or crossed, as applicable, at its non-displayed price by the posted price of an incoming Displayed Order to execute against a

[3] References herein to BX Rules in the 4000 Series shall mean Rules in BX Equity 4.

[4] An ''Order Attribute'' is a further set of variable instructions that may be associated with an Order to further define how it will behave with respect to pricing, execution, and/or posting to the Exchange Book when submitted to the Exchange. *See id.*

[5] *See* Securities Exchange Act Release No. 34–95695 (September 7, 2022); 87 FR 56122 (September 13, 2022) (SR–BX–2022–015).

locking or crossing Orders as a liquidity taker automatically.'' The Exchange proposes to amend this rule text to state instead that Trade Now allows ''a resting Order that is locked or crossed, as applicable, at its non-displayed price by the posted price of an incoming Displayed Order or another Order or Orders (where such locking or crossing Order(s) or the order with Trade Now satisfies a Minimum Quantity condition) to execute against a locking or crossing Order(s) as a liquidity taker automatically, when such Orders become marketable.'' These proposed amendments serve several purposes.

First, the proposed amended text broadens the scope of the Rule so that it provides for Trade Now to also activate in circumstances where Orders possessing the Trade Now Order Attribute cannot execute at the point of initial interaction due to a Minimum Quantity condition [6] on the resting Order. The existing rule text suggests that Trade Now will activate only where it can do so immediately upon interaction with an incoming Displayed Order, rather than after waiting for any conditions that preclude immediate execution from occurring. Under the proposed amendment, Trade Now would activate and execute against the locking or crossing Orders when the Minimum Quantity condition that prevented the immediate execution is satisfied, provided that the other requirements for activation of Trade Now functionality remain satisfied at that time.[7]

This proposed amendment enables Trade Now to better achieve its underlying purpose—which is to help clear the Exchange Book of locking or crossing orders. The Exchange perceives no logical basis to preclude activation of Trade Now when two (or more) Orders meet the conditions for activation, but for the fact that one of them has a Minimum Quantity condition that precluded it from executing (immediately upon entry and/or against subsequent incoming contra-side orders). Provided that the conditions for Trade Now to activate remain satisfied as of the time when the Orders become marketable, the Exchange believes that it is logical and consistent with the purpose of Trade Now for this Order to execute such locking or crossing orders when the Minimum Quantity condition can be satisfied because doing so will help clear the Order Book of locked and crossed orders.

An example of a scenario in which the proposed amendment would apply is when an Order with Trade Now has a Minimum Quantity condition that a locking or crossing Order cannot initially satisfy. By way of illustration, assume that Participant A enters Order 1, which is a Displayed Order to sell 100 shares of XYZ at $10.00. Participant B then enters Order 2, which is a Non-Displayed Trade Now order to buy 200 shares of XYZ at $10.00, with a Minimum Quantity requirement of 200 shares. Order 2 will not automatically remove Order 1 due to the Minimum Quantity requirement. Participant C thereafter enters Order 3, which is a Non-Displayed Order to sell 100 shares of XYZ at $10.00. Under the existing Rule, Order 2 would not remove Order 3 using Trade Now due to the Minimum Quantity requirement of Order 2. Under the proposed amended Rule text, however, Trade Now would be activated for Order 2, and it would remove both Orders 1 and 3.

Similarly, the amendment would apply when it is an incoming locking Order, or a resting locking Order, that has a Minimum Quantity condition which the Order with Trade Now cannot satisfy immediately. In this scenario, assume that Participant A enters Order 1, which is a Non-Displayed Order to sell 300 shares of XYZ at $10.00, with a Minimum Quantity requirement of 200 shares. Participant B then enters Order 2, which is a Non-Displayed Order with Trade Now to buy 100 shares of XYZ at $10.00. Under the existing Rule, Order 2 will lock Order 1 but not execute due to the Minimum Quantity requirement associated with Order 1. If Participant C thereafter enters Order 3, which is another Displayed Order to buy 200 shares of XYZ at $10.00, then under the existing Rule, Order 3 will execute against Order 1 upon receipt, but Order 2 will not use Trade Now to trade against the remaining shares of Order 1. Under the proposal, however, once Order 3 is entered, it will execute against Order 1, satisfying the Minimum Quantity requirement of Order 1 and reducing the remaining size of Order 1 to 100 shares. At this point, Order 2 is capable of executing against the reduced size of Order 1. Order 2 will activate Trade Now, execute against Order 1, and clear the locked book.

In addition to the above, the proposed amendments to Rule 4703(l), along with corresponding amendments to Rule 4702(b)(4)(C), would discontinue the applicability of Trade Now to Post-Only Orders.[8] The Exchange proposes to eliminate the applicability of Trade Now to this Order Type because Trade Now is incompatible with the designs of this Order Type. In other words, Post-Only Orders are liquidity-adding Order Type, whereas Orders with Trade Now are designed to be liquidity taking Orders. Because of this incompatibility, the Exchange finds that market participants rarely, as a practical matter, select Trade Now for their Post-Only Orders. Insofar as Trade Now serves no apparent utility as an Attribute of this Order Type, the Exchange proposes to eliminate its applicability thereto.

Lastly, the Exchange proposes to modify existing language in the Rule which states that only an incoming Displayed Order whose displayed price locks or crosses a resting Order with Trade Now at its non-displayed price will trigger the Trade Now functionality. The proposed Rule amendment broadens this text to also provide for another Order (including a Displayed or a Non-Displayed Order) whose price locks or crosses a resting Order with Trade Now to trigger Trade Now where the resting Order with Trade Now has a Minimum Quantity condition that the incoming Order (either itself, or in aggregate with other resting Orders) satisfies. The purpose of this new language is to account for the fact that a non-Displayed incoming Order, in addition to a Displayed incoming Order, can lock or cross a resting Order with Trade Now if it satisfies the Minimum Quantity condition of the resting Trade Now Order. The proposed amended Rule text also accounts for scenarios in which the Order with Trade Now does not possess a Minimum Quantity condition, but instead, the incoming locking/crossing Order or another resting locking/crossing Order possesses the Minimum Quantity Attribute, and the Minimum Quantity condition is reduced such that the Order with Trade Now becomes able to satisfy the condition. The proposed amendments

[6] Pursuant to Rule 4703(e), ''Minimum Quantity'' is an Order Attribute that allows a Participant to provide that an Order will not execute unless a specified minimum quantity of shares can be obtained. The Rule provides for two types of Minimum Quantity Attributes: one in which a participant specifies that the condition may be satisfied by execution against one or more orders with an aggregate size of at least the minimum quantity; and another in which the condition must be satisfied by execution against one or more Orders, each of which must have a size of at least the minimum quantity. *Id.* This proposed rule change concerns the first of these two alternatives.

[7] The Proposal also replaces the word ''becomes'' with ''is'' in the existing phrase ''resting Order that becomes locked or crossed, as applicable, at its non-displayed price'' to accommodate the fact that, with the proposed amendment, Trade Now could activate after an Order with Trade Now becomes locked if it is not marketable at that initial point in time.

[8] The existing rule text of Rule 4703(l) expressly applies Trade Now to Post-Only Orders by virtue of Trade Now's applicability to Displayed Orders (Post-Only Orders are Displayed).

would provide for Trade Now to activate in these scenarios as well.

The Exchange will publish an Equity Trader Alert at least seven days prior to implementing the proposed amendments.

2. Statutory Basis

The Exchange believes that its proposal is consistent with Section 6(b) of the Act,[9] in general, and further the objectives of Section 6(b)(5) of the Act,[10] in particular, in that it is designed to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general to protect investors and the public interest.

Specifically, the Exchange believes that it is consistent with the Act to amend the Exchange's Trade Now Rule to allow for Trade Now to activate, not only immediately upon receipt of a locking or crossing contra Displayed Order, but also at such time when the Order with Trade Now become marketable, if it was not marketable initially due to a Minimum Quantity Condition. The Exchange believes that the proposed behavior is consistent with the underlying intent of Trade Now, which is to help to clear the Exchange's Order Book of locking and crossing Orders. The Exchange perceives no logical basis to preclude activation of Trade Now when two Orders meet the conditions for activation, but for the fact that one of them is not marketable, and thus cannot interact with the other one immediately upon entry. Provided that the conditions for Trade Now to activate remain satisfied as of the time when the Orders become marketable, the Exchange believes that these Orders should execute automatically at that time. Moreover, the Exchange believes that the proposed behavior is consistent with the expectations of market participants for Trade Now functionality.

In addition to the above, it is also consistent with the Act to amend Rule 4703(l), along with Rule 4702(b)(4)(C), to discontinue the applicability of Trade Now to Post-Only Orders. As noted above, the Exchange proposes to eliminate the applicability of Trade Now to this Order Type because Trade Now, which classifies an Order as a liquidity taker, is incompatible with the designs of this Order Type as liquidity maker Orders. Insofar as Trade Now serves no apparent utility as an Attribute of this Order Type, it is reasonable and in the interests of the markets and investors to eliminate its applicability thereto.

Lastly, the Exchange believes it is consistent with the Act to modify existing language in the Rule which states that only an incoming Displayed Order whose displayed price locks or crosses a resting Order with Trade Now at its non-displayed price will trigger the Trade Now functionality. As stated above, the proposed Rule amendment broadens this text to also provide for another Order (including a Displayed or a Non-Displayed Order) whose price locks or crosses a resting Order with Trade Now to trigger Trade Now where the resting Order with Trade Now has a Minimum Quantity condition that the incoming Order satisfies. This new language would account for the fact that a non-Displayed incoming Order, in addition to a Displayed incoming Order, can lock or cross a resting Order with Trade Now if it satisfies the Minimum Quantity condition. The proposed amended Rule text also accounts for scenarios in which the Order with Trade Now does not possess a Minimum Quantity condition, but instead, the incoming locking/crossing Order or another resting locking/crossing Order possesses the Minimum Quantity Attribute, and the Minimum Quantity condition is reduced such that the Order with Trade Now becomes able to satisfy the condition. The proposed amendments would provide for Trade Now to activate in these scenarios as well. Again, no purpose is served by excluding these scenarios from triggering Trade Now. To the contrary, including them would further the purpose of Trade Now, which is to aid in the clearing the Exchange's Order Book of locked and crossing Orders.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule changes will impose any burden on competition not necessary or appropriate in furtherance of the purposes of the Act. Although the proposal will broaden the applicability of Trade Now, the Exchange neither intends nor perceives that this rule change will have any significant impact on competition other than to make the Exchange's Trade Now Attribute more useful for participants, and thus the Exchange a more attractive venue in which to trade. Even as amended, Trade Now will remain an optional functionality that the Exchange offers at no charge, and which may be used equally by similarly-situated participants.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were either solicited or received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A)(iii) of the Act[11] and subparagraph (f)(6) of Rule 19b–4 thereunder.[12]

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission shall institute proceedings to determine whether the proposed rule should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (*https://www.sec.gov/rules/sro.shtml*); or
- Send an email to *rule-comments@sec.gov.* Please include file number SR–BX–2024–013 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549–1090.

All submissions should refer to file number SR–BX–2024–013. This file

[9] 15 U.S.C. 78f(b).

[10] 15 U.S.C. 78f(b)(5).

[11] 15 U.S.C. 78s(b)(3)(A)(iii).

[12] 17 CFR 240.19b–4(f)(6). In addition, Rule 19b–4(f)(6) requires a self-regulatory organization to give the Commission written notice of its intent to file the proposed rule change at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission. The Exchange has satisfied this requirement.

number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (*https://www.sec.gov/rules/sro.shtml*). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. Do not include personal identifiable information in submissions; you should submit only information that you wish to make available publicly. We may redact in part or withhold entirely from publication submitted material that is obscene or subject to copyright protection. All submissions should refer to file number SR–BX–2024–013, and should be submitted on or before May 30, 2024.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[13]

J. Matthew DeLesDernier,

Deputy Secretary.

SMALL BUSINESS ADMINISTRATION

[Disaster Declaration #20288 and #20289; LOUISIANA Disaster Number LA–20003]

Administrative Declaration of a Disaster for the State of LOUISIANA

AGENCY: Small Business Administration.

ACTION: Notice.

SUMMARY: This is a notice of an Administrative declaration of a disaster for the State of LOUISIANA dated 05/03/2024.

Incident: Severe Storm, Flooding, Straight-line Winds and Tornadoes.

Incident Period: 04/10/2024.

DATES: Issued on 05/03/2024.

Physical Loan Application Deadline Date: 07/02/2024.

Economic Injury (EIDL) Loan Application Deadline Date: 02/03/2025.

ADDRESSES: *Visit the MySBA Loan Portal at https://lending.sba.gov* to apply for a disaster assistance loan.

FOR FURTHER INFORMATION CONTACT: Alan Escobar, Office of Disaster Recovery & Resilience, U.S. Small Business Administration, 409 3rd Street SW, Suite 6050, Washington, DC 20416, (202) 205–6734.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the Administrator's disaster declaration, applications for disaster loans may be submitted online using the MySBA Loan Portal *https://lending.sba.gov* or other locally announced locations. Please contact the SBA disaster assistance customer service center by email at *disastercustomerservice@sba.gov* or by phone at 1–800–659–2955 for further assistance.

The following areas have been determined to be adversely affected by the disaster:

Primary Parishes: St. Tammany

Contiguous Parishes/Counties:

Louisiana: Jefferson, Orleans, Tangipahoa, Washington

Mississippi: Hancock, Pearl River

The Interest Rates are:

	Percent
For Physical Damage:	
Homeowners with Credit Available Elsewhere	5.375
Homeowners without Credit Available Elsewhere	2.688
Businesses with Credit Available Elsewhere	8.000
Businesses without Credit Available Elsewhere	4.000
Non-Profit Organizations with Credit Available Elsewhere	3.250
Non-Profit Organizations without Credit Available Elsewhere	3.250
For Economic Injury:	
Business and Small Agricultural Cooperatives without Credit Available Elsewhere	4.000
Non-Profit Organizations without Credit Available Elsewhere	3.250

The number assigned to this disaster for physical damage is 20288C and for economic injury is 202890.

The States which received an EIDL Declaration are Louisiana, Mississippi.

Federal Highway Administration

[Docket No. FHWA–2024–0035]

Agency Information Collection Activities: Request for Comments for a New Information Collection

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice and request for comments.

SUMMARY: The FHWA invites public comments about our intention to request the Office of Management and Budget's (OMB) approval for a new information collection, which is summarized below under **SUPPLEMENTARY INFORMATION**. We are required to publish this notice in the **Federal Register** by the Paperwork Reduction Act of 1995.

DATES: Please submit comments by July 8, 2024.

ADDRESSES: You may submit comments identified by DOT Docket ID Number 0035 by any of the following methods:

Website: For access to the docket to read background documents or comments received go to the Federal eRulemaking Portal: Go to *http://www.regulations.gov*. Follow the online instructions for submitting comments.

Fax: 1–202–493–2251.

Mail: Docket Management Facility, U.S. Department of Transportation, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE, Washington, DC 20590–0001.

Hand Delivery or Courier: U.S. Department of Transportation, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE, Washington, DC 20590, between 9 a.m. and 5 p.m. ET, Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Frances Ramirez, (202) 961–8605 FHWA, Office of Federal Lands Highway, Office of Federal Lands Programs, 22001 Loudoun County Parkway, Building E1, Suite 150, Ashburn, VA 20147. Office hours are from 8 a.m. to 4 p.m., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Title: Nationally Significant Federal Lands and Tribal Projects (NSFLTP) Program.

Background: The NSFLTP Program was authorized under section 1123 of the Fixing America's Surface Transportation (FAST) Act (Pub. L. 114–94) and amended by section 11127 of the BIL. The NSFLTP Program funds are to be awarded on a competitive basis for the construction, reconstruction, and

rehabilitation of nationally significant projects within, adjacent to, or accessing Federal and Tribal lands. The NSFLTP Program provides an opportunity to address significant challenges across the Nation for transportation facilities that serve Federal and Tribal lands.

Respondents: Eligible applicants include Federal Land Management Agencies (FLMA); Tribal governments; and States, counties, and units of local government may also apply, but only if sponsored by an FLMA or Tribal government.

Activity: Notice of Funding Opportunity (NOFO).

Application Frequency: The application package is annually following the instructions of the NOFO.

Estimated Average Burden per Response: On average, addressing the criteria requested on the NOFO may take 5 hours to complete.

Estimated Total Annual Burden Hours: Total estimated average annual burden is 110 hours.

Activity: Executing Grant Agreement

Application Frequency: A successful grant recipient requires an executed grant agreement to receive the NSFLTP funding.

Estimated Average Burden per Response: On average, completing and executing a grant agreement may take 3 hours to complete.

Estimated Total Annual Burden Hours: Total estimated burden is 54 hours.

Activity: Post Award Reporting

Application Frequency: if the grant recipient is a State or a Tribal government, the project performance report is submitted every six months (biannually). If the grant recipient is and FLMA, the project performance report is submitted every three months (quarterly).

Estimated Average Burden per Response: On average, the project performance report may take 1 hours to complete.

Estimated Total Annual Burden Hours: Total estimated average annual burden is 50 hours. Per the activities described above, the total estimated burden is 214 hours annually.

Public Comments Invited: You are asked to comment on any aspect of this information collection, including: (1) Whether the proposed collection is necessary for the FHWA's performance; (2) the accuracy of the estimated burdens; (3) ways for the FHWA to enhance the quality, usefulness, and clarity of the collected information; and (4) ways that the burden could be minimized, including the use of electronic technology, without reducing the quality of the collected information. The agency will summarize and/or include your comments in the request for OMB's clearance of this information collection.

Authority: The Paperwork Reduction Act of 1995; 44 U.S.C. chapter 35, as amended; and 49 CFR 1.48.

Issued on: March 6, 2024.

Jazmyne Lewis,

Information Collection Officer.

Hand Delivery or Courier: U.S. Department of Transportation, West Building Ground Floor, Room W12–140, 1200 New Jersey Avenue SE, Washington, DC 20590, between 9 a.m. and 5 p.m. ET, Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Julie Johnston, (202) 591–5858, Office of Preconstruction, Construction and Pavements, Federal Highway Administration, Department of Transportation, 1200 New Jersey Avenue SE, Washington, DC 20590. Office hours are from 7 a.m. to 4 p.m., Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Title: Annual Value Engineering Call for Data.

Background: Value Engineering (VE) is defined as a systematic process of review and analysis of a project, during the concept and design phases, by a multidiscipline team of persons not involved in the project, that is conducted to provide recommendations for providing the needed functions safely, reliably, efficiently, and at the lowest overall cost; improving the value and quality of the project; and reducing the time to complete the project. Applicable projects requiring a VE analysis include Projects on the National Highway System (NHS) receiving Federal assistance with an estimated total cost of $50,000,000 or more; Bridge projects on the NHS receiving Federal assistance with an estimated total cost of $40,000,000 or more; any major project, as defined in 23 U.S.C. 106(h), located on or off the NHS, that utilizes Federal-aid highway funding in any contract or phase; and other projects as defined in 23 CFR 627.5. 23 U.S.C. 106(e)(4)(iv) and 23 CFR 627.7(3) require States to monitor, evaluates and annually submit a report that describes the results of the value analyses that are conducted, and the recommendations implemented on applicable projects. The FHWA Annually submits a National Call for VE Data in order to monitor and assess the VE Program and meet the requirements of 23 U.S.C. 106(h).

Respondents: 52, including 50 State Transportation Departments, the District of Columbia, the Commonwealth of Puerto Rico.

Frequency: Once per year.

Estimated Average Burden per Response: Approximately 2 hours per participant over a year.

Estimated Total Annual Burden Hours: Approximately 104 hours per year.

Public Comments Invited: You are asked to comment on any aspect of this information collection, including: (1) Whether the proposed collection is necessary for the FHWA's performance; (2) the accuracy of the estimated burdens; (3) ways for the FHWA to enhance the quality, usefulness, and clarity of the collected information; and (4) ways that the burden could be minimized, including the use of

electronic technology, without reducing the quality of the collected information. The agency will summarize and/or include your comments in the request for OMB's clearance of this information collection.

Authority: The Paperwork Reduction Act of 1995; 44 U.S.C. chapter 35, as amended; and 49 CFR 1.48.

Issued on: May 6, 2024.

Jazmyne Lewis,

Information Collection Officer.

BILLING CODE 4910–22–P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA–2023–0057]

Commercial Driver's License Standards: Application for Exemption; Pitt Ohio Express, LLC

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), Department of Transportation (DOT).

ACTION: Notice of final disposition; denial of application for exemption.

SUMMARY: FMCSA announces its denial of the application from Pitt Ohio Express, LLC (Pitt Ohio) to exempt its drivers from one of the requirements in the Agency's Safe Driver Apprenticeship Pilot (SDAP) program. Pitt Ohio requests an exemption allowing it to use drivers under the age 21, who hold a Commercial Learner's Permit (CLP) to operate commercial motor vehicles (CMVs) in interstate commerce, to participate in the SDAP program. FMCSA analyzed the application and determined that there is insufficient basis to conclude that the exemption would likely achieve a level of safety that is equivalent to, or greater than, the level that would be achieved absent such exemption.

FOR FURTHER INFORMATION CONTACT: Mr. Richard Clemente, Driver and Carrier Operations Division; Office of Carrier, Driver and Vehicle Safety Standards; FMCSA; (202) 366–2722; *richard.clemente@dot.gov*. If you have questions on viewing or submitting material to the docket, contact Dockets Services at (202) 366–9826.

SUPPLEMENTARY INFORMATION:

I. Public Participation

Viewing Comments and Documents

To view comments, go to *www.regulations.gov,* insert the docket number ''FMCSA–2023–0057'' in the keyword box, and click ''Search.'' Next, sort the results by ''Posted (Newer-Older),'' choose the first notice listed, click ''Browse Comments.''

To view documents mentioned in this notice as being available in the docket, go to *www.regulations.gov,* insert the docket number ''FMCSA–2023–0057'' in the keyword box, click ''Search,'' and chose the document to review.

If you do not have access to the internet, you may view the docket online by visiting Dockets Operations on the ground floor of the DOT West Building, 1200 New Jersey Avenue SE, Washington, DC 20590, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal holidays. To be sure someone is there to help you, please call (202) 366–9317 or (202) 366–9826 before visiting Dockets Operations.

II. Legal Basis

FMCSA has authority under 49 U.S.C. 31136(e) and 31315(b) to grant exemptions from Federal Motor Carrier Safety Regulations (FMCSRs). FMCSA must publish a notice of each exemption request in the **Federal Register** (49 CFR 381.315(a)). The Agency must provide the public an opportunity to inspect the information relevant to the application, including any safety analyses that have been conducted. The Agency must provide an opportunity for public comment on the request.

The Agency reviews safety analyses and public comments submitted and determines whether granting the exemption would likely achieve a level of safety equivalent to, or greater than, the level that would be achieved by the current regulation (49 CFR 381.305(a)). The Agency must publish its decision in the **Federal Register** (49 CFR 381.315(b)). If granted, the notice will identify the regulatory provision from which the applicant will be exempt, the effective period, and all terms and conditions of the exemption (49 CFR 381.315(c)(1)). If the exemption is denied, the notice will explain the reason for the denial (49 CFR 381.315(c)(2). The exemption may be renewed (49 CFR 381.300(b)).

III. Background

Current Regulations

Under 49 CFR 391.11(b)(1) a person may not drive a (CMV) in interstate commerce unless they are at least 21 years old, regardless of whether operation of the CMV requires a commercial driver's license (CDL). Additionally, for drivers under 21 operating CMVs requiring a CLP or CDL, under 49 CFR 383.153(b)(2)(ix)(G), an intrastate only ''K'' restriction must appear on the individual's CLP or CDL.

Safe Driver Apprenticeship Pilot Program

The SDAP program allows registered motor carriers to use apprentice drivers who are 18 to 20 years old under certain circumstances. Apprentice drivers under the SDAP program must hold a CDL and complete separate 120- and 280-hour probationary periods during their apprenticeship with registered motor carriers. (87 FR 2477).

Applicant's Request

Pitt Ohio is a less-than-truckload regional carrier which operates multiple straight trucks. The applicant seeks an exemption from the requirement in the Agency's SDAP program that an apprentice hold a CDL prior to enrolling in the program. Pitt Ohio requests the exemption to allow it to use CLP holders in the SDAP Program. These CLP holders would still need to meet all the remaining apprentice requirements, as well as the existing regulatory requirements for CLP holders (*e.g.,* presence of a valid CDL holder in the passenger seat). Pitt Ohio estimates that 25 CLP holders would operate under the exemption each year. The applicant believes the exemption would relieve them of ''difficulty locating and recruiting apprentice drivers into [the] SDAP Program.''

Applicant's Method To Ensure an Equivalent or Greater Level of Safety

According to Pitt Ohio, CLP drivers operating under the exemption would be as safe or safer than those currently allowed to operate under the SDAP program. Pitt Ohio asserts that the CLP driver operating under the exemption will be safer and more productive due to being trained initially in a smaller CMV so the apprentice can learn and gain an understanding of the industry with the same equipment and oversight from an experienced and approved FMCSA trainer before graduating into larger equipment for the post-CDL aspect of the SDAP program. Pitt Ohio did not ask for any exemption to the level of safety required under the current SDAP program and indicated that they would meet or exceed all hours of training and technology on the CMVs the apprentice would operate. Pitt Ohio would be voluntarily applying SDAP program requirements to the pre-CDL portion of driver development and training, and in addition would report all progress of the program as required and any additional requirements that may be requested by FMCSA to meet the exemption request.

IV. Public Comments

On February 23, 2023, FMCSA published notice of the Pitt Ohio application and requested public comments (88 FR 11504). The Agency was seeking comment on whether this exemption should be limited to Pitt Ohio, or whether it should be drafted to apply to any SDAP program participating motor carrier that is currently listed as a certified training provider for purposes of the FMCSRs, or that enters into a partnership with a certified training provider. On this question, one individual responded, ''I am all for this plan, so long as you make the training program universal for everyone.'' The Agency received a total of 23 comments: 4 supporting the exemption request, 16 opposing it, and the other 3 taking no position either for or against. Joint comments filed by the Truck Safety Coalition, Citizens for Reliable and Safe Highways (CRASH), and Parents Against Tired Truckers (PATT) stated ''Pitt-Ohio(sic) Express, LLC has not met the measure of evidence required to prove an equivalent or greater level of safety in its exemption application. They only request that FMCSA dilute the program requirements in misplaced efforts to make it easier to attract under-21 drivers.'' Edward Richard opposed the application and stated ''allowing them to put more immature drivers on the road is just wrong and unsafe.'' AWM Associates, LLC also opposed, noting that ''until Pitt-Ohio(sic) is an approved CDL training provider on the FMCSA's Training Provider Registry (TPR) its petition must be denied.'' Those in support commented that the Pitt Ohio request should be made universal for everyone, that age should not matter, and that the Agency should use great caution in implementing the exemption should it be granted.

V. FMCSA's Decision

FMCSA has evaluated Pitt Ohio's application and the filed comments and finds that there is insufficient basis to conclude that the exemption would likely achieve a level of safety equivalent to, or greater than, the level achieved without the exemption. The SDAP's purpose is to determine whether there are conditions where safety data indicate younger drivers (18- to 20-year-olds) might be allowed to operate CMVs. Congress authorized SDAP, opening the pilot to those 18- to 20-year-olds who hold a CDL, not a CLP. In addition, granting the Pitt Ohio exemption could potentially put young and inexperienced drivers in a position of high responsibility, potentially exposing them and surrounding drivers to crashes and incidents involving CMVs. The Agency therefore believes that Pitt Ohio's prospective apprentice CLP drivers should not be legally permitted to operate CMVs in interstate commerce if less than 21 years of age.

For the above reasons, FMCSA denies Pitt Ohio's exemption application.

Sue Lawless,

Acting Deputy Administrator.

BILLING CODE 4910–EX–P

DEPARTMENT OF TRANSPORTATION

Federal Railroad Administration

[Docket Number FRA–2024–0043]

Petition for Waiver of Compliance

Under part 211 of title 49 Code of Federal Regulations (CFR), this document provides the public notice that on March 13, 2024, Rapid City, Pierre & Eastern Railroad and the International Association of Sheet Metal, Air, Rail and Transportation Workers (collectively, ''Petitioners''), petitioned the Federal Railroad Administration (FRA) for a waiver of compliance from certain provisions of the Federal railroad safety regulations contained at 49 CFR part 240 (Qualification and Certification of Locomotive Engineers) and part 242 (Qualification and Certification of Conductors). FRA assigned the petition Docket Number FRA–2024–0043.

Specifically, Petitioners request relief required to participate in FRA's Confidential Close Call Reporting System (C^{3}RS) Program. Petitioners seek to shield reporting employees from mandatory punitive sanctions that would otherwise arise as provided in §§ 240.117(e)(1)–(4); 240.305(a)(1)–(4) and (a)(6); 240.307; 242.403(b), (c), (e)(1)–(4), (e)(6)–(11), (f)(1)–(2); and 242.407. The C^{3}RS Program encourages certified operating crew members to report close calls and protects the employees and the railroad from discipline or sanctions arising from the incidents reported per the C^{3}RS Implementing Memorandum of Understanding.

A copy of the petition, as well as any written communications concerning the petition, is available for review online at *www.regulations.gov.*

Interested parties are invited to participate in these proceedings by submitting written views, data, or comments. FRA does not anticipate scheduling a public hearing in connection with these proceedings since the facts do not appear to warrant a hearing. If any interested parties desire an opportunity for oral comment and a public hearing, they should notify FRA, in writing, before the end of the comment period and specify the basis for their request.

All communications concerning these proceedings should identify the appropriate docket number and may be submitted at *www.regulations.gov.* Follow the online instructions for submitting comments.

Communications received by July 8, 2024 will be considered by FRA before final action is taken. Comments received after that date will be considered if practicable.

Anyone can search the electronic form of any written communications and comments received into any of our dockets by the name of the individual submitting the comment (or signing the document, if submitted on behalf of an association, business, labor union, etc.). Under 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its processes. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov,* as described in the system of records notice (DOT/ALL–14 FDMS), which can be reviewed at *https://www.transportation.gov/privacy.* See also *https://www.regulations.gov/privacy-notice* for the privacy notice of regulations.gov.

BILLING CODE 4910–06–P

DEPARTMENT OF TRANSPORTATION

Federal Railroad Administration

[Docket Number FRA–2003–15010]

Petition for Extension of Waiver of Compliance

Under part 211 of title 49 Code of Federal Regulations (CFR), this document provides the public notice that on February 28, 2024, CPKC [1] petitioned the Federal Railroad Administration (FRA) for an extension of a waiver of compliance from certain provisions of the Federal railroad safety regulations contained at 49 CFR part

[1] On April 14, 2023, Canadian Pacific Railway Company (CP) and Kansas City Southern (KCS) combined to create a single railway company doing business under the trademark CPKC. The original waiver in this docket was granted to CP.

241 (United States Locational Requirements for Dispatching of United States Rail Operations). The relevant Docket Number is FRA–2003–15010.

Specifically, CPKC requests an extension of relief pursuant to 49 CFR 241.7(c), *Fringe border dispatching,* to allow the continuation of Canadian dispatching of three locations in the United States: (1) 1.8 miles of the Windsor Subdivision between Windsor, Ontario, Canada, and Detroit, Michigan, United States; [2] and (2) two track segments totaling 23.44 miles on the Newport Subdivision between Richford, Vermont, and East Richford, Vermont, United States, and between North Troy, Vermont, and Newport, Vermont, United States.[3] CPKC notes that all locations are dispatched by the Operations Centre in Calgary, Alberta, Canada. In support of its request, CPKC states that ''in the approximately twenty-one years since the original waiver was granted, CPKC has operated safely on the Windsor Subdivision and has operated safely on the Newport Subdivision since the acquisition of this territory in 2020.'' CPKC adds that it ''is not aware of any issues that have developed since the last waiver was granted.''

A copy of the petition, as well as any written communications concerning the petition, is available for review online at *www.regulations.gov.*

Interested parties are invited to participate in these proceedings by submitting written views, data, or comments. FRA does not anticipate scheduling a public hearing in connection with these proceedings since the facts do not appear to warrant a hearing. If any interested party desires an opportunity for oral comment and a public hearing, they should notify FRA, in writing, before the end of the comment period and specify the basis for their request.

All communications concerning these proceedings should identify the appropriate docket number and may be submitted at *https://www.regulations.gov.* Follow the online instructions for submitting comments.

Communications received by July 8, 2024 will be considered by FRA before final action is taken. Comments received after that date will be considered if practicable. Anyone can search the electronic form of any written communications and comments received into any of our dockets by the name of the individual submitting the comment (or signing the document, if submitted on behalf of an association, business, labor union, etc.). Under 5 U.S.C. 553(c), the U.S. Department of Transportation (DOT) solicits comments from the public to better inform its processes. DOT posts these comments, without edit, including any personal information the commenter provides, to *www.regulations.gov,* as described in the system of records notice (DOT/ALL–14 FDMS), which can be reviewed at *https://www.transportation.gov/privacy.* See also *https://www.regulations.gov/privacy-notice* for the privacy notice of regulations.gov.

BILLING CODE 4910–06–P

DEPARTMENT OF TRANSPORTATION

Federal Railroad Administration

[Docket Number FRA–2003–15012]

Petition for Extension of Waiver of Compliance

Under part 211 of title 49 Code of Federal Regulations (CFR), this document provides the public notice that on February 28, 2024, Canadian National Railway Company (CN) petitioned the Federal Railroad Administration (FRA) for an extension of a waiver of compliance from certain provisions of the Federal railroad safety regulations contained at 49 CFR part 241 (United States Locational Requirements for Dispatching of United States Rail Operations). The relevant FRA Docket Number is FRA–2003–15012.Specifically, CN requests an extension of relief pursuant to 49 CFR 241.7(c), *Fringe border dispatching,* to allow the continuation of Canadian dispatching of two locations in the United States: the portion of the Sprague Subdivision extending approximately 43.8 miles between Baudette and International Boundary, Minnesota, and the portion of the Strathroy Subdivision extending approximately 3.1 miles between Sarnia, Ontario, Canada, through the St. Clair River Tunnel, to Port Huron, Michigan.[1] In support of its request, CN states that, since the initial waiver was granted, ''each of these fringe border segments ha[ve] been regularly and safety dispatched from Canada'' and this extension would allow CN to ''continue what it has been safely doing for decades.'' CN explains that changing dispatching to the United States on this section of the Sprague Subdivision ''would introduce two [dispatching] hand-offs, given that the track only briefly enters the United States before re-entering Canada.'' Additionally, in reference to the portion of track on the Strathroy Subdivision, CN states that grating the waiver extension ''avoids any risk or safety concern associated with a [dispatching] hand-off in the middle of a single-track underwater tunnel.''

A copy of the petition, as well as any written communications concerning the petition, is available for review online at *www.regulations.gov.*

Interested parties are invited to participate in these proceedings by submitting written views, data, or comments. FRA does not anticipate scheduling a public hearing in connection with these proceedings since the facts do not appear to warrant a hearing. If any interested party desires an opportunity for oral comment and a public hearing, they should notify FRA, in writing, before the end of the comment period and specify the basis for their request.

All communications concerning these proceedings should identify the appropriate docket number and may be submitted at *https://www.regulations.gov.* Follow the online instructions for submitting comments.

Communications received by July 8, 2024 will be considered by FRA before final action is taken. Comments received after that date will be considered if practicable. Anyone can search the electronic form of any written communications and comments received into any of our dockets by the name of the individual submitting the comment (or signing the document, if submitted on behalf of an association, business, labor union, etc.). Under 5 U.S.C. 553(c), the U.S. Department of Transportation (DOT) solicits comments from the public to better inform its processes. DEPARTMENT OF THE TREASURY

Office of Foreign Assets Control

Notice of OFAC Sanctions Action

AGENCY: Office of Foreign Assets Control, Treasury.

ACTION: Notice.

SUMMARY: The U.S. Department of the Treasury's Office of Foreign Assets Control (OFAC) is publishing the name of a person whose property and interests in property have been unblocked and who has been removed from the Specially Designated Nationals and Blocked Persons List (SDN List). OFAC is also publishing a removal of aircraft currently identified on OFAC's SDN List.

DATES: See **SUPPLEMENTARY INFORMATION** section for effective date(s).

FOR FURTHER INFORMATION CONTACT: OFAC: Bradley T. Smith, Director, tel.: 202–622–2490; Associate Director for Global Targeting, tel.: 202–622–2420; Assistant Director for Licensing, tel.: 202–622–2480; Assistant Director for Regulatory Affairs, tel.: 202–622–4855; or the Assistant Director for Sanctions Compliance & Evaluation, tel.: 202–622–2490.

SUPPLEMENTARY INFORMATION:

Electronic Availability

The SDN List and additional information concerning OFAC sanctions programs are available on OFAC's website (*https://www.treasury.gov/ofac*).

Notice of OFAC Action(s)

A. On May 3, 2024, OFAC removed from the SDN List the person listed below, whose property and interests in property were blocked pursuant to section 1(a) of Executive Order 14024 of April 15, 2021, ''Blocking Property With Respect To Specified Harmful Foreign Activities of the Government of the Russian Federation,'' 86 FR 20249, 3 CFR, 2021 Comp., p. 542 (Apr. 15, 2021) (E.O. 14024). On May 3, 2024, OFAC determined that circumstances no longer warrant the inclusion of the following person on the SDN List under this authority. This person is no longer subject to the blocking provisions of section 1(a) of E.O. 14024.

1. EMPEROR AVIATION LTD (a.k.a. EMPEROR AVIEISHN LTD (Cyrillic: ЭМПЕРОР АВИЭЙШН ЛТД)), W Business Centre, Level 3, Triq Karmenu Pirotta, Birkirkara BKR 1114, Malta; Presnenskaya nab. 8/1, Moscow 123112, Russia; Organization Established Date 27 Nov 2013; Tax ID No. 21637116 (Malta); alt. Tax ID No. 9909425511 (Russia); Registration Number C 62836 (Malta) [RUSSIA–EO14024] (Linked To: KERIMOVA, Gulnara Suleymanovna).

B. On May 3, 2024, OFAC removed from the SDN List the aircraft listed below, which were subject to prohibitions imposed pursuant to E.O. 14024.

1. 9H–AMN; Aircraft Manufacture Date 2006; Aircraft Model BD–700–1A11; Aircraft Manufacturer's Serial Number (MSN) 9324; Aircraft Tail Number 9H–AMN (aircraft) [RUSSIA–EO14024] (Linked To: EMPEROR AVIATION LTD).

2. 9H–ARK; Aircraft Manufacture Date 2019; Aircraft Model BD–700–1A10; Aircraft Manufacturer's Serial Number (MSN) 60011; Aircraft Tail Number 9H–ARK (aircraft) [RUSSIA–EO14024] (Linked To: EMPEROR AVIATION LTD).

3. 9H–EAA; Aircraft Manufacture Date 2014; Aircraft Model Citation XLS+; Aircraft Manufacturer's Serial Number (MSN) 560–6170; Aircraft Tail Number 9H–EAA (aircraft) [RUSSIA–EO14024] (Linked To: EMPEROR AVIATION LTD).

4. 9H–MAO; Aircraft Manufacture Date 2006; Aircraft Model BD–700–1A10; Aircraft Manufacturer's Serial Number (MSN) 9223; Aircraft Tail Number 9H–MAO (aircraft) [RUSSIA–EO14024] (Linked To: EMPEROR AVIATION LTD).

5. 9H–SIS; Aircraft Manufacture Date 2015; Aircraft Model CL–600–2B16 (604 Variant); Aircraft Manufacturer's Serial Number (MSN) 6050; Aircraft Tail Number 9H–SIS (aircraft) [RUSSIA–EO14024] (Linked To: EMPEROR AVIATION LTD).

6. 9H–SSK; Aircraft Manufacture Date 2016; Aircraft Model G650; Aircraft Manufacturer's Serial Number (MSN) 6195; Aircraft Tail Number 9H–SSK (aircraft) [RUSSIA–EO14024] (Linked To: EMPEROR AVIATION LTD).

7. 9H–TIO; Aircraft Manufacture Date 2018; Aircraft Model BD–700–1A11; Aircraft Manufacturer's Serial Number (MSN) 9813; Aircraft Tail Number 9H–TIO (aircraft) [RUSSIA–EO14024] (Linked To: EMPEROR AVIATION LTD).

Dated: May 3, 2024.

Internal Revenue Service

ETAAC Public Meeting Announcement

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Notice of meeting.

SUMMARY: The Electronic Tax Administration Advisory Committee (ETAAC) will hold a public meeting on Wednesday, June 26, 2024.

FOR FURTHER INFORMATION CONTACT: Mr. Alec Johnston, Office of National Public Liaison, at (202) 317–4299, or send an email to *publicliaison@irs.gov*

SUPPLEMENTARY INFORMATION: Notice is hereby given pursuant to 5 U.S.C. 10(a)(2) of the Federal Advisory Committee Act that a public meeting of the ETAAC will take place on Wednesday, June 26, 2024, from 9:00 a.m. to 11:00 a.m. EDT, at 1111 Constitution Ave. NW, in Washington, DC The purpose of the ETAAC is to provide continuing advice regarding the development and implementation of the IRS organizational strategy for electronic tax administration. ETAAC is an organized public forum for discussion of electronic tax administration issues such as prevention of identity theft and refund fraud. It supports the overriding goal that paperless filing should be the preferred and most convenient method of filing tax and information returns. ETAAC members convey the public's perceptions of IRS electronic tax administration activities, offer constructive observations about current or proposed policies, programs, and procedures, and suggest improvements. Please call or email Mr. Alec Johnston to confirm your attendance in person or by conference call or if you wish to submit a written statement. Mr. Johnston can be reached at 202–317–4299 or *PublicLiaison@irs.gov.*

Dated: May 6, 2024.

No. 91 May 9, 2024

Part II

Department of Transportation

National Highway Traffic Safety Administration

49 CFR Parts 571, 595, and 596
Federal Motor Vehicle Safety Standards; Automatic Emergency Braking Systems for Light Vehicles; Final Rule

DEPARTMENT OF TRANSPORTATION

National Highway Traffic Safety Administration

49 CFR Parts 571, 595, and 596

[Docket No. NHTSA–2023–0021]

RIN 2127–AM37

Federal Motor Vehicle Safety Standards; Automatic Emergency Braking Systems for Light Vehicles

AGENCY: National Highway Traffic Safety Administration (NHTSA), Department of Transportation (DOT).

ACTION: Final rule.

SUMMARY: This final rule adopts a new Federal Motor Vehicle Safety Standard to require automatic emergency braking (AEB), including pedestrian AEB (PAEB), systems on light vehicles. An AEB system uses various sensor technologies and sub-systems that work together to detect when the vehicle is in a crash imminent situation, to automatically apply the vehicle brakes if the driver has not done so, or to apply more braking force to supplement the driver's braking. This final rule specifies that an AEB system must detect and react to an imminent crash with both a lead vehicle or a pedestrian. This final rule fulfills a mandate under the Bipartisan Infrastructure Law (BIL) directing the Department to promulgate a rule to require that all passenger vehicles be equipped with an AEB system. The purpose of this final rule is to reduce the number of deaths and injuries that result from crashes in which drivers do not apply the brakes or fail to apply sufficient braking power to avoid or mitigate a crash, and to reduce the consequences of such crashes.

DATES:

Effective Date: This rule is effective July 8, 2024.

IBR date: The incorporation by reference of certain material listed in the rule is approved by the Director of the **Federal Register** beginning July 8, 2024. The incorporation by reference of certain other material listed in the rule was approved by the Director of the Federal Register as of July 8, 2022.

Compliance Date: September 1, 2029. However, vehicles produced by small-volume manufacturers, final-stage manufacturers, and alterers must be equipped with a compliant AEB system by September 1, 2030.

Petitions for reconsideration: Petitions for reconsideration of this final rule must be received not later than June 24, 2024.

ADDRESSES: Petitions for reconsideration of this final rule must refer to the docket number set forth above (NHTSA–2023–0021) and be submitted to the Administrator, National Highway Traffic Safety Administration, 1200 New Jersey Avenue SE, Washington, DC 20590.

FOR FURTHER INFORMATION CONTACT: *For technical issues:* Mr. Markus Price, Office of Crash Avoidance Rulemaking, Telephone: 202–366–1810, Facsimile: 202–366–7002. *For legal issues:* Ms. Sara R. Bennett, Office of the Chief Counsel, Telephone: 202–366–2992, Facsimile: 202–366–3820. The mailing address for these officials is: National Highway Traffic Safety Administration, 1200 New Jersey Avenue SE, Washington, DC 20590.

SUPPLEMENTARY INFORMATION: This final rule adopts a new Federal Motor Vehicle Safety Standard (FMVSS) No. 127 to require automatic emergency braking (AEB), including pedestrian AEB (PAEB), systems on light vehicles. FMVSS No. 127 applies to all passenger cars and to all multipurpose passenger vehicles (MPVs), trucks, and buses with a gross vehicle weight rating (GVWR) of 4,536 kilograms (kg) (10,000 pounds (lbs.)) or less (''light vehicles''). An AEB system uses various sensor technologies and sub-systems that work together to detect when the vehicle is in a crash imminent situation, to automatically apply the vehicle brakes if the driver has not done so, or to apply more braking force to supplement the driver's braking.

This final rule specifies that an AEB system must detect and react to an imminent crash with both a lead vehicle and a pedestrian. This final rule advances DOT's January 2022 National Roadway Safety Strategy, which identified a requirement for AEB, including PAEB technologies, on new passenger vehicles as a key Departmental action to improve vehicle and pedestrian safety. Finally, this final rule fulfills section 24208(a) of BIL, which directs the Secretary of Transportation to promulgate a rule to require that all passenger vehicles be equipped with an AEB system.

NHTSA published the notice of proposed rulemaking preceding this final rule on June 13, 2023 (88 FR 38632).

I. Executive Summary

In 2019, prior to the COVID–19 pandemic, there were nearly 2.2 million rear-end police-reported crashes involving light vehicles, which led to 1,798 deaths and 574,000 injuries. In addition, there were 6,272 pedestrian fatalities in motor vehicle crashes, representing 17 percent of all motor vehicle fatalities.[1] This represents the continuation of the recent trend of increased pedestrian deaths on our nation's roadways.[2] A further 76,000 pedestrians were injured in motor vehicle crashes. Deaths and injuries in more recent years are even greater.

NHTSA is issuing this final rule to address these significant safety problems through a new Federal Motor Vehicle Safety Standard that requires all light vehicles be equipped with forward collision warning (FCW),[3] automatic emergency braking (AEB), and pedestrian automatic emergency braking (PAEB) technology.[4] AEB systems reduce the frequency and severity of lead vehicle and pedestrian collisions. They employ sensor technologies and sub-systems that work together to sense when the vehicle is in a crash imminent situation, to automatically apply the vehicle brakes if the driver has not done so, and to apply more braking force to supplement the driver's braking. These systems can reduce both lead vehicle rear-end (lead vehicle AEB) and pedestrian (PAEB) crashes. AEB systems have reached a level of maturity to make a significant contribution to reducing the frequency and severity of crashes and are thus ready to be mandated through adoption of a new FMVSS on all new light vehicles.

This rule is estimated to save at least 362 lives and mitigate 24,321 non-fatal injuries a year. It represents a crucial step forward in implementing DOT's January 2022 National Roadway Safety Strategy (NRSS) to address the rising numbers of transportation deaths and serious injuries occurring on this country's roadways, including those involving pedestrians.[5]

The crash problem that the agency seeks to address with the AEB requirements in this final rule is substantial.[6] For example, 60 percent of fatal rear-end crashes and 73 percent of crashes resulting in injuries were on roads with posted speed limits of 60 mph or below. Similarly, most of these crashes occurred in clear, no adverse atmospheric conditions—72 percent of fatal crashes and 74 percent of crashes resulting in injuries. Also, about 51 percent of fatal rear-end crashes and 74 percent of rear-end crashes resulting in injuries, all involving light vehicles, occurred in daylight conditions. In addition, 65 percent of pedestrian fatalities and 67 percent of pedestrian injuries were the result of a strike by the front of a light vehicle. Finally, 77 percent of pedestrian fatalities, and about half of the pedestrian injuries, occur in dark lighting conditions. Importantly, this final rule requires that PAEB systems be able to avoid pedestrian crashes in dark testing conditions.

This final rule is issued under the authority of the National Traffic and Motor Vehicle Safety Act of 1966. Under 49 U.S.C. chapter 301, the Secretary of Transportation is responsible for prescribing motor vehicle safety standards that are practicable, meet the need for motor vehicle safety, and are stated in objective terms. The responsibility for promulgation of FMVSSs is delegated to NHTSA. This rulemaking addresses a statutory mandate under the Bipartisan Infrastructure Law (BIL), codified as the Infrastructure Investment and Jobs Act (IIJA),[7] which added 49 U.S.C. 30129, directing the Secretary of Transportation to promulgate a rule requiring that all passenger motor vehicles manufactured for sale in the United States be equipped with an FCW system and an AEB system.

The Focus on AEB

The decision to mandate AEB builds on decades of research and development, which began in the 1990s, with initial research programs to support development of AEB technologies and methods by which system performance could be assessed. NHTSA began testing AEB systems as part of the New Car Assessment Program (NCAP) in 2010 and reporting on the research and progress surrounding the technologies shortly thereafter.[8] These research efforts led to NHTSA listing FCW systems as a ''recommended advanced technology'' in NCAP in model year 2011, and in November 2015, added crash imminent braking (CIB) [9] and dynamic brake support (DBS) technologies to the program.[10] Most recently, NHTSA proposed upgrades to the lead vehicle AEB test in its March 2022 request for comment on NCAP.[11]

In March 2016, NHTSA and the Insurance Institute for Highway Safety (IIHS) announced a commitment by 20 manufacturers representing more than 99 percent of the U.S. light vehicle market to include low-speed AEB as a standard feature on nearly all new light vehicles not later than September 1,

[2] *Id.,* Table 1 Pedestrian fatalities 2010—4,302, 2019—6,272.

[3] A forward collision warning (FCW) system uses sensors that detect objects in front of vehicles and provides an alert to the driver. An FCW system is able to use the sensors' input to determine the speed of an object in front of it and the distance between the vehicle and the object. If the FCW system determines that the closing distance and velocity between the vehicle and the object is such that a collision may be imminent, the system is designed to induce an immediate forward crash avoidance response by the vehicle operator. FCW systems may detect impending collisions with any number of roadway obstacles, including vehicles and pedestrians. Warning systems in use today provide drivers with a visual warning signal, such as an illuminated telltale on or near the instrument panel, an auditory signal, or a haptic signal that provides tactile feedback to the driver to warn the driver of an impending collision so the driver may intervene. FCW systems alone do not brake the vehicle.

[4] Hereafter, when this final rule refers to ''AEB'' generally, unless the context clearly indicates otherwise, it refers to a system that has: (a) an FCW component to alert the driver to an impending collision with a forward obstacle; (b) a CIB component that automatically applies the vehicle's brakes if the driver does not respond to the FCW; and (c) a DBS component that automatically supplements the driver's brake application if the driver applies insufficient manual braking to avoid a crash. Furthermore, unless the context indicates otherwise, reference to AEB includes both lead vehicle AEB and PAEB.

[5] *https://www.transportation.gov/sites/dot.gov/files/2022-01/USDOT_National_Roadway_Safety_Strategy_0.pdf.*

[6] The Insurance Institute for Highway Safety (IIHS) estimates a 50 percent reduction in front-to-rear crashes of vehicles with AEB (IIHS, 2020) and a 25 to 27 percent reduction in pedestrian crashes for PAEB (IIHS, 2022).

[7] Public Law 117–58, 24208 (Nov. 15, 2021).

[8] 77 FR 39561 (Jul. 2, 2012).

[9] This final rule does not split the terminology of these CIB and DBS functionalities outside of certain contexts, like discussions of NCAP, but instead considers them both as parts of AEB. The final rule includes performance tests that would require an AEB system that has both CIB and DBS functionalities.

2022. As part of this voluntary commitment, manufacturers are including both FCW and a CIB system that reduces a vehicle's speed in certain rear-end crash-imminent test conditions.

NHTSA also conducted research to understand the capabilities of PAEB systems beginning in 2011. This work began with an assessment of the most common pedestrian crash scenarios to determine how test procedures could be designed to address them. As part of this research, the agency looked closely at a potential pedestrian mannequin to be used during testing and explored several aspects of the mannequin, including size and articulation of the arms and legs. This work resulted in a November 2019 draft research test procedure providing the methods and specifications for collecting performance data on PAEB systems for light vehicles.[12] This procedure was expanded to cover updated vehicle speed ranges and different ambient conditions and included in a March 2022 request for comments notice proposing to include PAEB, higher speed AEB, blind spot warning and blind spot intervention in NCAP.[13]

Need for Regulation

While the above actions have increased market penetration of AEB systems, reduced injuries, and saved lives, NHTSA believes that mandating AEB systems that can address both lead vehicle and pedestrian crashes is appropriate and necessary to better address the safety need. NHTSA incorporated FCW into NCAP beginning in model year 2011 and AEB into NCAP beginning in model year 2018. This has achieved success, with approximately 65% of new vehicles meeting the lead vehicle test procedures included in NCAP.[14] Similarly, the voluntary commitment resulted in approximately 90 percent of new light vehicles manufactured in 2022 having an AEB system.

That said, the test speeds and performance specifications in NCAP and the voluntary commitment do not ensure that the systems perform in a way that will prevent or mitigate crashes resulting in serious injuries and fatalities. The vast majority of fatalities, injuries, and property damage crashes occur at speeds above 40 km/h (25 mph), which are above those covered by the voluntary commitment.

Voluntary measures are intended to supplement rather than substitute for the FMVSSs, which remain NHTSA's core method of ensuring that all motor vehicles can achieve an adequate level of safety performance. The NCAP program is designed to provide valuable safety-related information to consumers in a simple to understand way, but the agency believes that gaps in market penetration will continue to exist for the most highly effective AEB systems. NHTSA has also observed that, in the case of both electronic stability control and rear visibility, only approximately 70 percent of vehicles had these technologies during the time they were part of NCAP. Thus, while NCAP serves a vital safety purpose, only regulation can ensure that all vehicles are equipped with AEB that meet minimum performance requirements.

These considerations are of even greater weight when deciding whether to require a system that can reduce pedestrian crashes, and the agency has concluded that PAEB is both achievable and necessary. Pedestrian fatalities are increasing, and NHTSA's testing reveals that PAEB systems will be able to significantly reduce these deaths.[15] Manufacturers' responses to adding lead vehicle AEB and other technologies to NCAP suggest that it will take several years after PAEB is introduced to NCAP before the market begins to see significant numbers of new vehicles that are able to meet a finalized NCAP test. Even so, since PAEB addresses the safety of someone other than a vehicle occupant, it is not clear if past experience with NCAP is necessarily indicative of how quickly PAEB systems will reach the market penetration levels of lead vehicle AEB.

A final factor weighing in favor of requiring AEB is that the technology is significantly more mature now than it was at the time of the voluntary commitment and when it was introduced into NCAP. NHTSA's most recent testing has shown that higher performance levels than those in the voluntary commitment or the existing NCAP requirements are now practicable. Many model year 2019 and 2020 vehicles were able to repeatedly avoid impacting the lead vehicle in CIB tests and the pedestrian test mannequin in PAEB tests, even at higher test speeds than those prescribed currently in the agency's CIB and PAEB test procedures.

These results show that AEB systems can reduce the frequency and severity of both lead vehicle and pedestrian crashes. Mandating AEB systems would address a clear and, in the case of pedestrian deaths, growing safety problem. To wait for market-driven adoption, even to the extent spurred on by NCAP, would lead to deaths and injuries that could be avoided if the technology were required.

Summary of the NPRM

In view of the significant safety problem and NHTSA's recent test results, and consistent with the Safety Act and BIL, on June 13, 2023 (88 FR 38632) NHTSA published an NPRM proposing a new FMVSS requiring AEB systems that can address both lead vehicle and pedestrian collisions on all new light vehicles. The proposed lead vehicle AEB test procedures built on the existing FCW, CIB, and DBS NCAP procedures, but proposed higher speed performance requirements. Crash avoidance was proposed at speeds up to 100 km/h (62 mph) when manual braking is applied and up to 80 km/h (50 mph) when no manual braking is applied during the test. NHTSA proposed testing under both daylight and darkness lighting conditions, noting the importance of darkness testing of PAEB because more than three-fourths of all pedestrian fatalities occur in conditions other than daylight.

The proposal included four requirements for the AEB system for both lead vehicles and pedestrians. The AEB system would be required to: (1) provide an FCW at any forward speed greater than 10 km/h (6.2 mph), presented via auditory and visual modalities, with permissible additional warning modes, such as haptic; (2) apply the brakes automatically at any forward speed greater than 10 km/h (6.2 mph) when a collision with a lead vehicle or a pedestrian is imminent, including at speeds above those tested by NHTSA; (3) prevent the vehicle from colliding with the lead vehicle or pedestrian test mannequin when tested according to the proposed test procedures, which would include pedestrian tests in both daylight and darkness and two false positive tests; and (4) provide visual notification to the driver of any malfunction that causes the AEB system not to meet the minimum proposed performance requirements.

To ensure test repeatability, NHTSA proposed specifications for the test devices that would be used in both the lead vehicle and pedestrian compliance tests, relying in large part on relevant International Organization for Standardization standards.

[12] 84 FR 64405 (Nov. 21, 2019).

[13] 87 FR 13452 (Mar. 9, 2022).

[14] Percentage based on the vehicle manufacturer's model year 2022 projected sales volume reported through the New Car Assessment Program's annual vehicle information request.

[15] NHTSA's accompanying Final Regulatory Impact Analysis (FRIA) estimates the impacts of this final rule. The FRIA can be found in the docket for this final rule. The docket number is listed in the heading of this document.

NHTSA proposed that all vehicles manufactured four years after the publication date of a final rule would be required to meet all requirements. NHTSA also proposed that all vehicles manufactured on or after three years after the publication date of a final rule would be required to meet all requirements except that lower speed PAEB performance test requirements would not apply. Small-volume manufacturers, final-stage manufacturers, and alterers would be provided an additional year (added to those above) to meet the requirements of the final rule.

NHTSA sought comments on all aspects of the NPRM and any alternative requirements that would address the safety problem. In response, over 1,000 comments were received from a wide variety of stakeholders and interested persons. These comments are available in the docket for the NPRM.[16]

This Final Rule

After careful consideration of all comments, this final rule adopts most of the proposed NPRM requirements, with a few of the changes relevant to significant matters. The differences between the NPRM and the final rule are noted at the end of this Executive Summary and discussed in the relevant sections of this preamble.

With this final rule, NHTSA has issued a Final Regulatory Impact Analysis (FRIA), available in the docket for this final rule (NHTSA–2023–0021).

NHTSA estimates that systems can achieve the requirements of this final rule primarily through upgraded software, with a limited number of vehicles needing additional hardware. Therefore, the incremental cost associated with this rule reflects the cost of a software upgrade that will allow current systems to achieve lead vehicle AEB and PAEB functionality that meets the requirements specified in this rule and the cost to equip a second sensor (radar) on five percent of the estimated fleet that is not projected to have the needed hardware. Taking into account both software and hardware costs, the total annual cost associated with this final rule is approximately $354 million in 2020 dollars.

Table 1 below summarizes the finding of the benefit-cost analysis. The projected benefits of this rule greatly exceed the projected costs. The lifetime monetized net benefit of this rule is projected to be between $5.82 and $7.26 billion with a cost per equivalent life saved of between $550,000 and $680,000, which is far below the Department's recommended value of a statistical life saved, of as $11.6 million in 2020 dollars.

Table 1: Lifetime Summary of Benefits and Costs for Passenger Cars and Light Trucks (Millions 2020$), Discount Rate

Benefits	3% Discount Rate	7% Discount Rate
Lifetime Monetized	$7,610	$6,180
Costs		
Lifetime Monetized	$354	$354
Net Benefits		
Lifetime Monetized	$7,260	$5,820

Table 2: Estimated Quantifiable Benefits

Benefits	
Fatalities Reduced	362
Injuries Reduced	24,321

Table 3: Estimated Installation Costs (2020$)

Category	**Percentage of New Light Vehicle Impacted**	**Total Annual Cost (Millions)**
Software	100%	$282.20
Hardware	5%	$71.86
Total		$354.06

Cost per Equivalent Life Saved	
AEB Systems	$0.55 to $0.68 million*

*The range presented reflects the use of a 3% or 7% discount rate.

Differences Between This Final Rule and the NPRM

NHTSA has made a number of changes to the NPRM based on information from the comments. The changes are discussed below. NHTSA discusses each of these changes in the relevant sections of this preamble.

• In the NPRM, NHTSA estimated that systems can achieve the proposed requirements through upgraded software alone. Commenters suggested that in some instances additional hardware will also be needed, so the incremental cost associated with this rule now includes the cost of a software upgrade and the cost to equip a second sensor (radar) on the five percent of the estimated fleet that does not now have the needed hardware.

• NHTSA has made changes to lead time and compliance date requirements. The NPRM proposed that all vehicles comply with the requirements within 3 years, except for some higher speed PAEB performance requirements in darkness (which had 1 year more to comply than other requirements). This final rule requires that manufacturers comply with all provisions of the rule at the end of a 5-year period starting the first September 1 following publication of this rule, which would be September 1, 2029.[17] The requirements of this final rule compel robust AEB systems that are practicable, but the agency has determined that more time is needed for the technology to mature and be deployed into all vehicles.[18] We expect that many vehicles will be equipped with AEB systems that meet the new rule earlier than September 1, 2029, because of redesign schedules, but that manufacturers will be able to meet the requirement for all new vehicles by the new start date.

• This final rule modifies the range of forward speeds at which the AEB must operate. The NPRM required FCW and AEB systems to operate at any forward speed greater than 10 km/h. This final rule places an upper bound on the requirement that an AEB system operate of 145 km/h (90.1 mph) for FCW and lead vehicle AEB and 73 km/h (45.4 mph) for pedestrian AEB. This final rule also clarifies the environmental conditions under which the AEB system must perform to be the same environmental conditions specified in the track testing.

• This final rule includes an explicit prohibition against manufacturers installing a control designed for the sole purpose of deactivation of the AEB system, except where provided below as it relates to law enforcement. This final rule also allows for controls that have the ancillary effect of deactivating the AEB system. For instance, a manufacturer may choose to deactivate AEB if the driver has activated ''tow mode'' and the manufacturer has determined that AEB cannot perform safely while towing a trailer.

• This final rule modifies the FCW visual signal location requirement to increase the specified maximum visual angle from 10 degrees to 18 degrees in the vertical direction. This change from the NPRM provides manufacturers with the flexibility to locate the visual warning signal within the typical area of the upper half of the instrument panel and closer to the central field of view of the driver. While the agency continues to believe that an FCW visual warning signal presented near the central forward-looking region is ideal, it does not consider a head-up display to be necessary for the presentation of the FCW visual signal that is part of a complete AEB system.

• The rule contains several additional minor changes as well. These include the following:

—In the obstructed pedestrian scenario in PAEB performance tests, the NPRM did not specify the distance between the pedestrian test dummy and the farthest obstructing vehicle. This final rule corrects this oversight.

—In the false activation tests, this final rule adjusts the regulatory text to clarify that testing for false activation is done with and without manual brake application.

—Some minor parameters and definitions were modified, and various definitions were added, to clarify details of the lead vehicle and PAEB test procedures.

—To increase practicability of running the tests, a third manual brake application controller option, a force only feedback controller, was added. The force feedback controller is substantially similar to the hybrid controller with the commanded brake pedal position omitted, leaving only the commanded brake pedal force application.

—The procedure in Annex C, section C.3 of ISO 19206–2:2018 is specific for pedestrian targets, but recent testing performed by the agency indicates that the three-position measurement specified in Annex C, section C.3 of ISO 19206–3:2021 provides more reduction in multi-path reflections and offers more accurate radar cross section values. The agency is incorporating by reference ISO 19206–3:2021.

II. Background

A. The Safety Problem

There were 38,824 fatalities in motor vehicle crashes on U.S. roadways in 2020 and early estimates put the number of fatalities at 42,795 for 2022.[19] This is the highest number of fatalities since 2005. While the upward trend in fatalities may be related to increases in risky driving behaviors during the COVID–19 pandemic,[20] agency data show an increase of 3,356 fatalities between 2010 and 2019.[21] Motor vehicle crashes have also trended upwards since 2010, which corresponds to an increase in fatalities, injuries, and property damage.

[17] As proposed in the NPRM, this final rule provides small-volume manufacturers, final stage manufacturers, and alterers an additional year of lead time. As a result of the changes to the proposed lead time and compliance date requirements, small-volume manufactures, final stage manufactures, and alterers would be required to comply with all provisions of the rule starting September 1, 2030.

[18] As part of this extension of the lead time, the agency has removed the graduated approach to the PAEB performance requirements. The NPRM proposed that most PAEB requirements be met 3 years after a final rule, with an additional year for the dark lighting condition requirement. With the 5-year lead time for all requirements, there is no need for the phasing-in of requirements, so the agency is not adopting it.

[19] *https://crashstats.nhtsa.dot.gov/Api/Public/ViewPublication/813266, https://crashstats.nhtsa.dot.gov/Api/Public/ViewPublication/813428.*

[20] These behaviors relate to increases in impaired driving, the non-use of seat belts, and speeding. NHTSA also cited external studies from telematics providers that suggested increased rates of cell phone manipulation during driving in the early part of the pandemic.

[21] NHTSA's Traffic Safety Facts Annual Report, Table 2, *https://cdan.nhtsa.gov/tsftables/tsfar.htm#Accessed* March 28, 2023.

Overall Rear-End Crash Problem

NHTSA uses data from the Fatality Analysis Reporting System (FARS) and the Crash Report Sampling System (CRSS) to account for and understand motor vehicle crashes. As defined in a NHTSA technical manual relating to data entry for FARS and CRSS, rear-end crashes are incidents where the first event is defined as the frontal area of one vehicle striking a vehicle ahead in the same travel lane. In a rear-end crash, as instructed by the 2020 FARS/CRSS Coding and Validation Manual, the vehicle ahead is categorized as intending to head either straight, left or right, and is either stopped, travelling at a lower speed, or decelerating.[22]

In 2019, rear-end crashes accounted for 32.5 percent of all crashes, making them the most prevalent type of crash.[23] Fatal rear-end crashes increased from 1,692 in 2010 to 2,363 in 2019 and accounted for 7.1 percent of all fatal crashes in 2019, up from 5.6 percent in 2010. Because data from 2020 and 2021 may not be representative of the general safety problem due to the COVID–19 pandemic, and data from 2022 are not yet available, the following discussion refers to data from 2010 to 2020 when discussing rear-end crash safety problem trends, and 2019 data when discussing specific characteristics of the rear-end crash safety problem. While injury and property-damage-only rear-end crashes from 2010 (476,000 and 1,267,000, respectively) and 2019 (595,000 and 1,597,000, respectively) are not directly comparable due to differences in database structure and sampling, the data indicate that these numbers have not significantly changed from 2010–2015 (NASS–GES sampling) and 2016–2019 (CRSS sampling).

BILLING CODE 4910–59–P

Table 5: 2010-2020 Rear-end crashes All Vehicle Types By Crash Severity[24]

First Harmful Event	Rear-End Crash Severity			
	Fatal	Injury	Property-Damage-Only	Total Rear-End

Other / Unknown	150	0.4	8,000	0.4	69,000	1.4
Collision with a Fixed Object:						
	9,579	28.6	281,000	14.7	657,000	13.7
Collision with Object Not Fixed:						
	7,826	23.4	214,000	11.2	648,000	13.5
Non-collision:						
	2,870	8.6	58,000	3.0	54,000	1.1

The following paragraphs provide a breakdown of rear-end crashes by vehicle type, posted speed limit, light conditions and atmospheric conditions for the year 2019 based on NHTSA's FARS, CRSS, and the 2019 Traffic Safety Facts sheets.

Rear-End Crashes by Vehicle Type

In 2019, passenger cars and light trucks were involved in the vast majority of rear-end crashes. NHTSA's ''Manual on Classification of Motor Vehicle Traffic Accidents'' provides a standardized method for crash reporting. It defines passenger cars as ''motor vehicles used primarily for carrying passengers, including convertibles, sedans, and station wagons,'' and light trucks as ''trucks of 10,000 pounds gross vehicle weight rating or less, including pickups, vans, truck-based station wagons, and utility vehicles.'' [26] The 2019 data show that crashes where a passenger car or light truck is a striking vehicle represent at least 70 percent of fatal rear-end crashes, 95 percent of crashes resulting in injury, and 96 percent of damage only.[27]

[25] NHTSA's Traffic Safety Facts Annual Report, Table 29 for 2019, *https://crashstats.nhtsa.dot.gov/Api/Public/ViewPublication/813141* Accessed March 29, 2024.

Table 7: Rear-End Crashes with Impact Location - Front, by Vehicle Type, in 2019[28]

Vehicle Body Type, Initial Impact-Front	Fatal	Injury	Property-Damage-Only
Passenger Car	888	329,000	906,000
Light Truck	910	245,000	642,000
All Other	762	31,000	57,000

Rear-End Crashes by Posted Speed Limit

When looking at posted speed limit and rear-end crashes, data show that the majority of the crashes happened in areas where the posted speed limit was 60 mph (97 km/h) or less. The table below shows the rear-end crash data by posted speed limit and vehicle type from 2019. About 60 percent of fatal crashes were on roads with a speed limit of 60 mph (97 km/h) or lower. That number is 73 percent for injury crashes and 78 percent for property-damage-only crashes.

Table 8: 2019 Rear-end Crashes Involving Passenger Cars, MPVs, and Light Trucks with Frontal Impact by Posted Speed Limit[29, 30]

Vehicles by Posted speed limit	Passenger Cars, Light trucks, by Crash Severity					
	Fatal		Injury		Property-Damage-Only	
	Number	Percent	Number	Percent	Number	Percent
25 mph or less	16	1%	28,000	5%	103,000	7%
30	30	2%	24,000	4%	78,000	5%
35	95	5%	91,000	16%	267,000	17%
40	87	5%	66,000	11%	175,000	11%
45	223	12%	129,000	22%	373,000	24%
50	99	6%	19,000	3%	58,000	4%
55	401	22%	55,000	10%	122,000	8%
60	133	7%	12,000	2%	31,000	2%
65 and above	684	38%	75,000	13%	153,000	10%
All other	30	2%	75,000	13%	187,000	12%
Total:	1,798	100%	574,000	100%	1,547,000	100%

Rear-End Crashes by Light Condition

Slightly more fatal rear-end crashes (51 percent) occurred during daylight than during dark-lighted and dark-not-lighted conditions combined (43 percent) in 2019. Injury and property-damage-only rear-end crashes were reported to have happened overwhelmingly during daylight, at 76 percent for injury rear-end crashes and 80 percent for property-damage-only rear-end crashes. The table below presents a summary of all 2019 rear-end crashes of light vehicles by light conditions, where the impact location is the front of a light vehicle.

Total	1,798	100%	574,000	100%	1,547,000	100%

Rear-End Crashes by Atmospheric Conditions

In 2019, the majority of rear-end crashes of light vehicles were reported to occur during clear skies with no adverse atmospheric conditions. These conditions were present for 72 percent of all fatal rear-end crashes, while 14 percent of fatal rear-end crashes were reported to occur during cloudy conditions. Similar trends are reported for injury and property-damage-only crashes. A summary of 2019 rear-end crashes of light vehicle with frontal impact by atmospheric conditions is presented in the table below.

Table 10: 2019 Rear-End Crashes Involving Light Vehicles with Frontal Impact, by Atmospheric Conditions[32]

Crashes Atmospheric Conditions	Crash Severity					
	Fatal		Injury		Property-Damage-Only	
	Number	Percent	Number	Percent	Number	Percent
Clear, No Adverse	1,295	72%	426,000	74%	1,113,000	72%
Cloudy	247	14%	87,000	15%	245,000	16%
All Other	256	14%	61,000	11%	189,000	12%
Total	1,798	100%	574,000	100%	1,547,000	100%

Pedestrian Fatalities and Injuries

While the number of fatalities from motor vehicle traffic crashes is increasing, pedestrian fatalities are increasing at a greater rate than the general trend and becoming a larger percentage of total fatalities. In 2010, there were 4,302 pedestrian fatalities (13 percent of all fatalities), which increased to 6,272 (17 percent of all fatalities) in 2019. The latest agency estimation data indicate that there were 7,345 pedestrian fatalities in 2022.[33] Since data from 2020 and 2021 may not be representative of the general safety problem due to the COVID–19 pandemic and data for 2022 are early estimates, the following sections refer to data from 2010 to 2020 when discussing pedestrian safety problem trends, and 2019 data when discussing specific characteristics of the pedestrian safety problem. While the number of pedestrian fatalities is increasing, the number of pedestrians injured in crashes from 2010 to 2020 has not changed significantly, with exception of the 2020 pandemic year. As shown in the table below, the number and percentage of pedestrian fatalities and injuries for the 2010 to 2020 period is presented in relationship to the total number of fatalities and total number of people injured in all crashes.

[2] Data source: NASS GES 2010–2015, CRSS 2016–2019

The following sections present a breakdown of pedestrian fatalities and injuries by initial impact point, vehicle type, posted speed limit, lighting condition, and pedestrian age for the year 2019.

Pedestrian Fatalities and Injuries by Initial Point of Impact and Vehicle Type

In 2019, the majority of pedestrian fatalities, 4,638 (74 percent of all pedestrian fatalities), and injuries, 52,886 (70 percent of all pedestrian injuries), were in crashes where the initial point of impact on the vehicle was the front. When the crashes are broken down by vehicle body type, the majority of pedestrian fatalities and injuries occur where the initial point of impact was the front of a light vehicle (4,069 pedestrian fatalities and 50,831 pedestrian injuries) (see the table below).[35]

Table 12: 2019 Pedestrian Fatalities and Injuries, by Initial Point of Impact Front and Vehicle Body Type[36]

Vehicle Body Type, Initial Impact - Front	Crash Severity			
	Pedestrian Fatalities		Pedestrian Injuries	
	Number	Percent	Number	Percent
Passenger Car	1,976	43%	30,968	59%
Light Truck	2,093	45%	19,863	38%
All Other	569	12%	2,055	4%
Total	4,638	100%	52,886	100%

Pedestrian Fatalities and Injuries by Posted Speed Limit Involving Light Vehicles

In 2019, the majority of pedestrian fatalities from crashes involving light vehicles with the initial point of impact as the front occurred on roads where the posted speed limit was 45 mph or less, (about 70 percent). There is a near even split between the number of pedestrian fatalities in 40 mph and lower speed zones and in 45 mph and above speed zones (50 percent and 47 percent respectively with the remaining unknown or not reported). As for pedestrian injuries, in 34 percent of the sampled data, the posted speed limit is either not reported or unknown. In

[34] *https://crashstats.nhtsa.dot.gov/Api/Public/ViewPublication/813079* Pedestrian Traffic Facts 2019 Data, May 2021, *https://crashstats.nhtsa.dot.gov/Api/Public/ViewPublication/813310* Pedestrian Traffic Facts 2020, Data May 2022.

[35] As described previously, passenger cars and light trucks are the representative population for vehicles with a gross vehicle weight rating (GVWR) of 4,536 kg (10,000 lbs.) or less.

[36] NHTSA's Traffic Safety Facts Annual Report, Table 99 for 2019, *https://crashstats.nhtsa.dot.gov/Api/Public/ViewPublication/813141* Accessed March 29, 2024.

2019, 57 percent of the pedestrians were injured when the posted speed limit was 40 mph or below, and 9 percent when the posted speed limit was above 40 mph with the remaining not reported, reported as unknown, or reported as no speed limit. The table below shows the number of pedestrian fatalities and injuries for each posted speed limit.

Table 13: 2019 Pedestrian Fatalities and Injuries Involving Light Vehicles, by Posted Speed Limit and Initial Point of Impact Front[37]

Posted speed limit	Crash Severity			
	Pedestrian Fatalities		Pedestrian Injuries	
	Number	Percent	Number	Percent
5 mph	3	0.07%	185	0.36%
10 mph	7	0.17%	287	0.56%
15 mph	10	0.25%	865	1.70%
20 mph	14	0.34%	479	0.94%
25 mph	346	8.50%	9,425	18.54%
30 mph	325	7.99%	4,254	8.37%
35 mph	765	18.80%	9,802	19.28%
40 mph	551	13.54%	3,703	7.28%
45 mph	821	20.18%	3,094	6.09%

Total	4,069	100%	50,831	100%

Pedestrian Fatalities and Injuries by Lighting Condition Involving Light Vehicles

The majority of pedestrian fatalities where the front of a light vehicle strikes a pedestrian occurred in dark lighting conditions, 3,131 (75 percent). There were 20,645 pedestrian injuries (40 percent) in dark lighting conditions and 27,603 pedestrian injuries (54 percent) in daylight conditions.

[37] The accompanying FRIA estimates the impacts of the rule based on the estimated travel speed of the striking vehicle. This table presents the speed limit of the roads on which pedestrian crashes occur.

Table 14: 2019 Pedestrian Fatalities and Injuries Involving Light Vehicles, by Lighting Condition and Initial Point of Impact Front[38]

Light Condition	Crash Severity			
	Pedestrian Fatalities		Pedestrian Injuries	
	Number	Percent	Number	Percent
Daylight	767	19%	27,603	54%
Dark–Not Lighted	1,464	36%	4,551	9%
Dark–Lighted	1,621	40%	15,996	31%
Dark–Unknown Light	46	1%	98	0%
All Other	171	4%	2,583	5%
Total	4,069	100%	50,831	100%

Pedestrian Fatalities and Injuries by Age Involving Light Vehicles

In 2019, 646 fatalities and approximately 106,600 injuries involved children aged 9 and below. Of these, 68 fatalities and approximately 2,700 injuries involved pedestrians aged 9 and below in crashes with the front of a light vehicle. As shown in the table below, the first two age groups (under age 5 and ages 5 to 9) each represent less than 1 percent of the total pedestrian fatalities in crashes with the front of a light vehicle. These age groups also represent about 1.5 and 3.8 percent of the total pedestrian injuries in crashes with the front of a light vehicle, respectively. In contrast, age groups between age 25 and 69 each represent approximately 7 percent of the total pedestrian fatalities in crashes with the front of a light vehicle, with the 55 to 59 age group having the highest percentage at 10.9 percent. Pedestrian injury percentages were less consistent, but distributed similarly, to pedestrian fatalities, with lower percentages reflected in children aged 9 and below and adults over age 70.

[38] Generated from FARS and CRSS databases (*https://www.nhtsa.gov/file-downloads?p=nhtsa/downloads/FARS/2019/National/*, *https://www.nhtsa.gov/file-downloads?p=nhtsa/downloads/CRSS/2019/*, accessed October 17, 2022).

BILLING CODE 4910–59–C

B. Bipartisan Infrastructure Law (BIL)

This final rule responds to Congress's directive that NHTSA require AEB on all passenger vehicles. On November 15, 2021, the President signed the Bipartisan Infrastructure Law, codified as the Infrastructure Investment and Jobs Act (Pub. L. 117–58). Section 24208(a) of BIL added 49 U.S.C. 30129, directing the Secretary of Transportation to promulgate a rule to establish minimum performance standards with respect to crash avoidance technology and to require that all passenger motor vehicles manufactured for sale in the United States be equipped with a forward collision warning (FCW) system and an automatic emergency braking system. The FCW and AEB system is required to alert the driver if the vehicle is closing its distance too quickly to a vehicle ahead or to an object in the path of travel ahead and a collision is imminent, and to automatically apply

[39] Generated from FARS and CRSS databases (*https://www.nhtsa.gov/file-downloads?p=nhtsa/downloads/FARS/2019/National/, https://www.nhtsa.gov/file-downloads?p=nhtsa/downloads/CRSS/2019/,* accessed October 17, 2022).

[40] *https://www.census.gov/data/tables/2019/demo/age-and-sex/2019-age-sex-composition.html,* Table 12.

the brakes if the driver fails to do so. This final rule responds to this mandate and is estimated to reduce the frequency and severity of vehicle-to-vehicle rear-end crashes and to reduce the frequency and severity of vehicle crashes into pedestrians.

BIL requires that ''all passenger motor vehicles'' manufactured for sale in the United States be equipped with AEB and FCW. The BIL term ''passenger motor vehicle'' encompasses more vehicle categories than the term ''passenger car'' that NHTSA defines in 49 CFR 571.3. Thus, including multipurpose passenger vehicles, trucks, and buses aligns with Congress's mandate. Additionally, NHTSA considers passenger cars, truck, buses, and multipurpose passenger vehicles as light vehicles and generally uses the 10,000 GVWR cut-off for FMVSS that apply to light vehicles.[41] As a result, in this final rule, NHTSA requires AEB and FCW on all passenger cars and multipurpose passenger vehicles, trucks, and buses with a gross vehicle weight rating (GVWR) of 10,000 lbs. or less.

BIL further requires that an FCW system alert the driver if there is a ''vehicle ahead or an object in the path of travel'' if a collision is imminent.

NHTSA interprets BIL as requiring AEB capable of detecting and responding to vehicles and objects and authorizing NHTSA to promulgate specific performance requirements. NHTSA's rule requires light vehicles to be equipped with FCW and automatic emergency braking (AEB), and the proposal defines AEB as a system that detects an imminent collision with vehicles, objects, and road users,[42] in or near the path of a vehicle and automatically controls the vehicle's service brakes to avoid or mitigate the collision.

As discussed in the NPRM, section 24208 of BIL does not limit NHTSA's broad authority to issue motor vehicle safety regulations under the Safety Act. NHTSA interprets BIL as a mandate to act on a particular vehicle safety issue and as complementary to NHTSA's authority under the Safety Act. Thus, pursuant to its authority under 49 U.S.C 30111, NHTSA is requiring all light passenger vehicles to be equipped with PAEB in addition to AEB. NHTSA is ensuring that PAEB is available on all light passenger vehicles to address a significant safety problem, and in so doing, recognizes the availability of technology capable of preventing needless injuries and lost lives.

C. High-level Summary of Comments on the NPRM

NHTSA received more than a thousand comments on the proposed rule. The agency received comments from a wide variety of commenters including advocacy groups, manufacturers, trade associations, suppliers, and individuals. The advocacy groups submitting comments included AAA Inc. (AAA), AARP, Advocates for Highway and Auto Safety (Advocates), America Walks, American Foundation for the Blind (AFB), Association of Pedestrian and Bicycle Professionals (APBP), Center for Auto Safety (CAS), Consumer Reports, DRIVE SMART Virginia, Insurance Institute for Highway Safety (IIHS), International Association of Fire Chiefs, Intelligent Transportation Society of America (ITS America), League of American Bicyclists (League), McHenry County Bicycle Advocates, National Safety Council (NSC), Paralyzed Veterans of America (PVA), United Spinal Association, Utah Public Lands Alliance, and Vulnerable Road Users Safety Consortium (VRUSC). Trade associations submitting comments included Alliance for Automotive Innovation (Alliance), American Chemistry Council, American Motorcyclist Association (AMA), Automotive Safety Council (ASC), Autonomous Vehicle Industry Association (AVIA), the Governors Highway Safety Association (GHSA), Lidar Coalition, the Motor and Equipment Manufacturers Association (MEMA), National Automotive Dealers Association (NADA), National Association of City Transportation Officials (NACTO), Association for the Work Truck Industry (NTEA), SAE International (SAE), and Specialty Equipment Market Association (SEMA). We also received comments from individual vehicle manufacturers such as FCA US LLC (FCA), Ford Motor Company (Ford), General Motors LLC (GM), American Honda Motor, Co., Inc. (Honda), Hyundai Motor Company (Hyundai), Mitsubishi Motors R & D of America, Inc. (Mitsubishi), Nissan North America, Inc. (Nissan), Porsche Cars North America (Porsche), Rivian Automotive, LLC (Rivian), Toyota Motor North America, Inc. (Toyota), and Volkswagen Group of America (Volkswagen). Suppliers and developers commenting on the NPRM included Adasky North America (Adasky), Applied Intuition (Applied), Aptiv, Automotive Electronics Products COMPAL Electronics, Inc. (COMPAL), Autotalks, Forensic Rock, LLC (Forensic Rock), Humanetics Safety (Humanetics), Hyundai America Technical Center, Inc. (HATCI), Hyundai MOBIS, imagery Inc. (Imagery), LHP Inc. (LHP), Luminar Technologies, Inc. (Luminar), Mobileye Vision Technologies LTD (Mobileye), Owl Autonomous Imaging, Inc. (Owl AI), Radian Labs LLC (Radian), Robert Bosch LLC (Bosch), Teledyne FLIR (Teledyne), ZF North America (ZF), and Zoox, Inc. (Zoox). Government agencies that commented included the National Transportation Safety Board (NTSB), the City of Houston (Houston), City of Philadelphia (Philadelphia), Humboldt County Association of Governments, Maryland Department of Transportation Motor Vehicle Administration (MDOT), Multnomah County, and Nashville Department of Transportation and Multimodal Infrastructure (Nashville). Healthcare and insurance companies submitting comments included American Property Casualty Insurance Association (APCIA), National Association of Mutual Insurance Companies, and Richmond Ambulance Authority. The agency also received approximately 970 comments from individual commenters. In general, the commenters expressed support for the goals of this rulemaking, and many commenters offered recommendations on the most appropriate way to achieve those goals.

Many commenters shared their general support for requiring AEB as standard equipment on passenger vehicles, while others opposed finalizing the proposed rule for various technical and policy reasons. In general, safety advocates supported finalizing the rule, while vehicle manufacturers opposed various aspects of the proposal, even if they expressed general support for AEB technology. The agency received comments on many aspects of the rule, including comments on the application, the performance requirements, the test procedure conditions and parameters, and the proposed lead time and phase-in schedule.

Consumer advocacy groups primarily supported the rule, with concerns regarding manual deactivation and the proposed requirements regarding PAEB. They urged that any conditions for AEB deactivation be restricted and have data supporting deactivation and asserted that any manual deactivation would need to have multiple steps and require the vehicle to be stationary. Many suggested that the testing speeds be increased to cover a larger portion of the safety problem. Another concern raised

[41] *See,* for example, 49 CFR 571.138, 571.208, and 571.111.

[42] While AEB is defined as a system that detects imminent collision with vehicles, objects, and road users, the performance requirements focus on protecting pedestrians until NHTSA can develop additional research to support a proposal to expand the performance requirements.

by advocacy groups was the lack of test procedures covering bicyclists and users of mobility devices and wheelchairs. They recommended that the agency add more PAEB testing scenarios, noting that there is a significant safety risk for pedestrians and all vulnerable road users. In general, advocacy groups supported the full collision avoidance, no-contact requirement for all proposed AEB tests as a necessity to uphold the strength of the rule.

While vehicle manufacturers supported the installation of AEB, the most significant concerns focused on the stringency of the requirements. The NPRM proposed the AEB system be operational at any forward speed above 10 km/h (6.2 mph). Several vehicle manufacturers and the Alliance opposed the open-ended upper bound, stating it was impracticable or that it would lead to false activations. These commenters stated that the lack of a defined maximum operational speed could create implementation ambiguity and difficulty complying with the rule due to significant development costs. The NPRM further proposed full collision avoidance with the lead vehicle during AEB testing (a no-contact performance requirement). The Alliance, and multiple manufacturers expressing support for the Alliance' comments, stated that a no-contact performance requirement is not practicable and increases the potential for unintended consequences such as inducing unstable vehicle dynamics, removing the driver's authority, increasing false activations, and creating conditions that limit bringing new products to market. These commenters asserted that a lack of rigorous testing by the agency leaves questions as to actual vehicle performance in the field.

The vehicle manufacturers also commented on the feasibility of specific performance requirements under the proposed phase-in schedule, arguing that the agency was mistaken to assume in the NPRM that most vehicles have the necessary hardware to implement this rule. They commented that the proposed phase-in schedule may require redesigns to their systems outside of the normal product development cycle and contended that such a scenario would significantly increase the costs and burdens of compliance. The manufacturers requested that the agency delay the rule by as much as eight years to afford them time to redesign their systems in conjunction with the normal vehicle redesign schedule.

Manufacturers and suppliers generally opposed the agency's proposal to prohibit manual deactivation of the AEB system above 10km/h. Commenters stated the need for deactivation during various scenarios, including four-wheel drive operation, towing, off-road use, car washes and low traction driving. There were multiple suggestions to adopt the deactivation criteria of the United Nations Economic Commission for Europe (UNECE) Regulation No. 152, in place of the NPRM proposed criteria, and to align with UNECE Regulation No. 152 more generally.

Among suppliers and developers, there was not a consensus on the no-contact requirement. Commenters such as Adasky and Luminar expressed support for the no-contact requirement, stating that current technology is capable of this performance. ZF, Aptiv, and Hyundai MOBIS believed the proposed no-contact requirement was not practicable and suggested harmonization with UNECE Regulation No. 152. Generally, those opposed to the no-contact requirement supported hybrid or speed reduction approaches.[43]

ZF, HATCI, and Aptiv supported the ability to manually deactivate the AEB system and recommended harmonization with UNECE Regulation No. 152 deactivation criteria. Imagry opposed the entirety of the NPRM as drawing resources and development away from fully autonomous driving, while Autotalks supported the regulation as ''urgently needed.''

Finally, most individual commenters expressed general support to the goals of this rule, citing the vulnerability of pedestrians on or near roadways. A significant portion of these commenters also noted that children, people with dark skin tones, and those using a wheelchair or mobility device are particularly vulnerable. Individual commenters opposed to this rule cited concerns about off-road operation and false activation.

D. Summary of the Notice of Proposed Rulemaking

NHTSA published the NPRM for this final rule on June 2, 2023 (88 FR 38632). Because this final rule adopts almost all of the requirements proposed in the NPRM, this summary is brief and mirrors the description of the final rule provided in the Executive Summary, *supra.*

1. The NPRM proposed creating a new FMVSS to require AEB systems on light vehicles that can reduce the frequency and severity of both rear-end and pedestrian crashes. The proposed AEB performance requirements were intended to ensure that an AEB system is able to automatically and completely avoid collision with the rear of another vehicle or a pedestrian in specific combinations of scenarios and speeds, while continuing to alert and apply the brakes at speeds beyond those in the test procedure.

2. The NPRM proposed four requirements for the AEB systems. The proposed AEB system must: (a) provide the driver with a forward collision warning (FCW) at any forward speed greater than 10 km/h (6.2 mph); (b) automatically apply the brakes at any forward speed greater than 10 km/h (6.2 mph) when a collision with a lead vehicle or a pedestrian is imminent; (c) prevent the vehicle from contacting the lead vehicle (*i.e.,* vehicle test device) or pedestrian test device when tested according to the proposed test procedures; and (d) detect AEB system malfunctions and notify the driver of any malfunction that causes the AEB system not to meet the proposed minimum performance requirements of the safety standard.

3. The NPRM's test procedures evaluate the lead vehicle AEB performance, PAEB performance, and two scenarios that evaluate situations where braking is not warranted (*i.e.,* false positives). Under this proposed requirement, crash avoidance braking is considered to have occurred when the automatic portion of the brake activation (excluding any manual braking) exceeds 0.25g.

4. For the lead vehicle AEB performance, the agency proposed three test scenarios: lead vehicle stopped, lead vehicle decelerating, and lead vehicle slower-moving. Each lead vehicle scenario is tested at specific speeds or within specified ranges of speeds to evaluate the AEB performance with and without applying manual braking to the subject vehicle.

For the lead vehicle stopped scenario, the agency proposed that the subject vehicle must perform when no manual braking is used at speeds ranging from 10 km/h to 80 km/h, and from 70 km/h to 100 km/h when manual braking is used. The subject (and lead vehicle) speeds proposed for the decelerating lead vehicle scenario were 50 km/h and 80 km/h while the proposed range of lead vehicle deceleration was 0.3 g to 0.5 g. Additionally, for the decelerating lead vehicle scenario, the agency proposed a headway range of 12 m to 40 m for each of the two subject vehicle speeds. For the slower-moving lead vehicle scenario, a subject vehicle must perform at speeds ranging from 40 km/h to 80 km/h when no manual braking

[43] A kind of hybrid approach would maintain no-contact requirements for lower-mid-range speeds while permitting contact at higher speed if acceptable speed reductions that reduce the risk of serious injury can be achieved in the higher-speed scenarios.

is used, while a subject vehicle must perform at speeds ranging from 70 km/h to 100 km/h when manual braking is used.

5. For the assessment of PAEB performance, the proposed test procedures evaluate the subject vehicle in three pre-crash scenarios involving pedestrians: (a) where the pedestrian crosses the road in front of the subject vehicle, (b) where the pedestrian walks alongside the road in the path of the subject vehicle, and (c) where the pedestrian stands in the roadway in front of the subject vehicle. The NPRM proposed a specified range of speeds in both daylight and darkness lighting conditions with lower and upper beam headlamps activated.

6. NHTSA proposed that AEB systems continuously detect system malfunctions. If an AEB system detects a malfunction that prevents it from performing its required safety function, the vehicle would provide the vehicle operator with a warning. The warning would be required to remain active as long as the malfunction exists while the vehicle's starting system is on. NHTSA considers a malfunction to include any condition in which the AEB system fails to meet the proposed performance requirements. NHTSA proposed that the driver be warned in all instances of component or system failures, sensor obstructions, environmental limitations (like heavy precipitation), or other situations that would prevent a vehicle from meeting the proposed AEB performance requirements.

7. With respect to compliance dates, the NPRM proposed that vehicles manufactured on or after September 1, three years after the publication date of a final rule, but before September 1, four years after the publication date of a final rule, would be required to meet all requirements except that lower speed PAEB performance test requirements. Vehicles manufactured four years after the publication date of a final rule would be required to meet all requirements specified in the final rule. NHTSA proposed that small-volume manufacturers, final-stage manufacturers, and alterers would be provided an additional year of lead time for all requirements.

E. Additional Research Conducted in 2023

While past testing conducted in support of the NPRM provided ample support for the proposed performance requirements, NHTSA conducted additional research in 2023, which included an evaluation of the newest vehicles available on the market.[44] The new research confirmed that AEB and PAEB performance maintained good performance when compared with previous testing. This research used three test scenarios to evaluate the AEB performance of six light vehicles. The vehicles tested included the 2023 BMW iX, 2023 Ford F–150 Lightning, 2023 Hyundai Ioniq 5 Limited, 2024 Mazda CX–90 Turbo S, 2023 Nissan Pathfinder SL, and the 2023 Toyota Corolla Hybrid XLE. The lead vehicle testing evaluated the effects of regenerative braking settings for electric (and some hybrid) vehicles, adaptive cruise control settings, and ambient lighting conditions on the AEB performance of these vehicles.

The lead vehicle scenarios used in this research included the proposed conditions of lead vehicle stopped, moving, and decelerating. All conditions and parameters for this research were consistent with those described in the proposed rule. For nominal testing (tests not designed to investigate a particular condition or parameter) the Toyota used in this research avoided contacting the vehicle test device at all speeds tested from 10 km/h to 80 km/h (50 mph) in the lead vehicle stopped condition. The Mazda avoided contacting the lead vehicle test device in all lead vehicle stopped conditions up to 60 km/h (37.5 mph).

[44] NHTSA's 2023 Light Vehicle Automatic Emergency Braking Research Test Summary and NHTSA's 2023 Light Vehicle Pedestrian Automatic Emergency Braking Research Test Summary, available in the docket for this final rule (NHTSA–2023–0021).

-- Means that no test was conducted for this parameter

The agency also studied lead vehicle AEB performance in darkness. Results from the dark ambient lighting tests are shown in the table below. The lead vehicle stopped scenario was used for all day/darkness comparative tests. The results observed during the dark ambient tests were largely consistent with those produced during the daylight tests. The dark versus day contact results observed for a given test speed were identical or nearly identical for the Hyundai, Mazda, Nissan, and Toyota. Where impacts occurred, the impact speeds were very close.

-- Means that no test was conducted for this parameter

The agency also studied the effects of regenerative braking settings for electric and hybrid electric vehicles on the performance of lead vehicle AEB. Again, the lead vehicle stopped test scenario was used for this comparison. The

regenerative braking settings did not have a negative effect on the performance of the tested AEB systems. As expected, performance under the highest regenerative braking settings was slightly better that the lower, or off, settings. However, the effect of regenerative brake setting on the vehicle's ability to avoid contact with the lead vehicle test device was dependent on the vehicle tested.

CA – No Contact occurred during testing

The number in each cell reports the relative speed in which the vehicle tested impacted the lead vehicle test device in km/h

-- Means that no test was conducted for this parameter

The agency also conducted additional PAEB testing. The same vehicles used for the lead vehicle testing presented above were used to evaluate their PAEB performance consistent with the proposed rule. The results of this testing

are summarized in the table below. The table provides the maximum speed tested at which the vehicle avoided contacting the pedestrian test device. Of specific note, one vehicle avoided contacting the pedestrian test device at all speeds tested. Some vehicles contacted the test device at 10 km/h but under further testing, demonstrated the ability to avoid contacting the pedestrian test device at much higher speeds. Further details of this testing and additional results are available in the report contained in the docket provided at the beginning of this final rule.

- Denotes the vehicle did not avoid contacting the pedestrian test device at any tested speed.

BILLING CODE 4910–59–C

III. Final Rule and Response to Comments

A. Summary of the Final Rule (and Modifications to the NPRM)

With a few notable exceptions, this final rule adopts the performance requirements from the proposed rule. This rule requires manufacturers to install AEB systems that meet specific performance requirements. These performance requirements include the installation of an AEB system, track testing requirements for avoiding both lead vehicles and pedestrians, false activations test requirements, and malfunction indication requirements.

This final rule includes four requirements for AEB systems for both lead vehicles and pedestrians. First, there is an equipment requirement that vehicles have an AEB system that provides the driver with an FCW at any forward speed greater than 10 km/h (6.2 mph) and less than 145 km/h (90.1 mph). The FCW must be presented via auditory and visual modalities when a collision with a lead vehicle or a pedestrian is imminent. This final rule includes specifications for the auditory and visual warning components consistent with those of the proposed rule, with some modifications to keep the effectiveness of the FCW while reducing the potential costs associated with this rule for some vehicle designs. Similarly, this final rule includes an equipment requirement that light vehicles have an AEB system that applies the brakes automatically at any forward speed that is greater than 10 km/h (6.2 mph) and less than 145 km/h (90.1 mph) when a collision with a lead vehicle is imminent, and at any forward speed greater than 10 km/h (6.2 mph) and less than 73 km/h (45.4 mph) when a collision with a pedestrian is

imminent. The maximum speed of lead vehicle AEB is modified from the NPRM, which did not include upper limits on speeds. NHTSA also clarified that this requirement applies only when environmental conditions permit.

Second, the AEB system is required to prevent the vehicle from colliding with the lead vehicle or pedestrian test devices when tested according to the standard's test procedures. These track test procedures have defined parameters, including travel speeds up to 100 km/h (62.2 mph), that ensure that AEB systems prevent crashes in a controlled testing environment. The three scenarios for testing vehicles with a lead vehicle and four scenarios for testing vehicles with a pedestrian test device are finalized as proposed. The agency has finalized pedestrian tests in both daylight and darkness, while testing using the lead vehicle test device is conducted in daylight only as proposed.

Third, this final rule includes the two false activation tests, driving over a steel trench plate and driving between two parked vehicles, in which the vehicle is not permitted to brake in excess of specified amounts proposed in the NPRM.

Finally, a vehicle must detect AEB system malfunctions and notify the driver of any malfunction that causes the AEB system not to meet the minimum proposed performance requirements. The system must continuously detect system malfunctions, including performance degradation caused solely by sensor obstructions. If the system detects a malfunction, or if the system adjusts its performance such that it will not meet the requirements of the finalized standard, the system must provide the vehicle operator with a telltale notification. This final rule has also clarified that the purpose of the malfunction telltale is to provide information about the operational state of the vehicle. Some commenters understood the NPRM to have required that the malfunction telltale activate based on information about the vehicle's surroundings such as low friction road surfaces.

This final rule includes several changes to the NPRM based on the comments received:

First, NHTSA includes in this final rule an explicit prohibition against manufacturers installing a control designed for the sole purpose of deactivating the AEB system but allows for controls that have the ancillary effect of deactivating the AEB system (such as deactivating AEB if the driver has activated ''tow mode'' and the manufacturer has determined that AEB cannot perform safely while towing).

NHTSA also modifies the FCW visual signal location requirement in this final rule to increase the specified visual angle from 10 degrees to 18 degrees in the vertical direction. This change from the NPRM provides manufacturers with the flexibility to locate the visual warning signal within the typical area of the upper half of the instrument panel and closer to the central field of view of the driver. While the agency continues to believe that an FCW visual warning signal presented near the central forward-looking region is ideal, it does not consider a head-up display to be necessary for the presentation of the FCW visual signal.

In addition, NHTSA modifies in this final rule the range of forward speeds at which the AEB must operate. The NPRM required FCW and AEB systems to operate at any forward speed greater than 10 km/h. This final rule places an upper bound on the requirement that an AEB system operate of 145 km/h (90.1 mph) for FCW and lead vehicle AEB and 73 km/h (45.4 mph) for pedestrian AEB. This final rule also clarifies the environmental conditions under which the AEB system must perform to be the same environmental conditions specified in the track testing.

NHTSA also makes a minor adjustment in this final rule to the measurement method used to characterize the radar cross-section for the pedestrian test devices. It maintains the cross-section boundaries contained within the proposed rule as incorporated from ISO 19206–2:2018 but uses parts of the updated measurement method incorporated from ISO 10206–3:2021. This newer method was proposed for use in measuring the vehicle test device, while the older measurement method was proposed for the pedestrian test devices. The newer method provides for better filtration of noise by using average measurements taken at three radar heights as opposed to the single measurement height specified in the older method. This final rule modifies the measurement methods for the pedestrian test device to match the method used when characterizing the vehicle test device.

Finally, this final rule makes a few significant changes to the lead-time and phase-in requirements. Instead of the deadline proposed under the NPRM, this final rule requires that manufacturers comply with all provisions of the rule at the end of the 5-year period starting the first September 1 after this publication. This will provide manufacturers with more time to meet the requirements of this final rule, as most vehicles do not currently meet all of the performance requirements set forth in this final rule and in light of manufacturer redesign schedules. The added lead time avoids significantly increasing the costs of the rule by compelling equipment redesigns outside of the normal production cycle.

As part of this extension of the lead time, the agency has removed the phase-in approach to the PAEB performance requirements. While the NPRM proposed the most stringent PAEB requirements be met 4 years after a final rule (1 year more than all the other requirements), the agency is finalizing a 5-year lead time for all requirements (eliminating the phasing in of requirements during the lead time).

B. Application

NHTSA proposed that the new FMVSS No. 127 apply to all passenger cars and to all multipurpose passenger vehicles, trucks, and buses with a GVWR of 4,536 kilograms (10,000 pounds) or less. The agency did not propose that the new FMVSS apply to vehicles with a GVWR over 4,536 kilograms (10,000 pounds) or to include motorcycles or low-speed vehicles.

Vehicle Body Types

Several commenters requested that NHTSA consider various vehicle types in the application of the new FMVSS. The Alliance noted that the agency's analysis focused only on performance for sedan, SUV and crossover, and pickup vehicles, and did not consider the constraints associated with the installation of sensors on vehicles with certain vehicle designs such as sports cars, which may affect system capabilities based on unique design characteristics and low profile. FCA noted that the NPRM did not include the low-speed vehicle (LSV) class and supported their inclusion in this rule, in part based on the inclusion of LSVs in the most recent modifications to FMVSS No. 111 and FMVSS No. 141.

While NHTSA acknowledges the Alliance's concerns that mounting forward-looking sensors on certain vehicle body types, such as sports cars, may present some challenges, we believe that technology already present on some existing production vehicles can be adapted to address the concern. We also believe that 5 years provides adequate lead time for manufacturers to consider the changes necessary to their models to implement AEB. We further note that manufacturers are not restricted as to sensor placement. Existing production vehicles have sensors located in a variety of places. NHTSA is aware of several vehicles

equipped with radar and camera sensors mounted in the cabin near the rearview mirror. Such a sensor configuration would avoid the installation constraints imposed by small bumpers, avoid placement behind carbon fiber material, and accommodate placement further above the ground.

Regarding FCA's comment, LSVs were excluded from the scope of the final rule for several reasons. First, there are no LSVs on the market that NHTSA is aware of that are currently equipped with AEB or PAEB. This means that NHTSA was not able to procure a vehicle for testing or otherwise evaluate how a LSV would perform if equipped with AEB/PAEB. Second, there is a lack of specific safety data to support an argument that LSVs should be equipped with AEB/PAEB. NHTSA does not want to preclude such vehicles from being equipped with these safety systems, but the current safety data does not provide justification for including them in this rule. Finally, and as discussed in the FRIA, LSVs were not included due to uncertainty about the feasibility and practicability of AEB for those vehicles. Although LSVs were included in the two most recent standard of significance (FMVSS 111 Backup Camera and FMVSS 141 Sound for Electric Vehicles) without practicability concerns, we note that those standards include requirements that provide aids to assist the driver or alerts the driver. In such cases, those features do not require the vehicle to react but instead elicit a driver reaction. As these vehicles were not included in the testing conducted by the agency, our analysis is unable to characterize the performance of AEB on these vehicles. Therefore, in the absence of any data to characterize how these systems may perform on LSVs, they were not included in the final rule.

Heavier Vehicles

The Alliance and FCA commented about the interaction between the proposed standard and FMVSS Nos. 105 and 135, which regulate braking. The Alliance recommended a comprehensive review of the impact of the proposed rule with appropriate accommodations to exclude or include a cap on the applicability of the proposal based on vehicle weight. The Alliance stated that typical electronic stability control (ESC) systems may not provide the fluid flow rates needed to produce the braking performance necessary to meet the proposed rule. FCA noted that the proposed standard applies to vehicles between 7,716 pounds GVWR (the upper limit for FMVSS No. 135 application) and 10,000 pounds GVWR, opining that this proposed standard is not intended to force changes in the underlying braking performance of vehicles in that range and noting that testing has not been conducted on vehicles over 7,000 pounds GVWR. FCA suggested limiting application of proposed FMVSS No. 127 to vehicles under 7,716 pounds GVWR.

NHTSA evaluated compliance test results for FMVSS No. 135 conducted over the last several years. There were 30 vehicles included in this testing, including small sedans, large pickup trucks, minivans, SUVs and other vehicle types to which this new FMVSS would apply. The results indicate that the braking performance of nearly all vehicles was much better than what FMVSS No. 135 requires and the average deceleration for the larger pickup trucks also outperformed some of the smaller sedans, SUVs, and minivans. These test results indicate that braking performance is more than sufficient to permit compliance with this final rule without a need for braking changes or supplements. While this rule is not intended to force changes in the underlying braking performance of vehicles, the commenters stopped short of asserting that braking improvements would be necessary, stating only that improvements may be necessary. Moreover, even if underlying braking performance improvements were necessary, nothing in the comments suggests that there are any technical barriers or any other impediments that would make such improvements infeasible.

Automated Driving Systems

Several commenters suggested exempting vehicles with automated driving systems from the application of some or all of the proposed FMVSS No. 127. Volkswagen recommended exempting autonomous vehicles (AVs) from the parts of the regulation that involve displaying warnings and the parts for which manipulation of manual controls is part of the test procedure. Similarly, AVIA requested that the forward collision warning requirements not apply to AVs.

Zoox requested that the proposed FMVSS not apply to AVs. Zoox viewed the proposed rule as directed toward human drivers, and that applying it to AVs may result in unintended consequences, such as establishing emergency collision avoidance standards for AVs without considering other avoidance tools available to AVs, thereby constraining their safety capabilities.

AVIA also provided suggested changes to the proposed application language that would exclude vehicles equipped with ADS from the requirement to have an AEB system if the ADS meets the performance requirements of the proposed standard. The Alliance commented that ADS-equipped vehicles without manual controls should be exempt from the driver warning and DBS requirements, which it viewed as relevant only when there is a human driver and similarly that the DBS requirements should be applicable only if a brake pedal is installed or required to be installed in the vehicle.

NHTSA expects that ADS-equipped vehicles are capable of meeting the performance requirements of this rule, especially those related to identifying crash imminent situations with vehicles and pedestrians and applying the brakes to avoid contact. Volkswagen is correct that NHTSA is considering how to address telltales, alerts, and warnings, like FCW, in the context of vehicles driven by ADS.[47] While NHTSA continues to engage in research to support the related rulemakings evaluating the application of existing FMVSS to ADS-equipped vehicles, NHTSA is finalizing this rule for all light vehicles and will consider future modifications regarding telltales, alerts, and warnings, as well as crash avoidance standards, generally, for ADS-equipped vehicles as needed under separate rulemaking efforts.[48]

C. Definitions

The proposed rule contained key definitions to facilitate the understanding of the rule. While there were 15 proposed definitions included in section S4 of the proposed new FMVSS, this section focuses on those raised in comments.

AEB System

The NPRM defined an automatic emergency braking system as a system that detects an imminent collision with vehicles, objects, and road users in or near the path of a vehicle and automatically controls the vehicle's service brakes to avoid or mitigate the collision. Several commenters recommended changes to the definition of AEB system:

Bosch asked NHTSA to consider adopting the definition of ''Advanced Emergency Braking System (AEBS)'' used in United Nations Regulation No. 152 (UNECE R152) to promote global harmonization and enhance clarity in

[47] See *https://www.reginfo.gov/public/do/eAgendaViewRule?pubId=202304&RIN=2127-AM07.*

[48] See *https://www.reginfo.gov/public/do/eAgendaViewRule?pubId=202304&RIN=2127-AM00.*

the terminology used across various jurisdictions.

Porsche and Volkswagen stated that the AEB system requirements throughout the NPRM require performance metrics specific to mitigating collisions with lead vehicles and pedestrians, generally not mitigating collisions with objects, but the proposed definition for AEB includes reference to ''objects'' and ''road users.'' Specifically, Porsche referred to the requirements that the vehicle is required not to apply braking when encountering a steel trench plate. Porsche expressed concern that, by including ''object,'' the AEB definition could introduce confusion in whether braking could be applied in false activation tests. Volkswagen noted that the trench plate could be categorized as an ''object.'' Bosch commented that the broad definition poses challenges in requiring that there is no collision with any ''object.''

In reference to the term ''road users,'' Porsche and Volkswagen commented that the NPRM referenced pedestrians and was not more broadly inclusive of other road-users such as bicyclists. Both recommended replacing the term ''road user'' with ''pedestrian'' to align with the proposed requirements. Bosch did not specifically address the term ''road users,'' but recommended that NHTSA replace ''object'' with ''pedestrian'' in the proposal for more clarity and consistency in the context of the FCW and AEB system.

An anonymous commenter stated that the AEB system definition does not specify what constitutes a ''crash imminent situation'' or how the system determines if the driver has not applied the brakes, or how much braking force is applied to the system. This commenter noted that these are important details that may affect the performance and effectiveness of the AEB system.

BIL requires that an FCW system alert the driver if there is a ''vehicle ahead or an object in the path of travel'' if a collision is imminent. Consistent with this definition, NHTSA defines an AEB system as one that detects an imminent collision with a vehicle or with an object. However, nothing in the definition of AEB system requires vehicles to detect and respond to imminent collisions with all vehicles or all objects in all scenarios. Such a requirement would be unreasonable given the wide array of harmless objects that drivers could encounter on the roadway that do not present safety risks.

The agency has reviewed the various definitions used in the NPRM to assess whether meaningful harmonization could be achieved with UNECE regulations. In UNECE Regulation No. 152, ''Advanced Emergency Braking System (AEBS)'' means a system which can automatically detect an imminent forward collision and activates the vehicle braking system to decelerate the vehicle with the purpose of avoiding or mitigating a collision. The definition proposed in the NPRM is functionally very similar, but uses language from BIL. Unlike UNECE Regulation No. 152, NHTSA's definition also provides a level of clarity as to where the detection of vehicles, objects, and road users must occur, that is ''in or near the path of a vehicle.''

The commenters' concern that this definition requires detection of and reaction to ''all objects'' is unfounded. NHTSA has also considered the use of the term ''road users'' in the AEB definition. NHTSA is aware of manufacturers that have designed AEB systems to detect pedestrians. However, the performance requirements make clear that this final rule requires detection and reaction to pedestrians and lead vehicles. The use of ''objects'' and ''road users'' merely identify potential hazards on a road that may require emergency braking, but are not intended to impose requirements beyond the requirements set forth in the standard.

The agency considered comments seeking inclusion of various performance requirements in the definitions section. Those comments did not explain why such a change is necessary. As a general matter of regulatory structure, NHTSA limits the definition section to defining terms; the operative regulatory text is the appropriate location for performance requirements and other directives of substantive effect.

Therefore, NHTSA adopts the proposed definition of AEB, which is defined as a system that detects an imminent collision with vehicles, objects, and road users in or near the path of a vehicle and automatically controls the vehicle's service brakes to avoid or mitigate the collision.

Forward Collision Warning

The NPRM defined forward collision warning as an auditory and visual warning provided to the vehicle operator by the AEB system that is designed to induce immediate forward crash avoidance response by the vehicle operator.

Consistent with its comment about alignment of the definition of AEB with UNECE R152, Bosch recommended that NHTSA adopt UNECE R152's Collision Warning definition for the FCW definition: ''a warning emitted by the [Advanced Emergency Brake System] AEBS to the driver when the AEBS has detected a potential forward collision.''

NHTSA has finalized the definition of FCW as an auditory and visual warning provided to the vehicle operator by the AEB system that is designed to induce immediate forward crash avoidance. This definition provides clarity that both an auditory and visual warning are necessary for a complete warning that is most likely to reengage a distracted driver. For purposes of the test procedure established in this final rule, if only the visual or only the auditory component of the FCW is provided, then the FCW onset has not happened, and the test procedure steps will not take place until both the auditor and visual components are both in place. As such, the UNECE R152 definition suggested by the commenters does not provide this needed clarity.

Zoox also recommended changes to the FCW definition to clarify applicability to conventional vehicles with human drivers only. As noted above, NHTSA is finalizing this rule for all light vehicles and will consider future modifications regarding telltales, alerts, and warnings, as well as crash avoidance standards, generally, for ADS-equipped vehicles as needed under separate rulemaking efforts. Because NHTSA is not adjusting requirements to accommodate ADS, no definition changes are required to address this issue.

Onset

Commenters requested clarification or addition to the definitions to further clarify the proposed requirements and test procedures. The NPRM defined ''forward collision warning onset'' as the first moment in time when a forward collision warning is provided. Automotive Safety Council sought clarification whether this would be measured in terms of a signal output on the Controller Area Network (CAN) bus, or measured by sound physically emitted from the speaker. NHTSA clarifies that FCW onset would be determined via measurement of the FCW auditory signal sound output within the vehicle cabin and the illumination of the FCW visual signal. CAN bus information would not be used to assess FCW onset.

The NPRM did not provide a definition of braking onset. Humanetics stated that the term ''vehicle braking onset'' needed further clarification in all test protocols. Humanetics suggested a target value of speed change or deceleration value should be used as an indicator of the time of braking onset.

NHTSA has decided to clarify the term ''vehicle braking onset'' in the regulation text as Humanetics suggested, by defining the ''subject vehicle braking onset'' as the point at which the subject vehicle achieves a deceleration of 0.15g due to the automatic control of the service brakes. To ensure clarity in the PAEB test procedure, NHTSA has used the term ''subject vehicle braking onset'' to clarify that NHTSA is referring to the vehicle braking onset of the subject vehicle. The 0.15g deceleration was adopted based on the agency's experience conducting AEB testing as this value has proven a reliable marker for PAEB onset during track testing.[49]

Other Definitions

NHTSA does not believe that any further additional definitions are necessary for manufacturers to understand the performance requirements of the standard or their obligations. NHTSA believes that terms appearing within the proposed definitions are sufficiently clear from the context of the regulation. For example, we believe the meaning of ''crash imminent situation'' is discernable from close review of the performance requirements, including the test procedures; from these, the commenter can determine what the agency would consider crash imminent for the set of testable ranges included in this rule.

Finally, NHTSA acknowledges Consumer Reports' and AAA's requests to limit the use of the terms CIB and DBS. NHTSA has already done this by excluding those terms from the regulatory text. While NHTSA used CIB and DBS throughout the preamble to the NPRM and in this final rule, it is doing so because these terms are frequently used by industry, and their use in the preamble helps readers understand what NHTSA is saying, particularly in the context of prior research and NCAP, which use those terms.

D. FCW and AEB Equipment Requirements

NHTSA proposed that an FCW must provide the driver warning of an impending collision when the vehicle is traveling at a forward speed greater than 10 km/h (6.2 mph). Similarly, the NPRM require a vehicle to have an AEB system that applies the service brakes automatically when a collision with a lead vehicle or pedestrian is imminent at any forward speed greater than 10 km/h (6.2 mph). NHTSA stated in the NPRM that this minimum speed should not be construed to prevent a manufacturer from designing an AEB system that activates at speeds below 10 km/h (6.2 mph).

This proposed requirement was described as an equipment requirement with no associated performance test. No specific speed reduction or crash avoidance would be required. However, this requirement was included to ensure that AEB systems are able to function at all times, including at speeds above those NHTSA proposed as part of the performance test requirements where on-track testing is currently not practicable. NHTSA received comments regarding both the minimum required activation speed and the lack of maximum activation speed.

1. Minimum Activation Speed

Comments

MEMA supported not having FCW and AEB performance requirements at a speed below 10 km/h (6 mph), opining that AEB systems do not offer consistent performance at such low speeds.

Bosch and Volkswagen suggested changing the FCW minimum activation speed to 30 km/h. Bosch believed that FCW may not be beneficial at lower speeds because the AEB system proves to be a sufficient solution. Bosch stated that at lower velocities no driver reaction is required because the AEB intervention can fully avoid the collision after the ''last time to steer'' has already occurred. According to Bosch, as the vehicle speed increases, from 30 km/h upwards, the last point to steer gradually moves to a point after the last point to brake. In effect, a driver warning then becomes beneficial, and FCW can help the driver take appropriate action to avoid or mitigate a collision.

Volkswagen stated that setting a requirement for FCW at low speeds can lead to high false positive rates. Volkswagen also noted that meeting the proposed performance requirements depended on the FCW being issued before the activation of AEB, and could lead to very sensitive system behavior, especially for PAEB. Volkswagen suggested increasing the minimum FCW activation speed to 30 km/h, but suggested it would still be acceptable to display the FCW symbol simultaneously with AEB activation at speeds below 30 km/h to make the driver aware of the event that just occurred.

The Center for Auto Safety disagreed with the 10 km/h minimum speed threshold saying that it was not clear why it was selected. The Center for Auto Safety commented that PAEB should be activated as soon as the vehicle is shifted into gear to avoid injurious or fatal rollovers of children and other hazards. Consumer Reports commented that it understood the technical reasons for the proposed minimum speed of 10 km/h (6.2 mph), but expressed concern that such a lower speed bound would fail to address the issue of what it described as ''frontover'' incidents.[50] Consumer Reports said there had been an increase in ''frontover'' incidents since 2016, and that it believed that the increasing market share of larger vehicles with increased blind zones was correlated with this increase.

Agency Response

NHTSA is finalizing a minimum activation speed of 10 km/h as proposed. The agency considered increasing this minimum to 30 km/h, as suggested by some commenters, to avoid unwanted and unnecessary alert at low speeds. However, after considering the potential impacts of such a modification, particularly the safety of pedestrians, the agency is finalizing the minimum activation speed as proposed for the forward collision warning. This 10 km/h minimum threshold is also harmonized with UNECE Regulation No. 152. Furthermore, as stated in the NPRM, 6 of 11 manufacturers whose owner's manuals NHTSA reviewed indicated that their AEB system have a minimum speed below 10 km/h. NHTSA is encouraged that manufacturers are choosing to have lower speed thresholds for AEB functionality.

As for frontover crashes, NHTSA agrees with Consumer Reports about the importance of understanding driver visibility and about the need to reduce such crashes. Additional research is needed to develop accurate and rigorous methods of evaluating direct visibility

[49] *https://www.regulations.gov/document/NHTSA-2021-0002-0002.*

[50] There is not yet a finalized definition of ''frontover'' that is used within NHTSA or outside of NHTSA, and NHTSA is currently researching how this crash type should be defined. As NHTSA previously indicated, until more data is gathered via the Non-Traffic Surveillance (NTS) system, actual frontover crash counts are difficult to confirm due to the challenges law enforcement faces in distinguishing these crashes from other forward moving vehicle impacts with non-motorists and to the locations where these crashes often occur. For example, a forward moving vehicle crash involving a driver turning into a driveway and striking a child playing in the driveway would typically not be considered a frontover; but if that driver struck the child while pulling out of a garage (having backed into the garage), it would be considered a frontover. These nuances pose difficulties for law enforcement to accurately capture frontover incidents which, in turn, complicates our data collection. Additionally, frontover crashes frequently occur in driveways and parking lots that are not located on the public trafficway; thus, law enforcement may not report these occurrences using a crash report.

from the driver's seat. Research is also needed to better understand the safety problem and the scenarios associated with forward blind zones and frontover crashes. Beginning in January 2023, two new non-traffic crash data elements related to backovers [51] and frontovers were added to the agency's Non-Traffic Surveillance System, which will enhance evaluation of the scope and factors associated with frontover crashes.

2. Maximum Activation Speed

Comments

The National Transportation Safety Board (NTSB) supported the proposed requirements for FCW, specifically pertaining to the necessity of the warning at all speeds above 10 km/h, but the NTSB stated that FCW activation must never delay AEB engagement. NTSB stated that its support was rooted in several NTSB investigations of vehicles operating in partial automation mode at the time of the crash.

In contrast, many commenters raised substantial concerns about the proposed NPRM requirement that FCW and AEB function, at least at some level, at all speeds and under all environmental conditions. Among these concerns was that the requirement would not meet various aspects of the Safety Act.

The Alliance disagreed with the agency setting undefined performance requirements that are not stated in objective terms consistent with 49 U.S.C. 30111 and urged NHTSA to provide clarification when issuing a final rule that compliance verification will be measured only by defined test procedures that meet established criteria for rulemaking. It objected to what it viewed as undefined performance requirements without a clearly demonstrated safety need that create significant challenges from a product development perspective, making it unclear whether or how NHTSA might seek to verify compliance. Without defined and objective criteria, the Alliance thought that policy uncertainty would create ambiguity about potential enforcement actions as there would be no clear parameters to reliably measure performance.

The Alliance suggested that a defined upper bound or maximum operational speed for the AEB/PAEB system was needed due to the possible unstable vehicle dynamics that could result from hard braking at very high speeds. Furthermore, the Alliance opposed open-ended performance requirements through regulation without objective test procedures, noting that it becomes increasingly more challenging to provide significant levels of speed reductions at higher speeds, and it viewed the expectation that manufacturers are capable of providing undefined levels of avoidance at all speeds as neither practicable nor reasonable. According to the Alliance, requirements that exceed the current speed ranges must be supported by relevant data to support practicability and must include defined and objective test procedures. The Alliance noted that the complexity of designing systems capable of going beyond what the agency proposes to test would likely result in significant development costs that are not accounted for in the agency's cost-benefit analysis and that would add unnecessary costs for consumers, while diverting research and development efforts from other priority areas that may yield greater improvements in vehicle safety.

Multiple automakers expressed similar concerns, some recommending that NHTSA limit AEB activation to maximum speeds and several specifying suggested upper bounds. For example, Honda suggested that NHTSA limit AEB activation to when the vehicle is traveling at maximum 135 km/h (84 mph) when approaching a lead vehicle traveling at maximum 75 km/h (47 mph) and limit pedestrian AEB activation to when the vehicle is traveling at maximum 88 km/h (55 mph). Porsche suggested that for the lead vehicle, DBS apply to speeds above 100 km/h (62 mph) and for pedestrians to speeds above 65 km/h (40 mph), and that crash imminent braking (CIB) be required to operate between 10 km/h (6 mph) and 100 km/h (62 mph) for lead vehicle and between 10 km/h (6 mph) and 65 km/h (40 mph) for pedestrian. Porsche also provided suggested regulatory text.[52]

NTSB expressed similar concerns about the need for testing, stating that without a dedicated test protocol or an explicit statement about the extent of operational functionality, broader capabilities (above the testing requirements) remain only presumed and not necessarily expected. NTSB encouraged NHTSA to clarify its intent and expectations for system performance in scenarios and conditions outside the proposed test-track compliance testing by considering additional testing or other compliance tools to examine the performance of AEB systems under other real-world conditions, and particularly whether the operational functionality would extend to non-tested hazards such as traffic safety hardware, bicyclists and motorcyclists, and vehicles with untested profiles or at varying angles and offsets.

Commenters raised potential technical challenges to effective implementation of the proposed requirement. For example, Honda was concerned about AEB and radar sensor limitations when operating at high speeds—mainly the complex interdependency between speed and the distance and accuracy at which objects must be detected to be avoided (or even to mitigate a crash). Honda noted that higher speeds mean that objects will need to be detected at greater distances, and at greater distances there is less image resolution, greater positional error, and greater impact from things like roadway geometry. Honda and Porsche stated that requiring braking to occur at unrestricted high speeds leads to misidentification of objects and increases false positive activations.

Honda further asserted that camera resolution is limited by the pixel count on the image capture chip and that at longer distances, the number of pixels for an object will be reduced, resulting in blur that makes it difficult to detect objects (the blur can be further exacerbated by the designed focal length of the lens). Further, Honda stated that a higher resolution can be achieved only through new sensor hardware that would require further developmental work as well as more processing power, including a change of imaging processing electronic control unit (ECU). Honda stated that for camera-radar fusion systems, small errors in the fusion algorithm are amplified at higher speeds (due to the longer distances) and could compromise the system's performance. Additionally, according to Honda, these reductions in sensor accuracy significantly increase the risk of misidentification of potential objects and may lead to excessive false positive activations, potentially creating negative safety consequences. This could include situations where the system mistakenly recognizes the same lane as the adjacent lane or roadway objects as other vehicles.

Other commenters also raised concerns about the potential for false activations caused by the need for AEB to operate at very high speeds. For example, Volkswagen commented that false activation becomes more of a risk as speeds increase, and that these risks

[51] NHTSA has previously defined backover crashes as crashes where non-occupants of vehicles (such as pedestrians or cyclists) are struck by vehicles moving in reverse. See *https://www.federalregister.gov/documents/2014/04/07/2014-07469/federal-motor-vehicle-safety-standards-rear-visibility.*

[52] *https://www.regulations.gov/comment/NHTSA-2023-0021-0868.*

are not controllable, as defined in ISO 26262.

Commenters raised concerns about whether braking was the most appropriate avoidance maneuver in high-speed scenarios. Honda was concerned that AEB activation might interfere with other technologies such as the Automatic Emergency Steering. Mitsubishi, and Toyota echoed the Alliance's concern that in some situations AEB activation while traveling at high speed may induce unstable vehicle dynamics. Mitsubishi stated that these situations may occur due to unfavorable interactions with road surface conditions, road curvature, or for other unpredictable reasons. Mitsubishi thought that such activation could also lead to unexpected outcomes for a vehicle following the subject vehicle.

Rivian stated that if post-crash review is used to assess compliance, it may introduce a number of uncontrollable or subjective variables into the compliance evaluation. Rivian opined that post-crash review would necessarily involve evaluation of a motor vehicle that is no longer a new motor vehicle and that may have been modified or altered in a manner to affect the AEB performance. It further noted that varying environment or roadway conditions could also impact the AEB performance and, without a proper comparison using reference test equipment, it would be difficult to identify discrepancies between the expected AEB results and the actual results, limiting the technical effectiveness of a post-crash review.

Commenters suggested a number of different solutions to resolve their concerns. Most requested that the all-speeds requirement be removed. Alternatively, Honda and others (as noted earlier) asked that NHTSA establish a maximum speed at which AEB detection performance is assessed according to an established test procedure. Volkswagen asked that NHTSA exclude activation against vulnerable road users at high speeds, believing it would decrease false positive rates significantly. Volkswagen thought this could be justified as pedestrians would not be expected on the roads with these higher speeds.

Agency Response

Authority Under the Safety Act

Various commenters asserted that performance requirements without objective test criteria were inconsistent with the Safety Act's requirements for objectivity and practicability. NHTSA believes that these assertions reflect a misunderstanding of the proposal. Essentially, NHTSA proposed specific performance requirements for AEB within a defined range of speeds (accompanied by specific testing procedures) and, separately, an equipment requirement—*i.e.,* a requirement for a functioning vehicle AEB system. The proposed requirement for a functioning AEB system at all speeds was an equipment requirement, not a performance requirement. Case law supports that where a performance standard is not practical or does not sufficiently meet the need for safety, NHTSA may specify an equipment requirement as part of an FMVSS.[53] Testing at high speeds is not practical due to the dynamics of such testing and testing equipment limitations. As detailed in the NPRM, the testing requirement upper speeds are based on the capability to safely and repeatably conduct testing. The testing devices can only be driven, and can only tolerate impacts, up to certain speeds. These edge speeds are the main limiting factor for the upper bound of the testing speeds, as testing above those speeds would be impractical. NHTSA has previously specified an equipment requirement without an accompanying test procedure. For example, under FMVSS No. 126, NHTSA issued an equipment requirement for understeer and explained why a performance test for understeer was too cumbersome for the agency and the regulated community.[54] In the final rule for FMVSS No. 126, NHTSA stated that historically, ''the agency has striven to set motor vehicle safety standards that are as performance-based as possible, but we have interpreted our mandate as permitting the adoption of more specific regulatory requirements when such action is in the interest of safety.'' [55]

There are other FMVSS that contain equipment requirements, sometimes in addition to performance requirements. FMVSS No. 111 has several requirements that are equipment requirements. S5.1 of FMVSS No. 111 requires that each passenger car be equipped with an inside rearview mirror of unit magnification, which is the equipment requirement without an associated test procedure. S5.3 requires that any vehicle that has an inside rearview mirror that does not meet the performance requirements for field of view included in S5.1.1 must also have an outside rearview mirror meeting certain performance requirements. FMVSS No. 135 requires that the service brakes shall be activated by means of foot control. This is an equipment requirement in an FMVSS that also has performance requirements. S5.1 of FMVSS No. 224, ''Rear impact protection,'' requires trailers and semitrailers with a GVWR of 4,536 kg or more to be equipped with a rear impact guard certified as meeting FMVSS No. 223, ''Rear impact guards.''

Technical Concerns

Various commenters raised concerns about technical limitations that might create challenges for AEB systems at high speeds, such as sensor limitations, false activations, and whether hard braking was an appropriate response at higher speeds.

NHTSA is aware, from a review of owner's manuals, that many manufacturers have equipped their vehicles with AEB systems that activate at speeds higher than the testable ranges NHTSA proposed. As an example, the 2022 Toyota Prius Prime owner's manual informs vehicle owners that the maximum AEB activation speed for its system is 180 km/h (112 mph). Other examples include: the 2023 Hyundai Palisade lists the maximum AEB activation speed as 200 km/h (124.27 mph), the 2018 Tesla Model 3 Dual Motor lists the maximum AEB activation speed as 150 km/h (93.2 mph), the 2021 Volvo S60 lists the maximum AEB activation speeds as 115 km/h (71.4 mph), the 2021 Ford Bronco lists the maximum AEB activation speed as 120 km/h (74.5 mph), and the 2022 Lexus NX 250 lists a maximum AEB activation speed of 180 km/h (111.8 mph). This demonstrates that it is common practice for AEB systems to function above the testable range of speeds.

The agency considered comments asserting that higher travel speeds require longer sensing ranges. However, the equipment requirement does not specify a particular speed reduction or level of avoidance. The agency considered the kinematics for an AEB system installed on a vehicle that meets the track test requirements at 80 km/h without manual braking. For a vehicle with automatic initiated deceleration capabilities of 0.7g, in a lead vehicle stopped situation, the brakes must be applied at a distance of approximately 37 m (equates to a time-to-collision of 1.66 s). In such a situation, the vehicle's sensor range would need to demonstrate capabilities at a distance of at least 37 m. In a similar rear end collision situation with the vehicle traveling at 145 km/h and an identical detection

[53] *Chrysler Corp.* v. *Dep't of Transp., OT,* 515 F.2d 1053 (6th Cir. 1975) (holding that NHTSA's specification of dimensional requirements for rectangular headlamps constitutes an objective performance standard under the Safety Act).

[54] 72 FR 17236 (Apr. 6, 2007).

[55] *Id.* at 17299.

range of 37 m, the time-to-collision would be only 0.91 s. If the vehicle applied the same 0.7g deceleration at the same 37 m distance, a collision would not be avoided. A theoretical collision would occur with the vehicle impacting the stopped vehicle at 119 km/h (74 mph). However, the vehicle would have an AEB system that applied the brakes when a crash is imminent, as the proposal would require.

Requiring that the AEB system function at higher speeds has significant safety benefits. According to the injury risk curve used in the FRIA available in this docket, the probability of a fatality occurring in a rear-end collision where the striking vehicle is impacting at 90 mph is almost 20 percent. That probability is reduced to 6.8 percent for a travel speed of 74 mph. That reduction in fatality risk is afforded with little to no additional sensing system capabilities beyond what is required to satisfy the track tested requirements. In other words, if the AEB system activates at 90 mph and slows the vehicle down by just 16 mph, the risk of a fatality declines significantly. If the system were deactivated at speeds above the test procedure limit of 62 mph, many more fatalities would occur than if the system is activated and functioning with the capabilities required to satisfy the track tested requirements. Beyond 145 km/h (90.1 mph), however, the expected safety benefits are greatly diminished, primarily because very high travel speeds are relatively uncommon and currently above legal operating speeds in the U.S.

NHTSA does recognize that pedestrian crash interactions are much less straightforward kinematically than a lead vehicle rear-end crash interaction. This is because the pedestrian may be moving in any number of directions in front of the vehicle, including suddenly darting in front of a vehicle, making detection and mitigation more challenging as speed increases. In such situations, the agency agrees with commenters that it is not practical to require an alert and braking at speeds greatly above those for which the track test applies. For this reason, this final rule reduces the speed range for pedestrian detection functionality to any speed greater than 10 km/h (6.2 mph) and less than 73 km/h (45.4 mph). Similarly, for pedestrian AEB functionality, this final rule reduces the upper end speed for which alerts and braking are required to 73 km/h (45.4 mph). This speed range balances practicability and safety.

Post-Crash Review

As for Rivian's comment on post-crash review, NHTSA can determine compliance with this equipment requirement through visual observation and other information, if requested from the manufacturer. Post-crash review is an important tool to the agency. NHTSA acknowledges Rivian's discomfort with post-crash review being considered as a primary tool for compliance purposes, but NHTSA does not believe post-crash review will be necessary to enforce this requirement. Instead, NHTSA believes it can rely on visual observation, manufacturer test results used as a basis for certification, and other information to determine whether a vehicle meets this equipment requirement.

Conclusion

After careful consideration and in response to commenters stating that there was not a safety need justifying the lack of a maximum speed cap on this equipment requirement, NHTSA has decided to modify the proposed requirement. The agency recognizes that while vehicles are capable of very high speeds, the current maximum speed limit in the United States is 85 mph. With this in mind and in response to comments urging a speed cap for AEB operation, NHTSA decided to require that AEB systems operate (*i.e.,* warn the driver and apply the brakes) at speeds up to 145 km/h (90.1 mph) for lead vehicle detection and 73 km/h (45.4 mph—based on the overall complexity of detecting and differentiating between an imminent pedestrian crash and a pedestrian encounter that is unlikely to result in a crash, such as when a pedestrian is located on the sidewalk) for pedestrian detection. NHTSA also believes that adopting this speed cap is consistent with the agency's analysis of the safety problem and with NHTSA's goals of resolving as much of the safety problems as possible.

NHTSA believes this requirement is feasible, particularly in light of the absence of any performance requirements (for example, that a vehicle brake automatically to avoid contact) other than at the speeds tested in the performance requirements specified in this standard. This final rule simply requires that an AEB system function to warn and apply the brakes at speeds up to 145 km/h (90.1 mph) for FCW and lead vehicle AEB. The agency is not preventing manufacturers from having FCW activate at speeds above 145 km/h (90.1 mph). NHTSA is aware from recent research into owner's manuals that many AEB systems operate at speeds above the testable range, and NHTSA wants to ensure that manufacturers have the flexibility to provide FCW (and AEB) at speeds above those included in this final rule. This maximum required activation speed addresses the concerns raised by commenters about a requirement without an upper bound.

3. Environmental Conditions

In the NPRM, NHTSA explained that this equipment requirement was intended to complement the performance requirements by, among other things, ensuring that AEB systems continue to function in all environments, not just the test track environment. Unlike track testing, real world traffic scenarios may involve additional vehicles, pedestrians, bicyclists, buildings, and other objects within the view of the sensors and should not negatively affect their operation.

NHTSA received several comments expressing concern about the unspecified environmental conditions included in the NPRM.

NHTSA is committed to establishing performance requirements that are as reflective of the real world as possible, and that encourage manufacturers to develop robust AEB systems with sufficient resiliency to handle the widely variable scenarios they are intended to handle. In general, NHTSA is concerned that high system brittleness will not provide the maximum safety benefits and could be confusing to the public because of expectations about how AEB systems should work. The language of the NPRM sought to provide safety under environmental conditions outside of those specified in a track testing environment.

That said, NHTSA agrees with commenters that the expectation that the AEB system work in unspecified environments should be clarified for manufacturers to certify that their vehicles will meet the equipment requirement established by this final rule. There are environmental conditions that may preclude the safe application of automatic braking, and to a lesser extent warnings. However, the complexity of conditions and combination of conditional factors make it difficult to clearly enumerate those conditions. Therefore, this final rule now clearly specifies the conditions in which the systems are expected to perform to meet the equipment requirement are those conditions specified for testing the performance requirements. Notwithstanding this specificity, NHTSA encourages manufacturers to continue working

toward delivering AEB systems that are robust and that function in as many real-world environments as possible.

The Utah Public Lands Alliance commented that the proposed rule did not take into account the complexities of off-road environments, such as obstacles, mud, rocks, and varying slopes, which may render the AEB less effective or even cause false alarms, disrupting the driving experience. NHTSA notes that the final rule does not include off-road environments as a required aspect of AEB performance because the agency's authority under the Safety Act focuses on the on-road environment.

E. AEB System Requirements (Applies to Lead Vehicle and Pedestrian)

1. Forward Collision Warning Requirements

Because the window of time that FCW affords a driver in a crash-imminent situation is small, the proposed warning characteristics were intended to facilitate quick direction of the driver's attention to the roadway in front of them and to compel the driver to apply the brakes assertively. The FCW criteria proposed were based on many years of warning research and vehicle crash avoidance research conducted by NHTSA and others as described in the NPRM. The criteria seek to achieve an effective warning strategy that is consistent across vehicle models and proven by research to promote the highest likelihood of drivers quickly understanding the situation and responding efficiently to avoid a crash.

Comments

Commenters generally supported a requirement for an FCW to be presented for lead vehicle and pedestrian scenarios. However, a majority of commenters preferred more flexibility of FCW implementation than is afforded by the requirements, as summarized below.

Multiple commenters were opposed to the degree of specificity included in the proposed FCW requirements. These commenters thought that the state of varied implementation of FCW that exists currently was sufficient. For example, Volkswagen opined that the regulation ''should specify the warning modes (visual, auditory, optionally haptic), but leave the implementation up to the manufacturer if the warning is easily perceivable and visually distinguishable from other warnings.'' Volkswagen thought that variation in FCW strategy across manufacturers would not be a problem since manufacturers ''explain their warning strategy in their owner's manuals.'' Similarly, the Alliance contended that U.S. customers may be ''already familiar with the ISO symbol and flashing alert'' and that it ''would be beneficial to safety'' for NHTSA to allow flexibility for manufacturers to select the visual warnings deemed to be most effective in the context of the overall vehicle HMI.

IIHS cited its own research as a basis for contending that the proposed FCW ''design requirements are unnecessarily overly prescriptive'' given that ''existing industry practices for FCW are not only effective for preventing crashes but are also acceptable and understandable to drivers.'' IIHS highlighted its crash data analyses for FCW-equipped vehicles stating, ''Our analyses of police-reported crashes and insurance loss data indicate that most FCW systems are effective for preventing rear-end crashes despite disparate designs. Cicchino (2017) examined rear-end crash involvement rates for vehicles with FCW from five automakers relative to vehicles without the system. The presence of FCW was associated with statistically significant reductions in rear-end crash involvement rates for three of the five automakers.''

Some commenters suggested that the FCW requirements should more closely follow other related standards. Ford recommended establishing FCW requirements similar to existing AEB regulations from Europe (UNECE R152 [56]), Australia (ADR98 [57]), and Korea (KMVSS [58]) instead of restricting the individual components of the warning. Hyundai opposed ''overly specifying details for FCW and oppose[d] the use of SAE J2400 standards (particularly 10-degree vision cone provision).'' Porsche's comments sought additional flexibility and alignment with UNECE Regulation No. 152.

Lastly, multiple commenters voiced support for standardization of FCW characteristics. The GHSA indicated support for FCW standardization, stating that ''increased consistency will bolster the safety impact of these features as drivers become more accustomed to what to expect and how to react when these systems are engaged.'' AAA also expressed support for standardization, stating that ''consumers would find it beneficial to standardize visual alert characteristics. . . . such as the location of the warning.'' AAA cited its previous testing experience that found ''characteristics among vehicles significantly vary with some warnings hardly noticeable relative to visual warnings presented in other vehicles.'' As a result, AAA urged NHTSA to ''consider standardization requirements for visual alerts to promote consistency and understanding for all drivers, particularly hearing-impaired drivers who may not perceive an auditory signal.''

Agency Response

NHTSA notes the general support from commenters for requiring some kind of FCW to be presented prior to AEB activation. The point of FCW is to elicit a timely and productive crash avoidance response from the driver, thereby mitigating or, if possible, avoiding the need for AEB to intervene in a crash-imminent situation. The proposed FCW characteristics outlined in the NPRM are based on more than 35 NHTSA research efforts related to crash avoidance warnings or forward collision warnings conducted over the past nearly 30 years. Other research, existing standards (ISO Standards 15623 and 22839), and SAE documents (J3029 and J2400) also were considered as input for the proposed requirements. While multiple commenters sought flexibility for automakers to use an FCW of their own preference in lieu of one conforming to the proposed specification, no safety data were provided concerning consumers' degree of understanding of the wide variety of existing FCW implementations—just generalized statements about consumer familiarity. NHTSA does not view these arguments as sufficient to overcome the value of standardization as a means of ensuring consumer familiarity.

Data from NHTSA's 2023 AEB testing showed that each of six test vehicle models from different manufacturers used a different FCW visual signal or symbol. Only one model used the ISO FCW symbol. FCW visual symbols that differ by manufacturer and, in some cases across models from the same manufacturer, are likely to lead to confusion among consumers. The observed substantial variety in existing FCW implementations highlights the need for improved consistency of FCW visual symbols to increase efficient comprehension of crash-imminent warnings by vehicle operators and aid them in understanding the reason for

[56] UN Regulation No 152—Uniform provisions concerning the approval of motor vehicles with regard to the Advanced Emergency Braking System (AEBS) for M1 and N1 vehicles [2020/1597] (OJ L 360 30.10.2020, p. 66, ELI: *http://data.europa.eu/eli/reg/2020/1597/oj*).

[57] Australian Design Rule, Vehicle Standard (Australian Design Rule 98/01—Advanced Emergency Braking for Passenger Vehicles and Light Goods Vehicles) 2021.

[58] Korean Motor Vehicle Safety Standard (KMVSS) Article 15–3, ''Advanced Emergency Braking Systems (AEBS).''

their vehicle's (or, indeed, an unfamiliar rental vehicle's) active crash avoidance intervention. Allowing for individual design choices—even those with positive safety records—does not address this important safety consideration.

Such confusion has also been documented by past research. Research by industry published in a 2004 SAE paper focused on comprehension testing of active safety symbols and assessed the ISO FCW symbol and the SAE J2400 FCW symbol to assess their ability to communicate the idea, ''Warning: You may be about to crash into a car in front of you.'' Results of that research showed the ISO FCW symbol to have 45 percent ''high comprehension'' and the SAE J2400 symbol to have 23 percent high comprehension. However, while high comprehension was noted for the lead vehicle crash scenario, NHTSA is not aware of any data supporting effectiveness of the ISO FCW symbol for communicating the idea of an impending forward pedestrian crash.'' [59]

NHTSA acknowledges the research by IIHS showing crash reduction benefits from some existing FCW designs. IIHS research results found that some automakers' FCW designs were associated with higher crash reductions than others. However, this research did not evaluate FCW characteristics by automaker or by model for vehicle models it studied and whether such characteristics may have contributed to FCW effectiveness differences, so care should be taken when drawing conclusions. Regardless, while the IIHS studies have shown some existing FCW in light vehicles are effective for preventing rear-end crashes, research does not support an argument against taking other measures to increase FCW effectiveness, as this action seeks to do. It is likely that increasing the consistency of FCW characteristics and standardization of the primary warning signals across vehicles and models will lead to benefits beyond those documented to date due to increased driver understanding of the meaning of FCW signals.

The agency disagrees with Volkswagen's comment that explanations in the owner's manual adequately inform consumers about manufacturer-specific FCW signals. A British study found that only 29% of motorists surveyed had read their car handbook in full.[60] That same study examined owner's manual word counts and estimated that the time required to read some of the longest would take up to 12 hours. An April 2022 Forbes article states that ''the average new-vehicle's owners' manuals, which, concurrent with the complexity of contemporary cars, have become imposingly thick and mind-numbing tomes of what should be essential information... remain unread in their respective models' gloveboxes.'' [61] With these concerns in mind, NHTSA does not believe that owner's manual information is an acceptable substitute for standardization of this important safety functionality across all vehicles.

After careful review of these comments, NHTSA has decided to adopt a majority of the proposed FCW requirements unchanged as described in the following sections.

a. FCW Signal Modality

NHTSA proposed that FCW modalities and related characteristics of auditory and visual components be the same for lead vehicle AEB and PAEB performance, and that the FCW be presented to the vehicle operator via at least two sensory modalities—auditory and visual. The FCW auditory signal was proposed to be the primary means used to direct the vehicle operator's attention to the forward roadway. NHTSA did not propose to require a haptic FCW signal component but invited comment on whether requiring FCW to contain a haptic component presented via any location may increase FCW effectiveness or whether an FCW haptic signal presented in only one standardized location should be allowed.

Comments

Of those commenting on FCW signal modality, all supported a multimodal FCW signal strategy. Multiple commenters including NTSB, Consumer Reports, Ford, GHSA, Honda, MEMA, and Porsche expressed support for the combination of auditory and visual warning modalities that was proposed by NHTSA. For example, NTSB expressed support for visual and auditory warning, and noted several NTSB investigations in which visual warnings were found to be ineffective in capturing drivers' attention. GHSA expressed support for requiring standardized auditory and visual warnings when a collision is imminent, believing that increased consistency would bolster the safety impact of these features. Ford supported an auditory and visual alert based on their experience implementing an FCW system. Honda stated that a multimodal auditory and visual warning provided sufficient redundancy. Consumer Reports also highlighted the importance of providing a visual warning for those who are hearing impaired, who are listening to music, or are otherwise distracted.

The remaining supporters of the multimodal approach preferred the flexibility to use any combination of possible modalities (auditory, visual and haptic). These included the Alliance, ASC, Bosch, GM, HATCI, and Rivian. For example, the Alliance agreed with the agency's conclusion that the auditory signal should be the primary means of communicating with the driver, but expressed support for allowing warnings to be provided using any combination of two of the three alert modalities, with a third allowable, but not required. ASC recommended that the warnings be aligned with UNECE Regulation No. 152. ASC and ZF also cited research showing FCW with auditory and haptic components prompt a quicker driver reaction time than FCW with auditory and visual components.

Ford and MEMA agreed that OEMs should be permitted to supplement the primary auditory and visual FCW signal modalities with a haptic warning component. Bosch encouraged NHTSA to include haptic as one of the warning modes, citing the potential for advantages in loud environments or with hearing impaired individuals. Volkswagen agreed with NHTSA's proposal to not require an FCW haptic component, but clarified that if haptic was required, then only two out of the three warning types should be required. HATCI requested that NHTSA permit haptic signals to be used as the primary or secondary warning, stating that haptic warnings draw the driver's attention to the hazard without requiring them to identify a warning symbol with their eyes.

Consumer Reports suggested that a haptic signal may cause driver confusion because haptic steering signals are also used by many lane departure warning systems, which activate more frequently. Along the same line, Porsche noted its desire ''to avoid causing driver confusion related to other safety systems where haptic signals may be more appropriate (*e.g.,*

[59] Campbell, John & Hoffmeister, David & Kiefer, Raymond & Selke, Daniel & Green, Paul & Richman, Joel. (2004). Comprehension Testing of Active Safety Symbols. 10.4271/2004–01–0450.

steering wheel vibration used for lane keeping).''

Agency Response

After consideration of the comments, NHTSA is moving forward with the originally proposed requirements for a primary FCW auditory signal and a secondary visual signal, while neither requiring nor prohibiting a supplementary FCW haptic signal. While a few commenters expressed the desire to require a haptic FCW signal, no supporting data were provided. Therefore, NHTSA declines to make a haptic warning signal a requirement. However, NHTSA cautions those interested in implementing supplementary FCW haptic signals to take steps to ensure that the haptic signal used will not be confused with those currently used in association with systems not designed to elicit a forward crash avoidance response, for example, lane-keeping driver assistance features.

b. FCW Auditory Signal Requirements

NHTSA proposed that the FCW auditory signal would be the primary warning modality and asserted criteria to ensure that the FCW would be successful in quickly capturing the driver's attention, directing the driver's attention to the forward roadway, and compelling the driver to quickly apply the brakes. NHTSA proposed that the FCW auditory signal's fundamental frequency be at least 800 Hz and that it include a duty cycle, or percentage of time the sound is present, of 0.25–0.95, and a tempo in the range of 6–12 pulses per second. This final rule also includes FCW requirements that were discussed in the NPRM. Specifically, the FCW auditory signal is required to have a minimum intensity of 15–30 dB above the masked threshold.

Comments

GHSA, Honda, and Rivian supported the proposed standardized FCW auditory signal requirements. Honda stated that the proposed tone, tempo, and frequency would contribute to making this a distinct and recognizable warning, especially if standardized across the fleet. Rivian agreed that a common FCW auditory signal is necessary so that drivers can easily recognize warning conditions across different vehicle makers and models.

Multiple commenters, including the Alliance, Ford, Nissan, Porsche, Toyota, and Volkswagen indicated a preference for more flexibility in the allowed FCW auditory signal characteristics. More specifically, the Alliance and Nissan stated that not defining the required sound level and characteristics is consistent with UNECE Regulation No. 152. Ford recommended that the manufacturer be provided with flexibility to design FCW auditory warning signals. Ford stated that the parameters for an audible alert are often tuned for different vehicle applications or customizable by drivers. Both Porsche and Volkswagen contended that consumers may be used to existing FCW auditory signals used in current vehicles. Volkswagen further stated that allowing flexibility in FCW auditory signal characteristics enables manufacturers to update or adjust the warnings as technologies evolve.

Regarding FCW auditory signal distinguishability, IIHS recommended that NHTSA consider IIHS's method for assessing auditory seat belt reminders to ensure auditory FCWs are easily discerned by drivers beyond ambient levels of sound inside the vehicle.

On the issue of FCW auditory signal deactivation, Hyundai MOBIS encouraged NHTSA to consider permitting the audible warning to be suppressed as long as the FCW visual warning remains illuminated.

Agency Response

The FCW auditory signal minimum intensity requirement was inadvertently left out of the proposed regulatory text, although it was discussed in the preamble of the NPRM. Multiple commenters addressed the topic of FCW auditory signal intensity in their comments. While multiple commenters disagreed with NHTSA's proposed FCW auditory signal criteria, NHTSA's data from 2023 AEB testing also showed that some existing systems already meet some of the FCW proposed requirements. One vehicle, a 2024 Mazda CX–90, met all proposed FCW auditory requirements. Two vehicles met all proposed auditory requirements except the minimum intensity requirement of 15–30 dB above the masked threshold. Two other vehicles met 3 of the 5 FCW auditory signal requirements while the last vehicle met only 2 of the 5 requirements. All six vehicles' FCW auditory signals met the proposed duty cycle requirement and four of the six met the fundamental frequency requirement. Some variety in AEB test vehicles' FCW auditory signals was also seen. FCW auditory signal intensities above the masked threshold spanned a range of 28.8 dBA and five of the six tested vehicles did not meet the proposed intensity requirement. FCW auditory signals fundamental frequencies ranged from 600 to 2000 Hz.

NHTSA believes that auditory signal intensities are especially important for FCW because of the urgency of the crash-imminent situation, the goal of compelling a driver to apply the brakes, and the speed with which action is necessary. Additionally, the minimum sound intensity is supported by research that provides a strong foundation for this requirement. Commenters who did not support the proposed FCW auditory signal requirements provided no data to document the effectiveness of existing FCW auditory signals, nor the purported benefits of permitting vehicle manufacturers to choose their own unique FCW designs. While providing flexibility for design choices that have been proven to increase safety is valuable, providing flexibility that allows for differences related to branding or that just serves to make a model unique does not add safety value.

Regarding Ford's comment expressing interest in the ability to decrease FCW auditory signal intensity when the driver's alertness level is confirmed to be high, NHTSA notes that the proposed requirements provide leeway for manufacturers to implement a less invasive advisory or preliminary alert that would precede the required FCW. It also would not prevent multiple intensities that all meet the minimum requirement in this final rule.

NHTSA disagrees with the suggestion by Hyundai MOBIS to permit the auditory warning to be suppressed as long as the FCW visual warning remains illuminated. As the FCW auditory signal is considered the primary means of warning a potentially inattentive driver, allowing the auditory FCW signal to be suppressed would undercut its important safety function.

After considering the comments, NHTSA has decided to finalize the proposed FCW auditory signal intensity discussed in the preamble of the NPRM in this final rule.

c. FCW Auditory Signal Presentation With Simultaneous Muting of Other In-Vehicle Audio

In the preamble to the NPRM, NHTSA explained its intent to require muting or substantial reduction in volume of other in-vehicle audio (*i.e.,* entertainment and other non-critical audio information) during the presentation of the FCW. This requirement would serve to ensure that the FCW auditory signal is conspicuous to the vehicle operator and detectable at the critical moment at which a crash avoidance response by the driver is needed. However, this intended requirement was inadvertently left out of the proposed regulatory text.

Comments

ASC, MEMA, and ZF supported the muting or reducing other in-vehicle

audio during an audio FCW alert because the FCW alert is the highest priority in the vehicle and should override all other sounds. ASC and MEMA suggested that FCW alert volume should rise with speed to overcome external sounds like wind noise or road noise.

Honda, Porsche and Volkswagen opposed muting of other in-vehicle audio during FCW presentation. Honda stated that, because environmental sound levels can vary drastically, it is unnecessary to require audio muting. Honda cited the lack of a sound level requirement for the FMVSS No. 208 seatbelt warning as rationale for not needing such a requirement for FCW. Porsche and Volkswagen suggested that it is the driver's responsibility to ensure that in-vehicle audio does not interfere with the driving task. Volkswagen cited the requirement of a both a visual and audio warning as justification for not requiring muting of in-vehicle audio. Volkswagen also questioned how to accommodate other mandatory audio signals if these occur simultaneous with the collision warning.

Agency Response

Regarding Honda's comparison to the FMVSS No. 208 auditory warning signal requirement for fastening seatbelts, NHTSA does not believe the two requirements are comparable. The immediate consequences associated with an impending forward crash are not comparable to those associated with vehicle occupants fastening seat belts at the start of a drive.

In response to concerns expressed by Volkswagen and Porsche about addressing multiple simultaneous auditory signals, NHTSA will clarify that the audio required to be muted would be any audio for other than crash avoidance or safety purposes, such as music or other entertainment related audio.

Regarding the assertions by both Porsche and Volkswagen that drivers are responsible for ensuring that in-vehicle audio system use does not interfere with the driver's full attention to the driving task, the situations in which FCW is expected to emit sound are urgent enough that the most attentive driver would need to be able to hear the auditory signal. NHTSA does not believe that attention or inattention is the crux of the issue, though inattention could complicate a driver's response. It is important to ensure that the FCW auditory signal is audible even when sound levels from in-vehicle sources are high.

Although the requirement to mute other in-vehicle audio during the presentation of the FCW was inadvertently left out of the proposed regulatory text, NHTSA is including such a requirement in this final rule. Similar to the issue of auditory intensity, multiple commenters addressed the topic of muting. The requirement will be finalized to require that in-vehicle audio not related to a safety purpose or safety system (*i.e.,* entertainment and other audio content not related to or essential for safe performance of the driving task) must be muted, or reduced in volume to within 5 dB of the masked threshold, during presentation of the FCW auditory signal. This specification will serve to ensure that the amplitude of the FCW auditory signal is at least 10 dB above the masked threshold (MT) to preserve the saliency of the auditory warning.[62]

d. FCW Visual Symbol Requirements

NHTSA proposed that FCW visual signals must use the SAE J2400 (2003–08) symbol.[63] The SAE J2400 symbol relates the idea of an impending frontal crash without depicting a particular forward object and, as such, is readily applicable to both lead vehicle and pedestrian scenarios. The FCW visual signal would be required to be red, as is generally used to communicate a dangerous condition and as recommended by ISO 15623 and SAE J2400 (2003–08). Because the FCW visual signal is intended to be confirmatory for the majority of drivers and because NHTSA-sponsored research [64] has shown that instrument-panel-based crash warnings can draw drivers' eyes downward away from the roadway at a critical time when crash avoidance action may be needed [65] the symbol would be required to be steady burning.

Comments

Multiple commenters voiced support for standardization of FCW characteristics. For example, the Governors Highway Safety Association (GHSA) indicated support for FCW standardization, stating that increased consistency will bolster the safety impact of these features. AAA cited its previous testing experience that some warnings were hardly noticeable relative to visual warnings presented in other vehicles.

Multiple commenters were opposed to specificity included in the proposed FCW requirements. These commenters thought that the state of varied implementation of FCW that exists currently was sufficient. For example, Volkswagen described the proposed warning strategy for AEB as too prescriptive. Volkswagen thought the regulation should specify the warning modes, but leave the implementation up to the manufacturer if the warning is easily perceivable and visually distinguishable from other warnings. Volkswagen thought that variation in FCW strategy across manufacturers would not be a problem because manufacturers explain their warning strategy in their owner's manuals. NADA, Nissan, Mitsubishi, and Porsche also suggested manufacturers have more flexibility to choose the form of visual warning.

The Alliance opined that NHTSA should allow flexibility for manufacturers to select the visual warnings deemed to be most effective in the context of the overall vehicle human-machine interface, which could include ISO or SAE symbols, word-based warnings, or other flashing or steady burning illumination as appropriate. The Alliance stated that NHTSA has not presented data to indicate that any one visual alert type or symbol is any more or less effective than another. Consumer Reports supported standardization but recommended that a word be used rather than a symbol.

Some commenters suggested that the FCW requirements should more closely follow other related standards. Ford recommended establishing FCW requirements similar to existing AEB regulations from Europe,[66] Australia,[67]

and Korea [68] instead of restricting the individual components of the warning. Hyundai opposed the use of SAE J2400 standards, including the symbol. Hyundai believed it was more appropriate to adopt ISO 15623. Porsche's comments seek additional flexibility and alignment with UNECE Regulation No. 152.

Hyundai MOBIS, Toyota, the Alliance, Ford, and Honda, disagreed with the steady burning requirement for the FCW visual signal, expressing support for allowing it to flash. Honda recommended aligning with the specifications of ISO 15008.

Honda supported both visual symbol and word-based FCW options. Honda recommended that NHTSA allow flexibility to continue using already well understood text-based warnings like ''BRAKE!,'' which Honda currently employs, reasoning that a well-designed warning would instruct drivers what to do to avoid a hazard. Rivian also supported allowing the use of the word, ''BRAKE,'' in lieu of an FCW visual symbol.

Agency Response

After careful review of these comments, NHTSA has decided to adopt the proposed standardized FCW visual warning requirements unchanged. While multiple commenters sought flexibility for automakers to use an FCW visual signal of their own choice rather than a standardized signal, no safety data were provided concerning consumers' degree of understanding of the wide variety of existing FCW implementations nor any safety advantages or benefits of not standardizing the visual symbol. The proposed FCW characteristics outlined in the NPRM are based on more than 35 NHTSA research efforts related to crash avoidance warnings or forward collision warnings conducted over the past nearly 30 years. Other research, existing standards (ISO Standards 15623 and 22839), and SAE documents (J3029 and J2400) also were considered as input for the proposed requirements. NHTSA does not view the provided arguments as sufficient to overcome the value of standardization as a means of ensuring consumer familiarity and ensuring the applicability of the chosen symbol to both lead vehicle and pedestrian scenarios.

Data from NHTSA's 2023 AEB testing showed that each of six test vehicle models from different manufacturers used a different FCW visual signal or symbol. Only one model used the ISO FCW symbol. FCW visual symbols that differ by manufacturer and, in some cases across models from the same manufacturer, are likely to lead to confusion among consumers. The observed substantial variety in existing FCW implementations highlights the need for improved consistency of FCW visual symbols to increase efficient comprehension of crash-imminent warnings by vehicle operators and aid them in understanding the reason for their vehicle's (or an unfamiliar rental vehicle's) active crash avoidance intervention. Allowing for individual design choices does not address this important safety consideration.

Such confusion relating to automotive symbol comprehension has also been documented by NHTSA research. Past research conducted by NHTSA to assess comprehension of vehicle symbols including the ISO tire pressure, ISO tire failure, and ISO engine symbols showed that while 95 percent of subjects correctly identified the engine symbol, recognition percentages for the ISO tire pressure and tire failure icons were the lowest of the 16 icons tested, 37.5 percent and 25 percent, respectively.'' [69] Research by industry published in a 2004 SAE paper focused on comprehension testing of active safety symbols and assessed the ISO FCW symbol and the SAE J2400 FCW symbol to assess their ability to communicate the idea, ''Warning: You may be about to crash into a car in front of you.'' Results of that research showed the ISO FCW symbol to have 45 percent ''high comprehension'' and the SAE J2400 symbol to have 23 percent high comprehension. However, while high comprehension was noted for the lead vehicle crash scenario, NHTSA is not aware of any data supporting effectiveness of the ISO FCW symbol for communicating the idea of an impending forward pedestrian crash.'' [70]

Consumer Reports ''Guide to ADAS'' states that ''CR's most recent survey data shows that industry-wide, only 48% of owners of vehicles equipped with FCW say they understand how it works.'' [71]

NHTSA believes that improved consistency of FCW visual symbols is important to increase efficient comprehension of crash-imminent warnings.

NHTSA acknowledges the research by IIHS showing crash reduction benefits from some existing FCW designs. IIHS research results found that some automakers' FCW designs were associated with higher crash reductions than others. However, this research did not evaluate FCW characteristics by automaker or by model for vehicle models it studied and whether such characteristics may have contributed to FCW effectiveness differences, so care should be taken when drawing conclusions. Regardless, the IIHS studies have shown some existing FCW in light vehicles FCW systems are effective for preventing rear-end crashes, research does not support an argument against taking other measures to increase FCW effectiveness. It is likely that increasing the consistency of FCW characteristics and standardization of the primary warning signals across vehicles and models will lead to benefits beyond those documented to date due to increased driver understanding of the meaning of FCW signals.

The agency disagrees with Volkswagen's comment that explanations in the owner's manual adequately inform consumers about manufacturer-specific FCW signals. As noted previously, a British study found that only 29% of motorists surveyed had read their car handbook in full.[72] That same study examined owner's manual word counts and estimated that the time required to read some of the longest would take up to 12 hours. An April 2022 Forbes article states that ''the average new-vehicle's owners' manuals, which, concurrent with the complexity of contemporary cars, have become imposingly thick and mind-numbing tomes of what should be essential information . . . remain unread in their respective models' gloveboxes.'' [73] With these concerns in mind, NHTSA does not believe that owner's manual information is an acceptable substitute for standardization of this important safety functionality across all vehicles.

Finally, as for the use of words instead of a symbol, as noted in the NPRM, word-based FCW visual warnings are used by some U.S. vehicle models including, ''BRAKE!,'' ''BRAKE,'' and ''STOP!''. SAE J2400 also includes a word-based visual warning recommendation consisting of the word, ''WARNING.'' With regard to this existing use of word-based FCW visual warnings in some models, research by Consumer Reports noted in its online ''Guide to forward collision warning'' found that for some models, visual warning word use was found to be confusing to some drivers surveyed. Specifically, survey respondents reported a common complaint that ''their vehicle would issue a visual ''BRAKE'' alert on the dash, but it wouldn't bring the car to a stop.'' [74] While NHTSA does find merit in the rationale for using an effective word-based visual warning for FCW purposes, we have decided in favor of the value of consistency across U.S. vehicles to promote consumer recognition of a dedicated FCW symbol. This symbol-based strategy for the FCW visual signal follows is consistent with the strategies of ISO 15623 and SAE J2400 (2003–08).

NHTSA notes, however, that this requirement does not preclude the use of a word-based warning that supplements the required FCW symbol presentation. In that event, NHTSA agrees with Honda and Consumer Reports that the word, ''BRAKE!'', including the exclamation point, is likely the best choice for effective communication to the driver the need for them to apply the brakes. NHTSA believes, as has been suggested by Consumer Reports, that there is a tendency for drivers to interpret some words used as warnings as describing an action being performed by the vehicle, rather than a command to the driver. To avoid such confusion by the driver, NHTSA recommends that manufacturers wishing to complement the FCW symbol with a word-based warning use, ''BRAKE!'' to aid in drivers interpreting the word as an instruction.

Finally, with respect to the steady-burning requirement, NHTSA does not agree with commenters recommending that the FCW visual warning be allowed to flash. As the FCW visual signal is intended to be secondary to the FCW auditory signal, allowing the symbol to flash in an attempt to draw the drivers' attention could actually draw the drivers' gaze downward to the instrument panel rather than to the forward roadway at a critical time for the driver to initiate a crash avoidance response.

After evaluation of the comments, the agency has determined to retain the proposal requirement for the visual symbol from SAE J2400 (2003–08), ''Human Factors in Forward Collision Warning Systems: Operating Characteristics and User Interface Requirements'' (Information report), to communicate the idea of an impending frontal crash without depicting a particular forward object. With no comments opposed to requiring the FCW visual signal to be presented using the color red, NHTSA is also finalizing that requirement as proposed and clarifying that it will apply to the required FCW symbol and any manufacturer-chosen words to accompany the required symbol.

e. FCW Visual Signal Location Requirements

The agency proposed that the FCW visual signal be presented within a 10-degree cone of the driver's forward line of sight.[75] This requirement is based on SAE J2400, ''Human Factors in Forward Collision Warning Systems: Operating Characteristics and User Interface Requirements,'' paragraph 4.1.14. This FCW visual signal location guidance is also consistent with ISO 15623, which states that the FCW visual signal shall be presented in the ''main glance direction.'' Multiple research studies provide support for a visual warning location close to the driver's forward line of sight. NHTSA-sponsored research also supports this requirement, showing that instrument-panel-based crash warnings can draw drivers' eyes downward away from the roadway at a critical time when crash avoidance action may be needed.[76] Industry-sponsored research published in 2009 also indicates that an FCW visual signal presented in the instrument panel can slow driver response.[77] The 10-degree requirement would also increase the likelihood of FCW visual signal detection by hearing-impaired drivers.

Comments

Consumer Reports and AAA supported the proposed requirement that the FCW visual signal be presented in a location within a 10-degree cone of the driver's forward line of sight. In contrast, multiple commenters opposed the 10-degree cone requirement, some believing that the requirement could only be met using a head-up display. A majority of commenters who addressed this point requested that NHTSA consider expanding the 10-degree cone of the driver's line of sight requirement for FCW visual signal location.

FCA, Hyundai, Nissan, NADA, Rivian, and Volkswagen opposed the 10-degree cone requirement. The Alliance disagrees that the SAE J2400 information report provides adequate justification for the 10-degree requirement.

FCA thought the proposed requirement was impracticable. Rivian recommended that the FCW visual signal be presented on the top location of the driver instrument panel, in the instrument panel, or in a head-up display unless NHTSA can demonstrate that the data indicates that one location is clearly superior for driver perception. Toyota requested that the cone size be expanded to allow for suitable placement of the visual alert in areas such as the meter cluster or multi-information display, which would still be clearly visible in front of the driver.

Porsche recommended that NHTSA consider replacing the 10-degree with an allowance of up to 30 degrees, arguing that this would facilitate the use of long-established visual warning locations which it viewed as sufficient to provide the necessary cues. Multiple commenters, including Mitsubishi, the Alliance, and Honda, recommended use of a 60-degree cone requirement. Mitsubishi explained that the 60-degree value is based on a book chapter titled, Visual Fields, by R.H. Spector, et al., which states the vertical viewing angle of humans to be 60 degrees.

Agency Response

While many current vehicle models present an FCW visual signal within the instrument panel, drawing a driver's eyes downward away from the roadway in front of them to the instrument panel during a forward crash-imminent situation is likely to have a negative impact on the effectiveness of the driver's response to the FCW. NHTSA's research indicates that a visual FCW signal presented in the instrument panel can draw drivers' eye gaze downward away from the forward roadway and slow driver response to a forward crash-

[75] Line of sight based on the forward-looking eye midpoint (Mf) as described in FMVSS No. 111, ''Rear visibility,'' S14.1.5.

[76] DOT HS 812 191 September 2015, Evaluation of Heavy-Vehicle Crash Warning Interfaces. *https://www.nhtsa.gov/sites/nhtsa.gov/files/812191_evalheavyvehiclecrashwarninterface.pdf.*

[77] ''Evaluation of Forward Collision Warning System Visual Alert Candidates and SAE J2400,'' SAE Paper No. 2009–01–0547, *https://trid.trb.org/view/1430473.*

imminent event.[78] Further, Industry-sponsored research published in 2009 also indicates that an FCW visual signal presented in the instrument panel can slow driver response.[79]

Mitsubishi highlighted content from ''Visual Fields,'' by R.H. Spector, et.al that states the vertical viewing angle of humans to be 60 degrees.[80] Specter's chapter specifically states that ''a normal visual field is an island of vision measuring 90 degrees temporally to central fixation, 50 degrees superiorly and nasally, and 60 degrees inferiorly.'' Mitsubishi contended that if the FCW visual warning is displayed within this range, the driver will be able to recognize it. However, the referenced Spector visual field information relates to average humans' ability see objects presented before them and not specifically to drivers' ability to detect and quickly respond to an FCW visual signal within the potentially cluttered visual scene of a driver's-view perspective. Research sponsored by NHTSA and industry, respectively, has shown that instrument panel based visual crash warnings can draw drivers' eyes downward away from the roadway at a critical time when crash avoidance action may be needed and that an FCW visual signal presented in the instrument panel can slow driver response.[81] [82] Comparison to other warnings is not apt because other most other warnings do not require as immediate of a response as FCW.

As the text of SAE J2400 states, locating the FCW visual signal within a 10-degree cone could be accomplished in a top-of-dashboard location, NHTSA did not intend to require presentation of the FCW visual signal only via head-up display. To evaluate the potential difficulties associated with attempting to meet this FCW visual symbol location requirement, NHTSA gathered additional information regarding what visual angle about the driver's forward line of sight could be used to locate the FCW visual signal near the driver's forward line of sight, such as within the upper center portion of the instrument panel, without requiring substantial redesign of vehicles' instrument panels or dashboards, or require a head-up display.

NHTSA gathered information regarding the driver's visual angle when looking at the instrument panel for a set of 10 light vehicles. Eight of the vehicles were model year 2022, one was from the 2021 model year, and one was from model year 2023. Vehicle makes examined spanned a wide range of manufacturers including Chevrolet, Ford, Honda, Hyundai, Jeep, Nissan, RAM Subaru, Toyota, and Volkswagen. The vehicles examined also spanned a range of vehicle sizes including two large pickup trucks.

NHTSA used a coordinate measuring machine to record within a single coordinate system the locations of the upper and lower extents of the active display area of each vehicle's instrument panel, as well as the left and right extents of the instrument panel. These points were used to locate the geometric center of the instrument panel. The eye midpoint location for a properly seated 50th percentile male driver was also located using an H-point machine and recorded. The 50th percentile male driver size was used to represent the midpoint of the range of possible driver eye midpoint locations across all driver sizes. This full set of coordinate data was used to calculate visual angles between the eye midpoint and each of the center and upper and lower extents of the vehicles' instrument panels at their horizontal center. The plot below depicts visual angle calculation results for the instrument panel central upper edge, center point, and central lower edge for a 50th male driver's point of view.

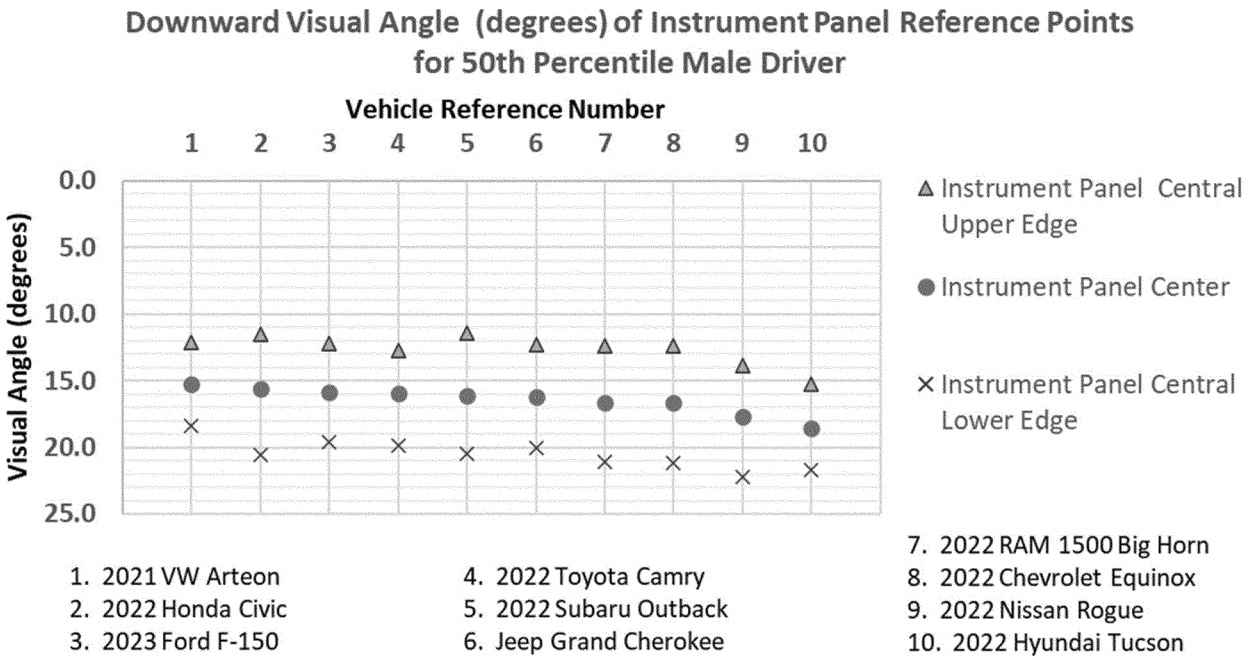
[80] Spector RH. Visual Fields. In: Walker HK, Hall WD, Hurst JW, editors. Clinical Methods: The History, Physical, and Laboratory Examinations. 3rd ed. Boston: Butterworths; 1990. Chapter 116. PMID: 21250064.

[81] DOT HS 812 191 September 2015, Evaluation of Heavy-Vehicle Crash Warning Interfaces. *https://www.nhtsa.gov/sites/nhtsa.gov/files/812191_evalheavyvehiclecrashwarninterface.pdf.*

[82] ''Evaluation of Forward Collision Warning System Visual Alert Candidates and SAE J2400,'' SAE Paper No. 2009–01–0547, *https://trid.trb.org/view/1430473.*

Figure 1:



Visual angle values for the instrument panel center point for these vehicles were found to range from 15.7 to 18.5 degrees. Nine of the ten vehicles were found to have instrument panel center locations that reside within 18 degrees downward of the driver's forward horizontal line of sight. Based on these data, NHTSA believes that revising the FCW visual symbol location 10-degree requirement to an 18-degree vertical angle would permit the large majority of current vehicle designs to display a telltale-sized or larger FCW visual symbol in the upper half of the instrument panel without any structural redesign or necessity of using a head-up display. Therefore, NHTSA has decided to expand the vertical angle to 18 degrees while retaining the 10-degree horizontal angle. The 10-degree value is being retained for the horizontal angle to preserve the FCW symbol's presentation at the center of the driver's forward field of view to maximize its perceptibility.

2. AEB Requirement

a. AEB Deactivation

NHTSA discussed the issue of AEB deactivation in various circumstances, and the various ways it might become deactivated (*i.e.,* manually or automatically). NHTSA used both ''disablement'' and ''deactivation'' in the proposal, intending that those terms mean the same thing. The NPRM proposed prohibiting manual AEB system deactivation at any speed above the proposed 10 km/h minimum speed threshold for AEB system operation. NHTSA sought comment on this and whether the agency should permit manual deactivation similar to that permitted for ESC systems in FMVSS No. 126. NHTSA also sought comment on the appropriate performance requirements if the standard permitted installation of a manually operated deactivation switch.

Regarding automatic deactivation, NHTSA stated that it anticipated driving situations in which AEB activation may not increase safety and in some rare cases may increase risk. For instance, an AEB system where sensors have been compromised because of misalignment, frayed wiring, or other partial failure, could provide the perception system with incomplete information that is misinterpreted and causes a dangerous vehicle maneuver. In instances where a light vehicle is towing a trailer with no independent brakes, or with brakes that do not include stability control functions, emergency braking may cause jack-knifing, or other dangerous outcomes. In the proposal, NHTSA stated that it was considering restricting the automatic deactivation of the AEB system generally and sought comment on providing a list of situations in which the vehicle is permitted to automatically deactivate the AEB or otherwise restrict braking authority granted to the AEB system.

In addition to these situations, NHTSA requested comment on allowing the AEB system to be placed in a nonfunctioning mode whenever the vehicle is in 4-wheel drive low or the ESC is turned off, and whenever equipment is attached to the vehicle that might interfere with the AEB system's sensors or perception system, such as a snowplow. NHTSA requested comment on the permissibility of automatic deactivation of the AEB system and under which situations the regulation should explicitly permit automatic deactivation of the AEB system.

Comments

Several commenters discussed AEB deactivation. The City of Philadelphia, the Richmond Ambulance Authority, DRIVE SMART Virginia, the National Association of City Transportation Officials (NACTO), Advocates for Highway and Auto Safety (Advocates), the Nashville Department of Transportation and Multimodal Infrastructure, and the City of Houston supported the proposed requirement to prevent AEB deactivation. In general, they stated that allowing system deactivation would diminish safety benefits.

In contrast, many commenters stated that AEB deactivation should be allowed. For example, ASC, ZF, MEMA, NADA, Mitsubishi, Porsche, Aptiv and Volkswagen suggested that the agency should follow the specific deactivation criteria under UNECE Regulation No. 152. That regulation requires at least

two deliberate actions to deactivate the AEB system, and the system must default back to ''on'' after each ignition cycle.[83] Toyota, Porsche, and Hyundai stated that manual deactivation for AEB systems should be similar to what is allowed for ESC systems in FMVSS No. 126. Rivian stated that manual deactivation should be allowed via either a software or hardware switch.

Advocates opposed allowing deactivation of AEB systems, but they provided some suggestions for NHTSA if deactivation were allowed in narrowly tailored instances for specific applications with strong justification and supporting data. Advocates stated that any conditions allowed for automatic deactivation must not enable a means to intentionally deactivate the AEB system and suggest that any deactivation should trigger the malfunction telltale and be recorded as part of a data recording requirement. If NHTSA were to allow manual AEB deactivation, Advocates thought the process should require multiple steps while the vehicle is not moving and require drivers to engage in a deliberate and significant effort (*i.e.* a driver should not be able to disable AEB by pressing a single button). Advocates aligned with other commenters in suggesting that if any AEB deactivation occur, the system should default back to ''on'' at any new ignition cycle.

The Alliance, Honda, NADA, Porsche, and Volkswagen suggested that the agency should allow manual deactivation to mitigate consumer dissatisfaction. Honda and NADA also stated that not allowing deactivation may lead to substantially higher false positive rates, while AAA stated that allowing for automatic or manual deactivation could increase consumer acceptance and minimize the perception that the systems are overbearing. NADA also stated that AEB false positives are a significant source of consumer complaints about AEB systems and that only 59 percent of respondents to a Consumer Reports survey indicated that they were satisfied with their AEB systems. The Alliance stated that in many cases, the circumstances warranting AEB deactivation are already described in vehicle owner's manuals or other information sources, and that it supports the continuation of describing such circumstances to the user.

ASC stated that for ADAS-equipped vehicles where the primary operating responsibility belongs to the driver, AEB is an assist function and the driver should be able to deactivate the AEB system if required. ASC also stated that under extreme operating or environmental conditions, the AEB system may be outside its operating design domain and should automatically deactivate (temporarily) and that in some situations such as testing, or service, the AEB system should be able to be deactivated.

SEMA, Ford, The Alliance, Rivian, Volkswagen, and HATCI suggested that there are likely several circumstances where deactivation of the system may be needed to ensure a safe vehicle operation, including track use, off-road use, and car washes. Some specific examples suggested by commenters include the use of chains on tires for traction, towing, four-wheel drive, low traction driving scenarios, and off-roading. SEMA and Mitsubishi stated that on a vehicle towing a trailer without an independent brake system, AEB activation may cause jack-knifing or other dangerous conditions. MEMA stated that drivers of many existing vehicles can currently disable their AEB system in cases where the AEB system is predictably, but incorrectly, triggered by objects or structures.

NTEA stated that there is a need to be able to deactivate AEB when certain vocational equipment is attached in frontal areas where it intrudes into the field-of-view of an AEB system. NTEA stated that final stage manufacturers and alterers are not currently (nor foreseeably in the future) able to move/reinstall/recalibrate these systems to accommodate vocational upfits that can be in direct conflict with how these systems need to function. NTEA uses snowplows as an example of a vehicle equipment for which sensor relocation cannot accommodate AEB. NTEA stated, as an example of how provisions for deactivation could be included in the requirement, that one vehicle manufacturer has previously created a method to detect the presence of a plow blade in their electrical architecture, so that when the blade is attached, AEB is deactivated. AEB functionality resumes when the blade hardware is removed. NTEA provided examples of other front-mounted equipment such as winches, sirens and push bumpers on emergency vehicles that could cause unintended consequences with the system reaction of AEB. Further, NTEA identified operational aspects of emergency and first responder vehicles that merit more consideration for AEB deactivation.

The Alliance and Porsche stated that NHTSA should provide manufacturers with the ability to define automatic deactivation criteria. While Volkswagen stated that NHTSA should provide a list of situations where automatic deactivation is allowed it stated that this list should not be mandatory and joined the Alliance and Porsche in stating that OEM's should establish the situations where the AEB system is permitted to automatically deactivate, or otherwise restrict braking authority granted to the AEB system. HATCI did not specifically comment on the list of situations, but stated that allowing manual deactivation would provide affordances for unforeseen scenarios that industry and NHTSA have not yet contemplated which would help futureproof against situations that may not exist today. The Alliance stated that this approach introduces additional complexity in terms of demonstrating compliance with the standard. Porsche stated that providing a not ''overly intrusive'' deactivation warning message would be appropriate and that the range of situations in which the systems would be automatically deactivated be infrequent and of limited duration.

Finally, the Alliance also addressed whether the deactivation of ESC may cause deactivation of AEB. While not encouraged, a driver seeking to disable AEB may be left with no option but to turn both AEB and ESC systems off under NHTSA's proposal, reducing potential safety benefits from having the ESC system remain active.

Agency Response

In this final rule, NHTSA does not allow for vehicles to be equipped with a manual control whose sole functionality is the deactivation of the AEB system. NHTSA agrees with the commenters who noted concerns about diminishing the safety benefits of this rule. Harmonization alone is an insufficient justification for allowing a control to deactivate the AEB system. Commenters have not explained why there is a safety need of a dedicated deactivation control or why a dedicated deactivation control would not diminish the safety benefits of AEB. The agency also disagrees with ASC's assertion that AEB is an ''assist function,'' and even if true, that such a description would serve as a justification for allowing a manual deactivation control.

NHTSA does not agree that any theoretical consumer dissatisfaction is one of the circumstances that justify allowing manual deactivation. AEB systems have been available on vehicles for many years. It is not reasonable to assume that there will be consumer acceptance issues due to the requirements of this final rule.

[83] UN Regulation No 152—Uniform provisions concerning the approval of motor vehicles with regard to the Advanced Emergency Braking System (AEBS) for M1 and N1 vehicles [2020/1597] (OJ L 360 30.10.2020, p. 66, ELI: *http://data.europa.eu/eli/reg/2020/1597/oj*).

NHTSA is not persuaded by comments that suggest that not permitting deactivation would lead to substantially higher false positive rates. NHTSA recognizes that AEB false positives are a source of consumer complaints, but NHTSA does not believe AEB deactivation is the solution to the engineering challenges manufacturers with lower performing systems might face in meeting this rule's requirements.

That said, NHTSA recognizes that there are certain circumstances where deactivation may be appropriate, and the commenters raise several situations where NHTSA believes automatic deactivation would be the best approach. Examples of such a scenario include when a trailer is being towed, or when a snowplow is attached to a pickup truck. AEB activation while towing a trailer may be unsafe if the trailer does not have brakes. A snowplow may interfere with the sensing capabilities of the AEB system. In such cases, NHTSA expects that the manufacturer would automatically disable AEB functionality when interference with the sensing capabilities occurs. Using the example of towing, NHTSA expects that the manufacturer would design AEB to scan for towing connections and automatically disable AEB if it registers any.

NHTSA agrees that it is important for the AEB system to default back to ''on'' after each ignition cycle, except in one circumstance—in a low-range four-wheel drive configuration selected by the driver on the previous ignition cycle that is designed for low-speed, off-road driving. In that situation, NHTSA believes that reverting to the manufacturer's original default AEB setting would not be necessary. There is a similar exception for the ESC Off control.

NHTSA also agrees with the Advocates that any deactivation should trigger the malfunction telltale because consistent illumination is important to remind drivers that safety equipment (*i.e.,* AEB) is not functioning as the driver expects. Should the OEM design its systems in a way where the AEB system would automatically deactivate when the system detects that it cannot function properly (*i.e.,* change performance in a way that takes the AEB system out of compliance with the requirements of the standard), then the driver must be alerted of this performance issue through a telltale. This applies to partial or full disablement of the system.

NHTSA does not agree with the Alliance that restricting the installation of an ''AEB off'' control leaves a driver seeking to disable AEB with no option but to turn both AEB and ESC systems off. First, it is up to the manufacturer to decide if AEB is automatically turned off when ESC is turned off. Second, while it is not restricted by the FMVSS, it is the manufacturer's choice to install an ESC off switch. Finally, the agency asserts that if a driver does use the ESC off control for the purpose of turning off AEB, the restrictions included in this final rule limit the potential safety impacts particularly once the vehicle's ignition is turned off because AEB is required to turn back on with each ignition cycle, except when using a low-range four-wheel drive configuration.

While NHTSA understands commenters' concerns about emergency vehicles, the Agency notes that flexibilities already exist for these vehicles, and we anticipate those flexibilities would be appropriate and sufficient to address these concerns. There are a number of ways that owners, and purchasers of emergency vehicles for official purposes, could modify their vehicles to fit the unique needs of emergency responders. Currently, manufacturers have the ability to sell upfit packages that provide the means, and instructions (upfit guides), for an emergency responder to interact with various vehicle features, including mandated safety features. A common example of these modifications involves the modification of lighting equipment and the activation of patterns which are not compliant with FMVSS No.108. While a vehicle manufacturer cannot manufacture a vehicle for sale with such lighting and activation patterns that fail to comply with FMVSS No. 108, Lamps, reflective devices, and associated equipment, an emergency responder, as the owner of a vehicle, is not prohibited from making modifications to the vehicle.[84] In addition, this final rule allows for the deactivation of AEB when ancillary systems that may affect AEB performance are activated.

In summary, NHTSA agrees with those commenters expressing opposition to broad inclusion of an on-off switch. The agency believes, as do those commenters, that the lifesaving benefits would be significantly compromised. However, some commenters noted that certain vehicles are used in unusual environments or for unique purposes, and their operation might be hampered by an AEB system that cannot be deactivated. The agency has not included on-off AEB functionality for emergency vehicles, as a broad group, as these purpose-built vehicles already have flexibilities. However, the agency believes that one other situation is appropriate for inclusion of on-off functionality—vehicles used by law enforcement.

Law enforcement has unique needs that often necessitate some differences in the configuration or functionality of their motor vehicles. The motor vehicles they purchase may be purpose-built police vehicles or unaltered vehicles available to the general public. In either case, law enforcement has a critical need to deactivate AEB when such vehicles are used in intervention maneuvers to disable a suspect's vehicle or in security escorts and processions driving in tight formation. For this reason, this final rule provides a limited exception that allows the manufacture, or the modification after sale, of vehicles that include the ability to activate and deactivate AEB for vehicles owned by law enforcement agencies.[85] Manufacturers should work to directly provide an on-off capability for verified law-enforcement-owned vehicles or make it as easy as possible for a third party to do so on behalf of law enforcement, with appropriate security safeguards, and NHTSA is committed to actively facilitating this process. Should manufacturers fail to address this important need, NHTSA may consider taking additional regulatory action. NHTSA anticipates that law enforcement vehicles resold to other than law enforcement entities will be restored to their original condition (*i.e.,* by disabling the on-off capability).

NTEA's comment requests that NHTSA consider adding regulatory compliance pathways for upfitters. NHTSA understands NTEA's concern regarding glass replacement and the impact that has on FCW/AEB sensors. As AEB is not a new system, this is not a new issue for glass replacement upfitters. The agency is aware of glass replacement upfitters that already work with manufacturers to ensure proper sensor calibration. It is not expected that the requirements of this final rulemaking will affect their ability to continue to collaborate as they have been. NHTSA also expects that manufacturers might provide for automatic deactivation for vocationally

[84] In the absence of an AEB mandate, some OEMs currently facilitate deactivation for emergency responders; for example ''Available PreCollision Assist With Pedestrian Detection— . . . For unique law-enforcement demands, a switch allows the feature to be temporarily disabled.'' *https://www.ford.com/police-vehicles/hybrid-utility/,* Accessed March 7th, 2024 at 10:20 a.m.

[85] The agency does not have a precise estimate of the number of vehicles that may be affected by this flexibility, but notes that, when considered as part of the entire fleet, this effect is likely to be de minimis.

specific equipment when it is in use, such as the snowplow example NTEA provides in its comment.

As for the equipment installed for vocational vehicles, NHTSA expects upfitters to avoid installing equipment that would result in AEB no longer working (or malfunctioning). NHTSA expects that in rare cases where no engineering solution may exist such as with snowplows, that upfitters would leave final installation of this equipment to the vehicle owners to avoid making inoperative required safety equipment. In such situations, NHTSA expects that the malfunction indicator would illuminate as a constant reminder to the driver that AEB is not working. As discussed in other sections, NHTSA believes that this consistent illumination is important to remind drivers that important safety equipment (*i.e.,* AEB) is not functioning as the driver expects.

b. Aftermarket Modifications

SEMA stated that while the proposed rule applies to motor vehicle manufacturers and alterers of new passenger cars and light trucks, it does not specify how aftermarket vehicle modifications and alterations may impact AEB systems. SEMA stated that they seek guidance from NHTSA on implementing FMVSS for AEB and PAEB and the legal obligations of SEMA members who produce, install, or sell aftermarket parts, as well manufacturers, installers, retailers, distributors, and independent repair shops regarding the ''tampering/make inoperative'' provision (49 U.S.C. 30122).

NHTSA notes that SEMA's comment invokes two separate provisions of the Safety Act because the situations of alterers and repair businesses are different. NHTSA has issued several interpretations of the obligations of both alterers and repair businesses, and the agency summarizes those key points here.[86]

An ''alterer'' is defined as a person who alters by addition, substitution, or removal of components (other than readily attachable components) a certified vehicle before the first purchase of the vehicle other than for resale.[87] The Safety Act and NHTSA's regulations require vehicle manufacturers certify that their vehicles comply with all applicable FMVSSs (49 U.S.C. 30112; 49 CFR part 567). NHTSA's regulations at 49 CFR 567.7 require the alterer to ensure that the vehicle, as altered, conforms to the FMVSSs affected by the alteration(s) and to certify to that effect in accordance with the same section. Alterers make this certification by affixing a permanent label to the altered vehicle identifying the alterer and the date of alteration.

In contrast, a vehicle repair business is defined as a person holding itself out to the public to repair for compensation a motor vehicle or motor vehicle equipment. Repair businesses usually work on vehicles after the time of first sale, which means that instead of complying with the certification requirements like a manufacturer or alterer, a repair business must ensure that it does not violate the Safety Act's make inoperative prohibition. The Safety Act states that a vehicle manufacturer, distributor, dealer, rental company or repair business is prohibited from knowingly making inoperative any part of a device or element of design installed in or on a motor vehicle that complies with an applicable FMVSS.[88] An entity does not need to have actual knowledge that a device or element of design would be made inoperative by the entity's modification in order for that modification to violate section 30122.[89]

Additionally, section 30122 does not require repair shops to restore safety systems damaged in a collision to a new or pre-crash condition.[90] Instead, under section 30122, when any repair to a vehicle is completed, the vehicle must be returned to the customer with the safety systems capable of functioning at least as well as they were able to when the vehicle was received by the repair shop.[91]

Given the information above, NHTSA concludes the two types of entities about which SEMA is concerned both have an obligation to prevent a noncompliance with the FMVSS created by this final rule. Since NHTSA is establishing a new FMVSS with this final rule, the same rules of certification and make inoperative will apply, except for narrow circumstances for law enforcement-owned vehicles.

NHTSA is aware that many law enforcement vehicles are modified after purchase to meet the unique needs of law enforcement. Sometimes this work is completed by in-house entities, and other times, this work may be contracted out to third parties. If those third parties are the entities listed in 49 U.S.C. 30122, they are prohibited from making inoperative any system or element of design that is in compliance with a FMVSS, including this new FMVSS. To ensure that law enforcement are able to modify their vehicles to fit their unique needs, and to ensure that third-party repair businesses are capable of assisting them, NHTSA has added a make inoperative exemption in 49 CFR part 595 that permits manufacturers, dealers,and motor vehicle repair businesses to modify a vehicle owners by a law enforcement agency to provide a means to temporarily deactivate an AEB system. This addition is complementary to the additional text added in S5.4.2.1 and discussed in the proceeding section.

c. No-Contact Requirement for Lead Vehicle AEB

The proposed performance criterion for all AEB tests involving a lead vehicle is full collision avoidance, meaning the subject vehicle must not contact the lead vehicle.

NHTSA requested comment on two alternatives to a no-contact requirement for the lead vehicle performance test requirements. The first alternative would be to permit low speed contact in NHTSA's on-track testing. The agency requested comment on the appropriateness of such a requirement, any factors to consider surrounding such a performance level, and what the appropriate reduction in speed or maximum impact speed should be. The other alternative discussed in the proposed rule was a requirement that permits the vehicle to use multiple runs to achieve the performance test requirements. This alternative is discussed in the ''Permissibility of Failure'' section.

Comments

In response to the NPRM, the IIHS, the Advocates, NTSB, AAA, Adasky, and Luminar, expressed support for the full collision avoidance (*i.e.,* no-contact) requirement in all proposed AEB tests. IIHS stated that their evaluations of existing AEB systems indicated that some current systems are completely avoiding collisions at the highest speeds IIHS has tested, which is 70 km/h. Advocates stated that the vehicles are

[91] Nonetheless, NHTSA strongly encourages repair shops to restore functionality to safety systems to ensure that the vehicles will continue to provide crash protection for occupants during the life of the vehicle.

tested under nearly ideal conditions and, by requiring a no-contact condition for success, the benefits of the system will be stronger under less-than-ideal conditions in the real world. NTSB and AAA stated that the no-contact requirement is consistent with the need for safety, and potentially necessary to ensure test repeatability. Luminar stated that they were concerned that regulating some degree of contact in these scenarios presents significant concerns for test efficiency, integrity and cost related to compliance. Luminar stated that the no-contact performance is within the capability of existing technology.

Several commenters, including the Alliance, Honda, FCA, Nissan, Volkswagen, SEMA, and MEMA stated that the proposed no-contact requirement in lead vehicle AEB tests is not practicable at the proposed test speeds. Many of these commenters suggested a hybrid approach of collision avoidance at lower speeds and speed reduction at higher speeds. Multiple commenters stated that the proposed test speeds will require earlier intervention by AEB systems to meet the ''no-contact'' requirement, which they state will cause various unintended consequences, such as false positives due to test speeds or AEB intervention at a time where evasive steering may still be possible.

Many commenters stated that the expectation of no contact in the real world is not practical. The Alliance stated that while the research indicated that certain vehicles performed better under certain test conditions, the number of tests run, particularly at higher speeds, is insufficient to make any reliable determination as to the repeatability and reproducibility of testing and that the agency ran only one test per vehicle at each of the different speed ranges in each scenario. Many commenters also observed that no vehicle was found to have met all the proposed requirements.

Further, the Alliance described two aspects of brake performance that they suggested should be considered. First, they stated that peak deceleration capability of the vehicle is generally limited by the tire adhesion and is therefore not likely to be impacted by brake hardware changes, and performance today typically exceeds the mandated performance from FMVSS No. 135 or FMVSS No. 105. The second aspect of brake performance which the Alliance stated must be considered is the time factor to reach the target deceleration.

Honda, Nissan, and other commenters stated that the proposed test requirements do not consider the trade-off between collision avoidance through evasive steering and emergency braking, leading to increased concerns for false activations. Further, Honda stated that to meet the proposed higher speed no-contact requirements, current systems would be forced to provide braking intervention with significantly reduced recognition reliability and that current AEB systems would need to be completely redesigned.

Bosch stated that its testing shows that when the speed reaches approximately 75 km/h, there are reproducibility challenges with multi-sensor fusion of the object in time to initiate AEB and avoid the obstruction, and considerations should be made on how these requirements align with current functional safety requirements.

Volkswagen stated that they conducted an analysis using the Crash Investigation Sampling System (CISS) where data from rear-end crashes were collected from Event Data Recorder (EDR) data. The results were that there were no injuries above the Vehicle Abbreviated Injury Scale (VAIS) of 3+ in this small sample, noting that this was a non-statistically significant sample of 56 rear end crashes below a relative collision speed of 50 km/h.

MEMA stated that they agreed with the NHTSA alternate proposal for contact which, consistent with European regulations, allows low speed contact during testing. MEMA suggested a no-contact test requirement at speeds up to 25 mph (roughly 40 km/h), and a realistic speed reduction requirement above this speed (*i.e.,* collision mitigation). Hyundai stated that a target deceleration rather than no contact should be used as the appropriate criterion for assessing AEB performance.

HATCI stated that the requirements for damageability from 49 CFR part 581 address the need to reduce severity of any impact following activation of AEB, such that reductions in fatalities and injuries are achieved without stipulating no contact. Further, HATCI stated that the part 581 bumper standard speeds do not cause damage to the vehicle or Global Vehicle Target (GVT) and are highly unlikely to cause injuries to the vehicle occupants.

Mitsubishi stated the agency should allow for maximum contact speed instead of no contact, especially for higher test speeds, as the NPRM's proposed requirement would require OEMs to fully redesign their AEB systems, including new hardware. Further, Mitsubishi stated that the benefit for systems which allow a low speed, such as a 10 km/h, impact to the rear-end of another vehicle can be considered comparable to no contact in terms of fatal or severe injury likelihood. Mitsubishi also stated that they opposed a regulatory requirement whose purpose appears to be reduction of the test burden by seeking to avoid rebuilding the strikable target when impacted. Therefore, Mitsubishi stated that they suggest 1) allowing low speed contact, 2) eliminating the higher approaching-speed test, and 3) securing reasonable headway distance, particularly with higher speed of the decelerating lead-vehicle scenarios.

FCA raised issues with whether the no-contact requirement was appropriate for vehicles with greater mass. FCA provided a graph developed from their research that suggests that as test weight went up, the overall pass (contact) rate went down.[92] FCA stated that this means one of two things: heavier vehicles installed less capable AEB systems or otherwise if all AEB systems were comparable, then the test weight of vehicle hardware could be a dominant factor in the compliant ''no-contact'' outcomes.

Furthermore, FCA stated that the proposed requirements that the subject vehicle under test ''does not collide'' is subjective. The soft coverings over both devices will have dimensional variation as they exhibit wrinkles and folds or fluttering. FCA stated that they do not understand what ''not collide'' means in this context. FCA suggested NHTSA investigate this concept and make a new proposal as to what ''collide'' means as an objective, regulatory concept.

Agency Response

This final rule adopts the full collision avoidance (*i.e.,* no-contact) requirement proposed in the NPRM, which requires that the subject vehicle must not contact the lead vehicle in all AEB performance tests listed in the regulation. After considering all comments and for the reasons discussed below, the agency believes that the proposed no-contact requirement continues to be the most appropriate. NHTSA does not believe that further investigation is necessary to determine what collide means, in the context of this rule.

No Contact Provides Maximum Safety Benefits and Is Consistent With the Safety Act

As noted in the NPRM, one of the primary reasons for choosing the no-contact requirement in lead vehicle AEB tests is to maximize the safety benefits of the rule. Many commentors agreed

[92] *https://www.regulations.gov/comment/NHTSA-2023-0021-0999,* see page 9.

with the agency's decision to obtain maximum benefits to the public. Advocates stated that allowing contact during AEB testing will lessen the strength/benefit of the rule. Similarly, NTSB stated that the no-contact requirement is consistent with the need for safety and should be mandated to obtain the best possible safety outcome. Further, AAA and NSC stated that the no-contact requirement could eliminate millions of injuries and thousands of fatalities over a five-year period. Alliance acknowledged that the alternative approaches proposed by the organization could provide meaningful safety gains (not the best benefit). As for additional benefits of the requirement, we agree with Luminar that the no-contact requirement also provides economic benefit by reducing the total cost of vehicle ownership with insurance savings.

NHTSA agrees with the commenters who stated that obtaining safety benefits is crucial for this final rule. NHTSA agrees with IIHS that some current systems are already completely avoiding collisions under the proposed lead vehicle AEB testing more than five years before this rule will take effect. One vehicle discussed in the additional research section performed very well and passed all lead vehicle AEB requirements except for only the most stringent condition under the lead vehicle decelerating scenario—satisfying the requirements in two out of five tests. Thus, the outcome of that additional confirmatory testing is encouraging and demonstrates that these requirements are practicable. The testing results provided by IIHS in their comment provide NHTSA with additional evidence that the requirements are within reach for manufacturers because the technology exists and the final rule provides sufficient lead time.

The No-Contact Requirement Is Practicable

The commenters who opposed the no-contact requirement and asserted that it is not practicable rely heavily on the 2020 testing and that no single vehicle achieved compliance in any single run. This assertion rests on misunderstandings of the applicable law and a failure to consider the trajectory of the technology and its performance.

First, no single vehicle must meet every requirement for an FMVSS to be considered practicable under the Safety Act. The Sixth Circuit in *Chrysler Corp.* v. *Dep't of Transp.* provided detailed analysis of the technology-forcing authority possessed by NHTSA and the legislative history that reinforces the court's conclusion.[93] The Sixth Circuit stated:

''[the] explicit purpose of the Act, as amplified in its legislative history, is to enable the Federal government to impel automobile manufacturers to develop and apply new technology to the task of improving the safety design of automobiles as readily as possible.'' [94] The Senate Report also states that Congress rejected the Automobile Manufacturers Association's attempt to bind the rate of innovation imposed by safety standards to the pace of innovation of the manufacturers.[95] Similarly, the House Report states that NHTSA should consider all relevant factors when considering whether a safety standard is practicable, ''including technological ability to achieve the goal of a particular standard.'' [96] The Sixth Circuit rightly points out that there would be no need for NHTSA to consider technological ability to achieve a particular safety goal if NHTSA was limited to issuing standards that reflected the current state of technology.[97] The court ultimately ruled that NHTSA is empowered by the Safety Act to issue FMVSS that require improvements in existing technology or that might even require development of new technology.[98]

Second, NHTSA has evidence that AEB performance improved dramatically between 2020 and 2023 model years. Considering the marked improvement in AEB system performance demonstrated in NHTSA's additional testing, NHTSA finds that manufacturers are already coming close to meeting the requirements of this final rule.

The agency disagrees with commenters that the no-contact requirement is not practicable because no vehicle in the agency's 2020 research met all lead vehicle AEB tests as presented in the NPRM. We believe that the vehicles used in the 2020 research were designed with the intention to meet the demands from the 2016 voluntary commitment and the existing U.S. NCAP. As presented in the NPRM, these programs demand a much lower level of AEB performance than those of this final rule. For example, the highest test speeds of the 2016 voluntary commitment and the NCAP are both 40 km/h (25 mph) in a lead vehicle stopped test scenario. On the other hand, the highest subject vehicle test speed of this rule for the same scenario is 80 km/h (50 mph)—much higher than that of the programs. Even though the AEB systems were designed with substantially low target performance goals, three out of eleven vehicles in the 2020 research were able to meet the no-contact requirement at the speed up to 72.4 kph (45 mph) in the lead vehicle stopped test scenario.

NHTSA conducted additional AEB research with six model year 2023 vehicles (from six different manufacturers) using the performance requirements and test procedures of this final rule.[99] The results of this additional research demonstrated that one vehicle was able to meet the no-contact requirement at least once in all required lead vehicle AEB test conditions. Thus, the technologies needed to make the AEB systems which can meet the no-contact requirement and other performance requirements of this final rule are currently available. IIHS also observed similar results, which they assert indicate that some existing AEB systems are able to completely avoid collisions in the required lead vehicle AEB testing conditions.

Furthermore, in analyzing whether an FMVSS is objective, practicable and meets the need for motor vehicle safety, NHTSA must balance benefits and costs and consider safety as the preeminent factor in its considerations.[100] NHTSA believes that lowering the performance requirement to one that allows for contact would fail to treat safety as the preeminent factor for this final rule and otherwise be inconsistent with the goals of the Safety Act.

Co.,* 463 U.S. 29, 55 (1983) (''The agency is correct to look at the costs as well as the benefits of Standard 208 . . . When the agency reexamines its findings as to the likely increase in seat belt usage, it must also reconsider its judgment of the reasonableness of the monetary and other costs associated with the standard. In reaching its judgment, NHTSA should bear in mind that Congress intended safety to be the preeminent factor under the Motor Vehicle Safety Act.'').

Increasing Unintended Consequences

In the comments, vehicle manufacturers and equipment suppliers expressed concern that the no-contact requirement may cause some unintended consequences, such as increasing false positive activations and taking away driver's authority at a high speed.

As for the false positives, the concern is based on a hypothetical situation that the no-contact requirement might cause a vehicle to prematurely activate the AEB system from a far distance where there is not a true risk of an imminent crash. The rationale is that the vehicle would be forced to initiate an early braking to achieve a full collision avoidance. These comments represent a combination of concerns—concerns with the no-contact requirement and concerns with the maximum speed in the testable range. This section addresses only the issue of no contact. Other related issues are addressed in the appropriate sections.

NHTSA does not expect that false activation would occur for well-designed systems. NHTSA recognizes that false activation could occur when an AEB system has low accuracy and reliability. As mentioned previously, we agree with Luminar and other commentors that no-contact performance is within the capability of existing technology. For example, Honda asserted that an AEB system will likely intervene improperly when the road in front of a subject vehicle is curved to the left and there is a vehicle parked on the right side of the road that causes no risk of collision. If the subject vehicle is equipped with sufficient technology to detect the shape of the road ahead, the AEB system would not improperly activate based on the mere fact that a parked vehicle appeared in the middle of AEB's field of view. There are manners in which an algorithm can assess the shape of the road. The system will also be continuously receiving more data as the vehicle gets closer.

Another technical option is having redundant systems as suggested in the Alliance's comment. Regardless of whatever technical solution manufacturers choose, NHTSA does not believe that it should lower performance to match that of poor performers. Rather, manufacturers with poorly performing vehicles should strive to resolve their systems' deficiencies so that they can perform as well as the market's better or best performing vehicles.

Additionally, while this rule imposes performance requirements for AEB systems, it does not specify how manufacturers must meet the requirements. The agency is providing maximum flexibility to manufacturers in designing AEB system for their vehicles. NHTSA recognizes that different manufacturers have different economic and practical realities that face their businesses. NHTSA principal concern is with the safety outcome and not the path that a manufacturer chooses to take to get to the required outcome. Given the various technical options, selecting technology for their AEB systems and setting the level of accuracy and reliability are at the manufacturers' discretion. At the same time, the manufacturers should be responsible for any safety-related defects in their vehicle products, in this case potential false positive activations. Therefore, we expect that vehicle and equipment manufacturers will mitigate and resolve any product defect issues including potential false activation in their AEB systems. NHTSA will continue to monitor complaints on AEB systems from the public, including those involving false activations, and will evaluate the risks they present.

NHTSA does not agree with the Alliance and other commenters that an AEB activation at a high speed may remove a safer crash avoidance option from drivers. The AEB system presumably only starts braking when the system detects an imminent crash, which is the first thing NHTSA expects a driver would do. While last-minute steering by the driver intended to avoid a crash is another possibility, NHTSA is not persuaded this is the safest option or that it is incompatible with AEB activation. A steering maneuver to avoid a crash might succeed under very limited circumstances. First, there must be another lane adjacent to the primary lane where a subject vehicle and a target vehicle are located. Second, a sufficient space must also be available in the adjacent lane. Finally, the driver must have the ability to safely maneuver a vehicle at such a high speed. Regardless, nothing in this rule specifies what an AEB system must do when a driver executes a steering maneuver to avoid a crash.

Global Harmonization Is Not Possible for No Contact Because it Unreasonably Lowers the Safety Benefits Received by the Public

NHTSA received comments that requested NHTSA to reject the no-contact requirement and adopt UNECE Regulation No. 152 requirements that permit low speed contact. Consistent with NHTSA's longstanding commitment to international harmonization [101] and section 24211 of BIL, NHTSA cooperates to the maximum extent practicable with respect to global harmonization of vehicle regulations as a means for improving motor vehicle safety.

NHTSA has been a leader in various international forums that impact vehicle safety for decades. The primary forum in which NHTSA engages in these activities is UNECE World Forum for Harmonization of Vehicle Regulations (WP.29). This international work is crucial to NHTSA's safety mission because it allows the agency to share its knowledge and expertise with foreign counterparts around the world, and for NHTSA to learn from its foreign counterparts. It also allows for NHTSA to advocate for standards that meet NHTSA's robust requirements and improve safety is measurable ways. Analysis of safety benefits provide NHTSA with a good understanding of the expected impact of its regulations. Such analysis is not necessarily required or conducted at WP.29.

NHTSA does not interpret section 24211 of BIL as requiring that NHTSA adopt harmonized regulations for the primary purpose of harmonization. To adopt this interpretation would be inconsistent with the text of section 24211 and the Safety Act. NHTSA interprets section 24211 as requiring NHTSA to promote safety in global forums. NHTSA believes that ''as a means for improving motor vehicle safety'' is intended to convey that the requirement to harmonize has the goal of improving motor vehicle safety. In situations where adopting an international or regional regulation would result in reducing motor vehicle safety, NHTSA does not believe the agency carries any obligation under the abovementioned section to adopt regulations that result in lower performance.

UNECE Regulation No. 152 was drafted by entities under an agreement to which NHTSA is not a party, and it was drafted years before NHTSA's NPRM. The testing NHTSA has conducted in support of this rule indicate that the industry has made substantial progress between 2020 and 2023 model years. NHTSA's adoption of more stringent requirements than existing UN Regulations indicates NHTSA's commitment to maximizing safety.

[101] *https://www.federalregister.gov/documents/1994/03/08/94-5181/revision-of-the-1958-united-nations-economic-commission-for-europe-agreement-regarding-the.*

Variability and Compliance Margins

FCA's comment indicates that it is concerned both about variability and about the compliance margins it thinks may be necessary for it to ensure compliance with this rule. First, FCA commented that the no-contact requirement would force early decisions and that the NPRM did not discuss why, in multiple runs, vehicles can pass some but not all tests without contacts. From NHTSA's perspective, the variability seen in NHTSA testing is expected because the systems tested were not designed to be compliant with the proposed requirements. As NHTSA has seen through its NCAP testing, manufacturers design systems to meet whatever thresholds are set, and when they do that, their vehicles are designed to pass those tests. This suggests to NHTSA that the variability in the NHTSA testing is due to the fact that no manufacturer has designed their systems to meet all of these requirements. While NHTSA understands that industry is concerned about the stringency of the no-contact requirement, variability does not seem to be at the heart of that issue.

FCA also raised concerns about the compliance margins it believes may be necessary for its products to comply with the no-contact requirement. Compliance margins are usually manufacturer dependent due to a variety of reasons that include the fact that each manufacturer establishes a different level of organizational risk acceptance and each manufacturers' products are usually unique to that manufacturer. As stated in the FRIA accompanying this rule, different manufacturers may have differing compliance margins with which their companies are most comfortable. Differing compliance margins and overall organizational risk management practices can impact the product and costs to make that product. Manufacturers are free to choose what compliance margins make sense for their organization and their products, and NHTSA does not dictate that. NHTSA establishes a minimum level of performance and manufacturers are required to ensure that their products meet that minimum level.

NHTSA's Testing Is Sufficient To Support This Rule

The testing conducted by the agency included the most common rear-end crash scenarios across several speeds and included a range of vehicle types and both camera and radar and camera fusion systems. In the case that the vehicle met the requirements (no contact) for a specific crash scenario and speed, testing continued at higher speeds. For the Lead Vehicle AEB testing, each vehicle was tested five to seven times for each scenario and speed combination. For the PAEB testing, each vehicle was typically tested five times for each combination of scenario, speed, and lighting condition.

In the absence of unlimited time and resources, it is not possible to test every vehicle across each combination of scenario, speed, and condition. Further, contact with a target object has the potential to compromise future test runs. Even relatively low speed impacts can result in a misalignment of forward-looking sensors, particularly those mounted behind lower trim and/or the grill. As a result, subsequent (*i.e.,* post impact) tests may not be representative of the vehicle condition at time of first sale.

The vehicles included in the testing conducted by the agency include a variety of body styles including heavier vehicles such as SUVs and pick-up trucks. The heavier vehicles included in testing NHTSA used to support the NPRM were Ford F–150 SuperCrew, Mercedes-Benz GLC 300, Hyundai Palisade, Audi Q5, and Range Rover Sport. The vehicles that NHTSA tested also included a mix of camera only and radar and camera fused systems utilized by model year 2020/19 vehicles.

Furthermore, NHTSA performed additional confirmatory testing that included 2023 model years. This testing showed that the models tested performed even better than those in 2020, which supports NHTSA's position that this rule is not only achievable but very close to being within reach for many manufacturers. NHTSA believes that the research from 2020 and 2023 is sufficient to support this final rule.

d. No-Contact Requirement for Pedestrians

Similar to the lead vehicle AEB performance test requirements, NHTSA proposed that PAEB-equipped vehicles must completely avoid a collision with a pedestrian test mannequin during specific test track scenarios. NHTSA requested comment on the same two alternatives to a no-contact requirement for pedestrian performance test requirements.

NHTSA notes that the positions taken by commenters for both lead vehicle AEB and PAEB are substantially similar, and therefore, much of what was said in the previous section also applies. This section primarily addresses issues specific to pedestrians.

Comments

IIHS stated that their evaluations of existing PAEB systems indicated that some current systems are completely avoiding collisions in the required PAEB testing conditions. IIHS stated that they began evaluating PAEB performance in new vehicles during the day in 2019 and at night in 2022. Furthermore, they stated that IIHS's PAEB ratings are based on a mixture of the data submitted by manufacturers for verification and the results from their internal testing. As of June 2023, IIHS stated that they rated 194 model year 2023 PAEB systems tested during the day. Of those, 33 (17 percent) fully avoided the pedestrian mannequin in every test condition. IIHS further stated that of the 114 model year 2023 PAEB systems tested at night, 12 (11 percent) fully avoided the pedestrian mannequin in every test condition.

MEMA commented that full avoidance is not reproduceable at higher velocities in low light conditions and in obstructed scenes. Due to external influences, MEMA contended that it is impossible to ensure that every test run is performed under the exact same conditions in this test, which is why it cannot be guaranteed that AEB will always achieve its maximum performance.

The Alliance stated that they suggest that the agency set the requirements of the regulation with the goal of minimizing the risk of serious injury in cases where vehicle to pedestrian contact occur, while providing for more certainty in making a determination to apply the brakes for crash avoidance and mitigation. Based on available research, the Alliance stated that establishing a no-contact requirement up to 30 km/h and a residual relative speed contact threshold not to exceed 25km/h would ensure the risks of sustaining a MAIS 3+ injury is well below 10%. Further, The Alliance stated that this exceeds the acceptable injury thresholds established in NCAP (for achieving a five-star rating) as well as the recommendations of Academic Expert Group for the 3rd Global Ministerial Conference on Road Safety. The Alliance stated that the suggested hybrid approach which would maintain the no-contact requirements at vehicles speeds up to 30 km/h but permit some level of contact if an acceptable speed reduction were achieved would reduce the potential for false positives under real world conditions.

Bosch stated that they wanted to address the ''no-contact'' requirement in performance testing and its implications for safety systems, particularly in the

context of pedestrian dummy detection and reaction. Further, Bosch stated that considering the challenge of detecting and reacting to the pedestrian dummy, there are still reservations concerning the no-contact requirement. Further, Bosch stated that they suggest that the criteria for collision mitigation systems be based on a certain amount of minimum speed reduction while considering injury-related assessments, such as the Head Injury Criteria (HIC) or similar measures (*e.g.,* acceleration exerted on the body during crash).

Agency Response

After considering the comments, the agency has concluded that the full collision avoidance requirement in PAEB tests, as proposed in the NPRM, is most appropriate for this final rule.

First, we agree with commenters that pedestrians could suffer severe injury at any speed in the testable range. Pedestrians are particularly vulnerable when coming in contact with a vehicle of any size. This is especially true when pedestrians are stuck by larger vehicles such as SUVs and pickup trucks. NHTSA believes that the increased vulnerability of pedestrians makes it even less desirable to permit any vehicle-to-pedestrian contact within the testable range.

Second, the impracticability argument raised by Alliance, MEMA and other manufacturers is not persuasive. That argument is primarily based on the agency's 2020 PAEB research presented in the NPRM, in which no vehicle met all required PAEB performance tests. The commenters assert that this reflects that the existing AEB related technologies are not ready for the level of PAEB performance required by this rule. However, we disagree with the commentors and believe that the results of the 2020 research are not indicative of shortcomings in the overall capability of the current PAEB technology. Rather, they are systems designed to meet a lower level of performance.

The agency conducted PAEB research with six model year 2023 vehicles (from six different manufacturers) using the proposed performance requirements and test procedures.[102] The results demonstrated that at least one vehicle was able to meet all performance requirements of this final rule. To the extent others do not, NHTSA has authority to issue technology-forcing standards when it is shown, as it is here, that meeting the standard is practicable.

[102] NHTSA's 2023 Light Vehicle Pedestrian Automatic Emergency Braking Research Test Summary, available in the docket for this final rule (NHTSA–2023–0021).

While the Alliance asserts that reducing impact speeds with pedestrians below 25 km/h could reduce the risk of serious injury, NHTSA believes that striking a person with a vehicle is not acceptable at any speed under any conditions. NHTSA included pedestrians in this rule because of their vulnerability and the trend of increasing pedestrian fatalities. Accordingly, we believe that retaining the no-contact requirement for the PAEB performance tests in the final rule is the most appropriate to ensure the maximum safety of the pedestrians.

e. Permissibility of Failure

As an alternative to the no-contact requirement with a single run that NHTSA proposed for lead vehicle AEB and PAEB, NHTSA sought comment on permitting the subject vehicle to use multiple test runs to achieve the performance test requirements. NHTSA provided background about how NHTSA's crash imminent braking and dynamic brake support testing within the New Car Assessment Program tests performance criteria, at the time of NPRM publication, specify that the speed reduction requirements for each test scenario must be met in at least 5 out of 7 tests runs. NHTSA stated this approach would provide a vehicle more opportunities to achieve the required performance and the agency more statistical power in characterizing the performance of the vehicle.

The agency also requested comment on the number of repeated tests for a given test condition and on potential procedures for repeated tests. The agency further requested comment on the merits of permitting a vehicle that fails to activate its AEB system in a test to be permitted additional repeat tests, including a repeat test process similar to that in the recent revisions to UNECE Regulation No. 152. Finally, the agency requested comment on whether there should be additional tests performed in the event no failure occurs on an initial test for each series.

The Advocates, Forensic Rock and AAA oppose allowing repeated test trials in all test situations. Forensic Rock stated test failures should not be allowed when performing testing under ideal conditions. AAA stated that repeated tests would lead to ambiguity around whether a vehicle that has previously passed the test should be retested.

The ASC, ZF, Humanetics, MEMA, Bosch, Mitsubishi, the Alliance, Porsche, Hyundai, Aptiv, Rivian, and Volkswagen all support allowing repeated test trials. ASC, ZF, Humanetics, MEMA, Bosch, and the Alliance specifically acknowledge that testing with a 5 out of 7 passing threshold for the speed reduction tests would be appropriate. Rivian recommends running between 3 and 5 tests and averaging the speed reduction achieved with a passing grade being given to vehicles that average greater than a 50 percent speed reduction. The Alliance and Porsche also recommend that a vehicle could pass after three consecutive successful tests. ASC and ZF recommend that repeated trial testing be used at speeds of 25 mph and higher. ZF recommends that the speed reduction targets should be data driven based on speeds where there is a severely limited risk of injury to pedestrians or vehicle occupants. ZF, Porsche, Aptiv, Volkswagen and ASC also suggest the test requirements be aligned with UNECE Regulation No. 152 speed reduction requirements for daytime scenarios.

NHTSA is not including multiple test trials in this final rule. NHTSA agrees with commenters that allowing for repeated test trials, which would essentially permit a certain threshold of failures, under ideal test conditions is not acceptable. NHTSA believes that a single test run, and the expectation that a manufacturer pass all test runs if NHTSA chooses to run the same test several times, provides the performance consistency that consumers expect and safety demands. This is particularly true given that NHTSA will be conducting testing in idealized, controlled conditions when compared to real-world situations. For many years, NCAP testing and other testing around the world has permitted repeated test trials, and NHTSA believes that is appropriate for a technology that is new or being developed. However, for more mature systems with a long record of real-world use, NHTSA believes that a single test run is necessary to provide the agency the confidence that the performance it is regulating will perform as consistently as possible.

NHTSA believes it is even more important that PAEB perform in a single run with no contact due to the vulnerability of pedestrians in a vehicle-to-pedestrian crash. First, the speed ranges in which PAEB is expected to not contact a pedestrian mannequin during testing are lower than they are for lead vehicle AEB. Second, as with the no-contact provision, allowing for multiple runs is even more unacceptable for vehicle-to-pedestrian crashes because pedestrians are more vulnerable when being struck by a vehicle.

F. False Activation Requirement

NHTSA proposed to include two scenarios in which braking is not warranted. The agency proposed that AEB systems need to be able to differentiate between a real threat and a non-threat to avoid false activations. The two proposed false activation scenarios were the steel trench plate and the vehicle pass-through test scenarios.

1. Need for Requirement

NHTSA remains concerned that false activation events may introduce hard braking situations when such actions are not warranted, potentially causing rear-end crashes. The false activation tests establish only a baseline for system functionality. They are by no means comprehensive, nor sufficient to eliminate susceptibility to false activations. Rather, the tests are a means to establish minimum performance. NHTSA expects that vehicle manufacturers will design AEB systems to thoroughly address the potential for false activations. Vehicles that have excessive false positive activations may pose an unreasonable risk to safety and may be considered to have a safety-related defect. Previous implementations of other technologies have shown that manufacturers have a strong incentive to mitigate false positives and are successful even in the absence of specific requirements.

The two proposed false activation scenarios are the steel trench plate and the vehicle pass-through test scenarios. Both of these tests include acceleration pedal release and testing both with and without manual braking, similar to testing with a stopped lead vehicle. NHTSA proposed that, during each test trial, the subject vehicle accelerator pedal will be released either when a forward collision warning is given or at a headway that corresponds to a time-to-collision of 2.1 seconds, whichever occurs earlier. For tests where manual braking occurs, the brake is applied at a headway that corresponds to a time-to-collision of 1.1 seconds.

In the steel trench plate false activation scenario, a subject vehicle traveling at 80 km/h (50 mph) encounters a secured 2.4 m (7.9 ft) wide by 3.7 m (12.1 ft) long steel by 25 mm (1 in) thick ASTM A36 steel plate placed flat in the subject vehicle's lane of travel, and centered in the travel path, with its short side toward the vehicle (long side transverse to the path of the vehicle).

The pass-through test, as the name suggests, simulates the subject vehicle encountering two vehicles outside of the subject vehicle's path that do not present a threat to the subject vehicle. The test is similar to the UNECE Regulation No. 131 and UNECE Regulation No. 152 false reaction tests.[103] In the pass-through scenario, two vehicle test devices (VTDs) are positioned in the adjacent lanes to the left and right of the subject vehicle's travel path, while the lane in which the subject vehicle is traveling is free of obstacles.

The two stopped VTDs are positioned parallel to each other and 4.5 m (14.8 ft) apart in the two adjacent lanes to that of the subject vehicle (one to the left and one to the right with a 4.5 m (14.8 ft) gap between them). The 4.5 m (14.8 ft) gap represents a typical travel lane of about 3.6 m (11.8 ft) plus a reasonable distance at which a vehicle would be stationary within the adjacent travel lanes.

Comments

ASC, MEMA, Hyundai, Volkswagen, Mitsubishi, and the Alliance for Automotive Innovation submitted comments opposing the proposed false activation tests. ASC stated that EuroNCAP does not include a false activation test because the vehicle could be programmed to pass any specific false activation test. ASC further stated that the current sensors used in vehicles do not have the same susceptibility to false activations that the proposed tests were designed to identify. Volkswagen and Hyundai questioned whether the test scenarios were comparable to real world scenarios. MEMA and the Alliance stated that testing for two specific scenarios does not entirely represent what is required to design AEB systems that accurately discriminate between actual crash-imminent situations and false triggers. As a consequence, the commenters asserted that meeting the proposed performance requirements only increases testing burdens while not providing a good indicator of the likelihood of a system producing false activations in real world driving conditions.

Advocates, Humanetics, and Consumer Reports support the proposed false activation requirements, stating that to maximize safety and consumer acceptance, false activations must be limited as much as possible through test procedures included in the final rule. In addition, these performance-based tests are a more robust solution than a document-based approach. Adasky also supported including false positive testing.

Luminar Technologies stated that it is neutral on the matter of requiring the false positive testing as proposed or demonstration of false positive measures by the manufacturer in another way. Luminar believes that false positive testing is absolutely necessary for safety and to create public trust, but understands that in some situations, especially for future autonomous vehicles, that the proposed false positive scenario may not necessarily occur in the real world.

Porsche recommends NHTSA consider aligning false activation test requirements with those that are found on the UNECE Regulation No. 152.

Agency Response

The agency has retained the two false activation requirements including the steel trench plate and the vehicle pass-through scenarios. Like many NHTSA tests, the false activation tests do not cover all the situations in the real world where false activations can occur. However, NHTSA believes that these tests add value to the rule. The steel trench place test provides protection against a known engineering challenge for some sensing technologies. Road construction sites often include steel trench plates for which vehicles will encounter in the real world. Likewise, a vehicle driven particularly in urban areas often drives between parked cars on both sides of the road.

Manufacturers must be responsible for false activations regardless of FMVSS test requirements and must engage in the precision engineering to prevent false activation and unintended consequences. The industry responsibility does not mean that NHTSA should not include aspects of performance that products must continue to meet. NHTSA believes that issuing an FMVSS with false activation prevent testing underscores the industry responsibility and works to ensure better performing systems.

The comments from MEMA and Alliance suggests a potential need for more robust false activation testing. However, it is impossible for NHTSA to test all circumstances in which false activations may occur. That is not a logical basis for having no false activation tests. The commenters did not suggest additional tests for NHTSA to consider in this final rule.

NHTSA agrees with Advocates, Humanetics, and Consumer Reports that maximizing safety and consumer acceptance are essential elements to

[103] UNECE Regulation No. 131 (Feb. 27, 2020), available at *https://unece.org/fileadmin/DAM/trans/main/wp29/wp29regs/2015/R131r1e.pdf;* UNECE Regulation No. 152, E/ECE/TRANS/505/Rev.3/Add.151/Amend.1 (Nov. 4, 2020), available at *https://unece.org/fileadmin/DAM/trans/main/wp29/wp29regs/2020/R152am1e.pdf.*

help ensure the public receives the benefits of this technology. NHTSA agrees with Mitsubishi that ultimately protecting against the activation of AEB in situations where there is no imminent crash is the responsibility of the manufacturer. However, it is also appropriate for the FMVSS to set a minimum standard below which no vehicles should perform. While current systems may be less prone to false activations in the scenarios proposed, the scenarios represent known vulnerabilities in previous technologies. The tests ensure that performance of new technologies continue to provide the resistance to these false activation situations.

Considering Porsche's suggestion that NHTSA use the same false activation tests as the UNECE, NHTSA agrees that the curved road and turning scenarios that are part of UNECE Regulation No. 152 are relevant real-world conditions. Not all situations, however, can be tested through regulation. NHTSA is finalizing the two false activation tests it proposed because of the expected positive impacts they will have on system performance by preventing reemergence of prior performance issues and preventing other types of false activations.

2. Peak Additional Deceleration

NHTSA proposed that the AEB system must not engage the brakes to create a peak deceleration of more than 0.25g additional deceleration than any manual brake application generates (if used) in the steel trench plate false activation scenario. Similarly, NHTSA proposed that the AEB must not engage the brakes to create a peak deceleration of more than 0.25g beyond any manual braking in the pass-through test.

Comments

Consumer Reports suggested the threshold for maximum deceleration should be zero, especially under manual brake application. Consumer Reports opined that a 0.25g braking event is noticeable by passengers and could confuse or distract the driver. Consumer Reports asked that NHTSA remove any tolerance for false braking in these scenarios, or at the very least lower the threshold.

Agency Response

NHTSA is finalizing the braking criteria limit of 0.25g beyond manual braking as proposed. The agency balanced two factors in determining that a 0.25g criterion is more appropriate than using a 0.0g criterion. First, the ability to measure negative acceleration that results from the automatic application of the service brakes is difficult at low levels. As the total magnitude of deceleration increases, it is easier to establish that the service brakes are contributing as opposed to wind, tire friction, or engine drag. Second, it is unlikely that small levels of additional deceleration (less than 0.25g) could present a safety risk that could potentially lead to a crash.

3. Process Standard Documentation as Alternative to False Activation Requirements

As an alternative to the false activation requirements that were proposed, NHTSA requested comment on requiring manufacturers to maintain documentation demonstrating that robust process standards were followed specific to the consideration and suppression of false application of AEB in the real world. ISO 26262, ''Road vehicles—Functional safety,'' ISO 21448, ''Safety of the Intended Functionality (SOTIF),'' and related standards, are examples of this approach. The agency requested public comment on all aspects of requiring manufacturers to maintain documentation that they have followed industry process standards in the consideration of the real-world false activation performance of the AEB system.

Comments

Advocates, Mitsubishi, the Alliance for Automotive Innovation, Honda, and FCA opposed the agency's alternative to require that manufacturers maintain technical documentation that they have followed industry process standards. Advocates and Consumer Reports stated that documentation should not be used as a replacement for testing, but as a supplement to testing. MEMA, ZF and Volkswagen supported the technical documentation option presented in the NPRM.

Mitsubishi explained as part of its opposition to technical documentation that it is impossible to predict all false-positive scenarios and be able to generate technical documentation for it. The Alliance stated such a requirement will increase the administrative burden on manufacturers with no added safety benefit. FCA and Mitsubishi stated that the suggested processes standard, like ISO 26262 or SOTIF, should not be an element of any FMVSS. FCA also stated that any FMVSS should be purely about a vehicle presented to a test site and with performance assessed according to objective criteria. FCA further stated that it is not necessary for the agency to understand how a product was developed to meet a minimum performance requirement, just that it does. Finally, FCA noted that NHTSA has other information gathering powers over industry (*e.g.,* the current ADAS Standing General Order) and development practices or engineering methods should fall under that authority, not as part of an FMVSS.

In its support for a technical documentation requirement, ZF stated that, although they do not recommend a false activation test, they agree that efforts should be made in system design to mitigate against that risk. ZF supported some documentation to demonstrate efforts had been made in system design to prevent false activation. Volkswagen stated the most effective way to combat false positives is during the development process. Volkswagen and ZF both considered the suggested documentation requirements on measures taken against false positives to be a suitable approach.

Agency Response

After considering comments, NHTSA has opted not to include a requirement in the FMVSS that manufacturers maintain documentation of the application of process standards during AEB system development. Instead, the agency chooses to keep the false activation tests proposed and incorporate them into this final rule. NHTSA believes that performance testing of final products remains an important compliance tool for the agency.

Even though the agency is not finalizing the documentation proposal, NHTSA disagrees with commenters who asserted that this sort of documentation is not of use to the agency. The agency believes that the application of process standards in good faith is likely to increase the chances that manufacturers have created products that minimize unreasonable safety risks. NHTSA agrees that the agency has other pathways through which it could seek this sort of information, including during an inquiry into the reasonableness of a manufacturer's certification and through a defect investigation. Therefore, it is not necessary to include such a requirement in the FMVSS.

4. Data Storage Requirement as Alternative to False Activation Requirements

As another alternative to the two proposed false activation tests, NHTSA requested comment on requiring targeted data recording and storage of significant AEB activations. As an example, NHTSA considered requiring that an AEB event that results in a speed

reduction of greater than 20 km/h (12 mph) activate the recording and storage of key information.

Comments

ASC, IIHS, MEMA, APCI, NTSB, and Forensic Rock supported data storage requirements. Advocates and Consumer Reports stated data storage requirements should not be used as a replacement for testing, but as a supplement to testing. ZF recommended that AEB system data be retained in some capacity by EDR systems. They stated that classification of the target that triggered the AEB activation may be useful for accident or false activation reconstruction. AAA and Rivian recommended the agency weigh how the data recording requirement would be implemented in the context of consumer privacy concerns. ASC stated its support of Event Data Recording (EDR) to assist in crash reconstruction and identification of false activation trigger factors. NTSB stated that without the data, it will be extremely challenging to determine whether and to what extent these systems were engaged during a crash. Forensic Rock stated that ensuring investigators have access to post-collision data that can objectively evaluate the performance of the AEB system in both lead vehicle and pedestrian collision scenarios is paramount and should be included in the FMVSS.

Honda, Bosch, Hyundai, Mitsubishi, the Alliance for Automotive Innovation and Volkswagen opposed requirements that would include AEB data storage. Honda stated that it was unclear as to the problem such a requirement would be meant to address. Bosch stated data recorders have limitations and are not able to determine whether a safety system's decision was reasonable, considering the provided sensor data. Hyundai stated it would entail significant burdens and unwarranted delays to this rulemaking and would provide no direct safety benefit. Mitsubishi stated a lack of objective and clear definitions of false activation indefinitely increases the data elements to record, which would require hardware reengineering. In addition, Mitsubishi stated that data is more likely to include privacy-sensitive information. The Alliance stated the agency has not provided any analysis on the technical feasibility of the proposal under consideration, nor has sufficient justification been made as to the practical utility of any data obtained as part of an information collection effort or the overall safety benefit to consumers. Volkswagen stated that to determine whether an activation was justified, camera data would be required in most cases and that storing camera data is not technically feasible for most current vehicle platforms due to processing and storage limitations of the existing architectures.

Agency Response

After considering comments, NHTSA is not including data storage as part of this FMVSS, and intends to keep the false activation tests that it proposed. NHTSA believes that the false activation tests will provide the minimum level of assurance that AEB systems will not provide unwarranted engagement. In the future, NHTSA can consider amending the EDR requirements established in 49 CFR part 563 and more broadly consider updates to vehicle data collection, event triggers for crash reconstruction, and potential gaps in performance of AEB and other safety systems. By looking at vehicle data holistically and considering the updates necessary to modernize 49 CFR part 563 and capture the information necessary for various driver assistance systems, the agency can further consider the data needs and associated burden to update the regulation to reflect the vehicle safety needs of today, current vehicle systems, and current manufacturer practices, while balancing privacy concerns.[104] Finally, regarding data manufacturers are already collecting, NHTSA has broad authority to request information from manufacturers during the course of investigations. Therefore, even absent a data recording requirement in an FMVSS or regulation, NHTSA expects that it can require manufacturers to provide the information that they are currently collecting on AEB systems.

G. Malfunction Detection Requirement

In the NPRM, NHTSA proposed that AEB systems must continuously detect system malfunctions. If an AEB system detects a malfunction that prevents it from performing its required safety function, the vehicle would illuminate a telltale that identifies (or indicates) the malfunction condition. The telltale would be required to remain active as long as the malfunction exists while the vehicle's starting system is on. NHTSA would consider a malfunction to include any condition in which the AEB system no longer functions as required by this rule. NHTSA proposed that the driver must be informed of the malfunction condition in all instances of component or system failures, sensor obstructions, or other situations that would prevent a vehicle from meeting the proposed AEB performance requirements. While NHTSA did not propose a specific telltale, NHTSA anticipates that the characteristics of the alert will provide sufficient information to the vehicle operator to identify it as an AEB malfunction.

1. Need for Requirement

The rationale behind the requirement that AEB systems continuously detect system malfunctions is that drivers would need to know when AEB is not functioning because AEB is an important safety system. NHTSA stated in the NPRM that it was considering minimum requirements for the malfunction indication to standardize the means by which the malfunction is communicated to the vehicle operator. Malfunctions of an AEB system are somewhat different than other malfunctions NHTSA has considered in the past. While some malfunctions may be similar to other malfunctions NHTSA has considered in FMVSSs because they require repair (loose wires, broken sensors, etc.), others are likely to resolve without any intervention, such as low visibility due to environmental conditions or blockages due to build-up of snow, ice, or loose debris.

Comments

Advocates, NAMIC, IIHS, MEMA and NTSB supported the proposed requirements for malfunction. NAMIC commented that it is important to include in a final rule a requirement that manufacturers notify the driver when AEB or other advanced driver assistance systems are malfunctioning or not performing as designed, and to include detailed directions for resolving the issue such as cleaning the sensor or going to a service center.

The Alliance stated that wording of the proposed malfunction requirements would likely result in excessive notifications to consumers and notifications that do not accurately communicate the status of the system. and may be misleading as to the actions required on the part of the driver to remedy the situation. The Alliance and Aptiv stated that it is not reasonable or practicable to require a manufacturer to detect changes in the roadway environment (*e.g.,* road surface condition) or the extent to which these changes may affect the performance of a vehicle in meeting the requirements of the rule. The Alliance, Consumer Reports, and ITS America commented

[104] With regard to consumer privacy, those concerns should be alleviated, at least partially, by the existence and application of the Driver Privacy Act of 2015, part of the Fixing America's Surface Transportation Act of 2015. The Driver Privacy Act assigned ownership of EDR data, as defined in 49 CFR 563.5, as the property of the owner or lessee of a vehicle. Importantly, it limits the access of EDR data to specific parties for specific purposes.

that malfunction failure indication should be limited to specific failures related to the hardware or software components that comprise an AEB system, not diminished performance due to environmental conditions such as heavy fog or snow.

The Alliance, NADA, and AAA recommended that NHTSA create separate definitions for ''malfunction warning'' and ''system availability warning'' to characterize these two conditions more accurately. Aptiv, Volkswagen, and Porsche suggested a warning based on UNECE Regulation No. 152 for non-electrical failures (for example, obstructions due to weather). Bosch suggested further specification in the warning of ''an appreciable time interval between each AEB system self-check.''

NTEA recommended that a compromised system function should not only warn the driver, but consider the possible prohibition of AEB activation. NTEA also provided cases where they feel sensors need self-monitoring abilities and temporary deactivation, such as a when going through a car wash or when overhead cargo is present that obstructs a portion of the forward camera's field of view.

Agency Response

The agency agrees with commenters who state that it is necessary that AEB systems monitor system health and notify the driver when a malfunction is present. Where the agency diverges from commenters is with regard to the need to require manufacturers to provide detailed information regarding the nature of the malfunction. The primary information necessary for a driver to determine if it is safe to operate the vehicle is simply whether the AEB system is working relative to the performance requirements of this new final rule.

The agency agrees with the commenters who stated that external conditions that limit system performance (such as minute changes in the road surface construction, the presence of sand or gravel on the road surface, etc.) are not malfunctions of the system, and in some cases, it is not possible to determine the AEB system's ability to perform. These conditions are often not readily measurable by vehicle sensors and are often temporary in nature.

NHTSA is clarifying that it did not intend to mandate that AEB perform in all environmental conditions. Rather, NHTSA requires that AEB systems function as required within the set of conditions provided in S6 of the regulatory text. The same is true for malfunction detection. NHTSA understands that there are differences between the driving environment hindering ideal AEB performance and true malfunctions of the system that likely require intervention to resolve. To give an example, snow might cause degraded performance for a variety of reasons, but a malfunction notification would not be necessary unless that snow results in deactivation of the AEB system, such as a situation when the snow obstructs the AEB sensors, causing the system to not meet the performance requirements. Alerting the driver to this type of malfunction is vital to the safe operation of the vehicle. Any notification of degraded system performance arising from any source (temporary or permanent) should end when the conditions that lead to the degradation end.

Therefore, this final rule clarifies that if the system detects a malfunction, or if the system adjusts its performance such that it will not meet the performance requirements, the system must provide the vehicle operator with a telltale notification. This requirement makes clear that if the system reduces its performance capabilities (regardless of if the reason is because of environmental conditions or for other reasons), the driver must be informed. Also, if the system is broken or a sensor is obstructed, the driver must be informed. However, if there are environmental conditions that decrease the system's ability to function (for instance decreased stopping distance) but the system has made no internal adjustments, a telltale is not required.

As for the issue of separate telltales to inform the driver of permanent and temporary malfunctions, the requirement proposed and adopted here was intended to give manufacturers flexibility in the style and nature of the driver malfunction notification. The requirements allow for different notification types for different types of degraded performance (*e.g.,* internal malfunctions or external conditions) that degrade performance, should the manufacturer choose to do so. The manufacturer may also, at the manufacturer's discretion, choose to use the same telltale or other notification for the different types of degraded performance. NHTSA has observed that some manufacturers currently do this and nothing in the NPRM was intended to prohibit this. This is consistent with the malfunction warning requirements in UNECE Regulation No. 152.

The agency appreciates Bosch suggesting a more specific definition, but NHTSA is not adopting the proposed definition for malfunction detection provided at this time because it is not workable for an FMVSS. For example, ''appreciable time interval'' is not an objective measure of timing, nor does it give manufacturers notice as to what NHTSA expects of them. Furthermore, NHTSA does not have a basis for why it would treat electrical failure conditions differently than any other type of system malfunction, as suggested by Bosch.

Regarding NTEA's suggestion that NHTSA prohibit AEB activation in the instances where a malfunction may be present, NHTSA does not believe that mandating the prohibition of AEB activation is necessary since there is no evidence that a manufacturer would permit its systems to function in a state so degraded as to present an unreasonable risk to safety.

2. Malfunction Telltale

NHTSA did not propose the specifics of the telltale but anticipated that the characteristics of the alert would provide sufficient information to the vehicle operator to identify it as an AEB malfunction, and would also be documented in the vehicle owner's manual. NHTSA requested comment on the potential advantages of specifying test procedures that would describe how the agency would test a malfunction telltale and on the related level of detail that this regulation should require. The agency also requested comment on the need and potential safety benefits of requiring a standardized appearance for the malfunction telltale and what standardized characteristics would achieve the best safety outcomes. The agency further requested comment on the use of an amber FCW warning symbol as the malfunction notification.

Comments

The Alliance and Nissan commented that specifics of a telltale for malfunction (and related system status) should be defined by the manufacturer. Nissan observed that UNECE Regulation No. 152 does not define the specific form of the malfunction telltale.

ASC suggested that the agency require an AEB malfunction telltale to be located on the vehicle's instrument panel. ASC stated that on start-up, the AEB system could run diagnostics and trigger the malfunction telltale if a failure or obstruction is detected.

However, several other commenters suggested standardization of a common malfunction telltale. ZF and MEMA suggest a telltale modeled after the ESC telltale, in an effort to better alert the driver to an AEB malfunction.

Toyota stated that an amber telltale may be appropriate, as it aligns with

similar malfunction requirements, such as those in FMVSS No. 135.

IIHS commented that NHTSA should require manufacturers to notify the driver when AEB or other ADAS are malfunctioning or not performing as designed. They noted that, ideally, the notification should provide directions for resolving the issue, such as cleaning the sensor or going to a service center, noting that drivers should not be expected to troubleshoot misbehavior or malfunctions from their ADAS, especially when the malfunction introduces new risks. They provided two examples of a vehicle with a misaligned radar following a crash and a skewed camera following a windshield replacement, which did not provide an indication of malfunction or reduction of performance.

AVIA commented that for AVs, NHTSA should consider adding language that allows a malfunction detection notification to be directly communicated to the ADS itself or communicated to a remote assistant or to service personnel in the case of an AV without manually operated driving controls. They added that for an ADS-equipped vehicle with manually operated driving controls, the notification can be directly communicated to the ADS when it is engaged as well as through a telltale notification to the human operator. Zoox commented that the malfunction telltale requirement should specify that it be visible from the driver seating position and that, for vehicles without a driver seating position, the mechanism is specified by the manufacturer and provided upon request, and suggested that testing not be conducted while an equivalent notification to the telltale is active for vehicles without a driver seating position.

Agency Response

NHTSA agrees that the specifics of a telltale for malfunction should be defined in detail by the manufacturer. The agency has concerns, however, about drivers confusing a malfunction indicator that is co-located with the FCW symbol. As such, Toyota's suggestion to align the malfunction telltale with the FCW symbol may be problematic. The agency is concerned about confusing drivers, because using the same telltale could be interpreted as asking the driver to brake or as a malfunction.

NHTSA understands the positions of commenters who requested a standardized malfunction telltale. Nothing prohibits the industry from working together, such as through a standards organization, to implement a common telltale. However, NHTSA does not believe standardization is necessary at this time. Commenters did not provide sufficient evidence to demonstrate a need for a standardized malfunction indicator. Thus, NHTSA is not adding additional constraints on the telltale, in this final rule. If warranted, NHTSA would consider standardization if in the future it is determined that drivers do not adequately comprehend when an AEB malfunction has occurred.

NHTSA does not agree with ASC's suggestion of a standardized location for a telltale. FMVSS No. 101 does not provide specification for the location of any telltale except that it be visible to the driver when a driver is restrained by a seat belt. There is no evidence of a safety need for any more specific location requirement for an AEB system malfunction telltale.

As discussed in other sections, NHTSA agrees with IIHS that the driver should be notified when AEB is malfunctioning, which is the entire goal of a malfunction telltale requirement. NHTSA does not believe that it is necessary to notify drivers of the directions for resolving the issue, but that such information could be provided to drivers in the owner's manual. A driver who is driving on the street doesn't need to be told while the vehicle is moving that she needs to clean the sensor. Rather, this is diagnostic information that could be communicated through other means, like through the use of diagnostic tools accessing information in the OBD–II port.

As for the comments related to AVs, NHTSA believes it is most appropriate to address specific concerns related to AVs through other mechanisms, rather than shaping this particular FMVSS around the needs of a very specific set of vehicles that may still have to apply for an exemption from other FMVSS. NHTSA is considering crash avoidance test procedures to facilitate the safe introduction and certification of new vehicle designs equipped with automated driving systems in a separate rulemaking.[105] NHTSA is also looking across all FMVSS to address the applicability and appropriateness of safety messaging (telltales, indicators, and warnings) in new vehicle designs without conventional driver controls.[106] Additionally, NHTSA notes that manufacturers are free to design their vehicles to have the malfunction detection notification be communicated directly to the ADS, a remote assistant or service personnel, as a redundant means of communication. Such redundancy is permissible in situations that a manufacturer believes it is necessary.

3. Sensor obstructions and testing

NHTSA proposed that the driver must be warned in all instances of malfunctions, including malfunctions caused solely by sensor obstructions. The NPRM also proposed that during track testing of the AEB system all sensors used by the system and any part of the vehicle immediately ahead of the sensors, such as plastic trim, the windshield, etc., would be free of debris or obstructions. NHTSA stated that it was considering requirements pertaining to specific failures and including an accompanying test procedure.

Comments

The Alliance stated that it is important that NHTSA define a finite set of scenarios that could be reasonably defined as a malfunction, should the agency decide to regulate in this area, to ensure that relevant scenarios are being addressed, and that other factors that may influence AEB performance are evaluated independently. Mobileye recommended performing full blockage camera/radar testing as in the Euro-NCAP Assisted Driving protocol. ZF also suggested testing by obstructing sensors. Rivian recommended that NHTSA adopt detailed procedures that can be performed on the test track and are representative of relatively high frequency occurrence in actual use cases. ZF commented that malfunction indicator light testing could be done by deliberately blocking for radar to simulate snow accumulation, or a piece of tape for cameras to simulate a lens blockage.

Agency Response

After considering the comments, NHTSA is not making any further specifications of failures that would be tested. As is customary with NHTSA's standards, the laboratory compliance test procedures will specify how NHTSA intends to run its compliance test regarding illumination of a malfunction telltale.

H. Procedure for Testing Lead Vehicle AEB

This section describes the lead vehicle AEB performance tests adopted by this final rule. After considering the comments to the NPRM, NHTSA has adopted the proposed procedures with a few changes. Some minor parameters

[105] *https://www.reginfo.gov/public/do/eAgendaViewRule?pubId=202310&RIN=2127-AM00.*

[106] *https://www.reginfo.gov/public/do/eAgendaViewRule?pubId=202310&RIN=2127-AM07.*

and definitions were modified and various definitions were added, to clarify details of the test procedures. Additionally, to increase the practicability of running the tests, a third manual brake application controller option, a force only feedback controller, has been added. The force feedback controller is substantially similar to the hybrid controller with the commanded brake pedal position omitted, leaving only the commanded brake pedal force application.

This section responds to the comments and explains NHTSA's reasons for adopting the provisions set forth in this final rule. For the convenience of readers, a list of the test specifications can be found in the appendix A to this final rule preamble.

The lead vehicle AEB performance tests require a vehicle to automatically brake, or supplement insufficient manual braking, when tested during daylight under three specific test scenarios. The scenarios involve a stopped lead vehicle, a slower-moving lead vehicle, and a decelerating lead vehicle. The performance criterion for all AEB tests involving a lead vehicle is full collision avoidance, meaning the subject vehicle must not contact the lead vehicle.

The lead vehicle AEB tests include parameters necessary to fully define the initial test conditions in each scenario. Key test parameters for the lead vehicle AEB tests include the travel speed of both the subject vehicle and lead vehicle, the initial headway between the subject vehicle and the lead vehicle, the deceleration of the lead vehicle, and any manual brake application made to the subject vehicle. For each test run conducted under each of the scenarios, NHTSA will select the subject vehicle speed (V_{SV}), lead vehicle speed (V_{LV}), headway, and lead vehicle deceleration from the ranges specified in the standard.[107]

There will be testing under two conditions. In one condition, NHTSA will test without any manual brake application. This would simulate a scenario where a driver does not intervene at all in response to the FCW or impending collision. In the other condition, NHTSA will test with manual brake application that will not be sufficient to avoid the crash. Not only will the second condition ensure that the AEB will supplement the manual braking when needed, it also provides a way to ensure that an application of insufficient manual braking will not suppress automatic braking in circumstances where automatic braking is initiated before the manual brake application is used.

1. Scenarios

Many commenters suggested including additional scenarios in lead vehicle AEB testing.[108] Many commenters urged NHTSA to include lead vehicle AEB testing in the dark to increase the benefits of the rule. The Lidar Coalition commented that it supports testing AEB in the darkest realistic conditions possible. It stated that a test procedure in dark conditions would evaluate AEB and PAEB technologies in the real-world scenarios where these systems are most needed because of diminished visibility. Forensic Rock state that they found differences in the performance of a specific vehicle's AEB system during the day as compared to testing under the same conditions at night and that to comprehensively evaluate the performance of AEB systems, daytime and nighttime tests should be conducted under the same closing speeds. Advocates suggested that NHTSA evaluate and present data demonstrating that the exclusion of testing lead vehicle (vehicle-to-vehicle) AEB under dark conditions is not limiting the performance level demanded by the proposed rule nor needlessly jeopardizing safety.

In response, NHTSA appreciates the interest in including additional scenarios to potentially assess AEB systems under a wider range of potential real-world situations. NHTSA does not, however, include further tests in this final rule. The decision to include a particular test scenario depends on various factors, including the safety benefit resulting from a requirement, the practicability of meeting the requirement, the practicality and safety of conducting a test, and, in accordance with E.O. 12866, the likelihood that market forces will incentivize manufacturers to provide the needed performance absent the requirement. NHTSA at present does not have sufficient supporting data to assess the need for, practicability of, or practicalities involved with adding darkness test scenarios to the lead vehicle AEB tests. This is in contrast to the PAEB test, which includes darkness test scenarios.

There is not enough data supporting a finding for a safety need for a darkness test. The test scenarios of this rule broadly represent real world situations by sampling the most common types of light vehicle rear-end crashes. In NHTSA's latest testing described earlier in this document, the agency observed that vehicle performance during the dark ambient tests were largely consistent with those produced during the daylight tests (in the absence of a regulation). The dark- compared to day-contact results observed for a given test speed were identical or nearly identical for several of the vehicles tested. Where impacts occurred, the impact speeds were very similar. Additionally, as detailed in the safety problem section of this preamble, 51 percent of rear end crash fatalities occur during daylight, and injury and property-damage-only rear-end crashes were reported to have happened overwhelmingly during daylight, at 76 percent for injury rear-end crashes and 80 percent for property-damage-only rear-end crashes.

Some data indicate that there may not be a technical need for a darkness test to reap the benefits of lead vehicle AEB in darkness. As part of this final rule, NHTSA is specifying minimum performance requirements for pedestrian avoidance in dark conditions. The agency believes that systems that can identify, and respond to, a pedestrian in the roadway at night could also possibly detect lead vehicle taillamps and other reflective surfaces that distinguish a vehicle from the surrounding visual landscape. The agency also believes a radar sensor will perform the same regardless of the lighting condition. As such, NHTSA believes an AEB system could be highly effective at classifying the rear of a lead vehicle in a dark condition, even without an explicit regulation requiring such performance. Only the daylight condition was proposed for lead vehicle AEB testing, and this sole lighting condition is maintained in this final rule.

Luminar, Forensic Rock, Consumer Reports, and Aptiv suggest the agency expand testing with additional overlaps (the measurement of deviation of the lead vehicle centerline and the subject vehicle centerline) for lead vehicle testing. Luminar stated that a 50 percent overlap in car-to-car scenario is used in both US and Euro NCAP testing and suggested that NHTSA should consider 50 percent overlap which, the commenter believed, is a common, achievable, car-to-car test scenario. Forensic Rock suggests expanding the testing to include a 25–50% overlap condition would ensure that the

[107] In instances where an FMVSS includes a range of values for testing or performance requirements, 49 CFR 571.4 states that the word any, used in connection with a range of values, means generally the totality of the items or values, any one of which may be selected by NHTSA for testing, except where clearly specified otherwise.

[108] These commenters included Luminar, Forensic Rock, Consumer Reports, Applied, Rivian, Advocates, Adsky and the Lidar Coalition.

performance of these systems included more than just pure collinear crash scenarios.

In response, NHTSA has not included test scenarios with an overlap less than 100 percent (although a tolerance on the travel path of the subject vehicle is included). A rear-end crash as defined in the FARS database is ''a collision in which one vehicle collides with the rear of another vehicle.'' [109] Even at the higher speeds used in testing, a change of the overlap during testing from 100 percent to 50 percent or 25 percent would result in only a marginal change in the position of the lead vehicle in the field of view of the sensors. The proposed overlap for lead vehicle AEB testing is consistent with NHTSA's NCAP test procedures for CIB and DBS, the IIHS test procedure, as well as UNECE Regulation No. 152.[110] The agency does not have the necessary information to demonstrate practicality and need for a regulation that adopts scenarios that include a broad range of overlap.

Some commenters suggest that NHTSA should consider adding additional testing scenarios from EuroNCAP, such as the head-on scenarios and left turn across path. Consumer Reports suggested NHTSA incorporate additional scenarios such as a curved travel path, scenarios involving challenges posed by environmental conditions, and circumstances in which the lead vehicle is revealed suddenly or is not aligned straight when in front of the subject vehicle.

In response, this final rule requires lead vehicle AEB systems that will prevent or mitigate rear-end crashes of light vehicles and is based on the research and other data demonstrating the efficacy and practicability of these systems. The data and technologies for test scenarios representing crashes other than a rear-end crash are not yet available to support possible inclusion in an FMVSS.

Applied stated that NHTSA should include additional scenarios and elements through virtual testing procedures. It stated that modeling and simulation technologies allow for a vehicle to be put through a much more expansive set of testing scenarios and elements than what are possible in real-world testing and may allow to vastly increase the number of tests that can be run creating a much greater pool of data to evaluate a vehicle.

In response, while virtual test scenarios involving modeling and simulation may be employed, and are employed, by manufacturers in developing lead vehicle AEB systems, such testing is not suitable for NHTSA's compliance testing of AEB systems at this time. Virtual testing has the potential to provide many benefits and advancements to motor vehicle safety. There are challenges, however, in using virtual assessments in agency compliance tests. The agency must be assured that the virtual scenarios it was running are representative of the real world and that the test results it obtained would be the same as those obtained in tests of an actual vehicle. Neither condition currently exists. Also, virtual test environments are reliable only if they have been appropriately validated. Right now, NHTSA does not have the research available to support the development of a simulator designed for the purposes of testing compliance with this rule. Though simulation testing is a method that NHTSA is very interested in from a research perspective, it is not yet an approach that is ready for NHTSA use in compliance testing.[111]

After considering the comments, this final rule adopts the three track test scenarios, which are lead vehicle stopped, lead vehicle moving and lead vehicle decelerating, as proposed in the NPRM.

2. Subject Vehicle Speed Ranges

The proposed speed ranges were selected based on the speeds at which rear-end crashes tend to happen, while considering two primary factors. The first factor is the practical ability of AEB technology to consistently operate and avoid contact with a lead vehicle. NHTSA's 2020 and 2023 research testing indicate that the selected speed ranges for the various scenarios are within the capabilities of current production vehicles. NHTSA proposed speed ranges to ensure AEB system robustness. To illustrate, during the agency's AEB research testing, two vehicles performed better at higher speeds (48 km/h or 30 mph) than at lower speeds (40 km/h or 25 mph) in the lead vehicle stopped tests, which suggests that a range of speeds should be used in FMVSS No. 127.[112]

The second factor is the practical limits of safely conducting track tests of AEB systems. Based on the available data, a majority of fatalities and injuries from rear-end crashes occur at posted speeds up to 97 km/h (60 mph). Due to the tendency of fatalities and injuries to increase as the vehicle travel speed increases, NHTSA proposed AEB system testing at the highest speeds at which NHTSA can safely and repeatably conduct tests. If a system does not intervene as required and the subject vehicle collides with the lead vehicle test device, it should do so in a manner that will not injure test personnel or demolish the laboratory's equipment and set-up.

Comments Seeking To Increase Testing Speeds To Increase Potential Safety Benefits

Many government entities, consumer interest groups, private individuals and others suggested that NHTSA consider exploring ways to increase test speeds.[113] Many suggested lead-vehicle AEB tests above 100 km/h (~60 mph) for the stopped lead vehicle and slower-moving lead vehicle scenarios, and 80 km/h (~50 mph) for the decelerating lead vehicle scenarios. These commenters point to the increased risk of crashes as well as fatalities and serious injuries resulting from crashes as speeds rise, and some believed that a requirement to meet higher test speeds is practicable. Forensic Rock stated that if a private accident reconstruction firm can find suitable track length to conduct

[111] There are also several practical challenges that prevent NHTSA from using virtual testing to determine compliance with the FMVSS. NHTSA's goal is to independently purchase vehicles available on the market without notification to the manufacturer (or anyone) that it is purchasing a particular vehicle. This helps make sure that the product that NHTSA is testing is one that consumers of that product would also purchase. If NHTSA were to obtain vehicles directly from manufacturers for compliance testing, NHTSA may not be as confident about the independence of its testing results. Also, AEB systems are proprietary systems. If NHTSA needs capabilities and access to the technicalities of the AEB system to conduct virtual testing, confidential business information issues may arise.

high closing speed tests, NHTSA should be able to as well. NTSB stated that test scenarios be designed to best reflect real world operating conditions as NTSB investigations have shown there is a need to consider systems' performance in other crash-relevant scenarios including unusual vehicle profiles and configurations encountered in real-world conditions.

Agency Response

After considering the comments, NHTSA declines to increase the test speeds proposed in the NPRM. The agency explained in the NPRM that NHTSA proposed what it believed to be the highest practicable and reasonable testing speeds. Testing speeds are bound by important practicability matters and practical limitations, such as the safety of the testing personnel, vehicle and test equipment damage, and the repeatability of testing and test validity. Forensic Rock suggested adding equipment such as ''deer/cattle guards'' to the subject vehicle during testing. NHTSA believes such an approach is untenable because such equipment would still not protect testing equipment and would alter the ''real-world'' condition of the vehicle.

NHTSA limited the maximum test speeds for lead vehicle AEB to no more than a maximum 80 km/h (50 mph) speed differential. NHTSA is encouraged by Luminar and Forensic Rock's testing at speeds higher than the NPRM, but, with regard to Luminar's comment that the systems they tested performed at speeds up to 120 km/h, the agency's limit for the testing speed was determined based on factors including safety need and practicability, and not just on AEB performance. While NHTSA is currently researching other testing scenarios for AEB, the agency does not have the needed information regarding practicability and the need for a higher speed regulation to include a broader speed range at this time.

Comments Suggesting Different Approaches

Several commenters suggested NHTSA should take a hybrid approach and reduce speeds for a no-contact requirement while allowing contact at a higher speed. The Alliance, Toyota and others suggested NHTSA implement a hybrid approach that maintains no-contact requirements for lower-mid-range speeds while permitting compliance if acceptable speed reductions that reduce the risk of serious injury can be achieved in higher-speed scenarios. It stated that such an approach would align with the approach implemented by other international bodies, such as UNECE Regulation No. 152, where no contact is required up to 40 km/h and various levels of maximum impact speeds are allowed from 42 km/h up to 60 km/h.[114] A number of other commenters suggested reducing the range of testing speeds and allowing contact above certain testing speeds.[115]

The Alliance stated that the hybrid approach would ensure that vehicle speeds are reduced to a level where crashworthiness features can provide an additional layer of protection for reducing the severity of occupant and pedestrian injury outcomes by lowering the overall impact speed. Volkswagen provided an analysis, which it stated is not statistically significant, which showed that vehicles on the road today can protect their occupants from severe injuries of MAIS 3+ even with collision speeds up to 50 km/h. Toyota recommended an approach that vehicle-to-lead vehicle target contact be allowed ''at a speed low enough that the crash would be highly unlikely to be fatal or to result in serious injury.'' Honda also considered NHTSA's crash injury estimations for the risk of severe injury or fatality in frontal crashes to suggest a hybrid type approach.

Agency Response

The commenters support a hybrid approach where collision avoidance would be required only up to 42 km/h (26.1 mph) and speed reduction (a mitigated collision) permitted at speeds above 42 km/h (26.1 mph) during testing. NHTSA does not find this approach acceptable. The agency's intent is to prevent crashes at the highest practicable speeds and the proposed limits in testing speeds reflect this.

Using the speed limit as a proxy for traveling speed, the data presented earlier in this document show that about 60 percent of fatal rear-end crashes were on roads with a speed limit of 97 km/h (60 mph) or lower. That number is 73 percent for injury rear-end crashes and 78 percent for property-damage-only rear-end crashes. Out of the total rear-end crash population, only about 1 percent of fatalities, 5 percent of injuries and 7 percent of property-damage-only crashes happen where the speed limit is 40 km/h (25 mph) or less. If NHTSA were to require collision avoidance only for crashes up to 40 km/h (25 mph), in NHTSA's view only a fraction of fatalities and injuries would be avoided when so many more motorists could benefit. Such an outcome would fall short of meeting the need for safety, as meeting the proposed test speeds is practicable. As detailed in the research section, the 2023 Toyota Corolla Hybrid was able to avoid collision under all testing conditions up to the maximum proposed testing speed requirement for lead vehicle stopped and lead vehicle moving. That same vehicle, when tested for the lead vehicle decelerating scenario with a 12 m headway and 0.5g lead vehicle deceleration, was able to avoid collision in all trials when tested at 50 km/h and was able to avoid collision on two trials and incur impact speeds of approximately 5 km/h and below on the other three trials when tested at 80 km/h (50 mph). If NHTSA were not to require collision avoidance during testing at speeds up to 100 km/h (62 mph), the majority of fatal rear-end crashes would not be prevented.

NHTSA is providing a five-year lead time to push development of the technology while providing time to foster the evolution of it to achieve AEB's life-saving potential. Four out of the six vehicles tested avoided collision during agency testing at 50 km/h subject vehicle to 50 km/h lead vehicle and 12 m and the other two avoided in four out of the five trials. Considering that current AEB systems seem somewhat detuned at higher speeds because they were not designed to this requirement, the agency is encouraged that when engineered to meet this requirement, AEB will be able to avoid collision in a similar fashion as they do now under the 50 km/h condition.

The injury curves and thresholds provided by the commenters show that below 40 km/h (25 mph), there is a reduced probability of AIS3+ injury. With AEB, there is the potential to prevent the crash from occurring in the first place, *i.e.,* to completely mitigate the risk of injury. The technology has proven capable of avoiding collisions during testing at higher speeds. With the potential of AEB technology, its rapid evolution, and the significant lead time this final rule is providing to allow for maturation and deployment of AEB, NHTSA has decided to maintain the no-contact requirement and speed limits at the levels proposed in the NPRM.

As another approach, Honda suggested to test only at what they state are worst case scenarios that pose the highest risk of injury (*i.e.,* impact relative speed) and present the most challenging situations for AEB systems to react quickly (*i.e.,* time to impact). Honda stated that after evaluating

[114] *https://unece.org/transport/documents/2023/06/standards/un-regulation-no-152-rev2*. Other commenters supported harmonizing with UNECE Regulation No. 152, including ASC, Ford, Mitsubishi, and Nissan.

[115] These commenters included HATCI, Nissan, ZF, and Aptiv.

various combinations within the proposed headway distance and lead vehicle deceleration ranges, the worst-case scenarios are for impact relative speed of 72 km/h, time to collision (TTC) of 2.1 sec with a lead vehicle deceleration of 0.5 g, at both the 12 m and 40 m headway distances at 50 or 80 km/h.

In response, NHTSA does not believe that ''worst case'' scenario testing is appropriate for this standard in this final rule. In past NHTSA tests, vehicles sometimes avoided contacting the vehicle test device at higher speed tests but contacted it at lower speeds. A range of tests is necessary to better ensure satisfactory performance of the systems in the real world.

Some Commenters Suggest Reduced Speeds and Repeat Trials To Avoid What They See as Potential Negative Consequences

A number of commenters believed that having to meet the higher end of the proposed speed range will increase the likelihood of negative consequences. Several commenters believed that the higher end of the proposed speed range will increase the likelihood of false positives.[116] Porsche and Volkswagen stated that doubling the relative velocity at which no contact is required, as compared to UNECE Regulation No. 152, may impact the robustness of the system in real-world performance, potentially leading to increased instances of premature or unnecessary braking in the real-world. Aptiv stated that due to the possibility of false positives, NHTSA should reduce testing speeds to 50 km/h (31 mph) and allow repeat trials. Mobileye stated that the proposed requirement will necessitate hardware updates or replacement, and preferred a speed reduction requirement, based on a 2 out of 3 test runs. HATCI stated that NHTSA should follow the AEB voluntary commitment requirements.[117]

Agency Response

One reason the commenters requested lowering the upper speed range for a no-contact requirement was the concern that false activations would increase. In the NPRM, NHTSA stated that the proposed testing requirements are practicable and are intended to avoid and mitigate the most crashes. In the NPRM, NHTSA expressed that AEB systems are undergoing rapid advancement and have been able to achieve collision avoidance at higher testing speeds without major updates. Since the publication of the NPRM, NHTSA research has confirmed that a vehicle (the 2023 Toyota Corolla Hybrid) was able to avoid collision under all testing conditions up to the maximum proposed testing speed requirement for lead vehicle stopped and lead vehicle moving. That same vehicle, when tested for the lead vehicle decelerating scenario with a 12 m headway and 0.5 g lead vehicle deceleration, was able to avoid collision in all trials when tested at 50 km/h and was able to avoid collision on two trials and incur impact speeds of approximately 5 km/h and below on the other three trials when tested at 80 km/h (50 mph).

This vehicle's ability to pass these tests demonstrate that the proposed requirements are practicable and the technology is still evolving. As stated in the NPRM, the expectation for the tested AEB production systems (which were not designed to meet these requirements) was not that they would pass all trials; rather, it was to inform the agency on the practicability of the proposed testing speeds. The fact that a current AEB system is already capable of meeting the AEB requirements confirms the agency's assumption that current AEB systems can be further developed within the lead time provided.

Another area of concern expressed by the commenters was sensor range performance. Honda and Bosch both had concerns about requiring no contact when testing at higher speeds as current AEB systems sensor range makes it difficult for the system to discern objects far enough to achieve no contact and mitigate false positives. In previous agency testing that informed development of the NPRM, for the vehicle that performed the best—according to the publicly available information from the manufacturer—the upgrades to the AEB system from the previous generation included, among others, improved sensor range.[118] As shown by the evolution of the Toyota system, and based on the testing results from the other vehicles which also show significant advancement in collision avoidance, NHTSA is confident that current systems, given sufficient development time, can be engineered to avoid contact and mitigate false positives in a similar manner as the Toyota system.

The request for further development time was raised by the majority of industry commenters, and, as discussed later in this preamble, NHTSA agrees and is providing more time to meet this final rule. Based on the comments received, it seems that the main solution currently employed by manufacturers to mitigate false positives is to detune the system at higher speeds (consistent with current UNECE requirements). Euro NCAP, while not a regulation, employs similar testing at similar speeds as proposed in the NPRM (and adopted by this final rule), and many vehicles achieve a full score on Euro NCAP testing due to their collision avoidance capabilities. This information further reinforces NHTSA's assessment that the proposed testing speeds are practicable and deployable in the real world with sufficient lead time.

Ford stated that harsh braking to avoid high speed collisions can result in rear end collisions based on an internal controllability study with randomly selected drivers in Germany. Based on that study Ford stated there is an increase in rear end collisions resulting from AEB activation above differential speeds of 60 km/h (37.5 mph).

In response, NHTSA was unable to find this study as Ford did not provide any data on it. Thus, NHTSA was unable to evaluate the relevance of Ford's statement to the current rule. The agency observes, however, the proposed requirements do not require hasher braking than currently demonstrated by vehicles compliant with FMVSS No. 135. Further, if all vehicles were equipped with AEB systems conforming to this final rule, it is plausible that no crash would happen.

Comments About Increased Costs as New Hardware is Needed

Mobileye stated that for the stopped lead vehicle, the majority of AEB systems in vehicles today will need a new safety strategy and may need hardware updates/replacements. Therefore, Mobileye states, the assumption that all vehicles have the necessary hardware is not correct.

Agency Response

In response, NHTSA concurs that the cost estimates in the NPRM underestimated the incremental hardware costs associated with this final rule. Accordingly, this final rule has

[116] These commenters included, ASC, Mobileye, Bosch, Ford, Mitsubishi, Honda, the Alliance, Porsche, Volkswagen, HATCI, Rivian, Bosch, and Aptiv.

[117] The voluntary commitment included automatic braking system performance (CIB only) able to achieve a specified average speed reduction over five repeated trials when assessed in a stationary lead vehicle test conducted at either 19 or 40 km/h (12 or 25 mph). To satisfy the performance specifications in the voluntary commitment, a vehicle would need to achieve a speed reduction of at least 16 km/h (10 mph) in either lead vehicle stopped test, or a speed reduction of 8 km/h (5 mph) in both tests.

[118] *https://www.jdpower.com/cars/shopping-guides/what-is-toyota-safety-sense,* accessed November 13, 2023.

adjusted the estimates presented in the NPRM to include the costs associated with software and hardware improvements, compared to the baseline condition. Incremental costs reflect the difference in costs associated with all new light vehicles being equipped with AEB with no performance standard (the baseline condition) relative to all light vehicles being equipped with AEB that meets the performance requirements specified in this final rule. The Final Regulatory Impact Analysis (FRIA) provides a detailed discussion of the benefits and costs of this final rule.

Comments About the Effect of Test Speed on Evasive Steering

When a driver is alerted to an impending crash, the driver may manually intervene by, for example, applying the vehicle's brakes or making an evasive steering maneuver, to avoid or mitigate the crash. Several commenters believed that the agency should ensure that all final test conditions (especially at higher test speeds) would preserve steering intervention or other intentional driving behavior regarding the TTC intervention times.

A number of commenters believed that at higher testing speeds, AEB could interfere with evasive steering maneuvers.[119] Honda stated that AEB should only intervene when a collision is otherwise unavoidable and is designed to intervene as late as possible to mitigate injury and not interfere with evasive or normal driver steering maneuvers. Honda stated that differentiating between those situations where steering is more appropriate than emergency braking is critical when considering the unintended consequences of AEB. Honda believed that, under the proposed speeds, AEB intervention will be forced to occur before the driver might steer, hindering the driver's appropriate and intended response in real-world higher speed scenarios.

The Alliance stated that, based on a NHTSA study,[120] the time required to avoid impact by steering or braking are equal at approximately 35 kph and 0.61 seconds and that above 35 kph, avoidance though braking begins to require increasingly more time than steering. Drivers are generally more likely to initiate braking to avoid striking an object at speeds below 44 kph and are more likely to initiate steering to avoid impact above 44 kph. The Alliance stated that the driver will typically initiate their maneuver before 1.7 seconds TTC and therefore, any ''no-contact'' requirement for AEB at higher speeds will necessitate activating AEB before the driver has an opportunity to steer around the threat when a steering maneuver would be more effective. Similarly, Toyota stated that NHTSA should define a maximum speed for the lead vehicle AEB testing with no manual brake application, of no greater than 60 km/h for the ''no-contact'' requirement, due to the potential effect of evasive steering and the timing of AEB activation.

Agency Response

NHTSA has considered the comments but does not find the arguments relating to evasive steering compelling. AEB intervention is a last resort crash avoidance maneuver, and it does not seem reasonable to assume that a driver who is inattentive until moments before a crash will reengage and be able to perform a safe steering maneuver that would not jeopardize other traffic participants. The information provided by Honda, Toyota, and the Alliance seem to consider only the timing required for a vehicle to brake to a complete stop versus the timing of a steering maneuver, without considering any other factors. Such factors as vehicle dynamics, traffic conditions, and traffic participants all influence the safety benefit of a steering avoidance maneuver. While NHTSA does not encourage aggressive and unsafe driving behavior as shown in that example, we do note that because the test procedures involve manual braking, disengagement of AEB cannot happen solely due to brake application. Nothing in our standard, however, requires a manufacturer to suppress steering. A manufacturer, outside of the testing requirements, may elect to detune or disengage the AEB system based on an emergency steering maneuver as long as they meet all the AEB requirements.

The type of roadway (two lane, divided, interstate) is an important factor in assessing whether a steering maneuver is appropriate, as is the traffic on such roadways. It seems unreasonable to expect that, except for very specific situations such as when an adjacent lane exists and is empty, a disengaged driver could perform any type of steering maneuver safer than stopping in the lane.

In normal driving situations, rear end crashes frequently happen in heavy traffic where crash avoidance maneuvers from automatic or manual steering could cause the vehicle to either depart the road, collide with a vehicle in the adjacent lane, or, on an undivided two-lane road, cause a head-on frontal crash. Further, research referenced by Porsche in their comments shows that overwhelmingly, drivers either brake, or brake and steer, when presented with a surprise obstacle catapulted from the side.[121] In this research, when the obstacle was presented to the drivers at a TTC of 1.5s, with the adjacent lane free of obstacles and the drivers had the opportunity to avoid a collision by steering alone, 43 percent of participants attempted to avoid by braking alone. The other 57 percent of participants tried to avoid the collision by braking and steering, while no participant tried to avoid contact by steering alone.

At a TTC of 2.0 s, 46 percent of participants tried to avoid by braking alone, 38 percent by braking and steering, and 15 percent by steering alone, while at a TTC of 2.5s 72 percent of participants tried to avoid by braking only, 14 percent tried to avoid by braking and steering, and 14 percent tried to avoid by steering alone.

This research found that only at TTCs later than two seconds did drivers attempt to avoid only by steering alone, which suggests that drivers were not comfortable steering to avoid the presented object at the speed they were traveling without braking, further reinforcing the agency's assertion that braking in lane is appropriate. Looking at these results and considering that this research was performed with a surprise object catapulted from the side (which induces a preference for drivers to avoid by steering), it is clear that drivers are more inclined to brake in an emergency. Additionally, drivers brake even as they attempt a steering maneuver, which can lead to unstable vehicle dynamics. This serves to reinforce the agency's findings that a brake in the lane maneuver, even if it occurs early, before a TTC of 1.5s, is the safest, most appropriate, maneuver.

The other situation where steering may be more appropriate, according to the commenters, is an engaged driver who consciously decides to avoid by steering. The steering avoidance maneuver by an engaged driver as shown by HATCI in their comment would still present a higher safety risk than a brake in the lane maneuver. In that example, a vehicle avoids the lead vehicle by cutting in front of a vehicle

[119] These commenters included ASC, Mobileye, Bosch, the Alliance, HATCI, Ford, Mitsubishi, Porsche and ITS America.

[120] *Forward Collision Warning Requirements Project Final Report—Task 1 (DOT HS 809 574)—January 2003.*

[121] Emergency Steer and Brake Assist—A Systematic Approach for System Integration of Two Complementary Driver Assistance Systems (Eckert, Continental AG, Paper Number 11–0111), *https://www-esv.nhtsa.dot.gov/Proceedings/22/files/22ESV-000111.pdf.*

on the adjacent lane. NHTSA fails to understand how such a maneuver is safe for any of the vehicles involved, especially considering the likelihood that other vehicles would be in the adjacent lanes. A subject vehicle darting out of its lane into an adjacent lane could result in a different type of crash.

3. Headway

Comments

A key test parameter for the lead vehicle AEB tests is the initial headway [122] between the subject vehicle and the lead vehicle. Several vehicle and equipment manufacturers opposed the proposed headway conditions (12 m at 80 km/h) in decelerating lead vehicle AEB tests.[123] They stated that the proposed headway requirement is not practical because the short headway values at high relative speeds go beyond the capabilities of current AEB systems. Volkswagen, Porsche, Rivian, and others argued that the low headway conditions at high relative speeds may increase false positive rates, leading to phantom braking because earlier braking means the system looks further ahead, both in space and in time. (Hence, commenters stated, the probability for a collision is estimated at a lower accuracy value and this may lead to a false positive activation.)

Many commenters believed the 12 m proposed headway at 80 km/h is a very close following distance that would equate to an unsafe following distance in the real world and that AEB systems are not designed to account for this type of ''misuse'' by the driver. In addition, they believed that compliance with a no-contact requirement would require immediate emergency braking at maximum deceleration, which, the commenters stated, would result in an uncontrollable safety hazard for following traffic. Volkswagen and Porsche suggested removing the 12 m headway at the 80 km/h scenario from the decelerating lead vehicle tests and aligning with the requirements of UNECE Regulation No. 152.[124] Similarly, Mitsubishi suggested 23 m as the minimum headway because the proposed minimum headway distance (12 m) is considered close enough to issue an FCW even with minimal deceleration of the subject vehicle. MEMA and Bosch suggested a headway greater than 16 m and a time gap greater than 0.2 seconds at 80 km/h to create a more representative test scenario that resembles a constant following distance. Mobileye stated that the headway of the 12 m in decelerating lead vehicle test scenario at 80 km/h is around 0.5 s which, the commenter believed, was not realistic because research data showed that the median headway time across 10 different sites was 1.74 s.

Agency Response

The agency disagrees with Volkswagen and other manufacturers that the lower bound (*i.e.,* 12 m) of the headway range is not practicable for the current AEB systems at a high speed (*e.g.,* 80 km/h). NHTSA discussed in the NPRM that 4 out of 11 vehicles in the agency's 2020 AEB research met the no-contact requirement of this rule when the subject vehicle and lead vehicle were traveling at 72.4 km/h (45 mph) with an initial headway of 13.8 m (45 ft). The deceleration of the lead vehicle was 0.3 g. This research also included decelerating lead vehicle testing at 56.3 km/h (35 mph) with a deceleration rate of 0.5 g.

In the NPRM, NHTSA tentatively concluded that the current lead vehicle AEB systems would be able to meet the most stringent headway requirement (*i.e.,* 12 m) if their perception software was properly tuned for the higher lead vehicle deceleration (0.5 g). The agency's MY 2023 AEB research supports this.[125] The test results demonstrated that one of the six vehicles was able to meet the requirements of this standard in all five trials at 80 km/h with the initial headway of 12 m and the lead vehicle deceleration of 0.5 g. Another vehicle was also able to meet the test requirements in 2 out of 5 trials for the same test speeds.

In their comment, Honda stated that the worst-case scenarios for impact relative speed (72 km/h) are accomplished with a lead vehicle deceleration of 0.5 g at the 12 m headway distance. Given the performance of these two vehicles in the most difficult testing scenario, NHTSA continues to believe that the headway specifications of this final rule—any distance between 12 m (39.4 ft) and 40 m (131.2 ft)—are within the capabilities of the AEB systems designed to comply with this final rule.

As for the potential increase of false positive rate raised by Volkswagen, Porsche and Rivian, false positive activation that causes an unreasonable risk to safety is a defect issue. Vehicle manufacturers are responsible for mitigating and resolving any defects in their vehicle products. Here, the concern is based on a hypothetical situation where a vehicle at a high speed with a small headway (*e.g.,* 12 m) may prematurely activate the AEB system—forcing initiation of early braking—when there is not a true risk of an imminent collision. At 80 km/h (50 mph), a headway of 12 m is uncomfortably close to a crash imminent situation and the agency feels strongly that it is difficult even for an attentive driver to react properly to avoid a crash in this scenario, especially with a lead vehicle braking above 0.3g. It is up to manufacturers to design their AEB systems to deal with situations where the driver is following close to the vehicle in front of it, and the lead vehicle decelerates between 0 and 0.3 g. They must determine what is a false positive and what is an actual positive.

As for replacing the current range requirements for headway with discrete values, NHTSA disagrees with Honda and Volkswagen that the range requirements require infinite number tests and cause unreasonable test burden to manufacturers. The agency noted in the NPRM that the use of a range of potential values allows NHTSA to ensure that AEB system performance remains consistent, as conditions—in this case headway—vary within the bounds of the range. NHTSA has observed that some lead vehicle AEB systems performed well under high speed or shorter headway scenarios, but did not perform as well under lower speed or longer headway scenarios. This type of performance inconsistency is why the agency proposed a range of values, and not just discrete values.

The current range headway provides manufacturers an understanding of the performance the FMVSS requires. Manufacturers have the ability and flexibility to decide how they can certify that a given AEB system complies with the requirements contained in this final rule. This includes the number and types of tests needed to ensure that an AEB system works throughout the proposed range. The agency is providing notice of how we test a vehicle's compliance. For these reasons, NHTSA believes that the headway range requirements do not cause an unreasonable test burden.

Accordingly, NHTSA declines to amend the range of headway specifications in decelerating lead vehicle AEB tests. This final rule adopts that the headway specifications in

[122] Headway refers to the distance or interval of time between vehicles moving in the same direction on the same route.

[123] These commenters included Volkswagen, Porsche, Mitsubishi, Rivian, Honda, MEMA, Bosch, and Mobileye.

[124] That regulation currently requires full collision avoidance up to 40 km/h relative speed between the subject and lead vehicle.

[125] NHTSA's 2023 Light Vehicle Automatic Emergency Braking Research Test Summary, available in the docket for this final rule (NHTSA–2023–0021).

decelerating lead vehicle AEB tests to include any distance between 12 m (39.4 ft) and 40 m (131.2 ft) as proposed in the NPRM.

4. Lead Vehicle Deceleration

The decelerating lead vehicle scenario is meant to assess the AEB performance when the subject vehicle and lead vehicle initially are travelling at the same constant speed in a straight path and the lead vehicle begins to decelerate. NHTSA's proposed lead vehicle AEB tests included parameters for the deceleration of the lead vehicle.

Honda expressed concern that the proposed rule included a broad range of parameters for lead vehicle deceleration (ranging from 0.3 to 0.5 g). It further stated that testing a theoretically infinite number of combinations within the proposed range is impractical. Honda suggested that the proposed range of deceleration values should be replaced with discrete nominal test values for lead vehicle AEB deceleration tests.

In response to Honda, NHTSA believes that the targeted average deceleration is best represented by a bounded range, rather than a discrete value, to better evaluate vehicle performance. During agency testing, NHTSA has observed vehicles that may perform well at the upper and lower bounds of a performance range, yet inconsistently perform in the middle of a performance range. The agency believes that specifying a bounded range of 0.3 g to 0.5 g will better ensure consistent performance of AEB systems in real world situations than if a discrete value were specified. Further, the test procedures of this rule provide information regarding how the agency will conduct tests. Manufacturers have the flexibility to certify the compliance of their vehicles using reasonable care, and are not required to conduct testing as the agency does if the vehicle passes when tested by NHTSA as specified in the standard. Therefore, this final rule adopts the average deceleration range proposed in the NPRM.

Humanetics commented that the provision related to ''targeted deceleration'' should state that the deceleration is maintained until the speed is below a target value (such as 1 km/h) and that the regulatory text ''250 ms prior to coming to a stop'' in proposed S7.5.3a should be replaced with ''the lead vehicle speed is reduced to 1 km/h.''

NHTSA disagrees with the comment. When determining the targeted average deceleration, the agency has specified that the targeted deceleration will occur within 1.5 sec of lead vehicle braking onset, giving the lead vehicle time to reach the desired deceleration. As the vehicle comes to a stop, the acceleration profile becomes noisy and is not reflective of the actual deceleration observed through most of the test. Thus, the agency proposed that the last 250 milliseconds (ms) of the vehicle braking before coming to a stop are not used in the calculation of the targeted average deceleration. Changing this threshold to be a speed measurement, as suggested by Humanetics, would change the end of test parameter to allow for contact and would not address the noise in the deceleration as the vehicle comes to a stop. (This metric is consistent with how NCAP currently performs AEB testing.) NHTSA concludes that the metric does not need additional clarification and thus declines to replace the current time-based provision with a speed-based protocol.

5. Manual Brake Application

NHTSA proposed lead vehicle AEB performance tests that included parameters for the manual brake application made to the subject vehicle.

NHTSA received several comments from vehicle and equipment manufacturers on the provisions. Porsche and Volkswagen stated that NHTSA should provide additional clarity specific to the brake robot application, particularly regarding proposed S10 specific to the set-up and calibration of the braking robot and the rate of brake pedal application. Hyundai suggested removing the manual braking tests and replacing them by a statement in FMVSS No. 127 to the effect that, ''A driver's manual activation of the brake pedal shall not impair the operation or effectiveness of AEB.'' ASC sought further clarification regarding the manual brake application profile. Humanetics believed that the tolerance was too tight in proposed S10.4 that brake pedal force is to be maintained within 10 percent of the commanded brake pedal force. Humanetics encouraged NHTSA to adopt a wider tolerance, such as allowing an applied force within 25 percent of the commanded force, while also allowing shorter duration forces (less than 200 ms) that may exceed the 25 percent tolerance.

This final rule adopts the NPRM's proposed specifications for the manual braking conditions. It also includes a third brake control option that a manufacturer may choose.

The agency disagrees with Hyundai that the purpose of the manual braking conditions can be achieved by the suggested statement. The tests with manual braking application are different from the lead vehicle AEB tests without manual braking. First, manual braking tests are conducted at a higher range of subject vehicle speed, at any subject vehicle speed between 70 km/h (43 mph) and 100 km/h (62 mph) for both the stopped and slower-moving lead vehicle scenarios, than that of corresponding AEB tests without manual braking application. Second, the tests with manual braking application represent two different real-world situations. The first represents a driver that reacts to the FCW and re-engages in the driving task by applying the brake (although with insufficient force to prevent a collision). In this case, the vehicle must be capable of recognizing that the driver has failed to provide adequate manual braking and supplement it with automated braking force. The second represents a driver who re-engages very late in the AEB event. The test ensures that the act of late manual braking does not disrupt or disengage crash imminent braking functionality.

The language suggested by the commenter considers only this second condition and not the first. Additionally, Hyundai did not provide a metric for ensuring that this performance could be met using their proposed language. Therefore, NHTSA declines to remove the manual braking test conditions in the lead vehicle AEB tests of this final rule.

Regarding the specifications for the braking robot, the agency notes that both Porsche and Volkswagen requested more detail but neither explained the issues they faced, or what is needed in terms of additional information. Both manufacturers have experienced braking robots in other AEB testing. In the proposal, NHTSA stated that either a displacement braking controller or a hybrid braking controller (braking robot) could be used, at the manufacturer's discretion, and proposed requirements for the performance of these two styles of controllers. Additionally, the agency imposed no limitations on how manufacturers can self-certify. Thus, manufacturers, who have the best knowledge of their AEB systems, are free to choose a braking method (type of braking controller, human test driver, etc.) that best serves their needs to certify their vehicles. As Porsche recognized, various brake robots are available with different specifications. A manufacturer can easily select the one that is most appropriate for testing its AEB system. Therefore, NHTSA concludes it is unnecessary to specify a single brake controller or braking robot.

ASC sought further clarification regarding the tests that require manual brake application on the manual brake

application profile. It specifically highlighted the time for driver reaction, movement of foot brake pedal application, and build system pressure. They also highlighted that 1.2 seconds after an FCW would be a typical driver response time according to Euro NCAP.

As stated in the proposal, brake pedal application onset occurs 1.0 ± 0.1 second after the forward collision warning onset, thus, the driver response time is approximately one second. The agency does not have data showing that a reaction time of 1.2 is more appropriate. Specifics such as the movement of foot brake pedal application and system pressure are best not stipulated as absolutes, as they may change based off each brake system and in-vehicle brake controller. The agency believes it has provided sufficient notice for manufacturers to understand how NHTSA will test.

ASC also sought information on how the agency determines brake pedal application onset. NHTSA does not believe that specifying a minimum brake pedal displacement, along with a minimum level of force applied to the pedal is necessary. To displace the pedal at all requires a minimum amount of force. The agency believes that 11 N (2.5 lbf) of force is small enough to be easily achieved by a driver or controller, and large enough to show intent to brake. Thus, the agency is not adopting a change to the brake pedal application onset.

ASC highlighted that NHTSA had not considered braking systems using force feedback. The agency agrees that a force only feedback controller will provide another useful method of brake application. As such, the final rule includes this third brake control option that a manufacturer may choose. It is substantially similar to the hybrid controller with the commanded brake pedal position omitted, leaving only the commanded brake pedal force application. The force feedback brake pedal application applies the force that would result in a mean deceleration of 0.4 g in the absence of AEB activation.

6. Testing Setup and Completion

The NPRM proposed that the subject vehicle and lead vehicle speeds are maintained within 1.6 km/h, the travel paths do not deviate more than 0.3 m laterally from the intended travel path, and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. MEMA and ASC suggested that the lane positioning requirements should be harmonized with UNECE Regulation No. 152, *e.g.,* 0.2 m not 0.3 m permitted lateral variance. Humanetics suggested that NHTSA use more strict tolerances for the subject vehicle, to increase repeatability. Humanetics also stated that as the yaw rate is quite a noisy signal, a filter should be used for the lead and subject vehicles. Humanetics further suggested that the agency should consider currently accepted tolerances to test speeds and other test parameters in defining these FMVSS tests.

In response, NHTSA disagrees with the commenters that a tighter tolerance is needed. The agency's specification is in line with previous NHTSA testing. As for requiring a smaller tolerance for vehicle speed and providing additional tolerances for a target carrier, the agency disagrees with Humanetics that the tolerance specified is excessively large for attaining repeatable and reliable testing. NHTSA does not have any data showing that manufacturers cannot meet these tolerances, nor that the tolerances proposed induce testing failures. Additionally, requiring a tighter tolerance is not representative of expected on road conditions. Accordingly, the agency does not see value in providing tighter tolerances.

NHTSA also notes that the agency proposed tolerances for where the lead vehicle will be positioned and operated during the performance tests. NHTSA is concerned that adding more tolerances to the carrier system that drives the vehicle test device would overly constrain the testing set up. Lastly, ISO 19206–7 is in draft form and is yet to be finalized. As such, it would be premature to incorporate the document into this final rule. Given the above, the agency declines to change lane positioning requirements or adopt additional tolerancing.

Regarding test completion, the NPRM proposed that, ''The test run is complete when the subject vehicle comes to a complete stop without making contact with the lead vehicle or when the subject vehicle makes contact with the lead vehicle.'' The Alliance stated that, for the slower-moving vehicle scenario, imposing a full braking requirement may not be appropriate if the target/lead vehicle were to continue to move (or if a stopped vehicle were to move again under real-world conditions). The commenter suggested that test completion be defined as ''the instance when the subject vehicle speed is equal or less than the lead vehicle speed without making contact with the lead vehicle, or when the subject vehicle makes contact with the lead vehicle.''

In response, NHTSA notes that the NPRM addressed the Alliance's concern in the proposed test procedures in proposed S7.4.4. This final rule adopts the proposed test completion criteria—''test run is complete when the subject vehicle speed is less than or equal to the lead vehicle speed''—for slower moving lead AEB tests as proposed.

Bosch suggested NHTSA consider setting parameters to define a ''valid run'' with respect to pedal and steering inputs to maintain tolerance on approach. Bosch stated that they encountered testing cases where an overly narrow definition of the calibration tolerances of the robot has interfered with the system reaction. Bosch also commented that, depending on the robot mode and type of vehicle brakes utilized, interference with the ADAS systems may occur. Bosch suggested the adoption of tolerances outlined in UNECE Regulation No. 152 for performance testing, with the aim of promoting standardized and realistic evaluations of automotive safety systems.

In response to Bosch's suggestion to define what a valid run is, NHTSA highlights the position and speed specifications for testing as stated in the NPRM that beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs. Additionally, the subject vehicle heading is maintained with minimal steering input such that the travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. Bosch provided no additional information as to the inadequacy of NHTSA's proposed specifications for how the lead vehicle and subject vehicle respond prior to subject vehicle braking. Additionally, Bosch did not identify specific inadequacies in the braking controllers specified for use with manual braking

As for the proposed triggering times/TTCs (related to the ''beginning of tests''), the ASC stated that different test procedures in the NPRM specify different triggering times/TTCs (*e.g.,* three (3) seconds in S7.5.2, four (4) seconds in S8.2). ASC suggested that the trigger time period be standardized for all test scenarios.

The agency disagrees with this TTC suggestion. NHTSA selected appropriate test procedures, including triggering times, for each test scenario based on its unique features. For example, a three-second triggering time in a decelerating lead vehicle AEB test (S7.5.2) is selected to provide sufficient time to align a subject vehicle with a lead vehicle and to set a proper headway between the vehicles. On the other hand, a four-second triggering time in a PAEB test (S8.2) is selected to estimate an initial headway between a subject vehicle and

a pedestrian surrogate. As such, these triggering times represent unique features of two different tests. There are reasons not to standardize a triggering time to use across all lead vehicle and pedestrian AEB test scenarios.

ASC sought clarification on the accelerator pedal release process when the vehicle cruise control is active. In response, as stated in the NPRM, when cruise control is active the pedal release process is omitted as the accelerator pedal is already released. The agency expects an equivalent level of crash avoidance or mitigation regardless of whether cruise control is active.

7. Miscellaneous Comments

Mobileye stated that in some cases of target deceleration, the robot deceleration will be enough, or close enough, to avoid a collision. Mobileye stated that, in cases where the collision speed is very small, the AEB system can cause a nuisance event by a slight modification of the braking power by the driver. Mobileye suggested a more deterministic approach for these test scenarios which will result in a collision speed above 10 kph when using the robot 0.4 g deceleration.

In response, NHTSA does not specify the level of deceleration that the AEB system needs employ to safely bring the vehicle to a stop. In fact, during testing, the agency has observed that while some vehicles employ late and harsh braking as described by Mobileye, more refined AEB systems do not perform in such a manner.[126] As shown by Mobileye, to resolve the example they provided, only a slight additional deceleration, to further reduce the subject vehicle speed of 6.3 km/h, is needed to avoid the collision without harsh braking.

Bosch suggested NHTSA consider employing the term ''stationary vehicle'' as used in the UNECE Regulation No. 152 specification, instead of ''stopped,'' to promote uniformity and consistency in automotive safety terminology with existing standards and specifications. Bosch believed the distinction is crucial for some AEB systems as ''stopped'' vehicle implies that the vehicle was in motion immediately before the sensors have detected the Vehicle Under Test (VUT). Bosch suggested using the term ''stationary'' instead of ''stopped'' to align with existing standards and avoid any potential misinterpretations about the VUT as moving.

NHTSA does not agree with Bosch that the term ''stopped lead vehicle'' should be amended to ''stationary vehicle.'' The standard's test procedures clearly specify how the lead vehicle test device is placed (see, S7.3.2 of the proposed regulatory text) (''the lead vehicle is placed stationary with its longitudinal centerline coincident to the intended travel path'') and does not lend itself to potential misinterpretations. The term stopped, used in this requirement, is consistent with the agency's practices in previous AEB research and in the current U.S. NCAP.

NHTSA received several comments regarding test speeds as applied to vehicles equipped with ADS. The Alliance, AVIA and Zoox suggested that compliance testing be limited to the maximum speed that an ADS-equipped vehicle can achieve within its operational design domain. AVIA commented that some ADS-equipped vehicles have top speeds below those required in the Lead Vehicle AEB Collision Avoidance test parameters, and therefore suggested modifying the test parameters such that they can be met when an ADS-equipped vehicle operates at its highest speed if that speed is lower than the originally proposed subject and lead vehicle speeds. Zoox commented that an ADS may ''refuse'' to drive at 80 km/h at a following distance of 12 m or at 80 kph between two parked cars because this behavior does not align with its more conservative driving parameters.

In response, by including a maximum speed of 90 mph in this final rule, NHTSA is not requiring that manufacturers design their vehicles to be capable of driving 90 mph. Similarly, NHTSA is not requiring that Zoox design its ADS to operate at 90 mph. Instead, NHTSA may test the vehicle at the maximum speed the vehicle can achieve in its operational design domain. However, if the speed limitation in Zoox's vehicles are solely due to ADS programming and the vehicle itself is not speed limited, then Zoox must certify compliance to all speeds up to the maximum speed its vehicles are capable of being driven. As an example, if Zoox's ADS is programmed to drive at speeds up to 45 mph, but the vehicle has functionality that would allow it to be driven at speeds up to 90 mph, then Zoox must certify that AEB operates as required by this final rule at speeds up to 90 mph.

Regarding proposed subject vehicle specifications, an anonymous commenter stated that they found some of the procedures and criteria to be unclear or confusing in the NPRM. They stated that NHTSA should provide more diagrams and figures to clarify the test procedures and criteria.

In response, NHTSA believes that the NPRM provided sufficient information to the public to understand the requirements of the proposed standard. The agency included many figures, diagrams, and tables, that highlighted and explained key information. These figures, coupled with the detailed testing scenarios and test track conditions, adequately describe the rulemaking and the performance NHTSA is requiring by issuing FMVSS No. 127.

I. Procedures for Testing PAEB

This section describes the pedestrian AEB performance tests adopted by this final rule. After considering the comments to the NPRM, NHTSA has adopted the proposed procedures tests with a few minor revisions to some parameters and definitions, to clarify details of the test procedures. Importantly, NHTSA has increased the lead time to meet the requirements by providing a five-year lead time.

This section responds to the comments and explains NHTSA's reasons for adopting the provisions set forth in this final rule. For the convenience of readers, a list of the test specifications can be found in appendix B to this final rule preamble.

The pedestrian AEB performance tests require AEB systems to provide a forward collision warning (FCW) and automatically apply the service brakes at all forward speeds above 10 km/h (6 mph) to avoid an imminent collision with a pedestrian.[127]

The test scenarios required for PAEB evaluation fall into three groups of scenarios based on how NHTSA will apply the pedestrian test device—crossing path, stationary and along path. For each test conducted under the testing scenarios, there are the following provisions within those testing scenarios: (1) pedestrian crossing (right or left) relative to an approaching subject vehicle; (2) subject vehicle overlap (25% or 50%); [128] (3) pedestrian obstruction (Yes/No); and, (4) pedestrian speed (stationary, walking, or running) (V_P).

NHTSA will select further parameters from a subject vehicle speed range (V_{SV}) and the lighting condition (daylight, lower beams or upper beams). The

[126] *https://www.regulations.gov/document/NHTSA-2021-0002-0002.*

[127] The FCW and brake application need not be sequential.

[128] Overlap describes the location of the point on the front of the subject vehicle that would contact a pedestrian if no braking occurred. It refers to the percentage of the subject vehicle's overall width that the pedestrian test mannequin traverses. It is measured from the right or the left (depending on which side of the subject vehicle the pedestrian test mannequin originates).

subject vehicle's travel path in each of the test scenarios is straight.

1. Scenarios

Request To Add Scenarios

Many commenters suggested additional scenarios in PAEB testing.[129] Commenters urged NHTSA to include test devices representative of bicyclists and other vulnerable road users (VRUs), such as motorcyclists. A number of commenters recommended expanding additional scenarios involving pedestrians, such as older adult pedestrians who may walk slower than 3 mph, persons with disabilities, a running adult from the left scenario with dark lower beam or upper beam, pedestrians crossing from both directions, or pedestrians traveling against traffic.

NHTSA is highly interested in having PAEB address more scenarios, road users, and pedestrians than the scenarios covered by this final rule. NHTSA explained in the NPRM that the agency is actively conducting research to characterize, among other matters, the performance of AEB systems in response to bicycles and motorcycles, in both daylight and darkness conditions. However, the state of knowledge is not at the point where NHTSA can proceed with including bicycle and motorcycle surrogates in the new standard at this time. To illustrate, preliminary testing discussed in the NPRM identified issues with the design of the bicycle and motorcycle surrogates and their effect on the vehicles under test, indicating a need to learn more about these devices.[130] NHTSA is continuing its research to learn more, and present and future studies may well result in efforts to define test procedures, refine the bicycle and motorcycle surrogate devices, and characterize AEB system performance for possible incorporation into the FMVSS.

NHTSA proceeded with this rulemaking because it has the information needed to support an NPRM and final rule on the pedestrian behaviors addressed by the rule. Less is known about additional pedestrian behaviors to which commenters refer. NHTSA does not have the research necessary to determine well-reasoned and practicable performance requirements for the full range of travel behaviors pedestrians employ. Because developing the technical underpinnings and assessing the feasibility of potential further countermeasures need more time, NHTSA is adopting the PAEB test procedures proposed in the NPRM as a sound first step.

Request To Remove PAEB Scenarios

The Alliance requested that NHTSA not include the test of the stationary pedestrian test in nighttime conditions (S8.4). The Alliance stated that an analysis of real-world data from NHTSA's FARS database showed that fewer than 5 percent of stationary pedestrian crashes occur in dark, or low light, conditions, which is substantially lower than the other scenarios evaluated in the NPRM. The Alliance stated that the complexity in designing countermeasures is increased, particularly for vision-based systems, in discerning non-moving objects that may resemble the human form in low light conditions at high speed. The Alliance expressed concerns that this requirement would force the installation of additional sensors to verify the presence of an object in the roadway. The Alliance stated that this scenario has additional cost implications and underscores that meeting the requirements of the rule is not as straightforward as the agency suggested.

Similarly, MEMA questioned if crash data support the stationary pedestrian test, because the commenter believed it is unlikely a pedestrian would be completely stationary and without movement in any real-world condition. MEMA further stated that this test increases the probability of false activation from other stationary roadside objects. MEMA suggested that the moving along path scenario addresses real-world scenarios.

In response, NHTSA declines this request to eliminate the stationary pedestrian in nighttime conditions test. The commenters addressed the size and existence of the safety problem, with the Alliance providing an analysis showing that the standing pedestrian scenario comprises 5 percent (479 lives) of unlit nighttime crashes between 2014 and 2021. The unlit nighttime testing is designed to test a worst-case scenario, where there is no appreciable light other than that generated by the vehicle to aid in the detection of a pedestrian.[131] While the stationary position of the pedestrian test mannequin adds to the challenge of the test, real pedestrians encounter these potential dual dangers of darkness and stillness every day in the real world. NHTSA testing, discussed in the NPRM, has shown that AEB performance is reduced when testing the stationary scenario as compared to the along path scenario. Given the certainty that there are pedestrians outside in the dark each day, the likelihood that they may be stationary at times and not always in motion when a vehicle approaches, and the certainty of their vulnerable status vis-à-vis the vehicle (even low-speed vehicle impacts with pedestrians can result in fatalities and serious injuries), NHTSA believes that eliminating the test would not be reasonable. This is particularly so given that meeting the requirement is practicable.[132] Further, even if the agency accepts the Alliance analysis and interprets in a similar manner ''standing'' as equivalent to stationary during PAEB testing, NHTSA believes that the almost 50 annual fatalities over 8 years of data lends support for adopting the proposed test.

Ford believed that some tests are redundant and requested their removal. Ford recommends the removal of daytime 50 percent overlap crossing use cases as this will be 25 percent redundant with crossing use cases, as well as removing either the in-path stationary or moving scenarios which, the commenter believed, are redundant to each other.

In response, NHTSA does not agree the tests are redundant. Testing with a 25 percent overlap is more stringent than the 50 percent overlap test, as the pedestrian is exposed to the vehicle for a shorter amount of time. However, the 50 percent overlap test assesses a different scenario than the 25 percent overlap test. In the 50 percent overlap test, the vehicle comes upon the pedestrian later in the event. NHTSA is retaining the 50 percent overlap test, and the other mentioned tests, to ensure that PAEB systems are tuned to detect pedestrians across a wide and reasonable range in the roadway.

Lack of Dynamic Brake Support (DBS) Testing in PAEB Scenarios

Unlike for lead vehicle AEB, NHTSA did not propose that the AEB system supplement the driver's brake input with a dynamic brake support system. This is because NHTSA believes that, due to the sudden succession of events in a potential collision between a

[129] These commenters included NTSB, Advocates, the League, AMA, APBP, NSC, Forensic Rock, Consumer Reports, CAS, Radian Labs, AARP, NSC, America Walks, APBP, AARP, United spinal, Radian Labs, Adasky, VRUSC, AFB, Humanetics, and PVA.

[130] This report is expected to be completed within 2024.

[131] NHTSA expects that this performance will also be representative of, and beneficial to, nighttime conditions where brighter ambient light conditions exist.

[132] NHTSA's 2023 testing demonstrated that six out of six vehicles were able to fully meet the stationary requirements in both daylight and upper beam nighttime scenarios. The testing showed that half of the vehicles tested also were able to fully meet the proposed requirements for the lower beam nighttime scenario.

vehicle and a pedestrian, particularly for the pedestrian crossing path scenarios, a driver is unlikely to have enough time to react to the crash imminent event, and the vehicle will brake automatically without driver input. Further, NHTSA stated that it anticipates that AEB system designs would include DBS.

Advocates commented that NHTSA should either state that manual braking alone is insufficient to interrupt the AEB functionality or include testing of DBS functionality in the PAEB scenarios. AARP commented that it is important that the PAEB system function regardless of the characteristics of the vehicle's driver, and testing should reflect predictable variations such as those that result from the characteristics of older drivers.

In response, NHTSA is declining to add a manual braking test for pedestrians in this final rule. As stated in the NPRM, NHTSA expects that manufacturers will include this functionality when approaching a pedestrian. While the agency does not test PAEB with manual brake application, it does not make any distinction as to when AEB is required based on manual brake application. Thus, an AEB system tested for manual brake application under lead vehicle AEB testing will function in the same manner when approaching a pedestrian.

The agency also decided to test PAEB only without manual brake application due to the timing of crashes involving pedestrians, as it is not realistic to expect a quick enough response from a driver when presented with a warning to mitigate a collision under the proposed testing scenarios. NHTSA testing for lead vehicle AEB is premised on data that often an engaged driver does not brake enough to avoid a collision when presented with an FCW. However, the timing of a crossing path pedestrian scenario in some cases does not afford the ability to warn a driver and wait for a driver response. This difference between the lead vehicle and pedestrian crash scenarios renders requiring a manual brake application inappropriate for PAEB.[133] As such, the agency is declining to add a manual braking test for pedestrians at this time.

Lack of 25 Percent Overlap for PAEB Scenarios in Dark Conditions

Several comments suggested including PAEB performance tests with 25 percent overlap in dark conditions. Advocates requested that testing requirements at 25 percent overlap be included in the proposal, as a quarter of the vehicles tested by NHTSA in a limited study included such capability. Luminar stated the proposed PAEB testing overlap is arbitrary since the NPRM proposes PAEB testing at 25 percent overlap, but only 50 percent overlap for other scenarios, including some nighttime tests.

In response, as discussed in the NPRM, NHTSA declined to add the 25 percent overlap scenario for nighttime pedestrian AEB because it is not practicable at speeds relevant to the safety problem. The final rule has more benefits when pedestrian avoidance is tested at a more stringent and higher speed 50 percent overlap scenario.

NHTSA disagrees with Luminar that the overlap scenarios are arbitrary. UNECE Regulation No. 152 specifies the pedestrian target's positioning at the same location as a 50 percent overlap scenario. Euro NCAP also uses impact locations of 25, 50, and 75 percent. NHTSA still views testing at high speeds with a 25 percent overlap during nighttime scenarios as not practicable. The agency views setting higher speed tests for crossing path with a 50 percent overlap at night as merited and more appropriate for this final rule than specifying lower max speeds for a 25 percent overlap at night. Accordingly, NHTSA is declining to add a scenario for a high-speed test with a 25 percent overlap during nighttime condition.

Lack of Turning Scenarios

Several commenters recommended the inclusion of turning scenarios as part of the PAEB test requirements, *i.e.,* expanding the testing conditions to evaluate pedestrian during right and left turns of the subject vehicle.[134] Luminar stated that turning real word traffic conditions that mimic common pedestrian encounters in which the subject's movement partially or momentarily obscured and performance of crash avoidance technology in these scenarios is achievable. Some commenters stated that turning car-to-pedestrian AEB testing is performed as part of Euro NCAP.

In response, this final rule adopts the tests as proposed based on the research and other data demonstrating the efficacy and practicability of systems meeting the crossing path, stationary and along path scenarios. The data and technologies for test scenarios representing other crashes have not been analyzed as to their merit for inclusion in a possible FMVSS (as discussed throughout this document, rear-end crashes have been analyzed).

NHTSA included pedestrian AEB in turning from the left and turning from the right as a potential regulatory alternative for a more stringent rule. While commenters pointed out that Euro NCAP and other world NCAP programs offer some turning scenarios, NHTSA does not have sufficient information to propose or finalize incorporating a turning scenario at this time. NHTSA is not selecting this alternative in this final rule, however, and will consider conducting additional research and adopting requirements for turns in a future rulemaking, as appropriate. As discussed in the NPRM, NHTSA focused on the practicable scenarios that have the largest impact on the safety problem. While turning scenarios are responsible for around 48 percent of the total crash population for pedestrians, NHTSA crash data shows that 90 percent of fatal pedestrian-vehicle crashes, and 52 percent of the total pedestrian-vehicle crash population are covered under the standard NHTSA has developed.[135] In contrast, NHTSA data found that the turning right and turning left scenarios were found to only account for 1 percent and 4 percent of pedestrian fatalities, respectively.

[133] NHTSA is also mindful that implementing similar manual braking test scenarios for PAEB as for lead vehicle AEB may increase the likelihood of false positives when the systems are driven on the road. At 60 km/h (37.3 mph) automatic braking would need to occur at a minimum distance to the pedestrian of 20.25 meters with a 0.7g stop, which is a TTC of 1.21 sec, and it takes the vehicle 2.4 sec to stop. A pedestrian traveling with a walking speed of 5 km/h (3.1 mph) would cover 3.36 meters in this time, which puts that pedestrian 3.8 meters from the center of an average vehicle in the 25 percent overlap scenario, or about 2.9 meters from the side of the vehicle. In an urban setting, this would place the pedestrian in the buffer zone between the sidewalk and the travel lane, indicating the intent to cross the street. In this scenario the pedestrian would be a further 1.38 meters away in case of a warning issued 1 second prior to the minimum TTC described above, or more with a longer warning. This would place a pedestrian outside the buffer zone and solidly on the sidewalk. Adding additional time for a forward collision warning and driver reaction time increases the likelihood of false alerts, as it becomes increase difficult to determine the pedestrian's intent the further outside the travel lane the pedestrian is. Because of this, NHTSA proposed requiring, ''The vehicle must automatically apply the brakes and alert the vehicle operator such that the subject vehicle does not collide with the pedestrian test mannequin when tested using the procedures in S8 under the conditions specified in S6.''

[134] These commenters included Forest Rock, Luminar, APBP, NSC, the Coalition, Consumer Reports, and AARP.

[135] Mikio Yanagisawa, Elizabeth D. Swanson, Philip Azeredo, and Wassim Najm (2017, April) Estimation of potential safety benefits for pedestrian crash avoidance/mitigation systems (Report No. DOT HS 812 400) Washington, DC: National Highway Traffic Safety Administration, p xiii.

2. Subject Vehicle Speed Ranges

Increase PAEB Testing Speeds

Comments

NHTSA received many comments requesting the agency to increase the test speed of the vehicle.[136] Commenters generally stated that since the most common speed limit for a road where a pedestrian is killed is 45 mph, PAEB testing speeds should be increased above the proposed speeds (they generally did not suggest a maximum testing speed).

Agency Response

In response, as explained in the earlier section for lead vehicle testing speeds, NHTSA has bounded the testing speeds after considering practicability and other issues. These practicability concerns include, among others, the performance that can reasonably be achieved in the lead time provided for the final rule, the safety need that can be addressed, the safety of the testing personnel, and the practicalities of conducting a test that can be run repeatably and consistently without damaging lab equipment, to preserve the integrity and validity of the test data. NHTSA proposed and is adopting the highest practicable testing speeds. Accordingly, NHTSA has decided not to increase the test speeds for PAEB in this final rule. NHTSA considered, and is currently researching, other testing scenarios for PAEB, so more will be known about the future about the practicability and reasonableness of higher test speeds.

Reduce PAEB Testing Speeds

Comments

NHTSA received many comments from manufacturers and others requesting the agency to decrease the test speed of the vehicle.[137] Some manufacturers commented that NHTSA should permit low impact speeds when testing PAEB above certain testing speeds (when testing 30 km/h (19 mph) and above).

Like their comments on the lead vehicle speed tests, the Alliance and others suggested a hybrid approach that would permit some level of contact with the pedestrian test device for speeds above, *e.g.,* 30 km/h (19 mph). These commenters stated that providing full crash avoidance at higher speeds may not always be practicable due to increased potential for false positives under real world conditions. Additionally, the Alliance stated that the PAEB system must have sufficient information upon which to base its decision to apply braking force. The high testing speeds and no-contact requirement may force the AEB system to be too aggressive particularly in view of what can be unpredictable movement of pedestrians in and around the roadway environment. Honda suggested when PAEB is tested between 50 km/h and 65 km/h (31 mph to 40 mph), NHTSA should allow low speed contact up to 15 km/h (9.3 mph). Honda stated that the basis for the suggested speed threshold is that according to pedestrian injury data in the U.S., the risk of severe injury or fatality in pedestrian crashes below 15 km/h is highly unlikely.

The Alliance expressed concern about false positives or bad actors seeking to manipulate the AEB system into activating by imitating the act of entering the roadway environment. Mitsubishi was concerned about pedestrians who are about to jaywalk but stop due to approaching cars. The commenter stated that this behavior may lead to unnecessary activation and induce unintended consequences as current technology cannot predict pedestrian behavior with 100% accuracy. The Alliance and others stated that impact speeds of 25 km/h (16 mph) should be allowed as such impact speeds would have a reasonable safety outcome when the crash speed was mitigated from a higher speed testing. Some commenters stated that NHTSA should harmonize with UNECE Regulation No. 152, where impact speeds up to 40 km/h (25 mph) are allowed.

Agency Response

NHTSA is adopting the proposed testing speed ranges with a no-contact requirement and is not permitting repeat trials.

The commenters' main arguments in support of reducing the PAEB testing speeds are the potential increase in the likelihood of false positives due to difficulties in detecting pedestrians and classifying pedestrian action (such as intention to enter the roadway). In general, the commenters suggested allowing some level of pedestrian contact at above certain reduced speeds, ranging from 30 km/h to 50 km/h (10 mph to 31 mph), with most commenters suggesting around 40 km/h (25 mph) as the maximum speed for a no-contact requirement.

NHTSA proposed testing requirements that can be met, and that can avoid as many crashes, and mitigate as much harm, as practicable. For PAEB, NHTSA seeks to avoid crashes at the highest practicable speeds because of the vulnerability of a pedestrian in a vehicle crash. Vehicle contact with a pedestrian can be fatal or result in serious injury with potential long-term effects. NHTSA scrutinizes hybrid approaches, such as that of the Alliance, that incorporate as part of its framework the vehicle's hitting a pedestrian because the risk of injury to a pedestrian in a vehicle crash is so great. After reviewing the comments and other information, NHTSA does not believe that striking a pedestrian is an acceptable safety outcome given the availability of technologies that can prevent any kind of contact in the test scenarios.

Using the speed limit as a proxy for traveling speed, the data presented in the previous section of this document show that about 50 percent of pedestrian fatalities, and about 57 percent of injuries, occur on roads with a speed limit of 65 km/h (40 mph) or less. NHTSA believes an upper speed limit less than 65 km/h (40 mph) for a no-contact PAEB requirement would not be appropriate when test data on the performance of current vehicles show the practicability of meeting the proposed limits, particularly when more lead time is provided for the technology to evolve.

The injury curves and thresholds provided by some of the commenters show that below 25 km/h, there is a reduced probability of AIS3+ and MAIS3+ injury compared to impacts at greater speeds. However, the safety problem that PAEB can mitigate exists mainly at speeds above 40 km/h. Given that AEB, when developed to meet a no-contact requirement, could help mitigate the occurrence of pedestrian impacts up to 65 km/h (40 mph), NHTSA believes it unreasonable to set the no-contact limit at speeds at just a 40 km/h (25 mph) threshold.

As demonstrated by NHTSA testing, the technology has already proven effective at avoiding collisions at speeds up to 65 km/h (40 mph). As detailed in the research section, NHTSA found that a vehicle (the 2023 Toyota Corolla Hybrid) was able to avoid collision under all testing conditions up to the maximum proposed testing speeds requirement for all PAEB testing scenarios and speeds.[138] In addition,

[136] These commenters included the cities of Philadelphia, Nashville and Houston, the Richmond Ambulance Authority, Drive Smart Virginia, Teledyne, the Lidar Coalition, Luminar, Consumer Reports, Forensic Rock, Luminar, COMPAL, and NACTO.

[137] These commenters included the Alliance, Honda, Mobileye, Mitsubishi, Porsche, Volkswagen, Nissan, Toyota, and Aptiv.

[138] NHTSA's 2023 Light Vehicle Pedestrian Automatic Emergency Braking Research Test

four of the six vehicles tested achieved collision avoidance up to the proposed maximum speeds in almost all scenarios–some even in the most challenging dark lower beam scenarios. Additionally, another vehicle was able to achieve collision avoidance at all tested speeds in 3 scenarios.

NHTSA believes that the practicability of meeting the PAEB requirements of this final rule is demonstrated by the test data showing the performance of the 2023 Toyota Corolla Hybrid that passed all scenarios, and that of the several other vehicles that almost passed all scenarios. These test results are even more noteworthy because the tested vehicles did not have AEB systems designed to meet the requirements of proposed FMVSS No. 127. They were not prototypes or vehicles specially engineered to the specifications of the proposed standard for research purposes. To be clear, these were production vehicles already in the marketplace. The fact that current vehicles not particularly engineered to meet the new standard's requirements could meet them as designed, or with slight modification, further demonstrates the practicability of this final rule. Because current AEB systems are already capable of meeting the AEB requirements, NHTSA's assumption is confirmed that manufacturers will be able to meet the requirements of FMVSS No. 127 with the lead time provided, without major upgrades while mitigating excessive false positives or other unintended consequences.

Several commenters also believed that repeated trials should be allowed during PAEB testing. In response, NHTSA notes that the agency does not usually incorporate repeated trials in its vehicle compliance program. NHTSA's position has been to conduct a compliance test and, if an apparent noncompliance results, the agency should pursue the matter with the vehicle manufacturer without having to run a repeated trial. NHTSA's view is that the vehicle manufacturer is responsible for certifying the compliance of its vehicles and for ensuring the basis of its certification is sufficiently robust such that each vehicle will pass the test when tested by NHTSA. The agency acknowledges that for many years, NCAP testing (and other testing around the world) has encompassed repeated test trials to populate information about AEB in the consumer information program. NHTSA took the repeated trial approach in NCAP only because it was for a technology that was new or being developed. For more mature systems with a substantial record of real-world use, a single test run is preferable. A single test approach provides the agency the confidence that the performance it is regulating will perform as consistently as possible in the real world.

Regarding the comments received relating to AEB perception,[139] pedestrian detection, and classification, the MY 2023 vehicles tested for PAEB were generally able to avoid collision in all scenarios and at the majority of higher testing speeds. These vehicles are in production and on the road, demonstrating that solutions have been engineered to the PAEB perception in the real world. The engineering solutions have also accounted for no-contact testing performance. Also, Euro NCAP, while not a regulation, employs similar testing at similar speeds as the requirements in this final rule and many vehicles achieve a full score on Euro NCAP testing due to their collision avoidance capabilities. This performance further reinforces NHTSA's assessment that meeting the testing speeds of this final rule are practicable.

Evasive Steering (PAEB)

Comments

For the small overlap (25% test conditions), Porsche stated the last point to steer is much closer to the pedestrian than the last point to brake and the proposed test speeds may increase the likelihood for emergency braking engagement that may often be perceived by the customer as a false activation in scenarios where the driver is aware of the pedestrian on the road and planning to steer around them. Porsche stated that this dilemma is similar to high speed AEB for lead vehicles, but occurs at lower speeds, as small overlap pedestrian scenarios are harder to detect and predict.

Agency Response

In response, after considering the comments, and similar to its assessment of comments regarding lead vehicle evasive steering, the agency is not persuaded that evasive steering is an acceptable avoidance maneuver during testing. As thoroughly discussed previously, such factors as vehicle dynamics, traffic conditions and traffic participants all influence the safety benefit of a steering avoidance maneuver. A steering maneuver, as an avoidance maneuver, may not be as safe as a brake-in-lane maneuver, particularly in an urban environment. In any event, like for the lead vehicle situation, a manufacturer, outside of the testing requirements, may elect to detune or disengage the AEB system based on an emergency steering maneuver as long as the vehicle meets all the AEB requirements.

3. Pedestrian Test Device Speed

Comments

AARP and ASC commented on the proposed pedestrian test device speeds. AARP suggested that NHTSA consider whether testing the adult pedestrian scenarios at a walking speed of 3.1 mph (5 km/h) is sufficient to improve safety for those who walk at slower speeds. ASC stated that IIHS, and UNECE Regulation No. 152 and No. 131, require a speed of less than or equal to 5 km/h, which is representative of a walking adult pedestrian.

Agency Response

In response, NHTSA believes that the proposed crossing path test speed of 5 km/h (3.1 mph) for walking adult scenarios reasonably addresses the safety of adult pedestrians, including those who walk at slower speeds. Higher pedestrian test device walking speeds are more challenging for AEB systems. The longer a pedestrian is in the roadway, the more time a vehicle has to identify, classify, and avoid striking the pedestrian. NHTSA proposed that tests be performed at 5 km/h (3.1 mph) and 8 km/h (5 mph), as these speeds are representative of able-bodied adults walking and running. The agency expects that manufacturers will not turn pedestrian avoidance off at pedestrian speeds below those tested but will instead design systems that detect pedestrians moving at speeds lower than 5 km/h (3.1 mph) and avoid them. Further, the agency also included in the requirements testing with stationary pedestrian test devices, so that PAEB performs under three distinct pedestrian test mannequin speed scenarios (0 km/h, 5 km/h and 8 km/h). Therefore, NHTSA declines to include additional tests with pedestrian surrogate speeds lower than 5 km/h (3.1 mph) based on the absence of a safety need to do so.

In response to ASC, NHTSA notes that the 8 km/h (5 mph) test speed is used in the pedestrian crossing from the left scenario. It is representative of an able-bodied pedestrian running. This

Summary, available in the docket for this final rule (NHTSA–2023–0021).

[139] The performance of each AEB system depends on the ability of the system to use sensor data to appropriately detect and classify forward objects. The AEB system uses this detection and classification to decide if a collision is imminent and then avoid or mitigate the potential crash. Manufacturers and suppliers of AEB systems have worked to address unnecessary AEB activations through techniques such as sensor fusion, which combines and filters information from multiple sensors, and advanced predictive models.

performance test was proposed in the NPRM to ensure that pedestrian avoidance occurs in as wide a range of scenarios as is practicable. Data from NHTSA's testing of six model year 2023 vehicles showed that four of the six vehicles were able to meet the performance levels proposed in the NPRM. Based on the above, NHTSA concludes this test scenario is practical and appropriate for inclusion in the final rule. The agency also expects that if manufacturers can meet this performance for pedestrians crossing from the left at 8 km/h (5 mph), they can also avoid slower moving pedestrians, because in general the slower moving scenario poses a less demanding performance condition.

After considering the comments, the final rule adopts the 5 km/h (3 mph) speed for walking adult scenarios and the 8 km/h (5 mph) speed for running adult scenarios in crossing path PAEB tests, as proposed in the NPRM.

4. Overlap

Bosch commented on NHTSA's use of the term ''overlap'' in the NPRM. Overlap is a term used to describe the location of the point on the front of the subject vehicle that would make contact with a pedestrian if no braking occurred. The NPRM defined overlap as the percentage of the subject vehicle's overall width that the pedestrian test mannequin traverses. It is measured from the right or the left, depending on the side of the subject vehicle where the pedestrian test mannequin originates.

NHTSA proposed to use two overlaps for testing: a 25 percent overlap and a 50 percent overlap. The agency proposed the minimum overlap of 25 percent to allow for the test mannequin to fully be in the path of the subject vehicle. The agency also explained that the overlap determines the available time for the AEB system to detect and react when a collision with the test mannequin is imminent—a 50 percent overlap allows for more time than a 25 percent overlap. As for tolerances, the NPRM proposed that for each test run, the actual overlap would have to be within 0.15 m of the specified overlap.

Bosch did not object to the meaning of the term, the values proposed, or the tolerance provided for overlap, but suggested that NHTSA consider using the phrase ''percentage of the vehicle's width,'' rather than ''overlap.'' The commenter believed that the phrase accurately describes the lateral distance between the person in front of the vehicle and is terminology used by Euro NCAP. Bosch further stated that a similar approach by NHTSA would promote consistency and comparability in AEB performance evaluation across the industry.

In response, NHTSA declines to change the term ''overlap.'' The agency believes that the term overlap used in the proposal, and ''percent vehicle width'' used in Euro NCAP, are synonymous and not in conflict. Furthermore, the use of ''overlap'' is consistent with NHTSA's use of terms in its crashworthiness regulations, NHTSA's NCAP program, and NHTSA's practices in previous PAEB research. In addition, the definition of ''overlap'' in S8.1.2—the percentage of the subject vehicle's overall width—already includes the phrase put forth by Bosch.

5. Light Conditions

This final rule adopts the proposed requirements in the NPRM to specify compliance testing of AEB systems in daylight and dark conditions. The conditions ensure performance in a wide range of ambient light conditions. For daylight testing, the ambient illumination at the test site is not less than 2,000 lux. This minimum level approximates a typical roadway light level on an overcast day. The acceptable range also includes any higher illumination level including levels associated with bright sunlight on a clear day. For PAEB testing in darkness, the ambient illumination at the test site must be no greater than 0.2 lux. This value approximates roadway lighting in dark conditions without direct overhead lighting with moonlight and low levels of indirect light from other sources, such as reflected light from buildings and signage.

Comments

NHTSA received many comments to the proposed light conditions. Consumer advocacy groups and others generally support the proposed PAEB tests in daylight and darkness (with lower and upper beam) conditions.[140] NSC and GHSA emphasize that 75 to 77 percent of pedestrian fatalities occur in darkness or after dark, regardless of whether artificial lighting was present. GHSA also states that disadvantaged communities are overrepresented in pedestrian fatalities. Consumer Reports is supportive of PAEB in dark conditions based on the overrepresentation of nighttime pedestrian crashes among the total.

With respect to the use of headlamps during PAEB testing, Consumer Reports believes there does not appear to be a significant advantage of testing with the upper beams if the system already meets the requirements with the lower beams, and, that there is no guarantee that drivers will use the upper beams. In addition, Consumer Reports anticipates an increasing number of vehicles will be offered with adaptive driving beam (ABD) technology that can be used rather than lower beam and upper beams, and suggests that NHTSA's AEB tests test with ADB. Therefore, Consumer Reports suggests NHTSA replace the lower and upper beam language with language referring to the ''lowest level of active illumination,'' or similar, and require that the system pass the test at this level of lighting. Some equipment manufacturers expressed support for the proposed PAEB tests in daylight and darkness conditions, stating that infra-red sensors would increase safety for dark lighting conditions.

The Lidar Coalition expressed strong support for the proposed testing of PAEB in low light conditions with no overhead lighting and only lower beams activated. The commenter states that NHTSA is correctly focusing on addressing the largest portion of pedestrian fatalities on U.S. roadways. The Lidar Coalition suggests that NHTSA prioritize testing in the darkest realistic conditions possible. The commenter states that the proposed test procedure in dark conditions will evaluate PAEB technologies in the real-world scenarios where the commenter believes these systems are most needed, when the human eye falls short. The Lidar Coalition states the Insurance Institute for Highway Safety found that in darkness conditions, camera and radar based PAEB systems fail in every instance to detect pedestrians. They additionally referenced the GHSA finding that in an evaluation of roadway fatalities in 2020, 75% of pedestrian fatalities occur at night.

COMPAL supports a finding of a safety need for PAEB under dark condition and higher speeds (greater than 60 km/h (37.5 mph)), and believes that placing infrared sensors as a forward-looking sensor in PAEB testing can improve AEB functionality in challenging situations, such as testing for the crossing child obstructed scenario and the crossing adult running from the left. It states that infrared sensors should not be considered an emerging technology and that they work well in sun glare and darkness conditions and can detect a pedestrian much further than typical headlamps.

Vehicle manufacturers and equipment manufacturers generally oppose the proposed PAEB dark test conditions with only low beams because of the

[140] These commenters included NSC, NTSB, GHSA, Consumer Reports, Forensic Rock, the Lidar Coalition, ZF, and COMPAL.

limited ability to illuminate pedestrians. The Alliance, Ford, Nissan, Toyota, Honda, MEMA, Mobileye and Adasky support the idea of allowing the use of the advanced lighting technology (such as ADB headlamps) if available on the model as standard equipment, or to incorporate the use of streetlights to simulate urban traffic conditions. The Alliance argues that allowing all dark lighting conditions to be tested with the advanced lighting features activated aligns with NHTSA's considerations for similar testing in the proposed NCAP upgrade and further promotes the adoption of these advanced lighting systems. Porsche states that the required nighttime PAEB performance requirements at the higher relative speeds is likely to exceed the technical capabilities of many current AEB system hardware. MEMA states that, in dark environments without streetlights, the lower beams would not be active because upper beams provide a better view, so this lower beam test is not depicting a real driving situation.

Ford and Nissan also state that the lighting requirements in FMVSS No. 108 impact feasibility and practicability in testing certain low light PAEB tests. Similarly, Honda commented that the primary sensor for detecting pedestrian targets is the camera, which relies on optical information. Honda state this exceeds the recognition capability and reliability range of current camera systems and will lead to excessive false activations.

Agency Response

After considering the comments, NHTSA has determined there is a safety need for the dark testing requirement, given the number of nighttime pedestrian fatalities and IIHS's finding that several AEB systems that performed well in daylight performed poorly in dark conditions. The agency has adopted the dark lighting requirements as proposed. However, as explained in the discussion below, NHTSA concurs that more time is needed to meet the dark lighting conditions. This final rule provides five years of lead time to do the additional engineering work needed to bring poorer performing AEB systems to a level where they can meet this final rule's requirements.

Consumer Reports commented that testing with upper beam may be redundant if the system already meets the requirements with the lower beam. While this might be true for some systems, agency testing performed for the NPRM showed inconsistent performance while testing with the upper beam.[141] In rare cases, vehicles performed better with lower beams illuminated than with upper beam. NHTSA is adopting an upper beam test to assure the functionality of the AEB system when the driver uses the upper beam.

Forensic Rock, Lidar Coalition, COMPAL and ZF, appear to assert that all scenarios should be tested under dark and daylight condition, or that testing should be performed in the darkest realistic condition. NHTSA does not concur with that view, as the agency must consider, among other matters, the safety problem being addressed (to ensure the FMVSSs appropriately address a safety need), and the practicability and capabilities of the technology. NHTSA has assessed the tests and performance requirements adopted in this final rule to ensure each satisfies the requirements for FMVSS established in the Safety Act. Some tests did not pass NHTSA's assessment and were not proposed. To illustrate, the test results for the crossing scenarios at 25% overlap at night indicate meeting the test is impracticable at this time.[142] Similarly, the obstructed child scenario depicts a situation that very rarely occurs at night (as noted by ZF as well), so NHTSA did not propose testing for such a scenario at night as not practical or reasonable.[143]

Many commenters believe that testing should be allowed with the adaptive driving beam (ADB) active. NHTSA disagrees. NHTSA does not require ADB, whereas the lower beam and upper beam are required by the FMVSSs on the vehicle. Further, even if an ADB system were installed on the vehicle, a driver may not use it. NHTSA does not believe it appropriate to tie the life-saving benefits associated with AEB to a technology (ADB) that a driver may or may not use on a trip.

Additionally, ADB still employs the lower beam and upper beam, and merely switches automatically to the lower beam at times appropriate to do so. Thus, even if a driver has ADB operational, if the ADB reverts to a lower beam on a large portion of the beam area, in effect the operating conditions would be lower beam only, which, under the commenters' suggested approach, would not have been assessed with AEB. Testing PAEB with ADB on could, under the commenters' suggested testing conditions, essentially amount to the agency only testing the upper beam condition. Such an outcome would be undesirable from a safety standpoint, as most drivers rarely use their upper beams when operating vehicles at night. IIHS test data of 3,200 isolated vehicles (where other vehicles were at least 10 or more seconds away) showed that only 18 percent had their upper beams on.[144] At one unlit urban location, IIHS data showed that upper beam use was less than 1 percent. IIHS found that even on rural roads, drivers used their upper beams less than half of the time they should have for maximum safety, on average. Testing during daylight and dark with lower beam and upper beam provides confidence that in urban dark lighted environment, PAEB will perform even with only the lower beam operational.

NHTSA understands that lower beam testing scenarios may require better lowlight cameras and may require improved recognition algorithms for the lower performing AEB systems, which is why the agency is affording manufacturers additional time to engineer such systems up to FMVSS No. 127 performance. NHTSA's testing conducted for the NPRM indicated that the proposed PAEB dark scenarios represent ambitious, yet achievable performance criteria.[145] The latest agency research, detailed in this notice, on six model year 2023 vehicles found that in the scenario where the pedestrian is approaching from the right, five of the six vehicles tested were able to meet the performance requirements for the upper beam lighting condition, and four of the six were able to meet the lower beam lighting condition. In the scenario where the pedestrian is stationary, all vehicles were able to meet the upper beam light condition, and three of the six vehicles were able to meet the lower beam testing condition. The final nighttime scenario, with the pedestrian moving along the vehicle's path, four vehicles met the performance requirements for the upper beam condition, and a single vehicle met the lower beam condition. The 2023 Toyota Corolla was able to avoid collision in two instances and had impact speeds of about 5 km/h or less in the other three tests.

These data indicate the practicability of meeting the PAEB tests proposed in the NPRM. Although not all manufacturers can currently certify to

all dark tests, AEB technologies are evolving rapidly, with significant improvements occurring even in the last year or two of NHTSA's AEB research program. NHTSA is providing five years for further development and integration of the technology into the new vehicle fleet. The agency adopts the upper and lower beam conditions as proposed in the NPRM without change, except for providing more lead time to meet the standard's requirements.

As for Honda's concerns about the sensors that they use, *i.e.,* cameras, NHTSA is aware of different sensor combinations capable of detecting pedestrian mannequins, as is evidenced by the higher performing vehicles identified during NHTSA testing. While Honda's current generation cameras may have recognition capability and reliability range challenges, other sensors and sensor combinations do not. NHTSA is not required to limit performance requirements to what one particular manufacturer using specific sensors is capable of doing at a given point in time. If Honda faces the challenges it describes, then software and possibly hardware updates may be necessary for Honda to meet the require performance.

6. Testing Setup

Pedestrian, Obstructed Running Child, Crossing Path From the Right

In the test of an obstructed running child crossing from the right, an obstructed child pedestrian test device moves in the vehicle's travel path from the right of the travel path. The pedestrian surrogate crosses the subject vehicle's travel path from in front of two stopped vehicle test devices (VTDs). The VTDs are parked to the right of the subject vehicle's travel path, in the adjacent lane, at 1.0 m (3 ft) from the side of the subject vehicle. The VTDs are parked one after the other and are facing in the same direction as the subject vehicle. The subject vehicle must avoid collision with the child pedestrian surrogate without manual brake input.

Comments and Agency Responses

Porsche, Volkswagen, FCA, and ASC commented on the proposed obstructed pedestrian scenario in PAEB performance tests. Porsche and Volkswagen stated that the distance between the pedestrian test dummy and the farthest obstructing vehicle is not specified in the proposed regulation (*i.e.,* S8.3.3). The commenters believe this is critical to be defined because the level of obstruction of the child test dummy can only be defined by this distance. If multiple distances are required to reflect full and partial obstruction, then each specific test scenario should be defined.

In response, NHTSA agrees with the commenters that the proposed testing setup should have, but did not, include the distance between a pedestrian test mannequin and the obstructing vehicle device positioned further from a subject vehicle. In this final rule, NHTSA adopts the following regulatory text language to clarify the test setup for the obstructed pedestrian crossing scenario: ''[t]he frontmost plane of the vehicle test device furthermost from the subject vehicle is located 1.0 ± 0.1 m from the parallel contact plane (to the subject vehicle's frontmost plane) on the pedestrian test mannequin.''

ASC stated that the vehicles obstructing the mannequin should be specified. The commenter believes that due to the large size of common vehicles sold in the US (*e.g.,* pick-ups and sport utility vehicles), specific vehicle models or types should be defined for this test configuration.

In response, the agency disagrees with ASC that NHTSA should specify models or types of the obstructing vehicles. The regulatory text specifies that two vehicle test devices are used as an obstruction in obstructed pedestrian crossing tests and the text also provides the dimensional specifications and other measurements of the vehicle test device. Therefore, the standard includes sufficient information specifying the obstructing vehicles to ensure repeatable and reproducible testing.

FCA commented that the obstruction vehicles in the research testing were a Honda Accord and Toyota Highlander and every research test used this combination of real vehicles as obstructions, but that there was no data in the NPRM or the research about how these scenarios react or correlate to the vehicle test devices proposed for the FMVSS at S8.3.3(g). FCA expressed concern that this could lead to added practicability or other concerns for the associated test condition.

In response, NHTSA highlights the additional testing performed. In this course of this testing, NHTSA evaluated using real vehicles, the 4Active vehicle test device, and the ABD test device.[146] The agency found no appreciable differences in performance between real vehicles and either vehicle test device. Thus, NHTSA believes that using the vehicle test device in the obstructed child crossing scenario is practicable and reasonable.

With respect to Bosch's suggestion that the maximum allowed travel path deviation needs to be specified as ⅛th of the subject vehicle width and not the 0.3 m allowed in the proposal, the agency agrees in general that the tolerance for the expected point of contact should be from the subject vehicle and not the lane. Thus, in the proposal, the tolerance for the expected contact point was specified as the difference between the actual overlap and the specified overlap. This tolerance was specified and is finalized independent of the vehicle's position in the lane. The NPRM's proposed regulatory text stated: ''For each test run, the actual overlap will be within 0.15 m of the specified overlap.'' This is a tighter tolerance than Bosch suggested (⅛th of the average vehicle width is approx. 0.22 m). As such, the agency does not believe this will allow the situation Bosch proposed (where 25 percent overlap can be mistaken for a 50 percent overlap, and 50 percent overlap can be mistaken for 25 percent overlap from the left) to occur.

FCA suggested that NHTSA should consider using a standard road width and simply positioning the pedestrian mannequins across percentages of the lane, as this would be indicative of a position in the real world. FCA stated that NHTSA intended to position pedestrians according to ratios derived from the overall width of each vehicle, but that this set up can be overly complicated.

NHTSA disagrees with FCA that applying mannequin positions—described as percentages of the width of a standard test lane—would simplify test procedures. First, the agency is not aware of a standard test lane specification that is universally accepted for PAEB tests, and which can represent various types of roads in the real-world. Such roads would include lanes marked by two lines on highways, lanes marked by only one line in urban residential sections, and lanes without any marking in rural areas. Second, applying a same mannequin position within the test lane for all PAEB tests could cause unnecessary confusion because it might result in different overlap scenarios for different sizes of subject vehicles. For example, a pedestrian mannequin positioned at a certain percentage of the lane width may be appropriate for a 25 percent overlap test with a full-size pickup truck. However, such positioning may result in an invalid test with a small compact car—for example, a Fiat 500—since a mannequin at the same lateral

[146] ''NHTSA's 2023 Light Vehicle Automatic Emergency Braking Research Test Summary'' Available in the docket for this final rule (NHTSA–2023–0021).

position within the test lane may not make a contact with such a small subject vehicle. Therefore, NHTSA declines to adopt a mannequin position that is defined by lane width and not percent overlap.

J. Procedures for Testing False Activation

This section describes the false activation performance tests adopted by this final rule. These tests are sometimes referred to as ''false-positive'' tests. After considering the comments to the NPRM, NHTSA has adopted the proposed procedures tests with little change. This section responds to the comments and explains NHTSA's reasons for adopting the provisions set forth in this final rule. For the convenience of readers, a list of the test specifications can be found in appendix C to this final rule preamble.

This final rule adopts the two proposed false activation testing scenarios—the steel trench plate test and the vehicle pass-through scenario. Both tests are performed during daylight. Testing is performed with manual brake application and without manual brake application. The performance criterion is that the AEB system must not engage the brakes to create a peak deceleration of more than 0.25 g additional deceleration than any manual brake application would generate (if used).

Comments

NHTSA received comments both supporting and opposing the proposed false activation tests. Commenters in favor of including the tests in FMVSS No. 127 include: Consumer Reports, Advocates, the Lidar Coalition, AAA, Bosch, Porsche, and CAS. Consumer Reports states that it is important to limit false activations to maximize safety and consumer acceptance. AAA supported the steel trench plate test, stating that it is important to ensure that increased system sensitivity does not occur at the expense of unnecessary braking. CAS suggested the addition of a third test involving a railroad crossing. The Lidar Coalition stated that false positive tests are important for evaluating both sensing modalities and perception systems, as well as the interplay between both pieces of an effective AEB and PAEB system.

NHTSA also received comments opposing inclusion of one or both of the tests. Volkswagen recommended eliminating the proposed false activation tests from the rule, believing the tests have no comparable real-world relevance. Luminar expressed similar concern about real-world similarity.

Agency Response

After considering the comments, NHTSA has decided to maintain the false positive testing scenarios for AEB proposed in the NPRM. The proposed false activation tests establish only a baseline for system functionality and are by no means comprehensive, nor sufficient to eliminate susceptibility to false activations. However, the tests are a means to establish at least a minimum threshold of performance in the standard.

NHTSA expects that vehicle manufacturers will design AEB systems to thoroughly address the potential for false activations.[147] Previous implementations of other technologies have shown that manufacturers have a strong incentive to mitigate false positives. Vehicles that have excessive false positive activations may pose an unreasonable risk to safety and may be considered to have a safety-related defect. NHTSA understands from industry comments to this rulemaking and others that industry generally designs their systems to minimize false activations.[148]

Nonetheless, NHTSA is including the false activation tests in this final rule because NHTSA has seen evidence of false activations in those scenarios and because NHTSA expects that the scenario might be particularly challenging for AEB systems. Thus, the agency does not agree to remove or add additional test scenarios or conditions to the test scenarios at this time. NHTSA is including the tests in FMVSS No. 127 to establish a reasonable minimum when it comes to false activation assessment and mitigation; the agency may add to the tests in the future if the need arises.

CR commented that a 0.25g deceleration threshold is too high, stating that a ''0.25g braking event is noticeable by passengers and could confuse or distract the driver.'' In response, the requirement is for peak additional deceleration, not for average deceleration. In other words, the deceleration that Consumer Reports is describing would likely not meet the requirement. Consumer Reports is referring to a brief, not sustained, brake pulse, which would be noticeable. The 0.25g peak deceleration threshold was chosen as an obvious indication of external braking that is easily measurable by testing equipment.

Bosch supported the proposed steel trench plate properties for the steel trench plate test but suggested that the orientation of the plate be accurately aligned within a tolerance, *e.g.,* aligning the leading edge of the plate 90 degrees plus or minus 0.5 degrees to the centerline of the test vehicle.

In response, NHTSA does not agree with Bosch that a tolerance is appropriate for positioning of the steel plate, particularly such a low tolerance as 0.5 degrees. The steel plate false activation test is an established test which has been performed without a specific tolerance for the alignment of the steel plate for an extended period without any indication that the lack of a tolerance influences the outcome of the tests. Further, Bosch has not provided any data in support of their suggestion, and NHTSA does not have any data suggesting that any slight misalignment of the steel plate influences the results.

Porsche stated that they support the false positive tests with some suggested improvements. Porsche stated that they suggest modifying the pass-through test lateral distance gap in S9.3.1(b) to be in relation to the exterior of the vehicle body instead of the front wheels. Porsche also suggested adding a test matrix table to section S8.1. Volkswagen suggested that NHTSA better define the test scenarios, such as with regard to the exterior dimensions of the stationary vehicles in the pass-through gap test and whether there is a manual brake application in either test.

In response, while Porsche states that the gap between the vehicles should be measured based on the exterior of the vehicles, not the wheels, the commenter did not provide any data or reasoning for the suggestion. Volkswagen suggests that more detail should be given on the exterior dimensions of the stationary vehicles but also did not provide any supporting data or reasoning. NHTSA had evaluated these requirements when developing the NPRM and found them to be sufficient. Accordingly, the agency is not revising how the space between the vehicles is measured and how we specify the dimensions of the two stationary vehicles.

Porsche and Volkswagens both state it is unclear whether testing is to be done with and without manual brake application. In response, NHTSA notes

[147] 88 FR 38632 at 38696.

[148] In response to a 2022 NCAP Request for Comment, the Alliance stated in their comments to the 2022 NCAP notice where NHTSA requested comment on the inclusion of false positive tests in NCAP the Alliance stated that vehicle manufacturers will optimize their systems to minimize false positive activations for consumer acceptance purposes, and thus such tests will not be necessary. Similarly, in response to the same 2022 NCAP notice, Honda stated that vehicle manufacturers must already account for false positives when considering marketability and HMI. These comments are available in this docket *https://www.regulations.gov/document/NHTSA-2023-0020-0001.*

that in the NPRM, NHTSA specifically states that it would test vehicles with and without manual application. While the agency does not believe a table is needed specifying the key parameters when testing for lead vehicle and PAEB, NHTSA agrees that the proposed regulatory text was not clear on this topic. Thus, the agency has revised the regulatory text for the steel plate and for the pass-through test to be clear that testing is conducted with manual brake application and without manual brake application.

K. Track Testing Conditions

1. Environmental Test Conditions

Lighting Conditions

Under this final rule, NHTSA will test AEB systems in daylight for lead vehicle AEB and PAEB testing, as well as in darkness for PAEB testing. The light conditions ensure performance in a wide range of ambient light conditions. For all daylight testing, the ambient illumination at the test site is not less than 2,000 lux, which approximates the minimum light level on a typical roadway on an overcast day. To better ensure test repeatability, testing may not be performed while the intended travel path is such that the heading angle of the vehicle is less than 25 degrees with respect to the sun and while the solar elevation angle is less than 15 degrees. The intensity of low-angle sunlight can create sensor anomalies that may lead to unrepeatable test results.

For PAEB darkness testing, the ambient illumination at the test site must be no greater than 0.2 lux. This value approximates roadway lighting in dark conditions without direct overhead lighting with moonlight and low levels of indirect light from other sources. This darkness level accounts for the effect ambient light has on AEB performance, particularly for camera-based systems. It ensures robust performance of all AEB systems, regardless of what types of sensors are used.

Comments

NHTSA received several comments on the lighting conditions,[149] particularly the proposed ambient illumination requirement (*i.e.,* any level at or below 0.2 lux) for darkness PAEB testing.

HATCI and others believe that NHTSA should use nighttime lighting conditions for PAEB testing that are more characteristic of urban environments. HATCI states that NHTSA would use the same specification for lower and upper beams, 0.2 lux, but that an ambient environment of 0.2 lux is extremely dark and is unlikely to be representative of real-world conditions in an urban area. HATCI stated that since 82% of the pedestrian fatalities occur in urban areas, these environmental conditions should be reflected in the test procedures. HATCI suggests that the agency should include overhead lights as it is more representative of the urban environment. The commenters state that additional lighting, including streetlights, would align lighting conditions with Euro NCAP. In contrast, AAA believes NHTSA should refrain from allowing testing under artificially bright overhead lighting for PAEB system performance requirements in darkness conditions.

Agency Response

After considering the comments submitted about the lighting conditions, NHTSA has decided to adopt the proposed lighting conditions for several reasons. First, the agency is finalizing the proposed lighting conditions because they present the most challenging, but practicable, lighting conditions for PAEB systems. Because they will be able to meet the most challenging condition, PAEB will be able to perform well in situations with more light, like roads that have streetlights. Although NHTSA agrees with commenters that 0.2 lux may not be representative of urban scenarios at night, the agency disagrees with HATCI, MEMA, Bosch, and Mitsubishi that testing should be conducted with lighting conditions that mimic urban areas. Testing in dark conditions, below 0.2 lux, represents the worst lighting case, where pedestrians are most at risk.[150]

Second, testing during daylight and dark with lower beams and upper beams provides confidence that in urban dark lighted environments, PAEB will perform even if the agency does not test under such a condition

In addition, the agency conducted confirmatory testing that indicates that the proposed lighting conditions represented ambitious, yet achievable conditions. The agency conducted additional research on the performance of the AEB systems of six model year 2023 vehicles when approaching a pedestrian. The darkness testing occurred with less than 0.2 lux of ambient lighting. In the scenario where the pedestrian is approaching from the right, five of the six vehicles tested were able to meet the performance requirements for the upper beam lighting condition, and four of the six were able to meet the lower beam lighting condition. In the scenario where the pedestrian is stationary, all vehicles were able to meet the upper beam light condition, and three of the six vehicles were able to meet the lower beam testing condition. The final nighttime scenario, with the pedestrian moving along the vehicle's path, four vehicles met the performance requirements for the upper beam condition, and a single vehicle met the lower beam condition. NHTSA believes that this data show that testing with the ambient light below 0.2 lux is practicable. For the above reasons, NHTSA believes the lighting conditions adopted by this final rule best ensure that PAEB systems work in all environments where pedestrians are at the highest safety risk.

As for the proposed PAEB daylight testing conditions, several sensor suppliers suggested that the agency should reconsider the sunlight glare avoidance requirement (*i.e.,* not driving toward or away from the sun—less than 25 degrees in vertical and 15 degrees in horizontal directions). Adasky and the Lidar Coalition stated that the NHTSA should include additional real world environmental conditions, such as direct sunlight.

In response, the agency agrees with Luminar that there is a safety issue on the road when drivers operate in direct sunlight. However, the agency does not have enough test data to assess the statements from manufacturers of lidar systems (Adasky, Luminar, The Lidar Coalition) on the efficacy of LIDAR systems and potential sensor saturation by testing in direct sunlight. Additionally, NHTSA believes that, if research is warranted to assess the accuracy of the companies' assertions, that would delay this rulemaking. Thus, NHTSA declines to change the final rule as requested.

Ambient Temperature

This final rule adopts the proposed specification that the ambient temperature in the test area be between 0 Celsius (32 °F) and 40 Celsius (104 °F) during AEB testing. This ambient temperature range matches the range specified in NHTSA's safety standard for brake system performance and is representative of the wide range of conditions that AEB-equipped vehicles encounter. As explained in the NPRM,

[149] These commenters included HATCI, MEMA, Bosch, Mitsubishi, and AAA.

[150] For the proposed PAEB testing in darkness, the ambient illumination at the test site must be no greater than 0.2 lux. This value approximates roadway lighting in dark conditions without direct overhead lighting with moonlight and low levels of indirect light from other sources, such as reflected light from buildings and signage.

while AEB controls and sensors can operate at lower temperatures, the limiting factor here is the braking performance.

Comments

FCA commented that, given the only proposed outcome is ''no contact'' and passing results in the research data are often less than one meter, brake stopping performance and variation become crucial. FCA stated that because of this, testing at temperature becomes a primary concern. FCA suggested that if NHTSA believes braking performance at hot temperatures is the worst case, it should make that explanatory statement. However, if NHTSA believes braking is worst case at cold temperatures, it should assess AEB performance at the freezing point minimum temperature. Otherwise, it should limit the regulatory testing to a much more modest range to accommodate the existing data.

Agency Response

In response, NHTSA notes that FCA did not provide the testing range that it believes would be acceptable, or explain its concern about aspects of the proposed range. NHTSA believes that braking performance would be relatively unaffected by outside temperature because the procedures specify that there will be an initial braking temperature which ensures that the brakes are warm when tested, and has specified a burnishing procedure to ensure that the brakes perform consistently. The final rule specifies a testing range consistent with the ranges included in the existing braking standards applying to the vehicles subject to FMVSS No. 127. Those testing temperatures have worked well in those braking standards, and NHTSA is unaware of information indicating they would be unacceptable for this rule. Accordingly, NHTSA adopts the ambient temperature range proposed in the NPRM without change.

Wind Conditions

This final rule adopts the proposed specification that the maximum wind speed during AEB compliance testing be no greater than 10 m/s (22 mph) for lead vehicle avoidance tests and 6.7 m/s (15 mph) for pedestrian avoidance tests. Excessive wind during testing could disturb the test devices in various ways. For example, high wind speeds could affect the ability of the VTD to maintain consistent speed and/or lateral position, or could while cause the pedestrian mannequin to bend or sway unpredictably.

Comments

Bosch and Zoox are concerned with testing up to the proposed maximum wind speed. Bosch states that the testing equipment is not able to consistently maintain stability in windy conditions. Bosch and MEMA suggest using language similar to UNECE R152 which specifies testing only when there is no wind present that is liable to affect the results. Zoox suggests reducing the maximum test wind speed from 10 m/s to 5 m/s for all AEB testing.

Agency Response

NHTSA declines to adopt the suggested changes. The wind speeds included in the proposal and adopted in this final rule have long been used by the agency in AEB testing and testing of other systems in the FMVSS. As stated in the NPRM, these are the same maximum wind speeds specified for AEB tests in the agency's AEB NCAP test procedures and PAEB draft research test procedure without problems. The wind speed specified for lead vehicle avoidance tests is also in line with the maximum wind speed specified for passenger vehicles in FMVSS No. 126, ''Electronic stability control systems for light vehicles.'' The specification has been workable for many years.

Commenters did not explain the basis for characterizing the proposed wind speeds as windy conditions, or what winds could affect test results. They provided no information showing that the proposed wind speeds would affect braking performance and test equipment stability. NHTSA believes that the UNECE R152 approach would not be helpful, as it is open-ended about wind speeds. It would not provide manufacturers with notice of the wind speeds under which the agency would test. NHTSA believes its approach of specifying the specific range of wind speeds, as opposed to leaving it open ended and undefined like UNECE R152, provides notice about the test conditions under which compliance testing would be conducted and more assurance about what NHTSA considers a valid test. The agency therefore adopts the provisions for wind speed without change.

Precipitation

NHTSA adopts the proposed specification that NHTSA will not conduct AEB compliance tests during periods of precipitation, including rain, snow, sleet, or hail. The presence of precipitation could influence the outcome of the tests because wet, icy, or snow-covered pavement has lower friction. Conducting a test under those conditions also poses risks to lab personnel. Additionally, the presence of precipitation like rain, snow, sleet, or hail, makes it much more difficult to reproduce a friction level with good precision. That is, even if NHTSA were able to run a particular test on a pavement with precipitation, replicating the same test conditions may not be possible.

Comments

Consumer Reports stated that the variation of AEB performance in different conditions is why this additional testing is needed. It noted that in its experience evaluating vehicles' wet-road braking performance, it is feasible to establish objective test procedures for conditions in which the ground is wet.

Agency Response

In response, NHTSA does not have the information necessary to demonstrate that such testing would be possible for compliance testing. NHTSA is encouraged that Consumer Reports conducts wet pavement testing because such testing can add to the agency's knowledge in this area. NHTSA encourages Consumer Reports to share more detailed information about its wet-road braking to possibly provide a foundation for future NHTSA research.

Visibility

This final rule adopts the proposed specification that AEB performance tests will be conducted when visibility at the test site is unaffected by fog, smoke, ash, or airborne particulate matter. Reduced visibility in the presence of fog or other particulate matter is difficult to reproduce in a manner that produces repeatable test results. While NHTSA considered a minimum visibility range during the development of the proposal, the agency proposed a limitation on the presence of conditions that would obstruct visibility during AEB testing. NHTSA sought comment on whether to adopt a minimum visibility range.

Comments

ASC, ZF, and MEMA supported the proposed visibility conditions for AEB testing. ASC, MEMA and ZF stated that defining minimum visibility ranges would be challenging due to current sensor performance and creating repeatable test conditions.

Other commentators requested a minimum visibility requirement and gave suggestions on how to create a minimum visibility definition. The Alliance stated that this should be objectively defined. Mobileye suggests that a minimum level of visibility could

be defined as the visibility that allows a human driver to see the target within 5 seconds time to collision. Bosch and FCA states that NHTSA should establish a precise and comprehensive definition for ''visibility'' (*e.g.,* that visibility will be greater than 1 km, 0.5 km, etc.). Bosch and Volkswagen state that the test must ensure that the horizontal visibility range will allow the target to be clearly observed throughout the test. Aptiv and Consumer Reports recommend adding additional testing to account for real-world conditions such as sun glare, rain, fog and smoke.

Agency Response

NHTSA adopts the provisions proposed in the NPRM without change, for the reasons provided in the proposal. The agency agrees with commenters that there may be merits to having an objective way to measure visibility, but defining a minimum visibility range that is objective is challenging, as noted by ASC, ZF, and MEMA. Bosch suggested requiring visibility be measured as greater than ''X'' kilometers, similar to NCAP programs,[151] and Mobileye suggested an approach.

NHTSA will further consider the pros and cons of these and other approaches and determine whether to consider them in a future rulemaking. For now, it does not appear that the commenters' requested changes to the visibility metric proposed in the NPRM present a better measurement than the limitation on the presence of conditions that would obstruct visibility. Therefore, NHTSA will adopt the provisions described in the NPRM.

2. Road/Test Track Conditions

Surface

This final rule adopts the proposed specification that NHTSA will test on a dry, uniform, solid-paved surface with a peak friction coefficient (PFC) of 1.02 when measured using an ASTM F2493 standard reference test tire, in accordance with ASTM E1337–19 at a speed of 64.4 km/h (40 mph), without water delivery.[152] Surface friction is a critical factor in testing systems that rely heavily on brake system performance testing, such as AEB. The presence of moisture will significantly change the measured performance of a braking system. A dry surface is more consistent and provides for greater test repeatability.

Comments

MEMA supports the test track surface having a peak friction coefficient of 1.02. AAA recommended, based on previous testing, that there should be some tolerance allowed in terms of peak friction coefficient to allow for a greater number of closed-course facilities to be suitable for confirmation testing. FCA asked for clarification, as they see a maximum Roadway Friction Coefficient (RFC) but no mention of any minimum RFC. In addition, FCA suggested adopting a similar calculation for over speed/under speed tests within FMVSS No. 127 as in FMVSS No. 135. The Alliance commented that NHTSA should define the tolerance for the required test track surface with maximum and minimum friction coefficients. It stated that such a tolerance would ensure fairness when conducting tests across different test facilities, reduce the cost/burden associated with maintaining a test surface having a specific PFC, particularly since this value can change over time, and is consistent with NCAP's Crash Avoidance test procedures.

Agency Response

NHTSA first addressed this issue in the final rule upgrading the motorcycle brake system standard published in 2012.[153] NHTSA stated that, by specifying a single PFC, the intent is not to specify testing only on surfaces with that PFC. Rather, the intent is to set a target PFC that acts as a reference point. Manufacturers who choose to conduct on-track testing to certify their vehicles can use test surfaces with any PFC below the specified level to ensure compliance at the specified level. On the other hand, NHTSA, and laboratories conducting compliance tests, would use surfaces having a PFC at or above the target PFC to allow a reasonable margin for friction variations and other test surface variables.

This approach of specifying PFC without tolerance is consistent with how surface peak friction coefficients are specified in FMVSS No. 121, ''Air Brake Systems,'' FMVSS No. 135, ''Light Vehicle Brake Systems,'' and in FMVSS No. 126, ''Electronic Stability Control Systems. FMVSS No. 126 mandates Electronic Stability Control (ESC) systems on light vehicles, and establishes test procedures to ensure that ESC systems meet minimum requirements. In the rulemaking that established FMVSS No. 126, NHTSA originally proposed a tolerance around the surface PFC specification, but ultimately specified a single PFC for the test surface in the final rule. The agency explained that, although the proposed tolerance was an attempt to increase objectivity, such a tolerance created the possibility of compliance tests for FMVSS No. 126 being performed on lower friction coefficient surfaces than those for other braking standards, which is not the intention. NHTSA explained that while it is unlikely that any facility has a surface with exactly that friction coefficient, compliance testing for other braking standards is performed on a surface with a PFC slightly higher than the specification, which has more adhesion and creates a margin for clear enforcement. Here, as in the ESC final rule, NHTSA will use consistent compliance test conventions across all FMVSSs when specifying surface PFC.

Slope

This final rule adopts the proposed specification that NHTSA's test surface will have a consistent slope between 0 and 1 percent. The slope of the road surface can affect the performance of an AEB-equipped vehicle.[154] The slope also influences the dynamics and layout involved in the AEB test scenarios.

Comments

MEMA and Bosch commented, suggesting language from FMVSS No. 135 stating that the test surface has no more than a 1% gradient in the direction of testing and no more than a 2% gradient perpendicular to the direction of testing.

Agency Response

In response, NHTSA has not made the requested change. The agency's proposed specification did not specify that this is consistent in only the direction of travel. The agency might test on a surface that is not necessarily a defined lane, so, much like with ESC testing, the surface could be 1% in the direction of travel or normal to the direction of travel.

NHTSA provides the public with information on how the agency will conduct compliance tests, but manufacturers are not required to certify their vehicles using the tests in the FMVSS. Testing on a surface that is less flat could be more stringent, and manufacturers are free to test on a more stringent surface than what the agency

[151] Euro NCAP specifies visibility of at least 1 km (0.62 miles) and NHTSA's NCAP specifies 5 km (3.1 miles).

[152] ASTM E1337–19, *Standard Test Method for Determining Longitudinal Peak Braking Coefficient (PBC) of Paved Surfaces Using Standard Reference Test Tire.*

[154] Kim, H. et al., *Autonomous Emergency Braking Considering Road Slope and Friction Coefficient,* International Journal of Automotive Technology, 19, 1013–1022 (2018).

uses.[155] Therefore, the agency does not see a need for the suggested change.

Markings

This final rule adopts the proposed specification that, in NHTSA's tests, within 2 m of the intended travel path, the road surface can be unmarked, or marked with one, or two lines of any configuration or color, at NHTSA's option. If lines are used, they must be straight, and, in the case of two lines, they must be parallel to each other and the distance between them must be from 2.7 m to 4.5 m. Vehicles equipped with AEB often are equipped with other advanced driver assistance systems, such as lane-centering technology, which detects lane lines. Those systems may be triggered by the presence of road markings, potentially leading to unrepeatable results.

Comments

In its comment, Bosch recommended including surface conditions such as grade lane markings, surrounding clearance areas, and acceptable target object specifications to enhance the accuracy and reliability of the testing process in each scenario. Zoox recommended specific markings for the regulation. It suggests text stating: ''The road surface within 2 m of the intended travel path is marked with two solid lines (yellow on the left, white on the right) that are straight, parallel to each other, and at any distance from 2.7 m to 4.5m.'' Zoox believes that, in the scenarios prescribed and with the variety of permissible lane markings, an ADS may drive around the obstruction instead of stopping in lane. It recommends specifying lane markings consistent with the Manual on Uniform Traffic Control Devices (MUTCD).

Agency Response

NHTSA disagrees with the recommendation by Bosch and Zoox to change the lane marking specifications for the compliance test. Fully marking the lane would simulate a vehicle traveling on new, well-marked roadways, which reduces the representativeness of test of the real-world. Lane markings across the country vary in terms of existence, quality, and placement. Many rural roads have little to no lane markings, older roads may have degraded or missing lane markings, and even new roadways may have lane markings that are not yet present. The provision that states that NHTSA has flexibility in how the lanes are marked puts manufacturers on notice that they must consider all roadway types when designing their AEB system, not just road with newly marked lines. The most commonly encountered lane marking colors are white and yellow; however, there are areas where vehicles may encounter other colors. The MUTCD states that markings are to be yellow, white, red, blue, or purple. Less common situations include E–ZPass lanes that are marked with purple/white lane markings. In general NHTSA does not believe that lane markings/colors have a technical effect on AEB performance, however specifying that lane lines used may be any color ensures that AEB performance will not vary based on lane marking color faded color.

NHTSA believes it is important to the real-world efficacy of AEB systems that AEB be designed to consider a wide variety of lane markings that it is reasonable to assume the systems may encounter in the real world. NHTSA is concerned that reducing the types of lane markings they need to consider would work against NHTSA's goals of ensuring the robustness of AEB systems and the safety benefits AEB can attain. Therefore, the agency will adopt the provisions described in the NPRM without change.

Subject Vehicle Conditions

This final rule adopts the proposed specification about the subject vehicle conditions during testing relating to the following topics: AEB initialization, tires, subject vehicle brakes, fluids and propulsion battery charge, user adjustable settings, headlamps and subject vehicle loading. Where the agency received no comments a particular topic, it is not discussed below. All proposals are adopted for the reasons discussed in the NPRM.

AEB System State and Initialization

In the NPRM, NHTSA proposed that testing not be conducted if the AEB malfunction telltale is illuminated or any of the sensors used by the AEB systems are obstructed. NHTSA proposed that AEB systems would be initialized before each series of performance tests to ensure the AEB system is in a ready state for each test trial. This is because the electronic components of an AEB system, including sensors and processing modules, may require a brief interval following each starting system cycle to reset to their default operating state. It also may be necessary for an AEB-equipped vehicle to be driven at a minimum speed for a period of time prior to testing so that the electronic systems can self-calibrate to a default or baseline condition, and/or for the AEB system to become active.

The proposed initialization procedure specifies that, once the test vehicle starting system is cycled on, it will remain on for at least one minute and the vehicle is driven at a forward speed of at least 10 km/h (6 mph) before any performance trials commence. This procedure also ensures that no additional driver actions are needed for the AEB system to be in a fully active state.

In its comment, Porsche suggested that vehicles should be brought to operating temperature before testing is begun. NHTSA disagrees with this suggestion for several reasons. First, it is NHTSA's position that the AEB system should be functional regardless of the vehicle's operating temperature because to choose otherwise could lead to unnecessary and concerning real-world limitations. The agency believes that specifying that the vehicle will be started and running for at least one minute prior to test initiation is more than sufficient for the manufacturer to have a functional AEB system. In the real world, vehicles often travel at the speeds proposed shortly after the driver powers the vehicle on. NHTSA requires brakes, lights, and crashworthiness devices, like seat belts and air bags, to work when the vehicle is turned on. In the same manner, the vehicle must meet FMVSS No. 127 when turned on. NHTSA is providing a brief initiation state for the AEB system to reset to a default operating state, but extending that state to the period suggested by Porsche would be contrary to the need for safety.

NHTSA believes the one-minute initiation period is generous in the context of the FMVSSs. There is a risk that drivers will not wait a minute to start driving. These drivers likely expect all vehicle system, especially safety systems, to be ready to operate once the vehicle is turned on. Porsche did not provide sufficient justification for its suggestion to extend that time. Based on these the above factors, NHTSA is not accepting Porsche's suggestion.

MEMA, Volkswagen, Porsche, and Bosch commented that the agency should adopt the pre-test conditioning process from UNECE Regulation No. 152 where, if requested by the manufacturer, the vehicle can be driven a maximum of 100 km (62.1 miles) to initialize the sensor system.

NHTSA also disagrees with this suggestion for the reasons discussed in the previous paragraph. This suggestion

[155] The manufacturer must exercise due care in making its certification. While manufacturers are not required to follow the tests in the FMVSSs, manufacturers seek to ensure that their vehicles will meet the FMVSS when NHTSA tests them according to the test procedures in the FMVSSs.

presents issues similar to those flagged in the previous paragraph, namely that the system should be available and functioning as soon as possible after vehicle start up and that a failure to do that could be very confusing to drivers and result in a failure to provide the safety benefits it should. For the reasons explained in this section, this final rule adopts the provisions proposed in the NPRM without change.

Brake Burnishing

To maximize test repeatability, this final rule adopts the proposed specification that subject vehicle brakes be burnished prior to AEB performance testing according to the specifications of either S7.1 of FMVSS No. 135, Light vehicle brake systems, which applies to passenger vehicles with GVWR of 3,500 kilograms or less, or to the specifications of S7.4 of FMVSS No. 105, which applies to passenger vehicles with GVWR greater than 3,500 kilograms. Since AEB capability relies upon the function of the service brakes on a vehicle, it is reasonable and logical that the same pre-test conditioning procedures that apply to service brake performance evaluations should also apply to AEB system performance evaluations.

Comments

In comments, MEMA, Volkswagen, Porsche, and Bosch suggest that the agency adopt the pre-test conditioning process from UNECE Regulation No. 152 in that the vehicle can undergo a series of brake activations to burnish the brake system.

Agency Response

In response, NHTSA agrees with commenters that properly burnishing the brake system is important, but NHTSA does not believe that it must adopt this aspect of UNECE Regulation No. 152 to accomplish that. NHTSA believes that the proposed brake burnishing procedures that are consistent with both FMVSS No. 135 and FMVSS No. 105 properly burnish the brake system, depending on the test vehicle's GVWR. Additionally, commenters did not provide NHTSA with any evidence that the brake burnishing procedures the agency proposed are improper for burnishing brakes or are otherwise unacceptable for any reason. NHTSA is not adopting the changes and will adopt the provisions proposed in the NPRM without change.

Brake Temperature

This final rule adopts the proposed specification that the subject vehicle service brakes be maintained at an average temperature between 65° C (149 °F) and 100° C (212 °F) measured as an average of the brakes on the hottest axle. This temperature range, which is the same as the range specified in FMVSS No. 135, is important for consistent brake performance and test repeatability.

Comments

In comments, MEMA, Volkswagen, Porsche, and Bosch suggest that NHTSA adopt the pre-test conditioning process from UNECE Regulation No. 152, specifically, that the average temperature of the service brakes on the hottest axle should be between 65–100 degrees C prior to each test run. Zoox also recommends that the hottest axle on the service brakes should be between 65–100 degrees C prior to testing, and that the agency should use FMVSS No. 135 as a guide for warming the vehicle brakes.

Agency Response

In response, NHTSA points out that the commenters refer to initial brake temperatures tested according to the procedure in FMVSS No. 135, and appear to be supporting NHTSA's proposed provisions notwithstanding reference to UNECE Regulation No. 152. The procedure in FMVSS No. 135 more rigorously specifies how and where temperature is measured than the equivalent in UNECE Regulation No. 152. NHTSA concurs and is adopting the provisions as proposed in the NPRM

User Adjustable Settings

This final rule adopts the proposed specification that NHTSA may test user adjustable settings such as engine braking, regenerative braking, and those associated with FCW, at any available setting state. Furthermore, adaptive and traditional cruise control may be used in any selectable setting during testing. The agency may test vehicles with any cruise control or adaptive cruise control setting to make sure that these systems do not disrupt the ability of the AEB system to stop the vehicle in crash imminent situations. However, for vehicles that have an ESC off switch, NHTSA will keep ESC engaged for the duration of the test.

Comments

In its comments, HATCI stated that NHTSA should test the vehicles using the default settings to represent real-world driving conditions because HATCI's research indicates that consumers do not typically change the settings. Bosch commented that the regenerative brakes add too much variability to the vehicle performance. Therefore, Bosch stated that the regenerative braking feature of a car, if equipped with one, should be overridden for the duration of AEB testing. AAA expressed concern that the proposal to allow vehicle testing with any cruise control setting would introduce too many variables into the testing scenario. AAA recommended the agency test all vehicles with the latest AEB setting and/or test all vehicles with and without the cruise control activated.

Agency Response

The purpose of the ''any'' user adjustable parameter is to ensure that driver-activated settings do not negatively impact AEB performance. NHTSA seeks to avoid a situation where use of a setting reduces the requisite performance of AEB when tested according to the parameters of S7, S8, and S9. NHTSA also sought to incorporate the word ''any'' into the standard to make clear that NHTSA has wide latitude to adjust the settings in a compliance test, in accordance with 49 CFR 571.4. That section states: ''The word *any,* used in connection with a range of values or set of items in the requirements, conditions, and procedures of the standards or regulations in this chapter, means generally the totality of the items or values, any one of which may be selected by the Administration for testing, except where clearly specified otherwise.''

NHTSA did not receive any comments indicating that the agency's approach to ensure AEB performance would be problematic. Vehicle manufacturers will have to assure that their designs do not negative affect the performance of AEB and may have more of a certification burden to assure such performance. The burden is reasonable, though, to assure that AEB systems work properly when other systems are engaged. Therefore, the agency is adopting the provisions proposed in the NPRM without change.

Loading

This final rule adopts the proposed specification that NHTSA will load the subject vehicle with not more than 277 kg (611 lbs.), which includes the sum of any vehicle occupants and any test equipment and instrumentation. The agency proposed this specification for load because tests of the fully loaded vehicles are already required and conducted under exiting FMVSSs, such as FMVSS No. 135, ''Light vehicle brake systems,'' to measure the maximum brake capacity of a vehicle.

Comments

NHTSA received comments from MEMA and ASC recommending that the agency harmonize with procedures of UNECE R151 and R152, and Euro NCAP. Those procedures specify a maximum load of 200 kg.

Agency Response

In response, NHTSA declines to adopt the suggested change. NHTSA derives the subject vehicle load of 277 kg (611 lbs.) from agency testing, which uses the provision in NHTSA's NCAP test procedures. Most, if not all, vehicle manufacturers are familiar with NCAP's procedures and have designed their vehicles in accordance with them. As explained in the NPRM, the stopping performance of a fully loaded vehicle is already assessed under FMVSS No. 135. Commenters supporting the UN Regulations maximum load of 200 kg gave little technical support or rationale as to why that maximum load was preferred to the 277 kg proposed load. It is not apparent to NHTSA whether or the degree to which the 77 kg difference would change the test results. Therefore, given the information available to the agency, NHTSA is adopting the proposal.

L. Vehicle Test Device

This final rule adopts specifications for a VTD to be used for compliance testing for the lead vehicle requirements. The GVT is a full-sized harmonized surrogate vehicle developed to test crash avoidance systems. To ensure repeatable and reproducible testing that reflects how a subject vehicle would be expected to respond to an actual vehicle in the real world, the VTD specified in this final rule will be used as a lead vehicle, pass through vehicle, and obstructing vehicle during testing. This final rule adopts all the specifications in the NPRM.

This final rule specifies that the vehicle test device is based on certain specifications defined in ISO 19206–3:2021, ''Road vehicles-Test devices for target vehicles, vulnerable road users and other objects, for assessment of active safety functions—Part 3: Requirements for passenger vehicle 3D targets.'' [156] The vehicle test device is a tool that NHTSA will use in compliance tests to measure the performance of AEB systems required by FMVSS No. 127.

1. General Description

In the NPRM, NHTSA provided background on the agency's purpose and rationale for proposing the VTD.[157] The VTD provides a sensor representation of a passenger motor vehicle. The rear view of the vehicle test device contains representations of the vehicle silhouette, a rear window, a high-mounted stop lamp, two taillamps, a rear license plate, two rear reflex reflectors, and two tires.

NHTSA received several comments on the proposed test device, all of which were generally supportive. Bosch, AAA, Rivian, the Alliance, and Ford all generally supported use of the proposed GVT across all AEB systems. AAA stated that the GVT is easy to use and provides versatility that allows for the evaluation of many realistic vehicle interaction. Rivian recommended NHTSA align the GVT device with the device used by Euro NCAP.

Forensic Rock, on the other hand, recommends higher speed targets that can withstand high closing speed tests with minimal damage to the vehicles. In response, NHTSA will continuously monitor the development of AEB technologies and test devices associated with system performance. If a need arises for new test devices, NHTSA can assess and respond to the situation at that time.

2. Definitions

The proposal defined a ''vehicle test device'' as a test device that simulates a passenger vehicle for the purpose of testing AEB system performance and defined a vehicle test device carrier as a movable platform on which a lead vehicle test device may be attached during compliance testing.

Bosch recommended the definition of ''vehicle test device'' be changed to ''a test device with the appearance and radar characteristics that, together with the vehicle test device carrier, simulates a passenger vehicle for the purpose of testing automatic emergency brake system performance.''

In response, NHTSA has considered the difference in the proposed definition for the ''vehicle test device'' and the definition suggested by Bosch and believes there to be no utility difference. The definition suggested by Bosch contains two areas of distinction from that of the proposed rule. First, Bosch suggested adding the phrase ''with the appearance and radar characteristics.'' While the specifications contain appearance and radar characteristics, such details are not needed within the definition to fulfill the purpose of a definition, which is to provide clarity as to what items are included and excluded from the term. The agency has decided to keep the definition broad and specify the technical details in the body of the regulation.

Second, the definition suggested by Bosch provides that only the combination of the vehicle test device and the vehicle test device carrier represent a passenger vehicle. While the specifications provide details of the carrier device, those details are minimal and are primarily designed to minimize the carrier's appearances. One limitation of Bosch's suggestion would be that only the combination of the vehicle test device and the carrier would be usable for testing at a definition level. Not all tests require movement of the vehicle test device and as such, these tests could be conducted without a carrier (provided that the vehicle test device meet the specifications without the carrier). Considering that the appearance of the carrier is to be minimal, such flexibility of testing provides advantages for compliance testing. Accordingly, the agency is finalizing the definition of vehicle test device as proposed in the NPRM.

3. Sideview Specification

NHTSA proposed to establish specifications applicable to only the rear-end of the vehicle test device. The proposal sought comment on whether the specifications for the vehicle test device should include sides of the vehicle, as well as the rear-end, and proposed potentially including the specifications from ISO 19206–3:2021.

Comments

Advocates, MEMA, ZF, and Bosch all support specification of sideview, so the AEB can address cross traffic in the future. MEMA and ZF also recommend angled rear view (30 degrees, for example) representing a vehicle making a right-hand turn. Advocates suggested that any shortcomings established with specifications of rear view should also be addressed by NHTSA for side view. Bosch stated that for test cases in which the sides of the vehicle are within the signal detection of the radars and/or sensors, the sides need to be included.

Agency Response

In response, NHTSA is not adopting turning scenarios or other scenarios where the side of the vehicle test device is critical to the outcome of the test. All lead vehicle scenarios, with the single exception of the false activation pass-through test, align the subject vehicle with the vehicle test device longitudinally along each centerline. Similar to the pass-through test, the obstructed pedestrian test that utilizes the vehicle test device aligns the subject

[156] *https://www.iso.org/standard/70133.html.* May 2021.

[157] 88 FR 38632 at 38705.

vehicle with vehicle test device longitudinally, with offsetting centerlines. Thus, no tests finalized in this final rule are dependent on the side view characteristics of the vehicle test device. If, in the future, tests are added that include side view interactions, the agency will consider additional specifications to the vehicle test device. For this final rule, the agency has finalized the rear-view characteristics only and has not added any view characteristics other than 180 degrees.

4. Field Verification Procedure

The NPRM did not specify in-the-field verifications be performed to assess whether the radar cross section falls within the acceptability corridor throughout the life of the device. NHTSA sought comment regarding the adoption of the optional field verification procedure provided in ISO 19206–3:2021, Annex E, Section E.3.

Comments

Bosch commented in support of the utilization of the optimal field verification procedure provided in ISO 19206–3:2021, Annex E, Section E.3, and further suggests the inclusion of suitable parts of the Annex C.

Agency Response

In response, the field verification procedure is not included in this final rule. NHTSA testing has shown that the radar cross section of a new GVT and a ''used'' GVT manufactured by at least one company fall consistently within the specified corridor incorporated by reference from ISO 19206–3:2021.[158] The field verification procedure alone does not fully demonstrate that the vehicle test device is within the specifications outlined in this rule. Accordingly, while the agency may informally use the field verification test to provide a general indication of the state of the vehicle test device, such a procedure is not appropriate for the test procedure.

5. Dimensional Specification

NHTSA proposed that the rear silhouette and the rear window be symmetrical about a shared vertical centerline and that representations of the taillamps, rear reflex reflectors, and tires also be symmetrical about the surrogate's centerline. Further, the license plate representation was proposed to have a width of 300 ± 15 mm and a height of 150 ± 15 mm, and be mounted with a license plate holder angle within the range described in 49 CFR 571.108, S6.6.3.1. Lastly, NHTSA proposed that the VTD representations be located within the minimum and maximum measurement values specified in columns 3 and 4 of Table A.4 of ISO 19206–3:2021 Annex A. The tire representations are to be located within the minimum and maximum measurement values specified in columns 3 and 4 of Table A.3 of ISO 19206–3:2021 Annex A. Additional clarification of terms was included in the NPRM stating that ''rear light'' means ''taillamp,'' ''retroreflector'' means ''reflex reflector,'' and ''high centre taillight'' means ''high-mounted stop lamp.''

Comments

In their comments, Ford, Porsche, and FCA all agree with NHTSA that the vehicle test device should be based on specifications defined in ISO 19206–3:2021. AAA and Adasky, alternatively, suggests that NHTSA re-assess the proposed requirement to be consistent with subcompact and compact cars, given the increased popularity of larger crossovers, SUVs, and light-duty trucks. Adasky recommends that the influences of hood height and A-pillar be included in the vehicle test device property definition.

Agency Response

In response, NHTSA has adopted the specification as proposed. Most commentors agreed with the use of ISO 19206–3:2021, which NHTSA proposed as appropriate in the NPRM. The agency does not have information to support adopting a change at this time. The agency would also point out that including the hood height and A pillar is unnecessary for front to rear crashes because they are not visible from the rear of the test device, which is the orientation for all tests.

6. Visual and Near Infrared Specification

NHTSA proposed that the vehicle test device rear representation colors be within the ranges specified in Tables B.2 and B.3 of ISO 19206–3:2021 Annex B. The proposal also specified that the infrared properties of the vehicle test device be within the ranges specified in Table B.1 of ISO 19206–3:2021 Annex B for wavelengths of 850 to 950 nm when measured according to the calibration and measurement setup specified in paragraph B.3 of ISO 19206–3:2021 Annex B. Lastly, NHTSA proposed that the rear reflex reflectors, and at least 50 cm^2 of the taillamp representations, of the vehicle test device be grade DOT–C2 reflective sheeting as specified in 49 CFR 571.108, S8.2.

NHTSA received no comments on this proposal. The agency has adopted the provision for the reasons provided in the NPRM.

7. Radar Reflectivity

NHTSA proposed that the radar cross section of the vehicle test device is to be measured while attached to the carrier (robotic platform). NHTSA also proposed that the radar reflectivity of the carrier platform be less than 0 dBm^2 for a viewing angle of 180 degrees at a distance of 5 to 100 m, when measured according to the radar measurement procedure specified in C.3 of ISO 19206–3:2021 Annex C for fixed-angle scans. The proposal also stated that the rear bumper area, as shown in Table C.1 of ISO 19206–3:2021 Annex C, contributes to the target radar cross section. NHTSA proposed that the radar cross section be assessed using a radar sensor that operates at 76 to 81 GHz and has a range of at least 5 to 100 m, a range gate length smaller than 0.6 m, a horizontal field of view of 10 degrees or more (–3dB amplitude limit), and an elevation field of view of 5 degrees or more (–3dB amplitude). The proposal stated that a minimum of 92 percent of the filtered data points of the surrogate radar cross section for the fixed vehicle angle, variable range measurements be within the radar cross section boundaries defined in Section C.2.2.4 of ISO 19206–3:2021 Annex C for a viewing angle of 180 degrees when measured according to the radar measurement procedure specified in C.3 of ISO 19206–3:2021 Annex C for fixed-angle scans. Lastly, the proposed rule stated that between 86 to 95 percent of the vehicle test device spatial radar cross section reflective power be within the primary reflection region defined in Section C.2.2.5 of ISO 19206–3:2021 Annex C, when measured according to the radar measurement procedure specified in Section C.3 of ISO 19206–3:2021 Annex C using the angle-penetration method.

Comments

In their comments, ZF and ASC both consider the tolerance of +/− 10dBm^2 to be quite high. ZF noted that information derived might be misleading (*e.g.,* object classification). In addition, ZF, ASC, Mobileye, and MEMA recommend including acceptable Radar Cross Section (RCS) ranges for the rear and the side of the VTD. While ZF, ASC, and MEMA suggest using the same RCS corridor values as specified in ISO 19206–3:2021, Mobileye suggests setting the bars at the lower RCS values (*e.g.,* –10dBsm for VRU, 0dBsm or below for

[158] Assessing the Effect of Wear on Vehicle Test Device Radar Return Characteristics, available in the docket for this final rule (NHTSA–2023–0021).

motorcycle). Mobileye also suggests including lateral edge errors as critical metrics because identifying the lateral edges of the object lowers risk of false association with camera or other sensors. Bosch recommends amending the radar reflectivity specifications because, ''The radar reflectivity of the carrier platform alone is less than 0 dBm^2 for a viewing angle of 180 degrees and over a range of 5 to 100 m when measured according to the radar measurement procedure specified in Section C.3 of ISO 19206–3:2021 Annex C for fixed-angle scans.''

Agency Response

The agency disagrees with the suggested revision to the radar reflectivity for the carrier, as the carrier radar characteristics are important when attached to the VTD, not the carrier by itself for the purposes of testing AEB. Testing the carrier alone fails to take into account the actual interface between the VTD and the carrier system.

Regarding the RCS range, the agency believes that both values are needed to set appropriate bounds of what is acceptable RCS for the VTD to match real world vehicles. The vehicle tests using two different sensors documented in the ISO 19206–3:2021 Figure C.17 and C.18 show that the vehicles tested varied within +/− 10dBm^2. Thus, permitting the vehicle test device to vary within this tolerance provides real-world application for the various vehicles on the road. In addition, lateral error tolerances are included in the test set-up specifications.

NHTSA is not adding turning scenarios to this proposal, and therefore the agency believes that side presentation specifications are not needed. NHTSA is finalizing the radar reflectivity specifications for the vehicle test device as proposed in the NPRM.

8. List of Actual Vehicles

In addition to the vehicle test device specifications, NHTSA sought comment on specifying a set of real vehicles to be used as vehicle test devices in AEB testing. NHTSA also sought comment on the utility and feasibility of safely conducting AEB tests with real vehicles, such as through removing humans from test vehicles and automating scenario execution, and how laboratories would adjust testing costs to factor in the risk of damaged vehicles. Additionally, NHTSA sought comments on the merits and potential need for testing using real vehicles, in addition to using a vehicle test device, as well as challenges, limitations, and incremental costs of such.

Comments

Advocates and Bosch both generally support the development of a list of possible real vehicles that could be used for testing in addition to the GVT. While Bosch suggests that NHTSA reference the relevant parts of ISO 19206–3:2021 if using a set of real vehicles, Advocates recommend that NHTSA consider the most frequently registered vehicles in the US over some lookback period with an established timeline.

In contrast, Rivian, Alliance, ASC, ZF, and MEMA all oppose using real vehicles. ZF, MEMA, and ASC state high cost and risk of injury to human subjects in performing high-speed AEB tests. ASC and ZF added that the advantages of testing with real vehicles compared to soft vehicle targets is not clear. Furthermore, ZF and MEMA mention that the tests that involve a soft target could serve as a real vehicle test if combined with documentation provided by the OEM.

The Alliance notes test repeatability and reproducibility challenges due to potential differences in vehicles selected for testing and that repairs may be expensive and time-consuming if contact occurs. It also notes that the current GVT is correlated to real world vehicles through collaborative global government/industry testing and verification. Rivian stated that using representative test devices, as opposed to real vehicles, reduces test burdens on manufacturers and poses lesser risk of injury if AEB fails to avoid a crash during the test procedure. ASC and ZF believe that vehicles with AEB systems should be able to detect a wide range of vehicles and suggests that if NHTSA decides to develop its own, more US-fleet representative GVT target, then it should be compliant with the ISO standard.

Agency Response

NHTSA agrees that the VTD specifications provide sufficient flexibility in appearance that creating a list of vehicles for testing is not likely to increase the safety impacts of the rule. NHTSA also agrees that there are concerns over the cost of testing with real vehicles, and, that there are potential safety risks to test operators. NHTSA believes that the GVT is representative of a genuine vehicle,[159] and does not believe that the increased costs of adding a documentation requirement for manufacturers to show this is warranted at this time. Accordingly, the agency is not adopting a list of real vehicles for testing at this time.

M. Pedestrian Test Devices

This final rule adopts specifications for two pedestrian test devices to be used for compliance testing for the PAEB requirements. The two pedestrian test devices each consist of a test mannequin and a motion apparatus (carrier system) that positions the test mannequin during a test. NHTSA's specifications for pedestrian test mannequins represent a 50th percentile adult male and a 6- to 7-year-old child. NHTSA has incorporated by reference specifications from three ISO standards.

1. General Description

The Adult Pedestrian Test Mannequin (APTM) provides a sensor representation of a 50th percentile adult male and consists of a head, torso, two arms and hands, and two legs and feet. The Child Pedestrian Test Mannequin (CPTM) provides a sensor representation of a 6- to 7-year-old child and consists of a head, torso, two arms and hands, and two legs and feet. The arms of both test mannequins are posable but will not move during testing. The legs of the test mannequins will articulate and will be synchronized to the forward motion of the mannequin.

In the NPRM, NHTSA provided background on the agency's purpose and rationale for proposing the test devices and the history of the devices and their use,[160] including previous NHTSA **Federal Register** notices that have solicited input from the public on test procedures that include the use of these pedestrian test devices either in current or past form (*i.e.,* articulated vs. non-articulated legs).

NHTSA received many comments on the proposal, all of which were generally supportive. Commenters generally supported the use of the ISO 19206–2:2018 mannequins as these are already validated and readily available. SAE noted that its mannequin prototypes had limited testing in the test track and deferred to NHTSA's understanding of the new standard to know which pedestrian mannequin would be most appropriate for the regulation. The commenters also supported harmonizing with international standards, such as UNECE Regulation No. 152, as a baseline for mannequin specifications, and with ISO

[159] Overall, the AEB system sensors interpret the SSV appears to sensors as a genuine vehicle. Nearly all vehicle manufacturers and many suppliers have assessed how the SSV appears to the sensors used for their AEB systems. The results of these scans have been very favorable. 80 FR 68615, NCAP RFC, Docket No. NHTSA–2015–0006.

[160] 88 FR at 38702.

19206–2:2018 regarding the PAEB mannequins.

In response, NHTSA is adopting the relevant parts of ISO 19206–2:2018 and ISO 19206–4:2020, as specified in the NPRM. ISO 19206 has a larger body of research testing to support its test devices than SAE J3116, and using ISO 19206 is consistent with international standards like UNECE Regulation No. 152.

For the mannequin carrier system, Bosch suggested adoption of the ISO 19206–7 specifications and test hardware to specify the carrier system used to move the pedestrian test mannequin. Bosch further recommended revising the definitions of the adult and child mannequins to refer to the carrier systems. NHTSA is declining to make these changes. Because ISO 19206–7 is still in draft form, NHTSA believes it is premature to consider it for adoption. Regarding the carrier system, it is a modular system designed to move the child and adult test mannequins. As such, NHTSA believes that the definition of the carrier system should lie outside the definition of either mannequin. It is also more appropriate to specify how the carrier system can affect sensor representations of the mannequins, rather than specify it as part of a mannequin.

The American Foundation for Blind (AFB) recommended NHTSA use the most inclusive and effective mannequins that will reduce road injuries and deaths among people with disabilities, including women, adults with short stature, and cyclists. Some commenters suggest that NHTSA use pedestrian test mannequins using mobility assistive devices, such as wheelchairs (motorized and non-motorized), walkers, motorized scooters, or canes.

In response, NHTSA is interested in additional pedestrian test devices outside of the child and adult pedestrian test mannequins, including those that reflect the broad diversity among the American public. At this time, however, there is a need for more development, research, and testing for pedestrian test mannequins that are using mobility assistive devices. NHTSA intends to monitor the progress of these devices as they are developed and standardized, for possible inclusion in the standard at a future date.

2. Dimensions and Posture

The APTM and the CPTM have basic body dimensions and proportions specified in ISO 19206–2:2018. All commenters responding to the proposed dimensions agreed with the proposal. The agency is adopting the proposal for the reasons provided in the NPRM.

A number of commenters responded to NHTSA's question asking whether use of the 50th percentile adult male test mannequin would ensure PAEB systems will react to small adult females and other pedestrians other than mid-size adult males. Consumer Reports (CR) supported NHTSA's proposal to use a pedestrian test mannequin representing a 50th-percentile adult male and one representing a six- to seven-year-old child, stating it is critical to use both mannequins in PAEB testing to account for a range of human proportions. The commenter believed it is especially important to use the child mannequin to provide adequate protection for children and other shorter individuals, particularly from impacts involving large vehicles that have tall hoods or that otherwise have limited frontal visibility.

Several commenters (Advocates, AARP, ZF, Consumer Reports, and MEMA) suggested including an adult female mannequin and the child mannequin in all tests. NHTSA is unaware of any standards providing specifications for a 5th percentile adult female test mannequin, or of any consumer information programs testing with such a device.

The Alliance stated that the proposed child and adult test devices should provide a reasonable assessment across a broad spectrum of occupant sizes.[161] AAA recommended not including the child test mannequin for all testing scenarios, as this would increase testing burdens. AAA suggested that, as an alternative, NHTSA could test some scenarios with the smaller SAE pedestrian test mannequin.

After reviewing the comments, NHTSA is satisfied that the currently proposed pedestrian test mannequins provide a reasonable representation of the pedestrian crash population for purposes of issuing this final rule. In its comment to the NPRM, IIHS stated that evidence does not demonstrate that current PAEB systems are tuned only to the adult male mannequin. This rulemaking does not expand the mannequins used in new FMVSS No. 127, or expand how the child dummy is used, because NHTSA does not have the body of research necessary to support such changes for this final rule.

FCA noted that there are no dimensional tolerances on the pedestrian test device. In response, NHTSA's testing has not shown an issue with the dimensions specified in the NPRM. Further, the locational bounds of the pedestrian test mannequin are specified in the individual test scenarios. Thus, the agency is not adopting additional tolerances on the dimensional specification of the pedestrian test mannequins. SAE responded to NHTSA's comment on shoe height, stating that the overall mannequin height on the sled is representative of the overall height of real pedestrians with shoes.

3. Visual Properties

The mannequins will have specified features for the depictions of hair, skin tone, clothing, and the like. The features are specified in the ISO standards incorporated by reference into FMVSS No. 127 by this final rule. The incorporated ISO standards provide needed specifications for these features, but they also allow NHTSA to harmonize with specifications for test mannequins in use by Euro NCAP.

Because specifications for test mannequin skin color are not found in ISO 19206–2:2018, NHTSA is incorporating by reference the bicyclist mannequin specifications for color and reflectivity found in ISO 19206–4:2020, ''Road vehicles—test devices for target vehicles, vulnerable road users and other objects, for assessment of active safety functions—Part 4: Requirements for bicyclists targets.'' Although this standard provides requirements for bicyclist test devices, NHTSA is referencing it for color and reflectivity for the prescribed adult and child test mannequins because the specifications are workable for use with the ISO standard for pedestrian test devices. NHTSA is specifying that the test mannequins be of a color that matches a specified range of skin colors representative of very dark to very light complexions. The mannequins must also have standardized properties that represent hair, facial skin, hands, and other features, and must have a standardized long-sleeve black shirt, blue long pants, and black shoes.

Commenters (AARP, Safe Kids Worldwide (SKW), Safe Kids in Autonomous Vehicles Alliance (SKAVA), Luminar, and private citizens) supported NHTSA's effort to ensure PAEB detect pedestrians of all skin colors. The agency agrees with the commentors that sensors should detect skin tones other than light skin tones.

Luminar did not support the white face, black shirt, and blue pants on mannequins. While NHTSA understands that the commenter would like to see testing outside of the

[161] The Alliance supported using a child test mannequin in daytime scenarios only, and not also in the nighttime scenario. NHTSA discussed this comment in separate section.

specifications identified in the NPRM, the agency does not have the body of knowledge necessary to objectively specify clothing outside of the black shirt and blue pants. Furthermore, commenters did not provide data demonstrating that current PAEB systems do not already detect a wide array of skin tones. The proposal includes a range of colors (based on ISO 19206–4_2020 standard) for skin, face, and hands. NHTSA encourages manufacturers to consider designing their systems to detect all pedestrians, including those wearing various clothing colors.

4. Radar Properties

The radar reflectivity characteristics of the pedestrian test device approximates that of a pedestrian of the same size when approached from the side or from behind. Radar cross section measurements of the pedestrian test mannequins must fall within the upper and lower boundaries shown in Annex B, section B.3, figure B.6 of ISO 19206–2:2018 when tested in accordance with the measure procedure in Annex C, section C.3 of ISO 19206–2:2018.

In response to Bosch, this final rule adopts the newer ISO 19206–3:2021 instead of ISO 19206–2:2018 in determining the upper and lower boundaries for an object for radar cross-section measurements. The proposed procedure in Annex C, section C.3 of ISO 19206–2:2018 is specific for pedestrian targets; however, recent testing performed by the agency indicates that the three position measurement specified in Annex C, section C.3 of ISO 19206–3:2021 provides more reduction in multi-path reflections and offers more accurate radar cross section values. This testing confirms the recommendation from Bosch to adopt the measurement procedure in Annex C, section C.3 of ISO 19206–3:2021. Therefore, the agency is adopting the new version of the ISO standard.

5. Articulation Properties

This final rule adopts the proposal that the legs of the pedestrian test device be in accordance with, and as described in, Annex D, section D.2 and illustrated in Figures D.1, D.2, and D.3 of ISO 19206–2:2018. For the test scenarios involving a moving pedestrian, the legs of the pedestrian test mannequin will articulate to simulate a walking motion. A test mannequin that has leg articulation when in motion more realistically represents an actual walking or running pedestrian. For test scenarios involving a stationary pedestrian, the legs of the pedestrian test mannequin remain at rest (*i.e.,* simulate a standing posture).

Commenters to this issue supported the pedestrian test mannequin with articulation characteristics. The Alliance agreed that mannequins equipped with articulate moving legs are more representative of actual pedestrians than mannequins with stationary legs. While agreeing with the NPRM, Aptiv noted that even when people are standing next to a road, they move in some way (*e.g.,* body micro-movement) and so NHTSA may want to add some upper body movement to the stationary pedestrian test mannequin. Porsche supported the adoption of articulated dummies, explaining that the articulated motion is required because of the ''micro doppler'' effect, which is an important consideration for radar sensors.

NHTSA has adopted the proposal for the articulation properties of the legs. The agency is not adding pedestrian micro-movement to the articulation requirements as there are currently no consensus standards available for pedestrian micro-movement and NHTSA does not testing experience with mannequins of that type.

6. Comments on Thermal Characteristics

In addition to the characteristics specified in the proposal presented in the NPRM, NHTSA requested comments on whether test mannequins should have thermal characteristics. Several commenters [162] responding to the NPRM discussed the merits of thermal characteristics in the pedestrian test mannequins. Owl AI and Teledyne explained that thermal imaging can capture infrared radiation emitted by pedestrians in the 8–14μm (long wave) band, which allows for pedestrians to be easily distinguished from other objects. AAA supported inclusion of thermal specifications, especially for nighttime testing.

NHTSA currently does not have the body of research necessary to develop test protocols that support the inclusion of thermally active pedestrian test mannequins but concurs this matter may be a topic for future consideration. NHTSA will continue to monitor the development of thermally active pedestrian test mannequins so that the agency can explore their use in the future.

N. Miscellaneous Topics

Advocates, ZF, AAA, Rivian, Volkswagen, AARP, the National Associations of Mutual Insurance Companies, and ASC suggested a requirement that vehicle manufacturers provide information in owners' manuals and elsewhere describing how the AEB system works, and its capabilities and its limitations. SEMA suggested a requirement that specific information such as diagnostic codes and calibration information be shared with consumers, MEMA suggested web links to information, and NADA suggested using a QR code on the Monroney label. SEMA also requested that NHTSA provide a system of information about AEB to aftermarket suppliers.

In contrast, the Alliance and Hyundai opposed new information requirements about AEB, suggesting that information is already provided in the absence of a regulation. Additionally, the Alliance stated it is unaware of the safety impacts of providing AEB information to consumers.

This final rule has not adopted additional information requirements. The agency concludes that the primary safety impacts from AEB is the functionality itself. While information regarding the capabilities and limitations of the AEB system may be generally useful, AEB as required by this rule is a last second intervention system. Thus, a driver's basic driving technique should not change based on the capabilities or even the existence of AEB (aside from heeding the warning of the malfunction indicator to attend to a problem with the AEB system).

FCA believed that the proposed requirements overly focus performance on the vehicle's braking system and not on the output of the sensing and perception capacity of the AEB system. FCA further stated that it could be possible to focus the regulatory requirement solely onto the AEB system (*i.e.,* the sensors and perception system) by defining a perception mandate for output signals for time to warn or the BRAKE! Command. FCA further asserted that this output could be derived from fleet averages, equations of motion, and that as vehicle performance improves, the timing could be revised accordingly.

In response, NHTSA declines FCA's suggestion to directly regulate the sensing and perception systems directly instead of the ability of the entire system to avoid crashes. This FMVSS is created with important safety goals in mind to address significant safety problems that this technology can resolve. For this rule, the safety problems are rear-end crashes and crashes involving pedestrians struck by the front of a vehicle. The performance requirements (avoiding contact with a lead vehicle and pedestrian) address

[162] Commenters included Advocates, Adasky, Owl AI, Teledyne, and AAA.

this safety problem in an effective and expeditious manner. They are solidly supported and informed by data from years of agency and industry research, the voluntary commitment and NCAP, substantial collaborative work between entities, and NHTSA's close monitoring of AEB development and maturation. A new approach specifying a particular time to collision based on the information from the perception system is not supported by the current stated of knowledge and would take years to research and develop.

FCA commented that NHTSA did not provide a baseline or compliance assessment of the front lighting equipment installed in the research vehicles, so manufacturers are unaware of the performance level of the lighting relative to the FMVSS No. 108 range. For example, the vehicles may have been equipped with optional lighting packages within the product lineup, which may have enhanced performance. FCA also noted that lighting was not included in the technical assessment or economic analysis in the proposal. FCA expressed that NHTSA should have knowledge regarding the high cost of modern lighting systems and importantly, how much lead time would be needed to develop them, and that performance requirements should not prohibit otherwise compliant lighting systems. Finally, it stated that if improved lighting is mandatory for AEB nighttime performance objectives, FMVSS No. 108 should be reconfigured in a separate rulemaking.

In response, NHTSA's performance-oriented approach in this final rule directly addresses the safety problem while providing manufacturers the most flexibility in designing vehicles to meet FMVSS No. 127. Improved lighting is not a requisite of the final rule. A manufacturer may choose to create a robust perception system that initiates braking sooner, have a lesser performing perception system and equip the vehicle with robust brakes, have a high performing headlighting system to help achieve the performance required, or implement another means of meeting the standard. Because FMVSS No. 127 is a performance standard, manufacturers decide what countermeasures makes the most sense for them to meet the standard, and the marketplace can continue to drive innovation while achieving positive safety outcomes.

O. Effective Date and Phase-In Schedule

NHTSA proposed that all requirements be phased in within four years of publication of a final rule. Under the proposal, all AEB-equipped vehicles would be required to meet all requirements associated with lead vehicle AEB within three years. NHTSA also proposed that all PAEB-equipped vehicles would be required to meet all daylight test requirements for PAEB within three years. For PAEB performance in darkness, NHTSA proposed lower maximum test speed thresholds that would have to be met within three years for some specified test procedures. Under the proposal, all vehicles would be required to meet the minimum performance requirements with higher darkness test speeds four years after the publication of a final rule. Small-volume manufacturers, final-stage manufacturers, and alterers would be provided an additional year of lead time for all requirements.

NHTSA requested comments on the proposed lead time for meeting the proposed requirements, and how the lead time can be structured to maximize the benefits that can be realized most quickly while ensuring that the standard is practicable.

Comments

In general, manufacturers, suppliers, and industry advocacy groups asserted that more time is needed to meet the performance requirements in the NPRM. In contrast, safety advocates and municipalities requested that the proposed requirements be implemented sooner.

More specifically, the Alliance cited concerns over the practicability of no contact, the NPRM's underestimation of the software and hardware changes needed to facilitate crash avoidance at higher speeds, and the complexity of addressing false positives all within a short lead time. They expressed that it cannot be known whether systems can achieve the proposed requirements through software upgrades until a comprehensive system review, analysis, and synthesis has been performed by manufacturers. Further, they expressed that the proposed timeline could disrupt vehicle developments already underway as it may require revisiting previous hardware and software design decisions and redesigning systems expected to impact or be impacted by the AEB/PAEB system. In addition, they stated that existing vehicle electrical architectures may not be capable of handling the additional or upgraded sensors, additional communication bandwidth and processing power to upgrade the vehicle ADAS system to the proposed level of performance.

The Alliance, Mitsubishi, Honda, and Nissan proposed a compliance date starting seven years or more after the issuance of a final rule for large volume manufacturers, and the Alliance suggested an additional four years for small volume manufacturers. The Alliance proposed an alternative compliance schedule that begins five years after the issuance of a final rule but noted that this would not address the outstanding technical issues and unintended consequences that they outlined in their comments.

Volkswagen and Porsche suggested a phased-in compliance process where a certain percentage of the fleet would be required to comply over a period of several years until 100 percent of the fleet was required to comply with the final rule. The Alliance and Nissan suggested that if the agency considered its proposal to harmonize with UNECE Regulation No. 152, compliance could occur sooner. Porsche and Volkswagen suggested that compliance with UNECE Regulation No. 152 could be considered for end-of-production lines or as part of a phase-in.

Bosch recommended a stepwise regulatory timeline, observing that speeds up to 60 km/h are achievable as proposed in the NPRM, but additional time would be necessary for testing at higher speeds. Mobileye suggested a similar approach.

Advocates stated that the agency should require a more aggressive schedule for compliance given the baseline inclusion of the components for AEB systems in new vehicles. In addition, Advocates stated that they oppose any further extension of the proposed compliance dates in the NPRM. The NTSB encouraged NHTSA to consider reducing the timeline for the rule's effective dates to expedite deployment as some manufacturers may be able to achieve some of the performance requirements immediately. Consumer Reports suggested that all requirements, other than darkness pedestrian avoidance requirements, be effective no later than one year after issuing a final rule. For darkness pedestrian avoidance requirements, Consumer Reports stated that NHTSA should set the compliance timeline at no more than two years after publication of a final rule. NAMIC and IIHS stated that, based on recent IIHS test data, manufacturers have made dramatic progress in PAEB programs in a short time, and recommended a one-year phase-in. Finally, NACTO, Richmond Ambulance Authority, DRIVE SMART Virginia, the city of Philadelphia, the city of Houston, and the Nashville DOT recommended that NHTSA have the higher speed pedestrian avoidance tests in dark conditions required on the same timeline as the daytime scenarios.

Agency Response

The agency finds the arguments for additional lead time compelling. For the reasons discussed below, this final rule requires that manufacturers comply with all provisions of this final rule at the end of the five-year period starting the first September 1 after this publication, or September 1, 2029. Most vehicles sold today do not meet all of the requirements set forth in this final rule, and many may not be easily made compliant with all of the requirements established in this final rule. While NHTSA recognizes the urgency of the safety problem, NHTSA also recognizes that the requirements of this final rule are technology-forcing. The agency believes that the requirements are crucial in ensuring the safety in the long run, but we are extending the schedule to avoid significantly increasing the costs of this rule by requiring that manufacturers conduct expensive equipment redesigns outside of the normal product cycle. Because of the normal product development cycle, it is likely that there will be significant market penetration of complying systems as they are developed prior to the effective date of this rule.

While some commenters suggested that the proposed lead time is practicable if the agency reduced the stringency of this final rule's requirements, such an approach would result in a substantial decrease in the expected benefits of this rule in the long run. A lead time of five years provides manufacturers with the ability to fully integrate the AEB system into vehicles in line with the typical design cycle in many cases. Such a process permits manufacturers to fully design systems that minimize the false activations that industry has expressed concern about, yet still provide the level of performance required by this rule. NHTSA believes a five-year lead time fully balances safety considerations, the capabilities of the technology, and the practical need to engineer systems that fully comply with this final rule.

Note that as discussed in the Regulatory Flexibility Act section of the document, NHTSA is giving certain small manufacturers and alterers an additional year of lead time to comply with this rule.

Safety Act

Under 49 U.S.C. 30111(d), a standard may not become effective before the 180th day after the standard is prescribed or later than one year after it is prescribed, unless NHTSA finds, for good cause shown, that a different effective date is in the public interest and publishes a reason for the finding. A 5-year compliance period is in the public interest because most vehicles will require upgrades of hardware or software to meet the requirements of this final rule. To require compliance with this standard outside of the normal development cycle would significantly increase the cost of the rule because vehicles cannot easily be made compliant with the requirements of this final rule outside of the normal vehicle design cycle.

IV. Summary of Estimated Effectiveness, Cost, and Benefits

The requirements specified in this final rule for Lead Vehicle AEB address rear-impact crashes. Between 2016 and 2019, an average of 1.12 million rear-impact crashes involving light vehicles occurred annually. These crashes resulted in an annual average of 394 fatalities, 142,611 non-fatal injuries, and approximately 1.69 million property-damage-only vehicles (PDOVs).

In specifying the requirements for Lead Vehicle AEB, the agency considered the number of fatalities and non-fatal injuries resulting from crashes that could potentially be prevented or mitigated given the current capabilities of this technology. As a result, the requirements specified for Lead Vehicle AEB consider the need to address this safety issue by ensuring that these systems have sufficient braking authority to generate speed reductions that can prevent or mitigate real-world crashes.

The requirements specified in the final rule for PAEB address crashes in which a light vehicle strikes a pedestrian. Between 2016 and 2019, an average of approximately 23,000 crashes that could potentially be addressed by PAEB occurred annually. These crashes resulted in an annual average of 2,642 fatalities and 17,689 non-fatal injuries.

In specifying the requirements for PAEB, the agency considered the number of fatalities and non-fatal injuries resulting from crashes that could potentially be prevented or mitigated given the current capabilities of this technology. As a result, the requirements specified for PAEB consider the need to address this safety issue by ensuring that these systems have sufficient braking authority to generate speed reductions that can prevent or mitigate real-world crashes with pedestrians.

The target population for the lead vehicle AEB analysis includes two-vehicle, rear-end light vehicle crashes and their resulting occupant fatalities and non-fatal injuries. FARS is used to obtain the target population for fatalities and CRSS is used to obtain the target population for property-damage-only crashes and occupant injuries. The target population includes two-vehicle light-vehicle to light-vehicle crashes in which the manner of collision is a rear-end crash and the first harmful event was a collision with a motor vehicle in transport. Further refinement includes limiting the analysis to crashes where the striking vehicle was traveling straight ahead prior to the collision at a speed less than 90.1 mph (145 km/h) and the struck vehicle was either stopped, moving, or decelerating.

Table 23: Light Vehicle to Light Vehicle Target Population

Light Vehicle to Light Vehicle Target Population	Crashes	PDOVs	Injuries						Fatalities
			MAIS1	MAIS2	MAIS3	MAIS4	MAIS5	MAIS 1-5	
All Conditions	1,119,470	1,692,678	130,736	9,364	1,942	256	57	142,611	394

The target population for the PAEB analysis considered only light vehicle crashes that included a single vehicle and pedestrian in which the first injury-causing event was contact with a pedestrian. The area of initial impact was limited to the front of the vehicle, specified as clock points 11, 12, and 1, and the vehicle's pre-event movement was traveling in a straight line.

These crashes were then categorized as either the pedestrian crossing the vehicle path or along the vehicle path. The crashes are inclusive of all light, road surface, and weather conditions to capture potential crashes, fatalities, and injuries in real world conditions. Data

elements listed as ''unknown'' were proportionally allocated, as needed.

Table 24: Target Population of Pedestrian Fatalities and Non-Fatal Injuries

Light Vehicle to Pedestrian Target Population	Injuries						Fatalities
	MAIS 1	MAIS 2	MAIS 3	MAIS 4	MAIS 5	MAIS 1-5	
All Scenarios	13,894	3,335	1,541	300	75	19,511	2,508
Crossing Path	12,637	3,087	1,442	284	71	17,522	2,083
Along Path	1,257	248	98	16	4	1,622	425

A. Benefits

As a result of the requirements for Lead Vehicle AEB and PAEB specified in this final rule, we estimate that 362 fatalities and more than 24,000 non-fatal MAIS 1–5 injuries will be mitigated over the course of one vehicle model year's lifetime.

Table 25: Summary of Benefits: Estimated Quantified Benefits for Non-Fatal Injuries and Fatalities Mitigated

Injury Severity	Lead Vehicle AEB	PAEB	Total
MAIS 1	18,449	2,089	20,538
MAIS 2	2,575	401	2,976
MAIS 3	536	153	689
MAIS 4	71	23	94
MAIS 5	18	6	24
Total MAIS 1-5	21,649	2,672	24,321
Fatal	124	238	362

MAIS - Maximum Abbreviated Injury Scale

B. Costs

The agency estimated the incremental costs associated with this final rule, which has been adjusted from the estimates presented in the NPRM to include the costs associated with software and hardware improvements, compared to the baseline condition. Incremental costs reflect the difference in costs associated with all new light vehicles being equipped with AEB with no performance standard (the baseline condition) relative to all light vehicles being equipped with AEB that meets the performance requirements specified in this final rule.

As common radar and camera systems are used across Lead Vehicle AEB and PAEB systems, functionality can be achieved through upgraded software for most of the affected vehicles. Therefore, the agency accounts for the incremental cost associated with a software upgrade for all new light vehicles. Although the majority of new light vehicles would be able to achieve the minimum performance requirement without adding additional hardware to their current AEB systems, a small percentage would need to add either an additional camera or radar. Based on the prevalence of mono-camera systems in our test data and in NCAP reporting data, as well as a discussion with Bosch, this analysis estimated that approximately five percent of new light vehicles would require additional hardware.[163] Therefore, in addition to software costs, the agency also accounts for the incremental cost for five percent of new light vehicles would add additional hardware (radar) to their existing AEB systems in order to meet the requirements specified in this final rule. Taking into account both software and hardware costs, the total annual

[163] Ex Parte Docket Memo and Presentation_ Bosch, available at: *https://www.regulations.gov/document/NHTSA-2023-0021-1058.*

cost associated with this final rule is approximately $354.06 million in 2020 dollars.

Table 26: Summary of Incremental Costs

Category	Percentage of New Light Vehicles Impacted	Total Annual Cost (Millions)
Software	100%	$282.20
Hardware	5%	$71.86
Total		**$354.06**

C. Net Impact

The Benefits associated with this final rule, which are measured in fatalities prevented and non-fatal injuries reduced, were converted into equivalent lives saved. Under this final rule, the cost per equivalent life saved ranges from $0.55 million and $0.68 million. Therefore, the final rule is considered to be cost-effective. To calculate net benefits, both measures must be represented in commeasurable units. Therefore, total benefits are translated into monetary value. When discounted at three and seven percent, the net benefits associated with the final rule are $7.26 billion and $5.82 billion, respectively. Furthermore, when discounted at three and seven percent, the benefit cost ratios associated with the final rule are 21.51 and 17.45, respectively. Therefore, this final rule is net beneficial. Overall, the agency's analyses indicate that society will be better off as a result of the final rule.

Table 27: Calculation of Monetized Benefits

MAIS Level	Non-Fatal Injuries and Fatalities Mitigated	Comprehensive Cost of Injuries	Monetized Benefits (Billions)
MAIS 1	20,538	$66,071	$1.36
MAIS 2	2,976	$504,776	$1.50
MAIS 3	689	$2,172,806	$1.50
MAIS 4	94	$3,825,873	$0.36
MAIS 5	24	$6,414,626	$0.15
Fatal	362	$11,937,313	$4.32
Total			**$9.19**

Note: Values may not sum due to rounding.

Table 28: Discounted Monetized Benefits (Billions)

Monetized Benefits	Discount Rate		Discounted Monetized Benefits
$9.19	3%	0.8285	$7.61
	7%	0.6721	$6.18

Table 29: Summary of Net Benefits (Millions)

Total Cost	Monetized Benefits		Net Benefits	
	3%	7%	3%	7%
$354.06	$7,614.86	$6,177.36	$7,260.80	$5,823.31

V. Regulatory Notices and Analyses

Executive Orders 12866, 13563, and 14094 and DOT Regulatory Policies and Procedures

The agency has considered the impact of this rulemaking action under Executive Order (E.O.) 12866, E.O. 13563, E.O. 14094, and the Department of Transportation's regulatory procedures. This rulemaking is considered ''(3)(f)(1) significant'' and was reviewed by the Office of Management and Budget under E.O. 12866, ''Regulatory Planning and Review,'' as amended by E.O. 14094, ''Modernizing Regulatory Review.'' It is expected to have an annual effect on the economy of $200 million or more. NHTSA has prepared a regulatory impact analysis that assesses the cost and benefits of this rule, which has been included in the docket listed at the beginning of this rule. The benefits, costs, and other impacts of this rule are summarized in the final regulatory impact analysis.

Regulatory Flexibility Act

The Regulatory Flexibility Act of 1980, as amended, requires agencies to evaluate the potential effects of their proposed and final rules on small businesses, small organizations, and small governmental jurisdictions. The Small Business Administration's regulations at 13 CFR part 121 define a small business, in part, as a business entity ''which operates primarily within the United States.'' (13 CFR 121.105(a)). No regulatory flexibility analysis is required if the head of an agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. The SBREFA amended the Regulatory Flexibility Act to require Federal agencies to provide a statement of the factual basis for certifying that a rule will not have a significant economic impact on a substantial number of small entities.

NHTSA has considered the effects of this final rule under the Regulatory Flexibility Act.

The RIA discusses the economic impact of the rule on small vehicle manufacturers, of which NHTSA is aware of 12. NHTSA believes that this rule would not have a significant economic impact on these manufacturers. The vehicles produced by manufacturers listed in RIA can roughly be grouped into three classes: (1) luxury/ultra-luxury vehicles; (2) alternative electric vehicles; and (3) modified vehicles from other manufacturers. For luxury/ultra-luxury vehicles, any potential incremental compliance costs would not impact demand. Similarly, we would expect alternative electric vehicles to offer amenities meeting or exceeding the established market alternatives, including effective AEB and PAEB systems. Lastly, regarding final stage manufacturers, NHTSA is aware that these manufacturers buy incomplete vehicles from first-stage manufacturers. Then these vehicles are modified from larger manufacturer stock that would already be compliant. Therefore, there would be no incremental compliance costs.

As noted in the NPRM, much of the work developing and manufacturing AEB system components would be conducted by suppliers. Although the final certification would be made by the manufacturer, the NPRM proposed allowing for one additional year for small-volume manufacturers to comply with any requirement. That approach is similar to the approach we have taken in other rulemakings in recognition of manufacturing differences between larger and smaller manufacturers. As the countermeasures are developed, AEB suppliers would likely supply larger vehicle manufacturers first, before small manufacturers. In the proposed rule, NHTSA recognized this and maintained the agency's position that small manufacturers need additional flexibility, so they have time to obtain the equipment and work with the suppliers after the demands of the larger manufacturers are met.

The difference between the proposal and what is finalized in this rule is that NHTSA is no longer pursuing different lead-times based on the technology or phase-in schedules. Rather, the agency is providing all manufacturers with two extra years of lead time for lead vehicle AEB and one extra year of lead time for the most stringent requirements for PAEB (*i.e.,* 5 years of lead time regardless of technology). The rule adopts a 5-year lead time for all requirements and all manufacturers to ensure that the public attains lead vehicle AEB and PAEB safety benefits as soon as practicable. Small volume manufacturers would not have to comply for six years due to the additional year provided to them.

This rule may also affect final stage manufacturers, many of whom would be small businesses. While it is NHTSA's understanding that final stage manufacturers rarely make modifications to a vehicle's braking system and instead rely upon the pass-through certification provided by a first-stage manufacturers, as with small-volume manufacturers, final stage manufacturers would be provided with one additional year to comply with any requirement.

NHTSA received comments on the Regulatory Flexibility Act analysis included in the NPRM. One commenter asserted that NHTSA did not adequately consider the additional burden for small volume manufacturers and the unique design characteristics that would present additional compliance challenges for small manufacturers. The unique design considerations include low ground clearance, bumper characteristics that would require mounting radar very close to the ground, thereby requiring additional engineering to manage increased sensor signal noise, the general shape of the bumper, and the materials used for the bumper. This commenter said that the combination of these factors raises the risk of false positives and/or angular distortion of the target object in vertical and horizontal plane. Another commenter raised concerns about the engineering challenges faced by manufacturers of ''SuperCars'' and concern that these manufacturers would revert to seeking exemptions instead of pursuing FMVSS compliance.

In response to these comments, NHTSA notes that it has extended the lead time for all manufacturers to 5 years in this final rule. As proposed, final stage manufacturers and small-volume manufacturers would receive an additional year to comply, thus giving those entities 6 years to comply with this final rule. NHTSA believes that 6 years is sufficient time for even the smallest manufacturers to design and conform their products to this FMVSS, or seek an exemption if they have grounds under one of the bases listed in 49 CFR part 555.

I certify that this final rule would not have a significant economic impact on a substantial number of small entities. Additional information concerning the potential impacts of this rule on small entities is presented in the RIA accompanying this rule.

National Environmental Policy Act

The National Environmental Policy Act of 1969 (NEPA) [164] requires Federal agencies to analyze the environmental impacts of proposed major Federal actions significantly affecting the quality of the human environment, as well as the impacts of alternatives to the proposed action.[165] The Council on Environmental Quality (CEQ) directs Federal agencies to prepare an environmental assessment for a proposed action ''that is not likely to

[164] 42 U.S.C. 4321–4347.

[165] 42 U.S.C. 4332(2)(C).

have significant effects or when the significance of the effects is unknown.'' [166] When a Federal agency prepares an environmental assessment, CEQ's NEPA implementing regulations require it to (1) ''[b]riefly provide sufficient evidence and analysis for determining whether to prepare an environmental impact statement or a finding of no significant impact;'' and (2) ''[b]riefly discuss the purpose and need for the proposed action, alternatives . . ., and the environmental impacts of the proposed action and alternatives, and include a listing of agencies and persons consulted.'' [167]

This section serves as NHTSA's Final Environmental Assessment (EA). In this Final EA, NHTSA outlines the purpose and need for the rulemaking, a reasonable range of alternative actions the agency considered through rulemaking, the projected environmental impacts of these alternatives. NHTSA did not receive any comments on the Draft EA.

Purpose and Need

This final rule sets forth the purpose of and need for this action. In this final rule, NHTSA is adopting a new FMVSS to require AEB systems on light vehicles capable of reducing the frequency and severity of both lead vehicle rear-end (lead vehicle AEB) and pedestrian crashes (PAEB). As explained earlier in this preamble, the AEB system improves safety by using various sensor technologies and sub-systems that work together to detect when the vehicle is in a crash imminent situation, to automatically apply the vehicle brakes if the driver has not done so, or to apply more braking force to supplement the driver's braking, thereby detecting and reacting to an imminent crash with a lead vehicle or pedestrian. This final rule promotes NHTSA's goal to reduce the frequency and severity of crashes described in the summary of the crash problem discussed earlier in the final rule, and advances DOT's January 2022 National Roadway Safety Strategy that identified requiring AEB, including PAEB technologies, on new passenger vehicles as a key Departmental action to enable safer vehicles. This final rule also responds to a mandate under the Bipartisan Infrastructure Law (BIL) directing the Department to promulgate such a rule.

Alternatives

NHTSA considered four regulatory alternatives for the proposed action and a ''no action alternative.'' Under the no action alternative, NHTSA would not issue a final rule requiring that vehicles be equipped with systems that meet minimum specified performance requirements, and manufacturers would continue to add AEB systems voluntarily. However, because the BIL directs NHTSA to promulgate a rule that would require that all passenger vehicles be equipped with an AEB system, NHTSA cannot adopt the no action alternative. Alternative 1 considers requirements specific to lead vehicle AEB only. Alternative 2 includes the lead vehicle AEB requirements in Alternative 1 and a requirement in which PAEB is only required to function in daylight conditions. Alternative 3, the selected alternative, considers requirements for lead vehicle AEBs and PAEB requirements in both daylight and darkness conditions. Alternative 4 considers a more-stringent requirement in which PAEB would be required to provide pedestrian protections in turning scenarios (no change to the lead vehicle AEB requirements in the final rule).

NHTSA also considered other options, including the International Organization for Standardization (ISO) standards, SAE International standards, the Economic Commission for Europe (ECE) standards, test procedures used by NHTSA's New Car Assessment Program (NCAP) and Euro NCAP, which are described above in this preamble and accompanying appendices. In the final rule, NHTSA incorporates aspects of the test procedures and standards mentioned here, but departs from them in numerous and significant ways.

Environmental Impacts of the Proposed Action and Alternatives

This final rule is anticipated to result in the employment of sensor technologies and sub-systems on light vehicles that work together to sense when a vehicle is in a crash imminent situation, to automatically apply the vehicle brakes if the driver has not done so, and to apply more braking force to supplement the driver's braking if insufficient. This final rule is also anticipated to improve safety by mitigating the number of fatalities, non-fatal injuries, and property damage that would result from crashes that could potentially be prevented or mitigated because of AEB. As a result, the primary environmental impacts [168] that could potentially result from this rulemaking are associated with: greenhouse gas emissions and air quality, socioeconomics, public health and safety, solid waste/property damage/congestion, and hazardous materials. Consistent with CEQ regulations and guidance, this EA discusses impacts in proportion to their potential significance. The effects of the final rule that were analyzed further are summarized below.

Greenhouse Gas Emissions and Air Quality

NHTSA has previously recognized that additional weight required by FMVSS could potentially negatively impact the amount of fuel consumed by a vehicle, and accordingly result in greenhouse gas emissions or air quality impacts from criteria pollutant emissions. Atmospheric greenhouse gases (GHGs) affect Earth's surface temperature by absorbing solar radiation that would otherwise be reflected back into space. Carbon dioxide (CO_2) is the most significant greenhouse gas resulting from human activity. Motor vehicles emit CO_2 as well as other GHGs, including methane and nitrous oxides, in addition to criteria pollutant emissions that negatively affect public health and welfare.

Additional weight added to a vehicle, like added hardware from safety systems, can cause an increase in vehicle fuel consumption and emissions. An AEB system requires the following hardware: sensing, perception, warning hardware, and electronically modulated braking subsystems.[169] As discussed in the preamble and the RIA, NHTSA anticipates that under the no action alternative and Alternatives 1–3, the majority of vehicles subject to the rulemaking would already have all of the hardware capable of meeting the requirements by the effective date of a final rule. For all alternatives, NHTSA assumes that manufacturers will need

[166] 40 CFR 1501.5(a).

[167] 40 CFR 1501.5(c).

[168] NHTSA anticipates that this rulemaking would have negligible or no impact on the following resources and impact categories, and therefore has not analyzed them further: topography, geology, soils, water resources (including wetlands and floodplains), biological resources, resources protected under the Endangered Species Act, historical and archeological resources, farmland resources, environmental justice, and section 4(f) properties.

[169] Automatic actuation of a vehicle's brakes requires more than just technology to sense when a collision is imminent. In addition to the sensing system, hardware is needed to apply the brakes without relying on the driver to depress the brake pedal. The automatic braking system relies on two foundational braking technologies—electronic stability control to automatically activate the vehicle brakes and an antilock braking system to mitigate wheel lockup. Not only do electronic stability control and antilock braking systems enable AEB operation, these systems also modulate the braking force so that the vehicle remains stable while braking during critical driving situations where a crash with a vehicle or pedestrian is imminent.

time to build code that analyses the frontal view of the vehicle (*i.e.,* manufacturers would need to upgrade the software for the perception subsystem) in a way that achieves the requirements of this final rule. Furthermore, approximately five percent of vehicles would add additional hardware such as a camera or radar. In addition to those costs, Alternative 4 includes an assumption that two cameras would be added; however, based on weight assumptions included in studies cited in the RIA, that weight impact would be minimal. The incremental weight associated with a stereo camera module is 785 g (1.73 lbs.) and for the entire camera and radar fused system is 883 g. (1.95 lbs.). NHTSA has previously estimated that a 3–4-pound increase in vehicle weight is projected to reduce fuel economy by 0.01 mpg.[170] Accordingly, Alternatives 1–3 would not have any fuel economy penalty for 95 percent of vehicles subject to the rulemaking because no hardware would be added. The potential impact on fuel economy for those five percent that would add an additional hardware would be negligible as it would potentially be under a pound when considering half the weight of either the stereo camera module or camera and radar fused system or under two pounds based on the stereo camera module. Similarly, Alternative 4 would potentially have a negligible fuel economy penalty as the potential incremental weight would be under two pounds based on the stereo camera module.

Pursuant to the Clean Air Act (CAA), the U.S. Environmental Protection Agency (EPA) has established a set of National Ambient Air Quality Standards (NAAQS) for the following ''criteria'' pollutants: carbon monoxide (CO), nitrogen dioxide (NO_2), ozone, particulate matter (PM) less than 10 micrometers in diameter (PM_{10}), PM less than 2.5 micrometers in diameter ($PM_{2.5}$), sulfur dioxide (SO_2), and lead (Pb). The NAAQS include ''primary'' standards and ''secondary'' standards. Primary standards are intended to protect public health with an adequate margin of safety. Secondary standards are set at levels designed to protect public welfare by accounting for the effects of air pollution on vegetation, soil, materials, visibility, and other aspects of the general welfare. Under the General Conformity Rule of the CAA,[171] EPA requires a conformity determination when a Federal action would result in total direct and indirect emissions of a criteria pollutant or precursor originating in nonattainment or maintenance areas equaling or exceeding the emissions thresholds specified in 40 CFR 93.153(b)(1) and (2). The General Conformity Rule does not, however, require a conformity determination for Federal ''rulemaking and policy development and issuance,'' such as this action.[172] Therefore, NHTSA has determined it is not required to perform a conformity analysis for this action.

Socioeconomics

The socioeconomic impacts of the rulemaking would be primarily felt by vehicle manufacturers, light vehicle drivers, passengers, and pedestrians on the road that would otherwise be killed or injured in light vehicle crashes. NHTSA conducted a detailed assessment of the economic costs and benefits of establishing the new rule in its RIA. The main economic benefits come primarily from the reduction in fatalities and non-fatal injuries (safety benefits). Reductions in the severity of motor vehicle crashes would be anticipated to have corresponding reductions in costs for medical care, emergency services, insurance administrative costs, workplace costs, and legal costs due to the fatalities and injuries avoided. Other socioeconomic factors discussed in the RIA that would affect these parties include software and some hardware costs and property damage savings. Overall, Alternative 1 is anticipated to have societal net benefits of $3.40 to $4.28 billion, Alternative 2 is anticipated to have societal net benefits of $4.23 to $5.30 billion, Alternative 3 (the selected alternative) is anticipated to have societal net benefits of $5.82 to $7.26 billion, and Alternative 4 is anticipated to have societal net benefits of $4.18 to $5.73 billion. The RIA discusses this information in further detail.

Public Health and Safety

The affected environment for public health and safety includes roads, highways and other driving locations used by all light vehicle drivers, other drivers, passengers in light vehicles and other motor vehicles, and pedestrians or other individuals who could be injured or killed in crashes involving the vehicles regulated by the proposed action. In the RIA, the agency determined the impacts on public health and safety by estimating the reduction in fatalities and injuries resulting from the decreased crash severity due to the use of AEB systems under the four action alternatives. Under Alternative 1, it is expected that the addition of a less stringent requirement that only specifies requirements for lead vehicle AEB would result each year in 314 to 388 equivalent lives saved. Under Alternative 2, it is expected that the less-stringent requirement, in which PAEB is only required to function in daylight conditions, would result each year in 384 to 473 equivalent lives saved. Under Alternative 3 (the selected alternative), it is expected that the regulatory option would result each year in 517 to 638 equivalent lives saved. Finally, under Alternative 4, it is expected that the addition of more stringent requirements in which PAEB would be required to provide pedestrian protections in turning scenarios would result each year in 555 to 684 equivalent lives saved. The RIA discusses this information in further detail.

Solid Waste/Property Damage/ Congestion

Vehicle crashes can generate solid wastes and release hazardous materials into the environment. The chassis and engines, as well as associated fluids and components of automobiles and the contents of the vehicles, can all be deemed waste and/or hazardous materials. Solid waste can also include damage to the roadway infrastructure, including road surface, barriers, bridges, and signage. Hazardous materials are substances that may pose a threat to public safety or the environment because of their physical, chemical, or radioactive properties when they are released into the environment, in this case as a result of a crash.

NHTSA's rulemaking is projected to reduce the amount and severity of light vehicle crashes, and therefore may reduce the quantity of solid waste, hazardous materials, and other property damage generated by light vehicle crashes in the United States. The addition of an AEB system may also result in reduced damage to the vehicles and property, as well as reduced travel delay costs due to congestion. This is especially the case in ''property-damage-only'' crashes, where no individuals are injured or killed in the crash, but there may be damage to the vehicle or whatever is impacted by it. NHTSA estimates that based off data from 2016–2019 alone, an average of 1.12 million rear-impact crashes involving light vehicles occurred

[170] Final Regulatory Impact Analysis, Corporate Average Fuel Economy for MYs 2012–2016 Passenger Cars and Light Trucks, Table IV–5 (March 2010).

[171] Section 176(c) of the CAA, codified at 42 U.S.C. 7506(c); To implement CAA section 176(c), EPA issued the General Conformity Rule (40 CFR part 51, subpart W and part 93, subpart B).

[172] 40 CFR 93.153(c)(2)(iii).

annually. These crashes resulted in an annual average of 394 fatalities, 142,611 non-fatal injuries, and approximately 1.69 million PDOVs.

Less solid waste translates into cost and environmental savings from reductions in the following areas: (1) transport of waste material, (2) energy required for recycling efforts, and (3) landfill or incinerator fees. Less waste will result in beneficial environmental effects through less GHG emissions used in the transport of it to a landfill, less energy used to recycle the waste, less emissions through the incineration of waste, and less point source pollution at the scene of the crash that would result in increased emissions levels or increased toxins leaking from the crashed vehicles into the surrounding environment.

The addition of an AEB system may also result in reduced post-crash environmental effects from congestion. As discussed in the RIA, NHTSA's monetized benefits are calculated by multiplying the number of non-fatal injuries and fatalities mitigated by their corresponding ''comprehensive costs.'' The comprehensive costs include economic costs that are external to the value of a statistical life (VSL) costs, such as emergency management services or legal costs, and congestion costs. NHTSA has recognized that motor vehicle crashes result in congestion that has both socioeconomic and environmental effects. These environmental effects include ''wasted fuel, increased greenhouse gas production, and increased pollution as engines idle while drivers are caught in traffic jams and slowdowns.'' [173] NHTSA's monetized benefits therefore include a quantified measure of congestion avoidance. NHTSA did not calculate congestion effects specifically for each regulatory alternative; however, because comprehensive costs are a discrete cost applied to non-fatal injuries and fatalities at the same rate, we can conclude that there are increasing benefits associated with fewer crashes, and specifically decreased congestion, as the monetized benefits increase across regulatory alternatives. To the extent that any regulatory option for AEB results in fewer crashes and accordingly higher monetized benefits, there would be fewer congestion-related environmental effects.

NHTSA has tentatively concluded that under the agency's rulemaking, the economic benefits resulting from improved safety outcomes, property damage savings, fuel savings, and GHG reductions would limit the negative environmental impacts caused by additional solid waste/property damage due to crashes because of the crashes that will be avoided due to the requirements of this rule. Similarly, while the potential degree of hazardous materials spills prevented due to the reduction of crash severity and crash avoidance expected from the rulemaking has not specifically been analyzed in the RIA or final rule, the addition of the AEB system is projected to reduce the amount and severity of light vehicle crashes and may improve the environmental effects with respect to hazardous material spills. While the RIA does not specifically quantify these impact categories, in general NHTSA believes the benefits would increase relative to the crashes avoided and would be relative across the different alternatives. The RIA discusses information related to quantified costs and benefits of crashes, and in particular property damage due to crashes, for each regulatory alternative in further detail.

Cumulative Impacts

In addition to direct and indirect effects, CEQ regulations require agencies to consider cumulative impacts of major Federal actions. CEQ regulations define cumulative impacts as the impact ''on the environment that result from the incremental [impact] of the action when added to . . . other past, present, and reasonably foreseeable actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions.'' [174] NHTSA notes that the public health and safety, solid waste/property damage/congestion, air quality and greenhouse gas emissions, socioeconomic, and hazardous material benefits identified in this EA were based on calculations described in the RIA, in addition to other NHTSA actions and studies on motor vehicle safety as described in the preamble. That methodology required the agency to adjust historical figures to reflect vehicle safety rulemakings that have recently become effective. As a result, many of the calculations in this EA already reflect the incremental impact of this action when added to other past actions.

NHTSA's and other parties' past actions that improve the safety of light vehicles, as well as future actions taken by the agency or other parties that improve the safety of light vehicles, could further reduce the severity or number of crashes involving light vehicles. Any such cumulative improvement in the safety of light vehicles would have an additional effect in reducing injuries and fatalities and could reduce the quantity of solid and hazardous materials generated by crashes. To the extent that this rule may have some minimal impact on fuel economy for the small percentage of vehicles where additional hardware may be required, NHTSA would consider that impact when setting maximum feasible fuel economy standards.'' [175]

Agencies and Persons Consulted

This preamble describes the various materials, persons, and agencies consulted in the development of the final rule. NHTSA invited public comments on the contents and tentative conclusions of the Draft EA. No public comments addressing the Draft EA were received. Furthermore, none of the public comments that were received addressed any issues related to the human environment that would be relevant to the Final EA.

Finding of No Significant Impact

Although this rule is anticipated to result in additional FMVSS requirements for light vehicle manufacturers, AEB systems have already largely been introduced by manufacturers voluntarily. The addition of regulatory requirements (depending on the regulatory alternative) to standardize the AEB systems in all vehicle models is anticipated to result in negligible or no fuel economy and emissions penalties (*i.e.,* five percent of vehicles would require additional hardware, but the added weight is negligible), increasing socioeconomic and public safety benefits as the alternatives get more stringent, and an increase in benefits from the reduction in solid waste, property damage, and congestion (including associated traffic level impacts like reduction in energy consumption and tailpipe pollutant emissions) from fewer vehicle crashes across the regulatory alternatives.

Based on the Final EA, NHTSA concludes that implementation of any of the alternatives considered for the proposed action, including the selected alternative, will not have a significant effect on the human environment and that a ''finding of no significant impact''

[173] Blincoe, L.J., Miller, T.R., Zaloshnja, E., & Lawrence, B.A. (2015, May). The economic and societal impact of motor vehicle crashes, 2010. (Revised) (Report No. DOT HS 812 013). Washington, DC: National Highway Traffic Safety Administration.

[174] 40 CFR 1508.1(g)(3).

[175] 49 U.S.C. 32902(f), which states that we consider the effect of other motor vehicle standards of the Government on fuel economy in the max feasible discussion.

is appropriate. This statement constitutes the agency's ''finding of no significant impact,'' and an environmental impact statement will not be prepared.[176]

Executive Order 13132 (Federalism)

NHTSA has examined this rule pursuant to Executive Order 13132 (64 FR 43255, August 10, 1999) and concluded that no additional consultation with States, local governments, or their representatives is mandated beyond the rulemaking process. The agency has concluded that this rule will not have sufficient federalism implications to warrant consultation with State and local officials or the preparation of a federalism summary impact statement. The rule does not have ''substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.''

NHTSA rules can preempt in two ways. First, the National Traffic and Motor Vehicle Safety Act contains an express preemption provision: When a motor vehicle safety standard is in effect under this chapter, a State or a political subdivision of a State may prescribe or continue in effect a standard applicable to the same aspect of performance of a motor vehicle or motor vehicle equipment only if the standard is identical to the standard prescribed under this chapter. 49 U.S.C. 30103(b)(1). It is this statutory command by Congress that preempts any non-identical State legislative and administrative law addressing the same aspect of performance. The express preemption provision described above is subject to a savings clause under which compliance with a motor vehicle safety standard prescribed under this chapter does not exempt a person from liability at common law. 49 U.S.C. 30103(e). Pursuant to this provision, State common law tort causes of action against motor vehicle manufacturers that might otherwise be preempted by the express preemption provision are generally preserved. However, the Supreme Court has recognized the possibility, in some instances, of implied preemption of such State common law tort causes of action by virtue of NHTSA's rules, even if not expressly preempted. The second way that NHTSA rules can preempt is dependent upon there being an actual conflict between an FMVSS and the higher standard that would effectively be imposed on motor vehicle manufacturers if someone obtained a State common law tort judgment against the manufacturer, notwithstanding the manufacturer's compliance with the NHTSA standard. Because most NHTSA standards established by an FMVSS are minimum standards, a State common law tort cause of action that seeks to impose a higher standard on motor vehicle manufacturers will generally not be preempted. If and when such a conflict does exist—for example, when the standard at issue is both a minimum and a maximum standard—the State common law tort cause of action is impliedly preempted. *See Geier* v. *American Honda Motor Co.,* 529 U.S. 861 (2000).

Pursuant to Executive Orders 13132 and 12988, NHTSA has considered whether this rule could or should preempt State common law causes of action. The agency's ability to announce its conclusion regarding the preemptive effect of one of its rules reduces the likelihood that preemption will be an issue in any subsequent tort litigation. To this end, the agency has examined the nature (*i.e.,* the language and structure of the regulatory text) and objectives of this rule and finds that this rule, like many NHTSA rules, would prescribe only a minimum safety standard. As such, NHTSA does not intend this rule to preempt state tort law that would effectively impose a higher standard on motor vehicle manufacturers. Establishment of a higher standard by means of State tort law will not conflict with the minimum standard adopted here. Without any conflict, there could not be any implied preemption of a State common law tort cause of action.

Executive Order 12988 (Civil Justice Reform)

When promulgating a regulation, section 3(b) of Executive Order 12988, ''Civil Justice Reform'' (61 FR 4729, February 7, 1996) requires that Executive agencies make every reasonable effort to ensure that the regulation: (1) Clearly specifies the preemptive effect; (2) clearly specifies the effect on existing Federal law or regulation; (3) provides a clear legal standard for affected conduct, while promoting simplification and burden reduction; (4) clearly specifies the retroactive effect, if any; (5) adequately defines key terms; and (6) addresses other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. This document is consistent with that requirement.

Pursuant to this Order, NHTSA notes that the preemptive effect of this rulemaking is discussed above in connection with Executive Order 13132. NHTSA notes further that there is no requirement that individuals submit a petition for reconsideration or pursue other administrative proceeding before they may file suit in court.

Executive Order 13045 (Protection of Children From Environmental Health and Safety Risks)

Executive Order 13045, ''Protection of Children from Environmental Health and Safety Risks,'' (62 FR 19885; April 23, 1997) applies to any proposed or final rule that: (1) Is determined to be ''economically significant,'' as defined in E.O. 12866, and (2) concerns an environmental health or safety risk that NHTSA has reason to believe may have a disproportionate effect on children. If a rule meets both criteria, the agency must evaluate the environmental health or safety effects of the rule on children, and explain why the rule is preferable to other potentially effective and reasonably feasible alternatives considered by the agency.

This rule is not expected to have a disproportionate health or safety impact on children. Consequently, no further analysis is required under Executive Order 13045.

Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 et. seq., as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. NHTSA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. Because this rule meets the criteria in 5 U.S.C. 804(2), it will be effective sixty days after the date of publication in the **Federal Register**.

Paperwork Reduction Act (PRA)

Under the PRA of 1995, a person is not required to respond to a collection of information by a Federal agency unless the collection displays a valid OMB control number. There are no ''collections of information'' (as defined at 5 CFR 1320.3(c)) in this rule.

[176] 40 CFR 1501.6(a).

National Technology Transfer and Advancement Act

Under the National Technology Transfer and Advancement Act of 1995 (NTTAA) (Pub. L. 104–113), all Federal agencies and departments shall use technical standards developed or adopted by voluntary consensus standards bodies, using such technical standards as a means to carry out policy objectives or activities determined by the agencies and departments. Voluntary consensus standards are technical standards (*e.g.,* materials specifications, test methods, sampling procedures, and business practices) developed or adopted by voluntary consensus standards bodies, such as the International Organization for Standardization and SAE International. The NTTAA directs us to provide Congress, through OMB, explanations when we decide not to use available and applicable voluntary consensus standards.

NHTSA is incorporating by reference ISO and ASTM standards into this rule. NHTSA considered several ISO standards and has opted to use ISO 19206–3:2021 to specify the vehicle test device and a combination of ISO 19206–2:2018 and ISO 19206–4:2020 to specify the test mannequins. NHTSA is incorporating by reference ASTM E1337–19, which is already incorporated by reference into many FMVSSs, to measure the peak braking coefficient of the testing surface.

NHTSA considered SAE International Recommended Practice J3087, ''Automatic emergency braking (AEB) system performance testing,'' which defines the conditions for testing AEB and FCW systems. This standard defines test conditions, test targets, test scenarios, and measurement methods, but does not provide performance criteria. There is considerable overlap in the test setup and conditions between this rule and the SAE standard including the basic scenarios of lead vehicle stopped, slower moving, and decelerating. This SAE recommended practice is substantially similar to the existing NCAP test procedures and this rule.

NHTSA also considered SAE International Standard J3116, ''Active Safety Pedestrian Test Mannequin Recommendation,'' which provides recommendations for the characteristics of a surrogate that could be used in testing of active pedestrian safety systems. As proposed, NHTSA incorporates the ISO standard because the ISO standard specifications are more widely adopted than the SAE Recommended Practice.

In appendix B of the NPRM's preamble, NHTSA described several international test procedures and regulations the agency considered for use in this rule. This rule has substantial technical overlap with UNECE Regulation No. 131 and UNECE Regulation No. 152. This rule and the UNECE regulations both specify a forward collision warning and automatic emergency braking. Several lead vehicle AEB scenarios are nearly identical, including the lead vehicle stopped and lead vehicle moving scenarios. The pedestrian crossing path scenario specified in UNECE Regulation No. 152 is also substantially similar to this rule. As discussed in the preamble, this rule differs from the UNECE standards in the areas of maximum test speed and the minimum level of required performance. This rule uses higher test speeds and a requirement that the test vehicle avoid contact, both of which are more stringent than the UNECE regulations and more reflective of the safety need in the United States. NHTSA expects that this approach would increase the repeatability of the test and maximize the realized safety benefits of the rule.

Incorporation by Reference

Under regulations issued by the Office of the Federal Register (1 CFR 51.5), an agency, as part of a proposed rule that includes material incorporated by reference, must summarize material that is proposed to be incorporated by reference and discuss the ways the material is reasonably available to interested parties or how the agency worked to make materials available to interested parties. At the final rule stage, regulations require that the agency seek formal approval, summarize the material that it incorporates by reference in the preamble of the final rule, discuss the ways that the materials are reasonably available to interested parties, and provide other specific information to the Office of the Federal Register.

In this rule, NHTSA incorporates by reference six documents into the Code of Federal Regulations, ASTM E1337–19, *Standard Test Method for Determining Longitudinal Peak Braking Coefficient (PBC) of Paved Surfaces Using Standard Reference Test Tire,* is already incorporated by reference elsewhere in 49 CFR part 571. ASTM E1337 is a standard test method for evaluating peak braking coefficient of a test surface using a standard reference test tire using a trailer towed by a vehicle. NHTSA uses this method in all of its braking and electronic stability control standards to evaluate the test surfaces for conducting compliance test procedures.

NHTSA also incorporates by reference SAE J2400 *Human Factors in Forward Collision Warning System: Operating Characteristics and User Interface Requirements,* into part 571. SAE J2400 is an information report intended as a starting point of reference for designers of forward collision warning systems. NHTSA incorporates this document by reference solely to specify the location specification and symbol for a visual forward collision warning.

NHTSA incorporates by reference four ISO standards into 49 CFR part 596. The first of these standards is ISO 3668:2017(E), *Paints and varnishes—Visual comparison of colour of paints.* This document specifies a method for the visual comparison of the color of paints against a standard. This method will be used to verify the color of certain elements of the pedestrian test mannequin NHTSA will use in PAEB testing. Specifically, NHTSA will use these procedures to determine that the color of the hair, torso, arms, and feet of the pedestrian test mannequin is black and that the color of the legs are blue.

NHTSA incorporates by reference ISO 19206–2:2018(E), *Road vehicles—Test devices for target vehicles, vulnerable road users and other objects, for assessment of active safety functions—Part 2: Requirements for pedestrian targets.* This document addresses the specification for a test mannequin. It is designed to resemble the characteristics of a human, while ensuring the safety of the test operators and preventing damage to subject vehicles in the event of a collision during testing. NHTSA references many, but not all, of the specifications of ISO 19206–2:2018, as discussed earlier in the preamble of this rule.

NHTSA also incorporates by reference ISO 19206–3:2021(E), *Test devices for target vehicles, vulnerable road users and other objects, for assessment of active safety functions—Part 3: Requirements for passenger vehicle 3D targets.* This document provides specification of three-dimensional test devices that resemble real vehicles. Like the test mannequin described in the prior paragraph, it is designed to ensure the safety of the test operators and to prevent damage to subject vehicles in the event of a collision during testing. NHTSA references many, but not all, of the specifications of ISO 19206–3:2021, as discussed earlier in the preamble of this rule.

Finally, NHTSA incorporates by reference ISO 19206–4:2020(E), *Road vehicles—test devices for target vehicles,*

vulnerable road users and other objects, for assessment of active safety functions—Part 4: Requirements for bicyclists targets. This standard describes specifications for bicycle test devices representative of adult and child sizes. NHTSA will not use a bicycle test device during testing for this final rule. Rather, this standard is incorporated by reference solely because it contains specifications for color and reflectivity, including skin color, that NHTSA is applying to its pedestrian test mannequin.

All standards incorporated by reference in this rule are available for review at NHTSA's headquarters in Washington, DC, and for purchase from the organizations promulgating the standards (see 49 CFR 517.5 for contact information). The ASTM standard presently incorporated by reference into other NHTSA regulations is also available for review at ASTM's online reading room.[177]

Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) requires agencies to prepare a written assessment of the costs, benefits, and other effects of proposed or final rules that include a Federal mandate likely to result in the expenditures by States, local or tribal governments, in the aggregate, or by the private sector, of more than $100 million annually (adjusted annually for inflation with base year of 1995). Adjusting this amount by the implicit gross domestic product price deflator for 2021 results in an estimated current value of $165 million (2021 index value of 113.07/1995 index value of 68.60 = 1.65). The assessment may be included in conjunction with other assessments, as it is for this rule in the RIA.

A rule on lead vehicle AEB and PAEB is not likely to result in expenditures by State, local or tribal governments of more than $100 million annually. However, it is estimated to result in the estimated expenditure by automobile manufacturers and/or their suppliers of $354 million annually (estimated to be an average of approximately $23 per light vehicle annually). This average estimated cost impacts reflects that the estimated incremental costs depend on a variety of lead vehicle AEB hardware and software that manufacturers plan to install (in vehicles used as ''baseline'' for the cost estimate). The final cost will greatly depend on choices made by the automobile manufacturers to meet the lead vehicle AEB and PAEB test requirements. These effects have been discussed in the RIA developed in support of this final rule.

The Unfunded Mandates Reform Act requires the agency to select the ''least costly, most cost-effective or least burdensome alternative that achieves the objectives of the rule.'' As an alternative, the agency considered a full-vehicle dynamic test to evaluate the capability of lead vehicle AEB and PAEB systems to prevent crashes or mitigate the severity of crashes. Based on our experience on conducting vehicle tests for vehicles equipped with lead vehicle AEB and PAEB where we utilize a reusable surrogate target crash vehicle and test mannequins instead of conducting the test with an actual vehicle as the target, we determined that full vehicle-to-vehicle crash tests can have an undesired amount of variability in vehicle kinematics. Unlike vehicle-to-vehicle tests, the lead vehicle AEB and PAEB tests with a surrogate target vehicle is conducted in a well-controlled test environment, which results in an acceptable amount of variability. In addition, the agency's lead vehicle AEB and PAEB tests with surrogate target vehicle and pedestrian were able to reveal deficiencies in the system that resulted in inadequate system capability in detecting and activating the brakes. Therefore, we concluded that a full vehicle-to-vehicle test would not achieve the objectives of the rule.

In addition, the agency evaluated data across a broad range of test scenarios in an effort to identify the maximum range of test speeds at which it is feasible for test vehicles to achieve a no-contact result. The range of feasible speeds for no contact identified in the review was specified as the mandated range in the rule. Thus, there are no alternative test procedures available that would improve the ability of manufacturers to achieve no-contact results. In turn, the agency concluded that lead vehicle AEB and PAEB systems designed to meet the no-contact requirement at speeds outside the ranges specified in the rule would not achieve the objectives of the rule.

Executive Order 13609 (Promoting International Regulatory Cooperation)

The policy statement in section 1 of E.O. 13609 states, in part, that the regulatory approaches taken by foreign governments may differ from those taken by U.S. regulatory agencies to address similar issues and that, in some cases, the differences between the regulatory approaches of U.S. agencies and those of their foreign counterparts might not be necessary and might impair the ability of American businesses to export and compete internationally. The E.O. states that, in meeting shared challenges involving health, safety, labor, security, environmental, and other issues, international regulatory cooperation can identify approaches that are at least as protective as those that are or would be adopted in the absence of such cooperation, and that international regulatory cooperation can also reduce, eliminate, or prevent unnecessary differences in regulatory requirements. NHTSA requested public comment on the ''regulatory approaches taken by foreign governments'' concerning the subject matter of this rulemaking. NHTSA received many comments expressing that NHTSA should either align or adopt existing international regulations. As discussed above, while NHTSA has adopted aspects of these regulations, it has rejected others because of the stringency of the regulations due to the reasons discussed in further detail in various parts of the preamble and National Technology Transfer and Advancement Act section.

Severability

The issue of severability of FMVSSs is addressed in 49 CFR 571.9. It provides that if any FMVSS or its application to any person or circumstance is held invalid, the remainder of the part and the application of that standard to other persons or circumstances is unaffected. It expresses NHTSA's view that, even with invalidated portions or applications disregarded, remaining portions and applications can still function sensibly.

Regulation Identifier Number

The Department of Transportation assigns a regulation identifier number (RIN) to each regulatory action listed in the Unified Agenda of Federal Regulations. The Regulatory Information Service Center publishes the Unified Agenda in April and October of each year. You may use the RIN contained in the heading at the beginning of this document to find this action in the Unified Agenda.

VI. Appendices to the Preamble

A. Appendix A: Description of the Lead Vehicle AEB Test Procedures Stopped Lead Vehicle

Test Parameters

The stopped lead vehicle scenario consists of the vehicle traveling straight ahead, at a constant speed, approaching a stopped lead vehicle in its path. The vehicle must be able to avoid contact with the stopped lead vehicle. The testing is at any subject vehicle speed

[177] *https://www.astm.org/products-services/reading-room.html.*

between 10 km/h and 80 km/h with no manual brake application and between 70 km/h and 100 km/h with manual brake application.

Test Conduct Prior to FCW Onset

Prior to the start of a test, the lead vehicle is placed with its longitudinal centerline coincident to the intended travel path and with no specific limitations on how a subject vehicle may be driven prior to the test start. As long as the specified initialization procedure is executed, a subject vehicle may be driven under any conditions including any speed and direction, and on any road surface, for any elapsed time prior to reaching the point where a test trial begins. As the subject vehicle approaches the rear of the lead vehicle, beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs. Furthermore, beginning when the headway corresponds to L_0, the subject vehicle heading is maintained with minimal steering input such that the subject vehicle travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. The purpose of these test tolerances is to assure test practicability and repeatability of results.

Test Conduct After FCW Onset

During each test, the subject vehicle accelerator pedal is released in response to the FCW. The procedure states that the accelerator pedal is released at any rate and is fully released within 500 milliseconds for subject vehicles tested without cruise control active. The accelerator release procedure ensures consistent release of the accelerator and assures test repeatability. The accelerator pedal release can be omitted from tests of vehicles with cruise control actively engaged because there is no driver input to the accelerator pedal in that case. The AEB performance requirements are the same for vehicles with and without cruise control engaged, and AEB systems must provide an equivalent level of crash avoidance or mitigation regardless of whether cruise control is active.

For testing without manual brake application, no manual brake application is made until one of the test completion criteria is satisfied. For tests that include manual brake application, the service brakes are applied at 1.0 ± 0.1 second after FCW.

Test Completion Criteria

Any test is complete when the subject vehicle comes to a complete stop without making contact with the lead vehicle or when the subject vehicle makes contact with the lead vehicle.

Slower-Moving Lead Vehicle

Test Parameters

The slower-moving lead vehicle scenario involves the subject vehicle traveling straight ahead at constant speed, approaching a lead vehicle traveling at a slower speed in the subject vehicle path. NHTSA will test at the same two subject vehicle speed ranges as the stopped lead vehicle scenario depending on the manual brake application. The lead vehicle speed is 20 km/h.

Test Conduct Prior to FCW Onset

Prior to the start of a test trial the lead vehicle is propelled forward in a manner such that the longitudinal center plane of the lead vehicle does not deviate laterally more than 0.3m from the intended travel path.

As the subject vehicle approaches the rear of the lead vehicle, beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs. Furthermore, beginning when the headway corresponds to L_0, the subject vehicle and lead heading are to be maintained with minimal steering input such that the subject vehicle travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s.

Test Conduct After FCW Onset

Similar to the stopped lead vehicle test, the subject vehicle accelerator pedal is released in response to the FCW. The procedure states that the accelerator pedal is released at any rate and is fully released within 500 milliseconds for subject vehicles tested without cruise control active. The accelerator pedal release can be omitted from tests of vehicles with cruise control actively engaged due to the lack of driver input to the accelerator pedal.

For testing without manual brake application, no manual brake application is made until one of the test completion criteria is satisfied. For testing with manual brake application, the service brake application occurs at 1.0 ± 0.1 second after FCW onset.

Test Completion Criteria

Any test run is complete when the subject vehicle speed is less than or equal to the lead vehicle speed without making contact with the lead vehicle or when the subject vehicle makes contact with the lead vehicle.

Decelerating Lead Vehicle

Test Parameters

The decelerating lead vehicle scenario is meant to assess the AEB performance when the subject vehicle and lead vehicle initially are travelling at the same constant speed in a straight path and the lead vehicle begins to decelerate. NHTSA tests under two basic setups for this scenario, one where both the subject vehicle and lead vehicle initial travel speed ($V_{SV} = V_{LV}$) is 50 km/h and another where both vehicles travel at 80 km/h. For both testing speeds, NHTSA tests with, and without, manual brake application, at any headway between 12 m and 40 m and at any lead vehicle deceleration between 0.3 g and 0.5 g.

Test Conduct Prior to Lead Vehicle Braking Onset

Up to 3 seconds prior to the start of a test trial there are no specific limitations on how a subject vehicle may be driven. Between 3 seconds prior and the lead vehicle braking onset, the lead vehicle is propelled forward in a manner such that the longitudinal center plane of the lead vehicle does not deviate laterally more than 0.3m from the intended travel path. During this same time interval, the subject vehicle follows the lead vehicle at the testing headway distance between 12 m and 40m. While the subject vehicle follows the lead vehicle from 3 seconds prior and lead vehicle brake onset, the subject vehicle and lead vehicle speeds are maintained within 1.6 km/h and their travel paths do not deviate more than 0.3 m laterally from the centerline of the lead vehicle. The speed is to be maintained with minimal and smooth accelerator pedal inputs and the and yaw rate of the subject vehicle may not exceed ±1.0 deg/s.

Test Conduct After Lead Vehicle Braking Onset

The lead vehicle is decelerated to a stop with a targeted average deceleration of any value between 0.3g and 0.5g. The targeted deceleration magnitude is to be achieved within 1.5 seconds of lead vehicle braking onset and maintained until 250 ms prior to coming to a stop. Similar to the lead vehicle tests, during each test trial, the subject vehicle accelerator pedal is released in response to the FCW and fully released within 500 milliseconds.

In the same manner as the slower lead vehicle tests, when testing without

manual brake application, no manual brake application is made until one of the test completion criteria is satisfied. For testing with manual brake application, the service brake application occurs at 1.0 ± 0.1 second after FCW onset.

Test Completion Criteria

Any test run is complete when the subject vehicle comes to a complete stop without making contact with the lead vehicle or when the subject vehicle makes contact with the lead vehicle, similarly to the stopped lead vehicle tests.

Headway Calculation

For the scenarios where the headway is not specified (stopped lead vehicle and slower lead vehicle) the headway (L_0), in meters, providing 5 seconds time to collision (*TTC*) is calculated. L_0 is determined with the following equation where V_{SV} is the speed of the subject vehicle in m/s and V_{LV} is the speed of the lead vehicle in m/s:

$L_0 = \mathrm{TTC}_0 \times (V_{SV} - V_{LV})$

$TTC_0 = 5.0$

Travel Path

The intended travel path is the target path for a given test scenario and is identified by the projection onto the road surface of the frontmost point of the subject vehicle located on its longitudinal, vertical center plane. The subject vehicle's actual travel path is recorded and compared to the intended path.

The intended subject vehicle travel path is coincident with the center of a test lane whenever there are two edge lines marking a lane on the test track surface. If there is only one lane line (either a single or double line) marked on the test track, the vehicle path will be parallel to it and offset by 1.8 m (6 ft) to one side (measured from the inside edge of the line).

Subject Vehicle (Manual) Brake Application Procedures

Subject vehicle brake application is performed through either displacement or hybrid feedback at the manufacturer's choosing. The subject vehicle brake application procedures are consistent with the manual brake applications defined in NHTSA's NCAP test procedures for DBS performance assessment. The procedure is to begin with the subject vehicle brake pedal in its natural resting position with no preload or position offset.

Displacement Feedback Procedure

For the displacement feedback procedure, the commanded brake pedal position is the brake pedal position that results in a mean deceleration of 0.4 g in the absence of AEB system activation. The mean deceleration is the deceleration over the time from the pedal achieving the commanded position to 250 ms before the vehicle comes to a stop. The pedal displacement controller depresses the pedal at a rate of 254 mm/s ±25.4 mm/s to the commanded brake pedal position. The standard allows for the pedal displacement controller to overshoot the commanded position by any amount up to 20 percent. In the event of an overshoot, it may be corrected within 100 ms. The achieved brake pedal position is any position within 10 percent of the commanded position from 100 ms after pedal displacement occurs and any overshoot is corrected.

Hybrid Brake Pedal Feedback Procedure

For the hybrid brake pedal feedback procedure, the commanded brake pedal application is the brake pedal position and a subsequent commanded brake pedal force that results in a mean deceleration of 0.4 g in the absence of AEB system activation. The hybrid brake pedal application procedure follows the displacement application procedure, but instead of maintaining the achieved brake pedal displacement, the controller starts to control the force applied to the brake pedal (100 ms after pedal displacement occurs and any overshoot is corrected). The hybrid controller applies a pedal force of at least 11.1 N and maintains the pedal force within 10 percent of the commanded brake pedal force from 350 ms after commended pedal displacement occurs and any overshoot is corrected, until test completion.

Force Feedback Procedure

For the force feedback procedure, the commanded brake pedal application is the brake pedal force that results in a mean deceleration of 0.4 g in the absence of AEB system activation. The mean deceleration is the deceleration over the time from when the commanded brake pedal force is first achieved to 250 ms before the vehicle comes to a stop. The force controller achieves the commanded brake pedal force within 250 ms. The application rate is unrestricted. The force controller may overshoot the commanded force by up to 20 percent. If such an overshoot occurs, it is corrected within 250 ms from when the commanded force is first achieved. The force controller applies a pedal force of at least 11.1 N from the onset of the brake application until the end of the test.

B. Appendix B: Description of the PAEB Test Procedures

Test Parameters

The PAEB performance tests require a vehicle to avoid a collision with a pedestrian test device by applying the brakes automatically under certain test-track scenarios during daylight and darkness (with lower beam and with upper beams activated). Similar to the lead vehicle AEB performance test requirements, NHTSA adopted a no-contact requirement as a performance metric. The test scenarios for PAEB evaluation fall into three groups of scenarios based on the actions of the pedestrian test device—crossing path, stationary and along path. For each test conducted under the testing scenarios, NHTSA adopted the following options within those testing scenarios: (1) pedestrian crossing (right or left) relative to an approaching subject vehicle, (2) subject vehicle overlap (25% or 50%), (3) pedestrian obstruction (Yes/No), and (4) pedestrian speed stationary, walking, or running(V_P). Further parameters when approaching a pedestrian are selected from a subject vehicle speed range (V_{SV}) and the lighting condition (daylight, lower beams or upper beams). As opposed to lead vehicle AEB track testing, manual brake application by the driver is not a parameter of the test scenarios for PAEB.

Similarly to the lead vehicle AEB testing, NHTSA specifies that the travel path in each of the test scenarios be straight. For PAEB testing, the intended travel path of the subject vehicle is a straight line originating at the location corresponding to a headway of L_0.

NHTSA specifies that if the road surface is marked with a single or double lane line, the intended travel path be parallel to, and 1.8 m from the inside of the closest line. If the road surface is marked with two lane lines bordering the lane, the intended travel path is centered between the two lines.

For each PAEB test run, the headway (L_0), in meters, between the front plane of the subject vehicle and a parallel contact plane on the pedestrian test mannequin providing 4.0 seconds time to collision (*TTC*) is calculated. L_0 is determined with the following equation where V_{SV} is the speed of the subject vehicle in m/s and V_{P-y} is the component of speed of the pedestrian test mannequin in m/s in the direction of the intended travel path:

$L_0 = \mathrm{TTC}_0 \times (V_{SV} - V_{P\text{-}y})$

$\mathrm{TTC}_0 = 4.0$

Overlap describes the location of the point on the front of the subject vehicle that would make contact with the

pedestrian test mannequin (PTM) if no braking occurred and is the percentage of the subject vehicle's overall width that the pedestrian test mannequin traverses. It identifies the point on the subject vehicle that would contact a test mannequin within the subject vehicle travel path if the subject vehicle were to maintain its speed without braking, and it is measured from the right or the left (depending on the side of the subject vehicle where the pedestrian test mannequin originates).

Pedestrian Crossing Path

Test Parameters—Unobstructed From the Right

The unobstructed crossing path from the right scenario consists of the subject vehicle traveling straight at a constant speed towards the adult PTM, which enters its travel path (perpendicular to the vehicle's travel path) from the right side of the vehicle. The subject vehicle must be able to avoid contact with the pedestrian test mannequin crossing its path. NHTSA specifies testing the unobstructed crossing path scenario from the right with a 25% and 50% overlap during daylight and a 50% overlap for darkness with independent tests with the lower and upper beams activated. The subject vehicle testing speed is any speed between 10 km/h and 60 km/h, while the PTM speed is 5km/h.

Pedestrian Test Mannequin—Unobstructed From the Right

An adult PTM is used for this scenario and NHTSA specifies that the PTM is to be secured to a moving apparatus so that it faces the direction of motion at 4.0 ± 0.1 m to the right of the subject vehicle's intended travel path. The PTM's leg articulation is to start on apparatus movement and stops when the apparatus stops. The PTM speed is 5 km/h.

Test Parameters—Unobstructed From the Left

The unobstructed crossing path from the left scenario consists of the subject vehicle traveling straight at a constant speed towards the adult PTM, which enters its travel path (perpendicular to the vehicle's travel path) from the left side of the vehicle. The subject vehicle must be able to avoid contact with the pedestrian test mannequin crossing its path. NHTSA will test the unobstructed crossing path scenario from the left with a 50% overlap during daylight. The subject vehicle testing speed is any speed between 10 km/h and 60 km/h, while the PTM speed is 8 km/h.

Pedestrian Test Mannequin—Unobstructed From the Left

An adult PTM is used for this scenario, and NHTSA specifies that the PTM be secured to a moving apparatus so that it faces the direction of motion at 6.0 ± 0.1 m to the left of the intended travel path. The PTM's leg articulation is to start on apparatus movement and stops when the apparatus stops. As this simulates a running adult pedestrian, the PTM speed is 8 km/h.

Test Parameters—Obstructed From the Right

The obstructed crossing path from the right scenario consists of the subject vehicle traveling straight at a constant speed towards a child PTM, which enters its travel path (perpendicular to the travel path) from the right side of the vehicle. The child PTM crosses the subject vehicle's travel path from in front of two stopped VTDs. The VTDs are parked to the right of the subject vehicle's travel path, in the adjacent lane, at 1.0 m (3 ft) from the side of the subject vehicle (tangent with the right outermost point of the subject vehicle when the subject vehicle is in the intended travel path). The VTDs are parked one after the other and are facing in the same direction as the subject vehicle. One VTD is directly behind the other, separated by 1.0 ± 0.1 m. The subject vehicle must be able to avoid contact with the child PTM crossing its path. NHTSA specifies testing this scenario with a 50% overlap during daylight. The subject vehicle testing speed is any speed between 10 km/h and 50 km/h, while the child PTM speed is 5 km/h.

Pedestrian Test Mannequin—Obstructed From the Right

A child PTM is used for the obstructed scenario. NHTSA specifies that the child PTM is secured to a moving apparatus so that it faces the direction of motion at 4.0 ± 0.1 m to the right of the intended travel path. The PTM's leg articulation is to start on apparatus movement and stops when the apparatus stops. This scenario simulates a running child pedestrian and the child PTM speed is 5 km/h.

Test Conduct Prior to FCW or Vehicle Braking Onset

NHTSA specifies that, as the subject vehicle approaches the crossing path of the PTM, beginning when the headway corresponds to L_0, the subject vehicle speed be maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs. Furthermore, beginning when the headway corresponds to L_0, the subject vehicle heading is to be maintained with minimal steering input such that the subject vehicle travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. Prior to the start of a test trial, as long as the specified initialization procedure is executed, a subject vehicle may be driven under any conditions including any speed and direction, and on any road surface, for any elapsed time prior to reaching the point where a test trial begins. For all tests, there is no specific limitations on how a subject vehicle is driven prior to the start of a test trail, in the same manner as for the lead vehicle trials.

The PTM apparatus is to be triggered at a time such that the pedestrian test mannequin meets the intended overlap. The agency specifies that the PTM achieve its intended speed within 1.5 m after the apparatus begins to move and maintains its intended speed within 0.4 km/h until the test completion criteria is satisfied.

Test Conduct After Either FCW or Vehicle Braking Onset

NHTSA specifies that after FCW or vehicle braking onset, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active.

During testing, no manual brake application is permitted and the PTM continues to move until one of the test completion criteria is satisfied.

Test Completion Criteria

NHTSA specifies that any test run is complete when the subject vehicle comes to a complete stop without making contact with the PTM, when the PTM is no longer in the forward path of the subject vehicle, or when the subject vehicle makes contact with the PTM.

Stationary Pedestrian

Test Parameters

The stationary pedestrian scenario consists of the subject vehicle traveling straight at a constant speed towards the adult PTM, which is stationary at an overlap of 25%, facing away from the approaching subject vehicle. The subject vehicle must be able to avoid contact with the stationary PTM during daylight and darkness with lower beam and upper beam. The subject vehicle testing speed is any speed between 10 km/h and 55 km/h.

Pedestrian Test Mannequin

An adult PTM is used for this scenario and NHTSA specifies that the PTM be stationary and face away from

the subject vehicle. The pedestrian test mannequin legs remain still.

Test Conduct Prior to FCW or Vehicle Braking Onset

NHTSA specifies that as the subject vehicle approaches the stationary PTM, beginning when the headway corresponds to L_0, the subject vehicle speed be maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs. Furthermore, beginning when the headway corresponds to L_0, the subject vehicle heading is to be maintained with minimal steering input such that the subject vehicle travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. Similarly to the other tests, the subject vehicle may be driven under any conditions including any speed and direction, and on any road surface, for any elapsed time prior to reaching the point where a test trial begins.

Test Conduct After Either FCW or Vehicle Braking Onset

NHTSA specifies that after FCW or vehicle braking onset, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active. No manual braking is permitted during testing until one of the test completion criteria is satisfied.

Test Completion Criteria

NHTSA specifies that any test run is complete when the subject vehicle comes to a complete stop without making contact with the PTM or when the subject vehicle makes contact with the PTM.

Pedestrian Moving Along the Path

Test Parameters

The pedestrian moving along path scenario consists of the subject vehicle traveling straight at a constant speed towards an adult PTM moving away from the vehicle. The PTM is moving at 5 km/h at an overlap of 25%, facing away on the same travel path as the vehicle. The PTM's movement is parallel to and in the same direction as the subject vehicle. The subject vehicle must be able to avoid contact with the moving PTM during daylight and darkness with lower beam and upper beam. The subject vehicle testing speed is any speed between 10 km/h and 65 km/h.

Test Conduct Prior to FCW or Vehicle Braking Onset

NHTSA specifies that as the subject vehicle approaches the moving PTM, beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs. Furthermore, beginning when the headway corresponds to L_0, the subject vehicle heading is to be maintained with minimal steering input such that the subject vehicle travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. Similarly to the other tests the subject vehicle may be driven under any conditions including any speed and direction, and on any road surface, for any elapsed time prior to reaching the point where a test trial begins.

The PTM is to be secured to a moving apparatus triggered any time after the distance between the front plane of the subject vehicle and a parallel contact plane on the pedestrian test mannequin corresponds to L_0. The specifications state that the PTM achieve its intended speed within 1.5 m after the apparatus begins to move and maintain its intended speed within 0.4 km/h until one of the test completion criteria is satisfied.

Test Conduct After Either FCW or Vehicle Braking Onset

NHTSA specifies that after FCW or vehicle braking onset, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active. No manual braking is permitted during testing until one of the test completion criteria is satisfied.

Test Completion Criteria

NHTSA specifies that any test run is complete when the subject vehicle slows to a speed below that of the PTM without making contact with the PTM, or when the subject vehicle makes contact with the PTM.

C. Appendix C: Description of the False Activation Test Procedures

Test Parameters

Headway Calculation

NHTSA specifies that for each test run conducted, the headway (L_0, $L_{2.1}$, $L_{1.1}$), in meters, between the front plane of the subject vehicle and either the steel trench plate's leading edge or the rearmost plane normal to the centerline of the vehicle test devices providing a 5.0 second, 2.1 second, and 1.1 second time to collision (TTC) is calculated. L_0, $L_{2.1}$, and $L_{1.1}$ are determined with the following equation where V_{SV} is the speed of the subject vehicle in m/s:

$L_x = TTC_x \times (V_{SV})$ *m*
TTC 0 = 5.0 s
TTC 2.1 = 2.1 s
TTC 1.1 = 1.1 s

Steel Trench Plate

Test Parameters

The steel trench plate false activation scenario involves the subject vehicle approaching at 80 km/h a steel plate, commonly used in road construction, placed on the surface of a test track in its intended travel path. The steel trench plate is positioned flat on the test surface so that its longest side is parallel to the vehicle's intended travel path and horizontally centered on the vehicle's intended travel path. The steel plate presents no imminent danger, and the subject vehicle can safely travel over the plate without harm. NHTSA specifies testing with and without manual brake application.

Test Conduct

The procedure states that as the subject vehicle approaches the steel trench plate, the subject vehicle speed shall be maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs beginning when the headway corresponds to L_0. Furthermore, beginning when the headway corresponds to L_0, the subject vehicle heading is to be maintained with minimal steering input such that the subject vehicle travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. If an FCW occurs, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for tests performed with the subject vehicle's cruise control active.

For testing without manual brake application, no manual brake application is made until one of the test completion criteria is satisfied. For testing with manual brake application, the subject vehicle's accelerator pedal, if not already released, is released when the headway corresponds to $L_{2.1}$ at any rate such that it is fully released within 500 ms. The service brake application occurs at headway $L_{1.1.}$

Test Completion Criteria

The test run is complete when the subject vehicle comes to a stop prior to crossing over the leading edge of the steel trench plate or when the subject vehicle crosses over the leading edge of the steel trench plate.

Pass-through Test

Test Parameters

The pass-through test simulates the subject vehicle approaching at 80 km/h vehicle test devices secured in a stationary position parallel to one another with a lateral distance of 4.5 m ±0.1 m between the vehicles' closest front wheels. The centerline between the two vehicles is parallel to the intended travel path and the travel path is free of obstacles. NHTSA tests with and without manual brake application.

Test Conduct

The procedure states that as the subject vehicle approaches the gap between the two vehicle test devices, beginning when the headway corresponds to L_0, the subject vehicle speed be maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs. Furthermore, beginning when the headway corresponds to L_0, the subject vehicle heading is to be maintained with minimal steering input such that the subject vehicle travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s. If an FCW occurs, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active.

For testing without manual brake application, no manual brake application is made until one of the test completion criteria is satisfied. For testing with manual brake application, the subject vehicle's accelerator pedal, if not already released, is released when the headway corresponds to $L_{2.1}$ at any rate such that it is fully released within 500 ms. The service brake application occurs at headway $L_{1.1.}$

Test Completion Criteria

The test run is complete when the subject vehicle comes to a stop prior to its rearmost point passing the vertical plane connecting the forwardmost point of the vehicle test devices or when the rearmost point of the subject vehicle passes the vertical plane connecting the forwardmost point of the vehicle test devices.

List of Subjects

49 CFR Part 571

Imports, Incorporation by reference, Motor vehicle safety, Motor vehicles, Rubber and rubber products.

49 CFR Part 595

Motor vehicle safety, Motor vehicles.

49 CFR Part 596

Automatic emergency braking, Incorporation by reference, Motor vehicles, Motor vehicle safety, Test devices.

In consideration of the foregoing, NHTSA amends 49 CFR chapter V as follows:

PART 571—FEDERAL MOTOR VEHICLE SAFETY STANDARDS

■ 1. The authority citation for part 571 continues to read as follows:

Authority: 49 U.S.C. 322, 30111, 30115, 30117 and 30166; delegation of authority at 49 CFR 1.95.

■ 2. Amend § 571.5 by:
■ a. Revising paragraph (d)(35);
■ b. Redesignating paragraphs (l)(49) and (50) as paragraphs (l)(50) and (51), respectively; and
■ c. Adding new paragraph (l)(49).

The revision and addition read as follows:

§ 571.5 Matter incorporated by reference.

* * * * *

(d) * * *

(35) ASTM E1337–19, ''Standard Test Method for Determining Longitudinal Peak Braking Coefficient (PBC) of Paved Surfaces Using Standard Reference Test Tire,'' approved December 1, 2019, into §§ 571.105; 571.121; 571.122; 571.126; 571.127; 571.135; 571.136; 571.500.

■ 3. Add § 571.127 to read as follows:

§ 571.127 Standard No. 127; Automatic emergency braking systems for light vehicles.

S1. *Scope.* This standard establishes performance requirements for automatic emergency braking (AEB) systems for light vehicles.

S2. *Purpose.* The purpose of this standard is to reduce the number of deaths and injuries that result from crashes in which drivers do not apply the brakes or fail to apply sufficient braking power to avoid or mitigate a crash.

S3. *Application.* This standard applies to passenger cars and to multipurpose passenger vehicles, trucks, and buses with a gross vehicle weight rating (GVWR) of 4,536 kilograms (10,000 pounds) or less.

S4. *Definitions.*

Adaptive cruise control system is an automatic speed control system that allows the equipped vehicle to follow a lead vehicle at a pre-selected gap by controlling the engine, power train, and service brakes.

Ambient illumination is the illumination as measured at the test surface, not including any illumination provided by the subject vehicle.

Automatic emergency braking (AEB) system is a system that detects an imminent collision with vehicles, objects, and road users in or near the path of a vehicle and automatically controls the vehicle's service brakes to avoid or mitigate the collision.

Brake pedal application onset is when 11 N of force has been applied to the brake pedal.

Forward collision warning is an auditory and visual warning provided to the vehicle operator by the AEB system that is designed to induce immediate forward crash avoidance response by the vehicle operator.

Forward collision warning onset is the first moment in time when a forward collision warning is provided.

Headway is the distance between the subject vehicle's frontmost plane normal to its centerline and as applicable: the vehicle test device's rearmost plane normal to its centerline; a parallel contact plane (to the subject vehicle's frontmost plane) on the pedestrian test mannequin; and the leading edge of the steel trench plate.

Lead vehicle is a vehicle test device facing the same direction and preceding a subject vehicle within the same travel lane.

Lead vehicle braking onset is the point at which the lead vehicle achieves a deceleration of 0.05 g due to brake application.

Masked threshold is the quietest level of a signal that can be perceived in the presence of noise.

Pedestrian test mannequin is a device used during AEB testing, when approaching pedestrians, meeting the specifications of subpart B of 49 CFR part 596.

Small-volume manufacturer means an original vehicle manufacturer that produces or assembles fewer than 5,000 vehicles annually for sale in the United States.

Steel trench plate is a rectangular steel plate often used in road construction to temporarily cover sections of pavement unsafe to drive over directly.

Subject vehicle is the vehicle under examination for compliance with this standard.

Travel path is the path projected onto the road surface of a point located at the intersection of the subject vehicle's frontmost vertical plane and

longitudinal vertical center plane, as the subject vehicle travels forward.

Subject vehicle braking onset is the point at which the subject vehicle achieves a deceleration of 0.15 g due to the automatic control of the service brakes.

Vehicle test device is a device meeting the specifications set forth in subpart C of 49 CFR part 596.

S5. *Requirements.*

(a) Except as provided in S5(b), vehicles manufactured on or after September 1, 2029 must meet the requirements of this standard.

(b) The requirements of S5(a) do not apply to small-volume manufacturers, final-stage manufacturers, and alterers until one year after the dates specified in S5(a).

S5.1. *Requirements when approaching a lead vehicle.*

S5.1.1. *Forward collision warning.* A vehicle is required to have a forward collision warning system, as defined in S4 that provides an auditory and visual signal to the driver of an impending collision with a lead vehicle. The system must operate under the conditions specified in S6 when traveling at any forward speed that is greater than 10 km/h (6.2 mph) and less than 145 km/h (90.1 mph).

(a) *Auditory signal.*

(1) The auditory signal must have a high fundamental frequency of at least 800 Hz.

(2) The auditory signal must have a tempo in the range of 6–12 pulses per second and a duty cycle in the range of 0.25–0.95.

(3) The auditory signal must have a minimum intensity of 15–30 dB above the masked threshold.

(4) In-vehicle audio that is not related to a safety purpose or safety system (*i.e.,* entertainment and other audio content not related to or essential for safe performance of the driving task) must be muted, or reduced in volume to within 5 dB of the masked threshold during presentation of the FCW auditory signal.

(b) *Visual signal.*

(1) The visual signal must be located within an ellipse that extends 18 degrees vertically and 10 degrees horizontally of the driver forward line of sight based on the forward-looking eye midpoint (M_f) as described in S14.1.5. of § 571.111.

(2) The visual signal must include the crash pictorial symbol in SAE J2400, 4.1.16, incorporated by reference (see § 571.5).

(3) The visual signal symbol must be red in color and steady burning.

S5.1.2. *Automatic emergency braking.* A vehicle is required to have an automatic emergency braking system, as defined in S4, that applies the service brakes automatically when a collision with a lead vehicle is imminent. The system must operate under the conditions specified in S6 when the vehicle is traveling at any forward speed that is greater than 10 km/h (6.2 mph) and less than 145 km/h (90.1 mph).

S5.1.3. *Performance test requirements.* The vehicle must provide a forward collision warning and subsequently apply the service brakes automatically when a collision with a lead vehicle is imminent such that the subject vehicle does not collide with the lead vehicle when tested using the procedures in S7 under the conditions specified in S6. The forward collision warning is not required if adaptive cruise control is engaged.

S5.2. *Requirements when approaching pedestrians.*

S5.2.1. *Forward collision warning.* A vehicle is required to have a forward collision warning system, as defined in S4, that provides an auditory and visual signal to the driver of an impending collision with a pedestrian. The system must operate under the conditions specified in S6 when the vehicle is traveling at any forward speed that is greater than 10 km/h (6.2 mph) and less than 73 km/h (45.3 mph). The forward collision warning system must meet the auditory signal and visual signal requirements specified in S5.1.1.

S5.2.2. *Automatic emergency braking.* A vehicle is required to have an automatic emergency braking system, as defined in S4, that applies the service brakes automatically when a collision with a pedestrian is imminent when the vehicle is under the conditions specified in S6 and is traveling at any forward speed that is greater than 10 km/h (6.2 mph) and less than 73 km/h (45.3 mph).

S5.2.3. *Performance test requirements.* The vehicle must provide a forward collision warning and apply the brakes automatically such that the subject vehicle does not collide with the pedestrian test mannequin when tested using the procedures in S8 under the conditions specified in S6.

S5.3. *False activation.* The vehicle must not automatically apply braking that results in peak additional deceleration that exceeds what manual braking would produce by 0.25 g or greater, when tested using the procedures in S9 under the conditions specified in S6.

S5.4. *Malfunction detection and controls.*

S5.4.1 The system must continuously detect system malfunctions, including performance degradation caused solely by sensor obstructions. If the system detects a malfunction, or if the system adjusts its performance such that it will not meet the requirements specified in S5.1, S5.2, or S5.3, the system must provide the vehicle operator with a telltale notification.

S5.4.2 Except as provided in S5.4.2.1 and S5.4.2.2, the manufacturer must not provide a control that will place the AEB system in a mode or modes in which it will no longer satisfy the performance requirements of S5.1, S5.2, and S5.3.

S5.4.2.1 The manufacturer may provide a control to allow AEB deactivation that is securely activated, provided the manufacturer enables such activation exclusively in a vehicle owned by a law enforcement agency.

S5.4.2.2 The manufacturer may allow AEB deactivation to occur during low-range four-wheel drive configurations, when the driver selects ''tow mode,'' or when another vehicle system is activated that will have a negative ancillary impact on AEB operation.

S5.4.3 The vehicle's AEB system must always return to the manufacturer's original default AEB mode that satisfies the requirements of S5.1, S5.2, and S5.3 at the initiation of each new ignition cycle, unless the vehicle is in a low-range four-wheel drive configuration selected by the driver on the previous ignition cycle designed for low-speed, off-road driving.

S6. *Test conditions.*

S6.1. *Environmental conditions.*

S6.1.1. *Temperature.* The ambient temperature is any temperature between 0 °C and 40 °C.

S6.1.2. *Wind.* The maximum wind speed is no greater than 10 m/s (22 mph) during lead vehicle avoidance tests and 6.7 m/s (15 mph) during pedestrian avoidance tests.

S6.1.3. *Ambient lighting.*

(a) *Daylight testing.*

(1) The ambient illumination on the test surface is any level at or above 2,000 lux.

(2) Testing is not performed while driving toward or away from the sun such that the horizontal angle between the sun and a vertical plane containing the centerline of the subject vehicle is less than 25 degrees and the solar elevation angle is less than 15 degrees.

(b) *Dark testing.*

(1) The ambient illumination on the test surface is any level at or below 0.2 lux.

(2) Testing is performed under any lunar phase.

(3) Testing is not performed while driving toward the moon such that the horizontal angle between the moon and a vertical plane containing the centerline of the subject vehicle is less

than 25 degrees and the lunar elevation angle is less than 15 degrees.

S6.1.4. *Precipitation.* Testing is not conducted during periods of precipitation or when visibility is affected by fog, smoke, ash, or other particulate.

S6.2. *Road conditions.*

S6.2.1. *Test Track surface and construction.* The tests are conducted on a dry, uniform, solid-paved surface. Surfaces with debris, irregularities, or undulations, such as loose pavement, large cracks, or dips may not be used.

S6.2.2. *Surface friction.* The road test surface produces a peak friction coefficient (PFC) of 1.02 when measured using an ASTM F2493 standard reference test tire, in accordance with ASTM E1337–19 (incorporated by reference, see § 571.5), at a speed of 64 km/h (40 mph), without water delivery.

S6.2.3. *Slope.* The test surface has any consistent slope between 0 percent and 1 percent.

S6.2.4. *Markings.* The road surface within 2 m of the intended travel path is marked with zero, one, or two lines of any configuration or color. If one line is used, it is straight. If two lines are used, they are straight, parallel to each other, and at any distance from 2.7 m to 4.5 m apart.

S6.2.5. *Obstructions.* Testing is conducted such that the vehicle does not travel beneath any overhead structures, including but not limited to overhead signs, bridges, or gantries. No vehicles, obstructions, or stationary objects are within 7.4 m of either side of the intended travel path except as specified.

S6.3. *Subject vehicle conditions.*

S6.3.1. *Malfunction notification.* Testing is not conducted while the AEB malfunction telltale specified in S5.4 is illuminated.

S6.3.2. *Sensor obstruction.* All sensors used by the system and any part of the vehicle immediately ahead of the sensors, such as plastic trim, the windshield, etc., are free of debris or obstructions.

S6.3.3. *Tires.* The vehicle is equipped with the original tires present at the time of initial sale. The tires are inflated to the vehicle manufacturer's recommended cold tire inflation pressure(s) specified on the vehicle's placard or the tire inflation pressure label.

S6.3.4. *Brake burnish.*

(a) Vehicles subject to § 571.105 are burnished in accordance with S7.4 of § 571.105.

(b) Vehicles subject to § 571.135 are burnished in accordance with S7.1 of § 571.135.

S6.3.5. *Brake temperature.* The average temperature of the service brakes on the hottest axle of the vehicle during testing, measured according to S6.4.1 of § 571.135, is between 65°C and 100°C prior to braking.

S6.3.6. *Fluids.* All non-consumable fluids for the vehicle are at 100 percent capacity. All consumable fluids are at any level from 5 to 100 percent capacity.

S6.3.7. *Propulsion battery charge.* The propulsion batteries are charged at any level from 5 to 100 percent capacity.

S6.3.8. *Cruise control.* Cruise control, including adaptive cruise control, is configured under any available setting.

S6.3.9. *Adjustable forward collision warning.* Forward collision warning is configured in any operator-configurable setting.

S6.3.10. *Engine braking.* A vehicle equipped with an engine braking system that is engaged and disengaged by the operator is tested with the system in any selectable configuration.

S6.3.11. *Regenerative braking.* Regenerative braking is configured under any available setting.

S6.3.12. *Headlamps.*

(a) Daylight testing is conducted with the headlamp control in any selectable position.

(b) Darkness testing is conducted with the vehicle's lower beams active and separately with the vehicle's upper beams active.

(c) Prior to performing darkness testing, headlamps are aimed according to the vehicle manufacturer's instructions. The weight of the loaded vehicle at the time of headlamp aiming is within 10 kg of the weight of the loaded vehicle during testing.

S6.3.13. *Subject vehicle loading.* The vehicle load, which is the sum of any vehicle occupants and any test equipment and instrumentation, does not exceed 277 kg. The load does not cause the vehicle to exceed its GVWR or any axle to exceed its GAWR.

S6.3.14. *AEB system initialization.* The vehicle is driven at a speed of 10 km/h or higher for at least one minute prior to testing, and subsequently the starting system is not cycled off prior to testing.

S6.4. *Equipment and test devices.*

S6.4.1. The vehicle test device is specified in 49 CFR part 596, subpart C. Local fluttering of the lead vehicle's external surfaces does not exceed 10 mm perpendicularly from the reference surface, and distortion of the lead vehicle's overall shape does not exceed 25 mm in any direction.

S6.4.2. Adult pedestrian test mannequin is specified in 49 CFR part 596, subpart B.

S6.4.3. Child pedestrian test mannequin is specified in 49 CFR part 596, subpart B.

S6.4.4. The steel trench plate used for the false activation test has the dimensions 2.4 m x 3.7 m x 25 mm and is made of ASTM A36 steel. Any metallic fasteners used to secure the steel trench plate are flush with the top surface of the steel trench plate.

S7. *Testing when approaching a lead vehicle.*

S7.1. *Setup.*

(a) The testing area is set up in accordance with figure 2 to this section.

(b) Testing is conducted during daylight.

(c) For reference, table 1 to S7.1 specifies the subject vehicle speed (V_{SV}), lead vehicle speed (V_{LV}), headway, and lead vehicle deceleration for each test that may be conducted.

(d) The intended travel path of the vehicle is a straight line toward the lead vehicle from the location corresponding to a headway of L_0.

(e) If the road surface is marked with a single or double lane line, the intended travel path is parallel to and 1.8 m from the inside of the closest line. If the road surface is marked with two lane lines bordering the lane, the intended travel path is centered between the two lines.

(f) For each test run conducted, the subject vehicle speed (V_{SV}), lead vehicle speed (V_{LV}), headway, and lead vehicle deceleration will be selected from the ranges specified in table 1 to S7.1.

TABLE 1 TO S7.1—TEST PARAMETERS WHEN APPROACHING A LEAD VEHICLE

	Speed (km/h)		Headway (m)	Lead vehicle decel (g)	Manual brake application
	V_{SV}	V_{LV}			
Stopped Lead Vehicle	Any 10–80	0	—	—	No.
	Any 70–100	0	—	—	Yes.
Slower-Moving Lead Vehicle	Any 40–80	20	—	—	No.
	Any 70–100	20	—	—	Yes.

TABLE 1 TO S7.1—TEST PARAMETERS WHEN APPROACHING A LEAD VEHICLE—Continued

	Speed (km/h)		Headway (m)	Lead vehicle decel (g)	Manual brake application
	V_{SV}	V_{LV}			
Decelerating Lead Vehicle	50	50	Any 12–40	Any 0.3–0.5	No.
	50	50	Any 12–40	Any 0.3–0.5	Yes.
	80	80	Any 12–40	Any 0.3–0.5	No.
	80	80	Any 12–40	Any 0.3–0.5	Yes.

S7.2. *Headway calculation.* For each test run conducted under S7.3 and S7.4, the headway (L_0), in meters, providing 5.0 seconds time to collision (*TTC*) is calculated. L_0 is determined with the following equation where V_{SV} is the speed of the subject vehicle in m/s and V_{LV} is the speed of the lead vehicle in m/s:

Equation 1 to S7.2

$$L_0 = \mathrm{TTC}_0 \times (V_{SV} - V_{LV})$$
$$\mathrm{TTC}_0 = 5.0$$

S7.3. *Stopped lead vehicle.*

S7.3.1. *Test parameters.*

(a) For testing with no subject vehicle manual brake application, the subject vehicle test speed is any speed between 10 km/h and 80 km/h, and the lead vehicle speed is 0 km/h.

(b) For testing with manual brake application of the subject vehicle, the subject vehicle test speed is any speed between 70 km/h and 100 km/h, and the lead vehicle speed is 0 km/h.

S7.3.2. *Test conduct prior to forward collision warning onset.*

(a) The lead vehicle is placed stationary with its longitudinal centerline coincident to the intended travel path.

(b) Before the headway corresponds to L_0, the subject vehicle is driven at any speed, in any direction, on any road surface, for any amount of time.

(c) The subject vehicle approaches the rear of the lead vehicle.

(d) Beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs.

(e) Beginning when the headway corresponds to L_0, the subject vehicle heading is maintained with minimal steering input such that the travel path does not deviate more than 0.3 m laterally from the intended travel path and the subject vehicle's yaw rate does not exceed ±1.0 deg/s.

S7.3.3. *Test conduct after forward collision warning onset.*

(a) The accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles tested with cruise control active.

(b) For testing conducted with manual brake application, the service brakes are applied as specified in S10. The onset of brake pedal application occurs 1.0 ± 0.1 second after forward collision warning onset.

(c) For testing conducted without manual brake application, no manual brake application is made until the test completion criteria of S7.3.4 are satisfied.

S7.3.4. *Test completion criteria.* The test run is complete when the subject vehicle comes to a complete stop without making contact with the lead vehicle or when the subject vehicle makes contact with the lead vehicle.

S7.4. *Slower-moving lead vehicle.*

S7.4.1. *Test parameters.*

(a) For testing with no subject vehicle manual brake application, the subject vehicle test speed is any speed between 40 km/h and 80 km/h, and the lead vehicle speed is 20 km/h.

(b) For testing with manual brake application of the subject vehicle, the subject vehicle test speed is any speed between 70 km/h and 100 km/h, and the lead vehicle speed is 20 km/h.

S7.4.2. *Test conduct prior to forward collision warning onset.*

(a) The lead vehicle is propelled forward in a manner such that the longitudinal center plane of the lead vehicle does not deviate laterally more than 0.3m from the intended travel path.

(b) The subject vehicle approaches the lead vehicle.

(c) Before the headway corresponds to L_0, the subject vehicle is driven at any speed, in any direction, on any road surface, for any amount of time.

(d) Beginning when the headway corresponds to L_0, the subject vehicle and lead vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs.

(e) Beginning when the headway corresponds to L_0, the subject vehicle and lead vehicle headings are be maintained with minimal steering input such that the subject vehicle's travel path does not deviate more than 0.3 m laterally from the centerline of the lead vehicle, and the yaw rate of the subject vehicle does not exceed ±1.0 deg/s prior to the forward collision warning onset.

S7.4.3. *Test conduct after forward collision warning onset.*

(a) The subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles tested with cruise control active.

(b) For testing conducted with manual braking application, the service brakes are applied as specified in S10. The onset of brake pedal application is 1.0 ±0.1 second after the forward collision warning onset.

(c) For testing conducted without manual braking application, no manual brake application is made until the test completion criteria of S7.4.4 are satisfied.

S7.4.4. *Test completion criteria.* The test run is complete when the subject vehicle speed is less than or equal to the lead vehicle speed without making contact with the lead vehicle or when the subject vehicle makes contact with the lead vehicle.

S7.5. *Decelerating lead vehicle.*

S7.5.1. *Test parameters.*

(a) The subject vehicle test speed is 50 km/h or 80 km/h, and the lead vehicle speed is identical to the subject vehicle test speed.

(b) [Reserved]

S7.5.2. *Test conduct prior to lead vehicle braking onset.*

(a) Before the 3 seconds prior to lead vehicle braking onset, the subject vehicle is be driven at any speed, in any direction, on any road surface, for any amount of time.

(b) Between 3 seconds prior to lead vehicle braking onset and lead vehicle braking onset:

(1) The lead vehicle is propelled forward in a manner such that the longitudinal center plane of the vehicle does not deviate laterally more than 0.3 m from the intended travel path.

(2) The subject vehicle follows the lead vehicle at a headway of any distance between 12 m and 40 m.

(3) The subject vehicle's speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs prior to forward collision warning onset.

(4) The lead vehicle's speed is maintained within 1.6 km/h.

(5) The subject vehicle and lead vehicle headings are maintained with minimal steering input such that their travel paths do not deviate more than 0.3 m laterally from the centerline of the lead vehicle, and the yaw rate of the subject vehicle does not exceed ±1.0 deg/s until onset of forward collision warning.

S7.5.3. *Test conduct following lead vehicle braking onset.*

(a) The lead vehicle is decelerated to a stop with a targeted average deceleration of any value between 0.3g and 0.5g. The targeted deceleration magnitude is achieved within 1.5 seconds of lead vehicle braking onset and is maintained until 250 ms prior to coming to a stop.

(b) After forward collision warning onset, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active.

(c) For testing conducted with manual braking application, the service brakes are applied as specified in S10. The brake pedal application onset occurs 1.0 ± 0.1 second after the forward collision warning onset.

(d) For testing conducted without manual braking application, no manual brake application is made until the test completion criteria of S7.5.4 are satisfied.

S7.5.4. *Test completion criteria.* The test run is complete when the subject vehicle comes to a complete stop without making contact with the lead vehicle or when the subject vehicle makes contact with the lead vehicle.

S8. *Testing when approaching a pedestrian.*

S8.1. *Setup.*

S8.1.1. *General.*

(a) For reference, table 2 to S8.1.1 specifies the pedestrian test mannequin direction of travel, overlap, obstruction condition and speed (V_P), the subject vehicle speed (V_{SV}), and the lighting condition for each test that may be conducted.

(b) The intended travel path of the vehicle is a straight line originating at the location corresponding to a headway of L_0.

(c) If the road surface is marked with a single or double lane line, the intended travel path is parallel to and 1.8 m from the inside of the closest line. If the road surface is marked with two lane lines bordering the lane, the intended travel path is centered between the two lines.

(d) For each test run conducted, the subject vehicle speed (V_{SV}) will be selected from the range specified in table 2 to S8.1.1.

TABLE 2 TO S8.1.1—TEST PARAMETERS WHEN APPROACHING A PEDESTRIAN

	Direction	Overlap	Obstructed	Speed (km/h)		Lighting condition
				V_{SV}	V_P	
Pedestrian Crossing Road.	Right	25	No	Any 10–60	5	Daylight
	Right	50	No	Any 10–60	5	Daylight Lower Beams Upper Beams
	Left	50	No	Any 10–60	8	Daylight
	Right	50	Yes	Any 10–50	5	Daylight
Stationary Pedestrian	Right	25	No	Any 10–55	0	Daylight Lower Beams Upper Beams
Pedestrian Moving Along the Path.	Right	25	No	Any 10–65	5	Daylight Lower Beams Upper Beams

S8.1.2. *Overlap.* As depicted in figure 1 to this section, overlap describes the location of the point on the front of the subject vehicle that would make contact with a pedestrian if no braking occurred. Overlap is the percentage of the subject vehicle's overall width that the pedestrian test mannequin traverses. It is measured from the right or the left, depending on the side of the subject vehicle where the pedestrian test mannequin originates. For each test run, the actual overlap will be within 0.15 m of the specified overlap.

S8.1.3. *Pedestrian test mannequin.*

(a) For testing where the pedestrian test mannequin is secured to a moving apparatus, the pedestrian test mannequin is secured so that it faces the direction of motion. The pedestrian test mannequin leg articulation starts on apparatus movement and stops when the apparatus stops.

(b) For testing where the pedestrian test mannequin is stationary, the pedestrian test mannequin faces away from the subject vehicle, and the pedestrian test mannequin legs remain still.

S8.2. *Headway calculation.* For each test run conducted under S8.3, S8.4, and S8.5, the headway (L_0), in meters, providing 4.0 seconds time to collision (TTC) is calculated. L_0 is determined with the following equation where V_{SV} is the speed of the subject vehicle in m/s and $V_{P\text{-}y}$ is the component of speed of the pedestrian test mannequin in m/s in the direction of the intended travel path:

Equation 2 to S8.2

$$L_0 = TTC_0 \times (V_{SV} - V_{P\text{-}y})$$

$$TTC_0 = 4.0$$

S8.3. *Pedestrian crossing road.*

S8.3.1. *Test parameters and setup (unobstructed from right).*

(a) The testing area is set up in accordance with figure 3 to this section.

(b) Testing is conducted in the daylight or darkness conditions, except that testing with the pedestrian at the 25 percent overlap is only conducted in daylight conditions.

(c) Testing is conducted using the adult pedestrian test mannequin.

(d) The movement of the pedestrian test mannequin is perpendicular to the subject vehicle's intended travel path.

(e) The pedestrian test mannequin is set up 4.0 ± 0.1 m to the right of the intended travel path.

(f) The intended overlap is 25 percent from the right or 50 percent.

(g) The subject vehicle test speed is any speed between 10 km/h and 60 km/h.

(h) The pedestrian test mannequin speed is 5 km/h.

S8.3.2 *Test parameters and setup (unobstructed from left).*

(a) The testing area is set up in accordance with figure 4 to this section.

(b) Testing is conducted in the daylight condition.

(c) Testing is conducted using the adult pedestrian mannequin.

(d) The movement of the pedestrian test mannequin is perpendicular to the intended travel path.

(e) The pedestrian test mannequin is set up 6.0 ± 0.1 m to the left of the intended travel path.

(f) The intended overlap is 50 percent.

(g) The subject vehicle test speed is any speed between 10 km/h and 60 km/h.

(h) The pedestrian test mannequin speed is 8 km/h.

S8.3.3. *Test parameters and setup (obstructed).*

(a) The testing area is set up in accordance with figure 5 to this section.

(b) Testing is conducted in the daylight condition.

(c) Testing is conducted using the child pedestrian test mannequin.

(d) The movement of the pedestrian test mannequin is perpendicular to the intended travel path.

(e) The pedestrian test mannequin is set up 4.0 ± 0.1 m to the right of the intended travel path.

(f) The intended overlap is 50 percent.

(g) Two vehicle test devices are secured in stationary positions parallel to the intended travel path. The two vehicle test devices face the same direction as the intended travel path. One vehicle test device is directly behind the other separated by 1.0 ± 0.1 m. The frontmost plane of the vehicle test device furthermost from the subject vehicle is located 1.0 ± 0.1 m from the parallel contact plane (to the subject vehicle's frontmost plane) on the pedestrian test mannequin. The left side of each vehicle test device is 1.0 ± 0.1 m to the right of the vertical plane parallel to the intended travel path and tangent with the right outermost point of the subject vehicle when the subject vehicle is in the intended travel path.

(h) The subject vehicle test speed is any speed between 10 km/h and 50 km/h.

(i) The pedestrian test mannequin speed is 5 km/h.

S8.3.4. *Test conduct prior to forward collision warning or subject vehicle braking onset.*

(a) Before the headway corresponds to L_0, the subject vehicle is driven at any speed, in any direction, on any road surface, for any amount of time.

(b) The subject vehicle approaches the crossing path of the pedestrian test mannequin.

(c) Beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs.

(d) Beginning when the headway corresponds to L_0, the subject vehicle heading is maintained with minimal steering inputs such that the subject vehicle's travel path does not deviate more than 0.3 m laterally from the intended travel path, and the yaw rate of the subject vehicle does not exceed ±1.0 deg/s prior to any automated braking onset.

(e) The pedestrian test mannequin apparatus is triggered at a time such that the pedestrian test mannequin meets the intended overlap, subject to the criteria in S8.1.2. The pedestrian test mannequin achieves its intended speed within 1.5 m after the apparatus begins to move and maintains its intended speed within 0.4 km/h until the test completion criteria of S8.3.6 are satisfied.

S8.3.5. *Test conduct after either forward collision warning or subject vehicle braking onset.*

(a) After forward collision warning or subject vehicle braking onset, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active.

(b) No manual brake application is made until the test completion criteria of S8.3.6 are satisfied.

(c) The pedestrian mannequin continues to move until the completion criteria of S8.3.6 are satisfied.

S8.3.6. *Test completion criteria.* The test run is complete when the subject vehicle comes to a complete stop without making contact with the pedestrian test mannequin, when the pedestrian test mannequin is no longer in the path of the subject vehicle, or when the subject vehicle makes contact with the pedestrian test mannequin.

S8.4. *Stationary pedestrian.*

S8.4.1. *Test parameters and setup.*

(a) The testing area is set up in accordance with figure 6 to this section.

(b) Testing is conducted in the daylight or darkness conditions.

(c) Testing is conducted using the adult pedestrian test mannequin.

(d) The pedestrian mannequin is set up at the 25 percent right overlap position facing away from the approaching vehicle.

(e) The subject vehicle test speed is any speed between 10 km/h and 55 km/h.

(f) The pedestrian mannequin is stationary.

S8.4.2. *Test conduct prior to forward collision warning or subject vehicle braking onset.*

(a) Before the headway corresponds to L_0, the subject vehicle is driven at any speed, in any direction, on any road surface, for any amount of time.

(b) The subject vehicle approaches the pedestrian test mannequin.

(c) Beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs.

(d) Beginning when the headway corresponds to L_0, the subject vehicle heading is maintained with minimal steering inputs such that the subject vehicle's travel path does not deviate more than 0.3 m laterally from the intended travel path, and the yaw rate of the subject vehicle does not exceed ±1.0 deg/s prior to any automated braking onset.

S8.4.3. *Test conduct after either forward collision warning or subject vehicle braking onset.*

(a) After forward collision warning or subject vehicle braking onset, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted with vehicles with cruise control active.

(b) No manual brake application is made until the test completion criteria of S8.4.4 are satisfied.

S8.4.4. *Test completion criteria.* The test run is complete when the subject vehicle comes to a complete stop without making contact with the pedestrian test mannequin, or when the subject vehicle makes contact with the pedestrian test mannequin.

S8.5. *Pedestrian moving along the path.*

S8.5.1. *Test parameters and setup.*

(a) The testing area is set up in accordance with figure 7 to this section.

(b) Testing is conducted in the daylight or darkness conditions.

(c) Testing is conducted using the adult pedestrian test mannequin.

(d) The movement of the pedestrian test mannequin is parallel to and in the same direction as the subject vehicle.

(e) The pedestrian test mannequin is set up in the 25 percent right offset position.

(f) The subject vehicle test speed is any speed between 10 km/h and 65 km/h.

(g) The pedestrian test mannequin speed is 5 km/h.

S8.5.2. *Test conduct prior to forward collision warning or subject vehicle braking onset.*

(a) Before the headway corresponds to L_0, the subject vehicle is driven at any speed, in any direction, on any road surface, for any amount of time.

(b) The subject vehicle approaches the pedestrian test mannequin.

(c) Beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs.

(d) Beginning when the headway corresponds to L_0, the subject vehicle heading is maintained with minimal steering inputs such that the travel path does not deviate more than 0.3 m laterally from the intended travel path, and the yaw rate of the subject vehicle does not exceed ±1.0 deg/s prior to any automated braking onset.

(e) The pedestrian test mannequin apparatus is triggered any time after the distance between the front plane of the subject vehicle and a parallel contact plane on the pedestrian test mannequin corresponds to L_0. The pedestrian test mannequin achieves its intended speed within 1.5 m after the apparatus begins to move and maintains its intended speed within 0.4 km/h until the test completion criteria of S8.5.4 are satisfied.

S8.5.3. *Test conduct after either forward collision warning or subject vehicle braking onset.*

(a) After forward collision warning or subject vehicle braking onset, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active.

(b) No manual brake application is made until the test completion criteria of S8.5.4 are satisfied.

S8.5.4. *Test completion criteria.* The test run is complete when the subject vehicle slows to speed below the pedestrian test mannequin travel speed without making contact with the pedestrian test mannequin or when the subject vehicle makes contact with the pedestrian test mannequin.

S9. *False AEB activation.*

S9.1. *Headway calculation.* For each test run to be conducted under S9.2 and S9.3, the headway (L_0, $L_{2.1}$, $L_{1.1}$), in meters, providing 5.0 seconds, 2.1 seconds, and 1.1 seconds time to collision (TTC) is calculated. L_0, $L_{2.1}$, and $L_{1.1}$ are determined with the following equation where V_{SV} is the speed of the subject vehicle in m/s:

Equation 3 to S9.1

$$L_x = TTC_x \times (V_{SV})$$

$TTC_0 = 5.0$

$TTC_{2.1} = 2.1$

$TTC_{1.1} = 1.1$

S9.2. *Steel trench plate.*

S9.2.1. *Test parameters and setup.*

(a) The testing area is set up in accordance with figure 8 to this section.

(b) The steel trench plate is secured flat on the test surface so that its longest side is parallel to the vehicle's intended travel path and horizontally centered on the vehicle's intended travel path.

(c) The subject vehicle test speed is 80 km/h.

(d) Testing is conducted with manual brake application and without manual brake application.

(e) Testing is conducted during daylight.

S9.2.2. *Test conduct.*

(a) Before the headway corresponds to L_0, the subject vehicle is driven at any speed, in any direction, on any road surface, for any amount of time.

(b) The subject vehicle approaches the steel trench plate.

(c) Beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h of the test speed with minimal and smooth accelerator pedal inputs.

(d) Beginning when the headway corresponds to L_0, the subject vehicle heading is maintained with minimal steering input such that the travel path does not deviate more than 0.3 m laterally from the intended travel path, and the yaw rate of the subject vehicle does not exceed ±1.0 deg/s.

(e) If forward collision warning occurs, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms. This action is omitted for vehicles with cruise control active.

(f) For tests where no manual brake application occurs, manual braking is not applied until the test completion criteria of S9.2.3 are satisfied.

(g) For tests where manual brake application occurs, the subject vehicle's accelerator pedal, if not already released, is released when the headway corresponds to $L_{2.1}$ at any rate such that it is fully released within 500 ms.

(h) For tests where manual brake application occurs, the service brakes are applied as specified in S10. The brake application pedal onset occurs at headway $L_{1.1}$.

S9.2.3. *Test completion criteria.* The test run is complete when the subject vehicle comes to a stop prior to crossing over the leading edge of the steel trench plate or when the subject vehicle crosses over the leading edge of the steel trench plate.

S9.3. *Pass-through.*

S9.3.1. *Test parameters and setup.*

(a) The testing area is set up in accordance with figure 9 to this section.

(b) Two vehicle test devices are secured in a stationary position parallel to one another with a lateral distance of 4.5 m ±0.1 m between the vehicles' closest front wheels. The centerline between the two vehicles is parallel to the intended travel path.

(c) The subject vehicle test speed is 80 km/h.

(d) Testing is conducted with manual brake application and without manual brake application.

(e) Testing is conducted during daylight.

S9.3.2. *Test conduct.*

(a) Before the headway corresponds to L_0, the subject vehicle is driven at any speed, in any direction, on any road surface, for any amount of time.

(b) The subject vehicle approaches the gap between the two vehicle test devices.

(c) Beginning when the headway corresponds to L_0, the subject vehicle speed is maintained within 1.6 km/h with minimal and smooth accelerator pedal inputs.

(d) Beginning when the headway corresponds to L_0, the subject vehicle heading is maintained with minimal steering input such that the travel path does not deviate more than 0.3 m laterally from the intended travel path, and the yaw rate of the subject vehicle does not exceed ±1.0 deg/s.

(e) If forward collision warning occurs, the subject vehicle's accelerator pedal is released at any rate such that it is fully released within 500 ms.

(f) For tests where no manual brake application occurs, manual braking is not applied until the test completion criteria of S9.3.3 are satisfied.

(g) For tests where manual brake application occurs, the subject vehicle's accelerator pedal, if not already released, is released when the headway corresponds to $L_{2.1}$ at any rate such that it is fully released within 500 ms.

(h) For tests where manual brake application occurs, the service brakes are applied as specified in S10. The brake application onset occurs when the headway corresponds to $L_{1.1}$.

S9.3.3. *Test completion criteria.* The test run is complete when the subject vehicle comes to a stop prior to its rearmost point passing the vertical plane connecting the forwardmost point of the vehicle test devices or when the rearmost point of the subject vehicle passes the vertical plane connecting the forwardmost point of the vehicle test devices.

S10. *Subject vehicle brake application procedure.*

S10.1. The procedure begins with the subject vehicle brake pedal in its natural resting position with no preload or position offset.

S10.2. At the option of the manufacturer, either displacement feedback, hybrid feedback, or force feedback control is used.

S10.3. *Displacement feedback procedure.* For displacement feedback, the commanded brake pedal position is the brake pedal position that results in a mean deceleration of 0.4 g in the absence of AEB system activation.

(a) The mean deceleration is the deceleration over the time from the brake pedal achieving the commanded position to 250 ms before the vehicle comes to a stop.

(b) The pedal displacement controller displaces the brake pedal at a rate of 254 mm/s ±25.4 mm/s to the commanded brake pedal position.

(c) The pedal displacement controller may overshoot the commanded position by any amount up to 20 percent. If such an overshoot occurs, it is corrected within 250 ms from when the commanded position is first achieved.

(d) The achieved brake pedal position is any position within 10 percent of the commanded position from 250 ms after the commanded brake pedal position is first achieved to the end of the test.

S10.4. *Hybrid brake pedal feedback procedure.* For hybrid brake pedal feedback, the commanded brake pedal application is the brake pedal position and a subsequent commanded brake pedal force that results in a mean deceleration of 0.4 g in the absence of AEB system activation.

(a) The mean deceleration is the deceleration over the time from the brake pedal achieving the commanded position to 250 ms before the vehicle comes to a stop.

(b) The hybrid controller displaces the brake pedal at a rate of 254 mm/s ±25.4 mm/s to the commanded pedal position.

(c) The hybrid controller may overshoot the commanded position by any amount up to 20 percent. If such an overshoot occurs, it is corrected within 250 ms from then the commanded position is first achieved.

(d) The hybrid controller begins to control the force applied to the brake pedal and stops controlling pedal displacement within 100 ms after the commanded brake pedal displacement occurs.

(e) The hybrid controller applies a pedal force of at least 11.1 N from the onset of the brake application until the end of the test.

(f) The average pedal force is maintained within 10 percent of the commanded brake pedal force from 350 ms after commended pedal displacement occurs until test completion.

S10.5. *Force feedback procedure.* For force feedback, the commanded brake pedal application is the brake pedal force that results in a mean deceleration of 0.4 g in the absence of AEB system activation.

(a) The mean deceleration is the deceleration over the time from when the commanded brake pedal force is first achieved to 250 ms before the vehicle comes to a stop.

(b) The force controller achieves the commanded brake pedal force within 250 ms. The application rate is unrestricted.

(c) The force controller may overshoot the commanded force by any amount up to 20 percent. If such an overshoot occurs, it is corrected within 250 ms from when the commanded force is first achieved.

(d) The force controller applies a pedal force of at least 11.1 N from the onset of the brake application until the end of the test.

(e) The average pedal force is maintained within 10 percent of the commanded brake pedal force from 250 ms after commended pedal force occurs until test completion.

PART 595—MAKE INOPERATIVE EXEMPTIONS

■ 4. The authority citation for part 595 continues to read as follows:

Authority: 49 U.S.C. 322, 30111, 30115, 30117, 30122 and 30166; delegation of authority at 49 CFR 1.95.

■ 5. Amend § 595.4 by adding the definition of ''Manufacturer'' in alphabetical order to read as follows:

§ 595.4 Definitions.

* * * * *

Manufacturer is defined as it is in 49 U.S.C. 30102(a).

* * * * *

■ 6. Add subpart D to read as follows:

Subpart D—Modifications to Law Enforcement Vehicles

§ 595.9 Automatic emergency braking.

A manufacturer, dealer, or motor vehicle repair business that modifies a vehicle owned by a law enforcement agency to provide a means to temporarily deactivate an AEB system is exempted from the ''make inoperative'' prohibition in 49 U.S.C. 30122 to the extent that such modification affects the motor vehicle's compliance with 49 CFR 571.127, S5.4.2. Modifications that would take a vehicle out of compliance with any other Federal motor vehicle safety standards, or portions thereof, are not covered by this exemption.

■ 7. Add part 596 to read as follows.

PART 596—AUTOMATIC EMERGENCY BRAKING TEST DEVICES

Subpart A—General

Sec.
596.1 Scope.
596.2 Purpose.
596.3 Application.
596.4 Definitions.
596.5 Matter incorporated by reference.

Subpart B—Pedestrian Test Devices

596.7 Specifications for pedestrian test devices.
596.8 [Reserved]

Subpart C—Vehicle Test Device

596.9 General description.
596.10 Specifications for the vehicle test device.

Authority: 49 U.S.C. 322, 30111, 30115, 30117 and 30166; delegation of authority at 49 CFR 1.95.

Subpart A—General

§ 596.1 Scope.

This part describes the test devices to be used for compliance testing of motor vehicles with motor vehicle safety standards for automatic emergency braking.

§ 596.2 Purpose.

The design and performance criteria specified in this part are intended to describe devices with sufficient precision such that testing performed with these test devices will produce repetitive and correlative results under similar test conditions to reflect adequately the automatic emergency braking performance of a motor vehicle.

§ 596.3 Application.

This part does not in itself impose duties or liabilities on any person. It is a description of tools that are used in compliance tests to measure the performance of automatic emergency braking systems required by the safety standards that refer to these tools. This part is designed to be referenced by, and become part of, the test procedures specified in motor vehicle safety standards, such as 49 CFR 571.127.

§ 596.4 Definitions.

All terms defined in section 30102 of the National Traffic and Motor Vehicle Safety Act (49 U.S.C. chapter 301, *et seq.*) are used in their statutory meaning.

Adult pedestrian test mannequin (APTM) means a test device with the appearance and radar cross section that simulates an adult pedestrian for the purpose of testing automatic emergency brake system performance.

Child pedestrian test mannequin (CPTM) means a test device with the appearance and radar cross section that stimulates a child pedestrian for the purpose of testing automatic emergency brake system performance.

Pedestrian test device(s) means an adult pedestrian test mannequin and/or a child pedestrian test mannequin.

Pedestrian test mannequin carrier means a movable platform on which an adult pedestrian test mannequin or child pedestrian test mannequin may be attached during compliance testing.

Vehicle test device means a test device that simulates a passenger vehicle for the purpose of testing automatic emergency brake system performance.

Vehicle test device carrier means a movable platform on which a lead vehicle test device may be attached during compliance testing.

§ 596.5 Matter incorporated by reference.

(b) [Reserved]

Subpart B—Pedestrian Test Devices

§ 596.7 Specifications for pedestrian test devices.

(a) *Explanation of usage.* The words ''recommended,'' ''should,'' ''can be,'' or ''should be'' appearing in sections of ISO 19206–2:2018 (incorporated by reference, see § 596.5), referenced in this section, are read as setting forth specifications that are used.

(b) *Explanation of usage.* The words ''may be,'' or ''either'' used in connection with a set of items appearing in sections of ISO 19206–2:2018 (incorporated by reference, see § 596.5), referenced in this section, are read as setting forth the totality of items, any one of which may be selected by NHTSA for testing.

(c) *Specifications for the pedestrian test devices*—(1) *General description.* The adult pedestrian test mannequin (APTM) provides a sensor representation of a 50th percentile adult male and consist of a head, torso, two arms and hands, and two legs and feet. The child pedestrian test mannequin (CPTM) provides a sensor representation of a 6- to 7-year-old child and consists of a head, torso, two arms and hands, and two legs and feet. The arms of the APTM and CPTM are posable, but do not move during testing. The legs of the APTM and CPTM articulate and are synchronized to the forward motion of the mannequin.

(2) *Dimensions and posture.* The APTM has basic body dimensions and proportions specified in Annex A, table A.1 in ISO 19206–2:2018 (incorporated by reference, see § 596.5). The CPTM has basic body dimensions and proportions specified in Annex A, table A.1 in ISO 19206–2:2018 (incorporated by reference, see § 596.5).

(3) *Visual properties*—(i) *Head.* The head has a visible hairline silhouette by printed graphic. The hair is black as defined in Annex B table B.2 of ISO 19206–4:2020, as tested in accordance with ISO 3668:2017 (both incorporated by reference, see § 596.5).

(ii) *Face.* The head does not have any facial features (*i.e.,* eyes, nose, mouth, and ears).

(iii) *Skin.* The face, neck and hands have a skin colored as defined Annex B, table B.2 of ISO 19206–4:2020 (incorporated by reference, see § 596.5).

(iv) *Torso and arms.* The torso and arms are black as defined in Annex B table B.2 of ISO 19206–4:2020, as tested in accordance with ISO 3668:2017 (both incorporated by reference, see § 596.5).

(v) *Legs.* The legs are blue as defined in Annex B table B.2 of ISO 19206–4:2020, as tested in accordance with ISO 3668:2017 (both incorporated by reference, see § 596.5).

(vi) *Feet.* The feet are black as defined in Annex B table B.2 of ISO 19206–4:2020, as tested in accordance with ISO 3668:2017 (both incorporated by reference, see § 596.5).

(4) *Infrared properties.* The surface of the entire APTM or CPTM are within the reflectivity ranges specified in Annex B section B.2.2 of ISO 19206–2:2018, as illustrated in Annex B, figure B.2 (incorporated by reference, see § 596.5).

(5) *Radar properties.* The radar reflectivity characteristics of the pedestrian test device approximates that of a pedestrian of the same size when approached from the side or from behind.

(6) *Radar cross section measurements.* The radar cross section measurements of the APTM and the CPTM is within the upper and lower boundaries shown in Annex B, section B.3, figure B.6 of ISO 19206–2:2018 when tested in accordance with the measure procedure in Annex C, section C.3, Scenario 2 Fixed Angle Scans of ISO 19206–3:2021 with a measurement range of 4m to 40m (incorporated by reference, see § 596.5).

(7) *Posture.* The pedestrian test device has arms that are posable and remain posed during testing. The pedestrian test device is equipped with moving legs consistent with standard gait phases specified in Section 5.6 of ISO 19206–2:2018 (incorporated by reference, see § 596.5).

(8) *Articulation properties.* The legs of the pedestrian test device are in accordance with, and as described in, Annex D, section D.2 and illustrated in Figures D.1, D.2, and D.3 of ISO 19206–2:2018 (incorporated by reference, see § 596.6).

§ 596.8 [Reserved]

Subpart C—Vehicle Test Device

§ 596.9 General description.

(a) The vehicle test device provides a sensor representation of a passenger motor vehicle.

(b) The rear view of the vehicle test device contains representations of the vehicle silhouette, a rear window, a high-mounted stop lamp, two taillamps, a rear license plate, two rear reflex reflectors, and two tires.

§ 596.10 Specifications for the vehicle test device.

(a) *Explanation of usage.* The words ''recommended,'' ''should,'' ''can be,'' or ''should be'' appearing in sections of ISO 19206–3:2021 (incorporated by reference, see § 596.5), referenced in this section, are read as setting forth specifications that are used.

(b) *Explanation of usage.* The words ''may be,'' or ''either,'' used in connection with a set of items appearing in sections of ISO 19206–3:2021 (incorporated by reference, see § 596.5), referenced in this section, are read as setting forth the totality of items, any one of which may be selected by NHTSA for testing.

(c) *Dimensional specifications.* (1) The rear silhouette and the rear window are symmetrical about a shared vertical centerline.

(2) Representations of the taillamps, rear reflex reflectors, and tires are symmetrical about the surrogate's centerline.

(3) The license plate representation has a width of 300 ± 15 mm and a height of 150 ± 15 mm and mounted with a license plate holder angle within the range described in 49 CFR 571.108, S6.6.3.1.

(4) The vehicle test device representations are located within the minimum and maximum measurement values specified in columns 3 and 4 of Tables A.4 of ISO 19206–3:2021 Annex A (incorporated by reference, see § 596.5). The tire representations are located within the minimum and maximum measurement values specified in columns 3 and 4 of Tables A.3 of ISO 19206–3:2021 Annex A (incorporated by reference, see § 596.5). The terms ''rear light'' means ''taillamp,'' ''retroreflector'' means ''reflex reflector,'' and ''high centre taillight'' means ''high-mounted stop lamp.''

(d) *Visual and near infrared specification.* (1) The vehicle test device rear representation colors are within the ranges specified in Tables B.2 and B.3 of ISO 19206–3:2021 Annex B (incorporated by reference, see § 596.5).

(2) The rear representation infrared properties of the vehicle test device are within the ranges specified in Table B.1 of ISO 19206–3:2021 Annex B (incorporated by reference, see § 596.5) for wavelengths of 850 to 950 nm when measured according to the calibration and measurement setup specified in paragraph B.3 of ISO 19206–3:2021 Annex B (incorporated by reference, see § 596.5).

(3) The vehicle test device rear reflex reflectors, and at least 50 cm^2 of the taillamp representations are grade DOT–C2 reflective sheeting as specified in 49 CFR 571.108, S8.2.

(e) *Radar reflectivity specifications.* (1) The radar cross section of the vehicle test device is measured with it attached to the carrier (robotic platform). The radar reflectivity of the carrier platform is less than 0 dBm^2 for a viewing angle of 180 degrees and over a range of 5 to 100 m when measured according to the radar measurement procedure specified in Section C.3 of ISO 19206–3:2021 Annex C (incorporated by reference, see § 596.5) for fixed-angle scans.

(2) The rear bumper area as shown in Table C.1 of ISO 19206–3:2021 Annex C (incorporated by reference, see § 596.5) contributes to the target radar cross section.

(3) The radar cross section is assessed using radar sensor that operates at 76 to 81 GHz and has a range of at least 5 to 100 m, a range gate length smaller than 0.6m, a horizontal field of view of 10 degrees or more (–3dB amplitude limit), and an elevation field of view of 5 degrees or more (–3dB amplitude).

(4) At least 92 percent of the filtered data points of the surrogate radar cross section for the fixed vehicle angle, variable range measurements are within the radar cross section boundaries defined in Section C.2.2.4 of ISO 19206–3:2021 Annex C (incorporated by reference, see § 596.5) for a viewing angle of 180 degrees when measured according to the radar measurement procedure specified in Section C.3 of ISO 19206–3:2021 Annex C (incorporated by reference, see § 596.5) for fixed-angle scans.

(5) Between 86 to 95 percent of the vehicle test device spatial radar cross section reflective power is with the primary reflection region defined in Section C.2.2.5 of ISO 19206–3:2021 Annex C (incorporated by reference, see § 596.5) when measured according to the radar measurement procedure specified in Section C.3 of ISO 19206–3:2021 Annex C (incorporated by reference, see § 596.5) using the angle-penetration method.

Issued in Washington, DC, under authority delegated in 49 CFR 1.95 and 501.5.

RIN 2060–AV09

New Source Performance Standards for Greenhouse Gas Emissions From New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions From Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is finalizing multiple actions under section 111 of the Clean Air Act (CAA) addressing greenhouse gas (GHG) emissions from fossil fuel-fired electric generating units (EGUs). First, the EPA is finalizing the repeal of the Affordable Clean Energy (ACE) Rule. Second, the EPA is finalizing emission guidelines for GHG emissions from existing fossil fuel-fired steam generating EGUs, which include both coal-fired and oil/gas-fired steam generating EGUs. Third, the EPA is finalizing revisions to the New Source Performance Standards (NSPS) for GHG emissions from new and reconstructed fossil fuel-fired stationary combustion turbine EGUs. Fourth, the EPA is finalizing revisions to the NSPS for GHG emissions from fossil fuel-fired steam generating units that undertake a large modification, based upon the 8-year review required by the CAA. The EPA is not finalizing emission guidelines for GHG emissions from existing fossil fuel-fired stationary combustion turbines at this time; instead, the EPA intends to take further action on the proposed emission guidelines at a later date.

DATES: This final rule is effective on July 8, 2024. The incorporation by reference of certain publications listed in the rules is approved by the Director of the Federal Register as of July 8, 2024. The incorporation by reference of certain other materials listed in the rule was approved by the Director of the Federal Register as of October 23, 2015.

ADDRESSES: The EPA has established a docket for these actions under Docket ID No. EPA–HQ–OAR–2023–0072. All documents in the docket are listed on the *https://www.regulations.gov* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov*.

FOR FURTHER INFORMATION CONTACT: Lisa Thompson (she/her), Sector Policies and Programs Division (D243–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, 109 T.W. Alexander Drive, P.O. Box 12055, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5158; and email address: *thompson.lisa@epa.gov*.

SUPPLEMENTARY INFORMATION:

Preamble acronyms and abbreviations. Throughout this document the use of ''we,'' ''us,'' or ''our'' is intended to refer to the EPA. The EPA uses multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

K. Congressional Review Act (CRA)
XIV. Statutory Authority

I. Executive Summary

In 2009, the EPA concluded that GHG emissions endanger our nation's public health and welfare.[1] Since that time, the evidence of the harms posed by GHG emissions has only grown, and Americans experience the destructive and worsening effects of climate change every day.[2] Fossil fuel-fired EGUs are the nation's largest stationary source of GHG emissions, representing 25 percent of the United States' total GHG emissions in 2021.[3] At the same time, a range of cost-effective technologies and approaches to reduce GHG emissions from these sources is available to the power sector—including carbon capture and sequestration/storage (CCS), co-firing with less GHG-intensive fuels, and more efficient generation. Congress has also acted to provide funding and other incentives to encourage the deployment of various technologies, including CCS, to achieve reductions in GHG emissions from the power sector.

In this notice, the EPA is finalizing several actions under section 111 of the Clean Air Act (CAA) to reduce the significant quantity of GHG emissions from fossil fuel-fired EGUs by establishing emission guidelines and new source performance standards (NSPS) that are based on available and cost-effective technologies that directly reduce GHG emissions from these sources. Consistent with the statutory command of CAA section 111, the final NSPS and emission guidelines reflect the application of the best system of emission reduction (BSER) that, taking into account costs, energy requirements, and other statutory factors, is adequately demonstrated.

Specifically, the EPA is first finalizing the repeal of the Affordable Clean Energy (ACE) Rule. Second, the EPA is finalizing emission guidelines for GHG emissions from existing fossil fuel-fired steam generating EGUs, which include both coal-fired and oil/gas-fired steam generating EGUs. Third, the EPA is finalizing revisions to the NSPS for GHG emissions from new and reconstructed fossil fuel-fired stationary combustion turbine EGUs. Fourth, the EPA is finalizing revisions to the NSPS for GHG emissions from fossil fuel-fired steam generating units that undertake a large modification, based upon the 8-year review required by the CAA. The EPA is not finalizing emission guidelines for GHG emissions from existing fossil fuel-fired combustion turbines at this time and plans to expeditiously issue an additional proposal that more comprehensively addresses GHG emissions from this portion of the fleet. The EPA acknowledges that the share of GHG emissions from existing fossil fuel-fired combustion turbines has been growing and is projected to continue to do so, particularly as emissions from other portions of the fleet decline, and that it is vital to regulate the GHG emissions from these sources consistent with CAA section 111.

These final actions ensure that the new and existing fossil fuel-fired EGUs that are subject to these rules reduce their GHG emissions in a manner that is cost-effective and improves the emissions performance of the sources, consistent with the applicable CAA requirements and caselaw. These standards and emission guidelines will significantly decrease GHG emissions from fossil fuel-fired EGUs and the associated harms to human health and

[1] 74 FR 66496 (December 15, 2009).

[2] The 5th National Climate Assessment (NCA5) states that the effects of human-caused climate change are already far-reaching and worsening across every region of the United States and that climate change affects all aspects of the energy system-supply, delivery, and demand-through the increased frequency, intensity, and duration of extreme events and through changing climate trends.

[3] *https://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions.*

welfare. Further, the EPA has designed these standards and emission guidelines in a way that is compatible with the nation's overall need for a reliable supply of affordable electricity.

A. Climate Change and Fossil Fuel-Fired EGUs

These final actions reduce the emissions of GHGs from new and existing fossil fuel-fired EGUs. The increasing concentrations of GHGs in the atmosphere are, and have been, warming the planet, resulting in serious and life-threatening environmental and human health impacts. The increased concentrations of GHGs in the atmosphere and the resulting warming have led to more frequent and more intense heat waves and extreme weather events, rising sea levels, and retreating snow and ice, all of which are occurring at a pace and scale that threaten human health and welfare.

Fossil fuel-fired EGUs that are uncontrolled for GHGs are one of the biggest domestic sources of GHG emissions. At the same time, there are technologies available (including technologies that can be applied to fossil fuel-fired power plants) to significantly reduce emissions of GHGs from the power sector. Low- and zero-GHG electricity are also key enabling technologies to significantly reduce GHG emissions in almost every other sector of the economy.

In 2021, the power sector was the largest stationary source of GHGs in the United States, emitting 25 percent of overall domestic emissions.[4] In 2021, existing fossil fuel-fired steam generating units accounted for 65 percent of the GHG emissions from the sector, but only accounted for 23 percent of the total electricity generation.

Because of its outsized contributions to overall emissions, reducing emissions from the power sector is essential to addressing the challenge of climate change—and sources in the power sector also have many available options for reducing their climate-destabilizing emissions. Particularly relevant to these actions are several key technologies (CCS and co-firing of lower-GHG fuels) that allow fossil fuel-fired steam generating EGUs and stationary combustion turbines to provide power while emitting significantly lower GHG emissions. Moreover, with the increased electrification of other GHG-emitting sectors of the economy, such as personal vehicles, heavy-duty trucks, and the heating and cooling of buildings, reducing GHG emissions from these affected sources can also help reduce power sector pollution that might otherwise result from the electrification of other sectors of the economy.

B. Recent Developments in Emissions Controls and the Electric Power Sector

Several recent developments concerning emissions controls are relevant for the EPA's determination of the BSER for existing coal-fired steam generating EGUs and new natural gas-fired stationary combustion turbines. These include lower costs and continued improvements in CCS technology, alongside Federal tax incentives that allow companies to largely offset the cost of CCS. Well-established trends in the sector further inform where using such technologies is cost effective and feasible, and form part of the basis for the EPA's determination of the BSER.

In recent years, the cost of CCS has declined in part because of process improvements learned from earlier deployments and other advances in the technology. In addition, the Inflation Reduction Act (IRA), enacted in 2022, extended and significantly increased the tax credit for carbon dioxide (CO_2) sequestration under Internal Revenue Code (IRC) section 45Q. The provision of tax credits in the IRA, combined with the funding included in the Infrastructure Investment and Jobs Act (IIJA), enacted in 2021, incentivize and facilitate the deployment of CCS and other GHG emission control technologies. As explained later in this preamble, these developments support the EPA's conclusion that CCS is the BSER for certain subcategories of new and existing EGUs because it is an adequately demonstrated and available control technology that significantly reduces emissions of dangerous pollution and because the costs of its installation and operation are reasonable. Some companies have already made plans to install CCS on their units independent of the EPA's regulations.

Well documented trends in the power sector also influence the EPA's determination of the BSER. In particular, CCS entails significant capital expenditures and is only cost-reasonable for units that will operate enough to defray those capital costs. At the same time, many utilities and power generating companies have recently announced plans to accelerate changing the mix of their generating assets. The IIJA and IRA, state legislation, technology advancements, market forces, consumer demand, and the advanced age of much of the existing fossil fuel-fired generating fleet are collectively leading to, in most cases, decreased use of the fossil fuel-fired units that are the subjects of these final actions. From 2010 through 2022, fossil fuel-fired generation declined from approximately 72 percent of total net generation to approximately 60 percent, with generation from coal-fired sources dropping from 49 percent to 20 percent of net generation during this period.[5] These trends are expected to continue and are relevant to determining where capital-intensive technologies, like CCS, may be feasibly and cost-reasonably deployed to reduce emissions.

Congress has taken other recent actions to drive the reduction of GHG emissions from the power sector. As noted earlier, Congress enacted IRC section 45Q in section 115 of the Energy Improvement and Extension Act of 2008 to provide a tax credit for the sequestration of CO_2. Congress significantly amended IRC section 45Q in the Bipartisan Budget Act of 2018, and more recently in the IRA, to make this tax incentive more generous and effective in spurring long-term deployment of CCS. In addition, the IIJA provided more than $65 billion for infrastructure investments and upgrades for transmission capacity, pipelines, and low-carbon fuels.[6] Further, the Creating Helpful Incentives to Produce Semiconductors and Science Act (CHIPS Act) authorized billions more in funding for development of low- and non-GHG emitting energy technologies that could provide additional low-cost options for power companies to reduce overall GHG emissions.[7] As discussed in greater detail in section IV.E.1 of this preamble, the IRA, the IIJA, and CHIPS contain numerous other provisions encouraging companies to reduce their GHGs.

C. Summary of the Principal Provisions of These Regulatory Actions

These final actions include the repeal of the ACE Rule, BSER determinations and emission guidelines for existing fossil fuel-fired steam generating units, and BSER determinations and accompanying standards of performance for GHG emissions from new and reconstructed fossil fuel-fired stationary combustion turbines and modified fossil fuel-fired steam generating units.

[4] *https://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions.*

[7] *https://www.congress.gov/bill/117th-congress/house-bill/4346.*

The EPA is taking these actions consistent with its authority under CAA section 111. Under CAA section 111, once the EPA has identified a source category that contributes significantly to dangerous air pollution, it proceeds to regulate new sources and, for GHGs and certain other air pollutants, existing sources. The central requirement is that the EPA must determine the ''best system of emission reduction . . . adequately demonstrated,'' taking into account the cost of the reductions, non-air quality health and environmental impacts, and energy requirements.[8] The EPA may determine that different sets of sources have different characteristics relevant for determining the BSER and may subcategorize sources accordingly.

Once it identifies the BSER, the EPA must determine the ''degree of emission limitation'' achievable by application of the BSER. For new sources, the EPA establishes the standard of performance with which the sources must comply, which is a standard for emissions that reflects the degree of emission limitation. For existing sources, the EPA includes the information it has developed concerning the BSER and associated degree of emission limitation in emission guidelines and directs the states to adopt state plans that contain standards of performance that are consistent with the emission guidelines.

Since the early 1970s, the EPA has promulgated regulations under CAA section 111 for more than 60 source categories, which has established a robust set of regulatory precedents that has informed the development of these final actions. During this period, the courts, primarily the U.S. Court of Appeals for the D.C. Circuit and the Supreme Court, have developed a body of caselaw interpreting CAA section 111. As the Supreme Court has recognized, the EPA has typically (and does so in these actions) determined the BSER to be ''measures that improve the pollution performance of individual sources,'' such as add-on controls and clean fuels. *West Virginia* v. *EPA,* 597 U.S. 697, 734 (2022). For present purposes, several of a BSER's key features include that it must reduce emissions, be based on ''adequately demonstrated'' technology, and have a reasonable cost of control. The case law interpreting section 111 has also recognized that the BSER can be forward-looking in nature and take into account anticipated improvements in control technologies. For example, the EPA may determine a control to be ''adequately demonstrated'' even if it is new and not yet in widespread commercial use, and, further, that the EPA may reasonably project the development of a control system at a future time and establish requirements that take effect at that time. Further, the most relevant costs under CAA section 111 are the costs to the regulated facility. The actions that the EPA is finalizing are consistent with the requirements of CAA section 111 and its regulatory history and caselaw, which is discussed in further detail in section V of this preamble.

[8] CAA section 111(a)(1).

1. Repeal of ACE Rule

The EPA is finalizing its proposed repeal of the existing ACE Rule emission guidelines. First, as a policy matter, the EPA concludes that the suite of heat rate improvements (HRI) that was identified in the ACE Rule as the BSER is not an appropriate BSER for existing coal-fired EGUs. Second, the ACE Rule rejected CCS and natural gas co-firing as the BSER for reasons that no longer apply. Third, the EPA concludes that the ACE Rule conflicted with CAA section 111 and the EPA's implementing regulations because it did not provide sufficient specificity as to the BSER the EPA had identified or the ''degree of emission limitation achievable though application of the [BSER].''

Also, the EPA is withdrawing the proposed revisions to the New Source Review (NSR) regulations that were included the ACE Rule proposal (83 FR 44773–83; August 31, 2018).

2. Emission Guidelines for Existing Fossil Fuel-Fired Steam Generating Units

The EPA is finalizing CCS with 90 percent capture as BSER for existing coal-fired steam generating units. These units have a presumptive standard[9] of an 88.4 percent reduction in annual emission rate, with a compliance deadline of January 1, 2032. As explained in detail below, CCS is an adequately demonstrated technology that achieves significant emissions reduction and is cost-reasonable, taking into account the declining costs of the technology and a substantial tax credit available to sources. In recognition of the significant capital expenditures involved in deploying CCS technology and the fact that 45 percent of regulated units already have announced retirement dates, the EPA is finalizing a separate subcategory for existing coal-fired steam generating units that demonstrate that they plan to permanently cease operation before January 1, 2039. The BSER for this subcategory is co-firing with natural gas, at a level of 40 percent of the unit's annual heat input. These units have a presumptive standard of 16 percent reduction in annual emission rate corresponding to this BSER, with a compliance deadline of January 1, 2030.

The EPA is finalizing an applicability exemption for existing coal-fired steam EGUs demonstrating that they plan to permanently cease operation prior to January 1, 2032, based on the Agency's determination that units retiring before this date generally do not have cost-reasonable options for improving their GHG emissions performance. Sources that demonstrate they will permanently cease operation before this applicability deadline will not be subject to these emission guidelines. Further, the EPA is not finalizing the proposed imminent-term or near-term subcategories.

The EPA is finalizing the proposed structure of the subcategory definitions for natural gas- and oil-fired steam generating units. The EPA is also finalizing routine methods of operation and maintenance as the BSER for intermediate load and base load natural gas- and oil-fired steam generating units. Furthermore, the EPA is finalizing presumptive standards for natural gas- and oil-fired steam generating units that are slightly higher than at proposal: base load sources (those with annual capacity factors greater than 45 percent) have a presumptive standard of 1,400 lb CO_2/MWh-gross, and intermediate load sources (those with annual capacity factors greater than 8 percent and less than or equal to 45 percent) have a presumptive standard of 1,600 lb CO_2/MWh-gross. For low load (those with annual capacity factors less than 8 percent), the EPA is finalizing a uniform fuels BSER and a presumptive input-based standard of 170 lb CO_2/MMBtu for oil-fired sources and a presumptive standard of 130 lb CO_2/MMBtu for natural gas-fired sources.

3. Standards of Performance for New and Reconstructed Fossil Fuel-Fired Combustion Turbines

The EPA is finalizing emission standards for three subcategories of combustion turbines—base load, intermediate load, and low load. The BSER for base load combustion turbines includes two components to be implemented initially in two phases. The first component of the BSER for base load combustion turbines is highly efficient generation (based on the emission rates that the best performing

[9] Presumptive standards of performance are discussed in detail in section X of the preamble. While states establish standards of performance for sources, the EPA provides presumptively approvable standards of performance based on the degree of emission limitation achievable through application of the BSER for each subcategory.

units are achieving) and the second component for base load combustion turbines is utilization of CCS with 90 percent capture. Recognizing the lead time that is necessary for new base load combustion turbines to plan for and install the second component of the BSER (*i.e.,* 90 percent CCS), including the time that is needed to deploy the associated infrastructure (CO_2 pipelines, storage sites, *etc.*), the EPA is finalizing a second phase compliance deadline of January 1, 2032, for this second component of the standard.

The EPA has identified highly efficient simple cycle generation as the BSER for intermediate load combustion turbines. For low load combustion turbines, the EPA is finalizing its proposed determination that the BSER is the use of lower-emitting fuels.

4. New, Modified, and Reconstructed Fossil Fuel-Fired Steam Generating Units

The EPA is finalizing revisions of the standards of performance for coal-fired steam generating units that undertake a large modification (*i.e.,* a modification that increases its hourly emission rate by more than 10 percent) to mirror the emission guidelines for existing coal-fired steam generators. This reflects the EPA's determination that such modified sources are capable of meeting the same presumptive standards that the EPA is finalizing for existing steam EGUs. Further, this revised standard for modified coal-fired steam EGUs will avoid creating an unjustified disparity between emission control obligations for modified and existing coal-fired steam EGUs.

The EPA did not propose, and we are not finalizing, any review or revision of the 2015 standard for large modifications of oil- or gas-fired steam generating units because we are not aware of any existing oil- or gas-fired steam generating EGUs that have undertaken such modifications or have plans to do so, and, unlike an existing coal-fired steam generating EGUs, existing oil- or gas-fired steam units have no incentive to undertake such a modification to avoid the requirements we are including in this final rule for existing oil- or gas-fired steam generating units.

As discussed in the proposal preamble, the EPA is not revising the NSPS for newly constructed or reconstructed fossil fuel-fired steam electric generating units (EGU) at this time because the EPA anticipates that few, if any, such units will be constructed or reconstructed in the foreseeable future. However, the EPA has recently become aware that a new coal-fired power plant is under consideration in Alaska. Accordingly, the EPA is not, at this time, finalizing its proposal not to review the 2015 NSPS, and, instead, will continue to consider whether to review the 2015 NSPS. As developments warrant, the EPA will determine either to conduct a review, and propose revised standards of performance, or not conduct a review.

Also, in this final action, the EPA is withdrawing the 2018 proposed amendments [10] to the NSPS for GHG emissions from coal-fired EGUs.

5. Severability

This final action is composed of four independent rules: the repeal of the ACE rule; GHG emission guidelines for existing fossil fuel-fired steam generating units; NSPS for GHG emissions from new and reconstructed fossil fuel-fired combustion turbines; and revisions to the standards of performance for new, modified, and reconstructed fossil fuel-fired steam generating units. The EPA could have finalized each of these rules in separate **Federal Register** notices as separate final actions. The Agency decided to include these four independent rules in a single **Federal Register** notice for administrative ease because they all relate to climate pollution from the fossil fuel-fired electric generating units source category. Accordingly, despite grouping these rules into one single **Federal Register** notice, the EPA intends that each of these rules described in sections I.C.1 through I.C.4 is severable from the other.

In addition, each rule is severable as a practical matter. For example, the EPA would repeal the ACE Rule separate and apart from finalizing new standards for these sources as explained herein. Moreover, the BSER and associated emission guidelines for existing fossil fuel-fired steam generating units are independent of and would have been the same regardless of whether the EPA finalized the other parts of this rule. In determining the BSER for existing fossil fuel-fired steam generating units, the EPA considered only the technologies available to reduce GHG emissions at those sources and did not take into consideration the technologies or standards of performance for new fossil fuel-fired combustion turbines. The same is true for the Agency's evaluation and determination of the BSER and associated standards of performance for new fossil fuel-fired combustion turbines. The EPA identified the BSER and established the standards of performance by examining the controls that were available for these units. That analysis can stand alone and apart from the EPA's separate analysis for existing fossil fuel-fired steam generating units. Though the record evidence (including, for example, modeling results) often addresses the availability, performance, and expected implementation of the technologies at both existing fossil fuel-fired steam generating units and new fossil fuel-fired combustion turbines in the same record documents, the evidence for each evaluation stands on its own, and is independently sufficient to support each of the final BSERs.

In addition, within section I.C.1, the final action to repeal the ACE Rule is severable from the withdrawal of the NSR revisions that were proposed in parallel with the ACE Rule proposal. Within the group of actions for existing fossil fuel-fired steam generating units in section I.C.2, the requirements for each subcategory of existing sources are severable from the requirements for each other subcategory of existing sources. For example, if a court were to invalidate the BSER and associated emission standard for units in the medium-term subcategory, the BSER and associated emission standard for units in the long-term subcategory could function sensibly because the effectiveness of the BSER for each subcategory is not dependent on the effectiveness of the BSER for other subcategories. Within the group of actions for new and reconstructed fossil fuel-fired combustion turbines in section I.C.3, the following actions are severable: the requirements for each subcategory of new and reconstructed turbines are severable from the requirements for each other subcategory; and within the subcategory for base load turbines, the requirements for each of the two components are severable from the requirements for the other component. Each of these standards can function sensibly without the others. For example, the BSER for low load, intermediate load, and base load subcategories is based on the technologies the EPA determined met the statutory standards for those subcategories and are independent from each other. And in the base load subcategory units may practically be constructed using the most efficient technology without then installing CCS and likewise may install CCS on a turbine system that was not constructed with the most efficient technology. Within the group of actions for new, modified, and reconstructed fossil fuel-fired steam generating units in section I.C.4, the revisions of the standards of performance for coal-fired steam

[10] See 83 FR 65424, December 20, 2018.

generators that undertake a large modification are severable from the withdrawal of the 2018 proposal to revise the NSPS for emissions of GHG from EGUs. Each of the actions in these final rules that the EPA has identified as severable is functionally independent—*i.e.,* may operate in practice independently of the other actions.

In addition, while the EPA is finalizing this rule at the same time as other final rules regulating different types of pollution from EGUs—specifically the Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category (FR 2024–09815, EPA–HQ–OW–2009–0819; FRL–8794–02–OW); National Emission Standards for Hazardous Air Pollutants: Coal and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review (FR 2024–09148, EPA–HQ–OAR–2018–0794; FRL–6716.3–02–OAR); Hazardous and Solid Waste Management System: Disposal of Coal Combustion Residuals From Electric Utilities; Legacy CCR Surface Impoundments (FR 2024–09157, EPA–HQ–OLEM–2020–0107; FRL–7814–04–OLEM)—and has considered the interactions between and cumulative effects of these rules, each rule is based on different statutory authority, a different record, and is completely independent of the other rules.

D. Grid Reliability Considerations

The EPA is finalizing multiple adjustments to the proposed rules that ensure the requirements in these final actions can be implemented without compromising the ability of power companies, grid operators, and state and Federal energy regulators to maintain resource adequacy and grid reliability. In response to the May 2023 proposed rule, the EPA received extensive comments from balancing authorities, independent system operators and regional transmission organizations, state regulators, power companies, and other stakeholders on the need for the final rule to accommodate resource adequacy and grid reliability needs. The EPA also engaged with the balancing authorities that submitted comments to the docket, the staff and Commissioners of the Federal Energy Regulatory Commission (FERC), the Department of Energy (DOE), the North American Electric Reliability Corporation (NERC), and other expert entities during the course of this rulemaking. Finally, at the invitation of FERC, the EPA participated in FERC's Annual Reliability Technical Conference on November 9, 2023.

These final actions respond to this input and feedback in multiple ways, including through changes to the universe of affected sources, longer compliance timeframes for CCS implementation, and other compliance flexibilities, as well as articulation of the appropriate use of RULOF to address reliability issues during state plan development and in subsequent state plan revisions. In addition to these adjustments, the EPA is finalizing several programmatic mechanisms specifically designed to address reliability concerns raised by commenters. For existing fossil fuel-fired EGUs, a short-term reliability emergency mechanism is available for states to provide more flexibility by using an alternative emission limitation during acute operational emergencies when the grid might be temporarily under heavy strain. A similar short-term reliability emergency mechanism is also available to new sources. In addition, the EPA is creating an option for states to provide for a compliance date extension for existing sources of up to 1 year under certain circumstances for sources that are installing control technologies to comply with their standards of performance. Lastly, states may also provide, by inclusion in their state plans, a reliability assurance mechanism of up to 1 year that under limited circumstances would allow existing units that had planned to cease operating by a certain date to temporarily remain available to support reliability. Any extensions exceeding 1 year must be addressed through a state plan revision. In order to utilize this reliability pathway, there must be an adequate demonstration of need and certification by a reliability authority, and approval by the appropriate EPA Regional Administrator. The EPA plans to seek the advice of FERC for extension requests exceeding 6 months. Similarly, for new fossil fuel-fired combustion turbines, the EPA is creating a mechanism whereby baseload units may request a 1-year extension of their CCS compliance deadline under certain circumstances.

The EPA has evaluated the resource adequacy implications of these actions in the final technical support document (TSD), *Resource Adequacy Analysis,* and conducted capacity expansion modeling of the final rules in a manner that takes into account resource adequacy needs. The EPA finds that resource adequacy can be maintained with the final rules. The EPA modeled a scenario that complies with the final rules and that meets resource adequacy needs. The EPA also performed a variety of other sensitivity analyses looking at higher electricity demand (load growth) and impact of the EPA's additional regulatory actions affecting the power sector. These sensitivity analyses indicate that, in the context of higher demand and other pending power sector rules, the industry has available pathways to comply with this rule that respect NERC reliability considerations and constraints.

In addition, the EPA notes that significant planning and regulatory mechanisms exist to ensure that sufficient generation resources are available to maintain reliability. The EPA's consideration of reliability in this rulemaking has also been informed by consultation with the DOE under the auspices of the March 9, 2023, memorandum of understanding (MOU) [11] signed by the EPA Administrator and the Secretary of Energy, as well as by consultation with FERC expert staff. In these final actions, the EPA has included various flexibilities that allow power companies and grid operators to plan for achieving feasible and necessary reductions of GHGs from affected sources consistent with the EPA's statutory charge while ensuring that the rule will not interfere with systems operators' ability to ensure grid reliability.

A thorough description of how adjustments in the final rules address reliability issues, the EPA's outreach to balancing authorities, EPA's supplemental notice, as well as the introduction of mechanisms to address short- and long-term reliability needs is presented in section XII.F of this preamble.

E. Environmental Justice Considerations

Consistent with Executive Order (E.O.) 14096, and the EPA's commitment to upholding environmental justice (EJ) across its policies and programs, the EPA carefully considered the impacts of these actions on communities with environmental justice concerns. As part of the regulatory development process for these rulemakings, and consistent with directives set forth in multiple Executive Orders, the EPA conducted extensive outreach with interested parties including Tribal nations and communities with environmental justice concerns. These opportunities gave the EPA a chance to hear directly from the public, including from communities potentially impacted by these final

[11] *Joint Memorandum of Understanding on Interagency Communication and Consultation on Electric Reliability* (March 9, 2023). *https://www.epa.gov/power-sector/electric-reliability-mou.*

actions. The EPA took this feedback into account in its development of these final actions.[12] The EPA's analysis of environmental justice in these final actions is briefly summarized here and discussed in further detail in sections XII.E and XIII.J of the preamble and section 6 of the regulatory impact analysis (RIA).

Several environmental justice organizations and community representatives raised significant concerns about the potential health, environmental, and safety impacts of CCS. The EPA takes these concerns seriously, agrees that any impacts to historically disadvantaged and overburdened communities are important to consider, and has carefully considered these concerns as it finalized its determinations of the BSERs for these rules. The Agency acknowledges that while these final actions will result in large reductions of both GHGs and other emissions that will have significant positive benefits, there is the potential for localized increases in emissions, particularly if units installing CCS operate for more hours during the year and/or for more years than they would have otherwise. However, as discussed in section VII.C.1.a.iii(B), a robust regulatory framework exists to reduce the risks of localized emissions increases in a manner that is protective of public health, safety, and the environment. The Council on Environmental Quality's (CEQ) February 2022 *Carbon Capture, Utilization, and Sequestration Guidance* and the EPA's evaluation of BSER recognize that multiple Federal agencies have responsibility for regulating and permitting CCS projects, along with state and tribal governments. As the CEQ has noted, Federal agencies have ''taken actions in the past decade to develop a robust carbon capture, utilization, and sequestration/storage (CCUS) regulatory framework to protect the environment and public health across multiple statutes.'' [13] [14]

Furthermore, the EPA plans to review and update as needed its guidance on NSR permitting, specifically with respect to BACT determinations for GHG emissions and consideration of co-pollutant increases from sources installing CCS. For the reasons explained in section VII.C, the EPA is finalizing the determination that CCS is the BSER for certain subcategories of new and existing EGUs based on its consideration of all of the statutory criteria for BSER, including emission reductions, cost, energy requirements, and non-air health and environmental considerations. At the same time, the EPA recognizes the critical importance of ensuring that the regulatory framework performs as intended to protect communities.

These actions are focused on establishing NSPS and emission guidelines for GHGs that states will implement to significantly reduce GHGs and move us a step closer to avoiding the worst impacts of climate change, which is already having a disproportionate impact on communities with environmental justice concerns. The EPA analyzed several illustrative scenarios representing potential compliance outcomes and evaluated the potential impacts that these actions may have on emissions of GHG and other health-harming air pollutants from fossil fuel-fired EGUs, as well as how these changes in emissions might affect air quality and public health, particularly for communities with EJ concerns.

The EPA's national-level analysis of emission reduction and public health impacts, which is documented in section 6 of the RIA and summarized in greater detail in section XII.A and XII.D of this preamble, finds that these actions achieve nationwide reductions in EGU emissions of multiple health-harming air pollutants including nitrogen oxides (NO_X), sulfur dioxide (SO_2), and fine particulate matter ($PM_{2.5}$), resulting in public health benefits. The EPA also evaluated how the air quality impacts associated with these final actions are distributed, with particular focus on communities with EJ concerns. As discussed in the RIA, our analysis indicates that baseline ozone and $PM_{2.5}$ concentration will decline substantially relative to today's levels. Relative to these low baseline levels, ozone and $PM_{2.5}$ concentrations will decrease further in virtually all areas of the country, although some areas of the country may experience slower or faster rates of decline in ozone and $PM_{2.5}$ pollution over time due to the changes in generation and utilization resulting from these rules. Additionally, our comparison of future air quality conditions with and without these rules suggests that while these actions are anticipated to lead to modest but widespread reductions in ambient levels of $PM_{2.5}$ and ozone for a large majority of the nation's population, there is potential for some geographic areas and demographic groups to experience small increases in ozone concentrations relative to the baseline levels which are projected to be substantially lower than today's levels.

It is important to recognize that while these projections of emissions changes and resulting air quality changes under various illustrative compliance scenarios are based upon the best information available to the EPA at this time, with regard to existing sources, each state will ultimately be responsible for determining the future operation of fossil fuel-fired steam generating units located within its jurisdiction. The EPA expects that, in making these determinations, states will consider a number of factors and weigh input from the wide range of potentially affected stakeholders. The meaningful engagement requirements discussed in section X.E.1.b.i of this preamble will ensure that all interested stakeholders—including community members adversely impacted by pollution, energy workers affected by construction and/or other changes in operation at fossil-fuel-fired power plants, consumers and other interested parties—will have an opportunity to have their concerns heard as states make decisions balancing a multitude of factors including appropriate standards of performance, compliance strategies, and compliance flexibilities for existing EGUs, as well as public health and environmental considerations. The EPA believes that these provisions, together with the protections referenced above, can reduce the risks of localized emissions increases in a manner that is protective of public health, safety, and the environment.

F. Energy Workers and Communities

These final actions include requirements for meaningful engagement in development of state plans, including with energy workers and communities. These communities, including energy workers employed at affected EGUs, workers who may construct and install pollution control technology, workers employed by fuel extraction and delivery, organizations

[12] Specifically, the EPA has relied on, and is incorporating as a basis for this rulemaking, analyses regarding possible adverse environmental effects from CCS, including those highlighted by commenters. Consideration of these effects is permissible under CAA section 111(a)(1). Although the EPA also conducted analyses of disproportionate impacts pursuant to E.O. 14096, see section XII.E, the EPA did not consider or rely on these analyses as a basis for these rules.

[13] 87 FR 8808, 8809 (February 16, 2022).

[14] This framework includes, among other things, the EPA regulation of geologic sequestration wells under the Underground Injection Control (UIC) program of the Safe Drinking Water Act; required reporting and public disclosure of geologic sequestration activity, as well as implementation of rigorous monitoring, reporting, and verification of geologic sequestration under the EPA's Greenhouse Gas Reporting Program (GHGRP); and safety regulations for CO_2 pipelines administered by the Pipeline and Hazardous Materials and Safety Administration (PHMSA).

representing these workers, and communities living near affected EGUs, are impacted by power sector trends on an ongoing basis and by these final actions, and the EPA expects that states will include these stakeholders as part of their constructive engagement under the requirements in this rule.

The EPA consulted with the Federal Interagency Working Group on Coal and Power Plant Communities and Economic Revitalization (Energy Communities IWG) in development of these rules and the meaningful engagement requirements. The EPA notes that the Energy Communities IWG has provided resources to help energy communities access the expanded federal resources made available by the Bipartisan Infrastructure Law, CHIPS and Science Act, and Inflation Reduction Act, many of which are relevant to the development of state plans.

G. Key Changes From Proposal

The key changes from proposal in these final actions are: (1) the reduction in number of subcategories for existing coal-fired steam generating units, (2) the extension of the compliance date for existing coal-fired steam generating units to meet a standard of performance based on implementation of CCS, (3) the removal of low-GHG hydrogen co-firing as a BSER pathway, and (4) the addition of two reliability-related instruments. In addition, (5), the EPA is not finalizing proposed requirements for existing fossil fuel-fired stationary combustion turbines at this time.

The reduction in number of subcategories for existing coal-fired steam generating units: The EPA proposed four subcategories for existing coal-fired steam generating units, which would have distinguished these units by operating horizon and by load level. These included subcategories for existing coal-fired EGUs planning to cease operations in the imminent-term (*i.e.,* prior to January 1, 2032) and those planning to cease operations in the near-term (*i.e.,* prior to January 1, 2035). While commenters were generally supportive of the proposed subcategorization approach, some requested that the cease-operation-by date for the imminent-term subcategory be extended and the utilization limit for the near-term subcategory be relaxed. The EPA is not finalizing the imminent-term and near-term subcategories of coal-fired steam generating units. Rather, the EPA is finalizing an applicability exemption for coal-fired steam generating units demonstrating that they plan to permanently cease operation before January 1, 2032. See section VII.B of this preamble for further discussion.

The extension of the compliance date for existing coal-fired steam generating units to meet a standard of performance based on implementation of CCS. The EPA proposed a compliance date for implementation of CCS for long-term coal-fired steam generating units of January 1, 2030. The EPA received comments asserting that this deadline did not provide adequate lead time. In consideration of those comments, and the record as a whole, the EPA is finalizing a CCS compliance date of January 1, 2032 for these sources.

The removal of low-GHG hydrogen co-firing as a BSER pathway and only use of low-GHG hydrogen as a compliance option: The EPA is not finalizing its proposed BSER pathway of low-GHG hydrogen co-firing for new and reconstructed base load and intermediate load combustion turbines in accordance with CAA section 111(a)(1). The EPA is also not finalizing its proposed requirement that only low-GHG hydrogen may be co-fired in a combustion turbine for the purpose of compliance with the standards of performance. These decisions are based on uncertainties identified for specific criteria used to evaluate low-GHG hydrogen co-firing as a potential BSER, and after further analysis in response to public comments, the EPA has determined that these uncertainties prevent the EPA from concluding that low-GHG hydrogen co-firing is a component of the ''best'' system of emission reduction at this time. Under CAA section 111, the EPA establishes standards of performance but does not mandate use of any particular technology to meet those standards. Therefore, certain sources may elect to co-fire hydrogen for compliance with the final standards of performance, even absent the technology being a BSER pathway.[15] See section VIII.F.5 of this preamble for further discussion.

The addition of two reliability-related instruments: Commenters expressed concerns that these rules, in combination with other factors, may affect the reliability of the bulk power system. In response to these comments the EPA engaged extensively with balancing authorities, power companies, reliability experts, and regulatory authorities responsible for reliability to inform its decisions in these final rules. As described later in this preamble, the EPA has made adjustments in these final rules that will support power companies, grid operators, and states in maintaining the reliability of the electric grid during the implementation of these final rules. In addition, the EPA has undertaken an analysis of the reliability and resource adequacy implications of these final rules that supports the Agency's conclusion that these final rules can be implemented without adverse consequences for grid reliability. Further, the EPA is finalizing two reliability-related instruments as an additional layer of safeguards for reliability. These instruments include a reliability mechanism for short-term emergency issues, and a reliability assurance mechanism, or compliance flexibility, for units that have chosen compliance pathways with enforceable retirement dates, provided there is a documented and verified reliability concern. In addition, the EPA is finalizing compliance extensions for unanticipated delays with control technology implementation. Specifically, as described in greater detail in section XII.F of this preamble, the EPA is finalizing the following features and changes from the proposal that will provide even greater certainty that these final rules are sensitive to reliability-related issues and constructed in a manner that does not interfere with grid operators' responsibility to deliver reliable power:

(1) longer compliance timelines for existing coal-fired steam generating units;

(2) a mechanism to extend compliance timelines by up to 1 year in the case of unforeseen circumstances, outside of an owner/operator's control, that delay the ability to apply controls (*e.g.,* supply chain challenges or permitting delays);

(3) transparent unit-specific compliance information for EGUs that will allow grid operators to plan for system changes with greater certainty and precision;

(4) a short-term reliability mechanism to allow affected EGUs to operate at

[15] The EPA is not placing qualifications on the type of hydrogen a source may elect to co-fire at this time (see section VIII.F.6.a of this preamble for further discussion). The Agency continues to recognize that even though the combustion of hydrogen is zero-GHG emitting, its production can entail a range of GHG emissions, from low to high, depending on the production method. Thus, even though the EPA is not finalizing the low-GHG hydrogen co-firing as a BSER, as proposed, it maintains that the overall GHG profile of a particular method of hydrogen production should be a primary consideration for any source that decides to co-fire hydrogen to ensure that overall GHG reductions and important climate benefits are achieved. The EPA also notes the anticipated final rule from the U.S. Department of the Treasury pertaining to clean hydrogen production tax and energy credits, which in its proposed form contains certain eligibility parameters, as well as programs administered by the U.S. Department of Energy, such as the recent H2Hubs selections.

baseline emission rates during documented reliability emergencies; and

(5) a reliability assurance mechanism to allow states to delay cease operation dates by up to 1 year in cases where the planned cease operation date is forecast to disrupt system reliability.

Not finalizing proposed requirements for existing fossil fuel-fired stationary combustion turbines at this time: The EPA proposed emission guidelines for large (*i.e.,* greater than 300 MW), frequently operated (*i.e.,* with an annual capacity factor of greater than 50 percent), existing fossil fuel-fired stationary combustion turbines. The EPA received a wide range of comments on the proposed guidelines. Multiple commenters suggested that the proposed provisions would largely result in shifting of generation away from the most efficient natural gas-fired turbines to less efficient natural gas-fired turbines. Commenters stated that, as emissions from coal-fired steam generating units decreased, existing natural gas-fired EGUs were poised to become the largest source of GHG emissions in the power sector. Commenters noted that these units play an important role in grid reliability, particularly as aging coal-fired EGUs retire. Commenters further noted that the existing fossil fuel-fired stationary combustion turbines that were not covered by the proposal (*i.e.,* the smaller and less frequently operating units) are often less efficient, less well controlled for other pollutants such as NO_X, and are more likely to be located near population centers and communities with environmental justice concerns.

The EPA agrees with commenters who observed that GHG emissions from existing natural gas-fired stationary combustion turbines are a growing portion of the emissions from the power sector. This is consistent with EPA modeling that shows that by 2030 these units will represent the largest portion of GHG emissions from the power sector. The EPA agrees that it is vital to promulgate emission guidelines to address GHG emissions from these sources, and that the EPA has a responsibility to do so under section 111(d) of the Clean Air Act. The EPA also agrees with commenters who noted that focusing only on the largest and most frequently operating units, without also addressing emissions from other units, as the May 2023 proposed rule provided, may not be the most effective way to address emissions from this sector. The EPA's modeling shows that over time as the power sector comes closer to reaching the phase-out threshold of the clean electricity incentives in the Inflation Reduction Act (IRA) (*i.e.,* a 75 percent reduction in emissions from the power sector from 2022 levels), the average capacity factor for existing natural gas-fired stationary combustion turbines decreases. Therefore, the EPA's proposal to focus only on the largest units with the highest capacity factors may not be the most effective policy design for reducing GHG emissions from these sources.

Recognizing the importance of reducing emissions from all fossil fuel-fired EGUs, the EPA is not finalizing the proposed emission guidelines for certain existing fossil fuel-fired stationary combustion turbines at this time. Instead, the EPA intends to issue a new, more comprehensive proposal to regulate GHGs from existing sources. The new proposal will focus on achieving greater emission reductions from existing stationary combustion turbines—which will soon be the largest stationary sources of GHG emissions—while taking into account other factors including the local non-GHG impacts of gas turbine generation and the need for reliable, affordable electricity.

II. General Information

A. Action Applicability

The source category that is the subject of these actions is composed of fossil fuel-fired electric utility generating units. The North American Industry Classification System (NAICS) codes for the source category are 221112 and 921150. The list of categories and NAICS codes is not intended to be exhaustive, but rather provides a guide for readers regarding the entities that these final actions are likely to affect.

Final amendments to 40 CFR part 60, subpart TTTT, are directly applicable to affected facilities that began construction after January 8, 2014, but before May 23, 2023, and affected facilities that began reconstruction or modification after June 18, 2014, but before May 23, 2023. The NSPS codified in 40 CFR part 60, subpart TTTTa, is directly applicable to affected facilities that begin construction, reconstruction, or modification on or after May 23, 2023. Federal, state, local, and tribal government entities that own and/or operate EGUs subject to 40 CFR part 60, subpart TTTT or TTTTa, are affected by these amendments and standards.

The emission guidelines codified in 40 CFR part 60, subpart UUUUb, are for states to follow in developing, submitting, and implementing state plans to establish performance standards to reduce emissions of GHGs from designated facilities that are existing sources. Section 111(a)(6) of the CAA defines an ''existing source'' as ''any stationary source other than a new source.'' Therefore, the emission guidelines would not apply to any EGUs that are new after January 8, 2014, or reconstructed after June 18, 2014, the applicability dates of 40 CFR part 60, subpart TTTT. Under the Tribal Authority Rule (TAR), eligible tribes may seek approval to implement a plan under CAA section 111(d) in a manner similar to a state. See 40 CFR part 49, subpart A. Tribes may, but are not required to, seek approval for treatment in a manner similar to a state for purposes of developing a tribal implementation plan (TIP) implementing the emission guidelines codified in 40 CFR part 60, subpart UUUUb. The TAR authorizes tribes to develop and implement their own air quality programs, or portions thereof, under the CAA. However, it does not require tribes to develop a CAA program. Tribes may implement programs that are most relevant to their air quality needs. If a tribe does not seek and obtain the authority from the EPA to establish a TIP, the EPA has the authority to establish a Federal CAA section 111(d) plan for designated facilities that are located in areas of Indian country.[16] A Federal plan would apply to all designated facilities located in the areas of Indian country covered by the Federal plan unless and until the EPA approves a TIP applicable to those facilities.

B. Where To Get a Copy of This Document and Other Related Information

In addition to being available in the docket, an electronic copy of these final rulemakings is available on the internet at *https://www.epa.gov/stationary-sources-air-pollution/greenhouse-gas-standards-and-guidelines-fossil-fuel-fired-power*. Following signature by the EPA Administrator, the EPA will post a copy of these final rulemakings at this same website. Following publication in the **Federal Register**, the EPA will post the **Federal Register** version of the final rules and key technical documents at this same website.

C. Judicial Review and Administrative Review

Under CAA section 307(b)(1), judicial review of these final actions is available only by filing a petition for review in

[16] See the EPA's website, *https://www.epa.gov/tribal/tribes-approved-treatment-state-tas*, for information on those tribes that have treatment as a state for specific environmental regulatory programs, administrative functions, and grant programs.

the United States Court of Appeals for the District of Columbia Circuit by July 8, 2024. These final actions are ''standard[s] of performance or requirement[s] under section 111,'' and, in addition, are ''nationally applicable regulations promulgated, or final action taken, by the Administrator under [the CAA],'' CAA section 307(b)(1). Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that ''[o]nly an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review.'' This section also provides a mechanism for the EPA to convene a proceeding for reconsideration, ''[i]f the person raising an objection can demonstrate to the EPA that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment, (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule.'' Any person seeking to make such a demonstration to us should submit a Petition for Reconsideration to the Office of the Administrator, U.S. Environmental Protection Agency, Room 3000, WJC West Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

III. Climate Change Impacts

Elevated concentrations of GHGs have been warming the planet, leading to changes in the Earth's climate that are occurring at a pace and in a way that threatens human health, society, and the natural environment. While the EPA is not making any new scientific or factual findings with regard to the well-documented impact of GHG emissions on public health and welfare in support of these rules, the EPA is providing in this section a brief scientific background on climate change to offer additional context for these rulemakings and to help the public understand the environmental impacts of GHGs.

Extensive information on climate change is available in the scientific assessments and the EPA documents that are briefly described in this section, as well as in the technical and scientific information supporting them. One of those documents is the EPA's 2009 ''Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the CAA'' (74 FR 66496, December 15, 2009) (''2009 Endangerment Finding''). In the 2009 Endangerment Finding, the Administrator found under section 202(a) of the CAA that elevated atmospheric concentrations of six key well-mixed GHGs—CO_2, methane (CH_4), nitrous oxide (N_2O), HFCs, perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6)—''may reasonably be anticipated to endanger the public health and welfare of current and future generations'' (74 FR 66523, December 15, 2009). The 2009 Endangerment Finding, together with the extensive scientific and technical evidence in the supporting record, documented that climate change caused by human emissions of GHGs threatens the public health of the U.S. population. It explained that by raising average temperatures, climate change increases the likelihood of heat waves, which are associated with increased deaths and illnesses (74 FR 66497, December 15, 2009). While climate change also increases the likelihood of reductions in cold-related mortality, evidence indicates that the increases in heat mortality will be larger than the decreases in cold mortality in the U.S. (74 FR 66525, December 15, 2009). The 2009 Endangerment Finding further explained that compared with a future without climate change, climate change is expected to increase tropospheric ozone pollution over broad areas of the U.S., including in the largest metropolitan areas with the worst tropospheric ozone problems, and thereby increase the risk of adverse effects on public health (74 FR 66525, December 15, 2009). Climate change is also expected to cause more intense hurricanes and more frequent and intense storms of other types and heavy precipitation, with impacts on other areas of public health, such as the potential for increased deaths, injuries, infectious and waterborne diseases, and stress-related disorders (74 FR 66525 December 15, 2009). Children, the elderly, and the poor are among the most vulnerable to these climate-related health effects (74 FR 66498, December 15, 2009).

The 2009 Endangerment Finding also documented, together with the extensive scientific and technical evidence in the supporting record, that climate change touches nearly every aspect of public welfare [17] in the U.S., including the following: changes in water supply and quality due to changes in drought and extreme rainfall events; increased risk of storm surge and flooding in coastal areas and land loss due to inundation; increases in peak electricity demand and risks to electricity infrastructure; and the potential for significant agricultural disruptions and crop failures (though offset to some extent by carbon fertilization). These impacts are also global and may exacerbate problems outside the U.S. that raise humanitarian, trade, and national security issues for the U.S. (74 FR 66530, December 15, 2009).

In 2016, the Administrator issued a similar finding for GHG emissions from aircraft under section 231(a)(2)(A) of the CAA.[18] In the 2016 Endangerment Finding, the Administrator found that the body of scientific evidence amassed in the record for the 2009 Endangerment Finding compellingly supported a similar endangerment finding under CAA section 231(a)(2)(A) and also found that the science assessments released between the 2009 and 2016 Findings ''strengthen and further support the judgment that GHGs in the atmosphere may reasonably be anticipated to endanger the public health and welfare of current and future generations'' (81 FR 54424, August 15, 2016).

Since the 2016 Endangerment Finding, the climate has continued to change, with new observational records being set for several climate indicators such as global average surface temperatures, GHG concentrations, and sea level rise. Additionally, major scientific assessments continue to be released that further advance our understanding of the climate system and the impacts that GHGs have on public health and welfare for both current and future generations. These updated observations and projections document the rapid rate of current and future

[17] The CAA states in section 302(h) that ''[a]ll language referring to effects on welfare includes, but is not limited to, effects on soils, water, crops, vegetation, manmade materials, animals, wildlife, weather, visibility, and climate, damage to and deterioration of property, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being, whether caused by transformation, conversion, or combination with other air pollutants.'' 42 U.S.C. 7602(h).

[18] *Finding That Greenhouse Gas Emissions From Aircraft Cause or Contribute to Air Pollution That May Reasonably Be Anticipated To Endanger Public Health and Welfare.* 81 FR 54422, August 15, 2016 (''2016 Endangerment Finding'').

climate change both globally and in the U.S.[19] [20] [21] [22] [23] [24] [25] [26] [27] [28] [29] [30] [31]

The most recent information demonstrates that the climate is continuing to change in response to the human-induced buildup of GHGs in the atmosphere. These recent assessments show that atmospheric concentrations of GHGs have risen to a level that has no precedent in human history and that they continue to climb, primarily because of both historical and current anthropogenic emissions, and that these elevated concentrations endanger our health by affecting our food and water sources, the air we breathe, the weather we experience, and our interactions with the natural and built environments. For example, atmospheric concentrations of one of these GHGs, CO_2, measured at Mauna Loa in Hawaii and at other sites around the world reached 419 parts per million (ppm) in 2022 (nearly 50 percent higher than preindustrial levels) [32] and have continued to rise at a rapid rate. Global average temperature has increased by about 1.1 °C (2.0 °F) in the 2011–2020 decade relative to 1850–1900.[33] The years 2015–2021 were the warmest 7 years in the 1880–2021 record, contributing to the warmest decade on record with a decadal temperature of 0.82 °C (1.48 °F) above the 20th century.[34] [35] The Intergovernmental Panel on Climate Change (IPCC) determined (with medium confidence) that this past decade was warmer than any multi-century period in at least the past 100,000 years.[36] Global average sea level has risen by about 8 inches (about 21 centimeters (cm)) from 1901 to 2018, with the rate from 2006 to 2018 (0.15 inches/year or 3.7 millimeters (mm)/year) almost twice the rate over the 1971 to 2006 period, and three times the rate of the 1901 to 2018 period.[37] The rate of sea level rise over the 20th century was higher than in any other century in at least the last 2,800 years.[38] Higher CO_2 concentrations have led to acidification of the surface ocean in recent decades to an extent unusual in the past 65 million years, with negative impacts on marine organisms that use calcium carbonate to build shells or skeletons.[39] Arctic sea ice extent continues to decline in all months of the year; the most rapid reductions occur in September (very likely almost a 13 percent decrease per decade between 1979 and 2018) and are unprecedented in at least 1,000 years.[40] Human-induced climate change has led to heatwaves and heavy precipitation becoming more frequent and more intense, along with increases in agricultural and ecological droughts [41] in many regions.[42]

The assessment literature demonstrates that modest additional amounts of warming may lead to a climate different from anything humans have ever experienced. The 2022 CO_2 concentration of 419 ppm is already higher than at any time in the last 2 million years.[43] If concentrations exceed 450 ppm, they would likely be higher than any time in the past 23 million years: [44] at the current rate of increase of more than 2 ppm per year, this would occur in about 15 years. While GHGs are not the only factor that controls climate, it is illustrative that 3 million years ago (the last time CO_2 concentrations were above 400 ppm) Greenland was not yet completely covered by ice and still supported forests, while 23 million years ago (the last time concentrations were above 450 ppm) the West Antarctic ice sheet was not yet developed, indicating the possibility that high GHG concentrations could lead to a world that looks very different from today and from the conditions in which human civilization has developed. If the Greenland and Antarctic ice sheets were

to melt substantially, sea levels would rise dramatically.

The NCA4 found that it is very likely (greater than 90 percent likelihood) that by mid-century, the Arctic Ocean will be almost entirely free of sea ice by late summer for the first time in about 2 million years.[45] Coral reefs will be at risk for almost complete (99 percent) losses with 1 °C (1.8 °F) of additional warming from today (2 °C or 3.6 °F since preindustrial). At this temperature, between 8 and 18 percent of animal, plant, and insect species could lose over half of the geographic area with suitable climate for their survival, and 7 to 10 percent of rangeland livestock would be projected to be lost.[46] The IPCC similarly found that climate change has caused substantial damages and increasingly irreversible losses in terrestrial, freshwater, and coastal and open ocean marine ecosystems.

Every additional increment of temperature comes with consequences. For example, the half degree of warming from 1.5 to 2 °C (0.9 °F of warming from 2.7 °F to 3.6 °F) above preindustrial temperatures is projected on a global scale to expose 420 million more people to frequent extreme heatwaves at least every five years, and 62 million more people to frequent exceptional heatwaves at least every five years (where heatwaves are defined based on a heat wave magnitude index which takes into account duration and intensity—using this index, the 2003 French heat wave that led to almost 15,000 deaths would be classified as an ''extreme heatwave'' and the 2010 Russian heatwave which led to thousands of deaths and extensive wildfires would be classified as ''exceptional''). It would increase the frequency of sea-ice-free Arctic summers from once in 100 years to once in a decade. It could lead to 4 inches of additional sea level rise by the end of the century, exposing an additional 10 million people to risks of inundation as well as increasing the probability of triggering instabilities in either the Greenland or Antarctic ice sheets. Between half a million and a million additional square miles of permafrost would thaw over several centuries. Risks to food security would increase from medium to high for several lower-income regions in the Sahel, southern Africa, the Mediterranean, central Europe, and the Amazon. In addition to food security issues, this temperature increase would have implications for human health in terms of increasing ozone concentrations, heatwaves, and vector-borne diseases (for example, expanding the range of the mosquitoes which carry dengue fever, chikungunya, yellow fever, and the Zika virus or the ticks which carry Lyme, babesiosis, or Rocky Mountain Spotted Fever).[47] Moreover, every additional increment in warming leads to larger changes in extremes, including the potential for events unprecedented in the observational record. Every additional degree will intensify extreme precipitation events by about 7 percent. The peak winds of the most intense tropical cyclones (hurricanes) are projected to increase with warming. In addition to a higher intensity, the IPCC found that precipitation and frequency of rapid intensification of these storms has already increased, the movement speed has decreased, and elevated sea levels have increased coastal flooding, all of which make these tropical cyclones more damaging.[48]

The NCA4 also evaluated a number of impacts specific to the U.S. Severe drought and outbreaks of insects like the mountain pine beetle have killed hundreds of millions of trees in the western U.S. Wildfires have burned more than 3.7 million acres in 14 of the 17 years between 2000 and 2016, and Federal wildfire suppression costs were about a billion dollars annually.[49] The National Interagency Fire Center has documented U.S. wildfires since 1983, and the 10 years with the largest acreage burned have all occurred since 2004.[50] Wildfire smoke degrades air quality, increasing health risks, and more frequent and severe wildfires due to climate change would further diminish air quality, increase incidences of respiratory illness, impair visibility, and disrupt outdoor activities, sometimes thousands of miles from the location of the fire. Meanwhile, sea level rise has amplified coastal flooding and erosion impacts, requiring the installation of costly pump stations, flooding streets, and increasing storm surge damages. Tens of billions of dollars of U.S. real estate could be below sea level by 2050 under some scenarios. Increased frequency and duration of drought will reduce agricultural productivity in some regions, accelerate depletion of water supplies for irrigation, and expand the distribution and incidence of pests and diseases for crops and livestock. The NCA4 also recognized that climate change can increase risks to national security, both through direct impacts on military infrastructure and by affecting factors such as food and water availability that can exacerbate conflict outside U.S. borders. Droughts, floods, storm surges, wildfires, and other extreme events stress nations and people through loss of life, displacement of populations, and impacts on livelihoods.[51] The NCA5 further reinforces the science showing that climate change will have many impacts on the U.S., as described above in the preamble. Particularly relevant for these rules, the NCA5 states that climate change affects all aspects of the energy system-supply, delivery, and demand-through the increased frequency, intensity, and duration of extreme events and through changing climate trends.'' [52]

EPA modeling efforts can further illustrate how these impacts from climate change may be experienced across the U.S. EPA's Framework for Evaluating Damages and Impacts (FrEDI) [53] uses information from over 30 peer-reviewed climate change impact studies to project the physical and economic impacts of climate change to the U.S. resulting from future temperature changes. These impacts are projected for specific regions within the U.S. and for more than 20 impact categories, which span a large number of sectors of the U.S. economy.[54] Using

Continued

this framework, the EPA estimates that global emission projections, with no additional mitigation, will result in significant climate-related damages to the U.S.[55] These damages to the U.S. would mainly be from increases in lives lost due to increases in temperatures, as well as impacts to human health from increases in climate-driven changes in air quality, dust and wildfire smoke exposure, and incidence of suicide. Additional major climate-related damages would occur to U.S. infrastructure such as roads and rail, as well as transportation impacts and coastal flooding from sea level rise, increases in property damage from tropical cyclones, and reductions in labor hours worked in outdoor settings and buildings without air conditioning. These impacts are also projected to vary from region to region with the Southeast, for example, projected to see some of the largest damages from sea level rise, the West Coast projected to experience damages from wildfire smoke more than other parts of the country, and the Northern Plains states projected to see a higher proportion of damages to rail and road infrastructure. While information on the distribution of climate impacts helps to better understand the ways in which climate change may impact the U.S., recent analyses are still only a partial assessment of climate impacts relevant to U.S. interests and in addition do not reflect increased damages that occur due to interactions between different sectors impacted by climate change or all the ways in which physical impacts of climate change occurring abroad have spillover effects in different regions of the U.S.

Some GHGs also have impacts beyond those mediated through climate change. For example, elevated concentrations of CO_2 stimulate plant growth (which can be positive in the case of beneficial species, but negative in terms of weeds and invasive species, and can also lead to a reduction in plant micronutrients [56]) and cause ocean acidification. Nitrous oxide depletes the levels of protective stratospheric ozone.[57] Methane reacts to form tropospheric ozone.

Section XII.E of this preamble discusses the impacts of GHG emissions on individuals living in socially and economically vulnerable communities. While the EPA did not conduct modeling to specifically quantify changes in climate impacts resulting from these rules in terms of avoided temperature change or sea-level rise, the Agency did quantify climate benefits by monetizing the emission reductions through the application of the social cost of greenhouse gases (SC–GHGs), as described in section XII.D of this preamble.

These scientific assessments, the EPA analyses, and documented observed changes in the climate of the planet and of the U.S. present clear support regarding the current and future dangers of climate change and the importance of GHG emissions mitigation.

IV. Recent Developments in Emissions Controls and the Electric Power Sector

In this section, we discuss background information about the electric power sector and controls available to limit GHG pollution from the fossil fuel-fired power plants regulated by these final rules, and then discuss several recent developments that are relevant for determining the BSER for these sources. After giving some general background, we first discuss CCS and explain that its costs have fallen significantly. Lower costs are central for the EPA's determination that CCS is the BSER for certain existing coal-fired steam generating units and certain new natural gas-fired combustion turbines. Second, we discuss natural gas co-firing for coal-fired steam generating units and explain recent reductions in cost for this approach as well as its widespread availability and current and potential deployment within this subcategory. Third, we discuss highly efficient generation as a BSER technology for new and reconstructed simple cycle and combined cycle combustion turbine EGUs. The emission reductions achieved by highly efficient turbines are well demonstrated in the power sector, and along with operational and maintenance best practices, represent a cost-effective technology that reduces fuel consumption. Finally, we discuss key developments in the electric power sector that influence which units can feasibly and cost-effectively deploy these technologies.

A. Background

1. Electric Power Sector

Electricity in the U.S. is generated by a range of technologies, and different EGUs play different roles in providing reliable and affordable electricity. For example, certain EGUs generate base load power, which is the portion of electricity loads that are continually present and typically operate throughout all hours of the year. Intermediate EGUs often provide complementary generation to balance variable supply and demand resources. Low load ''peaking units'' provide capacity during hours of the highest daily, weekly, or seasonal net demand, and while these resources have low levels of utilization on an annual basis, they play important roles in providing generation to meet short-term demand and often must be available to quickly increase or decrease their output. Furthermore, many of these EGUs also play important roles ensuring the reliability of the electric grid, including facilitating the regulation of frequency and voltage, providing ''black start'' capability in the event the grid must be repowered after a widespread outage, and providing reserve generating capacity [58] in the event of unexpected changes in the availability of other generators.

In general, the EGUs with the lowest operating costs are dispatched first, and, as a result, an inefficient EGU with high fuel costs will typically only operate if other lower-cost plants are unavailable or are insufficient to meet demand. Units are also unavailable during both routine and unanticipated outages, which typically become more frequent as power plants age. These factors result in the mix of available generating capacity types (*e.g.,* the share of capacity of each type of generating source) being substantially different than the mix of the share of total electricity produced by each type of generating source in a given season or year.

expert peer review, following EPA peer-review guidelines.

[57] WMO (World Meteorological Organization), *Scientific Assessment of Ozone Depletion: 2018, Global Ozone Research and Monitoring Project*—Report No. 58, 588 pp., Geneva, Switzerland, 2018.

[58] Generation and capacity are commonly reported statistics with key distinctions. Generation is the production of electricity and is a measure of an EGU's *actual* output while capacity is a measure of the maximum *potential* production of an EGU under certain conditions. There are several methods to calculate an EGU's capacity, which are suited for different applications of the statistic. Capacity is typically measured in megawatts (MW) for individual units or gigawatts (1 GW = 1,000 MW) for multiple EGUs. Generation is often measured in kilowatt-hours (1 kWh = 1,000 watt-hours), megawatt-hours (1 MWh = 1,000 kWh), gigawatt-hours (1 GWh = 1 million kWh), or terawatt-hours (1 TWh = 1 billion kWh).

Generated electricity must be transmitted over networks [59] of high voltage lines to substations where power is stepped down to a lower voltage for local distribution. Within each of these transmission networks, there are multiple areas where the operation of power plants is monitored and controlled by regional organizations to ensure that electricity generation and load are kept in balance. In some areas, the operation of the transmission system is under the control of a single regional operator; [60] in others, individual utilities [61] coordinate the operations of their generation and transmission to balance the system across their respective service territories.

2. Types of EGUs

There are many types of EGUs including fossil fuel-fired power plants (*i.e.,* those using coal, oil, and natural gas), nuclear power plants, renewable generating sources (such as wind and solar) and others. This rule focuses on the fossil fuel-fired portion of the generating fleet that is responsible for the vast majority of GHG emissions from the power sector. The definition of fossil fuel-fired electric utility steam generating units includes utility boilers as well as those that use gasification technology (*i.e.,* integrated gasification combined cycle (IGCC) units). While coal is the most common fuel for fossil fuel-fired utility boilers, natural gas can also be used as a fuel in these EGUs and many existing coal- and oil-fired utility boilers have refueled as natural gas-fired utility boilers. An IGCC unit gasifies fuel—typically coal or petroleum coke—to form a synthetic gas (or syngas) composed of carbon monoxide (CO) and hydrogen (H_2), which can be combusted in a combined cycle system to generate power. The heat created by these technologies produces high-pressure steam that is released to rotate turbines, which, in turn, spin an electric generator.

Stationary combustion turbine EGUs (most commonly natural gas-fired) use one of two configurations: combined cycle or simple cycle turbines. Combined cycle units have two generating components (*i.e.,* two cycles) operating from a single source of heat. Combined cycle units first generate power from a combustion turbine (*i.e.,* the combustion cycle) directly from the heat of burning natural gas or other fuel. The second cycle reuses the waste heat from the combustion turbine engine, which is routed to a heat recovery steam generator (HRSG) that generates steam, which is then used to produce additional power using a steam turbine (*i.e.,* the steam cycle). Combining these generation cycles increases the overall efficiency of the system. Combined cycle units that fire mostly natural gas are commonly referred to as natural gas combined cycle (NGCC) units, and, with greater efficiency, are utilized at higher capacity factors to provide base load or intermediate load power. An EGU's capacity factor indicates a power plant's electricity output as a percentage of its total generation capacity. Simple cycle turbines only use a combustion turbine to produce electricity (*i.e.,* there is no heat recovery or steam cycle). These less-efficient combustion turbines are generally utilized at non-base load capacity factors and contribute to reliable operations of the grid during periods of peak demand or provide flexibility to support increased generation from variable energy sources.[62]

Other generating sources produce electricity by harnessing kinetic energy from flowing water, wind, or tides, thermal energy from geothermal wells, or solar energy primarily through photovoltaic solar arrays. Spurred by a combination of declining costs, consumer preferences, and government policies, the capacity of these renewable technologies is growing, and when considered with existing nuclear energy, accounted for 40 percent of the overall net electricity supply in 2022. Many projections show this share growing over time. For example, the EPA's Power Sector Platform 2023 using IPM (*i.e.,* the EPA's baseline projections of the power sector) projects zero-emitting sources reaching 76 percent of electricity generation by 2040. This shift is driven by multiple factors. These factors include changes in the relative economics of generating technologies, the efforts by states to reduce GHG emissions, utility and other corporate commitments, and customer preference. The shift is further promoted by provisions of Federal legislation, most notably the Clean Electricity Investment and Production tax credits included in IRC sections 48E and 45Y of the IRA, which do not begin to phase out until the later of 2032 or when power sector GHG emissions are 75 percent less than 2022 levels. (See section IV.F of this preamble and the accompanying RIA for additional discussion of projections for the power sector.) These projections are consistent with power company announcements. For example, as the Edison Electric Institute (EEI) stated in pre-proposal public comments submitted to the regulatory docket: ''Fifty EEI members have announced forward-looking carbon reduction goals, two-thirds of which include a net-zero by 2050 or earlier equivalent goal, and members are routinely increasing the ambition or speed of their goals or altogether transforming them into net-zero goals . . . . EEI's member companies see a clear path to continued emissions reductions over the next decade using current technologies, including nuclear power, natural gas-based generation, energy demand efficiency, energy storage, and deployment of new renewable energy—especially wind and solar—as older coal-based and less-efficient natural gas-based generating units retire.'' [63] The Energy Strategy Coalition similarly said in public comments that ''[a]s major electrical utilities and power producers, our top priority is providing clean, affordable, and reliable energy to our customers'' and are ''seeking to advance'' technologies ''such as a carbon capture and storage, which can significantly reduce carbon dioxide

[59] The three network interconnections are the Western Interconnection, comprising the western parts of the U.S. and Canada, the Eastern Interconnection, comprising the eastern parts of the U.S. and Canada except parts of Eastern Canada in the Quebec Interconnection, and the Texas Interconnection, encompassing the portion of the Texas electricity system commonly known as the Electric Reliability Council of Texas (ERCOT). See map of all NERC interconnections at *https://www.nerc.com/AboutNERC/keyplayers/PublishingImages/NERC%20Interconnections.pdf.*

[60] For example, PJM Interconnection, LLC, New York Independent System Operator (NYISO), Midwest Independent System Operator (MISO), California Independent System Operator (CAISO), *etc.*

[61] For example, Los Angeles Department of Power and Water, Florida Power and Light, *etc.*

[62] Non-dispatchable renewable energy (electrical output cannot be used at any given time to meet fluctuating demand) is both variable and intermittent and is often referred to as intermittent renewable energy. The variability aspect results from predictable changes in electric generation (*e.g.,* solar not generating electricity at night) that often occur on longer time periods. The intermittent aspect of renewable energy results from inconsistent generation due to unpredictable external factors outside the control of the owner/operator (*e.g.,* imperfect local weather forecasts) that often occur on shorter time periods. Since renewable energy fluctuates over multiple time periods, grid operators are required to adjust forecast and real time operating procedures. As more renewable energy is added to the electric grid and generation forecasts improve, the intermittency of renewable energy is reduced.

emissions from fossil fuel-fired EGUs.'' [64]

B. GHG Emissions From Fossil Fuel-Fired EGUs

The principal GHGs that accumulate in the Earth's atmosphere above pre-industrial levels because of human activity are CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6. Of these, CO_2 is the most abundant, accounting for 80 percent of all GHGs present in the atmosphere. This abundance of CO_2 is largely due to the combustion of fossil fuels by the transportation, electricity, and industrial sectors.[65]

The amount of CO_2 produced when a fossil fuel is burned in an EGU is a function of the carbon content of the fuel relative to the size and efficiency of the EGU. Different fuels emit different amounts of CO_2 in relation to the energy they produce when combusted. The heat content, or the amount of energy produced when a fuel is burned, is mainly determined by the carbon and hydrogen content of the fuel. For example, in terms of pounds of CO_2 emitted per million British thermal units of energy produced when combusted, natural gas is the lowest compared to other fossil fuels at 117 lb CO_2/MMBtu.[66] [67] The average for coal is 216 lb CO_2/MMBtu, but varies between 206 to 229 lb CO_2/MMBtu by type (*e.g.,* anthracite, lignite, subbituminous, and bituminous).[68] The value for petroleum products such as diesel fuel and heating oil is 161 lb CO_2/MMBtu.

The EPA prepares the official U.S. Inventory of Greenhouse Gas Emissions and Sinks [69] (the U.S. GHG Inventory) to comply with commitments under the United Nations Framework Convention on Climate Change (UNFCCC). This inventory, which includes recent trends, is organized by industrial sectors. It presents total U.S. anthropogenic emissions and sinks [70] of GHGs, including CO_2 emissions since 1990. According to the latest inventory of all sectors, in 2021, total U.S. GHG emissions were 6,340 million metric tons of CO_2 equivalent (MMT CO_2e).[71] The transportation sector (28.5 percent), which includes approximately 300 million vehicles, was the largest contributor to total U.S. GHG emissions with 1,804 MMT CO_2e followed by the power sector (25.0 percent) with 1,584 MMT CO_2e. In fact, GHG emissions from the power sector were higher than the GHG emissions from all other industrial sectors combined (1,487 MMT CO_2e). Specifically, the power sector's emissions were far more than petroleum and natural gas systems [72] at 301 MMT CO_2e; chemicals (71 MMT CO_2e); minerals (64 MMT CO_2e); coal mining (53 MMT CO_2e); and metals (48 MMT CO_2e). The agriculture (636 MMT CO_2e), commercial (439 MMT CO_2e), and residential (366 MMT CO_2e) sectors combined to emit 1,441 MMT CO_2e.

Fossil fuel-fired EGUs are by far the largest stationary source emitters of GHGs in the nation. For example, according to the EPA's Greenhouse Gas Reporting Program (GHGRP), of the top 100 large facilities that reported facility-level GHGs in 2022, 85 were fossil fuel-fired power plants while 10 were refineries and/or chemical plants, four were metals facilities, and one was a petroleum and natural gas systems facility.[73] Of the 85 fossil fuel-fired power plants, 81 were primarily coal-fired, including the top 41 emitters of CO_2. In addition, of the 81 coal-fired plants, 43 have no retirement planned prior to 2039. The top 10 of these plants combined to emit more than 135 MMT of CO_2e, with the top emitter (James H. Miller power plant in Alabama) reporting approximately 22 MMT of CO_2e with each of its four EGUs emitting between 5 MMT and 6 MMT CO_2e that year. The combined capacity of these 10 plants is more than 23 gigawatts (GW), and all except for the Monroe (Michigan) plant operated at annual capacity factors of 50 percent or higher.[74] For comparison, the largest GHG emitter in the U.S. that is not a fossil fuel-fired power plant is the ExxonMobil refinery and chemical plant in Baytown, Texas, which reported 12.6 MMT CO_2e (No. 6 overall in the nation) to the GHGRP in 2022. The largest metals facility in terms of GHG emissions was the U.S. Steel facility in Gary, Indiana, with 10.4 MMT CO_2e (No. 16 overall in the nation).

Overall, CO_2 emissions from the power sector have declined by 36 percent since 2005 (when the power sector reached annual emissions of 2,400 MMT CO_2, its historical peak to date).[75] The reduction in CO_2 emissions can be attributed to the power sector's ongoing trend away from carbon-intensive coal-fired generation and toward more natural gas-fired and renewable sources. In 2005, CO_2 emissions from coal-fired EGUs alone measured 1,983 MMT.[76] This total dropped to 1,351 MMT in 2015 and reached 974 MMT in 2019, the first time since 1978 that CO_2 emissions from coal-fired EGUs were below 1,000 MMT. In 2020, emissions of CO_2 from coal-fired EGUs measured 788 MMT as the result of pandemic-related closures and reduced utilization before rebounding in 2021 to 909 MMT. By contrast, CO_2 emissions from natural gas-fired generation have almost doubled since 2005, increasing from 319 MMT to 613 MMT in 2021, and CO_2 emissions from petroleum products (*i.e.,* distillate fuel oil, petroleum coke, and residual fuel oil) declined from 98 MMT in 2005 to 18 MMT in 2021.

[64] Energy Strategy Coalition Comments on EPA's proposed New Source Performance Standards for Greenhouse Gas Emissions From New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions From Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule, Document ID No. EPA–HQ–OAR–2023–0072–0672, August 14, 2023.

[66] Natural gas is primarily CH_4, which has a higher hydrogen to carbon atomic ratio, relative to other fuels, and thus, produces the least CO_2 per unit of heat released. In addition to a lower CO_2 emission rate on a lb/MMBtu basis, natural gas is generally converted to electricity more efficiently than coal. According to EIA, the 2020 emissions rate for coal and natural gas were 2.23 lb CO_2/kWh and 0.91 lb CO_2/kWh, respectively. *www.eia.gov/tools/faqs/faq.php?id=74&t=11.*

[67] Values reflect the carbon content on a per unit of energy produced on a higher heating value (HHV) combustion basis and are not reflective of recovered useful energy from any particular technology.

[76] U.S. Energy Information Administration (EIA). Monthly Energy Review, table 11.6. September 2022. *https://www.eia.gov/totalenergy/data/monthly/pdf/sec11.pdf.*

When the EPA finalized the Clean Power Plan (CPP) in October 2015, the Agency projected that, as a result of the CPP, the power sector would reduce its annual CO_2 emissions to 1,632 MMT by 2030, or 32 percent below 2005 levels (2,400 MMT).[77] Instead, even in the absence of Federal regulations for existing EGUs, annual CO_2 emissions from sources covered by the CPP had fallen to 1,540 MMT by the end of 2021, a nearly 36 percent reduction below 2005 levels. The power sector achieved a deeper level of reductions than forecast under the CPP and approximately a decade ahead of time. By the end of 2015, several months after the CPP was finalized, those sources already had achieved CO_2 emission levels of 1,900 MMT, or approximately 21 percent below 2005 levels. However, progress in emission reductions is not uniform across all states and is not guaranteed to continue, therefore Federal policies play an essential role. As discussed earlier in this section, the power sector remains a leading emitter of CO_2 in the U.S., and, despite the emission reductions since 2005, current CO_2 levels continue to endanger human health and welfare. Further, as sources in other sectors of the economy turn to electrification to decarbonize, future CO_2 reductions from fossil fuel-fired EGUs have the potential to take on added significance and increased benefits.

C. Recent Developments in Emissions Control

This section of the preamble describes recent developments in GHG emissions control in general. Details of those controls in the context of BSER determination are provided in section VII.C.1.a for CCS on coal-fired steam generating units, section VII.C.2.a for natural gas co-firing on coal-fired steam generating units, section VIII.F.2.b for efficient generation on natural gas-fired combustion turbines, and section VIII.F.4.c.iv for CCS on natural gas-fired combustion turbines. Further details of the control technologies are available in the final TSDs, *GHG Mitigation Measures for Steam Generating Units* and *GHG Mitigation Measures—CCS for Combustion Turbines,* available in the docket for these actions.

1. CCS

One of the key GHG reduction technologies upon which the BSER determinations are founded in these final rules is CCS—a technology that can capture and permanently store CO_2 from fossil fuel-fired EGUs. CCS has three major components: CO_2 capture, transportation, and sequestration/storage. Solvent-based CO_2 capture was patented nearly 100 years ago in the 1930s[78] and has been used in a variety of industrial applications for decades. Thousands of miles of CO_2 pipelines have been constructed and securely operated in the U.S. for decades.[79] And tens of millions of tons of CO_2 have been permanently stored deep underground either for geologic sequestration or in association with enhanced oil recovery (EOR).[80] The American Petroleum Institute (API) explains that ''CCS is a proven technology'' and that ''[t]he methods that apply to [the] carbon sequestration process are not novel. The U.S. has more than 40 years of CO_2 gas injection and storage experience. During the last 40 years the U.S. gas and oil industry's (EOR) enhanced oil recovery operations) have injected more than 1 billion tonnes of CO_2.'' [81] [82]

In 2009, Mike Morris, then-CEO of American Electric Power (AEP), was interviewed by Reuters and the article noted that Morris's ''companies' work in West Virginia on [CCS] gave [Morris] more insight than skeptics who doubt the technology.'' In that interview, Morris explained, ''I'm convinced it will be primetime ready by 2015 and deployable.'' [83] In 2011, Alstom Power, the company that developed the 30 MW pilot project upon which Morris had based his conclusions, reiterated the claim that CCS would be commercially available in 2015. A press release from Alstom Power stated that, based on the results of Alstom's ''13 pilot and demonstration projects and validated by independent experts . . . we can now be confident that CCS works and is cost effective . . . and will be available at a commercial scale in 2015 and will allow [plants] to capture 90% of the emitted CO_2.'' The press release went on to note that ''the same conclusion applies for a gas plant using CCS.'' [84]

In 2011, however, AEP determined that the economic and regulatory environment at the time did not support further development of the technology. After canceling a large-scale commercial project, Morris explained, ''as a regulated utility, it is impossible to gain regulatory approval to cover our share of the costs for validating and deploying the technology without federal requirements to reduce greenhouse gas emissions already in place.'' [85]

Thirteen years later, the situation is fundamentally different. Since 2011, the technological advances from full-scale deployments (*e.g.,* the Petra Nova and Boundary Dam projects discussed later in this preamble) combined with supportive policies in multiple states and the financial incentives included in the IRA, mean that CCS can be deployed at scale today. In addition to applications at fossil fuel-fired EGUs, installation of CCS is poised to dramatically increase across a range of industries in the coming years, including ethanol production, natural gas processing, and steam methane reformers.[86] Many of the CCS projects across these industries, including capture systems, pipelines, and sequestration, are already in operation or are in advanced stages of deployment. There are currently at least 15 operating CCS projects in the U.S., and another 121 that are under

construction or in advanced stages of development.[87]

Process improvements learned from earlier deployments of CCS, the availability of better solvents, and other advances have decreased the costs of CCS in recent years. As a result, the cost of CO_2 capture, excluding any tax credits, from coal-fired power generation is projected to fall by 50 percent by 2025 compared to 2010.[88] The IRA makes additional and significant reductions in the cost of implementing CCS by extending and increasing the tax credit for CO_2 sequestration under IRC section 45Q.

With this combination of polices, and the advances related to CO_2 capture, multiple projects consistent with the emission reduction requirements of a 90 percent capture amine based BSER are in advanced stages of development. These projects use a wider range of technologies, and some of them are being developed as first-of-a-kind projects and offer significant advantages over the amine-based CCS technology that the EPA is finalizing as BSER.

For instance, in North Dakota, Governor Doug Burgum announced a goal of becoming carbon neutral by 2030 while retaining the core position of its fossil fuel industries, and to do so by significant CCS implementation. Gov. Burgum explained, ''This may seem like a moonshot goal, but it's actually not. It's actually completely doable, even with the technologies that we have today.'' [89] Companies in the state are backing up this claim with projects in multiple industries in various stages of operation and development. In the power sector, two of the biggest projects under development are Project Tundra and Coal Creek. Project Tundra is a carbon capture project on Minnkota Power's 705 MW Milton R Young Power Plant in Oliver County, North Dakota. Mitsubishi Heavy Industries will be providing an advanced version of its carbon capture equipment that builds upon the lessons learned from the Petra Nova project.[90] Rainbow Energy is developing the project at the Coal Creek Station, located in McLean, North Dakota. Notably, Rainbow Energy purchased the 1,150 MW Coal Creek Station with a business model of installing CCS based on the IRC section 45Q tax credit of $50/ton that existed at the time (the IRA has since increased the amount to $85/ton).[91] Rainbow Energy explains, ''CCUS technology has been proven and is an economical option for a facility like Coal Creek Station. We see CCUS as the best way to manage emissions at our facility.'' [92]

While North Dakota has encouraged CCS on coal-fired power plants without specific mandates, Wyoming is taking a different approach. Senate Bill 42, enacted in 2024, requires utilities to generate a specified percentage of their electricity using coal-fired power plants with CCS. SB 42 updates HB 200, enacted in 2020, which required the CCS to be installed by 2030, which SB 42 extends to 2033. To comply with those requirements, PacificCorp has stated in its 2023 IRP that it intends to install CCS on two coal-fired units by 2028.[93] Rocky Mountain Power has also announced that it will explore a new carbon capture technology at either its David Johnston plant or its Wyodak plant.[94] Another CCS project is also under development at the Dry Fork Power Plant in Wyoming. Currently, a pilot project that will capture 150 tons of CO_2 per day is under construction and is scheduled to be completed in late 2024. Work has also begun on a full-scale front end engineering design (FEED) study.

Like North Dakota, West Virginia does not have a carbon capture mandate, but there are several carbon capture projects under development in the state. One is a new, 2,000 MW natural gas combined cycle plant being developed by Competitive Power Ventures that will capture 90–95 percent of the CO_2 using GE turbine and carbon capture technology.[95] A second is an Omnis Fuel Technologies project to convert the coal-fired Pleasants Power Station to run on hydrogen.[96] Omnis intends to use a pyrolysis-based process to convert coal into hydrogen and graphite. Because the graphite is a usable, solid form of carbon, no CO_2 sequestration will be required. Therefore, unlike more traditional amine-based approaches, instead of the captured CO_2 being a cost, the graphite product will provide a revenue stream.[97] Omnis states that the Pleasants Power Project broke ground in August 2023 and will be online by 2025.

It should be noted that Wyoming, West Virginia, and North Dakota represented the first-, second-, and seventh-largest coal producers, respectively, in the U.S. in 2022.[98]

In addition to the coal-based CCS projects mentioned above, multiple other projects are in advanced stages of development and/or have completed FEED studies. For instance, Linde/BASF is installing a 10 MW pilot project on the Dallman Power Plant in Illinois. Based on results from small scale pilot studies, techno economic analysis indicates that the Linde/BASF process can provide a significant reduction in capital costs compared to the NETL base case for a supercritical pulverized coal plant with carbon capture.'' [99] Multiple other FEED studies are either completed or under development, putting those projects on a path to being able to be built and to commence operation well before January 1, 2032.

In addition to the Competitive Power Partners project, there are multiple post-combustion CCS retrofit projects in various stages of development. In particular, NET Power is in advanced stages of development on a 300 MW project in west Texas using the Allam-Fetvedt cycle, which is being designed to achieve greater than 97 percent CO_2 capture. In addition to working on this first project, NET Power has indicated that it has an additional project under development and is working with

suppliers to support additional future projects.[100]

In developing these final rules, the EPA reviewed the current state and cost of CCS technology for use with both steam generating units and stationary combustion turbines. This review is reflected in the respective BSER discussions later in this preamble and is further detailed in the accompanying RIA and final TSDs, *GHG Mitigation Measures for Steam Generating Units* and *GHG Mitigation Measures—Carbon Capture and Storage for Combustion Turbines.* These documents are included in the rulemaking docket.

2. Natural Gas Co-Firing

For a coal-fired steam generating unit, the substitution of natural gas for some of the coal so that the unit fires a combination of coal and natural gas is known as ''natural gas co-firing.'' Existing coal-fired steam generating units can be modified to co-fire natural gas in any desired proportion with coal. Generally, the modification of existing boilers to enable or increase natural gas firing involves the installation of new gas burners and related boiler modifications and may involve the construction of a natural gas supply pipeline if one does not already exist. In recent years, the cost of natural gas co-firing has declined because the expected difference between coal and gas prices has decreased and analysis supports lower capital costs for modifying existing boilers to co-fire with natural gas, as discussed in section VII.C.2.a of this preamble.

It is common practice for steam generating units to have the capability to burn multiple fuels onsite, and of the 565 coal-fired steam generating units operating at the end of 2021, 249 of them reported use of natural gas as a primary fuel or for startup.[101] Based on hourly reported CO_2 emission rates from the start of 2015 through the end of 2020, 29 coal-fired steam generating units co-fired with natural gas at rates at or above 60 percent of capacity on an hourly basis.[102] The capability of those units on an hourly basis is indicative of the extent of boiler burner modifications and sizing and capacity of natural gas pipelines to those units, and it implies that those units are technically capable of co-firing at least 60 percent natural gas on a heat input basis on average over the course of an extended period (*e.g.,* a year). Additionally, many coal-fired steam generating EGUs have also opted to switch entirely to providing generation from the firing of natural gas. Since 2011, more than 80 coal-fired utility boilers have been converted to natural gas-fired utility boilers.[103]

In developing these final actions, the EPA reviewed in detail the current state of natural gas co-firing technology and costs. This review is reflected in the BSER discussions later in this preamble and is further detailed in the accompanying RIA and final TSD, *GHG Mitigation Measures for Steam Generating Units.* Both documents are included in the rulemaking docket.

3. Efficient Generation

Highly efficient generation is the BSER technology upon which the first phase standards of performance are based for certain new and reconstructed stationary combustion turbine EGUs. This technology is available for both simple cycle and combined cycle combustion turbines and has been demonstrated—along with best operating and maintenance practices—to reduce emissions. Generally, as the thermal efficiency of a combustion turbine increases, less fuel is burned per gross MWh of electricity produced and there is a corresponding decrease in CO_2 and other air emissions.

For simple cycle turbines, manufacturers continue to improve the efficiency by increasing firing temperature, increasing pressure ratios, using intercooling on the air compressor, and adopting other measures. Best operating practices for simple cycle turbines include proper maintenance of the combustion turbine flow path components and the use of inlet air cooling to reduce efficiency losses during periods of high ambient temperatures. For combined cycle turbines, a highly efficient combustion turbine engine is matched with a high-efficiency HRSG. High efficiency also includes, but is not limited to, the use of the most efficient steam turbine and minimizing energy losses using insulation and blowdown heat recovery. Best operating and maintenance practices include, but are not limited to, minimizing steam leaks, minimizing air infiltration, and cleaning and maintaining heat transfer surfaces.

As discussed in section VIII.F.2.b of this preamble, efficient generation technologies have been in use at facilities in the power sector for decades and the levels of efficiency that the EPA is finalizing in this rule have been achieved by many recently constructed turbines. The efficiency improvements are incremental in nature and do not change how the combustion turbine is operated or maintained and present little incremental capital or compliance costs compared to other types of technologies that may be considered for new and reconstructed sources. In addition, more efficient designs have lower fuel costs, which offset at least a portion of the increase in capital costs. For additional discussion of this BSER technology, see the final TSD, *Efficient Generation in Combustion Turbines* in the docket for this rulemaking.

Efficiency improvements are also available for fossil fuel-fired steam generating units, and as discussed further in section VII.D.4.a, the more efficiently an EGU operates the less fuel it consumes, thereby emitting lower amounts of CO_2 and other air pollutants per MWh generated. Efficiency improvements for steam generating EGUs include a variety of technology upgrades and operating practices that may achieve CO_2 emission rate reductions of 0.1 to 5 percent for individual EGUs. These reductions are small relative to the reductions that are achievable from natural gas co-firing and from CCS. Also, as efficiency increases, some facilities could increase their utilization and therefore increase their CO_2 emissions (as well as emissions of other air pollutants). This phenomenon is known as the ''rebound effect.'' Because of this potential for perverse GHG emission outcomes resulting from deployment of efficiency measures at certain steam generating units, coupled with the relatively minor overall GHG emission reductions that would be expected, the EPA is not finalizing efficiency improvements as the BSER for any subcategory of existing coal-fired steam generating units. Specific details of efficiency measures are described in the final TSD, *GHG Mitigation Measures for Steam Generating Units,* and an updated 2023 Sargent and Lundy HRI report (*Heat Rate Improvement Method Costs and Limitations Memo*), available in the docket.

D. The Electric Power Sector: Trends and Current Structure

1. Overview

The electric power sector is experiencing a prolonged period of transition and structural change. Since the generation of electricity from coal-fired power plants peaked nearly two decades ago, the power sector has changed at a rapid pace. Today, natural gas-fired power plants provide the largest share of net generation, coal-fired power plants provide a significantly smaller share than in the recent past, renewable energy provides a steadily increasing share, and as new technologies enter the marketplace, power producers continue to replace aging assets—especially coal-fired power plants—with more efficient and lower-cost alternatives.

These developments have significant implications for the types of controls that the EPA determined to qualify as the BSER for different types of fossil fuel-fired EGUs. For example, power plant owners and operators retired an average annual coal-fired EGU capacity of 10 GW from 2015 to 2023, and coal-fired EGUs comprised 58 percent of all retired capacity in 2023.[104] While use of CCS promises significant emissions reduction from fossil fuel-fired sources, it requires substantial up-front capital expenditure. Therefore, it is not a feasible or cost-reasonable emission reduction technology for units that intend to cease operation before they would be able to amortize its costs. Industry stakeholders requested that the EPA structure these rules to avoid imposing costly control obligations on coal-fired power plants that have announced plans to voluntarily cease operations, and the EPA has determined the BSER in accordance with its understanding of which coal-fired units will be able to feasibly and cost-effectively deploy the BSER technologies. In addition, the EPA recognizes that utilities and power plant operators are building new natural gas-fired combustion turbines with plans to operate them at varying levels of utilization, in coordination with other existing and expected new energy sources. These patterns of operation are important for the type of controls that the EPA is finalizing as the BSER for these turbines.

2. Broad Trends Within the Power Sector

For more than a decade, the power sector has been experiencing substantial transition and structural change, both in terms of the mix of generating capacity and in the share of electricity generation supplied by different types of EGUs. These changes are the result of multiple factors, including normal replacements of older EGUs; technological improvements in electricity generation from both existing and new EGUs; changes in the prices and availability of different fuels; state and Federal policy; the preferences and purchasing behaviors of end-use electricity consumers; and substantial growth in electricity generation from renewable sources.

One of the most important developments of this transition has been the evolving economics of the power sector. Specifically, as discussed in section IV.D.3.b of this preamble and in the final TSD, *Power Sector Trends,* the existing fleet of coal-fired EGUs continues to age and become more costly to maintain and operate. At the same time, natural gas prices have held relatively low due to increased supply, and renewable costs have fallen rapidly with technological improvement and growing scale. Natural gas surpassed coal in monthly net electricity generation for the first time in April 2015, and since that time natural gas has maintained its position as the primary fuel for base load electricity generation, for peaking applications, and for balancing renewable generation.[105] In 2023, generation from natural gas was more than 2.5 times as much as generation from coal.[106] Additionally, there has been increased generation from investments in zero- and low-GHG emission energy technologies spurred by technological advancements, declining costs, state and Federal policies, and most recently, the IIJA and the IRA. For example, the IIJA provides investments and other policies to help commercialize, demonstrate, and deploy technologies such as small modular nuclear reactors, long-duration energy storage, regional clean hydrogen hubs, CCS and associated infrastructure, advanced geothermal systems, and advanced distributed energy resources (DER) as well as more traditional wind, solar, and battery energy storage resources. The IRA provides numerous tax and other incentives to directly spur deployment of clean energy technologies. Particularly relevant to these final actions, the incentives in the IRA,[107] [108] which are discussed in detail later in this section of the preamble, support the expansion of technologies, such as CCS, that reduce GHG emissions from fossil-fired EGUs.

The ongoing transition of the power sector is illustrated by a comparison of data between 2007 and 2022. In 2007, the year of peak coal generation, approximately 72 percent of the electricity provided to the U.S. grid was produced through the combustion of fossil fuels, primarily coal and natural gas, with coal accounting for the largest single share. By 2022, fossil fuel net generation was approximately 60 percent, less than the share in 2007 despite electricity demand remaining relatively flat over this same period. Moreover, the share of generation supplied by coal-fired EGUs fell from 49 percent in 2007 to 19 percent in 2022 while the share supplied by natural gas-fired EGUs rose from 22 to 39 percent during the same period. In absolute terms, coal-fired generation declined by 59 percent while natural gas-fired generation increased by 88 percent. This reflects both the increase in natural gas capacity as well as an increase in the utilization of new and existing natural gas-fired EGUs. The combination of wind and solar generation also grew from 1 percent of the electric power sector mix in 2007 to 15 percent in 2022.[109]

Additional analysis of the utility power sector, including projections of future power sector behavior and the impacts of these final rules, is discussed in more detail in section XII of this preamble, in the accompanying RIA, and in the final TSD, *Power Sector Trends.* The latter two documents are available in the rulemaking docket. Consistent with analyses done by other energy modelers, the information

[109] U.S. Energy Information Administration (EIA). *Annual Energy Review,* table 8.2b Electricity net generation: electric power sector. *https://www.eia.gov/totalenergy/data/annual/.*

provided in the RIA and TSD demonstrates that the sector trend of moving away from coal-fired generation is likely to continue, the share from natural gas-fired generation is projected to decline eventually, and the share of generation from non-emitting technologies is likely to continue increasing. For instance, according to the Energy Information Administration (EIA), the net change in solar capacity has been larger than the net change in capacity for any other source of electricity for every year since 2020. In 2024, EIA projects that the actual increase in generation from solar will exceed every other source of generating capacity. This is in part because of the large amounts of new solar coming online in 2024 but is also due to the large amount of energy storage coming online, which will help reduce renewable curtailments.[110] EIA also projects that in 2024, the U.S. will see its largest year for installation of both solar and battery storage. Specifically, EIA projects that 36.4 GW of solar will be added, nearly doubling last year's record of 18.4 GW. Similarly, EIA projects 14.3 GW of new energy storage. This would more than double last year's record installation of 6.4 GW and nearly double the existing total capacity of 15.5 GW. This compares to only 2.5 GW of new natural gas turbine capacity.[111] The only year since 2013 when renewable generation did not make up the majority of new generation capacity in the U.S. was 2018.[112]

3. Coal-Fired Generation: Historical Trends and Current Structure

a. Historical Trends in Coal-Fired Generation

Coal-fired steam generating units have historically been the nation's foremost source of electricity, but coal-fired generation has declined steadily since its peak approximately 20 years ago.[113] Construction of new coal-fired steam generating units was at its highest between 1967 and 1986, with approximately 188 GW (or 9.4 GW per year) of capacity added to the grid during that 20-year period.[114] The peak annual capacity addition was 14 GW, which was added in 1980. These coal-fired steam generating units operated as base load units for decades. However, beginning in 2005, the U.S. power sector—and especially the coal-fired fleet—began experiencing a period of transition that continues today. Many of the older coal-fired steam generating units built in the 1960s, 1970s, and 1980s have retired or have experienced significant reductions in net generation due to cost pressures and other factors. Some of these coal-fired steam generating units repowered with combustion turbines and natural gas.[115] With no new coal-fired steam generating units larger than 25 MW commencing construction in the past decade—and with the EPA unaware of any plans being approved to construct a new coal-fired EGU—much of the fleet that remains is aging, expensive to operate and maintain, and increasingly uncompetitive relative to other sources of generation in many parts of the country.

Since 2007, the power sector's total installed net summer capacity[116] has increased by 167 GW (17 percent) while coal-fired steam generating unit capacity has declined by 123 GW.[117] This reduction in coal-fired steam generating unit capacity was offset by a net increase in total installed wind capacity of 125 GW, net natural gas capacity of 110 GW, and a net increase in utility-scale solar capacity of 71 GW during the same period. Additionally, significant amounts (40 GW) of DER solar were also added. At least half of these changes were in the most recent 7 years of this period. From 2015 to 2022, coal capacity was reduced by 90 GW and this reduction in capacity was offset by a net increase of 69 GW of wind capacity, 63 GW of natural gas capacity, and 59 GW of utility-scale solar capacity. Additionally, a net summer capacity of 30 GW of DER solar were added from 2015 to 2022.

b. Current Structure of Coal-Fired Generation

Although much of the fleet of coal-fired steam generating units has historically operated as base load, there can be notable differences in design and operation across various facilities. For example, coal-fired steam generating units smaller than 100 MW comprise 18 percent of the total number of coal-fired units, but only 2 percent of total coal-fired capacity.[118] Moreover, average annual capacity factors for coal-fired steam generating units have declined from 74 to 50 percent since 2007.[119] These declining capacity factors indicate that a larger share of units are operating in non-base load fashion largely because they are no longer cost-competitive in many hours of the year.

Older power plants also tend to become uneconomic over time as they become more costly to maintain and operate,[120] especially when competing for dispatch against newer and more efficient generating technologies that have lower operating costs. The average coal-fired power plant that retired between 2015 and 2022 was more than 50 years old, and 65 percent of the remaining fleet of coal-fired steam generating units will be 50 years old or more within a decade.[121] To further illustrate this trend, the existing coal-fired steam generating units older than 40 years represent 71 percent (129 GW)[122] of the total remaining capacity. In fact, more than half (100 GW) of the coal-fired steam generating units still operating have already announced retirement dates prior to 2039 or conversion to gas-fired units by the

[121] eGRID 2020 (January 2022 release from EPA eGRID website). Represents data from generators that came online between 1950 and 2020 (inclusive); a 71-year period. Full eGRID data includes generators that came online as far back as 1915.

[122] U.S. Energy Information Administration (EIA). Electric Generators Inventory, Form–860M, Inventory of Operating Generators and Inventory of Retired Generators. August 2022. *https://www.eia.gov/electricity/data/eia860m/.*

same year.[123] As discussed later in this section, projections anticipate that this trend will continue.

The reduction in coal-fired generation by electric utilities is also evident in data for annual U.S. coal production, which reflects reductions in international demand as well. In 2008, annual coal production peaked at nearly 1,172 million short tons (MMst) followed by sharp declines in 2015 and 2020.[124] In 2015, less than 900 MMst were produced, and in 2020, the total dropped to 535 MMst, the lowest output since 1965. Following the pandemic, in 2022, annual coal production had increased to 594 MMst. For additional analysis of the coal-fired steam generation fleet, see the final TSD, *Power Sector Trends* included in the docket for this rulemaking.

Notwithstanding these trends, in 2022, coal-fired energy sources were still responsible for 50 percent of CO_2 emissions from the electric power sector.[125]

4. Natural Gas-Fired Generation: Historical Trends and Current Structure

a. Historical Trends in Natural Gas-Fired Generation

There has been significant expansion of the natural gas-fired EGU fleet since 2000, coinciding with efficiency improvements of combustion turbine technologies, increased availability of natural gas, increased demand for flexible generation to support the expanding capacity of variable energy resources, and declining costs for all three elements. According to data from EIA, annual capacity additions for natural gas-fired EGUs peaked between 2000 and 2006, with more than 212 GW added to the grid during this period (about 35 GW per year). Of this total, approximately 147 GW (70 percent) were combined cycle capacity and 65 GW were simple cycle capacity.[126] From 2007 to 2022, more than 132 GW of capacity were constructed and approximately 77 percent of that total were combined cycle EGUs. This figure represents an average of almost 8.8 GW of new combustion turbine generation capacity per year. In 2022, the net summer capacity of combustion turbine EGUs totaled 419 GW, with 289 GW being combined cycle generation and 130 GW being simple cycle generation.

This trend away from electricity generation using coal-fired EGUs to natural gas-fired turbine EGUs is also reflected in comparisons of annual capacity factors, sizes, and ages of affected EGUs. For example, the average annual capacity factors for natural gas-fired units increased from 28 to 38 percent between 2010 and 2022. And compared with the fleet of coal-fired steam generating units, the natural gas fleet is generally smaller and newer. While 67 percent of the coal-fired steam generating unit fleet capacity is over 500 MW per unit, 75 percent of the gas fleet is between 50 and 500 MW per unit. In terms of the age of the generating units, nearly 50 percent of the natural gas capacity has been in service less than 15 years.[127]

b. Current Structure of Natural Gas-Fired Generation

In the lower 48 states, most combustion turbine EGUs burn natural gas, and some have the capability to fire distillate oil as backup for periods when natural gas is not available, such as when residential demand for natural gas is high during the winter. Areas of the country without access to natural gas often use distillate oil or some other locally available fuel. Combustion turbines have the capability to burn either gaseous or liquid fossil fuels, including but not limited to kerosene, naphtha, synthetic gas, biogases, liquified natural gas (LNG), and hydrogen.

Over the past 20 years, advances in hydraulic fracturing (*i.e.,* fracking) and horizontal drilling techniques have opened new regions of the U.S. to gas exploration. As the production of natural gas has increased, the annual average price has declined during the same period, leading to more natural gas-fired combustion turbines.[128] Natural gas net generation increased 181 percent in the past two decades, from 601 thousand gigawatt-hours (GWh) in 2000 to 1,687 thousand GWh in 2022. For additional analysis of natural gas-fired generation, see the final TSD, *Power Sector Trends* included in the docket for this rulemaking.

E. The Legislative, Market, and State Law Context

1. Recent Legislation Impacting the Power Sector

On November 15, 2021, President Biden signed the IIJA [129] (also known as the Bipartisan Infrastructure Law), which allocated more than $65 billion in funding via grant programs, contracts, cooperative agreements, credit allocations, and other mechanisms to develop and upgrade infrastructure and expand access to clean energy technologies. Specific objectives of the legislation are to improve the nation's electricity transmission capacity, pipeline infrastructure, and increase the availability of low-GHG fuels. Some of the IIJA programs [130] that will impact the utility power sector include more than $20 billion to build and upgrade the nation's electric grid, up to $6 billion in financial support for existing nuclear reactors that are at risk of closing, and more than $700 million for upgrades to the existing hydroelectric fleet. The IIJA established the Carbon Dioxide Transportation Infrastructure Finance and Innovation Program to provide flexible Federal loans and grants for building CO_2 pipelines designed with excess capacity, enabling integrated carbon capture and geologic storage. The IIJA also allocated $21.5 billion to fund new programs to support the development, demonstration, and deployment of clean energy technologies, such as $8 billion for the development of regional clean hydrogen hubs and $7 billion for the development of carbon management technologies, including regional direct air capture hubs, carbon capture large-scale pilot projects for development of transformational technologies, and carbon capture commercial-scale demonstration projects to improve efficiency and effectiveness. Other clean energy technologies with IIJA and IRA funding include industrial demonstrations, geologic sequestration, grid-scale energy storage, and advanced nuclear reactors.

The IRA, which President Biden signed on August 16, 2022,[131] has the potential for even greater impacts on the electric power sector. Energy Security and Climate Change programs in the

[131] *https://www.congress.gov/bill/117th-congress/house-bill/5376/text.*

IRA covering grant funding and tax incentives provide significant investments in low and non GHG-emitting generation. For example, one of the conditions set by Congress for the expiration of the Clean Electricity Production Tax Credits of the IRA, found in section 13701, is a 75 percent reduction in GHG emissions from the power sector below 2022 levels. The IRA also contains the Low Emission Electricity Program (LEEP) with funding provided to the EPA with the objective to reduce GHG emissions from domestic electricity generation and use through promotion of incentives, tools to facilitate action, and use of CAA regulatory authority. In particular, CAA section 135, added by IRA section 60107, requires the EPA to conduct an assessment of the GHG emission reductions expected to occur from changes in domestic electricity generation and use through fiscal year 2031 and, further, provides the EPA $18 million ''to ensure that reductions in [GHG] emissions are achieved through use of the existing authorities of [the Clean Air Act], incorporating the assessment. . . .'' CAA section 135(a)(6).

The IRA's provisions also demonstrate an intent to support development and deployment of low-GHG emitting technologies in the power sector through a broad array of additional tax credits, loan guarantees, and public investment programs. Particularly relevant for these final actions, these provisions are aimed at reducing emissions of GHGs from new and existing generating assets, with tax credits for CCUS and clean hydrogen production, providing a pathway for the use of coal and natural gas as part of a low-GHG electricity grid.

To assist states and utilities in their decarbonizing efforts, and most germane to these final actions, the IRA increased the tax credit incentives for capturing and storing CO_2, including from industrial sources, coal-fired steam generating units, and natural gas-fired stationary combustion turbines. The increase in credit values, found in section 13104 (which revises IRC section 45Q), is 70 percent, equaling $85/metric ton for CO_2 captured and securely stored in geologic formations and $60/metric ton for CO_2 captured and utilized or securely stored incidentally in conjunction with EOR.[132] The CCUS incentives include 12 years of credits that can be claimed at the higher credit value beginning in 2023 for qualifying projects. These incentives will significantly cut costs and are expected to accelerate the adoption of CCS in the utility power and other industrial sectors. Specifically for the power sector, the IRA requires that a qualifying carbon capture facility have a CO_2 capture design capacity of not less than 75 percent of the baseline CO_2 production of the unit and that construction must begin before January 1, 2033. Tax credits under IRC section 45Q can be combined with some other tax credits, in some circumstances, and with state-level incentives, including California's low carbon fuel standard, which is a market-based program with fuel-specific carbon intensity benchmarks.[133] The magnitude of this incentive is driving investment and announcements, evidenced by the increased number of permit applications for geologic sequestration.[134]

The new provisions in section 13204 (IRC section 45V) codify production tax credits for 'clean hydrogen' as defined in the provision. The value of the credits earned by a project is tiered (four different tiers) and depends on the estimated GHG emissions of the hydrogen production process as defined in the statute. The credits range from $3/kg H_2 for less than 0.45 kilograms of CO_2-equivalent emitted per kilogram of low-GHG hydrogen produced (kg CO_2e/kg H_2) down to $0.6/kg H_2 for 2.5 to 4.0 kg CO_2e/kg H_2 (assuming wage and apprenticeship requirements are met). Projects with production related GHG emissions greater than 4.0 kg CO_2e/kg H_2 are not eligible. Future costs for clean hydrogen produced using renewable energy are anticipated to through 2030 due to these tax incentives and concurrent scaling up of manufacturing and deployment of clean hydrogen production facilities.

Both IRC section 45Q and IRC section 45V are eligible for additional provisions that increase the value and usability of the credits. Certain tax-exempt entities, such as electric co-operatives, may elect direct payment for the full 12- or 10-year lifetime of the credits to monetize the credits directly as cash refunds rather than through tax equity transactions. Tax-paying entities may elect to have direct payment of IRC section 45Q or 45V credits for 5 consecutive years. Tax-paying entities may also elect to transfer credits to unrelated taxpayers, enabling direct monetization of the credits again without relying on tax equity transactions.

In addition to provisions such as 45Q that allow for the use of fossil-generating assets in a low-GHG future, the IRA also includes significant incentives to deploy clean energy generation. For instance, the IRA provides an additional 10 percent in production tax credit (PTC) and investment tax credit (ITC) bonuses for clean energy projects located in energy communities with historic employment and tax bases related to fossil fuels.[135] The IRA's Energy Infrastructure Reinvestment Program also provides $250 billion for the DOE to finance loan guarantees that can be used to reduce both the cost of retiring existing fossil assets and of replacement generation for those assets, including updating operating energy infrastructure with emissions control technologies.[136] As a further example, the Empowering Rural America (New ERA) Program provides rural electric cooperatives with funds that can be used for a variety of purposes, including ''funding for renewable and zero emissions energy systems that eliminate aging, obsolete or expensive infrastructure'' or that allow rural cooperatives to ''change [their] purchased-power mixes to support cleaner portfolios, manage stranded assets and boost [the] transition to clean energy.'' [137] The $9.7 billion New ERA program represents the single largest investment in rural energy systems since the Rural Electrification Act of 1936.[138]

On September 12, 2023, the EPA released a report assessing the impact of the IRA on the power sector. Modeling results showed that economy-wide CO_2 emissions are lower under the IRA. The

results from the EPA's analysis of an array of multi-sector and electric sector modeling efforts show that a wide range of emissions reductions are possible. The IRA spurs CO_2 emissions reductions from the electric power sector of 49 to 83 percent below 2005 levels in 2030. This finding reflects diversity in how the models represent the IRA, the assumptions the models use, and fundamental differences in model structures.[139]

In determining the CAA section 111 emission limitations that are included in these final actions, the EPA did not consider many of the technologies that receive investment under recent Federal legislation. The EPA's determination of the BSER focused on ''measures that improve the pollution performance of individual sources,'' [140] not generation technologies that entities could employ as alternatives to fossil fuel-fired EGUs. However, these overarching incentives and policies are important context for this rulemaking and influence where control technologies can be feasibly and cost-reasonably deployed, as well as how owners and operators of EGUs may respond to the requirements of these final actions.

2. Commitments by Utilities To Reduce GHG Emissions

Integrated resource plans (IRPs) are filed by public utilities and demonstrate how utilities plan to meet future forecasted energy demand while ensuring reliable and cost-effective service. In developing these rules, the EPA reviewed filed IRPs of companies that have publicly committed to reducing their GHGs. These IRPs demonstrate a range of strategies that public utilities are planning to adopt to reduce their GHGs, independent of these final actions. These strategies include retiring aging coal-fired steam generating EGUs and replacing them with a combination of renewable resources, energy storage, other non-emitting technologies, and natural gas-fired combustion turbines, and reducing GHGs from their natural gas-fired assets through a combination of CCS and reduced utilization. To affirm these findings, according to EIA, as of 2022 there are no new coal-fired EGUs in development. This section highlights recent actions and announced plans of many utilities across the industry to reduce GHGs from their fleets. Indeed, 50 power producers that are members of the Edison Electric Institute (EEI) have announced CO_2 reduction goals, two-thirds of which include net-zero carbon emissions by 2050.[141] The members of the Energy Strategies Coalition, a group of companies that operate and manage electricity generation facilities, as well as electricity and natural gas transmission and distribution systems, likewise are focused on investments to reduce carbon dioxide emissions from the electricity sector.[142] This trend is not unique. Smaller utilities, rural electric cooperatives, and municipal entities are also contributing to these changes.

Many electric utilities have publicly announced near- and long-term emission reduction commitments independent of these final actions. The Smart Electric Power Alliance demonstrates that the geographic footprint of commitments for 100 percent renewable, net-zero, or other carbon emission reductions by 2050 made by utilities, their parent companies, or in response to a state clean energy requirement, covers portions of 47 states and includes 80 percent of U.S. customer accounts.[143] According to this same source, 341 utilities in 26 states have similar commitments by 2040. Additional detail about emission reduction commitments from major utilities is provided in section 2.2 of the RIA and in the final TSD, *Power Sector Trends.*

3. State Actions To Reduce Power Sector GHG Emissions

States across the country have taken the lead in efforts to reduce GHG emissions from the power sector. As of mid-2023, 25 states had made commitments to reduce economy-wide GHG emissions consistent with the goals of the Paris Agreement, including reducing GHG emissions by 50 to 52 percent by 2030.[144] [145] [146] These actions include legislation to decarbonize state power systems as well as commitments that require utilities to expand renewable and clean energy production through the adoption of renewable portfolio standards (RPS) and clean energy standards (CES).

Several states have enacted binding economy-wide emission reduction targets that will require significant decarbonization from state power sectors, including California, Colorado, Maine, Maryland, Massachusetts, New Jersey, New York, Rhode Island, Vermont, and Washington.[147] These commitments are statutory emission reduction targets accompanied by mandatory agency directives to develop comprehensive implementing regulations to achieve the necessary reductions. Some of these states, along with other neighboring states, also participate in the Regional Greenhouse Gas Initiative (RGGI), a carbon market limiting pollution from power plants throughout New England.[148] The pollution limit combined with carbon price and allowance market has led member states to reduce power sector CO_2 emissions by nearly 50 percent since the start of the program in 2009. This is 10 percent more than all non-RGGI states.[149]

Other states dependent on coal-fired power generation or coal production also have significant, albeit non-

binding, commitments that signal broad public support for policy with emissions-based metrics and public affirmation that climate change is fundamentally linked to fossil-intensive energy sources. These states include Illinois, Michigan, Minnesota, New Mexico, North Carolina, Pennsylvania, and Virginia. States like Wyoming, the top coal producing state in the U.S., have promulgated sector-specific regulations requiring their public service commissions to implement low-carbon energy standards for public utilities.[150] [151] Specific standards are further detailed in the sections that follow and in the final TSD, *Power Sector Trends.*

Technologies like CCS provide a means to achieve significant emission reduction targets. For example, to achieve GHG emission reduction goals legislatively enacted in 2016, California Senate Bill 100, passed in 2018, requires the state to procure 60 percent of all electricity from renewable sources by 2030 and plan for 100 percent from carbon-free sources by 2045.[152] Achieving California's established goal of carbon-free electricity by 2045 requires emissions to be balanced by carbon sequestration, capture, or other technologies. Therefore, California Senate Bill 905, passed in 2022, requires the California Air Resources Board (CARB) to establish programs for permitting CCS projects while preventing the use of captured CO_2 for EOR within the state.[153] As mentioned previously, as the top coal producing state, Wyoming has been exceptionally persistent on the implementation of CCS by incentivizing the national testing of CCS at Basin Electric's coal-fired Dry Fork Station[154] and by requiring the consideration of CCS as an alternative to coal plant retirement.[155] At least five other states, including Montana and North Dakota, also have tax incentives and regulations for CCS.[156] In the case of Montana, the acquisition of an equity interest or lease of coal-fired EGUs is prohibited unless it captures and stores at least 50 percent of its CO_2 emissions.[157] These state policies have coincided with the planning and development of large CCS projects.

Other states have broad decarbonization laws that will drive significant decrease in power sector GHG emissions. In New York, The Climate Leadership and Community Protection Act, passed in 2019, sets several climate targets. The most important goals include an 85 percent reduction in GHG emissions by 2050, 100 percent zero-emission electricity by 2040, and 70 percent renewable energy by 2030. Other targets include 9,000 MW of offshore wind by 2035, 3,000 MW of energy storage by 2030, and 6,000 MW of solar by 2025.[158] Washington State's Climate Commitment Act sets a target of reducing GHG emissions by 95 percent by 2050. The state is required to reduce emissions to 1990 levels by 2020, 45 percent below 1990 levels by 2030, 70 percent below 1990 levels by 2040, and 95 percent below 1990 levels by 2050. This also includes achieving net-zero emissions by 2050.[159] Illinois' Climate and Equitable Jobs Act, enacted in September 2021, requires all private coal-fired or oil-fired power plants to reach zero carbon emissions by 2030, municipal coal-fired plants to reach zero carbon emissions by 2045, and natural gas-fired plants to reach zero carbon emissions by 2045.[160] In October 2021, North Carolina passed House Bill 951 that required the North Carolina Utilities Commission to ''take all reasonable steps to achieve a seventy percent (70 percent) reduction in emissions of carbon dioxide (CO_2) emitted in the state from electric generating facilities owned or operated by electric public utilities from 2005 levels by the year 2030 and carbon neutrality by the year 2050.'' [161]

The ambition and scope of these state power sector polices will impact the electric generation fleet for decades. Seven states with 100-percent power sector decarbonization polices include a total of 20 coal-fired EGUs with slightly less than 10 GW total capacity and without announced retirement dates before 2039.[162] Virginia, which has three coal-steam units with no announced retirement dates and one with a 2045 retirement date, enacted the Clean Economy Act in 2020 to impose a 100 percent RPS requirement by 2050. The combined capacity of all four of these units in Virginia totals nearly 1.5 GW. North Carolina, which has one coal-fired unit without an announced retirement date and one with a planned 2048 retirement, as previously mentioned, enacted a state law in 2021 requiring the state's utilities commission to achieve carbon neutrality by 2050. The combined capacity of both units totals approximately 1.4 GW of capacity. Nebraska, where three public utility boards serving a large portion of the state have adopted net-zero electricity emission goals by 2040 or 2050, includes six coal-fired units with a combined capacity of 2.9 GW. The remaining eight units are in states with long-term decarbonization goals (Illinois, Louisiana, Maryland, and Wisconsin). All four of these states have set 100 percent clean energy goals by 2050.

Twenty-nine states and the District of Columbia have enforceable RPS [163] that require a percentage of electricity that utilities sell to come from eligible renewable sources like wind and solar rather than from fossil fuel-based sources like coal and natural gas. Furthermore, 20 states have adopted a CES that includes some form of clean

[162] These estimates are based on an analysis of the EPA's NEEDS database, which contains information about EGUs across the country. The analysis includes a basic screen for units within the NEEDS database that are likely subject to the final 111(d) EGU rule, namely coal-steam units with capacity greater than 25 MW, and then removes units with an announced retirement dates prior to 2039, units with announced plans to convert from coal- to gas-fired units, and units likely to fall outside of the rule's applicability via the cogeneration exemption.

[163] DSIRE, Renewable Portfolio Standards and Clean Energy Standards (2023). *https://ncsolarcen-prod.s3.amazonaws.com/wp-content/uploads/2023/12/RPS-CES-Dec2023-1.pdf;* LBNL, *U.S. State Renewables Portfolio & Clean Electricity Standards: 2023 Status Update. https://emp.lbl.gov/publications/us-state-renewables-portfolio-clean.*

energy requirement or goal with a 100 percent or net-zero target.[164] A CES shifts generating fleets away from fossil fuel resources by requiring a percentage of retail electricity to come from sources that are defined as clean. Unlike an RPS, which defines eligible generation in terms of the renewable attributes of its energy source, CES eligibility is based on the GHG emission attributes of the generation itself, typically with a zero or net-zero carbon emissions requirement. Additional discussion of state actions and legislation to reduce GHG emissions from the power sector is provided in the final TSD, *Power Sector Trends.*

F. Future Projections of Power Sector Trends

Projections for the U.S. power sector—based on the landscape of market forces in addition to the known actions of Congress, utilities, and states—have indicated that the ongoing transition will continue for specific fuel types and EGUs. The EPA's Power Sector Platform 2023 using IPM reference case (*i.e.,* the EPA's projections of the power sector, which includes representation of the IRA absent further regulation), provides projections out to 2050 on future outcomes of the electric power sector. For more information on the details of this modeling, see the model documentation.[165]

Since the passage of the IRA in August 2022, the EPA has engaged with many external partners, including other governmental entities, academia, non-governmental organizations (NGOs), and industry, to understand the impacts that the IRA will have on power sector GHG emissions. In addition to engaging in several workgroups, the EPA has contributed to two separate journal articles that include multi-model comparisons of IRA impacts across several state-of-the-art models of the U.S. energy system and electricity sector [166] [167] and participated in public events exploring modeling assumptions for the IRA.[168] The EPA plans to continue collaborating with stakeholders, conducting external engagements, and using information gathered to refine modeling of the IRA.

While much of the discussion below focuses on the EPA's Power Sector Platform 2023 using IPM reference case, many other analyses show similar trends,[169] and these trends are consistent with utility IRPs and public GHG reduction commitments, as well as state actions, both of which were described in the previous sections.

1. Future Projections for Coal-Fired Generation

As described in the EPA's baseline modeling, coal-fired steam generating unit capacity is projected to fall from 181 GW in 2023 [170] to 52 GW in 2035, of which 11 GW includes retrofit CCS. Generation from coal-fired steam generating units is projected to also fall from 898 thousand GWh in 2021 [171] to 236 thousand GWh by 2035. This change in generation reflects the anticipated continued decline in projected coal-fired steam generating unit capacity as well as a steady decline in annual operation of those EGUs that remain online, with capacity factors falling from approximately 48 percent in 2022 to 45 percent in 2035 at facilities that do not install CCS. By 2050, coal-fired steam generating unit capacity is projected to diminish further, with only 28 GW, or less than 16 percent of 2023 capacity (and approximately 9 percent of the 2010 capacity), still in operation across the continental U.S.

These projections are driven by the eroding economic opportunities for coal-fired steam generating units to operate, the continued aging of the fleet of coal-fired steam generating units, and the continued availability and expansion of low-cost alternatives, like natural gas, renewable technologies, and energy storage. The projected retirements continue the trend of coal plant retirements in recent decades that is described in section IV.D.3. of this preamble (and further in the *Power Sector Trends* technical support document). The decline in coal generation capacity has generally resulted from a more competitive economic environment and increasing coal plant age. Most notably, declines in natural gas prices associated with the rise of hydraulic fracturing and horizontal drilling lowered the cost of natural gas-fired generation.[172] Lower gas generation costs reduced coal plant capacity factors and revenues. Rapid declines in the costs of renewables and battery storage have put further price pressure on coal plants, given the zero marginal cost operation of solar and wind.[173] [174] [175] In addition, most operational coal plants today were built before 2000, and many are reaching or have surpassed their expected useful lives.[176] Retiring coal plants tend to be

---

[164] This count is adapted from Lawrence Berkeley National Laboratory's (LBNL) *U.S. State Renewables Portfolio & Clean Electricity Standards: 2023 Status Update,* which identifies 15 states with 100 percent CES. The LBNL count includes Virginia, which the EPA omits because it considers Virginia a 100 percent RPS. Further, the LBNL count excludes Louisiana, Michigan, New Jersey, and Wisconsin because their clean energy goals are set by executive order. The EPA instead includes Louisiana, New Jersey, and Wisconsin but characterizes them as goals rather than requirements. Michigan, which enacted a CES by statute after the LBNL report's publication, is also included in the EPA count. Finally, the EPA count includes Maryland, whose December 2023 *Climate Pollution Reduction Plan* sets a goal of 100 percent clean energy by 2035, and Delaware, which enacted a statutory goal to reach net-zero GHG emissions by 2050. See LBNL, *U.S. State Renewables Portfolio & Clean Electricity Standards: 2023 Status Update, https://emp.lbl.gov/publications/us-state-renewables-portfolio-clean*; *Maryland's Climate Pollution Reduction Plan, https://mde.maryland.gov/programs/air/ClimateChange/Maryland%20Climate%20Reduction%20Plan/Maryland%27s%20Climate%20Pollution%20Reduction%20Plan%20-%20Final%20-%20Dec%2028%202023.pdf*; and *HB 99, An Act to Amend Titles 7 and 29 of the Delaware Code Relating to Climate Change, https://legis.delaware.gov/json/BillDetail/GenerateHtmlDocumentEngrossment?engrossmentId=25785&docTypeId=6.*

old.[177] As plants age, their efficiency tends to decline and operations and maintenance costs increase. Older coal plant operational parameters are less aligned with current electric grid needs. Coal plants historically were used as base load power sources and can be slow (or expensive) to increase or decrease generation output throughout a typical day. That has put greater economic pressure on older coal plants, which are forced to either incur the costs of adjusting their generation or operate during less profitable hours when loads are lower or renewable generation is more plentiful.[178] All of these factors have contributed to retirements over the past 15 years, and similar underlying factors are projected to continue the trend of coal retirements in the coming years.

In 2020, there was a total of 1,439 million metric tons of CO_2 emissions from the power sector with coal-fired sources contributing to more than half of those emissions. In the EPA's Power Sector Platform 2023 using IPM reference case, power sector related CO_2 emission are projected to fall to 724 million metric tons by 2035, of which 23 percent is projected to come from coal-fired sources in 2035.

2. Future Projections for Natural Gas-Fired Generation

As described in the EPA's Power Sector Platform 2023 using IPM reference case, natural gas-fired capacity is expected to continue to build out during the next decade with 34 GW of new capacity projected to come online by 2035 and 261 GW of new capacity by 2050. By 2035, the new natural gas capacity is comprised of 14 GW of simple cycle turbines and 20 GW of combined cycle turbines. By 2050, most of the incremental new capacity is projected to come just from simple cycle turbines. This also represents a higher rate of new simple cycle turbine builds compared to the reference periods (*i.e.,* 2000–2006 and 2007–2021) discussed previously in this section.

It should be noted that despite this increase in capacity, both overall generation and emissions from the natural gas-fired capacity are projected to decline. Generation from natural gas units is projected to fall from 1,579 thousand GWh in 2021[179] to 1,344 thousand GWh by 2035. Power sector related CO_2 emissions from natural gas-fired EGUs were 615 million metric tons in 2021.[180] By 2035, emission levels are projected to reach 521 million metric tons, 96 percent of which comes from NGCC sources.

The decline in generation and emissions is driven by a projected decline in NGCC capacity factors. In model projections, NGCC units have a capacity factor early in the projection period of 59 percent, but by 2035, capacity factor projections fall to 48 percent as many of these units switch from base load operation to more intermediate load operation to support the integration of variable renewable energy resources. Natural gas-fired simple cycle turbine capacity factors also fall, although since they are used primarily as a peaking resource and their capacity factors are already below 10 percent annually, their impact on generation and emissions changes are less notable.

Some of the reasons for this anticipated continued growth in natural gas-fired capacity, coupled with a decline in generation and emissions, include the anticipated growth in peak load, retirement of older fossil generators, and growth in renewable energy coupled with the greater flexibility offered by combustion turbines. Simple cycle turbines operate at lower efficiencies than NGCC units but offer fast startup times to meet peaking load demands. In addition, combustion turbines, along with energy storage technologies and demand response strategies, support the expansion of renewable electricity by meeting demand during peak periods and providing flexibility around the variability of renewable generation and electricity demand. In the longer term, as renewables and battery storage grow, they are anticipated to outcompete the need for some natural gas-fired generation and the overall utilization of natural gas-fired capacity is expected to decline. For additional discussion and analysis of projections of future coal- and natural gas-fired generation, see the final TSD, *Power Sector Trends* in the docket for this rulemaking.

As explained in greater detail later in this preamble and in the accompanying RIA, future generation projections for natural gas-fired combustion turbines differ from those highlighted in recent historical trends. The largest source of new generation is from renewable energy, and projections show that total natural gas-fired combined cycle capacity is likely to decline after 2030 in response to increased generation from renewables, deployment of energy storage, and other technologies. Approximately 95 percent of capacity additions in 2024 are expected to be from non-emitting generation resources including solar, battery storage, wind, and nuclear.[181] The IRA is likely to influence this trend, which is also expected to impact the operation of certain combustion turbines. For example, as the electric output from additional variable renewable generating sources fluctuates daily and seasonally, flexible low and intermediate load combustion turbines will be needed to support these variable sources and provide reliability to the grid. This requires the ability to start and stop quickly and change load more frequently. Today's system includes 212 GW of intermediate and low load combustion turbines. These operational changes, alongside other tools like demand response, energy storage, and expanded transmission, will maintain reliability of the grid.

V. Statutory Background and Regulatory History for CAA Section 111

A. Statutory Authority To Regulate GHGs From EGUs Under CAA Section 111

The EPA's authority for and obligation to issue these final rules is CAA section 111, which establishes mechanisms for controlling emissions of air pollutants from new and existing stationary sources. CAA section 111(b)(1)(A) requires the EPA Administrator to promulgate a list of categories of stationary sources that the Administrator, in his or her judgment, finds ''causes, or contributes significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare.'' The EPA has the authority to define the scope of the source categories, determine the pollutants for which standards should be developed, and distinguish among classes, types, and sizes within categories in establishing the standards.

1. Regulation of Emissions From New Sources

Once the EPA lists a source category, the EPA must, under CAA section 111(b)(1)(B), establish ''standards of performance'' for ''new sources'' in the source category. These standards are referred to as new source performance standards, or NSPS. The NSPS are national requirements that apply directly to the sources subject to them.

Under CAA section 111(a)(1), a ''standard of performance'' is defined, in the singular, as ''a standard for emissions of air pollutants'' that is determined in a specified manner, as noted in this section, below.

Under CAA section 111(a)(2), a ''new source'' is defined, in the singular, as ''any stationary source, the construction or modification of which is commenced after the publication of regulations (or, if earlier, proposed regulations) prescribing a standard of performance under this section, which will be applicable to such source.'' Under CAA section 111(a)(3), a ''stationary source'' is defined as ''any building, structure, facility, or installation which emits or may emit any air pollutant.'' Under CAA section 111(a)(4), ''modification'' means any physical change in, or change in the method of operation of, a stationary source which increases the amount of any air pollutant emitted by such source or which results in the emission of any air pollutant not previously emitted. While this provision treats modified sources as new sources, EPA regulations also treat a source that undergoes ''reconstruction'' as a new source. Under the provisions in 40 CFR 60.15, ''reconstruction'' means the replacement of components of an existing facility such that: (1) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable entirely new facility; and (2) it is technologically and economically feasible to meet the applicable standards. Pursuant to CAA section 111(b)(1)(B), the standards of performance or revisions thereof shall become effective upon promulgation.

In setting or revising a performance standard, CAA section 111(a)(1) provides that performance standards are to reflect ''the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any non-air quality health and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated.'' The term ''standard of performance'' in CAA 111(a)(1) makes clear that the EPA is to determine both the ''best system of emission reduction . . . adequately demonstrated'' (BSER) for the regulated sources in the source category and the ''degree of emission limitation achievable through the application of the [BSER].'' *West Virginia* v. *EPA,* 597 U.S. 697, 709 (2022). To determine the BSER, the EPA first identifies the ''system[s] of emission reduction'' that are ''adequately demonstrated,'' and then determines the ''best'' of those systems, ''taking into account'' factors including ''cost,'' ''nonair quality health and environmental impact,'' and ''energy requirements.'' The EPA then derives from that system an ''achievable'' ''degree of emission limitation.'' The EPA must then, under CAA section 111(b)(1)(B), promulgate ''standard[s] for emissions''—the NSPS—that reflect that level of stringency.

2. Regulation of Emissions From Existing Sources

When the EPA establishes a standard for emissions of an air pollutant from new sources within a category, it must also, under CAA section 111(d), regulate emissions of that pollutant from *existing* sources within the same category, unless the pollutant is regulated under the National Ambient Air Quality Standards (NAAQS) program, under CAA sections 108–110, or the National Emission Standards for Hazardous Air Pollutants (NESHAP) program, under CAA section 112. See CAA section 111(d)(1)(A)(i) and (ii); *West Virginia,* 597 U.S. at 710.

CAA section 111(d) establishes a framework of ''cooperative federalism for the regulation of existing sources.'' *American Lung Ass'n,* 985 F.3d at 931. CAA sections 111(d)(1)(A)–(B) require ''[t]he Administrator . . . to prescribe regulations'' that require ''[e]ach state . . . to submit to [EPA] a plan . . . which establishes standards of performance for any existing stationary source for'' the air pollutant at issue, and which ''provides for the implementation and enforcement of such standards of performance.'' CAA section 111(a)(6) defines an ''existing source'' as ''any stationary source other than a new source.''

To meet these requirements, the EPA promulgates ''emission guidelines'' that identify the BSER and the degree of emission limitation achievable through the application of the BSER. Each state must then establish standards of performance for its sources that reflect that level of stringency. However, the states need not compel regulated sources to adopt the particular components of the BSER itself. The EPA's emission guidelines must also permit a state, ''in applying a standard of performance to any particular source,'' to ''take into consideration, among other factors, the remaining useful life of the existing source to which such standard applies.'' 42 U.S.C. 7411(d)(1). Once a state receives the EPA's approval of its plan, the provisions in the plan become federally enforceable against the source, in the same manner as the provisions of an approved State Implementation Plan (SIP) under the Act. CAA section 111(d)(2)(B). If a state elects not to submit a plan or submits a plan that the EPA does not find ''satisfactory,'' the EPA must promulgate a plan that establishes Federal standards of performance for the state's existing sources. CAA section 111(d)(2)(A).

3. EPA Review of Requirements

CAA section 111(b)(1)(B) requires the EPA to ''at least every 8 years, review and, if appropriate, revise'' new source performance standards. However, the Administrator need not review any such standard if the ''Administrator determines that such review is not appropriate in light of readily available information on the efficacy'' of the standard. *Id.* When conducting a review of an NSPS, the EPA has the discretion and authority to add emission limits for pollutants or emission sources not currently regulated for that source category. CAA section 111 does not by its terms require the EPA to review emission guidelines for existing sources, but the EPA retains the authority to do so. See 81 FR 59277 (August 29, 2016) (explaining legal authority to review emission guidelines for municipal solid waste landfills).

B. History of EPA Regulation of Greenhouse Gases From Electricity Generating Units Under CAA Section 111 and Caselaw

The EPA has listed more than 60 stationary source categories under CAA section 111(b)(1)(A). See 40 CFR part 60, subparts Cb–OOOO. In 1971, the EPA listed fossil fuel-fired EGUs (which includes natural gas, petroleum, and coal) that use steam-generating boilers in a category under CAA section 111(b)(1)(A). See 36 FR 5931 (March 31, 1971) (listing ''fossil fuel-fired steam generators of more than 250 million Btu per hour heat input''). In 1977, the EPA listed fossil fuel-fired combustion turbines, which can be used in EGUs, in a category under CAA section 111(b)(1)(A). See 42 FR 53657 (October 3, 1977) (listing ''stationary gas turbines'').

Beginning in 2007, several decisions by the U.S. Supreme Court and the D.C. Circuit have made clear that under CAA section 111, the EPA has authority to regulate GHG emissions from listed source categories. The U.S. Supreme Court ruled in *Massachusetts* v. *EPA* that GHGs [182] meet the definition of ''air pollutant'' in the CAA,[183] and subsequently premised its decision in *AEP* v. *Connecticut* [184]—that the CAA displaced any Federal common law right to compel reductions in CO_2 emissions from fossil fuel-fired power plants—on its view that CAA section 111 applies to GHG emissions. The D.C. Circuit confirmed in *American Lung Ass'n* v. *EPA,* 985 F.3d 914, 977 (D.C. Cir. 2021), discussed in section V.B.5, that the EPA is authorized to promulgate requirements under CAA section 111 for GHG from the fossil fuel-fired EGU source category notwithstanding that the source category is regulated under CAA section 112. As discussed in section V.B.6, the U.S. Supreme Court did not accept certiorari on the question whether the EPA could regulate GHGs from fossil-fuel fired EGUs under CAA section 111(d) when other pollutants from fossil-fuel fired EGUs are regulated under CAA section 112 in *West Virginia* v. *EPA,* 597 U.S. 697 (2022), and so the D.C. Circuit's holding on this issue remains good law.

In 2015, the EPA promulgated two rules that addressed CO_2 emissions from fossil fuel-fired EGUs. The first promulgated standards of performance for new fossil fuel-fired EGUs. ''Standards of Performance for Greenhouse Gas Emissions From New, Modified, and Reconstructed Stationary Sources: Electric Utility Generating Units; Final Rule,'' (80 FR 64510; October 23, 2015) (2015 NSPS). The second promulgated emission guidelines for existing sources. ''Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units; Final Rule,'' (80 FR 64662; October 23, 2015) (Clean Power Plan, or CPP).

1. 2015 NSPS

In 2015, the EPA promulgated an NSPS to limit emissions of GHGs, manifested as CO_2, from newly constructed, modified, and reconstructed fossil fuel-fired electric utility steam generating units, *i.e.,* utility boilers and IGCC EGUs, and newly constructed and reconstructed stationary combustion turbine EGUs. These final standards are codified in 40 CFR part 60, subpart TTTT. In promulgating the NSPS for newly constructed fossil fuel-fired steam generating units, the EPA determined the BSER to be a new, highly efficient, supercritical pulverized coal (SCPC) EGU that implements post-combustion partial CCS technology. The EPA concluded that CCS was adequately demonstrated (including being technically feasible) and widely available and could be implemented at reasonable cost. The EPA identified natural gas co-firing and IGCC technology (either with natural gas co-firing or implementing partial CCS) as alternative methods of compliance.

The 2015 NSPS included standards of performance for steam generating units that undergo a ''reconstruction'' as well as units that implement ''large modifications,'' *(i.e.,* modifications resulting in an increase in hourly CO_2 emissions of more than 10 percent). The 2015 NSPS did not establish standards of performance for steam generating units that undertake ''small modifications'' (*i.e.,* modifications resulting in an increase in hourly CO_2 emissions of less than or equal to 10 percent), due to the limited information available to inform the analysis of a BSER and corresponding standard of performance.

The 2015 NSPS also finalized standards of performance for newly constructed and reconstructed stationary combustion turbine EGUs. For newly constructed and reconstructed base load natural gas-fired stationary combustion turbines, the EPA finalized a standard based on efficient NGCC technology as the BSER. For newly constructed and reconstructed non-base load natural gas-fired stationary combustion turbines and for both base load and non-base load multi-fuel-fired stationary combustion turbines, the EPA finalized a heat input-based standard based on the use of lower-emitting fuels (referred to as clean fuels in the 2015 NSPS). The EPA did not promulgate final standards of performance for modified stationary combustion turbines due to lack of information. The 2015 NSPS remains in effect today.

The EPA received six petitions for reconsideration of the 2015 NSPS. On May 6, 2016 (81 FR 27442), the EPA denied five of the petitions on the basis that they did not satisfy the statutory conditions for reconsideration under CAA section 307(d)(7)(B) and deferred action on one petition that raised the issue of the treatment of biomass. Apart from these petitions, the EPA proposed to revise the 2015 NSPS in 2018, as discussed in section V.B.2.

Multiple parties also filed petitions for judicial review of the 2015 NSPS in the D.C. Circuit. These cases have been briefed and, on the EPA's motion, are being held in abeyance pending EPA action concerning the 2018 proposal to revise the 2015 NSPS.

In the 2015 NSPS, the EPA noted that it was authorized to regulate GHGs from the fossil fuel-fired EGU source categories because it had listed those source categories under CAA section 111(b)(1)(A). The EPA added that CAA section 111 did not require it to make a determination that GHGs from EGUs contribute significantly to dangerous air pollution (a pollutant-specific significant contribution finding), but in the alternative, the EPA did make that finding. It explained that ''[greenhouse gas] air pollution may reasonably be anticipated to endanger public health or welfare,'' 80 FR 64530 (October 23, 2015) and emphasized that power plants are ''by far the largest emitters'' of greenhouse gases among stationary sources in the U.S. *Id.* at 64522. In *American Lung Ass'n* v. *EPA,* 985 F.3d 977 (D.C. Cir. 2021), the court held that even if the EPA were required to determine that CO_2 from fossil fuel-fired EGUs contributes significantly to dangerous air pollution—and the court emphasized that it was not deciding that the EPA was required to make such a pollutant-specific determination—the determination in the alternative that the EPA made in the 2015 NSPS was not arbitrary and capricious and, accordingly, the EPA had a sufficient basis to regulate greenhouse gases from EGUs under CAA section 111(d) in the ACE Rule. This aspect of the decision remains good law. The EPA is not reopening and did not solicit comment on any of those determinations in the 2015 NSPS concerning its rational basis to regulate GHG emissions from EGUs or its alternative finding that GHG emissions from EGUs contribute significantly to dangerous air pollution.

2. 2018 NSPS Proposal To Revise the 2015 NSPS

In 2018, the EPA proposed to revise the NSPS for new, modified, and reconstructed fossil fuel-fired steam generating units and IGCC units, in the *Review of Standards of Performance for Greenhouse Gas Emissions From New, Modified, and Reconstructed Stationary Sources: Electric Utility Generating Units; Proposed Rule* (83 FR 65424;

[182] The EPA's 2009 endangerment finding defines the air pollution which may endanger public health and welfare as the well-mixed aggregate group of the following gases: CO_2, methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs).

[183] 549 U.S. 497, 520 (2007).

[184] 131 S. Ct. 2527, 2537–38 (2011).

December 20, 2018) (2018 NSPS Proposal). The EPA proposed to revise the NSPS for newly constructed units, based on a revised BSER of a highly efficient SCPC, without partial CCS. The EPA also proposed to revise the NSPS for modified and reconstructed units. As discussed in IX.A, in the present action, the EPA is withdrawing this proposed rule.[185]

3. Clean Power Plan

With the promulgation of the 2015 NSPS, the EPA also incurred a statutory obligation under CAA section 111(d) to issue emission guidelines for GHG emissions from existing fossil fuel-fired steam generating EGUs and stationary combustion turbine EGUs, which the EPA initially fulfilled with the promulgation of the CPP. See 80 FR 64662 (October 23, 2015). The EPA first determined that the BSER included three types of measures: (1) improving heat rate (*i.e.,* the amount of fuel that must be burned to generate a unit of electricity) at coal-fired steam plants; (2) substituting increased generation from lower-emitting NGCC plants for generation from higher-emitting steam plants (which are primarily coal-fired); and (3) substituting increased generation from new renewable energy sources for generation from fossil fuel-fired steam plants and combustion turbines. See 80 FR 64667 (October 23, 2015). The latter two measures are known as ''generation shifting'' because they involve shifting electricity generation from higher-emitting sources to lower-emitting ones. See 80 FR 64728–29 (October 23, 2015).

The EPA based this BSER determination on a technical record that evaluated generation shifting, including its cost-effectiveness, against the relevant statutory criteria for BSER and on a legal interpretation that the term ''system'' in CAA section 111(a)(1) is sufficiently broad to encompass shifting of generation from higher-emitting to lower-emitting sources. See 80 FR 64720 (October 23, 2015). The EPA then determined the ''degree of emission limitation achievable through the application of the [BSER],'' CAA section 111(a)(1), expressed as emission performance rates. See 80 FR 64667 (October 23, 2015). The EPA explained that a state would ''have to ensure, through its plan, that the emission standards it establishes for its sources individually, in the aggregate, or in combination with other measures undertaken by the state, represent the equivalent of'' those performance rates (80 FR 64667; October 23, 2015). Neither states nor sources were required to apply the specific measures identified in the BSER (80 FR 64667; October 23, 2015), and states could include trading or averaging programs in their state plans for compliance. See 80 FR 64840 (October 23, 2015).

Numerous states and private parties petitioned for review of the CPP before the D.C. Circuit. On February 9, 2016, the U.S. Supreme Court stayed the rule pending review, *West Virginia* v. *EPA,* 577 U.S. 1126 (2016). The D.C. Circuit held the litigation in abeyance, and ultimately dismissed it at the petitioners' request. *American Lung Ass'n,* 985 F.3d at 937.

4. The CPP Repeal and ACE Rule

In 2019, the EPA repealed the CPP and replaced it with the ACE Rule. In contrast to its interpretation of CAA section 111 in the CPP, in the ACE Rule the EPA determined that the statutory ''text and reasonable inferences from it'' make ''clear'' that a ''system'' of emission reduction under CAA section 111(a)(1) ''is limited to measures that can be applied to and at the level of the individual source,'' (84 FR 32529; July 8, 2019); that is, the system must be limited to control measures that could be applied at and to each source to reduce emissions at each source. See 84 FR 32523–24 (July 8, 2019). Specifically, the ACE Rule argued that the requirements in CAA sections 111(d)(1), (a)(3), and (a)(6), that each state establish a standard of performance ''for'' ''any existing source,'' defined, in general, as any ''building . . . [or] facility,'' and the requirement in CAA section 111(a)(1) that the degree of emission limitation must be ''achievable'' through the ''application'' of the BSER, by their terms, impose this limitation. The EPA concluded that generation shifting is not such a control measure. See 84 FR 32546 (July 8, 2019). Based on its view that the CPP was a ''major rule,'' the EPA further determined that, absent ''a clear statement from Congress,'' the term '' 'system of emission reduction' '' should not be read to encompass ''generation-shifting measures.'' See 84 FR 32529 (July 8, 2019). The EPA acknowledged, however, that ''[m]arket-based forces ha[d] already led to significant generation shifting in the power sector,'' (84 FR 32532; July 8, 2019), and that there was ''likely to be no difference between a world where the CPP is implemented and one where it is not.'' See 84 FR 32561 (July 8, 2019); the Regulatory Impact Analysis for the Repeal of the Clean Power Plan, and the Emission Guidelines for Greenhouse Gas Emissions from Existing Electric Utility Generating Units, 2–1 to 2–5.[186]

In addition, the EPA promulgated in the ACE Rule a new set of emission guidelines for existing coal-fired steam-generating EGUs. See 84 FR 32532 (July 8, 2019). In light of ''the legal interpretation adopted in the repeal of the CPP,'' (84 FR 32532; July 8, 2019)—which ''limit[ed] 'standards of performance' to systems that can be applied at and to a stationary source,'' (84 FR 32534; July 8, 2019)—the EPA found the BSER to be heat rate improvements alone. See 84 FR 32535 (July 8, 2019). The EPA listed various technologies that could improve heat rate (84 FR 32536; July 8, 2019), and identified the ''degree of emission limitation achievable'' by ''providing ranges of expected [emission] reductions associated with each of the technologies.'' See 84 FR 32537–38 (July 8, 2019).

5. D.C. Circuit Decision in American Lung Association v. EPA Concerning the CPP Repeal and ACE Rule

Numerous states and private parties petitioned for review of the CPP Repeal and ACE Rule. In 2021, the D.C. Circuit vacated the ACE Rule, including the CPP Repeal. *American Lung Ass'n* v. *EPA,* 985 F.3d 914 (D.C. Cir. 2021). The court held, among other things, that CAA section 111(d) does not limit the EPA, in determining the BSER, to measures applied at and to an individual source. The court noted that ''the sole ground on which the EPA defends its abandonment of the [CPP] in favor of the ACE Rule is that the text of [CAA section 111] is clear and unambiguous in constraining the EPA to use only improvements at and to existing sources in its [BSER].'' 985 F.3d at 944. The court found ''nothing in the text, structure, history, or purpose of [CAA section 111] that compels the reading the EPA adopted.'' 985 F.3d at 957. The court likewise rejected the

[185] In the 2018 NSPS Proposal, the EPA solicited comment on whether it is required to make a determination that GHGs from a source category contribute significantly to dangerous air pollution as a predicate to promulgating a NSPS for GHG emissions from that source category for the first time. 83 FR 65432 (December 20, 2018). The EPA subsequently issued a final rule that provided that it would not regulate GHGs under CAA section 111 from a source category unless the GHGs from the category exceed 3 percent of total U.S. GHG emissions, on grounds that GHGs emitted in a lesser amount do not contribute significantly to dangerous air pollution. 86 FR 2652 (January 13, 2021). Shortly afterwards, the D.C. Circuit granted an unopposed motion by the EPA for voluntary vacatur and remand of the final rule. *California* v. *EPA,* No. 21–1035, doc. 1893155 (D.C. Cir. April 5, 2021).

[186] *https://www.epa.gov/sites/default/files/2019-06/documents/utilities_ria_final_cpp_repeal_and_ace_2019-06.pdf.*

view that the CPP's use of generation-shifting implicated a ''major question'' requiring unambiguous authorization by Congress. 985 F.3d at 958–68.

The D.C. Circuit concluded that, because the EPA had relied on an ''erroneous legal premise,'' both the CPP Repeal Rule and the ACE Rule should be vacated. 985 F.3d at 995. The court did not decide, however, ''whether the approach of the ACE Rule is a permissible reading of the statute as a matter of agency discretion,'' 985 F.3d at 944, and instead ''remanded to the EPA so that the Agency may 'consider the question afresh,' '' 985 F.3d at 995 (citations omitted).

The court also rejected the arguments that the EPA cannot regulate CO_2 emissions from coal-fired power plants under CAA section 111(d) at all because it had already regulated mercury emissions from coal-fired power plants under CAA section 112. 985 F.3d at 988. In addition, the court held that that the 2015 NSPS included a valid determination that greenhouse gases from the EGU source category contributed significantly to dangerous air pollution, which provided a sufficient basis for a CAA section 111(d) rule regulating greenhouse gases from existing fossil fuel-fired EGUs. *Id.* at 977.

Because the D.C. Circuit vacated the ACE Rule on the grounds noted above, it did not address the other challenges to the ACE Rule, including the arguments by Petitioners that the heat rate improvement BSER was inadequate because of the limited number of reductions it achieved and because the ACE Rule failed to include an appropriately specific degree of emission limitation.

Upon a motion from the EPA, the D.C. Circuit agreed to stay its mandate with respect to vacatur of the CPP Repeal, *American Lung Assn* v. *EPA,* No. 19–1140, Order (February 22, 2021), so that the CPP remained repealed. Therefore, following the D.C. Circuit's decision, no EPA rule under CAA section 111 to reduce GHGs from existing fossil fuel-fired EGUs remained in place.

6. U.S. Supreme Court Decision in West Virginia v. EPA Concerning the CPP

The Supreme Court granted petitions for certiorari from the D.C. Circuit's *American Lung Association* decision, limited to the question of whether CAA section 111 authorized the EPA to determine that ''generation shifting'' was the best system of emission reduction for fossil-fuel fired EGUs. The Supreme Court did not grant certiorari on the question of whether the EPA was authorized to regulate GHG emissions from fossil-fuel fired power plants under CAA section 111, when fossil-fuel fired power plants are regulated for other pollutants under CAA section 112. In 2022, the U.S. Supreme Court reversed the D.C. Circuit's vacatur of the ACE Rule's embedded repeal of the CPP. *West Virginia* v. *EPA,* 597 U.S. 697 (2022). The Supreme Court stated that CAA section 111 authorizes the EPA to determine the BSER and the degree of emission limitation that state plans must achieve. *Id.* at 2601–02. The Supreme Court concluded, however, that the CPP's BSER of ''generation-shifting'' raised a ''major question,'' and was not clearly authorized by section 111. The Court characterized the generation-shifting BSER as ''restructuring the Nation's overall mix of electricity generation,'' and stated that the EPA's claim that CAA section 111 authorized it to promulgate generation shifting as the BSER was ''not only unprecedented; it also effected a fundamental revision of the statute, changing it from one sort of scheme of regulation into an entirely different kind.'' *Id.* at 2612 (internal quotation marks, brackets, and citation omitted). The Court explained that the EPA, in prior rules under CAA section 111, had set emissions limits based on ''measures that would reduce pollution by causing the regulated source to operate more cleanly.'' *Id.* at 2610. The Court noted with approval those ''more traditional air pollution control measures,'' and gave as examples ''fuel-switching'' and ''add-on controls,'' which, the Court observed, the EPA had considered in the CPP. *Id.* at 2611 (internal quotations marks and citation omitted). In contrast, the Court continued, generation shifting was ''unprecedented'' because ''[r]ather than focus on improving the performance of individual sources, it would improve the overall power system by lowering the carbon intensity of power generation. And it would do that by forcing a shift throughout the power grid from one type of energy source to another.'' *Id.* at 2611–12 (internal quotation marks, emphasis, and citation omitted).

The Court recognized that a rule based on traditional measures ''may end up causing an incidental loss of coal's market share,'' but emphasized that the CPP was ''obvious[ly] differen[t]'' because, with its generation-shifting BSER, it ''simply announc[ed] what the market share of coal, natural gas, wind, and solar must be, and then require[ed] plants to reduce operations or subsidize their competitors to get there.'' *Id.* at 2613 n.4. The Court also emphasized ''the magnitude and consequence'' of the CPP. *Id.* at 2616. It noted ''the magnitude of this unprecedented power over American industry,'' *id.* at 2612 (internal quotation marks and citation omitted), and added that the EPA's adoption of generation shifting ''represent[ed] a transformative expansion in its regulatory authority.'' *Id.* at 2610 (internal quotation marks and citation omitted). The Court also viewed the CPP as promulgating ''a program that . . . Congress had considered and rejected multiple times.'' *Id.* at 2614 (internal quotation marks and citation omitted). For these and related reasons, the Court viewed the CPP as raising a major question, and therefore, requiring ''clear congressional authorization'' as a basis. *Id.* (internal quotation marks and citation omitted).

The Court declined to address the D.C. Circuit's conclusion that the text of CAA section 111 did not limit the type of ''system'' the EPA could consider as the BSER to measures applied at and to an individual source. *See id.* at 2615. Nor did the Court address the scope of the states' compliance flexibilities.

7. D.C. Circuit Order Reinstating the ACE Rule

On October 27, 2022, the D.C. Circuit responded to the U.S. Supreme Court's reversal by recalling its mandate for the vacatur of the ACE Rule. *American Lung Ass'n* v. *EPA,* No. 19–1140, Order (October 27, 2022). Accordingly, at that time, the ACE Rule came back into effect. The court also revised its judgment to deny petitions for review challenging the CPP Repeal Rule, consistent with the judgment in *West Virginia,* so that the CPP remains repealed. The court took further action denying several of the petitions for review unaffected by the Supreme Court's decision in *West Virginia,* which means that certain parts of its 2021 decision in *American Lung Association* remain in effect. These parts include the holding that the EPA's prior regulation of mercury emissions from coal-fired electric power plants under CAA section 112 does not preclude the Agency from regulating CO_2 from coal-fired electric power plants under CAA section 111, and the holding, discussed above, that the 2015 NSPS included a valid significant contribution determination and therefore provided a sufficient basis for a CAA section 111(d) rule regulating greenhouse gases from existing fossil fuel-fired EGUs. The court's holding to invalidate amendments to the implementing regulations applicable to emission guidelines under CAA section 111(d) that extended the preexisting schedules

for state and Federal actions and sources' compliance, also remains in force. Based on the EPA's stated intention to replace the ACE Rule, the court stayed further proceedings with respect to the ACE Rule, including the various challenges that its BSER was flawed because it did not achieve sufficient emission reductions and failed to specify an appropriately specific degree of emission limitation.

C. Detailed Discussion of CAA Section 111 Requirements

This section discusses in more detail the key requirements of CAA section 111 for both new and existing sources that are relevant for these rulemakings.

1. Approach to the Source Category and Subcategorizing

CAA section 111 requires the EPA first to list stationary source categories that cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare and then to regulate new sources within each such source category. CAA section 111(b)(2) grants the EPA discretion whether to ''distinguish among classes, types, and sizes within categories of new sources for the purpose of establishing [new source] standards,'' which we refer to as ''subcategorizing.'' Whether and how to subcategorize is a decision for which the EPA is entitled to a ''high degree of deference'' because it entails ''scientific judgment.'' *Lignite Energy Council* v. *EPA,* 198 F.3d 930, 933 (D.C. Cir. 1999).

Although CAA section 111(d)(1) does not explicitly address subcategorization, since its first regulations implementing the CAA, the EPA has interpreted it to authorize the Agency to exercise discretion as to whether and, if so, how to subcategorize, for the following reasons. CAA section 111(d)(1) grants the EPA authority to ''prescribe regulations which shall establish a procedure . . . under which each State shall submit to the Administrator a plan [with standards of performance for existing sources.]'' The EPA promulgates emission guidelines under this provision directing the states to regulate existing sources. The Supreme Court has recognized that, under CAA section 111(d), the ''Agency, not the States, decides the amount of pollution reduction that must ultimately be achieved. It does so by again determining, as when setting the new source rules, 'the best system of emission reduction . . . that has been adequately demonstrated for [existing covered] facilities.' *West Virginia,* 597 U.S. at 710 (citations omitted).

The EPA's authority to determine the BSER includes the authority to create subcategories that tailor the BSER for differently situated sets of sources. Again, for new sources, CAA section 111(b)(2) confers authority for the EPA to ''distinguish among classes, types, and sizes within categories.'' Though CAA section 111(d) does not speak specifically to the creation of subcategories for a category of existing sources, the authority to identify the ''best'' system of emission reduction for existing sources includes the discretion to differentiate between differently situated sources in the category, and group those sources into subcategories in appropriate circumstances. The size, type, class, and other characteristics can make different emission controls more appropriate for different sources. A system of emission reduction that is ''best'' for some sources may not be ''best'' for others with different characteristics. For more than four decades, the EPA has interpreted CAA section 111(d) to confer authority on the Agency to create subcategories. The EPA's implementing regulations under CAA section 111(d), promulgated in 1975, 40 FR 53340 (November 17, 1975), provide that the Administrator will specify different emission guidelines or compliance times or both ''for different sizes, types, and classes of designated facilities when [based on] costs of control, physical limitations, geographical location, or [based on] similar factors.'' [187] This regulation governs the EPA's general authority to subcategorize under CAA section 111(d), and the EPA is not reopening that issue here. At the time of promulgation, the EPA explained that subcategorization allows the EPA to take into account ''differences in sizes and types of facilities and similar considerations, including differences in control costs that may be involved for sources located in different parts of the country'' so that the ''EPA's emission guidelines will in effect be tailored to what is reasonably achievable by particular classes of existing sources. . . .'' *Id.* at 53343. The EPA's authority to ''distinguish among classes, types, and sizes within categories,'' as provided under CAA section 111(b)(2), generally allows the Agency to place types of sources into subcategories. This is consistent with the commonly understood meaning of the term ''type'' in CAA section 111(b)(2): ''a particular kind, class, or group,'' or ''qualities common to a number of individuals that distinguish them as an identifiable class.'' See *https://www.merriam-webster.com/dictionary/type*.

The EPA has developed subcategories in many rulemakings under CAA section 111 since the 1970s. These rulemakings have included subcategories on the basis of the size of the sources, see 40 CFR 60.40b(b)(1)–(2) (subcategorizing certain coal-fired steam generating units on the basis of heat input capacity); the types of fuel combusted, *see Sierra Club,* v. *EPA,* 657 F.2d 298, 318–19 (D.C. Cir. 1981) (upholding a rulemaking that established different NSPS ''for utility plants that burn coal of varying sulfur content''), 2015 NSPS, 80 FR 64510, 64602 (table 15) (October 23, 2015) (subdividing new combustion turbines on the basis of type of fuel combusted); the types of equipment used to produce products, see 81 FR 35824 (June 3, 2016) (promulgating separate NSPS for many types of oil and gas sources, such as centrifugal compressors, pneumatic controllers, and well sites); types of manufacturing processes used to produce product, see 42 FR 12022 (March 1, 1977) (announcing availability of final guideline document for control of atmospheric fluoride emissions from existing phosphate fertilizer plants) and ''Final Guideline Document: Control of Fluoride Emissions From Existing Phosphate Fertilizer Plants,'' EPA–450/2–77–005 1–7 to 1–9, including table 1–2 (applying different control requirements for different manufacturing operations for phosphate fertilizer); levels of utilization of the sources, see 2015 NSPS, 80 FR 64510, 64602 (table 15) (October 23, 2015) (dividing new natural gas-fired combustion turbines into the subcategories of base load and non-base load); the activity level of the sources, see 81 FR 59276, 59278–79 (August 29, 2016) (dividing municipal solid waste landfills into the subcategories of active and closed landfills); and geographic location of the sources, see 71 FR 38482 (July 6, 2006) (SO_2 NSPS for stationary combustion turbines subcategorizing turbines on the basis of whether they are located in, for example, a continental area, a non-continental area, the part of Alaska north of the Arctic Circle, and the rest of Alaska). Thus, the EPA has subcategorized many times in rulemaking under CAA sections 111(b) and 111(d) and based on a wide variety of physical, locational, and operational characteristics.

Regardless of whether the EPA subcategorizes within a source category

[187] 40 CFR 60.22(b)(5), 60.22a(b)(5). Because the definition of subcategories depends on characteristics relevant to the BSER, and because those characteristics can differ as between new and existing sources, the EPA may establish different subcategories as between new and existing sources.

for purposes of determining the BSER and the degree of emission limitation achievable, a state retains certain flexibility in assigning standards of performance to its affected EGUs. The statutory framework for CAA section 111(d) emission guidelines, and the flexibilities available to states within that framework, are discussed below.

2. Key Elements of Determining a Standard of Performance

Congress first included the definition of ''standard of performance'' when enacting CAA section 111 in the 1970 Clean Air Act Amendments (CAAA), amended it in the 1977 CAAA, and then amended it again in the 1990 CAAA to largely restore the definition as it read in the 1970 CAAA. The current text of CAA section 111(a)(1) reads: ''The term 'standard of performance' means a standard for emission of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any non-air quality health and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated.'' The D.C. Circuit has reviewed CAA section 111 rulemakings on numerous occasions since 1973,[188] and has developed a body of caselaw that interprets the term ''standard of performance,'' as discussed throughout this preamble.

The basis for standards of performance, whether promulgated by the EPA under CAA section 111(b) or established by the states under CAA section 111(d), is that the EPA determines the ''degree of emission limitation'' that is ''achievable'' by the sources by application of a ''system of emission reduction'' that the EPA determines is ''adequately demonstrated,'' ''taking into account'' the factors of ''cost . . . and any nonair quality health and environmental impact and energy requirements,'' and that the EPA determines to be the ''best.'' The D.C. Circuit has stated that in determining the ''best'' system, the EPA must also take into account ''the amount of air pollution'' [189] reduced and the role of ''technological innovation.'' [190] The D.C. Circuit has also stated that to determine the ''best'' system, the EPA may weigh the various factors identified in the statute and caselaw against each other, and has emphasized that the EPA has discretion in weighing the factors.[191] [192]

The EPA's overall approach to determining the BSER and degree of emission limitation achievable, which incorporates the various elements, is as follows: The EPA identifies ''system[s] of emission reduction'' that have been ''adequately demonstrated'' for a particular source category and determines the ''best'' of these systems after evaluating the amount of emission reductions, costs, any non-air health and environmental impacts, and energy requirements. As discussed below, for each of numerous subcategories, the EPA followed this approach to determine the BSER on the basis that the identified costs are reasonable and that the BSER is rational in light of the statutory factors, including the amount of emission reductions, that the EPA examined in its BSER analysis, consistent with governing precedent.

After determining the BSER, the EPA determines an achievable emission limit based on application of the BSER.[193] For a CAA section 111(b) rule, the EPA determines the standard of performance that reflects the achievable emission limit. For a CAA section 111(d) rule, the states have the obligation of establishing standards of performance for the affected sources that reflect the degree of emission limitation that the EPA has determined. As discussed below, the EPA is finalizing these determinations in association with each of the BSER determinations.

The remainder of this subsection discusses each element in our general analytical approach.

a. System of Emission Reduction

The CAA does not define the phrase ''system of emission reduction.'' In *West Virginia* v. *EPA,* the Supreme Court recognized that historically, the EPA had looked to ''measures that improve the pollution performance of individual sources and followed a ''technology-based approach'' in identifying systems of emission reduction. In particular, the Court identified ''the sort of 'systems of emission reduction' [the EPA] had always before selected,'' which included '' 'efficiency improvements, fuel-switching,' and 'add-on controls'.'' 597 U.S. at 727 (quoting the Clean Power Plan).[194] Section 111 itself recognizes that such systems may include off-site activities that may reduce a source's pollution contribution, identifying ''precombustion cleaning or treatment of fuels'' as a ''system'' of ''emission reduction.'' 42 U.S.C. 7411(a)(7)(B). A ''system of emission reduction'' thus, at a minimum, includes measures that an individual source applies that improve the emissions performance of that source. Measures are fairly characterized as improving the pollution performance of a source where they reduce the individual source's overall contribution to pollution.

In *West Virginia,* the Supreme Court did not define the term ''system of emissions reduction,'' and so did not rule on whether ''system of emission reduction'' is limited to those measures that the EPA has historically relied upon. It did go on to apply the major questions doctrine to hold that the term ''system'' does not provide the requisite clear authorization to support the Clean Power Plan's BSER, which the Court described as ''carbon emissions caps based on a generation shifting approach.'' *Id.* at 2614. While the Court did not define the outer bounds of the meaning of ''system,'' systems of emissions reduction like fuel switching, add-on controls, and efficiency improvements fall comfortably within the scope of prior practice as recognized by the Supreme Court.

b. ''Adequately Demonstrated''

Under CAA section 111(a)(1), an essential, although not sufficient, condition for a ''system of emission

[188] *Portland Cement Ass'n* v. *Ruckelshaus,* 486 F.2d 375 (D.C. Cir. 1973); *Essex Chemical Corp.* v. *Ruckelshaus,* 486 F.2d 427 (D.C. Cir. 1973); *Sierra Club* v. *Costle,* 657 F.2d 298 (D.C. Cir. 1981); *Lignite Energy Council* v. *EPA,* 198 F.3d 930 (D.C. Cir. 1999); *Portland Cement Ass'n* v. *EPA,* 665 F.3d 177 (D.C. Cir. 2011); *American Lung Ass'n* v. *EPA,* 985 F.3d 914 (D.C. Cir. 2021), *rev'd in part, West Virginia* v. *EPA,* 597 U.S. 697 (2022). *See also Delaware* v. *EPA,* No. 13–1093 (D.C. Cir. May 1, 2015).

[189] *See Sierra Club* v. *Costle,* 657 F.2d 298, 326 (D.C. Cir. 1981).

[190] *See Sierra Club* v. *Costle,* 657 F.2d at 347.

[191] *See Lignite Energy Council,* 198 F.3d at 933.

[192] CAA section 111(a)(1), by its terms states that the factors enumerated in the parenthetical are part of the ''adequately demonstrated'' determination. In addition, the D.C. Circuit's caselaw makes clear that the EPA may consider these same factors when it determines which adequately demonstrated system of emission reduction is the ''best.'' *See Sierra Club* v. *Costle,* 657 F.2d at 330 (recognizing that CAA section 111 gives the EPA authority ''when determining the best technological system to weigh cost, energy, and environmental impacts'').

[193] See, *e.g.,* Oil and Natural Gas Sector: New Source Performance Standards and National Emission Standards for Hazardous Air pollutants Reviews (77 FR 49494; August 16, 2012) (describing the three-step analysis in setting a standard of performance).

[194] As noted in section V.B.4 of this preamble, the ACE Rule adopted the interpretation that CAA section 111(a)(1), by its plain language, limits ''system of emission reduction'' to those control measures that could be applied at and to each source to reduce emissions at each source. 84 FR 32523–24 (July 8, 2019). The EPA has subsequently rejected that interpretation as too narrow. *See Adoption and Submittal of State Plans for Designated Facilities: Implementing Regulations Under Clean Air Act Section 111(d),* 88 FR 80535 (November 17, 2023).

reduction'' to serve as the basis for an ''achievable'' emission standard is that the Administrator must determine that the system is ''adequately demonstrated.'' The concepts of adequate demonstration and achievability are closely related: as the D.C. Circuit has stated, ''[i]t is the system which must be adequately demonstrated and the standard which must be achievable,'' [195] through application of the system. An achievable standard means a standard based on the EPA's record-based finding that sufficient evidence exists to reasonably determine that the affected sources in the source category can adopt a specific system of emission reduction to achieve the specified degree of emission limitation. As discussed below, consistent with Congress's use of the word ''demonstrated,'' the caselaw has approved the EPA's ''adequately demonstrated'' determinations concerning systems utilized at test sources or other individual sources operating at commercial scale. The case law also authorizes the EPA to set an emissions standard at levels more stringent than has regularly been achieved, based on the understanding that sources will be able to adopt specific technological improvements to the system in question that will enable them to achieve the lower standard. Importantly, and contrary to some comments received on the proposed rule, CAA section 111(a)(1) does *not* require that a system of emission reduction exist in widespread commercial use in order to satisfy the ''adequately demonstrated'' requirement.[196] Instead, CAA section 111(a)(1) authorizes the EPA to establish standards which encourage the deployment of more effective systems of emission reduction that have been adequately demonstrated but that are not yet in widespread use. This aligns with Congress's purpose in enacting the CAA, in particular its recognition that polluting sources were not widely adopting emission control technology on a voluntary basis and that Federal regulation was necessary to spur the development and deployment of those technologies.[197]

[195] *Essex Chem. Corp.* v. *Ruckelshaus,* 486 F.2d 427, 433 (1973) (emphasis omitted).

[196] *See, e.g., Essex Chem. Corp.* v. *Ruckelshaus,* 486 F.2d 427 (D.C. Cir. 1973) (in which the D.C. Circuit upheld a CAA section 111 standard based on a system which had been extensively used in Europe but at the time of promulgation was only in use in the United States at one plant).

[197] In introducing the respective bills which ultimately became the 1970 Clean Air Act upon Conference Committee review, both the House and Senate emphasized the urgency of the matter at hand, the intended power of the new legislation, and in particular its technology-forcing nature. The first page of the House report declared that ''[t]he purpose of the legislation reported unanimously by [Committee was] to speed up, expand, and intensify the war against air pollution in the United States . . .'' H.R. Rep. No. 17255 at 1 (1970). It was clear, stated the House report, that until that point ''the strategies which [the United States had] pursued in the war against air pollution [had] been inadequate in several important respects, and the methods employed in implementing those strategies often [had] been slow and less effective than they might have been.'' *Id.* The Senate report agreed, stating that their bill would ''provide a much more intensive and comprehensive attack on air pollution,'' 1 S. 4358 at 4 (1970), including, crucially, by increased federal involvement. *See id.*

[198] The D.C. Circuit stated in *Nat'l Asphalt Pavement Ass'n* v. *Train,* 539 F.2d 775, 786 (D.C. Cir. 1976) ''The standard of review of actions of the Administrator in setting standards of performance is an appropriately deferential one, and we are to affirm the action of the Administrator unless it is ''arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law,'' 5 U.S.C. 706(2)(A) (1970). Since this is one of those ''highly technical areas, where our understanding of the import of the evidence is attenuated, our readiness to review evidentiary support for decisions must be correspondingly restrained.'' *Ethyl Corporation* v. *EPA,* 96 S. Ct. 2663 (1976). ''Our 'expertise' is not in setting standards for emission control, but in determining if the standards as set are the result of reasoned decision-making.'' *Essex Chem. Corp.* v. *Ruckelshaus,* 486 F.2d 427, 434 (D.C. Cir. 1973)) (cleaned up).''

[199] 42 U.S.C. 7409(b)(1).

[200] 744 F.3d 1334 (D.C. Cir. 2013).

[201] *Id.*

[202] While not relevant here, because CCS is already in existence, the text, case law, and legislative history make a compelling case that EPA is authorized to go farther than this, and may make a projection regarding the way in which a particular system will develop to allow for greater emissions reductions in the future. *See* 80 FR 64556–58 (discussion of ''adequately demonstrated'' in 2015 NSPS).

[203] Webster's New World Dictionary: Second College Edition (David B. Guralnik, ed., 1972).

i. Plain Text, Statutory Context, and Legislative History of the ''Adequately Demonstrated'' Provision in CAA Section 111(a)(1)

Analysis of the plain text, statutory context, and legislative history of CAA section 111(a)(1) establishes two primary themes. First, Congress assigned the task of determining the appropriate BSER to the Administrator, based on a reasonable review of available evidence. Second, Congress authorized the EPA to set a standard, based on the evidence, that encourages broader adoption of an emissions-reducing technological approach that may not yet be in widespread use.

The plain text of CAA section 111(a)(1), and in particular the phrase ''the Administrator determines'' and the term ''adequately,'' confer discretion to the EPA in identifying the appropriate system. Rather than providing specific criteria for determining what constitutes appropriate evidence, Congress directed the Administrator to ''determine[ ]'' that the demonstration is ''adequate[ ].'' Courts have typically deferred to the EPA's scientific and technological judgments in making such determinations.[198] Further, use of the term ''adequate'' in provisions throughout the CAA highlights EPA flexibility and discretion in setting standards and in analyzing data that forms the basis for standard setting.

In setting NAAQS under CAA section 109, for example, the EPA is directed to determine, according to ''the judgment of the Administrator,'' an ''adequate margin of safety.'' [199] The D.C. Circuit has held that the use of the term ''adequate'' confers significant deference to the Administrator's scientific and technological judgment. In *Mississippi* v. *EPA,*[200] for example, the D.C. Circuit in 2013 upheld the EPA's choice to set the NAAQS for ozone below 0.08 ppm, and noted that any disagreements with the EPA's interpretations of the scientific evidence that underlay this decision ''must come from those who are qualified to evaluate the science, not [the court].'' [201] This *Mississippi* v. *EPA* precedent aligns with the general standard for judicial review of the EPA's understanding of the evidence under CAA section 307(d)(9)(A) (''arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law'').

The plain language of the phrase ''has been adequately demonstrated,'' in context, and in light of the legislative history, further strongly indicates that the system in question need not be in widespread use at the time the EPA's rule is published. To the contrary, CAA section 111(a)(1) authorizes technology forcing, in the sense that the EPA is authorized to promote a system which is not yet in widespread use; provided the technology is in existence and the EPA has adequate evidence to extrapolate.[202]

Some commenters argued that use of the phrase ''has been'' in ''has been adequately demonstrated'' means that the system must be in widespread commercial use at the time of rule promulgation. We disagree. Considering the plain text, the use of the past tense, ''*has been* adequately demonstrated'' indicates a requirement that the technology *currently* be demonstrated. However, ''demonstrated'' in common usage at the time of enactment meant to ''explain or make clear by using examples, experiments, *etc.*'' [203] As a general matter, and as this definition indicates, the term ''to demonstrate'' suggests the need for a test or study—as in, for example, a ''demonstration

project'' or ''demonstration plant''—that is, examples of technological feasibility.

The statutory context is also useful in establishing that where Congress wanted to specify the availability of the control system, it did so. The only other use of the exact term ''adequately demonstrated'' occurs in CAA section 119, which establishes that, in order for the EPA to require a particular ''means of emission limitation'' for smelters, the Agency must establish that such means ''has been adequately demonstrated to be reasonably available. . . .'' [204] The lack of the phrase ''reasonably available'' in CAA section 111(a)(1) is notable, and suggests that a system may be ''adequately demonstrated'' under CAA section 111 even if it is not ''reasonably available'' for every single source.[205]

The term ''demonstration'' also appears in CAA section 103 in an instructive context. CAA section 103, which establishes a ''national research and development program for the prevention and control of air pollution'' directs that as part of this program, the EPA shall ''conduct, and promote the coordination and acceleration of, research, investigations, experiments, demonstrations, surveys, and studies relating to'' the issue of air pollution.[206] According to the canon of *noscitur a sociis,* associated words in a list bear on one another's meaning.[207] In CAA section 103, the word ''demonstrations'' appears alongside ''research,'' ''investigations,'' ''experiments,'' and ''studies''—all words suggesting the development of new and emerging technology. This supports interpreting CAA section 111(a)(1) to authorize the EPA to determine a system of emission reduction to be ''adequately demonstrated'' based on demonstration projects, testing, examples, or comparable evidence.

Finally, the legislative history of the CAA in general, and section 111 in particular, strongly supports the point that BSER technology need not be in widespread use at the time of rule enactment. The final language of CAA section 111(a)(1), requiring that systems of emission reduction be ''adequately demonstrated,'' was the result of compromise in the Conference Committee between the House and Senate bill language. The House bill would have required that the EPA give ''appropriate consideration to technological and economic feasibility'' when establishing standards.[208] The Senate bill would have required that standards ''reflect the greatest degree of emission control which the Secretary determines to be achievable through application of the latest available control technology, processes, operating methods, or other alternatives.'' [209] Although the exact language of neither the House nor Senate bill was adopted in the final bill, both reports made clear their intent that CAA section 111 would be significantly technology-forcing. In particular, the Senate Report referred to ''available control technology''—a phrase that, as just noted, the Senate bill included—but clarified that the technology need not ''be in actual, routine use somewhere.'' [210] The House Report explained that EPA regulations would ''prevent and control such emissions to the fullest extent compatible with the available technology and economic feasibility as determined by [the EPA],'' and ''[i]n order to be considered 'available' the technology may not be one which constitutes a purely theoretical or experimental means of preventing or controlling air pollution.'' [211] This last statement implies that the House Report anticipated that the EPA's determination may be technology forcing. Nothing in the legislative history suggests that Congress intended that the technology already be in widespread commercial use.

ii. Caselaw

In a series of cases reviewing standards for new sources, the D.C. Circuit has held that an adequately demonstrated standard of performance may reflect the EPA's reasonable projection of what that particular system may be expected to achieve going forward, extrapolating from available data from pilot projects or individual commercial-scale sources. A standard may be considered achievable even if the system upon which the standard is based has not regularly achieved the standard in testing. See, *e.g., Essex Chem. Corp.* v. *Ruckelshaus* [212] (upholding a standard of 4.0 lbs per ton based on a system whose average control rate was 4.6 lbs per ton, and which had achieved 4.0 lbs per ton on only three occasions and '''nearly equaled' [the standard] on the average of nineteen different readings.'') [213] The *Ruckelshaus* court concluded that the EPA's extrapolation from available data was ''the result of the exercise of reasoned discretion by the Administrator'' and therefore ''[could not] be upset by [the] court.'' [214] The court also emphasized that in order to be considered achievable, the standard set by the EPA need not be regularly or even specifically achieved at the time of rule promulgation. Instead, according to the court, ''[a]n achievable standard is one which is within the realm of the adequately demonstrated system's efficiency and which, while not at a level that is purely theoretical or experimental, need not necessarily be routinely achieved within the industry prior to its adoption.'' [215]

Case law also establishes that the EPA may set a standard more stringent than has regularly been achieved based on its identification of specific available technological improvements to the system. See *Sierra Club* v. *Costle* [216] (upholding a 90 percent standard for SO_2 emissions from coal-fired steam generators despite the fact that not all plants had previously achieved this standard, based on the EPA's expectations for improved performance with specific technological fixes and the use of ''coal washing'' going forward).[217] Further, the EPA may extrapolate based on testing at a particular kind of source to conclude that the technology at issue will also be effective at a different,

[204] The statutory text at CAA section 119 continues, ''as determined by the Administrator, taking into account the cost of compliance, nonair quality health and environmental impact, and energy consideration.'' 42 U.S.C. 7419(b)(3).

[205] It should also be noted that the section 119 language was added as part of the 1977 Clean Air Act amendments, while the section 111 language was established in 1970. Thus, Congress was aware of section 111's more permissive language when it added the ''reasonably available'' language to section 119.

[206] 42 U.S.C. 7403(a)(1).

[207] As the Supreme Court recently explained in *Dubin* v. *United States,* even words that might be indeterminate alone may be more easily interpreted in ''company,'' because per *noscitur a sociis* ''a word is known by the company it keeps.'' 599 U.S. 110, 244 (2023).

[208] H.R. Rep. No. 17255 at 921 (1970) (quoting CAA Sec. 112(a), as proposed).

[209] S. Rept. 4358 at 91 (quoting CAA Sec. 113(b)(2), as proposed).

[210] S. Rep. 4358 at 15–16 (1970). The Senate Report went on to say that the EPA should ''examine the degree of emission control that has been or can be achieved through the application of technology which is available or normally can be made available . . . at a cost and at a time which [the Agency] determines to be reasonable.'' *Id.* Again, this language rebuts any suggestion that a BSER technology must be in widespread use at the time of rule enactment—Congress assumed only that the technology would be ''available'' or even that it ''[could] be made available,'' not that it would be *already* broadly used.

[211] H.R. Rep. No. 17255 at 900.

related, source. See *Lignite Energy Council* v. *EPA* [218] (holding it permissible to base a standard for industrial boilers on application of SCR based on extrapolated information about the application of SCR on utility boilers).[219] The *Lignite* court clarified that ''where data are unavailable, EPA may not base its determination that a technology is adequately demonstrated or that a standard is achievable on mere speculation or conjecture,'' but the ''EPA may compensate for a *shortage* of data through the use of other qualitative methods, including the reasonable extrapolation of a technology's performance in other industries.'' [220]

As a general matter, the case law is clear that at the time of Rule promulgation, the system which the EPA establishes as BSER need not be in widespread use. See, *e.g., Ruckelshaus* [221] (upholding a standard based on a relatively new system which was in use at only one United States plant at the time of rule promulgation. Although the system was in use more extensively in Europe at the time of rule promulgation, the EPA based its analysis on test results from the lone U.S. plant only.) [222] This makes good sense, because, as discussed above, CAA section 111(a)(1) authorizes a technology-forcing standard that encourages broader adoption of an emissions-reducing technological approach that is not yet broadly used. It follows that at the time of promulgation, not every source will be prepared to adopt the BSER at once. Instead, as discussed next, the EPA's responsibility is to determine that the technology can be adopted in a reasonable period of time, and to base its requirements on this understanding.

iii. Compliance Timeframe

The preceding subsections have shown various circumstances under which the EPA may determine that a system of emission reduction is ''adequately demonstrated.'' In order to establish that a system is appropriate for the source category as a whole, the EPA must also demonstrate that the industry can deploy the technology at scale in the compliance timeframe. The D.C. Circuit has stated that the EPA may determine a ''system of emission reduction'' to be ''adequately demonstrated'' if the EPA reasonably projects that it may be more broadly deployed with adequate lead time. This view is well-grounded in the purposes of CAA section 111(a)(1), discussed above, which aim to control dangerous air pollution by allowing for standards which encourage more widespread adoption of a technology demonstrated at individual plants.

As a practical matter, CAA section 111's allowance for lead time recognizes that existing pollution control systems may be complex and may require a predictable amount of time for sources across the source category to be able to design, acquire, install, test, and begin to operate them.[223] Time may also be required to allow for the development of skilled labor, and materials like steel, concrete, and speciality parts. Accordingly, in setting 111 standards for both new and existing sources, the EPA has typically allowed for some amount of time before sources must demonstrate compliance with the standards. For instance, in the 2015 NSPS for residential wood heaters, the EPA established a ''stepped compliance approach'' which phased in requirements over 5 years to ''allow manufacturers lead time to develop, test, field evaluate and certify current technologies'' across their model lines.[224] The EPA also allowed for a series of phase-ins of various requirements in the 2023 oil and gas NSPS.[225] For example: the EPA finalized a compliance deadline for process controllers allowing for 1 year from the effective date of the final rule, to allow for delays in equipment availability; [226] the EPA established a 1-year lead time period for pumps, also in response to possible equipment and labor shortages; [227] and the EPA built in 24 months between publication in the **Federal Register** and the commencement of a requirement to end routine flaring and route associated gas to a sales line.[228]

Finally, the EPA's longstanding regulations for new source performance standards under CAA section 111 specifically authorize a minimum period for lead time. Pursuant to 40 CFR 60.11, compliance with CAA section 111 standards is generally determined in accordance with performance tests conducted under 40 CFR 60.8. Both of these regulatory provisions were adopted in 1971. Under 40 CFR 60.8, source performance is generally measured via performance tests, which must typically be carried out ''within 60 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup of such facility, or at such other times specified by this part, and at such other times as may be required by the Administrator under section 114 of the Act. . . .'' [229] The fact that this provision has been in place for over 50 years indicates that the EPA has long recognized the need for lead time for at least one component of control development.[230]

c. Costs

Under CAA section 111(a)(1), in determining whether a particular emission control is the ''best system of emission reduction . . . adequately demonstrated,'' the EPA is required to take into account ''the cost of achieving [the emission] reduction.'' Although the CAA does not describe how the EPA is to account for costs to affected sources, the D.C. Circuit has formulated the cost standard in various ways, including stating that the EPA may not adopt a standard the cost of which would be ''excessive'' or ''unreasonable.'' [231] [232]

[218] 198 F.3d 930 (D.C. Cir. 1999).

[219] *See id.* at 933–34.

[220] *Id.* at 934 (emphasis added).

[221] 486 F.2d 375 (D.C. Cir. 1973). *See also Sierra Club* v. *Costle,* 657 F.2d 298 (D.C. Cir. 1981), which supports the point that EPA may extrapolate from testing results, rather than relying on consistent performance, to identify an appropriate system and standard based on that system. In that case, EPA analyzed scrubber performance by considering performance during short-term testing periods. *See id.* at 377.

[222] 486 F.2d at 435–36.

[223] As discussed above, although the EPA is not relying on this point for purposes of these rules, it should be noted that the EPA may determine a system of emission reduction to be adequately demonstrated based on some amount of projection, even if some aspects of the system are still in development. Thus, the authorization for lead time accommodates the development of projected technology.

[231] *Sierra Club* v. *Costle,* 657 F.2d 298, 343 (D.C. Cir. 1981). *See* 79 FR 1430, 1464 (January 8, 2014); *Lignite Energy Council,* 198 F.3d at 933 (costs may not be ''exorbitant''); *Portland Cement Ass'n* v. *EPA,* 513 F.2d 506, 508 (D.C. Cir. 1975) (costs may not be ''greater than the industry could bear and survive'').

[232] These cost formulations are consistent with the legislative history of CAA section 111. The 1977 House Committee Report noted:

In the [1970] Congress [sic: Congress's] view, it was only right that the costs of applying best practicable control technology be considered by the owner of a large new source of pollution as a normal and proper expense of doing business.

1977 House Committee Report at 184. Similarly, the 1970 Senate Committee Report stated:

The implicit consideration of economic factors in determining whether technology is ''available'' should not affect the usefulness of this section. The overriding purpose of this section would be to

The EPA has discretion in its consideration of cost under section 111(a), both in determining the appropriate level of costs and in balancing costs with other BSER factors.[233] To determine the BSER, the EPA must weigh the relevant factors, including the cost of controls and the amount of emission reductions, as well as other factors.[234]

The D.C. Circuit has repeatedly upheld the EPA's consideration of cost in reviewing standards of performance. In several cases, the court upheld standards that entailed significant costs, consistent with Congress's view that ''the costs of applying best practicable control technology be considered by the owner of a large new source of pollution as a normal and proper expense of doing business.'' [235] *See Essex Chemical Corp.* v. *Ruckelshaus,* 486 F.2d 427, 440 (D.C. Cir. 1973); [236] *Portland Cement Ass'n* v. *Ruckelshaus,* 486 F.2d 375, 387–88 (D.C. Cir. 1973); *Sierra Club* v. *Costle,* 657 F.2d 298, 313 (D.C. Cir. 1981) (upholding NSPS imposing controls on SO_2 emissions from coal-fired power plants when the ''cost of the new controls . . . is substantial. The EPA estimates that utilities will have to spend tens of billions of dollars by 1995 on pollution control under the new NSPS.'').

In its CAA section 111 rulemakings, the EPA has frequently used a cost-effectiveness metric, which determines the cost in dollars for each ton or other quantity of the regulated air pollutant removed through the system of emission reduction. *See, e.g.,* 81 FR 35824 (June 3, 2016) (NSPS for GHG and VOC emissions for the oil and natural gas source category); 71 FR 9866, 9870 (February 27, 2006) (NSPS for NO_X, SO_2, and PM emissions from fossil fuel-fired electric utility steam generating units); 61 FR 9905, 9910 (March 12, 1996) (NSPS and emission guidelines for nonmethane organic compounds and landfill gas from new and existing municipal solid waste landfills); 50 FR 40158 (October 1, 1985) (NSPS for SO_2 emissions from sweetening and sulfur recovery units in natural gas processing plants). This metric allows the EPA to compare the amount a regulation would require sources to pay to reduce a particular pollutant across regulations and industries. In rules for the electric power sector, the EPA has also looked at a metric that determines the dollar increase in the cost of a MWh of electricity generated by the affected sources due to the emission controls, which shows the cost of controls relative to the output of electricity. *See* section VII.C.1.a.ii of this preamble, which discusses $/MWh costs of the Good Neighbor Plan for the 2015 Ozone NAAQS (88 FR 36654; June 5, 2023) and the Cross-State Air Pollution Rule (CSAPR) (76 FR 48208; August 8, 2011). This metric facilitates comparing costs across regulations and pollutants. In these final actions, as explained herein, the EPA looks at both of these metrics, in addition to other cost evaluations, to assess the cost reasonableness of the final requirements. The EPA's consideration of cost reasonableness in this way meets the statutory requirement that the EPA take into account ''the cost of achieving [the emission] reduction'' under section 111(a)(1).

d. Non-Air Quality Health and Environmental Impact and Energy Requirements

Under CAA section 111(a)(1), the EPA is required to take into account ''any nonair quality health and environmental impact and energy requirements'' in determining the BSER. Non-air quality health and environmental impacts may include the impacts of the disposal of byproducts of the air pollution controls, or requirements of the air pollution control equipment for water. *Portland Cement Ass'n* v. *Ruckelshaus,* 465 F.2d 375, 387–88 (D.C. Cir. 1973), *cert. denied,* 417 U.S. 921 (1974). Energy requirements may include the impact, if any, of the air pollution controls on the source's own energy needs.

e. Sector or Nationwide Component of Factors in Determining the BSER

Another component of the D.C. Circuit's interpretations of CAA section 111 is that the EPA may consider the various factors it is required to consider on a national or regional level and over time, and not only on a plant-specific level at the time of the rulemaking.[237] The D.C. Circuit based this interpretation—which it made in the 1981 *Sierra Club* v. *Costle* case regarding the NSPS for new power plants—on a review of the legislative history, stating,

> [T]he Reports from both Houses on the Senate and House bills illustrate very clearly that Congress itself was using a long-term lens with a broad focus on future costs, environmental and energy effects of different technological systems when it discussed section 111.[238]

The court has upheld EPA rules that the EPA ''justified . . . in terms of the policies of the Act,'' including balancing long-term national and regional impacts. For example, the court upheld a standard of performance for SO_2 emissions from new coal-fired power plants on grounds that it—

> reflects a balance in environmental, economic, and energy consideration by being sufficiently stringent to bring about substantial reductions in SO_2 emissions (3 million tons in 1995) yet does so at reasonable costs without significant energy penalties. . . .[239]

The EPA interprets this caselaw to authorize it to assess the impacts of the controls it is considering as the BSER, including their costs and implications for the energy system, on a sector-wide, regional, or national basis, as appropriate. For example, the EPA may assess whether controls it is considering would create risks to the reliability of the electricity system in a particular area or nationwide and, if they would, to reject those controls as the BSER.

f. ''Best''

In determining which adequately demonstrated system of emission reduction is the ''best,'' the EPA has broad discretion. In *AEP* v. *Connecticut,* 564 U.S. 410, 427 (2011), the Supreme Court explained that under CAA section 111, ''[t]he appropriate amount of regulation in any particular greenhouse gas-producing sector cannot be prescribed in a vacuum: . . . informed assessment of competing interests is required. Along with the environmental benefit potentially achievable, our Nation's energy needs and the possibility of economic disruption must weigh in the balance. The Clean Air Act entrusts such complex balancing to the EPA in the first instance, in combination with state regulators. Each ''standard of performance'' the EPA sets must ''tak[e] into account the cost of achieving [emissions] reduction and any nonair quality health and environmental impact and energy requirements.'' (paragraphing revised; citations omitted)).

prevent new air pollution problems, and toward that end, maximum feasible control of new sources at the time of their construction is seen by the committee as the most effective and, in the long run, the least expensive approach.

S. Comm. Rep. No. 91–1196 at 16.

[233] *Sierra Club* v. *Costle,* 657 F.2d 298, 343 (D.C. Cir. 1981).

[234] *Id.* (EPA's conclusion that the high cost of control was acceptable was ''a judgment call with which we are not inclined to quarrel'').

[235] 1977 House Committee Report at 184.

[236] The costs for these standards were described in the rulemakings. See 36 FR 24876 (December 23, 1971), 37 FR 5769 (March 21, 1972).

[237] See 79 FR 1430, 1465 (January 8, 2014) (citing *Sierra Club* v. *Costle,* 657 F.2d at 351).

[238] *Sierra Club* v. *Costle,* 657 F.2d at 331 (citations omitted) (citing legislative history).

[239] *Sierra Club* v. *Costle,* 657 F.2d at 327–28 (quoting 44 FR 33583–84; June 11, 1979).

Likewise, in *Sierra Club* v. *Costle,* 657 F.2d 298 (D.C. Cir. 1981), the court explained that ''section 111(a) explicitly instructs the EPA to balance multiple concerns when promulgating a NSPS,'' [240] and emphasized that ''[t]he text gives the EPA broad discretion to weigh different factors in setting the standard,'' including the amount of emission reductions, the cost of the controls, and the non-air quality environmental impacts and energy requirements.[241] And in *Lignite Energy Council* v. *EPA,* 198 F.3d 930 (D.C. Cir. 1999), the court reiterated:

> Because section 111 does not set forth the weight that should be assigned to each of these factors, we have granted the agency a great degree of discretion in balancing them . . . . EPA's choice [of the 'best system'] will be sustained unless the environmental or economic costs of using the technology are exorbitant . . . . EPA [has] considerable discretion under section 111.[242]

Importantly, the courts recognize that the EPA must consider several factors and that determining what is ''best'' depends on how much weight to give the factors. In promulgating certain standards of performance, the EPA may give greater weight to particular factors than it does in promulgating other standards of performance. Thus, the determination of what is ''best'' is complex and necessarily requires an exercise of judgment. By analogy, the question of who is the ''best'' sprinter in the 100-meter dash primarily depends on only one criterion—speed—and therefore is relatively straightforward, whereas the question of who is the ''best'' baseball player depends on a more complex weighing of multiple criteria and therefore requires a greater exercise of judgment.

The term ''best'' also authorizes the EPA to consider factors in addition to the ones enumerated in CAA section 111(a)(1), that further the purpose of the statute. In *Portland Cement Ass'n* v. *Ruckelshaus,* 486 F.2d 375 (D.C. Cir. 1973), the D.C. Circuit held that under CAA section 111(a)(1) as it read prior to the enactment of the 1977 CAA Amendments that added a requirement that the EPA take account of non-air quality environmental impacts, the EPA must consider ''counter-productive environmental effects'' in Determining the BSER. *Id.* at 385. The court elaborated: ''The standard of the 'best system' is comprehensive, and we cannot imagine that Congress intended that 'best' could apply to a system which did more damage to water than it prevented to air.'' *Id.,* n.42. In *Sierra Club* v. *Costle,* 657 F.2d at 326, 346–47, the court added that the EPA must consider the amount of emission reductions and technology advancement in determining BSER, as discussed in section V.C.2.g of this preamble.

The court's view that ''best'' includes additional factors that further the purpose of CAA section 111 is a reasonable interpretation of that term in its statutory context. The purpose of CAA section 111 is to reduce emissions of air pollutants that endanger public health or welfare. CAA section 111(b)(1)(A). The court reasonably surmised that the EPA's determination of whether a system of emission reduction that reduced certain air pollutants is ''best'' should be informed by impacts that the system may have on other pollutants that affect public or welfare. *Portland Cement Ass'n,* 486 F.2d at 385. The Supreme Court confirmed the D.C. Circuit's approach in *Michigan* v. *EPA,* 576 U.S. 743 (2015), explaining that administrative agencies must engage in ''reasoned decisionmaking'' that, in the case of pollution control, cannot be based on technologies that ''do even more damage to human health'' than the emissions they eliminate. *Id.* at 751–52. After *Portland Cement Ass'n,* Congress revised CAA section 111(a)(1) to make explicit that in determining whether a system of emission reduction is the ''best,'' the EPA should account for non-air quality health and environmental impacts. By the same token, the EPA takes the position that in determining whether a system of emission reduction is the ''best,'' the EPA may account for the impacts of the system on air pollutants other than the ones that are the subject of the CAA section 111 regulation.[243] We discuss immediately below other factors that the D.C. Circuit has held the EPA should account for in determining what system is the ''best.''

g. Amount of Emissions Reductions

Consideration of the amount of emissions from the category of sources or the amount of emission reductions achieved as factors the EPA must consider in determining the ''best system of emission reduction'' is implicit in the plain language of CAA section 111(a)(1)—the EPA must choose the *best* system of *emission reduction.* Indeed, consistent with this plain language and the purpose of CAA section 111, the EPA must consider the quantity of emissions at issue. *See Sierra Club* v. *Costle,* 657 F.2d 298, 326 (D.C. Cir. 1981) (''we can think of no sensible interpretation of the statutory words ''best . . . system'' which would not incorporate the amount of air pollution as a relevant factor to be weighed when determining the optimal standard for controlling . . . emissions'').[244] The fact that the purpose of a ''system of emission reduction'' is to reduce emissions, and that the term itself explicitly incorporates the concept of reducing emissions, supports the court's view that in determining whether a ''system of emission reduction'' is the ''best,'' the EPA must consider the amount of emission reductions that the system would yield. Even if the EPA were not required to consider the amount of emission reductions, the EPA has the discretion to do so, on grounds that either the term ''system of emission reduction'' or the term ''best'' may reasonably be read to allow that discretion.

h. Expanded Use and Development of Technology

The D.C. Circuit has long held that Congress intended for CAA section 111

---

[240] *Sierra Club* v. *Costle,* 657 F.2d at 319.

[241] *Sierra Club* v. *Costle,* 657 F.2d at 321; *see also New York* v. *Reilly,* 969 F.2d at 1150 (because Congress did not assign the specific weight the Administrator should assign to the statutory elements, ''the Administrator is free to exercise [her] discretion'' in promulgating an NSPS).

[242] *Lignite Energy Council,* 198 F.3d at 933 (paragraphing revised for convenience). *See New York* v. *Reilly,* 969 F.2d 1147, 1150 (D.C. Cir. 1992) (''Because Congress did not assign the specific weight the Administrator should accord each of these factors, the Administrator is free to exercise his discretion in this area.''); *see also NRDC* v. *EPA,* 25 F.3d 1063, 1071 (D.C. Cir. 1994) (The EPA did not err in its final balancing because ''neither RCRA nor EPA's regulations purports to assign any particular weight to the factors listed in subsection (a)(3). That being the case, the Administrator was free to emphasize or deemphasize particular factors, constrained only by the requirements of reasoned agency decisionmaking.'').

[243] See generally *Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review—Supplemental Notice of Proposed Rulemaking,* 87 FR 74765 (December 6, 2022) (proposing the BSER for reducing methane and VOC emissions from natural gas-driven controllers in the oil and natural gas sector on the basis of, among other things, impacts on emissions of criteria pollutants). In this preamble, for convenience, the EPA generally discusses the effects of controls on non-GHG air pollutants along with the effects of controls on non-air quality health and environmental impacts.

[244] *Sierra Club* v. *Costle,* 657 F.2d 298 (D.C. Cir. 1981) was governed by the 1977 CAAA version of the definition of ''standard of performance,'' which revised the phrase ''best system of emission reduction'' to read, ''best technological system of continuous emission reduction.'' As noted above, the 1990 CAAA deleted ''technological'' and ''continuous'' and thereby returned the phrase to how it read under the 1970 CAAA. The court's interpretation of the 1977 CAAA phrase in *Sierra Club* v. *Costle* to require consideration of the amount of air emissions focused on the term ''best,'' and the terms ''technological'' and ''continuous'' were irrelevant to its analysis. It thus remains valid for the 1990 CAAA phrase ''best system of emission reduction.''

to create incentives for new technology and therefore that the EPA is required to consider technological innovation as one of the factors in determining the ''best system of emission reduction.'' *See Sierra Club* v. *Costle,* 657 F.2d at 346–47. The court has grounded its reading in the statutory text of CAA 111(a)(1), defining the term ''standard of performance.'' [245] In addition, the court's interpretation finds support in the legislative history.[246] The legislative history identifies three different ways that Congress designed CAA section 111 to authorize standards of performance that promote technological improvement: (1) The development of technology that may be treated as the ''best system of emission reduction . . . adequately demonstrated;'' under CAA section 111(a)(1); [247] (2) the expanded use of the best demonstrated technology; [248] and (3) the development of emerging technology.[249] Even if the EPA were not required to consider technological innovation as part of its determination of the BSER, it would be reasonable for the EPA to consider it because technological innovation may be considered an element of the term ''best,'' particularly in light of Congress's emphasis on technological innovation.

i. Achievability of the Degree of Emission Limitation

For new sources, CAA section 111(b)(1)(B) and (a)(1) provides that the EPA must establish ''standards of performance,'' which are standards for emissions that reflect the degree of emission limitation that is ''achievable'' through the application of the BSER. A standard of performance is ''achievable'' if a technology can reasonably be projected to be available to an individual source at the time it is constructed that will allow it to meet the standard.[250] Moreover, according to the court, ''[a]n achievable standard is one which is within the realm of the adequately demonstrated system's efficiency and which, while not at a level that is purely theoretical or experimental, need not necessarily be routinely achieved within the industry prior to its adoption.'' [251] To be achievable, a standard ''must be capable of being met under most adverse conditions which can reasonably be expected to recur and which are not or cannot be taken into account in determining the 'costs' of compliance.'' [252] To show a standard is achievable, the EPA must ''(1) identify variable conditions that might contribute to the amount of expected emissions, and (2) establish that the test data relied on by the agency are representative of potential industry-wide performance, given the range of variables that affect the achievability of the standard.'' [253]

Although the courts have established these standards for achievability in cases concerning CAA section 111(b) new source standards of performance, generally comparable standards for achievability should apply under CAA section 111(d), although the BSER may differ in some cases as between new and existing sources due to, for example, higher costs of retrofit. 40 FR 53340 (November 17, 1975). For existing sources, CAA section 111(d)(1) requires the EPA to establish requirements for state plans that, in turn, must include ''standards of performance.'' As the Supreme Court has recognized, this provision requires the EPA to promulgate emission guidelines that determine the BSER for a source category and then identify the degree of emission limitation achievable by application of the BSER. *See West Virginia* v. *EPA,* 597 U.S. at 710.[254]

The EPA has promulgated emission guidelines on the basis that the existing sources can achieve the degree of emission limitation described therein, even though under the RULOF provision of CAA section 111(d)(1), the state retains discretion to apply standards of performance to individual sources that are less stringent, which indicates that Congress recognized that the EPA may promulgate emission guidelines that are consistent with CAA section 111(d) even though certain individual sources may not be able to achieve the degree of emission limitation identified therein by applying the controls that the EPA determined to be the BSER. Note further that this requirement that the emission limitation be ''achievable'' based on the ''best system of emission reduction . . . adequately demonstrated'' indicates that the technology or other measures that the EPA identifies as the BSER must be technically feasible.

3. EPA Promulgation of Emission Guidelines for States To Establish Standards of Performance

CAA section 111(d)(1) directs the EPA to promulgate regulations establishing a procedure similar to that provided by CAA section 110 under which states submit state plans that establish ''standards of performance'' for emissions of certain air pollutants from sources which, if they were new sources, would be regulated under CAA section 111(b), and that provide for the implementation and enforcement of such standards of performance. The term ''standard of performance'' is defined under CAA section 111(a)(1), quoted above. Thus, CAA sections 111(a)(1) and (d)(1) collectively require the EPA to determine the degree of emission limitation achievable through application of the BSER to existing sources and to establish regulations under which states establish standards of performance reflecting that degree of emission limitation. The EPA addresses both responsibilities through its emission guidelines, as well as through its general implementing regulations for CAA section 111(d). Consistent with the statutory requirements, the general implementing regulations require that the EPA's emission guidelines reflect—

> the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of such reduction and any non-air quality health and environmental

[245] *Sierra Club* v. *Costle,* 657 F.2d at 346 (''Our interpretation of section 111(a) is that the mandated balancing of cost, energy, and non-air quality health and environmental factors embraces consideration of technological innovation as part of that balance. The statutory factors which EPA must weigh are broadly defined and include within their ambit subfactors such as technological innovation.'').

In considering the representativeness of the source tested, the EPA may consider such variables as the '' 'feedstock, operation, size and age' of the source.'' *Nat'l Lime Ass'n* v. *EPA,* 627 F.2d 416, 433 (D.C. Cir. 1980). Moreover, it may be sufficient to ''generalize from a sample of one when one is the only available sample, or when that one is shown to be representative of the regulated industry along relevant parameters.'' *Nat'l Lime Ass'n* v. *EPA,* 627 F.2d 416, 434, n.52 (D.C. Cir. 1980).

[254] 40 CFR 60.21(e), 60.21a(e).

impact and energy requirements) the Administrator has determined has been adequately demonstrated from designated facilities.[255]

Following the EPA's promulgation of emission guidelines, each state must establish standards of performance for its existing sources, which the EPA's regulations call ''designated facilities.'' [256] Such standards of performance must reflect the degree of emission limitation achievable through application of the best system of emission reduction as determined by the EPA, which the Agency may express as a presumptive standard of performance in the applicable emission guidelines.

While the standards of performance that states establish in their plans must generally be no less stringent than the degree of emission limitation determined by the EPA,[257] CAA section 111(d)(1) also requires that the EPA's regulations ''permit the State in applying a standard of performance to any particular source . . . to take into consideration, among other factors, the remaining useful life of the existing source to which such standard applies.'' Consistent with this statutory direction, the EPA's general implementing regulations for CAA section 111(d) provide a framework for states' consideration of remaining useful life and other factors (referred to as ''RULOF'') when applying a standard of performance to a particular source. In November 2023, the EPA finalized clarifications to its regulations governing states' consideration of RULOF to apply less stringent standards of performance to particular existing sources. As amended, these regulations provide that states may apply a standard of performance to a particular designated facility that is less stringent than, or has a longer compliance schedule than, otherwise required by the applicable emission guideline taking into consideration that facility's remaining useful life and other factors. To apply a less stringent standard of performance or longer compliance schedule, the state must demonstrate with respect to each facility (or class of such facilities), that the facility cannot reasonably achieve the degree of emission limitation determined by the EPA based on unreasonable cost of control resulting from plant age, location, or basic process design; physical impossibility or technical infeasibility of installing necessary control equipment; or other circumstances specific to the facility. In doing so, the state must demonstrate that there are fundamental differences between the information specific to a facility (or class of such facilities) and the information the EPA considered in determining the degree of emission limitation achievable through application of the BSER or the compliance schedule that make achieving such degree of emission reduction or meeting such compliance schedule unreasonable for that facility.

In addition, under CAA section 116, states may establish standard of performances that are more stringent than the presumptive standards of performance contained in the EPA's emission guidelines.[258] The state must include the standards of performance in their state plans and submit the plans to the EPA for review according to the procedures established in the Agency's general implementing regulations for CAA section 111(d).[259] Under CAA section 111(d)(2)(A), the EPA approves state plans that are determined to be ''satisfactory.'' CAA section 111(d)(2)(A) also gives the Agency ''the same authority'' as under CAA section 110(c) to promulgate a Federal plan in cases where a state fails to submit a satisfactory state plan.

VI. ACE Rule Repeal

The EPA is finalizing repeal of the ACE Rule. The EPA proposed to repeal the ACE Rule and did not receive significant comments objecting to the proposal. The EPA is finalizing the proposal largely as proposed. A general summary of the ACE Rule, including its regulatory and judicial history, is included in section V.B.4 of this preamble. The EPA repeals the ACE Rule on three grounds that each independently justify the rule's repeal.

First, as a policy matter, the EPA concludes that the suite of heat rate improvements (HRI) the ACE Rule selected as the BSER is not an appropriate BSER for existing coal-fired EGUs. In the EPA's technical judgment, the suite of HRI set forth in the ACE Rule provide negligible CO_2 reductions at best and, in many cases, may increase CO_2 emissions because of the ''rebound effect,'' as explained in section VII.D.4.a.iii of this preamble. These concerns, along with the EPA's experience in implementing the ACE Rule, cast doubt that the ACE Rule would achieve emission reductions and increase the likelihood that the ACE Rule could make CO_2 pollution worse. As a result, the EPA has determined it is appropriate to repeal the rule, and to reevaluate whether other technologies constitute the BSER.

Second, even assuming the ACE Rule's rejection of CCS and natural gas co-firing was supported at the time, the ACE Rule's rationale for rejecting CCS and natural gas co-firing as the BSER no longer applies because of new factual developments. Since the ACE Rule was promulgated, changes in the power industry, developments in the costs of controls, and new federal subsidies have made other controls more broadly available and less expensive. Considering these developments, the EPA has determined that co-firing with natural gas and CCS are the BSER for certain subcategories of sources as described in section VII.C of this preamble, and that the HRI technologies adopted by the ACE Rule are not the BSER. Thus, repeal of the ACE Rule is proper on this ground as well.

Third, the EPA concludes that the ACE Rule conflicted with CAA section 111 and the EPA's implementing regulations because it did not specifically identify the BSER or the ''degree of emission limitation achievable though application of the [BSER].'' Instead, the ACE Rule described only a broad range of values as the ''degree of emission limitation achievable.'' In doing so, the rule did not provide the states with adequate guidance on the degree of emission limitation that must be reflected in the standards of performance so that a state plan would be approvable by the EPA. The ACE Rule is repealed for this reason also.

A. Summary of Selected Features of the ACE Rule

The ACE Rule determined that the BSER for coal-fired EGUs was a ''list of 'candidate technologies,' '' consisting of seven types of the ''most impactful HRI technologies, equipment upgrades, and best operating and maintenance practices,'' (84 FR 32536; July 8, 2019), including, among others, ''Boiler Feed Pumps'' and ''Redesign/Replace Economizer.'' *Id.* at 32537 (table 1). The rule provided a range of improvements

[255] 40 CFR 60.21a(e).

[256] 40 CFR 60.21a(b), 60.24a(b).

[257] As the Supreme Court explained in *West Virginia* v. *EPA,* ''Although the States set the actual rules governing existing power plants, EPA itself still retains the primary regulatory role in Section 111(d).'' 597 U.S. at 710. The Court elaborated that ''[t]he Agency, not the States, decides the amount of pollution reduction that must ultimately be achieved. It does so by again determining, as when setting the new source rules, 'the best system of emission reduction . . . that has been adequately demonstrated for [existing covered] facilities.' 40 CFR 60.22(b)(5) (2021); see also 80 FR 64664, and n.1. The States then submit plans containing the emissions restrictions that they intend to adopt and enforce in order not to exceed the permissible level of pollution established by EPA. See §§ 60.23, 60.24; 42 U.S.C. 7411(d)(1).'' *Id.*

[258] 40 CFR 60.24a(i).

[259] See generally 40 CFR 60.23a–60.28a.

in heat rate that each of the seven ''candidate technologies'' could achieve if applied to coal-fired EGUs of different capacities. For six of the technologies, the expected level of improvement in heat rate ranged from 0.1–0.4 percent to 1.0–2.9 percent, and for the seventh technology, ''Improved Operating and Maintenance (O&M) Practices,'' the range was ''0 to >2%.'' *Id.* The ACE Rule explained that states must review each of their designated facilities, on either a source-by-source or group-of-sources basis, and ''evaluate the applicability of each of the candidate technologies.'' *Id.* at 32550. States were to use the list of HRI technologies ''as guidance but will be expected to conduct unit-specific evaluations of HRI potential, technical feasibility, and applicability for each of the BSER candidate technologies.'' *Id.* at 32538.

The ACE Rule emphasized that states had ''inherent flexibility'' in evaluating candidate technologies with ''a wide range of potential outcomes.'' *Id.* at 32542. The ACE Rule provided that states could conclude that it was not appropriate to apply some technologies. *Id.* at 32550. Moreover, if a state decided to apply a particular technology to a particular source, the state could determine the level of heat rate improvement from the technology could be anywhere within the range that the EPA had identified for that technology, or even outside that range. *Id.* at 32551. The ACE Rule stated that after the state evaluated the technologies and calculated the amount of HRI in this way, it should determine the standard of performance 0that the source could achieve, *Id.* at 32550, and then adjust that standard further based on the application of source-specific factors such as remaining useful life. *Id.* at 32551.

The ACE Rule then identified the process by which states had to take these actions. States must ''evaluat[e] each'' of the seven candidate technologies and provide a summary, which ''include[s] an evaluation of the . . . degree of emission limitation achievable through application of the technologies.'' *Id.* at 32580. Then, the state must provide a variety of information about each power plant, including, the plant's ''annual generation,'' ''CO_2 emissions,'' ''[f]uel use, fuel price, and carbon content,'' ''operation and maintenance costs,'' ''[h]eat rates,'' ''[e]lectric generating capacity,'' and the ''timeline for implementation,'' among other information. *Id.* at 32581. The EPA explained that the purpose of this data was to allow the Agency to ''adequately and appropriately review the plan to determine whether it is satisfactory.'' *Id.* at 32558.

The ACE Rule projected a very low level of overall emission reduction if states generally applied the set of candidate technologies to their sources. The rule was projected to achieve a less-than-1-percent reduction in power-sector CO_2 emissions by 2030.[260] Further, the EPA also projected that it would increase CO_2 emissions from power plants in 15 states and the District of Columbia because of the ''rebound effect'' as coal-fired sources implemented HRI measures and became more efficient. This phenomenon is explained in more detail in section VII.D.4.a.iii of this document.[261]

The ACE Rule considered several other control measures as the BSER, including co-firing with natural gas and CCS, but rejected them. The ACE Rule rejected co-firing with natural gas primarily on grounds that it was too costly in general. 84 FR 32545 (July 8, 2019). The rule also concluded that generating electricity by co-firing natural gas in a utility boiler would be an inefficient use of the gas when compared to combusting it in a combustion turbine. *Id.* The ACE Rule rejected CCS on grounds that it was too costly. *Id.* at 32548. The rule identified the high capital and operating costs of CCS and noted the fact that the IRC section 45Q tax credit, as it then applied, would provide only limited benefit to sources. *Id.* at 32548–49.

B. Developments Undermining ACE Rule's Projected Emission Reductions

The EPA's first basis for repealing the ACE Rule is that it is unlikely that—if implemented—the rule would reduce emissions, and implementation could increase CO_2 emissions instead. Thus, the EPA concludes that as a matter of policy it is appropriate to repeal the rule and evaluate anew whether other technologies qualify as the BSER.

Two factors, taken together, undermine the ACE Rule's projected emission reductions and create the risk that implementation of the ACE Rule could increase—rather than reduce—CO_2 emissions from coal-fired EGUs. First, HRI technologies achieve only limited GHG emission reductions. The ACE Rule projected that if states generally applied the set of candidate technologies to their sources, the rule would achieve a less-than-1-percent reduction in power-sector CO_2 emissions by 2030.[262] The EPA now doubts that even these minimal reductions would be achieved. The ACE Rule's projected benefits were premised in part on a 2009 technical report by Sargent & Lundy that evaluated the effects of HRI technologies. In 2023, Sargent & Lundy issued an updated report which details that the HRI selected as the BSER in the ACE Rule would bring fewer emissions reductions than estimated in 2009. The 2023 report concludes that, with few exceptions, HRI technologies are less effective at reducing CO_2 emissions than assumed in 2009. Further reinforcing the conclusion that HRIs would bring few reductions, the 2023 report also concluded that most sources had already optimized application of HRIs, and so there are fewer opportunities to reduce emissions than previously anticipated.[263]

Second, for a subset of sources, HRI are likely to cause a ''rebound effect'' leading to an increase in GHG emissions for those sources. The rebound effect is explained in detail in section VII.D.4.a.iii of this preamble. The ACE Rule's analysis projected that the rule would increase CO_2 emissions from power plants in 15 states and the District of Columbia. The EPA's modeling projections assumed that, consistent with the rule, some sources would impose a small degree of efficiency improvements. The modeling showed that, as a consequence of these improvements, the rule would increase absolute emissions at some coal-fired sources as these sources became more efficient and displaced lower emitting sources like natural gas-fired EGUs.[264]

Even though the ACE Rule was projected to increase emissions in many states, these states were nevertheless obligated under the rule to assemble detailed state plans that evaluated available technologies and the performance of each existing coal-fired power plant, as described in section IX.A of this preamble. For example, the state was required to analyze the plant's ''annual generation,'' ''CO_2 emissions,'' ''[f]uel use, fuel price, and carbon content,'' ''operation and maintenance

[260] ACE Rule RIA 3–11, table 3–3.

[261] The rebound effect becomes evident by comparing the results of the ACE Rule IPM runs for the 2018 reference case, EPA, *IPM State-Level Emissions: EPAv6 November 2018 Reference Case,* Document ID No. EPA–HQ–OAR–2017–0355–26720, and for the ''Illustrative ACE Scenario. *IPM State-Level Emissions: Illustrative ACE Scenario,* Document ID No. EPA–HQ–OAR–2017–0355–26724.

[262] ACE Rule RIA 3–11, table 3–3.

[263] Sargent and Lundy. Heat Rate Improvement Method Costs and Limitations Memo. Available in Docket ID No. EPA–HQ–OAR–2023–0072.

[264] See EPA, *IPM State-Level Emissions: EPAv6 November 2018 Reference Case,* Document ID No. EPA–HQ–OAR–2017–0355–26720 (providing ACE reference case); *IPM State-Level Emissions: Illustrative ACE Scenario,* Document ID No. EPA–HQ–OAR–2017–0355–26724 (providing illustrative scenario).

costs,'' ''[h]eat rates,'' ''[e]lectric generating capacity,'' and the ''timeline for implementation,'' among other information. 84 FR 32581 (July 8, 2019). The risk of an increase in emissions raises doubts that the HRI for coal-fired sources satisfies the statutory criteria to constitute the BSER for this category of sources. The core element of the BSER analysis is whether the emission reduction technology selected reduces emissions. *See Essex Chem. Corp.* v. *Ruckelshaus,* 486 F.2d 427, 441 (D.C. Cir. 1973) (noting ''counter productive environmental effects'' raises questions as to whether the BSER selected was in fact the ''best''). Moreover, this evaluation and the imposition of standards of performance was mandated even though the state plan would lead to an *increase* rather than decrease CO_2 emissions. Imposing such an obligation on states under these circumstances was arbitrary.

The EPA's experience in implementing the ACE Rule reinforces these concerns. After the ACE Rule was promulgated, one state drafted a state plan that set forth a standard of performance that allowed the affected source to increase its emission rate. The draft partial plan would have applied to one source, the Longview Power, LLC facility, and would have established a standard of performance, based on the state's consideration of the ''candidate technologies,'' that was higher (*i.e.,* less stringent) than the source's historical emission rate. Thus, the draft plan would not have achieved any emission reductions from the source, and instead would have allowed the source to *increase* its emissions, if it had been finalized.[265]

Because there is doubt that the minimal reductions projected by the ACE Rule would be achieved, and because the rebound effect could lead to an increase in emissions for many sources in many states, the EPA concludes that it is appropriate to repeal the ACE Rule and reevaluate the BSER for this category of sources.

C. Developments Showing That Other Technologies Are the BSER for This Source Category

Since the promulgation of the ACE Rule in 2019, the factual underpinnings of the rule have changed in several ways and lead the EPA to determine that HRI are not the BSER for coal-fired power plants. This reevaluation is consistent with *FCC* v. *Fox Television Stations, Inc.,* 556 U.S. 502 (2009). There, the Supreme Court explained that an agency issuing a new policy ''need not demonstrate to a court's satisfaction that the reasons for the new policy are *better* than the reasons for the old one.'' Instead, ''it suffices that the new policy is permissible under the statute, that there are good reasons for it, and that the agency *believes* it to be better, which the conscious change of course adequately indicates.'' *Id.* at 514–16 (emphasis in original; citation omitted).

Along with changes in the anticipated reductions from HRI, it makes sense for the EPA to reexamine the BSER because the costs of two control measures, co-firing with natural gas and CCS, have fallen for sources with longer-term operating horizons. As noted, the ACE Rule rejected natural gas co-firing as the BSER on grounds that it was too costly and would lead to inefficient use of natural gas. But as discussed in section VII.C.2.b of this preamble, the costs of natural gas co-firing are presently reasonable, and the EPA concludes that the costs of co-firing 40 percent by volume natural gas are cost-effective for existing coal-fired EGUs that intend to operate after January 1, 2032, and cease operation before January 1, 2039. In addition, changed circumstances—including that natural gas is available in greater amounts, that many coal-fired EGUs have begun co-firing with natural gas or converted wholly to natural-gas, and that there are fewer coal-fired EGUs in operation—mitigate the concerns the ACE Rule identified about inefficient use of natural gas.

Similarly, the ACE Rule rejected CCS as the BSER on grounds that it was too costly. But the costs of CCS have substantially declined, as discussed in section VII.C.1.a.ii of the preamble, partly because of developments in the technology that have lowered capital costs, and partly because the IRA extended and increased the IRS section 45Q tax credit so that it defrays a higher portion of the costs of CCS. Accordingly, for coal-fired EGUs that will continue to operate past 2039, the EPA concludes that the costs of CCS are reasonable, as described in section VII.C.1.a.ii of the preamble.

The emission reductions from these two technologies are substantial. For long-term coal-fired steam generating units, the BSER of 90 percent capture CCS results in substantial CO_2 emissions reductions amounting to emission rates that are 88.4 percent lower on a lb/MWh-gross basis and 87.1 percent lower on a lb/MWh-net basis compared to units without capture, as described in section VII.C.2.b.iv of this preamble. For medium term units, the BSER of 40 percent natural gas co-firing achieves CO_2 stack emissions reductions of 16 percent, as described in section VII.C.2.b.iv of this preamble. Given the availability of more effective, cost-reasonable technology, the EPA concludes that HRIs are not the BSER for all coal-fired EGUs.

The EPA is thus finalizing a new policy for coal-fired power plants. This rule applies to those sources that intend to operate past January 1, 2032. For sources that intend to cease operations after January 1, 2032, but before January 1, 2039, the EPA concludes that the BSER is co-firing 40 percent by volume natural gas. The EPA concludes this control measure is appropriate because it achieves substantial reductions at reasonable cost. In addition, the EPA believes that because a large supply of natural gas is available, devoting part of this supply for fuel for a coal-fired steam generating unit in place of a percentage of the coal burned at the unit is an appropriate use of natural gas and will not adversely impact the energy system, as described in section VII.C.2.b.iii(B) of this preamble. For sources that intend to operate past January 1, 2039, the EPA concludes that the BSER is CCS with 90 percent capture of CO_2. The EPA believes that this control measure is appropriate because it achieves substantial reductions at reasonable cost, as described in section VII.C.1 of this preamble.

The EPA is not concluding that HRI is the BSER for any coal-fired EGUs. As discussed in section VII.D.4.a, the EPA does not consider HRIs an appropriate BSER for coal-fired EGUs because these technologies would achieve few, if any, emissions reductions and may increase emissions due to the rebound effect. Most importantly, changed circumstances show that co-firing natural gas and CCS are available at reasonable cost, and will achieve more GHG emissions reductions. Accordingly, the EPA believes that HRI do not qualify as the BSER for any coal-fired EGUs, and that other approaches meet the statutory standard. On this basis, the EPA repeals the ACE Rule.

D. Insufficiently Precise Degree of Emission Limitation Achievable From Application of the BSER

The third independent reason why the EPA is repealing the ACE Rule is that the rule did not identify with sufficient specificity the BSER or the degree of emission limitation achievable through the application of the BSER. Thus, states lacked adequate guidance on the BSER they should consider and

[265] West Virginia CAA § 111(d) Partial Plan for Greenhouse Gas Emissions from Existing Electric Utility Generating Units (EGUs), *https://dep.wv.gov/daq/publicnoticeandcomment/Documents/Proposed%20WV%20ACE%20State%20Partial%20Plan.pdf.*

level of emission reduction that the standards of performance must achieve. The ACE Rule determined the BSER to be a suite of HRI ''candidate technologies,'' but did not identify with specificity the degree of emission limitation states should apply in developing standards of performance for their sources. As a result, the ACE Rule conflicted with CAA section 111 and the implementing regulations, and thus failed to provide states adequate guidance so that they could ensure that their state plans were satisfactory and approvable by the EPA.

CAA section 111 and the EPA's longstanding implementing regulations establish a clear process for the EPA and states to regulate emissions of certain air pollutants from existing sources. ''The statute directs the EPA to (1) 'determine[ ],' taking into account various factors, the 'best system of emission reduction which . . . has been adequately demonstrated,' (2) ascertain the 'degree of emission limitation achievable through the application' of that system, and (3) impose an emissions limit on new stationary sources that 'reflects' that amount.'' *West Virginia* v. *EPA,* 597 U.S. at 709 (quoting 42 U.S.C. 7411(d)). Further, ''[a]lthough the States set the actual rules governing existing power plants, EPA itself still retains the primary regulatory role in Section 111(d) . . . [and] decides the amount of pollution reduction that must ultimately be achieved.'' *Id.* at 2602.

Once the EPA makes these determinations, the state must establish ''standards of performance'' for its sources that are based on the degree of emission limitation that the EPA determines in the emission guidelines. CAA section 111(a)(1) makes this clear through its definition of ''standard of performance'' as ''a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the [BSER].'' After the EPA determines the BSER, 40 CFR 60.22(b)(5), and the degree of emission limitation achievable from application of the BSER, ''the States then submit plans containing the emissions restrictions that they intend to adopt and enforce in order not to exceed the permissible level of pollution established by EPA.'' 597 U.S. at 710 (citing 40 CFR 60.23, 60.24; 42 U.S.C. 7411(d)(1)).

The EPA then reviews the plan and approves it if the standards of performance are ''satisfactory,'' under CAA section 111(d)(2)(A). The EPA's longstanding implementing regulations make clear that the EPA's basis for determining whether the plan is ''satisfactory'' includes that the plan must contain ''emission standards . . . no less stringent than the corresponding emission guideline(s).'' 40 CFR 60.24(c), 40 CFR 60.24a(c). In addition, under CAA section 111(d)(1), in ''applying a standard of performance to any particular source'' a state may consider, ''among other factors, the remaining useful life of the existing source to which such standard applies.'' This is also known as the RULOF provision and is discussed in section X.C.2 of this preamble.

In the ACE Rule, the EPA recognized that the CAA required it to determine the BSER and identify the degree of emission limitation achievable through application of the BSER. 84 FR 32537 (July 8, 2019). But the rule did not make those determinations. Rather, the ACE Rule described the BSER as a list of ''candidate technologies.'' And the rule described the degree of emission limitation achievable by application of the BSER as ranges of reductions from the HRI technologies. The rule thus shifted the responsibility for determining the BSER and degree of emission limitation achievable from the EPA to the states. Accordingly, the ACE Rule did not meet the CAA section 111 requirement that the EPA determine the BSER or the degree of emission limitation from application of the BSER.

As described above, the ACE Rule identified the HRI in the form of a list of seven ''candidate technologies,'' accompanied by a wide range of percentage improvements to heat rate that these technologies could provide. Indeed, for one of them, improved ''O&M'' practices (that is, operation and management practices), the range was ''0 to >2%,'' which is effectively unbounded. 84 FR 32537 (table 1) (July 8, 2019). The ACE Rule was clear that this list was simply the starting point for a state to calculate the standards of performance for its sources. That is, the seven sets of technologies were ''candidate[s]'' that the state could apply to determine the standard of performance for a source, and if the state did choose to apply one or more of them, the state could do so in a manner that yielded any percentage of heat rate improvement within the range that the EPA identified, or even outside that range. Thus, as a practical matter, the ACE Rule did not determine the BSER or any degree of emission limitation from application of the BSER, and so states had no guidance on how to craft approvable state plans. In this way, the ACE Rule did not adhere to the applicable statutory obligations. See 84 FR 32537–38 (July 8, 2019).

The only constraints that the ACE Rule imposed on the states were procedural ones, and those did not give the EPA any benchmark to determine whether a plan could be approved or give the states any certainty on whether their plan would be approved. As noted above, when a state submitted its plan, it needed to show that it evaluated each candidate technology for each source or group of sources, explain how it determined the degree of emission limitation achievable, and include data about the sources. But because the ACE Rule did not identify a BSER or include a degree of emission limitation that the standards must reflect, the states lacked specific guidance on how to craft adequate standards of performance, and the EPA had no benchmark against which to evaluate whether a state's submission was ''satisfactory'' under CAA section 111(d)(2)(A). Thus, the EPA's review of state plans would be essentially a standardless exercise, notwithstanding the Agency's longstanding view that it was ''essential'' that ''EPA review . . . [state] plans for their substantive adequacy.'' 40 FR 53342–43 (November 17, 1975). In 1975, the EPA explained that it was not appropriate to limit its review based ''solely on procedural criteria'' because otherwise ''states could set extremely lenient standards . . . so long as EPA's procedural requirements were met.'' *Id.* at 53343.

Finally, the ACE Rule's approach to determining the BSER and degree of emission limitation departed from prior emission guidelines under CAA section 111(d), in which the EPA included a numeric degree of emission limitation. See, *e.g.,* 42 FR 55796, 55797 (October 18, 1977) (limiting emission rate of acid mist from sulfuric acid plants to 0.25 grams per kilogram of acid); 44 FR 29829 (May 22, 1979) (limiting concentrations of total reduced sulfur from most of the subcategories of kraft pulp mills, such as digester systems and lime kilns, to 5, 20, or 25 ppm over 12-hour averages); 61 FR 9919 (March 12, 1996) (limiting concentration of non-methane organic compounds from solid waste landfills to 20 parts per million by volume or a 98 percent reduction). The ACE Rule did not grapple with this change in position as required by *FCC* v. *Fox Television Stations, Inc.,* 556 U.S. 502 (2009), or explain why it was appropriate to provide a boundless degree of emission limitation achievable in this context.

The EPA is finalizing the repeal the ACE Rule on this ground as well. The ACE Rule's failure to determine the BSER and the associated degree of emission limitation achievable from

application of the BSER deviated from CAA section 111 and the implementing regulations. Without these determinations, the ACE Rule lacked any benchmark that would guide the states in developing their state plans, and by which the EPA could determine whether those state plans were satisfactory.

For each of these three, independent reasons, repeal of the ACE Rule is proper.

E. Withdrawal of Proposed NSR Revisions

In addition to repealing the ACE Rule, the Agency is withdrawing the proposed revisions to the NSR applicability provisions that were included the ACE Rule proposal (83 FR 44756, 44773–83; August 31, 2018). These proposed revisions would have included an hourly emissions rate test to determine NSR applicability for a modified EGU, with the expressed purpose of alleviating permitting burdens for sources undertaking HRI projects pursuant to the ACE Rule emission guidelines. The ACE Rule final action did not include the NSR revisions, and the EPA indicated in that preamble that it intended to take final action on the NSR proposal in a separate action at a later date. However, the EPA did not take a final action on the NSR revisions, and the EPA has decided to no longer pursue them and to withdraw the proposed revisions.

Withdrawal of the proposal to establish an hourly emissions test for NSR applicability for EGUs is appropriate because of the repeal of the ACE rule and the EPA's conclusion that HRI is not the BSER for coal-fired EGUs. The EPA's basis for proposing the NSR revisions was to ease permitting burdens for state agencies and sources that may result from implementing the ACE Rule. There was concern that, for sources that modified their EGU to improve the heat rate, if a source were to be dispatched more frequently because of improved efficiency (the ''rebound effect''), the source could experience an increase in absolute emissions for one or more pollutants and potentially trigger major NSR requirements. The hourly emissions rate test was proposed to relieve such sources that were undertaking HRI projects to comply with their state plans from the burdens of NSR permitting, particularly in cases in which a source has an increase in annual emissions of a pollutant. However, given that this final rule BSER is not based on HRIs for coal-fired EGUs, the NSR revisions proposed as part of the ACE Rule would no longer serve the purpose that the EPA expressed in that proposal preamble.

Furthermore, in the event that any sources are increasing their absolute emissions after modifying an EGU, applicability of the NSR program is beneficial as a backstop that provides review of those situations to determine if additional controls or other emission limitations are necessary on a case-by-case basis to protect air quality. In addition, given that considerable time has passed since these EGU-specific NSR applicability revisions were proposed in 2018, should the EPA decide to pursue them at a later time, it is prudent for the Agency to propose them again at that time, accompanied with the EPA's updated context and justification to support re-proposing the NSR revisions, rather than relying on the proposal from 2018. Therefore, the EPA is withdrawing these proposed NSR revisions.

VII. Regulatory Approach for Existing Fossil Fuel-Fired Steam Generating Units

Existing fossil fuel-fired steam generation units are the largest stationary source of CO_2 emissions, emitting 909 MMT CO_2e in 2021. Recent developments in control technologies offer opportunities to reduce CO_2 emissions from these sources. The EPA's regulatory approach for these units is to require emissions reduction consistent with these technologies, where their use is cost-reasonable.

A. Overview

In this section of the preamble, the EPA identifies the BSER and degree of emission limitation achievable for the regulation of GHG emissions from existing fossil fuel-fired steam generating units. As detailed in section V of this preamble, to meet the requirements of CAA section 111(d), the EPA promulgates ''emission guidelines'' that identify the BSER and the degree of emission limitation achievable through the application of the BSER, and states then establish standards of performance for affected sources that reflect that level of stringency. To determine the BSER for a source category, the EPA identifies systems of emission reduction (*e.g.,* control technologies) that have been adequately demonstrated and evaluates the potential emissions reduction, costs, any non-air health and environmental impacts, and energy requirements. As described in section V.C.1 of this preamble, the EPA has broad authority to create subcategories under CAA section 111(d). Therefore, where the sources in a category differ from each other by some characteristic that is relevant for the suitability of the emission controls, the EPA may create separate subcategories and make separate BSER determinations for those subcategories.

The EPA considered the characteristics of fossil fuel-fired steam generating units that may impact the suitability of different control measures. First, the EPA observed that the type and amounts of fossil fuels—coal, oil, and natural gas—fired in the steam generating unit affect the performance and emissions reductions achievable by different control technologies, in part due to the differences in the carbon content of those fuels. The EPA recognized that many sources fire multiple types of fossil fuel. Therefore, the EPA is finalizing subcategories of coal-fired, oil-fired, and natural gas-fired steam generating units. The EPA is basing these subcategories, in part, on the amount of fuel combusted by the steam generating unit.

The EPA then considered the BSER that may be suitable for each of those subcategories of fuel type. For coal-fired steam generating units, of the available control technologies, the EPA is determining that CCS with 90 percent capture of CO_2 meets the requirements for BSER, including being adequately demonstrated and achieving significant emission reductions at reasonable cost for units operating in the long-term, as detailed in section VII.C.1.a of this preamble. Application of this BSER results in a degree of emission limitation equivalent to an 88.4 percent reduction in emission rate (lb CO_2/MWh-gross). The compliance date for these sources is January 1, 2032.

Typically, the EPA assumes that sources subject to controls operate in the long-term.[266] See, for example, the 2015 NSPS (80 FR 64509; October 23, 2015) or the 2011 CSAPR (76 FR 48208; August 8, 2011). Under that assumption, fleet average costs for CCS are comparable to the cost metrics the EPA has previously considered to be reasonable. However, the EPA observes that about half of the capacity (87 GW out of 181 GW) of existing coal-fired steam generating units have announced plans to permanently cease operation prior to 2039, as detailed in section IV.D.3.b of this preamble, affecting the period available for those sources to amortize the capital costs of CCS.

[266] Typically, the EPA assumes that the capital costs can be amortized over a period of 15 years. As discussed in section VII.C.1.a.ii of this preamble, in the case of CCS, the IRC section 45Q tax credit, which defrays a significant portion of the costs of CCS, is available for the first 12 years of operation. Accordingly, EPA generally assumed a 12-year amortization period in determining CCS costs.

Accordingly, the EPA evaluated the costs of CCS for different amortization periods. For an amortization period of more than 7 years—such that sources operate after January 1, 2039—annualized fleet average costs are comparable to or less than the metrics of costs for controls that the EPA has previously found to be reasonable. However, the group of sources ceasing operation prior to January 1, 2039, have less time available to amortize the capital costs of CCS, resulting in higher annualized costs.

Because the costs of CCS depend on the available amortization period, the EPA is creating a subcategory for sources demonstrating that they plan to permanently cease operation prior to January 1, 2039. Instead, for this subcategory of sources, the EPA is determining that natural gas co-firing at 40 percent of annual heat input meets the requirements of BSER. Application of the natural gas co-firing BSER results in a degree of emission limitation equivalent to a 16 percent reduction in emission rate (lb CO_2/MWh-gross). Co-firing at 40 percent entails significantly less control equipment and infrastructure than CCS, and as a result, the EPA has determined that affected sources are able to implement it more quickly than CCS, by January 1, 2030. Importantly, co-firing at 40 percent also entails significantly less capital cost than CCS, and as a result, the costs of co-firing are comparable to or less than the metrics for cost reasonableness with an amortization period that is significantly shorter than the period for CCS. The EPA has determined that the costs of co-firing meet the metrics for cost reasonableness for the majority of the capacity that permanently cease operation more than 2 years after the January 1, 2030, implementation date, or after January 1, 2032 (and up to December 31, 2038), and that therefore have an amortization period of more than 2 years (and up to 9 years).

The EPA is also determining that sources demonstrating that they plan to permanently cease operation before January 1, 2032, are not subject to the 40 percent co-firing requirement. This is because their amortization period would be so short—2 years or less—that the costs of co-firing would, in general, be less comparable to the cost metrics for reasonableness for that group of sources. Accordingly, the EPA is defining the medium-term subcategory to include those sources demonstrating that they plan to permanently cease operating after December 31, 2031, and before January 1, 2039.

Considering the limited emission reductions available in light of the cost reasonableness of controls with short amortization periods, the EPA is finalizing an applicability exemption for coal-fired steam generating units demonstrating that they plan to permanently cease operation before January 1, 2032.

For natural gas- and oil-fired steam generating units, the EPA is finalizing subcategories based on capacity factor. Because natural gas- and oil-fired steam generating units with similar annual capacity factors perform similarly to one another, the EPA is finalizing a BSER of routine methods of operation and maintenance and a degree of emission limitation of no increase in emission rate for intermediate and base load subcategories. For low load natural gas- and oil-fired steam generating units, the EPA is finalizing a BSER of uniform fuels and respective degrees of emission limitation defined on a heat input basis (130 lb CO_2/MMBtu and 170 lb CO_2/MMBtu). Furthermore, the EPA is finalizing presumptive standards for natural gas- and oil-fired steam generating units as follows: base load sources (those with annual capacity factors greater than 45 percent) have a presumptive standard of 1,400 lb CO_2/MWh-gross, intermediate load sources (those with annual capacity factors greater than 8 percent and or less than or equal to 45 percent) have a presumptive standard of 1,600 lb CO_2/MWh-gross. For low load oil-fired sources, the EPA is finalizing a presumptive standard of 170 lb CO_2/MMBtu, while for low load natural gas-fired sources the EPA is finalizing a presumptive standard of 130 lb CO_2/MMBtu. A compliance date of January 1, 2030, applies for all natural gas- and oil-fired steam generating units.

The final subcategories and BSER are summarized in table 1 of this document.

TABLE 1—SUMMARY OF FINAL BSER, SUBCATEGORIES, AND DEGREES OF EMISSION LIMITATION FOR AFFECTED EGUS

Affected EGUs	Subcategory definition	BSER	Degree of emission limitation	Presumptively approvable standard of performance *
Long-term existing coal-fired steam generating units.	Coal-fired steam generating units that are not medium-term units.	CCS with 90 percent capture of CO_2.	88.4 percent reduction in emission rate (lb CO_2/MWh-gross).	88.4 percent reduction in annual emission rate (lb CO_2/MWh-gross) from the unit-specific baseline.
Medium-term existing coal-fired steam generating units.	Coal-fired steam generating units that have demonstrated that they plan to permanently cease operations after December 31, 2031, and before January 1, 2039.	Natural gas co-firing at 40 percent of the heat input to the unit.	A 16 percent reduction in emission rate (lb CO_2/MWh-gross).	A 16 percent reduction in annual emission rate (lb CO_2/MWh-gross) from the unit-specific baseline.
Base load existing oil-fired steam generating units.	Oil-fired steam generating units with an annual capacity factor greater than or equal to 45 percent.	Routine methods of operation and maintenance.	No increase in emission rate (lb CO_2/MWh-gross).	An annual emission rate limit of 1,400 lb CO_2/MWh-gross.
Intermediate load existing oil-fired steam generating units.	Oil-fired steam generating units with an annual capacity factor greater than or equal to 8 percent and less than 45 percent.	Routine methods of operation and maintenance.	No increase in emission rate (lb CO_2/MWh-gross).	An annual emission rate limit of 1,600 lb CO_2/MWh-gross.
Low load existing oil-fired steam generating units.	Oil-fired steam generating units with an annual capacity factor less than 8 percent.	lower-emitting fuels	170 lb CO_2/MMBtu	170 lb CO_2/MMBtu.
Base load existing natural gas-fired steam generating units.	Natural gas-fired steam generating units with an annual capacity factor greater than or equal to 45 percent.	Routine methods of operation and maintenance.	No increase in emission rate (lb CO_2/MWh-gross).	An annual emission rate limit of 1,400 lb CO_2/MWh-gross.
Intermediate load existing natural gas-fired steam generating units.	Natural gas-fired steam generating units with an annual capacity factor greater than or equal to 8 percent and less than 45 percent.	Routine methods of operation and maintenance.	No increase in emission rate (lb CO_2/MWh-gross).	An annual emission rate limit of 1,600 lb CO_2/MWh-gross.

TABLE 1—SUMMARY OF FINAL BSER, SUBCATEGORIES, AND DEGREES OF EMISSION LIMITATION FOR AFFECTED EGUS—Continued

Affected EGUs	Subcategory definition	BSER	Degree of emission limitation	Presumptively approvable standard of performance *
Low load existing natural gas-fired steam generating units.	Oil-fired steam generating units with an annual capacity factor less than 8 percent.	lower-emitting fuels	130 lb CO_2/MMBtu	130 lb CO_2/MMBtu.

* Presumptive standards of performance are discussed in detail in section X of the preamble. While states establish standards of performance for sources, the EPA provides presumptively approvable standards of performance based on the degree of emission limitation achievable through application of the BSER for each subcategory. Inclusion in this table is for completeness.

B. Applicability Requirements and Fossil Fuel-Type Definitions for Subcategories of Steam Generating Units

In this section of the preamble, the EPA describes the rationale for the final applicability requirements for existing fossil fuel-fired steam generating units. The EPA also describes the rationale for the fuel type definitions and associated subcategories.

1. Applicability Requirements

For the emission guidelines, the EPA is finalizing that a designated facility [267] is any fossil fuel-fired electric utility steam generating unit (*i.e.,* utility boiler or IGCC unit) that: (1) was in operation or had commenced construction on or before January 8, 2014; [268] (2) serves a generator capable of selling greater than 25 MW to a utility power distribution system; and (3) has a base load rating greater than 260 GJ/h (250 million British thermal units per hour (MMBtu/h)) heat input of fossil fuel (either alone or in combination with any other fuel). Consistent with the implementing regulations, the term ''designated facility'' is used throughout this preamble to refer to the sources affected by these emission guidelines.[269] For the emission guidelines, consistent with prior CAA section 111 rulemakings concerning EGUs, the term ''designated facility'' refers to a single EGU that is affected by these emission guidelines. The rationale for the final applicability requirements is the same as that for 40 CFR part 60, subpart TTTT (80 FR 64543–44; October 23, 2015). The EPA includes that discussion by reference here.

Section 111(a)(6) of the CAA defines an ''existing source'' as ''any stationary source other than a new source.'' Therefore, the emission guidelines do not apply to any steam generating units that are new after January 8, 2014, or reconstructed after June 18, 2014, the applicability dates of 40 CFR part 60, subpart TTTT. Moreover, because the EPA is now finalizing revised standards of performance for coal-fired steam generating units that undertake a modification, a modified coal-fired steam generating unit would be considered ''new,'' and therefore not subject to these emission guidelines, if the modification occurs after the date the proposal was published in the **Federal Register** (May 23, 2023). Any coal-fired steam generating unit that has modified prior to that date would be considered an existing source that is subject to these emission guidelines.

In addition, the EPA is finalizing in the applicability requirements of the emission guidelines many of the same exemptions as discussed for 40 CFR part 60, subpart TTTT, in section VIII.E.1 of this preamble. EGUs that may be excluded from the requirement to establish standards under a state plan are: (1) units that are subject to 40 CFR part 60, subpart TTTT, as a result of commencing a qualifying modification or reconstruction; (2) steam generating units subject to a federally enforceable permit limiting net-electric sales to one-third or less of their potential electric output or 219,000 MWh or less on an annual basis and annual net-electric sales have never exceeded one-third or less of their potential electric output or 219,000 MWh; (3) non-fossil fuel units (*i.e.,* units that are capable of deriving at least 50 percent of heat input from non-fossil fuel at the base load rating) that are subject to a federally enforceable permit limiting fossil fuel use to 10 percent or less of the annual capacity factor; (4) combined heat and power (CHP) units that are subject to a federally enforceable permit limiting annual net-electric sales to no more than either 219,000 MWh or the product of the design efficiency and the potential electric output, whichever is greater; (5) units that serve a generator along with other affected EGU(s), where the effective generation capacity (determined based on a prorated output of the base load rating of EGU) is 25 MW or less; (6) municipal waste combustor units subject to 40 CFR part 60, subpart Eb; (7) commercial or industrial solid waste incineration units that are subject to 40 CFR part 60, subpart CCCC; (8) EGUs that derive greater than 50 percent of the heat input from an industrial process that does not produce any electrical or mechanical output or useful thermal output that is used outside the affected EGU; or (9) coal-fired steam generating units that have elected to permanently cease operation prior to January 1, 2032.

The exemptions listed above at (4), (5), (6), and (7) are among the current exemptions at 40 CFR 60.5509(b), as discussed in section VIII.E.1 of this preamble. The exemptions listed above at (2), (3), and (8) are exemptions the EPA is finalizing revisions for 40 CFR part 60, subpart TTTT, and the rationale for the exemptions is in section VIII.E.1 of this preamble. For consistency with the applicability requirements in 40 CFR part 60, subpart TTTT, and 40 CFR part 60, subpart TTTTa, the Agency is finalizing these same exemptions for the applicability of the emission guidelines.

2. Coal-Fired Units Permanently Ceasing Operation Before January 1, 2032

The EPA is not addressing existing coal-fired steam generating units demonstrating that they plan to permanently cease operating before January 1, 2032, in these emission guidelines. Sources ceasing operation before that date have far less emission reduction potential than sources that will be operating longer, because there are unlikely to be appreciable, cost-reasonable emission reductions available on average for the group of sources operating in that timeframe. This is because controls that entail capital expenditures are unlikely to be

[267] The term ''designated facility'' means ''any existing facility . . . which emits a designated pollutant and which would be subject to a standard of performance for that pollutant if the existing facility were an affected facility.'' See 40 CFR 60.21a(b).

[268] Under CAA section 111, the determination of whether a source is a new source or an existing source (and thus potentially a designated facility) is based on the date that the EPA proposes to establish standards of performance for new sources.

[269] The EPA recognizes, however, that the word ''facility'' is often understood colloquially to refer to a single power plant, which may have one or more EGUs co-located within the plant's boundaries.

of reasonable cost for these sources due to the relatively short period over which they could amortize the capital costs of controls.

In particular, in developing the emission guidelines, the EPA evaluated two systems of emission reduction that achieve substantial emission reductions for coal-fired steam generating units: CCS with 90 percent capture; and natural gas co-firing at 40 percent of heat input. For CCS, the EPA has determined that controls can be installed and fully operational by the compliance date of January 1, 2032, as detailed in section VII.C.1.a.i(E) of this preamble. CCS would therefore, in most cases, be unavailable to coal-fired steam generating units planning to cease operation prior to that date. Furthermore, the EPA evaluated the costs of CCS for different amortization periods. For an amortization period of more than 7 years—such that sources operate after January 1, 2039—annualized fleet average costs are comparable to or less than the costs of controls the EPA has previously determined to be reasonable ($18.50/MWh of generation and $98/ton of CO_2 reduced), as detailed in section VII.C.1.a.ii of this preamble. However, the costs for shorter amortization periods are higher. For sources ceasing operation by January 1, 2032, it would be unlikely that the annualized costs of CCS would be reasonable even were CCS installed at an earlier date (*e.g.,* by January 1, 2030) due to the shorter amortization period available.

Because the costs of CCS would be higher for shorter amortization periods, the EPA is finalizing a separate subcategory for sources demonstrating that they plan to permanently cease operating by January 1, 2039, with a BSER of 40 percent natural gas co-firing, as detailed in section VII.C.2.b.ii of this preamble. For natural gas co-firing, the EPA is finalizing a compliance date of January 1, 2030, as detailed in section VII.C.2.b.i(C) of this preamble. Therefore, the EPA assumes sources subject to a natural gas co-firing BSER can amortize costs for a period of up to 9 years. The EPA has determined that the costs of natural gas co-firing at 40 percent meet the metrics for cost reasonableness for the majority of the capacity that operate more than 2 years after the January 1, 2030, implementation date, *i.e.,* that operate after January 1, 2032 (and up to December 31, 2038), and that therefore have an amortization period of more than 2 years (and up to 9 years).

However, for sources ceasing operation prior to January 1, 2032, the EPA believes that establishing a best system of emission reduction corresponding to a substantial level of natural gas co-firing would broadly entail costs of control that are above those that the EPA is generally considering reasonable. Sources permanently ceasing operation before January 1, 2032 would have less than 2 years to amortize the capital costs, as detailed in section VII.C.2.a of this preamble. Compared to the metrics for cost reasonableness that EPA has previously deemed reasonable ($18.50/MWh of generation and $98/ton of CO_2 reduced), very few sources can co-fire 40 percent natural gas at costs comparable to these metrics with an amortization period of only one year; only 1 percent of units have costs that are below both $18.50/MWh of generation and $98/ton of CO_2 reduced. The number of sources that can co-fire lower amounts of natural gas at costs comparable to these metrics is likewise limited—only approximately 34 percent of units can co-fire with 20 percent natural gas at costs lower than both cost metrics. Furthermore, the period that these sources would operate with co-firing for would be short, so that the emission reductions from that group of sources would be limited.

By contrast, assuming a two-year amortization period, many more units can co-fire with meaningful amounts of natural gas at a cost that is consistent with the metrics EPA has previously used: 18 percent of units can co-fire with 40 percent natural gas at costs less than $98/ton and $18.50/MWh, and 50 percent of units can co-fire with 20 percent natural gas at costs lower than both metrics. Because a substantial number of sources can implement 40-percent co-firing with natural gas with an amortization period of two years or longer with reasonable costs, and even more can co-fire with lesser amounts with reasonable costs with amortization periods longer than two years,[270] the EPA determined that a technology-based BSER was available for coal-fired units operating past January 1, 2032.

Sources that retire before that date, however, are differently situated as described above. In light of the small number of sources that are planning to retire before January 1, 2032 that could cost-effectively co-fire with natural gas, coupled with the small amount of emissions reductions that can be achieved from co-firing in such a short time span, the EPA is choosing not to establish a BSER for these sources.[271]

Because, at this time, the EPA has determined that CCS and natural gas co-firing are not available at reasonable cost for sources ceasing operation before January 1, 2032, the EPA is not finalizing a BSER for such sources. Not finalizing a BSER for these sources is consistent with the Agency's discretion to take incremental steps to address CO_2 from sources in the category, and to direct the EPA's limited resources at regulation of those sources that can achieve the most emission reductions. The EPA is therefore providing that existing coal-fired steam generating EGUs that have elected to cease operating before January 1, 2032, are not regulated by these emission guidelines. This exemption applies to a source until the earlier of December 31, 2031, or the date it demonstrates in the state plan that it plans to cease operation. If a source continues to operate past this date, it is no longer exempt from these emission guidelines. See section X.E.1 of this preamble for discussion of how state plans should address sources subject to exemption (9).[272]

3. Sources Outside of the Contiguous U.S.

The EPA proposed the same emission guidelines for fossil fuel-fired steam

[270] As described in detail in section X.C.2 of this preamble, the EPA recognizes that particular affected EGUs may have characteristics that make it unreasonable to achieve the degree of emission limitation corresponding to 40 percent co-firing with natural gas. For example, a state may be able to demonstrate a fundamental difference between the costs the EPA considered in these emission guidelines and the costs to an affected EGU that plans to cease operation in late 2032. If such costs make it unreasonable for a particular unit to meet the degree of emission limitation corresponding to 40 percent co-firing with natural gas, the state may apply a less stringent standard of performance to that unit. Consistent with the requirements for calculating a less stringent standard of performance at 40 CFR 60.24a(f), under these emission guidelines states would consider whether it is reasonable for units that cannot cost-reasonably co-fire natural gas at 40 percent to co-fire at levels lower than 40 percent. It is thus appropriate that coal-fired EGUs that can reasonably co-fire any amount of natural gas be subject to these emission guidelines.

[271] For the reasons described at length in section VI.B, the EPA does not believe that heat rate improvement measures or HRI are appropriate for sources retiring before January 1, 2032 because HRI applied to coal-fired sources achieve few emission reductions, and can lead to the ''rebound effect'' where CO_2 emissions from the source increase rather than decrease as a consequence of imposing the technologies.

[272] The EPA notes that this applicability exemption does not conflict with states' ability to consider the remaining useful lives of ''particular'' sources that are subject to these emission guidelines. 42 U.S.C. 7411(d)(1). As the EPA's implementing regulations specify, the provision for states' consideration of RULOF is intended address the specific conditions of particular sources, whereas the EPA is responsible for determining generally how to regulate a source category under an emission guideline. Moreover, RULOF applies only to when a state is applying a standard of performance to an affected source—and the state would not apply a standard of performance to exempted sources.

generating units in non-continental areas (*i.e.,* Hawaii, the U.S. Virgin Islands, Guam, American Samoa, the Commonwealth of Puerto Rico, and the Northern Mariana Islands) and non-contiguous areas (non-continental areas and Alaska) as the EPA proposed for comparable units in the contiguous 48 states. The EPA notes that the modeling that supports the final emission guidelines focus on sources in the contiguous U.S. Further, the EPA notes that few, if any, coal-fired steam generating units operate outside of the contiguous 48 states and meet the applicability criteria. Finally, the EPA notes that the proposed BSER and degree of emissions limitation for non-continental oil-fired steam generating units would have achieved few emission reductions. Therefore, the EPA is not finalizing emission guidelines for existing steam generating units in states and territories (including Alaska, Hawaii, Guam, Puerto Rico, and the U.S. Virgin Islands) that are outside of the contiguous U.S. at this time.

4. IGCC Units

The EPA notes that existing IGCC units were included in the proposed applicability requirements and that, in section VII.B of this preamble, the EPA is finalizing inclusion of those units in the subcategory of coal-fired steam generating units. IGCC units gasify coal or solid fossil fuel (*e.g.,* pet coke) to produce syngas (a mixture of carbon monoxide and hydrogen), and either burn the syngas directly in a combined cycle unit or use a catalyst for water-gas shift (WGS) to produce a pre-combustion gas stream with a higher concentration of CO_2 and hydrogen, which can be burned in a hydrogen turbine combined cycle unit. As described in section VII.C of this preamble, the final BSER for coal-fired steam generating units includes co-firing natural gas and CCS. The few IGCC units that now operate in the U.S. either burn natural gas exclusively—and as such operate as natural gas combined cycle units—or in amounts near to the 40 percent level of the natural gas co-firing BSER. Additionally, IGCC units may be suitable for pre-combustion CO_2 capture. Because the CO_2 concentration in the pre-combustion gas, after WGS, is high relative to coal-combustion flue gas, pre-combustion CO_2 capture for IGCC units can be performed using either an amine-based (or other solvent-based) capture process or a physical absorption capture process. Alternatively, post-combustion CO_2 capture can be applied to the source. The one existing IGCC unit that still uses coal was recently awarded funding from DOE for a front-end engineering design (FEED) study for CCS targeting a capture efficiency of more than 95 percent.[273] For these reasons, the EPA is not distinguishing IGCC units from other coal-fired steam generating EGUs, so that the BSER of co-firing for medium-term coal-fired units and CCS for long-term coal-fired units apply to IGCC units.[274]

5. Fossil Fuel-Type Definitions for Subcategories of Steam Generating Units

In this action, the EPA is finalizing definitions for subcategories of existing fossil fuel-fired steam generating units based on the type and amount of fossil fuel used in the unit. The EPA is finalizing separate subcategories based on fuel type because the carbon content of the fuel combusted affects the output emission rate (*i.e.,* lb CO_2/MWh). Fuels with a higher carbon content produce a greater amount of CO_2 emissions per unit of fuel combusted (on a heat input basis, MMBtu) and per unit of electricity generated (*i.e.,* MWh).

The EPA proposed fossil fuel type subcategory definitions based on the definitions in 40 CFR part 63, subpart UUUUU, and the fossil fuel definitions in 40 CFR part 60, subpart TTTT. Those proposed definitions were determined by the relative heat input contribution of the different fuels combusted in a unit during the 3 years prior to the proposed compliance date of January 1, 2030. Further, to be considered an oil-fired or natural gas-fired unit for purposes of this emission guideline, a source would no longer retain the capability to fire coal after December 31, 2029.

The EPA proposed a 3-year lookback period, so that the proposed fuel-type subcategorization would have been based, in part, on the fuel type fired between January 1, 2027, and January 1, 2030. However, the intent of the proposed fuel type subcategorization was to base the fuel type definition on the state of the source on January 1, 2030. Therefore, the EPA is finalizing the following fuel type subcategory definitions:

- A *coal-fired steam generating unit* is an electric utility steam generating unit or IGCC unit that meets the definition of ''fossil fuel-fired'' and that burns coal for more than 10.0 percent of the average annual heat input during any continuous 3-calendar-year period after December 31, 2029, or for more than 15.0 percent of the annual heat input during any one calendar year after December 31, 2029, or that retains the capability to fire coal after December 31, 2029.
- An *oil-fired steam generating unit* is an electric utility steam generating unit meeting the definition of ''fossil fuel-fired'' that is not a coal-fired steam generating unit, that no longer retains the capability to fire coal after December 31, 2029, and that burns oil for more than 10.0 percent of the average annual heat input during any continuous 3-calendar-year period after December 31, 2029, or for more than 15.0 percent of the annual heat input during any one calendar year after December 31, 2029.
- A *natural gas-fired steam generating unit* is an electric utility steam generating unit meeting the definition of ''fossil fuel-fired,'' that is not a coal-fired or oil-fired steam generating unit, that no longer retains the capability to fire coal after December 31, 2029, and that burns natural gas for more than 10.0 percent of the average annual heat input during any continuous 3-calendar-year period after December 31, 2029, or for more than 15.0 percent of the annual heat input during any one calendar year after December 31, 2029.

The EPA received some comments on the fuel type definitions. Those comments and responses are as follows.

Comment: Some industry stakeholders suggested changes to the proposed definitions for fossil fuel type. Specifically, some commenters requested that the reference to the initial compliance date be removed and that the fuel type determination should instead be rolling and continually update after the initial compliance date. Those commenters suggested this would, for example, allow sources in the coal-fired subcategory that begin natural gas co-firing in 2030 to convert to the natural-gas fired subcategory prior to the proposed date of January 1, 2040, instead of ceasing operation.
