Comment: Several commenters expressed concern that this provision was written so broadly that it would interfere with the requirements in other parts of the proposed rule, including the requirement to provide reasonable assistance to persons using accessible medical equipment, for example, including helping a person who uses a wheelchair to transfer from their wheelchair to the exam table or diagnostic chair, as well as the variety of obligations to provide auxiliary aids. An organization representing persons who need communication tools and supports noted that devices used for communication are often not treated as covered auxiliary aids or services but as personal devices and, as a result, are not provided to persons with communication needs who require them to receive, for example, health care not as effective as that provided to others. This comment suggested adding regulatory text that, where personal devices and services are customarily provided as part of a recipient's program or activities, then these personal devices and services should also be provided to persons with disabilities.

Response: The Department is aware that many programs funded by the Department include, as a regular feature of the program, the provision of personal care services. Hospitals, nursing homes, child welfare services, and home and community-based services (HCBS), by their very nature, routinely provide assistance in eating, dressing, and toileting, the type of personal care services specifically not required by this provision. The Department reiterates its statement from the NPRM that where personal devices and services are customarily provided as part of a recipient's program or activities, then these personal devices and services should also be provided to persons with disabilities. However, it is important to preserve parity with the ADA regulations given Congress's intent that the ADA and section 504 be interpreted consistently and to reduce confusion for both recipients and individuals with disabilities. Therefore, the Department declines to add this statement to the regulatory text but emphasizes that this provision should not be interpreted as a blanket allowance for recipients to deny personal devices and services to individuals with disabilities that the recipient would customarily provide to individuals without disabilities as part of its programs and activities. The supplementary information accompanying DOJ's title III ADA regulation includes this interpretation as well.[77]

Comment: Another commenter on § 84.72 noted that the rule should be changed to make clear that recipients cannot require persons with disabilities to be separated from their own personal devices and to then function without their devices, for example, prohibiting persons who use wheelchairs from being told that they cannot take their own wheelchairs with them when being transported to the hospital.

Response: The Department does not believe it is necessary to add regulatory text to address this situation, but notes that there are circumstances in which recipients are prohibited from separating persons with disabilities from their personal devices that they need to function. For example, an ambulance company that receives Federal funds from HHS is called to the scene of an automobile accident and is going to take a person with a disability who uses a wheelchair to the emergency room of a hospital. The ambulance service, a recipient subject to the general prohibitions against excluding individuals with disabilities in § 84.68, generally cannot pick up the person and leave the wheelchair, an expensive piece of accessible personal equipment, behind at the scene of the accident and expect the person with the disability to recover their wheelchair. The Department recognizes that there may be room or other limitations in the ambulance itself, but that does not relieve the ambulance service of any responsibility to assist in returning the wheelchair to the person with a disability, which may be needed at the site where the person with the disability is being transported. As a recipient, the ambulance service is subject to all of the general prohibitions in § 84.68 which states that individuals with disabilities may not be excluded from participation in or be denied the benefits of their programs or activities. In situations like this, the ambulance company can have a policy or agreement in place to deal with the transport of a wheelchair that might not fit into the ambulance itself.

Similarly, in situations where a person with a speech disability enters a hospital or a nursing home with their personal communication device that they use because they cannot rely on speech alone to be heard and understood by others, the recipient hospital or nursing home must not separate the person from their device, which would deprive the person with a disability of the ability to communicate with others. The Department notes that DOJ has followed a similar policy in addressing concerns where, for example, police may make an arrest of a wheelchair user and must transport both the person and their accessibility equipment to the police station.

Summary of Regulatory Changes

For the reasons set forth above and considering comments received, we are finalizing § 84.72 as proposed with no modifications.

Service Animals (§ 84.73)

Proposed § 84.73 addressed service animals and tracks the ADA title II regulations.[78] Proposed § 84.73(a) stated that generally recipients shall modify its policies, practices, or procedures to permit the use of a service animal by an individual with a disability. The rule, in proposed § 84.10, defined a service animal as any dog that is individually trained to do work or perform tasks for the benefits of an individual with a disability.

Proposed § 84.73(b) contained detailed requirements for recipients and

[76] 88 FR 63478.

[77] 28 CFR part 36, appendix C (1991) (addressing § 36.306) (''Of course, if personal services are customarily provided to the customers or clients of a public accommodation, *e.g.,* in a hospital or senior citizen center, then these personal services should also be provided to persons with disabilities . . .'').

[78] 28 CFR 35.136.

handlers of service animals, including when a recipient may ask an individual with a disability to remove the service animal from the premises (§ 84.73(b)), that the service animal shall be under the control of its handler (§ 84.73(d)), that the recipient is not responsible for the care and supervision of a service animal (§ 84.73(e)), that the recipient shall not ask about the nature or extent of a person's disability, but may ask if the animal is required because of a disability and what work or task the animal has been trained to perform (§ 84.73(f)), that individuals with disabilities shall be permitted to be accompanied by their service animals in all areas of the recipient's facilities where members of the public go (§ 84.73(g)), and that recipients are not allowed to require an individual with a disability to pay a surcharge (§ 84.73(h)). Proposed § 84.73(i) stated that a recipient shall make reasonable modifications in policies, practices, or procedures to permit the use of a miniature horse by an individual with a disability and it provided assessment factors to determine whether reasonable modifications can be made to allow a miniature horse into a specific facility.

The comments and our responses regarding § 84.73 are set forth below.

General comment: The comments that the Department received on § 84.73 were uniformly supportive. Commenters noted that DOJ's ADA regulations were crafted through years of experience and a duly compassionate outlook and that having the same service animal regulation for section 504 as for title II of the ADA will provide necessary clarity for persons who work with service animals and health care and social service providers that receive Federal funding.

Comment: Some commenters recommended adding the example of ''carrying an individual's speech-generating device'' as an example of the type of work or service that a service animal could be trained to do.

Response: The Department agrees that service animals may be used to assist persons with communication disabilities and that recipients should be made aware of this possibility so that they do not unnecessarily inquire of persons with communication disabilities about the nature of the work that the service animal performs for the person. However, the Department is not adding language to the regulatory text, because adding phrases here that are not found in DOJ's ADA regulations on service animals may cause confusion.

Comment: The Department received several comments on the use of service animals in health care settings. An entity that operates a hotline providing guidance to service animal handlers and to recipients noted that over 70% of their callers addressed access challenges in health care facilities due to the presence of service dogs.

Response: The Centers for Disease Control and Prevention (CDC) notes there is no evidence that suggests that animals pose a more significant risk of transmitting infection than people; therefore, service animals should not be excluded from such areas unless a patient's situation or a particular animal poses risk that cannot be mitigated through reasonable measures.[79] Thus, the Department notes that under the final rule, a health care facility generally must permit a person with a disability to be accompanied by a service animal in all areas of the facility in which that person would otherwise be allowed. There are some exceptions, however. Consistent with case law and CDC guidance, it is generally appropriate to exclude a service animal from limited-access areas that employ general infection-control measures, such as operating rooms and burn units. Usually, a service animal may accompany its handler to such areas as admissions and discharge offices, the emergency room, inpatient and outpatient rooms, examining and diagnostic rooms, clinics, rehabilitation therapy areas, the cafeteria and vending areas, the pharmacy, restrooms, and all other areas of the facility where health care personnel, patients, and visitors are permitted without added precaution.

Comment: Several commenters asked for clarification on issues related to the phrase ''under the control of its handler.'' Commenters stated that this clarification should help prevent discrimination against minors and persons with severe disabilities who are sometimes viewed as incapable of acting as the handler of their own service dog due to age or false assumptions and stereotypes about their disability. Other commenters expressed concern about handlers who are not able to physically control their service dog. Commenters noted that people with mental and communication disabilities are increasingly using service dogs and their handlers may not be able to issue verbal commands but can control their service dog through gestures and nonverbal means.

Response: The Department agrees that the handler of a service animal is most often an individual with a disability. The Department's rule at § 84.73(d) notes that one way for an individual with a disability to exercise control over their service animal is by ''voice control, signals, or other effective means.'' This language encompasses gestures and nonverbal means of controlling a service dog.

Comment: Some commenters noted that some court decisions have applied the concept of reasonable modification to § 84.73(e), which states that the recipient is not responsible for the care and supervision of a service animal. The comments seek clarification that providing some assistance to a person with a disability while they handle or care for their service dog may be required as a reasonable modification as long as it does not rise to the level of a fundamental alteration and is consistent with the type of assistance provided to other people with or without disabilities.

Response: The Department notes that DOJ in its ''Frequently Asked Questions about Service Animals and the ADA,'' states that the handler is responsible for caring for and supervising the service animal, which includes toileting, feeding, and grooming.[80] However, a school or similar entity operating in the K–12 context may be required to provide some assistance, which is short of care or supervision, to enable an individual with a disability to handle their service animal.[81]

Recipients are not obligated to supervise or otherwise care for a service animal. This guidance specifically addresses patients in hospital care who have service animals with them in their hospital room. It states that, if the patient is not able to care for the service animal, the patient can make arrangements for a family member or friend to come to the hospital to provide these services, as it is always preferable that the service animal and its handler not be separated.[82] In addition, the CDC has stated that care of the service animal remains the obligation of the person with the disability, not the health care staff.[83]

Comment: Several commenters noted that the use of miniature horses as a form of reasonable modification of policy has worked well with ADA title II rules and should be added to the Department's section 504 rule. A trade organization noted that, while miniature horses can serve persons with disabilities, they are legally recognized as livestock and should be included as a separate entity from service animals. A legal rights advocacy organization stated that miniature horses may work best for higher weight or tall individuals, and stated the importance of including obesity as covered by section 504, as that would help ensure that higher weight individuals will be determined to be persons with disabilities and entitled to reasonable modification.

Response: The Department agrees that miniature horses, under § 84.73(i), are not included in the definition of service animal, which is limited to dogs, and that they are legally recognized as livestock. However, the regulatory text makes it clear that a recipient must make reasonable modifications in policies, practices, or procedures to permit use of a miniature horse by an individual with a disability if the animal has been individually trained to do work or perform tasks for the benefit of the individual with a disability. In the discussion of the definition of disability above at § 84.4, the Department noted that obesity could be considered a physical or mental impairment and that, if it substantially limited one or more of a person's major life activities, would qualify as a disability. In this case, a qualifying higher weight individual may be able to avail themselves of the use of miniature horses as a form of reasonable modification of polices, practices, or procedures.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.73 as proposed with no modifications.

Mobility Devices (§ 84.74)

This section in the section 504 NPRM was identical to the ADA title II regulation.[84] Proposed § 84.74(a) provided that recipients shall permit individuals with mobility disabilities to use wheelchairs and manually-powered mobility aids, such as walkers, crutches, canes, braces, or other similar devices designed for use by individuals with mobility disabilities in any areas open to pedestrian use.

Section 84.74(b) proposed to require a recipient to make reasonable modifications in its policies, practices, or procedures to permit the use of other power-driven mobility devices by individuals with mobility disabilities, unless a recipient can demonstrate that the class of other power-driven mobility devices cannot be operated in accordance with legitimate safety requirements. The rule, in proposed § 84.10, defined other power-driven mobility device to mean any mobility device powered by batteries, fuel, or other engines—whether or not designed primarily for use by individuals with mobilities disabilities—that is used by individuals with mobility disabilities for the purpose of locomotion.

Proposed § 84.74(b)(2) listed the factors that recipients would be required to consider in determining whether to permit other power-driven mobility devices on their premises, including the type, size, weight, dimensions, and speed of the device; the volume of pedestrian traffic; the facility's design; whether the facility is indoors or outdoors; the availability of storage space if requested; and whether the use of the device creates a substantial risk of serious harm to the environment or natural and cultural resources.

Proposed § 84.74(c)(1) would prohibit a recipient from asking an individual using a wheelchair or other power-driven mobility device questions about the nature and extent of the individual's disability. Proposed § 84.74(c)(2) would permit a recipient to ask a person using an other power-driven mobility device to provide a credible assurance that the mobility device is required because of the person's disability, including a valid, State-issued parking placard or other State-issued proof of disability, or in lieu of such documents, a verbal representation, not contradicted by observable fact, that the other power-driven mobility device is being used for a mobility disability.

The comments and our responses to them regarding § 84.74 and related terms are set forth below.

Comment: Commenters were generally appreciative of the Department's decision to adopt the approach taken by DOJ on mobility devices in § 84.74. Some commenters expressed concern that the phrase ''other power-driven mobility devices'' in § 84.74(b) could be interpreted to include scooters and power chairs commonly used by persons with disabilities, so they recommended that the Department clarify that higher capacity wheelchairs and scooters are covered in § 84.74(a), and not in § 84.74(b). A commenter providing health care made the case that the Department should exempt health care facilities from having to admit devices like Segways®, golf carts, and other motorized devices because allowing them into the facility will put patients in harm's way. One commenter noted that some recipients, including nursing homes, use blanket bans of power wheelchairs to exclude individuals with disabilities from programs and services.

Response: The Department notes that proposed § 84.74(a) specifically concerns ''wheelchairs'' and that the definition of ''wheelchair'' in § 84.10 includes a ''power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor, or of both indoor and outdoor locomotion.'' This definition includes scooters and power wheelchairs that are specifically designed for the use of persons with mobility disabilities. It contrasts with the definition of other power-driven mobility devices, which are not necessarily designed primarily for the use of persons with mobility disabilities. This definition of other power-driven mobility devices encompasses golf carts and electronic personal assistance mobility devices such as the Segway®. Thus, § 84.74(a) includes scooter and power wheelchairs designed for the use of persons with mobility disabilities, and § 84.74(b) includes golf carts, Segways®, and other similar motorized devices that have not been primarily designed for persons with mobility disabilities.

The Department believes that the processes established by § 84.74 will allow hospitals and other recipients to make reasonable and reasoned decisions about whether and how to allow other power-driven mobility devices into their facilities. Section 84.74(b)(1) provides that recipients shall make reasonable modifications in its policies, practices, or procedures to permit the use of other power-driven mobility devices by individuals with mobility disabilities, unless the recipient can demonstrate that the class of such devices cannot be operated in accordance with legitimate safety requirements. Section 84.74(b)(2) provides a list of assessment factors that recipients can use to consider in making determinations concerning whether and how the recipient will allow different types or classes of other power-driven mobility devices into its facilities. The Department believes that this process will allow hospitals and others to develop and issue policies that balance the need for patient safety with the needs of persons with disabilities who

[84] 28 CFR 35.137.

use other power-driven mobility devices in their facilities.

For example, using these assessment factors, a county hospital may decide that it can allow electronic personal assistance mobility devices (EPAMDs), which are other power-driven mobility devices under proposed § 84.10 in any areas open to pedestrian use, including the cafeteria and general patient rooms, but not in other specified areas of the hospital (*e.g.,* the emergency room or other areas with high traffic and cramped quarters), as long as operators do not operate the device faster than pedestrians are walking. A recipient might also decide, using the assessment factors, that due to air quality concerns, for example, gas-powered devices would not be allowed in the hospital's indoor facilities; or that certain classes of devices, such as golf carts, could not be allowed for safety reasons, because the facility's corridors or aisles are not wide enough to accommodate those vehicles and are heavily trafficked. Because § 84.74 establishes a procedure and sets forth appropriate assessment standards for recipients, the Department does not view it as necessary to exempt health care facilities from the requirements of this section in its final rule. In addition, the Department notes that health care facilities, both public and private, have already been subject to this same provision since 2010 under DOJ's ADA regulations for titles II and III.

As to the comment on blanket bans on the use of motorized wheelchairs in nursing homes, the Department notes that such bans may violate section 504. The Department's final rule requires recipients to allow the use of wheelchairs, including power-driven ones, and contains several disability-related provisions that require a recipient to tailor its approach based on the specific circumstances rather than apply blanket bans. For example, recipients need not allow an individual to participate in or benefit from the programs or activities of that recipient if it concludes, after an individualized assessment, that the individual poses a ''direct threat'' as set forth in § 84.75. Similarly, ''a recipient may impose legitimate safety requirements necessary for the safe operation of its programs or activities'' in § 84.68(h). However, the recipient must ensure that ''its safety requirements are based on actual risks, not on mere speculation, stereotypes, or generalizations about individuals with disabilities.'' In addition, § 84.68(b)(8) provides that a ''recipient shall not impose or apply eligibility criteria that screen out or tend to screen out an individual with a disability or any class of individuals with disabilities from fully and equally enjoying any program or activity, unless such criteria can be shown to be necessary for the provision of the program or activity being offered.''

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.74 as proposed with no modifications.

Direct Threat (§ 84.75)

Proposed § 84.75(a) stated that nothing in this part requires a recipient to permit an individual to participate in or benefit from programs or activities when that individual poses a direct threat.

Proposed § 84.75(b) stated that except as provided in paragraph (c), in determining whether an individual poses a direct threat, a recipient must make an individualized assessment, based on reasonable judgment that relies on current medical knowledge or on the best available objective evidence, to ascertain: the nature, duration, and severity of the risk; the probability that the potential injury will actually occur; and whether reasonable modifications of policies, practices, or procedures or the provision of auxiliary aids or services will mitigate the risk.

Proposed § 84.75(c) provided that in the area of employment, the individualized assessment must be made according to the ADA title I regulations of the Equal Employment Opportunity Commission.

The comments and our responses regarding § 84.75 are set forth below.

Comments: The Department received many comments, including from multiple organizations representing individuals with disabilities, stating that the direct threat defense has been misunderstood, overused, and misconstrued and has been used to justify blanket bans on wheelchairs, power wheelchairs, and other mobility assistive devices based on generalizations and stereotypes. The commenters asked that we clarify that the direct threat analysis should be focused on the individual and requires a fact-specific, individualized assessment.

Response: As set forth in the definition of direct threat in § 84.10, the standard to apply when determining whether a situation poses a direct threat is whether it is a significant risk to the health and safety of others that cannot be eliminated by a modification of policies, practices, and procedures, or by the provision of auxiliary aids and services. In determining whether that standard has been met, the Department affirms the notion that the determination is a factual one that requires an individualized assessment and that it cannot be used to impose blanket bans on, for example, mobility devices without consideration of the appropriate factors.

Comment: An organization representing an association of State government agencies highlighted the potential unintended consequences of the direct threat text. They focused on a subgroup of individuals with disabilities who have impulsive and explosive behaviors that can sometimes result in injury to themselves or others. The commenter noted that in these types of situations, many States have developed small community service settings for those individuals rather than providing services in more restrictive settings such as State institutions. The commenters were afraid that if the Department were to keep the direct threat language as in the proposed rule, individuals who need extraordinary measures will be permanently assigned to institutional care. They suggested the addition of a paragraph in the text indicating that if all reasonable modifications have been made to mitigate the risk and the probability of potential injury still exists, the recipient must structure the program with sufficient staff well trained to disarm and defend against the threatening behavior.

Response: The Department thanks the commenters for their thoughtful suggestions for additions to the direct threat text. Section 84.68(b)(7) contains the Department's reasonable modifications requirement. That section requires recipients to provide reasonable modifications to policies, practices, and procedures when such modifications are necessary to avoid discrimination on the basis of disability, unless the recipient can demonstrate that making the modifications would fundamentally alter the nature of the program or activity. And § 84.76 contains the Department's integration requirement. These regulations require ''reasonable'' modifications but commenters want the mandate to include ''extraordinary'' modifications. The Department is unable to change the direct threat text to require more of recipients than is required by the reasonable modifications and integration provisions. Recipients can certainly decide to provide more than is required by section 504 to serve particular individuals but we cannot mandate that they do so. Accordingly, we decline to change the regulatory text.

Summary of Regulatory Changes

For the reasons set forth above and considering comments received, we are retaining § 84.75 as proposed with no modifications.

Integration (§ 84.76)

Proposed § 84.76 expanded upon the integration mandate in the existing section 504 regulations at § 84.4(b)(2) and the integration requirement in proposed § 84.68(d).

Proposed § 84.76(a) addressed the application of the section.

Proposed § 84.76(b) prohibited administering a program or activity in a manner that results in unnecessary segregation of individuals with disabilities.

Proposed § 84.76(c) defined a segregated setting as one where individuals with disabilities are unnecessarily separated from people without disabilities. Such settings are populated exclusively or primarily with individuals with disabilities, and may be characterized by regimentation in daily activities; lack of privacy or autonomy; or policies limiting visitors or limiting individuals' ability to engage freely in community activities and to manage their own activities of daily living.

The Department invited comment on whether the definition of ''segregated setting'' should be expanded.

Proposed § 84.76(d) provided a non-exhaustive list of specific prohibitions.

Proposed § 84.76(e) stated that a recipient may establish a defense to the application of this section if it can demonstrate that a requested modification would fundamentally alter the nature of its program or activity.

The Department invited comment on what may constitute a fundamental alteration for recipients who are not public entities, for example, an individual skilled nursing facility responsible for identifying and preparing individuals who can and want to be discharged to available community-based services.

The comments and our responses regarding § 84.76 are set forth below.

General

Comments: Most commenters enthusiastically supported the clarification of integration requirements in this section. We received supportive comments from individuals, advocacy organizations, State government and provider associations, and managed care plans, among others. Commenters emphasized the importance of integrated services to ensure individuals with disabilities can live, work, and engage in the community like people without disabilities.

Response: The Department appreciates support for this section and intends for the new provisions to clarify the existing requirements of covered entities.

Comments: Several commenters, including parents of adult children with disabilities and parent advocacy organizations, expressed concerns related to the legitimacy of the integration provision and shared the opinion that institutional settings are the only appropriate option for some individuals with disabilities. Further, these commenters alleged that failure to ensure the availability of institutional placements is discrimination against individuals with disabilities.

Response: While this section elaborates on the prior rule's language requiring programs and services to be administered in the most integrated setting, the additions are intended to codify longstanding case law and Federal guidance with respect to the obligations of covered entities to serve individuals with disabilities in the most integrated setting appropriate to their needs.[85] The Department recognizes several commenters' opposition to the integration mandate. We note that contrary to some parent advocacy groups' position, the integration mandate in section 504 or title II does not require recipients or public entities to offer services, programs, or activities in institutional settings.[86] We reiterate this section clarifies existing obligations under Federal law to help recipients deliver services in the most integrated setting appropriate to a person's needs.

Comment: A commenter suggested that the Department's integration mandate discriminates against those persons with severe or multiple disabilities who may need the services of institutional settings. Another commenter representing State government stated that the proposed rule violates the constitutional principle of separation of powers.

Response: The Department does not agree that its integration requirement in § 84.76(b) discriminates against persons with severe disabilities. That section requires providing a person with a disability with the most integrated setting ''appropriate to the needs of a qualified persons with a disability.'' This language by its own terms recognizes the possibility that there may be situations where an appropriate placement may be in an institutional setting.

As to the comment on the separation of powers, the Department disagrees with the comment's assertion that its regulation removes political judgment from the hand of the States or supplants States' authority or discretion in this area. The Department is following the precedent set in the *Olmstead* decision. The regulation recognizes that, when States already have programs in place providing services to persons with disabilities, those programs must comply with two Federal civil rights requirements: section 504's and the ADA's requirement not to operate programs or activities in a manner that discriminates on the basis of disability. For reasons discussed elsewhere in our responses to comments about § 84.76 (d) (discussion of the ''at serious risk'' standard and the *U.S.* v. *Mississippi* decision) and the discussion of Executive Order 13132 and federalism, the rule's integration mandate, including the prohibition on failure to provide community-based services that results in ''serious risk of institutionalization,'' does not exceed statutory authority under section 504 and the ADA and therefore does not implicate separation of powers concerns by improperly intruding on State policymaking discretion.

Further, the rule requires only ''reasonable modifications,'' and codifies the ''fundamental alteration'' limitation, two additional features that respect the role of federalism.

Application (§ 84.76(a))

Comments: Several commenters asked the Department to clarify whether this section applies to specific programs, such as day programs for individuals with dementia or programs for individuals with mental illness. Additionally, some commenters asked for elaboration on how this applies to programs funded through Medicare Advantage. These commenters argued

[85] *See, e.g., Olmstead* v. *L.C.,* 527 U.S. 581 (1999); U.S. Dep't of Justice, Statement of the Department of Justice on Enforcement of the Integration Mandate of Title II of the Americans with Disabilities Act and *Olmstead* v. *L.C.* (2020), *https://www.ada.gov/olmstead/q&a_olmstead.htm.*

[86] *See e.g., Richard C. ex rel. Kathy B.* v. *Houstoun,* 196 FRD. 288, 292 (W.D. Ohio 2021) (''These courts find that failure to provide facility-based services does not constitute discrimination under the ADA or Rehabilitation Act.'' *citing D.T.* v. *Armstrong,* 2017 U.S. Dist. LEXIS 91725 *20–21, 2017 WL 2590137 *7–8 (D. Idaho 2017)*, Sciarrillo* v. *Christie,* 2013 U.S. Dist. LEXIS 175178, 2013 WL 6586569, * 4 (D. N.J. Dec. 13, 2013) (citing *Richard S.* v. *Dep't of Developmental Servs. of the State of Cal.,* 2000 U.S. Dist. LEXIS 22750, 2000 WL 35944246, *3 (C.D. Cal. Mar. 27, 2000)); *Richard C. ex rel. Kathy B.* v. *Houstoun,* 196 FRD. 288, 292 (W.D. Pa. 1999); *Ill. League of Advocates for the Developmentally, Disabled* v. *Quinn,* 2013 U.S. Dist. LEXIS 86637, 2013 WL 3168758, *5 (N.D. Ill. June 20, 2013)).

that the failure to provide Medicaid and Medicare beneficiaries with needed services, including mental health services, treatments, and equipment, quickly leads to decreased health and function that can put both Medicaid and Medicare enrollees at serious risk of unnecessary institutionalization.

Response: The integration requirements apply to all programs or activities that receive Federal financial assistance from the Department without exception. The rule clarifies recipients' existing obligations under section 504 and does not create new obligations regarding integration. For example, managed care organizations and Medicare Advantage entities are obligated to provide services in the most integrated setting if doing so does not fundamentally alter the program or service. Similarly, hospital systems receiving Federal financial assistance from the Department must ensure their discharge planning processes facilitate HCBS when appropriate, rather than defaulting to coordinating placements for congregate care facilities.

We note that the ''most integrated setting'' depends on what is appropriate for the individual with a disability.

Comments: Several commenters highlighted the importance of the availability of key resources like accessible, affordable housing; transportation; and assistive technology, that individuals with disabilities need to engage fully in the community. Shortages in these programs and services create barriers to community integration. Commenters encouraged the Department to include access to these services in the rule.

Response: The Department agrees that many federally funded services are necessary to help eliminate barriers to community living and engagement. We note that this rule's coverage extends only to recipients of Federal financial assistance through this Department, and does not reach many transportation, housing, education, or other programs that do not receive HHS funds. However, we collaborate frequently with our Federal partners who do fund these services and have issued joint guidance about how these programs support community integration for disabilities.[87] We will consider additional joint guidance to advance coordination as appropriate.

Applicability of the Integration Requirement in a Public Health Emergency

Comments: Several commenters noted that Public Health Emergencies and natural disasters are critical junctures where people with disabilities are institutionalized. They cited the National Council on Disability (NCD) report, ''Preserving Our Freedom: Ending Institutionalization of People with Disabilities During and After Disasters,'' which found that people with disabilities are often transferred to nursing facilities or segregated shelters during emergencies, without proper assessment, transition planning or discharge planning.[88] Commenters highlighted that, during the COVID–19 pandemic, people were often placed in congregate care settings with extreme levels of uncontrolled infection and resulting high mortality rates.

Response: The Department has consistently stated that section 504 and other civil rights obligations apply during a public health emergency.[89] Further, even if a practice is allowed through an administrative policy such as a Public Health emergency waiver, such a waiver does not obviate the covered entity's responsibility to meet their obligations under section 504.

Obligations under the Medicare Program

Comments: Several commenters noted that the integration mandate has substantial implications for the Medicare program and requested that the Department clarify obligations of recipients operating Medicare-financed programs under section 504's integration mandate, including with respect to home health and other Medicare benefits.

Response: The Department agrees that section 504's integration mandate applies to Medicare programs, including Medicare Advantage plans, Medicare Part D plans, and other entities that receive Medicare funding (such as the Program of All-inclusive Care for the Elderly (PACE) programs or health plans operating under the Centers for Medicare & Medicaid Services' (CMS's) dual eligible demonstrations).

Discriminatory Action Prohibited (§ 84.76(b))

Comments: Several commenters found the phrasing ''unnecessary segregation,'' in § 84.76 (b), to be an extraneous and potentially confusing term. They expressed concern that the addition of the term may lead to the assumption that there is a second standard distinct from ''most integrated setting appropriate to the needs of a qualified person with a disability,'' that determines whether segregation is unnecessary. Other commenters objected to the proposed phrase, stating that segregation of people with disabilities is never necessary.

Response: Recipients have a longstanding, affirmative obligation under the integration requirement of section 504 to administer a program or activity ''in the most integrated setting appropriate to the needs of a qualified person with a disability.'' [90] Failing to do so may violate section 504. We appreciate comments that the second sentence may confuse recipients about the applicable standard. To clarify the requirements, we are deleting the second sentence. In doing so, the Department intends only to clarify the requirement of this section and does not mean to narrow the obligation to provide services in the most integrated setting appropriate to the needs of the individual with a disability.

Responses to Integration Question 1

Comments: In the discussion in the preamble of the proposed definition of ''most integrated setting,'' we solicited comments on whether the definition should be expanded. Many commenters from disability advocacy organizations suggested a definition: ''The most integrated setting is a setting that enables people with disabilities to live as much as possible like people without disabilities.'' Commenters said this definition was supported in a 2014 disability coalition statement ''Community Integration for People with Disabilities.'' [91] Commenters also suggested that this definition avoids imposing concrete secondary standards distinct from the ''most integrated setting,'' such as determining what is ''mainstream society.'' Some commenters also found the phrase

''mainstream society'' to be pejorative or biased against groups not identified as ''mainstream.''

Comments: Many commenters supported the importance of the individual's right to choose how and when they engage in the broader community. Some also emphasized the importance of informed choice, that an individual receives adequate information about available and programs and resources available to support services in the community.

Response: We appreciate the commenters' thoughtful responses to our request for comment on whether the definition of ''most integrated setting'' should be expanded, and we note disability advocacy groups' preference for a more streamlined definition. We have modified the NPRM's definition of ''most integrated setting'' to align more closely with the description of ''most integrated setting'' in title II *Olmstead* guidance.[92] To mirror the guidance, we are adding the clause ''these settings provide opportunities to live, work, and receive services in the greater community, like individuals without disabilities,'' to the definition published in the NPRM.

Segregated Settings (§ 84.76(c))

Comments: Several commenters objected to the use of the word ''unnecessarily'' in the rule's proposed language: ''A segregated setting is one in which people with disabilities are unnecessarily separated from people without disabilities,'' on the basis that segregation is inherently stigmatizing and thus never necessary. Many commenters emphasized that segregated settings are defined by a lack of informed, individual choice or autonomy for participants in how and when they interact with the broader community. These characteristics can be present even in settings such as group homes physically located in integrated communities.[93]

Many commenters suggested a paragraph describing segregated settings that provides features of segregated settings but is not a definitive list, in a style mirroring that of DOJ's *Olmstead* guidance.[94] Several commenters suggested that the definition include ''practices'' as well as ''policies,'' as the relevant restrictions or limitations on individual autonomy are not limited to those in formally adopted policies but also include those reflected in the setting's practices.

Response: We appreciate the robust comments on segregated settings. We agree that the list of qualities of segregated settings should be inclusive of examples, rather than defined by any one characteristic. We also agree that a covered entity's practices, in addition to its policies, can result in segregation. Accordingly, we revised § 84.76(c) by deleting the first sentence of the section. Paragraph (c) now provides that segregated settings include, but are not limited to, congregate settings populated exclusively or primarily with individuals with disabilities, and may be characterized by regimentation in daily activities, a lack of privacy or autonomy, or policies or practices limiting visitors or limiting individuals' ability to engage freely in community activities and to manage their own activities of daily living.

Relationship to Medicaid Statutes and Funding

Comments: Several commenters expressed concern that the integration mandate is perceived to conflict with the title XIX of the Social Security Act requirements. Title XIX requires Medicaid services be funded through an approved waiver or State plan program when the State elects to provide those services in the community instead of the mandatorily funded long-term care facilities, a requirement sometimes referred to as Medicaid's ''institutional bias.'' Other commenters raised concern about the need for increased Medicaid funding and rebalancing available Medicaid funds to prioritize community-based services. Some commenters asked that the definition of segregated settings mirror the CMS HCBS settings rule,[95] which sets the requirements for HCBS settings funded by Medicaid waivers. The Settings Rule lists several qualities of home and community-based settings, centered on rights of privacy, dignity and respect, and freedom from coercion and restraint, as well as promoting independence in making life choices, including but not limited to, daily activities, physical environment, and with whom to interact.

Response: As noted in the preamble to the NPRM, the civil rights obligations created by section 504 are separate and distinct from the requirements of Medicaid and the Social Security Act.[96] Compliance with Medicaid requirements does not necessarily mean a recipient has met the obligations of section 504. Further, implementation of title XIX or other Federal statutes is beyond the authority of this regulation to address.

Acknowledging comments desiring the same framework of ''integrated setting'' as the HCBS settings rule, we note that, while the HCBS settings rule can help States fulfill their obligations under section 504, a State's obligations under section 504 are independent of a State's compliance with the HCBS settings rule.[97]

Additionally, the Department appreciates commenters' feedback about the need for increased HCBS funding and rebalancing available Medicaid

funds to prioritize community-based services. However, these concerns are beyond the scope of the Department's rulemaking under section 504.

Specific Prohibitions (§ 84.76(d))

Comments: State officials objected to the proposed rule's inclusion in the list of specific prohibitions ''[f]ailure to provide community-based services that results in . . . serious risk of institutionalization'' (§ 84.76(d)(4)). These commenters cited the Fifth Circuit's decision in *United States* v. *Mississippi,* 82 F.4th 387 (5th Cir. 2023), to support their position. Commenters also took issue with the reference to DOJ's *Olmstead* guidance in the proposed rule's discussion of integration requirements. Several courts of appeals have found DOJ's *Olmstead* guidance to reflect the best reading of the statute and the then-applicable regulations,[98] whereas the Fifth Circuit declined to follow the guidance on the facts before it.[99]

Response: Based on the Supreme Court's decision in *Olmstead,*[100] decades of consensus in circuit courts, and the unambiguous requirements of existing title II and section 504 regulations, the Department affirms its decision to codify the ''at serious risk of institutionalization'' principle set forth in case law and guidance.

In the more than twenty years since *Olmstead,* courts have repeatedly held that individuals may bring nondiscrimination claims under section 504 and the ADA by showing a covered entity's actions place them at serious risk of unnecessary institutionalization. As noted in *Fisher* v. *Oklahoma,* the integration mandate's ''protections would be meaningless if plaintiffs were required to segregate themselves by entering an institution before they could challenge an allegedly discriminatory law or policy that threatens to force them into segregated isolation.'' [101] To this point, the title II and section 504 regulations create an unambiguous, affirmative obligation to *avoid* discrimination through unjustified isolation, as discussed below.

Thus, the overwhelming weight of authority supports robust protection for individuals at serious risk of unnecessary institutionalization. Of the seven circuits to consider the issue, the Fifth Circuit stands apart as the only one to question the long-standing application of ''serious risk'' in *Olmstead* cases.[102] Further, the Fifth Circuit did not reach the question of whether the other six circuits erred in their interpretations, noting that it ''need not say'' that the decisions of the other six circuits were ''wrong.'' [103] And even the Fifth Circuit did not definitively reject *Olmstead's* application to ''at risk'' cases in all circumstances. '' [104] The other circuits' at-risk decisions, by contrast, involved circumstances in which class-wide risks of institutionalization were ''susceptible of quantification and, indeed, generalization.'' [105] Despite some broadly worded *dicta,* the Fifth Circuit's liability holding in *Mississippi* ultimately rests on what the court saw as the breadth of the claim in that case.'' [106] The court favored a narrow reading in part because of the doctrine of ripeness.[107] That doctrine, which reflects Article III limitations on judicial power, is not relevant to the proper scope of the Department's regulations. That holding does not compel us to reject the longstanding principle, adopted by six other circuits, that a policy or practice that places individuals at serious risk of unnecessary institutionalization violates the integration mandate in appropriate cases.

The title II and section 504 regulations create an unambiguous, affirmative obligation to *avoid* discrimination through unjustified isolation. As legislatively authorized regulations, both carry the ''force and effect of law.'' [108] 28 CFR 35.130(d) requires that a ''public entity shall administer services, programs, and activities in the most integrated setting appropriate to the needs of qualified individuals with disabilities.'' The Department has long interpreted section 504 to impose the same requirement on recipients of Federal funding in 45 CFR 84.4(b)(2). Further, the regulation interpreting the reasonable modification component of title II, which is located at 28 CFR 35.130(b)(7)(i), requires public entities to ''avoid discrimination.'' Courts have held this creates a duty to address the risk of prohibited harm.[109] The proposed section 504 regulation, 45 CFR 84.68(d), adopts the same language, codifying the longstanding obligation under section 504. Mitigating serious risk of institutionalization is necessary to avoid discrimination in the form of unjustified isolation. In addition, it would still be appropriate for courts to grant injunctive relief to those at serious risk in order to prevent the unnecessary institutionalization prohibited by law. The potential scope of a judicial remedy only further highlights why it is appropriate for the Department to interpret section 504 to require recipients to avoid unnecessary institutionalization.[110]

Comments: Several commenters asked us to elaborate on the meaning of ''at serious risk,'' noting that courts have evaluated the risk of institutionalization for both probability of institutionalization and timing, to conclude that individuals at risk are likely to be institutionalized in the foreseeable future.

Response: We agree with commenters that the determination of ''serious risk'' is a fact-based inquiry, which is why the courts of appeals to have considered the question have provided only general guidance on determining risk rather than an exhaustive test.[111] Likewise, the Department declines to codify

[105] *Id.* at 396.

[106] *Id.* at 398.

[107] *Id.* at 397 (quoting *Waskul* v. *Washtenaw Cnty. Cmty. Mental Health,* 979 F.3d 426, 470 (6th Cir. 2020) (Readler, J. concurring in part and dissenting in part)).

[108] *See, e.g., Ramsay* v. *Nat'l Bd. of Med. Examiners,* 968 F.3d 251, 257 n.6 (3d Cir. 2020) (''The ADA authorizes DOJ to issue regulations implementing the public accommodations provisions of the ADA. Such regulations have the force and effect of law.'') (Internal quotation omitted).

[109] *See, e.g., Wisconsin Cmty. Servs., Inc.* v. *City of Milwaukee,* 465 F.3d 737, 753 (7th Cir. 2006) (''By requiring measures that are 'necessary to avoid discrimination on the basis of disability,' 28 CFR 35.130(b)(7), the regulation clearly contemplates that prophylactic steps must be taken to avoid discrimination.'').

[110] *See, e.g., United States* v. *W.T. Grant Co.,* 345 U.S. 629, 633 (1953) (explaining that ''[t]he purpose of an injunction is to prevent future violations'' and that such relief is appropriate where there is a ''cognizable danger of recurrent violation.'').

[111] For example, in *Davis* v. *Shah,* 821 F.3d 231, 262–63 (2d Cir. 2016), the court quoted DOJ: ''a plaintiff ''need not wait until the harm of institutionalization or segregation occurs or is imminent'' to bring a claim under the ADA. Plaintiff establishes a ''sufficient risk of institutionalization to make out an *Olmstead* violation if a public entity's failure to provide community services . . . will likely cause a decline in health, safety, or welfare that would lead to the individual's eventual placement in an institution.'' *See also, Waskul* v. *Washtenaw Cnty. Cmty. Mental Health,* 979 F.3d 426, 462 (6th Cir. 2020) finding ''declines in health, safety, or welfare'' as to sufficient to show plaintiffs were at serious risk of institutionalization.

parameters of the inquiry into ''serious risk.''

Comment: Several commenters argued the Department failed to adequately estimate the costs of integration provision as proposed in the Regulatory Impact Analysis, citing the Unfunded Mandates Reform Act (UMRA). Further, some State officials worried about the impact of the integration provision, specifically the ''at serious risk'' on States. Some commenters also asked that that the integration provision's implementation be delayed in order for States to plan for additional costs.

Response: The final integration provision codifies existing responsibilities for recipients, as explained in our responses to comments about § 84.76(d). Due to the existing nature of recipients' obligations, and the same preexisting obligations under title II for public entities, the final rule's integration provision places no additional costs on recipients. For the reasons discussed in that section, we find the ''at serious risk'' principle to be a well-established, central tenet of the integration requirement and part of enforcement of statutory rights that prohibit discrimination on the basis of disability. The rule is thus exempted from and not subject to the UMRA, from which Federal regulations that enforce statutory rights that prohibit discrimination on the basis of disability are exempted.[112]

Fundamental Alteration (§ 84.76(e))

Comments: In response to our request for comment on what may constitute a fundamental alteration for recipients who are not public entities, various commenters proposed that the creation or offering of a new service would be a fundamental alteration for non-public entities. Several commenters raised questions about what services a covered entity must provide to comply with this section, and whether entities, particularly private providers, would be required to create new services to support individuals in more integrated settings.

Response: We note that a recipient is not required to create ''new'' programs to assist people with disabilities, nor is it required to provide a particular standard of care or level of benefits. However, recipients must comply with section 504's nondiscrimination requirements—including the integration requirement—for the services they in fact provide. When a covered entity chooses to provide a service, it must do so in a nondiscriminatory fashion by ensuring access to that service in the most integrated setting appropriate to the needs of the qualified individual.[113]

Recipients may be required to offer services in an integrated setting that they have only been offering in segregated settings; that is generally not offering a ''new service,'' but instead is ensuring the service is offered in integrated settings and not just in segregated settings.[114] However, the expansion of a service to different settings or offering a substantially similar service may be a fundamental alteration. To the extent that a benefit, including an optional benefit, is already provided in institutions or other segregated settings as part of the recipient's program, the same or a substantially similar [115] benefit must be offered in an integrated setting in a manner that does not incentivize institutional or other segregated services over community services, unless extending the benefit would constitute a fundamental alteration of the program.

For example, if a managed care plan offers a Medicaid-funded respite care benefit through the temporary placement of an individual with a disability in an institutional setting, such as a nursing home or Intermediate Care Facility,[116] but does not offer a comparable respite benefit available in an individual with a disability's home, that would likely be prohibited discrimination under the rule, unless the plan could prove that adding a home-based benefit would be a fundamental alteration. Similarly, a hospital system that facilitates discharge planning to skilled nursing facilities but does not facilitate discharge planning for people with disabilities who wish to receive nursing services in their own home may constitute ''[a]dministering a program or activity that results in unnecessary segregation,'' which would violate § 84.76(b) of the final rule. This approach is consistent with the existing integration requirement under current case law, section 504, and title II of the ADA.[117]

Because what constitutes a ''fundamental alteration'' is fact-specific, the Department has not modified the proposed regulatory text.

Comments: Several commenters asked that the Department address the ''workforce crisis'' as a basis for a fundamental alteration defense. Commenters wrote that national workforce shortages among nursing staff and direct care workers create challenges for public and private providers. In addition, commenters noted that State budgetary decisions constrain public and private providers in their ability to offer services, recruit and retain staff, and otherwise provide services to all eligible individuals with disabilities, noting that available funds and reimbursement rates may be beyond the control of individual providers or networks. Commenters also asked that OCR make explicit that a determination of whether something constitutes a fundamental alteration is fact and context-specific. Some commenters asked for an explanation of how an ''effectively working'' *Olmstead* plan could show that a requested modification would require fundamental alteration of the covered entity's existing programs or services.

Response: States and other recipients cannot dismiss their obligation to provide community services on the basis that services may require changes to the recipients' methods of administration. Reimbursement rates, direct workforce pay rates, and network adequacy are ''methods of administration'' under § 84.68(b)(3) as well as ''planning, service system design, funding, or service implementation practices'' under § 84.76(d)(4). A recipient might be in violation of this section if it adopts reimbursement practices or other

[112] 2 U.S.C. 1503(2).

[113] *See Olmstead* v. *L.C.,* 527 U.S. at 603; *see also Radaszewski* v. *Maram,* 383 F.3d 599, 609 (7th Cir. 2004) (citing *Olmstead* v. *L.C.,* 527 U.S. at 603 n. 14, for the principle ''that States must adhere to the ADA's nondiscrimination requirement with regard to the services they in fact provide'') (''While 'a State is not obligated to create new services,' it 'may violate Title II when it refuses to provide an existing benefit to a disabled person that would enable that individual to live in a more community-integrated setting.' '').

[114] *See* U.S. Dep't of Justice, Civil Rights Div., Statement of the Department of Justice on Enforcement of the Integration Mandate of Title II of the Americans with Disabilities Act and *Olmstead* v. *L.C.,* Question 8 (June 22, 2011), *https://archive.ada.gov/olmstead/q&a_olmstead.htm (stating that* (p)ublic entities cannot avoid their obligations under the ADA and *Olmstead* by characterizing as a ''new service'' services that they currently offer only in institutional settings.). *See also Townsend* v. *Quasim,* 328 F.3d 511, 517 (9th Cir. 2003) (''Here, the precise issue is not whether the state must provide the long term care services sought by Mr. Townsend and the class members—the state is already providing these services—but in what location these services will be provided.'').

[115] A substantially similar service is one that is similar in substance to the institutional service, even if the service ''might vary in format depending on whether it is provided . . . in an institution or a community-based setting.'' *Radaszewski ex. rel. Radaszewski* v. *Maram,* 383 F.3d 599, 610 (7th Cir. 2004).

[116] Please note, these are facilities that require an individual to meet eligibility requirements for a certain level of care for admission.

[117] *See, e.g.,* U.S. Dep't of Justice, Statement of the Department of Justice on Enforcement of the Integration Mandate of Title II of the Americans with Disabilities Act and *Olmstead* v. *L.C.,* Question 8 (2020), *https://www.ada.gov/olmstead/q&a_olmstead.htm; Steimel* v. *Wernert,* 823 F.3d 902, 914 (7th Cir. 2016).

methods of administration that result in individuals with disabilities only being able to receive residential, employment, day habilitation, or other necessary support services in segregated settings.[118]

We restate that fundamental alteration is a fact-specific inquiry and that increased cost alone is not necessarily a fundamental alteration.[119] Further, we note that cost and reimbursement decisions may be made by multiple entities, including State agencies, managed care plans, and private providers. As the Department noted in the proposed rule for section 1557, 87 FR 47873, recipients taking on financial risk for the delivery of HHS-funded services should scrutinize their capitation, reimbursement, quality measurement, and incentive structures to ensure that they do not result in the unjustified segregation of individuals with disabilities or place individuals with disabilities at serious risk of institutionalization or segregation. Under circumstances where responsibility for segregated and integrated services is shared across multiple entities, for example, under a managed care contract, both the State Medicaid agency and the contracted entity have obligations under this provision if they are both recipients of Federal financial assistance.

This shared responsibility means, for example, that recipients cannot assert that a staffing shortage, in and of itself, demonstrates that provision of services would be a fundamental alteration. If the recipient can address staffing shortages through pay rates, recruitment and retention incentives, flexible scheduling such as split shifts, or other actions, it may be required to do so as a reasonable modification.[120]

The availability of the fundamental alteration defense is clear as drafted and so we decline to change the language in the regulation text. In this final rule, we clarify a program is not required to provide coverage for a service in the most integrated setting appropriate to an individual's needs if it would fundamentally alter the program to do so.

Technical Assistance

Comments: Several commenters requested the Department provide technical assistance addressing the differences between compliance with Medicaid and adherence to civil rights laws, with practical examples and best practices. Other commenters suggested that the Department provide additional guidance to recipients on how the integration provision applies to transitions in care and effective community-based supports for those discharged from hospitals, skilled nursing facilities, and other institutional settings. Additionally, a few commenters recommended the Department offer technical assistance on how this regulation will address unfair practices in system design and funding.

Response: We appreciate the comments requesting clarification through sub-regulatory guidance. We will consider future guidance after this rule has been finalized and remain committed to our continued partnership with DOJ and CMS in developing shared guidance on civil rights requirements.

Summary of Regulatory Changes

For the reasons set forth above and considering comments received, we are revising § 84.76(b) and (c). Paragraph (b) requires a recipient to administer a program or activity in the most integrated setting appropriate to the needs of a qualified person with a disability. Paragraph (c) discusses integrated settings as settings that include (but are not limited to) congregate settings that are populated exclusively or primarily with individuals with disabilities, and may be characterized by regimentation in daily activities, lack of privacy or autonomy, or policies or practices limiting visitors or limiting individuals' ability to engage freely in community activities and to manage their own activities of daily living.

Subpart H—Communications

Proposed subpart H addressed requirements related to providing effective communication for individuals with disabilities. The Department requested comment on the importance of providing information in plain language for individuals with cognitive, developmental, intellectual, or neurological disabilities. Additionally, the Department requested comment on whether plain language is appropriately considered a reasonable modification that an individual must request, or if it should be considered an auxiliary aid or service.

The proposed requirements of this subpart are nearly identical to the requirements of subpart E, Communications, in the ADA title II regulations.[121]

General (§ 84.77)

Proposed § 84.77(a)(1) required recipients to take appropriate steps to ensure that communications with individuals with disabilities, and companions with disabilities, are as effective as communications with individuals without disabilities.

Proposed § 84.77(1)(2) defined ''companion.''

Proposed § 84.77(b)(1) required recipients to provide appropriate auxiliary aids and services to individuals with disabilities where necessary to afford those individuals an equal opportunity to benefit from the recipient's program or activity. Proposed § 84.77(b)(2) provided criteria for determining which auxiliary aid is appropriate. It stated that in order for auxiliary aids to be effective, they must be provided in accessible formats, in a timely manner, and in such a way as to protect the privacy and independence of the individual with a disability.

Proposed § 84.77(c) provided specifics regarding interpreters. It stated that recipients cannot require an individual with a disability to bring another individual to interpret. Nor can a recipient rely on an adult accompanying an individual with a disability to interpret or facilitate communication except in an emergency or when an individual with a disability specifically requests that the adult interpret, the adult agrees, and reliance on the adult is appropriate. Minor children cannot interpret except in an emergency when there is an imminent threat and no interpreter is available.

Proposed § 84.77(d) set forth specific standards that a recipient must meet if it chooses to provide qualified interpreters via video remote interpreting services.

The comments and our responses regarding § 84.77 are set forth below.

[118] Public entities may raise a fundamental alteration defense by showing that they have developed, and are implementing, a comprehensive, effectively working *Olmstead* plan. To avail themselves of such a defense, the entity's plan must have specific and reasonable timeframes and measurable goals for which the public entity may be held accountable, and the plan must have demonstrated success in actually moving individuals to integrated settings in accordance with the plan. *See, e.g., Brown* v. *District of Columbia,* 928 F.3d 1070, 1084 (D.C. Cir. 2019); *Frederick L.* v. *Dep't of Pub. Welfare,* 422 F.3d 151, 157 (3d Cir. 2005); *Jensen* v. *Minn. Dep't of Human Servs.,* 138 F. Supp. 3d 1068, 1072 (D. Minn. 2015).

July 14, 2023) (requiring Florida to increase private duty nursing services for medically fragile children and requiring the State to address the shortage of nurses ''by requiring that managed care plans raise PDN reimbursement rates, ensuring that the managed care plans comply with network adequacy standards, or utilizing any other tool at its disposal.'') (under appeal in *United States* v. *Florida,* No. 23–12331 (11th Cir.)

[121] 28 CFR 35.160 through 35.164.

Comment: Almost all of the commenters supported ensuring that recipients communicate effectively with people with disabilities. Disability rights organizations, recipient organizations, and individuals acknowledged that in the absence of appropriate auxiliary aids and services, people with disabilities are denied access to recipient programs and activities, including health care.

Response: The Department agrees that effective communication with people with disabilities is a critical right that benefits members of the public and recipients. The provision of sign language interpreters, Braille documents, and other appropriate auxiliary aids and services helps people with disabilities fully participate in and enjoy the benefits of recipient programs and activities from which they would otherwise be excluded on the basis of their disability. The importance of effective communication cannot be overstated in the context of health and human services, which is why the Department proposed the updates in subpart H of this rulemaking.

Comment: Many commenters described the importance of effective communication and provided firsthand accounts of instances where they were unable to receive health care because recipients did not provide them with auxiliary aids or services or reasonable modifications. For example, commenters relayed instances where American Sign Language interpreters were not provided even after a patient request, information was not provided in plain language for people with intellectual disabilities, and staff denied patients appropriate auxiliary aids and services due to appointment time constraints. Many of these commenters also discussed the importance of providing effective communication for companions.

Response: Unfortunately, the Department is aware of many instances where people with disabilities were discriminated against because recipients denied them effective communication. The Department has investigated and resolved many such instances and is aware that other Federal agencies have done likewise.[122] The Department and other Federal agencies have issued numerous guidance documents to attempt to further educate recipients on their effective communication responsibilities.[123] The Department added subpart H to the proposed rule because despite existing communication requirements for people with disabilities, it is apparent that some recipients are not providing effective communication to people with disabilities.

Comment: The majority of the commenters voiced support for requiring that all recipients, regardless of employee size, provide appropriate auxiliary aids and services to people with disabilities. Previously, § 84.52(d)(2) only required recipients with fewer than fifteen employees to provide auxiliary aids and services when the Director of OCR required those recipients to do so. Commenters stated that advancements in technology have made auxiliary aids and services affordable and attainable for recipients regardless of their size, eliminating the need for any exception. Those commenters also stated that the absence of appropriate auxiliary aids and services among small health care practices leads to disproportionate harm to patients with disabilities who are denied health care. One commenter requested that the Department maintain an exception for recipients with fewer than fifteen employees due to concerns that providing appropriate auxiliary aids and services would be too costly for small recipients.

Response: The Department agrees with the majority of commenters that effective communication is critical for people with disabilities, and that harm from a denial of effective communication for a person with a disability is the same regardless of the size of a recipient. Additionally, the Department expects that auxiliary aids and services are affordable and attainable for many recipients. All recipients, regardless of size, are not required, in providing effective communication, to take any action that the recipient can demonstrate would result in a fundamental alteration to the program or activity or pose undue financial and administrative burdens. In addition, the vast majority of recipients of Federal financial assistance from the Department are already required by either title II or title III of the ADA to provide auxiliary aids or services in order to ensure effective communication. Further, on December 19, 2000, the Department issued a notice in the **Federal Register** that it was exercising its authority under § 84.52(d)(2) to require recipients with fewer than fifteen employees to provide auxiliary aids to individuals with disabilities where the provision of such aids would not significantly impair the ability of the recipient to provide its benefits or services.[124] Accordingly, recipients with fewer than fifteen employees have been on notice since December of 2000 that the Department interprets section 504 to require all recipients, regardless of size, to provide appropriate auxiliary aids and services. The Department is incorporating this obligation to provide appropriate auxiliary aids and services in the final rule.

Plain Language

Comment: Many individuals and organizations submitted comments on the importance of providing plain language in health and human service programs and activities. Many commenters stated that plain language is a necessity that benefits all individuals, regardless of whether they have a disability. Some commenters stated that other groups, including individuals with limited English proficiency and people with lower education levels, would also benefit from the increased use of plain language. Through plain language, people with disabilities will have a better understanding of the services they are eligible for and may even be able to avoid unnecessary outcomes such as guardianships or the removal of children. Some commenters stated that plain language alone will not ensure effective communication for all people with disabilities and asked the Department to also require that recipients provide information through other means, such as audio or visual versions of certain standard language.

Response: The Department agrees that plain language may benefit individuals seeking to access a recipient's programs and activities, including individuals with disabilities. The Department also agrees that plain language alone will not be sufficient to ensure effective communication for people with disabilities in all circumstances, including for some people with intellectual or developmental disabilities. This Communications subpart provides detailed measures that

[122] *See e.g.,* U.S. Dep't of Health & Human Servs., Off. for Civil Rights, HHS Office for Civil Rights Takes Action to Ensure Effective Communication for Those Who Are Deaf or Hard of Hearing (Nov. 9, 2022), *https://www.hhs.gov/about/news/2022/11/09/hhs-office-for-civil-rights-takes-action-to-ensure-effective-communication-for-those-who-are-deaf-or-hard-of-hearing.html;* U.S. Dep't of Justice, Justice Department Secures Agreement with Hospital to Ensure Effective Communication with Deaf Patients and Companions (Jan. 4, 2022), *https://www.justice.gov/opa/pr/justice-department-secures-agreement-hospital-ensure-effective-communication-deaf-patients.*

[123] *See* U.S. Dep't of Health & Human Servs., Off. for Civil Rights, Disability Resources for Effective Communication, *https://www.hhs.gov/civil-rights/for-individuals/special-topics/hospitals-effective-communication/disability-resources-effective-communication/index.html.*

[124] 65 FR 79368 (Dec. 19, 2000).

should be taken to ensure effective communication for individuals with disabilities.

Comment: Many commenters recommended that the Department emphasize that plain language is a reasonable modification that can be made available to people with disabilities upon request when necessary to avoid discrimination. These commenters reasoned that while plain language may be vitally important for people with certain disabilities to understand important health or human service information, it will not be necessary or even beneficial in every circumstance. Alternatively, many commenters recommended that the Department specify that plain language is an auxiliary aid that a recipient must provide, when appropriate, to ensure effective communication for people with disabilities. One commenter stated that plain language should only be a recommended best practice and should not be an auxiliary aid or reasonable modification under this rulemaking because of the cost for recipients. One commenter recommended requiring specific standards to define plain language. Finally, some commenters requested additional technical assistance and guidance from the Department on what constitutes plain language and what recipients are required to provide to people with disabilities.

Response: As noted in the preamble to the NPRM, and consistent with title II of the ADA, providing information in plain language under some circumstances may be a reasonable modification a recipient may have to provide to avoid discrimination. It may also be a strategy recipients could use to improve their communications with people with disabilities. The Department appreciates the range of comments on this important issue and recognizes there are benefits and limitations to both methods of characterization.

Because of the wide range of situations in which the need for plain language could arise, the Department wants to preserve flexibility for both individuals with disabilities and recipients while limiting burdens. The Department notes that the effective communication provision of § 84.77(a)(1) requires recipients to take steps to ensure that their communications with individuals with disabilities are ''as effective as'' communications with others. In addition, reasonable modifications in § 84.68(b)(7)(i) are required when necessary to avoid discrimination on the basis of disability. Whether plain language is a reasonable modification in any given case will depend on particular facts, including the cost to the recipient of providing plain language materials or information. Because plain language may already be required by other provisions, including § 84.68(b)(7)(i), the Department declines to adopt any additional regulatory text on plain language. Accordingly, the Department will retain the current language in the preamble to the proposed rule that states plain language may be a reasonable modification to help ensure effective communication for people with disabilities.

Augmentative and Alternative Communication

Comment: Several commenters discussed augmentative and alternative communication (AAC) devices and voiced support for their inclusion in the rulemaking. Most of those commenters agreed that AAC may be an auxiliary aid or service to ensure effective communication for people with certain disabilities. Some also stated the Department should alter the definition of auxiliary aids and services to explicitly include AAC. Similarly, some commenters thought that the Department should provide a comprehensive definition of AAC in the rulemaking. One commenter stated a belief that the rulemaking should require recipients to provide training on the use of AAC devices for people with disabilities. One commenter stated that AAC may be a reasonable modification to provide effective communication.

Response: The Department appreciates the support for inclusion of language on AAC in the rulemaking and agrees that AAC may be an effective method for people with certain disabilities to communicate with recipients. The preamble to this section in the proposed rule noted that the definition for auxiliary aids and services is open-ended and allows for AAC as an appropriate auxiliary aid or service when necessary to ensure effective communication for people with disabilities. Because of this definition for auxiliary aids and services, it is not necessary at this time to edit the definition of auxiliary aids and services to explicitly include AAC, or to provide an extensive definition of AAC. The definition of auxiliary aids and services is purposefully drafted to ensure that it is inclusive of unnamed services and actions that provide effective communication. Whether training on the use of AAC devices would be a reasonable modification to policies, practices, or procedures, as required by this rulemaking, depends on specific facts.

Comment: One commenter recommended specific minor edits to the language of subpart H to make communication requirements more expansive and clarify how they apply to people with a variety of disabilities. Similarly, some commenters requested additional examples be added to the list of auxiliary aids and services, additional standards for measuring effective communication, and additional general requirements for communication with people with disabilities.

Response: The Department appreciates the recommendations from commenters concerning additional edits to effective communication requirements and the definition of auxiliary aids and services. We acknowledge the recommendations for additions to the language of the regulatory text for additional instances that would amount to effective communication or provide clarity that certain auxiliary aids and services are covered by the rulemaking, but we decline to incorporate the suggested changes. The current definition of auxiliary aids and services already adequately covers the recommendations from the commenters. The definition of ''auxiliary aids and services'' in the definitions section at § 84.10 contains a phrase that says that auxiliary aids and services include ''other similar services and actions.'' The current definition allows for additional auxiliary aids not contained in the preceding lists. We will retain the proposed language, which aligns with the communication requirements of the regulations under title II of the ADA.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.77 as proposed with no modifications.

Telecommunications (§ 84.78)

Proposed § 84.78 set forth the requirements that a recipient must meet when it communicates with applicants and beneficiaries by telephone or an automated-attendant system. Proposed § 84.78(a) stated that when a recipient communicates by telephone, text telephones (TTYs) or equally effective telecommunications systems shall be used to communicate with individuals who are deaf or hard of hearing or have speech impairments.

Proposed § 84.78(b) stated that when an automated-attendant system is used, that system must provide effective real-time communication with individuals using auxiliary aids and services.

Proposed § 84.78(c) stated that a recipient shall respond to telephone calls from a telecommunications relay service established under title IV of the ADA in the same manner that it responds to other telephone calls.

Comment: An organization that represents individuals with disabilities said that they appreciated the requirement in § 84.78(b) that when a recipient uses an automated-attendant system, real-time communication must be provided. However, they asked us to underscore that when using such a system, individuals must be able to opt out of the system and speak with a live representative.

Response: The Department appreciates the commenters' feedback. In order to be consistent with the title II ADA regulations, we decline to add any requirements to this section. However, we strongly urge recipients to have a way to communicate with a live person when using automated-attendant systems.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.78 as proposed with no modifications.

Telephone Emergency Services (§ 84.79)

Proposed § 84.79 stated that telephone emergency services must provide direct access to individuals who use TTYs and computer modems.

Comment: The Department received some comments supportive of this section. One commenter suggested that, in addition to 911, the section should refer to 988 which is the national suicide and crisis hotline.

Response: The Department appreciates the commenter's suggestion. However, there are other hotlines funded by the Department that also could potentially be listed by name in addition to the regulatory reference to telephone emergency services. Any such list could quickly become outdated and could cause confusion if inconsistent with the analogous provision of the regulation implementing title II of the ADA. Rather than list every hotline, the Department will keep the section as written.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.79 as proposed with no modifications.

Information and Signage (§ 84.80)

Proposed § 84.80(a) stated that recipients must ensure that interested persons including those with impaired vision or hearing can obtain information as to existence and location of accessible services, activities, and facilities. Section 84.80(b) stated that recipients must provide signage at all inaccessible entrances directing users to an accessible entrance or to a location where they can obtain information about accessible facilities. The international symbol for accessibility must be used at each accessible entrance of a facility.

Comments: The Department received a few comments on this section. One commenter asked that the section include a reference to individuals with language disorders such as aphasia. Another commenter asked whether the information and signage requirements apply to recipients' facilities that are not open to the public. The commenter noted the challenges of securing in-person Certified Deaf Interpreters and problems with relying on TTY State-operated phone lines.

Response: With regard to the request that we add language disorders to the text of the section, we note that coverage is not limited to individuals with impaired vision or hearing. The section requires that recipients ensure that all interested persons, *including* those with impaired vision or hearing, can obtain the information. We decline to add the requested language since the section already covers individuals with language disorders.

In response to the commenter's question about where signage must be placed, the requirement applies to all inaccessible entrances to each of a recipient's facilities. The Department recognizes the challenges that may be involved in complying with the regulations and notes that § 84.81 sets forth the duties of recipients when an action would result in a fundamental alteration or undue financial and administrative burdens.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.80 as proposed with no modifications.

Duties (§ 84.81)

Proposed § 84.81 stated that subpart H does not require recipients to take an action that would result in a fundamental alteration in the nature of a program or activity or undue financial and administrative burdens. It sets forth details about how that determination is to be made.

The comments and our responses regarding § 84.81 are set forth below.

Comment: Many recipient organizations voiced their support for the proposed exceptions concerning fundamental alteration or undue administrative and financial burdens. Recipient organizations noted that some small providers may find it difficult to pay for auxiliary aids and services and may rely on the exceptions. Many recipient organizations also requested that the Department provide additional guidance on instances where providing auxiliary aids or services would result in a fundamental alteration or undue burden. Some recipient organizations also requested that the Department provide additional funding or establish resource centers to provide auxiliary aids or services on behalf of recipients.

Response: As the commenters note, under proposed § 84.81, recipients would not be required to provide specific auxiliary aids or services, or take a specific action to ensure effective communication, if doing so would result in a fundamental alteration in the nature of a program or activity or in undue financial and administrative burdens. However, a recipient would still be required to take any other action that would not result in such an alteration or such burdens while providing effective communication to the maximum extent possible. For example, even if one type of auxiliary aid or service requested by the person with a disability would result in a fundamental alteration of the program or activity in question, if another appropriate auxiliary aid or service exists that would assist effective communication without fundamentally altering the program or activity, the recipient is required to offer that other auxiliary aid or service.

Effective communication, including provision of auxiliary aids and services, has been required for decades by the original section 504 implementing regulation, titles II and III of the ADA, and more recently the implementing regulation for section 1557 of the ACA, and numerous guidance documents on the topic already exist.[125] The Department remains committed to providing technical assistance and education to help recipients understand their legal obligations and so that individuals understand their rights.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.81 as proposed without modifications.

Subpart I—Web, Mobile, and Kiosk Accessibility [126]

Proposed subpart I addressed requirements related to providing accessible web content, mobile applications, and kiosks.

The Department proposed to add six definitions relevant to this subpart to the Definitions section in the newly redesignated § 84.10. We invited comment on the following questions regarding the definitions:

- *Web Accessibility Question 1:* The Department's definition of ''conventional electronic documents'' consists of an exhaustive list of specific file types. Should the Department instead craft a more flexible definition that generally describes the types of documents that are covered or otherwise change the proposed definition, such as by including other file types (*e.g.,* images or movies), or removing some of the listed file types?
- *Web Accessibility Question 2:* The Department requests comment on whether a definition of ''kiosks'' is necessary, and if so, requests comment on the Department's proposed definition in § 84.10 and any suggested revisions to it.
- *Web Accessibility Question 3:* Are there refinements to the definition of ''web content'' the Department should consider? Consider, for example, WCAG 2.1's definition of ''web content'' as ''information and sensory experience to be communicated to the user by means of a user agent, including code or markup that defines the content's structure, presentation, and interactions.'' [127]

The comments and responses regarding the definitions are set forth below.

Comment: Many commenters stated that the proposed definition of ''conventional electronic documents'' should be non-exhaustive to allow for broader application, such as other video, audio, image, spreadsheet, data files, and new content that has not yet been developed. Some commenters objected to the possibility of an open-ended definition and prefer the proposed definition the Department provided because they are concerned that allowing too much flexibility will lead to confusion among recipients and the general public as to what is covered.

Some commenters opposed the inclusion of ''database file formats'' in the definition of conventional electronic documents because database files and some spreadsheet files may include data that are not primarily intended to be human-readable. The commenters stated that in many cases such content is intended to be opened and analyzed with other special software tools and that data that is not primarily intended to be human-readable is equally accessible for individuals with disabilities and individuals without disabilities.

Response: The Department declines to change its approach to defining conventional electronic documents. The Department expects that a more flexible definition would result in less predictability for both recipients and individuals with disabilities, especially because the Department does not currently have sufficient information about how technology will develop in the future. The Department seeks to avoid such uncertainty because the definition of conventional electronic documents sets the scope of two exceptions, § 84.85(b) and (d). The Department carefully balanced benefits for individuals with disabilities with the challenges recipients face in making their web content and mobile apps accessible in compliance with this final rule when crafting these exceptions, and the Department does not want to inadvertently expand or narrow the exceptions with a less predictable definition of conventional electronic documents.

Based on the comments received, the Department has decided to delete database file formats from the definition of conventional electronic documents. Database files may be less commonly available through recipients' web content and mobile apps than other types of documents. To the extent that such files are provided or made available by recipients, the Department understands that they would not be readable by either individuals with disabilities or individuals without disabilities if they only contain data that are not primarily intended to be human-readable. Therefore, there would be limited accessibility concerns, if any, that fall within the scope of the rule associated with documents that contain data that are not primarily intended to be human-readable. Accordingly, the Department believes it could be confusing to include database file formats in the definition. However, the Department notes that while there may be limited accessibility concerns, if any, related to database files containing data that are not primarily intended to be human-readable, recipients may utilize these data to create outputs for web content or mobile apps, such as tables, charts, or graphs posted on a web page, and those outputs would be covered by the rule unless they fall into another exception.

The Department declines to make additional changes to the list of file formats included in the definition of conventional electronic documents. After reviewing the range of different views expressed by commenters, the Department believes the current list strikes the appropriate balance between ensuring access for people with disabilities and feasibility for recipients so that they can comply with this rule. The list included in the definition is also aligned with the Department's intention to cover documents that recipients commonly make available in either an electronic form or that would have been traditionally available as physical printed output. If recipients provide and make available files in formats not included in the definition, the Department notes that those other files may qualify for the exception in § 84.85(a) if they meet the definition for archived web content, or the exception in § 84.85(e) for certain preexisting social media posts if they are covered by that exception's description. To the extent those other files are not covered by one of the exceptions in § 84.85, the Department also notes that recipients would not be required to make changes to those files that would result in a fundamental alteration in the nature of a program or activity, or impose undue financial and administrative burdens, consistent with § 84.88.

Comment: Regarding the definition of ''kiosks,'' many commenters stated that they support a broad definition of kiosks that goes beyond the Department's proposed definition. Specifically, some commenters stated that anything with a user interface in a health care setting should be considered a kiosk. Other commenters proposed including a variety of physical devices that provide

[126] The Department of Justice recently promulgated new regulations implementing title II of the ADA to establish specific requirements, including the adoption of specific technical standards, for making accessible the web content and mobile apps that public entities provide or make available. *See* regulation to be codified at 28 CFR part 35, subpart H. The Department has made every effort to align its regulations on the accessibility standards in subpart I with DOJ's regulations, to maximize consistency in the obligations for web and mobile apps for recipients covered under section 504 and public entities covered under title II. Please refer to DOJ's rule, including Appendix D to the regulation implementing title II, for additional guidance related to this subpart.

[127] W3C®, *Web Content Accessibility Guidelines 2.1* (June 5, 2018), *https://www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A–GG2F.*

a variety of services through both closed and open functionality.

Response: The comments received covered a wide range of responses on definitions for kiosks. We note that the Access Board is currently engaged in the early stages of rulemaking around self-service transaction machines and self-service kiosks.[128] In part because of the wide range of responses that generally do not agree on a single definition, the Department does not believe it is appropriate to make changes to the definition of kiosks in this rulemaking. A broader definition of kiosks runs the risk of overclassifying devices used in a health or human services setting as a kiosk, while identifying specific types of physical devices could leave out devices that otherwise perform all of the functions normally attributed to kiosks. Because of the range of comments received, and because the Access Board is currently working towards addressing this issue in its own rulemaking, the Department will finalize its definition of kiosks in this rule without change from the proposed rule. Once the Access Board has finalized its rulemaking, the Department may consider addressing any additional issues raised with the Access Board's guidelines.

Comment: Regarding the definition of ''web content,'' some commenters opined that the definition should more closely align with the definition included in WCAG 2.1, especially since the proposed rule would include WCAG 2.1. Some of those commenters stated that a different definition would cause confusion among technical experts.

One commenter expressed approval of the proposed definition while another requested general clarification of what is covered and what specific content will have to be accessible under the proposed rule.

Response: The Department appreciates the comments and has decided to alter the definition of web content to more closely align with the definition in WCAG 2.1. The Department's definition in the NPRM was based on the WCAG 2.1 definition but was slightly less technical and intended to be more easily understood by the public generally. The Department decided to align the definition of ''web content'' with the definition in WCAG 2.1 in the final rule to avoid confusion, ensure consistency in application of WCAG 2.1, and assist technical experts in implementing this rule. Consistent with the suggestion of commenters, the Department believes this approach minimizes possible inadvertent conflicts between the type of content covered by the Department's regulatory text and the content covered by WCAG 2.1. Accordingly, the Department will use the WCAG 2.1 definition but also include the specific examples in a second sentence. This second sentence may be particularly useful for members of the public without a technical background.

Beyond the definition provided, as well as the preamble language explaining the definition, the Department remains committed to providing technical assistance and guidance to recipients so that they are able to fully comply with this rule. We also note that there is a period for recipients to become familiar with the web content compliance obligations before they come into effect, which will be two or three years depending on the size of the recipient.

The Department also added a definition for ''user agent.'' The definition exactly matches the definition of user agent in WCAG 2.1.[129] WCAG 2.1 includes an accompanying illustration, which clarifies that the definition of user agent means ''[w]eb browsers, media players, plug-ins, and other programs—including assistive technologies—that help in retrieving, rendering, and interacting with web content.'' [130]

The Department added this definition to the final rule to ensure clarity of the term ''user agent,'' which appears in the definition of ''web content'' requested by commenters and now adopted by the Department. As discussed, the Department has more closely aligned the definition of ''web content'' in the final rule with the definition in WCAG 2.1. Because this change introduced the term ''user agent'' into the section 504 regulation, and the Department does not believe this is a commonly understood term, the Department has added the definition of ''user agent'' provided in WCAG 2.1 to the final rule. The Department also believes adding this definition in the final rule is consistent with the suggestions of commenters who proposed aligning the definition of ''web content'' with the definition in WCAG 2.1.

Accordingly, we are finalizing the definition of ''kiosks'' with no modifications, editing ''conventional electronic documents'' and ''web content,'' and adding the definition of ''user agent,'' in § 84.10. As further discussed in the preamble to subpart A and § 84.85(a), we are also revising the definition of ''archived web content.''

Application (§ 84.82)

Proposed § 84.82 stated that this subpart applies to all programs and activities that receive Federal financial assistance from the Department.

The Department is finalizing § 84.82 as proposed.

Accessibility of Kiosks (§ 84.83)

Proposed § 84.83 articulated a general nondiscrimination requirement for programs and activities provided through kiosks.

The comments and our responses regarding § 84.83 are set forth below.

Comment: Many commenters expressed support for the inclusion of kiosks in the proposed rule, noting that kiosks have become more prevalent in health care settings and that often these kiosks are not accessible for people with disabilities. Many of these same commenters stated that the Department should require specific accessibility standards for kiosks beyond the general accessibility requirement proposed. Some commenters proposed specific functional standards that they believe are important for kiosk accessibility. Some commenters expressed approval of allowing for recipients to provide alternate methods for people with disabilities to access the programs and activities typically offered through kiosks, such as personnel to check in patients in a waiting area.

Response: The expanded use of kiosks, especially in medical settings, has allowed for recipients to automate portions of their programs and activities, but recipients must take into account the needs of people with disabilities in order to comply with civil rights laws, including section 504. Current Federal laws and regulations require the accessibility of all programs and activities of recipients of Federal financial assistance, including those provided through kiosks.[131] However, the Department believes it is necessary to include a general nondiscrimination provision specific to kiosks in this rulemaking because of how prevalent they have become and because if they

[130] *Id.*

[131] *See, e.g.,* 45 CFR 92.104; 45 CFR 84.4, redesignated as § 84.68. Note that compliance with these web and mobile accessibility requirements does not remove covered entities' obligations under title I of the ADA to not discriminate against qualified individuals on the basis of disability in regard to job application procedures; the hiring, advancement, or discharge of employees; employee compensation; job training; or other terms, conditions, and privileges of employment. These obligations include making reasonable accommodation to the known physical or mental limitations of applicants or employees, absent undue hardship.

are not designed with people with disabilities in mind they may serve as barriers to recipient programs and activities. Accordingly, the Department is finalizing a provision highlighting the application of general nondiscrimination requirements to recipients that use kiosks in their programs and activities.

While there is support among commenters for the rulemaking to impose measurable accessibility standards for kiosks, similar to those required of web content, mobile applications, and medical diagnostic equipment (MDE) in this rulemaking, the Department does not believe that is feasible at this time. While WCAG 2.1 and the Access Board's MDE Standards were both created after years of research, input, and testing, no comparable standard currently exists for kiosks, except to the extent that kiosks rely on web content or mobile apps as defined in § 84.10. The Access Board submitted an advanced notice of proposed rulemaking that sought public comment on requirements for self-service transaction machines, but that rulemaking has not been finalized.[132]

Recipients that use kiosks must make their programs accessible to persons with disabilities and may do so by instituting procedures that would allow persons with disabilities who cannot use kiosks because of their inaccessible features to access the program without using kiosks.[133] For example, a clinic or a social services office may allow persons with disabilities to go directly to the personnel at the main desk to register for necessary services. Such work-around procedures must afford persons with disabilities the same access, the same convenience, and the same confidentiality that the kiosk system provides.

In instances where kiosks are closed functionality devices that do not rely on web content or mobile apps, the proposed technical standards in § 84.84 will not apply. Under these circumstances, recipients are still obligated to ensure that individuals with disabilities are not excluded from participation in, denied the benefits of, or otherwise subjected to discrimination in any program or activity of the recipient, including the information exchange that would occur at the kiosk. This may require the recipient to provide reasonable modifications to policies, practices, or procedures, as required by § 84.68(b)(7), and take appropriate steps to ensure effective communication, including through the provision of appropriate auxiliary aids and services, which include accessible electronic and information technology, as required by subpart H.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.83 as proposed without modifications.

Requirements for Web and Mobile Accessibility (§ 84.84)

Proposed § 84.84(a) stated that recipients must ensure their web content and mobile applications made available to members of the public or used to offer programs or activities to members of the public must be readily accessible to and usable by individuals with disabilities.

Proposed § 84.84(b) required that recipients ensure their web content and mobile applications made available to members of the public or used to offer programs or activities to members of the public comply with the success criteria and conformance requirements of WCAG 2.1 Level A and Level AA within two or three years of the publication of this rule, depending on whether the recipient has fifteen or more employees, or fewer than fifteen employees, respectively. The section incorporated WCAG 2.1 by reference.

We invited comment on the following questions:

- *Web Accessibility Question 4: Are there technical standards or performance standards other than WCAG 2.1 that the Department should consider? For example, if WCAG 2.2 is finalized before the Department issues a final rule, should the Department consider adopting that standard? If so, what is a reasonable time frame for recipient conformance with WCAG 2.2 and why? Is there any other standard that the Department should consider, especially in light of the rapid pace at which technology changes?*
- *Web Accessibility Question 5: What compliance costs and challenges might small recipients face in conforming with this rule? How accessible are small recipients' current web content and mobile apps? Do small recipients have internal staff to modify their web content and mobile apps, or do they use outside consulting staff to modify and maintain their web content and mobile apps? If small recipients have recently, for example in the past three years, modified their web content and mobile apps to make them accessible, what costs were associated with those changes?*
- *Web Accessibility Question 6: Should the Department adopt a different WCAG version or conformance level for small recipients or a subset of small recipients?*
- *Web Accessibility Question 7: How do recipients use social media platforms and how do members of the public use content made available by recipients on social media platforms? What kinds of barriers do people with disabilities encounter when attempting to access recipients' services via social media platforms?*
- *Web Accessibility Question 8: How do recipients use mobile apps to make information and services available to the public? What kinds of barriers do people with disabilities encounter when attempting to access recipients' programs and activities via mobile apps? Are there any accessibility features unique to mobile apps that the Department should be aware of?*
- *Web Accessibility Question 9: Is WCAG 2.1 Level AA the appropriate accessibility standard for mobile apps? Should the Department instead adopt another accessibility standard or alternatives for mobile apps, such as the requirements from section 508 discussed above?*
- *Web Accessibility Question 10: How will the proposed compliance date affect small recipients? Are there technical or budget constraints that small recipients would face in complying with this rule, such that a longer phase-in period is appropriate?*
- *Web Accessibility Question 11: How will the proposed compliance date affect people with disabilities, particularly in rural areas?*
- *Web Accessibility Question 12: How should the Department define ''small recipient''? Should categories of small recipients other than those already delineated in this proposed rule be subject to a different WCAG 2.1 conformance level or compliance date?*
- *Web Accessibility Question 13: Should the Department consider factors other than the number of employees, such as annual budget, when establishing different or tiered compliance requirements? If so, what should those factors be, why are they more appropriate than the number of employees, and how should they be used to determine regulatory requirements?*
- *Web Accessibility Question 14: Should the Department consider other methods to ensure that a recipient that is also a public entity under title II of the ADA has a single compliance period to come into conformance with WCAG 2.1 AA? If so, what should those methods be?*
- *Web Accessibility Question 15: Should the Department consider a*

[132] 87 FR 57662 (Sept. 21, 2022).

[133] 45 CFR 84.22(b).

different compliance date for the captioning of live-audio content in synchronized media or exclude some recipients from the requirement? If so, when should compliance with this success criterion be required and why? Should there be a different compliance date for different types or sizes of recipients?

• *Web Accessibility Question 16: What types of live-audio content do small recipients post? What has been the cost for providing live-audio captioning?*

The comments and our responses regarding § 84.84 are set forth below.

Comment: Some commenters expressed concern that, as written, the rule would not apply to third party vendors that recipients contract with to create and maintain web content or mobile apps. Commenters noted that many recipients rely on third parties to create or update their web content and mobile apps, and that any rulemaking that does not clearly address those third parties would risk causing confusion and noncompliance.

Response: As the Department made clear in the preamble of the proposed rule, its intent is that websites operated on behalf of a recipient by a third party be covered by the rule. Based on the comments it received, the Department has determined that it should edit §§ 84.84(a)(1) and (2) and (b)(1) and (2) and 84.85(c) to make clear that the general requirements for web content and mobile app accessibility apply when a recipient, ''directly or through contractual, licensing, or other arrangements,'' provides or makes available web content or mobile apps. These edits will dispel any doubt that recipients cannot delegate away their obligations under section 504.

The phrase ''directly or through contractual, licensing, or other arrangements'' comes from existing regulatory language in section 504. The section on general prohibitions against discrimination in the existing section 504 regulation says that ''[a] recipient, in providing any aid, benefit, or service, may not, directly or through contractual, licensing, or other arrangements, on the basis of disability'' engage in various forms of discrimination.[134] The Department intentionally used the same phrasing in this rule to indicate that where recipients act through third parties using contractual, licensing, or other arrangements, they are not relieved of their obligations under this subpart.

Further, the Department notes that the phrase ''provides or makes available'' in § 84.84 is not intended to mean that § 84.84 only applies where the recipient created or owns the web content or mobile app. The plain meaning of ''make available'' includes situations where a recipient relies on a third party to operate or furnish content. Section 84.84 means that recipients provide or make available web content and mobile apps even where recipients do not design or own the web content or mobile app, if there is a contractual, licensing, or other arrangement through which the recipient uses the web content or mobile app to provide a program or activity.

The Department made another minor revision to § 84.84(a)(1) and (2). In the NPRM, § 84.84(a)(1) and (2) applied to web content and mobile apps that a recipient ''makes available to members of the public or uses to offer programs or activities to members of the public.'' [135] In the final rule, the Department revised § 84.84(a)(1) and (2) to apply to web content and mobile apps that a recipient ''provides or makes available.'' The Department also made corresponding revisions to the language of § 84.84(b)(1) and (2). The Department notes that the revised language does not change or limit the coverage of the final rule as compared to the NPRM. Rather, this change ensures consistency between the regulations implementing section 504 and title II of the ADA, respectively, and the broad coverage that both regulatory frameworks provide. The Department's section 504 regulation, at § 84.2, applies to all programs or activities of recipients; the title II regulation, at 28 CFR 35.102, states that the regulation applies to all services, programs, and activities ''provided or made available'' by covered entities. The Department therefore employs the ''provided or made available'' language in the final rule to avoid introducing confusion as to scope of coverage for recipients covered by both frameworks and maintain consistency between section 504 and title II.

Comment: Almost all of the comments on subpart I supported the general concept of requiring that the web content, mobile applications, and kiosks used by recipients be accessible to people with disabilities. Commenters noted the importance of web content, mobile applications, and kiosks in the delivery of health care, including their expanded importance during the COVID–19 Public Health Emergency, and pointed out specific instances where the only way to access a recipient's programs and activities was through web content, mobile applications, and kiosks. Commenters also stated that there are severe consequences when recipients do not provide accessible web content, mobile applications, and kiosks, including barriers to access to necessary health care, poor health outcomes, and even death for people with disabilities. Many commenters noted that some current web content, mobile applications, and kiosks are not designed with accessibility in mind, meaning that people with certain disabilities are unable to use them. Many commenters also expressed their agreement with the concept of a set standard to provide recipients and individuals certainty when determining whether web content, mobile applications, and kiosks are accessible under the law.

Response: The Department appreciates the comments and agrees that ensuring web content, mobile applications, and kiosks that recipients provide or make available are accessible to people with disabilities is necessary to avoid discrimination, health disparities, and poor outcomes. Recipients are increasingly using technology as part of their programs and activities, and unless that technology is accessible, people with disabilities will be left behind. The Department believes that adopting technical standards for web content and mobile app accessibility provides clarity to recipients regarding how to make accessible the programs and activities they offer via the web and mobile apps. Adopting specific technical standards for web content and mobile app accessibility also provides individuals with disabilities with consistent and predictable access to the web content and mobile apps of recipients. Web content, mobile apps, and kiosks already play a large role in the health and human services programs and activities offered by recipients, and that role will likely continue to grow in the future. This rulemaking is necessary given these realities.

Comment: A minority of commenters expressed displeasure with certain aspects of proposed subpart I, including a concern that any new requirements for web content, mobile app, and kiosk accessibility would result in financial burdens that would cause small clinics to shut down. One commenter also expressed opposition to preamble language that stated a phone line operated 24 hours a day, 7 days a week, would not be an acceptable alternative to providing accessible web content, mobile applications, and kiosks.

Response: The Department appreciates the concerns of these

[134] 45 CFR 84.4(b)(1) and (4).

[135] 88 FR 63392, 63509 (Sept. 14, 2023).

commenters and has taken steps to reduce burdens on small recipients. Under § 84.84(b)(2) of the final rule, small recipients, like all other recipients, need to conform to WCAG 2.1 Level AA,[136] but small recipients have three years, instead of the two years provided to larger recipients, to come into compliance. In addition, small recipients (like all recipients) can rely on the five exceptions set forth in § 84.85, in addition to the other mechanisms that are designed to make it feasible for all recipients to comply with the rule, as set forth in §§ 84.86, 84.87, 84.88, and 84.89. Recipients are not required to take action that would constitute a fundamental alteration in the nature of a program or activity or an undue financial or administrative burden. As discussed in the NPRM,[137] and consistent with DOJ's 2022 guidance on web accessibility [138] and DOJ's recent proposed title II rulemaking, ''Nondiscrimination on the Basis of Disability; Accessibility of Web Information and Services of State and Local Government Entities,'' [139] the Department does not believe that a phone line, even if it is staffed 24 hours a day, can realistically provide equal opportunity to people with disabilities. Websites—and often mobile apps—allow members of the public to get information or request a service within just a few minutes, and often to do so independently. Getting the same information or requesting the same service using a staffed phone line takes more steps and may result in wait times or difficulty getting the information. In addition, a staffed telephone line may not be accessible to someone who is deafblind, or who may have combinations of other disabilities, such as a coordination issue impacting typing; and an audio processing disability impacting comprehension over the phone. However, such individuals may be able to use web content and mobile apps that are accessible.

While existing civil rights laws, including the ADA and section 1557, already require that many of the recipients covered by section 504 make their web content, mobile apps, and kiosks accessible to people with disabilities, the Department believes, and the majority of commenters agree, that a regulation with a set standard is the most effective method to ensure that recipients are fulfilling their civil rights obligations.

Comment: Many commenters noted that in October of 2023, W3C issued WCAG 2.2 and requested that the Department use WCAG 2.2 instead of WCAG 2.1 as the accessibility standard for web content and mobile apps in this rulemaking. Those commenters stated that WCAG 2.2 includes new success criteria and builds off of WCAG 2.1, providing additional accessibility for people with disabilities without undermining key provisions from WCAG 2.1. Some commenters stated that the appropriate standards for this rulemaking are those set forth under the regulations for section 508 of the Rehabilitation Act [140] since it applies to all information and communication technology (ICT) rather than just web content. Some commenters also want the Department to impose additional standards for specific file types, such as PDF/UA1 for pdfs. Some commenters requested that the Department establish an evolving standard that automatically upgrades to the most recently released WCAG version, reasoning that both technology and standards to make that technology accessible are constantly changing. One commenter stated that they hope the Department will adopt whatever standard DOJ adopts in its title II web content rulemaking to make compliance with multiple standards easier for recipients that are covered by both rulemakings (89 FR 31320, April 24, 2024). Some commenters requested that there be no standard for compliance and recipients would simply be encouraged to conform to WCAG and make sure that their web content and mobile applications are generally accessible.

Response: The Department appreciates the range of responses received and recognizes that there are various possible technical standards for this rulemaking. The Department has determined that WCAG 2.1 Level AA [141] is the most appropriate standard for this rulemaking. As some commenters noted, WCAG 2.1 Level AA is a widely used and accepted industry standard for accessibility, and requiring conformance to WCAG 2.1 Level AA would result in a significant step forward in ensuring access for people with disabilities. In addition, because WCAG 2.1 Level AA was published in 2018, web developers and recipients have had time to familiarize themselves with it. The WCAG standards were designed to be ''technology neutral.'' [142] This means that they are designed to be broadly applicable to current and future web technologies.[143] Thus, WCAG 2.1 also allows web and mobile app developers flexibility and potential for innovation. WCAG 2.1 Level AA also includes success criteria addressing the accessibility of mobile apps or web content viewed on a mobile device.

WCAG 2.2 was released on October 5, 2023, and adds six additional Level A and AA success criteria beyond those included in WCAG 2.1 while removing

[136] The Web Accessibility Initiative published some revisions to WCAG 2.1 on September 21, 2023. *See* W3C, *Web Content Accessibility Guidelines (WCAG) 2.1* (Sept. 21, 2023), *https://www.w3.org/TR/WCAG21/* [*https://perma.cc/4VF7-NF5F*]. However, this rule requires conformance to the version of WCAG 2.1 that was published in 2018. W3C, *Web Content Accessibility Guidelines 2.1* (June 5, 2018), *https://www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F*. The Department believes that recipients have not had sufficient time to become familiar with the 2023 version. Recipients also may not have had an adequate opportunity to comment on whether the Department should adopt the 2023 version, which was published after the NPRM was published. One recent revision to WCAG 2.1 relates to Success Criterion 4.1.1, which addresses parsing. W3C has described Success Criterion 4.1.1 as ''obsolete'' and stated that it ''is no longer needed for accessibility.'' W3C, *WCAG 2 FAQ, https://www.w3.org/WAI/standards-guidelines/wcag/faq/#parsing411* [*https://perma.cc/24FK-V8LS*] (Oct. 5, 2023). According to the 2023 version of WCAG, Success Criterion 4.1.1 ''should be considered as always satisfied for any content using HTML or XML.'' W3C, *Web Content Accessibility Guidelines (WCAG) 2.1* (Sept. 21, 2023), *https://www.w3.org/TR/WCAG21/* [*https://perma.cc/4VF7-NF5F*]. The Department believes that either adopting this note from the 2023 version of WCAG or not requiring conformance to Success Criterion 4.1.1 is likely to create significant confusion. And although Success Criterion 4.1.1 has been removed from WCAG 2.2, W3C, *WCAG 2 FAQ, https://www.w3.org/WAI/standards-guidelines/wcag/faq/#parsing411* [*https://perma.cc/45DS-RRYS*] (Oct. 5, 2023), the Department has decided not to adopt WCAG 2.2 for the reasons described herein. Therefore, conformance to Success Criterion 4.1.1 is still required by this rule. Recipients that do not conform to Success Criterion 4.1.1 would nonetheless be able to rely on § 84.89 to satisfy their obligations under this rule if the failure to conform to Success Criterion 4.1.1 would not affect the ability of individuals with disabilities to use the recipient's web content or mobile app in the manner described in that section. The Department expects that this provision will help recipients avoid any unnecessary burden that might be imposed by Success Criterion 4.1.1.

[139] 88 FR 51948, 51953 (Aug. 4, 2023) (stating that DOJ ''no longer believes 24/7 staffed telephone lines can realistically provide equal access to people with disabilities.'').

[140] 36 CFR part 1194, appendix A.

[141] Conformance to Level AA requires satisfying the success criteria labeled Level A as well as those labeled Level AA, in addition to satisfying the relevant conformance requirements.

[142] W3C, *Introduction to Understanding WCAG* (June 20, 2023), *https://www.w3.org/WAI/WCAG21/Understanding/intro* [*https://perma.cc/XB3Y-QKVU*].

[143] *See* W3C, *Understanding Techniques for WCAG Success Criteria* (June 20, 2023), *https://www.w3.org/WAI/WCAG21/Understanding/understanding-techniques* [*https://perma.cc/AMT4-XAAL*].

the success criteria for parsing.[144] The Department recognizes that WCAG 2.2 is a newer standard, but in crafting this final rule the Department sought to balance benefits for individuals with disabilities with feasibility for recipients making their content accessible in compliance with this rule. The Department believes there will be fewer resources and less guidance available to web professionals and recipients on the new success criteria in WCAG 2.2. Given the benefits of WCAG 2.2 highlighted by commenters, some recipients might choose to implement WCAG 2.2 to provide an even more accessible experience for individuals with disabilities and to increase customer service satisfaction. The Department notes that this rule provides for equivalent facilitation in § 84.87, meaning recipients could choose to comply with this rule by conforming their web content to WCAG 2.2 Level AA because WCAG 2.2 Level AA provides substantially equivalent or greater accessibility and usability to WCAG 2.1 Level AA. This would be sufficient to meet the standard for equivalent facilitation in § 84.87, which is discussed in more detail later.

For several legal reasons, the Department is unable to adopt an evolving standard that continuously updates to the newest version of WCAG. First, the Department is incorporating WCAG 2.1 Level AA by reference into this rule and must abide by the Office of the Federal Register's regulation regarding incorporation by reference.[145] This regulation states that ''[i]ncorporation by reference of a publication is limited to the edition of the publication that is approved [by the Office of the Federal Register]. Future amendments or revisions of the publication are not included.'' [146] Accordingly, the Department only incorporates a particular version of the technical standard and does not state that future versions of WCAG would be automatically incorporated into the rule. In addition, the Department has concerns about regulating to a future standard of WCAG that has yet to be created, of which the Department has no knowledge, and for which compatibility with section 504 and recipients' content is uncertain. The Department believes that adopting WCAG 2.1 as the technical standard for this final rule is more appropriate than adopting WCAG 2.0. WCAG 2.1 provides for important accessibility features that are not included in WCAG 2.0, and an increasing number of governmental entities are using WCAG 2.1. A number of countries that have adopted WCAG 2.0 as their standard are now making efforts to move or have moved to WCAG 2.1.[147] In countries that are part of the European Union, public sector websites and mobile apps generally must meet a technical standard that requires conformance with the WCAG 2.1 success criteria.[148] And WCAG 2.0 is likely to become outdated or less relevant more quickly than WCAG 2.1. As discussed above, WCAG 2.2 was recently published and includes even more success criteria for accessibility.

The Department expects that the wide usage of WCAG 2.0 lays a solid foundation for recipients to become familiar with and implement WCAG 2.1's additional Level A and AA criteria. The Department understands that dozens of States either use or strive to use WCAG 2.0 or greater—either on its own or by way of implementing the section 508 technical standards—for at least some of their web content. It appears that at least ten States—Alaska, Delaware, Georgia, Louisiana, Massachusetts, Oregon, Pennsylvania, South Dakota, Utah, and Washington—already either use WCAG 2.1 or strive to use WCAG 2.1 for at least some of their web content. Given that WCAG 2.1 is a more recent standard than WCAG 2.0, adds some important criteria for accessibility, and has been in existence for long enough for web developers and recipients to get acquainted with it, the Department views it as more appropriate for adoption in this final rule than WCAG 2.0. In addition, even to the extent recipients are not already acquainted with WCAG 2.1, those recipients will have two or three years to come into compliance with a final rule, which should also provide sufficient time to become familiar with and implement WCAG 2.1. The Department also declines to adopt the Access Board's section 508 standards, which are harmonized with WCAG 2.0, for the same reasons it declines to adopt WCAG 2.0.

The Department has coordinated with DOJ and their rulemaking revising the regulation implementing title II of the ADA to establish specific requirements, including the adoption of specific technical standards, for making accessible the services, programs, and activities offered by State and local government entities to the public through the web and mobile apps, to eliminate or minimize instances where recipients that are also public entities under title II will be held to different standards. The goal of the Department is to issue clear and comprehensive rulemaking that requires accessibility for people with disabilities without causing unnecessary confusion among recipients.

The Department declines to adopt additional technical standards related to documents-. As discussed, the WCAG standards were designed to be ''technology neutral'' [149] and are designed to be broadly applicable to current and future web technologies. The Department is concerned that adopting multiple technical standards related to different types of web content and content in mobile apps could lead to confusion. However, the Department notes that this rule allows for equivalent facilitation in § 84.87, meaning that recipients could still choose to comply with additional standards or guidance related to documents to the extent that the standard or technique used provides substantially equivalent or greater accessibility and usability.

Finally, the Department does not intend to simply recommend that recipients make their web content and mobile apps accessible without requiring specific standards and methods of enforcement. As discussed in the NPRM, a variety of voluntary standards and structures have been developed for the web through nonprofit organizations using multinational collaborative efforts. For example, domain names are issued and administered through the internet Corporation for Assigned Names and Numbers, the internet Society publishes computer security policies and procedures for websites, and the World

Wide Web Consortium (''W3C'') develops a variety of technical standards and guidelines ranging from issues related to mobile devices and privacy to internationalization of technology. In the area of accessibility, the Web Accessibility Initiative (''WAI'') of the W3C created the WCAG.

Many organizations, however, have indicated that voluntary compliance with these accessibility guidelines has not resulted in equal access for people with disabilities; accordingly, they have urged the Department to take regulatory action to ensure web content and mobile app accessibility.[150] The National Council on Disability, an independent Federal agency that advises the President, Congress, and other agencies about programs, policies, practices, and procedures affecting people with disabilities, has similarly emphasized the need for regulatory action on this issue.[151]

Recent research documents the digital inaccessibility of the websites of more than 100 top hospitals across the United States, finding that only 4.9 percent are fully compliant with Web Content Accessibility Guidelines (WCAG) 2.1.[152] While WCAG 2.1 has been available to the general public, including web professionals, for over five years, and many of the success criteria it incorporates were available a decade prior in WCAG 2.0, it is likely that some recipients have not fully conformed with WCAG 2.1 AA in the absence of rulemaking requiring conformance. In general, as technology continues to advance, the methods for ensuring programs and activities are as effective for people with disabilities as those provided to others may need to change, as well.[153]

Despite the availability of voluntary web and mobile app accessibility standards; the Department's position that programs and activities of recipients, including those available on websites, must be accessible; and case law supporting that position, individuals with disabilities continue to struggle to obtain access to the websites of recipients.[154] In addition to the Department's guidance and enforcement, DOJ has brought enforcement actions to address web access, resulting in a significant number of settlement agreements with state and local government entities as well as public entities.[155]

The Department believes that adopting technical standards for web content and mobile app accessibility provides clarity to recipients regarding how to make the programs and activities they offer the public via the web and mobile apps accessible. Adopting specific technical standards for web content and mobile app accessibility also provides individuals with disabilities with consistent and predictable access to the websites and mobile apps of recipients.

Comment: Many commenters expressed their beliefs that the proposed time periods for compliance, two years for larger recipients and three years for smaller recipients, were too far in the future and should be shortened. These commenters expressed concern that the time recipients would spend making their web and mobile content accessible would be time that people with disabilities will not have access to their programs and activities, including necessary health care. Alternatively, some commenters stated they believed that the time periods for compliance should be extended to allow recipients, some of whom are small and have limited resources, additional time to come into compliance and ensure their web content and mobile apps comply with WCAG 2.1. These commenters stated that some small health care providers may decide to not accept funding from the Department, or go out of business altogether, if they are

required to come into compliance within three years. Some commenters believe that the proposed time period for compliance is adequate and strikes the appropriate balance between providing recipients adequate time and ensuring people with disabilities do not have to wait too long for services.

Some commenters expressed confusion as to whether the proposed rule as drafted only meant that recipients had a one-time obligation to update their web content and mobile apps for WCAG 2.1 AA conformance at two years or three years, depending on their size.

Response: Much like determining the appropriate compliance standard, the Department recognizes that commenters have a spectrum of opinions on whether the proposed dates for compliance are too soon or too far in the future. The Department worked closely with its Federal partners to determine appropriate compliance timeframes. After carefully weighing the arguments that the compliance dates should be kept the same, shortened, or lengthened, the Department has decided that the compliance dates in the final rule—two years for large recipients and three years for small recipients—strike the appropriate balance between the various interests at stake.

Shortening the compliance dates would likely result in increased costs and practical difficulties for recipients, especially small recipients. Lengthening the compliance dates would prolong the exclusion of many people with disabilities from recipients' web content and mobile apps. Additionally, any change in compliance dates runs the risk of introducing inconsistency with other rulemakings [156] where recipients that are also covered by those rulemakings would be subject to different compliance dates. The Department believes that the balance struck in the compliance timeframe proposed in the NPRM was appropriate, and that there are no overriding reasons to shorten or lengthen these dates given the important and competing considerations involved by stakeholders.

Regarding whether the proposed rule only required recipients to make their web content and mobile apps accessible once, the Department wishes to clarify that under this rule, recipients have an ongoing obligation to ensure that their web content and mobile apps comply with this rule's requirements, which would include content that is newly added or created after the compliance date. The compliance date is the first time that recipients need to be in compliance with the rule's requirements; it is not the last. Accordingly, after the compliance date, recipients will continue to need to ensure that all web content and mobile apps they provide or make available comply with the technical standard, except to the extent another provision of this rule permits otherwise. To make this point more clearly, the Department revised the language of § 84.84(b)(1) and (2), respectively, to state that a recipient needs to comply with this rule ''[b]eginning May 11, 2026'' and ''[b]eginning May 10, 2027,'' depending on the size of the recipient.

Comment: The Department received conflicting comments concerning the costs and challenges that small recipients will face in order to comply with the proposed rule. Some commenters believe that recipients with fewer than fifteen employees have budgets that will be significantly constrained by requirements to make the web content and mobile apps they use compliant with WCAG 2.1 in any amount of time. Some commenters also believe that because of their size, small recipients are less sophisticated and less aware of their obligations under Federal civil rights laws, and therefore should not be held to standards imposed on larger recipients. Alternatively, other commenters state that small recipients do not face insurmountable costs because advances in technology and the services offered to make web content accessible have made compliance much more attainable for even the smallest recipient.

Response: The Department believes that the final rule strikes the appropriate balance by requiring small recipients to comply with the same technical standard as larger recipients while giving small recipients additional time to do so. The Department believes this longer compliance time frame is prudent in recognition of the additional challenges that small recipients may face in complying, such as limited budgets, lack of technical expertise, and lack of personnel. The Department believes that providing an extra year for small recipients to conform to this section will give those recipients sufficient time to properly allocate their personnel and financial resources to make their web content and mobile apps comply with WCAG 2.1 Level AA, without providing so much additional time that people with disabilities have a reduced level of access to their resources for an extended period.

The Department appreciates the concerns of commenters and urges recipients to review the Regulatory Impact Analysis for the Department's full discussion of the costs and benefits of the proposed rulemaking. Small recipients in particular are much less likely to create their own web content and mobile apps and are more likely to contract with outside parties. Small recipients are also more likely to have smaller amounts of web content and mobile apps that would have to be compliant. Recipients will have the choice to remediate existing web content and mobile apps, or to create new accessible web content and mobile apps and may also decide whether to make changes themselves or contract with a third-party to make changes. Regarding sophistication and understanding of accessibility requirements, the Department is committed to issuing guidance and technical assistance for recipients on how to comply with accessibility requirements, in addition to existing guidance on WCAG 2.1. Finally, a recipient may be able to show that full compliance with subpart I would result in a fundamental alteration or undue burdens as described in § 84.88.

Comment: Many commenters believe that all recipients, regardless of size, should be held to the same accessibility standard. Specifically, they believe that any deviation in accessibility standards between small and large recipients would lead to unacceptable differences in levels of care to the detriment of patients with disabilities, especially those in rural areas. Those commenters also stated that small recipients should either have to come into compliance within the proposed three years or at an earlier date. Some commenters supported more lenient standards for small recipients because they believed achieving full accessibility under WCAG 2.1 would be too difficult for the smallest recipients. One commenter stated that the accessibility standard should be the same regardless of recipient size, but small providers should have more than three years to come into compliance. One commenter recommended a principles-based approach where small recipients would be required to take steps to make their web content and mobile apps accessible, but there would be no standard or method for testing their accessibility. One commenter believed there should be a permanent exemption for small recipients and that they should not be held to any standards for web content and mobile app accessibility. Finally, some commenters requested additional guidance for small recipients so that they could comply with the Department's proposed standards.

[156] *See, e.g.,* 88 FR 51948 (Aug. 4, 2023).

Response: The Department appreciates the range of responses on standards for small recipients. The Department agrees that requiring more lenient standards for small recipients would lead to differences in the accessibility and effectiveness of health and human service programs and activities. Given the importance of small recipients in the delivery of health care, such gaps are incompatible with the Department's statutory mandate; a wholesale exception would therefore be inappropriate. Such an exception would mean that an individual with a disability who lives in a small, rural area, might not have the same level of access to a recipient's web-based programs and activities as an individual with a disability in a larger, urban area. This would significantly undermine consistency and predictability in web accessibility. It would also be particularly problematic given the interconnected nature of many different websites. Furthermore, an exception for small recipients would reduce the benefits of the rule for those entities.

Requiring small recipients to comply with the same technical standards as all other recipients ensures consistent levels of accessibility for recipients of all sizes in the long term, which will promote predictability and reduce confusion about which standard applies. It will allow for individuals with disabilities to know what they can expect when navigating a recipient's web content; for example, it will be helpful for individuals with disabilities to know that they can expect to be able to navigate any recipient's web content independently using their assistive technology. It also ensures that individuals with disabilities who reside in rural areas that are mainly serviced by smaller recipients have comparable access to their counterparts in urban areas that are serviced by a range of smaller and larger recipients, which is critical given the transportation and other barriers that people in rural areas may face.[157]

The Department notes that under appropriate circumstances, small recipients may also rely on the exceptions, flexibilities, and other mechanisms described in §§ 84.85, 84.86, 84.87, 84.88, and 84.89 below, which the Department believes should help make compliance feasible for those recipients. Recipients are not required to take action that would constitute a fundamental alteration in the nature of a program or activity, or impose an undue financial or administrative burden.

Finally, the Department remains committed to making guidance documents and technical assistance available to the general public so that recipients are aware of their obligations and how to comply with them.

New Social Media Exception

Comment: Many of the comments on recipient use of social media and how it should be addressed in this rulemaking stated that recipients use social media for a wide variety of purposes, including purposes central to the programs and activities they provide. Recipients may post important announcements, scheduling information, informational videos, or other general information that is of high importance to the public. Many comments proposed specific technical requirements to ensure that social media posts from recipients are accessible, including plain language, alternative text for images, and audio descriptions and captions for videos. Some commenters stated that social media posts made before the implementation date for this rulemaking should not be required to be accessible unless they contain important information related to recipient programs or activities or the content of the posts is changed. Some commenters stated that older social media posts should be made accessible upon request or if a recipient posts significant important content on a certain social media platform, like YouTube. Some commenters stated that no preexisting social media posts should be required to be accessible due to the burden on recipients and the forward-looking nature of the proposed rule. Many commenters expressed concern that social media posts from recipients should not be deemed to violate this proposed rule if the social media platform itself is responsible for the violation.

Response: The Department is including an exception for preexisting social media posts in the final rule because making preexisting social media posts accessible may be impossible or result in a significant burden. The benefits of making all preexisting social media posts accessible will likely be limited as these posts are generally intended to provide then-current updates on platforms that are frequently refreshed with new information. The Department believes recipients' limited resources are better spent ensuring that current web content and content in mobile apps are accessible, rather than reviewing all preexisting social media posts for compliance or possibly deleting recipients' previous posts if remediation is impossible. As other commenters recommended, the Department believes this final rule should be more forward looking when determining which social media posts should be accessible.

The Department emphasizes that even if preexisting social media posts do not have to conform to the technical standard, recipients still need to ensure that their programs and activities offered using web content and mobile apps are accessible to people with disabilities on a case-by-case basis in accordance with their other obligations under section 504.

Based on these comments, the Department will include a new exception at § 84.85(e) that will state the requirements of § 84.84 do not apply to a recipient's social media posts that were posted before the date the recipient is required to comply with this rule.

The Department's final rule requires that web content and mobile apps that recipients provide or make available, directly or through contractual, licensing, or other arrangements, be made accessible within the meaning of § 84.84. This requirement applies regardless of whether that content is located on the recipient's own website or mobile app or elsewhere on the web or mobile apps. It therefore covers web content or content in a mobile app that a recipient makes available via a social media platform.

Many social media platforms that are widely used by members of the public are available to members of the public separate and apart from any arrangements with recipients to provide a program or activity. As a result, this rule does not require recipients to ensure that such platforms themselves conform to WCAG 2.1 Level AA. However, because the posts that recipients disseminate through those platforms are provided or made

[157] *See, e.g.,* NORC Walsh Ctr. for Rural Health Analysis & Rural Health Info. Hub, *Access to Care for Rural People with Disabilities Toolkit,* (Dec. 2016), *https://www.ruralhealthinfo.org/toolkits/disabilities.pdf* [*https://perma.cc/YX4E-QWEE*] (noting geographic, transportation, and service barriers to care in rural areas); U.S. Dep't of Health & Hum. Servs., Health Rsch. & Servs. Admin., Strengthening the Rural Health Workforce to Improve Health Outcomes in Rural Communities, 13–14 (Apr. 2022), *https://www.hrsa.gov/sites/default/files/hrsa/advisory-committees/graduate-medical-edu/reports/cogme-april-2022-report.pdf* (stating that the healthcare workforce in rural communities is overall short staffed with fewer hospitals and critical care physicians than urban areas); *About Rural Healthcare,* NHRA, *https://www.ruralhealth.us/about-nrha/about-rural-healthcare* (last visited Mar. 19, 2024) (stating that family physicians comprise only 15% of U.S. outpatient physician workforce but provide 42% of care in rural areas).

available by the recipients, they must conform to WCAG 2.1 Level AA. The Department understands that social media platforms often make available certain accessibility features like the ability to add captions or alt text. It is the recipient's responsibility to use these features when it makes web content available on social media platforms. For example, if a recipient posts an image to a social media platform that allows users to post alt text, the recipient needs to ensure that appropriate alt text accompanies that image so that screen reader users can access the information.

Comment: Many of the comments on recipients' use of mobile applications and how it should be addressed in this rulemaking stated that recipients use mobile apps for a wide range of services that are central to their programs and activities. For example, some recipients use mobile apps as the main method for making appointments, paying bills, and even communicating with the recipient. None of the commenters argued against addressing mobile applications in this rulemaking. Some commenters stated that WCAG 2.1 applies to mobile apps in addition to web content and the Department is correct in proposing to use the same standard for both. Some commenters recommended a different standard for mobile apps, like section 508 of the Rehabilitation Act, WCAG 2.2, or WCAG 2.0.

Response: The Department agrees that the same technical standard for accessibility should apply to both web content and mobile apps. The Department believes that applying the same technical standard to both web content and mobile apps will reduce confusion by ensuring consistent requirements and user experiences across web and mobile platforms.

One of the reasons the Department proposed WCAG 2.1 AA as the standard for web content and mobile apps is that the WCAG standards were designed to be ''technology neutral.'' [158] This means that they are designed to be broadly applicable to current and future web technologies,[159] which will help ensure accessibility for mobile apps. Although the Section 508 Standards include some additional requirements like interoperability that are not required by WCAG,[160] WCAG 2.1 Level AA includes specific success criteria related to mobile app accessibility. These success criteria address challenges such as touch target size, orientation, and motion actuation, among others.[161] Therefore, the Department believes that WCAG 2.1 Level AA is a robust framework for mobile app accessibility.

Comment: Most of the comments on how the proposed compliance dates will affect individuals with disabilities noted that the longer that individuals with disabilities are forced to wait for accessible web content and mobile apps, the worse health outcomes they will face. Some commenters noted that retrofitting existing web content is always more difficult than creating accessible content, so recipients should begin making new web content accessible as soon as possible.

Response: The Department agrees that creating accessible content from the start, rather than trying to remediate after the fact, is generally an easier undertaking for recipients and results in lower costs and burdens over time. While recipients must begin complying with the rule on the applicable compliance date, the Department expects that recipients will need to prepare for compliance during the two or three years before the compliance date. In addition, recipients still have an obligation to meet all of section 504's existing requirements—both before and after the date they must initially come into compliance with this rule.

Comment: There were limited comments concerning how to define small recipients under the proposed rulemaking. Some commenters agreed that fifteen was the appropriate employee cut off for small recipients. Some commenters stated that there should be no distinction between small and large recipients because patients require the same level of care regardless of the size of a provider. Some commenters requested that instead of using the section 504 definition of small recipient that includes recipients with fewer than fifteen employees, the Department use the definition from the 2015 Medicare Access and CHIP Reauthorization Act which includes practices with fifteen or fewer professionals, effectively making more recipients small recipients, as the commenters characterized the requested change.

Response: Since its publication over four decades ago, the Department's implementing regulation for section 504 of the Rehabilitation Act has recognized that there are practical differences between recipients with fewer than fifteen employees and recipients with fifteen or more employees. As a result, the Department limited the obligations of recipients with fewer than fifteen employees in certain areas. Maintaining this definition will significantly reduce the administrative complexity of enforcing this regulation and will improve predictability for recipients. The Department will not alter the definition of small recipient under a civil rights regulation to more closely align with a public law focused on physician payments.

Comment: Commenters agreed with the Department's proposed method for compliance for recipients that are also public entities covered by title II of the ADA.

Response: The Department agrees that its proposed method is appropriate. In instances where a recipient is also a public entity covered by title II of the ADA, the recipient will be required to comply with both this rulemaking and all title II regulations, including DOJ's rule establishing specific requirements, including the adoption of specific technical standards, for making accessible the services, programs, or activities offered by State and local government entities to the public through the web and mobile apps, and the associated compliance dates specified in that rulemaking.

Comment: Most commenters agreed that there should not be a separate standard or greater time period for captioning live audio. Many commenters agree that two or three years is adequate time to ensure captioning for live audio, especially given the current advances in automated captioning technology. One commenter asked whether captioning requirements would require captions in multiple different languages beyond English.

Response: As proposed in the NPRM, the final rule applies the same compliance date to all of the WCAG 2.1 Level AA success criteria, including live-audio captioning requirements. As stated in § 84.84(b), this provides three years after publication of the final rule for small recipients to comply, and two years for large recipients. The final rule takes this approach for several reasons. First, the Department understands that live-audio captioning technology has developed in recent years and continues to develop. Additionally, the COVID–19 pandemic moved a significant number of formerly in-person meetings,

[158] W3C, *Introduction to Understanding WCAG* (June 20, 2023), *https://www.w3.org/WAI/WCAG21/Understanding/intro* [*https://perma.cc/XB3Y-QKVU*].

[159] *See* W3C, *Understanding Techniques for WCAG Success Criteria* (June 20, 2023), *https://www.w3.org/WAI/WCAG21/Understanding/understanding-techniques* [*https://perma.cc/AMT4-XAAL*].

[160] *See* 36 CFR 1194.1; 36 CFR part 1194, appendix C, ch. 5.

[161] W3C, *Web Content Accessibility Guidelines (WCAG) 2.1* (June 5, 2018), *https://www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F* (success criteria 2.5.5, 1.3.4, & 2.5.4).

activities, and other gatherings to online settings, many of which incorporated live-audio captioning. As a result of these developments, live-audio captioning has become even more critical for individuals with certain types of disabilities. Further, the Department believes that requiring conformance with all success criteria by the same date (according to recipient size) will address the need for both clarity for recipients and predictability for individuals with disabilities.

This rulemaking is separate from other civil rights laws and regulations that prohibit discrimination based on race, color, or national origin and require meaningful access for individuals with limited English proficiency. Additional information on section 1557, which requires that certain health programs and activities take reasonable steps to provide meaningful access to individuals with limited English proficiency, can be found on the OCR website.

Comment: Some commenters noted that recipients post a variety of live audio content, including news blasts.

Response: The Department appreciates the responses.

Summary of Regulatory Changes

While the Department believes that the comments concerning § 84.84 were overall positive and recognized the intent of the proposed rule, there is also concern that more clarity can be provided to define the scope of coverage. Accordingly, the Department will modify the text of § 84.84(a)(1) and (2) and (b)(1) and (2) to clarify that this rulemaking applies to web content and mobile apps that a recipient provides, either ''directly or through contractual, licensing, or other arrangements.'' This approach is consistent with the NPRM, which clarified that throughout this rule, a recipient's 'website' is intended to include not only the websites hosted by the recipient, but also websites operated on behalf of a recipient by a third party. The Department also received comments in other sections emphasizing the importance of such a distinction and believes it is a fundamental part of this rule that should be emphasized.

The Department will also modify the regulatory text of § 84.84 to remove the words ''members of the public,'' which is more similar to the language in the application section of title II of the ADA but is not intended to change or limit the coverage of the final section 504 rule.

The Department will also edit the language at § 84.84(b)(1) and (2) to clarify that recipients have an ongoing obligation, not a one-time obligation, to make their web content and mobile apps accessible beginning two or three years after the publication of this final rule.

Exceptions (§ 84.85)

Proposed § 84.85 contained a number of exceptions to the requirements of § 84.84 including archived web content (§ 84.85(a)), preexisting conventional electronic documents (§ 84.85(b)), web content posted by a third party (§ 84.85(c)), linked third-party web content (§ 84.85(d)), password-protected course content for elementary, secondary, and postsecondary institutions (§ 84.85(e), (f)), and individualized password-protected documents (§ 84.85(g)).

The Department emphasizes that, even if certain content does not have to conform to the technical standard of this rulemaking, recipients still need to ensure that their programs and activities offered using web content and mobile apps are accessible to people with disabilities on a case-by-case basis in accordance with other obligations under this rulemaking. These obligations include making reasonable modifications to avoid discrimination on the basis of disability, ensuring that communications with people with disabilities are as effective as communications with people without disabilities, and providing people with disabilities an equal opportunity to participate in or benefit from the recipient's programs or activities.[162]

The Department sought comment on the following questions pertaining to archived web content (§ 85.85(a)):

- *Web Accessibility Question 17: How do recipients manage content that is maintained for reference, research, or recordkeeping?*
- *Web Accessibility Question 18: What would the impact of this exception be on people with disabilities?*
- *Web Accessibility Question 19: Are there alternatives to this exception that the Department should consider, or additional limitations that should be placed on this exception? How would foreseeable advances in technology affect the need for this exception?*

The comments and our responses on § 84.85(a) are set forth below.

Comment: One commenter stated that its content is stored in accordance with State administrative rules and made available to the public based on open records laws. Several commenters sought clarity on the definition of ''archived web content.'' Some commenters provided their understanding of what constitutes archived web content, and offered suggestions for updating the Department's proposed definition. One comment stated that archiving content includes taking stock of all the material on a website, then the website may be overhauled in such a way that archived relationships or content types are no longer visible. Some commenters requested an edit to the proposed definition of ''archived content'' to remove the term ''exclusively'' as it limits archived web content to content maintained for reference, research or recordkeeping and the commenters did not want to limit the exception to specific types of content.

Response: The Department appreciates the comments about the archived web content definition and exception. Specifically, some commenters offered recommendations to broaden the definition of archived web content, which would increase the total web content covered by the proposed exception, while other comments recommended limiting the definition of archived web content, which would decrease the total web content covered by the proposed exception. In the proposed rule, ''archived web content'' was defined as ''web content that (1) is retained exclusively for reference, research, or recordkeeping; (2) is not altered or updated after the date of archiving; and (3) is organized and stored in a dedicated area or areas clearly identified as being archived.'' [163]

The Department made several revisions to the definition of archived web content from the NPRM. To clarify the scope of content covered by the definition and associated exception, the Department added a new first part to the definition. That new part specifies that archived web content is limited to three types of historic content: web content that was created before the date the recipient is required to comply with subpart I; web content that reproduces paper documents created before the date the recipient is required to comply with subpart I; and web content that reproduces the contents of other physical media created before the date the recipient is required to comply with subpart I.

Web content that was created before the date a recipient is required to comply with subpart I satisfies the first part of the definition. In determining the date web content was created, the Department does not intend to prohibit recipients from making minor adjustments to web content that was initially created before the relevant

[162] *See* 45 CFR 84.68(b)(1)(ii), (b)(7), 84.77.

[163] 88 FR 63392, 63509 (Sept. 14, 2023).

compliance dates specified in § 84.84(b), such as by redacting personally identifying information from web content as necessary before it is posted to an archive, even if the adjustments are made after the compliance date. In contrast, if a recipient makes substantial changes to web content after the date the recipient is required to comply with the rule, such as by adding, updating, or rearranging content before it is posted to an archive, the content would likely no longer meet the first part of the definition. If the recipient later alters or updates the content after it is posted in an archive, the content would not meet the third part of the definition of archived web content and it would generally need to conform to WCAG 2.1 Level AA.

Web content that reproduces paper documents or that reproduces the contents of other physical media would also satisfy the first part of the definition if the paper documents or the contents of the other physical media were created before the date the recipient is required to comply with this rule. Paper documents include various records that may have been printed, typed, handwritten, drawn, painted, or otherwise marked on paper. Videotapes, audiotapes, film negatives, CD–ROMs, and DVDs are examples of physical media. The Department anticipates that recipients may identify or discover historic paper documents or historic content contained on physical media that they wish to post in an online archive following the time they are required to comply with this rule. For example, a research hospital might move to a new building after the date it is required to comply with this rule and discover a box in storage that contains hundreds of paper files and photo negatives from 1975 related to a research study the hospital conducted at that time. If the hospital reproduced the documents and photos from the film negatives as web content, such as by scanning the documents and film negatives and saving the scans as PDF documents that are made available online, the resulting PDF documents would meet the first part of the definition of archived web content because the underlying paper documents and photos were created in 1975. The Department reiterates that it does not intend to prohibit recipients from making minor adjustments to web content before posting it to an archive, such as by redacting personally identifying information from paper documents. Therefore, the hospital could likely redact personally identifying information about participants in the research study from the scanned PDFs as necessary before posting them to its online archive. But, if the hospital were to make substantial edits to PDFs, such as by adding, updating, or rearranging content before posting the PDFs to its archive, the PDFs would likely not meet the first part of the definition of archived web content because, depending on the circumstances, they may no longer be a reproduction of the historic content. In addition, if the hospital later altered or updated the PDFs after they were posted in an archive, the content would not meet the third part of the definition of archived web content and it would generally need to conform to WCAG 2.1 Level AA.

The Department believes the first part of the definition sets an appropriate time-based limitation on the scope of content covered by the definition and exception that is consistent with the Department's stated intent in the NPRM. In the NPRM, the Department explained that the definition of archived web content and the associated exception were intended to cover historic content that is outdated or superfluous.[164] The definition in the final rule, which is based on whether the relevant content was created before the date a recipient is required to comply with subpart I, is now more aligned with, and better situated to implement, the Department's intent to cover historic content. The Department believes it is appropriate to include a time-based limitation in the definition, rather than add new criteria stating that content must be historic, outdated, or superfluous, because it is more straight forward to differentiate content based on the date the content was created. Therefore, there will be greater predictability for individuals with disabilities and recipients as to which content is covered by the exception.

The Department declines to establish time-based limitations for when content may be posted to an archive or to otherwise set an expiration date for the exception. As discussed below, the Department recognizes that many recipients will need to carefully consider the design and structure of their web content before dedicating a certain area or areas for archived content, and that, thereafter, it will take time for recipients to identify all content that meets the definition of archived web content and post it in the newly created archived area or areas. The archived web content exception thus provides recipients flexibility as to when they will archive web content so long as the web content was created before the date the recipient was required to comply with subpart I or the web content reproduces such paper documents or the contents of other physical media created before the date the recipient was required to comply with subpart I. In addition, the Department does not believe it is necessary to establish a waiting period before newly created web content can be posted in an archive. New content created after the date a recipient is required to comply with this rule will generally not meet the first part of the definition of ''archived web content.'' In the limited circumstances in which newly created web content could meet the first part of the definition because it reproduces paper documents or the contents of other physical media created before the date the recipient is required to comply with this rule, the Department believes the scope of content covered by the exception is sufficiently limited by the second part of the definition: whether the content is retained exclusively for reference, research, or recordkeeping.

After considering all the comments, the Department declines to change what is now the second part of the definition of archived web content. Given the wide variety of web content that recipients provide or make available, the Department does not believe it is advisable to try to use additional, more specific language in the definition about what types of content are covered. Whether web content is retained exclusively for reference, research, or recordkeeping will depend on the facts of the particular situation. The Department notes that if a recipient posts web content that identifies the current policies or procedures of the recipient, or posts web content containing or interpreting applicable laws or regulations related to the recipient, that web content is unlikely to be covered by the exception. This is because the content is notifying members of the public about their ongoing rights and responsibilities. It therefore is not, as the definition requires, being used exclusively for reference, research, or recordkeeping.

Also, the Department's revised definition of archived web content, and specifically the new first part of the definition, make clear that the definition only pertains to certain content created before the date the recipient is required to comply with this rule. Therefore, new content such as agendas, meeting minutes, and other documents related to meetings that take place after the recipient is required to comply with this

[164] 88 FR 63392, 63464 (Sept. 14, 2023).

rule would likely not meet all parts of the definition of archived web content.

In addition to adding a new first part to the definition of archived web content, the Department made one further change to the definition from the NPRM. In the NPRM, what is now the second part of the definition pertained to web content that is ''maintained'' exclusively for reference, research, or recordkeeping. In the final rule, the word ''maintained'' is replaced with ''retained.'' The revised language is not intended to change or limit the coverage of the definition. Rather, the Department recognizes that the word ''maintain'' can have multiple meanings relevant to this rule. In some circumstances, ''maintain'' may mean ''to continue in possession'' of property, whereas in other circumstances it might mean ''to engage in general repair and upkeep'' of property.[165]

Additionally, the Department will retain the word ''exclusively'' in the definition of archived web content. The Department is concerned that removing the word ''exclusively'' would result in less predictability for both recipients and individuals with disabilities about the scope of content covered by the definition. In addition, if the Department were to remove the word ''exclusively,'' the exception for archived web content might cover important older web content that is still used for reasons other than reference, research, or recordkeeping. The purpose of the exception for archived web content is to help recipients focus their resources on making accessible the most important materials that people use most widely and consistently, rather than historic or outdated web content that is only used for reference, research, or recordkeeping.

Comment: Many commenters opposed the proposed archived web content exception because they believe it would result in people with disabilities being denied access in perpetuity to historical information. Several commenters noted that access to archived public documents is key to the public's right to know, petition, and engage in the American democratic process. These commenters said that these legal rights, such as access to public meeting information, should not be abridged on the basis of disability or any other exclusionary reason. Other commenters stated that if recipients do not respond to requests for accessible electronic documents in a timely manner, important information falls under this exception, and any essential documents should not be included in this exception. In addition, commenters said that individuals with disabilities may not know what content they are looking for to make such request for accessible versions. Several commenters stated there will be a negative impact on students, researchers, and other professionals with disabilities who frequently require access to archived content for their studies and livelihoods. One commenter supported the exception, saying that recipients should be encouraged to accommodate people with disabilities so they can access content when requested.

Response: The Department understands the concerns raised by commenters about the burdens that people with disabilities may face because archived web content is not required to conform to WCAG 2.1 Level AA. The Department emphasizes that even if certain content does not have to conform to the technical standard, recipients still need to ensure that their programs and activities offered using web content are accessible to people with disabilities on a case-by-case basis in accordance with their other obligations under section 504. These obligations include making reasonable modifications to avoid discrimination on the basis of disability, ensuring that communications with people with disabilities are as effective as communications with people without disabilities, and providing people with disabilities an equal opportunity to participate in or benefit from the recipient's programs or activities.[166]

The Department emphasizes that web content that is not archived, but instead notifies users about the existence of archived web content and provides users access to archived web content, generally must still conform to WCAG 2.1 Level AA. Therefore, the Department anticipates that members of the public will have information about what content is contained in an archive. For example, a recipient's archive may include a list of links to download archived documents. Under WCAG 2.1 Success Criterion 2.4.4, a recipient would generally have to provide sufficient information in the text of the link alone, or in the text of the link together with the link's programmatically determined link context, so users could understand the purpose of each link and determine whether they want to access a given document in the archive.[167]

The Department continues to believe that the exception appropriately encourages recipients to utilize their resources to make accessible the critical up-to-date materials that are most consistently used to access recipients' programs or activities. The Department believes the exception provides a measure of clarity and certainty for recipients about what is required of archived web content. Therefore, resources that might otherwise be spent making accessible large quantities of historic or otherwise outdated information available on some recipients' websites are freed up to focus on important current and future web content that is widely and frequently used by members of the public. However, the Department emphasizes that the exception is not without bounds. As discussed above, archived web content must meet all four parts of the archived web content definition in order to qualify for the exception. Content must meet the time-based criteria specified in the first part of the definition. The Department believes the addition of the first part of the definition will lead to greater predictability about the application of the exception for individuals with disabilities and recipients. In addition, web content that is used for something other than reference, research, or recordkeeping is not covered by the exception.

Comment: Many commenters pointed out that recipients already have the option to claim fundamental alteration or undue burdens limitations for the subpart. If a recipient cannot argue that making archived documents accessible would result in a fundamental alteration or undue burden, then they should provide access to archived documents via a schedule that prioritizes conversion based on the needs of their constituents. Some commenters suggested that priority should be based on which records are accessed more often, or those that are more chronologically recent. Some commenters mentioned that the burden of proving fundamental alteration or undue burden is on the recipient and the Department should provide clear guidelines on how to satisfy such defenses. One commenter asked about the consequences for noncompliance and encouraged the Department to give recipients ample time and opportunity to correct issues.

Several commenters pointed out that the status quo is that accessible documents are not provided in a timely

[165] *Maintain,* Black's Law Dictionary (11th ed. 2019).

[166] *See* 45 CFR 84.68(b)(1)(ii), (b)(7), 84.77.

[167] *See* W3C, *Web Content Accessibility Guidelines 2.1, Link Purpose (In Context)* (June 5, 2018), *https://www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F.*

manner upon request, and requested that if the Department does end up allowing the exception for archived documents, then the Department should define ''timely manner'' to no longer than a few business days. Commenters said the Department should also require that recipients post processes and timelines for accessing inaccessible archived documents.

Some commenters requested that any documents archived after the effective date of this rule be kept in an accessible format.

One commenter said the Department should distinguish between archives that are themselves programs of a recipient (*e.g.,* special digital collections and recordkeeping) versus any information that was originally web content and that may be archived solely for reference (*e.g.,* old calendar events or time-oriented resources kept on an archives section of the website). This commenter stated that when an archive is itself a program, it should be required to be accessible.

Response: The Department's aim in setting forth exceptions was to make sure that individuals with disabilities have ready access to recipients' web content and mobile apps, especially those that are current, commonly used, or otherwise widely needed, while also ensuring that practical compliance with this rule is feasible and sustainable for recipients. The exceptions help to ensure that compliance with this final rule is feasible by enabling recipients to focus their resources on making frequently used or high impact content WCAG 2.1 Level AA compliant first. The Department was mindful of the pragmatic concern that should the final rule require actions that are likely to result in fundamental alterations or undue burdens for large numbers of recipients or large swaths of their content, the rule could in practice lead to fewer improvements for accessibility across the board as recipients encountered these limitations. The Department believes that such a rule could result in recipients prioritizing accessibility of content that is ''easy'' to make accessible, rather than content that is essential, despite the spirit and letter of the rule. The Department believes that clarifying that recipients do not need to focus resources on certain content helps ensure that recipients can focus their resources on the large volume of content not covered by exceptions, as that content is likely more frequently used or up to date.

As discussed above, the Department has decided to keep the archived web content exception in the final rule. After reviewing the range of different views expressed by commenters, the Department continues to believe that the exception appropriately encourages recipients to utilize their resources to make accessible the critical up-to-date materials that are most consistently used to access recipients' programs or activities. The Department believes the exception provides a measure of clarity and certainty for recipients about what is required of archived web content. Therefore, resources that might otherwise be spent making accessible large quantities of historic or otherwise outdated information available on some recipients' websites are freed up to focus on important current and future web content that is widely and frequently used by members of the public.

The Department also declines to treat differently recipients whose primary function is to provide or make available what a commenter perceived as archived web content. The Department reiterates that whether archived web content is retained exclusively for reference, research, or recordkeeping depends on the particular facts and circumstances. The Department believes the exception and definition of archived web content together provide a workable framework for determining whether all types of recipients properly designate web content as archived.

The Department declines to require recipients to adopt procedures and timelines for how individuals with disabilities could request access to inaccessible archived web content covered by the exception. The Department reiterates that, even if content is covered by this exception, recipients still need to ensure that their programs and activities offered using web content are accessible to people with disabilities on a case-by-case basis in accordance with their other obligations under section 504. These obligations include making reasonable modifications to avoid discrimination on the basis of disability, ensuring that communications with people with disabilities are as effective as communications with people without disabilities, and providing people with disabilities an equal opportunity to participate in or benefit from the recipient's programs or activities.[168]

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.85(a) as proposed with no modifications and editing the definition of ''archived web content'' in § 84.10 by adding the following at paragraph (1): ''was created before the date the recipient is required to comply with § 84.84, reproduces paper documents created before the date the recipient is required to comply with § 84.84, or reproduces the contents of other physical media created before the date the recipient is required to comply with § 84.84.'' The provision designated as paragraph (1) in the NPRM will be redesignated as paragraph (2) and the word ''maintained'' will be replaced with ''is retained under.'' In addition, the provisions labelled paragraphs (2) and (3) in the NPRM will be redesignated as paragraphs (3) and (4), respectively.

The Department sought comment on the following questions pertaining to preexisting conventional electronic documents (§ 84.85(b)):

- *Web Accessibility Question 20: Where do recipients make conventional electronic documents available to the public? Do recipients post conventional electronic documents anywhere else on the web besides their own websites?*
- *Web Accessibility Question 21: Would this ''preexisting conventional electronic documents'' exception reach content that is not already excepted under the proposed archived web content exception? If so, what kinds of additional content would it reach?*
- *Web Accessibility Question 22: What would the impact of this exception be on people with disabilities? Are there alternatives to this exception that the Department should consider, or additional limitations that should be placed on this exception? How would foreseeable advances in technology affect the need for this exception?*

The comments and our responses on § 84.85(b) are set forth below.

Comment: Some commenters stated that preexisting conventional documents can easily be made accessible, such as by using .doc formats as opposed to .pdf or saving a .pdf in a more accessible manner. Some commenters wanted to broaden this exception to cover preexisting multimedia content and documents produced by government entities. Those commenters reasoned that documents provided by government entities may have statutory limitations that prevent changes and recipients would have no control over or ability to change the content of such documents. Another commenter appreciated the exception because they believe that without the exception recipients would be forced to delete a significant amount of helpful content from their websites. This commenter urged HHS to except content posted on platforms such as YouTube from coverage.

[168] *See* 45 CFR 84.68(b)(1)(ii), (b)(7), 84.77.

Commenters listed types of conventional electronic documents made available to the public such as PDF, brochures, announcements, and slides shows on websites, cloud drives, file sharing sites, and cloud document platforms. Commenters said recipients use social media which allows the posting of links, which can include links to the recipient's own website. Conventional electronic documents can be attached to the social media post themselves in limited circumstances. One commenter recommended changing the wording of exception to include documents that have been posted to sites other than the recipient's website (such as cloud drives and social media).

A State governor said the exception is too broad and proposed limiting the exception to archived documents that are no longer in regular and ongoing use to avoid excessive inaccessible legacy content.

Response: The Department does not intend to broaden this proposed exception at this time, because the exception at § 84.85(a) covers archived web content, the definition of which is not limited to documents.[169] Web content that recipients provide or make available must conform to WCAG 2.1 Level AA unless covered by an exception. That includes videos that a recipient creates.

The Department appreciates commenters' discussions of the types of conventional documents that recipients use and how to make them accessible. Preexisting conventional electronic documents are covered by this exception unless they are currently used to apply for, gain access to, or participate in a recipient's programs or activities.

The Department continues to believe that the exception provides an important measure of clarity and certainty for recipients as they initially consider how to address all the various conventional electronic documents provided and made available through their web content and mobile apps. The exception will allow recipients to primarily focus their resources on developing new conventional electronic documents that are accessible as defined under this rule and remediating preexisting conventional electronic documents that are currently used to apply for, gain access to, or participate in their programs or activities. In contrast, recipients will not have to expend their resources on identifying, cataloguing, and remediating preexisting conventional electronic documents that are not currently used to apply for, gain access to, or participate in the recipients' programs or activities.

The Department modified the language of this exception from the NPRM in ways that are relevant to the comment about the location of the conventional electronic documents, including social media sites and cloud drives. In the NPRM, the Department specified that the exception applied to conventional electronic documents ''created by or for a recipient'' that are available ''on a recipient's website or mobile app.'' The Department believes the language ''created by or for a recipient'' is no longer necessary in the regulatory text of the exception itself because the Department updated the language of § 84.84 to clarify the overall scope of content generally covered by the rule. In particular, and, as explained above, to make clear that recipients cannot delegate away their accessibility responsibilities, the text of § 84.84(a)(1) and (2) now states that the rule applies to all web content and mobile apps that a recipient provides or makes available either ''directly, or through contractual, licensing, or other arrangements.'' Section 84.85(b), which is an exception to the requirements of § 84.84, is therefore limited by the new language added to the general section.

In addition, the Department removed the phrase ''members of the public'' from the language of the exception in the proposed rule for consistency with the edits to § 84.84 of the section 504 regulation and title II of the ADA, as described above.

Comment: Several commenters pointed out that there may be a need for documents that fall under this exception because, while they are not used to apply for, gain access to, or participate in a recipient's programs or activities, they are important for understanding the recipient's programs, activities, and services. One commenter noted that ''apply for, gain access to, or participate in a recipient's services, programs, or activities'' may not be consistently interpreted among recipients, and that documents with information about understanding the recipient's overall programs and activities, research-related documents, directives on health care payment, coding, or coverage can govern medical decisions long after they are published. Commenters noted that disputes related to health care claims can take years to solve, making existing documents relevant for such claims. Commenters noted that even if updated, new documents may not replace older versions in all circumstances, and partial revisions to existing documents make it necessary for both versions to be accessible for comparison.

One commenter stated that the Department adequately addressed concerns about whether supporting information for conventional documents will be accessible with the statement ''a recipient must not only make a new patient form accessible, but it must also make accessible other materials that may be needed to complete the form, understand the process, or otherwise take part in the program.''

Response: Whether a conventional electronic document is currently used to apply for, gain access to, or participate in a recipient's programs or activities is a fact-specific analysis. For example, one commenter questioned whether a document containing a recipient's directives on health care payments would be covered by the exception if the document did not otherwise discuss a particular program or activity. The Department anticipates that the exception would likely not cover such a document because the document is likely used as instructions for making payments to the recipient as part of the recipient's program and activity of collecting payments for health services it provides. The Department provides additional information about how the exception applies to documents that provide instructions or guidance below. Another example is an informational document containing a recipient hospital's description of the accessibility features available throughout its hospital building. The Department anticipates that the exception would likely not cover such a document. One of the recipient's programs and activities is maintaining its building, including the building's accessibility features. An individual with a disability who accesses the document to understand the hospital's accessibility features before going to the hospital to visit a relative receiving treatment there would be currently using the document to gain access to the hospital's building.

Additionally, the Department notes that preexisting documents are also not covered by the exception if they provide instructions or guidance related to other documents that are directly used to apply for, gain access to, or participate in the recipient's programs or activities. Therefore, in addition to making a preexisting PDF application for benefits conform with WCAG 2.1 Level AA, a recipient would also have to make other preexisting documents conform with WCAG 2.1 Level AA if they may be needed to obtain the benefits, complete the application, understand the process, or otherwise take part in the program, such as application instructions,

[169] *See* § 84.10.

manuals, and guides, such as ''Questions and Answers'' documents.

The Department recognizes that there may be some overlap between the content covered by the archived web content exception and the exception for preexisting conventional electronic documents. The Department notes that if web content is covered by the archived web content exception, it does not need to conform to WCAG 2.1 Level AA to comply with this rule, even if the content fails to qualify for another exception, such as the preexisting conventional electronic document exception. For example, after the date a recipient college is required to comply with this rule, its health clinic website may still include PDF documents containing the schedules from academic year 2017–2018 that were posted in non-archived areas of the website in the summer of 2017. Those PDFs may be covered by the preexisting conventional electronic documents exception because they were available on the college's health clinic website prior to the date it was required to comply with this rule, unless they are currently used to apply for, gain access to, or participate in a recipient's programs or activities, in which case, as discussed in this rule, they would generally need to conform to WCAG 2.1 Level AA. However, if the college moved the PDFs to an archived area of its health clinic site and the PDFs satisfied all parts of the definition of archived web content, the documents would not need to conform to WCAG 2.1 Level AA, regardless of how the preexisting conventional electronic document exception might otherwise have applied, because the content would fall within the archived web content exception.

Also, because the exception only applies to preexisting conventional electronic documents, it would not cover documents that are open for editing if they are changed or revised after the date a recipient is required to comply with this rule. For example, a school may maintain an editable word processing file, such as a Google Docs file, that lists the dates on which the school held school board meetings. The school may post a link to the document on its website so members of the public can view the document online in a web browser, and it may update the contents of the document over time after additional meetings take place. If the document was posted to the school's website prior to the date it was required to comply with the rule, it would be a preexisting conventional electronic document unless the school added new dates to the document after the date it was required to comply with this rule. If the school made such additions to the document, the document would no longer be preexisting. Nevertheless, there are some circumstances where conventional electronic documents may be covered by the exception even if copies of the documents can be edited after the date the recipient is required to comply with this rule. For example, a recipient may post a Microsoft Word version of a flyer on its website prior to the date it is required to comply with this rule. A member of the public could technically download and edit that Word document after the date the recipient is required to comply with the rule, but their edits would not impact the ''official'' posted version. Therefore, the official version would still qualify as preexisting under the exception. Similarly, PDF files that include fillable form fields (*e.g.,* areas for a user to input their name and address) may also be covered by the exception so long as members of the public do not edit the content contained in the official posted version of the document. However, as discussed below, the exception does not apply to documents that are currently used to apply for, gain access to, or participate in a recipient's programs or activities. The Department notes that whether a PDF document is fillable may be relevant in considering whether the document is currently used to apply for, gain access to, or participate in a recipient's programs or activities. For example, a PDF form that must be filled out and submitted when submitting medical information to a health provider is currently used to apply for, gain access to, or participate in a recipient's programs or activities, and therefore would not be subject to the exception for preexisting conventional electronic documents.

Comment: Commenters mentioned several populations that would be affected, including participants in adult education programs that may need to use another recipient's document for tools, skills and programs for future employment training; citizens who will be unable to petition the government for redress of grievances due to inaccessible meeting presentation documents; and researchers who will not have access to research publications, public health reports, and reports about community health needs.

Several commenters pointed out that people with disabilities must disclose their disability in requests for accessible versions of preexisting conventional electronic documents and wait for the recipient to remediate the document. One commenter said that a recipient's time is better spent on making sure new conventional electronic documents are accessible rather than historical data.

Several commenters pointed out that small recipients will have an additional three years to publish inaccessible materials, many of which will not be archived for several years. These commenters believed that these timeframes could be interpreted by these recipients to mean that those documents do not need to be made accessible.

One commenter stated that documents that meet the preexisting conventional document exception but are no longer applicable to a current program or activity should be archived. The commenter wrote that the remaining documents included under this exception should be limited, if any. Another commenter said that documents that recipients provide are often ''living'' documents, meaning they will be edited often, but not archived for several years. A different commenter expressed appreciation of the Department's clarification that if a recipient updates an otherwise covered document after the effective date of this rule, it is no longer considered preexisting.

One commenter noted that there are already advances in technology that allow for modification of preexisting conventional electronic documents.

Response: The Department understands the concerns raised by commenters about the potential burdens that individuals with disabilities may face because some conventional electronic documents covered by the exception are not accessible. The Department emphasizes that even if certain content does not have to conform to the technical standard, recipients still need to ensure that their programs and activities offered using web content are accessible to people with disabilities on a case-by-case basis in accordance with their other obligations under section 504. These obligations include making reasonable modifications to avoid discrimination on the basis of disability, ensuring that communications with people with disabilities are as effective as communications with people without disabilities, and providing people with disabilities an equal opportunity to participate in or benefit from the recipient's programs or activities.[170]

The Department agrees that recipients may choose to archive their existing conventional electronic documents if they meet the definition of archived web content in § 84.10. The Department also agrees that if a recipient changes or

[170] *See* 45 CFR 84.68(b)(1)(ii), (b)(7), 84.77.

revises a preexisting document following the date it is required to comply with the rule, the document would no longer be ''preexisting'' for the purposes of the exception.

Summary of Regulatory Changes

For the reasons set forth above, the comments received, and other changes throughout this rulemaking, the Department is making limited modifications to § 84.85(b). As discussed above, the Department is eliminating the phrase ''created by or for a recipient'' because such situations are now addressed by the ''directly or through contractual, licensing, or other arrangements'' language inserted into § 84.84(a) and (b). The Department is also replacing ''on a recipient's website or mobile app'' with ''as part of a recipient's web content or mobile apps'' to ensure consistency with other parts of the regulatory text by referring to ''web content'' rather than ''websites.'' In addition, the Department removed the phrase ''members of the public'' from the language of the exception for consistency with the edits to § 84.84 of the section 504 regulation and title II of the ADA.

The Department sought comment on the following questions pertaining to web content posted by a third party (§ 84.85(c)):

- *Web Accessibility Question 23: What types of third-party web content can be found on websites of recipients? How would foreseeable advances in technology affect the need for creating an exception for this content? To what extent is this content posted by the recipients themselves, as opposed to third parties? To what extent do recipients delegate to third parties to post on their behalf? What degree of control do recipients have over content posted by third parties, and what steps can recipients take to make sure this content is accessible?*
- *Web Accessibility Question 24: What would the impact of this exception be on people with disabilities?*

The comments and our responses on § 84.85(c) are set forth below.

Comment: Commenters stated that social media profiles of recipients allow for public comments from news about emergencies like disasters or shooters and can be more current than the local news coverage. Commenters describe social media as spaces used to complain about community conditions, get advice, and get organized. Commenters also stated that social media is used to understand new programs, health policy, public comments, and public contracts. Some commenters found that tools for accessibility provided on social media platforms may not be sufficient for accessibility. Another commenter recommended requiring training on how to use these third-party accessibility features and that such trainings should be documented.

Commenters mentioned situations, other than through social media, where web content is posted by a third party on a recipient's website such as when recipients post forums for public comments, promote individuals' rights to petition the government for redress of grievances, solicit real-time feedback during public meetings, or seek bids for contracts on third-party platforms. Other commenters mentioned teachers assigning work through a class message board that may require students to reply with video, essay, wiki page or other work. Another commenter mentioned scheduling tools, maps, calendars, and payment systems. One commenter said that third-party content could be uploaded to a case docket and the inaccessibility of such posting could deny the individual the right to a fair hearing as well as equal employment in the legal profession.

Some commenters said that if this exception is eliminated, recipients can take steps to make sure content is accessible by changing settings, setting rules, and prompting users to include alt text.

A few commenters said they are not able to control third-party content and supported this exception. Those commenters said it's up to the third-party to make content accessible. Some commenters said recipients often receive materials from third parties, including legal documents like signed contracts, that could be materially altered if the recipient makes them accessible. One commenter said that enforcing accessibility may force recipients to remove resources otherwise helpful to their enrollees such as population health management programs. Another commenter agreed with the exception but thought that the recipient should be able to provide an accessible system for the general structure and that text-only postings should be easy to make accessible and recommend that this level of accessibility be required.

One commenter requested clarification on (1) criteria for how recipients can distinguish among third-party content that may or may not allow members of the public to participate in or benefit from the recipient's programs or activities; and (2) whether the technical standard requirements would apply to third-party materials that are linked within a recipient's website such as other websites or non-text content.

Some commenters voiced concerns with the challenge of meeting requirements in the proposed time frame as they have already procured most of their software for development. One commenter recommended that OCR conduct additional outreach and educational activities to software and other vendors to ensure that they know about technology accessibility standards.

Some other commenters requested that the Department edit part of the exception because while third-party content can be located on the recipient's website, it may not always be ''posted'' by the third-party entity.

Response: The Department appreciates the responses, particularly those that identified situations where a third party may post content on a recipient's website. The final rule includes this exception in recognition of the fact that individuals other than a recipient's agents sometimes post content on a recipient's web content and mobile apps. For example, members of the public may sometimes post on a recipient's online message boards, wikis, social media, or other web forums, many of which are unmonitored, interactive spaces designed to promote the sharing of information and ideas. Members of the public may post frequently, at all hours of the day or night, and a recipient may have little to no control over the content that the third party posted. In some cases, a recipient's website may include posts from third parties dating back many years, which are likely of limited, if any, relevance today. Because recipients often lack control over this third-party content, it may be challenging (or impossible) for them to make it accessible. Moreover, because this third-party content may be outdated or less frequently accessed than other content, there may be only limited benefit to requiring recipients to make this content accessible. An example would be a recipient website that includes a comment section that allows members of the public to post reviews or responses.

Based on the comments received, the Department believes there may be confusion, especially among recipients, as to what content would be excepted. The exception in § 84.85(c) does not apply to content posted by the recipient itself, or posted on behalf of the recipient due to contractual, licensing, or other arrangements, even if the content was originally created by a third party. For example, many recipients post third-party content on their websites, such as calendars, scheduling tools, maps, reservations systems, and payment systems that were developed

by an outside technology company. Sometimes a third party might even build a recipient's website template on the recipient's behalf. To the extent a recipient chooses to rely on third-party content on its website in these ways, it must select third-party content that meets the requirements of § 84.84. This is because a recipient may not delegate away its obligations under section 504.[171] If a recipient relies on a contractor or another third party to post content on the recipient's behalf, the recipient retains responsibility for ensuring the accessibility of that content.

The Department has added language to the third-party posted exception in the final rule to make clear that the exception does not apply where a third party is posting on behalf of the recipient. The language provides that the exception does not apply if ''the third party is posting due to contractual, licensing, or other arrangements with the recipient.'' The Department added this language to make clear that the exception only applies where the third-party posted content is independent from the actions of the recipient—that is, where there is no arrangement under which the third party is acting on behalf of the recipient. If such an arrangement exists, the third-party content is not covered by the exception and must be made accessible in accordance with this rule. This point is also made clear in language the Department added to the general requirements of § 84.84, which provides that recipient shall ensure web content and mobile apps that the recipients provide or make available, ''directly or through contractual, licensing, or other arrangements,'' are readily accessible to and usable by individuals with disabilities. The Department decided to add the same clarification to the exception for third-party posted content because this is the only exception in the final rule that applies solely based upon the identity of the poster (whereas the other exceptions identify the type of content at issue), and the Department believes clarity about the meaning of ''third party'' in the context of this exception is critical to avoid the exception being interpreted overly broadly. The Department believes this clarification is justified by the concerns raised by commenters.

The majority of the comments received addressed instances in which a State or local government may receive third party posts on public forum matters from members of the public, not instances where health and human service providers receive third party posts on their own websites. Many of the comments also focused on the social media posts of recipients that may receive third party comments over which the recipients have no control.

The Department is committed to providing guidance on this rulemaking once finalized as appropriate.

Comment: Many commenters disagreed with this exception. These commenters said that people would lose access to time-sensitive information, employment opportunities, educational content, and robust opportunities to participate in public feedback sessions. They also said that people with disabilities would not be able to participate in discussions of shared grievances and concerns about their communities that will lead to lack of ability to seek redress for those grievances. One commenter said that ADA covered entities may be less mindful of their ADA obligations if they are under no pressure from recipients to make certain content accessible. A different commenter remarked on the web accessibility standard differences between ADA title III entities posting on section 504 third-party pages, saying that because title III does not have specific web accessibility standards, third-party pages are less likely to make their content accessible if the section 504 entity doesn't pressure them to do so.

Several commenters expressed support for this exception. One commenter thought it was unreasonable to ask the recipient to police third-party content. One commenter was not sure how to pose a solution to inaccessible third-party content being posted, but thought that posting accessibility guidelines on their websites for third parties to use could be feasible. Another commenter thought that lack of access to third-party content was merely an annoyance to people with disabilities that could potentially become problematic if the recipient relies on the public to provide their customer support.

Response: After reviewing the comments, the Department emphasizes at the outset the narrowness of this exception—any third-party content that is posted due to contractual, licensing, or other arrangements with the recipient would not be covered by this exception. The Department sometimes refers to the content covered by this exception as ''independent'' or ''unaffiliated'' content to emphasize that this exception only applies to content that the recipient has not contracted, licensed, or otherwise arranged with the third party to post. This exception would generally apply, for example, where the recipient enables comments from members of the public on its social media page and third-party individuals independently comment on that post.

The Department recognizes that the inclusion of this exception means web content posted by third parties may not consistently be accessible by default. The Department emphasizes that even if certain content does not have to conform with the technical standard, recipients still need to ensure that their programs and activities offered using web content and mobile apps are accessible to people with disabilities on a case-by-case basis in accordance with their existing obligations under section 504. These obligations include making reasonable modifications to avoid discrimination on the basis of disability, ensuring that communications with people with disabilities are as effective as communications with people without disabilities, and providing people with disabilities an equal opportunity to participate in or benefit from the recipient's programs or activities.[172]

Additionally, the Department wishes to clarify that while the exception for third-party posted content applies to that content which is posted by an independent third party, the exception does not apply to the authoring tools and embedded content provided by the recipient, directly or through contractual, licensing, or other arrangements. Because of this, authoring tools, embedded content, and other similar functions provided by the recipient that facilitate third-party postings are not covered by this exception and must be made accessible in accordance with the rule. Further, recipients should consider the ways in which they can facilitate accessible output of third-party content through authoring tools and guidance.

With respect to comments pertaining to title III of the ADA, the Department emphasizes that this proposed rulemaking only addresses recipients' obligations under section 504.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.85(c) with limited modifications to clarify that the exception does not apply where a third party is posting on behalf of the recipient due to contractual, licensing, or other arrangements. This point is also made clear in the general requirements

[171] *See* 45 CFR 84.4, redesignated as § 84.68(b)(1) (prohibiting discrimination directly or through a contractual, licensing, or other arrangement that would provide an aid, benefit, or service to a qualified individual with a disability that is not equal to that afforded others).

[172] *See* 45 CFR 84.68(b)(1)(ii), (b)(7), 84.77.

of § 84.84, which provides that recipients shall ensure web content and mobile apps that the recipients, ''directly or through contractual, licensing, or other arrangements'' provide or make available are readily accessible to and usable by individuals with disabilities.

The Department sought comment on the following questions pertaining to linked third-party web content (§ 84.85(d)):

- *Web Accessibility Question 25: Do recipients link to third-party web content to allow members of the public to participate in or benefit from the recipients' programs or activities? If so, to what extent does the third-party web content that recipients use for that purpose conform with WCAG 2.1 Level AA?*
- *Web Accessibility Question 26: What would the impact of this exception be on people with disabilities, and how would foreseeable advances in technology affect the need for this exception?*
- *Web Accessibility Question 27: What types of external mobile apps, if any, do recipients use to provide access to their programs and activities to members of the public, and how accessible are these apps? While the Department has not proposed an exception to the requirements proposed in § 84.84 for recipients' use of external mobile apps, should the Department propose such an exception? If so, should this exception expire after a certain time, and how would this exception impact persons with disabilities?*

The comments and our responses on § 84.85(d) are set forth below.

Comment: Many commenters opposed this exception. Several commenters believed it was important that third parties share some of the responsibility for making their content accessible. Commenters provided examples of recipients linking to third-party web content such as a public health department providing up to date information about a shortage of a certain medication and identifying which pharmacies still have a supply. Some commenters said that recipients should only link content that is accessible on their own website.

Several commenters were in favor of this exception. One commenter believed that enforcing accessibility may force recipients to remove resources otherwise helpful to their enrollees such as a population health management program tailored to certain enrollees.

Response: After consideration of the comments received, the Department believes that inclusion of this exception is unnecessary, would result in confusion, and that removing the exception more consistently aligns with the language of section 504 and the Department's intent in proposing the exception in the NPRM. The Department believes that the proper analysis is whether a recipient has ''directly, or through contractual, licensing, or other arrangements,'' provided or made available the third-party content. This means that, for example, when a recipient posts links to third-party web content on the recipient's website, the links located on the recipient's website and the organization of the recipient's website must comply with § 84.84. Further, when a recipient links to third-party web content that is provided by the recipient, directly or through contractual, licensing, or other arrangements, the recipient is also responsible for ensuring the accessibility of that linked content. However, when recipients link to third-party websites, unless the recipient has a contractual, licensing, or other arrangement with the website to provide or make available content, those third-party websites are not covered by section 504, because they are not programs or activities provided or made available by recipients, and thus recipients are not responsible for the accessibility of that content. By deleting this exception, the Department will maintain its original intent without unnecessary confusion for recipients or members of the public.

Rather than conduct a separate analysis under the proposed exception in the NPRM, the Department believes the simpler and more legally consistent approach is for recipients to assess whether the linked third-party content reflects content that is covered under this rule to determine their responsibility to ensure the accessibility of that content. If that content is covered, it must be made accessible in accordance with the requirements of § 84.84. However, if the content is not provided or made available by a recipient, directly or through contractual, licensing, or other arrangements, even though the recipient linked to that content, the recipient would not be responsible for making that content accessible. The recipient would still need to ensure the links themselves are accessible, but not the unaffiliated linked third-party content.

Comment: Commenters who opposed this exception expressed the view that if the Department moves forward with this exception, it will undermine recipients' attempts to bring their vendors and partners into compliance. One commenter said that only posting accessible third-party content will reduce the chance of adverse impact on people with disabilities. This commenter believes that the provider writing the third-party content will benefit financially from such linkage and that this is a negotiating aspect for accessibility. Several commenters said that contracts with third parties should include accessibility requirements.

One commenter proposed that if the linked content is important to understanding or providing context to users of the recipient's website, an alternate method of access should be provided. For example, the commenter suggested using a statement like ''Please follow this link for relevant context or contact our customer support line if you need help understanding this information.''

Response: The Department reiterates that rather than conduct a separate analysis under the proposed exception in the NPRM, the simpler and more legally consistent approach is for recipients to assess whether the linked third-party content reflects content that is covered under this rule to determine their responsibility to ensure the accessibility of that content. If that content is covered, it must be made accessible in accordance with the requirements of § 84.84. However, if the content is not provided or made available by a recipient, directly or through contractual, licensing, or other arrangements, even though the recipient linked to that content, the recipient would not be responsible for making that content accessible. The recipient would still need to ensure the links themselves are accessible, but not the unaffiliated linked third-party content. Whether third-party linked content is covered by the requirements of § 84.84 depends on the facts and circumstances. In instances where linked third-party content provides instructions or guidance related to the recipient's programs and activities, the linked third-party content is likely subject to the requirements of § 84.84.

Comment: Most commenters thanked HHS for not including an exception for mobile apps. Commenters mentioned situations where external mobile apps would provide access to programs and activities, including but not limited to: telehealth, patient communication, appointment booking, bill payment, test results, medication information, tracking transit vehicles like non-emergency medical transportation, e-books, event announcements, tickets, food service ordering, media, and entertainment.

One commenter said the accessibility requirements should be included in the

contracts between recipients and third-party app developers. Another stated that content created should also follow accessibility standards in apps. Another commenter said that people who are deaf, deafblind, deafdisabled, late-deafened, and hard of hearing are often unable to seek telehealth medical advice due to the inability of the conferencing platform to support sign language interpretation, video relay service, or captioning.

One commenter encouraged HHS to include an exception for external mobile apps.

Response: The Department appreciates the comments. As discussed above, the Department has removed the linked third-party web content exception from the final rule altogether.

The Department recognizes that many recipients use mobile apps that are developed, owned, and operated by third parties, such as private companies, to allow the public to access the recipient's programs and activities. This part of the analysis refers to mobile apps that are developed, owned, and operated by third parties as ''external mobile apps.'' In the final rule, external mobile apps are subject to § 84.84 in the same way as mobile apps that are developed, owned, and operated by a recipient. Accordingly, if a recipient, directly or through contractual, licensing, or other arrangements, provides or makes available an external mobile app, that mobile app must comply with § 84.84 unless it is subject to one of the exceptions outlined in § 84.85.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are deleting proposed § 84.85(d).

Proposed § 84.85(e) contained an exception for password-protected class or course content used by postsecondary institutions with limitations based on when the recipient knew or should have known that a student with a disability is preregistered for a course or has enrolled in a course after the start of the academic term and will be unable to access the password-protected class or course content due to disability.

The Department invited comment on the following questions pertaining to password-protected class or course content:

- *Web Accessibility Question 28: Are there particular issues relating to the accessibility of digital books and textbooks that the Department should consider in finalizing this rule? Are there particular issues that the Department should consider regarding the impact of this rule on libraries?*
- *Web Accessibility Question 29: How difficult would it be for postsecondary institutions to comply with this rule in the absence of this exception?*
- *Web Accessibility Question 30: What would the impact of this exception be on people with disabilities?*
- *Web Accessibility Question 31: How do postsecondary institutions communicate general information and course-specific information to their students?*
- *Web Accessibility Question 32: Do postsecondary institutions commonly provide parents access to password-protected course content?*
- *Web Accessibility Question 33: The proposed exception and its limitations are confined to content on a password-protected or otherwise secured website for students enrolled in a specific course. Do postsecondary institutions combine and make available content for particular groups of students (e.g., newly admitted students or graduating seniors) using a single password-protected website and, if so, should such content be included in the exception?*
- *Web Accessibility Question 34: On average, how much content and what type of content do password-protected course websites of postsecondary institutions contain? Is there content posted by students or parents? Should content posted by students or parents be required to be accessible and, if so, how long would it take a postsecondary institution to make it accessible?*
- *Web Accessibility Question 35: How long would it take to make course content available on a recipient's password-protected or otherwise secured website for a particular course accessible, and does this vary based on the type of course? Do students need access to course content before the first day of class? How much delay in accessing online course content can a student reasonably overcome in order to have an equal opportunity to succeed in a course, and does the answer change depending on the point in the academic term that the delay occurs?*
- *Web Accessibility Question 36: To what extent do educational institutions use or offer students mobile apps to enable access to password-protected course content? Should the Department apply the same exceptions and limitations to the exceptions under proposed § 84.85(e) introductory text and (e)(1) and (2), respectively, to mobile apps?*
- *Web Accessibility Question 37: Should the Department consider an alternative approach, such as requiring that all newly posted course content be made accessible on an expedited time frame, while adopting a later compliance date for remediating existing content?*

The comments and our responses on § 84.85(e) are set forth below.

Comment: Several commenters mentioned that DOJ and ED provided guidance in early 2010 which led most public colleges and universities to develop universally designed courses using a framework that outlines methods of designing courses to make them accessible for all students, including students with disabilities. Commenters stated that Federal agencies have also funded technical assistance resources for colleges and universities; such resources have included information about how to implement coordinated systems for the timely provision of accessible materials and technologies and some of these resources touch on improving access capabilities to Science, Technology, Engineering, Math (STEM) materials.

Many commenters commented on how difficult it is for a college to wait until a student enrolls in a course and then have to retroactively attempt to fix inaccessible courses. Others mentioned that several colleges and universities already have policies requiring that new digital content be made accessible subject only to fundamental alteration and undue burden limitations. One commenter stated that simple courses may take five days to remediate while more complex courses with visual materials, audio materials, or other inaccessible documents will take significantly longer. This commenter added that if more than one course needs to be remediated, then the five-day period will no longer be feasible for simple courses. One commenter said that remediating a textbook can take the same amount of time as designing a new course. That same commenter mentioned that large videos can take a lot of time to caption and provide audio content on, even when outsourcing. One commenter mentioned that planning and coordination of the conversion of accessible content can take two to three hours per course.

Another commenter mentioned that students may need access to the course prior to the official start of the semester. Several commenters talked about the impact of a student dropping and then adding a course during the beginning of the semester.

One commenter asked who the responsible party is when a high school student enrolls in college courses in situations of dual enrollment.

One commenter mentioned that when requirements for captioned television shows were first mandated, similar

concerns were expressed about the difficulty of coming into compliance with new regulations, but now captioned television is part of the industry norm.

Some commenters supported the exception.

Response: Having reviewed the public comments, the Department believes it is appropriate, as many commenters suggested, not to include the previously proposed course content exceptions in the final rule. For many of the reasons noted by commenters, the Department concludes that the proposed exceptions would not meaningfully ease the burden on educational institutions and would significantly exacerbate educational inequities for students with disabilities. The Department concludes that the proposed exceptions would have led to an unsustainable and infeasible framework for recipients to make course content accessible, which would not have resulted in reliable access to course content for students with disabilities. As many commenters noted, it would have been extremely burdensome and sometimes even impossible for educational institutions to comply consistently with the rapid remediation timeframes set forth in the limitations to the proposed exceptions in the NPRM, which would likely have led to widespread delays in access to course content for students with disabilities. While extending the remediation timeframes might have made it more feasible for educational institutions to comply under some circumstances, this extension would have commensurately delayed access for students with disabilities, which would have been harmful for the many reasons noted by commenters. The Department believes that it is more efficient and effective for educational institutions to use the two- or three-year compliance timeframe to prepare to make course content accessible proactively, instead of having to scramble to remediate content reactively.

Accordingly, under the final rule, password-protected course content will be treated like any other content and will generally need to conform to WCAG 2.1 Level AA. To the extent that it is burdensome for recipients to make all of their content, including course content, accessible, the Department believes the rule contains a series of mechanisms that are designed to make it feasible for these institutions to comply, including the delayed compliance dates discussed in § 84.84, the other exceptions discussed in § 84.85, the provisions relating to conforming alternate versions and equivalent facilitation discussed in §§ 84.86 and 84.87, the fundamental alteration and undue burdens limitations discussed in § 84.88, and the approach to measuring compliance with the rule discussed in § 84.89.

Comment: Many commenters said this exception would reduce a person with a disability's opportunity to change courses, exclude them from education, and give them fewer opportunities to succeed than their peers. Several commenters mentioned that this exception would put a student with a disability five days behind their peers and that for a January or summer-term course, a five-day delay could be a third of the course. Commenters also mentioned that due to the delays in graduation, students faced loss of earning from being unable to enter the workforce which was a cost that taxpayers took on through vocational rehabilitation funds, Federal student loans, and Pell grants.

Some of the commenters mentioned a case where two blind students were excluded from an educational program because of inaccessible classroom materials, textbooks, websites, and educational applications. These commenters pointed out that the two students could not independently enroll in courses, nor could they use library databases, and were forced to either drop classes or accept a lower grade.

A commenter discussed instances where most of the classes in a law school were not made accessible, but in one class where they were accessible, it took six to eight weeks for a student to receive them. This student had to extend her studies and the cost was split between the student and the State's vocational rehabilitation program.

Some commenters pointed to the DOJ's May 19, 2023, *Dear Colleague Letter on Online Accessibility at Postsecondary Institutions,* saying that postsecondary institutions are already required to make all course materials accessible under the ADA.

Response: The Department appreciates the comments and notes the important concerns for students with disabilities when postsecondary institutions do not make their courses accessible or do not provide accessible materials in a timely manner. As discussed, the Department has decided not to include proposed § 84.85(e) in the final rule.

The comments on this issue illustrate the challenges associated with setting remediation timeframes in this context. If the Department were to shorten the remediation timeframes, it would make it even harder for educational institutions to comply, and commenters have already indicated that the previously proposed remediation timeframes would not be workable for those institutions. If the Department were to lengthen the remediation timeframes, it would further exacerbate the inequities for students with disabilities that were articulated by commenters. The Department believes the better approach is to not include the course content exceptions in the final rule to avoid the need for educational institutions to make content accessible on an expedited timeframe on the back end, and to instead require recipients to treat course content like any other content covered by this rule.

Comment: Commenters mentioned a wide variety of communication vehicles including emails, website postings, social media, mobile apps, phone video calls, live orientation events, in-class announcements, and learning management systems, that postsecondary institutions use to communicate information to their students.

Response: The Department appreciates these comments and notes that the definitions of ''web content'' and ''mobile apps'' describe the content that is covered under this rule.

Comment: Concerning whether postsecondary institutions provide parents with access to course content, one commenter mentioned the Family Educational Rights and Privacy Act which gives students the ability to allow parents and guardians limited access to student information including mid-semester and final grades. The commenter was concerned about access for parents with disabilities given permission under this law to view such content.

Response: The Department appreciates these comments. As noted above, the Department will not adopt this proposed exception.

Comment: On whether postsecondary institutions combine and make available content for particular groups, several commenters mentioned the learning management systems for general groups of students and said that password-protected websites should be required to meet WCAG guidelines.

Response: The Department appreciates these comments and notes that this final rule will not adopt the previously proposed exceptions for password-protected course content. Password-protected course content will therefore need to be accessible, in accordance with this final rule.

Comment: On how much and what content password-protected course websites contain, commenters listed electronic textbooks, slide decks, PDFs and digital articles, shared documents,

video and audio recordings, announcements, message boards, discussion boards, blogs, spreadsheets, assignments, tables and graphs, interactive labs, links to education sites, and interactive websites.

Response: The Department appreciates these comments and notes that the breadth of content that postsecondary institutions offer to students is one of the reasons that the Department will not include this proposed exception in the final rule.

Comment: One commenter stated that courses will likely take more than five days to remediate, especially if they rely on electronic textbooks and large videos.

Another commenter mentioned that students may need access to the course prior to the official start of the semester. Several commenters talked about the impact of a student dropping and then adding a course during the beginning of the semester.

One commenter asked who the responsible party is when a high school student enrolls in college courses in situations of dual enrollment.

Response: The Department appreciates these comments and, for the reasons already discussed, this rule will not adopt the previously proposed course content exceptions that included this five-day remediation period.

Comment: Some commenters supported applying the exceptions proposed at § 84.85(e) introductory text and (e)(1) and (2) to mobile apps. Other commenters disagreed saying that there should be no exceptions and that there are already federally funded resources and technical assistance that support the acquisition of software and applications that are accessible and interactive with assistive technology.

Response: The Department appreciates these comments. For the reasons previously noted, the final rule does not include the exception previously proposed at § 84.85(e).

Comment: On alternatives for this exception, including making newly posted course content accessible on an expedited time frame, commenters stated that priority should be given to entry-level courses, high enrollment courses, courses of the majors that students with disabilities are currently enrolled in, and courses with high drop, withdrawal and failing grade rates. Others mentioned being proactive about providing accessibility training to students and employees.

One commenter encouraged HHS to hold third-party vendors accountable for creating accessible products and suggested funding staff positions for course compliance reviews and remediation work. One commenter said that postsecondary institutions should be required to make student-provided visual and audio content accessible to students with disabilities.

Response: The Department appreciates these comments. For the reasons discussed, the Department is not including the proposed exception in the final rule and will not adopt the alternative approaches suggested. Also, the Department notes that the definitions of ''web content'' and ''mobile apps'' as well as the rule's exceptions and limitations describe the content that is covered under this rule.

Comment: Many commenters said that digital books and textbooks should be accessible to people with disabilities. Several commenters specifically said that digital books and textbooks should conform to WCAG 2.2 accessibility standards, and that e-readers, learning management systems, and other technology that delivers digital books and textbooks must also be accessible.

Many commenters wanted HHS to clarify that while schools or libraries may ultimately be responsible for providing access to digital books and textbooks, the third-party publishers play a significant role in the accessibility of textbooks and digital books. Some commenters indicated that if all libraries and schools required publishers to deliver accessible versions, then this would reduce the work that goes into converting them into accessible formats, often done by scanning pages and saving as PDF files. These commenters also said that schools and libraries are currently put into positions of having to procure, create, or break digital rights management protections to provide accessible textbooks and digital books.

One commenter mentioned a study that found that out of a random sampling of 355 Open Educational Resource materials, only two passed an accessibility test, and that the accessibility barriers were either caused by the author or creator or the authoring software and publishing tools.

One commenter mentioned additional challenges with STEM materials as they have complex equations, graphics, maps, and spatial educational materials and alt text may not be sufficient to convey the concept of these items.

Commenters suggested when a course is updated to use a new textbook (or a new edition of an existing textbook), the Department should require a recipient to select the most accessible option that meets the instructional goals. Commenters said educational institutions should be responsible for providing accessible alternatives to assigned homework and readings if the textbook is not accessible. These commenters remarked that educational institutions should report to students whether a textbook is accessible or not when the course is advertised, since this materially impacts the likelihood of timely access to the textbook. Commenters said that advertising this information about the accessibility status of a textbook also helps make the faculty members more aware for future decision making.

Response: The Department appreciates these comments and also recognizes the importance of the accessibility of digital textbooks for students regardless of disability status, and notes that the majority of commenters expressed concern with the possibility of lowered standards for the accessibility of digital textbooks. After weighing all the comments, the Department believes the most prudent approach is to treat digital textbooks, including EPUBs (electronic publications), the same as all other educational course materials, which are subject to this rule's accessibility requirements. The Department believes that treating digital textbooks, including EPUBs, in any other way would lead to the same problems with respect to the proposed exceptions for password-protected class or course content. For example, if the Department created a similar exception for digital textbooks, it could result in courses being partially accessible and partially inaccessible for certain time periods while books are remediated to meet the needs of an individual with a disability, which could be confusing for both educational institutions and students with disabilities. Furthermore, it would be virtually impossible to set forth a remediation timeframe that would provide educational institutions sufficient time to make digital textbooks accessible without putting students with disabilities too far behind their peers. Accordingly, the Department did not make any changes to the rule to specifically address digital textbooks. The Department notes that if there are circumstances where certain aspects of digital textbooks cannot conform to WCAG 2.1 Level AA without changing the meaning of the content, recipients may assess whether the fundamental alteration or undue financial or administrative burdens limitations apply, as provided in § 84.88. However, if an action required to comply with § 84.88 would result in such an alteration or such burdens, a recipient must take any other action that would not result in such an alteration or such

burdens but would nevertheless ensure that, to the maximum extent possible, individuals with disabilities receive the benefits or services provided by the recipient.

The Department also recognizes that WCAG 2.2 is a newer standard but, as discussed, the Department is adopting WCAG 2.1 Level AA to balance benefits for individuals with disabilities with feasibility for recipients making their content accessible in compliance with this rule. In addition, the Department believes that digital textbooks should be subject to the same standards as other web content and mobile apps to reduce confusion and ensure a uniform experience and expectations for users with disabilities.

The Department also recognizes the importance of the accessibility of digital books for students regardless of disability status, and notes that the majority of commenters expressed concern with the possibility of lowered standards for the accessibility of digital books. The Department agrees that third-party publishers will play an important role in making digital books accessible and appreciates the concerns expressed by commenters that educational institutions may have limited power to require third-party vendors to make content accessible. The Department believes that the delayed compliance dates in this rulemaking will help recipients establish contracts with third-party vendors with sufficient lead time to enable the production of materials that are accessible upon being created. In addition, if this rulemaking incentivizes publishers to produce accessible content, that decision may enable hundreds of educational institutions subject to this rule to obtain accessible content. The Department also expects that as a result of this rulemaking, there will be an increase in demand for accessible content from third-party vendors, and therefore a likely increase in the number of third-party vendors that are equipped to provide accessible content.

The Department also appreciates the suggestion of requiring an advertisement of whether a course's digital books are accessible, but believes that a more appropriate solution, based mainly on the overwhelming support for accessible digital books, would simply be to require all such content to be accessible.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, the Department has decided not to include proposed § 84.85(e) in the final rule.

Proposed § 84.85(f) contained an exception for password-protected class or course content used by elementary and secondary schools with limitations based on when the recipient knew or should have known that a student is preregistered for a course or has enrolled in a course after the start of the academic term, and the student or their parent will be unable to access the password-protected class or course content due to disability. The Department invited comment on the following questions pertaining to elementary and secondary schools:

- *Web Accessibility Question 38: How difficult would it be for elementary and secondary schools to comply with this rule in the absence of this exception?*
- *Web Accessibility Question 39: What would the impact of this exception be on people with disabilities?*
- *Web Accessibility Question 40: How do elementary and secondary schools communicate general information and class- or course-specific information to students and parents?*
- *Web Accessibility Question 41: The proposed exception and its limitations are confined to content on a password-protected or otherwise secured website for students enrolled, or parents of students enrolled, in a specific class or course. Do elementary or secondary schools combine and make available content for all students in a particular grade or certain classes (e.g., all 10th graders in a school taking chemistry in the same semester) using a single password-protected website and, if so, should such content be included in the exception?*
- *Web Accessibility Question 42: Do elementary and secondary schools have a system allowing a parent with a disability to provide notice of their need for accessible course content?*
- *Web Accessibility Question 43: On average, how much content and what type of content do password-protected course websites of elementary or secondary schools contain? Is there content posted by students or parents? Should content posted by students or parents be required to be accessible and, if so, how long would it take an elementary or secondary school to make it accessible?*
- *Web Accessibility Question 44: How long would it take to make class- or course content available on a recipient's password-protected or otherwise secured website for the particular class or course accessible, and does this vary based on the type of course? Do parents and students need access to class or course content before the first day of class? How much delay in accessing online course content can a student reasonably overcome in order to have an equal opportunity to succeed in a course, and does the answer change depending on the point in the academic term that the delay occurs?*
- *Web Accessibility Question 45: To what extent do elementary or secondary schools use or offer students or parents mobile apps to enable access to password-protected course content? Should the Department apply the same exceptions and limitations to the exceptions under § 84.85(f) introductory text and (f)(1) through (4), respectively, to mobile apps?*
- *Web Accessibility Question 46: Should the Department consider an alternative approach, such as requiring that all newly posted course content be made accessible on an expedited time frame, while adopting a later compliance date for remediating existing content?*

The comments and our responses on § 84.85(f) are set forth below.

Comment: Several commenters disagreed with implementing the exception for password-protected class or course content. Commenters said that this exception conflicts with ED's recommendations to States and school districts regarding the best ways to exemplify conditions and services for creating and sustaining a Statewide, high-quality accessible, educational materials (AEM) provision system that is also designed to meet statutory requirements under the Individuals with Disabilities Education Act (IDEA) and to assure students have access to the requisite assistive technology to access AEM. Commenters said if the exception remains, virtually every student with a relevant disability would be discriminated against in violation of both Federal and State statutes.

A couple of commenters mentioned that there have been legal actions that have resulted in schools directing significant financial and human power to accessibility. Commenters stated that by not including the exception and requiring accessibility of password-protected class or course content, the burden of making materials accessible would be taken off of teachers, who are already overburdened, and instead require action and investment from schools and districts.

Some commenters urged HHS to not sanction recipients that purchase inaccessible content and platforms. Several other commenters agreed with this exception.

Response: The Department appreciates these comments and recognizes that many commenters believe this proposed exception would have a negative impact on the education of elementary and secondary students with disabilities. For all of the reasons

commenters have provided, in addition to the reasons discussed above regarding the Department's decision not to adopt § 84.85(e), the Department will not include this proposed exception in the final rule.

With respect to schools and districts redirecting funding and resources towards accessibility, the Department acknowledges that, while this rulemaking may unburden teachers from having to ensure accessibility, it would also impose costs on recipients. Full estimates of costs can be found in the accompanying RIA. While recipients will likely incur costs to comply with this final rule, the RIA indicates that in comparing annualized costs and benefits of this rule, the monetized benefits to society outweigh the costs. In addition, the Department reminds recipients that they are already required to ensure that their programs and activities, including the programs and activities of educational institutions, are accessible to people with disabilities.[173]

Comment: Several commenters stated that all technology used to deliver instruction in the classroom should be accessible to all individuals with disabilities from kiosks, websites, and applications; to third-party websites or apps used for class content; and to any form of information and communication technology, including virtual reality (VR).

Commenters mentioned that accessibility challenges were evident during the COVID–19 public health emergency, and that students and adults with disabilities experienced significant barriers to education, including not being able to access instruction because schools claimed they did not have the capacity to make inaccessible online curriculum programs and related digital materials accessible. Commenters noted that when digital devices (*e.g.,* laptops and tablets) and materials (print, digital, audio, video, etc.) were provided for remote use in K–16 settings in particular, many were not accessible or interoperable (compatible) with the assistive technology used by the student, preventing equal access and opportunity to make the same academic progress as students without disabilities.

Some commenters said that five days to remediate is often unreasonable because schools may not have control over third-party platforms, and even if the school could meet the five-day deadline, it still puts the child with a disability at a disadvantage behind their peers. Some commenters mentioned an online science experiment without audio information that required that the student connect pieces by using finger gestures. One commenter provided an example where a student with a disability was given an exemption for that activity but missed out on the learning opportunity. Another example was given of a popular online mathematics curriculum which stated that third graders will encounter more than 300 math skills over the course of 47 lessons. A student could miss two or three lessons and 15 to 30 skills in a five-day period. Another commenter mentioned a situation where a school district had to buy a $12,000 textbook in Braille. While the other students were online playing games, the student with a disability was reading a textbook and was not included in the learning. The teacher also had to spend time figuring out how to align the textbook and online learning.

Some commenters said this exception leaves parents with disabilities out of meaningful participation in their child's education and makes it difficult for teachers with disabilities to stay employed.

Commenters pointed out that Federal law requires that students exhaust all remedies under the IDEA before pursuing an ADA complaint. These commenters stated that the proposed exception would only further delay student access to course materials in a timely way.

Response: The Department appreciates these comments and acknowledges the concerns about accessibility challenges during the COVID–19 pandemic, the proposed 5-day remediation period, and concerns about parents with disabilities not being able to participate in their child's education. The education of children in elementary and secondary settings is of vital importance and the Department does not intend to limit the educational opportunities, development, and future career potential for students with disabilities. Because, in part, of the issues raised in the comments above, as well as the reasons discussed earlier, the Department will not include this proposed exception in the final rule. The Department also appreciates the comments about the burden on teachers to provide accessible content and align the content with their lesson plans. The Department believes that rulemaking in this area will encourage schools and districts to create or acquire accessible content, removing this burden from teachers and spurring vendors to improve the accessibility of their offerings. With respect to the different technologies that recipients use to provide education, the Department again notes the definitions of ''web content'' and ''mobile apps'' describe the content that is covered under this rule.

Comment: On how elementary and secondary schools communicate with students and parents, commenters listed several methods including through emails, posts on school district websites, and posts on social media websites.

Response: The Department appreciates these comments and notes that the definitions of ''web content'' and ''mobile apps'' describe the content that is covered under this rule.

Comment: Some commenters remarked that content on a password-protected website should not be a part of this exception. They stated that content could be hosted by a third party such as a textbook publisher. These commenters said that when third parties ensure their content is accessible, it reduces the work that teachers have to do as the content is grouped by type of course.

Response: The Department appreciates these comments. While section 504 applies to recipients of Departmental financial assistance, recipients will have to ensure that any web content or mobile apps they provide or make available, directly or through contractual, licensing, or other arrangements, is accessible. This approach is consistent with the existing framework under section 504.[174] Under this framework, recipients have obligations in other section 504 contexts where they choose to contract, license, or otherwise arrange with third parties to provide programs or activities.

Comment: A few commenters said that most schools do not have a system for parents to notify the school of a need for access and that most do not provide access to their course content. Another commenter recommended that the Department require schools to inquire with parents about accessibility needs for both them and their students during the registration process. One commenter mentioned that special education services for students are not meant for parents with disabilities and that teachers and staff are usually the ones adapting materials for students.

Response: The Department appreciates these comments. In part because of issues with parents and students requesting accessible web content and mobile apps and elementary and secondary institutions providing that accessible web content and mobile apps, the Department does

[173] *See* 45 CFR 84.4, redesignated as § 84.68.

[174] *See* 45 CFR 84.4(b)(1), redesignated § 84.68(b)(1).

not intend to keep this proposed exception in the final rule.

Comment: One commenter said that password-protected course websites may merely contain supplemental information or all the information that the student needs to participate in class, and everything in-between. Another commenter listed types of documents that may be on a password-protected course website, including commercially produced curriculum, commercially produced e-books, teacher-created materials, materials purchased or otherwise obtained by the teacher from an external source, PDFs of passages from old books, and student-created materials.

Some commenters mentioned that content could be posted by third parties such as other students doing group work. One commenter said content posted by students or parents should also be required to be accessible.

One commenter suggested teaching children in 5th grade or above about how to make their own content accessible. This commenter argued that this could be a life skill that would be useful for future employment opportunities, otherwise, the school would have to remediate content posted by students.

One commenter asked the Department whether course content that can be accessed through a PIN authentication or the user's personal email login information would be considered password-protected course content under the NPRM.

Response: The Department appreciates these comments on the range of password-protected content on elementary and secondary websites. In part because of the wide range of content on password-protected course websites and its importance, the Department will not be including this exception in the final rule. Again, the Department notes that the definitions of ''web content'' and ''mobile apps'' describe the content that is covered, subject to the rule's exceptions and limitations.

Comment: Several commenters said that course content should be accessible on or before the first day of class for students and parents. One commenter mentioned that teachers sometimes require course work over the summer which means the content would need to be accessible earlier. One commenter said any delays should be minimal and offset by modifications in the meantime. Commentors pointed out that delays caused unnecessary stress and reduce learning outcomes.

One commenter stated that schools will take as long as the Department gives them to make the content accessible regardless of how long it actually takes them. The commenter stated that schools are juggling competing priorities, so if the Department makes this a priority, schools will follow.

Response: The Department understands these concerns and acknowledges there may be situations where providing remediated course content in five days would neither be possible or preferrable for the recipient, student, or parent. For the reasons already discussed, this final rule will not be adopting this exception.

Comment: Some commenters want the Department to adopt the same exceptions and limitations to the exceptions under § 84.85(f)(1) through (4) to mobile apps. Many commenters disagreed with applying the exception to mobile apps to enable access to password-protected course content for parents and students. Several commenters mentioned that a large majority of digital interfaces used by schools have associated mobile apps which need to be accessible for students and parents with disabilities and can be interoperable with assistive technology.

One commenter mentioned that students as young as kindergarten use mobile devices to access course materials, complete course work, and communicate with teachers. Another commenter said that schools even require mobile app use for course work in some instances.

Response: The Department appreciates these comments. The Department recognizes the importance and growing ubiquity of mobile apps in a variety of areas, including elementary and secondary education. For the reasons previously noted, the final rule does not include the exception previously proposed at § 84.85(e).

Comment: On whether the Department should consider an alternate approach to this exception, such as requiring all newly posted course content to be made accessible on an expedited time frame, one commenter said priority can be given to newly posted course content and existing required reading with the goal that the rest of the content come into compliance as well. Another commenter thought the Department should not extend the 2-to-3-year implementation period. Instead, the commenter said that schools should create a plan for remediation on the fastest possible timeline with the option to apply fundamental alteration and undue burdens limitations if appropriate and necessary.

One commenter mentioned that school curriculums for K–12 are often purchased on either a district or State level every three-to-five years. While such planning gives teachers less autonomy over their curriculums, by purchasing curriculums on a district or State level, accessibility concerns have drastically reduced. The same commenter recommended that institutions prioritize their proactive accessibility efforts along three dimensions: (1) classes that are required for graduation or promotion to the next grade, (2) district-level curriculum and educational technology adoption, and (3) courses that move at an accelerated pace (*e.g.,* honors, advanced placement).

Response: The Department appreciates these comments. While some commenters suggested requiring recipients to follow specific procedures to comply with this rule, the variety of proposals the Department received from commenters indicates the harm from being overly prescriptive in how educational institutions comply with the rule. The final rule provides educational institutions with the flexibility to determine how best to bring their content into compliance within the two or three years they have to begin complying with this rule.

Some commenters suggested that the Department should require all new course content to be made accessible more quickly, while providing a longer time period for recipients to remediate existing course content. There were a range of proposals from commenters about how this could be implemented. Some commenters suggested that the Department could set up a prioritization structure for existing content, requiring educational institutions to prioritize the accessibility of, for example, content for required courses; content for district-level courses; and content for honors-level courses.

The Department does not believe these approaches would be feasible. Treating new course content differently than existing course content could result in particular courses being partially accessible and partially inaccessible, which could be confusing for both educational institutions and students, and make it challenging for students with disabilities to have full and timely access to their courses. Moreover, even under this hybrid approach, the Department would presumably need to retain remediation timeframes for recipients to meet upon receiving a request to make existing course content accessible. For the reasons discussed above, it would be virtually impossible to set forth a remediation timeframe that would

provide educational institutions sufficient time to make content accessible without putting students with disabilities too far behind their peers. In addition, given the wide variation in types of courses and educational institution structures, it would be difficult to set a prioritization structure for existing content that would be workable across all such institutions.

The Department believes the better approach is to not include the course content exceptions in the final rule to avoid the need for educational institutions to make content accessible on an expedited timeframe on the back end, and to instead require recipients to treat course content like any other content covered by this rule.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, the Department has decided not to include proposed § 84.85(f) in the final rule.

Proposed § 84.85(g) contained an exception for individualized, password-protected documents. The Department invited comment on following questions regarding this exception:

- *Web Accessibility Question 47: What kinds of individualized, conventional electronic documents do recipients make available and how are they made available (e.g., on websites or mobile apps)? How difficult would it be to make such documents accessible? How do people with disabilities currently access such documents?*
- *Web Accessibility Question 48: Do recipients have an adequate system for receiving notification that an individual with a disability requires access to an individualized, password-protected conventional electronic document? What kinds of burdens do these notification systems place on individuals with disabilities and how easy are these systems to access? Should the Department consider requiring a particular system for notification or a particular process or timeline that recipients must follow when they are on notice that an individual with a disability requires access to such a document?*
- *Web Accessibility Question 49: What would the impact of this exception be on people with disabilities?*
- *Web Accessibility Question 50: Which provisions of this rule, including any exceptions (e.g., individualized, password-protected conventional electronic documents; content posted by a third party), should apply to mobile apps?*

The comments and our responses regarding § 84.85(g) are set forth below.

Comment: Commenters provided many examples of individualized, password-protected conventional electronic documents, including, but not limited to: test results, clinical summaries, post-operative care instructions, current and past bills, determination letters, patient health summaries, patient letters, questionnaires, results and reports, appointments, past visits, immunization records, explanation of benefits, receipts, diagnoses, imaging results, and treatment plans.

Some commenters supported the individualized, password-protected conventional electronic document exception. Several others wanted the exception eliminated, saying that many documents are already being made accessible in accordance with public law, such as electronic health records. These commenters also mentioned that making such documents accessible can be done without much difficulty; one commenter said that this is achievable through automated generation of accessible PDFs from HTML with layouts that are not overly complex. Many commenters pointed to the fundamental alteration and undue burdens limitations already available to recipients. Commenters believed this exception was disincentivizing recipients making content accessible.

One commenter asked the Department for guidance on how to best support providing accommodations to the public for PDF documents and whether they would need to make any workflow undertaken by a patient after authenticating such as when a patient uses a patient portal to schedule an appointment with their provider.

Response: After reviewing the comments, the Department has decided to retain this exception in the final rule. The Department continues to believe that recipients often provide or make available a large volume of individualized, password-protected or otherwise secured conventional electronic documents, many of which do not pertain to individuals with disabilities, and it may be difficult to make all such documents accessible. Therefore, the Department believes it is sensible to permit entities to focus their resources on ensuring accessibility for the specific individuals who need accessible versions of those documents. If, as many commenters suggested, it is in fact more efficient and less expensive for some recipients to make all such documents accessible by using a template, there is nothing in the rule that prevents recipients from taking that approach.

The Department notes that this exception applies only to password-protected or otherwise secured content. Content may be otherwise secured if it requires a member of the public to use some process of authentication or login to access the content. Unless subject to another exception, conventional electronic documents that are on a recipient's general, public web platform would not be covered by the exception.

The Department recognizes that there may be some overlap between the content covered by this exception and the exception for certain preexisting conventional electronic documents, § 84.85(b). The Department notes that if web content is covered by the exception for individualized, password-protected or otherwise secured conventional electronic documents, it does not need to conform to WCAG 2.1 Level AA to comply with this rule, even if the content fails to qualify for another exception, such as the preexisting conventional electronic document exception. For example, a recipient might retain on its website an individualized, password-protected unpaid medical bill in a PDF format that was posted before the date the entity was required to comply with this rule. Because the PDF would fall within the exception for individualized, password-protected or otherwise secured conventional electronic documents, the documents would not need to conform to WCAG 2.1 Level AA, regardless of how the preexisting conventional electronic documents exception might otherwise have applied.

The Department understands the concerns raised by commenters about the potential burdens that people with disabilities may face if individualized password-protected or otherwise secured documents are not all made accessible at the time they are created and about the potential negative consequences for people with disabilities who do not have timely access to the documents that pertain to them. The Department reiterates that, even when documents are covered by this exception, the existing section 504 obligations require recipients to furnish appropriate auxiliary aids and services where necessary to ensure an individual with a disability has, for example, an equal opportunity to enjoy the benefits of a service.[175] Such auxiliary aids and services could include, for example, providing PDFs that are accessible. In order for such an auxiliary aid or service to ensure effective communication, it must be provided in a timely manner, and in such a way as to protect the

[175] *See* 45 CFR 84.68(b)(1)(ii), (b)(7), 84.77.

privacy and independence of the individual with a disability. Whether a particular solution provides effective communication depends on circumstances in the interaction, including the nature, length, complexity, and context of the communication, per § 84.77(b)(2). For example, the presence of an emergency situation or a situation where information is otherwise urgently needed would impact what it would mean for a recipient to ensure it is meeting its effective communication obligations. Recipients can help to facilitate effective communication by providing individuals with disabilities with notice about how to request accessible versions of their individualized documents.

Moreover, while individualized, password-protected or otherwise secured conventional electronic documents are subject to this exception, any public-facing, web- or mobile app-based system or platform that a recipient uses to provide or make available those documents or to allow the public to make accessibility requests, must itself be accessible as defined in § 84.84 if it is not covered by another exception. The recipient would need to ensure that that platform complies with § 84.84. In addition, web content and content in mobile apps that does not take the form of individualized, password-protected or otherwise secured conventional electronic documents but instead notifies users about the existence of such documents must still conform to WCAG 2.1 Level AA unless it is covered by another exception. For example, a hospital's health records portal may include a list of links to download individualized, password-protected PDF medical records. Under WCAG 2.1 Success Criterion 2.4.4, a recipient would generally have to provide sufficient information in the text of the link alone, or in the text of the link together with the link's programmatically determined link context, so that a user could understand the purpose of each link and determine whether they want to access a given document.

The Department also reiterates that a recipient might also need to make reasonable modifications to ensure that a person with a disability has equal access to its programs or activities. For example, if a covered medical provider has a policy under which administrative support staff are in charge of uploading PDF versions of X-ray images into patients' individualized accounts after medical appointments, but the provider knows that a particular patient is blind, the provider may need to modify its policy to ensure that a staffer with the necessary expertise provides an accessible version of the information the patient needs from the X-ray. Also, at this time, the Department declines to provide guidance on PDF documents, but may provide future guidance, where appropriate.

The Department also understands that some of these documents, especially documents without complex layouts, may be made accessible relatively easily, including through automated generation. Even with the proposed exception, many recipients may decide that they will change their templates for individualized password-protected or otherwise secured conventional electronic documents to make them all accessible in order to avoid modifying individual documents after the fact for people with disabilities.

Comment: Many commenters said that the time that recipients spend on building a notification system would be better spent on making documents accessible from the start. Otherwise, commenters said that recipients generally do not provide a clear means of notification. One commenter wanted more robust requirements and enforcement. Several commenters suggested making methods of contact in easy-to-access location such as on a download index page, front page of a portal and throughout the online system in an accessible manner.

One State said it did not have ways for individuals to request access to documents on their main State web pages, but individual units and programs sometimes have an email for general questions and comments.

Commenters want HHS to establish timelines for providing accessible individualized, password-protected conventional electronic documents if this exception is implemented. Examples that commenters provided included same day for post-operative instructions and quickly for bills. One commenter recommended a maximum of five business days for remediation as delays in getting access to individualized, password-protected conventional electronic document can be inequitable or cause harm.

Several commenters mentioned that once such a request is made for an accessible individualized, password-protected conventional electronic document, then the recipient should apply that request to all documents and notices sent to the requester with a disability going forward.

Response: The Department appreciates the comments including those on notification systems and making all individualized password-protected or otherwise secured conventional electronic documents accessible from the start as well as methods of contact. The Department, however, believes it is more appropriate to give recipients flexibility in how they provide or make available individualized, password-protected or otherwise secured conventional electronic documents, so long as those recipients ensure that individuals with disabilities have timely access to the information contained in those documents in an accessible format that protects the privacy and independence of the individual with a disability.

Moreover, the Department does not believe it is workable to prescribe a set number of days under which a recipient must make these documents accessible since the content and quantity of individualized, password-protected or otherwise secured documents may vary widely, from a one-page medical bill to thousands of pages of medical records. The range of possible timeframes that commenters suggested, coupled with the comments the Department received on the remediation timeframes that were associated with the previously proposed course content exceptions, helps to illustrate the challenges associated with selecting a specific number of days for recipients to remediate content.

The Department also notes that where, for example, a recipient is on notice that an individual with a disability needs accessible versions of an individualized, password-protected PDF medical bill, that recipient is generally required to continue to provide information from that medical bill in an accessible format in the future; the recipient generally may not require the individual with a disability to make repeated requests for accessibility.

The Department reiterates that, even when documents are covered by this exception, other section 504 obligations require recipients to furnish appropriate auxiliary aids and services where necessary to ensure an individual with a disability has, for example, an equal opportunity to enjoy the benefits of a service.[176] Whether a particular solution provides effective communication depends on circumstances in the interaction, including the nature, length, complexity, and context of the communication.[177]

Comment: Several commenters said that the impact of an exception for individualized, password-protected documents on people with disabilities would be having to rely on companions

[176] 45 CFR 84.77(b)(1).

[177] 45 CFR 84.77(b)(2).

or strangers to read their documents, attempting to request accessible formats, or pursuing legal action. If the recipient posts contact information on their websites, many commenters pointed out that the onus is still on the individual with a disability to make the requests for accessible individualized, password-protected conventional electronic documents. Commenters mentioned these requests take time, and a patient with a disability who has just had surgery, for example, may not have the energy to make requests for accessible post-operative instructions. Additionally, commenters said that people with disabilities will continue to have difficulty with independence when paying their bills, receiving communications from their doctors, reviewing and using school transcripts, reading job offer letters or notices related to a contract, accessing their medical records and other personal information.

Some commenters believe that if the Department moves forward with this exception, then recipients are disincentivized from prioritizing accessibility.

Response: While the Department agrees that people with disabilities will sometimes need access to password-protected or otherwise secured conventional electronic documents on a rapid timeline, particularly when they have important health implications, the Department disagrees that this proposed exception signals to recipients that the Department is disincentivizing accessibility. Recipients are still required to ensure that they provide accessible versions of documents to people with disabilities who request them.

As discussed, the Department believes that recipients often provide or make available a large volume of individualized, password-protected or otherwise secured conventional electronic documents, many of which do not pertain to individuals with disabilities, and it may be difficult to make all such documents accessible. Therefore, the Department believes it is sensible to permit recipients to focus their resources on ensuring accessibility for the specific individuals who need accessible versions of those documents.

The Department intends to strike the appropriate balance between accessibility and for people with disabilities and practicality for recipients.

Comment: On whether any of the exceptions discussed should apply to mobile apps, several commenters said that they believe the Department should adopt the same rules for web content and mobile apps since many people use mobile phones almost exclusively.

Response: The Department agrees that the exceptions should apply to both web content and mobile apps to the extent both web content and mobile apps are used in the contexts covered by the exceptions.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.85(g) (redesignated as § 84.85(d) due to deletions of preceding paragraphs) with the addition of ''or otherwise secured conventional electronic'' to the heading of the exception, for consistency with the text of the exception itself. This modification does not change the meaning or substance of the exception as proposed in the NPRM.

Conforming Alternate Versions (§ 84.86)

Proposed § 84.86 stated that recipients may use conforming alternate versions of web content instead of making their web content accessible only if it is not possible to make their web content directly accessible due to technical or legal limitations.

The Department invited comment on the following:

- *Web Accessibility Question 51: Would allowing conforming alternate versions due to technical or legal limitations result in individuals with disabilities receiving unequal access to a recipients' programs and activities?*

The comments and our responses regarding § 84.86 are set forth below.

Comment: Many commenters agreed that conforming alternate versions of web content should only be allowed in instances where it is impossible to make the web content in question compliant with WCAG 2.1 Level AA due to technical or legal limitations. They argued that requiring a separate website or alternative method for people with disabilities is inherently unequal and recipients should avoid such situations unless absolutely necessary. They also noted that historically, separate websites for people with disabilities have not provided the same access and functionality. Some commenters stated that recipients should be allowed to create conforming alternate version of web content regardless of technical or legal limitations because it provides more flexibility for recipients. Some of those commenters argued that WCAG 2.1 allows for conforming alternate versions and stated a belief that a separate website would allow for greater attention to detail and operability for people with disabilities.

Response: We appreciate the comments regarding the Department's approach to ''conforming alternate versions.'' Under WCAG, a ''conforming alternate version'' is a separate web page that, among other things, is accessible, up-to-date, contains the same information and functionality as the inaccessible web page, and can be reached via a conforming page or an accessibility-supported mechanism.[178] Conforming alternate versions are allowable under WCAG. For reasons explained below, the Department believes it is important to put guardrails on when recipients may use conforming alternate versions under this rule. This final rule, therefore, specifies that the use of conforming alternate versions is permitted only in limited, defined circumstances, which represents a slight departure from WCAG 2.1. Section 84.86 states that a recipient may use conforming alternate versions of web content to comply with § 84.84 only where it is not possible to make web content directly accessible due to technical or legal limitations.

Generally, to conform to WCAG 2.1, a web page must be directly accessible in that it satisfies the success criteria for one of the defined levels of conformance—in the case of this final rule, Level AA.[179] However, as noted above, WCAG 2.1 also allows for the creation of a ''conforming alternate version.'' The purpose of a ''conforming alternate version'' is to provide individuals with relevant disabilities access to the information and functionality provided to individuals without relevant disabilities, albeit via a separate vehicle. The Department believes that having direct access to accessible web content provides the best user experience for many individuals with disabilities, and it may be difficult to reliably maintain conforming alternate versions, which must be kept up to date. W3C explains that providing a conforming alternate version is intended to be a ''fallback option for conformance to WCAG and the preferred method of conformance is to make all content directly accessible.'' [180] However, WCAG 2.1 does not explicitly limit the circumstances under which a

[178] *See* W3C, *Web Content Accessibility Guidelines 2.1, Conforming Alternate Version* (June 5, 2018), *https://www.w3.org/TR/WCAG21/#dfn-conforming-alternate-version* [*https://perma.cc/5NJ6-UZPV*].

[179] *See* W3C, *Web Content Accessibility Guidelines 2.1* (June 5, 2018), *https://www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F*.

[180] *See* W3C, *Understanding Conformance* (last updated June 20, 2023), *https://www.w3.org/WAI/WCAG21/Understanding/conformance* [*https://perma.cc/QSG6-QCBL*].

recipient may choose to create a conforming alternate version of a web page instead of making the web page directly accessible.

The Department is concerned that WCAG 2.1 can be interpreted to permit the development of two separate versions of a recipient's web content—one for individuals with relevant disabilities and another for individuals without relevant disabilities—even when doing so is unnecessary and when users with disabilities would have a better experience using the main web content that is accessible. Such an approach would result in segregated access for individuals with disabilities and be inconsistent with how section 504's core principles of inclusion and integration have been historically interpreted.[181] The Department is also concerned that the frequent or unbounded creation of separate web content for individuals with disabilities may, in practice, result in unequal access to information and functionality. For example, and as discussed later in this section, the Department is concerned that an inaccessible conforming alternate version may provide information that is outdated or conflicting due to the maintenance burden of keeping the information updated and consistent with the main web content. As another example, use of a conforming alternate version may provide a fragmented, separate, or less interactive experience for people with disabilities because recipients may assume that interactive features are not financially worthwhile or otherwise necessary to incorporate in conforming alternate versions. Ultimately, as discussed later in this section, the Department believes there are particular risks associated with permitting the creation of conforming alternate versions where not necessitated by the presence of technical or legal limitations.

Due to the concerns about user experience, segregation of users with disabilities, unequal access to information, and maintenance burdens discussed above, the Department is adopting a slightly different approach to conforming alternate versions than that provided under WCAG 2.1. Instead of permitting recipient to adopt conforming alternate versions whenever they believe it is appropriate, § 84.86 states that a recipient may use conforming alternate versions of web content to comply with § 84.84 only where it is not possible to make web content directly accessible due to technical limitations (*e.g.,* technology is not yet capable of being made accessible) or legal limitations (*e.g.,* web content that cannot be changed due to legal reasons). The Department believes conforming alternate versions should be used rarely—when it is truly not possible to make the content accessible for reasons beyond the recipient's control. However, § 84.86 does not prohibit recipients from providing alternate versions of web pages *in addition* to their WCAG 2.1 Level AA compliant main web page to possibly provide users with certain types of disabilities a better experience.

Having reviewed public comments and considered this issue carefully, the Department believes the rule strikes the right balance to permit conforming alternate versions, but only where it is not possible to make web content directly accessible due to technical or legal limitations. The Department believes that this approach ensures that generally, people with disabilities will have direct access to the same web content that is accessed by people without disabilities, but it also preserves flexibility for recipients in situations where, due to a technical or legal limitation, it is impossible to make web content directly accessible. The Department also believes that this approach will help avoid the concerns noted above with respect to segregation of people with disabilities by defining only specific scenarios when the use of conforming alternate versions is appropriate.

The determination of when conforming alternate versions are needed or permitted varies depending on the facts. For example, a conforming alternate version would not be permissible just because a recipient's web developer lacked the knowledge or training needed to make content accessible; that would not be a technical limitation within the meaning of § 84.86. By contrast, the recipient could use a conforming alternate version if its web content included a new type of technology that it is not yet possible to make accessible, such as a specific kind of immersive virtual reality environment. Similarly, a recipient would not be permitted to claim a legal limitation because its general counsel failed to approve contracts for a web developer with accessibility experience. Instead, a legal limitation would apply when the inaccessible content itself could not be modified for legal reasons specific to that content. The Department believes this approach is appropriate because it ensures that, whenever possible, people with disabilities have access to the same web content that is available to people without disabilities.

The Department would also like to clarify the interaction between the allowance of conforming alternate versions under § 84.86 and the general limitations provided in § 84.88. These two provisions are applicable in separate circumstances. If there is a technical or legal limitation that prevents a recipient from complying with § 84.84 for certain content, § 84.86 is applicable. The recipient can create a conforming alternate version for that content, and, under § 84.86, that recipient will be in compliance with this final rule. Separately, if a fundamental alteration or undue financial and administrative burdens prevent a recipient from complying with § 84.84 for certain content, § 84.88 is applicable. As set forth in § 84.88, the recipient must still ''take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient to the maximum extent possible.'' A recipient's legitimate claim of fundamental alteration or undue burdens does not constitute a legal limitation under § 84.86 for which a conforming alternate version automatically suffices to comply with the rule. Rather, the recipient must ensure access ''to the maximum extent possible'' under the specific facts and circumstances of the situation. Under the specific facts a recipient is facing, the recipient's best option to ensure maximum access may be an alternate version of its content, but the recipient also may be required to do something more or something different. Because the language of § 84.88 already allows for alternate versions if appropriate for the facts of recipient's fundamental alteration or undue burdens, the Department does not see a need to expand the language of § 84.86 to address commenters' concerns.

The Department also wishes to clarify the relationship between §§ 84.86 and 84.89, which are analyzed independently of each other. Section 84.86 provides that a recipient may use conforming alternate versions of web content, as defined by WCAG 2.1, to comply with § 84.84 *only* where it is not possible to make web content directly accessible due to technical or legal limitations. Accordingly, if a recipient does not make its web content directly accessible and instead provides a conforming alternate version when not required by technical or legal limitations, the recipient may not use that conforming alternate version to

[181] Redesignated, with minor revisions, at 45 CFR 84.68(d).

comply with its obligations under the rule, either by relying on § 84.86 or by invoking § 84.89.

Summary of Regulatory Changes

The Department will make a slight edit to § 84.86 to replace ''websites and web content'' with ''web content.'' Upon further review, the Department determined that ''web content'' is more in line with the rest of the rule and would limit potential confusion among sections, including § 84.84. This change will not alter the meaning of § 84.86.

Equivalent Facilitation (§ 84.87)

Proposed § 84.87 stated that recipients may use alternative methods to those described in this subpart when the alternative method results in substantially equivalent or greater accessibility and usability of the web content or mobile app.

Section 84.87 provides that nothing prevents a recipient from using designs, methods, or techniques as alternatives to those prescribed in the regulation, provided that such alternatives result in substantially equivalent or greater accessibility and usability. The 1991 and 2010 ADA Standards for Accessible Design both contain an equivalent facilitation provision.[182] The reason for allowing for equivalent facilitation in this subpart is to encourage flexibility and innovation by recipients while still ensuring equal or greater access to web content and mobile apps. Especially in light of the rapid pace at which technology changes, this provision is intended to clarify that recipients can use methods or techniques that provide equal or greater accessibility than this rule would require. For example, if a recipient wanted to conform its web content or mobile app to a future web and mobile app accessibility standard that expands accessibility requirements beyond WCAG 2.1 Level AA, this provision makes clear that the recipient would be in compliance with this rule. Recipients could also choose to comply with this rule by conforming their web content to WCAG 2.2 Level AA [183] because WCAG 2.2 Level AA provides substantially equivalent or greater accessibility and usability to WCAG 2.1 Level AA; in particular, WCAG 2.2 Level AA includes additional success criteria not found in WCAG 2.1 Level AA and every success criterion in WCAG 2.1 Level AA, with the exception of one success criterion that is obsolete.[184]

Similarly, a recipient could comply with this rule by conforming its web content and mobile apps to WCAG 2.1 Level AAA,[185] which is the same version of WCAG and includes all the WCAG 2.1 Level AA requirements, but includes additional requirements not found in WCAG 2.1 Level AA for even greater accessibility. For example, WCAG 2.1 Level AAA includes Success Criterion 2.4.10 [186] for section headings used to organize content and Success Criterion 3.1.4 [187] that includes a mechanism for identifying the expanded form or meaning of abbreviations, among others. The Department believes that this provision offers needed flexibility for recipients to provide usability and accessibility that meet or exceed what this rule would require as technology continues to develop. The responsibility for demonstrating equivalent facilitation rests with the recipient.

Summary of Regulatory Changes

The Department is finalizing § 84.87 as proposed with a single minor modification to add a missing comma.

Duties (§ 84.88)

Proposed § 84.88 stated that if compliance with § 84.84 would result in a fundamental alteration in the nature of a program or activity or undue financial and administrative burdens, the recipient is only required to comply with § 84.84 to the extent it does not result in a fundamental alteration or undue financial and administrative burdens. It also stated that a recipient has the burden of proving that compliance with § 84.84 would result in such alteration or burdens, and the decision that compliance would result in such alteration or burdens must be made by the head of a recipient or their designee after considering all resources available for use in the funding and operation of the program or activity, and must be accompanied by a written statement of the reasons for reaching that conclusion. In addition, it stated that a recipient shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient to the maximum extent possible.

The comments and our responses regarding § 84.88 are set forth below.

Comment: Many commenters expressed appreciation for proposed § 84.88 and opposed any measures that would constitute a fundamental alteration or undue burden. Some commenters asked for additional guidance on what would constitute a fundamental alteration or undue burden.

Response: The Department appreciates these comments. In determining whether an action would result in undue financial and administrative burdens, all of a recipient's resources available for use in the funding and operation of the program or activity should be considered. The burden of proving that compliance with the requirements of § 84.84 would fundamentally alter the nature of program or activity, or would result in undue financial and administrative burdens, rests with the recipient. These limitations on a recipient's duty to comply with the regulatory provisions mirror the fundamental alteration and undue burdens compliance limitations under the ADA title II regulation,[188] and are consistent with how the limitations already operate in many contexts under section 504. These limitations are thus familiar to many recipients.

The Department believes, in general, it would not constitute a fundamental alteration of a recipient's programs or activities to modify web content or mobile apps to make them accessible within the meaning of this final rule. However, this is a fact-specific inquiry, and the Department provides some examples later in this section of when a recipient may be able to claim a fundamental alteration. Moreover, like the fundamental alteration or undue burdens limitations in the title II regulation and elsewhere in this final rule, § 84.88 does not relieve a recipient of all obligations to individuals with disabilities. Although a recipient under this rule is not required to take actions that would result in a fundamental

[188] *See* 28 CFR 35.150(a)(3), 35.164, 35.130(b)(7).

alteration in the nature of a program or activity, or in undue financial and administrative burdens, it nevertheless must comply with the requirements of this subpart to the extent that compliance does not result in a fundamental alteration or undue financial and administrative burdens. For instance, a recipient might determine that complying with all of the success criteria under WCAG 2.1 Level AA would result in a fundamental alteration or undue financial and administrative burdens. However, the recipient must then determine whether it can take any other action that would not result in such an alteration or such burdens, but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient to the maximum extent possible. To the extent that the recipient can, it must do so. This may include the recipient bringing its web content into conformance to some of the WCAG 2.1 Level A or Level AA success criteria.

Whether the undue burdens limitation applies is a fact-specific assessment that involves considering a variety of factors. For example, some recipients have minimal operating budgets measured in the thousands or tens of thousands of dollars. If such a recipient had an archive section of its website with a large volume of older and historical material (such as old photographs), the recipient would have an obligation under the existing section 504 regulation to ensure that its programs and activities offered using web content and mobile apps are accessible to individuals with disabilities. However, it might be an undue burden for the recipient to make all those materials fully accessible in a short period of time in response to a request by an individual with a disability.[189] Whether the undue burdens limitation applies, however, would depend, among other things, on how large the recipient's operating budget is and how much it would cost to make the materials in question accessible. Whether the limitation applies will also vary over time. Increases in the recipient's budget, or changes in technology that reduce the cost of making the historical materials accessible, may make the limitation inapplicable. Lastly, even where it would impose an undue burden on the recipient to make its historical materials accessible within a certain time frame, the recipient would still need to take any other action that would not result in such a burden but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient to the maximum extent possible.

Application of the fundamental alteration limitation is similarly fact specific. For example, a recipient might hold an art contest in which students submit alternative covers for their favorite books and students view and vote on the submissions on the recipient's website. It would likely be a fundamental alteration to require the recipient to modify each piece of artwork so that any text drawn on the alternative covers, such as the title of the book or the author's name, satisfies the color contrast requirements in the technical standard. Even so, the recipient would still be required to take any other action that would not result in such an alteration but would nevertheless ensure that individuals with disabilities could participate in the contest to the maximum extent possible.

Because each assessment of whether the fundamental alteration or undue burdens limitations applies will vary depending on the recipient, the time of the assessment, and various other facts and circumstances, the Department declines to adopt any rebuttable presumptions about when the fundamental alteration or undue burdens limitations would apply.

Complying with the web and mobile app accessibility requirements set forth in §§ 84.84 to 84.89 means that a recipient of Federal financial assistance from the Department is not required by this section 504 rule to make any further modifications to the web content or content in mobile apps that it makes available to the public. However, it is important to note that compliance with §§ 84.84 through 84.89 will not relieve recipients of their distinct employment-related obligations under section 504, which applies the employment standards set forth in title I of the ADA, as described in § 84.16. The Department realizes that this rule is not going to meet the needs of and provide access to every individual with a disability, but believes that setting a consistent and enforceable web accessibility standard that meets the needs of a majority of individuals with disabilities will provide greater predictability for recipients, as well as added assurance of accessibility for individuals with disabilities.

This approach is consistent with the approach that the Department of Justice has taken in the context of physical accessibility under title II. In that context, a covered entity is not required to exceed the applicable design requirements of the ADA Standards even if certain wheelchairs or other power-driven mobility devices require a greater degree of accessibility than the ADA Standards provide.[190] The entity may still be required, however, to make other modifications to how it provides a program, service, or activity, where necessary to provide access for a specific individual. For example, where an individual with a disability cannot physically access a program provided in a building that complies with the ADA Standards, the covered entity does not need to make physical alterations to the building but may need to take other steps to ensure that the individual has an equal opportunity to participate in and benefit from that program.

Similarly, just because a recipient is in compliance with this rule's web content or mobile app accessibility standard does not mean it has met all of its obligations under section 504 or other applicable laws—it means only that it is not required to make further changes to the web content or content in mobile apps that it makes available. If an individual with a disability, on the basis of disability, cannot access or does not have equal access to a program or activity through a recipient's web content or mobile app that conforms to WCAG 2.1 Level AA, the recipient is still obligated under § 84.84(a) to provide the individual an alternative method of access to that program or activity unless the recipient can demonstrate that alternative methods of access would result in a fundamental alteration in the nature of a program or activity or in undue financial and administrative burdens. The recipient also must still satisfy its general obligations to provide effective communication, reasonable modifications, and an equal opportunity to participate in or benefit from the recipient's programs or activities.

The recipient must determine on a case-by-case basis how best to meet the needs of those individuals who cannot access a program or activity that the recipient provides through web content or mobile apps that comply with all of the requirements under WCAG 2.1 Level AA. A recipient should refer to 45 CFR 84.68(b)(1)(ii) to determine its obligations to provide individuals with disabilities an equal opportunity to participate in and enjoy the benefits of the recipient's programs or activities. A recipient should refer to § 84.77 (effective communication) to determine its obligations to provide individuals with disabilities with the appropriate auxiliary aids and services necessary to afford them an equal opportunity to

[189] *See* proposed 45 CFR 84.68(b)(1)(ii), (b)(7), 84.77, 84.81.

[190] *See* 28 CFR part 35, appendix A at 626 (2022).

participate in, and enjoy the benefits of, the recipient's programs or activities. A recipient should refer to § 84.68(b)(7) (reasonable modifications) to determine its obligations to provide reasonable modifications in policies, practices, or procedures to avoid discrimination on the basis of disability. It is helpful to provide individuals with disabilities with information about how to obtain the modifications or auxiliary aids and services they may need. For example, while not required in this final rule, a recipient is encouraged to provide an email address, accessible link, accessible web page, or other accessible means of contacting the recipient to provide information about issues individuals with disabilities may encounter accessing web content or mobile apps or to request assistance. Providing this information will help recipients to ensure that they are satisfying their obligations to provide equal access, effective communication, and reasonable modifications.

The Department also clarifies that a recipient's requirement to comply with general equal access, effective communication, and reasonable modification obligations remains in place for content that fits under one of the exceptions under § 84.85. For example, in the appropriate circumstances, a recipient may be obligated to add captions to a video that falls within the archived content exception and provide the captioned video file to the individual with a disability who needs access to the video, or edit an individualized password-protected PDF to be usable with a screen reader and provide it via a secure method to the individual with a disability. Of course, a recipient may also choose to further modify the web content or content in mobile apps it makes available to make that content more accessible or usable than §§ 84.84 to 84.89 require. In the context of the above examples, for instance, the Department believes it will often be most economical and logical for a recipient to post the captioned video, once modified, as part of web content made available to the public; or to modify the individualized PDF template so that it is used for all members of the public going forward.

Summary of Regulatory Changes

The Department's final rule removes the word ''full'' in § 84.88 so that the text reads ''compliance'' rather than ''full compliance.'' The Department made this change because § 84.84(b)(1) and (2) clarify that compliance with this final rule includes complying with the success criteria and conformance requirements under Level A and Level AA specified in WCAG 2.1. This minor revision does not affect the meaning of § 84.88, but rather removes an extraneous word to avoid redundancy and confusion.

Measuring Compliance

In the NPRM, the Department considered four possible approaches to defining and measuring compliance, which involved linking noncompliance with a technical standard to: (a) a numerical percentage; (b) situations that impact the ability to have equal access to the website or mobile app; (c) the use of robust policies and practices for accessibility feedback, testing, and remediation; or (d) organizational maturity.[191] The Department also invited comment on the following questions regarding measuring compliance:

- *Web Accessibility Question 52: What should be considered sufficient evidence to support an allegation of noncompliance with a technical standard for purposes of enforcement action? For example, if a website or mobile app is noncompliant according to one testing methodology, or using one configuration of assistive technology, hardware, and software, is that sufficient?*
- *Web Accessibility Question 53: In evaluating compliance, do you think a recipient's policies and practices related to web and mobile app accessibility (e.g., accessibility feedback, testing, remediation) should be considered and, if so, how?*
- *Web Accessibility Question 54: If you think a recipient's policies and practices for receiving feedback on web and mobile app accessibility should be considered in assessing compliance, what specific policies and practices for feedback would be effective? What specific testing policies and practices would be effective? What specific testing policies and practices would be effective?*
- *Web Accessibility Question 55: Should a recipient be considered in compliance with this part if the recipient remediates web and mobile app accessibility errors within a certain period of time after the recipient learns of nonconformance through accessibility testing or feedback? If so, what time frame for remediation is reasonable?*
- *Web Accessibility Question 56: Should compliance with this rule be assessed differently for web content that existed on the recipient's website on the compliance date than for web content that is added after the compliance date?*
- *Web Accessibility Question 57: In evaluating compliance, do you think a recipient's organizational maturity related to web and mobile app accessibility should be considered and, if so, how? For example, what categories of accessibility should be measured? Would such an approach be useful for recipients?*
- *Web Accessibility Question 58: Should the Department consider limiting recipients' compliance obligations if nonconformance with a technical standard does not prevent a person with disabilities from accessing the programs and activities offered on the recipient's website or mobile app?*
- *Web Accessibility Question 59: When assessing compliance, should all instances of nonconformance be treated equally? Should nonconformance with certain WCAG 2.1 success criteria, or nonconformance in more frequently accessed content or more important core content, be given more weight when determining whether a website or mobile app meets a particular threshold for compliance?*
- *Web Accessibility Question 60: How should the Department address isolated or temporary noncompliance*[192] *with a technical standard and under what circumstances should noncompliance be considered isolated or temporary? How should the Department address noncompliance that is a result of technical difficulties, maintenance, updates, or repairs?*
- *Web Accessibility Question 61: Are there any local, State, Federal, international, or other laws or policies that provide a framework for measuring, evaluating, defining, or demonstrating compliance with web or mobile app accessibility requirements that the Department should consider adopting?*

The provision at § 84.89, adopted in the final rule and discussed in the summary of regulatory changes, adopts approach (b), ''situations that impact the ability to have equal access to the website or mobile app,'' from the NPRM, with a few changes.

Comment: Many commenters provided their opinions on what will be necessary to measure compliance with the proposed standard adopted in § 84.84. Almost all commenters recognized that it would be nearly impossible for recipients to conform to WCAG 2.1 Level AA across 100% of web content and mobile apps, and recognized that there must be a more nuanced method for measuring compliance. Most commenters also

[191] 88 FR 63392, 63447–49 (Sept. 14, 2023).

[192] *See* 28 CFR 35.133(b).

supported a consistent standard that could be applied across the range of recipients. One commenter stated that because the Department intends to apply a nuanced approach to measuring compliance, any of these methods for measuring compliance will be too difficult to enforce and, therefore, the Department should not adopt any of the proposed approaches to measuring compliance with the requirements of § 84.84.

Response: The Department agrees that any method for measuring compliance must be consistently applied across all recipients. The Department is also persuaded that requiring 100 percent conformance to WCAG 2.1 Level AA would not be the most prudent approach, and that a recipient's compliance obligations can be limited under some narrow circumstances without undermining the rule's objective of ensuring equal access to web content and mobile apps. The Department believes its approach should emphasize actual access, be consistent with existing legal frameworks, and is supported by a wide range of commenters.

First, digital content changes much more frequently than physical buildings—another area covered by set accessibility standards—do. Every modification to web content or a mobile app could lead to some risk of falling out of perfect conformance to WCAG 2.1 Level AA. Recipients will need to address this risk much more frequently under this subpart than they do under physical access requirements, because web content and mobile apps are updated much more often than buildings are. By their very nature, web content and mobile apps can easily be updated often, while most buildings are designed to last for years, if not decades, without extensive updates.

As such, recipients trying to comply with their obligations under this rule will need to evaluate their compliance more frequently than they evaluate the accessibility of their buildings. But regular consideration of how any change that they make to their web content or mobile app will affect conformance to WCAG 2.1 Level AA and the resulting iterative updates may still allow minor nonconformances to escape notice. Given these realities attending web content and mobile apps the Department believes that it is likely to be more difficult for recipients to maintain perfect conformance to the technical standard set forth in this rule than it is to comply with physical access standards. Commenters agreed that maintaining perfect conformance to the technical standard would be difficult.

Web content and content in mobile apps are also more likely to be interconnected, such that updates to some content may affect the conformance of other content in unexpected ways, including in ways that may lead to technical nonconformance without affecting the user experience for individuals with disabilities. Thus, to maintain perfect conformance, it would not necessarily be sufficient for recipients to confirm the conformance of their new content; they would also need to ensure that any updates do not affect the conformance of existing content. The same kind of challenge is unlikely to occur in physical spaces.

Second, some commenters raised concerns about the litigation risk that requiring perfect conformance to WCAG 2.1 Level AA would pose. Commenters feared being subjected to a flood of legal claims based on any failure to conform to the technical standard, however minor, and regardless of the impact—or lack thereof—the nonconformance has on accessibility. Commenters agreed with the Department's suggestion that due to the dynamic, complex, and interconnected nature of web content and mobile apps, a recipient's web content and mobile apps may be more likely to be out of conformance to WCAG 2.1 Level AA than its buildings are to be out of compliance with the ADA Standards, leading to increased legal risk. Some commenters even stated that 100 percent conformance to WCAG 2.1 Level AA would be unattainable or impossible to maintain. Commenters also agreed with the Department's understanding that the prevalence of automated web accessibility testing could enable any individual to find evidence of nonconformance to WCAG 2.1 Level AA even where that individual has not experienced any impact on access and the nonconformance would not affect others' access, with the result that identifying instances of merely technical nonconformance to WCAG 2.1 Level AA is likely much easier than identifying merely technical noncompliance with the ADA Standards. Based on the comments it received, the Department believes that if it does not implement a tailored approach to compliance under this rule, the burden of litigation under this subpart could become particularly challenging for recipients, enforcement agencies, and the courts. Though many comments about litigation risk came from recipients, commenters from some disability advocacy organizations agreed that the rule should not encourage litigation about issues that do not affect a person with a disability's ability to equally use and benefit from a website or mobile app, and that liability should be limited.

The Department does not agree that allowing minor deviations from the technical standard that have minimal impact on access would be too complicated and untenable. Simply because this approach may require more steps to assess compliance than checking whether a website has satisfied 100% of the WCAG 2.1 Level AA success criteria does not mean this approach is not worthwhile or feasible. As discussed further, the Department believes that the final version of § 84.89 is tenable and will help ensure the full and equal access to which individuals with disabilities are entitled while allowing some flexibility for recipients if nonconformance with WCAG 2.1 Level AA is so minimal as to not affect use of the recipient's web content or mobile app.

Comment: Commenters advanced a variety of opinions on what is sufficient evidence of noncompliance with the proposed technical standard. Many commenters stated that any enforcement method should not solely rely on automated software used to check compliance with web content, but if automated checkers are used, any violations should be confirmed by a human being. Automated checkers may result in false positives or minor variations that do not affect access, leading to a flood of legal actions. Some commenters stated that a determination of noncompliance should only be made when there is a deviation from WCAG 2.1 Level AA and the deviation negatively impacts the ability of a person with a disability to use the web content in question. Some commenters stated that a deviation from WCAG 2.1 Level AA should only be a violation if the deviation is inherent to the web content itself, is widely prevalent, or there is no evidence of institutional development in response to the deviation. One commenter summed up their opinion by stating ''the true measure of compliance is whether a person with a disability who needs access to a service can actually access it or not.''

Response: The Department agrees that the method for measuring compliance must take into consideration whether the deviation from the WCAG 2.1 Level AA success criteria impacts an individual with a disability's access to the web content in question.

Comment: Comments on whether a numerical percentage should be used to measure compliance agreed that such a

measure of compliance would be arbitrary and not ensure that people with disabilities are able to access web content. Some commenters stated that it would be difficult, if not impossible, for larger recipients to ensure 100% technical compliance at all times.

Response: The Department considered requiring a certain numerical percentage of conformance with the technical standard and declines to take this approach. The Department concluded that approach would be unlikely to ensure access. Even if only a very small percentage of content does not conform with the technical standard, that could still block an individual with a disability from accessing a program or activity. For example, even if there was only one instance of nonconformance, that single error could prevent an individual with a disability from submitting an application for benefits. As such, the Department continues to believe that a percentage-based approach would not be sufficient to advance this rule's objective to ensure equal access to recipients' web content and mobile apps.

Comment: Some commenters expressed the view that a recipient's policies and practices should be considered when determining compliance with subpart I. Some of these commenters stated that policies for receiving feedback, automated and manual testing, and remediation along a set schedule should all be taken into account. Other commenters stated that actual conformance to WCAG 2.1 Level AA, not whether a recipient has policies in place, should determine compliance, but policies could be used when determining enforcement or remediation requirements following a violation. Some commenters thought that policies should require automated testing, some thought policies should require manual testing, and still others thought policies should require both.

Response: The Department appreciates the comments on recipient policies and practices concerning web and mobile accessibility. The Department declines to adopt a policy-based approach because there is not a sufficient rationale that would justify adopting any specific set of accessibility policies in this generally applicable rule. There was no consensus among commenters about what policies would be sufficient, and most commenters did not articulate a specific basis supporting why their preferred policies were more appropriate than any other policies. In the absence of more specific rationales or a clearer consensus among commenters or experts in the field about what policies would be sufficient, the Department does not believe it is appropriate to prescribe what specific accessibility testing and remediation policies all recipients must adopt to comply with their obligations under this rule. Based on the information available to the Department at this time, the Department's adoption of any such specific policies would be unsupported by sufficient evidence that these policies will ensure accessibility, which could cause significant harm. It would allow recipients to comply with their legal obligations under this rule based on policies alone, even though those policies may fail to provide equal access to online programs or activities.

The Department also declines to adopt a policy-based approach that would rely on the type of general, flexible policies, in which the sufficiency of recipients' policies would vary depending on the factual circumstances. The Department does not believe that such an approach would give individuals with disabilities sufficient certainty about what policies and access they could expect. Such an approach would also fail to give recipients sufficient certainty about how they should meet their legal obligations under this rule. If it adopted a flexible approach, the Department might not advance the current state of the law, because every recipient could choose any accessibility testing and remediation policies it believed would be sufficient to meet its general obligations, without conforming to the technical standard or ensuring access.

The Department agrees that while it may be useful to know a recipient's policies and practices when investigating alleged violations of this subpart, the ultimate goal is accessibility as defined by the subpart. The Office for Civil Rights (OCR) is responsible for investigating allegations that recipients have violated section 504 and typically reviews recipients' policies and procedures as part of an investigation. OCR will review policies, such as policies that address feedback, testing, and timely remediation, when determining resolutions of violations or instances where recipients agree to come into voluntary compliance.

Although the final rule does not specifically require manual testing by people with disabilities, because requiring such testing could pose logistical or other hurdles, the Department recommends that recipients seek and incorporate feedback from people with disabilities on their web content and mobile apps. Doing so will help ensure that everyone has access to critical government services.

Comment: Commenters were divided on whether a recipient should be deemed to be compliant with subpart I if it remediates errors within a set time period. Some commenters stated that the compliance date for WCAG 2.1 Level AA is when the rule goes into effect for the recipient and that any question of remediation is appropriately addressed in the enforcement process. Some commenters support allowing for remediation in a set time period, ranging from three days to months. Some commenters endorsed shorter remediation time periods for recipients with multiple violations or deviations from WCAG 2.1 AA.

Response: The Department agrees that the date for recipient web content and mobile applications to comply with WCAG 2.1 Level AA is stated in the proposed rule as either two or three years after the final rule's publication date depending on the size of the recipient. However, the Department is not adopting a framework where a recipient has a certain period of time to remediate inaccessibility issues before the recipient could be considered out of compliance with the rule. The Department believes that adopting this approach would undermine a core premise of the rule, which is that web content and mobile apps will generally be accessible by default. Under section 504, individuals with disabilities cannot be, by reason of such disability, excluded from participation in or denied the benefits of recipients' programs or activities, including those offered via the web and mobile apps.[193] Accordingly, it is important for individuals with disabilities to have access to the same platforms as their neighbors and friends at the same time, and the commenters' proposal would not achieve that objective. With this rule, the Department is ensuring that people with disabilities generally will not have to request access to recipients' web content and content in mobile apps, nor will they typically need to wait to obtain that access. Given recipients' existing obligations under section 504, recipients should already be on notice of their general obligations. If they are not, this rule unquestionably puts them on notice.

Comment: Most of the commenters opposed different compliance measures for new versus preexisting content. Almost all stated that policing content based on its publication date would be too complicated and that the proposed compliance dates of two or three years are sufficient for all content.

[193] 29 U.S.C. 794(a).

Response: The Department agrees that the two- or three-year compliance periods are sufficient for recipients to make their existing web content and mobile apps accessible while preparing to make new web content and mobile apps accessible, especially given the exception for archived web content under § 84.85(a).

Comment: Most of the comments on organizational maturity as a method for measuring compliance took the position that it should not be used. Specifically, those commenters stated that there is no direct correlation between a recipient's organizational maturity and its future compliance to WCAG 2.1 AA. One commenter stated that some organizations deemed ''mature'' post inaccessible content while some organizations not deemed ''mature'' post accessible content. Some commenters voiced general support for using organizational maturity as it would be a relatively simple method for the Department to enforce. Some commenters also expressed misunderstandings concerning organizational maturity, which suggests that an organizational maturity model would be confusing to the public if adopted.

Response: There are many ways to measure organizational maturity, and it is not clear to the Department that one organizational maturity model is more appropriate or more effective than any other. The Department therefore declines to adopt an organizational maturity approach in this final rule because any organizational maturity model for compliance with web accessibility that the Department could develop or incorporate would not have sufficient justification based on the facts available to the Department at this time. As with the policy-based approach discussed above, if the Department were to allow recipients to define their own organizational maturity approach instead of adopting one specific model, this would not provide sufficient predictability or certainty for people with disabilities or recipients.

Also, like the policy-based approach discussed above, if the Department were to adopt an organizational maturity approach that was not sufficiently rigorous, recipients would be able to comply this rule without providing equal access. This would undermine the purpose of the rulemaking.

Comment: Many of the commenters agreed that the Department should limit compliance obligations if deviation from a specific WCAG 2.1 AA success criteria does not limit access of a person with a disability. Specifically, some commenters stated that a recipient should not be deemed in violation of subpart I if people with disabilities are able to access their web content and mobile apps. Some commenters stated that the Department should prioritize the usability of the web content and actual functional barriers instead of focusing only on technical violations of WCAG 2.1 Level AA. Many commenters supported a functional definition of accessibility that would effectively allow for minor deviations from the technical standard as long as they do not impact the ability of people with disabilities to access and benefit from the web content in question. Some commenters specified that the ability to access and benefit from the web content in question also requires consideration of the timeliness, privacy, and independence in accessing the web content. This method would also result in the possibility that recipients could be in violation of subpart I if any aspect of their program or activity provided through web content is inaccessible to a person with a disability, even if the recipient is fully compliant with WCAG 2.1 AA. Some commenters stated that all information posted on a recipient's web content is important so all information, regardless of whether it limits access to a recipient's program or activity, should be accessible. Some commenters oppose this method of measuring compliance because they believe it would be too difficult to enforce.

Response: The Department has considered these comments and believes a recipient should be able to meet its requirements under this rule even if the recipient's web content or mobile app does not perfectly conform to the technical standard set forth in § 84.84.

Accordingly, this final rule adopts § 84.89, which describes a particular, limited circumstance in which a recipient ''will be deemed to have met'' the requirements of § 84.84 even though the recipient's web content or mobile app does not perfectly conform to the technical standard set forth in § 84.84(b). Section 84.89 will apply if the recipient can demonstrate that, although it was technically out of conformance to WCAG 2.1 Level AA, (*i.e.,* fails to exactly satisfy a success criterion or conformance requirement), the nonconformance has a minimal impact on access for individuals with disabilities, as defined in the regulatory text. If a recipient can make this showing, it will be deemed to have met its obligations under § 84.84 despite its nonconformance to WCAG 2.1 Level AA.

Section 84.89 does not alter a recipient's general obligations under this rule, nor is it intended as a blanket justification for a recipient to avoid conforming to WCAG 2.1 Level AA from the outset. Rather, § 84.89 is intended to apply in rare circumstances and will require a detailed analysis of the specific facts surrounding the impact of each alleged instance of nonconformance. The Department does not expect or intend that § 84.89 will excuse most nonconformance to the technical standard. Under § 84.84(b), a recipient must typically ensure that the web content and mobile apps it ''provides or makes available, directly or through contractual, licensing, or other arrangements, comply with Level A and Level AA success criteria and conformance requirements specified in WCAG 2.1.'' This remains generally true. However, § 84.89 allows for some minor deviations from WCAG 2.1 Level AA if specific conditions are met. This will provide a recipient that discovers that it is out of compliance with this rule with another means to avoid the potential liability that could result. Recipients that maintain conformance to WCAG 2.1 Level AA will not have to rely on § 84.89 to be deemed compliant with this rule, and full conformance to WCAG 2.1 Level AA is the only definitive way to guarantee that outcome. However, if a recipient falls out of conformance in a minimal way or such nonconformance is alleged, a recipient may be able to use § 84.89 to demonstrate that it has satisfied its legal obligations. Section 84.89 also does not alter existing enforcement mechanisms. Individuals can file complaints, and agencies can conduct investigations and compliance reviews, related to this rule the same way they would for any other requirement under section 504.

As the text of the provision indicates, the burden of demonstrating applicability of § 84.89 is on the recipient. The provision will only apply ''in the limited circumstance in which the recipient can demonstrate'' that all of the criteria described in § 84.89 are satisfied. This section requires the recipient to show that its nonconformance to WCAG 2.1 Level AA ''has such a minimal impact on access that it would not affect the ability of individuals with disabilities to use the recipient's web content or mobile app'' to do one of the activities enumerated in paragraphs (a) through (d) of § 84.89 in the manner described in § 84.89. If the nonconformance has affected an individual in the ways outlined in § 84.89 (further described below), the recipient will not be able to rely on this

provision. Further, as ''demonstrate'' indicates, the recipient must provide evidence that all of the criteria described in § 84.89 are satisfied in order to substantiate its reliance on this provision. While § 84.89 does not require a particular type of evidence, a recipient needs to show that, as the text states, its nonconformance ''would not affect'' the experience of individuals with disabilities as outlined below. Therefore, it would not be sufficient for a recipient to show only that it has not received any complaints regarding the nonconformance; nor would it likely be enough if the recipient only pointed to a few particular individuals with disabilities who were unaffected by the nonconformance. The recipient must show that the nonconformance is of a nature that would not affect people whose disabilities are pertinent to the nonconformance at issue, just as the analysis under other parts of section 504 regulations depends on the barrier at issue and the access needs of individuals with disabilities pertinent to that barrier.[194] For example, people with hearing or auditory processing disabilities, among others, have disabilities pertinent to captioning requirements.

With respect to the particular criteria that a recipient must satisfy, § 84.89 describes both *what* people with disabilities must be able to use the recipient's web content or mobile apps to do and *the manner* in which people with disabilities must be able to do it. Nonconformance to WCAG 2.1 Level AA must not ''affect the ability of individuals with disabilities to use the recipient's web content or mobile app . . . in a manner that provides substantially equivalent timeliness, privacy, independence, and ease of use'' compared to individuals without disabilities. Timeliness, privacy, independence, and ease of use are underscored throughout the ADA framework, as well as elsewhere in this rule under section 504, as key components of ensuring equal opportunity for individuals with disabilities to participate in or benefit from a recipient's programs and activities, and ''ease of use'' is intended to broadly encompass other aspects of a user's experience with web content or mobile apps. To successfully rely on § 84.89, it would not be sufficient for a recipient to demonstrate merely that its nonconformance would not completely block people with disabilities from using web content or a mobile app as described in § 84.89(a) through (d). That is, the term ''would not affect'' should not be read in isolation from the rest of § 84.89 to suggest that a recipient only needs to show that a particular objective can be achieved. Rather, a recipient must also demonstrate that, even though the web content or mobile app does not conform to the technical standard, the user experience for individuals with disabilities is substantially equivalent to the experience of individuals without disabilities.

For example, if a recipient's online health questionnaire does not conform to WCAG 2.1 Level AA, a person with a manual dexterity disability may need to spend significantly more time to fill out a health questionnaire online than someone without a disability. This person might also need to seek assistance from someone who does not have a disability, provide personal information to someone else, or endure a much more cumbersome and frustrating process than a user without a disability. Even if this person with a disability was ultimately able to fill out the form online, § 84.89 would not apply because, under these circumstances, their ability to use the web content ''in a manner that provides substantially equivalent timeliness, privacy, independence, and ease of use'' would be affected. Analysis under this provision is likely to be a fact-intensive analysis. Of course, a recipient is not responsible for every factor that might make a task more time-consuming or difficult for a person with a disability. However, a recipient is responsible for the impact of its nonconformance to the technical standard set forth in this rule. The recipient must show that its nonconformance would not affect the ability of individuals with pertinent disabilities to use the web content or mobile app in a manner that provides substantially equivalent timeliness, privacy, independence, and ease of use.

Paragraphs (a) through (d) of § 84.89 describe what people with disabilities must be able to use the recipient's web content or mobile apps to do ''in a manner that [is] substantially equivalent [as to] timeliness, privacy, independence, and ease of use.'' First, under § 84.89(a), individuals with disabilities must be able to ''[a]ccess the same information as individuals without disabilities.'' This means that people with disabilities can access all the same information using the web content or mobile app that users without disabilities are able to access. For example, § 84.89(a) would not be satisfied if certain web content could not be accessed using a keyboard because the content was coded in a way that caused the keyboard to skip over some content. In this example, an individual who relies on a screen reader would not be able to access the same information as an individual without a disability because all of the information could not be selected with their keyboard so that it would be read aloud by their screen reader. However, § 84.89(a) might be satisfied if the color contrast ratio for some sections of text is 4.45:1 instead of 4.5:1 as required by WCAG 2.1 Success Criterion 1.4.3.[195] Similarly, this provision might apply, for example, if the spacing between English words is only 0.15 times the font size instead of 0.16 times as required by WCAG 2.1 Success Criterion 1.4.12.[196] Such slight deviations from the specified requirements are unlikely to affect the ability of, for example, most people with vision disabilities to access information that they would be able to access if the content fully conformed with the technical standard. However, the recipient must always demonstrate that this element is met with respect to the specific facts of the nonconformance at issue.

Second, § 84.89(b) states that individuals with disabilities must be able to ''[e]ngage in the same interactions as individuals without disabilities.'' This means that people with disabilities can interact with the web content or mobile app in all of the same ways that people without disabilities can. For example, § 84.89(b) would not be satisfied if people with disabilities could not interact with all of the different components of the web content or mobile app, such as chat functionality, messaging, calculators, calendars, and search functions. However, § 84.89(b) might be satisfied if the time limit for an interaction, such as a chat response, expires at exactly 20 hours, even though Success Criterion 2.2.1,[197] which generally requires certain safeguards to prevent time limits from expiring, has an exception that only applies if the time limit is longer than 20 hours. People with certain types of disabilities, such as cognitive disabilities, may need more time than people without disabilities to engage in interactions. A slight deviation in

[197] *See* W3C, *Web Content Accessibility Guidelines (WCAG) 2.1, Success Criterion 2.2.1 Timing Adjustable* (June 5, 2018), *https://www.w3.org/TR/2018/REC-WCAG21-20180605/#timing-adjustable* [*https://perma.cc/V3XZ-KJDG*].

timing, especially when the time limit is long and the intended interaction is brief, is unlikely to affect the ability of people with these types of disabilities to engage in interactions. Still, the recipient must always demonstrate that this element is met with respect to the specific facts of the nonconformance at issue.

Third, pursuant to § 84.89(c), individuals with disabilities must be able to ''[c]onduct the same transactions as individuals without disabilities.'' This means that people with disabilities can complete all of the same transactions on the web content or mobile app that people without disabilities can. For example, § 84.89(c) would not be satisfied if people with disabilities could not submit a form or process their payment. However, § 84.89(c) would likely be satisfied if web content does not conform to Success Criterion 4.1.1 about parsing. This Success Criterion requires that information is coded properly so that technology like browsers and screen readers can accurately interpret the content and, for instance, deliver that content to a user correctly so that they can complete a transaction, or avoid crashing in the middle of the transaction.[198] However, according to W3C, this Success Criterion is no longer needed to ensure accessibility because of improvements in browsers and assistive technology.[199] Thus, although conformance to this Success Criterion is required by WCAG 2.1 Level AA, a failure to conform to this Success Criterion is unlikely to affect the ability of people with disabilities to conduct transactions. However, the recipient must always demonstrate that this element is met with respect to the specific facts of the nonconformance at issue.

Fourth, § 84.89(d) requires that individuals with disabilities must be able to ''[o]therwise participate in or benefit from the same programs and activities as individuals without disabilities.'' Section 84.89(d) is intended to address anything else within the scope of section 504 (*i.e.,* any program or activity that cannot fairly be characterized as accessing information, engaging in an interaction, or conducting a transaction) for which someone who does not have a disability could use the recipient's web content or mobile app. Section 84.89(d) should be construed broadly to ensure that the ability of individuals with disabilities to access or use any part of the recipient's web content or mobile app that individuals without disabilities are able to access or use is not affected by nonconformance to the technical standard.

The Department believes this framework is generally consistent with the framework of title II of the ADA, with which many recipients will be familiar, as well as the approach reflected in the Department's revisions and additions in §§ 84.68 and 84.77 of this final rule to ensure consistency between section 504 and title II of the ADA. Title II similarly requires covered entities to provide equal opportunity to participate in or benefit from services;[200] equal opportunity to obtain the same result;[201] full and equal enjoyment of services, programs, and activities;[202] and communications with people with disabilities that are as effective as communications with others, which includes consideration of timeliness, privacy, and independence.[203]

The regulatory language codified in § 84.89 is very similar to language discussed in the NPRM's preamble.[204] However, the Department believes it is helpful to explain differences between that discussion in the NPRM and this final rule. The Department has only made three substantive changes to the NPRM's relevant language.

First, though the NPRM discussed excusing noncompliance that ''does not prevent'' equal access, § 84.89 excuses noncompliance that ''would not affect'' such access. The Department was concerned that the use of ''does not'' could have been incorrectly read to require a showing that a specific individual did not have substantially equivalent access to the web content or mobile app. In changing the language to ''would not,'' the Department clarifies that the threshold requirements for bringing a challenge to compliance under this subpart are the same as under any other provision of section 504. Except as otherwise required by existing law, a rebuttal of a recipient's invocation of this provision would not need to show that a specific individual did not have substantially equivalent access to the web content or mobile app. Rather, the issue would be whether the nonconformance is the type of barrier that would affect the ability of people with pertinent disabilities to access the web content or mobile app in a substantially equivalent manner. Certainly, the revised standard would encompass a barrier that actually does affect a specific individual's access, so this revision does not narrow the provision.

Second, the Department originally proposed considering whether nonconformance ''prevent[s] a person with a disability'' from using the web content or mobile app, but § 84.89 instead considers whether nonconformance would ''affect the ability of individuals with disabilities'' to use the web content or mobile app. This revision is intended to clarify what a recipient seeking to invoke this provision needs to demonstrate. The Department explained in the NPRM that the purpose of this approach was to ''provide equal access to people with disabilities,'' and limit violations to those that ''affect access.'' [205] But even when not entirely ''prevent[ed]'' from using web content or mobile app, an individual with disabilities can still be denied equal access by impediments falling short of that standard. The language in the final rule more accurately reflects this reality and achieves the objective proposed in the NPRM. As explained above, under the language in the final rule it would not be sufficient for a recipient to show that its nonconformance would still permit people with disabilities to use the recipient's web content or mobile app as described in § 84.89(a) through (d). In other words, someone would not need to be entirely prevented from using the web content or mobile app before a recipient could be considered out of compliance. Instead, the effect of the nonconformance must be considered. This does not mean that any effect on usability, however slight, is sufficient to prove a violation. Only nonconformance that would affect the ability of individuals with disabilities to do the activities in § 84.89(a) through (d) in a way that provides substantially equivalent timeliness, privacy, independence, and ease of use would prevent a recipient from relying on this provision.

Third, the language proposed in the NPRM considered whether a person with a disability would have substantially equivalent ''ease of use.'' The Department believed that timeliness, privacy, and independence were all components that affected

[205] *Id.*

whether ease of use was substantially equivalent. Because some commenters proposed explicitly specifying these factors in addition to ''ease of use,'' the Department is persuaded that these factors warrant separate inclusion and emphasis as aspects of the user experience that must be substantially equivalent. This specificity ensures clarity for recipients, individuals with disabilities, Federal agencies, and courts about how to analyze an entity's invocation of this provision. Therefore, the Department has added additional language to clarify that timeliness, privacy, and independence are all important concepts to consider when evaluating whether this provision applies. If a person with a disability would need to take significantly more time to successfully navigate web content or a mobile app that does not conform to the technical standard because of the content or app's nonconformance, that person is not being provided with a substantially equivalent experience to that of people without disabilities. Requiring a person with a disability to spend substantially more time to do something is placing an additional burden on them that is not imposed on others. Privacy and independence are also crucial components that can affect whether a person with a disability would be prevented from having a substantially equivalent experience. Adding this language to § 84.89 ensures consistency with the effective communication provision of section 504.[206] The Department has included timeliness, privacy, and independence in this provision for clarity and to avoid unintentionally narrowing what should be a fact-intensive analysis. However, ''ease of use'' may also encompass other aspects of a user's experience that are not expressly specified in the regulatory text, such as safety risks incurred by people with disabilities as a result of nonconformance.[207] ''Ease of use'' should be construed broadly to allow for consideration of other ways in which nonconformance would make the experience of users with disabilities more difficult or burdensome than the experience of users without disabilities in specific scenarios.

Regarding comments that recommended a two-part method of measuring compliance that includes a functional definition of accessibility in addition to WCAG requirements, the Department is concerned about imposing additional requirements on recipients. A major benefit of requiring conformance to WCAG 2.1 Level AA is that if a recipient's web content and mobile apps fully conform to it, the recipient can be certain that they are compliant with § 84.84. Adding a functional accessibility standard beyond WCAG would result in situations where even if a recipient is 100% in compliance with WCAG 2.1 AA, they may still be in violation of subpart I if a single person with a disability is unable to access some portion of their web content or mobile app. This lack of certainty would prove difficult for recipients and result in confusion throughout health and human services programs and activities.

Comment: Some commenters expressed the view that not all instances of nonconformance to WCAG 2.1 Level AA should be treated equally. Some stated that there should be higher consequences based on how frequently accessed the content is, how egregious the violation is, and whether an issue is inherently more serious.

Response: The Department will investigate all alleged violations of section 504, including alleged nonconformance to WCAG 2.1 Level AA. During the investigation process, the Department may choose to pursue different methods of investigation and remedies depending on the specifics of the alleged violation, including the impact on people with disabilities and the importance of the content in question.

Comment: Some commenters stated that isolated or temporary instances of nonconformance to WCAG 2.1 Level AA should generally not be treated as violations as long as the recipient in question is not a repeat offender, they notify the public of the issue, they remediate the issue in a set period of time, and the issue itself is small.

Response: The Department has considered all of the comments it received on this issue and, based on the comments and its own independent assessment, decided not to separately excuse a recipient's isolated or temporary noncompliance with § 84.84(b) due to maintenance or repairs in the final rule. Rather, as stated in § 84.89, a recipient's legal responsibility for an isolated or temporary instance of nonconformance to WCAG 2.1 Level AA will depend on whether the isolated or temporary instance of nonconformance—as with any other nonconformance—would affect the ability of individuals with disabilities to use the recipient's web content or mobile app in a substantially equivalent way.

The Department believes it is likely that the approach set forth in § 84.89 reduces the need for a provision that would explicitly allow for instances of isolated or temporary noncompliance due to maintenance or repairs, while simultaneously limiting the negative impact of such a provision on individuals with disabilities. The Department believes this is true for two reasons.

First, to the extent isolated or temporary noncompliance due to maintenance or repairs occur that affect web content or mobile apps, it logically follows from the requirements in § 84.84 that these interruptions should generally result in the same impact on individuals with and without disabilities after the compliance date because, in most cases, all users would be relying on the same content, and so interruptions to that content would impact all users. From the compliance date onward, accessible web content and mobile apps and the web content and mobile apps used by people without disabilities should be one and the same (with the rare exception of conforming alternate versions provided for in § 84.86). Therefore, the Department expects that isolated or temporary noncompliance due to maintenance or repairs generally will affect the ability of people with disabilities to use web content or mobile apps to the same extent it will affect the experience of people without disabilities. For example, if a website is undergoing overnight maintenance and so an online form is temporarily unavailable, the form would already conform to WCAG 2.1 Level AA, and so there would be no separate feature or form for individuals with disabilities that would be affected while a form for people without disabilities is functioning. In such a scenario, individuals with and without disabilities would both be unable to access web content, such that there would be no violation of this rule.

Thus, the Department believes that a specific provision regarding isolated or temporary noncompliance due to maintenance or repairs is less necessary than it is for physical access. When there is maintenance to a feature that provides physical access, such as a broken elevator, access for people with disabilities is particularly impacted. In contrast, when there is maintenance to web content or mobile apps, people with and without disabilities will generally both be denied access, such

[206] 45 CFR 84.77.

[207] *See, e.g.,* W3C, *Web Content Accessibility Guidelines (WCAG) 2.1, Success Criterion 2.3.1. Three Flashes or Below Threshold* (June 5, 2018), *https://www.w3.org/TR/2018/REC-WCAG21-20180605/#three-flashes-or-below-threshold* [*https://perma.cc/A7P9-WCQY*] (addressing aspects of content design that could trigger seizures or other physical reactions).

that no one is denied access on the basis of disability.

Second, even to the extent isolated or temporary noncompliance due to maintenance or repairs affects only an accessibility feature, that noncompliance may fit the parameters laid out in § 84.89 such that a recipient will be deemed to have complied with its obligations under the rule. Section 84.89 does not provide a blanket limitation that would excuse all isolated or temporary noncompliance due to maintenance or repairs, however. The provision's applicability would depend on the particular circumstances of the interruption and its impact on people with disabilities. It is possible that an interruption that only affects an accessibility feature will not satisfy the elements of § 84.89 and a recipient will not be deemed in compliance with § 84.84. Even one temporary or isolated instance of nonconformance could affect the ability of individuals with disabilities to use the web content with substantially equivalent ease of use, depending on the circumstances. As discussed above, this will necessarily be a fact-specific analysis.

In addition to being less necessary than in the physical access context, the Department also believes a specific provision regarding isolated or temporary interruptions due to maintenance or repairs would have more detrimental incentives in the digital space by discouraging recipients from adopting practices that would reduce or avert the disruptions caused by maintenance and repair that affect accessibility. Isolated or temporary noncompliance due to maintenance or repairs of features that provide physical access would be necessary regardless of what practices recipients put in place,[208] and the repairs and maintenance to those features often cannot be done without interrupting access specifically for individuals with disabilities. For example, curb ramps will need to be repaved and elevators will need to be repaired because physical materials break down. In contrast, the Department believes that, despite the dynamic nature of web content and mobile apps, incorporating accessible design principles and best practices will generally enable recipients to anticipate and avoid many instances of isolated or temporary noncompliance due to maintenance or repairs—including many isolated or temporary instances of noncompliance that would have such a significant impact that they would affect people with disabilities' ability to use web content or mobile apps in a substantially equivalent way. Some of these best practices, such as regular accessibility testing and remediation, would likely be needed for recipients to comply with subpart I regardless of whether the Department incorporated a provision regarding isolated or temporary interruptions. And practices like testing content before it is made available will frequently allow maintenance and repairs that affect accessibility to occur without interrupting access, in a way that is often impossible in physical spaces. The Department declines to adopt a limitation for isolated or temporary interruptions due to maintenance or repairs. Such a limitation may disincentivize recipients from implementing processes that could prevent many interruptions from affecting substantially equivalent access.

Comment: Commenters mentioned specific laws or policies used by States, including California and Texas, which require covered entities to post certification of their sites' accessibility and submit to testing by the state comptroller, respectively. Some commenters pointed to different technical standards instead.

Response: The Department has considered many States' approaches to assessing compliance with their web accessibility laws [209] and declines to adopt these laws at the Federal level. State laws like those in Florida, Illinois, and Massachusetts, which do not specify how compliance will be measured or how entities can demonstrate compliance, are essentially requiring 100 percent compliance with a technical standard. This approach is not feasible for the reasons discussed earlier in this section. In addition, this approach is not feasible because of the large number and wide variety of recipients covered by section 504, as compared with the relatively limited number of State agencies in a given State. Laws like California's, which require entities covered by California's law to certify or post evidence of compliance, would impose administrative burdens on recipients similar to those imposed by the international approaches discussed below. Some State agencies, including in California, Minnesota, and Texas, have developed assessment checklists, trainings, testing tools, and other resources. The Department may also provide further guidance about best practices for a recipient to meet its obligations under this rule. However, such resources are not substitutes for clear and achievable regulatory requirements. Some commenters stated that regulations should not be combined with best practices or guidance, and further stated that testing methodologies are more appropriate for guidance. The Department agrees and believes recipients are best suited to determine how they will comply with the technical standard, depending on their needs and resources.

The Department also declines to adopt a model like the one used in Texas, which requires State agencies to, among other steps, conduct tests with one or more accessibility validation tools, establish an accessibility policy that includes criteria for compliance monitoring and a plan for remediation of noncompliant items, and establish goals and progress measurements for accessibility.[210] This approach is one way recipients may choose to ensure that they comply with this rule. However, as noted above when discussing the policy-based approach, the Department is unable to calibrate requirements that provide sufficient predictability and certainty for every recipient while maintaining sufficient flexibility. The Department declines to adopt an approach like Texas's for the same reasons it declined to adopt a policy-based approach.

The Department has also determined that other specific international approaches to evaluating compliance with web accessibility laws are currently not feasible to adopt in the United States.[211] The methodologies used by the European Union and Canada require reporting to government agencies.[212] This would pose counterproductive logistical and administrative difficulties for recipients and the Department. The Department believes that the resources recipients would need to spend on data collection and reporting would detract from efforts to increase the accessibility of web content and mobile apps. New

Zealand's approach,[213] which requires testing and remediation, is similar to the policy-based approach already discussed in this section, and the Department declines to adopt that approach for the reasons stated above. The approach taken in the United Kingdom, where a government agency audits websites and mobile apps, sends a report to the entity, and requires the entity to fix accessibility issues,[214] would raise similar logistical and administrative difficulties for recipients and the Department. Though the Department will continue to investigate complaints and enforce the section 504, given constraints on its resources and the large number of recipients within its purview to investigate, the Department is unable to guarantee that it will conduct a specific amount of enforcement under this rule on a particular schedule.

Given the number of recipients, the wide range in their uses of web content and mobile apps, and the Department's existing compliance activities, such arrangements would not be logistically feasible for section 504. Laws that require 100% conformance to WCAG are not feasible for section 504 for the reasons mentioned above. Laws that establish a single accessibility policy would not allow the hundreds of thousands of HHS recipients sufficient flexibility to determine how to ensure their web content and mobile apps comply with section 504.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are editing § 84.89 to formalize a method for measuring compliance. Specifically, we are finalizing a method of measuring compliance where a recipient that is not fully in compliance with § 84.84(b) will be deemed to have met the requirements of § 84.84 if the recipient can demonstrate that the noncompliance has a minimal impact on access. Whether the noncompliance has minimal impact on access depends on whether the noncompliance would not affect the ability of individuals with disabilities to access the same information, engage in the same interactions, conduct the same transactions, and otherwise participate in or benefit from the same programs and activities with substantially equivalent timeliness, privacy, independence, and ease of use.

Accessible Medical Equipment (Subpart J)

Subpart J addresses requirements related to providing accessible medical equipment for people with disabilities.

Application (§ 84.90)

Proposed § 84.90 stated that this subpart would apply to programs or activities that receive Federal Financial assistance and recipients that operate, or receive Federal financial assistance from the operation of, such programs or activities.

We received no comments on § 84.90.

Summary of Regulatory Changes

The Department is finalizing § 84.90 as proposed with no modifications.

Requirements for Medical Diagnostic Equipment (§ 84.91)

Proposed § 84.91 contained a general requirement that no individual with a disability shall be excluded from or denied the benefits of a program or activity of a recipient offered through MDE due to the inaccessibility of the recipient's MDE.

The comments and our responses regarding § 84.91 are set forth below.

Comment: Almost all commenters supported requiring recipients to ensure the availability of accessible MDE for health equity and access to needed care for people with disabilities. A wide array of stakeholders including disability rights advocates and organizations, individuals with disabilities, civil rights, faith-based, and reproductive rights advocacy groups, as well as medical providers, researchers, State and local jurisdictions, and public health groups all expressed support for incorporating the Access Board's MDE standards into this section 504 regulation.

Response: The Department agrees with commenters that accessible MDE is vital for health equity, person-centered care, and access to care for patients with disabilities. The support for providing accessible care comes from a variety of commenters and recipient groups including physicians, nurses, allied professions, hospital associations, medical suppliers, and others. As discussed in the preamble to our NPRM, researchers have demonstrated and documented that the scarcity of accessible MDE constitutes a significant barrier to access to care for patients with disabilities, resulting in a lack of preventative care and diagnostic exams, while contributing to poorer health outcomes and lower life expectancies. The Department hopes that implementation of this final rule will make a tangible difference.

Comment: Many commenters described the importance of accessible MDE and provided firsthand accounts of instances where they were unable to receive health care or received substandard care because recipients did not utilize accessible exam tables, scales, radiological or other diagnostic equipment. Commenters recounted instances when they were unable to receive prostate exams, mammograms, or skin biopsies or when they received incomplete physical exams because they could not transfer to an exam table. Other commenters noted that they could not have their weight checked regularly because of the lack of an accessible weight scale resulting in an inability to document unexpected weight loss or to track a child's weight and growth over time. Some commenters described recipients' expectations that individuals with mobility disabilities would be accompanied by companions to physically transfer them onto MDE. Some disability advocacy groups shared representative accounts submitted by a number of people documenting the harms experienced by people with disabilities due to recipients who lacked accessible MDE.

Response: The Department is aware of many instances where people with disabilities were denied access to needed care, subjected to demeaning situations, or received substandard care because recipients did not utilize accessible exam tables, weight scales, radiological, or other diagnostic equipment. OCR has taken action to enforce section 504 as it applies to medical care. However, the lack of standards for accessible MDE before the Access Board completed its standards in early 2017, the lack of scoping and rulemaking to make these standards enforceable for recipients, and modest voluntary adoption of accessible MDE by health care providers mean that these circumstances remain all too prevalent. This rulemaking and its effective date will be turning points in ensuring improved access to diagnostic services

[214] United Kingdom, Understanding accessibility requirements for public sector bodies (Aug. 22, 2022), *https://www.gov.uk/guidance/accessibility requirements-for-public-sector-websites-and-apps;* United Kingdom, Public sector website and mobile application accessibility monitoring (Nov. 1, 2022), *https://www.gov.uk/guidance/public-sector-websiteand-mobile-application-accessibility-monitoring.*

for people with disabilities. Because many people with disabilities are unable to receive even basic health care services as a result of inaccessible exam tables and weight scales, and because many health care providers, including primary care physicians, use exam tables and weight scales and the equipment is relatively inexpensive compared to other accessible MDE such as imaging equipment, the Department decided to add a specific requirement for exam tables and weight scales at § 84.92(c). At a minimum, recipients must acquire one accessible exam table, if they use exam tables, and one accessible weight scale, if they use weight scales, within two years. The Department decided on a two-year time period because it believes that is a sufficient period for most recipients to budget for and acquire accessible exam tables and weight scales. Some commenters were concerned that two years would be too long considering the availability and affordability of accessible exam tables and weight scales measured against the negative health outcomes experienced by people with disabilities when waiting for recipients to acquire accessible MDE, but the Department recognizes recipients will need some time to acquire accessible exam tables and weight scales. This requirement will help address the specific denials of service raised by commenters relating to the inaccessibility of exam tables and weight scales, and ensure that regardless of recipient size, as long as recipients use at least one exam table or weight scale, patients will have access to accessible exam tables and weight scales. The Department also chose to specify exam tables and weight scales because exam tables and weight scales that meet the MDE Standards are already available on the open market and are less expensive than some other available accessible MDE, such as imaging equipment.[215]

Comment: A few medical provider groups expressed concerns about the extension of responsibility for these provisions to facilities not directly controlled by the section 504 covered recipient, giving an example of an emergency department boarding patients for other departments when inpatient beds or appropriate transfers are unavailable. These groups sought clarification of whether accessible MDE responsibilities will apply in these cases and requested a collaborative approach with the Department rather than being held accountable for decisions beyond their control, and consideration when complying with these requirements would result in undue burden.

Response: Since its publication in 1977, the Department's section 504 regulations have applied to recipients of Federal financial assistance from the Department. This rulemaking does not change the recipients covered by section 504. This rulemaking applies to each recipient and to the program or activity that receives such assistance. In the unlikely circumstance that a health care provider that receives financial assistance from the Department uses the facilities of a health care provider that does not accept financial assistance from the Department, the recipient is still required to comply with section 504 and all other appropriate Federal civil rights laws. Section 84.68(b)(1)(i) in the general prohibitions against discrimination section states that a recipient, in providing any aid, benefit, or service, may not, directly or through contractual, licensing, or other arrangement deny a qualified individual the opportunity to participate in or benefit from the aid, benefit, or service that is not equal to that afforded others. Paragraphs (b)(1)(ii) through (vii) list other types of discrimination prohibited by recipients whether directly or through contractual, licensing, or other arrangements.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.91 as proposed with no modifications.

Newly Purchased, Leased, or Otherwise Acquired Medical Diagnostic Equipment (§ 84.92)

Proposed § 84.92(a) required that all MDE that recipients acquire more than 60 days after final publication of this rule must meet the Standards for Accessible MDE until the recipient satisfies scoping requirements in § 84.92(b). Proposed § 84.92(b) contained specific scoping requirements for accessible MDE ranging from 10% to 20% of all MDE based on facility specialty or purpose. We invited comment on the following questions:

- *MDE Question 1: The Department seeks public comment on whether and how to apply the existing scoping requirements for patient or resident sleeping rooms or parking spaces in certain medical facilities to MDE; and on whether there are meaningful differences between patient or resident sleeping rooms, accessible parking, and MDE that the Department should consider when finalizing the scoping requirements.*
- *MDE Question 2: The Department seeks public comment on whether different scoping requirements should apply to different types of MDE, and if so, what scoping requirements should apply to what types of MDE.*
- *MDE Question 3: Because more patients with mobility disabilities may need accessible MDE than need accessible parking, the Department seeks public comment on whether the Department's suggested scoping requirement of 20 percent is sufficient to meet the needs of persons with disabilities.*
- *MDE Question 4: The Department seeks public comment on any burdens that this proposed requirement or a higher scoping requirement might impose on recipients.*
- *MDE Question 5: The Department seeks public comment on whether the proposed approach to dispersion of accessible MDE is sufficient to meet the needs of individuals with disabilities, including the need to receive different types of specialized medical care.*
- *MDE Question 6: The Department seeks public comment on whether additional requirements should be added to ensure dispersion (e.g., requiring at least one accessible exam table and scale in each department, clinic, or specialty; requiring each department, clinic and specialty to have a certain percentage of accessible MDE).*
- *MDE Question 7: The Department seeks information regarding:*
  - *The extent to which accessible MDE can be moved or otherwise shared between clinics or departments.*
  - *The burdens that the rule's proposed approach to dispersion or additional dispersion requirements may impose on recipients.*
  - *The burdens that the rule's proposed approach to dispersion may impose on people with disabilities (e.g., increased wait times if accessible MDE needs to be located and moved, embarrassment, frustration, or impairment of treatment that may result if a patient must go to a different part of a hospital or clinic to use accessible MDE).*

We proposed in § 84.92(c) to require recipients that use exam tables must acquire at least one accessible exam table within two years of the final publication of this rule. We proposed the same requirement for recipients that use weight scales. As noted above, we decided that accessible exam tables and

[215] *See, e.g.,* 82 FR 2810, 2829 (Jan. 9, 2017) (stating that commenters were concerned about immediate compliance with the MDE Standards for ''more expensive imaging equipment'' compared to other accessible MDE). *See also 2024 Mammography Price Guide,* Block Imaging, *https://www.blockimaging.com/bid/95356/digital-mammography-equipment-price-cost-info* (last visited Feb. 20, 2024).

weight scales should be included in this requirement because many primary care health care providers use them for a range of basic diagnostic services. Additionally, accessible exam tables and weight scales are available on the open market and more affordable when compared to other accessible MDE, such as imaging equipment.[216] Finally, we proposed a two year time period to acquire an accessible exam table and accessible weight scale because while that MDE is currently available, we understand that some recipients may need additional time to budget for and acquire it. We did not propose a longer time period because, as commenters note below, the inability to receive even basic health care services because of inaccessible exam tables and weight scales results in negative health outcomes for people with disabilities. We invited comment on the following questions:

- *MDE Question 8: The Department seeks public comment on the potential impact of the requirement of paragraph (c) on people with disabilities and recipients, including the impact on the availability of accessible MDE for purchase and lease.*
- *MDE Question 9: The Department seeks public comment on whether two years would be an appropriate amount of time for the requirements of paragraph (c); and if two years would not be an appropriate amount of time, what the appropriate amount of time would be.*

We proposed in § 84.92(d) to make clear that recipients may use alternative standards to those required by the Standards for Accessible MDE as long as the alternative standards result in substantially equivalent or greater accessibility and usability.

We proposed in § 84.92(e) to provide that this section would not require a recipient to take actions that would result in a fundamental alteration in the nature of a program or activity, or in undue financial and administrative burdens, while providing additional clarity on claiming these exceptions.

We proposed in § 84.92(f) to provide that recipients could prove that compliance with § 84.92(a) or (c) would be a fundamental alteration if compliance would alter diagnostically required structural or operational characteristics of the equipment, and prevent the use of the equipment for its intended diagnostic purpose.

The comments and our responses to § 84.92 are set forth below.

Comment: Most recipient organizations acknowledged the need to provide accessible MDE to people with disabilities and generally supported the accessible MDE provisions with scoping as proposed in the NPRM. Many recipient organizations expressed appreciation of the Department's measured approach and expressed support for provisions offering providers flexible approaches to compliance, particularly for small provider organizations with fewer than fifteen employees and the proposals at § 84.22(c) for existing facilities allowing alternative compliance schemes. A minority of groups representing physician, dental, hospital and insurance providers expressed concerns with costs for small recipients and requested longer phase-in periods, extensions for small recipients if recent MDE purchases had been made, or in some cases, requiring all new purchases to be accessible MDE as opposed to requiring that practices have a minimum number or percentage of accessible equipment. A number of health care provider groups requested technical or financial assistance in support of their efforts to come into compliance.

Response: The Department appreciates provider groups' recognition of the importance of these provisions for people with disabilities, as well as their support for the nuanced approach the Department is taking with scoping. The Department declines to extend the phase-in period, offer extensions for small practices which recently procured MDE, or to only require newly purchased equipment to be accessible at this time. This is because the health disparities and barriers to access-to-care people with disabilities are facing are urgent [217] and extending phase-in periods will extend the time that they must wait for necessary services. Many people with disabilities have been urging the Department to make the MDE Standards mandatory since the Access Board issued them in 2017. Additionally, recipients have had considerable notice that these standards were under development, given that the ACA, enacted in 2010, directed the Access Board to promulgate standards for MDE.[218] Recipients were also on notice since the Access Board issued the MDE Standards in 2017 that enforcing agencies might make the standards enforceable.[219]

Finally, with the defenses of fundamental alteration and undue burden, this regulation already includes a carefully calibrated balance of interests to account for the burden on smaller recipients.

Comment: Many disability advocates, disability rights advocacy organizations, a member of Congress, and some State and local jurisdictions voiced concerns that the proposed scoping provisions were inadequate to meet demand among people with mobility disabilities. Many commenters dismissed using parking space percentages, which assume time-limited use of designated slots, as an inappropriate model for MDE scoping for facilities providing medical services

[216] *See* U.S. Access Board, Access Board Review of MDE Low Height and MSRP, (May 23, 2023), *https://www.regulations.gov/document/ATBCB-2023-0001-0002* (listing available exam table models that meet the height requirements of the MDE Standards, and their retail prices). Additionally, based on conversations with recipients, Federal partners, and advocacy organizations, and as supported in the comments received, accessible weight scales are more prevalent and affordable than accessible exam tables. On the affordability of accessible exam tables and weight scales compared to imaging equipment, *see* 82 FR 2810, 2829 (Jan. 9, 2017) (stating that commenters were concerned about immediate compliance with the MDE Standards for ''more expensive imaging equipment'' compared to other accessible MDE). *See also 2024 Mammography Price Guide,* Block Imaging, *https://www.blockimaging.com/bid/95356/digital-mammography-equipment-price-cost-info* (last visited Feb. 20, 2024).

[218] Section 4203 of the Affordable Care Act, 42 U.S.C. 18001 *et seq.,* amending the Rehabilitation Act to add section 510, 29 U.S.C. 794f.

[219] 82 FR 2810 (explaining that ''other agencies, referred to as enforcing authorities in the MDE Standards, may issue regulations or adopt policies that require health care providers subject to their jurisdiction to acquire accessible medical diagnostic equipment that complies with the MDE Standards'').

frequented by a growing population of patients with disabilities. Without a larger percentage or all equipment being accessible, they asserted that patients with disabilities will have fewer scheduling options than their nondisabled counterparts. Instead, some commenters suggested using standards now applied to transportation retrofits.

Many commenters felt that 10% and 20% were inadequate percentages for accessible MDE because of demographic trends and the belief that accessible MDE would be considerably more in demand than parking spaces, especially since nondisabled drivers often drive their relatives with disabilities to these facilities, while those who need accessible MDE can only utilize the accessible equipment. Those commenters either proposed higher percentage thresholds for compliance, such as 20% and 40%, or that facilities require all newly purchased and leased MDE to be accessible. Some commenters also noted that the cost difference between accessible and inaccessible scales is negligible, so thresholds for scales could be instituted in a shorter time frame. An individual with disabilities objected to having to wait two more years for accessible MDE after they already waited 50 years from the adoption of section 504 and warned that an additional two-year waiting period would put the health of some people with disabilities at risk and even result in untimely deaths. An independent Federal agency charged with advising the President, Congress, and other Federal agencies on policies, programs, practices, and procedures that affect people with disabilities also objected to the two-year implementation timeline, recommending instead one year for exam tables and 120 days for scales. A commenter from the health advocacy field noted the absence of timelines for accessible MDE beyond scales and medical exam tables and requested the Department set an outer limit for compliance with these provisions at two years.

While several disability commenters opposed varying percentage requirements for different covered entities because of the difficulties in identifying which specialties are most vital to people with disabilities, others supported higher requirements for facilities whose patient census includes large numbers of people with mobility disabilities.

Response: The Department appreciates the concerns of commenters seeking more stringent scoping and recognizes that the needs for accessible parking are not perfectly aligned with the needs underpinning accessible MDE. While parking spaces and MDE are not used in the exact same manner and may not be used with the same consistency, the limited use of MDE is analogous to the use of parking spaces at a rehabilitation facility because, as with parking spaces, multiple patients with mobility disabilities could use the same piece of MDE in a day. Additionally, the use of MDE is not analogous to the use of vehicles covered by transportation regulations, which address a transportation system, rather than the accessibility of individual units of equipment, as under this rule.[220] Weight scales and exam tables also typically cannot be retrofitted to be accessible with the same ease or cost ratio compared to acquiring accessible MDE. Inaccessible weight scales typically do not have large platforms that are required for wheelchair access. Inaccessible exam tables are usually fixed height ''box'' tables with static bases, and possibly drawers, that are not easily or cheaply replaced with adjustable mechanisms.[221]

Section 84.91 states that recipients may not exclude, deny benefits to, or otherwise discriminate against people with disabilities in programs or activities that use MDE. Additionally, § 84.93 requires that each program or activity that uses MDE be readily accessible to and usable by people with disabilities in its entirety independent of the scoping requirements for newly acquired MDE set forth in § 84.92. Acquiring additional accessible MDE is one method to ensure that recipients do not exclude, deny benefits to, or otherwise discriminate against people with disabilities in programs or activities that use MDE, but it is not the only method. If a recipient denies a physical exam to a patient with a disability before the recipient is required to have an accessible exam table, they may still violate the other provisions of section 504.

As noted above, the Department imposed specific requirements for exam tables and weight scales because of their ubiquity among primary care providers, their importance for basic diagnostic health services, and their relative attainability compared to more expensive accessible imaging equipment.[222] We did not propose a longer time period because the inability to receive even basic health care services because of inaccessible exam tables and weight scales results in negative health outcomes for people with disabilities. Additionally, we did not propose a shorter time period because we recognize that some recipients, especially small recipients with fewer resources, will need sufficient time to budget for and acquire accessible exam tables and weight scales.

Recipients that provide services that rely on other MDE are still required to provide those services to patients with disabilities, but section 504 will not require those recipients to acquire other accessible MDE (unless the requirements for all newly purchased, leased, or otherwise acquired MDE set forth in § 84.92(a) apply) if they are able to make their programs and activities accessible through other means.

In view of demands on recipients, particularly small practices and rural facilities, the Department will not require all newly acquired MDE, beyond the requirements set forth in § 84.92, to be accessible at this time or shorten the two-year implementation timeline. The utility of additional pieces of accessible MDE may be limited, given that multiple patients with mobility disabilities can use the same accessible MDE. Additionally, many recipients are small entities that only use a small amount of MDE. This means that regardless of whether the scoping requirement is 10%, 20%, or even 40%, many recipients would only be required to acquire one piece of accessible MDE.[223]

While the Department will not increase the scoping requirements of proposed § 84.92, recipients may determine that the most effective method to comply with the program access obligation set forth in § 84.93 will be to acquire additional accessible MDE beyond that required by § 84.92. In addition, the nondiscrimination provisions in §§ 84.68(a) and 84.91 continue to apply.

Comment: A few commenters suggested different scoping

requirements to reflect the omission of higher weight patients from the Standards for Accessible MDE by adding higher capacity equipment.

Response: The Department is not in a position to use scoping to address omissions from the MDE Standards developed by the Access Board as a part of this final rule.[224] However, these comments will be noted and relayed to the Access Board.

Comment: Some commenters asked whether MDE or medical treatment equipment used in home settings is covered under this rulemaking. Some commenters made the assumption that such equipment was covered. Although some commenters supported such application as urgently needed, others cautioned that it could add unforeseen burden to recipients or even impede access to home-based care.

Response: The obligations set forth in this rule apply to ''program[s] or activit[ies] offered through or with the use of MDE,'' and are subject to the limitations set forth in the rule, including the undue burden limitation. Whether recipients would need to ensure that MDE used in the provision of health care programs or activities in home settings complied with the MDE Standards would depend on the particular factual circumstances. Regarding the comments about the application of this rule to medical treatment equipment, while the Department inquired about application of these standards to non-diagnostic equipment as a part of MDE Question 14 for future consideration, the MDE Standards are not being applied to non-diagnostic equipment at this time. Any extension of the MDE Standards or new standards will result from the work of and future standards set by the Access Board, and the Department will relay this information to the Access Board for future consideration.

Comment: Many comments on the Department's proposed dispersion requirements to give larger covered entities flexibility in how they comply with subpart J requirements at § 84.92(b)(3) stated that it is not logistically feasible to share MDE across medical departments. Many disability advocates and public health groups expressed concern that the proposed rule would lead to incomplete or partial accessibility. Without additional safeguards, these groups worry there would be scheduling and logistical issues for providers and patients alike, leading to untimely access to necessary care, and commenters suggested additional statutory requirements or IT infrastructure would be needed to coordinate availability of accessible MDE. Some groups noted that some MDE isn't sufficiently portable to support the flexible compliance scheme the Department envisioned, particularly if equipment is being shared beyond one floor, building, or campus. A State cautioned that the experience of trying to serve at-risk populations with scarce resources during COVID–19 could prove instructive in anticipating the challenges medical facilities would have providing accessible MDE to considerable numbers of people with mobility disabilities. Further, commenters stressed that strategies to achieve compliance that rely on patients travelling between remote campuses are infeasible for the many people with mobility disabilities who may lack ready access to transportation. Alternatively, some provider groups expressed appreciation for a flexible approach to problem-solving and meeting patients' needs.

Response: The Department appreciates the comments on its proposed dispersion requirements. This provision does not require exact mathematical proportionality, which at times would be impossible. The Department agrees that there may be situations where a recipient with multiple departments, clinics, or specialties will not be able to simply disperse its accessible MDE proportionally across all departments, clinics, or specialties. If a recipient requires a patient with a disability who requires accessible MDE to use the MDE of another department, the recipient must ensure that the accessible MDE is readily accessible to and usable by the patient. Factors to consider in determining whether this standard has been met may include, among other things, whether the MDE is readily available and not a significant distance from where the patient is seeking care; whether changing locations during the patient visit significantly increases wait times; whether the patient is required to be undressed or partially dressed to use the MDE (if, for example, the patient has to go to a different part of the same building to use the accessible MDE); and whether the recipient provides assistance moving between locations. This means that some of the situations commenters described, including going to a separate campus or building to use a recipient's accessible MDE, could result in the recipient's program or activity not being readily accessible to and usable by patients with disabilities as required by § 84.93(a). Recipients must ensure that the dispersal of their accessible MDE does not discriminate against people with disabilities.

The Department also recognizes there may be situations where small recipients with a limited number of departments, clinics, or specialties in the same building may have one piece of accessible MDE that is shared among all departments, clinics, or specialties in a manner that provides access for all patients with disabilities who require access to the accessible MDE. The Department recommends as a best practice that where a recipient in a large facility with many departments, clinics, or specialties uses MDE, recipients have at least one piece of accessible MDE in each department, clinic, or specialty to limit instances where patients with disabilities must traverse between departments, clinics, or specialties for care.

Comment: The Department received many comments with suggestions for alternative requirements or methods for the placement of accessible MDE. Many disability and public health group commenters supported the alternative of requiring at least one exam table and scale per department, as a minimum, utilizing dispersion only as an interim measure. One commenter requested further clarity on how rules would apply to facilities with multiple non-adjacent campuses. Other disability organizations suggested requiring facilities to provide accessible transportation between facilities at no cost to the patient if necessary to secure timely access to MDE, or providing access to MDE via home visits. Similarly, one public health foundation expressed concern the NPRM did not recognize the burden imposed on people with disabilities of having to travel further or wait longer to access MDE. By contrast, many provider groups expressed concern about the cost and burden of more prescriptive approaches including one exam table and scale for each component of a medical facility.

Response: As noted in the Department's response above, recipients are encouraged to obtain at least one piece of accessible MDE for each department that uses that MDE. However, due to the varying sizes,

[224] The Rehabilitation Act, as amended by the ACA, directed the Access Board to promulgate technical standards for accessible MDE. 29 U.S.C. 794f. The Access Board's MDE Standards are not binding unless they are adopted by an enforcement agency such as HHS or DOJ. HHS is one of the 12 Federal agencies that are on the Access Board. The Access Board is the agency that can update its standards and HHS, as a member of the Board, participates in issuing updates to those standards. While HHS or another enforcement agency can establish scoping requirements if they adopt the Access Board's standards, neither HHS nor any other Federal agency can amend the Access Board's standards on its own.

patient populations, and circumstances of different recipients, the Department recognizes that recipients in large facilities with multiple departments will not necessarily have to obtain at least one piece of accessible MDE for each of its departments.

Situations where a recipient has multiple campuses and requires a patient who requires accessible MDE to go to different campuses for services from the same department due to the distribution of accessible MDE may constitute violations of § 84.92(b)(3) if the recipient's MDE is not readily accessible to or usable by persons with disabilities. In such situations, however, the recipient may be able to take other measures to ensure that its programs and activities are readily accessible to and usable by the patient. For example, it could offer home visits that provide equal access to care or accessible transportation to the patient with a disability at no cost to them within a reasonable time frame.

Comment: The Department received several comments urging the Department to amend this rule to reflect the Access Board NPRM proposing to revise the Accessible MDE standards by replacing the current 17 to 19 inch low transfer height range with a low transfer height of 17 inches.[225] The Access Board issued this NPRM to revise the height consistent with the findings of recent NIDILRR-funded research that the 17-inch low transfer height better reflects the needs of wheelchair users for safe transfers to examination tables.[226]

Response: The Access Board issued an NPRM that proposed to remove the sunset provision allowing for a 17 to 19 inch low transfer surface height and replace it with a 17-inch low transfer height requirement in May of 2023. As of the drafting of this final rule, the Access Board has not yet finalized the 17-inch low transfer height. As noted in the NPRM, the Department will consider issuing supplemental rulemaking updating the low transfer height requirement once the Access Board's NPRM on transfer height is finalized.

Under this rule, recipients acquiring accessible examination tables have the option acquiring examination tables that lower to between 17 to 19 inches.

As a reminder, under § 84.93(a) recipients are required to operate their programs and activities that use MDE so that they are accessible to people with disabilities, regardless of whether their exam tables lower to 17 or 19 inches.

Comment: A commenter encouraged the Department to work with the Access Board and DOJ on guidance and to consider the General Services Administration's framework for implementing the technology accessibility standards under section 508 of the Rehabilitation Act.

Response: The Department appreciates the recommendation and is committed to creating guidance documents and other technical assistance and providing education to assist recipients with understanding and meeting their obligations, in addition to guidance documents on the MDE Standards that already exist.[227]

Summary of Regulatory Changes

Based on comments we received concerning methods for acquiring accessible MDE, discussed below in the comments and responses concerning § 84.93, we are modifying § 84.92(a) to explicitly recognize that lease renewals, in addition to the purchase, lease, or other acquisition, of MDE, will trigger the requirements of § 84.92(a). The Department's intent was always that lease renewals fall under the umbrella of new purchases, leases, or other methods for acquiring MDE under § 84.92(a), but we recognize that some readers may be confused if lease renewals are not specifically mentioned.

Existing Medical Diagnostic Equipment (§ 84.93)

We proposed in § 84.93 to include clarifications regarding requirements for existing MDE. We proposed in § 84.93(a) to clarify that the program or activity in its entirety must be accessible, which does not necessarily require a recipient to make each of its pieces of MDE accessible, nor does it require a recipient to take an action that would result in a fundamental alteration in the nature of a program or activity, or in undue financial and administrative burdens.

In § 84.93(a)(3) of this final rule, we are correcting a typographical error in the NPRM. Section 84.93(a)(3) of the final rule will state that a recipient meets its burden of proving that compliance with § 84.93(a) would result in a fundamental alteration under § 84.93(a)(2) if it demonstrates that compliance with § 84.93(a) would alter diagnostically required structural or operational characteristics of the equipment and prevent the use of the equipment for its intended diagnostic purpose. The NPRM mistakenly referred to § 84.92(a) and (c) rather than § 84.93(a).

We proposed in § 84.93(b) to state that recipients could comply with this section through other methods beyond the acquisition of accessible MDE where other methods are effective in achieving accessibility of the program or activity. We invited comment on the following questions:

- *MDE Question 10: The Department seeks information about other methods that recipients can use to make their programs and activities readily accessible to and usable by individuals with disabilities in lieu of purchasing, leasing, or otherwise acquiring accessible MDE.*
- *MDE Question 11: The Department seeks information regarding recipients' leasing practices, including how many and what types of recipients use leasing, rather than purchasing, to acquire MDE; when recipients lease equipment; whether leasing is limited to certain types of equipment (e.g., costlier & more technologically complex types of equipment); and the typical length of recipients' MDE lease agreements.*
- *MDE Question 12: The Department seeks information regarding whether there is a price differential for MDE lease agreements for accessible equipment.*
- *MDE Question 13: The Department seeks information regarding any methods that recipients use to acquire MDE other than purchasing or leasing.*
- *MDE Question 14: If this rule were to apply to medical equipment that is not used for diagnostic purposes,*

o *Should the technical standards set forth in the Standards for Accessible Medical Diagnostic Equipment be applied to non-diagnostic medical equipment, and if so, in what situations should those technical standards apply to non-diagnostic medical equipment? Are there particular types of non-diagnostic medical equipment that should or should not be covered?*

The comments and our responses to proposed § 84.93 are set forth below.

Comment: The Department received comments on leasing arrangements and alternatives from disability, public health, and provider groups and State and local jurisdictions. One public health entity advised the Department to conduct a comprehensive survey to better understand leasing practices and their utilization in diagnostic health care delivery. This commenter

[225] 88 FR 33056 (May 23, 2023).

[226] *See, e.g.,* Clive D'Souza, University of Pittsburgh Dep't of Rehabilitation Science and Technology, Analysis of Low Wheelchair Seat Heights and Transfer surfaces for Medical Diagnostic Equipment Final Report (Jan. 2022), *https://www.access-board.gov/research/human/wheelchair-seat-height/.*

[227] *See e.g.,* ADA Nat'l Network, Accessible Medical Diagnostic Equipment, *https://adata.org/factsheet/accessible-medical-diagnostic-equipment* (last visited Dec. 11, 2023).

mentioned that in addition to leasing new equipment, some entities will lease or purchase refurbished units. Other health care providers may receive MDE through donations, long-term borrowing, or pooling and sharing arrangements. One commenter said that about 70% of medical equipment is leased, typically on three to five year contracts but often with early opt-out provisions, and that leases may qualify for tax benefits like IRS section 179. Disability and caregiving commenters specifically warned that lease renewals may be used by recipients to circumvent compliance and urged the Department to revise regulatory language to clarify that lease renewals are considered ''new'' leases. Another disability advocacy organization noted trade-ins and rentals as other possible alternatives to leases.

Response: The Department appreciates these responses. The Department agrees that recipients may not rely on the renewal of leases for existing MDE as a method to avoid acquiring accessible MDE for a prolonged period of time. Accordingly, the Department has edited the regulatory text at § 84.92(a) to clarify that lease renewals will also trigger the requirement to acquire accessible MDE. The intent of the rulemaking was always to require recipients to acquire accessible MDE when a recipient's lease of inaccessible MDE will expire at a set point in the future, when a piece of MDE reaches the end of its useful life and the recipient replaces it, or when a recipient decides to acquire a new piece of MDE for any of a myriad of reasons. Failing to explicitly state that lease renewals are included under § 84.92(a) may suggest that they are not covered and incentivize recipients to renew leases on inaccessible MDE for greater periods than they would have otherwise, extending the period where patients with disabilities do not have access to accessible MDE. Additionally, the Department notes that other arrangements, such as purchasing refurbished units or acquiring MDE through donations, long term borrowing, pooling, or sharing agreements will not exempt recipients from the obligations of § 84.92. Accordingly, the Department clarifies that lease renewals, purchasing refurbished MDE, acquiring MDE through donations, long term borrowing, pooling, and sharing agreements are all considered new purchases, leases, or other acquisitions of MDE under § 84.92 and its scoping standards. Additionally, the Department considers trade-in, rental, and other methods of acquisition of MDE as methods to ''otherwise acquire MDE'' already covered under § 84.92. The intent of this rulemaking is not to provide for loopholes where a recipient, regardless of fundamental alteration or undue burden, can avoid acquiring accessible MDE for long periods of time and avoid providing access to people with disabilities.

Comment: The Department received many comments from diverse stakeholders on whether the Access Board's MDE Standards should be applied to medical equipment beyond MDE. While most commenters supported applying the MDE Standards to non-diagnostic equipment, especially equipment used for therapeutic or treatment purposes, some commenters urged the Department not to do so without further input from interested parties. Disability stakeholders strongly supported these applications and several encouraged the Department to approve standards for a range of medical equipment used primarily for treatment. However, those commenters also stated that the Department lacks technical expertise to impose such standards unilaterally on a broad range of equipment. They therefore suggested the Department coordinate with the Access Board, while also extending new standards to account for blind individuals, people with sensory disabilities, higher weight people, and people with intellectual disabilities. Other commenters advocated for the Department to set standards for equipment used in the home and for telehealth.

Response: The Department agrees that any extension of the MDE standards to non-diagnostic equipment, or any new standards for medical equipment meant to account for additional disabilities, should come with additional input from the Access Board. The Department has been in frequent contact with the Access Board about this rulemaking and the MDE Standards, and would rely heavily on the Access Board's extensive knowledge and technical acumen before altering the MDE Standards or creating new standards. The Department also notes that proposed subpart I covers accessible web content and mobile apps, including telehealth platforms, and requires that recipients conform to the success criteria of WCAG 2.1 AA.

Comment: An association representing dental support organizations asked the Department whether dentists could continue to treat patients who prefer to be treated in their wheelchairs after the effective date of the final rule. This association also raised the issue of the accessibility of exam chairs in instances where plumbing is attached to the chairs in ways that prevent compliance with the standards.

Response: This rule establishes accessibility requirements that recipients that use MDE must comply with. It does not require patients to receive medical services while using accessible MDE if the recipient can provide the benefits of the recipient's programs or activities that the patient requires without the need for the patient to transfer to the accessible MDE, and if the patient prefers not to transfer to the accessible MDE.

In instances where a recipient has decided to use inaccessible exam chairs with plumbing built into the chair, whether replacing one or more of such inaccessible MDE with accessible MDE would constitute an undue burden or fundamental alteration would depend entirely on the individual circumstances of the recipient.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, in § 84.93(a)(3), we are replacing the reference to § 84.92(a) and (c) with a reference to § 84.93(a), and we are finalizing the remainder of § 84.93 as proposed with no other modifications.

Qualified Staff (§ 84.94)

Proposed § 84.94 required that a recipient ensure its staff is able to successfully operate accessible MDE, assist with transfers and positioning of individuals with disabilities, and carry out program access obligations for existing MDE. We invited comment on the following questions:

- *MDE Question 15: The Department seeks general comments on this proposal, including any specific information on the effectiveness of programs used by recipients in the past to ensure that their staff is qualified and any information on the costs associated with such programs.*
- *MDE Question 16: The Department seeks public comment on whether there are any barriers to complying with this proposed requirement, and if so, how they may be addressed.*

The comments and our responses to proposed § 84.94 are set forth below.

Comment: The Department received comments on how to ensure staff are qualified and properly trained from diverse stakeholders. Disability commenters overwhelmingly supported mandatory trainings of recipients on the safe use of accessible MDE, accompanied by modules covering effective communication and person-centered care, developed in consultation with disability rights organizations and advocates with lived experience with

refresher trainings at regular intervals. Commenters asserted that the costs of these trainings would be modest, especially when compared with the costs of worker or patient injury resulting from untrained staff. One commenter asserted that proposed § 84.94, as drafted in the NPRM, was insufficient to ensure recipients train and retrain qualified staff to operate accessible MDE and assist with necessary transfers and positioning to meet recipient program access obligations and safely serve clients. Many commenters agreed that health care providers must be trained on accessible MDE and given guidance on cultural competency in interactions with patients with disabilities, and urged the Department to provide more support and training for recipients.

Finally, some disability commenters, citing personal or aggregated accounts of hospitals asking relatives or companions to lift and transfer patients, requested that we clarify that it is hospital staff, not the patient or their relatives' responsibility, to do lifting and transferring necessary to utilize MDE.

Response: The Department appreciates the comments on qualified staff. As the NPRM notes, often the most effective way for recipients to ensure that their staff are able to successfully operate accessible MDE is to provide staff training on the use of MDE. While it may be in the best interest of recipients to provide training, both for the safety of the patient and the safety of the employee, the Department wishes to provide recipients with flexibility in how they ensure qualified staff. Appropriate training curricula and regimens for a small single-physician providers may differ from those required for large hospital systems.

Although specific trainings are not required, it is worth noting that medical practices and facilities seeking technical assistance on these and other health care accessibility requirements can reference previously issued joint guidance from the Department and the Department of Justice, titled ''Access to Medical Care for Individuals with Mobility Disabilities.'' [228] The Department will consider updating this guidance for consistency with this rulemaking.

Finally, the Department clarifies that, as noted in the NPRM, barring an applicable limitation or defense, a recipient cannot require a patient with a disability to bring someone along with them to help during an exam. A patient may choose to bring another person such as a friend, family member, or personal care aide to an appointment, but regardless, the recipient may need to provide reasonable assistance to enable the patient to receive medical care. Such assistance may include helping a person who uses a wheelchair to transfer from their wheelchair to the exam table or diagnostic chair.[229] The recipient cannot require the person accompanying the patient to assist. We also remind recipients that the provision in the ACA that required the development of these MDE accessibility standards was designed to ''allow independent entry to, use of, and exit from the equipment by such individuals to the maximum extent possible.'' [230]

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.94 as proposed with no modifications.

Subpart K—Procedures

Subpart K contains the procedures for enforcement of this rule.

Procedures (§ 84.98)

Proposed § 84.98, stated that the procedural provisions applicable to title VI of the Civil Rights Act of 1964 apply to the part. Those procedures are found in 45 CFR 80.6 through 80.10 and 45 CFR part 81.

The comments and our responses regarding § 84.98 are set forth below.

Comment: Many commenters expressed concerns about what they viewed as a lack of enforcement procedures in the rule, noting that without ''teeth,'' the regulation is not useful and will have no effect. One commenter urged that the rule contain a means of enforcement other than through filing a lawsuit.

Response: The Department appreciates commenters' concerns about what they believe to be a lack of enforcement procedures in the rule. As noted above, § 84.98 incorporates the compliance procedures of title VI of the Civil Rights Act of 1964 which prohibits discrimination on the basis of race, color, and national origin in federally funded programs. Many other civil rights regulations that apply to recipients of Federal financial assistance similarly incorporate title VI procedures.

The incorporated regulations mandate that the Department conduct proactive periodic compliance reviews without the need for a complaint and also that it investigate complaints filed with it. Any person who believes themselves or any specific class of individuals to have been subjected to discrimination may file a written complaint within 180 days from the alleged discrimination, unless the time is extended by the Department. The Department is required to make a prompt investigation whenever a compliance review, complaint, or other information coming to its attention indicates a possible failure to comply with this part. If compliance cannot be achieved through voluntary means, the regulations provide procedures for termination of Federal financial assistance following an administrative hearing. The Department may also refer the matter to DOJ to secure compliance through any other means authorized by law. These administrative procedures allow individuals to have their complaints investigated without having to file lawsuits.

Complaints may be filed through the OCR Complaint Portal at *ocrportal.hhs.gov/ocr/smartscreen/main.jsf.* The Department also accepts complaints by email at *OCRcomplaint@hhs.gov* and by mail at Centralized Case Management Operations, U.S. Department of Health and Human Services, 200 Independence Ave. SW, Room 509F, Washington, DC 20201.You can call OCR's toll-free number at (800) 368–1019 or (800) 537–7697 (TDD) to speak with someone who can answer your questions and guide you through the process.

Comment: Observing the urgent need for enforcement, multiple commenters, including several disability rights organizations, recommended that we put in place procedures for oversight, monitoring, and enforcement of the regulation. Others said that there must be prioritization and strengthening of enforcement mechanisms. Several commenters stated that compliance is complaint driven and they cautioned against reliance on complaints alone to enforce the regulations. They noted the difficulty of expecting individuals to file complaints during a very stressful time.

Many commenters expressed concerns that the Department does not have enough investigators for all the complaints. They felt that complaints were being ''pushed aside'' because of other priorities. Several commenters said that OCR needs to be adequately funded and staffed to fully implement and enforce the regulations. One commenter suggested that there be a separate division within the Department dedicated to investigating complaints.

[228] U.S. Dep't of Health & Human Servs., U.S. Dep't of Justice, *Access to Medical Care for Individuals with Mobility Disabilities* (July 2010), *https://www.hhs.gov/sites/default/files/ocr/civilrights/understanding/disability/adamobilityimpairmentsgudiance.pdf.*

[229] *See id.*

[230] 29 U.S.C. 794f.

Response: We appreciate commenters' concerns and recognize the need for strong enforcement mechanisms. As noted above, the Department can initiate proactive compliance reviews on any matter that comes to their attention without the need for a complaint to be filed. The Department has a robust program of performing proactive agency-initiated compliance and an enforcement division dedicated to compliance reviews and complaint investigations with regional offices around the county. We will continue to efficiently address complaints and conduct compliance reviews consistent with the finite resources that we have available.

Comment: We received many comments urging that the complaint process be reformed and streamlined. Several commenters highlighted the need for transparency about the complaint investigation process. A few commenters recommended that individuals should have more than 180 days to file complaints, there should be shorter time frames for responding by the Department, and barriers to accessing the complaint form should be eliminated. Many commenters suggested that resources, including legal assistance, be made available to help individuals in filing complaints. Noting that the Department encourages the use of the on-line complaint form, many commenters expressed concerns about the burden that this places on individuals who may have difficulty using a computer and filling out forms on-line. They said that the technical process should not create a hardship when an individual is already under emotional and mental stress because of perceived discrimination.

A number of commenters urged the Department to reduce the burden of filing complaints and to improve communication with individuals with disabilities during the filing process. Others said that we should provide specific guidance on how individuals and organizations can file complaints, how we will investigate them, and how they will be resolved. One commenter recommended that the regulations permit individuals to file complaints even if they haven't personally experienced discrimination.

Response: We thank the commenters for their suggestions to improve the complaint process. We understand that the complaint procedure can be challenging, and we are always striving to simplify the process and to make it as transparent as possible. Staff are available to assist in the process; however, we cannot provide legal assistance to individuals filing complaints. The OCR website contains information about the process of filing a complaint and what to expect when a complaint is filed. In response to the comment about extending the 180-day time frame for filing complaints, we note that under the existing regulations the Department has discretion to extend the 180-day requirement. In addition, the existing regulations make it clear that anyone can file a complaint of discrimination.

Comment: Many disability rights organizations and others urged the Department to use a cooperative rather than a punitive approach. They emphasized the need for the Department to work collaboratively with recipients to develop corrective action plans. Several asked that we provide recipients with resources and support to help them comply with the law. One commenter suggested that the Department focus on systemic practices while State and local recipients handle individual complaints. Noting that self-policing is a powerful way to promote enforcement, the commenter recommended that large recipients be required to institute internal complaint systems. Several commenters suggested that recipients designate someone to be responsible for ensuring enforcement of the regulation, accepting complaints, and answering questions.

Response: We appreciate commenters' concerns and remain firmly committed to using a cooperative approach. Throughout the investigative process, OCR provides technical assistance and works closely with recipients to help them comply with the law. The vast majority of OCR's complaints are resolved in this cooperative manner and often result in Voluntary Resolution Agreements. The Department's current section 504 regulation at § 84.61 adopts the procedural provisions of title VI of the Civil Rights Act of 1964 for its section 504 regulation. The title VI regulation provides the legal framework for the Department's investigative process, including the obligation to attempt to resolve matters voluntarily and to assist recipients with compliance. 45 CFR 80.6(a); 80.7(d)(1); 80.8(a).

The existing regulations require that recipients designate an individual responsible for ensuring compliance and instituting a grievance procedure. Section 84.7(a) in the existing section 504 rule, which is retained in this final rule, requires recipients with 15 or more employees to designate an employee to coordinate efforts to comply with the part. Section 84.7(b) requires those recipients to adopt grievance procedures that provide for prompt and equitable resolution of complaints.

With regard to the suggestion that the Department only handle statewide cases while State and local recipients handle individual matters, we note that the only agency with authority to enforce section 504 and to investigate section 504 complaints against its recipients is the Department. However, an effective grievance procedure can allow internal resolution of complaints, potentially reducing the number of formal complaints filed with the Department.

Comment: Multiple commenters, including several disability rights organizations, emphasized the urgent need for training and educational materials on the provisions in the rule. Many requested technical assistance and guidance documents to help them understand the requirements. Others asked for financial resources to help them comply.

Response: We appreciate commenters' concerns and understand the importance of providing technical assistance and guidance to support compliance with this rule, and we will continue our practice of providing educational materials, guidance, and technical assistance documents on our website. Commenters' requests for providing increased training on the rule will be taken into consideration. The Department cannot provide financial assistance to recipients to ensure compliance with the part.

Data Collection

Comment: A multitude of commenters, including many disability rights organizations, urged the Department to collect disability data. They recommended a provision in the rule requiring recipients to gather disability data that would allow for equal inclusion of people with disabilities in equity and quality analyses and would contain information as to whether and how individuals received modifications. Others said that there is a need for systematic, accurate, timely, and comprehensive collection, analysis, and public reporting of disability data for demographic purposes.

Response: Section 80.6(b) of the title VI regulations, incorporated into this rule by § 84.98, requires recipients to keep compliance records that must be submitted to the Department as requested including data showing the extent to which individuals with disabilities are beneficiaries of and participants in federally assisted programs. That section permits the Department to obtain any data it needs to determine compliance with this rule

as it performs complaint investigations and compliance reviews. However, obtaining data in this manner is done on a case-by-case basis as needed. There is no requirement that every recipient maintain and submit data to the Department.

We agree that there needs to be better standards and practices in collecting data as this can have a positive impact in reducing disparities. Developing a civil rights data collection scheme can help to ensure that any civil rights data collection yields accurate data that mitigates potential negative impacts and that adequately protects the privacy of individuals. The Department is actively engaged with other agencies within the Department and throughout the Federal Government related to responsible data collection and recognizes the importance of data collection to meet its mission. The value of any data collection requirement will be significantly hampered by misalignment with the data needs of other agencies. For these reasons, the Department has decided to forgo the imposition of a data collection requirement in this rulemaking. We will continue to work with recipients and beneficiaries, and will consider whether an additional data collection requirement is needed in a future rulemaking.

Summary of Regulatory Changes

For the reasons set forth above and considering the comments received, we are finalizing § 84.98 as proposed without modification.

Section 504 Federally Conducted Rule

This rule covers federally assisted programs. In the preamble to the proposed rule, we stated that since section 504 also covers programs and activities conducted by the Department, the Department intends to publish a separate rulemaking to update its federally conducted regulation enacted in 1998 (45 CFR part 85).

Comments: Many commenters, including several disability rights organizations, applauded the Department for issuing the federally assisted regulation, noting that the robust improvements in the proposed rule are welcome and critically important. However, they expressed disappointment that a federally conducted NPRM was not issued at the same time as the federally assisted NPRM. They said that this delay represents a striking omission, and they strongly urged the Department to accelerate publication of the rulemaking so that the essential updates to the section 504 federally assisted regulations can be applied to the Department itself which has a wide range of programs under its purview. Another commenter noted the importance of supporting individuals with disabilities within the Federal Government to ensure equal and full participation in the Federal workforce.

Response: The Department appreciates the comments received. We understand the importance of issuing a section 504 federally conducted rule, and we intend to do so soon. We note that the current section 504 federally conducted regulation remains in effect.[231]

IV. Executive Order 12866 and Related Executive Orders on Regulatory Review

A. Regulatory Impact Analysis Summary

a. Statement of Need

The Department is revising its existing section 504 regulation prohibiting discrimination on the basis of disability in programs and activities receiving Federal financial assistance from the Department. More than 40 years have passed since the Department originally issued regulations implementing section 504, with only limited changes in the decades since. During that time, major legislative and judicial developments have shifted the legal landscape of disability discrimination protections under section 504, including statutory amendments to the Rehabilitation Act, the enactment of the ADA and the ADAAA, the ACA, and Supreme Court and other significant court cases. HHS's section 504 regulation needed to be updated to reflect these developments in the law.

b. Overall Impact

We have examined the impacts of the final rule under Executive Order (E.O.) 12866, as amended by E.O. 14094; E.O. 13563; the Small Business Regulatory Enforcement Fairness Act (also known as the Congressional Review Act, 5 U.S.C. 801 *et seq.*); the Regulatory Flexibility Act (5 U.S.C. 601–612); and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4). E.O. 12866 and E.O. 13563 direct us to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). This final rule is a significant regulatory action under section 3(f)(1) of E.O. 12866, as amended by E.O. 14094.

The Regulatory Flexibility Act requires us to analyze regulatory options that would minimize any significant impact of a rule on small entities. Because the costs of the final rule are small relative to the revenue of recipients, including covered small entities, and because even the smallest affected entities would be unlikely to face a significant impact, we certify that the final rule will not have a significant economic impact on a substantial number of small entities.[232]

The Unfunded Mandates Reform Act of 1995 (section 202(a)) generally requires the Department to prepare a written statement, which includes an assessment of anticipated costs and benefits, before proposing ''any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any one year.'' This final rule is not subject to the Unfunded Mandates Reform Act because it falls under an exception for regulations that establish or enforce any statutory rights that prohibit discrimination on the basis of race, color, religion, sex, national origin, age, handicap, or disability.[233]

The Congressional Review Act (CRA) defines a ''major rule'' as ''any rule that the Administrator of the Office of Information and Regulatory Affairs (OIRA) of the Office of Management and Budget finds has resulted in or is likely to result in—(A) ''an annual effect on the economy of $100,000,000 or more''; (B) ''a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions''; or (C) ''significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic and export markets.'' 5 U.S.C. 804(2). OMB's Office of Information and Regulatory Affairs has determined that this final rule does meet the criteria set forth in 5 U.S.C. 804(2). The Department will comply with the CRA's requirements to inform Congress.

The Background and Overview sections at the beginning of this preamble contain a summary of this final rule and describe the reasons it is needed.

[231] 45 CFR part 85.

[232] *See* discussion in section ''Regulatory Flexibility Act—Small Entity Analysis'' below.

[233] 2 U.S.C. 1503(2).

Below is a summary of the results and methodology from our Regulatory Impact Analysis (RIA). A complete version of this RIA will be available at *https://www.hhs.gov/sites/default/files/sec-504-ria-final-rule-2024.PDF.*

c. Summary of Costs and Benefits

Section 504 has applied to medical care providers that receive Federal financial assistance from the Department for approximately fifty years. The Department issued regulatory language detailing specific requirements for health care providers in 1977.[234] The health care sector in the United States is quite broad, encompassing about 490,000 providers of ambulatory health care services and 3,044 hospitals. It includes 168,459 offices of physicians; 124,384 offices of dentists; 141,853 offices of other health care practitioners; 7,192 medical and diagnostic laboratories; 24,619 home health care service providers; and 19,625 outpatient care centers. Most of these entities receive Federal financial assistance. For example, the Department estimates that approximately 92% of doctors, 43% of dentists, and all hospitals receive Federal financial assistance from the Department and are thus subject to section 504. The Department's section 504 rule applies to this universe of recipients, updating the Department's original regulation and adding new provisions in several areas. This section 504 rule does not apply to health care programs and activities conducted by the Department. Those programs and activities are covered by part 85 of section 504, which covers federally conducted (as opposed to federally assisted) programs or activities.[235] While a majority of the estimated costs associated with this rule concern health care providers, the rule covers all recipients of HHS funding.

The RIA considers the various sections and quantifies several categories of costs that we anticipate recipients may incur. The RIA quantifies benefits people with disabilities are expected to receive due to higher percentages of accessible Medical Diagnostic Equipment (yielding improved health outcomes) at recipients' locations and discusses unquantified significant benefits and costs the final rule is expected to generate that could not be quantified or monetized (due to lack of data or for other methodological reasons). The RIA also quantifies benefits that will result from accessible web content and mobile applications while addressing unquantified benefits the final rule is expected to accrue.

Table 1 below summarizes RIA results with respect to the likely incremental monetized benefits and costs, on an annualized basis. All monetized benefits and costs were estimated using discount rates of 7 and 3 percent. The Final RIA results differ from Preliminary RIA results because some subpart I costs and benefits, which are based on the DOJ web accessibility RIA,[236] have been recalculated to account for changes DOJ has made to its web accessibility RIA. Final RIA results also differ from Preliminary RIA results because the Final RIA results are expressed in 2022 dollars, while the Preliminary RIA results are expressed in 2021 dollars.

TABLE 1—ANNUALIZED VALUE OF MONETIZED BENEFITS AND COSTS UNDER THE FINAL RULE, IN 2022 DOLLARS

[Annualized value of monetized costs and benefits under the final rule]

[In 2022 dollars]

	7-Percent discount rate (in millions)	3-Percent discount rate (in millions)
Monetized Incremental Costs		
Subpart I—Web, Mobile, and Kiosk Accessibility	934.7	916.9
Subpart J—Accessible Medical Equipment	377.4	371.6
§ 84.56—Medical Treatment	14.0	13.6
§ 84.57—Value Assessment Methods	0.1	0.1
§ 84.60—Child Welfare	0.1	0.1
Total Monetized Incremental Costs *	1,326.1	1,302.1
Monetized Incremental Benefits		
Subpart I—Web, Mobile, and Kiosk Accessibility	1,265.6	1,311.8
Subpart J—Accessible Medical Equipment	145.5	145.5
Total Monetized Incremental Benefits *	1,411.1	1,457.3

(* **Note:** Totals may not sum due to rounding. The effects of this rule overlap with the effects of DOJ's final rule under title II of the ADA (89 FR 31320, April 24, 2024); see Summary Table C in the Regulatory Impact Analysis (RIA), which is also reproduced below, for quantified overlapping costs and benefits.)

[234] For example, all recipients have been required to construct new facilities and alter existing facilities in an accessible manner, make changes to ensure program accessibility, provide alternate means of communication for persons who are blind, deaf, have low vision, or are hard of hearing (*e.g.,* sign language interpreters, materials in Braille or on tape), and prohibited from denying or limiting access to their health care programs or from otherwise discriminating against qualified persons with a disability in their health care programs or activities.

[236] U.S. Dep't of Justice, Title II Web and Mobile App Access FRIA 04–08–2024, *https://www.ada.gov/assets/pdfs/web-fria.pdf.*

SUMMARY TABLE C—ANNUALIZED VALUE OF MONETIZED BASE COSTS AND BENEFITS EXCLUDING THOSE ASSOCIATED WITH RECIPIENTS THAT ARE PUBLIC ENTITIES COVERED BY DOJ TITLE II WEB ACCESSIBILITY FINAL RULE (89 FR 31320, APRIL 24, 2024) IN 2022 DOLLARS

[Millions]

Subpart I costs and benefits	Costs, 7% discount rate	Costs, 3% discount rate	Benefits, 7% discount rate	Benefits 3% discount rate
(1) All recipients	934.7	916.9	1,265.6	1,311.8
(2) Excluding recipients that are also public entities under title II	384.9	393.2	77.4	84.0

Quantified incremental costs concerning accessible medical equipment under subpart J come from updating policies and procedures, acquiring accessible medical diagnostic equipment (MDE), and ensuring staff are qualified to successfully operate accessible MDE. Quantified incremental costs concerning web, mobile, and kiosk accessibility under subpart I come from reviewing and updating existing web content and mobile apps while ensuring ongoing conformance with listed standards for web content and mobile apps.

Additional costs for provisions under § 84.56, Medical treatment, § 84.57, Value assessment methods, and § 84.60, Child welfare, are calculated based on limited revisions to policies and procedures and training for employees on provisions that largely restate existing obligations and explicitly apply them to specific areas of health and human services. The RIA requested comment on more extensive transition and ongoing costs, but did not receive comments on those costs.

Concerning the provisions to ensure consistency with the ADA, statutory amendments to the Rehabilitation Act, and Supreme Court and other significant court cases, the Department believes that these provisions will likely result in no additional costs to recipients.

Regarding costs that can be monetized, the RIA finds that the final rule would result in annualized costs of $1,302.1 million or $1,326.1 million ($778.4 million or $776.4 million, if limited to costs that do not overlap with DOJ's final web accessibility rule under title II of the ADA), corresponding to a 3% or a 7% discount rate. We separately report a full range of cost estimates of about $1,047.5 million to $1,765.6 million at a 3% discount rate, and a full range of cost estimates of about $1,072.9 million to $1,798.8 million at a 7% discount rate.

For quantified benefits, the RIA quantifies the benefits that people with disabilities are expected to receive due to higher percentages of accessible Medical Diagnostic Equipment (yielding improved health outcomes) at recipients' locations and more accessible web content, mobile apps, and kiosks.

Benefits from web, mobile, and kiosk accessibility and accessible school courses come from time savings and better education outcomes for both people with disabilities and people without disabilities. We conclude that the final rule yields subpart I benefits of $1,311.8 million/year at a 3% discount rate or $1,265.6 million/year at a 7% discount rate ($84.0 million or $77.4 million, if limited to benefits that do not overlap with DOJ's web accessibility final rule).

Subpart J benefits are benefits people with disabilities are expected to receive thanks to higher percentages of accessible MDE yielding improved health outcomes at recipients' locations. We conclude that the final rule yields $145.5 million/year in cancer-associated benefits. We separately report a range of quantifiable cancer-associated benefit estimates of $97.0 million to $193.9 million per year.

Total quantified benefits from subparts I and J provisions are thus estimated to exceed corresponding costs. Total annualized benefits are estimated to be $1,457.3 million at a 3% discount rate and $1,411.1 million at a 7% discount rate ($229.4 million or $222.8 million, if limited to benefits that do not overlap with DOJ's web accessibility final rule).

In addition to these quantified benefit estimates, the RIA includes discussions of potential unquantified benefits under the rule. Generally, the RIA anticipates that the final rule will result in myriad benefits for individuals with disabilities as a result of greater access to necessary health and human service programs and activities as well as limitations to discriminatory actions. Analogously, some costs have been quantified, while for others, the RIA requested comment that would facilitate more thorough estimation, and we received no additional information.

The RIA discusses both quantitatively and qualitatively the regulatory alternatives the Department considered in an attempt to achieve the same statutory and regulatory goals while imposing lower costs on society.

Regulatory Flexibility Act—Small Entity Analysis

The Department examined the economic implications of this final rule as required by the Regulatory Flexibility Act. This analysis, as well as other sections in the Regulatory Impact Analysis, serves as the Regulatory Flexibility Analysis, as required under the Regulatory Flexibility Act.

The Department deems that a rule has a significant economic impact on a substantial number of small entities whenever the rule generates incremental cost representing more than 3% of revenue for 5% or more of small recipients.[237]

The U.S. Small Business Administration (SBA) maintains a Table of Small Business Size Standards Matched to North American Industry Classification System Codes (NAICS).[238] Because the RIA uses 2019 counts of firms, for consistency, we have used SBA yearly revenues thresholds for 2019, which for recipients ranged

[237] HHS uses as its measure of significant economic impact on a substantial number of small entities a change in revenues of more than 3% for 5% or more of affected small entities.'' 81 FR 31463 (May 18, 2016). *See also* 87 FR 47906 (Aug. 4, 2022) (''The Department generally considers a rule to have a significant impact on a substantial number of small entities if it has at least a 3% impact on revenue on at least 5% of small entities'').

[238] The most current version became effective on October 1, 2022. *See* U.S. Small Bus. Admin., Table of Size Standards, (last updated Oct. 1, 2022), *https://www.sba.gov/document/support-table-size-standards.* In our analyses, which pertain to 2019, we used the version effective in the 2019 calendar year. We note that CEs' distribution by SBA size—namely, the fraction of CEs that are small by SBA standards—did not change in any meaningful way in the past decades.

between $8 million [239] and $41.5 million.[240]

As reported in the RIA, 97.4% of all firms in the Health Care and Social Assistance sector (NAICS 62) are small. With the exception of Hospitals (Subsector 622), at least 9 out 10 of all recipients within each Health Care and Social Assistance NAICS code are small.

Most firms—98.3%—in the Pharmacies and Drug Stores (NAICS 446110) group are small as well. About 60% of Direct Health and Medical Insurance Carriers (NAICS 524114) are small. About 60% of Colleges, Universities, and Professional Schools (NAICS 611310) are small. Hence, almost all non-government recipients (*i.e.,* private firms) under the scope of the final rule are small businesses. Moreover, the fraction of total small firms in each NAICS code that falls in the smallest size group (fewer than 5 employees) is greater than 5% for all relevant NAICS codes. Because most non-government recipients under the scope of the final rule are small businesses, it is sufficient to investigate the impact of the final rule on the average recipient in the smallest size group to determine whether the final rule may generate a change in revenues of more than 3%. We need to determine whether the average firm in the smallest size group will incur incremental cost greater than 3%.

Below we discuss the two reasons for our conclusion that firms in the smallest groups will not experience a 3% reduction in revenues. Hence, we certify that the final rule will not have a significant economic impact on a substantial number of small entities.

As for the first reason, we note that, with the exception of a handful of HMO Medical Centers (NAICS 621491) and about 24,500 Child Day Care Services (NAICS 624410) firms, the yearly average revenue (in 2022 dollars) for a recipient belonging to the smallest size group—for each 6-digit NAICS code considered separately—is $190,000 or more. Three percent of this sum is about $5,700 (2022 dollars), which, based on our review of data on prices for MDE as well as incremental costs for ensuring qualified staff, we deem is an amount sufficient to finance purchase of the limited set of inexpensive MDE the smallest entities typically need as well as to ensure qualified staff.

Considering the smallest recipient groups among each of the 6-digit NAICS groups that private recipients belong to, the typical yearly average revenue is about $354,000. That represents the median of the average revenues across all relevant 6-digit NAICS codes. Podiatrists' offices' average yearly revenue is at the median, but general hospitals have the highest average yearly revenue among the relevant NAICS codes at $20 million, and Child Day Care Services have the lowest average yearly revenue among the relevant NAICS codes at $116,000. Thus, in many cases the 3% revenue threshold is about $10,000. Costs of the final rule are mostly proportional to the size of the recipient, and typical recipients in the smallest size group (fewer than 5 employees) are not expected to incur $10,000 incremental costs.[241]

In addition, we estimate that the obligation to ensure that web content and mobile applications for the Department's recipients that are small providers (those with fewer than fifteen employees) will be less than 3% of their revenues. We note that the vast majority of the Department's recipients are small providers and estimate that most of these small providers (approximately 85.9%) have websites. The websites of these small providers are typically one domain with up to a few thousand pages and limited visitors per month. Thus, the Department estimates that for a cost of approximately $440 per year small recipients will be able to ensure that their websites can be made accessible and kept accessible each year.

Comment: Some commenters expressed concern that the requirements of subpart I would lead to significant costs for recipients. One commenter in particular stated that it reviewed the price estimates of a firm that offers services to make web content ''ADA compliant'' and believed that the costs for reviewing existing web content for compliance and remediating web content for compliance could be more than $23,500 with additional monthly expenses.[242]

Response: In the RIA, the Department sampled several software companies' price lists for products and services designed to make websites accessible in order to estimate average compliance costs for recipients of various sizes. Based on that sampling, the Department estimates the average annual compliance costs for the 113,295 larger recipients to be $2,500 per year. Using that same methodology, the Department estimates the annual compliance costs for the 339,789 smaller recipients (comprising offices of physicians, dentists, and other health practitioners) will be much lower given that the smaller entities' websites are expected to be less complex and include fewer pages. The Department's RIA estimates that the 85.9% of these smaller entities that have websites will spend an average of $440/year to ensure their pages are accessible. While there will be instances where a recipient incurs costs above the Department's estimated annual costs, those will likely be incurred by large recipients, such as hospitals with multiple locations, that use web content and mobile apps extensively and already devote significant resources to creating and maintaining web content and mobile apps. In rare instances where a small recipient has a significant online presence that would require a large percentage of its resources to review and remediate, the recipient may argue that full compliance with subpart I would amount to an undue burden under § 84.88.

We stress that the final rule includes exceptions meant to ease the burden on small firms and does not require entities to take any action that would result in a fundamental alteration in the nature of a program or activity or cause the entities to incur undue financial and administrative burdens.

Executive Order 13132: Federalism

As required by E.O. 13132 on Federalism, the Department has examined the effects of provisions in the final regulation on the relationship between the Federal Government and the States. The Department has concluded that the final regulation has federalism implications but notes that State law will continue to govern unless displaced under standard principles of preemption.

[239] The $8 million yearly 2019 revenue threshold applies to several NAICS, including 621340, Offices of Physical, Occupational and Speech Therapists and Audiologists, and 624410, Child Day Care Services. These $8 million yearly 2019 revenue thresholds have been increased for three NAICS: 621340, Offices of Physical, Occupational and Speech Therapists and Audiologists (to $11 million); 621399, Offices of All Other Miscellaneous Health Practitioners (to $9 million) and 624410, Child Day Care Services (to 8.5 million).

[240] The $41.5 million yearly 2019 revenue threshold applies to Hospitals (NAICS 622), Direct Health and Medical Insurance Carriers (NAICS 524114) and Kidney Dialysis Centers (NAICS 621492). These thresholds have not changed in SBA's October 1, 2022, update. The $41.5 million yearly revenue threshold remains the highest value for recipients considered in our analyses.

[241] See full Regulatory Impact Analysis for tables and calculations.

[242] *See* Skynet Technologies, *How much does it cost to make a website ADA compliant? What are the factors that impact the cost?, https://www.skynettechnologies.com/blog/cost-to-make-website-ada-compliant* (last visited Dec. 15, 2023).

The regulation attempts to balance State autonomy with the necessity to create a Federal benchmark that will provide a uniform level of nondiscrimination protection across the country. It is recognized that the States generally have laws that relate to nondiscrimination against individuals on a variety of bases. Such State laws continue to be enforceable, unless they prevent application of the final rule. The rule explicitly provides that it is not to be construed to supersede State or local laws that provide additional protections against discrimination on any basis articulated under the regulation. Provisions of State law relating to nondiscrimination that are ''more stringent'' than the Federal regulatory requirements or implementation specifications will continue to be enforceable. Section 3(b) of E.O. 13132 recognizes that national action limiting the policymaking discretion of States will be imposed only where there is constitutional and statutory authority for the action and the national activity is appropriate considering the presence of a problem of national significance. Discrimination issues in relation to health care are of national concern by virtue of the scope of interstate health commerce.

Section 4(a) of E.O. 13132 expressly contemplates preemption when there is a conflict between exercising State and Federal authority under a Federal statute. Section 4(b) of the Executive order authorizes preemption of State law in the Federal rulemaking context when ''the exercise of State authority directly conflicts with the exercise of Federal authority under the Federal statute.'' The approach in this regulation is consistent with these standards in the Executive order in superseding State authority only when such authority is inconsistent with standards established pursuant to the grant of Federal authority under the statute.

We received comments, including from States, that the Department did not consult with States in violation of E.O. 13132, particularly with respect to the integration provision's prohibition of failure to provide community-based services that results in serious risk of institutionalization. As explained above in the preamble discussion of the integration provision at § 84.76, application of the integration mandate's protection to individuals ''at serious risk of institutionalization'' in the absence of community-based services is a well-established principle adopted by six circuits following *Olmstead,* beginning in 2003 with the decision in *Fisher* v. *Oklahoma Health Care Authority.*[243] Given that this rule creates no new obligations to State and local governments, all of which have the existing responsibilities clarified in this rule under section 504 and analogous regulatory provisions in title II, this rule does not impose any new preemption of State law. Moreover, although the proposed rule addresses circumstances not previously covered specifically in the existing rule, those provisions also do not create new obligations for State and local governments, or other recipients of Federal financial assistance, but instead explicate longstanding requirements in the existing section 504 regulations that prohibit recipients from providing services to qualified persons with disabilities in a manner that does not provide equal opportunities for such persons to gain the same benefits. In addition, a number of State and local governments and State agencies participated in the process by submitting comments in response to NPRM.

Section 6(b) of E.O. 13132 includes some qualitative discussion of substantial direct compliance costs that State and local governments would incur as a result of a final regulation. We have considered the cost burden that this rule imposes on State and local government recipients and estimate State and local government annualized costs will be about $563.6 million per year (2022 dollars) at a 3% discount rate and $589.8 million at a 7% discount rate.

These costs represent the sum of costs for compliance with all provisions applying to State and local governments, namely those for subpart I (about 40% of costs for all recipients, *i.e.,* public and private entities altogether), subpart J (about 10% of costs for all recipients), § 84.56—Medical treatment (about 10% of costs for all recipients), 100% of costs for § 84.57—Value assessment methods (only public entities—Medicaid agencies—bear these costs), and § 84.60—Child welfare (about 4% of costs of all recipients).

In addition, the Department is aware that DOJ published the final Regulatory Impact Analysis [244] to accompany its rule finalizing requirements for public entities covered by title II of the ADA and that its requirements are consistent with this Department's subpart I.[245] DOJ examined the costs of its proposal for all public entities covered by title II and stated that the rule will not be unduly burdensome or costly for public entities. Because this Department's rule is consistent with the DOJ final rule (89 FR 31320, April 24, 2024), we believe that the DOJ analysis provides further support for our belief that subpart I will not be unduly burdensome or costly for the Department's recipients that are public entities.

Paperwork Reduction Act

This final rule contains information collection requirements that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (PRA).[246] Under the PRA, agencies are required to submit to OMB for review and approval any reporting or record-keeping requirements inherent in a proposed or final rule and are required to publish such proposed requirements for public comment. In order to evaluate whether an information collection should be approved by OMB, the PRA requires that the Department solicits comment on the following issues:

1. Whether the information collection is necessary and useful to carry out the proper functions of the agency;

2. The accuracy of the agency's estimate of the information collection burden;

3. The quality, utility, and clarity of the information to be collected; and

4. Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.[247]

The PRA requires consideration of the time, effort, and financial resources necessary to meet the information collection requirements referenced in this section. The Department previously published a notice of a proposed data collection on September 14, 2023, at 88 FR 63392–6351, as part of an NPRM entitled ''Discrimination on the Basis of Disability in Health and Human Service Programs or Activities'' (RIN 0945–AA15), to invite public comment. OCR solicited comment on the issues listed above and estimated the annual burden of the information collection request (ICR) to be 256,763 hours. The new information collection is evaluated under OMB Control Number 0945–0013.

OCR did not receive comments related to the previous notice.

The notice requirement outlined in § 84.8 implicates the third-party disclosure provisions of the PRA implementing regulations, which compels an agency to request comment

[243] 335 F.3d 175 (10th Cir. 2003).

[244] U.S. Dep't of Justice, Title II Web and Mobile App Access FRIA 04–08–2024, *https://www.ada.gov/assets/pdfs/web-fria.pdf.*

[246] 44 U.S.C. 3501–3520.

[247] 44 U.S.C. 3506(c)(2)(A).

and submit for OMB review any agency regulation that requires an individual ''to obtain or compile information for the purpose of disclosure to members of the public or the public at large, through posting, notification, labeling or similar disclosure. . . .''

Table 6 of the Regulatory Impact Analysis reports that there are about 453,084 recipients covered by this rulemaking. We estimate the burden for responding to the § 84.8 notice requirement assuming a single response per recipient, and that administrative or clerical support personnel will spend 34 minutes (0.5667 of an hour) to respond. The estimated total number of hours to respond is 256,763 (0.5667 × 453,084).

Unfunded Mandates Reform Act

Section 4(2) of the Unfunded Mandates Reform Act of 1995 (UMRA), 2 U.S.C. 1503(2), excludes from coverage under that Act any proposed or final Federal regulation that ''establishes or enforces any statutory rights that prohibit discrimination on the basis of race, color, religion, sex, national origin, age, handicap, or disability.'' Accordingly, this rulemaking is not subject to the provisions of the UMRA.

The Department received comment from some State officials arguing that the integration provision in § 84.76 Integration is subject to the UMRA. For the reasons discussed in the preamble for § 84.76, the Department declines this interpretation and restates that the rule in its entirety is exempted from the UMRA as a rule that enforces nondiscrimination on the basis of disability.

National Technology Transfer and Advancement Act of 1995

The National Technology Transfer and Advancement Act of 1995 (NTTAA) directs that, as a general matter, all Federal agencies and departments shall use technical standards that are developed or adopted by voluntary consensus standards bodies, which are private, generally nonprofit organizations that develop technical standards or specifications using well-defined procedures that require openness, balanced participation among affected interests and groups, fairness and due process, and an opportunity for appeal, as a means to carry out policy objectives or activities.[248]

The Department sought public comment in the NPRM on the accessibility standards for accessible medical diagnostic equipment and whether there are any other standards for accessible medical diagnostic equipment that the Department should consider. We received no significant public comment in response to our question requesting suggestions of alternative standards to apply to MDE. We also sought comment on the selection of WCAG 2.1 AA to coordinate the implementation and enforcement by Executive agencies of section 504 of the Rehabilitation Act of 1973, as amended (29 U.S.C. 794). Executive Order 12250 at section 1–2(c), 45 FR 72995 (Nov. 2, 1980). E.O. 12250 does not apply to the 504 provisions relating to equal employment, which are reviewed and coordinated by the Equal Employment Opportunity Commission.[249] The Attorney General has delegated the E.O. 12250 functions to the Assistant Attorney General for the Civil Rights Division for purposes of reviewing and approving proposed and final rules.[250]

The proposed rule was reviewed and approved by the Assistant Attorney General, and this final rule was also reviewed and approved by the Assistant Attorney General.

Incorporation by Reference

Through this rule, the Department is adopting the internationally recognized accessibility standard for web access, WCAG 2.1, published in June 2018, as the technical standard for web and mobile app accessibility under section 504. WCAG 2.1, published by W3C WAI, specifies success criteria and requirements that make web content more accessible to all users, including individuals with disabilities. The Department incorporates WCAG 2.1 by reference into this rule, instead of restating all of its requirements verbatim. To the extent there are distinctions between WCAG 2.1 and the standards articulated in part 84, the standards articulated in part 84 prevail.

The Department notes that when W3C publishes new versions of WCAG, those versions will not be automatically incorporated into this rule. Federal agencies do not incorporate by reference into published regulations future versions of standards developed by bodies like W3C. Federal agencies are required to identify the particular version of a standard incorporated by reference in a regulation.[251] When an updated version of a standard is published, an agency must revise its regulation if it seeks to incorporate any of the new material.

WCAG 2.1 Level AA is reasonably available to interested parties. Free copies of WCAG 2.1 Level AA are available online on W3C's website at *https://www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F.* In addition, a copy of WCAG 2.1 Level AA is also available for inspection by appointment at Office for Civil Rights, U.S. Department of Health and Human Services, 200 Independence Ave. SW, Room 509F, HHH Building, Washington, DC 20201.

List of Subjects in 45 CFR Part 84

Adoption and foster care, Civil rights, Childcare, Child welfare, Colleges and universities, Communications, Disabled, Discrimination, Emergency medical services, Equal access to justice, Federal financial assistance, Grant programs, Grant programs—health, Grant programs—social programs, Health, Health care, Health care access, Health facilities, Health programs and activities, Incorporation by reference, Individuals with disabilities, Integration, Long term care, Medical care, Medical equipment, Medical facilities, Nondiscrimination, Public health.

For the reasons set forth in the preamble, the Department of Health and Human Services amends 45 CFR part 84 as follows:

TITLE 45—Public Welfare

PART 84—NONDISCRIMINATION ON THE BASIS OF DISABILITY IN PROGRAMS OR ACTIVITIES RECEIVING FEDERAL FINANCIAL ASSISTANCE

■ 1. The authority citation for part 84 is revised to read as follows:

Authority: 29 U.S.C. 794.

Subpart G also issued under 21 U.S.C. 1174; 42 U.S.C. 4581.

■ 2. Revise the heading for part 84 to read as set forth above.

Subpart A—General Provisions

■ 3. Revise § 84.1 to read as follows:

§ 84.1 Purpose and broad coverage.

(a) *Purpose.* The purpose of this part is to implement section 504 of the Rehabilitation Act of 1973, as amended, which prohibits discrimination on the basis of disability in any program or activity receiving Federal financial assistance.

(b) *Broad coverage.* The definition of ''disability'' in this part shall be

[248] Public Law 104–113, section 12(d)(1) (15 U.S.C. 272 Note).

[249] *See* E.O. 12250 (DOJ Coordination authority) at 1–503 and E.O. 12067 (EEOC Coordination authority).

[250] 28 CFR 0.51.

[251] *See, e.g.,* 1 CFR 51.1(f) (''Incorporation by reference of a publication is limited to the edition of the publication that is approved [by the Office of the Federal Register]. Future amendments or revisions of the publication are not included.'').

construed broadly in favor of expansive coverage to the maximum extent permitted by the terms of section 504. The primary object of attention in cases brought under section 504 should be whether entities receiving Federal financial assistance have complied with their obligations and whether discrimination has occurred, not whether the individual meets the definition of ''disability.'' The question of whether an individual meets the definition of ''disability'' under this part should not demand extensive analysis.

■ 4. Revise § 84.2 to read as follows:

§ 84.2 Application.

(a) This part applies to each recipient of Federal financial assistance from the Department and to the recipient's programs or activities that involve individuals with disabilities in the United States. This part does not apply to the recipient's programs or activities outside the United States that do not involve individuals with disabilities in the United States.

(b) The requirements of this part do not apply to the ultimate beneficiaries of any program or activity operated by a recipient of Federal financial assistance.

(c) Any provision of this part held to be invalid or unenforceable by its terms, or as applied to any person or circumstance, shall be construed so as to continue to give maximum effect to the provision permitted by law, unless such holding shall be one of utter invalidity or unenforceability, in which event the provision shall be severable from this part and shall not affect the remainder thereof or the application of the provision to other persons not similarly situated or to other dissimilar circumstances.

§ 84.10 [Removed]

■ 5. Remove § 84.10.

§ 84.3 [Redesignated as § 84.10]

■ 6. Redesignate § 84.3 as § 84.10.

■ 7. Add new § 84.3 to read as follows:

§ 84.3 Relationship to other laws.

This part does not invalidate or limit the remedies, rights, and procedures of any other Federal laws, or State or local laws (including State common law) that provide greater or equal protection for the rights of individuals with disabilities, or individuals associated with them.

■ 8. Revise § 84.4 to read as follows:

§ 84.4 Disability.

(a) *Definition*—(1) *Disability.* *Disability* means, with respect to an individual:

(i) A physical or mental impairment that substantially limits one or more of the major life activities of such individual;

(ii) A record of such an impairment; or

(iii) Being regarded as having such an impairment as described in paragraph (f) of this section.

(2) *Rules of construction.* (i) The definition of ''disability'' shall be construed broadly in favor of expansive coverage, to the maximum extent permitted by the terms of section 504.

(ii) An individual may establish coverage under any one or more of the three prongs of the definition of ''disability'' in paragraph (a)(1) of this section, the ''actual disability'' prong in paragraph (a)(1)(i) of this section, the ''record of'' prong in paragraph (a)(1)(ii) of this section, or the ''regarded as'' prong in paragraph (a)(1)(iii) of this section.

(iii) Where an individual is not challenging a recipient's failure to provide reasonable modifications, it is generally unnecessary to proceed under the ''actual disability'' (paragraph (a)(1)(i) of this section) or ''record of'' (paragraph (a)(1)(ii) of this section) prongs, which require a showing of an impairment that substantially limits a major life activity or a record of such an impairment. In these cases, the evaluation of coverage can be made solely under the ''regarded as'' (this paragraph (a)(1)(iii)) prong of the definition of disability, which does not require a showing of an impairment that substantially limits a major life activity or a record of such an impairment. An individual may choose, however, to proceed under the ''actual disability'' or ''record of'' prong regardless of whether the individual is challenging a recipient's failure to provide reasonable modifications.

(b) *Physical or mental impairment*—(1)(i) *Physical or mental impairment* is defined as any physiological disorder or condition, cosmetic disfigurement, or anatomical loss affecting one or more body systems, such as: neurological, musculoskeletal, special sense organs, respiratory (including speech organs), cardiovascular, reproductive, digestive, genitourinary, immune, circulatory, hemic, lymphatic, skin, and endocrine; or

(ii) Any mental or psychological disorder such as intellectual disability, organic brain syndrome, mental health condition, and specific learning disability.

(2) *Physical or mental impairment* includes, but is not limited to, contagious and noncontagious diseases and conditions such as the following: orthopedic, visual, speech and hearing impairments, and cerebral palsy, epilepsy, muscular dystrophy, multiple sclerosis, cancer, heart disease, diabetes, intellectual disability, mental health condition, dyslexia and other specific learning disabilities, Attention Deficit Hyperactivity Disorder, Human Immunodeficiency Virus infection (whether symptomatic or asymptomatic), tuberculosis, substance use disorder, alcohol use disorder, and long COVID.

(3) *Physical or mental impairment* does not include homosexuality or bisexuality.

(c) *Major life activities*—(1) *Definition.* Major life activities include, but are not limited to:

(i) Caring for oneself, performing manual tasks, seeing, hearing, eating, sleeping, walking, standing, sitting, reaching, lifting, bending, speaking, breathing, learning, reading, concentrating, thinking, writing, communicating, interacting with others, and working; and

(ii) The operation of a major bodily function, such as the functions of the immune system, special sense organs and skin, normal cell growth, and digestive, genitourinary, bowel, bladder, neurological, brain, respiratory, circulatory, cardiovascular, endocrine, hemic, lymphatic, musculoskeletal, and reproductive systems. The operation of a major bodily function includes the operation of an individual organ within a body system.

(2) *Rules of construction.* (i) In determining whether an impairment substantially limits a major life activity, the term major shall not be interpreted strictly to create a demanding standard.

(ii) Whether an activity is a major life activity is not determined by reference to whether it is of central importance to daily life.

(d) *Substantially limits*—(1) *Rules of construction.* The following rules of construction apply when determining whether an impairment substantially limits an individual in a major life activity.

(i) The term ''substantially limits'' shall be construed broadly in favor of expansive coverage, to the maximum extent permitted by the terms of section 504. ''Substantially limits'' is not meant to be a demanding standard.

(ii) The primary object of attention in cases brought under section 504 should be whether recipients have complied with their obligations and whether discrimination has occurred, not the extent to which an individual's impairment substantially limits a major life activity. Accordingly, the threshold issue of whether an impairment

substantially limits a major life activity should not demand extensive analysis.

(iii) An impairment that substantially limits one major life activity does not need to limit other major life activities to be considered a substantially limiting impairment.

(iv) An impairment that is episodic or in remission is a disability if it would substantially limit a major life activity when active.

(v) An impairment is a disability within the meaning of this part if it substantially limits the ability of an individual to perform a major life activity as compared to most people in the general population. An impairment does not need to prevent, or significantly or severely restrict, the individual from performing a major life activity to be considered substantially limiting. Nonetheless, not every impairment will constitute a disability within the meaning of this section.

(vi) The determination of whether an impairment substantially limits a major life activity requires an individualized assessment. However, in making this assessment, the term ''substantially limits'' shall be interpreted and applied to require a degree of functional limitation that is lower than the standard for substantially limits applied prior to the ADA Amendments Act of 2008 (ADAAA).

(vii) The comparison of an individual's performance of a major life activity to the performance of the same major life activity by most people in the general population usually will not require scientific, medical, or statistical evidence. Nothing in this paragraph (d)(1) is intended, however, to prohibit or limit the presentation of scientific, medical, or statistical evidence in making such a comparison where appropriate.

(viii) The determination of whether an impairment substantially limits a major life activity shall be made without regard to the ameliorative effects of mitigating measures. However, the ameliorative effects of ordinary eyeglasses or contact lenses shall be considered in determining whether an impairment substantially limits a major life activity. Ordinary eyeglasses or contact lenses are lenses that are intended to fully correct visual acuity or to eliminate refractive error.

(ix) The six-month ''transitory'' part of the ''transitory and minor'' exception in paragraph (f)(2) of this section does not apply to the ''actual disability'' (paragraph (a)(1)(i) of this section) or ''record of'' (paragraph (a)(1)(ii) of this section) prongs of the definition of ''disability.'' The effects of an impairment lasting or expected to last less than six months can be substantially limiting within the meaning of this section for establishing an actual disability or a record of a disability.

(2) *Predictable assessments.* (i) The principles set forth in the rules of construction in this section are intended to provide for generous coverage and application of section 504's prohibition on discrimination through a framework that is predictable, consistent, and workable for all individuals and entities with rights and responsibilities under section 504.

(ii) Applying the principles in this section, the individualized assessment of some types of impairments as set forth in paragraph (d)(2)(iii) of this section will, in virtually all cases, result in a determination of coverage under paragraph (a)(1)(i) of this section (the ''actual disability'' prong) or paragraph (a)(1)(ii) of this section (the ''record of'' prong). Given their inherent nature, these types of impairments will, as a factual matter, virtually always be found to impose a substantial limitation on a major life activity. Therefore, with respect to these types of impairments, the necessary individualized assessment should be particularly simple and straightforward.

(iii) For example, applying the principles of this section it should easily be concluded that the types of impairments set forth in paragraphs (d)(2)(iii)(A) through (K) of this section will, at a minimum, substantially limit the major life activities indicated. The types of impairments described in this paragraph (d)(2) may substantially limit additional major life activities (including major bodily functions) not explicitly listed in paragraphs (d)(2)(iii)(A) through (K).

(A) Deafness substantially limits hearing;

(B) Blindness substantially limits seeing;

(C) Intellectual disability substantially limits brain function;

(D) Partially or completely missing limbs or mobility impairments requiring the use of a wheelchair substantially limit musculoskeletal function;

(E) Autism Spectrum Disorder substantially limits brain function;

(F) Cancer substantially limits normal cell growth;

(G) Cerebral palsy substantially limits brain function;

(H) Diabetes substantially limits endocrine function;

(I) Epilepsy, muscular dystrophy, and multiple sclerosis each substantially limits neurological function;

(J) Human Immunodeficiency Virus (HIV) infection substantially limits immune function; and

(K) Major depressive disorder, bipolar disorder, post-traumatic stress disorder, traumatic brain injury, obsessive compulsive disorder, and schizophrenia each substantially limits brain function.

(3) *Condition, manner, or duration.* (i) At all times taking into account the principles set forth in the rules of construction in this section, in determining whether an individual is substantially limited in a major life activity, it may be useful in appropriate cases to consider, as compared to most people in the general population, the conditions under which the individual performs the major life activity; the manner in which the individual performs the major life activity; or the duration of time it takes the individual to perform the major life activity, or for which the individual can perform the major life activity.

(ii) Consideration of facts such as condition, manner, or duration may include, among other things, consideration of the difficulty, effort or time required to perform a major life activity; pain experienced when performing a major life activity; the length of time a major life activity can be performed; or the way an impairment affects the operation of a major bodily function. In addition, the non-ameliorative effects of mitigating measures, such as negative side effects of medication or burdens associated with following a particular treatment regimen, may be considered when determining whether an individual's impairment substantially limits a major life activity.

(iii) In determining whether an individual has a disability under the ''actual disability'' (paragraph (a)(1)(i) of this section) or ''record of'' (paragraph (a)(1)(ii) of this section) prongs of the definition of ''disability,'' the focus is on how a major life activity is substantially limited, and not on what outcomes an individual can achieve. For example, someone with a learning disability may achieve a high level of academic success, but may nevertheless be substantially limited in one or more major life activities, including, but not limited to, reading, writing, speaking, or learning because of the additional time or effort he or she must spend to read, write, speak, or learn compared to most people in the general population.

(iv) Given the rules of construction set forth in this section, it may often be unnecessary to conduct an analysis involving most or all of the facts related to condition, manner, or duration. This is particularly true with respect to

impairments such as those described in paragraph (d)(2)(iii) of this section, which by their inherent nature should be easily found to impose a substantial limitation on a major life activity, and for which the individualized assessment should be particularly simple and straightforward.

(4) *Mitigating measures.* Mitigating measures include, but are not limited to:

(i) Medication, medical supplies, equipment, appliances, low-vision devices (defined as devices that magnify, enhance, or otherwise augment a visual image, but not including ordinary eyeglasses or contact lenses), prosthetics including limbs and devices, hearing aid(s) and cochlear implant(s) or other implantable hearing devices, mobility devices, and oxygen therapy equipment and supplies;

(ii) Use of assistive technology;

(iii) Reasonable modifications or auxiliary aids or services as defined in this part;

(iv) Learned behavioral or adaptive neurological modifications; or

(v) Psychotherapy, behavioral therapy, or physical therapy.

(e) *Has a record of such an impairment*—(1) *General.* An individual has a record of such an impairment if the individual has a history of, or has been misclassified as having, a mental or physical impairment that substantially limits one or more major life activities.

(2) *Broad construction.* Whether an individual has a record of an impairment that substantially limited a major life activity shall be construed broadly to the maximum extent permitted by section 504 and should not demand extensive analysis. An individual will be considered to fall within the prong in this paragraph (e) of the definition of ''disability'' if the individual has a history of an impairment that substantially limited one or more major life activities when compared to most people in the general population or was misclassified as having had such an impairment. In determining whether an impairment substantially limited a major life activity, the principles articulated in paragraph (d)(1) of this section apply.

(3) *Reasonable modification.* An individual with a record of a substantially limiting impairment may be entitled to a reasonable modification if needed and related to the past disability.

(f) *Is regarded as having such an impairment.* The following principles apply under the ''regarded'' as prong of the definition of ''disability'' in paragraph (a)(1)(iii) of this section:

(1) Except as set forth in paragraph (f)(2) of this section, an individual is ''regarded as having such an impairment'' if the individual is subjected to a prohibited action because of an actual or perceived physical or mental impairment, whether or not that impairment substantially limits, or is perceived to substantially limit, a major life activity, even if the recipient asserts, or may or does ultimately establish, a defense to the action prohibited by section 504.

(2) An individual is not ''regarded as having such an impairment'' if the recipient demonstrates that the impairment is, objectively, both ''transitory'' and ''minor.'' A recipient may not defeat ''regarded as'' coverage of an individual simply by demonstrating that it subjectively believed the impairment was transitory and minor; rather, the recipient must demonstrate that the impairment is (in the case of an actual impairment) or would be (in the case of a perceived impairment), objectively, both ''transitory'' and ''minor.'' For purposes of this section, ''transitory'' is defined as lasting or expected to last six months or less.

(3) Establishing that an individual is ''regarded as having such an impairment'' does not, by itself, establish liability. Liability is established under section 504 only when an individual proves that a recipient discriminated on the basis of disability within the meaning of section 504.

(g) *Exclusions.* The term ''disability'' does not include the terms set forth at 29 U.S.C. 705(20)(F).

§ 84.6 [Amended]

■ 9. Amend § 84.6 by:

■ a. Removing the word ''handicap'' and adding in its place the word ''disability'' in paragraphs (a)(1) and (2); and

■ b. Removing the words ''handicapped persons'' and adding in their place the words ''persons with disabilities'' wherever they occur in paragraphs (a)(3), (b), and (c).

■ 10. Revise § 84.8 to read as follows:

§ 84.8 Notice.

A recipient shall make available to employees, applicants, participants, beneficiaries, and other interested persons information regarding the provisions of this part and its applicability to the programs or activities of the recipient, and make such information available to them in such manner as the head of the recipient or their designee finds necessary to apprise such persons of the protections against discrimination assured them by section 504 and this part.

■ 11. Revise and republish newly redesignated § 84.10 to read as follows:

§ 84.10 Definitions.

As used in this part, the term:

2004 ADA Accessibility Guidelines (ADAAG) means the requirements set forth in appendices B and D to 36 CFR part 1191 (2009).

2010 Standards means the 2010 ADA Standards for Accessible Design, which consist of the 2004 ADAAG and the requirements contained in 28 CFR 35.151.

ADA means the Americans with Disabilities Act (Pub. L. 101–336, 104 Stat. 327, 42 U.S.C. 12101–12213 and 47 U.S.C. 225 and 611), including changes made by the ADA Amendments Act of 2008 (Pub. L. 110–325), which became effective on January 1, 2009.

Applicant means one who submits an application, request, or plan required to be approved by the designated Department official or by a primary recipient, as a condition of eligibility for Federal financial assistance.

Architectural Barriers Act means the Architectural Barriers Act (42 U.S.C. 4151–4157), including the Architectural Barriers Act Accessibility Standards at 41 CFR 102–76.60 through 102–76.95.

Archived web content means web content that—

(1) Was created before the date the recipient is required to comply with § 84.84, reproduces paper documents created before the date the recipient is required to comply with § 84.84, or reproduces the contents of other physical media created before the date the recipient is required to comply with § 84.84;

(2) Is retained exclusively for reference, research, or recordkeeping;

(3) Is not altered or updated after the date of archiving; and

(4) Is organized and stored in a dedicated area or areas clearly identified as being archived.

Auxiliary aids and services include:

(1) Qualified interpreters on-site or through video remote interpreting (VRI) services; notetakers; real-time computer-aided transcription services; written materials; exchange of written notes; telephone handset amplifiers; assistive listening devices; assistive listening systems; telephones compatible with hearing aids; closed caption decoders; open and closed captioning, including real-time captioning; voice, text, and video-based telecommunications products and systems, including text telephones (TTYs), videophones, and captioned telephones, or equally effective telecommunications devices;

videotext displays; accessible electronic and information technology; or other effective methods of making aurally delivered information available to individuals who are deaf or hard of hearing;

(2) Qualified readers; taped texts; audio recordings; Braille materials and displays; screen reader software; magnification software; optical readers; secondary auditory programs (SAP); large print materials; accessible electronic and information technology; or other effective methods of making visually delivered materials available to individuals who are blind or have low vision;

(3) Acquisition or modification of equipment or devices; and

(4) Other similar services and actions.

Companion means a family member, friend, or associate of an individual seeking access to a program or activity of a recipient, who, along with such individual, is an appropriate person with whom the recipient should communicate.

Conventional electronic documents means web content or content in mobile apps that is in the following electronic file formats: portable document formats (PDF), word processor file formats, presentation file formats, and spreadsheet file formats.

Current illegal use of drugs means illegal use of drugs that occurred recently enough to justify a reasonable belief that a person's drug use is current or that continuing use is a real and ongoing problem.

Department means the Department of Health and Human Services.

Direct threat means:

(1) Except as provided in paragraph (2) of this definition, a significant risk to the health or safety of others that cannot be eliminated by a modification of policies, practices, or procedures, or by the provision of auxiliary aids or services as provided in § 84.75.

(2) With respect to employment as provided in § 84.12, the term as defined by the Equal Employment Opportunity Commission's regulation implementing title I of the Americans with Disabilities Act of 1990, at 29 CFR 1630.2(r).

Director means the Director of the Office for Civil Rights.

Disability means:

(1) Except as provided in paragraph (2) of this definition, the definition of *disability* found at § 84.4.

(2) With respect to employment, the definition of *disability* found at 29 CFR 1630.2.

Drug means a controlled substance, as defined in schedules I through V of section 202 of the Controlled Substances Act (21 U.S.C. 812).

Existing facility means a facility in existence on any given date, without regard to whether the facility may also be considered newly constructed or altered under this part.

Facility means all or any portion of buildings, structures, sites, complexes, equipment, rolling stock or other conveyances, roads, walks, passageways, parking lots, or other real or personal property, including the site where the building, property, structure, or equipment is located.

Federal financial assistance means any grant, cooperative agreement, loan, contract (other than a direct Federal procurement contract or a contract of insurance or guaranty), subgrant, contract under a grant or any other arrangement by which the Department provides or otherwise makes available assistance in the form of:

(1) Funds;

(2) Services of Federal personnel;

(3) Real and personal property or any interest in or use of such property, including:

(i) Transfers or leases of such property for less than fair market value or for reduced consideration; and

(ii) Proceeds from a subsequent transfer or lease of such property if the Federal share of its fair market value is not returned to the Federal Government; and

(4) Any other thing of value by way of grant, loan, contract, or cooperative agreement.

Foster care means 24-hour substitute care for children placed away from their parents or guardians and for whom the State agency has placement and care responsibility. This includes, but is not limited to, placements in foster family homes, foster homes of relatives, group homes, emergency shelters, residential facilities, childcare institutions, and pre-adoptive homes. A child is in foster care in accordance with this definition regardless of whether the foster care facility is licensed and payments are made by the State or local agency for the care of the child, whether adoption subsidy payments are being made prior to the finalization of an adoption, or whether there is Federal matching of any payments that are made.

Illegal use of drugs means the use of one or more drugs, the possession or distribution of which is unlawful under the Controlled Substances Act (21 U.S.C. 812). The term illegal use of drugs does not include the use of a drug taken under supervision by a licensed health care professional, or other uses authorized by the Controlled Substances Act or other provisions of Federal law.

Individual with a disability means a person who has a disability. The term *individual with a disability* does not include an individual who is currently engaging in illegal use of drugs when a recipient acts on the basis of such use.

Kiosks means self-service transaction machines made available by recipients at set physical locations for the independent use of patients or program participants in health and human service programs or activities. They often consist of a screen and an input device—either a keyboard, touch screen, or similar device—onto which the program participant independently types in or otherwise enters information. In health and human service programs, recipients often make kiosks available so that patients or program participants can check in, provide information for the receipt of services, procure services, have their vital signs taken, or perform other similar actions.

Medical diagnostic equipment (MDE) means equipment used in, or in conjunction with, medical settings by health care providers for diagnostic purposes. MDE includes, for example, examination tables, examination chairs (including chairs used for eye examinations or procedures, and dental examinations or procedures), weight scales, mammography equipment, x-ray machines, and other radiological equipment commonly used for diagnostic purposes by health professionals.

Mobile applications (apps) means software applications that are downloaded and designed to run on mobile devices, such as smartphones and tablets.

Most integrated setting means a setting that provides individuals with disabilities the opportunity to interact with nondisabled persons to the fullest extent possible. These settings provide opportunities to live, work, and receive services in the greater community, like individuals without disabilities; are located in mainstream society; offer access to community activities and opportunities at times, frequencies and with persons of an individual's choosing; and afford individuals choice in their daily life activities.

Other power-driven mobility device means any mobility device powered by batteries, fuel, or other engines—whether or not designed primarily for use by individuals with mobility disabilities—that is used by individuals with mobility disabilities for the purpose of locomotion, including golf cars, electronic personal assistance mobility devices (EPAMDs), such as the Segway® PT, or any mobility device designed to operate in areas without defined pedestrian routes, but that is not

a wheelchair within the meaning of this section. This definition does not apply to Federal wilderness areas; wheelchairs in such areas are defined in section 508(c)(2) of the ADA, 42 U.S.C. 12207(c)(2).

Parents means biological or adoptive parents or legal guardians, as determined by applicable State law.

Program or activity means all of the operations of any entity described in paragraphs (1) through (4) of this definition, any part of which is extended Federal financial assistance:

(1)(i) A department, agency, special purpose district, or other instrumentality of a State or of a local government; or

(ii) The entity of such State or local government that distributes such assistance and each such department or agency (and each other State or local government entity) to which the assistance is extended, in the case of assistance to a State or local government;

(2)(i) A college, university, or other postsecondary institution, a public system of higher education; or

(ii) A local educational agency (as defined in 20 U.S.C. 7801), system of career and technical education, or other school system;

(3)(i) An entire corporation, partnership, or other private organization, or an entire sole proprietorship—

(A) If assistance is extended to such corporation, partnership, private organization, or sole proprietorship as a whole; or

(B) Which is principally engaged in the business of providing education, health care, housing, social services, or parks and recreation; or

(ii) The entire plant or other comparable, geographically separate facility to which Federal financial assistance is extended, in the case of any other corporation, partnership, private organization, or sole proprietorship; or

(4) Any other entity which is established by two or more of the entities described in paragraph (1), (2), or (3) of this definition.

Prospective parents means individuals who are seeking to become foster or adoptive parents.

Qualified individual with a disability means:

(1) Except as provided in paragraphs (2) through (4) of this definition, an individual with a disability who, with or without reasonable modifications to rules, policies, or practices, the removal of architectural, communication, or transportation barriers, or the provision of auxiliary aids and services, meets the essential eligibility requirements for the receipt of services or the participation in programs or activities provided by a recipient; and

(2) With respect to employment, an individual with a disability who meets the definition of ''qualified'' in the Equal Employment Opportunity Commission's regulation implementing title I of the Americans with Disabilities Act of 1990, 29 CFR 1630.2(m).

(3) With respect to childcare, preschool, elementary, secondary, or adult educational services, a person with a disability—

(i) Of an age during which nondisabled persons are provided such services;

(ii) Of any age during which it is mandatory under State law to provide such services to persons with a disability; or

(iii) To whom a State is required to provide a free appropriate public education under the Individuals with Disabilities Education Act; and

(4) With respect to postsecondary and career and technical education services, an individual with a disability who, with or without reasonable modifications to rules, policies, or practices, the removal of architectural, communication, or transportation barriers, or the provision of auxiliary aids and services, meets the essential eligibility requirements for the receipt of services or the participation in the recipient's program or activity.

Qualified interpreter means an interpreter who, via an on-site appearance or through a video remote interpreting (VRI) service, is able to interpret effectively, accurately, and impartially, both receptively and expressively, using any necessary specialized vocabulary. Qualified interpreters include, for example, sign language interpreters, oral transliterators, and cued-language transliterators.

Qualified reader means a person who is able to read effectively, accurately, and impartially using any necessary specialized vocabulary.

Recipient means any State or its political subdivision, any instrumentality of a State or its political subdivision, any public or private agency, institution, organization, or other entity, or any person to which Federal financial assistance is extended directly or through another recipient, including any successor, assignee, or transferee of a recipient, but excluding the ultimate beneficiary of the assistance.

Section 504 means section 504 of the Rehabilitation Act of 1973 (Pub. L. 93–112, 87 Stat. 394 (29 U.S.C. 794)), as amended.

Section 508 Standards means the standards for Information and Communications Technologies (ICT) promulgated at 36 CFR part 1194 by the U.S. Access Board per section 508 of the Rehabilitation Act (29 U.S.C. 794d as amended).

Service animal means any dog that is individually trained to do work or perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability. Other species of animals, whether wild or domestic, trained or untrained, are not service animals for the purposes of this definition. The work or tasks performed by a service animal must be directly related to the individual's disability. Examples of work or tasks include, but are not limited to, assisting individuals who are blind or have low vision with navigation and other tasks, alerting individuals who are deaf or hard of hearing to the presence of people or sounds, providing non-violent protection or rescue work, pulling a wheelchair, assisting an individual during a seizure, alerting individuals to the presence of allergens, retrieving items such as medicine or the telephone, providing physical support and assistance with balance and stability to individuals with mobility disabilities, and helping persons with mental and neurological disabilities by preventing or interrupting impulsive or harmful behaviors. The crime deterrent effects of an animal's presence and the provision of emotional support, well-being, comfort, or companionship do not constitute work or tasks for the purposes of this definition.

Standards for Accessible Medical Diagnostic Equipment (''Standards for Accessible MDE'') means the standards promulgated by the Architectural and Transportation Barriers Compliance Board (Access Board) under section 510 of the Rehabilitation Act of 1973, as amended, found at 36 CFR part 1195 (as of Jan. 9, 2017), with the exception of M301.2.2 and M302.2.2.

State includes, in addition to each of the several States of the United States, the District of Columbia, the Commonwealth of Puerto Rico, the United States Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands.

Ultimate beneficiary means one among a class of persons who are entitled to benefit from, or otherwise participate in, a program or activity receiving Federal financial assistance and to whom the protections of this part

extend. The ultimate beneficiary class may be the general public or some narrower group of persons.

User agent means any software that retrieves and presents web content for users.

Video remote interpreting (VRI) service means an interpreting service that uses video conference technology over dedicated lines or wireless technology offering high-speed, wide-bandwidth video connection that delivers high-quality video images as provided in § 84.77(d).

WCAG 2.1 means the Web Content Accessibility Guidelines (WCAG) 2.1, W3C Recommendation 05 June 2018, *https://www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F.* WCAG 2.1 is incorporated by reference elsewhere in this part (see §§ 84.84 and 84.86).

Web content means the information and sensory experience to be communicated to the user by means of a user agent, including code or markup that defines the content's structure, presentation, and interactions. Examples of web content include text, images, sounds, videos, controls, animations, and conventional electronic documents.

Wheelchair means a manually-operated or power-driven device designed primarily for use by an individual with a mobility disability for the main purpose of indoor, or of both indoor and outdoor locomotion. This definition does not apply to Federal wilderness areas; wheelchairs in such areas are defined in section 508(c)(2) of the ADA, 42 U.S.C. 12207(c)(2).

■ 12. Revise subpart B to read as follows:

Subpart B—Employment Practices

Sec.
84.16 Discrimination prohibited.
84.17–84.20 [Reserved]

Subpart B—Employment Practices

§ 84.16 Discrimination prohibited.

(a) No qualified individual with a disability shall, on the basis of disability, be subjected to discrimination in employment under any program or activity receiving Federal financial assistance from the Department.

(b) The standards used to determine whether paragraph (a) of this section has been violated shall be the standards applied under title I of the Americans with Disabilities Act of 1990 (ADA), 42 U.S.C. 12111 *et seq.,* and, as such sections relate to employment, the provisions of sections 501 through 504 and 511 of the ADA of 1990, as amended (codified at 42 U.S.C. 12201–12204, 12210), as implemented in the Equal Employment Opportunity Commission's regulation at 29 CFR part 1630.

§§ 84.17–84.20 [Reserved]

Subpart C—Program Accessibility

■ 13. Revise § 84.21 to read as follows:

§ 84.21 Discrimination prohibited.

Except as otherwise provided in § 84.22, no qualified individual with a disability shall, because a recipient's facilities are inaccessible to or unusable by individuals with disabilities, be excluded from participation in, or be denied the benefits of the programs or activities of a recipient, or be subjected to discrimination by any recipient.

■ 14. Amend § 84.22 by:
■ a. Revising paragraphs (a) and (b);
■ b. Removing the words ''handicapped person'' and adding in their place the words ''person with a disability'' wherever they occur in paragraph (c);
■ c. Removing the words ''handicapped persons'' and adding in their place the words ''persons with disabilities'' wherever they occur in paragraphs (e) introductory text, (e)(1), and (f); and
■ d. Adding paragraph (g).

The revisions and addition read as follows:

§ 84.22 Existing facilities.

(a) *General.* A recipient shall operate each program or activity so that the program or activity, when viewed in its entirety, is readily accessible to and usable by individuals with disabilities. This paragraph (a) does not—

(1) Necessarily require a recipient to make each of its existing facilities accessible to and usable by individuals with disabilities; or

(2) Require a recipient to take any action that it can demonstrate would result in a fundamental alteration in the nature of a program or activity or in undue financial and administrative burdens. In those circumstances where a recipient's personnel believe that the proposed action would fundamentally alter the program or activity or would result in undue financial and administrative burdens, the recipient has the burden of proving that compliance with this paragraph (a) would result in such an alteration or burdens. The decision that compliance would result in such alteration or burdens must be made by the head of the recipient or their designee after considering all the recipient's resources available for use in the funding and operation of the program or activity, and must be accompanied by a written statement of the reasons for reaching that conclusion. If an action would result in such an alteration or such burdens, the recipient shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient.

(b) *Methods.* A recipient may comply with the requirements of this section through such means as redesign or acquisition of equipment, reassignment of services to accessible buildings, assignment of aides to beneficiaries, home visits, delivery of services at alternate accessible sites, alteration of existing facilities and construction of new facilities, use of accessible rolling stock or other conveyances, or any other methods that result in making its programs or activities readily accessible to and usable by individuals with disabilities. A recipient is not required to make structural changes in existing facilities where other methods are effective in achieving compliance with this section. A recipient, in making alterations to existing buildings, shall meet the accessibility requirements of § 84.23. In choosing among available methods for meeting the requirements of this section, a recipient shall give priority to those methods that offer programs and activities to qualified individuals with disabilities in the most integrated setting appropriate.

* * * * *

(g) *Safe harbor.* Elements that have not been altered in existing facilities on or after July 8, 2024, and that comply with the corresponding technical and scoping specifications for those elements in the American National Standard Specification (ANSI) (ANSI A117.1–1961(R1971)) for facilities constructed between June 3, 1977, and January 18, 1991) or for those elements in the Uniform Federal Accessibility Standards (UFAS), appendix A to 41 CFR part 101–19, subpart 101–19.6 (revised as of July 1, 2002), for those facilities constructed between January 18, 1991, and July 8, 2024, are not required to be modified to comply with the requirements set forth in the 2010 Standards.

■ 15. Revise § 84.23 to read as follows:

§ 84.23 New construction and alterations.

(a) *Design and construction.* Each facility or part of a facility constructed by, on behalf of, or for the use of a recipient shall be designed and constructed in such manner that the facility or part of the facility is readily accessible to and usable by individuals

with disabilities, if the construction was commenced after June 3, 1977.

(b) *Alterations.* Each facility or part of a facility altered by, on behalf of, or for the use of a recipient in a manner that affects or could affect the usability of the facility or part of the facility shall, to the maximum extent feasible, be altered in such manner that the altered portion of the facility is readily accessible to and usable by individuals with disabilities, if the alteration was commenced after June 3, 1977.

(c) *Accessibility standards and compliance dates for recipients that are public entities.* (1) The accessibility standards and compliance dates in this paragraph (c) apply to recipients that are public entities. Public entities are any State or local government; any department, agency, special purpose district, or other instrumentality of a State or States or local government; and the National Railroad Passenger Corporation, and any commuter authority (as defined in section 103(8) of the Rail Passenger Service Act). (45 U.S.C. 541)

(2) If physical construction or alterations commenced after June 3, 1977, but before January 18, 1991, then construction and alterations subject to this section shall be deemed in compliance with this section if they meet the requirements of the ANSI Standards (ANSI A117.1–1961(R1971)) (ANSI). Departures from particular requirements of ANSI by the use of other methods are permitted when it is clearly evident that equivalent access to the facility or part of the facility is provided.

(3) If physical construction or alterations commence on or after January 18, 1991, but before July 8, 2024, then new construction and alterations subject to this section shall be deemed in compliance with this section if they meet the requirements of the Uniform Federal Accessibility Standards (UFAS), appendix A to 41 CFR part 101–19, subpart 101–19.6 (revised as of July 1, 2002). Departures from particular requirements of UFAS by the use of other methods shall be permitted when it is clearly evident that equivalent access to the facility or part of the facility is thereby provided.

(4) For physical construction or alterations that commence on or after July 8, 2024, but before May 9, 2025, then new construction and alterations subject to this section may comply with either UFAS or the 2010 Standards. Departures from particular requirements of either standard by the use of other methods shall be permitted when it is clearly evident that equivalent access to the facility or part of the facility is thereby provided.

(5) If physical construction or alterations commence on or after May 9, 2025, then new construction and alterations subject to this section shall comply with the 2010 Standards.

(6) For the purposes of this section, ceremonial groundbreaking or razing of structures prior to site preparation do not commence physical construction or alterations.

(d) *Accessibility standards and compliance dates for recipients that are private entities.* (1) The accessibility standards and compliance dates in this paragraph (d) apply to recipients that are private entities. Private entities are any person or entity other than a public entity.

(2) New construction and alterations subject to this section where the date when the last application for a building permit or permit extension is certified to be complete by a State, county, or local government or, in those jurisdictions where the government does not certify completion of applications, if the date when the last application for a building permit or permit extension is received by the State, county, or local government between June 3, 1977, and January 18, 1991, or if no permit is required, if the start of physical construction or alterations occurs between June 3, 1977, and January 18, 1991, shall be deemed in compliance with this section if they meet the requirements of ANSI. Departures from particular requirements of ANSI by the use of other methods are permitted when it is clearly evident that equivalent access to the facility or part of the facility is provided.

(3) New construction and alterations subject to this section shall comply with UFAS if the date when the last application for a building permit or permit extension is certified to be complete by a State, county, or local government (or, in those jurisdictions where the government does not certify completion of applications, if the date when the last application for a building permit or permit extension is received by the State, county, or local government) is on or after January 18, 1991, and before July 8, 2024, or if no permit is required, if the start of physical construction or alterations occurs on or after January 18, 1991, and before July 8, 2024. Departures from particular requirements of UFAS by the use of other methods are permitted when it is clearly evident that equivalent access to the facility or part of the facility is provided.

(4) New construction and alterations subject to this section shall comply either with UFAS or the 2010 Standards if the date when the last application for a building permit or permit extension is certified to be complete by a State, county, or local government (or, in those jurisdictions where the government does not certify completion of applications, if the date when the last application for a building permit or permit extension is received by the State, county, or local government) is on or after July 8, 2024, and before May 9, 2025, or if no permit is required, if the start of physical construction or alterations occurs on or after July 8, 2024, and before May 9, 2025. Departures from particular requirements of either standard by the use of other methods shall be permitted when it is clearly evident that equivalent access to the facility or part of the facility is thereby provided.

(5) New construction and alterations subject to this section shall comply with the 2010 Standards if the date when the last application for a building permit or permit extension is certified to be complete by a State, county, or local government (or, in those jurisdictions where the government does not certify completion of applications, if the date when the last application for a building permit or permit extension is received by the State, county, or local government) is on or after May 9, 2025, or if no permit is required, if the start of physical construction or alterations occurs on or after May 9, 2025.

(6) For the purposes of this section, ceremonial groundbreaking or razing of structures prior to site preparation do not commence physical construction or alterations.

(e) *Noncomplying new construction and alterations.* (1) Newly constructed or altered facilities or elements covered by paragraph (a) or (b) of this section that were constructed or altered between June 3, 1977, and January 18, 1991, and that do not comply with ANSI shall be made accessible in accordance with the 2010 Standards.

(2) Newly constructed or altered facilities or elements covered by paragraph (a) or (b) of this section that were constructed or altered on or after January 18, 1991, and before May 9, 2025, and that do not comply with UFAS shall before May 9, 2025, be made accessible in accordance with either UFAS or the 2010 Standards.

(3) Newly constructed or altered facilities or elements covered by paragraph (a) or (b) of this section that were constructed or altered before May 9, 2025, and that do not comply with ANSI (for facilities constructed or altered between June 3, 1977, and January 18, 1991) or UFAS (for facilities

constructed or altered on or after January 18, 1991) shall, on or after May 9, 2025, be made accessible in accordance with the 2010 Standards.

(f) *Public buildings or facilities requirements.* New construction and alterations of buildings or facilities undertaken in compliance with the 2010 Standards will comply with the scoping and technical requirements for a ''public building or facility'' regardless of whether the recipient is a public entity as defined in 28 CFR 35.104 or a private entity.

(g) *Compliance with the Architectural Barriers Act of 1968.* Nothing in this section relieves recipients whose facilities are covered by the Architectural Barriers Act, from their responsibility of complying with the requirements of the Architectural Barriers Act and its implementing regulations, 41 CFR 102–76.60 through 102–76.95 (General Services Administration); 39 CFR part 255 (U.S. Postal Service); 24 CFR part 40 (U.S. Department of Housing and Urban Development); and the U.S. Department of Defense ''Policy Memorandum for Secretaries of the Military Departments: Access for People with Disabilities'' (October 31, 2008).

(h) *Mechanical rooms.* For purposes of this section, section 4.1.6(1)(g) of UFAS will be interpreted to exempt from the requirements of UFAS only mechanical rooms and other spaces that, because of their intended use, will not require accessibility to the public or beneficiaries or result in the employment or residence therein of individuals with physical disabilities.

■ 16. Revise the heading of subpart D to read as follows:

Subpart D—Childcare, Preschool, Elementary and Secondary, and Adult Education

■ 17. Revise § 84.31 to read as follows:

§ 84.31 Application of this subpart.

This subpart applies to childcare, preschool, elementary and secondary, and adult education programs or activities that receive Federal financial assistance and to recipients that operate, or that receive Federal financial assistance for the operation of, such programs or activities.

§§ 84.32 through 84.37 [Removed and Reserved]

■ 18. Remove and reserve §§ 84.32 through 84.37.

■ 19. Revise § 84.38 to read as follows:

§ 84.38 Childcare, preschool, elementary and secondary, and adult education.

A recipient to which this subpart applies that provides childcare, preschool, elementary and secondary, or adult education may not, on the basis of disability, exclude qualified individuals with disabilities and shall take into account the needs of such persons in determining the aids, benefits, or services to be provided.

§ 84.39 [Removed and Reserved]

■ 20. Remove and reserve § 84.39.

Subpart E—Postsecondary Education

§ 84.42 [Amended]

■ 21. Amend § 84.42 by:
■ a. Removing the word ''handicap'' and adding in its place the word ''disability'' in paragraphs (a) and (b)(3)(i);
■ b. Removing the words ''handicapped persons'' and adding in their place the words ''persons with disabilities'' wherever they occur in paragraphs (a), (b)(1), (b)(2) introductory text, and (b)(3)(iii);
■ c. Removing the words ''handicapped person'' and ''handicaps'' and adding in their places the words ''person with a disability'' and ''disabilities'', respectively, in paragraph (b)(4); and
■ d. Removing the word ''handicapped'' and adding in its place the word ''disabled'' in paragraph (c) introductory text.

§ 84.43 [Amended]

■ 22. Amend § 84.43 by:
■ a. Removing the words ''handicapped student'' and ''handicap'' and adding in their places the words ''student with a disability'' and ''disability'', respectively, in paragraphs (a) and (c); and
■ b. Removing the words ''handicapped persons'' and adding in their place the words ''persons with disabilities'' in paragraph (b).

§ 84.44 [Amended]

■ 23. Amend § 84.44 by:
■ a. Removing the word ''handicap'' and adding in its place the word ''disability'' in paragraphs (a) and (c);
■ b. Removing the words ''handicapped applicant or student'' and adding in their place the words ''applicant or student with a disability'' in paragraph (a);
■ c. Removing the words ''handicapped students'' and adding in their place the words ''students with disabilities'' wherever they occur in paragraph (b); and
■ d. Removing the words ''handicapped student'' and adding in their place the words ''student with a disability'' in paragraph (d)(1).

§ 84.45 [Amended]

■ 24. Amend § 84.45 by:
■ a. Revising paragraph (a); and
■ b. Removing the word ''handicap'' and adding in its place the word ''disability'' in paragraph (b).

The revision reads as follows:

§ 84.45 Housing.

(a) *Housing provided by the recipient.* A recipient that provides housing to its students without disabilities shall provide comparable, convenient, and accessible housing to students with disabilities at the same cost as to others. At the end of the transition period provided for in subpart C of this part, such housing shall be available in sufficient quantity and variety so that the scope of students with disabilities' choice of living accommodations is, as a whole, comparable to that of students without disabilities.

* * * * *

§ 84.46 [Amended]

■ 25. Amend § 84.46 by:
■ a. Removing the word ''handicap'' and adding in its place the word ''disability'' wherever it occurs in paragraph (a);
■ b. Removing the words ''handicapped persons'' and adding in their place the words ''persons with disabilities'' wherever they occur in paragraph (a)(1); and
■ c. Removing the words ''nonhandicapped persons'' and adding in their place the words ''persons without disabilities'' in paragraph (a)(1).

§ 84.47 [Amended]

■ 26. Amend § 84.47 by:
■ a. Removing the word ''handicap'' and adding in its place the word ''disability'' in paragraphs (a)(1) and (b);
■ b. Removing the words ''handicapped students'' and adding in their place the words ''students with disabilities'' in paragraphs (a)(1) and (2) and (b);
■ c. Removing the words ''handicapped student'' and adding in their place the words ''student with a disability'' in paragraph (a)(2); and
■ d. Removing the words ''nonhandicapped students'' and ''handicapped persons'' and adding in their places the words ''students without disabilities'' and ''persons with disabilities'', respectively, in paragraph (b).

Subpart F—Health, Welfare, and Social Services

§ 84.52 [Amended]

■ 27. Amend § 84.52 by:
■ a. Removing the words ''handicapped person'' and adding in its place the

words ''person with a disability'' in paragraphs (a)(1) through (3);
■ b. Removing the words ''nonhandicapped persons'' and adding in their place the words ''persons without disabilities'' in paragraph (a)(2);
■ c. Removing the words ''handicapped persons'' and adding in their place the words ''persons with disabilities'' wherever they occur in paragraphs (a)(4) and (5) and (b);
■ d. Removing the word ''handicap'' and adding in its place the word ''disability'' in paragraph (b); and
■ e. Removing paragraphs (c) and (d).

■ 28. Revise § 84.53 to read as follows:

§ 84.53 Individuals with substance and alcohol use disorders.

A recipient to which this subpart applies that operates a health care facility may not discriminate in admission or treatment against an individual with a substance or alcohol use disorder who has a medical condition, because of the person's substance or alcohol use disorder.

■ 29. Revise § 84.54 to read as follows:

§ 84.54 Education of institutionalized persons.

A recipient to which this subpart applies and that provides aids, benefits, or services to persons who are institutionalized because of disability shall ensure that each qualified individual with disabilities, as defined in § 84.10, in its program or activity is provided an appropriate education, consistent with the Department of Education section 504 regulations at 34 CFR 104.33(b). Nothing in this section shall be interpreted as altering in any way the obligations of recipients under subpart D of this part.

§ 84.55 [Amended]

■ 30. Amend § 84.55 by:
■ a. Removing the words ''handicapped infants'' and adding in their place the words ''infants with disabilities'' in the section heading, paragraph (a), and paragraph (f) introductory text;
■ b. Removing the words ''handicapped infants'' and adding in their place the words ''infants with disabilities'' in paragraphs (f)(1)(i), (f)(1)(ii)(A), and (f)(1)(ii)(C);
■ c. Removing the word ''handicaps'' and adding in its place the word ''disabilities'' in paragraph (f)(1)(ii)(C); and
■ d. Removing and reserving paragraphs (b) through (e).

■ 31. Add §§ 84.56 and 84.57 to read as follows:

§ 84.56 Medical treatment.

(a) *Discrimination prohibited.* No qualified individual with a disability shall, on the basis of disability, be subjected to discrimination in medical treatment under any program or activity that receives Federal financial assistance, including in the allocation or withdrawal of any good, benefit, or service.

(b) *Specific prohibitions.* The general prohibition in paragraph (a) of this section includes the following specific prohibitions:

(1) *Denial of medical treatment.* A recipient may not deny or limit medical treatment to a qualified individual with a disability when the denial is based on:

(i) Bias or stereotypes about a patient's disability;

(ii) Judgments that the individual will be a burden on others due to their disability, including, but not limited to caregivers, family, or society; or

(iii) A belief that the life of a person with a disability has lesser value than the life of a person without a disability, or that life with a disability is not worth living.

(2) *Denial of treatment for a separate symptom or condition.* Where a qualified individual with a disability or their authorized representative seeks or consents to treatment for a separately diagnosable symptom or medical condition (whether or not that symptom or condition is a disability under this part or is causally connected to the individual's underlying disability), a recipient may not deny or limit clinically appropriate treatment if it would be offered to a similarly situated individual without an underlying disability.

(3) *Provision of medical treatment.* A recipient may not, on the basis of disability, provide a medical treatment to an individual with a disability where it would not provide the same treatment to an individual without a disability, unless the disability impacts the effectiveness, or ease of administration of the treatment itself, or has a medical effect on the condition to which the treatment is directed.

(c) *Construction*—(1) *Professional judgment in treatment.* (i) Nothing in this section requires the provision of medical treatment where the recipient has a legitimate, nondiscriminatory reason for denying or limiting that service or where the disability renders the individual not qualified for the treatment.

(ii) Circumstances in which the recipient has a legitimate, nondiscriminatory reason for denying or limiting a service or where the disability renders the individual not qualified for the treatment may include circumstances in which the recipient typically declines to provide the treatment to any individual, or reasonably determines based on current medical knowledge or the best available objective evidence that such medical treatment is not clinically appropriate for a particular individual. The criteria in paragraphs (b)(1)(i) through (iii) of this section are not a legitimate nondiscriminatory reason for denying or limiting medical treatment and may not be a basis for a determination that an individual is not qualified for the treatment, or that a treatment is not clinically appropriate for a particular individual.

(2) *Consent.* (i) Nothing in this section requires a recipient to provide medical treatment to an individual where the individual, or their authorized representative, does not consent to that treatment.

(ii) Nothing in this section allows a recipient to discriminate against a qualified individual with a disability on the basis of disability in seeking to obtain consent from an individual or their authorized representative for the recipient to provide, withhold, or withdraw treatment.

(3) *Providing information.* Nothing in this section precludes a provider from providing an individual with a disability or their authorized representative with information regarding the implications of different courses of treatment based on current medical knowledge or the best available objective evidence.

§ 84.57 Value assessment methods.

A recipient shall not, directly or through contractual, licensing, or other arrangements, use any measure, assessment, or tool that discounts the value of life extension on the basis of disability to deny or afford an unequal opportunity to qualified individuals with disabilities with respect to the eligibility or referral for, or provision or withdrawal of any aid, benefit, or service, including the terms or conditions under which they are made available.

■ 32. Add § 84.60 to read as follows:

§ 84.60 Children, parents, caregivers, foster parents, and prospective parents in the child welfare system.

(a) *Discriminatory actions prohibited.* (1) No qualified individual with a disability shall, on the basis of disability, be excluded from participation in, be denied the benefits of, or otherwise be subjected to discrimination under any child welfare program or activity that receives Federal financial assistance.

(2) Under the prohibition set forth in paragraph (a)(1) of this section, discrimination includes:

(i) Decisions based on speculation, stereotypes, or generalizations that a parent, caregiver, foster parent, or prospective parent, because of a disability, cannot safely care for a child; and

(ii) Decisions based on speculation, stereotypes, or generalizations about a child with a disability.

(b) *Additional prohibitions.* The prohibitions in paragraph (a) of this section apply to actions by a recipient of Federal financial assistance made directly or through contracts, agreements, or other arrangements, including any action to:

(1) Deny a qualified parent with a disability custody or control of, or visitation to, a child;

(2) Deny a qualified parent with a disability an opportunity to participate in or benefit from any and all services provided by a child welfare agency, including but not limited to, family preservation and reunification services equal to that afforded to persons without disabilities;

(3) Terminate the parental rights or legal guardianship of a qualified individual with a disability;

(4) Deny a qualified caregiver, foster parent, companion, or prospective parent with a disability the opportunity to participate in or benefit from child welfare programs and activities; or

(5) Require children, on the basis on the disability, to be placed outside the family home through custody relinquishment, voluntary placement, or other forfeiture of parental rights in order to receive necessary services.

(c) *Parenting evaluation procedures.* A recipient to which this subpart applies shall establish procedures for referring to qualified professionals for evaluation those individuals, who, because of disability, need or are believed to need adapted services or reasonable modifications. A recipient shall also ensure that tests, assessments, and other evaluation tools and materials used for the purpose of assessing or evaluating parenting ability are based in evidence or research, are conducted by a qualified professional and are tailored to assess actual parenting ability and specific areas of disability-related needs. Parenting evaluations must be fully accessible to people with disabilities and shall not be based on a single general intelligence quotient or measure of the person's disability, rather than their parenting ability. Assessments of parents or children must be individualized and based on the best available objective evidence.

■ 33. Revise subpart G to read as follows:

Subpart G—General Requirements

Sec.
84.68 General prohibitions against discrimination.
84.69 Illegal use of drugs.
84.70 Maintenance of accessible features.
84.71 Retaliation or coercion.
84.72 Personal devices and services.
84.73 Service animals.
84.74 Mobility devices.
84.75 Direct threat.
84.76 Integration.

Subpart G—General Requirements

§ 84.68 General prohibitions against discrimination.

(a) No qualified individual with a disability shall, solely on the basis of disability, be excluded from participation in or be denied the benefits of the programs or activities of a recipient, or be subjected to discrimination by any recipient.

(b)(1) A recipient, in providing any aid, benefit, or service, may not, directly or through contractual, licensing, or other arrangements, on the basis of disability—

(i) Deny a qualified individual with a disability the opportunity to participate in or benefit from the aid, benefit, or service.

(ii) Afford a qualified individual with a disability an opportunity to participate in or benefit from the aid, benefit, or service that is not equal to that afforded others.

(iii) Provide a qualified individual with a disability an aid, benefit, or service that is not as effective in affording equal opportunity to obtain the same result, to gain the benefit or to reach the same level of achievement as that provided to others.

(iv) Provide different or separate aids, benefits, or services to individuals with disabilities or to any class of individuals with disabilities than is provided to others unless such action is necessary to provide qualified individuals with disabilities with aids, benefits, or services that are as effective as those provided to others.

(v) Aid or perpetuate discrimination against a qualified individual with a disability by providing significant assistance to an agency, organization, or person that discriminates on the basis of disability in providing any aid, benefit, or service to beneficiaries of the recipient's program.

(vi) Deny a qualified individual with a disability the opportunity to participate as a member of planning or advisory boards.

(vii) Otherwise limit a qualified individual with a disability in the enjoyment of any right, privilege, advantage, or opportunity enjoyed by others receiving the aid, benefit, or service.

(2) A recipient may not deny a qualified individual with a disability the opportunity to participate in programs or activities that are not separate or different, despite the existence of permissibly separate or different programs or activities.

(3) A recipient may not, directly or through contractual or other arrangements, utilize criteria or methods of administration—

(i) That have the effect of subjecting qualified individuals with disabilities to discrimination on the basis of disability;

(ii) That have the purpose or effect of defeating or substantially impairing accomplishment of the objectives of the recipient's program with respect to individuals with disabilities; or

(iii) That perpetuate the discrimination of another recipient if both recipients are subject to common administrative control or are agencies of the same state.

(4) A recipient may not, in determining the site or location of a facility, make selections—

(i) That have the effect of excluding individuals with disabilities from, denying them the benefits of, or otherwise subjecting them to discrimination; or

(ii) That have the purpose or effect of defeating or substantially impairing the accomplishment of the objectives of the program or activity with respect to individuals with disabilities.

(5) A recipient, in the selection of procurement contractors, may not use criteria that subject qualified individuals with disabilities to discrimination on the basis of disability.

(6) A recipient may not administer a licensing or certification program in a manner that subjects qualified individuals with disabilities to discrimination on the basis of disability, nor may a recipient establish requirements for the programs or activities of licensees or certified entities that subject qualified individuals with disabilities to discrimination on the basis of disability. The programs or activities of entities that are licensed or certified by the recipient are not, themselves, covered by this part.

(7)(i) A recipient shall make reasonable modifications in policies, practices, or procedures when such modifications are necessary to avoid discrimination on the basis of disability, unless the recipient can demonstrate that making the modifications would

fundamentally alter the nature of the program or activity.

(ii) A recipient is not required to provide a reasonable modification to an individual who meets the definition of ''disability'' solely under the ''regarded as'' prong of the definition of disability in § 84.4(a)(1)(iii).

(8) A recipient shall not impose or apply eligibility criteria that screen out or tend to screen out an individual with a disability or any class of individuals with disabilities from fully and equally enjoying any program or activity, unless such criteria can be shown to be necessary for the provision of the program or activity being offered.

(c) Nothing in this part prohibits a recipient from providing benefits, services, or advantages to individuals with disabilities, or to a particular class of individuals with disabilities beyond those required by this part.

(d) A recipient shall administer programs and activities in the most integrated setting appropriate to the needs of qualified individuals with disabilities.

(e)(1) Nothing in this part shall be construed to require an individual with a disability to accept a modification, aid, service, opportunity, or benefit provided under section 504 or this part which such individual chooses not to accept.

(2) Nothing in section 504 or this part authorizes the representative or guardian of an individual with a disability to decline food, water, medical treatment, or medical services for that individual.

(f) A recipient may not place a surcharge on a particular individual with a disability or any group of individuals with disabilities to cover the costs of measures, such as the provision of auxiliary aids or program accessibility, that are required to provide that individual or group with the nondiscriminatory treatment required by section 504 or this part.

(g) A recipient shall not exclude or otherwise deny equal programs or activities to an individual or entity because of the known disability of an individual with whom the individual or entity is known to have a relationship or association.

(h) A recipient may impose legitimate safety requirements necessary for the safe operation of its programs or activities. However, the recipient must ensure that its safety requirements are based on actual risks, not on mere speculation, stereotypes, or generalizations about individuals with disabilities.

(i) Nothing in this part shall provide the basis for a claim that an individual without a disability was subject to discrimination because of a lack of disability, including a claim that an individual with a disability was granted a reasonable modification that was denied to an individual without a disability.

§ 84.69 Illegal use of drugs.

(a) *General.* (1) Except as provided in paragraph (b) of this section, this part does not prohibit discrimination against an individual based on that individual's current illegal use of drugs.

(2) A recipient shall not discriminate on the basis of illegal use of drugs against an individual who is not engaging in current illegal use of drugs and who—

(i) Has successfully completed a supervised drug rehabilitation program or has otherwise been rehabilitated successfully;

(ii) Is participating in a supervised rehabilitation program; or

(iii) Is erroneously regarded as engaging in such use.

(b) *Services provided under the Rehabilitation Act.* (1) A recipient shall not exclude an individual on the basis of that individual's current illegal use of drugs from the benefits of programs and activities providing health services and services provided under subchapters I, II, and III of the Rehabilitation Act, if the individual is otherwise entitled to such services.

(2) A drug rehabilitation or treatment program may deny participation to individuals who engage in illegal use of drugs while they are in the program.

(c) *Drug testing.* (1) This part does not prohibit the recipient from adopting or administering reasonable policies or procedures, including but not limited to drug testing, designed to ensure that an individual who formerly engaged in the illegal use of drugs is not now engaging in current illegal use of drugs.

(2) Nothing in this paragraph (c) shall be construed to encourage, prohibit, restrict, or authorize the conduct of testing for the illegal use of drugs.

§ 84.70 Maintenance of accessible features.

(a) A recipient shall maintain in operable working condition those features of facilities and equipment that are required to be readily accessible to and usable by persons with disabilities by section 504 or this part.

(b) This section does not prohibit isolated or temporary interruptions in service or access due to maintenance or repairs.

(c) For a recipient, if the 2010 Standards reduce the technical requirements or the number of required accessible elements below the number required by UFAS, the technical requirements or the number of accessible elements in a facility subject to this part may be reduced in accordance with the requirements of the 2010 Standards.

§ 84.71 Retaliation or coercion.

(a) A recipient shall not discriminate against any individual because that individual has opposed any act or practice made unlawful by this part, or because that individual made a charge, testified, assisted, or participated in any manner in an investigation, proceeding, or hearing under section 504 or this part.

(b) A recipient shall not coerce, intimidate, threaten, or interfere with any individual in the exercise or enjoyment of, or on account of their having exercised or enjoyed, or on account of their having aided or encouraged any other individual in the exercise or enjoyment of any right granted or protected by section 504 or this part.

§ 84.72 Personal devices and services.

This part does not require a recipient to provide to individuals with disabilities personal devices, such as wheelchairs; individually prescribed devices, such as prescription eyeglasses or hearing aids; readers for personal use or study; or services of a personal nature including assistance in eating, toileting, or dressing.

§ 84.73 Service animals.

(a) *General.* Generally, a recipient shall modify its policies, practices, or procedures to permit the use of a service animal by an individual with a disability.

(b) *Exceptions.* A recipient may ask an individual with a disability to remove a service animal from the premises if—

(1) The animal is out of control and the animal's handler does not take effective action to control it; or

(2) The animal is not housebroken.

(c) *If an animal is properly excluded.* If a recipient properly excludes a service animal under paragraph (b) of this section, it shall give the individual with a disability the opportunity to participate in the program or activity without having the service animal on the premises.

(d) *Animal under handler's control.* A service animal shall be under the control of its handler. A service animal shall have a harness, leash, or other tether, unless either the handler is unable because of a disability to use a harness, leash, or other tether, or the use of a harness, leash, or other tether

would interfere with the service animal's safe, effective performance of work or tasks, in which case the service animal must be otherwise under the handler's control (*e.g.,* voice control, signals, or other effective means).

(e) *Care or supervision.* A recipient is not responsible for the care or supervision of a service animal.

(f) *Inquiries.* A recipient shall not ask about the nature or extent of a person's disability but may make two inquiries to determine whether an animal qualifies as a service animal. A recipient may ask if the animal is required because of a disability and what work or task the animal has been trained to perform. A recipient shall not require documentation, such as proof that the animal has been certified, trained, or licensed as a service animal. Generally, a recipient may not make these inquiries about a service animal when it is readily apparent that an animal is trained to do work or perform tasks for an individual with a disability (*e.g.,* the dog is observed guiding an individual who is blind or has low vision, pulling a person's wheelchair, or providing assistance with stability or balance to an individual with an observable mobility disability).

(g) *Access to areas of the recipient.* Individuals with disabilities shall be permitted to be accompanied by their service animals in all areas of the recipient's facilities where members of the public, participants in programs or activities, or invitees, as relevant, are allowed to go.

(h) *Surcharges.* A recipient shall not ask or require an individual with a disability to pay a surcharge, even if people accompanied by pets are required to pay fees, or to comply with other requirements generally not applicable to people without pets. If a recipient normally charges individuals for the damage they cause, an individual with a disability may be charged for damage caused by their service animal.

(i) *Miniature horses*—(1) *Reasonable modifications.* A recipient shall make reasonable modifications in policies, practices, or procedures to permit the use of a miniature horse by an individual with a disability if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability.

(2) *Assessment factors.* In determining whether reasonable modifications in policies, practices, or procedures can be made to allow a miniature horse into a specific facility, a recipient shall consider—

(i) The type, size, and weight of the miniature horse and whether the facility can accommodate these features;

(ii) Whether the handler has sufficient control of the miniature horse;

(iii) Whether the miniature horse is housebroken; and

(iv) Whether the miniature horse's presence in a specific facility compromises legitimate safety requirements that are necessary for safe operation.

(3) *Other requirements.* Paragraphs (c) through (h) of this section, which apply to service animals, shall also apply to miniature horses.

§ 84.74 Mobility devices.

(a) *Use of wheelchairs and manually-powered mobility aids.* A recipient shall permit individuals with mobility disabilities to use wheelchairs and manually-powered mobility aids, such as walkers, crutches, canes, braces, or other similar devices designed for use by individuals with mobility disabilities in any areas open to pedestrian use.

(b) *Use of other power-driven mobility devices*—(1) *Requirement.* A recipient shall make reasonable modifications in its policies, practices, or procedures to permit the use of other power-driven mobility devices by individuals with mobility disabilities, unless a recipient can demonstrate that the class of other power-driven mobility devices cannot be operated in accordance with legitimate safety requirements that a recipient has adopted pursuant to § 84.68(h).

(2) *Assessment factors.* In determining whether a particular other power-driven mobility device can be allowed in a specific facility as a reasonable modification under paragraph (b)(1) of this section, a recipient shall consider—

(i) The type, size, weight, dimensions, and speed of the device;

(ii) The facility's volume of pedestrian traffic (which may vary at different times of the day, week, month, or year);

(iii) The facility's design and operational characteristics (*e.g.,* whether its program or activity is conducted indoors, its square footage, the density and placement of stationary devices, and the availability of storage for the device, if requested by the user);

(iv) Whether legitimate safety requirements can be established to permit the safe operation of the other power-driven mobility device in the specific facility; and

(v) Whether the use of the other power-driven mobility device creates a substantial risk of serious harm to the immediate environment or natural or cultural resources, or poses a conflict with Federal land management laws and regulations.

(c) *Inquiry about disability*—(1) *Requirement.* A recipient shall not ask an individual using a wheelchair or other power-driven mobility device questions about the nature and extent of the individual's disability.

(2) *Inquiry into use of other power-driven mobility device.* A recipient may ask a person using an other power-driven mobility device to provide a credible assurance that the mobility device is required because of the person's disability. A recipient in permitting the use of an other power-driven mobility device by an individual with a mobility disability shall accept the presentation of a valid, State-issued, disability parking placard or card, or other State-issued proof of disability as a credible assurance that the use of the other power-driven mobility device is for the individual's mobility disability. In lieu of a valid, State-issued disability parking placard or card, or State-issued proof of disability, a recipient shall accept as a credible assurance a verbal representation, not contradicted by observable fact, that the other power-driven mobility device is being used for a mobility disability. A ''valid'' disability placard or card is one that is presented by the individual to whom it was issued and is otherwise in compliance with the State of issuance's requirements for disability placards or cards.

§ 84.75 Direct threat.

(a) This part does not require a recipient to permit an individual to participate in or benefit from the programs or activities of that recipient when that individual poses a direct threat.

(b) Except as provided in paragraph (c) of this section, in determining whether an individual poses a direct threat, a recipient must make an individualized assessment, based on reasonable judgment that relies on current medical knowledge or on the best available objective evidence, to ascertain: the nature, duration, and severity of the risk; the probability that the potential injury will actually occur; and whether reasonable modifications of policies, practices, or procedures or the provision of auxiliary aids or services will mitigate the risk.

(c) In determining whether an individual poses a direct threat in employment, the recipient must make an individualized assessment according to the Equal Employment Opportunity Commission's regulation implementing title I of the Americans with Disabilities Act of 1990, at 29 CFR 1630.2(r).

§ 84.76 Integration.

(a) *Application.* This section applies to programs or activities that receive Federal financial assistance from the Department and to recipients that operate such programs or activities.

(b) *Discriminatory action prohibited.* A recipient shall administer a program or activity in the most integrated setting appropriate to the needs of a qualified person with a disability.

(c) *Segregated setting.* Segregated settings include but are not limited to congregate settings that are populated exclusively or primarily with individuals with disabilities and may be characterized by regimentation in daily activities; lack of privacy or autonomy; or policies or practices limiting visitors or limiting individuals' ability to engage freely in community activities and to manage their own activities of daily living.

(d) *Specific prohibitions.* The general prohibition in paragraph (b) of this section includes but is not limited to the following specific prohibitions, to the extent that such action results in unnecessary segregation, or serious risk of such segregation, of persons with disabilities.

(1) Establishing or applying policies or practices that limit or condition individuals with disabilities' access to the most integrated setting appropriate to their needs;

(2) Providing greater benefits or benefits under more favorable terms in segregated settings than in integrated settings;

(3) Establishing or applying more restrictive rules and requirements for qualified individuals with disabilities in integrated settings than for individuals with disabilities in segregated settings; or

(4) Failure to provide community-based services that results in institutionalization or serious risk of institutionalization. This paragraph (d)(4) includes, but is not limited to planning, service system design, funding, or service implementation practices that result in institutionalization or serious risk of institutionalization. Qualified individuals with disabilities need not wait until the harm of institutionalization or segregation occurs to assert their right to avoid unnecessary segregation.

(e) *Fundamental alteration.* A recipient may establish a defense to the application of this section if it can demonstrate that a requested modification would fundamentally alter the nature of its program or activity.

■ 34. Add subpart H, consisting of §§ 84.77 through 84.81, to read as follows:

Subpart H—Communications

Sec.
84.77 General.
84.78 Telecommunications.
84.79 Telephone emergency services.
84.80 Information and signage.
84.81 Duties.

Subpart H—Communications

§ 84.77 General.

(a)(1) A recipient shall take appropriate steps to ensure that communications with applicants, participants, members of the public, and companions with disabilities are as effective as communications with others.

(2) For purposes of this section, *companion* means a family member, friend, or associate of an individual seeking access to a program or activity of a recipient, who, along with such individual, is an appropriate person with whom the recipient should communicate.

(b)(1) The recipient shall furnish appropriate auxiliary aids and services where necessary to afford qualified individuals with disabilities, including applicants, participants, beneficiaries, companions, and members of the public, an equal opportunity to participate in, and enjoy the benefits of, a program or activity of a recipient.

(2) The type of auxiliary aid or service necessary to ensure effective communication will vary in accordance with the method of communication used by the individual; the nature, length, and complexity of the communication involved; and the context in which the communication is taking place. In determining what types of auxiliary aids and services are necessary, a recipient shall give primary consideration to the requests of individuals with disabilities. In order to be effective, auxiliary aids and services must be provided in accessible formats, in a timely manner, and in such a way as to protect the privacy and independence of the individual with a disability.

(c)(1) A recipient shall not require an individual with a disability to bring another individual to interpret for him or her.

(2) A recipient shall not rely on an adult accompanying an individual with a disability to interpret or facilitate communication except—

(i) In an emergency involving an imminent threat to the safety or welfare of an individual or the public where there is no interpreter available; or

(ii) When the individual with a disability specifically requests that the accompanying adult interpret or facilitate communication, the accompanying adult agrees to provide such assistance, and reliance on that adult for such assistance is appropriate under the circumstances.

(3) A recipient shall not rely on a minor child to interpret or facilitate communication, except in an emergency involving an imminent threat to the safety or welfare of an individual or the public when there is no interpreter available.

(d) When the recipient chooses to provide qualified interpreters via video remote interpreting services (VRI), it shall ensure that it provides—

(1) Real-time, full-motion video and audio over a dedicated high-speed, wide-bandwidth video connection or wireless connection that delivers high-quality video images that do not produce lags, choppy, blurry, or grainy images, or irregular pauses in communication;

(2) A sharply delineated image that is large enough to display the interpreter's face, arms, hands, and fingers, and the participating individual's face, arms, hands, and fingers, regardless of their body position;

(3) A clear, audible transmission of voices; and

(4) Adequate training to users of the technology and other involved individuals so that they may quickly and efficiently set up and operate the VRI.

§ 84.78 Telecommunications.

(a) Where a recipient communicates by telephone with applicants and beneficiaries, text telephones (TTYs) or equally effective telecommunications systems shall be used to communicate with individuals who are deaf or hard of hearing or have speech impairments.

(b) When a recipient uses an automated-attendant system, including, but not limited to, voice mail and messaging, or an interactive voice response system, for receiving and directing incoming telephone calls, that system must provide effective real-time communication with individuals using auxiliary aids and services, including TTYs and all forms of Federal Communications Commission (FCC)-approved telecommunications relay systems, including internet-based relay systems.

(c) A recipient shall respond to telephone calls from a telecommunications relay service established under title IV of the ADA in the same manner that it responds to other telephone calls.

§ 84.79 Telephone emergency services.

Telephone emergency services, including 911 services, shall provide direct access to individuals who use TTYs and computer modems.

§ 84.80 Information and signage.

(a) A recipient shall ensure that interested persons, including persons with impaired vision or hearing, can obtain information as to the existence and location of accessible services, activities, and facilities.

(b) A recipient shall provide signage at all inaccessible entrances to each of its facilities, directing users to an accessible entrance or to a location at which they can obtain information about accessible facilities. The international symbol for accessibility shall be used at each accessible entrance of a facility.

§ 84.81 Duties.

This subpart does not require a recipient to take any action that it can demonstrate would result in a fundamental alteration in the nature of a program or activity or undue financial and administrative burdens. In those circumstances where a recipient's personnel believe that the proposed action would fundamentally alter the program or activity or would result in undue financial and administrative burdens, the recipient has the burden of proving that compliance with this subpart would result in such alteration or burdens. The decision that compliance would result in such alteration or burdens must be made by the head of the recipient or their designee after considering all the recipient's resources available for use in the funding and operation of the program or activity and must be accompanied by a written statement of reasons for reaching that conclusion. If an action required to comply with this part would result in such an alteration or such burdens, the recipient shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that, to the maximum extent possible, individuals with disabilities receive the benefits or services provided by the recipient.

■ 35. Add subpart I, consisting of §§ 84.82 through 84.89, to read as follows:

Subpart I—Web, Mobile, and Kiosk Accessibility

Sec.

84.82 Application.
84.83 Accessibility of kiosks.
84.84 Requirements for web and mobile accessibility.
84.85 Exceptions.
84.86 Conforming alternate versions.
84.87 Equivalent facilitation.
84.88 Duties.
84.89 Effect of noncompliance that has a minimal impact on access.

Subpart I—Web, Mobile, and Kiosk Accessibility

§ 84.82 Application.

This subpart applies to all programs or activities that receive Federal financial assistance from the Department.

§ 84.83 Accessibility of kiosks.

No qualified individual with a disability shall, on the basis of disability, be excluded from participation in, be denied the benefits of, or otherwise be subjected to discrimination under any program or activity of a recipient provided through kiosks.

§ 84.84 Requirements for web and mobile accessibility.

(a) *General.* A recipient shall ensure that the following are readily accessible to and usable by individuals with disabilities:

(1) Web content that a recipient provides or makes available, directly or through contractual, licensing, or other arrangements; and

(2) Mobile apps that a recipient provides or makes available, directly or through contractual, licensing, or other arrangements.

(b) *Requirements.* (1) Beginning May 11, 2026, a recipient with fifteen or more employees shall ensure that the web content and mobile apps that the recipient provides or makes available, directly or through contractual, licensing, or other arrangements, comply with Level A and Level AA success criteria and conformance requirements specified in WCAG 2.1, unless the recipient can demonstrate that compliance with this section would result in a fundamental alteration in the nature of a program or activity or in undue financial and administrative burdens.

(2) Beginning May 10, 2027, a recipient with fewer than fifteen employees shall ensure that the web content and mobile apps that the recipient provides or makes available, directly or through contractual, licensing, or other arrangements, comply with Level A and Level AA success criteria and conformance requirements specified in WCAG 2.1, unless the recipient can demonstrate that compliance with this section would result in a fundamental alteration in the nature of a program or activity or in undue financial and administrative burdens.

(3) WCAG 2.1 is incorporated by reference into this section with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. All material approved for incorporation by reference (IBR) is available for inspection at HHS and at the National Archives and Records Administration (''NARA''). Contact HHS, OCR at: Office for Civil Rights, U.S. Department of Health and Human Services, 200 Independence Ave. SW, Room 509F, HHH Building, Washington, DC 20201; phone: (202) 545–4884; email: *504@hhs.gov.* For information on the availability of this material at NARA, visit *www.archives.gov/federal-register/cfr/ibr-locations* or email *fr.inspection@nara.gov.* The material may be obtained from the World Wide Web Consortium (W3C) Web Accessibility Initiative (''WAI''), 401 Edgewater Place, Suite 600, Wakefield, MA 01880; phone: (339) 273–2711; email: *contact@w3.org;* website: *www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F.*

§ 84.85 Exceptions.

The requirements of § 84.84 do not apply to the following:

(a) *Archived web content.* Archived web content as defined in § 84.10.

(b) *Preexisting conventional electronic documents.* Conventional electronic documents that are available as part of a recipient's web content or mobile apps before the date the recipient is required to comply with § 84.84, unless such documents are currently used to apply for, gain access to, or participate in the recipient's programs or activities.

(c) *Content posted by a third party.* Content posted by a third party, unless the third party is posting due to contractual, licensing, or other arrangements with the recipient.

(d) *Individualized, password-protected documents or otherwise secured conventional electronic documents.* Conventional electronic documents that are:

(1) About a specific individual, their property, or their account; and

(2) Password-protected or otherwise secured.

(e) *Preexisting social media posts.* A recipient's social media posts that were posted before the date the recipient is required to comply with § 84.84.

§ 84.86 Conforming alternate versions.

(a) A recipient may use conforming alternate versions of web content, as defined by WCAG 2.1, to comply with § 84.84 only where it is not possible to

make web content directly accessible due to technical or legal limitations.

(b) WCAG 2.1 is incorporated by reference into this section with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. All material approved for incorporation by reference is available for inspection at HHS and at NARA. Contact HHS, OCR at: Office for Civil Rights, U.S. Department of Health and Human Services, 200 Independence Ave. SW, Room 509F, HHH Building, Washington, DC 20201; phone: (202) 545–4884; email: *504@hhs.gov.* For information on the availability of this material at NARA, visit *www.archives.gov/federal-register/cfr/ibr-locations* or email *fr.inspection@nara.gov.* The material may be obtained from the World Wide Web Consortium (W3C) Web Accessibility Initiative (''WAI''), 401 Edgewater Place, Suite 600, Wakefield, MA 01880; phone: (339) 273–2711; email: *contact@w3.org;* website: *www.w3.org/TR/2018/REC-WCAG21-20180605/* and *https://perma.cc/UB8A-GG2F.*

§ 84.87 Equivalent facilitation.

Nothing in this subpart prevents the use of designs, methods, or techniques as alternatives to those prescribed, provided that the alternative designs, methods, or techniques result in substantially equivalent or greater accessibility and usability of the web content or mobile app.

§ 84.88 Duties.

Where a recipient can demonstrate that compliance with the requirements of § 84.84 would result in a fundamental alteration in the nature of a program or activity or in undue financial and administrative burdens, compliance with § 84.84 is required to the extent that it does not result in a fundamental alteration or undue financial and administrative burdens. In those circumstances where personnel of the recipient believe that the proposed action would fundamentally alter the program or activity or would result in undue financial and administrative burdens, a recipient has the burden of proving that compliance with § 84.84 would result in such alteration or burdens. The decision that compliance would result in such alteration or burdens must be made by the head of a recipient or their designee after considering all resources available for use in the funding and operation of the program or activity, and must be accompanied by a written statement of the reasons for reaching that conclusion. If an action would result in such an alteration or such burdens, a recipient shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient to the maximum extent possible.

§ 84.89 Effect of noncompliance that has a minimal impact on access.

A recipient that is not in full compliance with the requirements of § 84.84(b) will be deemed to have met the requirements of § 84.84 in the limited circumstance in which the recipient can demonstrate that the noncompliance has such a minimal impact on access that it would not affect the ability of individuals with disabilities to use the recipient's web content or mobile app to do any of the following in a manner that provides substantially equivalent timeliness, privacy, independence, and ease of use:

(a) Access the same information as individuals without disabilities;

(b) Engage in the same interactions as individuals without disabilities;

(c) Conduct the same transactions as individuals without disabilities; and

(d) Otherwise participate in or benefit from the same programs and activities as individuals without disabilities.

■ 36. Add subpart J, consisting of §§ 84.90 through 84.97, to read as follows:

Subpart J—Accessible Medical Equipment

Sec.

84.90 Application.
84.91 Requirements for medical diagnostic equipment.
84.92 Newly purchased, leased, or otherwise acquired medical diagnostic equipment.
84.93 Existing medical diagnostic equipment.
84.94 Qualified staff.
84.95–84.97 [Reserved]

Subpart J—Accessible Medical Equipment

§ 84.90 Application.

This subpart applies to programs or activities that receive Federal financial assistance from the Department and to recipients that operate, or that receive Federal financial assistance for the operation of, such programs or activities.

§ 84.91 Requirements for medical diagnostic equipment.

No qualified individual with a disability shall, on the basis of disability, be excluded from participation in, be denied the benefits of the programs or activities of a recipient offered through or with the use of medical diagnostic equipment (MDE), or otherwise be subjected to discrimination under any program or activity that receives Federal financial assistance because the recipient's MDE is not readily accessible to or usable by persons with disabilities.

§ 84.92 Newly purchased, leased, or otherwise acquired medical diagnostic equipment.

(a) *Requirements for all newly purchased, leased, or otherwise acquired medical diagnostic equipment.* All MDE that recipients purchase, lease (including via lease renewals), or otherwise acquire more than July 8, 2024, subject to the requirements and limitations set forth in this section, meet the Standards for Accessible MDE, unless and until the recipient satisfies the scoping requirements set forth in paragraph (b) of this section.

(b) *Scoping requirements*—(1) *General requirement for medical diagnostic equipment.* Where a program or activity of a recipient, including physicians' offices, clinics, emergency rooms, hospitals, outpatient facilities, and multi-use facilities, utilizes MDE, at least 10 percent of the total number of units, but no fewer than one unit, of each type of equipment in use must meet the Standards for Accessible MDE.

(2) *Facilities that specialize in treating conditions that affect mobility.* In rehabilitation facilities that specialize in treating conditions that affect mobility, outpatient physical therapy facilities, and other programs or activities that specialize in treating conditions that affect mobility, at least 20 percent, but no fewer than one unit, of each type of equipment in use must meet the Standards for Accessible MDE.

(3) *Facilities with multiple departments.* In any facility or program with multiple departments, clinics, or specialties, where a program or activity uses MDE, the facility shall disperse the accessible MDE required by paragraphs (b)(1) and (2) of this section in a manner that is proportionate by department, clinic, or specialty using MDE.

(c) *Requirements for examination tables and weight scales.* Within 2 years after July 8, 2024, recipients shall, subject to the requirements and limitations set forth in this section, purchase, lease, or otherwise acquire the following, unless the recipient already has them in place:

(1) At least one examination table that meets the Standards for Accessible MDE, if the recipient uses at least one examination table; and

(2) At least one weight scale that meets the Standards for Accessible MDE, if the recipient uses at least one weight scale.

(d) *Equivalent facilitation.* Nothing in this section prevents the use of designs, products, or technologies as alternatives to those prescribed by the Standards for Accessible MDE, provided they result in substantially equivalent or greater accessibility and usability of the program or activity. The responsibility for demonstrating equivalent facilitation rests with the recipient.

(e) *Fundamental alteration and undue burdens.* This section does not require a recipient to take any action that it can demonstrate would result in a fundamental alteration in the nature of a program or activity, or in undue financial and administrative burdens. In those circumstances where personnel of the recipient believe that the proposed action would fundamentally alter the program or activity or would result in undue financial and administrative burdens, a recipient has the burden of proving that compliance with paragraph (a) or (c) of this section would result in such alteration or burdens. The decision that compliance would result in such alteration or burdens must be made by the head of a recipient or their designee after considering all resources available for use in the funding and operation of the program or activity and must be accompanied by a written statement of the reasons for reaching that conclusion. If an action would result in such an alteration or such burdens, a recipient shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient.

(f) *Diagnostically required structural or operational characteristics.* A recipient meets its burden of proving that compliance with paragraph (a) or (c) of this section would result in a fundamental alteration under paragraph (e) of this section if it demonstrates that compliance with paragraph (a) or (c) would alter diagnostically required structural or operational characteristics of the equipment, and prevent the use of the equipment for its intended diagnostic purpose. This paragraph (f) does not excuse compliance with other technical requirements where compliance with those requirements does not prevent the use of the equipment for its diagnostic purpose.

§ 84.93 Existing medical diagnostic equipment.

(a) *Accessibility.* A recipient shall operate each program or activity offered through or with the use of MDE so that the program or activity, in its entirety, is readily accessible to and usable by individuals with disabilities. This paragraph (a) does not—

(1) Necessarily require a recipient to make each of its existing pieces of medical diagnostic equipment accessible to and usable by individuals with disabilities; or

(2) Require a recipient to take any action that it can demonstrate would result in a fundamental alteration in the nature of a program or activity, or in undue financial and administrative burdens. In those circumstances where personnel of the recipient believe that the proposed action would fundamentally alter the program or activity or would result in undue financial and administrative burdens, a recipient has the burden of proving that compliance with this paragraph (a) would result in such alteration or burdens. The decision that compliance would result in such alteration or burdens must be made by the head of the recipient or their designee after considering all resources available for use in the funding and operation of the program or activity and must be accompanied by a written statement of the reasons for reaching that conclusion. If an action would result in such an alteration or such burdens, the recipient shall take any other action that would not result in such an alteration or such burdens but would nevertheless ensure that individuals with disabilities receive the benefits or services provided by the recipient.

(3) A recipient meets its burden of proving that compliance with this paragraph (a) would result in a fundamental alteration under paragraph (a)(2) of this section if it demonstrates that compliance with this paragraph (a) would alter diagnostically required structural or operational characteristics of the equipment, and prevent the use of the equipment for its intended diagnostic purpose.

(b) *Methods.* A recipient may comply with the requirements of this section through such means as reassignment of services to alternate accessible locations, home visits, delivery of services at alternate accessible sites, purchase, lease, or other acquisition of accessible MDE, or any other methods that result in making its programs or activities readily accessible to and usable by individuals with disabilities. A recipient is not required to purchase, lease, or otherwise acquire accessible medical diagnostic equipment where other methods are effective in achieving compliance with this section. In choosing among available methods for meeting the requirements of this section, a recipient shall give priority to those methods that offer programs and activities to qualified individuals with disabilities in the most integrated setting appropriate.

§ 84.94 Qualified staff.

Recipients must ensure their staff are able to successfully operate accessible MDE, assist with transfers and positioning of individuals with disabilities, and carry out the program access obligation regarding existing MDE.

§§ 84.95–84.97 [Reserved]

■ 37. Add subpart K, consisting of § 84.98, to read as follows:

Subpart K—Procedures

§ 84.98 Procedures.

The procedural provisions applicable to title VI of the Civil Rights Act of 1964 apply to this part. These procedures are found in 45 CFR 80.6 through 80.10 and 45 CFR part 81.

Xavier Becerra,

Secretary, Department of Health and Human Services.

Environmental Protection Agency

40 CFR Part 423
Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category; Final Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 423

[EPA–HQ–OW–2009–0819; FRL–8794–02–OW]

RIN 2040–AG23

Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA or the Agency) is finalizing a Clean Water Act regulation to revise the technology-based effluent limitations guidelines and standards (ELGs) for the steam electric power generating point source category applicable to flue gas desulfurization (FGD) wastewater, bottom ash (BA) transport water and legacy wastewater at existing sources, and combustion residual leachate (CRL) at new and existing sources. Last updated in 2015 and 2020, this regulation is estimated to cost an additional $536 million to $1.1 billion dollars annually in social costs and reduce pollutant discharges by an additional approximately 660 to 672 million pounds per year.

DATES: This final rule is effective on July 8, 2024. In accordance with 40 CFR part 23, this regulation shall be considered issued for purposes of judicial review at 1 p.m. Eastern time on May 23, 2024. Under section 509(b)(1) of the Clean Water Act (CWA), judicial review of this regulation can be had only by filing a petition for review in the U.S. Court of Appeals within 120 days after the regulation is considered issued for purposes of judicial review. Under section 509(b)(2), the requirements of this regulation may not be challenged later in civil or criminal proceedings brought by EPA to enforce these requirements.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OW–2009–0819. All documents in the docket are listed on the *https://www.regulations.gov* website. Although listed in the index, some information listed in the index is not publicly available, *e.g.,* confidential business information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov.*

FOR FURTHER INFORMATION CONTACT: For technical information, contact Richard Benware, Engineering and Analysis Division, telephone: 202–566–1369; email: *benware.richard@epa.gov.* For economic information, contact James Covington, Water Economics Center, telephone: 202–566–1034; email: *covington.james@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble Acronyms and Abbreviations. The EPA uses multiple acronyms and terms in this preamble. To ease the reading of this preamble and for reference purposes, the EPA defines terms and abbreviations used in appendix A (although the list of abbreviations in the appendix is not exhaustive).

Supporting Documentation. The rule is supported by several documents, including the following:

- *Technical Development Document for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* (TDD), Document No. 821R24004. This report summarizes the technical and engineering analyses supporting the rule. The TDD presents the EPA's updated analyses supporting the revisions to FGD wastewater, BA transport water, CRL, and legacy wastewater. The TDD includes additional data that has been collected since the publication of the 2015 and 2020 rules, updates to the industry (*e.g.,* retirements, updates to wastewater handling), cost methodologies, pollutant removal estimates, non-water quality environmental impacts associated with updated FGD and BA methodologies, and calculations for the effluent limitations. In addition to the TDD, the Technical Development Document for the Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category (2015 TDD, Document No. EPA–821–R–15–007) and the Supplemental Technical Development Document for Revisions to the Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category (2020 Supplemental TDD, Document No. EPA–821–R–20–001) provide a more complete summary of the EPA's data collection, description of the industry, and underlying analyses supporting the 2015 and 2020 rules.
- *Environmental Assessment for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category (EA),* Document No. 821R24005. This report summarizes the potential environmental and human health impacts estimated to result from implementation of the revisions to the 2015 and 2020 rules.
- *Benefit and Cost Analysis for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* (BCA), Document No. 821R24006. This report summarizes the societal benefits and costs estimated to result from implementation of the revisions to the 2015 and 2020 rules.
- *Regulatory Impact Analysis for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* (RIA), Document No. 821R24007. This report presents a profile of the steam electric power generating industry, a summary of estimated costs and impacts associated with the revisions to the 2015 and 2020 rules, and an assessment of the potential impacts on employment and small businesses.
- *Environmental Justice Analysis for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* (EJA), Document No. 821R24008. This report presents a profile of the communities and populations potentially impacted by this rule, an analysis of the distribution of impacts in the baseline scenario and with the revisions, and a summary of inputs from potentially impacted communities that the EPA met with prior to publishing the proposed rulemaking.
- *Docket Index for the Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category.* This document provides a list of additional memoranda, references, and other information the EPA relied on for the final revisions to the ELGs.

Organization of this Document. The information in this preamble is organized as follows:

Table of Contents

I. Executive Summary
  A. Purpose of Rule
II. Public Participation
III. General Information
  A. Does this action apply to me?
  B. What action is the EPA taking?
  C. What is EPA's authority for taking this action?
  D. What are the monetized incremental costs and benefits of this action?

Appendix A to the Preamble: Definitions, Acronyms, and Abbreviations Used in This Preamble

I. Executive Summary

A. Purpose of Rule

The EPA is promulgating this final supplemental rule to update requirements that apply to wastewater discharges from steam electric power plants, particularly coal-fired power plants. In 2015, the EPA set the first Federal limitations on the levels of toxic metals in several of the largest sources of wastewater that can be discharged from power plants after last updating these regulations in 1982 (80 **Federal Register** (FR) 67838; November 3, 2015) (hereinafter the ''2015 rule''). On an annual basis, the 2015 rule was projected to reduce the amount of toxic metals, nutrients, and other pollutants that steam electric power plants are allowed to discharge by 1.4 billion pounds and reduce water withdrawal by 57 billion gallons. This rule was reconsidered in 2020 and modified in part due to changing dynamics in the power sector (85 FR 64650; October 13, 2020) (hereinafter the ''2020 rule''). Steam electric power plants are increasingly aging and less competitive sources of electric power in many portions of the United States.

Steam electric power plants, coal-fired power plants in particular, are subject to several environmental regulations designed to control (and in some cases eliminate) air, water, and land pollution over time. This rule, the Steam Electric Power Generating Effluent Limitations Guidelines and Standards—or steam electric ELGs—applies to the subset of the electric power industry where ''generation of electricity is the predominant source of revenue or principal reason for operation, and whose generation of electricity results primarily from a process utilizing fossil-type fuel (*e.g.,* coal, oil, gas), fuel derived from fossil fuel (*e.g.,* petroleum coke, synthesis gas), or nuclear fuel in conjunction with a thermal cycle employing the steam-water system as the thermodynamic medium'' (40 Code of Federal Regulations (CFR) 423.10). The 2015 rule addressed discharges from FGD wastewater, fly ash (FA) transport water, BA transport water, flue gas mercury control (FGMC) wastewater, gasification wastewater, CRL, legacy wastewater, and nonchemical metal cleaning wastes. The 2020 rule modified the 2015 requirements for FGD wastewater and BA transport water for existing sources only. The 2015 limitations for CRL from existing sources and legacy wastewater were vacated by the United States (U.S.) Court of Appeals for the Fifth Circuit in *Southwestern Electric Power Co., et al.* v. *EPA,* 920 F.3d 999 (5th Cir. 2019).

In the years since the EPA revised the steam electric ELGs in 2015 and 2020, new information has become available, which the EPA considered in finalizing this supplemental rule. For example, pilot testing and full-scale use of various, better performing treatment technologies have continued to develop, along with more data and information about their performance. The final supplemental rule updates requirements for discharges from two wastestreams addressed in the 2020 rule: BA transport water and FGD wastewater at existing sources. The final supplemental rule also replaces the court-vacated limitations for CRL (except for CRL discharges in one subcategory) and a subcategory of legacy wastewater. Finally, for the remaining CRL and legacy wastewaters, this rule finalizes a site-specific approach to developing technology-based limitations based on the permitting authorities' best professional judgment (BPJ), an option discussed by the Court in *Southwestern Electric Power Co.* v. *EPA.*

B. Summary of Final Rule

For existing sources that discharge directly to surface water, with the exception of the subcategories discussed below, the final rule establishes the following effluent limitations based on Best Available Technology Economically Achievable (BAT):

- A zero-discharge limitation for all pollutants in FGD wastewater, BA transport water, and CRL.

• Numeric (nonzero) discharge limitations for mercury and arsenic in unmanaged CRL [1] and for legacy wastewater discharged from surface impoundments during the closure process if those surface impoundments have not commenced closure under the Coal Combustion Residuals (CCR) regulations as of the effective date of this rule.

The final rule eliminates the separate, 2020 rule's less stringent BAT requirements for two subcategories: high-flow facilities and low-utilization electric generating units (LUEGUs), except to the extent they apply to one new permanent cessation of coal combustion subcategory. The final rule leaves in place the existing subcategories for oil-fired and small (50 megawatts (MW) or less) electric generating units (EGUs) established in the 2015 rule. The final rule also leaves in place the existing subcategory for EGUs permanently ceasing the combustion of coal by 2028, which was established in the 2020 rule and amended in a 2023 direct final rule by extending the date for filing a Notice of Planned Participation (NOPP). *See* 88 FR 18440 (March 29, 2023). Lastly, the final rule creates a new subcategory for EGUs permanently ceasing coal combustion by 2034. For both the existing and new subcategories referenced immediately above, the EPA is finalizing additional reporting and recordkeeping requirements and zero-discharge limitations applicable after EGUs cease coal combustion, as well as procedural requirements for affected facilities to demonstrate permanent cessation of coal combustion or that permanent retirement will occur.

As stated above, the rule eliminates the 2020 rule subcategories for high flow and low utilization, except to the extent they apply to EGUs in the new permanent cessation of coal combustion by 2034 subcategory. The elimination of the 2020 rule's subcategories will affect the one known high-flow facility (the Tennessee Valley Authority (TVA) Cumberland Fossil Plant) that has indicated it is planning to close and the two known facilities with LUEGUs (GSP Merrimack LLC and Indiana Municipal Power Agency (IMPA) Whitewater Valley Station), one of which is also expected to close. For EGUs ceasing coal combustion by 2034, the final rule retains the 2020 rule requirements for FGD wastewater and BA transport water and the pre-2015 BPJ-based BAT requirements for CRL rather than requiring the new, more stringent zero-discharge requirements for these wastestreams. After the permanent cessation of coal combustion, however, EGUs in this subcategory must meet limitations on arsenic and mercury based on chemical precipitation for CRL.

Where BAT limitations in this final rule are more stringent than previously established Best Practicable Control Technology Currently Available (BPT) and BAT limitations, any new limitations for direct dischargers do not apply until a date determined by the permitting authority that is as soon as possible on or after July 8, 2024, but no later than December 31, 2029.

For indirect discharges (*i.e.,* discharges to publicly owned treatment works (POTWs)), the final rule establishes pretreatment standards for existing sources that are the same as the BAT limitations except where limitations are for total suspended solids (TSS), a pollutant that does not pass through POTWs. Pretreatment standards are directly enforceable and apply May 9, 2027.

While the EPA is not aware of any planned new sources that would be subject to the requirements of this final supplement rule, this action sets new source performance standards and pretreatment standards for discharges of CRL from new sources that are equivalent to the new BAT limitations—namely, zero discharge.

C. Summary of Costs and Benefits

The EPA estimates that the final rule will cost $536 million to $1.1 billion per year in social costs and result in $3.2 billion per year in monetized benefits using a 2 percent discount rate.[2]

The EPA's analysis reflects the Agency's understanding of the actions steam electric power plants are expected to take to meet the limitations and standards in the final rule, including the implementation of additional treatment technologies to reduce pollutant discharges. The EPA based its analysis on a modeled baseline that reflects the full implementation of the 2020 rule, the expected effects of announced retirements and fuel conversions, and the anticipated impacts of relevant final rules affecting the power sector. Not all costs and benefits can be fully quantified and monetized. While some health benefits and willingness to pay (WTP) for water quality improvements have been quantified and monetized, those estimates may not fully capture all important water-quality-related benefits. Furthermore, the EPA anticipates the final rule would generate important additional benefits that the Agency was only able to analyze qualitatively (*e.g.,* improved habitat conditions for plants, invertebrates, fish, amphibians, and the wildlife that prey on aquatic organisms).

For additional information on costs and benefits, *see* sections VIII and XII of this preamble, respectively.

II. Public Participation

During the 60-day public comment period on the 2023 proposed supplemental rule (88 FR 18824, March 29, 2023) (from March 29, 2023, to May 30, 2023), the EPA received more than 22,000 public comment submissions from private citizens, industry representatives, technology vendors, government entities, environmental groups, and trade associations. The EPA also hosted two online public hearings during the public comment period—one on April 20, 2023, and one on April 25, 2023. These hearings had a combined total of 196 attendees, 46 of whom registered to provide comment on the proposed rule. Available documents from each public hearing include the presentations given by the EPA and two transcripts (document control number (DCN) SE10469, DCN SE10469A1, DCN SE10470 and DCN SE10470A1).

III. General Information

A. Does this action apply to me?

Entities potentially regulated by any final rule following this action include the following:

[1] As discussed in section VII.C.5 of this document, the EPA is defining unmanaged CRL in this rule to mean CRL which either: (1) the permitting authority determines are the functional equivalent of a direct discharge to waters of the United States (WOTUS) through groundwater or (2) CRL that has leached from a waste management unit into the subsurface and mixed with groundwater prior to being captured and pumped to the surface for discharge directly to a WOTUS.

[2] The EPA estimated the annualized value of future benefits and costs using a discount rate of 2 percent, following current Office of Management and Budget (OMB) guidance in Circular A–4 (OMB, 2023). In appendix B of the BCA, the EPA also provides results of analyses performed using 3 percent and 7 percent discount rates to allow comparison of the final rule costs and benefits with those estimated at proposal, which followed the guidance applicable at the time the prior analysis was conducted (OMB, 2003).

Category	Example of regulated entity	North American Industry Classification System (NAICS) Code
Industry	Electric Power Generation Facilities—Electric Power Generation	22111
	Electric Power Generation Facilities—Fossil Fuel Electric Power Generation	221112

This section is not intended to be exhaustive, but rather provides a guide regarding entities likely to be regulated by this final rule. Other types of entities that do not meet the above criteria could also be regulated. To determine whether a specific facility is regulated by this final rule, carefully examine the applicability criteria listed in 40 CFR 423.10 and the definitions in 40 CFR 423.11. If you still have questions regarding the applicability of this final rule to a particular entity, consult the person listed for technical information in the preceding **FOR FURTHER INFORMATION CONTACT** section.

B. What action is the EPA taking?

The Agency is revising certain BAT ELGs for existing sources in the steam electric power generating point source category that apply to FGD wastewater, BA transport water, CRL, and legacy wastewater.

C. What is EPA's authority for taking this action?

The EPA is finalizing this rule under the authority of sections 301, 304, 306, 307, 308, 402, and 501 of the CWA, 33 United States Code (U.S.C.) 1311, 1314, 1316, 1317, 1318, 1342, and 1361.

D. What are the monetized incremental costs and benefits of this action?

This final rule is estimated to have social costs of $536 million to $1.1 billion per year and result in $3.2 billion in benefits using a two percent discount rate.[3]

IV. Background

A. Clean Water Act

Congress passed the Federal Water Pollution Control Act Amendments of 1972, also known as the CWA, to ''restore and maintain the chemical, physical, and biological integrity of the Nation's waters.'' 33 U.S.C. 1251(a). The CWA establishes a comprehensive program for protecting our nation's waters. Among its core provisions, the CWA prohibits the discharge of pollutants from a point source to waters of the United States (WOTUS), except as authorized under the CWA. Under section 402 of the CWA, discharges may be authorized through a National Pollutant Discharge Elimination System (NPDES) permit. The CWA also authorizes the EPA to establish nationally applicable, technology-based ELGs for discharges from different categories of point sources, such as industrial, commercial, and public sources.

Furthermore, the CWA authorizes the EPA to promulgate nationally applicable pretreatment standards that restrict pollutant discharges from facilities that discharge wastewater to WOTUS indirectly through sewers flowing to POTWs, as outlined in CWA sections 307(b) and (c), 33 U.S.C. 1317(b) and (c). The EPA establishes national pretreatment standards for those pollutants in wastewater from indirect dischargers that may pass through, interfere with, or are otherwise incompatible with POTW operations. Pretreatment standards are designed to ensure that wastewaters from direct and indirect industrial dischargers are subject to similar levels of treatment. *See* CWA section 301(b), 33 U.S.C. 1311(b); *Chem. Mfrs. Ass'n* v. *NRDC,* 470 U.S. 116, 119 (1985); *Envtl. Def. Fund* v. *Costle,* 636 F.2d 1229, 1235 n.15 (D.C. Cir. 1980); *Reynolds Metals Co.* v. *EPA,* 760 F.2d 549, 553 (4th Cir. 1985); *Chem. Mfrs. Ass'n* v. *EPA,* 870 F.2d 177, 249 (5th Cir. 1989). In addition, POTWs are required to implement local treatment limitations applicable to their industrial indirect dischargers to satisfy any local requirements. *See* 40 CFR 403.5.

Direct dischargers (*i.e.,* those discharging directly from a point source to surface waters rather than through POTWs) must comply with effluent limitations in NPDES permits. Discharges that flow through groundwater before reaching surface waters must also comply with effluent limitations in NPDES permits if those discharges are the ''functional equivalent'' of a direct discharge from a point source to a WOTUS. *County of Maui* v. *Hawaii Wildlife Fund,* 590 U.S. 165 (2020). Indirect dischargers, who discharge through POTWs, must comply with pretreatment standards. Technology-based effluent limitations in NPDES permits are derived from ELGs (CWA sections 301 and 304, 33 U.S.C. 1311 and 1314) and new source performance standards (CWA section 306, 33 U.S.C. 1316) promulgated by the EPA, or based on BPJ where the EPA has not promulgated an applicable effluent guideline or new source performance standard. CWA section 402(a)(1)(B), 33 U.S.C. 1342(a)(1)(B); 40 CFR 125.3(c). Additional limitations based on water quality standards are also required to be included in the permit in certain circumstances. CWA section 301(b)(1)(C), 33 U.S.C. 1311(b)(1)(C); 40 CFR 122.44(d). The EPA establishes ELGs by regulation for categories of point source dischargers, and these ELGs are based on the degree of control that can be achieved using various levels of pollution control technology.

The EPA promulgates national ELGs for major industrial categories for three classes of pollutants: (1) conventional pollutants (*i.e.,* TSS, oil and grease, biochemical oxygen demand (BOD_5), fecal coliform, and pH), as outlined in CWA section 304(a)(4) and 40 CFR 401.16; (2) toxic pollutants (*e.g.,* toxic metals such as arsenic, mercury, selenium, and chromium; toxic organic pollutants such as benzene, benzo-a-pyrene, phenol, and naphthalene), as outlined in section 307(a) of the Act, 40 CFR 401.15 and 40 CFR part 423, appendix A; and (3) nonconventional pollutants, which are those pollutants that are not categorized as conventional or toxic (*e.g.,* ammonia-N, phosphorus, total dissolved solids (TDS)).

B. Relevant Effluent Guidelines

The EPA develops effluent guidelines that are technology-based regulations for a category of dischargers. The EPA bases these regulations on the performance of control and treatment technologies. The legislative history of CWA section 304(b), which is the heart of the effluent guidelines program, describes the need to press toward higher levels of control through research and development of new processes, modifications, replacement of obsolete plants and processes, and other improvements in technology, while also accounting for the cost of controls. Legislative history and case law support that the EPA need

[3] See note 2.

not consider water quality impacts on individual water bodies as the guidelines are developed; *see* Statement of Senator Muskie (October 4, 1972), reprinted in Legislative History of the Water Pollution Control Act Amendments of 1972, at 170. (U.S. Senate, Committee on Public Works, Serial No. 93–1, January 1973); *see also Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1005 (''The Administrator must require industry, regardless of a discharge's effect on water quality, to employ defined levels of technology to meet effluent limitations.'') (citations and internal quotations omitted).

There are many technology-based effluent limitations (TBELs) that may apply to a discharger under the CWA: four types of standards applicable to direct dischargers, two types of standards applicable to indirect dischargers, and a default site-specific approach. The TBELs relevant to this rulemaking are described in detail below.

1. Best Practicable Control Technology Currently Available

Traditionally, the EPA defines Best Practicable Control Technology (BPT) effluent limitations based on the average of the best performances of facilities within the industry, grouped to reflect various ages, sizes, processes, or other common characteristics. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F3d at 1025. The EPA may promulgate BPT effluent limitations for conventional, toxic, and nonconventional pollutants. In specifying BPT, the EPA looks at several factors. The EPA considers the cost of achieving effluent reductions in relation to the effluent reduction benefits. The Agency also considers the age of equipment and facilities, the processes employed, engineering aspects of the control technologies, any required process changes, non-water quality environmental impacts (including energy requirements), and such other factors as the Administrator deems appropriate. CWA section 304(b)(1)(B), 33 U.S.C. 1314(b)(1)(B). If, however, existing performance is uniformly inadequate, the EPA may establish limitations based on higher levels of control than what is currently in place in an industrial category, when based on an agency determination that the technology is available in another category or subcategory and can be practicably applied.

2. Best Available Technology Economically Achievable

BAT represents the second level of stringency for controlling direct discharge of toxic and nonconventional pollutants. Courts have referred to this as the CWA's ''gold standard'' for controlling discharges from existing sources. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003; *see also Kennecott* v. *EPA,* 780 F.2d 445, 448 (4th Cir. 1985) (''The BAT standard reflects the intention of Congress to use the latest scientific research and technology in setting effluent limits, pushing industries toward the goal of zero discharge as quickly as possible.''). In general, BAT represents the best available, economically achievable performance of facilities in the industrial subcategory or category. As the statutory phrase intends, the EPA considers the technological availability and the economic achievability when determining what level of control represents BAT. CWA section 301(b)(2)(A), 33 U.S.C. 1311(b)(2)(A). Other statutory factors that the EPA considers in assessing BAT are the cost of achieving BAT effluent reductions, the age of equipment and facilities involved, the process employed, potential process changes, and non-water quality environmental impacts, including energy requirements, and such other factors as the Administrator deems appropriate. CWA section 304(b)(2)(B), 33 U.S.C. 1314(b)(2)(B). The Agency retains considerable discretion in assigning the weight to be accorded these factors. *Weyerhaeuser Co.* v. *Costle,* 590 F.2d 1011, 1045 (D.C. Cir. 1978). The EPA usually determines economic achievability based on the effect the cost of compliance with BAT limitations has on overall industry and subcategory financial conditions.

BAT reflects the highest performance in the industry and may reflect a higher level of performance than is currently being achieved based on technology transferred from a different subcategory or category, bench scale or pilot plant studies, or foreign plants. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1006; *Chem. Mfrs. Ass'n* v. EPA, 870 F.2d at 226; *Nat. Res. Def. Council* v. *EPA,* 863 F.2d 1420, 1426 (9th Cir. 1988); *American Paper Inst.* v. *Train,* 543 F.2d 328, 353 (D.C. Cir. 1976); *American Frozen Food Inst.* v. *Train,* 539 F.2d 107, 132 (D.C. Cir. 1976). BAT may be based upon process changes or internal controls, even when these technologies are not common industry practice. *See American Frozen Foods,* 539 F.2d at 132, 140; *Reynolds Metals Co.* v. *EPA,* 760 F.2d at 562; *California & Hawaiian Sugar Co.* v. *EPA,* 553 F.2d 280, 285–88 (2nd Cir. 1977). ''In setting BAT, EPA uses not the average plant, but the optimally operating plant, the pilot plant which acts as a beacon to show what is possible.'' *Kennecott* v. *EPA,* 780 F.2d at 448 (citing *A Legislative History of the Water Pollution Control Act Amendments of 1972,* 93d Cong., 1st Sess. (Comm. Print 1973), at 798). As recently reiterated by the U.S. Court of Appeals for the Fifth Circuit, ''Under our precedent, a technological process can be deemed available for BAT purposes even if it is not in use at all, or if it is used in unrelated industries. Such an outcome is consistent with Congress'[s] intent to push pollution control technology.'' *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1031 (citation and internal quotations omitted); *see also Am. Petroleum Inst.* v. *EPA,* 858 F.2d 261, 265 (5th Cir. 1988).

3. New Source Performance Standards

New Source Performance Standards (NSPS) reflect effluent reductions that are achievable based on the Best Available Demonstrated Control Technology (BADCT). Owners of new facilities have the opportunity to install the best and most efficient production processes and wastewater treatment technologies. As a result, NSPS should represent the most stringent controls attainable through the application of the BADCT for all pollutants (that is, conventional, nonconventional, and toxic pollutants). In establishing NSPS, the EPA is directed to take into consideration the cost of achieving the effluent reduction and any non-water quality environmental impacts and energy requirements. CWA section 306(b)(1)(B), 33 U.S.C. 1316(b)(1)(B).

4. Pretreatment Standards for Existing Sources

Section 307(b), 33 U.S.C. 1317(b), of the CWA calls for the EPA to issue pretreatment standards for discharges of pollutants to POTWs. Pretreatment standards for existing sources (PSES) are designed to prevent the discharge of pollutants that pass through, interfere with, or are otherwise incompatible with the operation of POTWs. Categorical pretreatment standards are technology-based and are analogous to BPT and BAT ELGs; thus, the Agency typically considers the same factors in promulgating PSES as it considers in promulgating BAT. The General Pretreatment Regulations, which set forth the framework for the implementation of categorical pretreatment standards, are found at 40 CFR part 403. These regulations establish pretreatment standards that apply to all non-domestic dischargers. *See* 52 FR 1586 (January 14, 1987).

5. Pretreatment Standards for New Sources

Section 307(c), 33 U.S.C. 1317(c), of the Act calls for the EPA to promulgate Pretreatment Standards for New Sources (PSNS). Such pretreatment standards must prevent the discharge of any pollutant into a POTW that may interfere with, pass through, or may otherwise be incompatible with the POTW. The EPA promulgates PSNS based on BADCT for new sources. New indirect dischargers have the opportunity to incorporate into their facilities the best available demonstrated technologies. The Agency typically considers the same factors in promulgating PSNS as it considers in promulgating NSPS.

6. Best Professional Judgment

CWA section 301 and its implementing regulation at 40 CFR 125.3(a) indicate that technology-based treatment requirements under section 301(b) of the CWA represent the minimum level of control that must be imposed in an NPDES permit. Where EPA-promulgated effluent guidelines are not applicable to a non-POTW discharge, or where such EPA-promulgated guidelines have been vacated by a court, such treatment requirements are established on a case-by-case basis using the permit writer's BPJ. Case-by-case TBELs are developed pursuant to CWA section 402(a)(1), which authorizes the EPA Administrator to issue a permit that will meet either: all applicable requirements developed under the authority of other sections of the CWA (*e.g.,* technology-based treatment standards, water quality standards, ocean discharge criteria) or, before taking the necessary implementing actions related to those requirements, ''such conditions as the Administrator determines are necessary to carry out the provisions of this Act.'' The regulation at 40 CFR 125.3(c)(2) cites this section of the CWA, stating that technology-based treatment requirements may be imposed in a permit ''on a case-by-case basis under section 402(a)(1) of the Act, to the extent that EPA-promulgated effluent limitations are inapplicable.'' Furthermore, § 125.3(c)(3) indicates, ''[w]here promulgated effluent limitations guidelines only apply to certain aspects of the discharger's operation, or to certain pollutants, other aspects or activities are subject to regulation on a case-by-case basis in order to carry out the provisions of the Act.'' The factors considered by the permit writer are the same as those that the EPA considers in establishing technology-based effluent limitations. *See* 40 CFR 125.3(d)(1) through (3).

C. 2015 Steam Electric Power Generation Point Source Category Rule

1. 2015 Rule Requirements

On November 3, 2015, the EPA promulgated a rule revising the regulations for the Steam Electric Power Generating point source category, 40 CFR part 423. 80 FR 67838, November 3, 2015. The rule set the first Federal limitations on the levels of toxic pollutants (*e.g.,* arsenic) and nutrients (*e.g.,* nitrogen) that can be discharged in the steam electric power generating industry's largest sources of wastewater, based on technology improvements in the steam electric power industry over the preceding three decades. Before the 2015 rule, regulations for the industry were last updated in 1982 and, for the industry's wastestreams with the largest pollutant loadings, contained only limitations on TSS and oil and grease.

Over those 30 years, new technologies for generating electric power and the widespread implementation of air pollution controls had altered existing wastewater streams or created new wastewater streams at many steam electric facilities, particularly coal-fired facilities. Discharges of these wastestreams include arsenic, lead, mercury, selenium, chromium, and cadmium. Once in the environment, many of these toxic pollutants can remain there for years and continue to cause adverse impacts.

The 2015 rule addressed effluent limitations and standards for multiple wastestreams generated by new and existing steam electric facilities: BA transport water, CRL, FGD wastewater, FGMC wastewater, FA transport water, gasification wastewater, and legacy wastewater.[4] The rule required most steam electric facilities to comply with the effluent limitations ''as soon as possible'' after November 1, 2018, and no later than December 31, 2023. NPDES permitting authorities established particular applicability date(s) within that range for each facility (except for indirect dischargers) at the time they reissued the facility's NPDES permit.

The 2015 rule was projected to reduce the amount of metals the CWA defines as toxic pollutants, nutrients, and other pollutants that steam electric facilities are allowed to discharge by 1.4 billion pounds per year and reduce water withdrawal by 57 billion gallons. At the time, the EPA estimated annual compliance costs for the final rule to be $480 million (in 2013 dollars, discounted at 3 percent) and estimated annual benefits associated with the rule to be $451 to $566 million (in 2013 dollars, discounted at 3 percent).

2. Vacatur of Limitations Applicable to CRL and Legacy Wastewater

Seven petitions for review of the 2015 rule were filed in various circuit courts by the electric utility industry, environmental groups, and drinking water utilities. These petitions were consolidated in the U.S. Court of Appeals for the Fifth Circuit, *Southwestern Electric Power Co.* v. *EPA,* Case No. 15–60821 (5th Cir.). On March 24, 2017, the Utility Water Act Group submitted to the EPA an administrative petition for reconsideration of the 2015 rule. On April 5, 2017, the Small Business Administration (SBA) submitted an administrative petition for reconsideration of the 2015 rule.

On August 11, 2017, then EPA Administrator Scott Pruitt announced his decision to conduct a rulemaking to potentially revise the new, more stringent BAT effluent limitations and pretreatment standards for existing sources in the 2015 rule that apply to FGD wastewater and BA transport water. The Fifth Circuit subsequently granted the EPA's request to sever and hold in abeyance petitioners' claims related to those limitations and standards, and those claims are still in abeyance. With respect to the remaining claims related to limitations applicable to legacy wastewater and CRL, the Fifth Circuit issued a decision on April 12, 2019, vacating those limitations as arbitrary and capricious under the Administrative Procedure Act and unlawful under the CWA, respectively. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d 999. In particular, the Court rejected the EPA's BAT limitations for each wastestream set equal to previously promulgated BPT limitations based on surface impoundments. In the case of legacy wastewater, the Court held that the EPA's record on surface impoundments did not support BAT limitations based on surface impoundments. *Id.* at 1015. In the case of CRL, the Court held that the EPA's setting of BAT limitations equal to BPT limitations was an impermissible conflation of the two standards, which are supposed to be progressively more stringent, and that the EPA's rationale was not authorized by the statutory factors for determining BAT. *Id.* at 1026. After the Court's decision, the EPA announced its plans to address the vacated limitations in a later action after the 2020 rule.

[4] These wastestreams are defined in appendix A to this preamble.

In September 2017 (82 FR 43494), using notice-and-comment procedures, the EPA finalized a rule postponing the earliest compliance dates for the more stringent BAT effluent limitations and PSES for FGD wastewater and BA transport water in the 2015 rule, from November 1, 2018, to November 1, 2020 (''postponement rule''). The EPA also withdrew a prior action it had taken to stay parts of the 2015 rule pursuant to section 705 of the Administrative Procedure Act, 5 U.S.C. 705. The postponement rule received multiple legal challenges, but the courts did not sustain any of them.[5]

D. 2020 Steam Electric Reconsideration Rule and Recent Developments

1. 2020 Rule Requirements

On October 13, 2020, the EPA promulgated the *Steam Electric Reconsideration Rule* (85 FR 64650). The 2020 rule revised requirements for FGD wastewater and BA transport water applicable to existing sources. Specifically, the 2020 rule made four changes to the 2015 rule. First, the rule changed the technology basis for control of FGD wastewater and BA transport water. For FGD wastewater, the technology basis was changed from chemical precipitation plus high-hydraulic-residence-time biological reduction to chemical precipitation plus low-hydraulic-residence-time biological reduction. This change in the technology basis resulted in less stringent selenium limitations but more stringent mercury and nitrogen limitations. For BA transport water, the technology basis was changed from dry-handling or closed-loop systems to high-recycle-rate systems, allowing for a site-specific purge not to exceed 10 percent of the BA transport system's volume. This change in technology resulted in less stringent limitations for all pollutants in BA transport water. Second, the 2020 rule revised the technology basis for the voluntary incentives program (VIP) for FGD wastewater from vapor compression evaporation to chemical precipitation plus membrane filtration. This change in the technology basis resulted in less stringent limitations for most pollutants but added new limitations for bromide and nitrogen. Third, the 2020 rule created three new subcategories for high-flow facilities, LUEGUs, and EGUs permanently ceasing coal combustion by 2028. These subcategories were subject to less stringent limitations: high-flow facilities were subject to FGD wastewater limitations based on chemical precipitation; LUEGUs were subject to FGD wastewater limitations based on chemical precipitation and BA transport water limitations based on surface impoundments and a best management practice (BMP) plan; and EGUs permanently ceasing coal combustion by 2028 were subject to FGD wastewater and BA transport water limitations based on surface impoundments. Finally, the 2020 rule required most steam electric facilities to comply with the revised effluent limitations ''as soon as possible'' after October 13, 2021, and no later than December 31, 2025.[6] NPDES permitting authorities established the particular applicability date(s) of the new limitations within that range for each facility (except for indirect dischargers) at the time they reissued the facility's NPDES permit.

2. Fourth Circuit Court of Appeals Litigation

Two petitions for review of the 2020 rule were timely filed by environmental group petitioners and consolidated in the U.S. Court of Appeals for the Fourth Circuit on November 19, 2020. *Appalachian Voices, et al.* v. *EPA,* No. 20–2187 (4th Cir.). An industry trade group and certain energy companies moved to intervene in the litigation, which the Court granted on December 3, 2020. On April 8, 2022, the Court granted the EPA's motion and placed the case into abeyance pending the completion of the current rulemaking.

3. Executive Order 13990 and Announcement of Supplemental Rule

On January 20, 2021, President Biden issued Executive Order 13990: *Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis.* 86 FR 7037. Executive Order 13990 directed Federal agencies to immediately review and, as appropriate and consistent with applicable law, take action to address the promulgation of Federal regulations and other actions during the previous four years that conflict with the national objectives of protecting public health and the environment.

On July 26, 2021, the EPA announced a new rulemaking to strengthen certain wastewater pollution discharge limitations for coal-fired power plants that use steam to generate electricity (86 FR 41801, August 3, 2021). The EPA later clarified that, as part of its new rulemaking, it would be reconsidering all aspects of the 2020 rule. The EPA undertook an evidence-based, science-based review of the 2020 rule under Executive Order 13990, finding that there are opportunities to strengthen certain wastewater pollution discharge limitations. For example, the EPA discussed how treatment systems using membranes have advanced since the 2020 rule's promulgation and continue to rapidly advance as an effective option for treating a wide variety of industrial pollution, including pollution from steam electric power plants. In the announcement, the EPA also clarified that, until a new rule is promulgated, part 423 will continue to be implemented and enforced to achieve needed pollutant reductions.[7]

4. Preliminary Effluent Guidelines Plan 15

In September 2021, the EPA issued *Preliminary Effluent Guidelines Program Plan 15*.[8] This document discussed the annual review of ELGs, rulemakings for new and existing industrial point source categories, and any new or existing sources receiving further analyses. Here, in the context of the EPA's ongoing steam electric ELG rulemaking, EPA noted relevant wastestreams including pointing out that the 2015 rule limitations for CRL and legacy wastewater had been vacated and remanded to the Agency. For further discussion of the vacatur and remand of the 2015 limitations applicable to CRL and legacy wastewater, see section IV.D of this preamble.

E. Other Ongoing EPA Rules Impacting the Steam Electric Sector

The EPA has recently proposed or finalized several other rules to protect the nation's air, land, and water from pollution resulting from coal-fired power plants. The EPA has primarily considered these other rules to support this final rulemaking in two ways. First, when appropriate, the EPA has included the impacts of final rules in the baseline of its analyses. Second, the EPA has designed this final rule to harmonize compliance dates, subcategories, and other aspects of these rules to the extent possible and appropriate under different statutory schemes. The following sections summarize the solid waste and

[5] *See Center for Biological Diversity* v. *EPA,* No. 18–cv–00050 (D. Ariz. filed January 20, 2018); *see also Clean Water Action.* v. *EPA,* No. 18–60079 (5th Cir.). On October 29, 2018, the District of Arizona case was dismissed upon the EPA's motion to dismiss for lack of jurisdiction, and on August 28, 2019, the Fifth Circuit denied the petition for review of the postponement rule.

[6] The 2015 rule's VIP compliance date was revised to December 31, 2028, in the 2020 rule.

[7] This includes both the 2020 rule and portions of the 2015 rule which were not revised or vacated.

[8] Available online at: *www.epa.gov/system/files/documents/2021-09/ow-prelim-elg-plan-15_508.pdf.*

air rules that are most directly relevant to the electric power sector.

1. Coal Combustion Residuals Disposal Rule

On April 17, 2015, the EPA promulgated the Disposal of Coal Combustion Residuals from Electric Utilities final rule (2015 CCR rule) (80 FR 21302). This rule finalized national regulations to provide a comprehensive set of requirements for the safe disposal of CCR, commonly referred to as coal ash, from steam electric power plants. The final 2015 CCR rule was the culmination of extensive study on the effects of coal ash on the environment and public health. The rule established technical requirements for CCR landfills and surface impoundments under subtitle D of the Resource Conservation and Recovery Act (RCRA), the Nation's primary law for regulating solid waste.

These regulations established requirements for the management and disposal of coal ash, including requirements designed to prevent leaking of contaminants into groundwater, blowing of contaminants into the air as dust, and the catastrophic failure of coal ash surface impoundments. The 2015 CCR rule also set recordkeeping and reporting requirements, as well as requirements for each plant to establish and post specific information to a publicly accessible website. The rule also established requirements to distinguish the beneficial use of CCR from disposal.

As a result of the D.C. Circuit Court decisions in *Utility Solid Waste Activities Group* v. *EPA,* 901 F.3d 414 (D.C. Cir. 2018) (''*USWAG* decision'' or ''*USWAG*''), and *Waterkeeper Alliance Inc. et al.* v. *EPA,* No. 18–1289 (D.C. Cir. filed March 13, 2019), the Administrator signed two rules: *A Holistic Approach to Closure Part A: Deadline to Initiate Closure and Enhancing Public Access to Information* (CCR Part A rule) (85 FR 53516, August 28, 2020) on July 29, 2020, and *A Holistic Approach to Closure Part B: Alternate Liner Demonstration* (CCR Part B rule) (85 FR 72506, December 14, 2020) on October 15, 2020. The EPA finalized five amendments to the 2015 CCR rule which are relevant to the management of the wastewaters covered by this ELG because these wastewaters have historically been co-managed with CCR in the same surface impoundments. First, the CCR Part A rule established a new deadline of April 11, 2021, for all unlined surface impoundments in which CCR are managed (''CCR surface impoundments''), as well as CCR surface impoundments that failed the location restriction for placement above the uppermost aquifer, to stop receiving waste and begin closure or retrofitting. The EPA established this date after evaluating the steps that owners and operators need to take for CCR surface impoundments to stop receiving waste and begin closure, and the timeframes needed for implementation. (This did not affect the ability of plants to install new, composite-lined CCR surface impoundments.) Second, the Part A rule established procedures for plants to obtain approval from the EPA for additional time to develop alternative disposal capacity to manage their wastestreams (both CCR and non-CCR) before they must stop receiving waste and begin closing their CCR surface impoundments. Third, the Part A rule changed the classification of compacted-soil-lined and clay-lined surface impoundments from lined to unlined. Fourth, the Part B rule finalized procedures potentially allowing a limited number of facilities to demonstrate to the EPA that, based on groundwater data and the design of a particular surface impoundment, the unit ensures there is no reasonable probability of adverse effects to human health and the environment. Should the EPA approve such a submission, these CCR surface impoundments would be allowed to continue to operate.

As explained in the 2015 and 2020 ELG rules, the ELGs and CCR rules may affect the same EGU or activity at a plant. Therefore, when the EPA finalized the ELG and CCR rules in 2015, and revisions to both rules in 2020, the Agency coordinated the ELG and CCR rules to minimize the complexity of implementing engineering, financial, and permitting activities. Likewise, the EPA considered the interaction of the two rules during the development of this final rule. The EPA's analytic baseline includes the final requirements of these rules using the most recent data provided under the CCR rule reporting and recordkeeping requirements. This is further described in Supplemental TDD, section 3. For more information on the CCR Part A and Part B rules, including information about their ongoing implementation, visit *www.epa.gov/coalash/coal-ash-rule.*

Concurrently with the final ELG, in a separate rulemaking, the EPA is also finalizing regulatory requirements for inactive CCR surface impoundments at inactive utilities (''legacy CCR surface impoundment'' or ''legacy impoundment'') (FR 2024–09157 (EPA–HQ–OLEM–2020–0107; FRL–7814–04–OLEM)). This action is being taken in response to the August 21, 2018, opinion by the U.S. Court of Appeals for the District of Columbia Circuit in the *USWAG* decision that vacated and remanded the provision exempting legacy impoundments from the CCR regulations. This action includes adding a definition for legacy CCR surface impoundments and other terms relevant to this rulemaking. It also requires that legacy CCR surface impoundments comply with certain existing CCR regulations with tailored compliance deadlines.

The EPA is also establishing requirements to address the risks from currently exempt solid waste management that involves the direct placement of CCR on the land. The EPA is extending a subset of the existing requirements in 40 CFR part 257, subpart D, to CCR surface impoundments and landfills that closed prior to the effective date of the 2015 CCR rule, inactive CCR landfills, and other areas where CCR is managed directly on the land. In this action, the EPA refers to these as CCR management units, or CCRMU. This rule will apply to all existing CCR facilities and all inactive facilities with legacy CCR surface impoundments subject to this final rule.

Finally, the EPA is making a number of technical corrections to the existing regulations, such as correcting certain citations and harmonizing definitions. For further information on the CCR regulations, including information about the CCR Part A and Part B rules' ongoing implementation, visit *www.epa.gov/coalash/coal-ash-rule.*

2. Air Pollution Rules and Implementation

The EPA is taking several actions to regulate a variety of conventional, hazardous, and greenhouse gas (GHG) air pollutants, including actions to regulate the same steam electric power plants subject to part 423. In light of these ongoing actions, the EPA has worked to consider appropriate flexibilities in this ELG rule to provide certainty to the regulated community while ensuring the statutory objectives of each program are achieved. Furthermore, to the extent that these actions have been published before this rule's signature and are already impacting steam electric power plant operations, the EPA has accounted for these changed operations in its Integrated Planning Model (IPM) modeling discussed in section VIII of this preamble.

a. The Revised Cross State Air Pollution Rule Update and the Good Neighbor Plan for the 2015 Ozone National Ambient Air Quality Standards

On June 5, 2023, the EPA promulgated its final Good Neighbor Plan, which secures significant reductions in ozone-forming emissions of nitrogen oxides (NO_X) from power plants and industrial facilities. 88 FR 36654. The Good Neighbor Plan ensures that 23 states meet the Clean Air Act's (CAA's) ''Good Neighbor'' requirements by reducing pollution that significantly contributes to problems attaining and maintaining EPA's health-based air quality standard for ground-level ozone (or ''smog''), known as the 2015 Ozone National Ambient Air Quality Standards (NAAQS), in downwind states. Further information on this action is available on the EPA's website.[9]

As of September 21, 2023, the Good Neighbor Plan's ''Group 3'' ozone-season NO_X control program for power plants is being implemented in: Illinois, Indiana, Maryland, Michigan, New Jersey, New York, Ohio, Pennsylvania, Virginia, and Wisconsin. Pursuant to court orders staying the Agency's State Implementation Plan disapproval action in the following States, the EPA is not currently implementing the Good Neighbor Plan ''Group 3'' ozone-season NO_X control program for power plants in: Alabama, Arkansas, Kentucky, Louisiana, Minnesota, Mississippi, Missouri, Nevada, Oklahoma, Texas, Utah, and West Virginia.[10]

On January 16, 2024, the EPA signed a proposal to partially approve and partially disapprove State Implementation Plan submittals addressing interstate transport for the 2015 ozone NAAQS from Arizona, Iowa, Kansas, New Mexico, and Tennessee and proposed to include these States in the Good Neighbor Plan beginning in 2025 (89 FR 12666, February 16, 2024).

On April 30, 2021, the EPA published the final Revised Cross-State Air Pollution Rule (CSAPR) Update (86 FR 23054), which resolved 21 states' good neighbor obligations for the 2008 ozone NAAQS, following the remand of the 2016 CSAPR Update (81 FR 74504, October 26, 2016) in *Wisconsin* v. *EPA,* 938 F.3d 308 (D.C. Cir. 2019). Together, these two rules establish the Group 2 and Group 3 market-based emissions trading programs for 22 states in the eastern United States for emissions of NO_X from fossil fuel-fired EGUs during the summer ozone season.

b. Clean Air Act section 111 Rule

Concurrently with the final ELG, the EPA is finalizing the repeal of the Affordable Clean Energy Rule, establishing Best System of Emissions Reduction (BSER) determinations and emission guidelines for existing fossil fuel-fired EGUs, and establishing BSER determinations and accompanying standards of performance for GHG emissions from new and reconstructed fossil fuel-fired stationary combustion turbines and modified fossil fuel-fired EGUs. Specifically, for coal-fired EGUs, the EPA is establishing final standards based on carbon capture and storage/sequestration with 90 percent capture with a compliance date of January 1, 2032 (FR 2024–09233 (EPA–HQ–OAR–2023–0072; FRL–8536–01–OAR)). For coal-fired EGUs retiring by January 1, 2039, the EPA is establishing final standards based on 40 percent natural gas co-firing with a compliance date of January 1, 2030.

While four subcategories for coal-fired EGUs were proposed, the EPA is finalizing just the two subcategories for coal-fired EGUs as described in the preceding paragraph. Consistent with 40 CFR 60.24a(e) and the Agency's explanation in the proposal, states have the ability to consider, *inter alia,* a particular source's remaining useful life when applying a standard of performance to that source.[11]

In addition, the EPA is creating an option for states to provide for a compliance date extension for existing sources of up to one year under certain circumstances for sources that are installing control technologies to comply with their standards of performance. States may also provide, by inclusion in their state plans, a reliability assurance mechanism of up to one year that under limited circumstances would allow existing EGUs that had planned to cease operating by a certain date to temporarily remain available to support reliability. Any extensions exceeding 1-year must be addressed through a state plan revision. Further information about the CAA section 111 rule is available online at *https://www.epa.gov/stationary-sources-air-pollution/greenhouse-gas-standards-and-guidelines-fossil-fuel-fired-power.*

c. Mercury and Air Toxics Standards Rule

On March 6, 2023 (88 FR 13956), the EPA published a final rule which reaffirmed that it remains appropriate and necessary to regulate hazardous air pollutants (HAP), including mercury, from power plants after considering cost. This action revoked a 2020 finding that it was not appropriate and necessary to regulate coal- and oil-fired power plants under CAA section 112, which covers toxic air pollutants. The EPA reviewed the 2020 finding and considered updated information on both the public health burden associated with HAP emissions from coal- and oil-fired power plants, as well as the costs associated with reducing those emissions under the Mercury and Air Toxics Standards (MATS). After weighing the public risks these emissions pose to all Americans (and particularly exposed and sensitive populations) against the costs of reducing this harmful pollution, the EPA concluded that it remains appropriate and necessary to regulate these emissions. This action ensures that coal- and oil-fired power plants continue to control emissions of hazardous air pollution and that the Agency properly interprets the CAA to protect the public from hazardous air emissions.

Concurrently with the final ELG, the EPA is finalizing an update to the National Emission Standards for Hazardous Air Pollutants for Coal- and Oil-Fired Electric Utility Steam Generating Units (EGUs), commonly known as the Mercury and Air Toxics Standards (MATS) for power plants, to reflect recent developments in control technologies and the performance of these plants (FR 2024–0918 (EPA–HQ–OAR–2018–0794; FRL–6716.3–02–OAR)). This final rule includes an important set of improvements and updates to MATS and also fulfills the EPA's responsibility under the Clean Air Act to periodically re-evaluate its standards in light of advancements in pollution control technologies to determine whether revisions are necessary. The improvements consist of:

- Further limiting the emission of non-mercury HAP metals from existing coal-fired power plants by significantly reducing the emission standard for filterable particulate matter (fPM), which is designed to control non-mercury HAP metals. The EPA is finalizing a two-thirds reduction in the fPM standard; [12]

[9] *See https://www.epa.gov/csapr/good-neighbor-plan-2015-ozone-naaqs.*

[10] Further information on EPA's response to the stay orders can be found online at: *https://www.epa.gov/Cross-State-Air-Pollution/epa-response-judicial-stay-orders.*

[11] See 88 FR 33240 (May 23, 2023) (invoking RULOF based on a particular coal-fired EGU's remaining useful life ''is not prohibited under these emission guidelines'').

[12] Also, the EPA is finalizing the removal of the low-emitting EGU provisions for fPM and non-mercury HAP metals.

- Tightening the emission limit for mercury for existing lignite-fired power plants by 70 percent; [13]
- Strengthening emissions monitoring and compliance by requiring coal-and oil-fired EGUs to comply with the fPM standard using PM continuous emission monitoring systems (CEMS); [14]
- Revising the startup requirements in MATS to assure better emissions performance during startup.

Additional information on the final MATS is available on the EPA's website.[15]

d. National Ambient Air Quality Standards Rules for Particulate Matter

On February 7, 2024, the EPA Administrator signed a final rule strengthening the National Ambient Air Quality Standards for Particulate Matter (PM NAAQS) to protect millions of Americans from harmful and costly health impacts, such as heart attacks and premature death (89 FR 16202, March 6, 2024). Particle or soot pollution is one of the most dangerous forms of air pollution, and an extensive body of science links it to a range of serious and in some cases deadly illnesses. The EPA set the level of the primary (health-based) annual particulate matter ($PM_{2.5}$) standard at 9.0 micrograms per cubic meter to provide increased public health protection, consistent with the available health science. The EPA did not change the current primary and secondary (welfare-based) 24-hour $PM_{2.5}$ standards, the secondary annual $PM_{2.5}$ standard, and the primary and secondary PM_{10} standards. The EPA also revised the Air Quality Index to improve public communications about the risks from $PM_{2.5}$ exposures and made changes to the monitoring network to enhance protection of air quality in communities overburdened by air pollution. More information about this action is available on the EPA's website.[16]

V. Steam Electric Power Generating Industry Description

A. General Description of Industry

For each previous regulatory action—the 2013 proposed rule (78 FR 34432, June 7, 2013), the 2015 final rule, the 2019 proposed rule (84 FR 64620, November 22, 2019), the 2020 final rule, and the 2023 proposed rule—the EPA provided general descriptions of the steam electric power generating industry. The Agency has continued to collect information and update this industry profile. The previous descriptions reflected the known information about the universe of steam electric power plants and incorporated final environmental regulations applicable at that time. For this rule, as described in the Supplemental TDD, section 3, the EPA has revised its description of the steam electric power generating industry (and its supporting analyses) to incorporate major changes such as additional retirements, fuel conversions, ash handling conversions, wastewater treatment updates, and updated information on capacity utilization.[17] The analyses supporting this rule use an updated baseline that incorporates these changes in the industry and include the 2015 and 2020 rules' limitations for FGD wastewater, BA transport water, CRL, and legacy wastewater. The analyses then compare the effect of the new rule's requirements to this baseline.

As described in the Regulatory Impact Analysis, of the 858 steam electric power plants in the country identified by the EPA, only those coal-fired power plants that discharge FGD wastewater, BA transport water, CRL, legacy wastewater and/or unmanaged CRL may incur compliance costs under this rule. The EPA estimates that 141 to 170 such plants may incur compliance costs under this rule, depending on the scenario used to model the occurrence of unmanaged CRL costs. See section VII.C.5 of this preamble for more information regarding subcategory for discharges of unmanaged CRL. See the EPA's memorandum, *Changes to Industry Profile for Coal-Fired Generating Units for the Steam Electric Effluent Guidelines Final Rule* (DCN SE11618), for more information about plant retirements, fuel conversions, ash handling conversions, wastewater treatment updates, and updated information on capacity utilization.

B. Current Market Conditions and Drivers in the Electricity Generation Sector

1. Inflation Reduction Act Implementation

On August 16, 2022, President Biden signed into law the Inflation Reduction Act (IRA). The IRA marks the most significant action Congress has taken on clean energy and climate change in the nation's history. The IRA provides tax credits, financing programs, and other incentives, some of which are administered by the EPA, that will accelerate the transition to forms of energy that produce little or no GHG emissions and other water and air pollutants. As such, it includes many provisions that will affect the steam electric power generating industry, causing both direct effects through changes in the production of electricity and indirect effects on electricity demand and changes to fuel markets.

In September 2023, the EPA published a report on the effect of the IRA on the electricity sector and on the economy in general.[18] The report found that the IRA would lead to emission reductions from the electric power sector of 49 to 83 percent below 2005 levels in 2030. The associated shifts from fossil fuel generation would also lead to reductions in water and air pollution from the sector. The study also found that the IRA would lower economy-wide CO_2 emissions, including emissions from electricity generation and use, by 35 to 43 percent below 2005 levels in 2030. Across the end-use sectors, the study found that buildings exhibit the greatest reductions from 2005 levels of direct plus indirect CO_2 emissions from electricity, followed by industry and transportation. Though it focuses on changes in climate-forcing emissions (in part attributable to the models it uses), the study also implies important changes in the emissions of other pollutants throughout the economy. The EPA used IPM to evaluate the impacts of the final ELG relative to a baseline that reflects impacts from other relevant policies and environmental regulations that affect the power sector, including the IRA and other on-the-books Federal and state rules (*see* section VIII.C.2 of this preamble for more information).

[13] This level aligns with the mercury standard that other coal-fired power plants have been achieving under the current MATS.

[14] PM CEMS provide regulators, the public, and facility owners or operators with cost-effective, accurate, and continuous emission measurements. This real-time, quality-assured feedback can lead to improved control device and power plant operation, which will reduce air pollutant emissions and exposure for local communities.

[15] *See https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards.*

[16] *See https://www.epa.gov/pm-pollution/national-ambient-air-quality-standards-naaqs-pm.*

[17] The data presented in the general description continue to reflect some conditions existing in 2009.The 2010 steam electric industry survey remains the EPA's best available source of information for characterizing operations across the industry in cases where the EPA has not received newer information.

Available online at: *https://www.epa.gov/inflation-reduction-act/electric-sector-emissions-impacts-inflation-reduction-act.*

2. Recent Developments in Ensuring Electric Reliability and Resource Adequacy

The nature and components of the bulk power sector have been evolving away from older and less efficient legacy fossil generation (mostly coal-fired power plants) towards more decentralized, renewable assets and flexible gas-fired generation. Stakeholders have raised concerns that centralized, dispatchable power plants are coming offline faster than new generation can replace the reliability attributes associated with them. However, a combination of technology innovation, revised market signals from the Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs), and reforms recently completed and underway by Federal Energy Regulatory Commission (FERC) are collectively poised to address current reliability challenges associated with the transition along with expected higher load growth and the increasing frequency of extreme weather events. EPA has continued to learn and engage on reliability issues, particularly as part of the Agency's implementation of the *Joint Memorandum on Interagency Communication and Consultation on Electric Reliability*.[19] As part of this process, EPA has engaged in regular meetings with Department of Energy (DOE), North American Electric Reliability Corporation (NERC), FERC, and the various ISOs/RTOs.

FERC, NERC, RTOs, and ISOs are already taking steps to ensure reliability during this period of asset evolution. Among FERC's actions to help address reliability is Order 2023, or ''Improvements to Generator Interconnection Procedures,'' which will help expedite interconnections for new assets waiting to connect to the grid. This is a very important development to ensure future resource adequacy because interconnection wait times for new energy assets entering energy markets have increased, which is stifling the ability of replacement generation to connect to the grid. FERC's final action on extreme cold weather preparedness will support the new peak demand hours, which have migrated to winter months. New reliability standards issued for inverter-based resources ''will help ensure reliability of the grid by accommodating the rapid integration of new power generation technologies, known as inverter-based resources (IBRs), that include solar photovoltaic, wind, fuel cell and battery storage resources. . . .'' [20] FERC has also undertaken various transmission-related efforts, from inter-regional transmission capacity efforts to reconductoring and dynamic line rating, that would help bolster reliability by increasing the transmission capacity of existing lines and creating incentives for new, inter-regional transmission. Increasing transmission capacity can enhance reliability by increasing the amount of generation that can access the grid to help meet demand.

Furthermore, there are new technologies coming online that can also help provide reliability attributes. The deployment of many of these technologies has been accelerating due to the incentives in the IRA. The rapid increase in energy storage deployment across the nation is an important part of future grid reliability, particularly as the duration of storage assets expands. Examples of existing and emerging storage resources include various types of fuel cells, batteries, pumped hydro-electric reservoirs, and underground hydrogen caverns. Energy storage can help buttress reliability by storing renewable energy for dispatch when demand is high. Improved management of demand response assets, better designed electricity tariff structures, aggregation of distributed resources like roof-top solar panels, and integration of behind-the-meter battery storage can further support balancing peak demand on power grids. For example, programs to manage demand, which have shown value well before the recent energy transition, incentivize customers to shift their demand during periods when there is ample supply, which can help reduce instances when supply is tight.

Despite these concerns, there are also existing procedures in place to ensure electricity system reliability and resource adequacy over both the short and long-term. For example, regional planning organizations typically have incentive or planning procedures to ensure that there is sufficient capacity to meet future demand such as day-ahead reserve and capacity markets and seasonal reserve margins. Furthermore, the EPA understands that before a unit implements a retirement decision, the unit's owner will follow the processes put in place by the relevant RTO, balancing authority, or state regulator to protect electric system reliability. These processes typically include analysis of the potential impacts of the proposed EGU retirement on electrical system reliability, identification of options for mitigating any identified adverse impacts, and, in some cases, temporary provision of additional revenues to support the EGU's continued operation until longer-term mitigation measures can be put in place.

C. Control and Treatment Technologies

In general, control and treatment technologies for some wastestreams have continued to advance since the 2015 and 2020 rules. Often, these advancements provide plants with additional approaches for complying with any effluent limitations. In some cases, these advancements have also decreased the associated costs of compliance. For this rule, the EPA incorporated updated information and evaluated several technologies available to control and treat FGD wastewater, BA transport water, CRL, and legacy wastewater generated by the steam electric power generating industry. See section VIII of this preamble for details on updated cost information.

1. FGD Wastewater

FGD scrubber systems are used to remove sulfur dioxide from flue gas so it is not emitted into the air. Dry FGD systems use water in their operation but generally do not discharge wastewater because it evaporates during operation. Wet FGD systems do produce a wastewater stream.

Steam electric power plants discharging FGD wastewater currently employ a variety of wastewater treatment technologies and operating/management practices to reduce the pollutants associated with FGD wastewater discharges. The EPA identified the following types of treatment and handling practices for FGD wastewater:

- Chemical precipitation. Chemicals are added as part of the treatment system to help remove suspended solids and dissolved solids, particularly metals. The precipitated solids are then removed from the solution by coagulation/flocculation followed by clarification and/or filtration. The 2015 and 2020 rules focused on a specific design that employs hydroxide precipitation, sulfide precipitation (organosulfide), and iron coprecipitation to remove suspended solids and convert soluble metal ions to insoluble metal hydroxides or sulfides. Chemical precipitation was part of the BAT technology basis for the effluent limitations in the 2015 and 2020 rules.
- High-hydraulic-residence-time biological reduction (HRTR). The EPA

[19] Available online at: *https://www.epa.gov/power-sector/electric-reliability-mou.*

[20] For further information about FERC actions to address IBRs, *see https://www.ferc.gov/news-events/news/ferc-moves-protect-grid-transition-clean-energy-resources.*

identified three types of biological treatment systems used to treat FGD wastewater: anoxic/anaerobic fixed-film bioreactors (which target removals of nitrogen compounds and selenium), anoxic/anaerobic suspended growth systems (which target removals of selenium and other metals), and aerobic/anaerobic sequencing batch reactors (which target removals of organics and nutrients). An anoxic/anaerobic fixed-film bioreactor designed to remove selenium and nitrogen compounds using high hydraulic residence times of approximately 10 to 16 hours was part of the BAT technology basis for the effluent limitations in the 2015 rule.

• Low-hydraulic-residence-time biological reduction (LRTR). LRTR is a biological treatment system that targets removal of selenium and nitrate/nitrite using fixed-film bioreactors in smaller, more compact reaction vessels. This system differs from the HRTR biological treatment system evaluated in the 2015 rule, in that the LRTR system is designed to operate with a shorter residence time (approximately one to four hours, compared to a residence time of 10 to 16 hours for HRTR) while still achieving significant removal of selenium and nitrate/nitrite. LRTR was part of the BAT technology basis for the effluent limitations in the 2020 rule.

• Membrane filtration. A membrane filtration system (*e.g.,* microfiltration, ultrafiltration, nanofiltration, forward osmosis, electrodialysis reversal, or reverse osmosis (RO)) is designed specifically for high-TDS and high-TSS wastestreams. These systems are designed to minimize fouling and scaling associated with industrial wastewater. These systems typically use pretreatment for potential scaling agents (*e.g.,* calcium, magnesium, sulfates) combined with one or more type of membrane technology to remove a broad array of particulate and dissolved pollutants from FGD wastewater. The membrane filtration units may also employ advanced techniques, such as vibration or creation of vortexes to mitigate fouling or scaling of the membrane surfaces. Membrane filtration can achieve zero discharge by recirculating permeate from an RO system back into plant operations.

• Spray evaporation. Spray evaporation technologies, which include spray dry evaporators (SDEs) and other similar proprietary variations, evaporate water by spraying fine misted wastewater into hot gases. The hot gases allow the water to evaporate before contacting the walls of an evaporation vessel, treating wastewater across a range of water quality characteristics such as TDS, TSS, or scale forming potential. Spray evaporation technologies use a less complex treatment configuration than brine concentrator and crystallizer systems (see the description of thermal evaporation systems) to evaporate water using a heat source, such as a slipstream of hot flue gas or an external natural gas burner. Spray evaporation technologies can be used in combination with other volume reduction technologies, such as membranes, to maximize the efficiency of each process. Concentrate from an RO system can then be processed through the spray evaporation technology to achieve zero discharge by recirculating permeate from the RO system back into plant operations.

• Thermal evaporation. Thermal evaporation systems use a falling-film evaporator (or brine concentrator), following a softening pretreatment step, to produce a concentrated wastewater stream and a distillate stream to reduce wastewater volume by 80 to 90 percent and reduce the discharge of pollutants. The concentrated wastewater is usually further processed in a crystallizer that produces a solid residue for landfill disposal and additional distillate that can be reused within the plant or discharged. These systems are designed to remove the broad spectrum of pollutants present in FGD wastewater to very low effluent concentrations.

• Some plants operate their wet FGD systems using approaches that eliminate the discharge of FGD wastewater. These plants use a variety of operating and management practices to achieve this, including the following:

—Complete recycle. The FGD wastestream is allowed to recirculate. Particulates (*e.g.,* precipitates and other solids) are removed and landfilled. Water is supplemented when needed to replace water that evaporated or was removed with landfilled solids. This process does not produce a saleable product (*e.g.,* wallboard grade gypsum) but it does not need a wastewater purge stream to maintain low levels of chlorides.

—Evaporation impoundments. Some plants located in warm, dry climates use surface impoundments as holding basins where the FGD wastewater is retained until it evaporates. The evaporation rate from these impoundments is greater than the flow rate of the FGD wastewater and amount of precipitation entering the impoundments; therefore, there is no discharge to surface water.[21] These impoundments must be large enough to accommodate extreme precipitation events to prevent overtopping and runoff.

—FA conditioning. Many plants that operate dry FA handling systems use the water from their FGD system in the FA handling system to suppress dust or improve handling and/or compaction characteristics in an on-site landfill.

—Combination of wet and dry FGD systems. The dry FGD process involves atomizing and injecting wet lime slurry, which ranges from approximately 18 to 25 percent solids, into a spray dryer. The water contained in the slurry evaporates from the heat of the flue gas within the system, leaving a dry residue that is removed from the flue gas using a fabric filter (*i.e.,* baghouse) or electrostatic precipitator.

—Underground injection. These systems dispose of wastes by injecting them into a permitted underground injection well as an alternative to discharging wastewater to surface waters.

The EPA also collected information on other FGD wastewater treatment technologies, including direct contact thermal evaporators and ion exchange. These treatment technologies have been evaluated, in full- or pilot-scale, or are being developed to treat FGD wastewater. More information on these technologies is available in section 4.1 of the Supplemental TDD.

2. BA Transport Water

BA (bottom ash) consists of heavier ash particles that are not entrained in the flue gas and fall to the bottom of the furnace. In most furnaces, the hot BA is quenched in a water-filled hopper.[22] Some plants use water to transport (sluice) the BA from the hopper to an impoundment or dewatering bins. The water used to transport the BA to the impoundment or dewatering bins is usually discharged to surface water as overflow from the systems after the BA has settled to the bottom. The industry also uses the following BA handling systems that generate BA transport water:

• Remote mechanical drag system (MDS). These systems transport BA to a remote MDS using the same processes as wet-sluicing systems. A drag chain conveyor pulls the BA out of the water bath on an incline to dewater the BA. The system can be operated either as a

[21] Such impoundments must be lined based on the requirements in the CCR rule. This lining would significantly reduce the potential for a discharge through groundwater that would be the functional equivalent of a direct discharge to a WOTUS.

[22] Consistent with the 2015 and 2020 rule, EGU slag is considered BA.

closed-loop system (part of the technology basis for the 2015 rule) or a high-recycle-rate system (technology basis for the 2020 rule).[23]

- Mobile MDS. This technology is a smaller, mobile version of a remote MDS with an additional clarification system. It is not intended to be a permanent installation, which allows facilities to reduce capital costs. Once in place, the system works like a remote MDS—the incoming water is clarified and primary separation occurs. The clarified water is taken from the mechanical drag system to a mobile clarifier and polished to a level suitable for recirculation. The mobile clarifier thickens the collected solids, which are then sent back to the mechanical drag system portion and mixed with coarse BA. This mixture is sent up an incline, dewatered, and disposed of.
- Dense slurry system. These systems use a dry vacuum or pressure system to convey the BA to a silo (as described below for the ''dry vacuum or pressure system''), but instead of using trucks to transport the BA to a landfill, the plant mixes the BA with a lower percentage of water compared to a wet-sluicing system and pumps the mixture to the landfill.

As part of the 2020 rule and this rule, the EPA identified the following BA handling systems that do not, by definition or practice, generate BA transport water.

- MDS. These systems are located directly underneath the EGU. The BA is collected in a water quench bath. A drag chain conveyor pulls the BA out of the water bath along an incline to dewater the BA.
- Dry mechanical conveyor. These systems are located directly underneath the EGU. The system uses ambient air to cool the BA in the boiler and then transports the ash out from under the EGU using a conveyor. There is no water used in this process.
- Dry vacuum or pressure system. These systems transport BA from the EGU to a dry hopper without using any water. Air is percolated through the ash to cool it and combust unburned carbon. Cooled ash then drops to a crusher and is conveyed via vacuum or pressure to an intermediate storage destination.
- Vibratory belt system. These systems deposit BA on a vibratory conveyor trough, where the ash is air-cooled and ultimately moved through the conveyor deck to an intermediate storage destination without using any water.
- Submerged grind conveyor. These systems are located directly underneath the EGU and are designed to reuse slag tanks, ash gates, clinker grinders, and transfer enclosures from the existing wet sluicing systems. The system collects BA from the discharge of each clinker grinder. A series of submerged drag chain conveyors transport and dewater the BA.

More information on these technologies is available in section 4.2 of the Supplemental TDD.

3. CRL

In promulgating the 2015 rule, the EPA determined that CRL from landfills and impoundments includes similar types of constituents as FGD wastewater, albeit at potentially lower concentrations and smaller volumes. Based on this characterization of the wastewater and knowledge of treatment technologies, the EPA determined that certain treatment technologies identified for FGD wastewater could also be used to treat CRL. These technologies, described in section V.C.1 of this preamble, include chemical precipitation, biological treatment (including LRTR), membrane filtration, spray evaporation, or other thermal treatment options. The EPA also identified other management and reuse strategies from responses to the 2010 *Questionnaire for the Steam Electric Power Generating Effluent Guidelines,* or steam electric survey, which included using CRL from either an impoundment or landfill for moisture conditioning FA, dust control, or truck wash. The EPA also identified plants that collect CRL from impoundments and recycle it directly back to the impoundment.

4. Legacy Wastewater

Legacy wastewater can be composed of FGD wastewater, BA transport water, FA transport water, CRL, gasification wastewater and/or FGMC wastewater generated before the ''as soon as possible'' date that more stringent effluent limitations from the 2015 or 2020 rules would apply. Discharges of legacy wastewater may occur through an intermediary source (*e.g.,* a tank or surface impoundment) or directly into a surface waterbody, with the vast majority of legacy wastewater currently contained in surface impoundments resulting from treating the wastestreams listed above to the previously established BPT limitations. The record indicates that the following technologies can be applied to treat this type of legacy wastewater: chemical precipitation, biological treatment (including LRTR), membrane filtration, spray evaporation, and other thermal treatment options. These technologies are described in section V.C.1 of this preamble. Another option, which may be used in combination with other systems such as chemical and physical treatment, is zero valent iron (ZVI).

- ZVI. This technology can be used to target specific inorganics, including selenium, arsenic, nitrate, and mercury in this type of legacy wastewater. The technology entails mixing influent wastewater with ZVI (iron in its elemental form), which reacts with oxyanions, metal cations, and some organic molecules in wastewater. ZVI causes a reduction reaction in these pollutants, after which the pollutants are immobilized through surface adsorption onto iron oxide coated on the ZVI or generated from oxidation of elemental iron. The coated, or spent, ZVI is separated from the wastewater with a clarifier. The quantity of ZVI required and number of reaction vessels can vary based on the composition and amount of wastewater being treated.

The EPA recognizes that the characterization of legacy wastewater differs within the layers of a CCR impoundment as it is dewatered and prepared for closure. Therefore, treatment requirements may change as closure continues. Wastewater characteristics may also differ across CCR impoundments due to the different types of fuels burned at the plant, duration of pond operation, and ash type. Each of the treatment technologies identified for legacy wastewater above is applicable to all legacy wastewaters; treatment may require a combination of those technologies (*e.g.,* chemical precipitation and membrane filtration).

In addition, solids dewatering is necessary to dredge CCR materials from the impoundment. Mobile dewatering systems are typically self-contained units on a trailer, allowing for the entire system to be easily moved on-site and off-site. Legacy wastewater from a holding area (*e.g.,* pit, pond, collection tank) is pumped through a filter press to generate a filter cake and water stream. A shaker screen can be added to the treatment train to remove larger particles prior to the filter press. Furthermore, the filter press can be equipped with automated plate shifters to allow solids to drop from the end of the trailer directly into a loader or truck. The resulting wastestream may be further treated to meet any discharge requirements.

[23] In some cases, additional treatment may be necessary to maintain a closed-loop system. This additional treatment could include polymer addition to enhance removal of suspended solids or membrane filtration of a slipstream to remove dissolved solids.

VI. Data Collection Since the 2020 Rule

A. Information from the Electric Utility Industry

1. Data Requests and Responses

In January 2022, the EPA requested the following pollution treatment system performance and cost information for coal-fired power plants from three steam electric power companies:

- FGD wastewater installations of the following technologies: thermal technology; membrane filtration technology; paste, solidification, or encapsulation of FGD wastewater brine; electrodialysis; and electrocoagulation.
- Overflow from an MDS, a compact submerged conveyor, or remote MDS installations, including purge rate and management from remote MDS systems, as well as any pollutant concentration data to characterize the overflow or purge.
- CRL treatment from on-site or off-site testing (full-, pilot-, or laboratory-scale).
- On-site or off-site testing (full-, pilot-, or laboratory-scale) and/or implementation of treatment technologies associated with surface impoundment dewatering treatment.
- Costs associated with these technologies.

In addition, after meeting with four additional power companies, the EPA sent each company a voluntary request inviting them to provide the same data described above.

In July 2023, the EPA requested any full-, pilot-, or laboratory-scale data associated with on-site or off-site testing or implementation of a recently commissioned spray dryer evaporator for FGD wastewater and legacy wastewater at a coal-fired power plant from Minnesota Power. The EPA also requested information on pretreatment or disposal systems necessary for continued spray dryer evaporator operations and any corresponding documentation (*e.g.,* wastestreams generated, process flow diagram).

2. Meetings With Individual Utilities

To gather information to support this supplemental rule, the EPA met with representatives from four utilities. Two of these utilities reached out to the EPA after the announcement of the supplemental rulemaking. The EPA contacted the remaining utilities due to their known or potential consideration of membrane filtration. At these meetings, the EPA discussed the operation of the utility's coal-fired EGUs and the treatment and management of BA transport water, FGD wastewater, legacy wastewater, and CRL since the 2020 rule. The EPA learned about updates associated with plant operations and studies at these plants, which were originally discussed during the 2015 and 2020 rules.

The objectives of these meetings were to gather general information about coal-fired power plant operations; pollution prevention and wastewater treatment system operations; ongoing pilot or laboratory scale study information for FGD wastewater treatment; BA system performance, characterization, and quantification of the overflow and purge from remote MDS installations; and treatment technologies and pilot testing associated with CRL and legacy wastewater. The EPA used this information to supplement the data collected in support of the 2015 and 2020 rules.

3. Voluntary CRL Sampling

In December 2021, the EPA invited eight steam electric power companies to participate in a voluntary program designed to obtain data to supplement the wastewater characterization data set for CRL. The EPA requested these data from facilities believed to have constructed new landfills pursuant to the 2015 CCR rule. Six power companies chose to participate in this program. The EPA incorporated these data into the CRL analytical dataset used to estimate pollutant loadings. More information on estimated CRL pollutant loadings is available in section 6 of the Supplemental TDD.

4. Electric Power Research Institute Voluntary Submission

The Electric Power Research Institute (EPRI) conducts industry-funded studies to evaluate and demonstrate technologies that can potentially remove pollutants from wastestreams or eliminate wastestreams using zero-discharge technologies. Following the 2015 rule, the EPA reviewed 35 EPRI reports published between 2011 and 2018 that were voluntarily provided regarding characteristics of FGD wastewater, FGD wastewater treatment pilot studies, BA transport water characterization, BA handling practices, halogen addition rates, and the effect of halogen additives on FGD wastewater. For this supplemental rule, EPRI provided an additional 25 reports generated since 2018. The EPA used the information in these reports to inform treatment technology performance and to update methodologies for estimating costs and pollutant removals associated with candidate treatment technologies.

5. Meetings With Trade Associations

In 2021 and 2022, the EPA met with the Edison Electric Institute and the American Public Power Association. These trade associations represent investor-owned utilities and community-owned utilities, respectively. They provided information and perspectives on the status of many utilities transitioning away from coal. The EPA also participated in meetings with one trade association following the 2023 proposed rule. This association requested meetings with the EPA to discuss the association's public comments.

B. Notices of Planned Participation

The 2020 rule required facilities to file a Notice of Planned Participation (NOPP) with their permitting authority no later than October 13, 2021, if the facility wished to participate in the LUEGU subcategory, the permanent cessation of coal combustion by 2028 subcategory, or in the VIP. For the permanent cessation of coal combustion by 2028 subcategory, this filing date was extended by a 2023 direct final rule to June 27, 2023. 88 FR 18440. While the facilities were not required to provide copies of the NOPPs to the Agency, the EPA nevertheless obtained a number of these filings. Some facilities provided the EPA a courtesy copy when filing with the relevant permitting authority. The Agency received notice of other filings when a state permitting authority sent new draft permits or modifications to the EPA for review. The EPA also asked some states for NOPPs after those states asked the EPA questions about the process or initiated discussions about specific plants. Environmental groups that collected some additional information about NOPPs also shared the information with EPA prior to the publication of the proposed rule.

The EPA is currently aware of NOPPs covering 94 EGUs at 38 plants. At the time of the proposed rule, four EGUs (at two plants) requested participation in the LUEGU subcategory, an additional 12 EGUs (at four plants) requested participation in the 2020 rule VIP, and the remaining 74 EGUs (at 33 plants) requested participation in the permanent cessation of coal combustion by 2028 subcategory.[24] Following the 2023 direct final rule, the EPA obtained one additional NOPP stating that two EGUs (at one plant) requested participation in the permanent cessation

[24] Plant Scherer filed a permanent cessation of coal combustion by 2028 NOPP for two EGUs and a 2020 rule VIP NOPP for the remaining two EGUs; thus, the plant count for the three groupings does not equal 38.

of coal combustion subcategory by 2028 instead of the 2020 rule VIP. The EPA notes that these counts are not a comprehensive picture of facilities' plans for two reasons. First, the EPA was unable to obtain information for all plants and states. Second, even where a facility has filed a NOPP, under the transfer provisions of 40 CFR 423.13(o)(1)(ii), it still retains flexibility to transfer between subcategories, or between a subcategory and the 2020 VIP provisions, until December 31, 2025.[25] For example, the EPA made industry profile updates to some of the 90 EGUs with corresponding NOPPs based on public comments and other power company data (*e.g.,* integrated resource planning reports). For further detail, the NOPPs the EPA is aware of have been placed in the docket along with a memorandum summarizing the information and providing record index numbers for locating each facility, entitled *Changes to Industry Profile for Coal-Fired Generating Units for the Steam Electric Effluent Guidelines Final Rule* (DCN SE11618).

C. Information from Technology Vendors and Engineering, Procurement, and Construction Firms

The EPA gathered data on the availability and effectiveness of FGD wastewater, BA handling, CRL, and surface impoundment dewatering operations and wastewater treatment technologies from technology vendors and engineering, procurement, and construction firms through presentations, conferences, meetings, and email and phone contacts. These collected data informed the development of the technology costs and pollutant removal estimates for FGD wastewater, BA transport water, CRL, and legacy wastewater.

D. Other Data Sources

The EPA gathered information on steam electric generating facilities from the DOE's Energy Information Administration (EIA) Forms EIA–860 (Annual Electric Generator Report) and EIA–923 (Power Plant Operations Report). The EPA used the 2019, 2020, and 2021 data to update the industry profile, including commissioning dates, energy sources, capacity, net generation, operating statuses, planned retirement dates, ownership, and pollution controls at the EGUs. The EPA also referenced 2022 EIA data to support the analysis of FGD halogen (bromide and iodine) loads. Finally, the EPA used a 2024 EIA study as the basis for estimating the costs of a new coal-fired steam power plant.[26]

The EPA conducted literature and internet searches to gather information on FGD wastewater treatment technologies, including information on pilot studies, applications in the steam electric power generating industry, and implementation costs and timelines. The EPA also used internet searches to identify or confirm reports of planned facility plant and EGU retirements and reports of planned unit conversions to dry or closed-loop recycle ash handling systems. The EPA used this information to inform the industry profile and identify process modifications occurring in the industry.

VII. Final Regulation

A. Description of the Options

The EPA analyzed four main regulatory options at proposal, the details of which were discussed in the proposed rule. *See* 88 FR 18824, 18837–18838 (Mar. 29, 2023). For the final rule, the EPA evaluated three main regulatory options, as shown in table VII–1 of this preamble. Option A corresponds to the proposed regulation with modifications, while Options B and C would require controls that would achieve greater pollutant reductions. All three options include the same technology basis for FGD wastewater (zero-discharge systems) and BA transport water (dry-handling or closed-loop systems), while incrementally increasing controls on CRL and legacy wastewater and removing certain subcategories as one moves from Option A to Option C. Each successive option from Option A to Option C would achieve a greater reduction in wastewater pollutant discharges. Each subcategorization is described further in section VII.C of this preamble.

1. FGD Wastewater

Under all three main options, the EPA would require zero discharge of FGD wastewater based on zero-discharge technologies and retain the 2020 FGD wastewater limitations and standards as an interim step toward achievement of zero-discharge requirements. Under all three options, the EPA would also eliminate the BAT and PSES subcategorizations for high-FGD-flow facilities and LUEGUs. Options A and B would also create a subcategory for EGUs that will permanently cease coal combustion no later than December 31, 2034, and instead of zero discharge would require discharges from these facilities to meet the 2020 rule limitations as included in their CWA permit. This subcategory modifies the proposed early adopters subcategory and is described further in section VII.C of this preamble. Under Option C, the EPA would not finalize a subcategory for those EGUs planning to cease coal combustion by December 31, 2034. Note that, for all three options, the EPA would retain the 2020 subcategory for EGUs permanently ceasing coal combustion by 2028.

2. BA Transport Water

Under all three main options, the EPA would require zero discharge of BA transport water based on dry-handling or closed-loop systems and retain the 2020 BA transport water limitations and standards as an interim step toward achievement of zero-discharge requirements. For all three options, the EPA would also eliminate the BAT and PSES subcategorizations for LUEGUs. Options A and B would also create a subcategory for EGUs that will permanently cease coal combustion no later than December 31, 2034, and instead would require discharges from these facilities to meet the 2020 rule limitations as permitted. Under Option C, the EPA would not finalize this subcategory. Note that, for all three options, the EPA would retain the 2020 subcategory for EGUs permanently ceasing coal combustion by 2028.

3. CRL

Under Option A, the EPA would establish BAT limitations and PSES for mercury and arsenic based on chemical precipitation treatment. Under Options B and C, BAT limitations and PSES would be zero discharge and the EPA would establish BAT limitations for mercury and arsenic based on chemical precipitation for discharges of unmanaged CRL. Options A and B would also create a subcategory for EGUs that would permanently cease coal combustion no later than December 31, 2034; CRL discharges from EGUs in this subcategory would be subject to case-by-case BPJ decision-making until permanent cessation of coal combustion, after which they would be subject to mercury and arsenic limitations based on chemical precipitation. Under Option C, the EPA would not finalize this subcategory.

4. Legacy Wastewater

Under Option A, the EPA would not specify a nationwide technology basis for BAT/PSES applicable to legacy

[25] The ability to transfer into the LUEGU subcategory ended on December 31, 2023.

[26] U.S. Energy Information Administration (2024). *Capital Cost and Performance Characteristics for Utility-Scale Electric Power Generating Technologies,* available at: *https://www.eia.gov/analysis/studies/powerplants/capitalcost/pdf/capital_cost_AEO2025.pdf.*

wastewater at this time and such limitations would be derived on a site-specific basis by the permitting authorities, using their BPJ. Under Options B and C, the EPA would establish a subcategory for discharges of legacy wastewater discharged from surface impoundments commencing closure after July 8, 2024. For such discharges, the EPA would establish mercury and arsenic limitations based on chemical precipitation.

Table VII-1. Main Regulatory Options

Wastestream	Subcategory	Technology Basis for the BAT/PSES Regulatory Options		
		A	**B (Final Rule)**	**C**
FGD wastewater	N/A	Zero-discharge systems	Zero-discharge systems	Zero-discharge systems
	High-FGD-flow facilities/LUEGUs	NS	NS	NS
	EGUs permanently ceasing coal combustion by 2028	Surface impoundments	Surface impoundments	Surface impoundments
	EGUs permanently ceasing coal combustion by 2034	2020 rule limitations as permitted	2020 rule limitations as permitted	NS
BA transport water	N/A	Dry-handling or closed-loop systems	Dry-handling or closed-loop systems	Dry-handling or closed-loop systems
	LUEGUs	NS	NS	NS
	EGUs permanently ceasing coal combustion by 2028	Surface impoundments	Surface impoundments	Surface impoundments
	EGUs permanently ceasing coal combustion by 2034	2020 rule limitations as permitted	2020 rule limitations as permitted	NS
CRL	N/A	Chemical precipitation	Zero-discharge systems	Zero-discharge systems
	Discharges of unmanaged CRL	NS	Chemical precipitation	Chemical precipitation
	EGUs permanently ceasing coal combustion by 2034	Reserved; Chemical precipitation after closure	Reserved; Chemical precipitation after closure	NS
Legacy wastewater	N/A	Reserved	Reserved	Reserved
	Legacy wastewater discharged from surface impoundments commencing closure after **July 8, 2024**	NS	Chemical precipitation	Chemical precipitation

N/A = Not applicable

NS = Not subcategorized

Note: The table above does not present existing subcategories included in the 2015 rule or the 2020 VIP for FGD wastewater. The EPA did not propose, nor is it finalizing, any changes to the existing 2015 rule subcategorization of oil-fired units, units with a nameplate capacity of 50 MW or less, or the 2020 VIP.

B. Rationale for the Final Rule

After considering the technologies described in this preamble and the TDD, as well as public comments, and in light of the factors specified in CWA sections 301(b)(2)(A) and 304(b)(2)(B) (*see* section IV of this preamble), the EPA is establishing BAT effluent limitations based on the technologies described in Option B.[27] While the EPA is establishing new BAT effluent limitations for FGD wastewater and BA transport water based on more stringent technologies than the 2020 rule, the EPA is retaining the 2020 rule BAT effluent limitations for discharges before the applicability dates for new limitations on these wastewaters.

1. FGD Wastewater

The EPA is identifying zero-discharge systems as the technology basis for establishing BAT limitations to control pollutants discharged in FGD wastewater.[28] More specifically, the technology basis for BAT is membrane filtration systems, SDEs, and thermal evaporation systems, alone or in any combination, including any necessary pretreatment (*e.g.,* chemical precipitation) or post-treatment (*e.g.,* crystallization).[29] Furthermore, where a permeate or distillate is generated from the final stage of treatment, the BAT technology basis uses a process wherein this water would then be recycled back into the plant as either FGD makeup water or EGU makeup water.[30] After considering the factors specified in CWA section 304(b)(2)(B), the record shows that this suite of technologies is technologically available, is economically achievable, and has acceptable non-water quality environmental impacts. It is the EPA's intent that these three technologies considered together constitute BAT for FGD wastewater, and the EPA concludes that this BAT basis meets the requisite statutory factors. The EPA also finds, however, that each of the individual technologies within this suite supports a BAT determination on its own.

In the following subsections, the EPA discusses its rationale for selecting three zero-discharge systems as BAT for the control of FGD wastewater, as well as how each individual zero-discharge technology supports the BAT technology basis on its own. The EPA also explains why it is not selecting a less stringent technology as BAT. For further discussion of the changes (now being finalized by the EPA) to the definition of FGD wastewater related to infrequent storm events and decommissioning wastewater, see section VII.B.5 of this preamble. For further discussion of the EPA's retention of the 2020 rule limitations as interim limitations, see section VII.C.7 of this preamble.

a. The EPA selects zero-discharge systems as BAT for FGD wastewater.

Technological availability of zero-discharge systems. At proposal, the EPA identified membrane filtration as a potential BAT on which to base zero-discharge limitations for FGD wastewater, but also solicited comment on several other zero-discharge technologies, such as thermal evaporation systems and SDEs, that the EPA thought might serve alone or in any combination as the BAT basis for a final rule.

The EPA received many comments that were specific to individual zero-discharge technologies, including both comments supporting and opposed to a finding of technological availability for these individual technologies as part of the BAT basis. Comments supporting zero-discharge limitations pointed to the large number of operating zero-discharge plants and pilot studies as evidence that more than just the best performing plant or pilot plants are using zero-discharge systems. Comments opposing such a finding primarily focused on membrane filtration, the EPA's proposed zero-discharge technology basis under the preferred regulatory option. The two concerns raised most commonly in opposition to the finding of membrane filtration availability were, first, that the EPA did not collect sufficient additional information to alter its findings in the 2020 rule regarding this technology's availability and, second, that the pilot studies and foreign plants cited by the EPA were conducted on small FGD wastewater flows that were not representative of domestic industry operations. For both membrane filtration systems and thermal evaporation systems, commenters who opposed a finding of availability also questioned whether back-end management options were available for the associated wastes from zero-discharge systems. To the extent it received comments suggesting that waste management alternatives are not available, the EPA has addressed these comments in the subsection discussing non-water quality environmental impacts, below.

After consideration of public comments and as further discussed below, the EPA is basing its determination that zero-discharge systems are available for control of pollutants found in FGD wastewater on the numerous full-scale domestic and foreign installations of zero-discharge systems to treat FGD wastewater, the large number of successful domestic and international pilot tests of zero-discharge systems on FGD wastewater, successful use of zero-discharge systems on other steam electric wastestreams, and the use of zero-discharge systems on wastestreams in many different industries besides the steam electric power generating industry. Alternatively, the EPA is basing its determination that each of the technologies that make up the suite of zero-discharge systems forming the BAT basis, standing alone, is available on the several full-scale domestic and/or

[27] The EPA is including severability language in the final rule that makes clear that if any provisions of the final rule are reviewed and vacated by a court, it is the EPA's intent that as many portions of the rule remain in effect as possible.

[28] As described in section VII.B.5 of this preamble, the EPA is also finalizing a definitional change to certain wastewaters, including FGD wastewater, that excludes discharges necessary as a result of high intensity, infrequent storm events, as well as wastewater removed from FGD wastewater treatment equipment within the first 120 days of decommissioning the equipment.

[29] While three main technologies are listed here and are used to evaluate costs and non-water quality environmental impacts, the list is not meant to exclude use of other known zero-discharge treatment processes, including FA fixation, direct encapsulation, or evaporation ponds.

[30] The 2020 rule finalized a carve out from the definition of FGD wastewater applicable to ''treated FGD wastewater permeate or distillate used as boiler makeup water.''

foreign installations of each of these technologies to treat FGD wastewater and/or the successful domestic and international pilot tests of each of these technologies on FGD wastewater. The availability of each technology standing alone is also supported by the successful use of each of these technologies on other steam electric wastestreams and/or the use of each of these technologies on wastestreams in different industries besides the steam electric power generating industry. The weight of the evidence supports the Agency's conclusion that the suite of zero-discharge systems (or each of the individual technologies alone) are available in the industry to control FGD wastewater discharges, notwithstanding certain uncertainties the EPA described in the 2020 rule about one of the technologies that form the zero-discharge BAT technology basis. Agencies have inherent authority to reconsider past decisions and to revise, replace, or repeal a decision to the extent permitted by law and supported by a reasoned explanation. *FCC* v. *Fox Television Stations, Inc.,* 556 U.S. 502, 515 (2009); *Motor Vehicle Mfrs. Ass'n* v. *State Farm Mutual Auto. Ins. Co.,* 463 U.S. 29, 42 (1983). A finding that zero-discharge systems are available, or that each of the zero-discharge technologies forming the BAT basis is available, is also consistent with the technology-forcing nature of BAT as described in the legislative history and legal precedents discussing this provision (*see* section IV.B.2 of this preamble).

Full-scale domestic zero-discharge systems. In the 2020 rule, the EPA rejected membrane filtration as a standalone BAT technology basis due in part to the lack of a single full-scale domestic installation, which is still the case today. In that rule, however, the EPA did not evaluate a technology basis that includes the three zero-discharge technologies that form this final rule's BAT basis.

First, the EPA notes that 40 coal-fired power plants in the United States currently (as of 2024) operate wet FGD systems and manage their wastewater to achieve zero discharge.[31] These plants achieve zero discharge using evaporation ponds, recycling of FGD wastewater, ash fixation, thermal evaporation systems (*e.g.,* falling film evaporators), or SDEs. About 19 additional plants operated zero-discharge systems for FGD wastewater since 2009 but have since retired or converted fuels such that the FGD wastewater generation, and associated zero-discharge operations, have ceased. In total, more domestic facilities operate, or have operated, zero-discharge systems than the biological treatment systems used as the 2015 and 2020 rule bases.[32] Not only are there more of these systems, but the systems for which the EPA has information have achieved continuous, long-term zero discharge.

With respect specifically to the BAT basis identified in this final rule, the EPA finds that there are four U.S. coal-fired power plants currently operating full-scale thermal and three U.S. coal-fired power plants currently operating full-scale SDE systems.[33] The full-scale domestic application of the technologies identified in the BAT basis for this final rule support the EPA's finding that the BAT technology basis is available, as that term is used in the CWA. It also supports a finding that thermal evaporation systems are technologically available on their own and that SDEs are technologically available on their own.

Full-scale, foreign zero-discharge systems and zero-discharge pilot plants. While the full-scale, domestic operation of zero-discharge systems is sufficient to determine availability of the BAT technology basis, the EPA has also identified a number of full-scale, foreign zero-discharge systems, as well as domestic and international pilot systems; these could additionally or separately support the EPA's conclusion that the BAT basis identified in this final rule is available.

In 2020, the EPA declined to find that full-scale, foreign installations of membrane filtration demonstrated the availability of that technology, in large part because the EPA had not visited these systems or obtained long-term performance data on them, and thus stated there were uncertainties around these applications that prevented a finding of availability. At the time of the 2020 rule, the Agency cited 12 foreign installations of membrane filtration systems on FGD wastewater.[34] These systems began operating as early as 2015, and all of them were designed to operate as zero-discharge systems.[35] Importantly, however, the EPA did not dispute the availability of thermal evaporation systems in the 2020 rule. This is consistent with the record, as even at the time of the 2015 rule, the EPA visited three thermal evaporation systems operating in Italy, obtaining relevant performance data on these systems, which it then used to establish BAT limitations for a voluntary incentive program based on such technology, as well as NSPS for FGD wastewater.[36]

Some commenters on the 2023 proposal reiterated the EPA's 2020 rule findings and argued that EPA has not collected sufficient new information on foreign installations of membrane filtration to reverse its 2020 findings. EPA first notes that, for this final rule, it has modified its BAT basis from proposal to consist of three zero-discharge systems (each of which was described in the proposal). Since the 2015 rule, EPA has collected information not just about membrane filtration systems abroad, but also about an additional four thermal evaporation systems and six SDE systems operating on FGD wastewater outside the United States.[37] The EPA finds that, when combined with the site visits and performance data EPA obtained on the three Italian thermal evaporation systems as part of the 2015 rulemaking, the current record is more than sufficient to determine, based on full-scale, foreign installations, that the suite of systems forming the BAT basis in this rule is available as that term is used in the CWA.

[31] One of these 40 plants, which was already achieving zero discharge of its FGD wastewater, is now installing SDE. See *https://www.woodplc.com/insights/articles/engineering-solutions-for-wastewater-treatment* (DCN SE10284).

[32] The EPA accounted for four plants operating biological treatment systems in the 2015 rule analyses (DCN SE05832) and nine plants in the 2020 rule analyses (DCN SE08629).

[33] In the 2020 rule and 2023 proposal, the EPA has continually deferred to one company's representations that, contrary to representations from the technology vendor, its membrane filtration system is a long-term pilot system rather than a full-scale installation. This is a distinction without a difference, as the EPA can rely on both full-scale installations and pilot plants in establishing BAT limitations. Therefore, the EPA addresses this system in the section on pilot systems below (even though it could arguably be used to treat the facility's entire wastestream in the future).

[34] ERG. 2020. *Technologies for the Treatment of Flue Gas Desulfurization Wastewater* (DCN SE09218); ERG. 2020. *Notes from Call with DuPont* (DCN SE08618); Beijing Jingneng Power. 2017. *Beijing Jingneng Power Company, Ltd. [35] *Technologies for the Treatment of Flue Gas Desulfurization Wastewater, Coal Combustion Residual Leachate, and Pond Dewatering* (DCN SE11695).

[36] This information was also used as the basis for the 2015 rule NSPS for FGD wastewater.

[37] *Technologies for the Treatment of Flue Gas Desulfurization Wastewater, Coal Combustion Residual Leachate, and Pond Dewatering* (DCN SE11695).

Furthermore, even looking at membrane filtration itself, as the EPA noted in the 2023 proposal, the foreign membrane filtration systems discussed in the 2020 rule have continued to successfully treat FGD wastewater and achieve zero discharge since 2020. Despite commenters arguing that this additional information is not important because it does not change the overall number of plants known to operate the technology or the number of influent and effluent concentration data points collected from these plants, the EPA finds that continued operations constitute significant new information. This is because the longer each zero-discharge system operates, the less probability that some yet unknown operational difficulty will appear and the more certainty the EPA has that the technology is capable of achieving long-term zero-discharge treatment of this wastewater. Thus, foreign installations of the suite of technologies forming the BAT basis support the EPA's conclusion that the BAT basis is available as that term is used in the CWA. At the same time, use of thermal evaporation systems abroad supports a finding that thermal evaporation systems are technologically available on their own, use of SDEs abroad supports a finding that SDEs are technologically available on their own, and use of membrane filtration systems abroad support a finding that membrane filtration is technologically available on its own.

With respect to pilot studies, the 2020 rule found that pilot projects on membrane filtration did not provide sufficient long-term concentration data on which to base a finding of availability or calculate limitations.[38] Commenters on the 2023 proposal reiterated the EPA's 2020 rule findings and suggested that the EPA had not supplemented the record with enough pilot studies to reach a new conclusion on availability. The EPA disagrees. The Agency first notes that the BAT technology basis in this final rule has been updated to consist of three zero-discharge systems. When the 13 thermal pilot projects and one SDE pilot project on FGD wastewater in the record are combined with the 30 membrane filtration pilots on FGD wastewater discussed in the proposed rule (including eight pilot studies conducted since the 2020 rule), the EPA has significant evidence of the ability of this suite of systems to handle a variety of operating conditions.[39] These domestic and foreign pilots have demonstrated success removing pollutants from FGD wastewater under a number of pretreatment settings, whether performed without chemical precipitation pretreatment, with chemical precipitation pretreatment, or following biological treatment.[40] Furthermore, while some systems will not generate a clean permeate or distillate that needs to be handled, those that do will recycle this clean water source back into the plant to meet the final zero-discharge limitations. Thus, long-term pollutant removal information is no longer as relevant as it was in 2020 because the EPA is not calculating nonzero limitations in this final rule. While this discussion of pilot projects is used to support the availability of the BAT technology basis comprised of multiple technologies, the large number of successful pilot projects of membrane filtration and thermal evaporation systems also supports the EPA's finding that these individual technologies are available on their own.

In comments, one recurring criticism of the 2023 proposal was that conclusions about membrane filtration system availability should not be drawn from foreign installations and pilot plants due to their small FGD wastewater flow rates. While the EPA acknowledges that foreign installations and pilot plants may have had smaller FGD wastewater flow rates than some of the plants the Agency expects would use this technology to meet the final limitations in this rule, this does not weigh against the EPA considering them as evidence of the technology's availability because the record shows that membrane filtration systems can be readily modified to handle different flow rates. This same comment was raised as far back as the 2015 rule with respect to thermal evaporation systems. At that time, the EPA responded to comments on the scalability of zero-discharge thermal evaporation systems:

> Additionally, even if the flow rates were smaller, the fact that the technology can treat the FGD wastewater demonstrates that the system is available, and the size of the system does not matter because the system design can be scaled and designed to accommodate different flow rates.[41]

The EPA has not received information since 2015 that suggests that technologies are no longer scalable to higher flows. With respect to membrane filtration scalability, in particular, the most common system design for operating membrane filtration technologies is to place modules of these systems in parallel and simply add more and more stacks to treat higher and higher flows. Therefore, the EPA concludes that use of zero-discharge systems in smaller flow rate pilots and full-scale foreign facilities supports the finding that the BAT technology basis is available; these uses also support the EPA's finding that each of the individual technologies forming the BAT technology basis are available on their own.[42]

Application to other wastestreams. While the record above is sufficient to determine that the BAT basis of several zero-discharge systems is available, use of the BAT basis on other wastewaters also supports the EPA's finding regarding its availability. In the 2020 rule, the EPA declined to find that membrane filtration treatment of non-FGD wastewaters was sufficient to support a finding of availability. In that rule, EPA's conclusions were based on the ways in which each non-FGD wastewater appeared different from FGD wastewater. The EPA first notes that the BAT basis includes three zero-discharge systems, not just membrane filtration. When considering the success with which this suite of zero-discharge systems has operated on non-FGD wastewater that has similar characteristics to FGD wastewater, the EPA views application of these systems to such non-FGD wastewater as supporting EPA's conclusion that the suite of zero-discharge technologies identified as BAT in this rule is in fact available.

Examining all three zero-discharge systems that constitute the basis for BAT, these systems are used in full-scale applications to other wastestreams in the steam electric power sector and other industrial sectors. The domestic steam electric power sector applies

[38] The EPA nevertheless established limitations based on membrane filtration technology in the 2020 VIP.

[39] One of the systems is a long-term pilot project at one facility, which is a commercial-scale system that may have sufficient capacity to treat the full FGD wastestream moving forward. Nevertheless, because the company is still making changes to the operation of the plant's FGD system, has also pilot tested a biological treatment system, and has continued to leave the possibility of biological treatment for compliance open, the EPA defers to the company's characterization of this system as a pilot, rather than a domestic, full-scale installation.

[40] In one case, a utility conducted a successful membrane pilot even when there were significant failures in the performance of upstream pretreatment systems leading to excessive TSS passthrough to the membrane system.

[41] U.S. EPA (Environmental Protection Agency). 2015. *Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category: EPA's Response to Public Comments.* Part 6 of 10. Page 6–40.

[42] It is also possible that some plants may choose to treat only a slipstream of FGD wastewater with a similarly small flow rate to keep the system closed loop.

membrane filtration and thermal evaporation systems to EGU makeup water,[43] cooling tower blowdown,[44] and ash transport water.[45] Other industrial sectors with full-scale applications of membrane filtration, thermal evaporation, and SDE systems include the textiles,[46] chemical manufacturing,[47] mining,[48] agriculture, [49] oil and gas extraction,[50] food and beverage,[51] landfills,[52] and automotive industries.[53]

Information in the record indicates that there are many similarities between the FGD and the non-FGD wastestreams where zero-discharge systems have been used. In the 2020 rule record, the EPA discussed that cooling tower blowdown at steam electric power plants and desalination in oil and gas extraction were examples of where membrane filtration has been used in full-scale applications for treating high-TDS wastewaters (high-TDS being a characteristic of FGD wastewater); 85 FR 64664–64665. The 2020 rule record also established that mining wastewaters, which are high in gypsum scaling potential (another characteristic of FGD wastewater), have been successfully treated with membrane filtration applications. Finally, the 2020 rule record established that, despite the high variability in ash transport water (a third characteristic of FGD wastewater), it has been successfully treated with membrane filtration. This information indicates that membrane filtration can operate effectively on wastestreams that contain several characteristics of FGD wastewater, including high TDS, high gypsum scaling potential, and high variability.[54] The similarities of other wastewaters to FGD wastewater are also relevant when considering the successful treatment by thermal evaporation systems. Thermal evaporation systems have been used to treat mining wastewaters, oil and gas wastewaters, and landfill leachate. SDE systems have been used to treat landfill leachate. Thus, based on the information, the use of zero-discharge systems on other wastestreams supports the Agency's conclusion that the BAT basis of zero-discharge systems is available for FGD wastewater discharges. These uses also support the Agency's conclusion that membrane filtration, thermal evaporation systems, or SDE systems are each available on their own.

For all the foregoing reasons, the EPA finds that the BAT basis of zero-discharge systems is technologically available for the control of discharges in FGD wastewater. Steam electric power plants have used membrane filtration systems to achieve zero discharge of FGD wastewater internationally for years, and they have used traditional thermal evaporation systems [55] and SDEs [56] to achieve zero discharge of FGD wastewater domestically and internationally for years, as even recent electric utility reports acknowledge.[57] [58] [59] [60] The widespread use across a variety of configurations of zero-discharge systems, when supplemented with the successful domestic and international pilot tests and use of such systems on other wastewaters in many industries (including the steam electric power generating industry itself and including wastewaters with characteristics that are similar to the FGD wastestream), further supports EPA's conclusion that the suite of zero-discharge technologies identified as the BAT basis in this rule is available. While this is not necessary to support its prior availability determination, the EPA further finds that any one of the technologies making up the BAT basis for FGD wastewater is available as that term is used in the Act. For membrane filtration, availability is demonstrated through full-scale use of membrane filtration abroad and in pilot projects both domestically and abroad, as well as its application to other wastestreams. For thermal evaporation, availability is demonstrated through use of full-scale thermal evaporation systems domestically and abroad and pilot projects both domestic and abroad, as well as their application to other wastestreams. For SDE systems, availability is demonstrated through use of full-scale SDE systems domestically and abroad, as well as their use in at least one known pilot project and application to a non-FGD wastestream.

Reliance interests in connection with 2020 BAT technologies. Several commenters on the 2023 proposal criticized EPA for continuing to support implementation of the 2020 rule while simultaneously revising that rule with potentially more stringent limitations. These commenters stated that utilities relied upon materials announcing the Agency's decision to reconsider the 2020 rule and statements in the 2023 proposal which both confirmed that utilities should continue to implement the 2020 rule. Thus, in reliance, utilities claimed that they have continued to install compliant technologies and that such reliance should lead the EPA to a decision not to finalize more stringent BAT for these wastewaters. alternative, some commenters recommended that such facilities reliance on, and compliance with, the 2020 rule should lead the EPA to build in additional flexibility for any more stringent BAT. Suggested flexibilities focused on subcategorization or longer timeframes for cost recovery before installation of more stringent technologies.

The EPA agrees that such reliance interests should be considered.[61] The EPA disagrees, however, with commenters who suggested these interests mean the Agency must retain only the 2020 limitations in all cases. First, no NPDES permittee has certainty of its limitations beyond its five-year NPDES permit term, as reissued permits must incorporate any newly promulgated technology-based limitations as well as potentially more stringent limitations necessary to achieve water quality standards. *See* 40 CFR 122.44(a) and (d). The statute is designed for both technology-based and water quality-based effluent limitations to be revisited in each permit and, when necessary, revised consistent with these provisions and in light of the goal of ultimately eliminating pollutant discharges from point sources into WOTUS. *See* CWA section 101, 33 U.S.C. 1251.

Moreover, the EPA has included enough time for facilities to build in any reasonable reliance interest. As discussed in section VII.E of this preamble, the Agency is finalizing a ''no later than'' date for the new FGD wastewater BAT limitations of December 31, 2029. Having a ''no later than'' date approximately five-and-a-half years following promulgation allows facilities to rely on permitted limitations for the remainder of any permit existing as of the effective date of this final rule.

Third, the EPA has considered the arguments that facilities have unrecoverable costs, particularly for biological treatment systems that the final rule may render obsolete, by evaluating both the existing costs of the 2020 rule and the costs of this final rule together in the IPM analysis. As discussed in sections VII.F and VIII.C, the EPA uses IPM to analyze electric sector impacts.[62] IPM shows small impacts across the industry and leads the EPA to the conclusion that even the cumulative cost of the two technologies is economically achievable (this concept is explained in section VII.F of this preamble). Where more stringent technologies are available, are economically achievable, and have acceptable non-water quality environmental impacts as zero-discharge systems do here, the fact that facilities may have to spend more to supplement or replace existing treatment systems, even relatively new ones, is not a sufficient reason on its own to reject selection of the technology.

Lastly, to the extent that the facilities claiming to be most impacted by having to add treatment are those that will be permanently ceasing coal combustion by 2034, the EPA has created a new subcategory for these facilities that would allow them to continue to meet only the 2020 BAT limitations and thereby avoid recovering the costs of two treatment systems (*i.e.,* biological treatment and a zero-discharge system), each one designed to meet the requirements of the 2020 or 2024 rules, over the facility's short remaining useful life. EPA anticipates that approximately nine EGUs may be able to avail themselves of this subcategory with respect to FGD wastewater.[63]

Economic achievability of zero-discharge systems. The EPA finds that the costs of zero-discharge systems for control of FGD wastewater are economically achievable. The 2020 rule cited the increased cost of membrane filtration as compared to the selected technology basis as a reason for rejecting membrane filtration[64] but did not find that the costs of membrane filtration were not economically achievable at that time. The EPA also declined in the 2020 rule to establish BAT based on thermal evaporation systems, which the Agency stated were 2.4 times the costs of the 2020 BAT technology basis of chemical precipitation plus low-residence-time-reduction biological treatment and 1.04 times the cost of membrane filtration. The Agency said that these costs were unreasonably high, and it cited this finding, together with the costs that the industry was facing due to other EPA rules, to reject thermal technologies as not economically achievable.

After updating the cost analysis and IPM modeling for the final rule, the EPA finds that the costs of the BAT basis of zero-discharge systems for FGD wastewater are economically achievable for the industry, as discussed further below and in sections VII.F and VIII. Furthermore, the EPA notes that the estimates in IPM are conservative with respect to FGD wastewater. To the extent that costs would have been lower at six plants had the EPA used certain CBI costs for thermal evaporation systems in its primary cost analysis, the economic impacts modeled in IPM at these plants are overestimated.[65]

Non-water quality environmental impacts of zero-discharge systems. The EPA finds that the non-water quality environmental impacts of zero-discharge systems are acceptable.

The EPA proposed to find that the non-water quality environmental impacts of membrane filtration are acceptable. Specifically, the EPA proposed to reverse findings from the 2020 rule regarding FA use to encapsulate the brine generated by membrane filtration. The EPA also solicited comment on the non-water quality environmental impacts of other zero-discharge systems that might be used as a BAT technology basis.

Some commenters raised concerns relating to the non-water quality environmental impacts of zero-discharge systems. Specifically, commenters expressed concerns that the EPA had incorrectly evaluated FA availability because it did not use the most recent EIA data (which demonstrates that there is not enough FA available for brine encapsulation), did not use proper brine generation and encapsulation blending rates, and did not account for the costs of lost FA sales. Other commenters questioned the technological availability of one method of handling the solid waste generated from zero-discharge technologies—brine encapsulation—claiming that it has not been demonstrated to adequately retain pollutants in a landfill and, furthermore, that a particular form of brine encapsulation (paste encapsulation) has not been demonstrated and may not satisfy current disposal requirements. Finally, commenters claimed that pollutants in encapsulated brines and unencapsulated salt crystals could be

[61] The Supreme Court has held that, while an agency may change policies based upon a reasoned explanation, where a prior policy has engendered serious reliance interests, those interests must be taken into account. *FCC* v. *Fox Television Stations, Inc.,* 556 U.S. at 515 (citation omitted).

[62] While this modeling illustrates how the sector may comply with the rule, the EPA notes that the rule does not require any facilities to close.

[63] Additional EGUs are projected to participate in this subcategory for BA transport water and CRL as discussed in the sections below.

[64] While the relative costs of technologies differ from plant to plant, the 2020 rule acknowledged, and additional information obtained during the 2022 information collection confirms, that, in some cases, technologies such as membrane filtration may be less costly than biological treatment at individual plants even where, on average, they would be more expensive to the industry as a whole.

[65] To the extent that cost estimates for individual technologies are roughly of the same magnitude as indicated in the primary cost analysis, these costs would not be expected to alter the findings on economic achievability, even if the Agency were to rely on any one of the zero-discharge technologies as a standalone BAT basis.

remobilized in a landfill setting or could damage the landfill-liner system. While some comments argued these disposal issues spoke to availability of the zero-discharge technology, the EPA views this rather as a non-water quality environmental impact (solid waste disposal issue) that it must consider. After considering these comments and the record, the EPA finds that the non-water quality environmental impacts of zero-discharge systems are acceptable.

With respect to comments on FA availability, the EPA agrees with commenters that it should evaluate the most recent EIA data, brine generation data, and data on encapsulation blends. Therefore, the EPA has updated its analysis to consider the most recent information in *2024 Steam Electric Supplemental Final Rule: Fly Ash Analysis* (DCN SE11692). As noted in that document, FA sold for beneficial use fluctuates from year-to-year, but over the last five years the amount sold would still be less than the amount available for sale even after assuming that every plant uses FA to encapsulate brine from an FGD wastewater and/or CRL treatment system. Thus, the EPA does not expect that under worst-case scenarios the use of FA to encapsulate brine would hamper the fly ash sales market, let alone constitute an unacceptable non-water quality environmental impact.

Furthermore, the assumption that all facilities use membrane filtration and generate a brine for encapsulation represents a conservative estimate on FA usage. The EPA has updated its cost estimates as discussed in section VIII and section 5 of the TDD. These revised cost estimates consist of least-cost analysis across the various zero-discharge systems. Part of this update also included adjustments to better account for the amount of FA available for encapsulation, brine generation rates, and brine encapsulation blends, all to respond to commenters and improve the accuracy of the Agency's analysis. The EPA finds that the now higher costs of membrane filtration lead thermal and SDE systems to be a less costly option at many plants. This finding is consistent with cost information received from some companies showing that membrane filtration would not be the least-cost technology. As a result of this analysis selecting non-membrane systems at a number of plants, the assumptions of FA usage presented above can be seen as a likely worst-case scenario. To the extent that FA sales would be even less hampered than the scenario already found to be acceptable above, it would only further support the Agency's conclusion that FA use in brine encapsulation has acceptable non-water quality environmental impacts. For a further discussion of EPA's revised cost estimates, see section 5 of the TDD.

With respect to comments about potential remobilization of pollutants from brine encapsulation and demonstration of paste encapsulation; as far back as the 2015 rule, the EPA pointed to multiple waste-handling alternatives that were being employed by facilities with zero-discharge systems. Some facilities at that time used the brine generated by thermal systems to condition ash for disposal. In the 2020 rule record, the EPA discussed facilities that directly engage in FA fixation of the FGD wastewater for this purpose, skipping the volume reduction step that a membrane or thermal system would offer (see section 4.1.5 of the 2020 TDD, DCN SE08650). When commenters express concern that contaminants from encapsulated brines could be remobilized, these comments assume less processing than EPA contemplates. The commenters reference situations where FGD wastewater or brine are merely used to condition ash without employing the further pozzolanic reactions that the EPA expects to occur in the full encapsulation process and that EPA included in its cost estimates of zero discharge. Encapsulation studies demonstrate that concentrations of leachate pass leachate toxicity tests and are of lower concentration than raw FGD wastewater. Encapsulation would also result in far less remobilization than exiting ash conditioning practices. Furthermore, to the extent that the EPA considered and discussed paste encapsulation, it was as a potentially cost-saving alternative to these conditioning and encapsulation techniques that are already well-demonstrated. Thus, to the extent that it is a less costly solid waste management alternative, it only provides the promise of cost savings compared to the EPA's estimates, but the EPA does not rely on this particular form of brine encapsulation in determining that solid waste disposal issues as a whole have acceptable non-water quality environmental impacts.

Even if brine encapsulation had not been adequately demonstrated as a solid waste handling practice, other solid waste handling alternatives are available. For example, facilities in the 2015 and 2020 rule records took the brine generated from a thermal system all the way down to a salt crystal using a crystallizer (DCN SE11695). The EPA evaluated these costs in the *FGD Wastewater, CRL, and Legacy Wastewater Zero Discharge Treatment Technologies Costs, Loadings, and Non-Water Quality Environmental Impacts* file (DCN SE11709) as an alternative and found it would increase annualized costs by three percent. These slightly higher overall costs would still be economically achievable.[66]

With respect to comments about remobilization of pollutants, the EPA agrees with commenters that pollutants in a landfill can be remobilized through percolation of rainwater through the disposed solid wastes. These solid wastes would include not only any encapsulated brines but also certain solids and salt crystals that would be disposed of following use of some thermal and SDE alternatives where no brine is generated. Here, absent the pozzolanic reactions from either ash conditioning or encapsulation, remobilization of pollution is more possible as rainfall percolates through these disposed solids. Nevertheless, proper landfill management is designed to reduce infiltration of water through a landfill and to capture leachate that makes it to the liner at the bottom of a landfill. The EPA received no comments that the facilities already generating these solids and salts have failed to properly operate their landfills such that contaminants were remobilized into the environment. Even where remobilization can reduce the overall effectiveness of the pollution treatment systems, as discussed in section VII.B.3 of this preamble, the EPA is also finalizing zero-discharge limitations for CRL during the life of the plant, unless they are discharges of unmanaged CRL.[67] This is designed to further ensure that these pollutants are kept in the landfill to the maximum extent possible rather than remobilized and released into the environment.

Many of the facilities presented in the record as having zero-discharge systems have also successfully disposed of conditioned ash or FGD solids in landfills for years. The record supports that a properly designed, installed, and maintained landfill can operate as intended. As the EPA learned during implementation of the CCR rule, many

[66] Facilities could also consider deep-well injection of their brine. The EPA found that these costs on a nationwide basis would be three times the costs of encapsulation, and so are unlikely to be pursued by most facilities, though this too would constitute an alternative disposal practice available for the management of brine.

[67] Note that the EPA is finalizing zero-discharge limitations for CRL, except as specified in the subcategories discussed in sections VII.C.4 and C.5. Where lined WMUs collect and treat CRL to zero-discharge standards during a facility's operation, permeate and distillate can be used to condition CCR for disposal in these WMUs.

historical CCR landfills may suffer from the lack of an adequate liner system. However, the Agency has no evidence that, where liners are properly designed, installed, and maintained, they are incompatible with the additional pollutants in FGD wastewater that zero-discharge systems would capture.[68]

Finally, the EPA finds that, even to the extent that there are any negative non-water quality environmental impacts, the positive non-water quality environmental impacts outweigh the negative ones. In particular, the EPA estimates that there are significant decreases in air pollution and water withdrawals [69] as a result of this rule. While the rule is not being promulgated to reduce these impacts, these resulting non-water quality environmental impacts further support the Agency's conclusion that zero-discharge systems for FGD wastewater are BAT.

b. The EPA rejects less stringent technologies than zero-discharge systems as BAT for FGD wastewater.

Except for the new permanent cessation of coal combustion by 2034 subcategory discussed in section VII.C.4 of this preamble, and for discharges before the applicability dates of the new zero discharge-requirements in this final rule, the EPA is not selecting chemical precipitation followed by a low hydraulic residence time biological treatment including ultrafiltration, as the BAT technology basis. BAT is the ''gold standard'' for controlling water pollution from existing sources, and the Supreme Court has explained that BAT must achieve ''reasonable further progress'' toward the CWA's goal of eliminating pollution. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003, 1006 (citing *Nat'l Crushed Stone* v. *EPA,* 449 U.S. 64, 75 (1980)). The record shows that the 2020 rule industrywide BAT technology basis for FGD wastewater removes fewer pollutants than the zero-discharge BAT technology basis identified in this final rule that has been found to be technologically available, be economically achievable and have acceptable non-water quality environmental impacts.[70] Similarly, except for the permanent cessation of coal combustion by 2028 subcategory discussed in section VII.C.3 of this preamble, the EPA is not identifying the less stringent (and previously rejected in the 2015 and 2020 rules) technologies of surface impoundments or chemical precipitation, as these technologies too will remove fewer pollutants than the BAT technology basis in this rule.

2. BA Transport Water

The EPA is identifying the zero-discharge systems of dry-handling or closed-loop systems as the technology basis for establishing BAT limitations to control pollutants discharged in BA transport water.[71] Specifically, dry-handling systems include both waterless air-cooled conveyor systems and pneumatic systems, as well as under-boiler mechanical drag systems (*e.g.,* submerged chain conveyors) and submerged grind conveyors (*e.g.,* compact submerged conveyors), which use quench water to cool the ash but immediately remove the ash without generating BA transport water. Closed-loop systems consist of remote mechanical drag systems that actively sluice the ash (*i.e.,* transport the ash with water) and are paired with any necessary storage tanks, chemical addition systems, and/or RO treatment necessary to fully recycle BA transport water except during high intensity, infrequent storm events as discussed below.[72] The EPA finds that these technologies are technologically available, are economically achievable, and have acceptable non-water quality environmental impacts after evaluating the factors specified in CWA section 304(b)(2)(B).

In the 2020 rule, the EPA rejected dry-handling or closed-loop systems as the BAT technology basis in favor of high-recycle-rate systems with a site-specific purge allowance of up to 10 percent of the BA transport water system's volume to address four potential purge needs.[73] The EPA justified this change in BAT due to process changes plants were making to comply with the CCR regulations, as well as the additional costs of dry-handling or closed-loop systems. In the 2023 proposal, the EPA reevaluated the four asserted purge needs relied upon in establishing the 2020 purge, and for each asserted purge need, the Agency explained why the record no longer supported that these purges should be part of the BAT technology basis. As a result, the EPA proposed returning to the dry-handling or closed-loop systems that served as the BAT technology basis in the 2015 rule.

The EPA received comments both supporting and criticizing the proposed return to the BAT basis of dry-handling or closed-loop systems selected in the 2015 rule. Comments supporting the EPA's proposal to return to the 2015 BAT technology basis for BA transport water focused on the lack of evidence in the record of facilities with a demonstrated need to purge BA transport water. These comments also focused on the legal standard that BAT represents the best performing plant, arguing further that the EPA has never disputed that the best performing plant can achieve zero discharge. Comments opposing the return to the 2015 rule standard reiterated the four potential purge needs discussed in the 2020 rule. In the alternative, these commenters asked the EPA to formulate flexibilities for purges that in practice might be more or less flexible than the site-specific 10 percent volumetric purge allowance arrived at in the 2020 rule.

Commenters also responded to the EPA's solicitation about the potential disparity between the purges from closed-loop systems and the purges from under-boiler ''dry'' handling systems that still use quench water. These comments asked EPA not to further regulate quench water from under-boiler systems because the water is not used to transport ash and these facilities had relied on the quench water from dry-handling systems being treated as a ''low volume waste source'' rather than BA transport water.

After considering all public comments and the EPA's extensive record in light of the statutory factors, and as explained below, the EPA finds that dry-handling or closed-loop systems are available and economically achievable, and that they have acceptable non-water quality environmental impacts. Therefore, the

[68] In contrast, FGD gypsum is already removed from FGD wastewater before discharge and is known to loosen clay soils which sometimes form the base of older landfills designed without composite liners.

[69] Reduced water withdrawals could also lead to reduced impingement and entrainment.

[70] In contrast, nothing in the record or public comments indicates that chemical precipitation plus low hydraulic residence time biological reduction has ceased to be available, be economically achievable, and have acceptable non-water quality environmental impacts for discharges before the applicability dates of the new, more stringent limitations of this rule.

[71] As described in section VII.B.5 of this preamble, the EPA is also finalizing a definitional change to certain wastewaters, including BA transport water, that excludes discharges necessary as a result of high intensity, infrequent storm events, as well as wastewater removed from ash handling equipment within the first 120 days of decommissioning the equipment.

[72] In addition to remote MDSs, non-BAT technologies include many dewatering bins (also known as hydrobins), and surface impoundments may also have the flexibility to operate as closed-loop systems. Like remote MDSs, the latter systems may need to install chemical addition systems (acid, caustic, and/or flocculants), RO systems, and/or additional storage tanks to operate as fully closed loop.

[73] The four asserted purge needs related to precipitation, maintenance, water chemistry, and water balance.

EPA is selecting dry-handling or closed-loop systems as the BAT technology basis for BA transport water but is retaining the 2020 rule limitations for discharges before the applicability dates of the new zero-discharge requirement.

In the first subsection immediately below, the EPA discusses its rationale for selecting dry-handling or closed-loop systems as the BAT technology basis for BA transport water. In the following subsection, the EPA explains why it is not selecting less stringent technologies than dry-handling or closed-loop systems as the BAT technology basis for BA transport water. In the final subsection, the EPA discusses the definition of BA transport water and why, in light of the record, it declines to change how under-boiler ''dry'' systems with a discharge are regulated. For further discussion of the definitional changes to BA transport water that are being finalized with respect to high intensity, infrequent storm events, as well as decommissioning wastewater, see section VII.B.5 of this preamble. For further discussion of the EPA's retention of the 2020 rule limitations as interim limitations, see section VII.C.7 of this preamble.

a. The EPA selects dry-handling or closed-loop systems as BAT for BA transport water.

Technological availability of dry-handling or closed-loop systems. Based on the record, the EPA finds that dry-handling or closed-loop systems are technologically available. At the time of the 2020 rule, the EPA estimated that more than 75 percent of plants already employed dry-handling systems or wet-sluicing systems in a closed-loop manner, or they had announced plans to switch to such systems soon. Some of these systems have been in use since the 1970s, and today, most facilities have installed one or more such systems.[74] The high percentage of plants employing these systems indicates that they are technologically available.

In the 2015 and 2020 rule preambles, the EPA discussed the widespread use of dry-handling systems for control of BA transport water servicing about 200 EGUs at over 100 plants. In the 2020 rule, the EPA also discussed advances in dry BA handling systems. Specifically, the Agency discussed a newer technology called submerged grind conveyors (one example of which is called a compact submerged conveyor). At the time, compact submerged conveyors were known to be installed and in operation at two plants. The EPA has since learned that an additional plant has installed compact submerged conveyors.[75] [76] In addition to the increased use of compact submerged conveyors, a higher number and broader array of dry-handling systems are currently in place than the EPA originally forecasted. For example, as indicated in the 2020 rule record, one utility commented that it had space constraints at a facility that would preclude the installation of a compact submerged conveyor, and the EPA thus projected that this facility would employ a high recycle rate system under the 2020 rule. After the 2020 rule, however, that utility ultimately installed a different dry-handling system—which highlights the broad array of dry-handling options available for coal-fired power plants, regardless of their configuration. Even where space constraints may prohibit certain dry systems, a plant could use a pneumatic system, albeit at a somewhat greater cost. The 2020 rule record included information on 50 pneumatic installations from as early as 1992. Given that BAT is to reflect the best performing plant in the field, *Kennecott* v. *EPA,* 780 F.2d at 447, and that the facts in the record support the use of dry-handling technology to achieve zero discharge of BA transport water, it is likely the EPA could have selected dry-handling systems as the sole technology basis for control of BA transport water. Nonetheless, as it did in the 2015 rule, the EPA is also identifying closed-loop systems as a BAT technology basis for controlling discharges of BA transport water, given that a limited number of plants may find that option to be more attractive due to space constraints and lower costs when compared to a pneumatic system.

After the 2015 rule and during the 2020 rulemaking, certain industry representatives argued that there are challenges to operating a closed-loop BA handling system in a truly zero-discharge manner. They argued that closed-loop systems, including remote MDS and dewatering bins, cannot maintain fully closed-loop operations due to chemistry issues or water imbalances in the system, such as those that might occur from unexpected maintenance or large precipitation events. Even accounting for these issues, however, the 2020 rule did not find that closed-loop systems are not technologically available. Information in the EPA's 2020 rule record indicated that plants can operate their closed-loop systems to achieve zero discharge, although this could require some process changes and their resulting costs. Instead, the Agency rejected this technology as a basis for BAT based process changes happening at plants to comply with the CCR regulations (addressed further below), while also noting the additional costs over the 2015 rule's estimates. As explained below, the record indicates that closed-loop BAT handling systems are economically achievable. See section VIII of this preamble for a further discussion of costs associated with the closed-loop system technology basis.

In the 2020 rule, the EPA discussed four potential challenges with maintaining closed-loop systems: (1) managing non-BA transport water inflows, (2) managing precipitation-related inflows, (3) managing unexpected maintenance events, and (4) maintaining water system chemistry. The 2023 proposal discussed these issues at length, including why EPA did not view them as a basis for rejecting zero-discharge requirements. As explained in the proposal and further discussed below, based on the current record, the EPA continues to view none of these previously discussed challenges as providing a basis for rejecting closed-loop systems as not technologically available, although these issues may in certain circumstances require a plant to incur additional costs (which are found to be economically achievable) or to have an infrequent precipitation-related discharge (which would be addressed by the definitional changes the EPA is finalizing in this rule).

First, in 2020, the EPA stated that managing non-BA transport water inflows had the potential to result in water imbalances within a closed-loop system. In the 2023 proposal, the EPA found that closed-loop systems can be sized to handle additional wastestreams. The EPA received comments reiterating the 2020 rule findings; however, none of these comments provided specific data or information demonstrating that even one system cannot handle non-BA transport water inflows. Thus, EPA is maintaining its finding from proposal that a purge in response to water imbalance due to management of other wastestreams is not necessary.

Second, in 2020, EPA stated that managing precipitation-related inflows had the potential to result in water imbalances in the BA handling system. At proposal, EPA found that precipitation-related inflows can be

[74] One vendor estimates that only seven ash conversions remain in the entire industry.

[75] Some utilities have even suggested that the discussion of compact submerged conveyors in the final 2020 rule preamble and additional compliance timeframes have led them to consider these newer dry systems rather than a previously contemplated high-recycle-rate/closed-loop system.

[76] *Final Burns & McDonnell Meeting Notes* (DCN SE10248).

adequately managed with design improvements, including the use of roofing where appropriate. The 2015 BAT technology basis and 2020 rule remote MDS technology designs included covers to avoid collecting precipitation, and the costs for covers were included in the associated cost analysis. The EPA received comments on the 2023 proposal reiterating the 2020 rule findings; however, none of these comments provided specific data or information demonstrating that even one system cannot handle common precipitation-related inflows.[77] To the extent that a plant experiences precipitation-related inflows as a result of a 10-year storm event of 24-hour or longer duration (*e.g.,* a 10-year, 30-day storm event), the EPA is finalizing a definitional change discussed in section VII.B.5 of this preamble.

The 2020 rule mentioned a third previously discussed challenge to operating a remote MDS as a closed-loop system: the possibility of infrequent maintenance events that might fall outside the 2015 rule exclusion of ''minor maintenance'' and ''leaks'' from the definition of BA transport water. EPRI[78] [79] listed several such maintenance events; most were expected to occur less than annually. EPRI provided information about the estimated frequency and volume of water associated with each maintenance event; however, EPRI did not provide information about a specific remote MDS unable to manage these maintenance events with existing maintenance tanks. In the 2023 proposal, the EPA found that maintenance could be managed within a closed-loop system. Furthermore, even where maintenance wastewater volumes are too large to be managed in existing maintenance tanks, utilities can, at additional cost, lease storage tanks for short-term maintenance where these infrequent maintenance events are foreseeable. Commenters did not provide any information on maintenance activities that would require a purge if facilities properly planned and executed regular operation and maintenance (O&M). Thus, the EPA is maintaining its finding from proposal that a purge of BA transport water for maintenance is not necessary.

The final engineering challenge discussed in the 2020 rule record with respect to closed-loop systems was the need to maintain water system chemistry. The 2020 rule discussed potentially problematic system chemistries, such as extreme acidic conditions, high scaling potential, and the buildup of fine particulates that could clog pumps and other equipment. The 2015 closed-loop system BAT design basis included a chemical addition system to manage these system chemistries, as does the BAT basis in this final rule. In particular, corrosivity can be managed through pH adjustment, scaling can be managed with acid and/or antiscalants, and fines can be further settled out with polymers and other coagulants. EPRI has documented that some systems have gone slightly further, pairing the chemical addition systems with changes in operations, such as higher flow rates or longer contact time. Some commenters on the 2023 proposal suggested that systems would not be able to manage these chemistry problems but did not provide information supporting this assertion. In the absence of information, the EPA finds that, even assuming that the previously mentioned strategies would not apply at a given plant, the same slipstream of purge allowed under the 2020 rule could be treated with RO and recycled back in as clean makeup water. The EPA has considered these additional costs as discussed in sections VII.F and VIII, and outside the additional cost (which is found to be economically achievable), there is no record evidence that this chemistry-related challenge cannot be overcome with reasonable steps. Therefore, this concern does not provide a basis for rejecting closed-loop systems as BAT.

For all the foregoing reasons, the EPA finds that the record indicates that dry-handling or closed-loop systems are technologically available for control of discharges in BA transport water.

Economic achievability of dry-handling or closed-loop systems. The EPA finds that the costs of dry-handling or closed-loop systems are economically achievable. In the 2020 rule, the EPA cited the costs of closed-loop systems as an additional basis for selecting high recycle rate systems. In the 2020 rule, the EPA noted that it had ''conservatively'' estimated costs of $63 million per year based on all facilities using a remote MDS needing a 10 percent purge to be treated with RO in order to achieve complete recycle (*i.e.,* zero discharge operations). The EPA never found, however, that the additional costs to achieve zero discharge were not economically achievable.

The EPA's updated cost estimates demonstrate that, after including the costs of treating all wastestreams—including achieving zero discharge for BA transport water—the final rule would result in minimal economic impacts. (For further information, see sections VII.F and VIII.) After considering these results, the EPA finds that these additional costs are economically achievable as that term is used in the CWA.

Non-water quality environmental impacts of dry-handling or closed-loop systems. The EPA finds that the non-water quality environmental impacts associated with dry-handling or closed-loop systems for controlling BA transport water discharges are acceptable. See sections VII.G and X below for more details.

Process changes associated with dry-handling or closed-loop systems. In the 2020 rule, the EPA also rejected dry handling or closed-loop systems due to process changes happening at steam electric facilities as they moved toward compliance with the CCR regulations. The EPA stated that, as plants close their surface impoundments under the CCR regulations, they may choose to send certain non-CCR wastewaters to their BA handling system. This was said to potentially complicate their efforts to fully close their BA handling systems due to increased scaling, corrosivity, or plugging of equipment. Alternatively, a closed-loop requirement might incentivize plants to discharge their non-CCR wastes rather than send them to their BA handling systems for control, in which case they would be subject to less stringent requirements governing low volume waste sources. The EPA also suggested that requiring limitations based on closed-loop systems could result in plants using their surface impoundments longer, assuming plants cannot build alternative storage capacity and need to continue to send their non-CCR wastes to unlined impoundments.

The rationale in the 2020 rule is no longer persuasive as a reason to select high recycle rate systems rather than dry-handling or closed-loop systems because the changes happening at plants under the CCR regulations are expected to be complete by the time the final BAT limitations apply to any given plant. In particular, the final rule BA transport water requirements will be included in NPDES permits with an applicability date of no later than December 31, 2029. This is over a decade after the

[77] In one comment, a utility suggested that it could not employ roofing at its plant without jeopardizing the necessary cooling of the BA, but this plant did not provide any data showing that it could not manage this heat transfer with standard heating, ventilation, and air conditioning (HVAC) equipment.

[78] EPRI, 2018. *Closed-Loop Bottom Ash Transport Water: Costs and Benefits to Managing Purges* (DCN SE06920).

[79] EPRI, 2016. *Guidance Document for Management of Closed-Loop Bottom Ash Handling Water in Compliance with the 2015 Effluent Limitations Guidelines* (DCN SE06963).

promulgation of the 2015 CCR rule and eight years after even the revised CCR surface impoundment deadline of April 11, 2021, by which facilities were required to cease receipt of all wastes into their unlined CCR surface impoundment.[80] As of the publication of this rule, most facilities have already completed conversions of their leaking, unlined CCR surface impoundments under the CCR regulations, which means that they no longer rely on these unlined surface impoundments as part of their BA handling systems, but rather have installed systems to handle their BA transport water that do not rely on unlined CCR surface impoundments.[81]

Of the remaining unlined CCR surface impoundments that might exist following promulgation of this rule, those operating under the CCR Part A rule flexibility found in § 257.103(f)(2) must permanently cease coal combustion, and as discussed below, the EPA is retaining the subcategory for EGUs permanently ceasing coal combustion by 2028, which does not require zero discharge of BA transport water. For those unlined CCR surface impoundments that are not permanently ceasing coal combustion and are required to close for cause but where alternative capacity is technically infeasible, there is some flexibility under the CCR Part A rule allowing for a maximum timeframe of October 15, 2023, or October 15, 2024, for the surface impoundment to cease receipt of waste.[82] The 2023 and 2024 extended timeframes require EPA approval.[83] Even with these extensions, the majority of facilities will have ceased receipt of waste in its non-compliant surface impoundment and completed its conversion to a CCR regulation-compliant BA handling method (necessary to remain in operation) within a few months of the effective date of this rule. Since there are no looming deadlines and tight timeframes under the CCR regulations that would justify continued flexibility, facilities with high recycle rate systems are free to focus on transitioning those high recycle rate systems to closed-loop operations.[84] Because ash handling changes will no longer be compelled by the CCR regulations by the time this final rule is effective, the EPA concludes that there are no ''process change'' or non-water quality environmental impact reasons related to the CCR regulations that weigh against the EPA's decision to select dry-handling or closed-loop systems as the BAT basis for control of BA transport water discharges.

b. The EPA rejects less stringent technologies than dry-handling or closed-loop systems as BAT for BA transport water.

Except for the new subcategory for EGUs permanently ceasing coal combustion by December 31, 2034, and for discharges before the applicability dates for the new zero-discharge requirement of this rule, the EPA is not establishing BAT limitations based on high recycle rate systems. In the 2020 rule, the EPA reversed its decision from the 2015 rule and determined that dry-handling or closed-loop systems were not BAT. As a result, the EPA established a volumetric purge allowance (with a maximum of 10 percent of the system volume) to be determined on a case-by-case basis by the permitting authority, which required a permitting authority's BPJ analysis to determine any appropriate further control. As discussed above, the technological issues identified in the 2020 rule can be resolved, albeit at potentially additional costs, which the EPA finds are economically achievable. Furthermore, a dewatering bin or remote MDS with a purge removes fewer pollutants than the BAT basis of dry-handling or closed-loop systems, which the Agency finds is technologically available, economically achievable, and has acceptable non-water quality environmental impacts.[85] BAT is the ''gold standard'' for controlling water pollution from existing sources, and the Supreme Court has explained that BAT must achieve ''reasonable further progress'' toward the Act's goal of eliminating pollution. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003, 1006 (citing *Nat'l Crushed Stone* v. *EPA,* 449 U.S. at 75). For these reasons, the EPA is not selecting high-rate-recycle systems as BAT.

Except for the subcategory for EGUs permanently ceasing coal combustion by December 31, 2028, the EPA is also not identifying the less stringent (and previously rejected in the 2015 and 2020 rules) technology of surface impoundments as the technology basis for BAT, as this technology would also remove fewer pollutants than the BAT basis of dry-handling or closed-loop systems, which the EPA finds is technologically available, is economically achievable, and has acceptable non-water quality environmental impacts.

c. The EPA continues to regulate discharges from some dry-handling BA systems as a low volume waste source.

As previously discussed, the final BAT technology basis for BA transport water is dry-handling or closed-loop systems. This technology basis incorporates systems that operate so as to not generate BA transport water at all (so-called ''dry'' systems), as well as systems that do generate BA transport water but recycle that transport water in a closed-loop manner so as to achieve no discharge (so-called ''wet'' systems). At proposal, EPA solicited comment on the issue of whether the final rule could create unintended consequences if discharges from a ''dry'' BA handling system are regulated differently than discharges from a ''wet'' BA handling system. Historically, discharges from a dry bottom ash handling system have not been considered transport water or BA purge water, but rather have been considered a ''low volume waste source,'' and therefore subject to their own limitations. These limitations include BPT limitations on TSS and oil and grease, as well as any more stringent BAT limitations that the permitting authority determines appropriate on a case-by-case basis using its BPJ.

In the proposal, the EPA pointed to one instance of a reported purge at an under-boiler dry-handling system that uses quench water to cool the BA but did not transport the ash with water and thus did not generate BA transport water. After soliciting comment on a number of potential modifications the Agency could make to address potential disparities between allowable purges from a wet BA handling system and a dry BA handling system, the EPA received only one comment that provided meaningful data relevant to the solicitations. Santee Cooper provided findings of a third-party analysis of the Cross facility's under-boiler dry BA handling system. Over the two years of 2021 and 2022, the BA system at Cross was fully drained 10 times and partially drained 29 times for maintenance. Historically, BA contact water such as that discharged at Cross has been treated as a low volume waste source.

[80] 40 CFR 257.101(a)(1).

[81] *See, e.g., https://www.epa.gov/coalash/coal-combustion-residuals-ccr-part-implementation.*

[82] 40 CFR 257.103(f)(1)(vi).

[83] Further information on the implementation of these Part A applications is available on EPA's website at: *https://www.epa.gov/coalash/coal-combustion-residuals-ccr-part-implementation.*

[84] Although the EPA estimates that fully closing the loop would be less expensive than converting to a dry-handling system, nothing would preclude a facility with a high recycle rate system from installing one of the technologically available and economically achievable dry-handling systems.

[85] In contrast, nothing in the record or public comments indicates that high-recycle-rate systems ceased to be available, be economically achievable, and have acceptable non-water quality environmental impacts for discharges before the applicability dates of the new, more stringent limitations of this rule.

Based on public comments and a consideration of the record, the EPA is not modifying the regulations to address discharges that the EPA has historically not considered BA transport water. EPA did not receive any information to call into question its previous conclusions about the different characteristics of BA contact water and BA transport water, including the Agency's findings in 2015 and 2020 that BA contact water has lower pollutant concentrations than BA transport water. Moreover, no commenters provided information supporting a finding that the zero-discharge requirements in this rule could have the unintended effect of leading to more discharges of low volume waste from dry BA handling systems than would otherwise occur. Based on the limited information provided in comments, EPA concludes no changes to the regulatory treatment of purges from a dry BA handling systems are warranted, and they will continue to be regulated as low-volume wastes.[86]

Aside from the under-boiler BA handling systems (''dry-handling'' systems) that the EPA solicited comment on, some commenters also responded to EPA's solicitations by suggesting that purges from remote BA handling systems (''closed-loop'' systems) should continue to be allowed to avoid creating disparities between dry-handling and closed-loop systems.[87] Comments in this vein tended to be very generalized and did not provide any meaningful reason for EPA to change direction from its proposal, with the exception of the EPA's definitional change described in section VII.B.5 of this preamble.

3. CRL

Except for the subcategory for discharges of unmanaged CRL, the EPA is identifying zero-discharge systems as the technology basis for establishing BAT limitations to control pollutants discharged in CRL.[88] More specifically, as with FGD wastewater, the technology basis for CRL is membrane filtration systems, SDEs, and thermal evaporation systems alone, or in any combination, including any necessary pretreatment *e.g.,* chemical precipitation) or post-treatment (*e.g.,* crystallization).[89] Furthermore, where a permeate or distillate is generated from the final stage of treatment, the technology basis is a process wherein this water would then be recycled back into the plant as either FGD makeup water or EGU makeup water.[90] After evaluating the factors specified in CWA section 304(b)(2)(B), the record shows that these technologies are available, are economically achievable, and have acceptable non-water quality environmental impacts. For discussion of the subcategory for discharges of unmanaged CRL, see section VII.C.5.

Based on the BAT technology basis identified, the EPA is establishing zero-discharge limitations for CRL, as it does for FGD wastewater. However, because CRL is different from FGD wastewater in that it is expected to continue to be generated and discharged following even the retirement of the plant, the EPA is also using the BAT technology basis identified to establish nonzero numeric limitations following a plant's eventual retirement—limitations based on membrane filtration for CRL permeate and limitations based on thermal evaporation for CRL distillate.

In the subsection immediately below, the EPA discusses its rationale for establishing zero-discharge systems as BAT for control of CRL. In the following subsection, the EPA explains why it rejected less stringent technologies as BAT. In the final subsection, the EPA explains the rationale for establishing zero-discharge systems as NSPS for control of CRL. For further discussion of the new subcategories for permanent cessation of coal combustion by 2034 and discharges of unmanaged CRL, see section VII.C of this preamble. For further discussion of the definitional change to CRL that is being finalized with respect to high intensity, infrequent storm events, see section VII.B.5 of this preamble.

a. The EPA selects zero-discharge systems as BAT for CRL.

Technological availability of zero-discharge systems. Although the EPA's preferred option at proposal was to identify BAT based on chemical precipitation, it solicited comment on a zero-discharge requirement based on other technologies as well, including the same technologies identified as the BAT basis for control of FGD wastewater in this rule. 88 FR 18849. The EPA received comments both for and against the availability of zero-discharge systems. Commenters favoring zero discharge of CRL pointed to the EPA's record, which shows that one facility already employs a zero-discharge thermal evaporation system to co-treat its CRL and FGD wastewater, many non-CCR landfills use zero-discharge systems to treat their leachate, and zero-discharge systems have been used to treat other wastewaters similar to CRL, including FGD wastewater. In contrast, commenters opposed to zero-discharge systems claimed that the EPA did not sufficiently evaluate such systems at proposal and further disputed EPA's findings that pollutants in CRL are similar to those in FGD wastewater.

After consideration of the comments received and evaluation of the extensive record, the EPA finds that zero-discharge systems are technologically available for control of CRL discharges. BAT is supposed to reflect the highest performance in the industry and may reflect a higher level of performance than is currently being achieved based on technology transferred from a different subcategory or category, bench scale or pilot plant studies, or foreign plants. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1006; *Am. Paper Inst.* v. *Train,* 543 F.2d at 353; *Am. Frozen Food Inst.* v. *Train,* 539 F.2d at 132. The EPA disagrees with commenters who suggested the Agency had not sufficiently evaluated zero-discharge options at proposal and instead agrees with commenters that the best-performing plant treating CRL domestically in this industry is achieving zero discharge. At proposal, the EPA discussed a thermal evaporation system that has achieved zero discharge of CRL and FGD

[86] Furthermore, the EPA notes that the resulting average annual discharge of about 600,000 gallons per year of BA contact water at Cross results in small pollutant loadings in both relative and absolute terms. Contrast this to the three million gallons *per day* of BA transport water and the relative reduction in water volumes alone, not accounting for the lower pollutant concentrations of BA contact water, mean that the pollutant discharges are reduced by over 99.9 percent.

[87] For context, the requested purges from remote systems operating as high-recycle-rate rather than closed-loop systems are often in the range of 50,000 to 100,000 gallons *per day,* an amount far greater than the amounts of BA contact water (a low-volume waste source with fewer pollutants) discharged in the one dry-handling facility for which the EPA has information on purges.

[88] As described in section VII.B.5 of this preamble, the EPA is also finalizing a definitional change to certain wastewaters, including CRL, that excludes discharges necessary as a result of high intensity, infrequent storm events.

[89] While three main technologies are listed here and are used to evaluate costs and non-water quality environmental impacts, the list is not meant to exclude use of FA fixation, direct encapsulation, evaporation ponds, or other zero-discharge treatment options where a facility uses these technologies to meet the zero-discharge standard established in this rule.

[90] The 2020 rule finalized a carve out from the definition of FGD wastewater applicable to ''treated FGD wastewater permeate or distillate used as boiler makeup water.'' The EPA is making the equivalent change to the definition of CRL for the same reasons the change was made to the definition FGD wastewater and to support consistency across these two zero-discharge wastewater streams. *See* 85 FR 64675. No corresponding change is necessary for use to condition CCR destined for disposal where the disposal would be subject to the same zero-discharge limitations.

wastewater since 2015.[91] [92] The record also includes two domestic pilot studies on CRL: one using membrane filtration and another using membrane filtration with SDE. Furthermore, the proposed rule record included information on treatment of non-CCR landfill leachate, including one thermal technology vendor with full-scale installations, one thermal technology vendor with a pilot study, and two installations of membrane filtration with SDE.[93] The successful use of these systems at non-CCR landfills is relevant to CRL because CRL contains the same pollutants as found in these landfills (*e.g.,* mercury, arsenic, selenium, nitrates), and indeed non-CCR landfills have potentially even more challenging characteristics that these systems are able to handle. In particular, these systems have proven able to successfully treat the same pollutants found in CRL, in addition to treating potentially more challenging organic pollutants and managing more challenging biological fouling agents found in non-CCR landfill leachate that are either absent from, or present in lower concentrations in, CRL. Since the absence of these pollutants and fouling agents make treatment simpler, these differences support the EPA's finding of technological availability.

Finally, since the record indicates that CRL is similar to FGD wastewater—which the record demonstrates can be effectively treated using zero-discharge systems—the EPA also independently relies on the record evidence discussed in section VII.B.1 of this preamble above and technology transfer from FGD wastewater to support its conclusion that zero-discharge systems are available for controlling CRL discharges. The EPA may rely on technology transfer to establish technology-based limitations such as those in this rule. *Am. Iron & Steel Inst.* v. *EPA,* 526 F.2d 1027, 1058, 1061, 1064 (3d Cir. 1975); *Weyerhaeuser Co.* v. *Costle,* 590 F.2d at 1054 n.70; *Reynolds Metals Co.* v. *EPA,* 760 F.2d at 562; *California & Hawaiian Sugar Co.* v. *EPA,* 553 F.2d at 287. In the 2015 rule record, EPA found that the pollutants of concern in CRL are the same pollutants that are present in, and in many cases are also pollutants of concern for, FGD wastewater, FA transport wastewater, BA transport water, and other CCR solids. This finding led the Agency to select chemical precipitation as the technology basis for the 2015 rule's NSPS and PSNS for CRL, based on technology transfer from the use of chemical precipitation on FGD wastewater.[94] This finding was never challenged. The EPA is basing the final rule CRL limitations on the same zero-discharge systems selected as BAT for treating FGD wastewater in this final rule. In contrast to comments that pollutants found in CRL are fundamentally different than those found in FGD wastewater, the EPA confirms its findings from the 2015 rule that CRL is characteristically like FGD wastewater. Even after accounting for additional data from 12 landfills gathered prior to the 2023 proposal, the EPA's analysis in the *CRL Analytical Data Evaluation—2024 Final Rule* (DCN SE11715) memorandum shows that CRL continues to have the same pollutants of concern in similar concentrations as other wastewaters, including FGD wastewater. Zero-discharge systems are available to treat this type of wastewater, and the limitations based on this technology would eliminate all arsenic, mercury, and other toxic pollutants from CRL discharges by the steam electric power generating industry. Moreover, just as the use of each individual technology within the BAT technology basis for FGD wastewater discussed in section VII.B.1 of this preamble supports the availability of each individual technology as BAT for that wastestream, based on technology transfer from FGD wastewater, the use of each individual technology is sufficient on its own to support the availability of a zero-discharge limitation for CRL.

At proposal, the EPA solicited comment on zero discharge limitations for CRL as well as transferring the 2015 NSPS or 2020 VIP nonzero numeric limitations for FGD wastewater. Some commenters claimed the need to discharge from a zero-discharge system after retirement. While EPA is requiring zero discharge of pollutants from CRL during active operations, this is based, in part, on the ability of active EGUs to use clean permeate or distillate resulting from CRL treatment either in an FGD absorber or as boiler makeup water. After the last EGU at a facility retires, it may become necessary for a facility to discharge the permeate or distillate from its zero-discharge treatment system. Thus, the EPA is transferring the BAT limitations from the 2020 VIP and 2015 NSPS to provide more flexibility to a plant post-retirement. Plants may discharge CRL permeate after retirement subject to the 2020 rule VIP limitations designed for permeate from a membrane filtration system. Alternatively, plants may discharge CRL distillate after retirement subject to the 2015 rule NSPS limitations designed for distillate from a thermal treatment system.[95]

Economic achievability of zero-discharge systems. The EPA finds that the costs of zero-discharge systems for control of CRL discharges are economically achievable. For further discussion of the economic analysis, see sections VII.F and VIII, below.

Non-water quality environmental impacts of zero-discharge systems. The EPA finds that the non-water quality environmental impacts associated with zero-discharge systems to control CRL discharges are acceptable. See discussion below in section VII.G and section X of this preamble.

b. The EPA rejects less stringent technologies than zero-discharge systems as BAT for CRL.

Except for the new subcategories for permanent cessation of coal combustion by 2034 and discharges of unmanaged CRL, discussed in sections VII.C.4 and VII.C.5 of this preamble, EPA is not selecting less stringent technologies than the zero-discharge systems discussed above. BAT is the ''gold standard'' for controlling water pollution from existing sources, and the Supreme Court has explained that BAT must achieve ''reasonable further progress'' toward the CWA's goal of eliminating pollution. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003, 1006 (citing *Nat'l Crushed Stone* v. *EPA,* 449 U.S. at 75). The record shows that zero-discharge systems are available, are economically achievable, and have acceptable non-water quality environmental impacts. Therefore, with the exception of the new subcategory for permanent cessation of coal combustion by 2034, the EPA is not leaving BAT for determination on a case-by-case BPJ basis by the permitting authority. Similarly, except for the new subcategory for discharges of

[91] ERG. 2020. *Final Notes from Site Call with Duke Energy's Mayo Steam Station.* June 15 (DCN SE08964).

[92] The EPA notes that, while the utility employing this system filed comments on the proposed rule, it did not dispute in its comments that its system effectively operates zero discharge for CRL, nor did it dispute that zero discharge is technologically available for CRL.

[93] An additional three membrane filtration technology vendors successfully treat non-CCR landfill leachate, but the operators of these installations have so far chosen to discharge the clean permeate instead of operating with zero discharge.

[94] In establishing chemical precipitation as the basis for NSPS, the Agency stated that for combustion residual leachate, chemical precipitation is a well-demonstrated technology for removing metals and other pollutants from a variety of industrial wastewaters, including leachate from landfills not located at power plants. Chemical precipitation is also well demonstrated at steam electric power plants for treatment of FGD wastewater that contains the pollutants in combustion residual leachate (80 FR 67859).

[95] SDEs and thermal systems that do not generate a distillate would not require this flexibility.

unmanaged CRL, the EPA is not identifying as BAT the less stringent technology of chemical precipitation, as this technology would remove fewer pollutants than the BAT basis in this final rule, which the EPA has found is available, is achievable, and has acceptable non-water quality environmental impacts. Finally, the EPA is also rejecting the less stringent technologies of surface impoundments and chemical precipitation followed by a low hydraulic residence time biological treatment, as these systems would also remove fewer pollutants than the BAT basis in this final rule, which the EPA has found meets the requisite statutory requirements.

c. The EPA selects zero-discharge systems as NSPS for CRL.

At proposal, the EPA solicited comments on the propriety of revising NSPS for CRL based on decisions made with respect to BAT for CRL.[96] The EPA did not receive any comments on its solicitation for updating NSPS for CRL. After considering all of the technologies described in this preamble and TDD section 7, and in light of the factors specified in CWA section 306, the EPA concludes that zero-discharge systems represent BADCT for CRL at steam electric power plants, and the final rule promulgates NSPS based on these systems. More specifically, the BADCT technology basis for CRL is membrane filtration systems, SDEs, and thermal evaporation systems alone, or in any combination, including any necessary pretreatment (*e.g.,* chemical precipitation) or post-treatment (*e.g.,* crystallization).[97] Furthermore, where a permeate or distillate is generated from the final stage of treatment, the technology basis is a process wherein this water would then be recycled back into the plant as either FGD makeup water or EGU makeup water.[98] The record indicates that the zero-discharge systems that serve as the basis for the final NSPS are well demonstrated. This is fully supported by the discussion of the availability of zero-discharge systems for identifying BAT, both as a whole and as stand-alone technologies, as described above in section VII.B.3 of this preamble. As discussed in the preceding BAT discussion, because CRL is expected to continue to be generated and discharged even after the retirement of the plant, the EPA is also using the BAT technology basis identified to establish nonzero numeric limitations following a plant's eventual retirement—limitations based on membrane filtration for CRL permeate and limitations based on thermal evaporation for CRL distillate.

The NSPS in the final rule poses no barrier to entry. This is due, first, to the fact that no new coal-fired power plants are expected to be built. As the EPA's *Power Sector Trends Technical Support Document* states:

> It is unlikely that new conventional coal-fired EGUs will come online in the US. The last year in which a new coal-fired EGU (greater than 25 MW) was completed was in 2014. There are no new announced plans to build new coal-fired EGUs.[99]

This is consistent with EIA data [100] and is due to the uncompetitive financial realities of coal-fired power. Existing coal is almost universally estimated to be more expensive than replacement capacity moving forward.[101] Since no new coal-fired power plants are expected, updating NSPS to the same zero-discharge systems as BAT is more of a safeguard to ensure a consistent regulation of CRL, even if it likely will never apply.

Second, the final NSPS poses no barrier to entry based on the EPA's assessment of the possible impacts of the final NSPS on new sources using a comparison of the incremental costs of the final rule to the costs of hypothetical new generating units. The EPA developed NSPS compliance costs for new sources using a methodology similar to the one used to develop compliance costs for existing sources. The EPA's estimates for compliance costs for new sources are based on the net difference in costs between (1) wastewater treatment system technologies that would likely have been implemented at new sources under the previously established regulatory requirements and (2) those that would likely be implemented under the final rule. The EPA estimated that the incremental compliance costs for a new generating unit (capital and O&M) represent about one percent of the annualized cost of building and operating a new 650 MW coal-fired plant,[102] with capital costs representing approximately one percent of the overnight construction costs, and annual O&M costs also representing one percent of the fuel and other O&M cost of operating a new plant.

Finally, the EPA analyzed the non-water quality environmental impacts and energy requirements associated with the final BAT limitations for CRL. Since there is nothing inherently different between an existing and new source, the EPA drew on the analyses for existing sources and determined that NSPS based on the final rule BAT technologies have acceptable non-water quality environmental impacts and energy requirements. For further discussion of the non-water quality environmental impacts evaluated for BAT, see sections VII.G and X.

The EPA did not retain chemical precipitation as the basis for NSPS for CRL because, under CWA section 306, NSPS reflect ''the greatest degree of effluent reduction . . . achievable.'' Zero-discharge systems are capable of eliminating all discharges associated with CRL, and they form the BAT technology basis used to establish limitations for existing sources of CRL discharges in this rule. Moreover, establishing NSPS for CRL based on zero-discharge systems does not add to the overall estimated cost of the rule because the EPA does not predict any new coal-fired generating units will be installed in the timeframe of the EPA's analyses.

4. Legacy Wastewater

Except for the subcategory for legacy wastewater discharged from surface impoundments commencing closure after July 8, 2024, the EPA is reserving BAT basis for legacy wastewater at this time and instead is continuing to reserve BAT limitations for case-by case determination by the permitting authority, using its BPJ. This potential case-by-case outcome was explicitly

[96] The EPA did not solicit comment on revising any other NSPS because the proposed BAT technology bases for FGD wastewater and BA transport water would be similar to the 2015 BADCT technology bases for these wastestreams. The final rule is consistent with the proposal in that way.

[97] While three main technologies are listed here and are used to evaluate costs and non-water quality environmental impacts, the list is not meant to exclude use of FA fixation, direct encapsulation, evaporation ponds, or other zero-discharge treatment options where a facility uses these technologies to meet the zero-discharge standard established in this rule.

[98] The 2020 rule finalized a carve out from the definition of FGD wastewater applicable to ''treated FGD wastewater permeate or distillate used as boiler makeup water.'' The EPA is making the equivalent change to the definition of CRL for the same reasons the change was made to the definition FGD wastewater and to support consistency across these two zero-discharge wastewater streams. *See* 85 FR 64675.

identified by the Fifth Circuit Court of Appeals as an alternative the EPA should have considered in the 2015 rule. *Southwestern Elec. Power Company* v. *EPA,* 920 F.3d at 1021 (''[E]ven assuming a lack of data prevented the EPA from determining BAT for legacy wastewater, nothing required the agency simply to set impoundments as BAT. Instead, the EPA could have declined to set nationwide effluent guidelines for legacy wastewater and allowed BAT determinations to be made by each facility's permitting authority through the NPDES permitting process on a site-specific basis.'') (citations omitted).

In the 2015 rulemaking and subsequent litigation, petitioners argued that the EPA lacks authority to establish differentiated limitations for legacy wastewater, as compared to newly generated wastewater, because the text of the CWA does not contain specific distinctions based on when wastewater is produced. As explained in the 2015 rule and in briefs before the Fifth Circuit Court of Appeals, however, nothing in the statute requires the EPA to establish the same technology basis for each wastestream within a point source category when establishing limitations.[103] The CWA directs the EPA to take into account a variety of factors in establishing the best available technology economically achievable, including,'' ''process changes,'' ''non-water quality environmental impacts,'' and ''such other factors ats the Administrator deems appropriate.'' 33 U.S.C. 1314(b)(2)(B). As discussed further below, the rule's differentiated BAT limitations for legacy wastewater are based on the changes happening at plants under the CCR regulations in relation specifically to legacy wastewater, which by and large is contained in surface impoundments. The EPA's conclusion that it is appropriate to set different BAT limits for legacy wastewater based on the different way this wastewater is handled in response to the CCR regulations is within the Agency's broad discretion under the statute. *See Texas Oil & Gas Ass'n* v. *EPA,* 161 F.3d 923, 934 (5th Cir. 1998) (''EPA has significant discretion in deciding how much weight to accord each statutory factor under the CWA.'').

In contrast to the environmental group petitioners' arguments discussed above that legacy wastewater should be subject to the same limitations and standards as newly generated wastewater, some commenters on the 2023 proposed rule argued that the EPA lacks authority to establish BAT limitations on legacy wastewater *at all* since it was previously generated and ''treated'' under the prior ELGs. The CWA regulates discharges of pollutants, 33 U.S.C. 1311(a), and nothing in the CWA prohibits the EPA from applying discharge limitations to previously generated (and even ''treated'') wastewater. The Commenters' view would lead to results under the statute that Congress could not have intended. Under commenters' reading, if wastewater was treated to meet BPT regulations, it could not be treated any further to meet more stringent BAT regulations. This would be contrary to the CWA's technology-forcing scheme. In this case, the treatment referred to by the commenter is treatment using a surface impoundment. The Fifth Circuit has strongly suggested that, in light of the EPA's 2015 finding that surface impoundments are ''largely ineffective'' at removing dissolved metals, to achieve the BAT standard, something more than limitations based on surface impoundments should be required of legacy wastewater discharges. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1015, 1017.

While commenters claim that it is not fair for plants to be subject to new limitations for wastewater generated when the plant was making operational decisions under a prior ELG, as further discussed below, the EPA finds that it is economically achievable for certain plants to meet additional limitations on their legacy wastewater, as required for Best Available Technology Economically Achievable under the CWA. Moreover, the EPA has considered the unique situation in which some plants may have already closed and, therefore, lack an active revenue stream to pay for additional pollution controls. For the case-by-case legacy wastewater limitations discussed below, permitting authorities can consider the site-specific economic achievability of particular requirements when identifying BAT. For the legacy wastewater subcategory described in section VII.C.6 of this preamble, the BAT limitations are based on chemical precipitation. The EPA rejected more stringent limitations than those based on chemical precipitation, alone, in part because of the higher costs of more advanced treatment-based limitations, given that many legacy discharges may occur after a plant ceases operating.

The EPA also disagrees with commenters that plants could not have known they might be subject to more stringent limits for wastewater already generated. The CWA has always regulated discharges, and plants should have known that their discharges would potentially be subject to more stringent requirements, given that the CWA envisions progressively more stringent limits to meet progressively more stringent standards. *See Texas Oil & Gass Ass'n* v. *EPA,* 161 F.3d at 927; *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1006–07. Plants should have known that the limitations to which their discharges are subject might changes, as ELGs are established or revised, including to account for technological advancements. *See* CWA sections 301(d) and 304(b), 33 U.S.C. 1311(d) and 1314(b). Indeed, water quality concerns might require water quality-based effluent limitations that change over time as well.

In the first subsection immediately below, the EPA discusses its rationale for reserving BAT limitations to be derived on a BPJ-basis to control legacy wastewater. In the second subsection, EPA discusses why it is not selecting surface impoundments as BAT for legacy wastewater. In the final subsection, the EPA discusses why it is not selecting more stringent technologies as BAT for legacy wastewater, except for a subcategory of legacy wastewater discussed in section VII.C.6 of this preamble. For further discussion of the subcategory for legacy wastewater discharged from surface impoundments commencing closure after July 8, 2024, see section VII.C.6 of this preamble.

a. BPJ-based BAT Limitations Will Continue To Apply to Legacy Wastewater

The EPA is finalizing the approach proposed for this rule for legacy wastewater: permitting authorities will continue to develop BAT limitations on a case-by-case basis, using their BPJ. The EPA received comments supporting and opposed to the case-by-case approach. Commenters opposing this approach came from two perspectives. Some industry commenters believed that only BPT and water quality-based effluent limitations currently apply to legacy wastewater and that the EPA should finalize this approach. In contrast, other commenters viewed the proposed BPJ approach as impermissibly allowing permitting authorities to select surface impoundments as BAT. In the alternative, these commenters recommended that the EPA formally constrain the permitting authorities' discretion when determining BAT with a BPJ analysis. Commenters that supported the EPA's proposed approach

[103] This was a question the Fifth Circuit never reached because it vacated and remanded the 2015 legacy wastewater limitations on other grounds. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1015.

opposed selecting more stringent technologies as BAT in large part because of the timelines for completing closure under the CCR regulations. Some commenters also stated that most or all legacy wastewater will have been discharged prior to the effective date of any final rule. Finally, commenters from multiple perspectives universally opposed certain definitional changes that the EPA solicited comment on at proposal, involving establishment of two new classes of legacy wastewaters called surface impoundment decant wastewater and surface impoundment dewatering wastewater. Their comments opposed the changes because of the unclear delineation between the two types of legacy wastewater and the view that all legacy wastewater should be regulated the same.

After considering the comments received and evaluating the record in light of the factors specified in CWA section 304(b)(2)(B), the EPA finds that no single technology is technologically available and economically achievable for control of pollutants in legacy wastewater, except for legacy wastewater from a subcategory of EGUs as discussed in section VII.C.6 of this preamble. Because of process changes happening at plants in the form of ongoing and soon-to-be-completed surface impoundment closures under the CCR regulations, the EPA finds that it is infeasible to finalize a nationwide BAT limitation for legacy wastewater mid-closure. The statute requires BAT to reflect what is technologically available, is economically achievable, and has acceptable non-water quality environmental impacts based on consideration of several factors, including ''process changes,'' ''non-water quality environmental impacts,'' and ''such other factors'' as the Administrator deems appropriate. Because many facilities with surface impoundments are in the process of closing their surface impoundments under the CCR regulations (regulations that create safeguards around the disposal of solid waste, as explained in section IV.E of this preamble), the technology that represents BAT for legacy wastewater treatment is likely to vary from site to site depending on several factors. These factors include, but are not limited to, the types of wastes and wastewaters present, the characteristics of the legacy wastewater in each layer of a surface impoundment, the amount of legacy wastewater remaining to be treated in a surface impoundment, the treatment already available on site, the treatment option costs, the extent to which CWA requirements could interfere with closure timeframes required under the CCR regulations, the potential for increased groundwater contamination, and the potential for increased discharges through groundwater that are determined to be the functional equivalent of direct discharges (FEDDs) to a WOTUS.

The effect of the EPA declining to identify a nationally applicable BAT for this wastewater is that permitting authorities will continue to establish site-specific technology-based effluent limitations using their BPJ.[104] Because the limitations under this rule are required to be derived on a site-specific basis, taking into account the requisite BAT statutory factors and applying them to the circumstances of a given plant, these case-by-case limitations would by definition be technologically available and economically achievable and have acceptable non-water quality environmental impacts, where the permitting record reflects that such is the case. While the dynamic and changing nature of this wastestream at this time means there is no typical site, given the CCR regulations' closure requirements, the EPA agrees with commenters that, were permitting authorities to choose surface impoundments as the BAT technology for a particular site using the same rationale that the EPA put forth in 2015, this would run afoul of the Fifth Circuit's decision that found selecting surface impoundments as BAT was arbitrary, capricious, and inconsistent with the ''technology-forcing mandate of the CWA.'' *Southwestern Elec. Power Company* v. *EPA,* 920 F.3d at 1017.

Factors the permitting authority must consider when establishing BPJ-based BAT effluent limitations for legacy wastewater are specified in section 304(b) of the CWA, 33 U.S.C. 1314(b), and 40 CFR 125.3(d). The EPA solicited comment on whether it should explicitly promulgate, in regulatory text, specific elements related to these factors for this steam electric wastewater. While some commenters advocated for further restrictions to deter or even prohibit permitting authorities from selecting surface impoundments as BAT through a BPJ analysis, the CWA and EPA regulations already require the permitting authority to evaluate whether more stringent technologies are available, are economically achievable, and have acceptable non-water quality environmental impacts. Moreover, given existing case law and information known about more advanced technologies, the EPA believes that a permitting authority which chooses to select surface impoundments as BAT would face substantial legal risk unless it could justify its decision based on the BAT statutory factors. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1018 n.20 (''EPA may have been uncertain about what the precise BAT for legacy wastewater should be, but the record fails to explain why impoundments are BAT, if that term is to have any meaning.'').

The EPA agrees with commenters that differentiating legacy wastewaters into two distinct classes in the manner the EPA solicited comment on at proposal (*i.e.,* decant and dewatering wastewaters) is unnecessary and not useful; therefore, the EPA is not finalizing new definitions to distinguish classes of legacy wastewater. The proposal would have potentially doubled the number of BPJ analyses performed by permitting authorities—as there would have been two classes of legacy wastewater that each required BPJ determinations—without likely changing the ultimate outcome of treatment of the legacy wastewater as a whole. Moreover, it is doubtful that creating two new definitions of legacy would be useful given that, where a surface impoundment is already closing under the CCR regulations, both types of wastewater would likely be discharged before a new CWA permit incorporating the limitations in this final rule would take effect. Lastly, given the confusion commenters expressed over how to interpret the definitions, the EPA is concerned that finalizing these definitions would complicate implementation.

The EPA also agrees with commenters that the vast majority of legacy wastewater likely has been, or will be, discharged pursuant to BPJ determinations under existing permits. Rapid closure of many of these surface impoundments is ongoing under the CCR regulations. The EPA notes that most surface impoundments had to cease receipt of waste by April 11, 2021, and commenced closure soon after. These surface impoundments were either unlined, in violation of location restrictions, or both. The EPA estimates that 398 of 507 such surface impoundments are less than 40 acres and thus must close within seven years of commencing closure (five years plus

[104] Because some commenters took issue with the EPA's statements in the proposed rule that, under the prior regulations in effect, BAT limitations based on a permitting authority's BPJ are appropriate for legacy wastewater, the Agency is explicitly reserving BAT limitations for legacy wastewaters in the regulatory provisions setting forth BAT requirements for FGD wastewater, BA transport water, FA transport water, and flue gas mercury control wastewater to avoid any ambiguity regarding whether BPJ applies.

a possible two-year extension).[105] The remaining 109 are over 40 acres and thus can receive additional two-year extensions. Even with the possibility of extensions, dewatering is one of the first steps of closure and, therefore, most of the 507 surface impoundments which have already begun the closure process will have completed dewatering before permitting authorities issue NPDES permits implementing this final ELG rule.

Moreover, as is the case for all promulgated effluent limitations guidelines, the requirements for direct dischargers [106] in this rule do not become applicable to a given discharger until they are contained in revised NPDES permits. NPDES permits are typically issued for the maximum allowed five-year permit term. Most permits are not immediately revised after the EPA issues a new ELG rule, rather permitting authorities incorporate the new ELG rule limitations at the time the next five-year permit is up for reissuance. In addition, it is not uncommon for permits to be administratively continued beyond the five-year permit term if a permittee submits a timely permit renewal application, in which case the existing permit stays in effect until a new permit is effective. *See* 40 CFR 122.6. Thus, even if these new ELG requirements were implemented into NPDES permits in a timely manner following their effective date on July 8, 2024, the vast majority of legacy wastewater would have been discharged or will be discharged pursuant to BPJ determinations in existing permits rather than pursuant to any regulations the EPA might promulgate. Much, if not all, of the remaining legacy wastewater is included in the 19 surface impoundments expected to be covered by the subcategory for legacy wastewater discharged from surface impoundments commencing closure after July 8, 2024. This subcategory is further described in section VII.C.6 of this preamble.

Reserving BAT limitations for this legacy wastewater to be developed by the permitting authority on a BPJ-basis would allow permitting authorities, on a case-by-case basis, to impose more stringent limitations (including potentially zero-discharge limitations) based on technologies that remove more pollutants than the previously promulgated BPT limitations based on surface impoundments, depending on what is technologically available and economically achievable for individual facilities. In this way, the final rule does not ''freeze impoundments in place as BAT for legacy wastewater,'' a criticism of the 2015 rule's legacy wastewater limitations by the Fifth Circuit, which acknowledged that BAT has in inbuilt 'reasonable further progress' standard and that 'BPT serves as the prior standard with respect to BAT.' *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1017 (citation omitted). Moreover, this final rule record includes information about technologies beyond surface impoundments and their application to legacy wastewater that could be useful to permitting authorities in making their determinations.

b. The EPA rejects surface impoundments as BAT for legacy wastewater.

The EPA is not selecting surface impoundments as the BAT basis for controlling discharges of legacy wastewater because there are more effective technologies for controlling discharges that some plants could use. Several plants described in the record employ technologies ranging from chemical precipitation to zero-discharge systems for legacy wastewaters. The previously promulgated BPT limitations are based on surface impoundments. As the Fifth Circuit has acknowledged, BPT is merely the first step toward the CWA's pollution reduction goals and provides the ''prior standard'' against which the stricter BAT is to be measured. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1006 (citing *Nat'l Crushed Stone,* 449 U.S. at 69, 77 & n.14). Therefore, the EPA is retaining the current case-by-case BAT approach rather than selecting surface impoundments.

c. The EPA rejects specific, across-the-board technologies more stringent than surface impoundments as BAT for legacy wastewater.

The EPA is not selecting more stringent, one-size-fits-all technologies, such as chemical precipitation, biological treatment, membrane filtration, thermal evaporation, and/or spray dryer evaporation as the BAT basis for controlling discharges of legacy wastewater, except for the legacy wastewater described in section VII.C.6 of this preamble. As explained previously, many plants with legacy wastewater have already begun closure of their surface impoundments under the CCR regulations. These plants are in different stages of the dewatering process, as they are trying to meet their closure deadlines under the CCR regulations. Requiring limitations based on a more stringent BAT technology basis at all plants that are in the process of dewatering when their permit is renewed but before closure is complete would jeopardize their ability to meet their closure deadlines under the CCR regulations. This is because having to consider and add one or more treatment components would slow the dewatering process, at some plants more than others. If plants could not meet their closure deadlines under the CCR regulations, this would be an unacceptable non-water quality environmental impact.

Furthermore, some zero-discharge technologies are not available to plants after they cease coal combustion, even if the discharge of legacy wastewater will occur after that date. For example, while Boswell Energy Center has installed and is operating an SDE for treating several wastewaters including legacy wastewater, this SDE would not be available to a facility that no longer produces power because it is designed and operated using a slipstream of the hot flue gas to evaporate the wastewater, a heat source no longer available after retirement.

Although the EPA cannot determine that a particular technology is available within the meaning of CWA section 304(b) to treat the legacy wastewater described in this section, the Agency could expect the permitting authority to select more stringent technologies than surface impoundments on a site-specific basis. In some cases, the stage of closure and realities on site may point to use of a more stringent technology. For example, a facility in early closure stages may be able to lease commercial, off-the-shelf equipment to treat its legacy wastewater. Alternatively, permitting authorities could assess the technologies a plant already uses for treatment of other wastewaters and determine that the legacy wastewater could be readily directed to an existing treatment system.

5. Definitional Changes

The EPA is finalizing two definitional changes. The first definitional change applies to high intensity, infrequent storm events as described in subsection (a), below. The second definitional change applies to decommissioning wastewater from FGD wastewater treatment equipment and ash handling equipment as discussed in subsection (b), below.

a. Definitional Change for High-Intensity, Infrequent Storm Events

The EPA is finalizing a definitional change for all the wastewaters for which the Agency is establishing zero-

[105] *See* 40 CFR 257.102(f).

[106] Indirect dischargers (those who discharge to POTWs) are subject to pretreatment standards that are directly implemented and enforceable. *See* CWA section 307, 33 U.S.C. 1317; 40 CFR part 403.

discharge limitations in this final rule: FGD wastewater, BA transport water, and CRL. Specifically, the EPA is excluding from the definitions of these wastewaters any discharges which are necessary (*i.e.,* cannot be managed with existing systems or practices) as the result of high-intensity, infrequent storm events exceeding a 10-year storm event of 24-hour or longer duration (*e.g.,* a 10-year, 30-day storm event). The EPA is specifically selecting this duration storm event as this is a consistent duration storm event to the storm event described in 40 CFR part 423 with respect to regulation of coal pile runoff.[107] Due to these definitional exclusions, such discharges would not be subject to the zero-discharge requirements that otherwise apply to FGD wastewater, BA transport water, and CRL under this final rule. Instead, these discharges would be considered a ''low volume waste source'' and the TSS and oil and grease BPT limitations for such waste would apply, as well as any BAT limitations for the low volume waste source developed by a permitting authority using its BPJ. As discussed in section XIV.C.4 of this preamble, the EPA is also finalizing reporting and recordkeeping requirements that facilities must comply with when they discharge during these high intensity, infrequent storm events, which are intended to demonstrate that the discharge is necessary and to provide information about the time, place, and volume of the necessary discharge. Each of the wastestreams subject to this definitional change is discussed in turn below.

At the outset, the EPA notes that stormwater is not FGD wastewater, BA transport water, or CRL, though it may mix with these wastewaters. Instead, the EPA describes stormwater on its website as follows:

> Stormwater runoff is generated from rain and snowmelt events that flow over land or impervious surfaces, such as paved streets, parking lots, and building rooftops, and does not soak into the ground. The runoff picks up pollutants like trash, chemicals, oils, and dirt/sediment that can harm our rivers, streams, lakes, and coastal waters. To protect these resources, communities, construction companies, industries, and others, use stormwater controls, known as best management practices (BMPs). These BMPs filter out pollutants and/or prevent pollution by controlling it at its source.[108]

Since stormwater picks up different pollutants, for example dirt, it has inherently different characteristics from the wastewaters regulated in this final rule. Furthermore, larger storm events result in a higher fraction of stormwater and stormwater pollutants as compared to the pollutants in FGD wastewater, BA transport water, and CRL. Taken together, this means that during these high intensity, infrequent storm events, a requirement to treat to zero discharge would essentially be requiring higher and higher amounts of stormwater treatment, rather than treatment of the pollutants of concern in these three wastewaters.

Based on the CWA statutory factors of ''process employed,'' ''engineering aspects'' of control techniques, and non-water quality environmental impacts, the EPA concludes that a zero-discharge requirement for discharges of CRL, FGD wastewater, and BA transport water that cannot be managed with existing systems or practices during a high-intensity, infrequent storm event is not warranted. The CWA statutory factor of ''cost'' provides additional support for EPA's decision. Regarding CRL, the EPA solicited comment on the potential to exclude discharges from the definition of CRL to account for specific storm events. Several commenters expressed concerns that CRL collection systems in general, or at specific facilities, collected both CRL and stormwater. In such cases, segregation of the CRL and stormwater may not be possible for treatment. One specific design of concern to these commenters, although not the only problematic one, employs a chimney system to channel stormwater vertically through a landfill in order to minimize contact with the ash, and thus minimize the generation of CRL in the first place. In some cases, this design is used voluntarily as a BMP to reduce the potential for groundwater contamination; in other cases, commenters pointed out that such a design is required by state law. The EPA agrees that minimizing the formation of CRL promotes the goals of both RCRA and the CWA by reducing the pollutants mobilized into CRL that can potentially migrate into groundwater, be discharged into surface water, or both. It would be impracticable (and in some cases may also violate state law) for a facility with such a landfill design to rip out these chimney structures in order to segregate CRL from stormwater, but more importantly it would result in the mobilization of more pollutants into CRL (because more water would percolate through the CCR), not less.

Alternatively, it may be possible to design larger treatment systems that can handle even the additional flows resulting from the high intensity, infrequent storm events specified in the definitional change described above. However, here too the record does not support zero-discharge systems as BAT to control necessary discharges of CRL during the storm events described. First, the rainfall that reached the collection system via the chimneys would either be pristine rainfall or rainfall contaminated by runoff sediment, and thus would not be CRL. Second, CRL generated by the rainfall that does percolate through the landfill would not reach the leachate collection system at the same time as the rainfall that passes immediately through the chimneys. Depending on the infiltration rate and depth of the CCR, it may take hours, days, weeks, or longer for the additional CRL generated by the rainfall to ultimately pass through the layers of CCR and into the leachate collection system below. Until the leachate from the storm event migrates to the leachate collection system, the treatment system could be treating mostly or entirely non-CRL stormwater.

The EPA concludes that the considerations discussed above are sufficient to support its decision to exclude necessary discharges of CRL during high intensity, infrequent storm events from the definition of CRL and, thus, from the zero-discharge requirement that would otherwise apply to CRL. The EPA also notes that cost is a statutory factor that it must consider when establishing BAT, and that treatment of the higher flows comprised of primarily non-CRL during such high intensity, infrequent storm events would be more costly. EPA examined the data in the National Oceanic and Atmospheric Administration's *Precipitation Frequency Data Server*.[109] The amount of precipitation for a storm event in the 10-year to 25-year storm event range will be approximately double that of a 1-year storm event. It approximately doubles yet again for something even more extreme such as a 1,000-year storm event. Thus, were the EPA not to finalize a definitional change related to high-intensity, infrequent storm events, a facility would be forced to construct a system at least double the size, but potentially much larger, in order to manage volumes from these low-probability of occurrence

[107] 40 CFR 423.12(b)(10) (BPT limitations) and 423.15(a)(12) and (b)(12) (NSPS) provide, ''Any untreated overflow from facilities designed, constructed, and operated to treat the volume of coal pile runoff which is associated with a 10, year, 24 hour rainfall event shall not be subject to'' the TSS limitations or standards that otherwise apply to discharges of coal pile runoff.

[108] Available online at: *https://www.epa.gov/npdes/npdes-stormwater-program.*

[109] Available online at: *https://hdsc.nws.noaa.gov/pfds/.*

precipitation events. As a result, costs could at least double.[110] The doubling of costs to have a system available to manage volumes from these low-probability events occurring once every 25 or 200 years would be a wholly disproportionate *costs per day in use* when compared to the costs actually considered in the EPA's cost estimates, costs that already treat the average annual flows of CRL under the more common storm events to zero discharge approximately nine years and 364 days out of every 10 years.[111] The EPA views the high cost of treating CRL discharges that cannot be managed by an existing zero-discharge system or practices during a high intensity, infrequent storm event as an additional factor supporting the EPA's decision to exclude such discharges from the definition of CRL.

The definitional change discussed for CRL is also appropriate for FGD wastewater. The EPA solicited comment on a zero-discharge requirement for discharges of FGD wastewater, including the availability of zero-discharge systems and ability of plants to meet zero-discharge limitations. The EPA received one comment suggesting that a zero-discharge requirement for FGD wastewater could force an offline plant to operate its coal-fired boilers for the sole purpose of recycling the excess water generated in its FGD treatment system during a storm event. The EPA acknowledges that some FGD treatment systems include open-air tanks and a few include lined surface impoundment pretreatment to increase physical settling. In these scenarios, it is possible that stormwater will increase the need to recycle the clean permeate or distillate from a zero-discharge system at a time when the plant is offline.[112] This scenario does raise concerns that there might be limited instances in which a discharge is necessary or otherwise might result in a plant running when it is not needed. This could result in unnecessary air emissions, a non-water quality environmental impact that the EPA is required to consider.

The EPA also notes that several facilities already co-treat FGD wastewater and CRL.[113] Nothing in this final rule would prohibit facilities from achieving zero discharge of these two wastewaters with a single system. Therefore, the EPA expects that, where there are economies of scale, facilities may elect to co-treat these wastewaters. While nothing in the final rule would prohibit such co-treatment, not finalizing a stormwater flexibility for FGD wastewater where such flexibility exists for CRL, and a discharge is necessary for the co-treated CRL, could make such co-treatment impracticable. Furthermore, just as with CRL, discharges during high intensity, infrequent storm events would consist primarily of rainfall and runoff rather than of FGD wastewater. For the reasons above, the EPA finds that zero-discharge systems are not BAT for discharges of FGD wastewater that cannot be managed with existing systems or practices during these high intensity, infrequent storm events.

Finally, the definitional change discussed above for CRL and FGD wastewater is appropriate for BA transport water as well. The EPA solicited comment on the potential need for purges from a closed-loop BA handling system, including purges related to precipitation events, which were a basis for including a purge allowance in the 2020 rule. The EPA's record shows that remote MDS systems can install roofing to mitigate the need to discharge during storm events, and this feature is included in the Agency's cost estimate. One commenter provided information about the necessary cooling received from its open air remote MDS and suggested that it may need to install expensive heat exchangers to make up for the lost cooling once a roof is installed. The EPA agrees that cooling BA (a waste so hot that is sometimes generated in molten form) is one of the primary functions of a BA handling system. While this comment did not provide data showing that cooling would fall enough to jeopardize the ability to recycle wastewater, to the extent that roofing could affect the ability of a remote MDS to return water cool enough to quench BA,[114] the EPA would agree that this could jeopardize the ability of that system to attain zero discharge during high intensity, infrequent storm events.

The EPA also acknowledges that some BA handling systems must recycle some BA into their FGD wastewater treatment systems either by design or to manage the volume of water or chemistry of water in the closed-loop system. For the reasons stated above finding that a definitional change is warranted for FGD wastewater, it would also make sense to have a definitional change for BA transport water, especially to the extent that the BA transport water in closed-loop systems is used as FGD makeup water to comply with the zero discharge-requirements. For the reasons above, the EPA finds that zero-discharge systems are not BAT for BA transport water discharges that cannot be managed with existing systems or practices during high intensity, infrequent storm events.

While the previous considerations are sufficient to support the Agency's decision to exclude necessary discharges of BA transport water during high intensity, infrequent storm events from the definition of BA transport water and, thus, from the zero-discharge requirement that would otherwise apply to BA transport water, the EPA notes that the statutory factor of cost also supports the EPA's decision. Remote MDS systems are not the only systems that the EPA estimates will operate as closed-loop systems. At some facilities, larger settling systems such as concrete basins have already been constructed. In contrast to MDS systems, the EPA acknowledges that its cost estimates assume that some non-MDS wet systems (*e.g.,* dewatering bins, lined surface impoundments, basins) would make low-cost changes to recirculate BA transport water rather than install a new BA handing system. A roof or other cover over surface impoundments or basins that could be acres in size would be cost prohibitive at such sites.

In summary, after considering public comments and the facts and analyses in the record, and in light of the requirements for the EPA to consider several statutory factors (including the process employed at the facility, the engineering aspects of the application of various types of control techniques, and

[110] Volume is one of the primary inputs to the EPA's cost models of zero-discharge systems. The relationships are not linear, but costs do increase at a similar enough rate for purposes of the illustrative argument above. For more information on the specific cost estimates the EPA used, see section 5 of the TDD.

[111] Furthermore, doubling the costs of these systems would not be justified as the CRL, and thus the pollutants in CRL, would not reach the leachate collection system until much later. Instead, this larger system would be underutilized for years or decades at a time, only to treat a wastestream composed of mostly non-CRL wastewater on the infrequent occasion that it was ultimately called upon just for the sake of saying that the system eliminated all CRL discharges. Courts have recognized that while CWA section 301 is intended to help achieve the national goal of eliminating the discharge of all pollutants, at some point the technology-based approach has its limitations. *See Am. Petroleum Inst.* v. *EPA,* 787 F.2d 965, 972 (5th Cir. 1986) (''EPA would disserve its mandate were it to tilt at windmills by imposing BAT limitations which removed de minimis amounts of polluting agents from our nation's waters . . . .'').

[112] Recall that recycling of the permeate or distillate into the FGD system or the boiler is part of the zero-discharge system technology basis.

[113] Other commenters that do not yet have co-treatment also suggested that co-treatment be allowed.

[114] The commenter stated that its facility needed water below 140 degrees Fahrenheit in order to sufficiently cool its BA.

non-water quality environmental impacts) the EPA rejects zero-discharge systems as BAT to control necessary discharges of FGD wastewater, BA transport water and CRL mixed with stormwater during high intensity, infrequent storm events exceeding a 10-year storm event of 24-hour or longer duration (*e.g.,* a 30-day storm event). The EPA's decision is further supported after considering the associated costs. While the EPA is excluding necessary discharges resulting from such storm events from the definitions of CRL, FGD wastewater, and BA transport water, this does not mean that no limitations apply to these discharges. As low volume waste sources (which are defined in 40 CFR part 423 as wastewater from all sources except those for which specific limitations or standards are otherwise established in this part), these discharges are subject to the BPT limitations for low volume waste sources as well as any BAT limitations developed by the permitting authority on a BPJ basis.

Furthermore, the EPA notes that facilities would still be required to follow any stormwater requirements. High-intensity, infrequent storm events are currently addressed in the *2021 Multi-Sector General Permit* (MSGP), the most recent to address industrial stormwater, including stormwater at steam electric power plants.[115] The MSGP requires a Stormwater Pollution Prevention Plan (SPPP), which is developed at each individual facility and is therefore tailored to the types and frequencies of storms experienced at each facility. This makes sense as a site prone to hurricanes may take different stormwater precautions than a site located in an arid climate.[116] As a result of site-specific permit requirements or voluntary efforts, some steam electric facilities already exceed the performance of a 10-year, 24-hour design standard and would have even less frequent stormwater-related discharge needs than envisioned by the definitional change in this final rule. For example, in a recent BA transport water purge request for the Four Corners Power Plant, the utility demonstrated the ability to fully recycle under a 10-year storm event, and only showed the need for discharge during a 100-year storm event.

For the final rule, in addition to requiring facilities to meet limitations applicable to low volume waste sources, to ensure facilities are not backing away from more protective management practices, the EPA is requiring that any necessary discharges of CRL, FGD wastewater, or BA transport water resulting from such a high-intensity, infrequent storm event be accompanied by an official certification statement that includes information that these discharges were necessary (*i.e.,* could not be managed with existing systems or practices). Importantly, nothing in this definitional change or the associated reporting and recordkeeping requirement changes a facility's obligations for stormwater management under its current permit or general permit. For further discussion of this reporting and recordkeeping requirement, see section XIV.C.4 of this preamble.

b. Definitional Change for Decommissioning Wastewater

When the EPA finalized non-zero limitations for FGD wastewater and BA transport water in the 2020 rule, facilities could discharge these wastewaters when decommissioning equipment after retirement. The EPA proposed zero-discharge limitations and at proposal did not specifically address the scenario in which plants may be decommissioning their zero-discharge treatment equipment. One commenter said that wastewater must be discharged from such equipment at the time of decommissioning and recommended that the Agency either retain the 2020 rule purge allowance or finalize an end-of-life flexibility that the EPA proposed in 2019 for ''wastewater present in equipment when a facility is retired from service.'' Another commenter, in the context of the permanent cessation of coal combustion subcategory, suggested that the Agency allow facilities to discharge wastewaters for 120 days after permanently ceasing coal combustion.

The EPA agrees with the commenter that, given the zero-discharge limitations being finalized for FGD wastewater and BA transport water in this rule, an end-of-life flexibility for certain discharges is warranted. More specifically, the EPA finds a limited definitional change, appliable to all EGUs, to allow one-time discharges associated with decommissioning an FGD wastewater treatment system or BA handling system after retirement is appropriate. Part of the basis for the zero-discharge limitations in this rule is tied to the ability of an active plant to recycle the wastewaters back into the plant (*e.g.,* as FGD makeup water). This is no longer the case when a facility retires. Furthermore, as discussed in the subsequent sections VII.C.3 and VII.C.4, the Agency is finalizing a tiered set of zero-discharge limitations for FGD wastewater and BA transport water at EGUs permanently ceasing coal combustion, but it is including time that allows for discharges of these wastewaters up to 120 days after the EGU ceases coal combustion, due to the technical constraints of achieving zero-discharge when active operations have ceased. Because there is no material difference in residual discharges from a decommissioned system at a plant retiring before the December 31, 2028, or December 31, 2034, dates in the permanent cessation of coal combustion subcategories, as compared to a plant retiring after those dates, it is consistent to treat facilities retiring before and after those dates the same. Thus, the EPA is excluding wastewater removed from wastewater treatment or ash handling equipment within the first 120 days of decommissioning the equipment from the definitions of FGD wastewater and transport water.

While the EPA is excluding this narrow class of wastewaters from the definitions of FGD wastewater and transport water, this does not mean that no limitations apply to discharges of such wastewater. As low volume waste sources (which are defined as wastewater from all sources except those for which specific limitations or standards are otherwise established in part 423), these discharges are subject to the BPT limitations for low volume waste sources, as well as any BAT limitations developed by the permitting authority on a BPJ basis. The EPA expects permitting authorities to consider any treatment technologies available at the plant in devising appropriate, case-by-case BAT limitations.

6. Clarification on the Interpretation of 40 CFR 423.10 (Applicability)

The EPA clarified at proposal that part 423 applies to discharges of legacy wastewater at inactive/retired power plants because the discharge of these wastewaters ''result[s] from the operation of a generating unit.'' [117] This

[115] Available online at: *https://www.epa.gov/npdes/stormwater-discharges-industrial-activities-epas-2021-msgp.*

[116] While climate change may be driving more extreme storm events in some areas, it is possible that, given this design and the age of the facility, the facility will never experience a situation where a stormwater-related discharge under this rule would be required before its retirement from service.

[117] 40 CFR 423.10. The provisions of the part apply to discharges resulting from the operation of a generating unit by an establishment whose generation of electricity is the predominant source of revenue or principal reason for operation, and whose generation of electricity results primarily from a process utilizing fossil-type fuel (coal, oil,

Continued

interpretation is consistent with the EPA's longstanding view on the applicability of 40 CFR part 423 to inactive/retired plants, as well as with implementation by state permitting authorities. For example, in 2016, the South Carolina Department of Health and Environmental Control reissued a permit to the South Carolina Electricity & Gas Company's Canadys Station Site (SC0002020) which stated, ''Because electricity is not being generated, 40 CFR part 423-Steam Electric Power Generating Point-Source Category will only apply to the discharge of legacy wastewaters.'' [118] This is also consistent with the EPA's position provided in response to comments on the 2015 rule, in which the Agency stated:

> EPA disagrees with the commenter that the 'effluent limits would not apply' to discharges associated with retired units. For example, combustion residual leachate from landfills or surface impoundments containing combustion residuals from the time a generating unit was operating may occur and continue to be subject to the effluent limitations and standards requirements long after a generating unit is retired. Similarly, if an impoundment containing wastewater created while the generating unit was in operation (*e.g.,* FGD wastewater, fly ash or bottom ash transport water) were to discharge, it would certainly be discharging wastewater 'resulting from the operation of a generating unit.' In these instances, even though the generating unit may no longer be in operation, the wastewater is the result of its previous operation. Therefore, to the extent that steam electric power plants discharge wastestreams like this resulting from the operation of a generating unit, the ELGs do apply.[119]

Due to the proposed expansion of the RCRA CCR closure requirements to inactive surface impoundments at inactive (*i.e.,* retired) plants, some of these surface impoundments are expected to dewater and therefore discharge legacy wastewater. At proposal, the EPA sought to clarify the applicability of part 423 to these legacy wastewaters since the Agency was soliciting comment on establishing nationally applicable BAT limitations rather than reserving BAT limitations to be developed on a case-by-case basis using a permitting authority's BPJ. As described in section VII.B.4 of this preamble, the EPA is instead declining to establish a nationwide BAT for discharges of legacy wastewaters, except for those discharges of legacy wastewater described in section VII.C.6 of this preamble (which would not occur at previously retired facilities), and it is thus continuing to reserve these BAT limitations for case-by-case decision-making using the permitting authorities' BPJ. As a result, the applicability of part 423 to legacy wastewater discharges at inactive/retired plants would not impact the technology-based effluent limitations that apply to such discharges. In other words, the EPA's interpretation makes no difference to the ultimate disposition of legacy wastewater because, while the EPA interprets the rule to apply to legacy wastewater at inactive/retired steam electric power plants, the same BPJ approach called for in this rule would apply even if inactive/retired plants were not subject to part 423, given that BAT limitations must be developed on a BPJ basis where nationally applicable limitations do not apply. *See* CWA section 402(a)(1), 33 U.S.C. 1342(a)(1); 40 CFR 122.44, 125.3. For further discussion of these additional legacy surface impoundments, *see Legacy Wastewater at CCR Surface Impoundments—Estimated Volumes, Treatment Costs, and Pollutant Loadings* (DCN SE11503).

At proposal, the EPA also solicited comment on whether there are other wastewaters that may continue to be discharged after the retirement of a facility and the generation of electricity is the ''but for'' cause of the discharge. Some commenters suggested that the Agency should clarify its interpretation to include additional wastewaters such as CRL, while others disagreed that this would be a permissible reading of the regulation. Commenters opposed to an expansive reading stated that other wastewaters such as CRL generated after closure were not generated as a result of operating a generating unit, but as the result of precipitation percolating through a waste management unit. Commenters opposed to an expansive reading also pointed to the history of 40 CFR part 423, suggesting that the EPA never intended to cover CRL from retired power plants as it never evaluated these facilities.

The EPA agrees with commenters stating that discharges of CRL, even after retirement, result from the operation of a steam EGU. Were it not for operation of the unit, there could be no CRL discharges, regardless of whether there are other conditions that also exist to facilitate the discharge. Moreover, the EPA disagrees with commenters that the Agency never intended to cover CRL from retired power plants. As can be seen from the response to comment excerpt above, in 2015, the EPA expected that CRL discharges would continue to be subject to 40 CFR part 423 after a facility retired. This is an important clarification that makes it clear that the limitations being finalized, including those for subcategories, would continue to apply after the facility retires. At the same time, two other statements from the 2015 rule record demonstrate that the Agency only intended the regulations to cover leachate prospectively from the 2015 rule. First, also in the 2015 response to comments is the EPA's statement that:

> Retired landfills with or without leachate collection systems are not subject to the combustion residual leachate limitations and standards. EPA's methodology does not include costs or pollutant loadings removals from closed or retired landfills in its analyses.[120]

Second, in the 2015 TDD, the EPA stated that ''combustion residual leachate from retired units is not regulated in the final rule.'' These two statements, together with the earlier response to comments discussed above, reflect the actual approach finalized in the 2015 rule; namely, that only CRL generated and discharged at EGUs operating after the effective date of the 2015 rule was covered.[121] The approach taken in this final rule is consistent with that of the 2015 rule. That is, discharges of CRL (including unmanaged CRL) are covered prospectively by the final rule, but they will continue to be covered even after that facility and any waste management units generating CRL have retired. To the extent that a retired facility or closed waste management unit (WMU) is subject to 40 CFR part 423 but its discharges of CRL (including unmanaged CRL) are not subject to this rule, permitting authorities will instead continue to establish technology-based effluent limitations that reflect BAT using their BPJ. Thus, these facilities will have to meet BAT limitations for their discharges of CRL that are available, are economically achievable,

or gas), fuel derived from fossil fuel (*e.g.,* petroleum coke, synthesis gas), or nuclear fuel in conjunction with a thermal cycle employing the steam water system as the thermodynamic medium. This part applies to discharges associated with both the combustion turbine and steam turbine portions of a combined cycle generating unit.

and have acceptable non-water quality environmental impacts.[122]

C. Subcategories

The EPA has authority in a national rulemaking to establish different limitations for different plants after considering the statutory factors listed in CWA section 304(b). *See Texas Oil & Gas Ass'n* v. *EPA,* 161 F.3d at 938 (stating that the CWA does not ''exclude a rule allowing less than perfect uniformity within a category or subcategory.'').

In the 2015 rule, the EPA established subcategories for small EGUs (less than or equal to 50 MW nameplate capacity) and oil-fired EGUs. In this rulemaking, the EPA did not propose to revise or eliminate these subcategories and did not receive any comments on removing such subcategories; therefore, this final rule keeps the 2015 subcategories intact.

In the 2020 rule, the EPA established additional subcategories for high FGD flow facilities (EGUs with FGD purge flows of greater than 4 million gallons per day), LUEGUs (EGUs with a capacity utilization rating of less than 10 percent per year), and EGUs permanently ceasing coal combustion by 2028. For these subcategorized units, the EPA established different limitations using different technology bases as compared to the limitations applicable to the rest of the steam electric point source category. In 2023, the EPA proposed to eliminate the 2020 rule's high FGD flow subcategory and LUEGU subcategory, but also proposed to retain the permanent cessation of coal combustion by 2028 subcategory.

Based on public comment, in this final rule, the EPA is eliminating the 2020 rule's high FGD flow subcategory, as well as the LUEGU subcategory, but is retaining the permanent cessation of coal combustion by 2028 subcategory. These three subcategories are addressed in subsections 1–3 below.

In addition, the final rule creates three new subcategories based on the proposal, as described further in subsections 4–6 below. These subcategories are for (1) EGUs permanently ceasing coal combustion by 2034, (2) discharges of unmanaged CRL, and (3) discharges of legacy wastewater from surface impoundments that will commence closure under the CCR regulations after the effective date of this final rule. For these subcategorized units, the EPA is establishing different limitations (using different technology bases) than the ones applicable to the rest of the steam electric point source category.

1. Plants With High FGD Flows

Except as discussed in section VII.C.4 of this preamble, as proposed, the EPA is eliminating the high FGD flow subcategory promulgated in the 2020 rule. The EPA finds that, after evaluating public comments, along with the record and factors specified in CWA section 304(b)(2)(B), the subcategory is no longer warranted.

At the time of the 2020 rule, the EPA's understanding was that this subcategory would apply to only one facility, TVA Cumberland, which operated with FGD purge flows of over 400 million gallons per day. The EPA based the creation of the subcategory on the supposedly disparately high costs that would result from high FGD flows at this facility and thus the need to install a larger, more costly treatment system than at other EGUs.

Several commenters on the 2019 and 2023 proposals claimed that this subcategory of one facility was inconsistent with the CWA, and further argued that the costs estimated for TVA were overestimated and not disparately high as compared to other facilities.[123] The EPA acknowledges that its cost estimates were higher than TVA's own estimates for installing biological treatment, and thus costs may not be as disparately high as indicated in the 2020 rule.

Since the 2020 rule, TVA has announced a notice in the **Federal Register** of plans to retire the facility, which are further detailed in a draft Environmental Impact Statement (EIS). *See* 86 FR 25933 (May 11, 2021). This draft EIS solicits comment on three alternatives, all of which include retirement but with different electricity replacement scenarios. While TVA's comments on the 2023 proposed rule still appear to support retaining this subcategory, its comments also confirm that TVA plans to retire the Cumberland plant.

Due to TVA's retirement plans, the EPA finds that this subcategory is no longer warranted based on the rationale provided in the 2020 rule. As appears in its **Federal Register** document, all the alternatives TVA is considering (including its preferred alternative) would result in the plant's retirement. To the extent that the plant is able to participate in the permanent cessation of coal combustion by 2028 subcategory, the plant's limitations would be based on surface impoundments.[124] To the extent that the plant operates beyond 2028, it would be able to participate in the permanent cessation of coal combustion by 2034 subcategory (discussed below in section VII.C.4 of this preamble) and have limitations based on chemical precipitation (the same 2020 rule limitations applicable to plants in the high FGD flow subcategory). Thus, there would be no costs to TVA Cumberland associated with the more stringent, zero-discharge limitations in this final rule, and thus no disparate costs. Disparate costs were the sole rationale for the high FGD flow subcategory, and neither the EPA nor commenters have identified alternative bases that could serve to support this subcategory. Furthermore, after the retirement of TVA Cumberland, because this plant was the only one qualifying as a high flow facility, this subcategory becomes a null set; therefore, the EPA is eliminating the subcategory.

2. LUEGUs

Except as discussed in section VII.C.4 of this preamble for the new permanent cessation of coal combustion subcategory, as proposed, the EPA is eliminating the LUEGU subcategory after evaluating public comments received and the record as it informs the factors specified in CWA section 304(b)(2)(B). The EPA finds that the subcategory is no longer warranted. The EPA established the subcategory for LUEGUs in the 2020 rule based on cost (disparate capital costs), non-water quality environmental impacts (energy reliability), and other factors the Administrator deemed appropriate (*i.e.,* harmonization with CAA and RCRA regulations that apply to electric utilities).

The EPA received comments on the proposal both in support of and opposition to eliminating this subcategory. Commenters supporting elimination of the subcategory agreed with the statements and findings included in the EPA's proposal that the

[122] The EPA conservatively included closed WMUs in its cost analyses when they were located at active facilities. CRL flows at composite-lined landfills could be comingled with the flows from adjacent, active landfill cells. Furthermore, unmanaged CRL flows could be caught up in site-wide pump-and-treat operations where both active and closed WMUs are present. Thus, while this is a conservative assumption, it is a reasonable estimate that helps ensure the costs of the rule are not underestimated and are economically achievable.

[123] The EPA notes that these commenters were also petitioners in the consolidated *Appalachian Voices* case discussed in section IV of this preamble.

[124] TVA submitted a NOPP for the permanent cessation of coal combustion subcategory to the Tennessee Department of Environment and Conservation on October 6, 2021. To date, the EPA is not aware of any actions taken at the facility to meet the limitations in the high flow subcategory no later than December 31, 2023, as required to participate in this subcategory.

2020 LUEGU subcategory is no longer warranted based on the factors originally cited. Commenters opposed to elimination of this subcategory faulted the EPA for several reasons. First, they contended that the EPA could not evaluate the subcategory without better understanding how many plants intend to make use of it. In particular, they claimed that the EPA's understanding of the universe of plants intending to make use of the subcategory is not based on a comprehensive accounting of NOPPs and facilities with LUEGU limitations included via the transfer provisions of the 2020 rule, contained in § 423.13(o), which allow facilities to transfer into the LUEGU subcategory automatically without requesting a permit modification. Second, these commenters reiterated the findings in the 2020 rule and claimed they supported creation of the subcategory. Finally, the commenters disputed the proposal's characterization of GSP Merrimack Station, the only plant currently seeking to participate in this subcategory.

Under the 2020 rule, a facility wishing to avail itself of the limitations available in the subcategories for low utilization or permanent cessation of coal combustion, or any facility wishing to participate in the VIP, was required to file a NOPP by October 13, 2021. The EPA acknowledges that facilities and permitting authorities were not required to provide NOPPs to the EPA as part of the 2020 rule. Instead, the EPA obtained NOPP submissions through normal permit reviews, as courtesy copies, in providing technical support to state permitting authorities, and via the sharing of a set of NOPPs that environmental groups had already collected. In total, these NOPPs cover 94 EGUs at 38 plants—about 34 percent of all facilities predicted to incur costs under the 2020 rule.[125] Furthermore, the EPA did not receive comments from any facilities stating that they had filed NOPPs of which the EPA was not aware. Most of these NOPPs are from plants wishing to avail themselves of flexibilities in the 2020 rule other than the LUEGU subcategory. Only one facility indicated it would like to avail itself of the BAT limitations in the subcategory for LUEGUs: the GSP Merrimack Station in Bow, New Hampshire.

On March 27, 2024, GSP issued a press release announcing a settlement with the EPA whereby GSP has committed to permanently ceasing coal combustion at Merrimack Station no later than June 1, 2028. This dates is memorialized in a Settlement Agreement that arose out of an Alternative Dispute Resolution process conducted in connection with an administrative appeal of an NPDES permit modification for Schiller Station.[126] As a result of the only known facility with LUEGUs retiring and no comments revealing the existence of any other LUEGU, the EPA is eliminating the LUEGU subcategory in this final rule, except to the extent it supports entry into the new permanent cessation of coal by 2034 subcategory discussed below.

3. EGUs Permanently Ceasing Coal Combustion by 2028

The EPA is retaining the subcategory for EGUs permanently ceasing coal combustion by 2028 after evaluating public comments and the record in light of the factors specified in CWA section 304(b)(2)(B) and finding that the subcategory continues to be warranted. For EGUs in this subcategory, the EPA is also retaining the 2020 rule BAT limitations based on surface impoundments.

The EPA proposed to retain the subcategory for EGUs permanently ceasing coal combustion by 2028 and simultaneously extended the NOPP filing date through a companion direct final rulemaking. *See* 88 FR 18440 (March 20, 2023). No commenter argued for the elimination of this subcategory, though commenters disagreed about any potential changes. Some commenters suggested extending the latest date to permanently cease coal combustion beyond December 31, 2028, while other commenters opposed any extension of this date. Similarly, some commenters sought additional transparency and enforceability of the criteria to permanently cease coal combustion while other commenters opposed such modifications. In the subsections below, the EPA discusses why this subcategory continues to be warranted and why it is retaining the BAT technology bases for this subcategory. The EPA also discusses the zero-discharge limitations that apply after ceasing coal combustion, as well as reporting and recordkeeping requirements in the final rule.

a. The subcategory continues to be warranted based on several statutory factors.

The EPA established this subcategory in the 2020 rule based on the statutory factors of cost, the age of the equipment and plants involved, non-water quality environmental impacts (including energy requirements), and such other factors as the Administrator deems appropriate (harmonization with the CCR regulations' alternative closure provisions). The EPA notes the unanimous agreement that this subcategory should be retained, and it agrees with commenters, although the EPA is no longer relying on cost as a primary basis for this subcategory, as discussed below.

In particular, the EPA recognizes that, based on the creation of this subcategory, which was part of the 2020 rule, many plants have begun moving forward with plans to retire or repower in the then-eight-year time frame afforded under that rule. In the 2020 rule, EPA described how recent NERC reliability assessments showed one region that was not anticipated to meet its reference margin [127] and another region that was anticipated to be very close to its reference margin (and these assessments are consistent with NERC's *2023 Long-Term Reliability Assessment*). Therefore, for the 2020 rule, the EPA found that premature closure of some plants and/or EGUs as a result of the general, industry-wide limitations would be an unacceptable non-water quality environmental impact because it could impact reliability. Utilities with a limited remaining useful life have planned and budgeted for replacement capacity under timelines approved by public utility commissions (PUCs) and public service commissions (PSCs) as part of the normal integrated resource planning process. These submissions were made since the 2020 rule, as part of the 2020 rule's eight-year window to permanently cease coal combustion. The EPA does not think that it should disrupt these ongoing plans by changing the date halfway through the period that plants have moved forward with those plans. Maintaining the same timeframe allowed by the prior rule supports efforts planned for the orderly transition of generating capacity as a result of the 2020 rule in a way that helps ensure

[125] Four units at two plants are represented twice. NOPPs for two units were initially filed by one plant for the VIP, and NOPPs for two separate units were initially filed by another plant for the LUEGU subcategory. Both plants then filed new NOPPs for their two units to permanently cease coal combustion by 2028.

[126] *See, e.g., https://indepthnh.org/2024/03/27/last-coal-plants-in-new-england-to-voluntarily-close-transitioning-to-renewable-energy-parks/.*

[127] ''Reference margins, which differ by region, are reserve margin targets based on each area's load, generation capacity, and transmission characteristics. In some cases, the reference margin level is a requirement implemented by states, provinces, independent system operators, or other regulatory bodies. Reliability entities in each region aim to have their anticipated reserve margins surpass their reference margins, which are generally set near 15% in most regions.'' Available online at: *https://www.eia.gov/todayinenergy/detail.php?id=31492.*

grid reliability and weighs in favor of retaining the same date in this rule.

With respect to air pollution, a non-water quality environmental impact, the EPA notes that several utilities have decided to make use of this subcategory where they may not have previously had plans to retire by 2028. For example, the DTE Energy Company filed a NOPP for this subcategory for its Belle River Power Plant and is now planning to retire in 2028 rather than 2030. Replacing coal-fired capacity with natural gas, renewables, and other sources leads to decreased emissions of several air pollutants. The subcategory allows utilities seeking to retire by 2028 to do so and achieve the associated air pollution and solid waste reductions, which further supports the finding that the subcategory continues to be warranted.

In addition, the EPA still wishes to harmonize this rule with the CCR alternative closure provisions as described in the proposal, and those provisions have not changed. Twenty-five plants are seeking to use the alternative closure provisions under the CCR regulations, which allow for closure of the unlined impoundment(s) and the power plant no later than 2023 (for surface impoundments under 40 acres) or 2028 (surface impoundments over 40 acres).[128] Elimination of the permanent cessation of coal combustion subcategory from this ELG could interfere with the plans of utilities with surface impoundments in the 2028 category, complicating their compliance with the CCR regulations. Furthermore, the EPA has also finalized additional flexibility under the Good Neighbor Plan, discussed in section IV.E.2.a of this preamble.[129] Harmonization between regulations on air, water, and land pollution gives industry certainty to plan and implement these requirements in an orderly, efficient manner.

Although the EPA concludes that the previous factors are sufficient to justify the retention of this subcategory, the EPA also notes that, with respect to cost, the 2020 rule record included an analysis showing that amortization of capital costs for less than the typical 20-year life of pollution control equipment leads to greater annualized costs per MWh as compared to costs at EGUs that are not retiring or repowering. Many plants made decisions at the time of the 2020 rule to opt for the alternative retirement compliance pathway, and they are now several years into meeting the milestones for that path. In this case, a change in the rule requiring these facilities to install new treatment technologies would result in even shorter timeframes and even greater costs per MWh. Thus, the EPA finds that cost provides an additional basis for the subcategory.

After considering all the information above, the EPA finds that the record and statutory factors discussed above continue to support this 2020 subcategory and associated limitations. Each of these bases, discussed above and supported by a statutory factor, provide a separate and independent basis for subcategorization, save for the cost basis which serves as additional support. Thus, the EPA is retaining this subcategory in its current form. This includes retaining the BAT technology basis for limitations applicable to EGUs in this subcategory, surface impoundments. Surface impoundments are technologically available, are economically achievable, and have acceptable non-water quality environmental impacts as applied to this subcategory. They represent BAT for this subcategory because they support the ability of plants with a limited remaining useful life to continue with their ongoing plans for orderly retirement or repowering. The EPA also notes that they would not lead to higher costs for facilities based on the remaining useful life of their EGUs. The EPA did not select any other technology for this subcategory because it would disrupt plants' already approved, ongoing plans for ceasing coal combustion by 2028. The EPA also notes that imposing more stringent BAT limitations on EGUs in this subcategory would subject them to greater costs per MWh, as compared to EGUs in the general industry, given that these EGUs have a limited remaining useful life.

b. The final rule includes post-coal combustion cessation zero-discharge limitations for EGUs in this subcategory to avoid circumvention.

The EPA proposed to include zero-discharge limitations applicable after the permanent cessation of coal combustion date, December 31, 2028, for all discharges in this subcategory. The goal of these limitations was to ensure that a facility does not manipulate the flexibilities in 40 CFR part 423 to avoid meeting industry-wide zero-discharge limitations and then simply keep discharging without relevant permit limitations being applicable to them. The EPA received several comments on these limitations that would apply after the permanent cessation of coal combustion date. Some commenters expressed a preference for them and sought an even stronger requirement that the zero-discharge limitations be retroactive. Other commenters suggested that these limitations are not necessary, are unduly burdensome, and are not cost-free, even where a facility successfully permanently ceases coal combustion by the specified date. One commenter in the latter category suggested a 120-day flexibility for facilities that permanently ceased coal combustion to allow for some residual discharges of these wastewaters as necessary, subject to requirements no more stringent than BPT limitations.

After considering these comments, the EPA is finalizing zero-discharge limitations that would apply after the permanent cessation of coal combustion date, December 31, 2028, with modifications from the proposal, in order to ensure that the eligibility for participation in this subcategory designed for EGUs that permanently cease coal combustion is not circumvented. The modifications the EPA made to these limitations following proposal are based on legitimate concern raised in public comments concerning the potential need to discharge for a relatively short period of about fourth months following the permanent cessation of coal combustion. For example, a facility retiring on December 31, 2028, may still need to discharge the wastewater remaining in existing tanks from the final hours and days of lawful operations. The EPA does not wish to interfere with owner/operator plans for the permanent cessation of coal combustion or discourage the use of this subcategory by unfairly preventing any residual discharges that are necessary after coal combustion has permanently ceased.

The final rule reflects that the EPA continues to view zero-discharge limitations that apply following the permanent cessation of coal combustion date as an appropriate tool to avoid circumvention, as well as some flexibility to account for legitimate concern regarding the need to discharge following the permanent cessation of coal combustion date. The final rule thus contains a tiered set of zero-discharge limitations applicable following December 31, 2028:

[128] Further information is available online at: *https://www.epa.gov/coalash/coal-combustion-residuals-ccr-part-implementation.*

[129] To facilitate a potentially economic and environmentally superior unit-level compliance response across the programs that nonetheless maintains the NO_X reductions required by the state budgets from 2026 forward in the proposal, the EPA requested comment on potentially deferring the application of the backstop daily rate for large coal EGUs that submit written attestation to the EPA that they make an enforceable commitment to retire by no later than the end of calendar year 2028. 87 FR 20036, 20122 (April. 6, 2022).

• The first tier of these limitations is composed of zero-discharge limitations for FGD wastewater and BA transport water after April 30, 2029. These limitations would apply if the EGU had in fact permanently ceased coal combustion by December 31, 2028, as the plant represented it would. As suggested in the comments, this date is 120 days after the latest permanent cessation of coal combustion date, allowing for facilities to complete any necessary residual decommissioning discharges.[130]

• The second tier is composed of zero-discharge limitations for these same wastewaters after December 31, 2028. If a plant fails to cease combustion of coal by 2028, as it represented it would, for any reason other than those specified in section 423.18, these zero-discharge limitations would automatically apply.

Dischargers to which the second tier applies, the EPA notes, would be subject not only to this rule's requirements, but also to enforcement for false statements in their filings under § 423.19—for example, statements made in the NOPP, in the annual progress reports, in the notice of material delay, and for failure to file a notice of material delay in a timely fashion. Any reporting and recordkeeping violations would also be subject to enforcement. The EPA finds that, together, the zero-discharge limitations and reporting and recordkeeping requirements, as modified below, are sufficient to ensure that facilities do not unfairly benefit by continuing to discharge after the subcategory's permanent cessation of coal combustion date.

c. The final rule includes additional reporting and recordkeeping requirements for EGUs in this subcategory.

For a discussion of additional reporting and recordkeeping requirements, see section XIV.C.1 of this preamble.

4. EGUs Permanently Ceasing Coal Combustion by 2034

The EPA proposed a new ''early adopter'' subcategory for EGUs permanently ceasing coal combustion by December 31, 2032, with certain eligibility criteria targeted toward those plants that had already installed the FGD and BA technology bases on which the 2020 rule rested by the date of the 2023 proposed rule. The EPA solicited comment on whether the permanent cessation of coal combustion date should be earlier or later than 2032, as well as the propriety of the proposed criteria based on technology adoption for the subcategory. Based on public comments, the EPA is finalizing the new subcategory, except that the date for permanently ceasing coal combustion is December 31, 2034, rather than 2032. In addition, the EPA is not establishing strict eligibility criteria that would have narrowed the universe of plants to which this subcategory might apply. Through public comments, the EPA learned that, while many plants have continued to move toward compliance with the 2020 rule limitations, including by making various expenditures toward that goal (*e.g.,* securing contracts, conducting pilots, etc.), relatively few had actually installed the technologies on which the 2020 rule limitations were based by the time the 2023 proposed rule was published. In some cases, this was due to the timing of when a plant's NPDES permit was expected to be renewed. As a result, the cutoff that the EPA proposed—in terms of both the date for adoption and what steps constituted adoption—as well as other cutoffs that the EPA considered, would not necessarily capture the universe of plants that the EPA intended to capture. Moreover, the bases for this subcategory in terms of the statutory factors, as discussed further below, support this subcategory even without the proposed requirement for installation of the 2020 rule BAT technologies by the 2023 proposed rule date.

For EGUs that permanently cease coal combustion by December 31, 2034, the EPA is establishing limitations for FGD wastewater and BA transport water that are the same as those in place following the effective date of the 2020 rule. These limitations differed for some EGUs if they participated in a subcategory promulgated by the 2020 rule, but for the general industrial category consisted of limitations based on chemical precipitation followed by low residence time biological reduction treatment for FGD wastewater and limitations based on high recycle rate systems for BA transport water.

The final rule also covers discharges of CRL from EGUs in the new permanent cessation of coal combustion subcategory. The EPA notes that facilities discharge CRL either alone or in combination with FGD wastewater and BA transport water. The EPA solicited comment at proposal on the treatment of CRL at EGUs that will soon permanently cease coal combustion and close their CCR landfills. In response to this solicitation, several commenters recommended either including CRL in any new permanent cessation of coal combustion subcategory or creating a separate subcategory for CRL generated at landfills nearing closure. Several commenters recommended that CRL discharged from retired EGUs or EGUs that were about to retire should be subcategorized to avoid imposing disparate costs. One commenter pointed to the Agency's findings that the volume of CRL generated after closure of a landfill was approximately an order of magnitude lower than the volume of CRL generated during that landfill's operation.

The EPA agrees with many of these comments and is including CRL as one of the wastestreams covered by the new permanent cessation of coal combustion by 2034 subcategory. While an EGU is still combusting coal, that combustion generates CCR, which in turn generates CRL. As well as being tied to ongoing operations during a facility's remaining useful life (as are FGD wastewater and BA transport water), CRL can be comanaged with FGD wastewater (as is currently done at some facilities). Furthermore, including CRL in this subcategory promotes ease of administration, avoiding the creation of a separate subcategory for CRL designed to accomplish the same fundamental goals.

For CRL discharged at EGUs in this subcategory, the EPA is reserving BAT limitations to be developed on a BPJ basis by the permitting authority until the permanent cessation of coal combustion, after which the EPA is establishing mercury and arsenic limitations based on chemical precipitation, which are the same limitations that EPA proposed for all discharges of CRL.

The EPA received a number of comments on the overall propriety of the proposed subcategory. Though commenters were split, many supported a new subcategory for additional flexibility but disagreed with the contours of what the EPA proposed. After considering the comments and evaluating the record in light of the factors specified in CWA section 304(b)(2)(B), the EPA finds that a new permanent cessation of coal combustion subcategory is warranted. The statutory bases for this subcategory are discussed in the subsection below. The rationale for the selected BAT technology bases appears thereafter, as well as the rationale for rejecting other technologies. Importantly, this subcategory is in addition to the 2020 rule's permanent cessation of coal combustion by 2028 subcategory, which is carried forward in this rule. While the

[130] The EPA notes that these do not include discharges of legacy wastewaters from surface impoundments closing under the CCR rule, which are covered by different regulatory provisions.

two subcategories are similar in that they apply to EGUs that plan to permanently cease combustion of coal, they differ as discussed below.

a. This subcategory is justified based on several statutory factors.

This subcategory is supported by consideration of three CWA section 304(b) statutory factors: age of equipment and facilities involved, non-water quality environmental impacts, and cost. The EPA notes that the cost factor supports subcategorization, but it is not relying on that factor as a primary basis for the subcategory. Each of the bases discussed below and supported by a statutory factor provide a separate and independent basis for subcategorization, except for cost, which simply provides additional support.

Age of the equipment and facilities involved. The EPA recognizes that this 2024 rule establishes new, more stringent limitations over the limitations promulgated in 2020. For some plants, that means that they may no longer be able to rely on parts of the wastewater treatment systems they installed to meet the 2020 limitations to meet the new 2024 limitations. Under the Act's technology-forcing regime, imposing limitations requiring facilities to shift installation to new pollution control technologies is warranted as more effective technologies are available and economically achievable. In the particular circumstances here, however, the ''age of equipment and facilities involved'' supports allowing plants with EGUs permanently ceasing combustion of coal by December 31, 2034, to continue to meet limitations under the 2020 rule. Such facilities either have recently or are in the process of installing technologies to meet the 2020 rule limitations and, rather than require these facilities to also install technologies to meet limitations under the 2024 rule as well, given the short remaining useful life of certain plants, the EPA views it as reasonable to provide flexibility in this rule for plants with EGUs permanently ceasing combustion of coal by December 31, 2034.

There are many coal-fired EGUs that have announced a retirement or fuel conversion that would occur after December 31, 2028, which is the date used to establish the 2020 subcategory applicable to EGUs permanently ceasing coal combustion. In table VII–2 below, the EPA presents all of the announcements at EGUs estimated to potentially make new investments under this final ELG rule.

TABLE VII-2. Announced Coal-Fired EGU Retirements and Fuel Conversions

* Entries 55 and 106 are EGUs less than 50 MW and therefore are not expected to be impacted by the rule

**While the EPA could not confirm the retirement of Shawnee 3 based on publicly available announcements at the time of analysis, during the 12866 review process, TVA confirmed that Shawnee 3 is also retiring in 2033. To the extent that the EPA has overestimated costs for Shawnee in its analysis, the analysis is conservative.

As seen in the table above, there have been 120 announcements that cover the years from 2029 to 2066. Of these, the EPA assumes that the nine EGUs retiring in 2029 would already be able to retire without making new investments under this rule, as these facilities could obtain a ''no later than'' date for the final limitations in this rule

from their permitting authority as late as December 31, 2029. In particular, the EPA notes that there is a cluster of announced retirements that tails off around 2034, with relatively few additional retirements in subsequent years until the 2039/2040 timeframe. These retirements have already been announced, planned for, and in some cases already approved by state and regional utility commissions or grid operators.

Some commenters expressed the view that the EPA had not considered reliance interests created by the 2020 rule and the EPA's decision to continue to implement that rule. The EPA disagrees. As discussed in previous sections, a facility cannot reasonably rely on the limitations established in a permit beyond the life of the permit itself, which is typically issued for five-year term, and the technology-forcing nature of the statute contemplates establishment and revision of limitations based on the best available technology reflecting currently available information. Nevertheless, as noted above, there are around 50 EGUs planning to permanently cease coal combustion between 2030 and 2034. The plants where these EGUs are located are in the process of installing or have recently installed new technologies under the 2020 rule, as the latest date for compliance in that rule is December 31, 2025. Without establishment of this subcategory, these plants could now be expected, under this rule, to potentially abandon parts of their 2020 treatment systems and install different treatment systems to comply with this 2024 rule, which has a compliance date of December 31, 2029, at the latest. These plants, in particular, have adopted certain strategies for an orderly transition to retirement or an alternate fuel source. The owners and operators of these plants have planned this transition taking into consideration effects on the broader grid and the reasonable useful life of recently installed or soon-to-be installed water pollution treatment equipment under the 2020 rule. Under these circumstances, the EPA does not view it as reasonable, in view of all the relevant considerations, to expect this group of plants to abandon prior installations under the 2020 rule and make additional upgrades under this 2024 rule, given the relatively short remaining useful life of the EGUs and treatment systems. The EPA notes, moreover, that plants installing and operating technologies to meet the 2020 limitations will achieve reductions of pollutants of concern in their wastewaters.

For CRL, it is also relevant to consider the remaining useful life of the WMU. As discussed earlier in this section, commenters recommended providing flexibility for landfills which were nearing retirement, as these landfills would be closed and generate a much smaller volume of CRL after retirement. Thus, instead of installing an oversized system to operate for potentially only a couple of years, a more tailored system could be installed to treat the smaller, post-closure flow.

Non-water quality environmental impacts (including energy requirements). The already planned retirements and fuel conversions of coal-fired EGUs discussed above would not only reduce or eliminate the water pollution associated with the continued operation of coal-fired EGUs, but it would also reduce or eliminate air pollution and solid waste generation. Electric utilities have an interest in continuing the planned, orderly transition of this cluster of EGUs in a way that achieves an adequate amortization period for the water pollution treatment technologies. Without subcategorization, this cluster of facilities may choose to extend the life of these EGUs in order to better amortize the costs of both the existing technologies as well as the new technologies that would otherwise be required by this final rule. If that were to happen, the reductions in air pollution and solid waste generation associated with the planned retirement or repowering of the EGU would be forgone, and the EPA finds these non-water quality environmental impacts weigh in favor of this subcategory.

In addition, ''energy requirements'' are an express non-water quality environmental impact that EPA must consider under the statute, and several commenters raised concerns regarding electric reliability. These commenters suggested that a subcategory was necessary to maintain reliability. As discussed above, the retirements of EGUs in this subcategory have already been announced, planned for, and in some cases already approved by state and regional utility commissions or grid operators. The Agency finds that the creation of this subcategory provides flexibility for the orderly retirement or fuel conversion of coal-fired EGUs in a way that helps ensure grid reliability, as it allows plants to continue as planned while meeting the 2020 limitations. This provides additional support for this subcategory.

Cost. The EPA also notes that ''cost' is a factor that EPA must consider under CWA section 304(b), and, while not a primary basis, this factor provides additional support for this subcategory. Looking at the EGUs permanently ceasing coal combustion by December 31, 2034, absent the new subcategory, these EGUs would have additional capital costs of $708M and additional O&M costs of $93.0M. Given the short remaining useful life of the EGUs and associated wastewater treatment equipment, facilities with these EGUs would have fewer years of remaining life over which to amortize these costs, and thus the costs would be higher per MWh than the costs per MWh for EGUs not permanently ceasing coal combustion by 2034. This is especially true of plants that might not install the 2024 technologies until the latest compliance date of December 31, 2029. The EPA analyzed these costs in the 2020 rule with respect to the permanent cessation of coal by 2028 subcategory and similarly found unreasonably higher costs for that subcategory.

Selection of 2034 date. While the EPA proposed a permanent cessation of coal combustion date of December 31, 2032, several commenters advocated for different dates as early as 2030 and as late as 2040. The record discussed above does not provide a clear delineation for where such a cutoff should be placed; however, after careful consideration of the information in the record, the EPA finds that selecting a permanent cessation of coal combustion date of December 31, 2034, to be a reasonable way to account for the interests described above while still furthering the CWA's goals. First, as discussed above, there is a cluster of retirements occurring from 2030 to 2034. Relatively few additional EGUs would qualify for the subcategory if the date were placed a year or two further into the future, but many EGUs would be excluded if the date were kept at 2032 or moved even earlier as some commenters suggested. Furthermore, cost per MWh becomes greater as the amortization period of new equipment is shortened. An effective date for the final rule in 2024 and a ''no later than'' date of December 31, 2029, means that plants with retirements or fuel conversions in the 2030 to 2034 cluster would amortize costs over a period of several months to at most, 10 years. Finally, the use of December 31, 2034, would create parity for facilities regardless of where they were in their permit cycle. Since the 5-year permit cycle after the effective date of this rule would go from 2024 to 2029, one more 5-year permit cycle after that ends in 2034.

Finally, the EPA has considered how the requirements in this rule interact

with the requirements in the CAA section 111 rule. One of the frequent comments received during the public comment period on the proposed ELG was that this rule and the CAA section 111 rule should be harmonized. Commenters argued that harmonization may consist of several aspects, including aligning compliance dates, aligning subcategories and other flexibilities, and aligning reporting and recordkeeping requirements. In the context of a subcategory for the permanent cessation of coal combustion, the EPA finds that the subcategory discussed here creates sufficient space for the flexibilities under the CAA section 111 rule to be utilized as appropriate.

As described in section IV.E.2 of this preamble, the final CAA section 111 rule consists of only two coal-fired EGU subcategories, and no longer has subcategories for EGUs retiring by 2032 or 2034 as were in the proposed CAA section 111 rule. Instead, the final CAA section 111 rule includes site-specific flexibilities to ensure reliability. While it is not always possible or necessary to harmonize the CAA and CWA requirements due to the different means by which flexibilities are implemented under the two statutes, EPA has provided flexibility under the ELG which would reasonably allow for the use of the site-specific flexibilities of the CAA section 111 rule. Specifically, since the two coal-fired EGU subcategories in the CAA section 111 final rule have compliance dates of January 1, 2030, and January 1, 2032, the use of the site-specific flexibilities tied to reliability would necessarily mean that some EGUs could retire after those dates with less stringent or delayed standards. Thus, the additional time provided by a 2034 permanent cessation of coal combustion date in the final ELG allows time for the corresponding site-specific flexibilities in the CAA 111 rule to be utilized.

While harmonization with the CAA section 111 rule supports the finding that this subcategory is appropriate, it is the EPA's intent that this new permanent cessation of coal combustion subcategory be retained even if the final CAA section 111 rule is not in effect. The EPA finds that, even in the absence of the CAA 111 rule, the other statutory factors of age, non-water quality environmental impacts, and cost are sufficient, either alone (save for cost) or together, to support the subcategory for EGUs permanently ceasing coal combustion by 2034.

b. The EPA is establishing BAT limitations for EGUs in this subcategory based on the currently applicable BAT technology bases for FGD wastewater, BA transport water, and CRL during the continued combustion of coal.

The EPA finds that the 2020 rule BAT technologies that formed the bases for the generally applicable limitations for FGD wastewater and BA transport water, as well as the BAT technologies that formed the bases for limitations in the high FGD flow subcategory and in the LUEGU subcategory, are available, are economically achievable, and have acceptable non-water quality environmental impacts, as explained in the 2020 rule and further confirmed by analyses in this rule. EPA is, therefore, identifying them as the BAT technology bases for FGD wastewater and BA transport water for EGUs in this subcategory.[131] The EPA is also declining to establish BAT limitations on CRL prior to permanently ceasing combustion of coal. The effect of EPA declining to establish BAT limitations for CRL discharged from EGUs in this subcategory prior to permanently ceasing coal combustion is that permitting authorities will continue to establish technology-based effluent limitations using their BPJ. Because the limitations are required to be derived on a case-by-case basis, taking into account the requisite statutory factors and applying them to the circumstances of a given plant, these limitations would by definition be technologically available and economically achievable and have acceptable non-water quality environmental impacts where the permitting authority supports in the record of the permit that such is the case.

The EPA rejects more stringent technologies, such as zero-discharge systems, for FGD wastewater, BA transport water, or CRL in this subcategory before the permanent cessation of coal combustion. Zero-discharge requirements for this subcategory may not allow electric utilities with a limited remaining useful life to continue their ongoing, approved plans for an organized phasing out of EGUs that are no longer economical, in favor of more efficient, newly constructed generating stations. This concern is reduced by maintaining the currently applicable BAT limitations for this subcategory.

While the previous basis is sufficient to reject technologies that would result in more stringent limitations, the EPA notes that limitations based on such technologies as zero-discharge systems would impose greater costs per MWh on this subcategory of EGUs, given their limited remaining useful life. This provides additional support for rejecting more stringent limitations. Retaining the currently applicable BAT for this subcategory alleviates the choice for these plants to either pass on the greater capital costs per MWh of zero-discharge systems over a shorter remaining useful life or risk the possibility that post-retirement rate recovery would be denied for the significant capital and operating costs associated with the final rule. In addition, with respect to CRL, requiring across-the-board BAT limitations before permanent cessation of coal combustion could lead to individual facilities experiencing disparate costs not only because of the short remaining useful life of the facility, but also because of the short remaining useful life of the waste management unit. The record indicates that the volumes of CRL generated by a retired landfill are approximately an order of magnitude lower than the volumes of CRL generated by an operating landfill. One of the primary inputs to EPA's cost model is the volume treated. Here, if the EPA mandated categorical limitations based on a treatment technology prior to ceasing combustion of coal, a facility would need to size that technology to treat the flows of a fully operating landfill. However, about 90 percent of that system would go idle only a few years later and remain idle into perpetuity. Thus, these capital investments would result in greater costs per MWh sold compared to the costs described to treat CRL discharges at plants continuing operations (see section VII.B.3 of this preamble). CRL costs for a post-retirement-sized system would be lower in absolute terms, but also lower in light of these costs being incurred later. This finding does not conflict with the EPA's finding that case-by-case BAT limitations developed using a permitting authority's BPJ are available, are economically achievable, and have acceptable non-water quality environmental impacts because a permitting authority can consider site-specific information, such as the availability of other existing wastewater treatment systems at the plant to accommodate the volumes of CRL generated.[132]

[131] In identifying the BAT technology bases of the 2020 rule as BAT for the new permanent cessation of coal combustion by 2034 subcategory, the EPA is excluding the technology bases for EGUs permanently ceasing coal combustion by 2028. These EGUs can already seek an ''as soon as possible'' date for the new 2024 limitations later than the December 31, 2028, date for the permanent cessation of coal combustion.

[132] For example, if an FGD wastewater treatment system already in place at a facility was under-

The EPA also rejects surface impoundments as BAT for FGD wastewater, BA transport water or CRL in this subcategory before the permanent cessation of coal combustion. Some commenters encouraged the EPA to finalize either a new or an extended permanent cessation of coal subcategory with surface impoundments as BAT. While EPA has today reaffirmed its 2020 rule findings that surface impoundments are BAT for the subcategory of EGUs permanently ceasing coal combustion by 2028 in the section above, part of those 2020 rule findings included the finding that more stringent technologies *were* BAT for EGUs operating beyond December 31, 2028, because those technologies are available, are economically achievable, and have acceptable non-water quality environmental impacts. The EPA received several comments in the record from utilities that have done as the EPA indicated at proposal: they have continued to move forward with implementation of the 2020 rule. These utilities discussed the significant costs associated with interim steps toward implementation such as engineering design, bidding, contracting for systems, and commencing construction. EPA acknowledges these expenditures. To the extent that costs have already been incurred, these are sunk costs that cannot be recovered, and thus the marginal impact of the rule would not interfere with power plants' already approved, ongoing plans to transition to retirement or repowering or impose disparate costs. While EPA expects that most costs will already have been incurred, the 2020 rule limitations have a ''no later than'' date of December 31, 2025, rather than this rule's ''no later than'' date of December 31, 2029, for the new, more stringent BAT limitations. Thus, even in the rare case that a facility has failed to diligently pursue treatment that would meet the 2020 rule limitations, such a facility will have an additional four years to amortize any remaining capital costs of their treatment systems before ceasing coal combustion in 2034 as compared to the amount of time they would have to amortize the capital costs of treatments systems to meet this final rule's more stringent BAT limitations. Therefore, it is less likely that the investments made to comply with the 2020 rule would interfere with the orderly transition of generating capacity for those EGUs in this subcategory.

Moreover, the EPA finds that the costs to EGUs in this subcategory for meeting the currently applicable FGD wastewater and BA transport water limitations as compared to EGUs that are not permanently ceasing coal combustion by 2034 do not justify rejecting the 2020 rule limitations in favor of BAT limitations based on surface impoundments, especially where there are more stringent technologies capable of greater pollutant discharge reduction as described above that are available, are achievable, and have acceptable non-water quality environmental impacts. This finding is further confirmed in the EPA's evaluation of the 2020 rule costs in the baseline and policy runs of IPM, both of which demonstrate that the 2020 rule limitations continue to be economically achievable. The EPA's decision to continue to require permitting authorities to develop limitations on CRL discharges is also consistent with the Fifth Circuit's decision in *Southwestern Electric Power Co.* v. *EPA.* There, the Court vacated BAT limitations for CRL based on surface impoundments, citing the EPA's statements in the record that surface impoundments do not adequately control dissolved metals and the fact that there are more stringent technologies than surface impoundments that are available to control discharges of CRL. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1029–1030. Reserving BAT limitations for CRL discharged before an EGU permanently ceases coal combustion in this subcategory allows for the permitting authority to impose more stringent technologies as appropriate.

c. For EGUs in this subcategory, BAT limitations for CRL after the EGU permanently ceases combustion of coal are based on chemical precipitation.

The EPA expects that, unlike FGD wastewater and BA transport water, CRL will continue to be discharged even after a plant permanently ceases coal combustion. For EGUs in this subcategory, the EPA is establishing nationwide limitations for CRL on mercury and arsenic based on chemical precipitation after permanently ceasing combustion of coal. Specifically, the BAT technology basis after permanently ceasing coal combustion is a chemical precipitation system that employs hydroxide precipitation, sulfide precipitation (organosulfide), and iron coprecipitation.

With respect to BAT limitations after permanent cessation of coal combustion, the rule record is extensive in support of the EPA's finding that chemical precipitation is technologically available for the treatment of arsenic and mercury in CRL. As far back as the 2015 rule, the EPA found that four plants operated chemical precipitation systems on their CRL and, in fact, established NSPS for CRL based on chemical precipitation systems.[133] The EPA also found that chemical precipitation was in use on FGD wastewater (which EPA found was characteristically similar to CRL), metal products and machinery plants, iron and steel manufacturers, metal finishers, and mining operations (including coal mines).[134] All of these uses have demonstrated the ability of chemical precipitation technology to remove arsenic and mercury.[135]

One commenter suggested that chemical precipitation does not treat dissolved arsenic concentrations. This comment contradicts what is known about chemical precipitation. In the 2015 rule record, the EPA explained that chemical precipitation systems typically use pH adjustment to make soluble forms of pollutants insoluble. The EPA found that most systems operate with three chemicals that are added in one tank or in separate tanks, depending on the pH at which individual metals will settle out.[136] Thus, while plants may need to adjust systems until it is optimized for the specific CRL and target pollutant removals, the EPA sees nothing to indicate that dissolved arsenic concentrations are not treatable just because they are dissolved. The pre- and post-treatment dissolved arsenic data the commenter refers to are a subset of total arsenic (not just dissolved arsenic) that the EPA noted in 2015 was very low (near or below the limit of quantification). The fact that some data points are above the limit of quantitation does not change the fact that these are still very low dissolved arsenic numbers that demonstrate the ability of the technology to meet the established limitations. The fact that the technology did not continue to remove arsenic below the treatment levels that the EPA established in 2015 does not negate the fact that this same data

utilized, the permitting authority might find that treatment with that system is available, economically achievable, and has acceptable non-water quality environmental impacts for that facility.

[133] U.S. EPA (Environmental Protection Agency). 2015. *Technical Development Document for the Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category.* September. Washington, DC 20460. EPA–821–R–15–007. Available online at: *https://www.epa.gov/sites/default/files/2015-10/documents/steam-electric-tdd_10-21-15.pdf.*

[134] *Id.*

[135] *Id.*

[136] *Id.*

demonstrates the technology *does* remove arsenic down to that limit.

Another commenter referenced 2010 survey data as showing elevated levels of iron, aluminum, and manganese in CRL from landfills where coal-handling byproducts were also disposed, which this commenter suggested would make treatment more complex. The commenter did not claim that these elevated influent concentrations make the waste untreatable through chemical precipitation, only that there may be additional solid wastes or a need for multiple treatment vessels. Without more information, the EPA has no reason to conclude that chemical precipitation would not work as intended in these scenarios.[137]

The EPA finds that BAT limitations based on chemical precipitation for EGUs discharging CRL after permanently ceasing coal combustion in this subcategory are economically achievable based on the results of IPM modeling, as explained in sections VII.F and VIII.

The EPA finds that BAT limitations based on chemical precipitation for EGUs discharging CRL after permanently ceasing coal combustion in this subcategory have acceptable non-water quality environmental impacts as discussed in sections VII.G and X.

For a further discussion of the availability timing of these limitations, see section VII.E of this preamble.

d. The EPA rejects surface impoundments as BAT for CRL after permanent cessation of coal combustion in this subcategory.

The EPA finds that surface impoundments are not BAT for CRL after permanent cessation of coal combustion for EGUs in this subcategory. The record shows that chemical precipitation is available, is economically achievable, and has acceptable non-water quality environmental impacts for treatment of CRL discharges after the permanent cessation of coal combustion. Moreover, chemical precipitation removes more pollutants than surface impoundments, which better achieves the BAT requirement of making reasonable further progress toward the CWA's goals. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003, 1006 (citing *Nat'l Crushed Stone* v. *EPA,* 449 U.S. at 75).

e. The EPA rejects more stringent technologies as BAT for CRL after permanent cessation of coal combustion in this subcategory.

The EPA finds that more stringent technologies are not BAT for CRL after permanent cessation of coal combustion for EGUs in this subcategory based on the statutory factors of age and cost, as well as given certain information gaps in the record. Specifically, the EPA finds that more stringent technologies are not commensurate with the age of the facility being in a retired status, which would lead to unacceptably higher capital costs that can no longer be spread over electricity sales.

Concerning CRL generated after retirement, the EPA notes that CRL will continue to be generated into perpetuity without any associated revenue stream tied to ongoing coal combustion, as several commenters pointed out.[138] This differs substantially from scenarios involved in a typical ELG, for which the EPA conducts a screening economic analysis that compares costs to revenues at the facility level in addition to the owner level.[139] The EPA notes that this results not in a standard disparate cost, but rather an overall disparate circumstance. Since this unique scenario does not often play out in ELGs, the EPA does not have examples to draw from in evaluating economic achievability.

Given this unique aspect of this ELG, the EPA notes that any treatment system built to operate only after the permanent cessation of coal combustion will necessarily experience costs in a differing circumstance when compared to the costs recovered via ongoing electricity sales by EGUs not in this subcategory. For CRL that is not otherwise subcategorized in this rule, the EPA is requiring limitations based on zero-discharge systems during operations to continue to apply even after retirement. These EGUs will continue to combust coal beyond 2034, so systems will already be partially or fully paid for with rate recovery from electricity sales during the active phase of the EGU. Thus, the marginal cost of continuing to use such an existing treatment system are limited to O&M costs, and thus would not result in capital costs being incurred under the disparate circumstance of retired coal-fired EGUs.

As this discussion demonstrates, the selected BAT basis, chemical precipitation, already imposes costs in a disparate circumstance compared to EGUs not in this subcategory. Compared to chemical precipitation systems, however, biological and zero-discharge systems worsen already existing situational revenue disparities based on the already passed retirement age for these EGUs when compared to the rest of the industrial category. Both chemical precipitation plus biological treatment systems and zero-discharge systems typically have capital costs about double the capital costs of chemical precipitation systems alone.[140] The EPA finds that the increased costs of these more stringent technologies renders them unacceptable in light of the post-retirement age of the EGUs to which they would apply. The EPA intends the age, cost, and economic achievability rationale discussed here is unique to the small number of industry-wide discharges at retired facilities with no revenue such as the landfill industrial point source category: it thus will not form a precedent for evaluating costs and economic achievability at the vast majority of facilities which continue to operate and have active revenue streams.

The EPA also considered the availability of biological treatment systems for CRL at closed landfills. Some commenters raised concerns that biological treatment systems could not handle low or fluctuating flows associated with CRL. The EPA agrees, in part, with these comments. Biological treatment systems require a minimum amount of feed source for the microorganisms to survive. While facilities have demonstrated the ability to supplement these nutrients in the FGD wastewater context, CRL generated after a landfill is closed is precipitation-dependent and may not be as easy to

[137] The EPA also notes that, should a facility with such a landfill generate CRL that is sufficiently different from the CRL evaluated in the record, the facility may be able to apply for a Fundamentally Different Factors variance.

[138] The EPA acknowledges that this subcategory also applies to fuel conversions. The EPA considered the fact that this subset of EGUs within this subcategory would have a future revenue stream, unlike EGUs that permanently retire. However, were the EPA to require more stringent treatment at this subset of EGUs, the result could be for a facility converting to natural gas (for example) to instead construct its replacement gas-fired capacity on an immediately adjacent greenfield to avoid the additional costs of treatment. This is a perverse incentive because it could implicate the development of additional land, perhaps even a greenfield, and construction of new transmission lines. These are adverse non-water quality environmental impacts that the EPA finds unacceptable, and it is thus declining to treat this subset differently from retiring EGUs. The EPA further notes that this outcome would result in additional costs of replacement capacity without achieving any additional pollutant discharge reductions.

[139] While The EPA has performed that comparison here using the operating revenues prior to the cessation of coal combustion, the Agency has already found that subcategorization is warranted for a number of reasons and justified retaining the current requirement that case-by-case BPJ determinations be made by the permitting authority in controlling CRL discharges.

[140] For biological treatment cost comparisons, the EPA is using the 2020 rule record with respect to FGD wastewater.

forecast as FGD wastewater flows. Thus, even if facilities provided a supplemental feed source, it would be possible to develop either too large or too small a bacterial colony. The EPA's record demonstrates that hydrogen sulfide formation can result from biological treatment when oxidation reduction potential (ORP) is too low. Sulfide produced in the system readily forms metal complexes with other metals and precipitate out of the FGD wastewater. During backwashing events, the system releases any trapped gasses generated in the process, including hydrogen sulfide (DCN SE02955). The EPA notes that large concentrations of sulfides are only a problem if the ORP goes too low for a long time.[141] The EPA's record lacks evidence of a biological treatment system operating on a retired landfill; therefore, no information is available on whether other issues related to biological treatment of CRL from retired landfills affect ORP or hydrogen sulfide production. In the absence of any record evidence of a biological treatment system operating on a retired landfill, the EPA concludes that these concerns, together with the age of the EGUs being in a retired status and the cost considerations regarding biological treatment discussed above, justify rejecting this technology as BAT for CRL post-cessation of coal combustion.

Zero-discharge systems can adapt to changes in flow rates more easily than biological treatment. Nevertheless, as with biological treatment, the record does not contain any information on zero-discharge systems operating on CRL or non-CCR landfill leachate after a facility has retired. The examples EPA has demonstrating availability consist of co-treatment with FGD wastewater or treatment of non-CCR landfill leachate during operations. During the development of this rule, the EPA sought information on treatment of CRL or non-CCR landfill leachate through vendors of applicable systems, but there were no known installations on retired landfills were indicated. While it may be possible for the EPA to establish zero-discharge systems even in record absence of operations post-cessation of coal combustion, when this information gap is combined with the age and cost considerations discussed above, it leads the EPA to conclude that zero-discharge systems do not represent BAT for post-cessation of coal combustion discharges of CRL in this subcategory.

[141] For FGD wastewater, EPA recommends ORP monitors to avoid these scenarios.

f. The EPA is not including legacy wastewater in the permanent cessation of coal combustion subcategory.

The EPA received some comments suggesting that any new permanent cessation of coal combustion subcategory should cover discharges of legacy wastewater from EGUs in the subcategory. These comments did not provide information demonstrating that legacy wastewater discharges are tied to the marginal operating costs of steam EGUs. Rather, the record demonstrates that legacy wastewater discharges will primarily continue to occur through the dewatering of surface impoundments closing under the CCR regulations. Since treatment of legacy wastewater will occur whether an EGU continues to burn coal or not, investments made under this rule do not have the potential to interfere with the orderly transition of generating capacity, as they would be incurred even if the EGU had ceased operations years ago. Moreover, because the costs must be incurred whether or not the EGU closes, these costs do not differ based on the remaining useful life of the EGUs. Since the EPA does not find that the statutory factors discussed above as the bases to establish this subcategory would apply to legacy wastewater, the EPA is not subcategorizing legacy wastewater based on the permanent cessation of coal combustion. Instead, the case-by-case limitations described in section VII.B.4 of this preamble will continue to apply.

g. The EPA is finalizing post-coal combustion cessation zero-discharge limitations for EGUs in this subcategory to avoid circumvention.

As with the permanent cessation of coal combustion by 2028 subcategory, the EPA proposed to include zero-discharge limitations applicable after the permanent cessation of coal combustion date for this subcategory, December 31, 2034. The EPA received comments that opposed the finalization of this subcategory, but in the alternative these commenters advocated for post-coal combustion cessation limitations to help ensure that the cease combustion of coal criterion for the subcategory is met. EPA also received more general comments as described in section VII.C.3 of this preamble.

After considering these comments, and for the same reasons set forth in section VII.C.3 of this preamble, the EPA is finalizing a tiered set of zero-discharge BAT limitations that apply following the cease combustion of coal by 2034 date, as follows:

- The first tier of these limitations is composed of zero-discharge limitations for FGD wastewater and BA transport water after April 30, 2035.[142] These limitations would apply if the EGU has in fact permanently ceased coal combustion as it represented it would. As suggested in the comments, this is 120 days after the latest permanent cessation of coal combustion date, allowing for facilities to complete any necessary residual decommissioning discharges.[143]
- The second tier is composed of zero-discharge limitations for the same wastewaters, as well as CRL, after December 31, 2034. If a plant fails to cease combustion of coal by 2034 (as it represented it would) for any reason other than those specified in § 423.18, these zero-discharge limitations would automatically apply.

As explained in section VII.C.3 of this preamble, the EPA finds that together, the zero-discharge limitations and reporting and recordkeeping requirements are sufficient to ensure that facilities do not unfairly benefit by continuing to discharge after the subcategory's permanent cessation of coal combustion date.

5. Discharges of Unmanaged CRL

The EPA is establishing a new subcategory for discharges of unmanaged CRL, which EPA is defining in this rule to mean the following: (1) discharges of CRL that the permitting authority determines are the FEDD to a WOTUS through groundwater or (2) discharges of CRL that has leached from a waste management unit into the subsurface and mixed with groundwater before being captured and pumped to the surface for discharge directly to a WOTUS.[144] After evaluating public comments, and in light of the factors specified in CWA section 304(b)(2)(B), the EPA finds that the record demonstrates such a subcategory is warranted based on the unacceptably high costs to the plants in this subcategory associated with zero-discharge requirements, which would

[142] The EPA is also finalizing requirements that the BAT limitations for CRL in this subcategory be met no later than April 30, 2035, to align with the dates in this backstop provision. For further discussion, see section VII.E of this preamble.

[143] The EPA notes that these do not include discharges of legacy wastewaters from surface impoundments closing under the CCR rule, which are covered by different regulatory provisions.

[144] The latter type of unmanaged CRL is no different than the former except that it is already being collected for treatment and discharge as of the effective date of the final rule. Since migration from the waste management unit and mixing with groundwater occurs in both cases, the characteristics and volumes of these two types of unmanaged CRL are expected to be consistent and, therefore, have been modeled consistently for the cost analysis discussed in section VIII.A of this preamble.

otherwise apply to CRL discharges under this rule (see discussion below). For units with discharges in this subcategory, The EPA is finalizing the proposed mercury and arsenic limitations, based on chemical precipitation, which the record shows are available, are economically achievable, and have acceptable non-water quality environmental impacts. A discussion of the selected technology basis, as well as rejected technology bases, appears below, following two subsections that address several overarching comments the EPA received about discharges in this subcategory.

The EPA solicited comment on an option to subcategorize EGUs with discharges through groundwater. Leachate is typically managed through the use of a liner and leachate collection system. In the context of municipal solid waste landfills and hazardous waste landfills, a leachate collection system is designed to maintain less than a 30-centimeter depth over the liner.[145] [146] As stated in *Solid Waste Disposal Facility Criteria Technical Manual:*

> The primary function of the leachate collection system is to collect and convey leachate out of the landfill unit and to control the depth of the leachate above the liner. The leachate collection system (LCS) should be designed to meet the regulatory performance standard of maintaining less than 30 cm (12 inches) depth of leachate, or ''head,'' above the liner. The 30-cm head allowance is a design standard and the Agency recognizes that this design standard may be exceeded for relatively short periods of time during the active life of the unit. Flow of leachate through imperfections in the liner system increases with an increase in leachate head above the liner. Maintaining a low leachate level above the liner helps to improve the performance of the composite liner.[147]

In contrast, many CCR landfills and surface impoundments have unmanaged CRL, which is allowed to percolate out of the WMU and into the subsurface and this subcategory applies to such unmanaged CRL. Specifically, the final subcategory covers such discharges of CRL that are determined, on a case-by-case, site-specific basis by the permitting authority to constitute the FEDD to a WOTUS. The EPA is also including certain direct discharges of CRL in this subcategory—in particular, discharges of CRL that has leached from a waste management unit into the subsurface and mixed with groundwater before being captured and pumped to the surface—because the EPA is aware that some plants could independently choose to pump and treat groundwater as a result of the CCR regulations, sometimes before wastewater from the impoundments traveling through groundwater has reached a WOTUS and become the FEDD to a WOTUS. This subcategory applies to any direct discharges of such CRL to a WOTUS. Both types of unmanaged CRL could occur at a plant with an unlined WMU, and both present the same basic issues in terms of costs for treatment, given the volumes of wastewater that would need to be treated to meet BAT limitations for unmanaged CRL.

a. The EPA has CWA authority to regulate certain discharges through groundwater from landfills and surface impoundments.

The EPA proposed that CRL limitations would apply not only to traditional end-of-pipe discharges, but also to discharges of CRL through groundwater, which a permitting authority deems to be the FEDD from a point source to a WOTUS. EPA received many comments related to the discharge of CRL through groundwater. Comments expressed varying views as to whether CRL discharged through groundwater from landfills and surface impoundments would be the FEDD.

As a threshold matter, as it explained in the proposed rule, the EPA is not determining that all discharges through groundwater from landfills and surface impoundments are the FEDD from a point source to a WOTUS. Rather, in this rule, the EPA is establishing limitations that apply to any discharge of this kind that a permitting authority or facility owner or operator determines to be the FEDD from a point source to a WOTUS, and thus requires an NPDES permit. The threshold standard for the ''functional equivalence'' determination is outside the scope of this rule.

Some comments argue that the EPA lacks the legal authority to regulate *any* leachate that reaches navigable waters through groundwater from landfills or surface impoundments because landfills and surface impoundments are not point sources. These comments cite two cases in support of this position. *See Sierra Club* v. *Va. Elec. & Power Co.,* 903 F.3d 403 (4th Cir. 2018); *Ky. Waterways All. V. Ky, Utils. Co.,* 905 F.3d 925 (6th Cir. 2018). Related comments suggest that, in *County of Maui,* there were unique facts regarding the existence of a point source that are not applicable in the CRL context.

In response to these comments, the EPA reaffirms its longstanding position, which is consistent with the *Maui* decision: a point source determination is case-specific, and some landfills and surface impoundments may likely meet the definition of point sources under the CWA. ''The term 'point source' means any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged.'' 33 U.S.C. 1362(14). At least some of the landfills and surface impoundments at steam electric facilities may fit this definition, in that they are ''discernible, confined, and discrete conveyances.'' A permitting authority may also deem surface impoundments at these facilities to be analogous to ''wells'' or ''containers'' some of the illustrative examples in the definition. As the Fifth Circuit noted in *Southwestern Elec. Power Co.* v. *EPA,* where leachate occurs at a steam electric power plant, it is typically collected and transported to an impoundment, and ''[u]nlined landfills or impoundments simply 'allow the leachate to potentially migrate to nearby ground waters, drinking water wells, or surface waters.' '' 920 F.3d at 1011 (citing the 2015 rule preamble); *id.* at 1029 (noting that the EPA's environmental assessment document reports that ''[c]ombustion residual leachate can migrate from the site in the ground water at concentrations that could contaminate public or private drinking water wells and surface waters, even years following disposal of combustion residuals'') (citation omitted). And the Fifth Circuit had earlier addressed the question of whether sump pits into which miners channeled contaminated runoff and which sometimes overflowed to ''waters of the United States'' were point sources, holding on these facts that ''[g]ravity flow, resulting in a discharge of a pollutant into a navigable water, may be a point source discharge if the miner at least initially collected or channeled the water and other materials.'' *Sierra Club* v. *Abston Construction Co., Inc.,* 620 F.2d 41, 45 (5th Cir. 1980). Under this rule, permitting authorities will continue to determine whether a particular landfill or surface impoundment meets the definition of point source, and then they will determine whether or not that point source has a discharge of pollutants subject to the CWA.

To the extent that the Fourth Circuit's decision in *Sierra Club* v. *Va. Elec. & Power Co.* held that an impoundment can never be a ''point source'' under the CWA, the Supreme Court's decision in

[145] 40 CFR 258.40(a)(2).

[146] 40 CFR 264.251(a)(2).

[147] U.S. EPA (Environmental Protection Agency). 1993. *Solid Waste Disposal Facility Criteria Technical Manual.* November. EPA530–R–93–017.

Maui calls that holding into question.[148] While commenters correctly point out that the parties in *Maui* conceded that there was a point source, so the issue was not directly before the Court, the injection wells at issue in *Maui* are factually very similar to some EGU surface impoundments. The Supreme Court in *Maui* described the facts of the case as a wastewater reclamation facility that ''collects sewage from the surrounding area, partially treats it, and pumps the treated water through four wells hundreds of feet underground. This effluent, amounting to about 4 million gallons each day, then travels a further half mile or so, through groundwater, to the ocean.'' *County of Maui,* 590 U.S. at 171. Furthermore, the Supreme Court rejected EPA's argument that ''all releases of pollutants to groundwater'' are excluded from the scope of the permitting program, ''even where pollutants are conveyed to jurisdictional surface waters via groundwater,'' in part because of the definition of ''point source,'' concluding:

> It is difficult to reconcile EPA's interpretation with the statute's inclusion of ''wells'' in the definition of ''point source,'' for wells most ordinarily would discharge pollutants through groundwater. And it is difficult to reconcile EPA's interpretation with the statutory provisions that allow EPA to delegate its permitting authority to a State only if the State (among other things) provides ''adequate authority'' to ''control the disposal of pollutants into wells.'' § 402(b), 86 Stat. 881. What need would there be for such a proviso if the Federal permitting program the State replaces did not include such discharges (from wells through groundwater) in the first place?

County of Maui, 590 U.S. at 181.

Similarly, some EGU impoundments, like wells, may discharge through groundwater to a WOTUS in a manner that is the FEDD. For example, suppose leachate from a coal-fired power plant is collected and contained in a waterfront surface impoundment dug below the groundwater table, and the leachate flows through the groundwater into the nearby ''water of the United States.'' Excluding such a discharge from CWA permitting requirements would create a loophole in the Act's coverage similar to the one that concerned the Supreme Court in *Maui:* ''We do not see how Congress could have intended to create such a large and obvious loophole in one of the key regulatory innovations of the Clean Water Act.'' *County of Maui,* 590 U.S. at 178–79. *Cf. California ex rel. State Water Resources Control Bd.,* 426 U.S., at 202–204 (basic purpose of Clean Water Act is to regulate pollution at its source); *The Emily,* 9 Wheat. 381, 390 (1824) (rejecting an interpretation that would facilitate ''evasion of the law'').

Thus, to the extent that landfills, surface impoundments, or other features that could be considered point sources and from which FEDDs of CRL occur to a WOTUS, this rule informs the permitting authority of the appropriate technology-based effluent limitations that would apply. At this time, the EPA cannot agree with commenters who presume to know the extent of such potential discharges. The EPA need not speculate as to the myriad of possible scenarios. Determining which impoundments and landfills meet the definition of ''point source'' is a task for permitting authorities and outside the scope of this rulemaking. Instead, the EPA points out that, based on current law and facts as they appear in the record, the CRL limitations the EPA is promulgating will apply to *some* discharges from *some* impoundments and landfills—*i.e.,* those that a permitting authority determines to be the FEDD from a point source to a WOTUS.

b. Potential interactions with RCRA and the CCR regulations do not justify rejection of a nationwide BAT for certain CRL discharges through groundwater.

With respect to RCRA and the CCR regulations, some commenters stated that regulation of CRL discharged through groundwater would ''nullify'' the CCR regulations in violation of RCRA's industrial wastewater exclusion or anti-duplication provision. Other commenters argued that imposing any CWA requirements on FEDDs of CRL could not be harmonized with RCRA requirements found in the CCR regulations and recommended that the EPA leave such discharges to be managed by the CCR program and states. Each of these comments is addressed in a separate discussion below.

RCRA industrial wastewater exclusion. The EPA disagrees with commenters stating that establishing BAT limitations for certain CRL discharges through groundwater would ''nullify'' the CCR regulations due to RCRA's industrial wastewater exclusion. At the outset, as explained above, this rule does not address the scope of the CWA, as it does not address which discharges may require an NPDES permit, but rather it establishes appropriate technology-based limitations to include in such a permit. Since this rule does not expand CWA jurisdiction over any discharges—in particular, it does not require CWA regulation of discharges, such as certain CRL discharges through groundwater, that would not already be regulated by the CWA—it does not alter the existing RCRA framework that accounts for the CWA.

The EPA also disagrees with commenters that regulation of certain CRL discharges through groundwater would block regulation by the CCR regulations. RCRA excludes from the definition of ''solid waste'' any ''industrial discharges which are point sources subject to permits'' under the CWA. 42 U.S.C. 6903(27). As the EPA has explained before, this RCRA exclusion applies to discharges to jurisdictional waters under the CWA, and not to any activity, including groundwater releases or contaminant migration, that occurs prior to that point. The EPA explained this in more detail in a ''Question and Answer'' on the EPA's website:

> Does the issuance of an NPDES permit covering discharges from a CCR unit exempt the owner/operator from any requirements under the CCR rule?
>
> No, discharges covered by an NPDES permit are not a ''solid waste'' pursuant to RCRA section 1004(27). The RCRA exclusion only applies to ''industrial discharges that are point sources subject to permits,'' *i.e.,* to the discharges to jurisdictional waters, and not to any activity, including groundwater releases or contaminant migration, that occurs prior to that point. See title 40 of the Code of Federal Regulations (CFR) 261.4(a)(2) (''This exclusion applies only to the actual point source discharge. It does not exclude industrial wastewaters while they are being collected, stored or treated before discharge.''). For purposes of the RCRA exclusion, EPA considers the ''actual point source discharge'' to be the point at which a discharge reaches the jurisdictional waters, and not in the groundwater or otherwise prior to the jurisdictional water. Thus, the issuance of an NPDES permit for discharges from a facility's CCR surface impoundment would not exempt the owner/operator from any requirements under the CCR rule applicable to the disposal unit, such as the requirements to ensure the structural stability of the unit, to clean up all releases to the aquifer, and to meet all closure standards.[149]

Compare RCRA's ''solid waste'' definition, 42 U.S.C. 6903(27), with the CWA's definition of the ''discharge of pollutants,'' 33 U.S.C. 1362(12) (''any addition of any pollutant to navigable waters from any point source''). Until the point at which the discharge reaches

[148] The decision in *Ky. Waterways All.* v. *Ky, Utils. Co.,* 905 F.3d 925, cited by some commenters did not address the question of whether an impoundment is a point source but rather held that ''The CWA does not impose liability on surface water pollution that comes by way of groundwater.'' The decision has been abrogated by *Maui.*

[149] Available online at: *https://www.epa.gov/coalash/relationship-between-resource-conservation-and-recovery-acts-coal-combustion-residuals-rule.*

''navigable waters,'' any collection, storage, treatment, or even groundwater contamination is still subject to RCRA and the requirements of the CCR regulations.

RCRA anti-duplication provision. The EPA also disagrees with commenters who asserted that regulation of certain CRL discharges through groundwater would be inconsistent with or duplicative of regulation by the CCR regulations due to RCRA's anti-duplication provision. RCRA, by its terms, requires administration and enforcement that is ''not inconsistent'' with, among other Federal statutes, the CWA. 42 U.S.C. 6905(a). It further requires both integration and non-duplication with the CWA ''to the maximum extent *practicable.*'' 42 U.S.C. 6905(b) (emphasis added). The requirements do not mean there can be no overlap to accomplish the purposes of each statute.

Circuit courts have found several similar instances of RCRA and the CWA operating in tandem.[150] For example, in *Goldfarb* v. *Mayor and City Council of Baltimore,* 791 F.3d 500 (4th Cir. 2005), construction activities allegedly spread/worsened existing soil, water, and groundwater contamination. The defendants maintained their NPDES permit shielded them from RCRA liability because of RCRA's anti-duplication provision. The court rejected this contention, explaining:

> To be ''inconsistent'' for purposes of [RCRA's] § 6905(a), then, the CWA must require something fundamentally at odds with what RCRA would otherwise require . . . RCRA mandates which are just different, or even greater, than what the CWA requires, are not necessarily the equivalent of being ''inconsistent'' with the CWA. . . . It is not enough that the activity or substance is already regulated under the CWA; it must also be ''incompatible, incongruous, and inharmonious.'' . . . The district court's conclusion is thus built on the faulty premise that the CWA and RCRA cannot regulate the *same* activity under any circumstance.

Goldfarb v. *Mayor and City Council of Baltimore,* 791 F.3d at 505–06, 510. Similarly, *Ecological Rights Foundation* v. *Pacific Gas & Electric Co.,* 874 F.3d 1083 (9th Cir. 2017), involved an action against owners of mining activities that allegedly leached toxic substances into navigable waters. The court held that so long as RCRA's application is not ''inconsistent'' with the CWA, the anti-duplication provision is no bar to a RCRA action. *Id.* at 1089, 1095–97 (collecting cases and a Department of Justice Office of Legal Counsel opinion). It further held that the term ''inconsistent'' must be ''mutually repugnant or contradictory'' such that ''one implies abrogation or abandonment of the other.'' *Id.* at 1095 (citations omitted). The case expressly recognized that there can be overlap between these regulatory schemes. Since case law generally supports the operation of the CWA in tandem, not *in lieu* of RCRA, the EPA disagrees with commenters. *See also Chemical Waste Management* v. *EPA,* 976 F.2d 2, 23, 25 (D.C. Cir. 1992).

Practical interaction of the CCR and ELG rules. The EPA also disagrees with commenters who stated that imposing any CWA requirements on FEDDs of CRL could otherwise not be harmonized with RCRA requirements found in the CCR regulations. The RCRA CCR regulations, which post-date the CWA, were written with integration in mind. That is, 40 CFR 257.52(b) provides: ''Any CCR landfill, surface impoundment, or lateral expansion of a CCR unit continues to be subject to the requirements in §§ 257.3–1, 3–2, and 3–3.'' And 40 CFR 257.3–3(a) provides: ''For purposes of section 4004(a) of the [Resource Conservation and Recovery] Act, a facility shall not cause a discharge of pollutants into waters of the United States that is in violation of the requirements of the National Pollutant Discharge Elimination System (NPDES) under section 402 of the Clean Water Act, as amended.'' Critically, nothing in § 257.3–3(a) or other sections establish a RCRA permitting scheme for discharges to navigable waters, nor in any other ways contradicts the CWA's NPDES permit program. The CCR regulations generally, and § 257.3–3(a) specifically, leave the regulation of point source discharges to navigable waters to the CWA. The CCR regulations regulate the management of CCR to protect human health and the environment, including groundwater, from contamination associated with the mismanagement of these wastes. *See, e.g.,* 40 CFR 257.91 through 257.98. They do so because, among other important reasons, CCR is a potential source of contamination in wells used for drinking water.

Given the above, the EPA does not agree with commenters that establishing limitations for functionally equivalent CRL discharges through groundwater would conflict with the CCR regulations. Instead, the CCR regulations require CRL-contaminated groundwater to meet specific levels or to be cleaned up to those levels through corrective action. The EPA expects that in many cases this would require pump-and-treat operations.[151] To the extent that a facility elects to pump CRL-contaminated groundwater to the surface and discharge it directly, this final subcategory and corresponding limitations would apply to the end of that pipe. While groundwater monitoring may be appropriate to ensure that CRL is not evading the pump-and-treat operations and resulting in an unpermitted discharge to a WOTUS, the groundwater concentrations would not be subject to this final rule.

To further elaborate the point that the limitations established in this final rule are for surface water discharges, consider the alternatives to pump-and-treat operations. Facilities are not required to employ the specific technology of chemical precipitation established as BAT today. Some commenters specifically requested that the EPA consider the flexibility for facilities to clean close their surface impoundments or to perform *in situ* treatment or impermeable barriers. But this flexibility already exists. If a facility were to install an impermeable barrier that prevented groundwater contamination from discharging to a WOTUS, or a semi-permeable barrier that treated the discharge to remove toxic pollutants, it could satisfy the specific mercury and arsenic limitations that the EPA is finalizing. It also might be possible for facilities to avoid the need for an NPDES permit by clean closing and eliminating any point source itself. In these cases, there very well may continue to be CRL-contaminated groundwater, but this is outside the purview of the CWA because the CRL would not be reaching WOTUS, as discussed in the sections above. Thus, the EPA does not find any conflict between the CCR regulations' protection of groundwater and the establishment of BAT limitations for CRL discharged through that groundwater that is found to be the FEDD; nor does it find any way in which the two sets of requirements cannot be harmonized.

c. The EPA selects chemical precipitation as BAT for discharges of CRL in this subcategory.

For this subcategory, the EPA is establishing BAT limitations for mercury and arsenic based on chemical precipitation. Specifically, the technology basis for BAT is a chemical

[150] In contrast, the EPA acknowledges that the *Ky. Waterways All.* case found that RCRA's anti-duplication provision barred CWA authority, a finding which is not only not supported by the text of the CWA but is also to the EPA's knowledge not found in the case law of any other circuit.

[151] The EPA acknowledges that, at present, many facilities have instead selected monitored natural attenuation as a remedy even though this remedy would, by definition, patently fail to meet the cleanup standards established in § 257.97(b).

precipitation system that employs hydroxide precipitation, sulfide precipitation (organosulfide), and iron coprecipitation.

As described in section VII.C.4 of this preamble, the rule record is extensive in support of the EPA's finding that chemical precipitation is technologically available for the treatment of arsenic and mercury in CRL. As far back as the 2015 rule, the EPA found that four plants operated chemical precipitation systems on their CRL.[152] EPA also found that chemical precipitation was in use on FGD wastewater (which the EPA found was characteristically similar to CRL), metal products and machinery plants, iron and steel manufacturers, metal finishers, and mining operations (including coal mines).[153] All of these uses have demonstrated the use of chemical precipitation technology to remove arsenic and mercury.[154]

At proposal, the EPA's preferred regulatory option would have established chemical precipitation as BAT for all types of CRL discharges. Several commenters took issue with the EPA's proposed findings and BAT selection for FEDDs of CRL. These commenters stated that EPA failed to evaluate how CRL changes in groundwater. Commenters stated that differences from end-of-pipe CRL suggest that the EPA should decline to set national limitations and retain case-by-case BPJ determinations for, or alternatively require only monitoring of, FEDD of CRL at this time.

With respect to the interaction of CRL with groundwater, while the EPA received general comments about the possibility of interactions in groundwater, commenters did not provide data to demonstrate that CRL in groundwater changes to the extent that pollutant concentrations would no longer fall within the range of concentrations evaluated by the EPA for CRL. Nor did commenters provide data that CRL becomes untreatable via chemical precipitation from any such changes. Instead, comments describe ''attenuation'' such as through adsorption. However, to the extent that adsorption and other attenuation processes would *remove* pollutants, this would only make it easier for chemical precipitation to meet the established limitations.

In addition to being technologically available, chemical precipitation for this subcategory is economically achievable. At proposal, EPA could not prospectively determine how many or which instances of CRL discharged through groundwater would ultimately be found to require CWA permits. As described above, to be a covered discharge, there must be a discharge (or FEDD) of pollutants from a point source into a WOTUS. Since this determination is outside the scope of the rule, EPA examined this cost via a sensitivity analysis entitled *Evaluation of Unmanaged CRL* (DCN SE11501). The fact that EPA estimated these costs (and pollutant loadings) in a separate document from the more traditional end-of-pipe discharges does not mean that the EPA concluded that none would be subject to CWA permitting, as some commenters claimed. Neither did the EPA's assumption for the purposes of a worst-case costing analysis suggest that the EPA was concluding that all of these potential discharges would be subject to CWA permitting, as other commenters claimed. Instead, when total costs (and pollutant loadings) are viewed in conjunction with this separate analysis, they provide the range within actual costs (and pollutant loadings) are expected to fall. The EPA acknowledges that a best estimate would be helpful, but in the absence of permitting determinations on which discharges are subject to CWA permitting, the EPA declines to speculate as to the ultimate coverage. This position is consistent with the position outlined above. All that the EPA is required to do for this rulemaking is make a reasonable estimation of costs, which EPA has does done. *See Chem. Mfrs. Ass'n* v. *EPA,* 870 F.2d at 237–38.

For the final rule, EPA has updated these CRL costs in *Evaluation of Unmanaged CRL* (DCN SE11501). These engineering costs were then used to develop an upper bound and lower bound that more accurately reflects the range of costs of treating unmanaged CRL as described in section VIII.A of this preamble. Using these costs, the EPA then conducted a screening-level analysis of economic impacts, which helped inform EPA's determination that the final rule's unmanaged CRL limitations are economically achievable. For further discussion of the screening-level analysis and economic achievability, see sections VII.F and VIII.C.1 of this preamble.

The EPA notes that some commenters suggested that state permitting authorities would face an incredible regulatory burden if the rule were finalized as proposed.[155] The EPA disagrees that it is creating any additional burden to permitting authorities in finalizing this subcategory. Permitting authorities are already required to determine whether a discharge is subject to CWA permitting and to act on applications for CWA permits or certain modification requests for such permits. Furthermore, FEDDs are already subject to the CWA under *Maui.* Thus, to the extent that permitting authorities are already required to evaluate and develop technology-based and water quality-based effluent limitations for FEDDs, this existing burden will not change, regardless of the EPA's selection of BAT. If burden is changing at all, it is decreasing, because EPA is selecting chemical precipitation as BAT, as discussed in the section below. Since this replaces BPJ determinations, it means that permitting authorities can avoid BPJ analyses that they otherwise would have performed for FEDDs of CRL.

d. The EPA rejects surface impoundments as BAT for discharges of CRL in this subcategory.

The EPA is not selecting surface impoundments as BAT for FEDDs of CRL. BAT must achieve ''reasonable further progress'' toward the CWA's goal of eliminating pollution. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003, 1006 (citing *Nat'l Crushed Stone* v. *EPA,* 449 U.S. at 75). The record shows that chemical precipitation removes more pollutants than surface impoundments and that chemical precipitation is technologically available, is economically achievable, and has acceptable non-water quality environmental impacts.

With respect to comments suggesting the EPA finalize only a monitoring requirement, the EPA does not view monitoring alone as satisfying the statutory obligation to identify BAT to control all discharges, particularly where there is a technology that can be applied to control discharges of CRL, chemical precipitation, that is technologically available, is economically achievable and has acceptable non-water quality environmental impacts. As described in section XIV.C.3 of this preamble below, however, the EPA is finalizing additional monitoring requirements to

[152] U.S. EPA (Environmental Protection Agency). 2015. *Technical Development Document for the Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category.* September. EPA–821–R–15–007. Available online at: *https://www.epa.gov/sites/default/files/2015-10/documents/steam-electric-tdd_10-21-15.pdf.*

[153] *Id.*

[154] *Id.*

[155] Some comments also pointed to the state amicus brief filed in *Maui,* where states made this very argument in a broader context (an argument ultimately rejected by the *Maui* Court itself).

support the implementation of the limitations in this subcategory.

e. The EPA rejects more stringent technologies as BAT for discharges of CRL in this subcategory.

EPA rejects zero-discharge systems as BAT for this subcategory. The EPA finds that the potential zero discharge costs for CRL discharges in this subcategory are unacceptably high. EPA's CRL costs as reflected in *Evaluation of Unmanaged CRL* (DCN SE11501) show that the capital costs of zero-discharge treatment could range as high as $17.4 billion while O&M costs could range as high as $2.04 billion per year. The annualized total costs of zero discharge could be as high as $3.69 billion. These costs are nearly an order of magnitude higher than total costs to the industry for all of the remaining end-of-pipe discharges from every wastestream combined (including costs associated with discharges of CRL that is not covered by this subcategory). The EPA finds that these additional zero discharge costs are unreasonable. Costs are one of the statutory factors that the EPA must consider, and courts have found that the EPA can properly rely on costs in rejecting potential BAT technologies. *See e.g., BP Exploration & Oil Inc.* v. *EPA,* 66 F.3d 784, 799–800 (6th Cir. 1995).[156] For further discussion of costs and economic achievability, see sections VII.F and VIII.

The EPA also rejects chemical precipitation plus low hydraulic residence time biological reduction as BAT for this subcategory. While no commenter recommended that the EPA select chemical precipitation plus low-hydraulic-residence-time biological reduction as BAT for discharges of CRL in this subcategory, the record does contain two plants treating traditional, end-of-pipe CRL with biological treatment. The EPA does not have sufficient data from these plants on which to base possible limitations. Therefore, the EPA declines to identify chemical precipitation plus biological treatment as BAT.[157]

[156] The high costs in this case were estimated to be about $3 billion in capital costs, or $6.7 billion after adjusting for inflation to 2023 dollars. The EPA notes that the $17.4 billion in capital costs for zero discharge here, even if only half of such discharges are covered, would still be higher (about 2.5 times).

[157] Although the EPA did not conduct a sensitivity analysis on costs of this technology as it did for chemical precipitation or zero discharge, the EPA notes that this cost would be between these two costs based on the cost estimation results of the previous rulemakings. Since these costs would be higher than chemical precipitation alone, they may also be unacceptably high, as are the costs for zero discharge.

6. Legacy Wastewater Discharged From Surface Impoundments Commencing Closure After July 8, 2024

The EPA is establishing a new subcategory for legacy wastewater discharged from surface impoundments which commence closure under the CCR regulations after July 8, 2024. For units in this subcategory, the EPA is establishing mercury and arsenic limitations based on chemical precipitation. More specifically, the technology basis for BAT includes the same chemical precipitation system described in the 2015 rule, which employs hydroxide precipitation, sulfide precipitation (organosulfide), and iron coprecipitation.

At proposal, the EPA solicited comment on a legacy wastewater subcategory for composite-lined surface impoundments that meet the location restrictions of the CCR regulations. In contrast to most surface impoundments, the EPA identified 22 surface impoundments at 17 facilities in *Legacy Wastewater at CCR Surface Impoundments* (DCN SE10252) that the record indicated met these criteria. The EPA solicited comment on this subcategory because its view was that these surface impoundments can continue to operate and thus would likely not begin closure and dewatering until after the effective date of any final ELG. Since these surface impoundments would not already be in the midst of dewatering under the tight closure timeframes of the CCR regulations, these facilities would have time to develop a CCR closure plan that included wastewater treatment during the dewatering phase of closure. Many commenters were opposed to the establishment of such a subcategory based on liner type. The EPA also received comments, however, recommending that, in order to address the issue that it had raised at proposal about potentially differentiated limitations for certain impoundments that have not already begun to dewater, a legacy wastewater subcategory should be created that is defined based on a deadline under the CCR regulations.

After considering the comments received and evaluating the record in light of the factors specified in CWA section 304(b)(2)(B), the EPA concludes that a subcategory is warranted for certain legacy wastewater discharges based on process changes at these plants happening under the CCR regulations. First, the EPA agrees with commenters that a liner-based subcategory would be inappropriate. On the one hand, some composite-lined surface impoundments may have already commenced closure under the CCR regulations. Thus, a subcategory that included these units would still include surface impoundments in the midst of closure under the tight deadlines of the CCR regulations, the very scenario described in section VII.B.4 of this preamble, for which the EPA found it is inappropriate to establish nationwide BAT limitations. On the other hand, the CCR regulations include flexibilities that allow a facility needed for reliability to continue to receive waste in an unlined surface impoundment or to make an alternate liner demonstration to continue to receive waste in an unlined surface impoundment. In both cases, the unlined surface impoundment could continue operation and not commence closure until after the ELG effective date. Thus, similar to the lined units discussed at proposal, these facilities would be able to build wastewater treatment into their closure plans. As is apparent from this discussion, a subcategory based on liner type is potentially both overinclusive and underinclusive, which was not the EPA's intent.

The EPA does, however, agree with comments suggesting an alternative subcategory designation more appropriately aligned with the EPA's intent and tied to the regulatory triggers in the CCR rule. It was suggested that the EPA consider using the CCR regulations' cease receipt of waste date; however, after a more thorough examination of 40 CFR part 257, the EPA finds that the ''commence closure'' date of § 257.102(e) is the appropriate regulatory trigger. This provision applies to surface impoundments that are not closed for cause (*i.e.,* unlined or failing location restrictions), but rather because the surface impoundment will no longer be used.[158] This subcategorization solves the dual problem described for the proposed liner-based subcategorization above. If a lined surface impoundment has already commenced closure under § 257.102(e), then it would not be subject to this subcategory, and if an unlined surface impoundment is continuing to operate under one of the CCR rule flexibilities, then it will not yet have commenced closure pursuant to this provision. Thus, the final rule subcategory captures only surface impoundments that are not in the midst of closure, as the proposed rule intended. While the

[158] Commencing closure is triggered when a unit ceases receipt of waste or ceases extraction of materials for beneficial use, though facilities are also permitted to postpone this commence closure date if they make a filing that the facility intends to restart the receipt of waste or extraction of materials for beneficial use at a specific future date.

EPA declined to establish nationwide BAT limitations for legacy wastewater in section VII.B.4 of this preamble based on process changes, specifically the ongoing closure of these units under the CCR rule, the EPA finds that this factor is inapplicable to the legacy wastewater that will be discharged in the future at these subcategorized surface impoundments.

a. The EPA selects chemical precipitation as BAT for legacy wastewater in this subcategory.

Since nationwide limitations are appropriate for this subcategory, the EPA next evaluates the final rule technology basis of chemical precipitation. For this subcategory of legacy wastewater discharges, EPA is establishing chemical precipitation-based limitations, as they are available, are economically achievable, and have acceptable non-water quality environmental impacts, as described below.

The EPA finds that chemical precipitation is available to treat legacy wastewater in this subcategory. At the time of the 2015 rule, the Agency acknowledged that chemical precipitation was being used on legacy wastewater discharges comprised of ash transport water. 80 FR 67855. Since that time, the EPA has learned of additional use on legacy wastewater of chemical precipitation at two Duke facilities and an SDE system at Boswell Energy Center. In addition to the use of chemical precipitation at a number of legacy wastewaters domestically, the EPA notes that, in the 2015 record, it did not discuss potential technology transfer of chemical precipitation-based limitations to legacy wastewater based on its performance in treating other wastestreams that comprise legacy wastewater. The Agency has consistently found, however, that two of the other three wastewaters regulated in this final rule (FGD wastewater and CRL) have the same pollutants and are amenable to treatment with the same treatment systems. As a result of this finding, the 2015 rule established NSPS for CRL based on chemical precipitation. Furthermore, in 2015, also found that CRL has the same pollutants as BA transport water, a wastewater that some facilities treated with chemical precipitation at the time of that final rule. *See* EPA–HQ–OW–2009–0819–6230. In short, the three wastewaters being regulated in this final rule for which the EPA is amending the legacy wastewater limitations have all been successfully treated with chemical precipitation systems. Based on what is known about the properties of these treatment systems, the characteristics of the various wastestreams at issue, and the demonstrated ability of chemical precipitation to treat such wastestreams, the EPA is transferring mercury and arsenic limitations from FGD wastewater and CRL to the subcategory of legacy wastewater described in this section for the final rule. As previously explained, EPA may rely on technology transfer to establish technology-based limitations such as those in this rule. *See Am. Iron & Steel Inst.* v. *EPA,* 526 F.2d at 1058, 1061, 1064; *Weyerhaeuser Co.* v. *Costle,* 590 F.2d at 1054 n.70; *Reynolds Metals Co.* v. *EPA,* 760 F.2d at 562; *California & Hawaiian Sugar Co.* v. *EPA,* 553 F.2d at 287.

The EPA also finds that the costs of chemical precipitation systems are economically achievable for the subcategory. At proposal, the EPA evaluated the costs for legacy wastewater in a sensitivity analysis. For this final rule, EPA has included these costs in its primary cost estimates and economic screening analysis. IPM, which projects decisions on dispatch of EGUs, is not affected by these costs, which occur irrespective of generation. Thus, the costs are not included in the IPM analysis. However, the cost analysis demonstrates that costs for treating this wastestream are low, a finding that is bolstered by the relatively low impacts as a percent of revenues as seen in the economic screening analysis of the final rule. (For further information, see sections VII.F and VIII.) Because the EPA is required to consider whether the cost of BAT can be reasonably borne by the industry and confers on the EPA discretion in consideration of the BAT factors, *see, e.g., Chem. Mfrs. Ass'n* v. *EPA,* 870 F.2d at 262; *Weyerhaeuser* v. *Costle,* 590 F.2d at 1045, EPA finds that these additional costs are economically achievable as that term is used in the CWA.

Finally, the EPA finds that the non-water quality environmental impacts associated with chemical precipitation systems for controlling legacy wastewater discharges in this subcategory are acceptable. See sections VII.G and X below for more details.

b. The EPA rejects less stringent technologies as BAT for legacy wastewater in this subcategory.

The EPA did not select surface impoundments as BAT for legacy wastewater in this subcategory, as surface impoundments would remove fewer pollutants than the BAT technology selected above, which is available, is achievable, and has acceptable non-water quality environmental impacts, and which will better achieve the BAT requirement of making reasonable further progress toward the CWA's goals. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003, 1006 (citing *Nat'l Crushed Stone* v. *EPA,* 449 U.S. at 75).

c. The EPA rejects more stringent technologies as BAT for legacy wastewater in this subcategory.

The EPA is not selecting chemical precipitation plus biological treatment as BAT for legacy wastewater in this subcategory. Biological treatment requires a period of optimization for concentration and composition of the microorganisms to reach a steady state in which the reduction-oxidation activity of the microorganisms can reduce pollutants of concern without creating excessive levels of hydrogen sulfide gas. Unlike FGD wastewater, however, which is a relatively consistent wastewater that can be equalized in tanks to moderate differences before treatment, legacy wastewater being drained from a surface impoundment is known to quickly change pollutant concentrations as the surficial water is drained and dewatering progresses down through one or more layers of CCR. Due to the relatively short timelines for dewatering when compared to the equalization timeframes for the bacteria, biological reduction would not be able to consistently meet the biological treatment-based limitations established for FGD wastewater in the 2015 or 2020 rules.

The EPA is also not selecting chemical precipitation plus ZVI systems as BAT. The EPA acknowledges that it learned of a plant using this technology to treat its legacy wastewater. The EPA does not, however, have any information in the record on the influent or effluent data from this system to establish limitations, nor has the EPA developed ZVI-based limitations for any other wastestream that it can transfer. Commenters did not advocate for establishment of limitations based on ZVI systems, nor submit any information related to the performance of these systems, including data that would allow the Agency to develop numerical limitations; therefore, the EPA cannot, at this time, establish limitations based on chemical precipitation plus ZVI systems.

The EPA finds that zero-discharge systems are not BAT for legacy wastewater in this subcategory based on the statutory factor of age and cost, as well as given certain information gaps in the record. Specifically, the EPA finds that more stringent zero-discharge technologies are not commensurate with the age of the facility being in a retired status, which would lead to unacceptably higher capital costs that

can no longer be spread over electricity sales.

As described in section VII.C.4 of this preamble with respect to CRL generated and discharged after a plant retires, surface impoundment dewatering at EGUs in this subcategory is also likely to take place when a facility would no longer be generating revenue, as several commenters pointed out. Thus, any treatment system, including the selected BAT basis of chemical precipitation, built to operate only after retirement will necessarily have to incur capital costs in a disparate circumstance of a post-retirement age when compared to costs to EGUs that dewater their impoundments while still generating revenue. Compared to chemical precipitation systems, however, zero-discharge systems worsen the disparate circumstance of EGUs facing costs while in a retired status. Zero-discharge systems typically have capital costs approximately double the capital costs of chemical precipitation systems alone. The EPA finds that the increased cost of these more stringent technologies renders them unacceptable in light of the unique position of the EGUs to which they would apply. The EPA intends that the cost and economic achievability rationale discussed here is unique to the small number of industry-wide discharges at retired facilities with no revenue, and thus will not form a precedent for evaluating costs and economic achievability at the vast majority of facilities which continue to operate and have active revenue streams.

The EPA also notes that there are data gaps in the record for zero-discharge technologies. The current record reflects only a single facility employing a zero-discharge SDE system to treat legacy wastewater, and unlike Boswell Energy Center, many facilities in this subcategory will dewater and close their ash impoundments after the facility ceases generating electricity. Without electricity production, there is no slipstream of flue gas with which to operate the same type of SDE system that is achieving zero discharge at Boswell. The EPA is not aware of any other facility that is employing a zero-discharge technology, such as membrane filtration or thermal evaporation, to treat its legacy wastewater. While it is possible that the EPA could transfer non-zero numerical limitations from treatment of other wastestreams using these technologies, given the information gap and the additional costs in the context of these EGUs unique position discussed above, the EPA declines to select zero-discharge systems as BAT for legacy wastewater in this subcategory.

7. Interim Limitations Applicable to FGD Wastewater and BA Transport Water

The EPA is retaining the final 2020 rule BAT technology bases and limitations for FGD wastewater and BA transport water as interim limitations until the applicability dates of the new zero-discharge limitations (see section VII.E of this preamble for availability timing of the new requirements). Specifically, the 2020 rule established BAT limitations for FGD wastewater based on chemical precipitation plus low hydraulic residence time biological reduction or, in the case of the high FGD flow and LUEGU subcategories, based on chemical precipitation only. BAT limitations for BA transport water were based on high recycle rate systems with up to a 10 percent volumetric purge or, in the case of the LUEGU subcategory, based on surface impoundments with a BMP plan. The EPA finds that the 2020 BAT technology bases continue to be available, economically achievable, and have acceptable non-water quality environmental impacts for all of the reasons stated in the 2020 rulemaking and as supplemented by the new IPM analyses updating the Agency's economic achievability determination and further discussed below.

Although it proposed more stringent zero-discharge limitations in 2023, the Agency always intended that the 2020 rule limitations would continue to apply. For example, when EPA explained its reasoning as to why it did not postpone the requirements in the 2020 rule, it stated, ''There is no basis in the record indicating that the limitations finalized in 2020 are not available or economically achievable, and thus there is no reason for the EPA to postpone their implementation. EPA is focused on progress toward eliminating discharges, consistent with CWA section 301(b)(2)(A).'' 88 FR 18886. Similarly, the EPA's earlier announcement of this supplemental rulemaking stated (and the proposal reiterated) that ''the pollutant reductions accomplished by the existing rules will occur while the Agency engages in rulemaking to consider more stringent requirements.'' 86 FR 41802.

The EPA received many comments from electric utilities arguing that this approach was not appropriate. Some commenters claimed that the EPA should have halted implementation while it considered rule revisions. Some commenters stated that costs of the 2020 rule technologies would not be fully recovered over the timeframe before new, more stringent limitations would come into effect. Others described these costs as high, or potentially drawing investment away from the transition to cleaner energy sources. One commenter claimed that the EPA violated its own policy of only revisiting ELGs for seven years after a final regulation is issued. Finally, the EPA received comments that the 2020 rule limitations were well founded.

After considering public comments, including those mentioned above, the EPA is retaining the 2020 rule limitations applicable to FGD wastewater and BA wastewater as interim limitations before the applicability dates of the zero-discharge limitations finalized. The EPA disagrees that it should have halted implementation of the 2020 rule. The EPA found the 2020 rule technologies to be available, economically achievable, and to have acceptable non-water quality environmental impacts. While the EPA agrees that cost recovery periods for the 2020 rule technologies will be curtailed, and that it is possible that this would divert investment dollars from clean energy projects, the record shows that the total costs of implementing the technologies of both rules under the corresponding timeframes are economically achievable according to the Agency's IPM modeling, discussed further in section VII.F of this preamble. Furthermore, the EPA disagrees with comments suggesting it cannot revisit an ELG for seven years. The EPA has revisited many final ELG rules within this time frame, either as the result of a court's vacatur or remand, or as the result of an administrative petition. In fact, the same commenter arguing against the EPA's supplemental rulemaking here submitted administrative petitions for the EPA to reconsider the 2015 rule, and at that time found no procedural problem with the EPA revising a rule before seven years had elapsed.

The EPA views the retention of the 2020 BAT limitations for FGD wastewater and BA wastewater in the interim as in keeping with the technology-forcing nature of the CWA and essential for meeting the statutory requirement that BAT result in reasonable further progress toward the CWA's goal of zero discharge of pollutants. *See Nat. Res. Def. Council* v. *EPA,* 808 F.3d 556, 563–64 (2d Cir. 2015) (''Congress designed this standard to be technology-forcing, meaning it should force agencies and permit applicants to adopt technologies that achieve the greatest reductions in pollution.'') (citation omitted). Without these interim limitations, which have a

latest applicability date of December 31, 2025, plants could potentially have up to December 31, 2029 (the latest applicability for the zero-discharge requirements in this final rule), before they are required to meet limitations beyond the 1982 limitations based on surface impoundments. The EPA never intended that, as part of this rulemaking to explore additional pollutant discharge reductions that this industry could achieve, plants could thereby avoid taking available and achievable steps toward discharge control in the interim. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1003–1004 (describing the 1982-era regulations as from a ''by-gone era'' in which limitations were based on the ''archaic'' technology of surface impoundments, ''which are essentially pits where wastewater sits, solids (sometimes) settle out, and toxins leach into groundwater.''). More information on implementation of the 2020 rule limitations as an interim step toward achievement of the new zero-discharge FGD wastewater limitations is available in section XIV.A of this preamble.

D. Additional Rationale for the Proposed PSES and PSNS

Before establishing PSES/PSNS for a pollutant, the EPA examines whether the pollutant ''passes through'' a POTW to WOTUS or interferes with the POTW operation or sludge disposal practices. In determining whether a pollutant passes through POTWs for these purposes, the EPA typically compares the percentage of a pollutant removed by well-operated POTWs performing secondary treatment to the percentage removed by the BAT/NSPS technology basis. A pollutant is determined to pass through POTWs when the median percentage removed nationwide by well-operated POTWs is less than the median percentage removed by the BAT/NSPS technology basis. The EPA establishes pretreatment standards for those pollutants regulated under BAT/NSPS that pass through POTWs.

The EPA received comments that it should update this analysis to include more recent POTW pollutant removal data. Specifically, one commenter pointed to more recent analyses that POTWs remove 45 percent of arsenic and 60 percent of mercury. This comment also faulted the EPA for summarily finding that pollutants treated by a zero-discharge system would pass through a POTW since the POTW does not achieve 100 percent removals of these pollutants.

After considering these comments, the EPA finds that the 2015 rule pass-through analyses of these same technologies is still representative of current pollutant behavior. Specifically, the EPA is continuing to rely on the pass-through analyses as the basis of the limitations and standards in the 2015 rule as the Agency did in the 2020 rule. This analysis found that POTWs do not significantly remove mercury and arsenic in several wastewaters. Contrary to commenters' assertions that new data show some significantly improving removals of these pollutants, the EPA notes that table 10–1 of the 2015 TDD shows median arsenic removals of 65.8 percent and median mercury removals of 90.2 percent, higher removals than the new removal data cited by the commenters. Thus, because the EPA considered pass-through using higher pollutant removals, the EPA's findings would not change substituting the new pollutant removal data. With respect to zero discharge, the EPA is establishing zero-discharge limitations for three wastestreams in this rule. As in the 2015 rule, the EPA did not conduct its traditional pass-through analysis for wastestreams with zero-discharge limitations or standards. Zero-discharge limitations and standards achieve 100 percent removal of pollutants, including salts like boron and bromide which are not treated at all by the typical POTW treatment system.[159] Therefore, the EPA concludes that all pollutants in those wastestreams treated by the zero-discharge technologies would otherwise pass through the POTW absent application of the zero discharge technologies that form the BAT bases for FGD wastewater, BA transport water, and CRL.

PSES. After considering public comments and the record in light of the relevant CWA statutory factors, the EPA is establishing PSES for indirect discharges based on the technologies described in Option B. EPA is establishing Option B technologies as the bases for PSES for the same reasons that it is finalizing the Option B technologies as the bases for BAT for direct dischargers. The EPA's analysis shows that, for both direct and indirect dischargers, the final rule technologies are available and economically achievable, and they have acceptable non-water quality environmental impacts, including energy requirements (*see* sections VIII and X). For the final rule, the EPA is not selecting other technology bases for PSES for the same reasons that it is not finalizing other technology bases for BAT.

Furthermore, the EPA reaches the same conclusions for the same reasons discussed in section VII.C of this preamble with respect to several subcategories. EPA finds that retention of differentiated PSES for EGUs permanently ceasing coal combustion by 2028 are warranted. The EPA also finds establishing two new subcategories with differentiated PSES for EGUs permanently ceasing coal combustion by 2034 and legacy wastewater discharged from surface impoundments commencing closure after July 8, 2024, is warranted. In contrast, the EPA is not establishing a subcategory with differentiated PSES for discharges of unmanaged CRL because that subcategory is only intended to address CRL discharges that are found by a permitting authority to be the functional equivalent of a *direct* discharge to WOTUS or that are *direct* discharges of CRL to a WOTUS that result from the capture and pumping to the surface of CRL that has leached from a waste management unit into the subsurface and mixed with groundwater. Given the high volumes associated with operations that might capture and pump to the surface CRL that has leached from a waste management unit into the subsurface, the EPA does not expect facilities to find it a cost-feasible alternative to send such volumes to a POTW.

With respect to the low utilization subcategory, the EPA is eliminating the PSES subcategory for LUEGUs, as it does for direct dischargers, after further considering specific facts about the universe of plants that would potentially qualify for this subcategory. The EPA is only aware of one indirect discharger that has filed a NOPP to potentially avail itself of this subcategory, the Whitewater Valley Station; the EPA received no further comments indicating other indirect dischargers that planned to make use of the 2020 LUEGU subcategory. Whitewater Valley Station consists of two EGUs (Coal Boiler #1 and Coal Boiler #2). Coal Boiler #1 has a nameplate capacity of 35 MW, and it had 2019 and 2020 CURs of 5 percent and 3.67 percent, respectively. Coal Boiler #2 has a nameplate capacity of 65 MW, and it had 2019 and 2020 CURs of 5.5 percent and 5.1 percent, respectively. On its website, IMPA states that the station ''has been utilized by IMPA during peak load periods during the hot summer months and cold winter months.'' [160] This utilization

[159] The commenter has, in fact, historically sent its FGD wastewater to a POTW, thereby diluting the wastewater to the extent that it can meet a water quality-based effluent limitation for boron.

[160] *See www.impa.com/about-impa/generation-resources/giant-tcr.*

profile was confirmed by IMPA's comments on the 2023 proposed rule. At proposal, the EPA noted that Coal Boiler #1 is small enough to avail itself of the 2015 rule subcategory for small EGUs (*i.e.,* less than or equal to 50 MW nameplate capacity). While IMPA agreed, it also conveyed in its comments that it may not be able to increase the utilization of this small EGU without changes to its permits, and furthermore that this would not make up for any loss of operation of Coal Boiler #2 since both EGUs perform winter and summer peaking operations in tandem.

IMPA also clarified in its comments that the ash handling system it employs to comply with the CCR rule has not resulted in the elimination of its BA transport water discharges. The system includes dewatering bins followed by the addition of flocculant and coagulant to facilitate particulate removals in geotubes. Remaining wastewater is then sent to four polishing surface impoundments that are not designed to hold an accumulation of CCR, and thus not subject to the CCR rule, before the wastewater is sent to the POTW. While IMPA also provided concentration data from its BA transport water, none of this information demonstrated removals of pollutants to a degree that would change the results of the pass-through analysis from the 2015 rule.

Finally, IMPA provided comments describing the costs of potential BA transport water modifications, the impacts to the local community, and the potential for the facility to continue to support reliability.[161] In the comments regarding reliability, IMPA appeared to suggest that the facility would be operating until 2032. IMPA and the EPA had a follow-up conversation to discuss these comments and the EPA confirmed that, in the absence of outside factors, the facility is expecting to cease operations in 2032.

After considering the comments and information in the record, the EPA is eliminating the LUEGU subcategory for indirect dischargers as unnecessary and not supported by the factors relied on in 2020. With respect to FGD wastewater under the LUEGU subcategory, no NOPPs were filed from indirect dischargers requesting this subcategory for this wastestream. Thus, continued existence of this subcategory is unnecessary. With respect to BA transport water, EPA notes that, under the final rule's subcategory for EGUs permanently ceasing coal combustion by 2034, the one facility with indirect discharges to a POTW known to be interested in using the 2020 LUEGU subcategory would be able to continue to operate under the BA transport water PSES of the 2020 rule and retire in 2032 as planned without incurring any additional treatment costs and without creating an energy reliability concern. Thus, the LUEGU subcategory is no longer supported by the factors the EPA cited in the 2020 rule, nor any other factors.

PSNS. The EPA selects zero-discharge systems as the bases for the CRL PSNS for the same reasons that EPA selects these systems as the bases for the CRL NSPS (see section VII.B.3 of this preamble). The EPA's record demonstrates that zero-discharge systems are available and demonstrated, do not pose a barrier to entry, and have acceptable non-water quality environmental impacts, including energy requirements (see sections VII.G and X of this preamble). The EPA rejected other options for CRL PSNS for the same reasons that it rejected other options for CRL NSPS. And, as with the final CRL PSES, the EPA concludes that the final CRL PSNS prevent pass through of pollutants from POTWs into receiving streams and help control contamination of POTW sludge.

E. Availability Timing of New Requirements

Where BAT limitations in the 2015 and 2020 rules are more stringent than previously established BPT limitations, those BAT limitations do not apply until a date determined by the permitting authority that is ''as soon as possible'' after considering four factors. Depending on the particular wastewater, the 2015 and 2020 rules also established a ''no later than'' date of December 31, 2023, or December 31, 2025, for reasons discussed in the record of those rules, including that, without such a date, implementation could be substantially delayed, and a firm ''no later than'' date creates a more level playing field across the industry.

As part of the consideration of the technological availability and economic achievability of the new BAT limitations in this regulation, the EPA considered the magnitude and complexity of process changes and new equipment installations that would be required for plants to meet the final rule's new, more stringent limitations and standards. Specifically, the EPA considered timeframes that enable many plants to raise needed capital, plan and design systems, procure equipment, and construct and test systems. The EPA also considered the timeframes needed for appropriate consideration of any plant changes being made in response to other Agency rules affecting the steam electric power generating industry. The EPA understands that some plants may have already installed, or are now installing, technologies that could comply with the rule's limitations. Therefore, EPA finds that the earliest date some plants can achieve compliance with these new limitations would be July 8, 2024. Where this is not the case, nothing in this rule would preclude a permitting authority from establishing a later date, up to the ''no later than'' date, after considering the four specific factors in 40 CFR 423.11(t).[162]

With respect to the latest compliance dates, the EPA collected updated information on the technical availability of the BAT technology bases. Information in EPA's rulemaking record indicates that a typical timeframe to raise capital, plan and design systems (including any necessary pilot testing), procure equipment, and construct and test systems falls well within the existing five-year permit cycle.[163] Furthermore, the chemical precipitation and zero-discharge BAT technologies here do not implicate the same industrywide competition over a small number of biological treatment vendors that the 2020 rule implicated. The EPA notes that while plants may not need about five years to comply with the final limitations, the ''no later than'' date creates an outer boundary beyond which no discharger may seek additional time and creates a level playing field regarding the latest date. Therefore, the EPA is finalizing the requirement that the new limitations for FGD wastewater, BA transport water, and CRL be achieved ''no later than'' December 31, 2029.

The EPA received comments that these ''no later than'' dates should be shortened or lengthened. Comments suggesting shortening these timeframes focused on record information

[161] While the EPA received comments from other parties about the elimination of this PSES subcategory, only IMPA provided site-specific information that was potentially relevant to the EPA's discussion here. For further discussion of comments, see *Response to Public Comments for Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category, April 2024* (SE11794).

[162] These factors are: (1) time to expeditiously plan (including to raise capital), design, procure, and install equipment to comply with the requirements of the final rule; (2) changes being made or planned at the plant in response to GHG regulations for new or existing fossil fuel-fired power plants under the CAA, as well as regulations for the disposal of coal combustion residuals under subtitle D of RCRA; (3) for FGD wastewater requirements only, an initial commissioning period to optimize the installed equipment; and (4) other factors as appropriate. *See* 40 CFR 423.11(t).

[163] *See* FGD and Bottom Ash Implementation Timing (DCN SE08480).

describing that individual facilities can install certain technologies in timeframes shorter than out to 2029. EPA declines to establish ''no later than'' dates shorter than one permit cycle from the final rule. Some permits may not be renewed and able to incorporate the new limitations until 2029, and this later date creates an even playing field for the industrial category. In contrast, commenters suggesting lengthening these timeframes did not provide specific data that demonstrate a legitimate need for a longer timeframe. In the absence of data demonstrating different timelines are necessary or appropriate (*e.g.,* engineering dependency charts), the EPA cannot justify timeframes longer than those in the Agency's current record.

For the new subcategory for EGUs permanently ceasing coal combustion by 2034, the EPA is finalizing different availability timing for the BAT limitations applicable to CRL discharged after cessation of coal combustion. Since CRL was not covered by the 2020 permanent cessation of coal subcategory, plants with EGUs retiring both before and after 2028 may wish to avail themselves of the CRL limitations applicable to the subcategory for EGUs permanently ceasing coal combustion by 2034. Furthermore, as discussed in section VII.C.4 of this preamble, the new subcategory for EGUs permanently ceasing coal combustion by 2034 takes into account the changes expected to occur in CRL flow after closure of the WMU, the timing of which depends on, but is not the same as, the date the EGU will cease coal combustion. To facilitate administration, the EPA is adopting the same ''as soon as possible'' applicability timing framework as used for other limitations in this rule. Thus, the BAT limitations for mercury and arsenic in CRL discharges from this subcategory must be met as soon as possible beginning 120 days after permanent cessation of coal combustion. Since the subcategory allows for permanent cessation of coal combustion by December 31, 2034, with an additional 120 days allowed for the discharge of FGD wastewater, the Agency is adopting an April 30, 2035 ''no later than'' date for meeting BAT limitations for discharges of CRL from this subcategory.[164] Thus, while a permitting authority must establish availability timing that is ''as soon as possible,'' nothing in this rule would preclude a permitting authority from establishing a later date, up to the ''no later than'' date, after considering the four specific factors in 40 CFR 423.11(t). For PSES in this subcategory the statute does not allow for flexible availability timing and so here, to provide the same flexibility, the Agency is adopting tiered limitations with the second tier applying no later than April 30, 2035.

For the discharge of legacy wastewater, the EPA is not establishing the same ''no later than'' date framework as the other wastewaters. Instead, the limitations for legacy wastewater are simply effective on July 8, 2024. For legacy wastewater generally, this makes sense because the BAT limitations are based on a permitting authority's BPJ, and permitting authorities may consider the availability timing of technologies to a particular plant as part of its BAT determination. For legacy wastewater in the new subcategory described in section VII.C.6 of this preamble, this will have no impact because, as of the effective date of this rule, these surface impoundments will not have triggered the requirements under the CCR regulations to cease receipt of waste and commence closure. Furthermore, allowing for up to five years before the limitations' ''no later than'' date could provide time for circumvention of these limitations where a plant quickly drains its surface impoundment under the existing case-by-case approach.

As with the new BAT effluent limitations, in considering the availability and achievability of the new PSES, the EPA concluded that existing indirect dischargers need some time to achieve the final standards, in part to avoid forced outages. While the BAT limitations apply on a date determined by the permitting authority that is as soon as possible beginning on the effective date of the final rule, but no later than December 31, 2029, under CWA section 307(b)(1), pretreatment standards shall specify a time for compliance not to exceed three years from the date of promulgation, so the EPA cannot establish a longer implementation period. Moreover, unlike requirements on direct discharges, requirements on indirect discharges are not implemented through NPDES permits. Nevertheless, the EPA finds that all existing indirect dischargers can meet the standards within three years of promulgation as discussed below.

At proposal, the EPA projected that there would be no remaining indirect dischargers of FGD wastewater. In response to this finding, City Water, Light and Power (CWLP) filed comments indicating that it retains the option of either sending its treated FGD wastewater to the local POTW, or directly discharging. The EPA takes CWLP at its word that it will continue to be an indirect discharger at least some of the time. Nevertheless, the EPA estimates that it would take a single plant 18 to 28 months to achieve zero discharge for both FGD wastewater and CRL. Similarly, with respect to BA transport water, the EPA estimates that a closed-loop system can achieve zero discharge within 35 months, and substantially sooner if a high recycle rate system is already operating.[165] Finally, with respect to legacy wastewater and CRL generated after permanent cessation of coal combustion, the EPA estimates the chemical precipitation systems can achieve the mercury and arsenic limitations within 22 months.[166] Thus, the final PSES are available 3 years after publication of the final rule. Further discussion of availability timing can be found in section XIVB.1 of this preamble.

F. Economic Achievability

Under the CWA, BAT limitations must be economically achievable. Courts have interpreted the economic achievability requirement as a test of whether the regulations can be ''reasonably borne'' by the industry as a whole. *Chem. Mfrs. Ass'n* v. *EPA,* 870 F.2d at 262; *BP Exploration & Oil* v. *EPA,* 66 F.3d at 799–800; *see also Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1006; *Nat'l Wildlife Fed'n* v. *EPA,* 286 F.3d 554, 570 (D.C. Cir. 2002); *CPC Int'l Inc.* v. *Train,* 540 F.2d 1329, 1341–42 (8th Cir. 1976), *cert. denied,* 430 U.S. 966 (1977). ''Congress clearly understood that achieving the CWA's goal of eliminating all discharges would cause 'some disruption in our economy,' including plant closures and job losses.'' *Chem. Mfrs. Ass'n* v. *EPA,* 870 F.2d at 252 (citations omitted).

At proposal, the EPA found that the rule was economically achievable, but solicited comment on whether and how to include the impacts of the IRA for the final rule analysis. The EPA received comments recommending modifications to its use of IPM. Specifically, some commenters recommended including the impacts of the IRA in the baseline, while other comments disagreed that the EPA should include the IRA impacts, with the latter commenters suggesting that any results with the IRA

[164] Where EGUs are ceasing coal combustion near the end of this timeframe, or where closure of a WMU is lengthy such that it extends past this latest date, it is possible that a facility may not be able to fully take advantage of this flexibility for all of its WMUs.

[165] DCN SE08480.

[166] The EPA expects this timing to be similar to a chemical precipitation installation for FGD wastewater, DCN SE10289.

included would be speculative and uncertain. The EPA also received comments that its findings should consider the joint impact of multiple regulations on this industry.

The EPA acknowledges these comments. The EPA used IPM to perform cost and economic impact assessments, using a baseline that reflects impacts from the IRA and final environmental regulations that were published before this rule was signed (*see* RIA).[167] As explained in detail in section VIII of this preamble, the IPM baseline used for this analysis includes the impacts of the IRA and several other final power sector regulations published before this rule. This is consistent with OMB Circular A–4 and EPA's *Guidelines for Preparing Economic Analysis.*[168] The EPA did not, however, include all the regulations some comments suggested. For example, two CAA rules, the MATS and section 111 rules, are being issued contemporaneously with this ELG and none of these rules includes the others in the baseline of the primary IPM analysis. This too is consistent with OMB guidelines and established EPA practice.

EPA's analysis for the final BAT limitations and PSES demonstrates that they are economically achievable for the steam electric industry, as required by CWA section 301(b)(2)(A). For the final rule, the model projected very small additional effects on the electricity market, on both a national and regional sub-market basis. Based on the results of these analyses, the EPA estimated that the final rule requirements would result in a net reduction of 5,782 MW in steam electric generating capacity as of the model year 2035, reflecting full compliance by all plants. This capacity reduction corresponds to a net effect of approximately five early plant retirements.[169] These IPM results support the EPA's conclusion that the final rule is economically achievable.

Furthermore, before the IPM analysis, the EPA also performed a cost-to-revenue screening analysis which included costs to wastestreams not tied to ongoing electric generation (*i.e.,* costs which would not change operational decisions in IPM). Specifically, this analysis included the upper bound and lower bound costs for treating unmanaged CRL as well as the costs of treating legacy wastewater discharged from surface impoundments commencing closure after July 8, 2024. For further discussion of these costs, see section VIII.A of this preamble. The screening-level assessment of economic impacts showed a greater potential for impacts with 13 to 17 parent entities incurring annualized costs representing one percent or more of their revenues, including 6 to 9 parent entities that would incur costs representing more than three percent of revenue. Since the EPA estimates that there are between 220 and 391 parent entities, this means that between three and eight percent of parent entities would incur costs representing one percent or more of their revenues and a subset of between two and four percent of parent entities would incur costs representing more than three percent of revenue. However, as noted in the RIA, these results are based on the conservative assumption that zero costs are passed on to consumers and represent a worst-case scenario from the plant owners' perspective. The combination of the screening analysis (including unmanaged CRL costs) and the IPM market-level results (excluding unmanaged CRL costs) supports the EPA's conclusion that the final rule is economically achievable.

Other considerations also support the EPA's findings on economic achievability. While EPA properly excluded from its main analysis regulations that are being issued contemporaneously with this rule and that were not published before this rule was signed, the Agency conducted a supplemental analysis to evaluate the cumulative effect of multiple rules affecting the electric power sector. This multi-rule modeling includes this final rule, CAA sections 111(d) and 111(b) EGU rules, and MATS as a combined policy scenario, and includes the EPA vehicle rules (LDV, MDV and HDV) in the baseline (*i.e.,* relevant EPA rules). As such, the results of this modeling cannot be used to show the individual effect of this final rule and are not a substitute for the rule-specific modeling EPA conducted to determine economic achievability of the final rule. However, the multi-rule modeling does clearly illustrate that the cumulative effect of these rules in terms of reduction in steam electric generating capacity is less than the sum of each of these rules individually. This means that, considering the rules together, the affected universe of EGUs with significant mitigation responsibilities under the EPA rules that make up the policy case is overlapping, not purely additive, as it largely reflects the same segment of the grid's generation portfolio. In other words, if the same EGU at baseline that has new regulatory requirements for both its air and water wastestreams chooses to retire rather than adopting control technologies, it would not do so twice, and so the generation lost from that EGU would only need to be replaced once. Hence, simply adding the independently modeled costs of each of the rules, which include effects associated with coal-fired EGU retirements attributable to each rule, would be inappropriate, as these effects are not additive. The sensitivity analysis bears this out over the time periods of relevance to the ELG.[170]

In terms of reductions in coal-fired generating capacity and coal plant closures, affected EGUs are expected to undertake investment decisions to comply with multiple rules simultaneously, as seen in the sensitivity analysis for the combined policy scenario. For example, EGUs that decide to invest in CCS in relevant years may also decide to invest in a dry-handling system, depending on the operational need of the unit. In this case, the costs of CCS and a dry-handling system may be summed. However, if an EGU decides to retire, then the costs associated with the retirement decision would occur only once. For the reasons discussed above, had the Agency done an IPM analysis of ELG impacts in which the other relevant EPA rules were in the baseline, EPA expects that the results of such an analysis would likely show comparable or fewer impacts attributable to the ELG than projected in EPA's main analysis.[171] Thus, nothing in the multi-rule modeling suggests EPA's conclusion that the final ELG rule is economically achievable would be meaningfully different, particularly where courts have upheld EPA's BAT regulations as economically achievable even under circumstances of much greater industry-wide economic impact than projected here. *See Chem. Mfrs. Ass'n* v. *EPA,* 870 F.2d at 252 n.337

[167] IPM is a comprehensive electricity market optimization model that can evaluate such impacts within the context of regional and national electricity markets. See section VIII of this preamble for additional discussion.

[168] Available online at: *https://www.epa.gov/environmental-economics/guidelines-preparing-economic-analyses-2016.*

[169] Given the design of IPM, unit-level and thereby plant-level projections are presented as an indicator of overall regulatory impact rather than a precise prediction of future unit-level or plant-specific compliance actions. The projected net plant closure occurs at a plant whose only steam electric EGU had a capacity utilization of only six percent in the baseline.

[170] See *IPM Sensitivity Runs Memo* (SE11829) for further details.

[171] The multi-rule run also confirms that resource adequacy is maintained, even taking into account the collective impact of the various EPA rules discussed here. See *Resource Adequacy Analysis: Vehicle Rules, 111 EGU rule, ELG, and MATS Technical MEMO* (SE11830).

(reviewing cases in which courts have upheld EPA's regulations that projected up to 50 percent closure rates).

Finally, the EPA notes that coal-fired power plants with the wastestreams subject to this final rule are only a fraction of all coal-fired power plants, which are only a fraction of all steam electric power plants subject to part 423. The combination of the screening analysis (including unmanaged CRL and legacy wastewater costs), the IPM market-level results (excluding unmanaged CRL and legacy wastewater costs), and the other considerations in this paragraph support the EPA's conclusion that the rule is economically achievable.

G. Non-Water Quality Environmental Impacts

For the 2023 proposed rule, the EPA assessed non-water quality environmental impacts, including energy requirements, air impacts, solid waste impacts, and changes in water use and found them to be acceptable. The EPA reevaluated these impacts in light of the changed industry profile and public comments, as well as the requirements of the final rule. Based on the results of these analyses, the EPA determines that the final rule has acceptable non-water quality environmental impacts. See additional information in section 7 of the Supplemental TDD, as well as section X of this preamble.

H. Impacts on Residential Electricity Prices and Communities With Environmental Justice Concerns

The EPA presents the effects of the final rule on consumers as part of the RIA. While the CWA section 304(b)'s ''consideration'' factors do not require these details, the EPA presents them for informational purposes. If all annualized compliance costs were passed on to residential consumers of electricity instead of being borne by the operators and owners of power plants (a conservative assumption), the average yearly electricity bill increase for a typical household would be $1.61 to $3.14 under the final rule, or a change of less than 0.1 percent relative to the baseline. For further information see section 7 of the RIA.

The EPA also presents the effect of the final rule on communities with environmental justice concerns under Executive Order 14096. As explained in sections XIII and XV.J, using demographic data on who resides closest to steam electric power plant discharges, who fishes in downstream waterbodies, and who consumes drinking water from downstream drinking water treatment plants, the EPA concludes that, although benefits are likely to accrue to all members of the affected public, communities with environmental justice concerns will experience health and environmental benefits more than the general population from the reductions in discharges associated with the final rule due to their disproportionate exposure.

VIII. Costs, Economic Achievability, and Other Economic Impacts

The EPA evaluated the costs and associated impacts of the three main final regulatory options on existing EGUs at steam electric power plants. The Agency analyzed these costs within the context of existing environmental regulations, market conditions, and other trends that have affected steam electric power plant profitability and generation, as described in section V.B of this preamble. This section provides an overview of the methodology the EPA used to assess the costs and the economic impacts and summarizes the results of these analyses. The methodology is largely the same as for the proposed rule analysis, but with updates to reflect more recent data and comments the EPA received on the proposal. See the RIA in the docket for additional detail.

In developing ELGs, and as required by CWA section 301(b)(2)(A), the EPA evaluates the economic achievability of regulatory options to assess the impacts of applying the limitations and standards to the industry as a whole, which typically includes an assessment of incremental plant closures attributable to a regulatory option. As described in more detail below, this supplemental ELG is expected to result in incremental costs when compared to baseline. Like the prior analysis of the 2015 and 2020 rules and the 2023 proposal, the cost and economic impact analysis for this final rule focuses on understanding the magnitude and distribution of compliance costs across the industry and the broader market impacts. The EPA used indicators to assess the impacts of the three regulatory options on the whole steam electric power generating industry. These indicators are consistent with those used to assess the economic achievability of the 2015 and 2020 rules and the 2023 proposal. As was done at proposal, the EPA compared the values to a baseline that reflects implementation of existing environmental regulations (as of this final rule), including the 2020 rule and the effects of the IRA of 2022, but does not include the effects of regulations discussed in section IV.E of this preamble that had not been published at the time of signature of this final rule. As such, the baseline appropriately includes the costs of achieving the 2020 rule limitations and standards, and the policy cases show the impacts resulting from potential changes to the existing 2020 limitations and standards. More specifically, the EPA considered the total cost to the industry and the change in the number and capacity of specific EGUs and plants expected to close under the final rule (Option B) compared to the baseline. The EPA also analyzed the ratio of compliance costs to revenue to see how the three main regulatory options affect how many plants (and their owning entities) exceed thresholds indicating potential financial strain. In addition to the analyses supporting the economic achievability of the regulatory options, the EPA conducted other analyses to (1) characterize other potential impacts of the regulatory options (*e.g.,* on electricity rates) and (2) meet the requirements of Executive Orders or other statutes (*e.g.,* Executive Order 12866, Regulatory Flexibility Act, Unfunded Mandates Reform Act).

A. Plant-Specific and Industry Total Costs

The EPA estimated plant-specific costs to control FGD wastewater, BA transport water, CRL, and legacy wastewater discharges at existing EGUs at steam electric power plants to which the ELGs apply.

The EPA assessed the operations and treatment system components currently in place at each unit (or expected to be in place because of other existing regulations, including the 2020 ELG rule), identified equipment and process changes that plants would likely make under each of the three regulatory options presented in table VII–1 of this preamble, considering the subcategory applicable to each EGU, and estimated the capital and O&M costs to implement those changes. As explained in the TDD, the baseline also accounts for additional announced unit retirements, conversions, and relevant operational changes that have occurred since the EPA promulgated the 2020 rule. Following the same methodology used for the 2015 and 2020 rules and the 2023 proposal analyses, when estimating the annualized industry compliance costs, the EPA used a private rate of capital to annualize one-time costs and costs recurring a nonannual basis. For this analysis, this rate is 3.76 percent and represents estimated weighted average cost of capital for the industry. For capital costs and initial one-time costs, the EPA used

a 20-year amortization period. For O&M costs incurred at intervals greater than one year, the EPA used the interval as the annualization period (*e.g.,* five years, 10 years). The EPA added annualized capital, initial one-time costs, and the nonannual portion of O&M costs to annual O&M costs to derive total annualized plant costs. The EPA estimated after-tax costs based on the type of entity owning each plant. The EPA then calculated total industry costs by summing plant-specific annualized costs.

The EPA proposed that membrane filtration was BAT for FGD wastewater; therefore the Agency continued to rely primarily on the costs of membrane filtration to evaluate economic achievability at proposal while analyzing costs of SDEs and thermal evaporation systems using sensitivity analyses. Comments supportive of zero discharge suggested that sometimes thermal evaporation systems were less costly than membrane filtration systems and that these systems can achieve zero discharge alone or in combination. Other commenters suggested that the EPA's cost estimates were too low. Specifically, commenters suggested that the EPA did not properly reflect the costs of FA diversion to a landfill as part of the proposal's membrane filtration costs.

The EPA has updated its cost estimates to more accurately reflect the costs of FA used for brine encapsulation. As a result of these updates, the EPA estimates that membrane filtration is no longer the least costly FGD treatment technology nationwide.

Furthermore, because the final rule identifies the BAT technology basis for FGD wastewater as membrane filtration, SDEs, and thermal evaporation systems alone or in combination, the EPA performed a least-cost analysis to determine which technology each plant would select. While the EPA costed all three technologies, the cost estimates for thermal technologies contain CBI and cannot be released publicly.[172] To increase transparency of this final rule, the EPA ran an alternative set of costs selecting the least-cost technology between only membrane filtration and SDEs. The EPA found that only six plants would select thermal evaporation systems as the lowest cost option when considering all three technologies. Moreover, when comparing the least-cost analysis among the three technologies to the least-cost analysis with only membrane filtration and SDEs, the EPA found that the overall costs associated with the latter exceed the former by only five percent. Since the non-CBI costs do not substantially differ from the CBI costs, the EPA ran these non-CBI costs through IPM so that model's inputs and outputs could also be made public.

With respect to BA transport water, the 2020 rule record never demonstrated that a full 10 percent purge at all facilities was a realistic costing assumption. The primary basis for the 2020 rule purge allowance was a 2016 report from EPRI that involved continuous purges, the majority of which were well under one percent. Thus, in the 2020 rule record, the EPA presented a sensitivity analysis with costs for a two percent purge treatment, which better reflect the handful of facilities for which the EPA has record evidence of a purge.

At proposal, the EPA retained this dual costing approach. Based on IPM modeling results, including the 10 percent purge treatment cost estimates, the EPA proposed to find that dry-handling or closed-loop systems are economically achievable. The EPA received comments suggesting that a 10 percent purge is not realistic of the potential purge needs of facilities. EPA agrees that the record reflects very few facilities with demonstrated purge needs, and that these were all two percent or less. Thus, the Agency has now adopted the more realistic two percent purge treatment cost estimate as its primary analysis but has retained the 10 percent purge treatment costs as a sensitivity analysis.[173]

With respect to CRL, the EPA proposed to establish limitations based on chemical precipitation systems but estimated the costs of alternative zero-discharge systems for treating CRL in a separate memorandum. Some commenters asked the EPA to repropose CRL limitations since these analyses were not presented as part of the main regulatory options. Commenters also presented various reasons why they believed that the EPA's cost estimates were too low. Specifically, commenters suggested that the EPA did not properly reflect the costs of fly ash diversion to a landfill as part of the proposal's membrane filtration costs.

The EPA disagrees with commenters that it should repropose CRL limitations because costs and pollutant loadings of additional technologies were estimated in a separate document. The Agency provided commenters with a fair opportunity to present their views on the contents of the final rule, which is all that is required to satisfy notice and comment requirements. *BASF Wyandotte Corp.* v. *Costle,* 598 F.2d 637, 641–644 (1st Cir. 1979) (rejecting notice and comment objections to a final ELG rule based on changes from proposal). The EPA has also updated its cost estimates to reflect more accurate costs of using FA for brine encapsulation as was done for FGD wastewater in section VII.B.1 of this preamble.

With respect to unmanaged CRL, the proposed rule included a bounding sensitivity analysis with costs for every facility and every unlined landfill and surface impoundment (WMU) to treat their unmanaged CRL either with chemical precipitation or SDEs. These bounding analyses were presented as a conservative estimate to demonstrate the potential universe of discharges of unmanaged CRL and potential costs. Some commenters stated their view that the EPA had not sufficiently evaluated unmanaged CRL and argued that the EPA should re-propose CRL limits after conducting a more accurate costing analysis. The EPA also received comments disagreeing with two misunderstandings of the Agency's proposed application of the rule to unmanaged CRL, with commenters believing either all or none of the facilities in the Agency's analyses were covered. One commenter further suggested that the EPA should include additional WMUs under the new CCR proposed rule (88 FR 31982).

The EPA disagrees with commenters that it did not sufficiently evaluate unmanaged CRL and that CRL limits should be re-proposed. The proposed rule gave commenters notice of the basic engineering cost and economic screening approaches that the Agency applied in evaluating discharges of unmanaged CRL for the final rule, as those approaches have not changed. Furthermore, at proposal, the EPA analysis included the broadest set of potential facilities and WMUs estimated to be potentially subject to these limitations to ensure that the public was given fair notice of how the final rule could apply, even in cases where such an application might be highly unlikely. The EPA disagrees with commenters that making this assumption for the purposes of a bounding analysis had any implications as to whether a permitting authority would ultimately find the existence of a point source with

[172] Standard thermal evaporation system costs are analyzed in DCN SE11694 but not included in this least cost analysis because portions of those costs are being treated as CBI pursuant to claims made by vendors under the EPA's CBI regulations.

[173] This primary use of the two percent numbers is also more reasonable when considering the definitional change whereby necessary discharges from storm events are not considered BA transport water, and thus would not require any additional purge or purge treatment.

a functional equivalent direct discharge to a WOTUS at any given WMU.

For the final rule, to better reflect on-the-ground reality, and in response to public comment, the EPA has refined the bounding analyses from proposal to remove the WMUs least likely to incur costs under this final rule. The EPA began by compiling groundwater monitoring information from unlined WMUs reported under the CCR regulations. This information consisted of detection monitoring data, assessment monitoring data, statistical analyses, and other narrative discussion in the groundwater monitoring reports. WMUs which are still in detection monitoring, and where there is either no statistically significant increase (SSI) of specified parameters [174] above the groundwater background, or an increase that is not attributable to the WMU, are the least likely to be sources of pollutants and therefore also the least likely to potentially incur treatment costs under the rule. Thus, the EPA excluded these units from its revised bounding analysis.

In addition to the updated bounding analysis, for the final rule, also in response to public comments, the EPA now presents a range of more likely costs consisting of a revised upper bound and revised lower bound analysis. These lower and upper bounds provide a likely more accurate range of cost estimates and other impacts for treating unmanaged CRL. The revised upper bound estimate probabilistically considers three separate scenarios, described in the next paragraph. The revised lower bound estimate probabilistically considers an additional four scenarios, also described below. Together, the resulting range represents a reasonable range of nationwide costs of treatment for unmanaged CRL, but as discussed in the following paragraphs, it could overestimate costs at some facilities and underestimate costs at others.

The revised upper bound cost estimate uses proxies for the factors that make unmanaged CRL more likely to be subject to the limitations in the final rule, and therefore more likely to incur costs. The first scenario the EPA modeled was one in which unmanaged CRL treatment costs are assigned only to each plant's WMU closest to a surface waterbody. The Supreme Court in *County of Maui* recognized the importance of distance in determining whether a discharge might fall within the CWA's jurisdiction. *County of Maui* v. *Hawaii Wildlife Fund,* 590 U.S. at 184. For any given facility, for purposes of this cost estimate, the EPA assumes that the unlined WMU that is most likely to have unmanaged CRL subject to this rule's limitations is the unlined WMU nearest a surface waterbody. In selecting the nearest such WMU for the purposes of analysis, the EPA is not making any findings that these unmanaged CRL discharges would be subject to the final rule requirements or that discharges from other WMUs would not be. In reality, WMUs further from a surface waterbody could be found to be point sources with FEDDs of CRL to a WOTUS which are subject to CWA permitting. In addition, any of the closest WMUs modeled here may be found not to be point sources with FEDDs of CRL and thus subject to CWA permitting. Nevertheless, the EPA finds that it is reasonable to assume that the closest WMUs are more likely to incur costs under this final rule.

The other two scenarios the EPA modeled focused not on distance, but on which WMUs are more likely to be a source of pollutants. For these WMUs, the Agency estimated costs of chemical precipitation treatment at both the WMU level and at the facility level. As discussed in the preceding paragraphs, the EPA's updated bounding analysis already removed those WMUs with less probability of incurring costs for unmanaged CRL treatment due to the absence of a WMU-caused SSI in detection monitoring pollutants (*e.g.,* TDS). Just because a facility finds an SSI for a detection monitoring parameter does not indicate that it will incur costs under this final rule. This final rule imposes mercury and arsenic limitations based on chemical precipitation, a treatment system that does not treat all pollutants which might be found in TDS and other detection monitoring parameters. Instead, the EPA notes that nearly all of the assessment monitoring pollutants in appendix IV to part 257 are pollutants treated by chemical precipitation. The EPA finds that WMUs that are the source for an SSI of one or more appendix IV pollutants, and thus trigger corrective action under the CCR regulations, are the most likely to incur chemical precipitation-related costs under this final rule. This is so for two reasons.

First, there is the possibility that these facilities could, in the future, select a pump-and-treat remedy under the corrective action requirements of the CCR regulation, which will be discharged. Any resulting direct discharge would need to comply with the limits in this rule. Second, where a pump-and-treat remedy is not selected, the EPA examined treatment of arsenic. Arsenic has historically been one of the most prevalent pollutants in CCR damage cases and under this final rule is also one of the two indicator pollutants monitored to demonstrate compliance with the BAT limitations for discharges of unmanaged CRL. While this regulation establishes technology-based limitations, the daily and monthly arsenic limitations being finalized are very close to, and bracket, the health-based arsenic standard in the CCR regulations.[175] Thus, for purposes of determining the facilities and WMUs most likely to incur costs with respect to unmanaged CRL, the EPA finds that focusing on arsenic is reasonable.

While the EPA believes that using WMUs that have triggered corrective action is a reasonable proxy for estimating WMUs most likely to incur costs associated with unmanaged CRL under this rule, EPA notes that here too, just because a facility is in corrective action for its groundwater contamination does not mean that the WMU at issue would necessarily be found to be a point source with a FEDD of CRL to a WOTUS. Thus, in some cases, these costs will be overestimated for specific facilities. At the same time, it may be possible that unmanaged CRL is subject to CWA permitting but does not trigger corrective action under the CCR regulations.

Due to the uncertainties surrounding future permitting authority findings regarding unmanaged CRL, the EPA probabilistically combined the three cost scenarios discussed above with equal weights: those involving (1) each plant's closest WMU, (2) cases of corrective action at the WMU level, and (3) cases of corrective action where surface impoundment flows are combined at the facility level. These modeling assumptions should not be interpreted as a finding that any specific site is subject to the unmanaged CRL limitations in the final rule. Rather, these assumptions should be considered as assisting in a reasonable estimation of costs nationwide, with actual site-specific costs under- or overestimated.

[174] Appendix III to Part 257—Constituents for Detection Monitoring includes TDS.

[175] The daily and monthly BAT limitations being established are 11 ug/L and 8 ug/L, respectively as compared to the maximum contaminant level of 10 ug/L, which is the trigger for corrective action under the CCR regulations.

The revised lower bound cost estimate uses proxies for the factors that make unmanaged CRL most likely to be subject to the limitations in the final rule, and therefore most likely to incur costs. Specifically, as of January 22, 2022, the EPA was aware of 67 WMUs at 38 facilities which had selected corrective action remedies that includes pumping and treating of groundwater now or in the future.[176] These data are summarized in table VIII–1 below.

Table VIII-1. CCR Corrective Action Remedies Selected by 2021

Unit/Facility	Count	Pump & Treat	GW Extraction/ Collection	Both	Pump & Treat %	Both %
Individual LFs	18	3	2	5	17%	28%
Individual Sis	49	11	6	17	22%	35%
Facilities w/LFs	16	3	2	5	19%	31%
Facilities w/Sis	26	2	4	6	8%	23%

* Notes: LF = landfill; SI = surface impoundment; Facility counts add to 42 rather than 38 because four facilities have both landfills and surface impoundments

While the statistics are based on a 2022 subset of the facilities that have selected corrective action remedies thus far or will select corrective action remedies in the future, this empirical data provides the best available information on which to base the fraction of WMUs or facilities that may ultimately select a remedy that generates a CRL wastestream that could potentially be discharged, and thus potentially incur treatment costs under the final rule. While some of these facilities selected a remedy that explicitly included pump-and-treat operations, others included other categories of groundwater extraction or collection that may or may not ultimately result in a discharge. The EPA probabilistically used four scenarios to account for the uncertainty in the likelihood of a discharge that would incur ELG compliance costs.

Two scenarios relied on the fraction of WMUs where such discharges were possible based on the remedy selected. Due to the number of WMUs at different facilities being unequal, the EPA also evaluated two scenarios that instead relied on the fraction of facilities with landfills and the fraction of facilities with surface impoundments where such discharges were possible. For each of these, a pair of estimates was generated assuming the fraction that would ultimately discharge subject to the ELG would include either only the pump-and-treat operations or, alternatively, both pump-and-treat operations and other remedies with groundwater collection or extraction that could potentially discharge in the future. For the two scenarios using the facility-based extrapolation, the EPA used the costs for facility-wide corrective action described as one scenario in the revised upper bound scenario in the preceding paragraphs. Finally, by treating each of these scenarios with an equal likelihood to occur, the revised lower bound estimate avoids attaching too much certainty to any individual estimate based on this data set.

The EPA notes that the revised upper bound analysis still represents a conservative estimate of the costs for unmanaged CRL. As facilities continue to implement the CCR regulations, landfills and surface impoundments continue to close and conduct corrective action. In some cases, closure may eliminate the continued source of pollutants (*e.g.,* WMUs which are clean closed) or may reduce the concentrations of pollutants, making treatment costs under this final ELG less likely. Furthermore, where corrective action is taken pursuant to the CCR regulations, it is possible that the corrective action selected would reduce the probability that the facility would incur costs under the final rule. This could be the result of installing impermeable or semi-permeable barriers, conducting *in-situ* treatment, or undergoing pump-and-treat operations where the water is returned to the ground rather than discharged. Even where unmanaged CRL in groundwater is pumped to the surface, some of that water may be reused within the plant or treated and returned to the ground. When considered against this backdrop, the revised upper bound costs estimated for unmanaged CRL can be considered a reasonable, conservative estimate for purposes of ensuring that these costs are considered and found to be economically achievable.

Similarly, the revised lower bound analysis still represents a likely underestimate of the costs of unmanaged CRL. Once regulations establishing a Federal CCR permit program are finalized, the EPA or state agencies may find that some previously selected corrective action remedies may not satisfy the corrective action requirements under the CCR regulations and, thus, a new remedy which does result in a discharge could be required. Furthermore, it may be possible that some unmanaged CRL satisfying the health-based requirements of the CCR regulations could still result in a FEDD of CRL into a WOTUS and, therefore, incur costs for complying with the ELG. For these reasons, the EPA believes the ultimate costs and economic impacts associated with unmanaged CRL are most likely to fall between the revised upper bound and revised lower bound estimates evaluated in the Agency's cost and economic analyses.

With respect to legacy wastewater, the EPA proposed to retain the existing case-by-case limitations but estimated the costs of alternative treatment systems for treating legacy wastewater in a separate memorandum at proposal. Some commenters asked the EPA to repropose legacy wastewater limitations since these analyses were not presented as part of the main regulatory options. The EPA disagrees with commenters for the same reasons presented in the CRL discussion immediately above. For the subcategory of surface impoundments continuing to operate after the effective

[176] EPA presents this dataset in DCN SE11501.

date of the rule, the EPA expects that many plants may only close and dewater their ponds after 2049, which is outside of the period of analysis (and thus, for the purposes of this analysis, would be zero). The Agency has also evaluated a worst-case scenario where all plants close and dewater their ponds soon after the final rule is effective (see RIA appendix C). These costing scenarios bound the potential costs of the final subcategory; however, the likely costs fall somewhere in between. While the EPA cannot know with certainty when a surface impoundment may be closed in the future, the Agency compiled data in the 2015 CCR rule record which revealed a median operating life of 40 years for a surface impoundment [177] and this 40-year life was used for estimating costs, benefits, and other impacts in *Regulatory Impact Analysis for EPA's 2015 Coal Combustion Residuals Final Rule.* To ensure that the costs of the final legacy wastewater subcategory were included in the Agency's main cost analyses, the Agency assumed that these costs would be incurred in 2044. This corresponds to 20 years after the effective date of the final rule (*i.e.,* half of a useful operating life).[178]

Pre-tax annualized costs provide insight on the total expenditure as incurred, while after-tax annualized costs are a more meaningful measure of impact on privately owned for-profit entities and incorporate approximate capital depreciation and other relevant tax treatments in the analysis. The EPA uses pre- and/or after-tax costs in different analyses, depending on the concept appropriate to each analysis (*i.e.,* social costs are calculated using pre-tax costs whereas cost-to-revenue screening-level analyses are conducted using after-tax costs).

The after-tax annualized costs of the final rule range between $479 million and $956 million for the lower and upper bound cost scenarios, respectively, whereas the pre-tax annualized costs range between $596 million and $1,164 million.

[177] See section 4.3.1 of *Human and Ecological Risk Assessment of Coal Combustion Residuals.*

[178] Assuming the same 40-year surface impoundment operating life used in the 2015 CCR rule record and acknowledging that these impoundments could be anywhere in that 40-year lifespan, the Agency uses the midpoint of 20-years as a reasonable approximation for purposes of ensuring that these costs are included in the main cost analyses of the final rule. To the extent that costs could be incurred before this date at some facilities and after this date at other facilities, these nationwide costs may either over- or underestimate the site-specific costs at any particular facility.

B. Social Costs

Social costs are the costs of the supplemental ELG from the viewpoint of society as a whole, rather than the viewpoint of regulated plants and owning entities (which are private costs). They include costs incurred by both private entities (*e.g.,* in complying with the regulation) and by the government (*e.g.,* in implementing the regulation). To calculate social costs, the EPA tabulated the pre-tax costs in the year they are estimated to be incurred, which varies across plants based on the estimated compliance year. The EPA performed the social cost analysis over a 25-year period of 2025 to 2049, which combines the length of the period during which plants are anticipated to install the control technologies (which could be as late as 2029) and the useful life of the longest-lived technology installed at any plant (20 years). The EPA calculated the social cost of the final rule using a two percent discount rate, following current OMB guidance in Circular A–4.[179]

As described further in section 10 of the RIA, there are no incremental increases in the cost to state governments to revise NPDES permits. Consequently, the only category of costs used to calculate social costs are those pre-tax costs estimated for steam electric power plants. Note that the annualized social costs differ from pre-tax industry compliance costs discussed in section VIII.A of this preamble due to differences in both the discount rate used (2 percent) and the year-explicit accounting of the costs. Whereas the costs in section VIII.A of this preamble represent the annualized costs of each option if they were incurred in 2024, the annualized social costs are estimated based on the stream of future costs starting in the year that individual plants are projected to comply with the requirements of the final rule. The final rule has estimated annualized incremental social costs of $536 million to $1,064 million.

C. Economic Impacts

The EPA assessed the economic impacts of this final rule in two ways: (1) a screening-level assessment of the cost impacts on existing EGUs at steam electric power plants and the entities that own those plants, based on a comparison of costs to revenue and (2) an assessment of the impacts within the context of the broader electricity market, which includes an assessment of changes in predicted plant closures attributable to the final rule. The following sections summarize the results of these analyses. The RIA discusses the methods and results in greater detail.

The first set of cost and economic impact analyses—at both the plant and parent company level—provides screening-level indicators of the impacts of costs for FGD wastewater, BA transport water, and CRL controls relative to historical operating characteristics of steam electric power plants incurring those costs (*i.e.,* level of electricity generation and revenue).[180] The EPA conducted these analyses for baseline and for the three regulatory options presented in table VII–1 of this preamble, then compared these impacts to understand the incremental effects of the regulatory options, including the final rule (Option B).

The second set of analyses looks at broader electricity market impacts, considering the interconnection of regional and national electricity markets. This analysis also looks at the distribution of impacts at the plant and EGU level. This second set of analyses provides insight on the impacts of the final rule on steam electric power plants, as well as the entire electricity market, including changes in capacity, generation, and wholesale electricity prices. The market analysis compares model predictions for the final rule to a base case that includes the predicted and observed economic and market effects of the 2020 rule and other environmental regulations.

1. Screening-Level Assessment

The EPA conducted a screening-level analysis of each regulatory option's potential impact on existing EGUs at steam electric power plants and parent entities based on cost-to-revenue ratios. For each of the two levels of analysis (plant and parent entity), the Agency assumed, for analytic convenience and as a worst-case scenario, that none of the compliance costs would be passed on to consumers through electricity rate increases and would instead be absorbed by the steam electric power plants and their parent entities. This assumption overstates the impacts of compliance expenditures since steam electric power plants that operate in a regulated market may be able to pass on changes in production costs to

[179] OMB (2023). Circular A–4: Regulatory Analysis. Washington DC. Available at *https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4.pdf.*

[180] As discussed in section VIII.A of this preamble, in analyzing the costs and benefits of the final rule, the EPA estimated that the costs to meet future legacy wastewater limitations would occur outside the period of analysis and therefore focused on the FGD wastewater, BA transport water and CRL wastestreams for this analysis.

consumers through changes in electricity prices. It is, however, an appropriate assumption for a screening-level estimate of the potential cost impacts.

a. Plant-Level Cost-to-Revenue Analysis

The EPA developed revenue estimates for this analysis using EIA data. The EPA then calculated the change in the annualized after-tax costs of the three regulatory options presented in table VII–1 of this preamble as a percentage of baseline annual revenues. See section 4 of the RIA for a more detailed discussion of the methodology used for the plant-level cost-to-revenue analysis.

Cost-to-revenue ratios are screening-level indicators of potential economic impacts. For this analysis, the EPA assessed plants incurring costs below one percent of revenue as unlikely to face economic impacts, plants with costs between one percent and three percent of revenue as having a higher chance of facing economic impacts, and plants incurring costs above three percent of revenue as having a still higher probability of economic impact.

Under the final rule (Option B), the EPA estimates that 50 to 72 plants would incur incremental costs greater than or equal to one percent of revenue under the lower and upper bound cost scenarios respectively, including 18 to 31 plants that have costs greater than or equal to three percent of revenue. An additional 91 to 98 plants would incur costs that are less than one percent of revenue. section 4.2 in the RIA provides results for the other regulatory options the EPA analyzed.

b. Parent Entity-Level Cost-to-Revenue Analysis

The EPA also assessed the economic impact of the regulatory options presented in table VII–1 of this preamble at the level of the firm that own steam electric power plants to analyze the potential impacts on these firms, referred to as ''parent entities.'' In this analysis, the domestic parent entity associated with a given plant is defined as the entity with the largest ownership share in the plant. For each parent entity, the EPA compared the incremental change in the total annualized after-tax costs and the total revenue for the entity to the baseline (see section 4 of the RIA for details). Following the methodology employed in the analyses for the 2015 and 2020 rules, the EPA considered a range of estimates for the number of entities owning an existing EGU at a steam electric power plant to account for partial information available for steam electric power plants that are not expected to incur ELG compliance costs.

Like the plant-level analysis above, cost-to-revenue ratios provide screening-level indicators of potential economic impacts, this time to the owning entities; higher ratios suggest a higher probability of economic impacts. The EPA estimates that the number of entities owning existing EGUs at steam electric plants ranges from 220 (lower-bound estimate) to 391 (upper-bound estimate), depending on the assumed ownership structure of plants not incurring ELG costs and not explicitly analyzed. The EPA estimates that under the final rule (Option B) and for the lower and upper bound cost scenarios, 13 to 17 parent entities would incur annualized costs representing one percent or more of their revenues, including 6 to 9 parent entity that would incur costs representing more than three percent of its revenue.

2. Electricity Market Impacts

To analyze the impacts of regulatory actions on the electric power sector, the EPA commonly uses IPM, a comprehensive electricity market optimization model that can evaluate such impacts within the context of regional and national electricity markets. The model is designed to evaluate the effects of changes in EGU-level electric generation costs on the total cost of electricity supply, subject to specified demand and emissions constraints. Use of a comprehensive market analysis system is important in assessing the potential impact of any power plant regulation because of the interdependence of EGUs that supply power to the electric transmission grid. Changes in electricity production costs at some EGUs can have a range of broader market impacts affecting other EGUs, including the average likelihood that various units are dispatched. The analysis also provides important insight on steam electric capacity closures (*e.g.,* retirements of EGUs that become uneconomical relative to other EGUs), based on a more detailed analysis of market factors than in the screening-level analyses above.

In contrast to the screening-level analyses, which are static and do not account for the interdependence of EGUs supplying power to the electric transmission grid, IPM accounts for potential changes in the generation profile of steam electric and other EGUs, as well as the consequent changes in market-level generation costs as the electric power market responds to changes in generation costs for steam electric EGUs due to the regulatory options. Additionally, in contrast to the screening-level analyses, in which the EPA assumed no cost pass-through of ELG compliance costs, IPM depicts production activity in wholesale electricity markets where the specific increases in electricity prices for individual markets would result in some recovery of compliance costs for plants. IPM is based on an inventory of U.S. utility- and nonutility-owned EGUs and generators that provide power to the integrated electric transmission grid, including plants to which the ELGs apply.

The EPA analyzed the final rule (Option B) using IPM to further inform the Agency's understanding of the potential impacts of the ELGs. The base case used for this analysis, which the EPA was developed using IPM Version 6, embeds an energy demand forecast that is derived from DOE's ''Annual Energy Outlook 2023.'' [181] The base case also includes the effects of the IRA provisions reflecting supply-side impacts, final Federal rules (*e.g.,* 2020 ELG rule, CSAPR and CSAPR Update, 2012 MATS rule, the 2014 CWA section 316(b) rule, and 2015 CCR rule and CCR Part A rule), and state rules and programs such as the Regional Greenhouse Gas Initiative, California's Global Warming Solutions Act, and state-level Renewable Portfolio Standards policies.

In analyzing the final rule, the EPA estimated incremental fixed and variable costs for the steam electric power plants and EGUs to comply with Option B. Because IPM is not designed to endogenously model the selection of wastewater treatment technologies as a function of electricity generation, effluent flows, and pollutant discharge, the EPA estimated these costs exogenously for each steam EGU and input these costs into the IPM model as fixed and variable O&M cost adders in addition to the costs already reflected in the base case, which included compliance with the 2020 ELG rule (the baseline analysis) and other applicable regulations. The EPA then ran IPM with these new cost estimates to determine the dispatch of EGUs that would meet projected demand at the lowest costs, subject to the same constraints as those in the baseline analysis. The estimated changes in plant- and EGU-specific production levels and costs—and, in turn, changes in the electric power sector's total costs and production profile—are key data elements in evaluating the expected national and regional effects of the final rule,

[181] U.S. Energy Information Administration (2023b). Annual Energy Outlook 2023. Available at *https://www.eia.gov/outlooks/aeo/.*

including closures or avoided closures of EGUs and plants.

The EPA considered impact metrics of interest at three levels of aggregation: (1) impact on national and regional electricity markets (all electric power generation, including steam and nonsteam electric power plants); (2) impact on steam electric power plants as a group, and (3) impact on individual steam electric power plants incurring costs. section 5 of the RIA discusses the first analysis; the sections below summarize the last two, which are further described in section 5 of the RIA. All results presented below are representative of modeled market conditions in the model year 2035, when the plants will have implemented changes to meet the revised ELGs.

a. Impacts on Existing Steam Electric Power Plants

The EPA used IPM results for 2035 to assess the potential impact of the final rule on existing EGUs at steam electric power plants. The purpose of this analysis is to assess any fleetwide changes from baseline impacts on EGUs at steam electric plants. Table VIII–2 of this preamble reports estimated results for existing EGUs at steam electric power plants, as a group. EPA looked at the following metrics: (1) incremental early retirements and capacity closures, calculated as the difference between capacity under the regulatory option and capacity under the baseline; (2) incremental capacity closures as a percentage of baseline capacity; (3) changes in electricity generation from plants subject to the ELGs; (4) changes in variable production costs per MWh, calculated as the sum of total fuel and variable O&M costs divided by net generation; and (5) changes in annual costs (fuel, variable O&M, fixed O&M, and capital). Items (1) and (2) provide important insight for determining the economic achievability of the ELG rule. Note that changes in electricity generation at steam electric power plants presented in table VIII–2 are attributable both to changes in retirements and changes in capacity utilization at operating EGUs and plants.

Table VIII-2. Estimated Impact of the Final Rule (Option B) on Steam Electric Power Plants as a Group in the Year 2035

Metric	Baseline Value	Change Attributable to the Final Rule as Compared to the Baseline	
		Value	Percent
Total capacity (MW)	220,237	-5,782	-2.6%
Early retirement or closure (MW)	104,544	5,782	5.5%
Early retirement or closure (number of plants)	78	5	6.4%
Total generation (GWh)	789,529	-23,579	-3.0%
Average variable production cost (2023$/MWh)	$20.18	-$0.21	-1.1%
Annual cost (million 2023$)	$28,580	-$840	-2.9%

MW = megawatt; MWh = megawatt-hour; GWh = gigawatt-hour = 1,000 MWh

Under the final rule, generation at steam electric power plants is projected to decrease by 23,579 GWh (3.0 percent) nationally when compared to baseline. IPM projects a net decline in total steam electric capacity by 5,782 MW (approximately 2.6 percent of total baseline steam electric capacity) due to early retirement attributable to this final rule. Five additional plants are projected to retire early under the final rule when compared to baseline. These incremental early retirements represent a 6.4 percent increase relative to projected baseline plant retirements, but only represent 0.7 percent of the total 688 steam electric power plants modeled in IPM. See section 5.2.2.2 in the RIA for details.

These findings suggest that the final rule can be expected to have small economic consequences for steam electric power plants as a group. Option B would affect the operating status of very few steam electric power plants, with five projected additional plant closures (including one plant that was not estimated to incur costs under Option B).

b. Impacts on Individual Plants Incurring Costs

To assess potential plant-level effects, the EPA also analyzed plant-specific changes attributable to the final rule for the following metrics: (1) capacity utilization (defined as annual generation (in MWh) divided by the product of capacity (MW) and 8,760 hours), (2) electricity generation, and (3) variable production costs per MWh, defined as variable O&M cost plus fuel cost divided by net generation. The analysis of changes in individual plants is detailed in section 5 of the RIA. The results indicate that most plants would experience only slight effects—*i.e.,* no change or a reduction/increase of less than one percent. Across the full set of steam electric power plants modeled, 36 plants would incur a reduction in generation of at least one percent; 17 of these plants are also estimated to incur a reduction in capacity utilization of at least one percent. At the same time, 21 plants would increase generation by at least one percent, and 10 plants see their capacity utilization increase by at least one percent. Of the subset of 35

steam electric power plants that were estimated to incur costs under the final rule (Option B), four plants would incur a decrease in generation, whereas four plants would see either no change or an increase in generation. Moreover, 13 plants for which the EPA estimated costs are projected to close in the baseline scenario, and four additional plants are projected to close under the final rule (Option B).

IX. Pollutant Loadings

In developing ELGs, the EPA typically evaluates the pollutant loading reductions of the final rule to assess the impacts of the compliance requirements on discharges from the whole industry. The EPA took the same approach to the one described above for plant-specific costs for estimating pollutant reductions associated with this rule. That is, the EPA compared the values to a baseline that reflects implementation of existing environmental regulations, including the 2020 rule for FGD wastewater and BA transport water.

The general methodology that the EPA used to calculate pollutant loadings is the same as that described in the 2020 rule. The EPA first estimated—on an annual, per plant basis—the pollutant discharge load associated with the technology bases evaluated for plants to comply with the 2020 rule requirements for FGD wastewater and BA transport water, accounting for the current or planned conditions at each plant. For CRL and legacy wastewater, the EPA estimated the pollutant discharge load associated with current discharges. For all wastestreams, the EPA similarly estimated plant-specific post-compliance pollutant loadings as the load associated with the technology bases for plants to comply with the effluent limitations in this rule. The EPA then calculated the changes in pollutant loadings at a particular plant as the sum of the differences between the estimated baseline and post-compliance discharge loadings for each applicable wastestream.

For plants that discharge indirectly to POTWs, the EPA adjusted the baseline and option loadings to account for pollutant removals expected from POTWs. These adjusted pollutant loadings for indirect dischargers therefore reflect the resulting discharges to receiving waters. For details on the methodology the EPA used to calculate pollutant loading reductions, see section 6 of the TDD.

A. FGD Wastewater

For FGD wastewater, the EPA continued to use the average pollutant effluent concentration with plant-specific discharge flow rates to estimate the mass pollutant discharge per plant for the baseline and the final rule. EPA used data compiled for the 2015 and 2020 rules as the initial basis for estimating discharge flow rates and updated the data to reflect retirements or other relevant changes in operation. As in the 2020 rule, the EPA also accounted for increased rates of recycle through the scrubber that would affect the discharge flow.

The EPA assigned pollutant concentrations for each analyte based on the operation of a treatment system designed to comply with baseline or the final rule. The EPA used data compiled for the 2020 rule to characterize FGD chemical precipitation plus LRTR effluent and chemical precipitation plus membrane filtration effluent. In addition, the EPA used data provided by industry and other stakeholders during the 2020 rule and 2023 proposed rule, as described in section IV of this preamble, to quantify bromide in FGD wastewater under baseline conditions and the final rule.

B. BA Transport Water

The EPA estimated baseline and post-compliance loadings for the final rule using pollutant concentrations for BA transport water and plant-specific flow rates. The EPA used data compiled for the 2020 rule as the basis for estimating BA transport water discharge flows and updated the data set to reflect retirements and other relevant changes in operation (*e.g.,* ash handling conversions, fuel conversions) that have occurred since collecting the 2020 rule data. Under the baseline, which reflects the 2020 rule requirement for the high recycle rate technology option (or BMP plan in the case of Merrimack Station), the EPA estimated discharge flows associated with the purge from remote MDS operation, based on the generating unit capacity and the volume of the remote MDS. Under the zero-discharge option, the EPA estimated a flow rate of zero.

C. CRL

For CRL, the EPA used the average pollutant effluent concentration with plant-specific discharge flow rates to estimate the mass pollutant discharge per plant for baseline and the final rule. The EPA used data compiled for the 2015 rule as the initial basis for estimating discharge flow rates and updated the data to reflect retirements. The EPA also used utilities' ''CCR Rule Compliance Data and Information'' websites to identify new landfills constructed since 2015 and waste management units that may discharge unmanaged CRL. For new landfills, the EPA used the 2015 methodology to estimate leachate flow proportionate to landfill size, if available, or as the median leachate volume (in gallons per day) calculated from the 2010 steam electric survey. For plants with EGUs no longer burning coal by 2034 (*e.g.,* retired, converted EGUs to natural gas), the EPA adjusted CRL discharge flow rates to account for an expected decrease in CRL volume following the closure of the waste management unit. For discharges of unmanaged CRL, the EPA estimated the volume of leachate-laden groundwater captured from pumping systems that draw down the groundwater elevation along the hydraulically downgradient cross-sectional width of the CCR management unit.

The EPA assigned pollutant concentrations for each analyte based on current operating conditions or treatment in place for the baseline and the operation of a treatment system designed to comply with the final rule. The EPA used data compiled for the 2015 rule, in addition to data gathered as part of this rulemaking (see section VI.A.3 of this preamble), to characterize untreated CRL. Consistent with its methodology for the 2015 rule, the EPA evaluated the new CRL data for use in the untreated CRL analytical dataset and incorporated the data acceptable for the loadings analyses (see section 6.4 of the TDD for more information). The EPA transferred the average FGD effluent concentrations for chemical precipitation, as it did in the 2015 rule.

D. Legacy Wastewater

The EPA estimated baseline and post-compliance loadings for the final rule using pollutant concentrations for legacy wastewater and plant-specific flow rates. The EPA used utilities' ''CCR Rule Compliance Data and Information'' websites to estimate the volume and type of CCR and water stored in impoundments. The EPA estimated the volume of impounded water (*i.e.,* decant wastewater) and dewatering wastewater for each impoundment primarily using information from the annual inspection reports. To estimate the flow rate, the EPA divided the total volume of legacy wastewater by the closure duration, specified in utilities' closure plans or estimated based on permit cycles. For surface impoundments where the total wastewater volume was unknown, the EPA used the median total estimated volume of wastewater from the impoundments in its analysis and a closure duration of seven years.

The EPA used 2015 rule surface impoundment effluent concentration

data sets to estimate baseline loadings as each impoundment in the population varies in the CCR material it contains, including FA, BA, combined ash, and FGD wastewater. The EPA transferred the average FGD effluent concentrations for chemical precipitation, as it did with CRL.

E. Summary of Incremental Changes of Pollutant Loadings from the Final Rule

Compared to the 2020 rule (baseline), the final rule results in a reduction of 656 million pounds of pollutants to surface waters annually. The EPA estimates pollutant removals associated with discharges of unmanaged CRL could amount to between 3.62 and 16.4 million pounds annually. See section VII.C.5 of this preamble for more information regarding the subcategory for discharges of unmanaged CRL.

X. Non-Water Quality Environmental Impacts

The elimination or reduction of one form of pollution may create or aggravate other environmental problems. Therefore, sections 304(b) and 306 of the CWA require the EPA to consider non-water quality environmental impacts (including energy requirements) associated with ELGs. Accordingly, the EPA has considered the potential impacts of this rule on air emissions, solid waste generation, and energy consumption. In general, to conduct this analysis, the EPA used the same methodology (with updated data as applicable) as it did for the analyses supporting the 2015 and 2020 rules. The following sections summarize the methodology and results. See section 7 of the supplemental TDD for additional details.

A. Energy Requirements

Steam electric power plants use energy when transporting ash and other solids on or off site, operating wastewater treatment systems (*e.g.,* chemical precipitation, membrane filtration, SDEs), or operating ash handling systems. For this final rule, the EPA considered whether there would be an associated change in the incremental energy requirements compared to the baseline. The EPA estimated the increase in energy usage in MWh for equipment added to the plant systems or in gallons of fuel consumed for transportation/operating equipment and summed the facility-specific estimates to calculate the net change in energy requirements from the baseline for the final rule.

The EPA estimated the amount of energy needed to operate wastewater treatment systems and ash handling systems based on the horsepower ratings of the pumps and other equipment. The EPA also estimated any changes in the fuel consumption associated with transporting solid waste and combustion residuals (*e.g.,* ash) from steam electric power plants to landfills (on- or off-site). The frequency and distance of transport depends on a plant's operation and configuration; specific factors include the volume of waste generated and the availability of either an on-site or off-site nonhazardous landfill and its distance from the plant. Table X–1 of this preamble shows the net change in annual electrical energy usage associated with the final rule compared to the baseline, as well as the net change in annual fuel consumption requirements associated with the final rule compared to the baseline.

Table X-1. Estimated Incremental Change in Energy Requirements Associated with the Final Rule Compared to the Baseline

Non-Water Quality Environmental Impact	Energy Use Associated with Final Rule
Electrical energy usage (MWh)	309,000
Fuel (thousand gallons)	116

The EPA estimates that energy use associated with discharges of unmanaged CRL could amount to as much as 280,000 MWh and 442 thousand gallons of fuel annually. See section VII.C.5 of this preamble for more information regarding the subcategory for discharges of unmanaged CRL.

B. Air Pollution

The final rule is expected to affect air pollution through three main mechanisms: (1) changes in auxiliary electricity use by steam electric power plants due to the need to operate wastewater treatment, ash handling, and other systems for compliance with regulatory requirements; (2) changes in transportation-related emissions due to the trucking of CCR waste to landfills; and (3) the change in the profile of electricity generation due to regulatory requirements. This section discusses air emission changes associated with the first two mechanisms and presents the corresponding estimated net changes in air emissions. See section XII.B.3 of this preamble for additional discussion of the third mechanism.

Steam electric power plants generate air emissions from operating transport vehicles, such as dump trucks, which release criteria air pollutants and GHGs. A decrease in energy use or vehicle operation would result in decreased air pollution.

The final rule is projected to result in changes in electrical energy compared to the baseline. To estimate the net air emissions associated with these changes, the EPA combined the energy usage estimates with air emission factors associated with electricity production to calculate air emissions associated with the incremental energy requirements. The EPA estimated NO_X, sulfur dioxide (SO_2), and CO_2 emissions using plant- or NERC-specific emission factors (tons/MWh) obtained from IPM for run year 2035.

To estimate net air emissions changes in the operation of transport vehicles, the EPA used the MOVES4.0 model to identify air emission factors (tons/mile) for the air pollutants of interest. The EPA estimated the annual number of miles that dump trucks moving ash or wastewater treatment solids to on- or off-site landfills would travel for the final rule. The EPA used these estimates to calculate the net change in air emissions for the final rule. Table X–2 of this preamble presents the estimated net change in air emissions associated with auxiliary electricity and transportation for the final rule.

Table X-2. Estimated Net Change in Industry-Level Air Emissions Associated with Auxiliary Electricity and Transportation for the Final Rule Compared to the Baseline

CO_2 (million tons/year)	CH_4 (thousand tons/year)	NO_X (thousand tons/year)	SO_2 (thousand tons/year)
0.14	0.008	0.09	0.12

CH_4 = methane

The EPA estimates that air emissions associated with discharges of unmanaged CRL could amount to as much as 0.048 million tons of CO_2, 0.022 thousand tons of NO_X, and 0.014 thousand tons of SO_2 annually. See section VII.C.5 of this preamble for more information regarding the subcategory for discharges of unmanaged CRL.

The modeled output from IPM predicts that compliance costs attributable to the final rule will result in changes in electricity generation compared to the baseline. These changes in electricity generation are, in turn, predicted to affect the amount of NO_X, SO_2, and CO_2 emissions from steam electric power plants.[182] Table X–3 of this preamble shows a summary of the net change in annual air emissions associated with the final rule for all three mechanisms for the IPM run year 2035. As with costs, the IPM run from the final rule reflects the range of non-water quality environmental impacts associated with the final rule. To provide some perspective on the estimated changes, the EPA compared the estimated change in air emissions to the net amount of air emissions generated in a year by all electric power plants throughout the United States. For a detailed breakout of each of the three sources of air emission changes, see section 7 of the TDD.

Table X-3. Estimated Net Change in Industry-Level Air Emissions Associated with Changes in Auxiliary Electricity, Transportation, and Electricity Generation for the Final Rule Compared to the Baseline in IPM Run Year 2035 and 2020 Emissions

Non-Water Quality Environmental Impact	Change in Emissions	2020 Emissions by Electric Power Generating Industry
CO_2 (million tons/year)	-13	1,650
NO_X (thousand tons/year)	-8.7	1,020
SO_2 (thousand tons/year)	-13	954

C. Solid Waste Generation and Beneficial Use

Steam electric power plants generate solid waste associated with sludge from wastewater treatment systems (*e.g.,* chemical precipitation). The EPA estimates the change in the amount of solids generated under the final rule compared to the baseline as 1.74 million tons per year. The EPA estimates that solid waste generation associated with the treatment of discharges of unmanaged CRL could amount to as much as 4.2 million tons per year.

The EPA also evaluated the potential impacts of diverting FA from current beneficial uses toward encapsulation of membrane filtration brine for disposal in a landfill. According to the latest American Coal Ash Association survey,[183] more than half of the FA generated by coal-fired power plants is being sold for beneficial uses rather than disposed of, and the majority of this beneficially used FA is replacing Portland cement in concrete. This also holds true for the specific facilities currently discharging FGD wastewater and expected to achieve zero discharge under the final rule, as seen by sales of FA in Schedule 8A of the 2021 EIA–923.[184] Summary statistics of the FA beneficial use percentage for these facilities is displayed in table X–4.

[182] The EPA also considered changes in particulate matter (see section XII.B.3 of this preamble). As explained in the BCA section 8.1: ''IPM outputs include estimated CO_2, NO_X, and SO_2 emissions to air from EGUs. The EPA also used IPM outputs to estimate EGU emissions of primary $PM_{2.5}$ based on emission factors described in U.S. EPA (2020c). Specifically, the EPA estimated primary $PM_{2.5}$ emissions by multiplying the generation predicted for each IPM plant type (ultrasupercritical coal without carbon capture and storage, combined cycle, combustion turbine, etc.) by a type-specific empirical emission factor derived from the 2016 National Emissions Inventory and other data sources. The emission factors reflect the fuel type (including coal rank), FGD controls, and state emission limits for each plant type, where applicable.''

[183] Available online at: *https://acaa-usa.org/wp-content/uploads/2022/12/2021-Production-and-Use-Survey-Results-FINAL.pdf.*

[184] Available online at: *https://www.eia.gov/electricity/data/eia923/.*

Table X-4. Percent of FA Sold for Beneficial Use at Facilities Discharging FGD Wastewater

Statistic	FA Percent Sold for Beneficial Use
Min	0%
10th	0%
25th	5%
Median	56%
Mean	48%
75th	83%
90th	93%
Max	100%

The EPA also evaluated FA sales at facilities with CRL discharges that achieve zero discharge under the final rule in Schedule 8A of the 2021 EIA–923.[185] Summary statistics of the FA beneficial use percentage for these facilities are displayed in table X–5.

Table X-5. Percent of FA Sold for Beneficial Use at Facilities Discharging CRL

Statistic	FA Percent Sold for Beneficial Use
Min	0%
10th	0%
25th	0%
Median	23%
Mean	38%
75th	81%
90th	100%
Max	100%

In the CCR rule,[186] the EPA noted that FA replacing Portland cement in concrete would result in significant avoided environmental impacts to energy use, water use, GHG emissions, air emissions, and waterborne wastes.

For the final rule, the EPA is identifying zero-discharge systems as the technology basis for establishing BAT limitations to control pollutants discharged in FGD wastewater and CRL. More specifically, the technology basis for BAT is membrane filtration systems, SDEs, and thermal evaporation systems (see section VII.B of this preamble for more details). For the final rule, the EPA made several updates to its FA analysis, including the following: revising estimates of the amount of FA required for brine encapsulation, revising estimates of the amount of FA available at each plant for brine encapsulation, adding costs for steam electric power plants that would need to purchase additional FA for brine encapsulation, adding costs for disposal of the additional FA, and revising compliance costs by selecting the least costly zero-discharge technology for FGD and/or CRL. See section 5 of the TDD and the EPA's *2024 Steam Electric Supplemental Final Rule: Fly Ash Analysis* memorandum (DCN SE11692) for more details. The EPA found that 17 of the 26 steam electric power plants with FGD wastewater discharges produce enough FA for the EPA's estimated brine encapsulation if they do not sell any FA. Two plants with a FA deficit are expected to retire or undergo fuel conversion prior to December 31, 2034, and will not need to meet zero-discharge requirements under the final rule. The EPA expects that the other seven plants with a FA deficit will install SDEs (or another technology at a lower cost) that will not require the use of FA for encapsulation to meet the final rule requirements. In addition, plants may be able to manage the FA deficit through FGD scrubber purge management and using a different brine encapsulation recipe (*e.g.,* include additional lime).

The EPA also found 61 of the 90 steam electric power plants with CRL discharges produce enough FA for the EPA's estimated brine encapsulation, even after accounting for encapsulation for FGD wastewater treatment. Thirteen of the 29 plants with a FA deficit will retire or undergo fuel conversion prior to December 31, 2034, and will not need to meet zero discharge requirements under the final rule. The EPA expects that the other 16 plants with a FA deficit will either purchase FA (accounted for in the EPA's cost estimates), manage the deficit using approaches described above for FGD wastewater, or install SDEs (or another technology at a lower cost) which will

[185] Available online at: *https://www.eia.gov/electricity/data/eia923/.*

[186] Available online at: *https://www.regulations.gov.* Docket ID: EPA–HQ–RCRA–2009–0640.

not require the use of FA for encapsulation to meet the final rule requirements. See additional discussion in section VII.B.1.a of this preamble.

D. Changes in Water Use

Steam electric power plants typically use water for handling solid waste, including ash, and for operating wet FGD scrubbers. The technology basis for FGD wastewater in the 2020 rule, chemical precipitation plus LRTR, was not expected to reduce or increase the volume of water used. Under this final rule, plants that install a membrane filtration or thermal evaporation system for FGD wastewater treatment are assumed to decrease their water use compared to the baseline by recycling all permeate back into the FGD system, which would avoid the costs of pumping or treating new makeup water. Therefore, the EPA estimated the reduction in water use resulting from membrane filtration or thermal evaporation treatment as equal to the estimated volume of the permeate stream from the membrane filtration system.

The BA transport technologies associated with the baseline and the final rule for BA transport water eliminate or reduce the volume of water used by wet sluicing BA operating systems. The 2020 rule established limitations based on plants operating a high recycle rate system, allowing up to a 10 percent purge of the total system volume. As part of this rule, the EPA is establishing zero-discharge requirements for BA handling. Thus, for the final rule, the EPA expects to see a decrease in water use for BA handling operations because plants that operate zero discharge BA handling systems are assumed to decrease their water use compared to baseline by recycling all transport water back to the BA handling system, which would avoid the costs of pumping or treating new makeup water. The EPA estimated the reduction in water use resulting from complete recycle as equal to the estimated volume of the percent purge (estimated to be 2 percent).

The EPA does not expect a change in water use associated with the treatment technology considered for the treatment of CRL or legacy wastewater as part of this final rule.

Overall, the EPA estimates that plants would decrease their water use by 5.52 million gallons per day (MGD) compared to the baseline under the final rule.

XI. Environmental Assessment

A. Introduction

The EPA conducted an environmental assessment for this final rule. The Agency reviewed available literature on the documented environmental and human health effects of the pollutants discharged in steam electric power plant FGD wastewater, BA transport water, CRL, and legacy wastewater. The EPA conducted modeling to determine the impacts of pollutant discharges from the plants that are regulated by this final rule. For the reasons described in section VIII of this preamble, the baseline for these analyses appropriately consists of the environmental and human health results of achieving the 2020 rule requirements (the same baseline the EPA used to evaluate costs, benefits, and pollutant loadings). Under this assessment, the EPA compared the change in impacts associated with the final rule to those projected under the baseline.

The EA presents information from the EPA's review of the scientific literature and documented cases of impacts of pollutants discharged in steam electric power plant wastewater on human health and the environment, as well as a description of EPA's modeling methodology and results. The EA contains information on literature that the EPA has reviewed since the 2020 rule, updates to the environmental assessment analyses, and modeling results for the final rule. The 2015 EA (EPA–821–R–15–006) and 2020 EA (EPA 821–R–20–002) provide information from the EPA's earlier review of the scientific literature and of documented cases of the impacts on human health and the environment associated with the wider range of steam electric power plant wastewater discharges addressed in the 2015 rule, as well as a full description of the EPA's modeling methodology.

Current scientific literature indicates that untreated steam electric power plant wastewaters, such as FGD wastewater, BA transport water, CRL, and legacy wastewater, contain large amounts of a wide range of pollutants, some of which are toxic and bioaccumulative and cause detrimental environmental and human health impacts. For additional information, see section 2 of the EA. The EPA also considered environmental and human health effects associated with changes in air emissions, solid waste generation, and water withdrawals. sections X and XII of this preamble discuss these effects.

B. Updates to the Environmental Assessment Methodology

For this rule, the EPA used the steady-state, national-scale immediate receiving water (IRW) model to evaluate the direct and indirect discharges from steam electric power plants. This model was also used for the 2015 and 2020 ELG rules and 2015 CCR rule. The model focused on impacts within the immediate surface waters where discharges occurred (defined as the closest segments of approximately 0.25 miles to five miles long). The EPA also modeled receiving water concentrations downstream from steam electric power plant discharges using a downstream fate and transport model (*see* section XII). For this final rule, the Agency updated pollutant-specific benchmarks based on revised guidance and standards. The environmental assessment also incorporates changes to the industry profile outlined in section V of this preamble.

C. Outputs From the Environmental Assessment

Based on comparisons to the baseline, the EPA estimated environmental and ecological changes associated with the changes in pollutant loadings expected under the final rule. These environmental and ecological changes include changes in impacts to wildlife and humans. More specifically, the environmental assessment evaluated changes in: (1) surface water quality, (2) impacts to wildlife, (3) number of receiving waters with potential human health cancer risks, (4) number of receiving waters with potential to cause noncancer human health effects, and (5) metal and nutrient discharges to sensitive waters (*e.g.,* CWA section 303(d) impaired waters).[187] The EPA also evaluated other unqantified environmental changes (*e.g.,* ground water quality and attractive nuisances), as well as further impacts as described in section XII.

As described in the EA, the EPA focused its quantitative analyses on the changes in environmental and human health impacts associated with exposure to toxic, bioaccumulative pollutants via the surface water pathway. The EPA modeled changes levels of toxic, bioaccumulative pollutants in

[187] For the proposed rule, the EPA evaluated potential cumulative impacts (joint toxic action) based on interaction profiles (*Supplemental Environmental Assessment for the Proposed Revisions to the Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* (EPA–821–R–23–004). DCN SE10328). EPA did not receive any comment on the analysis and provides a qualitative summary in the EA for the final rule based on the previous analysis.

discharges of FGD wastewater, BA transport water, CRL, and legacy wastewater into rivers, streams, and lakes, including reservoirs. The EPA also addressed environmental impacts from nutrients in the EA, as well as in a separate analysis in section XII of this preamble.

The environmental assessment concentrates on impacts to aquatic life based on changes in surface water quality; impacts to aquatic life based on changes in sediment quality in surface waters; impacts to wildlife from consumption of contaminated aquatic organisms; and impacts to human health from consumption of contaminated fish and water. The EA discusses, with quantified results, the estimated environmental improvements within the immediate receiving waters due to the pollutant loading reductions associated with the final rule compared to the 2020 rule.

XII. Benefits Analysis

This section summarizes the national environmental benefits due to changes in steam electric power plant discharges. The BCA report provides additional details on the benefits methodologies and analyses. The analysis methodology for quantified benefits is generally the same that EPA used for the 2015 and 2020 rule*s,* but with revised inputs and assumptions that reflect updated data and regulatory options. Consistent with the analysis of social costs, the EPA analyzed benefits of changes occurring in 2025 through 2049. The rule benefits are projected to begin accruing when each plant implements the control technologies needed to comply with any applicable BAT effluent limitations or pretreatment standards. As discussed in the BCA, for the purpose of the economic impact and benefit analysis, EPA generally estimates that plants will implement control technologies to meet the applicable rule limitations and standards as their permits are renewed, and no later than December 31, 2029. This schedule recognizes that control technology implementation is likely to be staggered over time across the universe of steam electric power plants. The period of analysis extends to 2049 to capture the estimated life of the compliance technology at any steam electric power plant (20 or more years), starting from the year of technology implementation, which can be as late as 2029. Benefits are annualized over 25 years.

A. Categories of Benefits Analyzed

Table XII–1 of this preamble summarizes benefit categories associated with the final rule. Analyzed benefits fall into four broad categories: (1) human health benefits from surface water quality improvements, (2) ecological conditions and recreational use effects from surface water quality changes, (3) market and productivity benefits, and (4) air-related effects.[188] Within these broad categories, the EPA was able to assess the benefits of the final rule with varying degrees of completeness and rigor. Where possible, the EPA quantified the expected changes in effects and estimated monetary values. However, data limitations, modeling limitations, and gaps in the understanding of how society values certain environmental changes prevented the EPA from quantifying and/or monetizing some benefit categories.

The following section summarizes the EPA's analysis of the benefit categories the Agency was able to partially quantify and/or monetize to various degrees (identified in the columns of table XII–1 of this preamble). The EPA reviewed comments received in response to the proposed rule on the extent to which partially quantified benefits (*e.g.,* some health endpoints) or unquantified benefits (*e.g.,* cost savings to drinking water systems) could be more fully quantified and/or monetized. In the final rule analysis, the Agency revised its approach to quantify and monetize additional benefits, including those associated with avoided cardiovascular disease premature mortality from reduced lead exposure and those associated with avoided drinking water treatment costs. The final rule also affects additional benefit categories that the Agency was not able to quantify or monetize at all. The BCA further describes some of these important nonmonetized benefits. The EPA notes that all human health and environmental improvements discussed in the EA also represent benefits of the final rule (whether quantified or unquantified).

[188] Consistent with Office of Management and Budget Circular A–4 (2023), EPA appropriately considers additional benefits of this action (*e.g.,* air benefits). Circular A–4 (2023) states:

> Your analysis should look beyond the obvious benefits and costs of your regulation and consider any important additional benefits or costs, when feasible. . . . These sorts of effects sometimes are referred to by other names: for example, indirect or ancillary benefits and costs, co-benefits, or countervailing risks.

Table XII-1. Summary of Estimated Benefits Categories

Benefit Category	Quantified and Monetized	Quantified, but Not Monetized	Neither Quantified nor Monetized (Analyzed Qualitatively)
Human Health Benefits from Surface Water Quality Improvements			
Changes in incidence of bladder cancer from exposure to total trihalomethanes (TTHM) in drinking water	✓		
Changes in incidence of cancer from arsenic exposure via consumption of self-caught fish		✓	
Changes in incidence of cardiovascular disease from lead exposure via consumption of self-caught fish	✓		
Changes in incidence of other cancer and noncancer adverse health effects (*e.g.*, reproductive, immunological, neurological, circulatory, or respiratory toxicity) due to exposure to arsenic, lead, cadmium, and other toxics from consumption of self-caught fish or drinking water		✓	
Changes in IQ loss in children from lead exposure via consumption of self-caught fish, including changes in specialized education needs for children from lead exposure via consumption of self-caught fish	✓		
Changes in IQ loss in infants from *in utero* mercury exposure via maternal consumption of self-caught fish	✓		
Changes in health hazards from exposure to pollutants in waters used recreationally (*e.g.*, swimming)		✓	
Ecological Condition and Recreational Use Effects from Surface Water Quality Changes			
Benefits from changes in surface water quality, including: aquatic and wildlife habitat; water-based recreation, including fishing, swimming, boating, and near-water activities; aesthetic benefits, such as enhancement of adjoining site amenities (*e.g.*, residing, working, traveling, and owning property near the water);[a] and nonuse value (existence, option, and bequest value from improved ecosystem health)[a]	✓		
Benefits from protection of threatened and endangered species		✓	
Changes in sediment contamination			✓
Market and Productivity Benefits			
Changes in water treatment costs for municipal drinking water	✓		
Changes in water treatment costs for irrigation water and industrial process			✓
Changes in commercial fisheries yields			✓
Changes in tourism and participation in water-based recreation			✓
Changes in property values from water quality changes			✓
Changes in maintenance dredging of navigational waterways and reservoirs due to changes in sediment discharges	✓		
Air-Related Effects			
Human health benefits from changes in morbidity and mortality from exposure to NO_X, SO_2, and $PM_{2.5}$	✓		
Avoided climate change impacts from GHG emissions	✓		

[a] Some, although not necessarily all, of these values are implicit in the total willingness to pay (WTP) for water quality improvements.

B. Quantification and Monetization of Benefits

1. Human Health Effects From Surface Water Quality Changes

Changes in pollutant discharges from steam electric power plants affect human health in multiple ways. Exposure to pollutants in steam electric power plant discharges via consumption of fish from affected waters can cause a wide variety of adverse health effects, including cancer, kidney damage, nervous system damage, fatigue, irritability, liver damage, circulatory system damage, vomiting, diarrhea, and IQ loss. Exposure to drinking water containing brominated disinfection byproducts can cause adverse health effects such as bladder cancer and reproductive and fetal development issues. Because the final rule will reduce discharges of steam electric pollutants into waterbodies that directly receive or are downstream from these discharges, it may reduce the incidence of associated illnesses, even if by relatively small amounts.

Due to data limitations and uncertainties, the EPA can only monetize a subset of the health benefits associated with changes in pollutant discharges from steam electric power plants resulting from the final rule. The EPA estimated changes in the number of individuals experiencing adverse human health effects in the populations exposed to steam electric discharges and/or altered exposure levels and valued these changes using different monetization methods for different benefit endpoints.

The EPA estimated changes in health risks from the consumption of contaminated fish from waterbodies within 50 miles of households. The EPA used Census block group population data and region-specific average fishing rates to estimate the exposed population. The EPA used cohort-specific fish consumption rates and waterbody-specific fish tissue concentration estimates to calculate potential exposure to steam electric pollutants in recreational fishers' households. Cohorts were defined by age, sex, race/ethnicity, and fishing mode (recreational or subsistence). EPA used these data to quantify and monetize changes in three categories of human health effects, which are further detailed in the BCA Report: (1) reduction in IQ loss from lead exposure via fish consumption in children aged zero to seven, (2) reduction in cardiovascular disease premature mortality from lead exposure via fish consumption and (3) reduction in *in utero* mercury exposure via maternal fish consumption and associated IQ loss. The EPA also analyzed the reduction in the incidence of skin cancer from arsenic exposure via fish consumption but found negligible changes and therefore did not monetize the associated benefits.

EPA estimated the annualized human health benefits of surface water quality changes of the final rule and the resultant reduction in pollutant exposure from consuming self-caught fish to range between $2.18 million and $2.45 million using a two percent discount rate. Most of these monetized benefits are associated with the changes in mercury exposure. section 5 of the BCA provides additional detail on the methodology.

The EPA also estimated changes in bladder cancer incidence from the use and consumption of drinking water with lower levels of total trihalomethanes (TTHMs) resulting from reductions in bromide discharges under the final rule. The EPA estimated changes in cancer risks within populations served by drinking water treatment plants with intakes on surface waters affected by bromide discharges from steam electric power plants. The EPA used the service area of each public water system to estimate and characterize the exposed population. The EPA modeled changes in waterbody-specific bromide concentrations and changes in facility-specific TTHM concentrations at drinking water treatment facilities to calculate potential reductions in TTHM exposure and associated health benefits. To value changes in the economic burden associated with cancer morbidity, the EPA used base WTP estimates from Bosworth, Cameron, and DeShazo (2009) for colon/bladder cancer. To value changes in excess mortality from bladder cancer, the EPA used the estimated value of a statistical life (VSL) for each year in the period of analysis (from $13.54 million per death in 2025 to $16.36 million per death in 2049).

The final rule is estimated to result in a total of 98 avoided cancer cases and 28 avoided premature excess deaths by reducing TTHM exposure during the period 2025–2049. The associated annualized benefits are $13.4 million using a two percent discount rate.

The formation of TTHM in a particular water treatment system is a function of several site-specific factors, including chlorine, bromine, and organic carbon concentrations; and temperature and pH of the water; and the system residence time. The EPA did not collect site-specific information on these factors at each potentially affected drinking water treatment facility. Instead, the EPA's analysis only addresses the estimated site-specific changes in bromides. The EPA used the national relationship between changes in TTHM exposure and changes in incidence of bladder cancer modeled by Regli et al. (2015) [189] and Weisman et al. (2022).[190] Thus, while the national changes in TTHM exposure and bladder cancer incidence are the EPA's best estimate given estimated changes in bromide, the EPA cautions that estimates for any specific drinking water treatment facility could be over- or underestimated. Additional details on this analysis are provided in section 4 of the BCA.

2. Ecological Condition and Recreational Use Effects from Changes in Surface Water Quality Improvements

The EPA evaluated whether the final rule would alter aquatic habitats and human welfare by reducing concentrations of harmful pollutants such as arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, zinc, nitrogen, phosphorus, and suspended sediment relative to baseline. These changes may affect the usability of some recreational waters relative to baseline, thereby affecting recreational users. Changes in pollutant loadings can also change the attractiveness of recreational waters by making recreational trips more or less enjoyable. The final rule may also change nonuse values stemming from bequest, altruism, and existence motivations. Individuals may value water quality maintenance, ecosystem protection, and healthy species populations independent of any use of those attributes.

The EPA uses a water quality index (WQI) to translate water quality measurements, gathered for multiple parameters that indicate various aspects of water quality, into a single numerical indicator. The indicator reflects achievement of quality consistent with the suitability for certain uses. The WQI includes seven parameters: dissolved oxygen, biochemical oxygen demand, fecal coliform, total nitrogen, total phosphorus, TSS, and one aggregate

(2015). *Estimating Potential Increased Bladder Cancer Risk Due to Increased Bromide Concentrations in Sources of Disinfected Drinking Waters.* Environmental Science & Technology, 49(22), 13094–13102. Available online at: *https://doi.org/10.1021/acs.est.5b03547.*

[190] Weisman, R., Heinrich, A., Letkiewicz, F., Messner, M., Studer, K., Wang, L., . . . Regli, S. (2022). *Estimating National Exposures and Potential Bladder Cancer Cases Associated with Chlorination DBPs in U.S. Drinking Water.* Environmental Health Perspectives, 130:8, 087002–1–087002–10. Available online at: *https://ehp.niehs.nih.gov/doi/full/10.1289/EHP9985.*

subindex for toxics. The EPA modeled changes in four of these parameters and held the remaining parameters (dissolved oxygen, biochemical oxygen demand, and fecal coliform) constant for the purposes of this analysis.

The EPA estimated the change in monetized benefit values using an updated version of the meta-regressions of surface water valuation studies used in the benefit analyses of the 2015 and 2020 rules. The meta-regressions quantify average household WTP for incremental improvements in surface water quality. section 6 of the BCA provides additional detail on the valuation methodology.

An estimated 58.9 million households reside in Census block groups that are within 100 miles of reaches that are affected by the final rule.[191] The central tendency estimate of the total WTP for water quality changes associated with reductions in metal pollutants (arsenic, cadmium, chromium, copper, lead, mercury, zinc, and nickel), nonmetal pollutants (selenium), nutrient pollutants (phosphorus and nitrogen under the final rule is $1.24 million using a two percent discount rate. The average WTP per household is $0.02 per year.

3. Changes in Air-Quality-Related Effects

The EPA expects the final rule to affect air pollution through three main mechanisms: (1) changes in auxiliary electricity use by steam electric facilities due to the need to operate wastewater treatment, ash handling, and other systems for compliance with the final rule; (2) changes in transportation-related air emissions due to changes in the trucking of CCR waste to landfills; and (3) changes in the electricity generation profile due to increases in wastewater treatment costs compared to baseline and the resulting changes in EGU relative operating costs.

Changes in the electricity generation profile can increase or decrease air pollutant emissions because emission factors vary for different types of EGUs. For this analysis, the changes in air emissions are based on the change in dispatch of EGUs as projected by IPM after overlaying the costs of complying with the final rule onto EGUs' production costs. As discussed in section VIII of this preamble, the IPM analysis accounts for the effects of other regulations on the electric power sector, as well as provisions of the IRA.

The EPA evaluated potential effects resulting from net changes in air emissions of five pollutants: CO_2, CH_4, NO_X, SO_2, and primary $PM_{2.5}$. CO_2 and CH_4 are key GHGs linked to a wide range of climate-related effects. CO_2 is also the main GHG emitted from coal power plants. NO_X and SO_2 are precursors to $PM_{2.5}$, which are also emitted directly, and NO_X is an ozone precursor. These air pollutants cause a variety of adverse health effects including premature mortality, nonfatal heart attacks, hospital admissions, emergency department visits, upper and lower respiratory symptoms, acute bronchitis, aggravated asthma, lost work and school days, and acute respiratory symptoms.

Table XII–2 of this preamble shows the changes in emissions of CO_2, CH_4, NO_X, SO_2, and primary $PM_{2.5}$ under the final rule relative to the baseline for selected IPM run years. The final rule will result in a net reduction in air emissions of four pollutants, and a small increase in CH_4 emissions due to the increased trucking of CCR waste to landfills. This effect is driven mostly by the estimated changes in the profile of electricity generation, as emission reductions due to shifts in modeled EGU dispatch and energy sources offset relatively small increases in air emissions from increased electricity use and trucking by steam electric power plants.

Table XII-2. Estimated Changes in Air Pollutant Emissions Under the Final Rule Compared to Baseline

Year	CO_2 (Million Short Tons/Year)	CH_4 (Thousand Short Tons/Year)	NO_X (Thousand Short Tons/Year)	SO_2 (Thousand Short Tons/Year)	Primary $PM_{2.5}$ (Thousand Short Tons/Year)
2028	-16.4	0.0042	-8.9	-10.7	-0.63
2030	-10.8	0.0083	-7.3	-2.4	-0.38
2035	-12.6	0.0083	-8.7	-12.5	-0.25
2040	-1.9	0.0083	-3.1	-2.2	-0.16
2045	-1.3	0.0083	-0.6	-0.9	-0.09
2050	-0.6	0.0079	-0.4	-0.7	-0.12

The EPA estimated the monetized value of human health benefits among populations exposed to changes in $PM_{2.5}$ and ozone. The final rule is expected to alter the emissions of primary $PM_{2.5}$, SO_2 and NO_X, which will in turn affect the level of $PM_{2.5}$ and ozone in the atmosphere. Using photochemical modeling, the EPA predicted the change in the annual average $PM_{2.5}$ and summer season ozone across the United States. The EPA next quantified the human health impacts and economic value of these changes in air quality using the environmental Benefits Mapping and Analysis Program—Community Edition.

To estimate the climate benefits associated with changes in CO_2 and CH_4 emissions, the EPA used social cost of greenhouse gas (SC–GHG) estimates specifically, estimates of the social cost of carbon (SC–CO_2) and social cost of methane (SC–CH_4). The SC–GHG is an estimate of the monetary value of the net harm to society associated with emitting a metric ton of the GHG in question into the atmosphere in a given

[191] A reach is a section of a stream or river along which similar hydrologic conditions exist, such as discharge, depth, area, and slope.

year, or the benefit of avoiding those emissions.[192]

To estimate the net climate benefits of CO_2 emission reductions expected from the final rule and disbenefits of increases in CH_4 emissions, the EPA used the SC–GHG estimates presented in the 2023 final rule Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review (U.S. EPA, 2023). These estimates reflect recent advances in the scientific literature on climate change and its economic impacts and incorporate recommendations made by the National Academies (National Academies, 2017). See section 8 of the BCA for more discussion of the SC–GHG values.

Table XII–3 of this preamble shows the annualized climate change, $PM_{2.5}$, and ozone-related human health benefits for the final rule. Climate change benefits are presented for the three near-term Ramsey discount rates used in developing the SC–GHG values, whereas the $PM_{2.5}$ and ozone-related human health benefits are based on long-term ozone exposure mortality risk estimates and with a two percent discount rate. See section 8 of the BCA for benefits based on pooled short-term ozone exposure mortality risk estimates.

Table XII-3. Annualized Benefits of Estimated Changes in Air Pollutant Emissions Under the Final Rule Compared to the Baseline (Millions of 2023$)

SC-GHG Near-term Ramsey Discount Rate	Climate Change Benefits	PM2.5 and Ozone Related Human Health Benefits at 2% Discount Rate[a]	Total
2.5%	$990	$1,600	$2,600
2.0%	$1,600	$1,600	$3,200
1.5%	$2,600	$1,600	$4,200

[a] Reflects long-term ozone exposure mortality risk estimate.

The estimates of monetized benefits shown here do not include several important benefit categories, such as direct exposure to SO_2, NO_X, and HAPs, including mercury and hydrogen chloride. Although the EPA does not have sufficient information or modeling available to provide monetized estimates of changes in exposure to these pollutants for the final rule, the EPA includes a discussion of these unquantified benefits in the BCA. For more information on the benefits analysis, see section 8 of the BCA.

4. Other Quantified and/or Monetized Benefits

a. Changes in Drinking Water Treatment Costs

The final rule will decrease discharges of pollutants that affect the costs of treating drinking water. TSS affects turbidity of source water, which drinking water systems treat by adding chemical coagulants to bond to the sediment particles. Drinking water systems thus accrue incremental costs related to purchases of coagulants as well as costs from disposal of coagulant sediment sludge. In addition, drinking water systems address taste and odor issues linked to excess nutrients (such as nitrogen) and associated eutrophication in source water. The EPA identified drinking water systems whose source waters are likely to see reductions in TSS and total nitrogen under the final rule, then estimated changes in source water concentrations of the pollutants for those systems. The EPA then estimated treatment cost savings associated with reductions in TSS and total nitrogen using a treatment cost elasticity approach (see Price and Heberling (2018) for a review of the literature on drinking water treatment cost elasticities). The EPA estimated cost changes relating to treatment O&M costs alone, assuming no net savings from any capital improvements drinking water systems already made. The EPA did not quantify avoided drinking water treatment costs associated with reductions in pollutants such as phosphorus, halogens, and metals due to uncertainties in the elasticity between source water concentrations of these parameters and drinking water treatment costs, lack of information on baseline concentrations of these pollutants at source water intakes, and the possibility of double-counting treatment cost savings for particular pollutants. The EPA expects that the final rule will provide relatively small annualized benefits from reductions in nitrogen and total suspended solids in the form of drinking water treatment cost savings of $460,000 to $552,000 per year, calculated using a 2 percent discount rate.

b. Changes in Dredging Costs

The final rule affects discharge loadings of various categories of pollutants, including TSS. As a result, the final rule is expected to change the rate of sediment deposition in affected waterbodies, including navigable waterways and reservoirs that require dredging for maintenance. The EPA estimated very small benefits from changes in sedimentation and associated maintenance dredging costs in reaches and reservoirs affected by steam electric power plant discharges. section 9 of the BCA provides additional detail on the methodology.

c. Benefits to Threatened and Endangered Species

To assess the potential for the final rule to benefit threatened and endangered species (both aquatic and terrestrial) relative to the 2020 ELG baseline, the EPA analyzed the overlap between waters expected to see reductions in wildlife water quality criteria exceedance status under the final rule and the known critical habitat

[192] In principle, the SC–GHG includes the value of all climate change impacts, including (but not limited to) changes in net agricultural productivity, human health effects, property damage from increased flood risk and natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services. The SC–GHG therefore, reflects the societal value of reducing emissions of by one metric ton. The EPA and other Federal agencies began regularly incorporating estimates of SC–CO_2 in their benefit-cost analyses conducted under Executive Order 12866 since 2008, following a Ninth Circuit Court of Appeals remand of a rule for failing to monetize the benefits of reducing CO_2 emissions in a rulemaking process.

locations of high-vulnerability threatened and endangered species. The EPA examined the life history traits of potentially affected threatened and endangered species and categorized the species by potential for population impacts due to surface water quality changes. Section 7 of the BCA provides additional detail on the methodology. The EPA's analysis showed that, of the species categorized as having higher vulnerability to water pollution, 30 have known critical habitats overlap with surface waters affected by steam electric power plant discharges. Improvements under the final rule between 2025 and 2029 are estimated to potentially benefit 10 of these species, whereas improvements projected after 2030 are estimated to benefit 12 species. Principal sources of uncertainty include the specifics of how changes under the final rule will impact threatened and endangered species, exact spatial distribution of the species, and additional species of concern not considered.

C. Total Monetized Benefits

Using the analysis approach described above, the EPA estimated annualized benefits of the final rule for all monetized categories. The final rule has monetized benefits estimated at $3,217 million using a two percent discount rate, as shown in table XII–4.

Table XII-4. Summary of Total Estimated Annualized Monetized Benefits at Two Percent [Millions of 2023$]

Benefit Category	Annualized Benefits (Million 2023$, 2 Percent Discount)
Human Health Effects from Water Quality Changes	
Changes in IQ losses in children from exposure to lead[a]	<$0.01
Changes in cardiovascular disease premature mortality from exposure to lead	$0.16 – $0.43
Changes in IQ losses in children from exposure to mercury	$1.98
Reduced cancer risk from disinfection byproducts in drinking water	$13.37
Ecological Conditions and Recreational Use Changes	
Use and nonuse values for water quality improvements	$1.24
Market and Productivity[a]	
Changes in drinking water treatment costs	$0.46 – $0.55
Changes in dredging costs[a]	<$0.01
Air-Related Effects	
Changes in GHG air emissions[b,c]	$1,600
Changes in human health effects from Changes in NO_X and SO_2 emissions[b]	$1,600
Total	**$3,217**

[a] An annualized benefit of "<$0.01" indicates that the monetary value is greater than $0 but less than $0.01 million.

[b] Values for air-quality related effects are rounded to two significant figures.

[c] Changes in CO_2 and CH_4 emissions monetized using SC-GHG estimates under the 2% near-term Ramsey discount rate. See section XII.B.3 and section 8 in the BCA for benefits monetized using SC-GHG estimates based on 1.5% and 2.5% near-term Ramsey discount rates.

D. Additional Benefits

The monetary value of the final rule's effects on social welfare does not account for all effects of the rule because, as described above, the EPA is currently unable to quantify and/or monetize some categories. The EPA anticipates that the final rule will also generate important unquantified benefits, including but not limited to:

- health benefits to over 30 million people who, due to reductions in PWS-level arsenic, lead, and thallium concentrations, will experience reductions in unmonetized cancer and non-cancer effects from exposure to toxic pollutants from consumption of fish or drinking water;
- unquantified and unmonetized averted IQ losses and educational effects from childhood lead exposure and *in-utero* mercury exposure from fish consumption by households that do not engage in recreational or subsistence fishing;
- improved habitat conditions for plants, invertebrates, fish, amphibians, and the wildlife that prey on aquatic organisms;
- enhanced ecosystem productivity and health, including reduced toxic discharges into habitats of over 100 high-vulnerability threatened and endangered species;

- additional changes to water treatment costs for drinking water, irrigation, and agricultural uses;
- changes in fisheries yield and harvest quality from aquatic habitat changes;
- changes in health hazards from recreational exposures; and
- groundwater quality impacts.

While some health benefits and WTP for water quality improvements have been partially quantified and/or monetized, those estimates may not fully capture all important water quality-related benefits. Although the following quantifications cannot necessarily be combined with other monetized effects, another way to characterize the benefits is that the final rule is expected to result in a 53 percent reduction in chronic exceedances and a 33 percent reduction in acute exceedances of the national recommended water quality criteria. It is also expected to result in a reduction of up to a 63 percent in the number of immediate receiving water reaches with ambient concentrations exceeding human health criteria for at least one pollutant.

The BCA discusses changes in these potentially important effects qualitatively, indicating their potential magnitude where possible.

XIII. Environmental Justice Impacts

Consistent with the EPA's commitment to advancing environmental justice (EJ) in the Agency's actions, the Agency has analyzed the impacts of this action on communities with EJ concerns and sought input and feedback from stakeholders representing these communities. The EPA has prepared this analysis to implement the recommendations of the Agency's EJ Technical Guidance.[193] For ELG rulemakings, an analysis of EJ impacts is typically conducted as part of the BCA alongside other non-statutorily required analyses such as monetized benefits. However, for this action, the analysis was placed in a standalone EJA document to provide the public with a more detailed discussion of the potential EJ impacts of this action and the initial outreach to communities with potential EJ impacts. The analysis does not form a basis or rationale for any of the actions the EPA is taking in this rulemaking.

Overall, EPA's EJ analysis showed the final rule will reduce differential baseline exposures to pollutants in wastewater and resulting human impacts for population groups of concern when considering potential EJ implications of this regulatory action. E.O. 12898 identifies a number of population groups of concern including minority populations, low-income populations, and Indigenous peoples in the United States and its territories and possessions. In this particular analysis, improvements to water quality, wildlife, and human health resulting from reductions in pollutants in surface water will be distributed more among low-income populations and some people of color under some or all of the regulatory options for this final rule.

Reductions in TTHM concentrations in drinking water and resulting reductions in bladder cancer cases and excess bladder cancer deaths will also be distributed more among communities with EJ concerns under the final rule. Remaining exposures, impacts, and benefits analyzed are small enough that EPA could not conclude whether changes in baseline disproportionate impacts would occur, such as reductions in avoided IQ point losses among children exposed to lead from fish consumption which were estimated to be a total of one avoided IQ point loss across approximately 1.5 million children.

Although the changes in GHGs attributable to the final rule are small compared to worldwide emissions, findings from peer-reviewed evaluations demonstrate that actions that reduce GHG emissions are also likely to reduce climate-related impacts on communities with EJ concerns.

At the national level, upper bound average compliance costs per residential households under the final rule are $3.14 per year. Costs of the final rule in terms of electricity price increases among residential households may impact low-income households and households of color more relative to all households as low-income households and households of color tend to spend a greater proportion of their income on energy expenditures. Despite this, the potential price increases under the upper bound cost scenario represent between less than 0.1 percent and 0.2 percent of energy expenditures for all income, race groups, and income quintiles, and therefore the EPA does not expect costs to have a substantial impact on low-income households and households of color. The methodology and findings of the EJA are described in further detail below.

A. Literature Review

The EPA conducted a literature review to identify academic research and articles on EJ concerns related to coal-fired power plants. The EPA identified eight papers that focused on coal-fired power plants in the United States that were directly relevant to this final rule. The findings of these papers suggest that coal-fired power plants tend to be in poor communities, Indigenous communities, and communities of color. Toomey (2013) reported that 78 percent of African Americans in the United States live within a 30-mile radius of a coal-fired power plant.[194] Impacts discussed in the reports included adverse health impacts resulting from air pollutants (*e.g.,* SO_2, NO_X, $PM_{2.5}$) for those living in proximity to coal-fired power plants, climate justice issues resulting from GHG emissions, and risk of impoundment failures for populations living in proximity to coal waste surface impoundments where coal is mined.[195] [196] [197] All these impacts were found in one or more papers to differentially impact poor communities, Indigenous communities, and communities of color. For further discussion of the literature review, see section 2 of the EJA.

B. Proximity Analysis

The EPA performed proximity analyses to identify and characterize the communities that are expected to be impacted by discharges from steam electric plants via relevant exposure pathways. First, the EPA used geographic information system (GIS) software to map out 1- and 3-mile buffers around each facility. A buffer is a zone that extends a specified distance in every direction from a point on a map. The EPA then assessed potential air impacts within those zones. The 1- and 3-mile distances were chosen to be consistent with the buffer distances

[197] NAACP (National Association for the Advancement of Colored People). 2012. *Coal Blooded: Putting Profits Before People.* Available online at: *https://www.naacp.org/resources/coal-blooded-putting-profits-people.*

used by the Office of Air and Radiation when performing screening analyses for communities surrounding industrial sources that are expected to be exposed to air emissions (U.S. EPA, 2021a).[198] These are the distances at which air pollution concentrations will be highest before the plume disperses, and an analysis of air impacts with these zones may capture other localized impacts such as air emissions from truck traffic due to changes in activities at steam electric power plants.

Second, the EPA assessed potential impacts in downstream surface waterbodies using 1-, 3-, 50-, and 100-mile buffer distances around each waterbody segment downstream of the initial common identifiers (COMIDs) identified for each effluent discharge. These buffers distances were used to capture impacts to local populations as well as impacts to those traveling to fish or recreate in downstream waterbodies (Sohngen et al, 2015; Sea Grant—Illinois-Indiana, 2018; Viscusi et al., 2008).[199] [200]

Finally, the EPA assessed potential drinking water impacts using information about the service area of PWSs with surface intakes downstream from steam electric power plants.

Overall, the EPA found that 90,000 people live within 1 mile of at least one of the 112 steam electric power plants expected to be affected by the final rule and modeled for the benefits analysis, and about 790,000 people live within 3 miles. When comparing the demographic characteristics of these populations to national demographic characteristics, small exceedances of the national average are observed. Of the population living within 3 miles of a steam electric power plant, the percentage of people identified as low-income is 0.1 percent greater than the national average, and the percent of the population identified as American Indian/Alaska Native and Other living within one and three miles of a steam electric power plant is one percent greater than the national average. The results show relatively greater proportions of people who identify as Asian (non-Hispanic), people who identify as American Indian or Alaska Native (non-Hispanic), and people who identify as Hispanic or Latino.

C. Community Outreach

During the public comment period, the EPA received a comment requesting that the Agency conduct additional outreach with the nine communities identified for outreach during the 2023 proposal. Commenters urged the EPA to not extend the written public comment period and to move forward expeditiously to finalize the proposed rule. Given the time required to plan and conduct the community outreach for the proposed rule (meetings with five of the nine communities were held between May and September 2022, with planning starting in February 2022), the EPA determined that it could not hold additional outreach meetings with all nine communities and also finalize the proposed rule expeditiously, as requested by the commenters. Therefore, the EPA did not hold additional outreach meetings for the final rule. The EPA presents the feedback received from the community outreach meetings conducted for the proposed rule in section 7.5 of the 2023 EJA,[201] which the EPA took into consideration for the final rule.

For the proposed rule, the EPA conducted initial outreach in all nine communities to local environmental and community development organizations, local government agencies, and individual community members involved in community organizing. Between May and September of 2022, EPA was able to meet with community members in five of the identified communities either virtually or in a hybrid format with some in-person participation. The EPA was not able to hold a virtual or hybrid meeting with the remaining four communities. For detailed information of the EPA's community selection methodology, the communities selected, and the structure of the community meetings, see section 7.4 of the 2023 EJA.[202]

The EPA received a broad range of input from individuals in these communities on regulatory preferences, environmental concerns, human health and safety concerns, economic impacts, cultural/spiritual impacts, and ongoing communication/public outreach. Community members also expressed interest in other EPA actions. Two broad themes were conveyed consistently across communities. First, community members identified several perceived harmful impacts from steam electric power plants and conveyed their desire for more stringent regulations to reduce these harmful impacts. Second, community members expressed that more transparency and communication is needed to overcome their decreasing trust in the regulated steam electric power plants and state regulatory agencies and their feelings of skepticism that their communities will be protected from these harmful impacts. In addition to these broad themes, commenters also raised concerns unique to each community. For example, members of the Navajo Nation discussed with the EPA the spiritual and cultural impacts to the community from pollution related to steam electric power plants. In Jacksonville, Florida, community members raised concerns about tidal flows that carry pollution upstream and about storm surges that occur during extreme weather events, causing additional challenges in their community. More detailed summaries of these meetings are presented in section X of the EJA.

The EPA considered all feedback received in these outreach meetings, including feedback on the stringency of potential new regulations and negative impacts experienced as a result of steam electric discharges. The final rule will result in more stringent limitations that will further reduce negative impacts associated with steam electric discharges. The EPA also considered feedback expressing the desire for increased transparency and communication. As discussed in section XIV.C.6, the EPA requiring posting of required reports to a publicly available website to improve transparency. In addition, the EPA recently added a new feature called ECHO Notify to the Enforcement and Compliance History Online (ECHO) website. ECHO Notify provides weekly email notifications of changes to enforcement and compliance data in ECHO. Notifications are tailored to the geographic locations, facility IDs, and notification options that users select. The EPA encourages interested community members to sign up for these alerts. Further information is available at *https://www.echo.epa.gov/tools/echo-notify*. The EPA also encourages individual facilities to work with local communities to foster trust and communication, for example, through text alert systems.

D. Distribution of Risks

The EPA evaluated the distribution of pollutant loadings, estimated human health, and estimated environmental impacts resulting from polluted air, surface water, and drinking water. The EPA examined these distributions under both baseline and the regulatory options to identify where current conditions and future improvements may have a differential impact on communities with EJ concerns. The following sections discuss the EPA's methodology and findings.

1. Air

The EPA evaluated air quality impacts in terms of changes in warm season maximum daily average 8-hour (MDA8) ozone and average annual $PM_{2.5}$ concentrations, as described in the BCA. The EPA used the results of the analysis to further evaluate the distribution of air—quality impacts in the EJA to determine whether communities with EJ concerns experience disproportionately high exposures to MDA8 ozone and average annual $PM_{2.5}$ under the baseline and Option B.

The results of the EPA's distributional analysis of air quality impacts indicates that, under the baseline, average annual $PM_{2.5}$ and MDA8 ozone exposures are higher among certain communities with EJ concerns. The EPA found higher exposures for some populations, such as American Indian and Alaska Native (non-Hispanic), Asian (non-Hispanic), and Hispanic populations, relative to their relevant comparison groups. While the regulatory analysis estimating changes in average annual $PM_{2.5}$ and MDA8 ozone exposures shows increases and decreases in pollutant emissions across regions of the United States under the final rule, these changes overall are small and do not change the distribution of air-quality impacts observed under the baseline. Therefore, the EPA concludes that the air-quality changes resulting from the final rule are not expected to mitigate or exacerbate distributional disparities present under the baseline. See section 4.2 of the EJA for more information.

2. Surface Water

Using results from the EA and BCA, the EPA evaluated the distribution of pollutant loadings and the environmental and human health effects of wastewater discharges from steam electric power plants into surface waters into immediate receiving waters. The following sections provide an overview of the EPA's methodology and the results of the EPA's distributional analysis.

a. Immediate Receiving Waters

Using results from the EA, the EPA evaluated the distribution of pollutant loadings and the environmental and human health effects of wastewater discharges from steam electric power plants into immediate receiving waters across communities with EJ concerns. To evaluate the distribution of water quality impacts, the EPA used the IRW model to evaluate water quality impacts by calculating annual average total and dissolved pollutant concentrations in the water column and sediment of immediate receiving waters. It then compares these concentrations to specific water quality criteria values—National Recommended Water Quality Criteria (NRWQC) and Maximum Contaminant Levels (MCLs)—to assess potential impacts to wildlife and human health. To evaluate potential impacts to wildlife, the EPA used the IRW model to estimate bioaccumulation of pollutants in fish tissue of trophic level 3 (T3) and trophic level 4 (T4) fish using the annual average pollutant concentrations in the immediate receiving water. Those results were then compared to benchmark values—threshold effect concentration (TEC) and no effect hazard concentration (NEHC)—to evaluate potential impacts on exposed sediment biota and piscivorous wildlife that consume T3 and T4 fish, respectively. The EPA also used estimated fish tissue concentrations to assess human health impacts—non-cancer and cancer risks—to human populations from consuming fish that are caught in contaminated receiving waters. For a more detailed discussion of the IRW Model see the EA. Information on the socioeconomic characteristics of affected communities was gather from the 2017–2021 ACS dataset and was included with the results from the model to evaluate the distribution of impacts (relative to the baseline) under the final rule.

b. Water Quality, Wildlife, and Human Health Impacts

Based on the results of the distributional analyses of water quality, wildlife, and human health impacts, the EPA determined that under the baseline there were distributional disparities among communities with EJ concerns. Disparities were most often observed among populations such as African American (non-Hispanic) or American Indian or Alaska Native (non-Hispanic) populations when comparing the percent of the population affected in communities with immediate receiving waters benchmark exceedances to the national average and to communities with immediate receiving waters without benchmark exceedances. This, along with distributional disparities observed under the baseline for other populations, indicates the presence of potential EJ concerns under the baseline across the three analyses. Analyzing the impacts of final rule across the analyses, the EPA found that the final rule reduced the amount of immediate receiving waters with benchmark exceedances and the population affected by these exceedances. However, in each of the analyses the EPA found that while the final rule mitigated distributional disparities identified under the baseline for communities with EJ concerns, remaining immediate receiving waters with exceedances under the final rule were more concentrated in other communities with EJ concerns. EPA found particular concentration for American Indian or Alaska Native populations relative to the baseline. See section 4.2 of the EJA for more information.

c. Downstream Waters

Using the results from the downstream analysis performed in the BCA, the EPA further evaluated the downstream surface water impacts in the EJA to determine whether communities with EJ concerns experience a differential share of noncancer health effects from exposure mercury through consuming fish in contaminated downstream surface waters.

The results of the EPA's analysis showed potential EJ concerns in the baseline in terms of differential and adverse impacts in communities with EJ concerns. Differential and adverse impacts were concentrated among infants of color (*e.g.,* Hispanic, Asian [non-Hispanic], and Other [non-Hispanic]) and infants below the poverty level of mothers consuming fish at recreational and subsistence rates relative to White children and children not below the poverty line, respectively. For both cohorts, under the final rule, increases in avoided IQ point losses were estimated relative to the baseline across all racial or ethnic groups and income groups. These estimated increases were too small to substantially change the distribution of IQ points relative to the baseline among infants of color and among infants below the poverty level. See section 4.3 of the EJA for more information.

The EPA also evaluated human health endpoints related to lead and arsenic exposures from fish consumption. As shown in the BCA, avoided IQ point losses in children and avoided cardiovascular deaths (CVD) in adults

from reductions in fish tissue concentrations of lead, as well as reductions in annual skin cancer cases in adults from reductions in fish tissue concentrations of arsenic estimated under the final rule were negligible (*e.g.,* a total avoided IQ point loss of one point across 1,555,558 exposed children). Therefore, the EPA determined that reporting fractional distributional changes by racial or ethnic groups and income groups for the affected population would not be informative. See section 4.3 of the EJA for more information.

3. Drinking Water

Using the results from the drinking water analysis performed in the BCA, the EPA further evaluated downstream drinking water impacts in the EJA to determine whether communities with EJ concerns served by potentially affected drinking water systems experience a differential share of bladder cancer cases from exposure to TTHM. In the BCA, the EPA modeled baseline incremental TTHM concentrations and bladder cancer cases attributable to steam electric discharges.[203] Since the EPA evaluated only the changes in TTHM concentrations and avoided bladder cancer cases and deaths attributable to steam electric discharges in the BCA, in this analysis, the EPA only evaluated whether the distribution of exposures and health effects indicated potential EJ concerns under the incremental changes resulting from the regulatory options.

The results of the EPA's analysis of changes in TTHM concentrations and resulting changes in bladder cancer cases and deaths from consuming drinking water with TTHM shows that the final rule reduces TTHM concentrations and reduces the incidence of bladder cancer cases and excess bladder cancer deaths in states with affected drinking water systems. Across the analyses, under the final rule, the majority of states with affected systems serve communities with at least one demographic group (*i.e.,* low-income or person of color) above the national average, with the largest proportion of these states having two demographic groups above the national average. Analyzing the distribution of changes across the analyses and regulatory options, the EPA finds that states with affected systems serving communities with one demographic group above the national average experience the largest median changes in TTHM concentrations and avoided bladder cancer cases and excess bladder cancer deaths than states serving communities with two and three or more demographic groups above the national average, respectively. While the magnitude of the median change observed across the analyses decreases in communities with one, two, or three or more demographic groups above the national average, the EPA finds that this is not due to there being smaller reductions in TTHM concentrations and avoided bladder cancer cases and excess bladder cancer deaths, but rather that these states generally have more systems experiencing smaller changes. See section 4.4. of the EJA for more information.

E. Distribution of Benefits and Costs

The EPA examined the estimated benefits and costs of the final rule for potential differences in how they are distributed across affected communities, in addition to evaluating the distribution of exposures and health impacts discussed above. Office of Management and Budget (OMB) Circular A–4, which implements E.O. 12866, states that regulatory analyses should analyze distributional effects which Circular A–4 defines as ''how the benefits and the costs of a regulatory action are ultimately experienced across the population and economy, divided up in various ways (*e.g.,* income groups, race or ethnicity, gender, sexual orientation, disability, occupation, or geography; . . .).'' As discussed below, EPA research demonstrates that climate change impacts associated with GHG reductions that are modeled to occur under this rule are likely to accrue to communities with EJ concerns but other benefits and costs under the final rule may not have substantial impacts.

The EPA began its evaluation of benefits with a screening of the benefits categories. For Option B, at both three percent and seven percent discount rates, approximately 99 percent of monetized benefits accrued from reductions in air pollution due to estimated shifts in electric generation resulting from the incremental costs of the final rule. Furthermore, these air benefits were always comprised of approximately a 3-to-1 ratio of conventional air pollutant health benefits to GHG benefits (see section 8 of the BCA for more information on air emissions and benefits).[204] Thus, while the EPA evaluated a number of exposures and endpoints for disproportionate baseline impacts, the Agency screened these two benefit categories through this initial comparison for further evaluation.

With respect to GHG benefits, scientific assessments and Agency reports produced over the past decade by the U.S. Global Change Research Program,[205] the Intergovernmental Panel on Climate Change,[206] [207] [208] [209] [210] and the National Academies of Science, Engineering, and Medicine [211] [212] provide evidence that the impacts of climate change raise potential EJ concerns. These reports conclude that poorer communities or communities of color can be especially vulnerable to climate change impacts because they tend to have limited adaptive capacities, are more dependent on climate-sensitive resources such as local water and food supplies or have less access to social and information resources. Some communities of color, specifically populations defined jointly by ethnic/

[203] Background TTHM concentrations and bladder cancer cases attributable to sources other than steam electric discharges were not modeled under the baseline but would not impact the analysis of incremental changes as discussed in the BCA.

[204] EPA scaled the air benefits to other regulatory options based on total costs.

racial characteristics and geographic location, may be uniquely vulnerable to climate change health impacts in the United States.

The EPA recently conducted a peer-reviewed analysis of the distribution of climate change impacts. EPA (2021) [213] evaluated the disproportionate risks to communities with EJ concerns. The EPA looked at factors including age, income, education, race, and ethnicity associated with six impact categories: air quality and health, extreme temperature and health, extreme temperature and labor, coastal flooding and traffic, coastal flooding and property, and inland flooding and property. The EPA calculated risks for each demographic group relative to its ''reference population'' (all individuals outside of each group) for scenarios with 2°C of global warming or 50 centimeters of sea level rise. The estimated risks were based on current demographic distributions in the contiguous United States. EPA (2021) includes findings that the following groups are more likely than their reference population to currently live in areas with:

- The highest increases in childhood asthma diagnoses from climate-driven changes in $PM_{2.5}$ (low-income, Black and African American, Hispanic and Latino, and Asian populations);
- The highest percentage of land lost to inundation (low-income and American Indian and Alaska Native populations);
- The highest increases in mortality rates due to climate-driven changes in extreme temperatures (low-income and Black and African American populations);
- The highest rates of labor hour losses for weather-exposed workers due to extreme temperatures (low-income, Black and African American, American Indian and Alaska Native, Hispanic and Latino, and Pacific Islander populations);
- The highest increases in traffic delays associated with high-tide flooding (low-income, Hispanic and Latino, Asian, and Pacific Islander populations); and
- The highest damages from inland flooding (Pacific Islander populations).

For further discussion of the impacts analyzed in U.S. EPA (2021) and other peer-reviewed evaluations, see section 5.1 of the EJA.

The EPA notes that the changes in GHG emissions attributable to the final rule are relatively small compared to worldwide emissions. Nevertheless, the findings of peer-reviewed evaluations demonstrate that actions that reduce GHG emissions are likely to reduce climate impacts on communities with EJ concerns. Findings demonstrate particular reductions in climate impacts for communities of color and low-income communities.

With respect to conventional air pollutant health benefits, the current EPA modeling methodology results in benefits that are proportional to exposures. In other words, the distributional findings of air pollutant exposures discussed above are the same findings the EPA has for this benefit category: exposure and health benefit improvements and degradations attributable to this final rule will be proportionately experienced by all communities evaluated. However, there are several important nuances and caveats to this conclusion owing to differences in vulnerability and health outcomes across demographic groups. For example, there is some information suggesting that the same $PM_{2.5}$ exposure reduction will reduce the hazard of mortality more so in Black populations than in White populations.[214] [215] In addition, demographic-stratified information relating $PM_{2.5}$ and ozone to other health effects and valuation estimates is currently lacking.

With respect to costs, the EPA notes that the impacts on ratepayers will depend on the degree to which compliance costs are passed through to electricity consumers via higher electricity rates. In general, lower-income households spend less, in the absolute, on energy than higher-income households, but energy expenditures represent a larger share of their income. Therefore, electricity price increases tend to have a relatively larger effect on lower-income households. Further discussion of these disparities is provided in section 5.2 of the EJA. The EPA estimated the potential impacts of incremental ELG compliance costs on households' utility bills based on average electricity consumption and assuming a worst-case scenario where all costs are passed through to consumers. The EPA estimated that the final rule (Option B) corresponds to an average increase of $3.14 per household per year, with a range of $0.19 to $5.44 per year across NERC regions. These cost increases are too small [216] to indicate the potential for significant direct impacts to household electricity consumers.[217]

XIV. Regulatory Implementation

A. Continued Implementation of Existing Limitations and Standards

The EPA has continually stressed, since the announcement of this supplemental rulemaking, that the existing 40 CFR part 423 limitations and standards in effect continue to apply.[218] In the sections below, the EPA discusses considerations for permitting authorities and regulated entities as they continue to implement existing regulations and look ahead to the regulations finalized.

1. Facilities Must Still Continue To Be Permitted for, and Meet, the 2020 Rule Limitations

The EPA reaffirms that permitting authorities must continue to write permits that include existing 2015 and 2020 rule BAT limitations as applicable, whether as part of permit renewals or as part of permit modifications. Similarly, permittees must meet applicable permit limitations as soon as possible. The Agency has not issued a postponement rule for the 2020 rule FGD wastewater and BA transport water BAT limitations as it did in 2017 for the 2015 rule. And as discussed in section VII of this preamble, the EPA is retaining the 2020 FGD wastewater and BA transport water limitations and affirms that the technologies on which they are based are available and achievable, as an interim step toward meeting the final zero-discharge requirements in this rule.

Since the EPA did not postpone the earliest compliance dates in the 2020 rule,[219] which have since passed, permitting authorities should not establish an ''as soon as possible'' date that is anything other than as soon as

[213] U.S. EPA (Environmental Protection Agency). 2021. *Climate Change and Social Vulnerability in the United States: A Focus on Six Impacts.* EPA 430–R–21–003.

[214] U.S. EPA (Environmental Protection Agency). 2019. *Integrated Science Assessment (ISA) for Particulate Matter (Final Report).* December. EPA/600/R–19/188. Available at: *https://www.epa.gov/naaqs/particulate-matter-pm-standards-integrated-science-assessments-current-review.*

[215] U.S. EPA (Environmental Protection Agency). 2022. *Supplement to the 2019 Integrated Science Assessment for Particulate Matter (Final Report).* May. EPA/600/R–22/028. Available at: *https://www.epa.gov/isa/integrated-science-assessment-isa-particulate-matter.*

[216] While the incremental burden relative to income is not distributionally neutral, *i.e.,* any increase would affect lower-income households to a greater extent than higher-income households, the final rule is expected to have a very small impact in the absolute across all regions analyzed which is also small relatively as the potential price increase is between less than 0.1 percent and 0.2 percent of energy expenditures for all income and race groups, and between less than 0.1 percent and 0.5 percent of just *electricity* expenditures for all but the bottom quintile income group in the most impacted NERC region.

[217] EPA notes that other electricity consumers (*e.g.,* industrial consumers) could also face increased electricity prices.

[218] 86 FR 41801 (August 3, 2021).

[219] Compliance dates for FGD wastewater and BA transport water in the 2020 rule were as soon as possible beginning October 13, 2021.

possible to comply with the 2020 limitations. In some cases, although unlikely at the time of this publication, a facility may still not have a permit incorporating the 2015 or 2020 rule BAT requirements. In such circumstances, a permitting authority must still include these limitations with the appropriate ''as soon as possible'' date. For example, suppose a permit applicant's permit still has the 1982 limitations; the applicant submits a permit modification request prior to this final rule effective date, but the permitting authority has not yet issued a modified permit. Here, the permitting authority may not simply issue the facility a permit incorporating this final zero-discharge limitations with a ''no later than'' date of 2029. Instead, the permittee is still obligated to meet the 2020 rule limitations no later than December 31, 2025. Note that, without the 2020 rule limitations in a permit, a facility may not participate in the permanent cessation of coal combustion by 2034 subcategory.

2. Permitting Site-Specific Technology-Based Effluent Limitations Through BPJ Analysis

At proposal, the EPA reaffirmed that BAT limitations were currently required to be developed on a BPJ basis by permitting authorities for discharges of both CRL and legacy wastewater. Some commenters contended that this outcome is improper because it does not constrain the permitting authority from selecting surface impoundments as BAT. The EPA disagrees. In *Southwestern Electric Power Co.* v. *EPA,* the Fifth Circuit stopped short of prohibiting any future selection of surface impoundments as the commenters stated. Instead, the Court held that the Agency's actions in selecting surface impoundments as BAT for legacy wastewater and CRL was arbitrary and capricious or inconsistent with the statute based on EPA's stated rationale. In particular, the Court faulted the EPA for not offering any rationale as to why surface impoundments were BAT, using the statutory factors. *See Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1018 n.20 (''[T]he record fails to explain why impoundments are BAT, if that term is to have any meaning. Furthermore, if chemical precipitation or biological treatment are technically feasible but simply too costly for treating legacy wastewater, the EPA could have said so.''); *id.* at 1025 (''The rule pegs BAT for leachate to the decades-old BPT standard, without offering any explanation for why that prior standard is now BAT. That is flatly inconsistent with the Act's careful distinction between the two standards.''). Permitting authorities performing a BPJ analysis are required to consider the statutory factors and determine what technologies are available, are economically achievable, and have acceptable non-water quality environmental impacts. Thus, permitting authorities would also be prohibited from defaulting to surface impoundments without explaining why surface impoundments represent BAT, as that term is used in the CWA. Instead, they must perform a thorough BPJ analysis that considers technologies beyond surface impoundments (including, presumably, the technologies described in this record) to identify the technology that represents BAT. The EPA does not rule out the possibility that circumstances at a facility will lead the permitting authority to select surface impoundments as BAT. However, this would only occur where a permitting authority can demonstrate that surface impoundments meet the BAT statutory factors, a tough hurdle for a treatment technology that has been found not to remove dissolved pollutants. *Id.* at 1026 (''To be sure, we do not say that EPA is precluded by the Act from ever setting BAT equivalent to a prior BPT standard. But given the plain distinction between the two standards market out in the Act, the agency would at least have to offer some explanation for its decision that speaks to the statutory differences between BAT and BPT.'').

Furthermore, the EPA received comments that certain state laws prohibit permitting authorities in those states from imposing BAT limitations more stringent than any national regulations. EPA disagrees that this poses an implementation challenge. The EPA has not established BAT based on surface impoundments, but rather, in some cases, reserved BAT limitations to be developed by permitting authorities using their BPJ. And the requirement for BPJ is to perform a thorough analysis to select the technology that represents BAT at a particular site. Thus, to the extent that a permitting authority determines a more stringent technology represents BAT at a particular site, this would not be inconsistent with the state laws cited.

3. Reopening Permits for CRL and Legacy Wastewater

At proposal, the EPA recommended, but did not require, that any permit issued or modified between the proposal and the final rule contain a reopener clause in accordance with 40 CFR 122.62(a)(7) and 124.5. Permitting authorities that included this provision should consider reopening these portions of existing permits as soon as practicable after July 8, 2024.

B. Implementation of New Limitations and Standards

The limitations and standards in this final rule apply to discharges from steam electric power plants through incorporation into NPDES permits issued by the EPA and authorized states under CWA section 402, and through pretreatment programs under CWA section 307. NPDES permits and pretreatment control mechanisms issued after July 8, 2024, must incorporate the ELGs, as applicable. Also, under CWA section 510, states can require effluent limitations under state law as long as they are no less stringent than the requirements of any final rule. Finally, as well as requiring application of the technology-based ELGs in any final rule, CWA section 301(b)(1)(C) requires the permitting authority to impose more stringent effluent limitations, as necessary, to meet applicable water quality standards. Relevant water quality-based considerations are discussed in section XIV.D.

1. Availability Timing of Final Rule Requirements

The direct discharge limitations in this rule apply only when implemented in an NPDES permit issued to a discharger. Under the CWA, the permitting authority must incorporate these ELGs into NPDES permits as a minimum level of control. The final rule provides the plant's permitting authority with discretion to determine the date when the new effluent limitations for FGD wastewater, BA transport water, and CRL would apply to a given discharger. For zero discharge requirements for FGD wastewater, BA transport water, and CRL, as well as the chemical precipitation-based requirements for unmanaged CRL, the limitations in this final rule become applicable by a date that is as soon as possible after July 8, 2024, but in no case later than December 31, 2029.

For dischargers subject to less stringent FGD wastewater and BA transport water limitations based on certifications that they qualify for a subcategory based on permanent cessation of coal combustion, the EPA is requiring permitting authorities to put in tiered limitations after the permanent cessation of coal combustion. For the permanent cessation of coal combustion by 2028 subcategory, the final rule contains a tiered set of limitations applicable following December 31, 2028:

- The first tier of these limitations is composed of zero-discharge limitations

for FGD wastewater and BA transport water after April 30, 2029. These limitations would apply if the EGU had in fact permanently ceased coal combustion by December 31, 2028, as the plant represented it would. As suggested in public comments, this date is 120 days after the permanent cessation of coal combustion date, allowing for facilities to complete any necessary residual discharges.[220]

- The second tier is composed of zero-discharge limitations for these same wastewaters after December 31, 2028. If a plant fails to cease combustion of coal by 2028, as it represented it would, for any reason other than those specified in § 423.18, these zero-discharge limitations would automatically apply.

For the permanent cessation of coal combustion by 2034 subcategory, the final rule contains a tiered set of limitations applicable following December 31, 2034:

- The first tier of these limitations is composed of zero-discharge limitations for FGD wastewater and BA transport water after April 30, 2035. These limitations would apply if the EGU had in fact permanently ceased coal combustion as it represented it would.
- The second tier is composed of zero-discharge limitations for the same wastewaters, as well as CRL, after December 31, 2034. If a plant fails to cease combustion of coal by 2034, as it represented it would, for any reason other than those specified in § 423.18, these zero-discharge limitations would automatically apply.

This final rule does not affect dischargers choosing to meet the 2020 VIP effluent limitations for FGD wastewater; the date for meeting those limitations is December 31, 2028. Similarly, where a facility has elected to participate in the subcategory for permanent cessation of coal combustion by December 31, 2028, the final rule allows for the zero-discharge limitations for FGD wastewater and BA transport water to be met as late as December 31, 2029, and is not designed to impose these zero-discharge limitations prior to the tiered zero-discharge limitations established for that subcategory.[221]

Pretreatment standards, unlike effluent limitations, are directly enforceable and must specify a time for compliance not to exceed three years from the date of promulgation under CWA section 307(b)(1). Under the EPA's General Pretreatment Regulations for Existing and New Sources, POTWs with flows in excess of five MGD must develop pretreatment programs meeting prescribed conditions.[222] These POTWs have the legal authority to require compliance with applicable pretreatment standards and control the introduction of pollutants to the POTW through permits, orders, or similar means. POTWs with approved pretreatment programs act as the control authorities for their industrial users. Among the responsibilities of the control authority are the development of the specific indirect discharge limitations for the POTW's industrial users. Because pollutant discharge limitations in categorical pretreatment standards may be expressed as concentrations or mass limitations, in many cases, the control authority must convert the concentration- or mass-based limitations applicable to a specific industrial user and then include these in POTW permits or another control instrument.

Regardless of when a plant's NPDES permit is ready for renewal, the EPA recommends that each plant immediately begin evaluating how it intends to comply with the requirements of the final rule. In cases where significant changes in operation are appropriate, the EPA recommends that the plant discuss such changes with its permitting authority and evaluate appropriate steps and a timeline for the changes as soon as possible, even before the permit renewal process begins.

The ''as soon as possible'' date is the effective date of any final rule, unless the permitting authority determines another date after receiving relevant information submitted by the discharger.[223] The final rule does not revise the specified factors permitting authorities must consider in determining the as soon as possible date under the 2015 and 2020 rules. Based on receiving relevant information from the discharger, the NPDES permitting authority may determine a different date is ''as soon as possible'' within the implementation period, using the factors below:

- Time to expeditiously plan (including to raise capital), design, procure, and install equipment to comply with the requirements of the final rule.
- Changes being made or planned at the plant in response to GHG regulations for new or existing fossil fuel-fired plants under the CAA, as well as regulations for the disposal of coal combustion residuals under subtitle D of RCRA.
- For FGD wastewater requirements only, an initial commissioning period to optimize the installed equipment.
- Other factors as appropriate.

The ''as soon as possible'' date determined by the permitting authority may or may not be different for each wastestream. The NPDES permitting authority should provide a well-documented justification of how it determined the ''as soon as possible'' date in the fact sheet or administrative record for the permit. If the permitting authority determines a date later than the effective date of the final rule, the justification should explain why allowing more time to meet any final limitations is appropriate, and why the discharger cannot meet the effluent limitations as of the effective date.

2. Conducting BPJ Analyses for Discharges of CRL and Legacy Wastewater

For some CRL and legacy wastewaters, the EPA is reserving BAT limitations to be determined on a case-by-case basis using the permitting authority's BPJ. The factors considered by the permit writer in a BPJ analysis are the same as those that EPA considers in establishing technology-based effluent limitations. *See* 40 CFR 125.3(d)(1) through (3). Thus, a permitting authority may not default to any technology (for example, surface impoundments) in selecting BAT, nor may a permitting authority fail to develop technology-based effluent limitations and instead simply calculate water quality-based effluent limitations. Instead, a permitting authority is required to determine limitations based on the BAT.[224]

Consideration of Leasing. Leasing is an option offered by commercial vendors. In some cases, it may be possible to lease various pollution treatment technologies for a timeframe shorter than the timeframes considered in this rule's primary evaluation. In

[220] The EPA notes that these do not include discharges of legacy wastewaters from surface impoundments closing under the CCR rule, which are covered by different regulatory provisions.

[221] In contrast, the subcategory for EGUs permanently ceasing coal combustion by December 31, 2028, does not cover discharges of CRL, and thus discharges of CRL would be permitted in accordance with limitations in the subcategory for EGUs permanently ceasing coal combustion by December 31, 2034.

[222] *See, e.g.,* 40 CFR 403.8(a).

[223] Information in the record indicates that most facilities should be able to complete all steps to implement changes needed to comply with the BA transport water requirements within 32 to 35 months, the FGD wastewater requirements within 28 months, and the CRL requirements within 22 months (DCN SE08480, SE10289).

[224] In doing so, permitting authorities may consider relevant information such pollution treatment technologies already in operation at the facility and the information contained in this record on the performance and costs of various technologies.

some cases, shorter duration leases might be more costly; however, where the record precluded the EPA from establishing a nationwide BAT, it is possible that site-specific considerations may make leased equipment economically achievable for a given facility, and thus a relevant consideration in a BPJ analysis.

Consideration of Closure Deadlines Pursuant to the CCR Rule. For certain legacy wastewater, the EPA declined to establish a nationwide BAT, in part, due to the tight closure timeframes for CCR surface impoundments under the CCR rule. The EPA cannot evaluate the precise stage of closure each CCR surface impoundment would be in at the time of its permit issuance or renewal and whether continuation with that stage of closure would be compatible with the operation of any specific technology. In contrast, permitting authorities can do this through the BPJ process after gathering relevant information through the permit application or permit modification. This may require examination of the site-specific closure plan required under the CCR rule and any additional details regarding the ongoing closure process that are not contained in the closure plan itself.

3. Conforming Changes to § 423.18

The EPA is making two changes to § 423.18. First, the EPA is including the new permanent cessation of coal combustion by 2034 subcategory in the permit conditions of § 423.18. When an EGU proceeds towards permanent cessation of coal combustion under the new subcategory, if that EGU is involuntarily forced to burn coal beyond December 31, 2034, it may qualify for the same protections as an EGU in the permanent cessation of coal combustion by 2028 subcategory.

Second, the EPA is clarifying that an Energy Emergency Alert (EEA) is a valid order under § 423.18(a)(3) to qualify for this provision. The purpose of an EEA is to provide real-time indication of potential and actual energy emergencies within an interconnection.[225] The EPA received comment about these alerts specifically in the context of the CAA section 111 proposed rule. These are short-duration reliability events similar to the types explicitly listed in § 423.18, and this clarification is not meant to limit the use of § 423.18, but rather to ensure that it operates as intended: to allow an EGU to operate for reliability purposes without violating its CWA permit.

4. Information To Assist in Permitting Discharges of Unmanaged CRL

At proposal, the EPA provided a recommended list of information that could be provided to a permitting authority to determine whether a discharge of CRL through groundwater constituted the FEDD from a point source into a WOTUS. The EPA also solicited comment on including provision of this information as a regulatory requirement or otherwise obtaining the data (*e.g.,* through a CWA section 308 request). The EPA received a wide range of comment on this solicitation, but on November 20, 2023, the Agency published a draft guidance titled *Applying the Supreme Court's County of Maui* v. *Hawaii Wildlife Fund Decision in the Clean Water Act section 402 National Pollutant Discharge Elimination System Permit Program to Discharges through Groundwater.* The draft guidance describes the *Maui* decision's functional equivalent analysis and explains the types of information that may be relevant to determining which discharges through groundwater require coverage under an NPDES permit. This guidance will assist permitting authorities, the regulated community, and other stakeholders in appropriately applying the ''functional equivalent'' standard in the NPDES permits program and is a more appropriate instrument for addressing this particular implementation issue. The EPA intends to issue revised guidance on this topic soon. For further information visit: *https://www.epa.gov/npdes/releases-point-source-groundwate*r.

C. Reporting and Recordkeeping Requirements

The EPA is finalizing several new or modified reporting and recordkeeping requirements in § 423.19, pursuant to authority under CWA sections 304(i) and 308. First, the EPA is including additional provisions for the annual progress reports required for EGUs permanently ceasing coal combustion by 2028. Second, the EPA is including reporting and recordkeeping requirements for the new subcategory of EGUs permanently ceasing coal combustion by 2034. Third, the EPA is including reporting and recordkeeping requirements for the subcategory for EGUs with certain discharges of unmanaged CRL. Fourth, the EPA is including reporting and recordkeeping requirements for facilities making use of the definitional changes with respect to necessary discharges of FGD wastewater, BA transport water or CRL during high intensity, infrequent storm events. Fifth, the EPA is including a one-year flexibility for EGUs that have installed zero-discharge systems to support their transition to zero discharge by allowing necessary discharges of permeate or distillate subject to reporting and recordkeeping requirements. Finally, the EPA is requiring this and all other reporting to be posted to a publicly available website.

1. Summary of Changes to the Annual Progress Reports for EGUs Permanently Ceasing Coal Combustion by 2028

The EPA is modifying the annual progress reports for the subcategory of EGUs permanently ceasing coal combustion by 2028, as it proposed it would. Specifically, the EPA is adding a requirement that the annual progress reports include either the official filing to the facility's reliability authority or a certification providing an estimate of when such a filing will be made. Furthermore, the EPA is requiring that the final annual progress report prior to permanent cessation of coal combustion must include the official filing. While facilities may already include these filings in the NOPP or annual progress reports, these filings were not explicitly required in the 2020 rule and provide the strongest assurance that a facility will not voluntarily change its plans and continue discharging beyond 2028.

2. Summary of the Reporting and Recordkeeping Requirements for EGUs Permanently Ceasing Coal Combustion by 2034

The EPA is including new reporting and recordkeeping requirements for EGUs permanently ceasing coal combustion by 2034, including an initial NOPP and annual progress reports, as it proposed it would. Consistent with the requirements for EGUs permanently ceasing coal combustion by 2028, the EPA is requiring that the initial NOPP contain several items. A NOPP shall include the expected date that each EGU is projected to achieve permanent cessation of coal combustion, whether each date represents a retirement or a fuel conversion, whether each retirement or fuel conversion has been approved by a regulatory body, and what the relevant regulatory body is. In addition, the NOPP shall include the most recent integrated resource plan for

[225] An EEA-Level 1 occurs when the ISO/RTO has enough power to meet demand but not enough backup resources. An EEA-Level 2 occurs when the ISO/RTO anticipates interruption of service and takes steps to avoid power outages by requesting outside help to meet requirements including consumers being asked to conserve energy. An EEA-Level 3 occurs when an ISO/RTO is energy deficient and operating with reserves below the required minimum. At level 3, utilities curtail energy use through controlled service interruptions.

which the applicable state agency approved the retirement or repowering of the unit subject to the ELGs, or other documentation supporting that the electric generating unit will permanently cease the combustion of coal by December 31, 2034. The NOPP shall also include, for each such EGU, a timeline to achieve the permanent cessation of coal combustion. Each timeline shall include interim milestones and the projected dates of completion. Finally, the NOPP shall include, for each such EGU, a certification statement that the facility is in compliance with the FGD wastewater and BA transport water limitations of the 2020 rule. Because the NOPP requires a certification statement that the facility is in compliance with the FGD wastewater and BA transport water limitations of the 2020 rule, which could have applicability dates as late as December 31, 2025, EPA has finalized that date as the date for submitting the NOPP.

The EPA is also requiring an annual progress report for facilities in this subcategory. An annual progress report shall detail the completion of any interim milestones listed in the NOPP since the previous progress report, provide a narrative discussion of any completed, missed, or delayed milestones, and provide updated milestones. An annual progress report shall also include one of the following:

- A copy of the official suspension filing (or equivalent filing) made to the facility's reliability authority detailing the conversion to a fuel source other than coal;
- A copy of the official retirement filing (or equivalent filing) made to the facility's reliability authority which must include a waiver of recission rights; or
- An initial certification, or recertification for subsequent annual progress reports, containing a statement that the facility will make one of the other filings.

The certification or recertification must include the estimated date that such a filing will be made. Furthermore, the EPA is requiring that the final annual progress report must include the actual filing to the reliability authority. Thus, the final annual progress report cannot include a certification statement.

3. Summary of Reporting and Recordkeeping Requirements for Certain Discharges of Unmanaged CRL

As discussed in section VII of this preamble, CRL can be discharged not only through end-of-pipe discharges, but also through groundwater, and the EPA is establishing BAT limitations for a subcategory of EGUs that includes EGUs with discharges of CRL that a permitting authority determines are the FEDD of CRL to a WOTUS. The EPA is including annual reporting and recordkeeping requirements to facilitate the permitting authorities' review of such discharges. These requirements also facilitate compliance monitoring and make compliance information available to the public.

As it proposed it would, the EPA is requiring that facilities with discharges of CRL that a permitting authority determines are the FEDD of CRL to a WOTUS file an annual combustion residual leachate monitoring report with the permitting authority. This annual reporting requirement would be implemented via NPDES permits that cover one or more FEDD of CRL to a WOTUS through groundwater. The EPA is requiring that this report provide a comprehensive set of monitoring data. The EPA is including this requirement to facilitate permitting authorities' ability to determine compliance with CRL limitations and to increase transparency to local communities. Thus, in addition to the data provided under 40 CFR part 127, where an EGU is determined to have a FEDD of CRL, the EPA is requiring groundwater monitoring data on the CRL leaving each landfill or surface impoundment and where it enters surface waterbodies. The EPA is also requiring the report to include monitoring data on all the pollutants treated by chemical precipitation, not just mercury and arsenic, the two indicator pollutants.

4. Certification for Necessary Discharges of FGD Wastewater, BA Transport Water, or CRL During High Intensity, Infrequent Storm Events

At proposal, the EPA solicited comment on a number of topics concerning stormwater mixed with regulated process wastewaters, as well as comment on any necessary, related reporting and recordkeeping requirements. As discussed in section VII.B.5 of this preamble, the EPA is finalizing a definitional change for wastewater resulting from certain high intensity, infrequent storm events. As part of this change, the EPA is requiring a certification that includes several pieces of information that will assure the permitting authority and the public that the discharge is necessary and does not violate any other permit requirements. First, the certification shall include a statement that the facility experienced a storm event exceeding a 10-year, 24-hour or longer duration, including specifics of the actual storm event that are sufficient for a third party to verify the accuracy of the statement. Second, the certification shall include a statement that the discharge of low volume wastewater that would otherwise meet the definition of FGD wastewater, BA transport water, or CRL was necessary, including a list of the best management practices at the site and a narrative discussion of the ability of on-site equipment and practices to manage the wastewater. Third, the certification statement shall include the duration and volume of any such discharge. Finally, the certification statement shall include a statement that the discharge does not otherwise violate any other limitation or permit condition.

5. One-Year Flexibility for Any Necessary Discharges of Permeate or Distillate From Newly Operational FGD Wastewater or CRL Treatment Systems

The EPA anticipates that some plants seeking to meet the final zero-discharge limitations for FGD wastewater or CRL may install one or more technologies that produce a distillate or permeate following treatment. The EPA's technology basis incorporates a process by which the plant will recycle such distillate or permeate within the plant to achieve zero discharge. At proposal, however, the EPA solicited comment on the propriety of a limited flexibility that would allow some time for a plant to optimize its zero-discharge system to fully achieve zero discharge, subject to a reporting requirement. Importantly, for plants seeking this flexibility, a permitting authority would not include this optimization period in the calculation of the plant's ''as soon as possible'' date for meeting the FGD wastewater or CRL limitations. A plant given this flexibility would monitor and report any necessary discharges of permeate or distillate over the first year of attempted zero discharge, while the system was being optimized, and these discharges would not be a violation of the otherwise applicable zero-discharge requirements. For subsequent years, the flexibility would be discontinued.

The EPA received few comments on this solicitation, but those that were received favored the additional flexibility. On the timeframe, the EPA received comments suggesting that one or two years might be appropriate for such a flexibility. One commenter specifically discussed steps for optimizing an initial stage chemical precipitation system that could take up to two years.

The EPA agrees with commenters that the flexibility is warranted, but disagrees that two years is appropriate. In discussions with technology vendors,

the EPA learned that new pollution control technology operators at a facility are most likely to seek vendor support during the first year of operations. Even the comment suggesting a two-year timeframe conceded, ''Commercially proven technology designs generally take a full year to optimize.'' During this optimization process, even with the flexibility to discharge permeate or distillate when necessary, the zero-discharge treatment technology will still result in significant additional pollutant removals which will only be improved upon once the optimization is complete and the permeate or distillate may no longer be discharged. The NSPS limitations established in the 2015 rule and the BAT limitations in the 2020 rule's VIP (which were developed using data from thermal evaporation systems' distillate and membrane filtration systems' permeate, respectively) result in more pollutant removals than either chemical precipitation alone or chemical precipitation plus biological treatment. By expressly allowing plants a period for optimization, and removing this optimization consideration that would otherwise allow for delayed availability timing under § 423.11(t)(3), this flexibility will also facilitate the transition to zero discharge by reducing the amount of time it would take for plants to begin full-scale use of their pollutant treatment systems. Therefore, the EPA is finalizing a flexibility in § 423.18 to allow discharges of distillate or permeate from a newly operational FGD wastewater or CRL treatment system, where necessary, in the first year of operations.

The necessary discharges included in this flexibility are subject to additional reporting and recordkeeping requirements. Specifically, the facility shall include a letter requesting this flexibility from the permitting authority. This initial request letter will detail the expected type, frequency, and duration of discharge. The letter will also include a certification that the facility has not considered the zero-discharge system optimization period in its availability timing request under § 423.11(t). After including flexibility for necessary discharges of the permeate or distillate in the permit, the permitting authority shall also extend any existing monitoring and reporting requirements to ensure that any necessary discharges of the distillate or permeate do not violate other applicable conditions of the permit such as water quality-based effluent limitations.

6. Requirement to Post Information to a Publicly Available Website

The reporting and recordkeeping requirements of the CCR rule included a novel approach for posting information to a publicly available website. This was done because, at the time the CCR rule was signed, the EPA did not have enforcement authority over the CCR rule. Thus, given the self-implementing nature of the regulations, EPA sought to make information more readily available to states, as well as members of the public, who could enforce the CCR rule through citizen suits.[226]

In contrast to the CCR rule, ELGs are implemented largely through authorized state permitting programs with EPA oversight. Nevertheless, one message that EPA received in initial outreach to communities was that there is a lack of trust of utilities (and in some cases, the states that regulate them). Another message was that there is an interest in more accessible information. At proposal, the EPA included a website posting requirement for all documentation included in § 423.19.

The EPA received comments both supporting and opposing the inclusion of a website requirement. Comments supporting the requirement desired additional transparency and suggested the EPA expand the requirement to all permitting documentation. Comments opposing the requirement expressed the opinion that these requirements would be a duplicative and unnecessary burden. One comment also pointed out that there was no provision for using a combined CCR rule/ELG rule website where a facility became subject to requirements after the effective date of the rule.

At the outset, the EPA agrees with commenters supporting a website reporting requirement. Given the success CCR rule websites have achieved in disseminating information to a variety of stakeholders, the EPA is finalizing a comparable posting requirement for the ELG rule. These websites will ensure transparency and ease of access to information. The EPA disagrees with these commenters that more is necessary. The existing reporting and recordkeeping requirements for general permitting provisions (*e.g.,* documentation during the permit application and permit modification processes, effluent reporting, etc.) are outside the scope of this rulemaking. Furthermore, even if the EPA were to consider broader changes to the reporting and recordkeeping requirements for all industrial categories, the Agency would do so through a rulemaking not specific to the steam electric power generating industry. Thus, the EPA is finalizing a website posting requirement only with respect to information contained in § 423.19.

Specifically, the EPA is requiring that all reporting and recordkeeping information not only be retained by the regulated entity and provided to the permitting authority, but that it also be posted to a public website for 10 years, or the length of the permit plus five years, whichever is longer. This posting requirement includes NOPPs and other filings that have occurred since the 2020 rule. The EPA is also allowing facilities to post on existing CCR rule compliance websites to reduce paperwork burden and make it easier for communities to access. One commenter correctly pointed out that, where facilities were not immediately subject to the reporting and recordkeeping requirements of § 423.19, it would have not been able to make the proper notification of combined CCR rule/ELG rule website usage within the proposed 60-day timeframe. Therefore, the EPA is finalizing a date for notification of this combined website that is July 8, 2024, or the date which the facility becomes subject to § 423.19 reporting requirements, whichever is later.

D. Site-Specific Water Quality-Based Effluent Limitations

The EPA regulations at 40 CFR 122.44(d)(1), implementing section 301(b)(1)(C) of the CWA, require each NPDES permit to include any requirements, in addition to or more stringent than ELGs or standards promulgated pursuant to sections 301, 304, 306, 307, 318, and 405 of the CWA, necessary to achieve water quality standards established under section 303 of the CWA, including state narrative criteria for water quality. Those same regulations require that limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) that the Director determines are or may be discharged at a level that will cause, have the reasonable potential to cause, or contribute to an excursion above any state water quality standard, including state narrative criteria for water quality. 40 CFR 122.44(d)(1)(i). In the sections below, the EPA describes the potential need to develop monitoring requirements and or limitations relating

[226] While the Water Infrastructure Improvements for the Nation Act later provided the EPA with permitting and oversight authority, the CCR rule continues to require posting to publicly available websites.

to bromide, per- and polyfluoroalkyl substances (PFAS), and Tribal rights.

1. Bromide

The preamble to the 2015 rule discussed bromide as a parameter for which water quality-based effluent limitations may be appropriate. The EPA stated its recommendation that permitting authorities carefully consider whether water quality-based effluent limitations for bromide or TDS would be appropriate for FGD wastewater discharged from steam electric power plants upstream of drinking water intakes. The EPA also stated its recommendation that the permitting authority notify any downstream drinking water treatment plants of the discharge of bromide.

The final rule requires zero discharge of FGD wastewater, BA transport water, and CRL. Nevertheless, the EPA is finalizing subcategories for these wastewaters that will allow some discharge of these wastewaters, and all three have been shown to have measurable levels of bromide.[227] Therefore, the records for the 2015 rule, the 2020 rule, and this action continue to suggest that permitting authorities should consider establishing water quality-based effluent limitations where necessary to meet applicable water quality standards to protect of populations served by downstream drinking water treatment plants.

In consultations conducted with state and local government entities, the EPA received comments from the American Water Works Association (AWWA) and the Association of Metropolitan Water Agencies. These comments requested that the EPA consider technologies that could treat upstream pollutants at the point of discharge, but also suggested that the EPA empower states to address the issue as well. The latter discussion referenced the approaches discussed in *Methods to Assess Anthropogenic Bromide Loads from Coal-Fired Power Plants and Their Potential Effect on Downstream Drinking Water Utilities.*[228] This document, provided in comments during the 2020 rulemaking and again during consultations on the current rulemaking, describes methodologies, data sources, and considerations for constructing an approach to bromide issues on a site-specific basis. This document presents additional data sources that NPDES permitting authorities could use to establish site-specific, water quality-based effluent limitations (*see, e.g.,* Figure 29 in AWWA's document). The document also provides examples of where states have already taken similar action. For example, AWWA cites California's 0.05 mg/L standard for in-river bromide to protect public health for specific waterways and drinking water treatment systems.

2. PFAS

In addition to considering water quality-based effluent limitations for parameters present in these wastestreams, the EPA also calls attention to the need to address potential for PFAS discharges. In the EPA's *PFAS Strategic Roadmap,*[229] the Agency laid out actions that would prevent PFAS from entering the environment. Specifically, the EPA stated it would ''proactively use existing NPDES authorities to reduce discharges of PFAS at the source and obtain more comprehensive information through monitoring on the sources of PFAS and quantity of PFAS discharged by these sources.'' The EPA's Office of Water issued a memorandum in 2022, covering facilities where the EPA is the permitting authority,[230] as well as guidance to state permitting authorities to address PFAS in NPDES permits.[231] While the steam electric power sector was not identified as one of the top PFAS dischargers, the EPA notes that PFAS may nevertheless be present in steam electric discharges. For example, the Wisconsin Department of Natural Resources has found PFAS at eight power plants.[232] In addition, firefighting foam used in exercises or actual fires at steam electric power plants could contain PFAS. Therefore, permitting or control authorities may appropriately consider whether PFAS monitoring and any further restrictions (*e.g.,* BMPs) would be appropriate at a given facility.

3. Tribal Reserved Rights

A third water-quality based consideration for steam electric power plants is Tribal reserved rights. Many Tribes hold reserved rights to resources on lands and waters where states establish water quality standards, through treaties, statutes, or other sources of Federal law. The U.S. Constitution defines treaties as the supreme law of the land. On December 5, 2022, the EPA proposed revisions to the Federal water quality standards (WQS) regulation at 40 CFR part 131. *See* 87 FR 74361 (Dec. 5, 2022) (''Tribal Reserved Rights proposed rule''). The proposed revisions, if finalized, would create a regulatory framework that would be applied case-specifically to protect aquatic and aquatic-dependent resources—such as fish—reserved to Tribes through treaties, statutes, and executive orders, in WOTUS. The Tribal Reserved Rights proposed rule aims to improve protection of resources reserved to Tribes and the health of Tribal members exercising their reserved rights, as well as transparency and predictability for Tribes, states, regulated community, and the public. The EPA is working to expeditiously finalize the proposed rule, taking into account public comments. During Tribal outreach on the Steam Electric ELG rulemaking, Tribes raised concerns about potential impacts to their Tribal reserved rights. For further discussion of EPA's outreach to Tribes, see section XV.F.

E. Severability

The purpose of this section is to clarify the Agency's intent with respect to the severability of provisions of this rule in the event of litigation. In the event of a stay or invalidation of any part of this rule, the Agency's intent is to preserve the remaining portions of the rule to the fullest possible extent. To dispel any doubt regarding the EPA's intent and to inform how the regulation would operate if severed, the EPA has added the following regulatory text at § 423.10(b): ''The provisions of this part are separate and severable from one another. If any provision is stayed or determined to be invalid, the remaining provisions shall continue in effect.'' This rule serves in many respects to further the goals of the CWA, and the Agency would have adopted each portion of this rule independent of the other portions. As explained below, the Agency carefully crafted this rule so that each provision or element of the rule

[227] The record also includes iodide in these discharges, another pollutant which should be considered alongside bromide for water quality-based effluent limitations.

[228] Available online at: *https://www.awwa.org/Portals/0/AWWA/ETS/Resources/17861ManagingBromideREPORT.pdf?ver=2020-01-09-151706-107.*

[232] The maximum sampled concentrations in discharge from eight steam electric power plants were 28 ng/L for perfluorooctane sulfonic acid (PFOS) and 35 ng/L for perfluorooctanoic acid (PFOA), which the Wisconsin Department of Natural Resources theorized was due to concentration in cooling tower effluent.

can operate independently. Moreover, the Agency has organized the rule so that if any provision or element of this rule is determined by judicial review or operation of law to be invalid, that partial invalidation will not render the remainder of this rule invalid.

This rule primarily regulates discharges associated with four steam electric wastestreams. The rule provides limitations and standards associated with each wastestream in separate sections that do not rely on one another. The decision to regulate each wastestream was made independently of the decisions to regulate the other wastestreams. This is because the EPA applied the BAT statutory factors in its decision for each wastestream. This is consistent with the Fifth Circuit's decision in *Southwestern Elec. Power Co.* v. *EPA,* in which the Court held that the EPA must apply the BAT factors with respect to each wastestream, in that case CRL. *Southwestern Elec. Power Co.* v. *EPA,* 920 F.3d at 1027. Indeed, the Court ultimately vacated only those portions of the 2015 rule regulating legacy wastewater and CRL, without disturbing any further aspects of the rule. *Id.* at 1033.

This rule also contains several subcategories. The rule provides limitations and standards associated with each subcategory in separate sections, which are not relied on by other aspects of the rule. The decision to subcategorize particular discharges, for example, certain discharges of unmanaged CRL or certain discharges of legacy wastewater, had no bearing on the BAT decisions made with respect to the rest of the industry, for which the EPA finds the rule is technologically available and economically achievable after a consideration of the CWA section 304(b) factors. And each subcategory is supported by its own, independent BAT determination. Moreover, the rest of the industry's requirements are not tied in the regulatory text to the requirements of the subcategories. Similarly, the decision to subcategorize certain discharges from EGUs expected to cease combustion of coal had no bearing on the EPA's BAT decisions made with respect to the rest of the industry, for which the EPA finds the rule is technologically available and economically achievable after a consideration of the CWA section 304(b) factors. And the cease combustion of coal subcategories are supported by their own, independent BAT determinations. Moreover, the rest of the industry's requirements are not tied in the regulatory text to the requirements of the subcategories. Were the EPA to receive an adverse decision on any of the subcategories established in this rule, the EPA would expect to potentially address any remand and/or vacatur of the limitations applicable to the subcategory by considering the Court's opinion and the requisite statutory factors in re-promulgating any appropriate limitations for such subcategory. The EPA would, for example, have to demonstrate that any new limitations for the subcategory are technologically available and economically achievable for the subcategory, after a consideration of the CWA section 304(b) factors. These examples are illustrative, rather than exhaustive, and the EPA intends each portion of the rule to be independent and severable. Furthermore, if the application of any portion of this rule to a particular circumstance is determined to be invalid, the Agency intends that the rule remain applicable to all other circumstances.

XV. Statutory and Executive Order Reviews

Additional information about these statutes and Executive orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 14094: Modernizing Regulatory Review

This action is a ''significant regulatory action,'' as defined under section 3(f)(1) of Executive Order 12866, as amended by Executive Order 14094. Accordingly, the EPA submitted this action to the Office of Management and Budget (OMB) for Executive Order 12866 review. The EPA has included redline strikeout versions showing changes made in response to the Executive Order 12866 review available in the docket. The EPA prepared an analysis of the estimated costs and benefits associated with this action. This analysis is contained in section 12 of the BCA and is also available in the docket.

B. Paperwork Reduction Act (PRA)

The information collection activities in this rule have been submitted for approval to the OMB under the PRA. The Information Collection Request (ICR) document that the EPA prepared has been assigned EPA ICR number 2752.02 and OMB Control Number 2040–0310. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

As described in section XIV.C, the EPA is finalizing several changes to the individual reporting and recordkeeping requirements of § 423.19 for specific subcategories of plants and/or plants that have certain types of discharges. The EPA is adding reporting and recordkeeping requirements for plants in the permanent cessation of coal combustion by 2034 subcategory and for plants that discharge unmanaged CRL. EPA is also removing reporting and recordkeeping requirements for LUEGUs and finalizing a new requirement for plants to post reports to a publicly available website.

Respondents/affected entities: The respondents affected by this ICR are steam electric power plants. The North American Industry Classification System (NAICS) identification number applicable to respondents is 221112: Electric Power Generation Plants—Fossil Fuel Electric Power Generation. The U.S. Census Bureau describes this U.S. industry as establishments primarily engaged in operating fossil-fuel-powered electric power generation facilities. These facilities use fossil fuels, such as coal, oil, or gas, in an internal combustion or a combustion turbine conventional steam process to produce electric energy. The electric energy produced in these establishments is provided to electric power transmission systems or to electric power distribution systems.

Respondent's obligation to respond: Mandatory (40 CFR parts 423 and 122).

Estimated number of respondents: The EPA estimates that 236 steam electric facilities would be subject to this final rule.

Frequency of response: The EPA made the following assumptions for estimating frequency:

- NOPPs, notices, and the Combustion Residual Leachate Monitoring Report (CRLMR) would be submitted one time (in the first year of the requirements).
- Progress reports and the annual CRLMR would be submitted once a year following the submittal of the official NOPP (*i.e.,* twice over a three-year period).
- Progress reports associated with EPA's VIP program or NOPPs that have already been submitted would be submitted once a year following the publication of the final rule.

Total estimated burden: For facilities, the estimated facility universe for any reporting, for the purpose of this estimate is 236 facilities. The EPA estimates the total one-time labor hours associated with this ICR to facilities is 6,520 and total annual labor hours of 22,000 hours for a total annual average of 24,300 hours. Similarly, the EPA estimates the total one-time labor costs

to facilities to be $650,000 and total annual labor costs of about $2,300,000 for a total annual average of $2,540,000. For permitting/control authorities, the estimated universe is 41. The EPA estimates the total one-time labor hours associated with this ICR to permitting/control authorities is 416 and total annual labor hours ranging from 3,050 to 3,160 for a total annual average of 3,230 hours. Similarly, the EPA estimates the total one-time labor costs to permitting/control authorities to be $33,300 and total annual labor costs range from $256,000 to $265,000 for a total annual average of $273,000.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. The small entities subject to the requirements of this action include small businesses and small governmental jurisdictions that own steam electric plants. The EPA has determined that 220 to 391 entities own steam electric power plants subject to the ELGs, of which 117 to 202 entities are small. These small entities own a total of 267 steam electric power plants (out of the total of 858 plants), including 33 to 39 plants estimated to incur costs under the final rule under the lower and upper cost scenarios, respectively. The EPA considered the impacts of the final rule on small businesses using a cost-to-revenue test. The analysis compares the cost of implementing wastewater controls under the final rule to those under baseline (which reflects the 2020 rule, as explained in section V of this preamble). Small entities estimated to incur compliance costs exceeding one or more of the one percent and three percent impact thresholds were identified as potentially incurring a significant impact. For the final rule under the lower bound cost scenario, the EPA's analysis shows 10 small entities (4 non-utilities, 3 cooperatives, and 3 municipalities) expected to incur incremental costs equal to or greater than one percent of revenue. For 5 of these small entities (2 non-utilities, 2 cooperatives, and 1 municipality), the incremental cost of the final rule exceeds three percent of revenue. For the upper bound cost scenario, an additional 2 small entities (both non-utilities) have costs equal to or greater than one percent of revenue for a total of 12 entities. For 2 non-utilities, 3 cooperatives, and 2 municipalities, these costs exceed three percent of revenue. Details of this analysis are presented in section 8 of the RIA, included in the docket.

These results support the EPA's finding of no significant impact on a substantial number of small entities.

D. Unfunded Mandates Reform Act (UMRA)

This action contains a Federal mandate under the UMRA, 2 U.S.C. 1531–1538 that may result in expenditures of $100 million (adjusted annually for inflation) or more for state, local, and Tribal governments, in the aggregate, or the private sector in any one year ($198 million in 2023 dollars). Accordingly, the EPA has prepared a written statement required under section 202 of UMRA. The statement is included in the docket for this action (see section 9 in the RIA) and briefly summarized below.

Consistent with the intergovernmental consultation provisions of section 204 of the UMRA, the EPA consulted with government entities potentially affected by this rule. The EPA described the government-to-government dialogue leading to the proposed rule in its preamble to the proposed rulemaking. The EPA received comments from state and local government representatives in response to the proposed rule and considered this input in developing the final rule.

Consistent with section 205, the EPA has identified and considered a reasonable number of regulatory alternatives to develop BAT. The main regulatory options are described in section VII of this preamble. These options included a range of technology-based approaches. As discussed in detail in section VII.B of this preamble, the EPA is selecting Option B as the BAT after considering the factors required under CWA section 304(b)(2)(B). The technologies are available, are economically achievable, and have acceptable non-water quality environmental impacts.

This final rule is not subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments. To assess the impact of compliance requirements on small governments (*i.e.,* governments with a population of less than 50,000), the EPA compared total costs and costs per plant estimated to be incurred by small governments with the costs estimated to be incurred by large governments. The EPA also compared costs for small government-owned plants with those of non-government-owned facilities. The Agency evaluated both the average and maximum annualized costs per plant under both the lower and upper bound cost scenarios. section 9 of the RIA provides details of these analyses. In all these comparisons, both for the cost totals and, in particular, for the average and maximum cost per plant, the costs for small government-owned facilities were less than those for small non-government-owned facilities. This was true for both the lower and upper bound cost scenarios. The maximum cost per plant was also smaller for the small government-owned plants vs. the large government-owned plants under the lower bound cost scenario. The average annualized costs per plant were larger for small government-owned plants vs. large government-owned plants under the upper bound cost scenario, but not markedly so. On this basis, the EPA concludes that the compliance cost requirements of the steam electric ELGs would not significantly or uniquely affect small governments.

E. Executive Order 13132: Federalism

The EPA has concluded that this action has federalism implications because it imposes direct compliance costs on state or local governments, and the Federal Government will not provide the funds necessary to pay those costs.

As discussed in section XV.B, the EPA anticipates that this final rule does not impose incremental administrative burden on states from issuing, reviewing, and overseeing compliance with discharge requirements. The EPA has identified 148 steam electric power plants owned by 63 state or local government entities. Under the final rule, the EPA projects that 15 government-owned plants would incur compliance costs. The EPA estimates the maximum compliance cost in any one year to governments (excluding the Federal Government) for the final rule range from $155 million and $220 million, whereas the annualized costs range between $40 million and $67 million (see section 9 of the RIA for details).

The EPA provides the following federalism summary impact statement.

The EPA consulted with state and local officials early in the process of developing the rule to permit them to

have meaningful and timely input into its development. The preamble to the proposed rule described these consultations, which included a meeting held on January 27, 2022, attended by representatives from 15 state and local government organizations and outreach with several intergovernmental associations representing elected officials and encouraged their members to participate in the meeting, including the National Governors Association, the National Conference of State Legislatures, the Council of State Governments, the National Association of Counties, the National League of Cities, the U.S. Conference of Mayors, the County Executives of America, and the National Associations of Towns and Townships.

The EPA received five sets of unique written comments after the meeting and considered these comments in the development of the proposed rule. For further information regarding the consultation process and supplemental materials provided to state and local government representatives, please go to the steam electric power generating effluent guidelines website at: *https://www.epa.gov/eg/2021-supplemental-steam-electric-rulemaking.*

The EPA received comment on the proposed ELGs from three state and local officials or their representatives. Some state and local officials expressed concerns the EPA had underestimated the costs and overstated the pollutant removals of the technology options. Commenters stated that the ELGs would impose significant costs on small entities and would result in electricity rate increases that are unaffordable for households. Commenters also expressed concern about coordination of the various rules affecting the power sector. The EPA considered these comments in developing the final rule.

A list of the state and local government commenters has been provided to OMB and has been placed in the docket for this rulemaking. In addition, the detailed response to comments from these entities is contained in the EPA's response to comments document on this final rulemaking, which has also been placed in the docket for this rulemaking.

As explained in section VII of this preamble, the EPA is establishing more stringent limitations on several wastestreams that would alleviate concerns raised by the public water systems. At the same time, the EPA's final rule includes subcategories for units certifying to the permanent cessation of coal combustion. The EPA believes these differentiated requirements alleviate some of the concerns raised by publicly owned utilities. Further, as explained in section VIII of this preamble, the EPA's analysis demonstrates that the final requirements are economically achievable for the steam electric power generating industry as a whole and for plants owned by state or local government entities.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action has Tribal implications; however, it will neither impose substantial direct compliance costs on federally recognized Tribal governments, nor preempt Tribal law, as specified in Executive Order 13175. *See* 65 FR 67249 (November 9, 2000). It does not have substantial direct effects on Tribal governments, on the relationship between the Federal Government and the Indian Tribes, or the distribution of power and responsibilities between the Federal Government and Indian Tribes as specified in Executive Order 13175. The EPA's analyses show that no facility subject to the final ELGs is owned by Tribal governments. Thus, Executive Order 13175 does not apply to this action. The EPA acknowledges this action has Tribal implications, not prescribed in Executive Order 13175, because during Tribal Consultation, the EPA received written comments from 3 Tribal nations that conveyed the importance of historical Tribal waters and rights (*e.g.,* fishing, trapping), recommended more stringent technological controls to protect those rights, or encouraged retirement or fuel conversion of old coal-fired EGUs.

Although Executive Order 13175 does not apply to this action, the EPA consulted with Tribal officials early in the process of developing this rule to enable them to have meaningful and timely input into its development. The EPA initiated consultation and coordination with federally recognized Tribal governments in January 2022, sharing information about the steam electric effluent guidelines rulemaking with the National Tribal Caucus, the National Tribal Water Council, and several individual Tribes. The EPA continued this government-to-government dialogue and, on February 1 and February 9, 2022, invited Tribal representatives to participate in further discussions about the rulemaking process and objectives, with a focus on identifying specific ways the rulemaking may affect Tribes.[233] The consultation process ended on March 29, 2022. The EPA is including in the docket for this action a memorandum that provides a response to the comments it received through this consultation and the consultations described in sections XVI.D and XVI.E of this preamble. For further information regarding the consultation process and supplemental materials provided to Tribal representatives, please go to the steam electric power generating effluent guidelines website at: *https://www.epa.gov/eg/2021-supplemental-steam-electric-rulemaking.*

Representatives from several Tribes provided input to the rule. The EPA considered input from Tribal representatives in developing this final rule.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 directs Federal agencies to include an evaluation of the health and safety effects of the planned regulation on children in Federal health and safety standards and explain why the regulation is preferable to potentially effective and reasonably feasible alternatives. This action is not subject to Executive Order 13045 because the EPA does not believe the environmental health risks or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are discussed in sections 4 and 5 of the BCA and are summarized below.

The EPA identified several ways in which the final rule will benefit children, including by potentially reducing health risks from exposure to pollutants present in steam electric power plant discharges, or through impacts of the discharges on the quality of source water used by public water systems. This reduction arises from more stringent pollutant limitations as compared to baseline. The EPA quantified the changes in IQ losses from lead exposure among preschool children and from mercury exposure *in utero* resulting from maternal fish consumption under the final rule as compared to baseline. The EPA also estimated changes in the lifetime risk of developing bladder cancer due to exposure to TTHM in drinking water, or of cardiovascular premature mortality from exposure to lead. For these analyses, the EPA did not estimate children-specific risks because these adverse health effects normally follow

[233] As discussed in sections XIII and XVI.J, the EPA also did targeted outreach to communities in the top tier of its EJ screening analysis which included two tribal communities.

long-term exposure. Finally, the EPA estimated changes in air-related adverse health effects resulting from changes in the profile of electricity generation under the final rule as compared to baseline. The analysis found that the resulting reductions in $PM_{2.5}$ and ozone will benefit children by reducing asthma onset and symptoms, allergy symptoms, emergency room visits and hospital visits for respiratory conditions, and school absences.

However, the EPA's Policy on Children's Health applies to this action. Information on how the Policy was applied is available under ''Children's Environmental Health'' in this **SUPPLEMENTARY INFORMATION** section.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

This final action is not a ''significant energy action'' because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. The EPA analyzed the potential energy effects of the final rule relative to baseline and found minimal or no impacts on electricity generation, generating capacity, cost of energy production, or dependence on a foreign supply of energy. Specifically, the Agency's analysis found that the final rule would not reduce electricity production by more than 1 billion kWhs per year or by 500 MW of installed capacity, nor would the final rule increase U.S. dependence on foreign energy supplies. For more detail on the potential energy effects of this action, see section 10.7 in the RIA, available in the docket.

I. National Technology Transfer and Advancement Act

This rulemaking does not involve technical standards.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations and Executive Order 14096: Revitalizing Our Nation's Commitment to Environmental Justice for All

The EPA believes that the human health or environmental conditions existing prior to this action result in or have the potential to result in disproportionate and adverse human health or environmental effects on communities with EJ concerns. Current research suggests that coal-fired power plants tend to be in low-income communities, Indigenous communities, and communities of color. Toomey (2013) reported that 78 percent of African Americans in the United States live within a 30-mile radius of a coal-fired power plant.[234] Impacts discussed in the reports included adverse health impacts resulting from air pollutants (*e.g.,* SO_2, NO_X, $PM_{2.5}$) for those living in proximity to coal-fired power plants, climate justice issues resulting from GHG emissions, and risk of impoundment failures for populations living in proximity to coal waste surface impoundments where coal is mined.[235] [236] [237] All these impacts were found in one or more papers to disproportionately impact low-income, minority, and Indigenous communities. The EPA also conducted a proximity analysis to characterize the demographics of communities potentially exposed to pollution from steam electric power plant wastewater discharges through proximity to plants, proximity to downstream surface waters receiving, or being served by a PWS using impacted downstream receiving waters as source water for drinking water. The results of the EPA's analysis showed that these communities have higher proportions of low-income individuals and people of color compared to the national average, national rural average, and respective state averages suggesting potential EJ concerns under the baseline in terms of disproportionate exposures. The EPA believes that this action is likely to reduce existing disproportionate and adverse effects on communities with EJ concerns. The EPA's EJ analysis showed the final rule will reduce differential baseline exposures for low-income communities and communities of color to pollutants in wastewater and resulting human impacts. Improvements to water quality, wildlife, and human health resulting from reductions in pollutants in surface water will be distributed more among communities with EJ concerns under some or all of the regulatory options due to their disproportionate exposures under the baseline. Drinking water improvements will also be distributed more among communities with EJ concerns under the final rule due to their disproportionate exposures under the baseline. Remaining exposures, impacts, and benefits analyzed are small enough that EPA could not conclude whether changes in disproportionate impacts under the baseline would occur. While the changes in GHGs attributable to the final rule are small compared to worldwide emissions, findings from peer-reviewed evaluations demonstrate that actions that reduce GHG emissions are also likely to reduce climate-related impacts on vulnerable communities, including communities with EJ concerns. Costs of the final rule in terms of electricity price increases among residential households may impact low-income households and households of color more relative to all households as low-income households and households of color tend to spend a greater proportion of their income on energy expenditures. Despite this, the potential price increases under the upper bound cost scenario represent between less than 0.1 percent and 0.2 percent of energy expenditures for all income, race groups, and income quintiles, and therefore the EPA does not expect costs to have a substantial impact on low-income households and households of color.

K. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action meets the criteria set forth in 5 U.S.C. 804(2).

Appendix A to the Preamble: Definitions, Acronyms, and Abbreviations Used in This Preamble

The following acronyms, abbreviations, and terms are used in this preamble. These terms are provided the reader's for convenience; they are not regulatory definitions with the force or effect of law, nor are they to be used as guidance for implementation of this rule.

Administrator. The Administrator of the U.S. Environmental Protection Agency.

Agency. U.S. Environmental Protection Agency.

BAT. Best available technology economically achievable, as defined by CWA sections 301(b)(2)(A) and 304(b)(2)(B).

BA transport water. Wastewater that is used to convey bottom ash from the ash collection or storage equipment, or boiler, and has direct contact with the ash.

BCA. Abbreviation used for the *Benefit and Cost Analysis for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* report.

[234] Toomey, D. 2013. *Coal Pollution and the Fight for Environmental Justice.* Yale Environment 360. June 19. Available online at: *https://www.e360.yale.edu/features/naacp_jacqueline_patterson_coal_pollution_and_fight_for_environmental_justice.*

[235] Liévanos, R., Greenberg, P., Wishart, P. 2018. *In the Shadow of Production: Coal Waste Accumulation and Environmental Inequality Formation in Eastern Kentucky,* pp. 37–55.

[236] Israel, B. 2012. *Coal Plants Smother Communities of Color. https://www.scientificamerican.com/article/coal-plants-smother-communities-of-color/#:~:text=People%20living%20near%20coal%20plants,percent%20are%20people%20of%20color.*

[237] NAACP (National Association for the Advancement of Colored People). 2012. *Coal Blooded: Putting Profits Before People. www.naacp.org/resources/coal-blooded-putting-profits-people.*

Bioaccumulation. A general term describing a process by which chemicals are taken up by an organism either directly from exposure to a contaminated medium or by consumption of food containing the chemicals, resulting in a net accumulation of the chemical over time by the organism.

BMP. Best management practice.

BA. Bottom ash. The ash, including EGU slag, that settles in a furnace or is dislodged from furnace walls. Economizer ash is included when it is collected with BA.

BA purge water. The water discharged from a wet BA handling system that recycles some, but not all, of its BA transport water.

BPT. The best practicable control technology currently available, as defined by CWA sections 301(b)(1) and 304(b)(1).

CBI. Confidential business information.

CCR. Coal combustion residuals.

CWA. Clean Water Act; the Federal Water Pollution Control Act Amendments of 1972 (33 U.S.C. 1251 *et seq.*), as amended, *e.g.,* by the Clean Water Act of 1977 (Pub. L. 95–217) and the Water Quality Act of 1987 (Pub. L. 100–4).

Combustion residuals. Solid wastes associated with combustion-related steam electric power plant processes, including fly ash and BA from coal-, petroleum coke-, or oil-fired units; FGD solids; FGMC wastes; and other wastewater treatment solids associated with steam electric power plant wastewater. In addition to the residuals associated with coal combustion, this also includes residuals associated with the combustion of other fossil fuels.

CRL. Combustion residual leachate. Leachate from landfills or surface impoundments that contains combustion residuals. Leachate is composed of liquid, including any suspended or dissolved constituents in the liquid, that has percolated through waste or other materials emplaced in a landfill, or that passes through the surface impoundment's containment structure (*e.g.,* bottom, dikes, berms). Combustion residual leachate includes seepage and/or leakage from a combustion residual landfill or impoundment unit. It also includes wastewater from landfills and surface impoundments located on non-adjoining property when under the operational control of the permitted facility.

CWA. Clean Water Act.

Direct discharge. (1) Any addition of any ''pollutant'' or combination of pollutants to ''waters of the United States'' from any ''point source'' or (2) any addition of any pollutant or combination of pollutant to waters of the ''contiguous zone'' or the ocean from any point source other than a vessel or other floating craft that is being used as a means of transportation. This definition includes additions of pollutants into waters of the United States from surface runoff that is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a state, municipality, or other person that do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances that lead into privately owned treatment works. This term does not include addition of pollutants by any ''indirect discharger.''

Direct discharger. A plant that discharges treated or untreated wastewaters into waters of the United States.

DOE. Department of Energy.

Dry BA handling system. A system that does not use water as the transport medium to convey BA away from the EGU. Dry-handling systems include systems that collect and convey the BA without using any water, as well as systems in which BA is quenched in a water bath and then mechanically or pneumatically conveyed away from the EGU. Dry BA handling systems do not include wet sluicing systems (such as remote MDS or complete recycle systems).

Effluent limitation. Under CWA section 502(11), any restriction, including schedules of compliance, established by a state or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents that are discharged from point sources into navigable waters, the waters of the contiguous zone, or the ocean.

EGU. Electric generating unit.

EIA. Energy Information Administration.

EJA. Abbreviation used for the *Environmental Justice Analysis for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* report.

ELGs. Effluent limitations guidelines and standards.

E.O. Executive order.

EPA. U.S. Environmental Protection Agency.

FA. Fly ash. The ash that is carried out of the furnace by a gas stream and collected by a capture device such as a mechanical precipitator, electrostatic precipitator, and/or fabric filter. Economizer ash is included in this definition when it is collected with FA. Ash is not included in this definition when it is collected in wet scrubber air pollution control systems whose primary purpose is particulate removal.

Facility. Any NPDES ''point source'' or any other facility or activity (including land or appurtenances thereto) that is subject to regulation under the NPDES program.

FA transport water. Wastewater that is used to convey fly ash from the ash collection or storage equipment, or boiler, and has direct contact with the ash.

FGD. Flue gas desulfurization.

FGMC. Flue gas mercury control.

FGD wastewater. Wastewater generated specifically from the wet FGD scrubber system that contacts the flue gas or the FGD solids, including, but not limited to, the blowdown or purge from the FGD scrubber system, overflow or underflow from the solids separation process, FGD solids wash water, and the filtrate from the solids dewatering process. Wastewater generated from cleaning the FGD scrubber, cleaning FGD solids separation equipment, cleaning FGD solids dewatering equipment, or that is collected in floor drains in the FGD process area is not considered FGD wastewater.

FGMC wastewater. Any wastewater generated from an air pollution control system installed or operated for the purpose of removing mercury from flue gas. This includes wastewater from fly ash collection systems when the particulate control system follows sorbent injection or other controls to remove mercury from flue gas. FGD wastewater generated at plants using oxidizing agents to remove mercury in the FGD system and not in a separate FGMC system is not considered FGMC wastewater.

Gasification wastewater. Any wastewater generated at an integrated gasification combined cycle operation from the gasifier or the syngas cleaning, combustion, and cooling processes. Gasification wastewater includes, but is not limited to, the following: sour/grey water; CO_2/steam stripper wastewater; sulfur recovery unit blowdown; and wastewater resulting from slag handling or fly ash handling, particulate removal, halogen removal, or trace organic removal. Air separation unit blowdown, noncontact cooling water, and runoff from fuel and/or byproduct piles are not considered gasification wastewater. Wastewater that is collected intermittently in floor drains in the gasification process area from leaks, spills, and cleaning occurring during normal operation of the gasification operation is not considered gasification wastewater.

Groundwater. Water that is found in the saturated part of the ground underneath the land surface.

Indirect discharge. Wastewater discharged or otherwise introduced to a POTW.

IPM. Integrated Planning Model.

Landfill. A disposal facility or part of a facility or plant where solid waste, sludges, or other process residuals are placed in or on any natural or manmade formation in the earth for disposal and which is not a storage pile, a land treatment facility, a surface impoundment, an underground injection well, a salt dome or salt bed formation, an underground mine, a cave, or a corrective action management unit.

Legacy wastewater. FGD wastewater, BA transport water, FA transport water, CRL, gasification wastewater and/or FGMC wastewater generated before the ''as soon as possible'' date that more stringent effluent limitations from the 2015 or 2020 rules would apply.

MDS. Mechanical drag system.BA handling system that collects BA from the bottom of an EGU in a water-filled trough. The water bath in the trough quenches the hot BA as it falls from the EGU and seals the EGU gases. A drag chain operates in a continuous loop to drag BA from the water trough up an incline, which dewaters the BA by gravity, draining the water back to the trough as the BA moves upward. The dewatered BA is often conveyed to a nearby collection area, such as a small bunker outside the EGU building, from which it is loaded onto trucks and either sold or transported to a landfill. The MDS is considered a dry BA handling system because the ash transport mechanism is mechanical removal by the drag chain, not the water.

Mortality. Death rate or proportion of deaths in a population.

NAICS. North American Industry Classification System.

NPDES. National Pollutant Discharge Elimination System.

NSPS. New Source Performance Standards.

ORP. Oxidation-reduction potential.

Paste. A substance containing solids in a fluid which behaves as a solid until a force is applied that causes it to behave like a fluid.

Paste landfill. A landfill that receives any paste designed to set into a solid after the passage of a reasonable amount of time.

Point source. Any discernible, confined, and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, vessel, or other floating craft from which pollutants are or may be discharged. The term does not include agricultural stormwater discharges or return flows from irrigated agriculture. *See* CWA section 502(14), 33 U.S.C. 1362(14); 40 CFR 122.2.

POTW. Publicly owned treatment works. *See* CWA section 212, 33 U.S.C. 1292; 40 CFR 122.2, 403.3.

PSES. Pretreatment Standards for Existing Sources.

PSC. Public service commission.

PUC. Public utility commission.

RCRA. The Resource Conservation and Recovery Act of 1976, 42 U.S.C. 6901 *et seq.*

Remote MDS. BA handling system that collects BA at the bottom of the EGU, then uses transport water to sluice the ash to a remote MDS that dewaters BA using a configuration similar to MDS. The remote MDS is considered a wet BA handling system because the ash transport mechanism is water.

RO. Reverse osmosis.

RFA. Regulatory Flexibility Act.

SBA. Small Business Administration.

Sediment. Particulate matter lying below water.

Surface water. All waters of the United States, including rivers, streams, lakes, reservoirs, and seas.

TDD. Abbreviation used for the *Technical Development Document for the Final Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category* report.

Toxic pollutants. As identified under the CWA, 65 pollutants and classes of pollutants, of which 126 specific substances have been designated priority toxic pollutants. *See* appendix A to 40 CFR part 423.

Transport water. Wastewater that is used to convey FA, BA, or economizer ash from the ash collection or storage equipment or EGU and that has direct contact with the ash. Transport water does not include low-volume, short-duration discharges of wastewater from minor leaks (*e.g.,* leaks from valve packing, pipe flanges, or piping) or minor maintenance events (*e.g.,* replacement of valves or pipe sections).

UMRA. Unfunded Mandates Reform Act.

Wet BA handling system. A system in which BA is conveyed away from the EGU using water as a transport medium. Wet BA systems typically send the ash slurry to dewatering bins or a surface impoundment. Wet BA handling systems include systems that operate in conjunction with a traditional wet sluicing system to recycle all BA transport water (*e.g.,* remote MDS or complete recycle systems).

Wet FGD system. Wet FGD systems capture sulfur dioxide from the flue gas using a sorbent that has mixed with water to form a wet slurry, and that generates a water stream that exits the FGD scrubber absorber.

List of Subjects in 40 CFR Part 423

Environmental protection, Electric power generation, Power facilities, Waste treatment and disposal, Water pollution control.

Michael S. Regan,

Administrator.

For the reasons stated in the preamble, the Environmental Protection Agency amends 40 CFR part 423 as follows:

PART 423—STEAM ELECTRIC POWER GENERATING POINT SOURCE CATEGORY

■ 1. The authority citation for part 423 is revised to read as follows:

Authority: 33 U.S.C. 1251 *et seq.;* 1311; 1314(b), (c), (e), (g), and (i)(A) and (B); 1316; 1317; 1318 and 1361.

■ 2. Revise § 423.10 to read as follows:

§ 423.10 Applicability and severability.

(a) *Applicability.* The provisions of this part apply to discharges resulting from the operation of a generating unit by an establishment whose generation of electricity is the predominant source of revenue or principal reason for operation, and whose generation of electricity results primarily from a process utilizing fossil-type fuel (coal, oil, or gas), fuel derived from fossil fuel (*e.g.,* petroleum coke, synthesis gas), or nuclear fuel in conjunction with a thermal cycle employing the steam water system as the thermodynamic medium. This part applies to discharges associated with both the combustion turbine and steam turbine portions of a combined cycle generating unit.

(b) *Severability.* The provisions of this part are separate and severable from one another. If any provision is stayed or determined to be invalid, the remaining provisions shall continue in effect.

■ 3. Amend § 423.11 by revising paragraphs (n), (p), (r), (w), (z), and (bb) and adding paragraphs (ee) and (ff) to read as follows:

§ 423.11 Specialized definitions.

* * * * *

(n) The term *flue gas desulfurization (FGD) wastewater* means any wastewater generated specifically from the wet flue gas desulfurization scrubber system that comes into contact with the flue gas or the FGD solids, including but not limited to, the blowdown from the FGD scrubber system, overflow or underflow from the solids separation process, FGD solids wash water, and the filtrate from the solids dewatering process. Wastewater generated from cleaning the FGD scrubber, cleaning FGD solids separation equipment, cleaning FGD solids dewatering equipment; FGD paste equipment cleaning water; treated FGD wastewater permeate or distillate used as boiler makeup water; water that is collected in floor drains in the FGD process area; wastewater removed from FGD wastewater treatment equipment within the first 120 days of decommissioning the equipment, or wastewater generated by a 10-year, 24-hour or longer duration storm event when meeting the certification requirements in § 423.19(o) is not considered FGD wastewater.

* * * * *

(p) The term *transport water* means any wastewater that is used to convey fly ash, bottom ash, or economizer ash from the ash collection or storage equipment, or boiler, and has direct contact with the ash. Transport water does not include low volume, short duration discharges of wastewater from minor leaks (*e.g.,* leaks from valve packing, pipe flanges, or piping), minor maintenance events (*e.g.,* replacement of valves or pipe sections), FGD paste equipment cleaning water, bottom ash purge water, wastewater removed from ash handling equipment within the first 120 days of decommissioning the equipment, or wastewater generated by a 10-year, 24-hour or longer duration storm event when meeting the certification requirements in § 423.19(o).

* * * * *

(r) The term *combustion residual leachate* means leachate from landfills or surface impoundments containing combustion residuals. Leachate is composed of liquid, including any suspended or dissolved constituents in the liquid, that has percolated through waste or other materials emplaced in a landfill, or that passes through the surface impoundment's containment structure (*e.g.,* bottom, dikes, berms). Combustion residual leachate includes seepage and/or leakage from a combustion residual landfill or impoundment unit. Combustion residual leachate includes wastewater from landfills and surface impoundments located on non-adjoining property when under the operational control of the permitted facility. Combustion residual leachate does not include wastewater generated by a 10-year, 24-hour or longer duration storm event when meeting the certification requirements in § 423.19(o).

* * * * *

(w) The term *permanent cessation of coal combustion* means the owner or operator certifies under § 423.19(g) or (h) that an electric generating unit will cease combustion of coal no later than December 31, 2028, or December 31, 2034.

* * * * *

(z) The term *low utilization electric generating unit* means any electric generating unit for which the facility owner certifies, and annually recertifies, under § 423.19(f) that the two-year average annual capacity utilization rating is less than 10 percent.

* * * * *

(bb) The term *tank* means a stationary device, designed to contain an accumulation of wastewater which is constructed primarily of non-earthen materials (*e.g.,* wood, concrete, steel, plastic) which provide structural support and which is not a coal combustion residual surface impoundment.

* * * * *

(ee) The term *coal combustion residual surface impoundment* means a natural topographic depression, man-made excavation, or diked area, which is designed to hold an accumulation of coal combustion residuals and liquids, and the unit treats, stores, or disposes of coal combustion residuals.

(ff) The term *unmanaged combustion residual leachate* means combustion residual leachate which either:

(1) Is determined by the permitting authority to be the functional equivalent of a direct discharge to waters of the United States (WOTUS) through groundwater; or

(2) Has leached from a waste management unit into the subsurface and mixed with groundwater prior to being captured and pumped to the surface for discharge directly to WOTUS.

■ 4. Amend § 423.13 by:

■ a. Revising paragraph (g);

■ b. Adding a heading for paragraph (h);

■ c. Revising paragraph (h)(1)(ii);

■ d. Adding a heading for paragraph (i);

■ e. Revising paragraph (i)(1)(ii); and

■ f. Revising paragraphs (k), (l), and (o).

The revisions and additions read as follows:

§ 423.13 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best available technology economically achievable (BAT).

* * * * *

(g) *FGD wastewater*—(1) *2020 BAT.* (i) Except for those discharges to which paragraph (g)(2) or (3) of this section applies, the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in table 5 to this paragraph (g)(1)(i). Dischargers must meet the effluent limitations for FGD wastewater in this paragraph (g)(1)(i) by a date determined by the permitting authority that is as soon as possible beginning October 13, 2021, but no later than December 31, 2025. The effluent limitations in this paragraph (g)(1)(i) apply to the discharge of FGD wastewater generated on and after the date determined by the permitting authority for meeting the effluent limitations, as specified in this paragraph (g)(1)(i), until the date determined by the permitting authority for meeting the effluent limitations in paragraph (g)(4) of this section.

TABLE 5 TO PARAGRAPH (g)(1)(i)

Pollutant or pollutant property	BAT effluent limitations	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	18	8
Mercury, total (ng/L)	103	34
Selenium, total (μg/L)	70	29
Nitrate/nitrite as N (mg/L)	4	3

(ii) For FGD wastewater generated before the date determined by the permitting authority, as specified in paragraph (g)(1)(i) of this section, the EPA is declining to establish BAT limitations and is reserving such limitations to be established by the permitting authority on a case-by-case basis using the permitting authority's best professional judgment.

(2) *2020 BAT subcategories.* (i) For any electric generating unit with a total nameplate capacity of less than or equal to 50 megawatts, that is an oil-fired unit, or for which the owner has submitted a certification pursuant to § 423.19(g), the quantity of pollutants discharged in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed for total suspended solids (TSS) in § 423.12(b)(11).

(A) For any electric generating unit for which the owner has submitted a certification pursuant to § 423.19(g), where such unit has permanently ceased coal combustion by December 31, 2028, there shall be no discharge of pollutants in FGD wastewater after April 30, 2029.

(B) For any electric generating unit for which the owner has submitted a certification pursuant to § 423.19(g), where such unit has failed to permanently cease coal combustion by December 31, 2028, there shall be no discharge of pollutants in FGD wastewater after December 31, 2028.

(ii) For FGD wastewater discharges from a high FGD flow facility, the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in table 6 to this paragraph (g)(2)(ii). Dischargers must meet the effluent limitations for FGD wastewater in this paragraph (g)(2)(ii) by a date determined by the permitting authority that is as soon as possible beginning October 13, 2021, but no later than December 31, 2023. The effluent limitations in this paragraph (g)(2)(ii) apply to the discharge of FGD wastewater generated on and after the date determined by the permitting authority for meeting the effluent limitations, as specified in this paragraph (g)(2)(ii), until the date determined by the permitting authority for meeting the effluent limitations in paragraph (g)(4) of this section.

TABLE 6 TO PARAGRAPH (g)(2)(ii)

Pollutant or pollutant property	BAT effluent limitations	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

(iii) For FGD wastewater discharges from a low utilization electric generating unit, the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in table 6 to paragraph (g)(2)(ii) of this section. Dischargers must meet the effluent limitations for FGD wastewater in this paragraph (g)(2)(iii) by a date determined by the permitting authority that is as soon as possible beginning October 13, 2021, but no later than December 31, 2023. These effluent limitations apply to the discharge of FGD wastewater generated on and after the date determined by the permitting authority for meeting the effluent limitations, as specified in this paragraph (g)(2)(iii), until the date determined by the permitting authority for meeting the effluent limitations in paragraph (g)(4) of this section.

(3) *Voluntary incentives plan.* (i) For dischargers who voluntarily choose to meet the effluent limitations for FGD wastewater in this paragraph (g)(3)(i), the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in table 7 to this paragraph (g)(3)(i). Dischargers who choose to meet the effluent limitations for FGD wastewater in this paragraph (g)(3)(i) must meet such limitations by December 31, 2028. The effluent limitations in this paragraph (g)(3)(i) apply to the discharge of FGD wastewater generated on and after December 31, 2028.

TABLE 7 TO PARAGRAPH (g)(3)(i)

Pollutant or pollutant property	BAT effluent limitations	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (ug/L)	5	NA
Mercury, total (ng/L)	23	10
Selenium, total (ug/L)	10	NA
Nitrate/Nitrite (mg/L)	2.0	1.2
Bromide (mg/L)	0.2	NA
TDS (mg/L)	306	149

(ii) For discharges of FGD wastewater generated before December 31, 2023, the quantity of pollutants discharged in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed for TSS in § 423.12(b)(11).

(4) *2024 BAT.* (i) Except for those discharges to which paragraphs (g)(3) and (g)(4)(ii) through (iv) of this section applies, there shall be no discharge of pollutants in FGD wastewater.

(A) Dischargers must meet the effluent limitations for FGD wastewater in this paragraph (g)(4)(i) by a date determined by the permitting authority that is as soon as possible beginning July 8, 2024, but no later than December 31, 2029. These effluent limitations apply to the discharge of FGD wastewater generated on and after the date determined by the permitting authority for meeting the effluent limitations, as specified in this paragraph (g)(4)(i).

(B) A facility which submits a request under § 423.19(n) may discharge permeate or distillate from an FGD wastewater treatment system designed to achieve the limitations in this paragraph (g)(4)(i) for an additional period of up to one year from the date determined in paragraph (g)(4)(i)(A) of this section.

(ii) For any electric generating unit with a total nameplate capacity of less than or equal to 50 megawatts or that is an oil-fired unit, the quantity of pollutants discharged in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed for TSS in § 423.12(b)(11).

(iii) For any electric generating unit for which the owner has submitted a certification pursuant to § 423.19(h), the quantity of pollutants discharged in FGD wastewater shall continue to be subject to limitations specified in paragraph (g)(1) or (g)(2)(ii) or (iii) of this section as incorporated into the existing permit.

(A) Where such unit has permanently ceased coal combustion by December 31, 2034, there shall be no discharge of pollutants in FGD wastewater after April 30, 2035.

(B) Where such unit has failed to permanently cease coal combustion by December 31, 2034, there shall be no discharge of pollutants in FGD wastewater after December 31, 2034.

(iv) For FGD wastewater discharged from any coal combustion residual surface impoundment which commences closure pursuant to 40 CFR 257.102(e) after July 8, 2024, the quantity of pollutants in FGD

wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in table 8 to this paragraph (g)(4)(iv).

TABLE 8 TO PARAGRAPH (g)(4)(iv)

Pollutant or pollutant property	BAT effluent limitations	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

(h) *Fly ash transport water.* (1) * * *

(ii) *Legacy fly ash transport water.* For fly ash transport water generated before the date determined by the permitting authority, as specified in paragraph (h)(1)(i) of this section, the EPA is declining to establish BAT limitations and is reserving such limitations to be established by the permitting authority on a case-by-case basis using the permitting authority's best professional judgment.

* * * * *

(i) *Flue gas mercury control wastewater.* (1) * * *

(ii) *Legacy flue gas mercury control wastewater.* For flue gas mercury control wastewater generated before the date determined by the permitting authority, as specified in paragraph (i)(1)(i) of this section, the EPA is declining to establish BAT limitations and is reserving such limitations to be established by the permitting authority on a case-by-case basis using the permitting authority's best professional judgment.

* * * * *

(k) *Bottom ash transport water*—(1) *2020 BAT.* (i) Except for those discharges to which paragraph (k)(2) of this section applies, or when the bottom ash transport water is used in the FGD scrubber, there shall be no discharge of pollutants in bottom ash transport water. Dischargers must meet the discharge limitation in this paragraph (k)(1)(i) by a date determined by the permitting authority that is as soon as possible beginning October 13, 2021, but no later than December 31, 2025. The limitation in this paragraph (k)(1)(i) applies to the discharge of bottom ash transport water generated on and after the date determined by the permitting authority for meeting the discharge limitation, as specified in this paragraph (k)(1)(i), until the date determined by the permitting authority for meeting the effluent limitations in paragraph (k)(4) of this section. Except for those discharges to which paragraph (k)(2) of this section applies, whenever bottom ash transport water is used in any other plant process or is sent to a treatment system at the plant (except when it is used in the FGD scrubber), the resulting effluent must comply with the discharge limitation in this paragraph (k)(1)(i). When the bottom ash transport water is used in the FGD scrubber, it ceases to be bottom ash transport water, and instead is FGD wastewater, which must meet the requirements in paragraph (g) of this section.

(ii) For bottom ash transport water generated before the date determined by the permitting authority, as specified in paragraph (k)(1)(i) of this section, the EPA is declining to establish BAT limitations and is reserving such limitations to be established by the permitting authority on a case-by-case basis using the permitting authority's best professional judgment.

(2) *2020 BAT subcategories.* (i)(A) The discharge of pollutants in bottom ash transport water from a properly installed, operated, and maintained bottom ash system is authorized under the following conditions:

(*1*) To maintain system water balance when precipitation-related inflows are generated from storm events exceeding a 10-year storm event of 24-hour or longer duration (*e.g.,* 30-day storm event) and cannot be managed by installed spares, redundancies, maintenance tanks, and other secondary bottom ash system equipment; or

(*2*) To maintain system water balance when regular inflows from wastestreams other than bottom ash transport water exceed the ability of the bottom ash system to accept recycled water and segregating these other wastestreams is not feasible; or

(*3*) To maintain system water chemistry where installed equipment at the facility is unable to manage pH, corrosive substances, substances or conditions causing scaling, or fine particulates to below levels which impact system operation or maintenance; or

(*4*) To conduct maintenance not otherwise included in paragraph (k)(2)(i)(A)(*1*), (*2*), or (*3*) of this section and not exempted from the definition of transport water in § 423.11(p), and when water volumes cannot be managed by installed spares, redundancies, maintenance tanks, and other secondary bottom ash system equipment.

(B) The total volume that may be discharged for the activities in paragraph (k)(2)(i)(A) of this section shall be reduced or eliminated to the extent achievable using control measures (including best management practices) that are technologically available and economically achievable in light of best industry practice. The total volume of the discharge authorized in this paragraph (k)(2)(i)(B) shall be determined on a case-by-case basis by the permitting authority and in no event shall such discharge exceed a 30-day rolling average of ten percent of the primary active wetted bottom ash system volume. The volume of daily discharges used to calculate the 30-day rolling average shall be calculated using measurements from flow monitors.

(ii) For any electric generating unit with a total nameplate generating capacity of less than or equal to 50 megawatts, that is an oil-fired unit, or for which the owner has certified to the permitting authority that it will cease combustion of coal pursuant to § 423.19(g), the quantity of pollutants discharged in bottom ash transport water shall not exceed the quantity determined by multiplying the flow of the applicable wastewater times the concentration for TSS listed in § 423.12(b)(4).

(A) Where a unit has certified that it will cease combustion of coal pursuant to § 423.19(g) and such unit has permanently ceased coal combustion by December 31, 2028, there shall be no

discharge of pollutants in bottom ash transport water after April 30, 2029.

(B) Where a unit has certified that it will cease combustion of coal pursuant to § 423.19(g) and such unit has failed to permanently cease coal combustion by December 31, 2028, there shall be no discharge of pollutants in bottom ash transport water after December 31, 2028.

(iii) For bottom ash transport water generated by a low utilization electric generating unit, the quantity of pollutants discharged in bottom ash transport water shall not exceed the quantity determined by multiplying the flow of the applicable wastewater times the concentration for TSS listed in § 423.12(b)(4), until the date determined by the permitting authority for meeting the effluent limitations in paragraph (k)(4) of this section, and shall incorporate the elements of a best management practices plan as described in paragraph (k)(3) of this section.

(3) *Best management practices plan.* Where required in paragraph (k)(2)(iii) of this section, the discharger shall prepare, implement, review, and update a best management practices plan for the recycle of bottom ash transport water, and must include:

(i) Identification of the low utilization coal-fired generating units that contribute bottom ash to the bottom ash transport system.

(ii) A description of the existing bottom ash handling system and a list of system components (*e.g.,* remote mechanical drag system, tanks, impoundments, chemical addition). Where multiple generating units share a bottom ash transport system, the plan shall specify which components are associated with low utilization generating units.

(iii) A detailed water balance, based on measurements, or estimates where measurements are not feasible, specifying the volume and frequency of water additions and removals from the bottom ash transport system, including:

(A) Water removed from the BA transport system:

(*1*) To the discharge outfall;

(*2*) To the FGD scrubber system;

(*3*) Through evaporation;

(*4*) Entrained with any removed ash; and

(*5*) To any other mechanisms not specified paragraphs (k)(3)(iii)(A)(*1*) through (*4*) of this section.

(B) Water entering or recycled to the BA transport system:

(*1*) Makeup water added to the BA transport water system.

(*2*) Bottom ash transport water recycled back to the system in lieu of makeup water.

(*3*) Any other mechanisms not specified in paragraphs (k)(3)(iii)(B)(*1*) and (*2*) of this section.

(iv) Measures to be employed by all facilities:

(A) Implementation of a comprehensive preventive maintenance program to identify, repair and replace equipment prior to failures that result in the release of bottom ash transport water.

(B) Daily or more frequent inspections of the entire bottom ash transport water system, including valves, pipe flanges and piping, to identify leaks, spills and other unintended bottom ash transport water escaping from the system, and timely repair of such conditions.

(C) Documentation of preventive and corrective maintenance performed.

(v) Evaluation of options and feasibility, accounting for the associated costs, for eliminating or minimizing discharges of bottom ash transport water, including:

(A) Segregation of bottom ash transport water from other process water.

(B) Minimization of the introduction of stormwater by diverting (*e.g.,* curbing, using covers) storm water to a segregated collection system.

(C) Recycling bottom ash transport water back to the bottom ash transport water system.

(D) Recycling bottom ash transport water for use in the FGD scrubber.

(E) Optimization of existing equipment (*e.g.,* pumps, pipes, tanks) and installing new equipment where practicable to achieve the maximum amount of recycle.

(F) Utilization of ''in-line'' treatment of transport water (*e.g.,* pH control, fines removal) where needed to facilitate recycle.

(vi) Description of the bottom ash recycle system, including all technologies, measures, and practices that will be used to minimize discharge.

(vii) A schedule showing the sequence of implementing any changes necessary to achieve the minimized discharge of bottom ash transport water, including the following:

(A) The anticipated initiation and completion dates of construction and installation associated with the technology components or process modifications specified in the plan.

(B) The anticipated dates that the discharger expects the technologies and process modifications to be fully implemented on a full-scale basis, which in no case shall be later than December 31, 2023.

(C) The anticipated change in discharge volume and effluent quality associated with implementation of the plan.

(viii) Description establishing a method for documenting and demonstrating to the permitting/control authority that the recycle system is well operated and maintained.

(ix) Performance of weekly flow monitoring for the following:

(A) Make up water to the bottom ash transport water system.

(B) Bottom ash transport water sluice flow rate (*e.g.,* to the surface impoundment(s), dewatering bins(s), tank(s), remote mechanical drag system).

(C) Bottom ash transport water discharge to surface water or publicly owned treatment works (POTW).

(D) Bottom ash transport water recycle back to the bottom ash system or FGD scrubber.

(4) *2024 BAT.* (i) Except for those discharges to which paragraphs (k)(4)(ii) through (iv) of this section applies, or when the bottom ash transport water is used in the FGD scrubber, there shall be no discharge of pollutants in bottom ash transport water. Dischargers must meet the discharge limitation in this paragraph (k)(4)(i) by a date determined by the permitting authority that is as soon as possible beginning July 8, 2024, but no later than December 31, 2029. The limitation in this paragraph (k)(4)(i) applies to the discharge of bottom ash transport water generated on and after the date determined by the permitting authority for meeting the discharge limitation, as specified in this paragraph (k)(4)(i).

(ii) For any electric generating unit with a total nameplate generating capacity of less than or equal to 50 megawatts or that is an oil-fired unit, the quantity of pollutants discharged in bottom ash transport water shall not exceed the quantity determined by multiplying the flow of the applicable wastewater times the concentration for TSS listed in § 423.12(b)(4).

(iii) For any electric generating unit for which the owner has submitted a certification pursuant to § 423.19(h), the quantity of pollutants discharged in bottom ash transport water shall continue to be subject to limitations specified in paragraph (k)(1) or (k)(2)(i) or (iii) of this section as incorporated into the existing permit.

(A) Where such unit has permanently ceased coal combustion by December 31, 2034, there shall be no discharge of pollutants in bottom ash transport water after April 30, 2035.

(B) Where such unit has failed to permanently cease coal combustion by December 31, 2034, there shall be no discharge of pollutants in bottom ash transport water after December 31, 2034.

(iv) For bottom ash transport water discharged from any coal combustion residual surface impoundment which commences closure pursuant to 40 CFR 257.102(e) after July 8, 2024, the quantity of pollutants in bottom ash transport water shall not exceed the quantity determined by multiplying the flow of bottom ash transport water times the concentration listed in table 10 to this paragraph (k)(4)(iv).

TABLE 10 TO PARAGRAPH (k)(4)(iv)

Pollutant or pollutant property	BAT effluent limitations	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

(l) *Combustion residual leachate*—(1) *2024 BAT.* (i) Except for those discharges to which paragraph (l)(1)(i)(B) or (C) or (1)(2) of this section applies, there shall be no discharge of pollutants in combustion residual leachate.

(A) Dischargers must meet the effluent limitations for combustion residual leachate in this paragraph (l)(1)(i) by a date determined by the permitting authority that is as soon as possible beginning July 8, 2024, but no later than December 31, 2029. The effluent limitations in this paragraph (l)(1)(i) apply to the discharge of combustion residual leachate generated on and after the date determined by the permitting authority for meeting the effluent limitations, as specified in this paragraph (l)(1)(i).

(B) A facility which submits a request under § 423.19(n) may discharge permeate or distillate from a combustion residual leachate treatment system designed to achieve the limitations in this paragraph (l)(1)(i) for an additional period of up to one year from the date determined in paragraph (l)(1)(i)(A) of this section.

(C) After the retirement of all units at a facility, the quantity of pollutants in combustion residual leachate (CRL) shall not exceed the quantity determined by multiplying the flow of CRL permeate times the concentrations listed in the table 7 to paragraph (g)(3)(i) of this section or the flow of CRL distillate times the concentrations listed in the table following § 423.15(b)(13).

(ii) For combustion residual leachate generated before the date determined by the permitting authority, as specified in paragraph (l)(1)(i) of this section, the EPA is declining to establish BAT limitations and is reserving such limitations to be established by the permitting authority on a case-by-case basis using the permitting authority's best professional judgment.

(2) *2024 BAT subcategories.* (i) Discharges of combustion residual leachate for which the owner has submitted a certification pursuant to § 423.19(h).

(A) Where such unit has permanently ceased coal combustion by December 31, 2034, the quantity of pollutants in combustion residual leachate shall not exceed the quantity determined by multiplying the flow of combustion residual leachate times the concentration listed in table 11 to this paragraph (l)(2)(i)(A) by a date determined by the permitting authority that is as soon as possible beginning 120 days after the facility permanently ceases coal combustion, but no later than April 30, 2035.

TABLE 11 TO PARAGRAPH (l)(2)(i)(A)

Pollutant or pollutant property	BAT effluent limitations	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

(B) Where such unit has failed to permanently cease coal combustion by December 31, 2034, there shall be no discharge of pollutants in combustion residual leachate after December 31, 2034.

(ii) For discharges of unmanaged combustion residual leachate, the quantity of pollutants in unmanaged combustion residual leachate shall not exceed the quantity determined by multiplying the flow of unmanaged combustion residual leachate times the concentration listed in the table 11 to paragraph (l)(2)(i)(A) of this section.

(A) Dischargers must meet the effluent limitations for unmanaged combustion residual leachate in this paragraph (l)(2)(ii) by a date determined by the permitting authority that is as soon as possible beginning July 8, 2024, but no later than December 31, 2029. The effluent limitations in this paragraph (l)(2)(ii) apply to the discharge of unmanaged combustion residual leachate generated on and after the date determined by the permitting authority for meeting the effluent limitations, as specified in this paragraph (l)(2)(ii).

(B) Discharges of unmanaged combustion residual leachate before the date determined in paragraph (l)(2)(ii)(A) of this section.

(iii) For combustion residual leachate discharged from any coal combustion residual surface impoundment which commences closure pursuant to 40 CFR

257.102(e) after July 8, 2024, the quantity of pollutants in combustion residual leachate shall not exceed the quantity determined by multiplying the flow of combustion residual leachate times the concentration listed in table 12 to this paragraph (l)(2)(iii).

TABLE 12 TO PARAGRAPH (l)(2)(iii)

Pollutant or pollutant property	BAT effluent limitations	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

* * * * *

(o) *Transfers.* (1) Transfer between applicable limitations in a permit. Where, in the permit, the permitting authority has included alternative limits subject to eligibility requirements, upon timely notification to the permitting authority under § 423.19(l), a facility can become subject to the alternative limits under the following circumstances:

(i) On or before December 31, 2023, a facility may convert:

(A) From limitations for electric generating units permanently ceasing coal combustion under paragraph (g)(2)(i) or (k)(2)(ii) of this section to limitations for low utilization electric generating units under paragraph (g)(2)(iii) or (k)(2)(iii) of this section; or

(B) From voluntary incentives program limitations under paragraph (g)(3)(i) of this section or generally applicable limitations under paragraph (k)(1)(i) of this section to limitations for low utilization electric generating units under paragraph (g)(2)(iii) or (k)(2)(iii) of this section.

(ii) On or before December 31, 2025, a facility may convert:

(A) From voluntary incentives program limitations under paragraph (g)(3)(i) of this section to limitations for electric generating units permanently ceasing coal combustion under paragraph (g)(2)(i) of this section; or

(B) From limitations for electric generating units permanently ceasing coal combustion under paragraph (g)(2)(i) or (k)(2)(ii) of this section to voluntary incentives program limitations under paragraph (g)(3)(i) of this section or generally applicable limitations under (k)(1)(i) of this section; or

(C) From limitations for low utilization electric generating units under paragraph (g)(2)(iii) or (k)(2)(iii) of this section to generally applicable limitations under paragraph (g)(1)(i) or (k)(1)(i) of this section; or

(D) From limitations for low utilization electric generating units under paragraph (g)(2)(iii) or (k)(2)(iii) of this section to voluntary incentives program limitations under paragraph (g)(3)(i) of this section or generally applicable limitations under paragraph (k)(1)(i) of this section; or

(E) From limitations for low utilization electric generating units under paragraph (g)(2)(iii) or (k)(2)(iii) of this section to limitations for electric generating units permanently ceasing coal combustion under paragraph (g)(2)(i) and (k)(2)(ii) of this section.

(2) A facility must be in compliance with all of its currently applicable requirements to be eligible to file a notice under § 423.19(l) and to become subject to a different set of applicable requirements under paragraph (o)(1) of this section.

(3) Where a facility seeking a transfer under paragraph (o)(1)(ii) of this section is currently subject to more stringent limitations than the limitations being sought, the facility must continue to meet those more stringent limitations.

* * * * *

■ 5. Amend § 423.15 by adding paragraph (c) to read as follows:

§ 423.15 New source performance standards (NSPS).

* * * * *

(c) *2024 NSPS for combustion residual leachate.* (1) Except as provided in paragraph (c)(2) of this section, there shall be no discharge of pollutants in combustion residual leachate (CRL). Whenever CRL is used in any other plant process or is sent to a treatment system at the plant, the resulting effluent must comply with the discharge standard in this paragraph (c).

(2) After the retirement of all units at a facility, the quantity of pollutants in CRL shall not exceed the quantity determined by multiplying the flow of CRL permeate times the concentrations listed in table 7 to § 423.13(g)(3)(i) or the flow of CRL distillate times the concentrations listed in the table in paragraph (b)(13) of this section.

* * * * *

■ 6. Amend § 423.16 by revising paragraphs (e) and (g) and adding paragraph (j) to read as follows:

§ 423.16 Pretreatment standards for existing sources (PSES).

* * * * *

(e) *FGD wastewater*—(1) *2020 PSES.* Except as provided for in paragraph (e)(2) of this section, for any electric generating unit with a total nameplate generating capacity of more than 50 megawatts, that is not an oil-fired unit, and that the owner has not certified that it will cease coal combustion pursuant to § 423.19(g), the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in table 3 to this paragraph (e)(1). Dischargers must meet the standards in this paragraph (e)(1) by October 13, 2023, except as provided for in paragraph (e)(2) of this section. The standards in this paragraph (e)(1) apply to the discharge of FGD wastewater generated on and after October 13, 2023.

TABLE 3 TO PARAGRAPH (e)(1)

Pollutant or pollutant property	PSES	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	18	8
Mercury, total (ng/L)	103	34
Selenium, total (μg/L)	70	29
Nitrate/nitrite as N (mg/L)	4	3

(2) *2020 PSES subcategories.* (i) For FGD wastewater discharges from a low utilization electric generating unit, the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in the table 4 to paragraph (e)(2)(ii) of this section. Dischargers must meet the standards in this paragraph (e)(2)(i) by October 13, 2023.

(ii) If any low utilization electric generating unit fails to timely recertify that the two year average capacity utilization rating of such an electric generating unit is below 10 percent per year as specified in § 423.19(f), regardless of the reason, within two years from the date such a recertification was required, the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in the table 3 to paragraph (e)(1) of this section.

TABLE 4 TO PARAGRAPH (e)(2)(ii)

Pollutant or pollutant property	PSES	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

(3) *2024 PSES.* Except as provided for in paragraph (e)(4) of this section, for any electric generating unit with a total nameplate generating capacity of more than 50 megawatts and that is not an oil-fired unit, there shall be no discharge of pollutants in FGD wastewater. Dischargers must meet the standards in this paragraph (e)(3) by May 9, 2027, except as provided for in paragraph (e)(4) of this section. The standards in this paragraph (e)(3) apply to the discharge of FGD wastewater generated on and after May 9, 2027.

(4) *2024 PSES subcategories.* (i) For any electric generating unit for which the owner has submitted a certification pursuant to § 423.19(h), the quantity of pollutants discharged in FGD wastewater shall continue to be subject to standards specified in paragraph (e)(1) or (2) of this section as incorporated into the existing control mechanism.

(A) Where such unit has permanently ceased coal combustion by December 31, 2034, there shall be no discharge of pollutants in FGD wastewater after April 30, 2035.

(B) Where such unit has failed to permanently cease coal combustion by December 31, 2034, there shall be no discharge of pollutants in FGD wastewater after December 31, 2034.

(ii) For FGD wastewater discharged from any coal combustion residual surface impoundment which commences closure pursuant to 40 CFR 257.102(e) after July 8, 2024, the quantity of pollutants in FGD wastewater shall not exceed the quantity determined by multiplying the flow of FGD wastewater times the concentration listed in the table 5 to this paragraph (e)(4)(ii).

TABLE 5 TO PARAGRAPH (e)(4)(ii)

Pollutant or pollutant property	PSES	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

* * * * *

(g) *Bottom ash transport water*—(1) *2020 PSES.* Except for those discharges to which paragraph (g)(2) of this section applies, or when the bottom ash transport water is used in the FGD scrubber, for any electric generating unit with a total nameplate generating capacity of more than 50 megawatts, that is not an oil-fired unit, that is not a low utilization electric generating unit, and that the owner has not certified that the electric generating unit will cease coal combustion pursuant to § 423.19(g), there shall be no discharge of pollutants in bottom ash transport water. The standard in this paragraph (g)(1) applies to the discharge of bottom ash transport water generated on and after October 13, 2023. Except for those discharges to which paragraph (g)(2) of this section applies, whenever bottom ash transport water is used in any other plant process or is sent to a treatment system at the plant (except when it is used in the FGD scrubber), the resulting effluent must comply with the discharge standard in this paragraph (g)(1). When the bottom ash transport water is used in the FGD scrubber, the quantity of pollutants in bottom ash transport water shall not exceed the quantity determined by multiplying the flow of bottom ash transport water times the concentration listed in table 3 to paragraph (e)(1) of this section.

(2) *2020 PSES subcategories.* (i) The discharge of pollutants in bottom ash transport water from a properly installed, operated, and maintained bottom ash system is authorized under the following conditions:

(A) To maintain system water balance when precipitation-related inflows are generated from a 10-year storm event of 24-hour or longer duration (*e.g.,* 30-day storm event) and cannot be managed by installed spares, redundancies, maintenance tanks, and other secondary bottom ash system equipment; or

(B) To maintain system water balance when regular inflows from wastestreams other than bottom ash transport water exceed the ability of the bottom ash system to accept recycled water and segregating these other wastestreams is feasible; or

(C) To maintain system water chemistry where current operations at the facility are unable to currently manage pH, corrosive substances, substances or conditions causing scaling, or fine particulates to below levels which impact system operation or maintenance; or

(D) To conduct maintenance not otherwise included in paragraphs (g)(2)(i)(A), (B), or (C) of this section and not exempted from the definition of transport water in § 423.11(p), and when water volumes cannot be managed by installed spares, redundancies, maintenance tanks, and other secondary bottom ash system equipment.

(ii) The total volume that may be discharged to a POTW for the activities in paragraphs (g)(2)(i)(A) through (D) of this section shall be reduced or eliminated to the extent achievable as determined by the control authority. The control authority may also include control measures (including best management practices) that are technologically available and economically achievable in light of best industry practice. In no event shall the total volume of the discharge exceed a 30-day rolling average of ten percent of the primary active wetted bottom ash system volume. The volume of daily discharges used to calculate the 30-day rolling average shall be calculated using measurements from flow monitors.

(iii) For bottom ash transport water generated by a low utilization electric generating unit, the quantity of pollutants discharged in bottom ash transport water shall incorporate the elements of a best management practices plan as described in § 423.13(k)(3).

(3) *2024 PSES.* Except for those discharges to which paragraph (g)(4) of this section applies, for any electric generating unit with a total nameplate generating capacity of more than 50 megawatts, that is not an oil-fired unit, there shall be no discharge of pollutants in bottom ash transport water. The standard in this paragraph (g)(3) applies to the discharge of bottom ash transport water generated on and after May 9, 2027. Except for those discharges to which paragraph (g)(4) of this section applies, whenever bottom ash transport water is used in any other plant process or is sent to a treatment system at the plant, the resulting effluent must comply with the discharge standard in this paragraph (g)(3).

(4) *2024 PSES subcategories.* (i) For any electric generating unit for which the owner has submitted a certification pursuant to § 423.19(h), the quantity of pollutants discharged in bottom ash transport water shall continue to be subject to standards specified in paragraph (g)(1) or (2) as incorporated into the existing control mechanism.

(A) Where such unit has permanently ceased coal combustion by December 31, 2034, there shall be no discharge of pollutants in bottom ash transport water after April 30, 2035.

(B) Where such unit has failed to permanently cease coal combustion by December 31, 2034, there shall be no discharge of pollutants in bottom ash transport water after December 31, 2034.

(ii) For bottom ash transport water discharged from any coal combustion residual surface impoundment which commences closure pursuant to 40 CFR 257.102(e) after July 8, 2024, the quantity of pollutants in bottom ash transport water shall not exceed the quantity determined by multiplying the flow of bottom ash transport water times the concentration listed in table 6 to this paragraph (g)(4)(ii).

TABLE 6 TO PARAGRAPH (g)(4)(ii)

Pollutant or pollutant property	PSES	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (µg/L)	11	8
Mercury, total (ng/L)	788	356

* * * * *

(j) *Combustion residual leachate*—(1) *2024 PSES.* (i) Except for those discharges to which paragraph (j)(2) or (j)(1)(ii) of this section applies, there shall be no discharge of pollutants in combustion residual leachate. The standard in this paragraph (j)(1)(i) applies to the discharge of combustion residual leachate generated on and after May 9, 2027. Except for those discharges to which paragraph (j)(2) of this section

applies, whenever combustion residual leachate is used in any other plant process or is sent to a treatment system at the plant, the resulting effluent must comply with the discharge standard in this paragraph (j)(1)(i).

(ii) After the retirement of all units at a facility, the quantity of pollutants in CRL shall not exceed the quantity determined by multiplying the flow of CRL permeate times the concentrations listed in the table 7 to § 423.13(g)(3)(i) or the flow of CRL distillate times the concentrations listed in the table in § 423.15(b)(13).

(2) *2024 PSES subcategories.* (i) Except as described in paragraph (j)(2)(i)(A) of this section, the EPA is declining to establish PSES for electric generating units for which the owner has submitted a certification pursuant to § 423.19(h) and is reserving such standards to be established by the control authority on a case-by-case.

(A) Where such unit has permanently ceased coal combustion by December 31, 2034, the quantity of pollutants in combustion residual leachate shall not exceed the quantity determined by multiplying the flow of combustion residual leachate times the concentration listed in the table 7 to this paragraph (j)(2)(i)(A) no later than April 30, 2035.

TABLE 7 TO PARAGRAPH (j)(2)(i)(A)

Pollutant or pollutant property	PSES	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

(B) Where such unit has failed to permanently cease coal combustion by December 31, 2034, there shall be no discharge of pollutants in FGD wastewater after December 31, 2034.

(ii) For combustion residual leachate discharged from any coal combustion residual surface impoundment which commences closure pursuant to 40 CFR 257.102(e) after July 8, 2024, the quantity of pollutants in combustion residual leachate shall not exceed the quantity determined by multiplying the flow of combustion residual leachate times the concentration listed in table 8 to this paragraph (j)(2)(ii).

TABLE 8 TO PARAGRAPH (j)(2)(ii)

Pollutant or pollutant property	PSES	
	Maximum for any 1 day	Average of daily values for 30 consecutive days shall not exceed
Arsenic, total (μg/L)	11	8
Mercury, total (ng/L)	788	356

■ 7. Amend § 423.17 by adding paragraph (c) to read as follows:

§ 423.17 Pretreatment standards for new sources (PSNS).

* * * * *

(c) *2024 PSNS for combustion residual leachate.* (1) Except as provided in paragraph (c)(2) of this section, there shall be no discharge of pollutants in combustion residual leachate (CRL). Whenever CRL is used in any other plant process or is sent to a treatment system at the plant, the resulting effluent must comply with the discharge standard in this paragraph (c)(1).

(2) After the retirement of all units at a facility, the quantity of pollutants in CRL shall not exceed the quantity determined by multiplying the flow of CRL permeate times the concentrations listed in table 7 to § 423.13(g)(3)(i) or the flow of CRL distillate times the concentrations listed in the table in § 423.15(b)(13).

■ 8. Revise § 423.18 to read as follows:

§ 423.18 Permit conditions.

All permits subject to this part shall include the following permit conditions:

(a) An electric generating unit shall qualify as a low utilization electric generating unit, permanently ceasing the combustion of coal by December 31, 2028, or permanently ceasing the combustion of coal by December 31, 2034, if such qualification would have been demonstrated absent the following qualifying event:

(1) An emergency order issued by the Department of Energy under section 202(c) of the Federal Power Act;

(2) A reliability must run agreement issued by a Public Utility Commission; or

(3) Any other reliability-related order, energy emergency alert, or agreement issued by a competent electricity regulator (*e.g.,* an independent system operator) which results in that electric generating unit operating in a way not contemplated when the certification was made; or

(4) The operation of the electric generating unit was necessary for load balancing in an area subject to a declaration under 42 U.S.C. 5121 *et seq.,* that there exists:

(i) An ''Emergency''; or

(ii) A ''Major Disaster''; and

(iii) That load balancing was due to the event that caused the ''Emergency'' or ''Major Disaster'' in paragraphs

(a)(4)(i) and (ii) of this section to be declared.

(b) Any facility providing the required documentation pursuant to § 423.19(i) may avail itself of the protections of the permit condition in paragraph (a) of this section.

(c) A facility discharging permeate or distillate from an FGD wastewater or combustion residual leachate treatment system and satisfying § 423.19(n) shall be deemed to meet the following requirements:

(1) The FGD wastewater requirements of § 423.13(g)(4) for up to one year after the date determined pursuant to § 423.11(t); and

(2) The combustion residual leachate requirements of § 423.13(l)(1) for up to one year after the date determined pursuant to § 423.11(t).

■ 9. Revise and republish § 423.19 to read as follows:

§ 423.19 Reporting and recordkeeping requirements.

(a) *In general.* Discharges subject to this part must comply with the reporting requirements in this section.

(b) *Signature and certification.* Unless otherwise provided in this section, all certifications and recertifications required in this part must be signed and certified pursuant to 40 CFR 122.22 for direct dischargers or 40 CFR 403.12(l) for indirect dischargers.

(c) *Publicly accessible internet site requirements.* (1) Except as provided in paragraph (c)(2) of this section, each facility subject to one or more of the reporting requirements in paragraphs (d) through (o) of this section must maintain a publicly accessible internet site (ELG website) containing the information specified in paragraphs (d) through (o), if applicable. This website shall be titled ''ELG Rule Compliance Data and Information.'' The facility must ensure that all information required to be posted is immediately available to anyone visiting the site, without requiring any prerequisite, such as registration or a requirement to submit a document request. All required information must be clearly identifiable and must be able to be immediately downloaded by anyone accessing the site in a format that enables additional analysis (*e.g.,* comma-separated values text file format). When the facility initially creates, or later changes, the web address (*i.e.,* Uniform Resource Locator (URL)) at any point, they must notify EPA via the ''contact us'' form on EPA's Effluent Guidelines website and the permitting authority or control authority within 14 days of creating the website or making the change. The facility's ELG website must also have a ''contact us'' form or a specific email address posted on the website for the public to use to submit questions and issues relating to the availability of information on the website.

(2)(i) When an owner or operator subject to this section already maintains a ''CCR Rule Compliance Data and Information'' website pursuant to 40 CFR 257.107, the postings required under this section may be made to the existing ''CCR Rule Compliance Data and Information'' website and shall be delineated under a separate heading that shall state ''ELG Rule Compliance Data and Information.'' When electing to use an existing website pursuant to this paragraph (c)(2), the facility shall notify EPA via the ''contact us'' form on EPA's Effluent Guidelines website and the permitting authority or control authority no later than July 8, 2024, or upon first becoming subject to paragraphs (d) through (o) of this section, whichever is later.

(ii) When the same owner or operator is subject to the provisions of this part for multiple facilities, the owner or operator may comply with the requirements of this section by using the same internet site for multiple facilities provided the ELG website clearly delineates information by the name of each facility.

(3) Unless otherwise required in this section, the information required to be posted to the ELG website must be made available to the public for at least 10 years following the date on which the information was first posted to the ELG website, or the length of the permit plus five years, whichever is longer. All required information must be clearly identifiable and must be able to be immediately downloaded by anyone accessing the site in a format that enables additional analysis (*e.g.,* comma-separated values text file format).

(4) Unless otherwise required in this section, the information must be posted to the ELG website:

(i) Within 30 days of submitting the information to the permitting authority or control authority; or

(ii) Where information was submitted to the permitting authority or control authority prior to July 8, 2024, by July 8, 2024.

(d) *Requirements for facilities discharging bottom ash transport water under this part*—(1) *Certification statement.* For sources seeking to discharge bottom ash transport water pursuant to § 423.13(k)(2)(i) or (g)(2)(i), an initial certification shall be submitted to the permitting authority by the as soon as possible date determined under § 423.11(t), or the control authority by October 13, 2023, in the case of an indirect discharger.

(2) *Signature and certification.* The certification statement must be signed and certified by a professional engineer.

(3) *Contents.* An initial certification shall include the following:

(i) A statement that the professional engineer is a licensed professional engineer.

(ii) A statement that the professional engineer is familiar with the requirements in this part.

(iii) A statement that the professional engineer is familiar with the facility.

(iv) The primary active wetted bottom ash system volume in § 423.11(aa).

(v) Material assumptions, information, and calculations used by the certifying professional engineer to determine the primary active wetted bottom ash system volume.

(vi) A list of all potential discharges under § 423.13(k)(2)(i)(A)(*1*) through (*4*) or § 423.16(g)(2)(i)(A) through (D), the expected volume of each discharge, and the expected frequency of each discharge.

(vii) Material assumptions, information, and calculations used by the certifying professional engineer to determine the expected volume and frequency of each discharge including a narrative discussion of why such water cannot be managed within the system and must be discharged.

(viii) A list of all wastewater treatment systems at the facility currently, or otherwise required by a date certain under this section.

(ix) A narrative discussion of each treatment system including the system type, design capacity, and current or expected operation.

(e) *Requirements for a bottom ash best management practices plan*—(1) *Initial and annual certification statement.* For sources required to develop and implement a best management practices plan pursuant to § 423.13(k)(3), an initial certification shall be made to the permitting authority with a permit application or within two years of October 13, 2021, whichever is later, or to the control authority no later than October 13, 2023, in the case of an indirect discharger, and an annual recertification shall be made to the permitting authority, or control authority in the case of an indirect discharger, within 60 days of the anniversary of the original plan.

(2) *Signature and certification.* The certification statement must be signed and certified by a professional engineer.

(3) *Contents for initial certification.* An initial certification shall include the following:

(i) A statement that the professional engineer is a licensed professional engineer.

(ii) A statement that the professional engineer is familiar with the requirements in this part.

(iii) A statement that the professional engineer is familiar with the facility.

(iv) The best management practices plan.

(v) A statement that the best management practices plan is being implemented.

(4) *Additional contents for annual certification.* In addition to the required contents of the initial certification in paragraph (e)(3) of this section an annual certification shall include the following:

(i) Any updates to the best management practices plan.

(ii) An attachment of weekly flow measurements from the previous year.

(iii) The average amount of recycled bottom ash transport water in gallons per day.

(iv) Copies of inspection reports and a summary of preventative maintenance performed on the system.

(v) A statement that the plan and corresponding flow records are being maintained at the office of the plant.

(f) *Requirements for low utilization electric generating units*—(1) *Notice of Planned Participation.* For sources seeking to qualify as a low utilization electric generating units, a Notice of Planned Participation shall be submitted to the permitting authority or control authority no later than October 13, 2021.

(2) *Contents.* A Notice of Planned Participation shall identify the potential low utilization electric generating unit. The notice shall also include a statement of at least two years' capacity utilization rating data for the most recent two years of operation of each low utilization electric generating unit and a statement that the facility has a good faith belief that each low utilization electric generating unit will continue to operate at the required capacity utilization rating. Where the most recent capacity utilization rating does not meet the low utilization electric generating unit requirement, a discussion of the projected future utilization shall be provided, including material data and assumptions used to make that projection.

(3) *Initial and annual certification statement.* For sources seeking to qualify as a low utilization electric generating unit under this part, an initial certification shall be made to the permitting authority, or to the control authority in the case of an indirect discharger, no later than December 31, 2023, and an annual recertification shall be made to the permitting authority, or control authority in the case of an indirect discharger, within 60 days of submitting annual electricity production data to the Energy Information Administration.

(4) *Contents.* A certification or annual recertification shall be based on the information submitted to the Energy Information Administration and shall include copies of the underlying forms submitted to the Energy Information Administration, as well as any supplemental information and calculations used to determine the two year average annual capacity utilization rating.

(g) *Requirements for units that will achieve permanent cessation of coal combustion by December 31, 2028*—(1) *Notice of Planned Participation.* For sources seeking to qualify as an electric generating unit that will achieve permanent cessation of coal combustion by December 31, 2028, under this part, a Notice of Planned Participation shall be made to the permitting authority, or to the control authority in the case of an indirect discharger, no later than June 27, 2023.

(2) *Contents.* A Notice of Planned Participation shall identify the electric generating units intended to achieve the permanent cessation of coal combustion. A Notice of Planned Participation shall include the expected date that each electric generating unit is projected to achieve permanent cessation of coal combustion, whether each date represents a retirement or a fuel conversion, whether each retirement or fuel conversion has been approved by a regulatory body, and what the relevant regulatory body is. The Notice of Planned Participation shall also include a copy of the most recent integrated resource plan for which the applicable state agency approved the retirement or repowering of the unit subject to the ELGs, certification of electric generating unit cessation under 40 CFR 257.103(b), or other documentation supporting that the electric generating unit will permanently cease the combustion of coal by December 31, 2028. The Notice of Planned Participation shall also include, for each such electric generating unit, a timeline to achieve the permanent cessation of coal combustion. Each timeline shall include interim milestones and the projected dates of completion.

(3) *Annual progress report.* Annually after submission of the Notice of Planned Participation in paragraph (g)(1) of this section, a progress report shall be filed with the permitting authority, or control authority in the case of an indirect discharger.

(4) *Contents.* An annual progress report shall detail the completion of any interim milestones listed in the Notice of Planned Participation since the previous progress report, provide a narrative discussion of any completed, missed, or delayed milestones, and provide updated milestones. An annual progress report shall also include one of the following:

(i) A copy of the official suspension filing (or equivalent filing) made to the facility's reliability authority detailing the conversion to a fuel source other than coal;

(ii) A copy of the official retirement filing (or equivalent filing) made to the facility's reliability authority which must include a waiver of recission rights; or

(iii) An initial certification, or recertification for subsequent annual progress reports, containing either a statement that the facility will make the filing required in paragraph (g)(4)(i) of this section or a statement that the facility will make the filing required in paragraph (g)(4)(ii) of this section. The certification or recertification must include the estimated date that such a filing will be made.

(iv) A facility shall not include a certification or recertification under paragraph (g)(4)(iii) of this section in the final annual progress report submitted prior to permanent cessation of coal combustion. Rather, this final annual progress report must include the filing under paragraph (g)(4)(i) or (ii) of this section.

(h) *Requirements for units that will achieve permanent cessation of coal combustion by December 31, 2034*—(1) *Notice of Planned Participation.* For sources seeking to qualify as an electric generating unit that will achieve permanent cessation of coal combustion by December 31, 2034, under this part, a Notice of Planned Participation shall be made to the permitting authority, or to the control authority in the case of an indirect discharger, no later than December 31, 2025.

(2) *Contents.* A Notice of Planned Participation shall identify the electric generating units intended to achieve the permanent cessation of coal combustion. A Notice of Planned Participation shall include the expected date that each electric generating unit is projected to achieve permanent cessation of coal combustion, whether each date represents a retirement or a fuel conversion, whether each retirement or fuel conversion has been approved by a regulatory body, and what the relevant regulatory body is.

The Notice of Planned Participation shall also include a copy of the most recent integrated resource plan for which the applicable state agency approved the retirement or repowering of the unit subject to the ELGs, or other documentation supporting that the electric generating unit will permanently cease the combustion of coal by December 31, 2034. The Notice of Planned Participation shall also include, for each such electric generating unit, a timeline to achieve the permanent cessation of coal combustion. Each timeline shall include interim milestones and the projected dates of completion. Finally, the Notice of Planned Participation shall also include, for each such electric generating unit, a certification statement that the facility is in compliance with the following limitations or standards:

(i) The applicable limitations or standards for FGD wastewater in § 423.13(g)(1) or (g)(2)(ii) or (iii) or § 423.16(e)(1) or (2); and

(ii) The applicable limitations or standards for bottom ash transport water in § 423.13(k)(1) or (k)(2)(i) or (iii) or § 423.16(g)(1) or (2).

(3) *Annual progress report.* Annually after submission of the Notice of Planned Participation in paragraph (h)(1) of this section, a progress report shall be filed with the permitting authority, or control authority in the case of an indirect discharger.

(4) *Contents.* An annual progress report shall detail the completion of any interim milestones listed in the Notice of Planned Participation since the previous progress report, provide a narrative discussion of any completed, missed, or delayed milestones, and provide updated milestones. An annual progress report shall also include one of the following:

(i) A copy of the official suspension filing (or equivalent filing) made to the facility's reliability authority detailing the conversion to a fuel source other than coal;

(ii) A copy of the official retirement filing (or equivalent filing) made to the facility's reliability authority which must include a waiver of recission rights; or

(iii) An initial certification, or recertification for subsequent annual progress reports, containing either a statement that the facility will make the filing required in paragraph (h)(4)(i) of this section or a statement that the facility will make the filing required in paragraph (h)(4)(ii) of this section. The certification or recertification must include the estimated date that such a filing will be made.

(iv) A facility shall not include a certification or recertification under paragraph (h)(4)(iii) of this section in the final annual progress report submitted prior to permanent cessation of coal combustion. Rather, this final annual progress report must include the filing under paragraph (h)(4)(i) or (ii) of this section.

(i) *Requirements for facilities seeking protections under this part*—(1) *Certification statement.* For sources seeking to apply the protections of the permit conditions in § 423.18(a), and for each instance that § 423.18(a) is applied, a one-time certification shall be submitted to the permitting authority, or control authority in the case of an indirect discharger, no later than:

(i) In the case of an order or agreement under § 423.18(a)(1), 30 days from receipt of the order or agreement attached pursuant to paragraph (i)(2)(ii) of this section; or

(ii) In the case of an ''Emergency'' or ''Major Disaster'' under § 423.18(a)(2), 30 days from the date that a load balancing need arose.

(2) *Contents.* A certification statement must include the following:

(i) The qualifying event from the list in § 423.18(a), the individual or entity that issued or triggered the event, and the date that such an event was issued or triggered.

(ii) A copy of any documentation of the qualifying event from the individual or entity listed under paragraph (i)(2)(i) of this section, or, where such documentation does not exist, other documentation with indicia of reliability for the permitting authority to confirm the qualifying event.

(iii) An analysis and accompanying narrative discussion which demonstrates that an electric generating unit would have qualified for the subcategory at issue absent the event detailed in paragraph (i)(2)(i) of this section, including the material data, assumptions, and methods used.

(3) *Termination of need statement.* For sources filing a certification statement under paragraph (i)(1) of this section, and for each such certification statement, a one-time termination of need statement shall be submitted to the permitting authority, or control authority in the case of an indirect discharger, no later than 30 days from when the source is no longer subject to increased production from the qualifying event.

(4) *Contents.* A termination of need statement must include a narrative discussion including the date the qualifying event terminated, or if it has not terminated, why the source believes the capacity utilization will no longer be elevated to a level requiring the protection of § 423.18.

(j) *Requirements for facilities voluntarily meeting limits in this part*—(1) *Notice of Planned Participation.* For sources opting to comply with the Voluntary Incentives Program requirements of § 423.13(g)(3)(i) by December 31, 2028, a Notice of Planned Participation shall be made to the permitting authority no later than October 13, 2021.

(2) *Contents.* A Notice of Planned Participation shall identify the facility opting to comply with the Voluntary Incentives Program requirements of § 423.13(g)(3)(i), specify what technology or technologies are projected to be used to comply with those requirements, and provide a detailed engineering dependency chart and accompanying narrative demonstrating when and how the system(s) and any accompanying disposal requirements will be achieved by December 31, 2028.

(3) *Annual progress report.* After submission of the Notice of Planned Participation in paragraph (j)(1) of this section, a progress report shall be filed with the permitting authority, or control authority in the case of an indirect discharger.

(4) *Contents.* An annual progress report shall detail the completion of interim milestones presented in the engineering dependency chart from the Notice of Planned Participation since the previous progress report, provide a narrative discussion of completed, missed, or delayed milestones, and provide updated milestones.

(5) *Rollover certification.* Where, prior to October 13, 2020, a discharger has already provided a notice to the permitting authority of opting to comply with the Voluntary Incentives Program requirements of § 423.13(g)(3)(i), such notice will satisfy paragraph (j)(1) of this section. However, where details required by paragraph (j)(2) of this section were missing from the previously provided notice, those details must be provided in the first annual progress report, no later than October 13, 2021.

(k) *Requirements for facilities with discharges of unmanaged combustion residual leachate*—(1) *Annual combustion residual leachate monitoring report.* In addition to reporting pursuant to 40 CFR part 127, each facility with discharges of unmanaged combustion residual leachate meeting the definition in § 423.11(ff)(1) shall file an annual combustion residual leachate monitoring report each calendar year to the permitting authority.

(2) *Contents.* The annual combustion residual leachate monitoring report shall provide the following monitoring data for each pollutant listed in table 1 to paragraph (k)(2)(v) of this section. For paragraphs (k)(2)(ii) and (iii) of this section the report shall also describe the location of monitoring wells, screening depth, and frequency of sampling. The report shall include summary statistics including monthly minimum, maximum, and average concentrations for each pollutant. The report shall be supported by an appendix of all samples.

(i) A list of coal combustion residual landfills and surface impoundments which the permitting authority has determined are point sources with functional equivalent direct discharges.

(ii) Groundwater monitoring data as the combustion residual leachate leaves each of the landfills or surface impoundment listed in paragraph (k)(2)(i) of this section.

(iii) Groundwater monitoring at the point the combustion residual leachate enters a surface waterbody.

(iv) Effluent monitoring data reported pursuant to 40 CFR part 127.

(v) Summary statistics for the data described in paragraphs (k)(2)(ii) through (iv) of this section including the monthly average and daily maximum of each pollutant in the table 1 to this paragraph (k)(2)(v) and a comparison to any limitation in § 423.13(l)(2)(ii).

TABLE 1 TO PARAGRAPH (k)(2)(v)

BAT Treated Pollutants in Combustion Residual Leachate	
Antimony	Magnesium
Arsenic	Manganese
Barium	Mercury
Beryllium	Molybdenum
Cadmium	Nickel
Chromium	Thallium
Cobalt	Titanium
Copper	Vanadium
Lead	Zinc

(l) *Requirements for facilities seeking to transfer between applicable limitations in a permit under this part*—(1) *Notice of Planned Participation.* For sources which have filed a Notice of Planned Participation under paragraph (f)(1), (g)(1), or (j)(1) of this section and intend to make changes that would qualify them for a different set of requirements under § 423.13(o), a Notice of Planned Participation shall be made to the permitting authority, or to the control authority in the case of an indirect discharger, no later than the dates stated in § 423.13(o)(1).

(2) *Contents.* A Notice of Planned Participation shall include a list of the electric generating units for which the source intends to change compliance alternatives. For each such electric generating unit, the notice shall list the specific provision under which this transfer will occur, the reason such a transfer is warranted, and a narrative discussion demonstrating that each electric generating unit will be able to maintain compliance with the relevant provisions.

(m) *Notice of material delay*—(1) *Notice.* Within 30 days of experiencing a material delay in the milestones set forth in paragraph (g)(2), (h)(2), or (j)(2) of this section and where such a delay may preclude permanent cessation of coal combustion or compliance with the voluntary incentives program limitations by December 31, 2028, a facility shall file a notice of material delay with the permitting authority, or control authority in the case of an indirect discharger.

(2) *Contents.* The contents of such a notice shall include the reason for the delay, the projected length of the delay, and a proposed resolution to maintain compliance.

(n) *Requirements for facilities seeking a one-year flexibility to discharge permeate or distillate from an FGD wastewater or combustion residual leachate treatment system designed to achieve limitations in this part*—(1) *Initial request letter.* When filing a permit application or permit modification request, a facility seeking to discharge permeate or distillate during the first year of operations after the date determined in § 423.13(g)(4)(i)(A) or (l)(1)(i)(A) shall include a letter requesting this flexibility from the permitting authority. The initial request letter shall detail the expected type, frequency, duration, and necessity of discharge. The initial request letter shall also state that this period of discharge was not included for consideration in establishing the applicability timing under § 423.11(t)(3).

(2) *Discharge monitoring and reporting.* Upon inclusion in the permit of the flexibility to discharge the permeate or distillate as requested in paragraph (n)(1) of this section, the permitting authority shall also extend any existing monitoring and reporting requirements (*e.g.,* arsenic monitoring).

(o) *Certification for wastewater generated by a 10-year, 24-hour or longer duration storm event*—(1) *Storm Event Discharge Certification Statement.* For sources seeking to discharge low volume wastewater which would otherwise be considered FGD wastewater, bottom ash transport water, or combustion residual leachate but for a storm event exceeding a 10-year, 24-hour or longer duration storm event, a Storm Event Discharge Certification Statement shall be submitted to the permitting authority, or control authority in the case of an indirect discharger, no later than five business days from the last discharge.

(2) *Signature and certification.* The certification statement must be signed and certified by a professional engineer.

(3) *Contents.* A Storm Event Discharge Certification shall include the following:

(i) A statement that the professional engineer is a licensed professional engineer.

(ii) A statement that the professional engineer is familiar with the requirements in this part.

(iii) A statement that the professional engineer is familiar with the facility.

(iv) A statement that the facility experienced a storm event exceeding a 10-year, 24-hour or longer duration, including specifics of the actual storm event that are sufficient for a third party to verify the accuracy of the statement.

(v) A statement that a discharge of low volume wastewater that would otherwise meet the definition of FGD wastewater, bottom ash transport water, or combustion residual leachate was necessary, including a list of the best management practices at the site and a narrative discussion of the ability of on-site equipment and practices to manage the wastewater.

(vi) The duration and volume of any such discharge.

(vii) A statement that the discharge does not otherwise violate any other limitation or permit condition.

RIN 1004–AE92

Conservation and Landscape Health

AGENCY: Bureau of Land Management, Interior.

ACTION: Final rule.

SUMMARY: The Bureau of Land Management (BLM) promulgates this final rule, pursuant to the Federal Land Policy and Management Act of 1976 (FLPMA), as amended, and other relevant authorities, to advance the BLM's multiple use and sustained yield mission by prioritizing the health and resilience of ecosystems across public lands. To support ecosystem health and resilience, the rule provides that the BLM will protect intact landscapes, restore degraded habitat, and make informed management decisions based on science and data. To support these activities, the rule applies land health standards to all BLM-managed public lands and uses, codifies conservation tools to be used within FLPMA's multiple-use framework, and revises existing regulations to better meet FLPMA's requirement that the BLM prioritize designating and protecting areas of critical environmental concern (ACECs). The rule also provides an overarching framework for multiple BLM programs to facilitate ecosystem resilience on public lands.

DATES: The final rule is effective on June 10, 2024.

FOR FURTHER INFORMATION CONTACT: Patricia Johnston, Project Manager for the Conservation and Landscape Health Rule, at 541–600–9693, for information relating to the substance of the final rule. Individuals in the United States who are deaf, deafblind, or hard of hearing, or who have a speech disability, may dial 711 (TTY, TDD, or TeleBraille) to access telecommunications relay services. Individuals outside the United States should use the relay services offered within their country to make international calls to the point-of-contact in the United States.

SUPPLEMENTARY INFORMATION:

I. Executive Summary
II. Background
III. Section-by-Section Discussion of the Final Rule and Revisions From the Proposed Rule
IV. Response to Public Comments
V. Procedural Matters

I. Executive Summary

Under FLPMA, the principles of multiple use and sustained yield govern the BLM's stewardship of public lands, unless otherwise provided by law. The BLM's ability to manage for multiple use and sustained yield of public lands depends on the resilience of ecosystems across those lands—that is, the ability of the ecosystems to withstand disturbance. Ecosystems that collapse due to disturbance cannot deliver ecosystem services, such as clean air and water, food and fiber, wildlife habitat, natural carbon storage, and more. Establishing and safeguarding resilient ecosystems has become imperative as the public lands experience adverse impacts from climate change and as the BLM works to ensure public lands and ecosystem services benefit human communities. The Conservation and Landscape Health Rule establishes the policy for the BLM to build and maintain the resilience of ecosystems on public lands in three primary ways: (1) protecting the most intact, functioning landscapes; [1] (2) restoring degraded habitat and ecosystems; and (3) using science and data as the foundation for management decisions across all plans and programs.

The rule establishes a definition of ''conservation'' that encompasses both protection and restoration actions,[2] recognizing that the BLM must protect intact natural landscapes and restore degraded landscapes to achieve ecosystem resilience. To support efforts to protect and restore public lands, the rule clarifies that conservation is a use on par with other uses of the public lands under FLPMA's multiple-use and sustained-yield mandate. Recognizing that public land conservation is incompatible with a ''one size fits all'' approach, the rule identifies multiple conservation tools to be used where appropriate, including protection of intact landscapes, restoration and mitigation planning, and ACEC designation. Consistent with how the BLM promotes and administers other uses, the rule establishes a durable mechanism—mitigation and restoration leasing—to facilitate both mitigation and restoration on the public lands, while providing opportunities to engage the public in the management of public lands for this purpose. Achieving ecosystem resilience will require, to some extent, the protection of intact landscapes. The goal of the rule is to provide a decision support and prioritization framework for the BLM as it seeks to identify where such protection is appropriate. The rule does not prioritize conservation above other uses; instead, it provides for considering and, where appropriate, implementing or authorizing conservation as one of the many uses managed under FLPMA, consistent with the statute's plain language.

The final rule also clarifies throughout that its provisions should be implemented in a manner that supports land use planning decisions and objectives that emphasize specific uses in specific areas. The Desert Renewable Energy Conservation Plan, for example, identifies Development Focus Areas and conservation areas, as well as conservation and management actions to mitigate the effects of renewable energy development. The 2015 Greater Sage-grouse Plans provide more protections for the most valuable Priority Habitat Management Areas while permitting more activities and related impacts in General Habitat Management Areas. The West-wide Energy Corridors designated by the BLM are identified as areas that are suitable for large transmission lines or pipelines, subject to site-specific analysis of proposed projects and required conditions to avoid or minimize adverse impacts. This preamble and the rule text raise as an example throughout areas that are managed for recreation or degraded lands prioritized for development. The use of this example is not meant to imply that the Bureau permits development only on degraded land.

This final rule does not alter the manner in which the BLM makes or implements these types of land use planning decisions and recognizes how managing for ecosystem resilience across a landscape can incorporate conservation and development, as well as other uses. This recognition is reflected in the rule's approach to identifying and managing areas for landscape intactness, prioritizing areas for restoration, and evaluating land health to inform decision-making.

[1] This rule defines ''intact landscape'' to mean ''a relatively unfragmented landscape free of local conditions that could permanently or significantly disrupt, impair, or degrade the landscape's composition, structure, or function. Intact landscapes are large enough to maintain native biological diversity, including viable populations of wide-ranging species. Intact landscapes provide critical ecosystem services and are resilient to disturbance and environmental change and thus may be prioritized for conservation action. For example, an intact landscape would have minimal fragmentation from roads, fences, and dams; low densities of agricultural, urban, and industrial development; and minimal pollution levels.''

[2] In this rule, conservation is a use; protection and restoration are tools to achieve conservation. Protection is not synonymous with preservation; rather, it allows for active management or other uses consistent with multiple use and sustained yield principles.

The BLM's efforts to protect and restore landscapes and ecosystems and make informed planning, permitting, and program decisions rest on the agency's ability to assess land health conditions and consider those conditions when making decisions. The rule therefore modifies existing BLM practice by applying the fundamentals of land health and related standards and guidelines to all BLM-managed public lands and uses, not just grazing (see § 6103.1(a)). This broad application includes uses, such as oil and gas development and renewable energy generation, that are likely to result in at least local impacts to land health. This rule requires the BLM to take ''appropriate action'' where a specific land use is a factor in failing to achieve land health, but what constitutes ''appropriate action'' may be constrained in a given case both by law and the applicable resource management plan (RMP). For example, where lands are available for solar development under the RMP, options for taking ''appropriate action'' to address land health would not include prohibiting solar development, but may include measures to avoid, minimize, or compensate for impacts from solar development. In general, assessments of land health are intended to inform how uses are managed, rather than if they occur, by providing accurate data on current conditions. In implementing the fundamentals of land health, the rule codifies the need across BLM programs to use high-quality information to prepare land health assessments and evaluations and make determinations about land health condition.

The rule reiterates the importance of meaningful consultation during decision-making processes with Tribes and Alaska Native Corporations on issues that affect their interests, as determined by the Tribes. It requires the BLM to respect and incorporate Indigenous Knowledge into management decisions for ecosystem resilience and directs the BLM to seek opportunities for Tribal co-stewardship of intact landscapes and other lands and ecosystems, consistent with agency and departmental guidance.

Finally, the rule amends the existing ACEC regulations to better assist the BLM in carrying out FLPMA's requirement to give priority to the designation and protection of ACECs. The regulatory changes elaborate on the role of ACECs as the principal administrative designation for protecting important natural, cultural, and scenic resources, and they establish a more comprehensive framework for the BLM to identify, evaluate, and consider special management attention for ACECs in land use planning. The rule emphasizes the role of ACECs in contributing to ecosystem resilience by clarifying that ACEC designation can be used to protect landscape intactness and habitat connectivity.

II. Background

A. The Need for Resilient Public Lands To Achieve Multiple Use and Sustained Yield

The BLM manages approximately 245 million acres of public lands, roughly one-tenth of the land area of the United States. These lands have become increasingly degraded in recent decades through the appearance of invasive species, extreme wildfire events, prolonged drought, and increased habitat fragmentation.[3] Degradation of the health of public lands threatens the BLM's ability to manage public lands as directed by FLPMA.

FLPMA requires that unless ''public land has been dedicated to specific uses according to any other provisions of law,'' the Secretary, through the BLM, must ''manage the public lands under principles of multiple use and sustained yield, in accordance with the land use plans developed by [the Secretary] under section 202 of this Act when they are available'' (43 U.S.C. 1732(a)). The term ''sustained yield'' means ''the achievement and maintenance in perpetuity of a high-level annual or regular periodic output of the various renewable resources of the public lands consistent with multiple use'' (43 U.S.C. 1702(h)).

The term ''multiple use'' means ''the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; the use of some land for less than all of the resources; a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and nonrenewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output.'' (43 U.S.C. 1702(c)).

FLPMA also directs the BLM to ''take any action necessary to prevent unnecessary or undue degradation of the lands.'' (43 U.S.C. 1732(b)). Additionally, section 102(a)(8) of FLPMA declares that it is the policy of the United States that ''the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use'' (43 U.S.C. 1701(a)(8)). Many of these resources and values that FLPMA authorizes the BLM to safeguard emanate from functioning and productive native ecosystems that supply food, water, habitat, and other ecological necessities.

Taken together, FLPMA's mandate to manage public lands for multiple use and sustained yield and its requirement to protect certain resources and values requires balanced management that maintains the availability of such resources and values for future generations. (See 43 U.S.C. 1702(c)) Widespread degradation of land health significantly limits the ability of public lands and their ecosystems to provide such resources and values and is inconsistent with the management direction and responsibility conferred to the BLM through FLPMA. The general resilience of public lands will determine the BLM's ability to effectively manage for multiple use and sustained yield over the long term. Resilience is a critical ecosystem trait that allows ecosystems to maintain or regain their composition, structure, and function following disturbances, including those resulting from changing environmental conditions. For example, maintaining habitat connectivity allows organisms to adapt to a changing climate from the North Slope of Alaska to the Rio Grande Valley of Colorado and New Mexico. To ensure the resilience of public lands,

[3] See, *e.g.,* Long-Term Trends in Vegetation on Bureau of Land Management Rangelands in the Western United States (*https://www.sciencedirect.com/science/article/pii/S1550742422001075*); Greater Sage-grouse Plan Implementation: Range-wide Monitoring Report 2015–2020 (*https://eplanning.blm.gov/public_projects/2016719/200502020/20050224/250056407/Greater%20Sage-Grouse%20Five-year%20Monitoring%20Report%202020.pdf*).

FLPMA provides the BLM with ample authority and direction to conserve ecosystems and other resources and values across the public lands.

The BLM recognizes this need for public lands to continue to provide resources and values when declaring its mission ''to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations.'' (*blm.gov;* see also 43 U.S.C. 1702(c)) Without ensuring that public lands and their component ecosystems can maintain their function and be resilient to future change, the agency risks failing on its statutory mandate and its commitment to future generations.

To assist the BLM in carrying out its mission and statutory mandate, this rule provides direction and tools to protect and restore landscapes and ecosystems and make decisions supported by science and data, assisting the agency in managing for resilient landscapes that support multiple uses and sustained yield of resources and preventing unnecessary or undue degradation of the lands and their resources. As intact landscapes play a central role in maintaining the resilience of an ecosystem, the rule emphasizes protecting those public lands with intact, functioning landscapes and restoring others. This rule is designed to support sustained yield such that the nation's public lands can continue to supply food, water, habitat, and other ecological necessities that can resist and recover from drought, wildfire, and other disturbances, and continue to provide energy, forage, timber, recreational opportunities, and safe and reliable access to minerals.

B. Conservation Use for Resilient Public Lands

Conservation is a key strategy for supporting resilient public lands, now and into the future. Conservation takes many forms on public lands, including in the ways grazing, recreation, forestry, wildlife and fisheries management, and many other uses are carried out. Conservation is both a land use and also an investment in the landscape intended to increase the yield of certain other benefits elsewhere or later in time. This rule focuses on conservation as a land use within the multiple use framework, including in decision-making, authorization, and planning processes. The rule develops the toolbox for conservation use—defined here as encompassing both protection and restoration actions—enabling some of the many conservation strategies the agency employs to steward the public lands for multiple use and sustained yield.

FLPMA has always encompassed conservation as a land use. As described above, FLPMA authorizes and obligates the BLM to, within the multiple use framework, protect natural resources, preserve public lands, and provide habitat for fish and wildlife, among other conservation measures. The BLM has been practicing conservation of the public lands throughout the agency's history. The change this rule aims to achieve is providing clear, consistent, and informed direction, vetted and shaped by public input, for conservation use to be implemented on the public lands in support of ecosystem resilience.

The rule does not prioritize conservation above other multiple uses. It also does not preclude other uses where conservation use is occurring. Many uses are compatible with different types of conservation use, such as sustainable recreation, grazing, and habitat management. The rule also does not enable conservation use to occur in places where an existing, authorized, and incompatible use is occurring.

One of the primary tools for conservation use that is established in this rule is restoration and mitigation leasing (called conservation leasing in the proposed rule). Restoration or mitigation leases can help facilitate dynamic landscape management over time by allowing an area to recover and be available for other uses after the termination of the lease. For example, a restoration lessee may collaborate with an existing grazing permittee to restore degraded rangeland with the ultimate goal of resuming sustainable grazing. These leases are not the only way to conduct restoration and mitigation on the public lands; these types of conservation activities occur in many ways. The leases provide a clear and consistent tool for those actions when appropriate and useful. Like all conservation uses included in the rule, restoration and mitigation leases will not be used where existing rights and authorized uses are in place that would conflict with the conservation use.

The BLM has, over the years, developed and revised regulations for many multiple uses, whereas a placeholder has remained in Title 43 of the CFR for the agency to develop regulations broadly pertaining to conservation. With this rule, the BLM provides necessary regulations for using conservation to support ecosystem resilience and landscape health.

C. Management Decisions To Build Resilient Public Lands

The rule recognizes that the BLM has three primary ways of applying conservation actions to manage for resilient public lands that inform one another and potentially overlap: (1) protection of intact, functioning landscapes; (2) restoration of degraded habitats and ecosystems; and (3) making decisions informed by appropriate conservation considerations identified through the development and execution of plans, programs, and permits. The organization of the rule text emanates from this structure, with principal sections on (1) protection of landscape intactness and guidance on the identification and designation of ACECs; (2) direction to plan for and restore degraded habitats; and (3) instruction for management actions to facilitate conservation, including application of mitigation, all based on the use of high-quality information and adherence to land health standards for all BLM programs.

1. Protection

As intact landscapes play a central role in maintaining the resilience of ecosystems, the rule provides direction for the protection of intact, functioning landscapes. The final rule directs the BLM to maintain an inventory of landscape intactness as a resource value and identify intact landscapes in land use plans and to protect the intactness of certain landscapes by, for example, implementing conservation actions that maintain ecosystem resilience and conserving landscape intactness when managing compatible uses. Inventories of landscape intactness focus on an estimate of naturalness measured against human-caused disturbance and influence. The BLM intends to assess intactness through use of watershed condition assessments consistent with peer-reviewed methods developed jointly with the U.S. Geological Survey.[4] One of the principal administrative tools the BLM has available to protect public land resources is the designation of ACECs. ACECs are areas where special management attention is needed to protect important historical, cultural, and scenic values or fish and wildlife or other natural resources; ACECs can also be designated to protect human life and safety from natural hazards. The rule clarifies and expands existing ACEC regulations to better support the BLM in carrying out FLPMA's direction to give

[4] See, for instance, this collaborative effort between the BLM and the USGS: A Multiscale Index of Landscape Intactness for the Western U.S. | U.S. Geological Survey (*usgs.gov*).

priority to the designation and protection of these important areas.

Pursuant to Executive Order 14072, *Strengthening the Nation's Forests, Communities, and Local Economies,* 87 FR 24851 (Apr. 22, 2022), and consistent with managing for multiple use and sustained yield and other applicable law, the BLM is working to ensure that forests and woodlands on public lands, including old and mature forests and woodlands, are managed to: promote their continued health and resilience, retain and enhance carbon storage, recruit old-growth forests and characteristics, conserve biodiversity, mitigate the risk of wildfires, enhance climate resilience, enable subsistence and cultural uses, provide outdoor recreation opportunities, and promote sustainable local economic development. Older forests and woodlands, including pinyon and juniper woodlands, which are the BLM's most abundant old forest type, have characteristics that contribute to ecosystem resilience and further the objectives of this rule. The characteristics include providing important wildlife habitat, maintaining intact landscapes, contributing ecosystem services, and harboring significant social and cultural values for human communities. As such, these resources will be considered and evaluated for protection and expansion under multiple provisions of the rule.

2. Restoration

To promote consistency in its application, the final rule establishes principles for the design and implementation of BLM restoration actions on public lands. To direct restoration efforts, the rule also requires that resource management plans identify restoration outcomes and that the BLM identify priority landscapes for restoration, develop restoration plans, and track implementation of restoration actions.

The rule offers new tools in the form of restoration leases and mitigation leases that allow qualified entities to directly support efforts to build and maintain resilient public lands. These leases will be available to entities seeking to restore public lands or mitigate reasonably foreseeable impacts from an authorized activity. Leases will not override valid existing rights or preclude other, subsequent authorizations so long as those authorizations are compatible with the restoration or mitigation use. The rule establishes the process for applying for and granting leases, terminating or suspending them, determining noncompliance, and setting bonding obligations. The rule expresses a preference for lease applications that are derived from collaboration with existing permittees, lease holders, or adjacent land managers or owners, or that include other specific factors enumerated in 6102.4(d) that will make lease issuance more likely. Restoration and mitigation leases will be issued for a term consistent with the time required to achieve their objectives. Restoration leases will be issued for a maximum of 10 years but can be renewed if necessary to serve the purposes for which the lease was first issued. Once these purposes have been achieved, the lease will not warrant renewal. Any mitigation lease will require a term commensurate with the impact(s) it is offsetting. Restoration and mitigation leases may also provide opportunities for co-stewardship with federally recognized Tribes.

3. Management Actions for Decision-Making

The final rule delineates how its goals can be achieved when implementing programs, establishing land use plans, and authorizing use. In doing so, the rule requires the BLM to use high-quality information, including Indigenous Knowledge. To ensure the BLM does not limit its ability to build resilient public lands when authorizing use, the rule requires the BLM to apply a mitigation hierarchy (*i.e.,* take actions to avoid, minimize, and compensate for certain residual impacts, generally in that order). (See § 6102.5.1(a)).[5] For important, scarce, or sensitive resources, the BLM must apply the mitigation hierarchy with particular care, with the goal of eliminating, reducing, and/or offsetting impact on the resource. The rule also establishes regulations to govern the BLM's approval of a third-party mitigation fund holder.

The final rule highlights the importance of environmental justice in decision-making, including advancing environmental justice through restoration and mitigation actions as one of the rule's objectives. The BLM is implementing Executive Order 14008 on *Tackling the Climate Crisis at Home and Abroad,* 86 FR 7619 (Jan. 27, 2021) and Executive Order 14096 on *Revitalizing Our Nation's Commitment to Environmental Justice for All,* 88 FR 25251 (Apr. 26, 2023), which establish environmental justice initiatives and policy goals.[6] The BLM issued guidance in September 2022 clarifying minimum requirements for incorporating environmental justice considerations in environmental reviews (Instruction Memorandum 2022–059, ''Environmental Justice Implementation''). This rule builds on the agency's current commitments and direction by highlighting opportunities to address impacts to disadvantaged communities that are marginalized by underinvestment and overburdened by pollution and to advance environmental justice. In planning for and prioritizing landscapes for restoration, the rule requires consideration of where restoration can address impacts on communities' environmental justice concerns, as well as other social and economic benefits. Environmental justice considerations are also identified as a factor in evaluating proposals for restoration and mitigation lease applications.

To support conservation actions and decision-making, the rule extends the application of the fundamentals of land health (taken verbatim from the existing fundamentals of rangeland health at 43 CFR 4180.1 (2005)) and related standards and guidelines to all lands managed by the BLM and across all program areas. The fundamentals are general descriptions of conditions that maintain the health and functionality of watersheds, ecological processes, water quality, and threatened, endangered, and special-status species habitat. The standards measure the level of physical and biological conditions required for healthy lands and sustainable uses of public lands, essentially identifying trends toward achieving or not achieving desired conditions. Assessment and evaluation of the standards informs decision-making at all levels of the BLM, including decisions made in resource management plans. However, it is the evaluation of multiple lines of evidence to conclude whether or not each land health standard is being achieved that is most relevant to a decision maker. Multiple lines of evidence that may be used to evaluate land health include, but are not limited to, standardized quantitative monitoring data, remote sensing-derived maps and data, qualitative assessments, photos, water quality data, habitat assessments, disturbance and land use

[5] The BLM's final rule adopts the definition of ''mitigation'' used by the Council on Environmental Quality's regulations implementing the procedural requirements of NEPA, 40 CFR 1508.1(s), including for compensatory mitigation: ''Compensating for the effect by replacing or providing substitute resources or environments.'' *Id.* § 1508.1(s)(5). This definition also aligns with existing BLM policy, including its Mitigation Manual Section, MS–1794, and its Mitigation Handbook, H–1794–1.

[6] These efforts build on prior Executive Orders, such as Executive Order 12898 on *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,* 59 FR 7629 (Feb. 11, 1994).

history, and weather and climate data relevant to each land health standard. Determining if a standard is being achieved, or not achieved, can inform how a land use may be modified or adapted to improve land health conditions consistent with the fundamentals. The rule does not require, however, that individual actions ''comply'' with the fundamentals of land health, nor does it require achievement of those fundamentals (as measured by the land health standards) as a precondition for any BLM decision.

Currently, the fundamentals of land health and related standards apply only to rangeland systems where the BLM authorizes grazing.[7] Existing land health standards vary across regions and states creating a complex, but locally adapted system of rangeland evaluation. The rule includes a process for developing and adopting consistent national land health standards and amending or supplementing them to apply them more effectively to habitats managed by the BLM other than rangelands (*e.g.,* forests, deserts, shrublands, wetlands). Until the BLM has developed a consistent set of national standards, existing standards and indicators will be applied according to the process described within this rule. However, broadening the applicability of existing land health standards ensures the BLM will more formally and consistently consider the condition of public lands in decision-making. The rule includes instruction, largely consistent with the existing framework at 43 CFR 4180.1, on how the BLM must assess, evaluate, and determine if public lands are meeting land health standards. At a critical moment in the health and history of our public lands, the rule directs the BLM to perform such assessments and evaluations at broad spatial and temporal scales, thereby creating efficiencies in the land health process and opportunities to streamline permit renewals and authorizations.

D. Tribal Engagement and Co-Stewardship

The final rule reflects the U.S. Government's special relationship with Indian Tribes by incorporating updated requirements for government-to-government consultation, provisions for respecting Indigenous Knowledge, and direction to seek opportunities for Tribal co-stewardship.

The BLM is committed to working with Tribes in the management of the public lands, which are the ancestral homelands of many American Indian and Alaska Native Tribes. The BLM is the country's largest land manager, and it is vital that the BLM respect the nation-to-nation relationship that exists with American Indian and Alaska Native Tribes while incorporating co-stewardship where possible. Engaging with Tribes through co-stewardship opportunities is a priority for the BLM as identified in: Joint Secretarial Order 3403 on *Fulfilling the Trust Responsibility to Indian Tribes in the Stewardship of Federal Lands and Waters* (Nov. 15, 2021); BLM Permanent Instruction Memorandum No. 2022–011, *Co-Stewardship with Federally Recognized Indian and Alaska Native Tribes Pursuant to Secretary's Order 3403* (Sept. 13, 2022); and the Department of the Interior Departmental Manual Part 502, *Collaborative and Cooperative Stewardship with Tribes and the Native Hawaiian Community.*

In response to comments and consultation on the proposed rule,[8] the BLM made several updates to the final rule to better embrace its commitment to working with Tribes in managing the public lands for ecosystem resilience and landscape health. A stated objective of the final rule (43 CFR 6101.2(i)) is to: ''[i]mprove engagement and co-stewardship of public lands with Tribal entities and promote the use of Indigenous Knowledge in decision-making.'' The final rule intends to achieve this objective through provisions for Tribal consultation, incorporation of Indigenous Knowledge, and co-stewardship.

The final rule directs the BLM to meaningfully consult with Indian Tribes and Alaska Native Corporations on actions that are determined, after allowing for Tribal input, to potentially have a substantial effect on the Tribe or Corporation. In taking management actions for ecosystem resilience, and in recognition that Tribes can initiate consultation upon request, the final rule requires the BLM to meaningfully consult with Indian Tribes and Alaska Native Corporations during the decision-making process. These changes promote consistency with Departmental Manual guidance for consultation with Tribes.

The rule includes guidance for respecting and considering Indigenous Knowledge and directs the BLM to identify opportunities for co-stewardship as an overarching objective and specifically when managing intact landscapes, planning restoration actions on public lands, and taking management actions for ecosystem resilience.

The final rule also includes updated definitions for Indigenous Knowledge and high-quality information to reflect current guidance and to make clear that Indigenous Knowledge qualifies as high-quality information when it is gained by prior informed consent, free of coercion, and generally meets the standards for high-quality information.

E. Inventory, Evaluation, Designation, and Management of ACECs

To implement FLPMA's direction to ''give priority to the designation and protection of areas of critical environmental concern,'' (43 U.S.C. 1712(c)(3)), the rule updates regulatory requirements found at 43 CFR 1610.7–2 and codifies policy instruction found in the BLM Manual that guides its treatment of ACECs. (*https://www.ntc.blm.gov/krc/system/files?file=legacy/uploads/5657/5_1613_ACEC_Manual%201988.pdf*) The BLM inventories, evaluates, and designates ACECs as part of the land use planning process. The land use planning process guides BLM resource management decisions in a manner that allows the BLM to respond to issues and consider trade-offs among environmental, social, and economic values in determining appropriate land uses for specific areas. Further, the planning process requires coordination, cooperation, and consultation and provides other opportunities for public involvement that can foster relationships, build trust, and result in durable decision-making.

In 40 years of applying the procedures found at 43 CFR 1610.7–2 and in the ACEC Manual, the BLM has identified a need for several revisions that it has now made in this final rule. These revisions are needed to provide clear direction and comprehensive guidance encompassing all elements of the ACEC designation and management process.

[7] The BLM currently maintains inventory, assessment and monitoring data from its implementation of the grazing regulations related to rangeland health through the agency's Assessment, Inventory, and Monitoring (AIM) program, and makes this data available to the public. *https://www.blm.gov/aim.*

[8] Pueblo of Tesque Comments on Bureau of Land Management Conservation and Landscape Health Rule (July 5, 2023), ; Pyramid Lake Paiute Tribe, Public Comment Regarding the Proposed Public Lands Rule (June 27, 2023), *https://www.regulations.gov/comment/BLM-2023-0001-153233;* Northwest Arctic Native Association (NANA) Regional Corporation, Inc., Comments—Proposed Conservation and Landscape Health Rule (July 5, 2023), *https://www.regulations.gov/comment/BLM-2023-0001-154147;* Colorado River Indian Tribes, Comments on BLM Proposed Federal Land Policy and Management Act of 1979 (FLPMA) Regulations on Conservation and Landscape Health (June 20, 2023), *https://www.regulations.gov/comment/BLM-2023-0001-120501;* Ute Indian Tribe of the Uintah and Ouray Reservation, Comments on the Bureau of Land Management Proposed Rule on Conservation and Landscape Health (June 27, 2023), *https://www.regulations.gov/comment/BLM-2023-0001-147694.*

Additionally, the final rule codifies the BLM's procedures for considering and designating potential ACECs, providing more cohesive direction and consistency than the previous procedures, which were described partially in regulation and partially in agency policy. The rule maintains the general process for inventorying, evaluating, designating, and managing ACECs, but makes specific changes to clarify and improve that process. The process is generally described here, with more detailed explanation in the ''Section-by-Section Discussion of the Final Rule and Revisions from the Proposed Rule'' and in the ''Response to Public Comments'' sections of this preamble to the final rule.

In the initial stages of the land use planning process, the BLM, through inventories and external nominations, identifies any potential new ACECs to evaluate for relevance, importance, and the need for special management attention. The BLM determines whether such special management attention is needed by evaluating land use planning alternatives and considering additional issues related to the management of the proposed ACEC, including public comments received during the planning process. Special management measures may also provide an opportunity for Tribal co-stewardship. In approved resource management plans, the BLM identifies all designated ACECs and provides the management direction necessary to protect the relevant and important values for which the ACECs were designated.

This rule establishes procedures that require the BLM to consider ecosystem resilience, landscape-level needs, and rapidly changing landscape conditions in designating and managing ACECs, and it establishes a management standard to ensure ACEC values are appropriately conserved. The rule also provides that the BLM may, at the agency's discretion, implement temporary management for potential ACECs identified outside of an ongoing planning process until the potential ACEC can be evaluated for designation through a land use planning process. When implementing temporary management, the BLM will comply with all applicable laws, including the National Environmental Policy Act (NEPA), notify the public of the temporary management, and periodically reevaluate its decision to provide for temporary management. These provisions do not change the presumption that the BLM generally addresses its management of areas that may be appropriate for an ACEC designation through the land use planning process. The final rule also codifies research natural areas as a type of ACEC designated for the primary purpose of research and education on public lands, consistent with existing regulations (43 CFR subpart 8223) and policy.

The BLM intends to revise its ACEC manual to integrate the new and existing regulations into policy and provide more detailed guidance for their implementation. Guidance will help the BLM and the public better understand how the ACEC regulations are applied on a case-by-case basis.

F. Statutory Authority

FLPMA establishes the BLM's mission to manage public lands ''under principles of multiple use and sustained yield'' (except for lands where another law directs otherwise). (43 U.S.C. 1732(a)) Multiple use is defined as:

> the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; the use of some land for less than all of the resources; a combination of balanced and diverse resource uses that takes into account the long- term needs of future generations for renewable and nonrenewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output.

(43 U.S.C. 1702(c)). Sustained yield is defined as, ''the achievement and maintenance in perpetuity of a high-level annual or regular periodic output of the various renewable resources of the public lands consistent with multiple use.'' (43 U.S.C. 1702(h)).

FLPMA also authorizes the Secretary to promulgate implementing regulations necessary ''to carry out the purposes'' of the Act. (43 U.S.C. 1740) This rule, enacted under that authority, (1) defines and regulates conservation use on the public lands in service of FLPMA's multiple use and sustained yield mandates; (2) provides for third-party authorizations to use the public lands for restoration and mitigation under FLPMA section 302(b) (43 U.S.C. 1732(b)); and (3) revises the existing regulations implementing FLPMA's direction in sections 201(a) and 202(c)(3) (43 U.S.C. 1711(a) and 1712(c)(3)) that the BLM shall give priority to the designation and protection of ACECs. (*See also* 43 U.S.C. 1701(a)(11) (''[I]t is the policy of the United States that—regulations and plans for the protection of public land areas of critical environmental concern be promptly developed.'')).

This rule clarifies that conservation is a use on par with other uses and responds to the direction inherent in FLPMA's multiple use and sustained yield mandate to manage public lands for resilience and future productivity and to mitigate resource impacts. A number of comments questioned the BLM's authority to treat ''conservation'' as a use within FLPMA's multiple use framework. As a general matter, the definition of ''multiple use'' makes clear, and courts have affirmed, that managing some lands for conservation use is a permissible, and indeed crucial, aspect of managing public lands under the principles of multiple use and sustained yield, as FLPMA requires. (*See* 43 U.S.C. 1702(c); *see also New Mexico ex rel. Richardson* v. *BLM,* 565 F.3d 683, 710 (10th Cir. 2009) (''It is past doubt that the principle of multiple use does not require BLM to prioritize development over other uses . . . BLM's obligation to manage for multiple use does not mean that development must be allowed . . . Development is a possible use, which BLM must weigh against other possible uses—including conservation to protect environmental values.''); *Theodore Roosevelt Conservation P'ship* v. *Salazar,* 616 F.3d 497, 518 (D.C. Cir. 2010) (''[T]he Bureau has wide discretion to determine how those [FLPMA] principles [of multiple use and sustained yield] should be applied.''); *Or. Nat. Desert Ass'n* v. *BLM,* 531 F.3d 1114, 1134 (9th Cir. 2008) (recognizing that the BLM's ''wide authority to manage the public lands under principles of multiple use and sustained yield allows it ample discretion for management of lands with wilderness values'')).

Public Comments on Statutory Authority

Several comments suggested more specifically that the decision in *Public Lands Council* v. *Babbitt,* 167 F.3d 1287 (10th Cir. 1999), would prohibit the restoration and mitigation leases available under this rule.

We disagree. In that case, the Tenth Circuit held that the Taylor Grazing Act and section 402 of FLPMA could not authorize ''issuing a 'grazing permit' that excludes livestock grazing for the entire term of the permit.'' *Id.* at 1307.

The court, therefore, enjoined the regulations purporting to authorize Taylor Grazing Act permits that provided for no grazing. In doing so, the Tenth Circuit expressly stated that the question in the case was ''not whether the Secretary possesses general authority to take conservation measures—which clearly he does.'' *Id.*

The present rule, in contrast to the grazing rule at issue in *Public Lands Council* v. *Babbitt,* is an exercise of that authority to take conservation measures. It does not rely on the Taylor Grazing Act, nor does it modify the terms and conditions available for grazing permits or authorize the BLM to issue grazing permits approving non-grazing uses. Rather, this rule provides for a separate category of leases, which can be exercised on public lands in areas with other ongoing uses, such as active grazing, consistent with the BLM's authority under FLPMA to ''manage the public lands under principles of multiple use and sustained yield'' (43 U.S.C. 1732(a)) and to ''regulate, through easements, permits, leases, licenses, published rules, or other instruments as the Secretary deems appropriate, the use, occupancy, and development of the public lands.'' (43 U.S.C. 1732(b)) The final rule renames what the proposed rule called ''conservation leases'' as ''restoration leases'' and ''mitigation leases'' to more precisely describe the activities that would be authorized on the leased lands.

A number of comments that object to including ''conservation'' alongside other uses in FLPMA's multiple use framework, including a letter from the Small Business Administration, Office of Advocacy (Advocacy), point to the absence of the word ''conservation'' from FLPMA's definition of ''principal or major uses.'' (*See* 43 U.S.C. 1702(*l*))

We disagree. Those comments misapprehend the meaning of the term ''principal or major uses'' within the statutory framework established by FLPMA. That term does not appear in any of FLPMA's discussion of multiple use, and the principal or major uses included in the definition of that term do not hold an exclusive or even superior position within the multiple use framework. Indeed, that defined term appears in FLPMA only in section 202(e) (43 U.S.C. 1712(e)), which provides that all land use plan decisions are subject to revision and modification and—specific to principal or major uses—includes a Congressional reporting provision (section 202(e)(2)) that contains no substantive constraint on the BLM's authority. The Advocacy letter asserts that restoration or mitigation leases must be submitted to Congress, citing Section 202(e)(2). But section 202(e)(2) merely provides for congressional *notification* if a management decision ''excludes (that is, totally eliminates)'' one or more of the principal or major uses for two or more years on an area exceeding one hundred thousand acres or more'' of the public lands. (43 U.S.C. 1712(e)(2)) The adoption of the final rule does not immediately result in any restoration or mitigation lease going into effect, much less one that covers one hundred thousand or more acres, let alone one that ''totally eliminates'' a principal or major use on such an area for two or more years. Nor does it follow from the rule that the leases the BLM does issue would necessarily meet the criteria to trigger section 202(e)(2). More importantly, the Advocacy letter fails to grapple with the necessary and obvious implication of this provision: Congress's clear recognition that the BLM is *authorized* to take actions that would exclude principal or major uses—including from large tracts of land—as long as it reports such actions to Congress when it does. In short, the provision is not only inapplicable to most, if not all, restoration and mitigation leases that may be issued under this rule, but it clearly demonstrates that the BLM has the authority Advocacy claims it lacks.

Several commenters suggested that the issuance of a final rule that recognizes conservation as a use of the public lands and allows for the issuance of restoration and mitigation leases might be challenged in federal court under the Administrative Procedure Act, speculating further that a reviewing court might evaluate these features of the rulemaking under the major questions doctrine.

We disagree. The Supreme Court deemed the major questions doctrine to apply when an agency's asserted statutory authority is unclear and when the ''history and the breadth of the authority'' and the ''economic and political significance'' of its assertion provide a ''reason to hesitate.'' *West Virginia* v. *EPA,* 142 S. Ct. 2587, 2595 (2022). But as this preamble to this final rule explains elsewhere in detail, and as courts have confirmed, FLPMA's animating principles of multiple use and sustained yield embrace conservation use as an integral component of the BLM's stewardship of the public lands. Moreover, while restoration and mitigation leases are specific new tools for managing the public lands, FLPMA provides clear and broad authority to manage the public lands at the discretion of the Secretary, including for conservation use, for the reasons described in detail above, and including through leases. (43 U.S.C. 1732(a)–(b))

The BLM has a long history of exercising that broad regulatory authority to manage its lands through leases and similar instruments, including by issuing permits or right-of-way grants that authorize the permit holder to implement restoration and mitigation as a component or a condition of an authorization to use the public lands for development or extractive purposes. See, *e.g.,* M–37039, The Bureau of Land Management's Authority to Address Impacts of its Land Use Authorizations through Mitigation, at 11–22 (Dec. 21, 2016) (reinstated by M–37075 (Apr. 15, 2022)) (''[The] BLM's charge under FLPMA to manage public lands based on principles of multiple use and sustained yield supports use of mitigation. The authority to evaluate and impose mitigation arises out of the broad authority FLPMA vests in the BLM to pursue congressional goals . . . for public lands. The BLM can evaluate and require mitigation through both the land use planning process and site-specific authorizations.''); *Theodore Roosevelt Conservation P'ship,* 616 F.3d at 505–06, 515–17 (concerning planning decision that outlined mitigation measures to be imposed as conditions of approval for oil and gas drilling). For the reasons noted above, Congress has spoken clearly that conservation—including in the forms of restoration or mitigation—is an appropriate use of the public lands and that, where a given use of the public lands is appropriate, leasing is an appropriate means to regulate such use.

Several commenters noted that a different BLM rule—Resource Management Planning, 81 FR 89580 (Dec. 12, 2016)—was subject to a congressional joint resolution of disapproval under the Congressional Review Act (CRA) (5 U.S.C. 802). These commenters suggested that this rule, therefore, may be precluded by the CRA provision that ''a new rule that is substantially the same as'' a rule that does not continue in effect due to a joint resolution of disapproval may not be issued. (5 U.S.C. 801(b)(2))

We disagree. This rule, which would promulgate a series of new regulations at 43 CFR part 6100 and make changes to 43 CFR 1610.7–2, is not substantially the same as the BLM's 2016 rule. The 2016 rule included amendments to § 1610.7–2, but they were different in substance and form from the revisions proposed in this rule and involved a much broader amendment to all of the

planning regulations at 43 CFR part 1600. For example, this rule identifies ''landscape intactness'' as a value meriting consideration for conservation, including through designation of ACECs, and calls for land health evaluations at geographic scales broader than grazing allotments. But these features of the present rule do not amount to the same landscape-scale planning approach that was central to the 2016 rule, and which would have been (and would need to be) implemented through a wholesale revision of the planning regulations at 43 CFR part 1600.

A number of comments noted that the BLM's management of the public lands is subject to additional laws beyond FLPMA and in some cases asked that the BLM limit the geographic scope of the final rule to exclude areas of public lands where another statute provides direction or informs how the BLM should manage those lands.

We agree that laws beyond FLPMA govern BLM's management of the public lands, but we decline to amend the rule in response to these comments. The final rule applies across BLM-managed lands. However, implementation of the rule—that is, land use planning and individual project-level decisions—will be subject to and must be undertaken consistent with all applicable laws, including the Mining Law of 1872, 30 U.S.C. 22 *et seq.,* the Oregon and California Revested Lands Sustained Yield Management Act of 1937, 43 U.S.C. 2601 *et seq.* (the O&C Act), the Alaska National Interest Lands Conservation Act, 16 U.S.C. 3101 *et seq.* (ANILCA), the Paleontological Resources Preservation Act of 2009, 16 U.S.C. 470aaa *et seq.* (PRPA), the Endangered Species Act, 16 U.S.C. 1531 *et seq.* (ESA), the National Environmental Policy Act, 42 U.S.C. 4321 *et seq.* (NEPA), and the National Historic Preservation Act, 54 U.S.C. 300101 *et seq.* (NHPA).

G. Related Executive and Secretarial Direction

The rule is consistent with directives set forth in several Executive and Secretary's Orders and related policies and strategies. These directives call on the Department of the Interior (DOI), and the Federal Government more generally, to use landscape-scale, science-based, collaborative approaches to natural resource management.

They include Executive Order 14072, *Strengthening the Nation's Forests, Communities, and Local Economies,* recognizes that healthy forests are ''critical to the health, prosperity, and resilience of our communities.'' It states a policy to:

> pursue science-based, sustainable forest and land management; conserve America's mature and old-growth forests on Federal lands; invest in forest health and restoration; support indigenous traditional ecological knowledge and cultural and subsistence practices; honor Tribal treaty rights; and deploy climate-smart forestry practices and other nature-based solutions to improve the resilience of our lands, waters, wildlife, and communities in the face of increasing disturbances and chronic stress arising from climate impacts.

The Executive Order calls for defining, identifying, and inventorying our nation's old and mature forests, then stewarding them for future generations to provide clean air and water, sustain plant and animal life, and respect their special importance to Tribal Nations. This rule advances these objectives by providing a framework for conservation use on public lands that would apply to mature and old-growth forests and woodlands managed by the BLM.

And Joint Secretarial Order 3403 on *Fulfilling the Trust Responsibility to Indian Tribes in the Stewardship of Federal Lands and Waters,* issued on November 15, 2021, by DOI and the Department of Agriculture, reiterates the Departments' commitment to the United States' trust and treaty obligations as an integral part of managing Federal lands. The order emphasizes that ''Tribal consultation and collaboration must be implemented as components of, or in addition to, Federal land management priorities and direction for recreation, range, timber, energy production, and other uses, and conservation of wilderness, refuges, watersheds, wildlife habitat, and other values.'' The order also notes the benefit of incorporating Tribal expertise and Indigenous Knowledge into Federal land and resources management.

H. Public Involvement in the Proposed Rule

The BLM published the proposed rule in the **Federal Register** on April 3, 2023 (88 FR 19583), for a 75-day comment period ending on June 20, 2023. In response to public requests for an extension, on June 15, 2023, the BLM announced a 15-day extension of the comment period. The official comment period extension notice was published on June 20, 2023 (88 FR 39818). The extended comment period closed on July 5, 2023.

During the comment period, the BLM hosted a variety of public outreach activities. The BLM held two virtual public meetings on May 15 and June 5, 2023. The BLM held three in-person meetings in Denver, Colorado (May 25, 2023); Albuquerque, New Mexico (May 30, 2023); and Reno, Nevada (June 1, 2023) to provide an overview of the proposed rule and answer questions from the public. All webinars and meetings were led by a third-party facilitator. A video recording of the May 15 virtual meeting and presentation slides in English and Spanish are available on the BLM website. The BLM also posted a reviewer guide and fact sheet, frequently asked questions on topics of interest, infographics, and other background information on the BLM website to further public understanding of the proposed rule. (*https://www.blm.gov/public-lands-rule.*)

In addition, the BLM conducted external outreach and participated in dozens of meetings to discuss the content of the proposed rule, including congressional briefings; meetings with States and State agencies; meetings with grazing, recreation, renewable energy, and other stakeholder interest groups and associations; and presentations at conferences and events. Meetings were conducted by both headquarters staff and regional staff across the country.

I. Tribal Consultation on the Proposed Rule

At the beginning of the rulemaking process, letters were sent to all federally recognized Tribes and Alaska Native Claims Settlement Act Corporations informing them of the proposed rule and inviting them to engage with the BLM to discuss their thoughts and concerns. The BLM conducted government-to-government consultation on the proposed rule as requested by Tribes.

To facilitate understanding of the proposed rule, the BLM posted all meeting materials, including a recording of the first virtual meeting, frequently asked questions, and meeting handouts, on its website to accommodate Tribal members and other members of the public who could not attend a public meeting. This final rule is informed by input received from Tribes during the public comment period. Over 20 Tribal governments, Alaska Native Corporations, and tribal entities submitted formal comments on the proposed rule. Tribal comments covered a range of topics including ACEC nomination, tribal consultation and co-stewardship, protection of cultural resources, and restoration and mitigation leasing. Responses to Tribal input are addressed in the ''Tribal Engagement and Co-Stewardship'' and ''Section-by-Section Discussion of the Final Rule and Revisions from the

Proposed Rule'' sections of this preamble to the final rule.

J. Summary of Changes

The BLM received an initial total of 216,403 comments from regulations.gov. Further analysis showed that there were public comment submissions with multiple cosigners, sometimes several thousand on one submission, which were initially counted as separate submissions but ultimately identified as a single submission with multiple signatures. Therefore, although 216,403 people voiced their opinion, the final count of comment letters came to 152,673. The comment letters on the proposed rule are available for viewing on the Federal e-rulemaking portal (*https://www.regulations.gov*) (search Docket ID: BLM–2023–0001).

The BLM has reviewed all public comments and made changes, as appropriate, to the final rule based on those comments and internal review. Those changes are described in detail in the ''Section-by-Section Discussion of the Final Rule and Revisions from the Proposed Rule'' of this preamble to the final rule. In addition, the ''Response to Public Comments'' section in this preamble to the final rule provides a summary of issues raised most frequently in public comments and the BLM's response.

III. Section-by-Section Discussion of the Final Rule and Revisions From the Proposed Rule

Note: This section of the preamble discusses newly promulgated part 6100 first before turning to the revisions to § 1610.7–2, notwithstanding that § 1610.7–2 appears first in the final rule text. Part 6100 contains the core content of this final rule, which frames the need for revision to § 1610.7–2.

43 CFR Subchapter F—Preservation and Conservation

PART 6100—ECOSYSTEM RESILIENCE

Subpart 6101—General Information

Section 6101.1—Purpose

This section describes the overall purpose for the rule. The rule is designed to facilitate healthy wildlife habitat, clean water, and ecosystem resilience so that public lands can better resist and recover from disturbances like drought and wildfire. It also aims to enhance mitigation options, establishing a regulatory framework for those seeking to use the public lands, while also ensuring that the public enjoys the benefits of mitigation measures. The rule discusses the use of protection and restoration actions, as well as tools such as land health evaluations, inventory, assessment, and monitoring.

In response to public comments, the final rule expands the purpose statement to include preventing permanent impairment or unnecessary or undue degradation of public lands, in addition to promoting the use of conservation to ensure ecosystem resilience.

Section 6101.2—Objectives

This section lists the specific objectives of the rulemaking. These objectives were discussed at length earlier in the preamble for the rule. In response to public comments, the BLM added four objectives to the original six, which are to: provide for healthy lands and waters that support sustainable outdoor recreation experiences for current and future generations; prevent permanent impairment or unnecessary or undue degradation of public lands; improve engagement and co-stewardship of public lands with Tribal entities and promote the use of Indigenous Knowledge in decision-making; and advance environmental justice through restoration and mitigation actions.

Additionally, in response to public comments, the final rule expands the objective that originally read ''Promote conservation by maintaining, protecting, and restoring ecosystem resilience and intact landscapes'' by specifically adding ''including habitat connectivity and old-growth forests.''

Section 6101.3—Authority

A number of comments identified potential additional statutory authority on which the BLM might rely in promulgating this rule. The BLM has determined the reference to statutory authority is sufficient.

A number of comments raised questions about the relationship between the rule and other laws, such as the Mining Law, the O&C Act, and ANILCA, that apply to particular areas or particular uses of the public lands. The final rule adds language in this section to clarify that implementation of the rule is subject to other applicable laws.

Section 6101.4—Definitions

This section provides new definitions for concepts such as conservation, ecosystem resilience, sustained yield, mitigation, and unnecessary or undue degradation, along with other terms used throughout the rule text. These definitions apply to the use of those terms in part 6100, while definitions for the terms casual use, conserve, ecosystem resilience, intactness, landscape, monitoring, protect, and restore also apply to the use of those terms in § 1610.7–2.

The final rule adopts, without revision, the proposed definitions of the terms: casual use; important, scarce, and sensitive resources; mitigation; mitigation strategies; monitoring; public lands; and reclamation. The final rule revises the proposed definitions of the terms: conservation, disturbance, effects, high-quality information, Indigenous Knowledge, intact landscape, landscape, permittee, protection, restoration, sustained yield, and unnecessary or undue degradation (including by identifying the elements of undue degradation and unnecessary degradation).

The final rule defines additional terms to provide further clarity for implementing the rule: in-lieu fee program, intactness, land health, mitigation bank, mitigation fund, significant causal factor, significant progress, and watershed condition assessment. The final rule removes the definitions of the terms best management practices and land enhancement. The BLM decided to remove the definition of best management practices, because it is not a term that is generally used for describing mitigation measures. The BLM decided to remove the definition of land enhancement based on public comments that found the term confusing.

The proposed rule defined the term ''resilient ecosystems.'' The final rule defines ''ecosystem resilience'' instead. The final rule does not, as some comments suggested it should, formally define the term ''permanent impairment,'' but the BLM intends that its meaning be informed by how it is used within the rule's definition of sustained yield.

The following paragraphs describe the definitions adopted in the final rule and changes to these definitions from the proposed rule as applicable.

The final rule defines the term ''casual use'' in order to clarify that the existence of a restoration or mitigation lease would not in and of itself preclude the public from accessing public lands for noncommercial activities such as recreation. Authorized officers may temporarily close public access for purposes authorized by restoration and mitigation leases, such as habitat improvement projects. However, in general, public lands leased for these purposes under the final rule would continue to be open to public use. The BLM received public comments recommending the definition be expanded to explicitly include uses

such as recreation. However, the BLM decided to retain the definition from the proposed rule because it exists in the same form in current regulations at 43 CFR 2920.0–5(k). The final rule adds language to the restoration and mitigation leasing section to clarify that leases will not preclude access to or across leased areas for recreation use, research use, or other compatible authorized uses, in addition to casual use. The definition of ''casual use'' in this part does not change the definition of casual use in 43 CFR 3809.5.

The final rule defines ''conservation'' in the context of these regulations to mean the management of natural resources to promote protection and restoration. The overarching purpose of the rule is to help facilitate the use of conservation to support ecosystem resilience, and in doing so the final rule clarifies conservation as a use within the BLM's multiple use framework, including in decision-making concerning land use planning and proposed projects. The final rule includes a stated objective to promote conservation on public lands, and subpart 6102 outlines principles, directives, management actions, and tools—including a new tool in restoration and mitigation leases—to meet this objective and fulfill the purpose of the rule. The BLM received comments recommending the definition of ''conservation'' more closely align with other definitions and recommending that the BLM distinguish between ''conservation'' and ''preservation.'' The definition of ''conservation'' was updated in the final rule to make clear that conservation is a use and that protection and restoration are tools to achieve conservation.

The final rule defines the term ''disturbance'' to provide the BLM with guidance in identifying and assessing impacts to ecosystems, restoring affected public lands, and minimizing and mitigating future impacts. Identifying and mitigating disturbances and restoring ecosystems are important components of supporting ecosystem resilience on public lands. The BLM received public comments recommending the BLM clarify that disturbances can be natural or human-caused, suggesting that defining disturbance as a discrete event was too restrictive, and recommending that the BLM adjust the definition to more closely align with how ''disturbance'' is used in environmental impact statements. The definition of disturbance was updated in the final rule to clarify that disturbance can be either discrete or chronic, characteristic (where ecosystem or species have evolved to survive such a disturbance) or uncharacteristic, and that disturbance can be natural or human-caused.

The final rule defines the term ''ecosystem resilience'' (whereas the proposed rule included a definition of ''resilient ecosystem'') in the context of the rule's foundational precept that the BLM's management of public lands on the basis of multiple use and sustained yield relies on resilient ecosystems. The definition is broad and mirrors Department guidance by including concepts of resistance, recovery, and adaptation. The BLM received comments that suggested removing this term, changing the definition to clarify that habitat connectivity is key to a resilient ecosystem, and changing the definition to better and more accurately describe the characteristics of a resilient ecosystem. The BLM changed the term to ''ecosystem resilience'' to match the usage of this term in the rule and defined ecosystem resilience to be consistent with existing DOI definitions of this term.[9] DOI's definition of ecosystem resilience is inclusive of three commonly used terms in scientific literature: resistance (*i.e.,* withstand disturbance), recovery (*i.e.,* recover from disturbance, and adaptability (*i.e.,* change/adapt to disturbance). The purpose of the rule is to facilitate the use of conservation as part of sustained yield, such that ecosystems on public lands can adapt to environmental change, resist disturbance, and maintain or regain their function following environmental stressors such as drought and wildfire.

The final rule defines the term ''effects'' as the direct, indirect, and cumulative impacts from a public land use and clarifies that the term should be viewed as synonymous with the term ''impacts'' for the purposes of the rule. The BLM received comments recommending the definition be changed to match the definition of effects in the BLM's planning regulations. The definition of effects was updated in the final rule to reference 40 CFR 1508.1(g) and clarify that the use of direct, indirect, and cumulative impacts in the rule is consistent with the definition of those terms in 40 CFR 1508.1(g).

The final rule defines the term ''high-quality information'' so that its use would ensure that the best available scientific information underpins decisions and actions that would be implemented under the proposed rule to achieve ecosystem resilience. The definition also clarifies that Indigenous Knowledge can be high-quality information that should be considered alongside other information that meets the standards for objectivity, utility, integrity, and quality set forth in the Department's Information Quality Guidelines. *https://www.doi.gov/ocio/policy-mgmt-support/information-quality-guidelines.* The BLM received public comments recommending that Indigenous Knowledge be considered as high-quality information, recommending that the BLM use the term ''credible data'' to describe high-quality information, and that the definition be clarified to be more specific about what qualifies as high-quality information. The definition of high-quality information was updated in the final rule to reference the most current Department guidance on scientific information and to specify when Indigenous Knowledge would be considered high-quality information in decision-making.

The final rule defines the terms ''important,'' ''scarce,'' and ''sensitive'' resources to provide clarity and consistency in the BLM's implementation of mitigation requirements, including under the final rule. The BLM received comments that the definition of these terms was vague and requesting more detail to clarify when a resource would qualify as important, scarce, or sensitive, as well as comments requesting more clarity on how the BLM determines whether a resource is important, scarce, or sensitive. The final rule does not change the definition of these terms, which are consistent with the BLM's mitigation policy and handbook. A determination that a resource is important, scarce, or sensitive is dependent on location, conditions within a planning area affecting a particular resource (*e.g.,* drought), and the adverse effects on that resource from other past and foreseeable future land uses.

The final rule defines the term ''Indigenous Knowledge'' to reflect the DOI's policies, responsibilities, and procedures to respect and equitably promote the inclusion of Indigenous Knowledge in the Department's decision-making, resource management, program implementation, policy development, scientific research, and other actions. The BLM received comments recommending changes to the definition of this term to encompass proper terminology for Indigenous Knowledge and make it consistent with existing Department regulations and guidance, or to drop the term from the rule. The definition of Indigenous Knowledge was updated in the final

[9] *https://www.doi.gov/sites/default/files/department-of-interior-climate-action-plan-final-signed-508-9.14.21.pdf.*

rule to clarify that Tribes may use different terms to refer to this concept and to bring the definition of Indigenous Knowledge in line with current BLM, Department, and White House guidance.[10] The final rule adds a definition for the term ''in lieu fee program.'' This term is used in § 6102.5.1, Mitigation, to describe an available method for offsetting adverse impacts. The definition of this term is consistent with the BLM's mitigation policy.

The final rule defines the term ''intact landscape'' to guide the BLM with implementing direction. The rule (§ 6102.2) would require the BLM to identify intact landscapes on public lands, manage certain landscapes to protect their intactness, and pursue strategies to protect and connect intact landscapes. The BLM received comments suggesting the definition be updated to clarify the size of an intact landscape, clarify the characteristics of an intact landscape (including cultural landscapes), and add habitat connectivity and mature, old-growth forests as markers of an intact landscape. The definition was updated in the final rule to reflect commonly used definitions in policy and ecological literature, link the definition of ''intact landscape'' to the revised ''landscape'' definition, and define intact landscapes in a manner that is more easily measured and assessed by the BLM to inform conservation actions. The revised definition reflects the reality that intactness exists on a spectrum and efforts to protect intactness should not be limited by a single threshold, but rather reflect landscape-specific levels required to support multiple use and sustained yield.

The final rule adds a definition for the term ''intactness,'' which is a measure of the degree to which human influences alter or impair the structure, function, or composition of a landscape. Because the rule requires the BLM to identify intact landscapes, the agency will need to measure and inventory intactness as a resource value. The final rule clarifies that as part of managing to protect intact landscapes, the BLM will develop and maintain an inventory of landscape intactness using watershed condition assessments to establish a consistent baseline condition. The BLM will then use the intactness inventory, along with other high-quality information including habitat connectivity and migration corridor data, to identify intact landscapes in the land use planning process and consider management opportunities.

The final rule adds a definition for the term ''land health.'' Land health is used throughout the rule to refer to the concept of a healthy and functioning ecosystem, and the BLM defines the term in the final rule to clarify the desired outcome of establishing land health standards and to be consistent with the definition of rangeland health in the BLM's Rangeland Health Standards Handbook, H–4180–1.[11]

The final rule makes small adjustments to the definition of the term ''landscape'' to be more inclusive in terms of the types of resources and interests that can anchor a landscape and to align with definitions used in landscape ecology. The term ''landscape'' is used throughout the rule to characterize a meaningful area of land and waters on which restoration, protection, and other management actions will take place. Determining how the BLM's management actions can influence the health and resilience of ecosystems can vary across landscapes and over time.

The rule defines ''mitigation'' consistent with the definition provided by existing Council on Environmental Quality regulations (40 CFR 1508.1(s)), which identify various ways to address adverse impacts to resources, including steps to avoid and minimize those impacts and compensate for residual impacts. As a tool to achieve ecosystem resilience of public lands, the BLM will generally apply a mitigation hierarchy to address impacts to public land resources, seeking to avoid, then minimize, and then compensate for any residual impacts. This definition and the related provisions in the rule supplement existing DOI policy, which among other things provides boundaries to ensure that compensatory mitigation is durable and effective. The BLM made no changes to the definition from the proposed rule.

The final rule adds a new definition for the term ''mitigation bank'' because the term is used in the final rule along with ''in-lieu fee program'' as a category of mitigation projects that would require a mitigation lease with additional requirements beyond those that would be required for smaller, single-use mitigation projects. A mitigation bank is a site where resources are restored, established, enhanced, or protected for the purpose of providing compensatory mitigation for an authorized use that is impacting similar resources elsewhere. The definition in the rule is consistent with the definition in the BLM's Mitigation Manual, MS–1794.[12]

The final rule adds a new definition for the term ''mitigation fund'' because the rule provides standards for the BLM to approve, through a formal agreement, a third-party mitigation fund holder to implement compensatory mitigation programs or projects. A mitigation fund is an account established by a mitigation fund holder to collect and then disperse funds for projects that satisfy compensatory mitigation commitments and obligations. The rule also provides for the BLM in some circumstances to require mitigation lease holders to submit a formal agreement with a qualified mitigation fund holder.

The final rule defines the term ''mitigation strategies'' as documents that identify, evaluate, and communicate potential mitigation needs and mitigation measures in advance of anticipated public land uses. The BLM received comments recommending replacing the word ''strategies'' with ''approaches'' or ''documents.'' The final rule does not change the definition of this term, which is consistent with the definition of mitigation strategies from the BLM's Mitigation Manual, MS–1794.

The rule defines the term ''monitoring'' to describe a critical suite of activities involving observation and data collection to evaluate (1) existing conditions, (2) the effects of management actions, or (3) the effectiveness of actions taken to meet management objectives. Management for ecosystem resilience requires the BLM to understand how proposed use activities impact resource condition at many scales. Monitoring is a critical component of the BLM's Assessment, Inventory and Monitoring (AIM) Strategy,[13] which provides a standardized framework for assessing natural resource condition and trends

[13] The *AIM Strategy* provides quantitative data and tools to guide and justify policy actions, land uses, and adaptive management decisions. *https://www.blm.gov/aim.*

on BLM-administered public lands. The BLM did not change the definition of ''monitoring'' from the proposed rule because it is based on the definition and use of that term in the grazing regulations (43 CFR 4100.0–5), is science-based, and enables the application of data to inform land management and understand management effects.

The rule defines the term ''permittee'' as a person or organization with a valid permit, right-of-way grant, lease, or other land use authorization from the BLM. The rule largely discusses ''permittees'' when identifying the responsibility of parties in the context of mitigation and in discussing the opportunities to rely on third parties in complying with mitigation requirements. The proposed rule defined a permittee as a person; the final rule defines a permittee as a person or other legal entity.

The final rule defines ''protection'' in the context of the overarching purpose of the rule, which is to promote the use of conservation measures to support the ecosystem resilience of public lands. ''Protection'' is a critical component of conservation, alongside restoration, and describes acts or processes that keep resources safe from degradation, damage, or destruction. The rule (§ 6101.2(b)) would include a stated objective to promote the protection of intact landscapes on public lands as a critical means to achieve ecosystem resilience. The BLM received comments that requested clarification of the term protection and recommended distinguishing between protection and preservation. Commenters suggested removing the term preserve from the definition of protection, and commenters were concerned that the term protection, as it was defined in the proposed rule, was intended to set land aside and preclude other uses. The definition of protection was updated in the final rule to clarify that protection is not synonymous with preservation and is not intended to prevent active management or other uses.

The rule defines ''public lands'' in order to clarify the scope of the proposed rule and its intended application to all BLM-managed lands and uses. The definition is similar to the definition of ''public lands'' that appears at 43 CFR 6301.5, but the BLM has modified the definition from the proposed rule in response to comments to clarify that this rule extends only to BLM-managed surface estate. The resulting definition in this rule is specific to new part 6100 and should not be interpreted as changing the definition of ''public lands'' in any other context, including where that term would extend to BLM-managed mineral estate under other BLM regulations.

The rule defines ''reclamation'' to identify restoration practices intended to achieve an outcome that reflects project goals and objectives, such as site stabilization and revegetation. While ''reclamation'' is a part of a continuum of restoration practices, it contrasts with other actions that are specifically designed to recover ecosystems that have been degraded, damaged, or destroyed. Reclamation often involves initial practices that can prepare projects or sites for further restoration activities. The rule, at § 6102.4.2, discusses reclamation in the context of bonding restoration and mitigation leases to ensure lessees hold sufficient bond amounts to provide for the reclamation of the lease areas and the restoration of any lands or surface waters adversely affected by lease operations. The BLM made no changes to the definition from the proposed rule.

The final rule defines ''restoration'' in the context of the overarching purpose of this rule, which is to promote the use of conservation to ensure the ecosystem resilience of public lands. ''Restoration'' is a critical component of conservation, alongside protection, and describes acts or processes of conservation that passively or actively assist the recovery of an ecosystem that has been degraded, damaged, or destroyed. The BLM received comments suggesting that the rule acknowledge both passive and active restoration as legitimate restoration methods and comments calling for the clarification of what the BLM's broad-scale recovery goals are for restoration. Specifically, commenters identified the need to be explicit about the goal of returning ecosystems to a more natural, native ecological state and that the use of nonnative species in restoration projects is not the preferred option. The definition of restoration was updated in the final rule to include both active and passive restoration and to clarify that the goal of restoration efforts is the recovery of an ecosystem to a more natural, native ecological state.

The final rule adds a definition for the term ''significant causal factor'' because the rule uses this term to trigger an obligation on the part of the BLM to take appropriate action, including through the modification of authorizations and management practices for relevant programs and uses, in order to achieve land health. A significant causal factor is a use, activity, or disturbance that prevents an area from achieving or making significant progress toward achieving one or more land health standards. The rule requires the BLM to document a determination of the significant causal factor in circumstances in which resource conditions are not achieving or making significant progress toward achieving land health standards. If the BLM determines that existing management is a significant causal factor preventing achievement of land health standards, authorized officers must take appropriate action as soon as practicable.

The final rule adds a definition for the term ''significant progress,'' which is used in the rule as the measure of satisfactory progress toward achieving land health standards. Many comments requested clarification of this term, and while it is impractical to quantify the magnitude or rate of change that constitutes significant progress, the BLM developed a qualitative definition for purposes of implementing the rule. The term is defined to mean measurable or observable changes in the indicators that demonstrate improved land health. Acceptable levels of change must be realistic in terms of the capability of the resource but must also be as expeditious and effective as practical.

The final rule bases its definition of ''sustained yield'' on the FLPMA definition of that same term. This rule facilitates the use of conservation to achieve resilient ecosystems on public lands, which are essential to managing for multiple use and sustained yield. The BLM received comments suggesting the definition be updated to incorporate more precisely the language of the statutory definition, as well as comments recommending combining the definitions of sustained yield and multiple use and incorporating non-renewable resources into the definition of sustained yield. The final rule updates the definition of sustained yield to remain focused on renewable resources and responsible development of non-renewable resources and to add ''consistent with multiple use'' to mirror the FLPMA definition of sustained yield.

In response to public comments, the final rule expands the definition of ''unnecessary or undue degradation'' to address its distinct elements of ''unnecessary degradation'' and ''undue degradation''; and confirms that the statutory obligation to prevent ''unnecessary or undue degradation'' applies when either unnecessary degradation or undue degradation, and not necessarily both, is implicated. The rule explains that ''undue degradation'' is harm to land resources or values that is excessive or disproportionate to the proposed action or an existing disturbance. For example, approving a

proposed access road through the only remaining critical habitat for a plant listed as endangered under the Endangered Species Act, even if there is not another location for the road, would generally (although not always) result in undue degradation. The rule explains that ''unnecessary degradation'' is harm to land resources or values that is not needed to accomplish a use's stated goals. For example, approving a proposed access road through critical habitat for a plant listed as endangered under the Endangered Species Act that could be located elsewhere without impacting critical habitat and still provide the needed access would generally (although not always) result in unnecessary degradation.

This definition is consistent with BLM's affirmative obligation under FLPMA to take action to prevent unnecessary or undue degradation, which applies when either unnecessary degradation or undue degradation, and not necessarily both, is implicated. The definition of ''unnecessary or undue degradation'' applies to the use of those terms in the part 6100 regulations promulgated by this rule. It does not alter the definition of the term ''unnecessary or undue degradation'' at § 3809.5 of this chapter and does not apply to that term's use in the regulations at subpart 3809 of this chapter.

The final rule adds a definition for ''watershed condition assessment,'' which is defined to mean a process for assessing and synthesizing information on the condition of soil, water, habitats, and ecological processes within a watershed following the land health fundamentals through consideration of the watershed's physical and biological characteristics, landscape intactness, and disturbances. Watershed condition assessments are equivalent to the ''watershed condition classifications'' and ''land health assessments'' discussed in the proposed rule. The final rule updates the term and provides this definition in response to many public comments seeking clarification and efficiency of process.

Section 6101.5—Principles for Ecosystem Resilience

The rule relies upon express direction provided in FLPMA to manage public lands on the basis of multiple use and sustained yield, and it establishes the principle that the BLM must conserve renewable natural resources at a level that maintains or improves ecosystem resilience in order to achieve this mission. The BLM made only minimal changes to this section from the proposed rule.

Section 6101.5(d) directs authorized officers to implement principles of ecosystem resilience by recognizing conservation as a land use within the multiple use framework, including in decision-making, authorizations, and planning processes; protecting and maintaining the fundamentals of land health; restoring and protecting intact public lands; applying the full mitigation hierarchy to address impacts to species, habitats, and ecosystems from land use authorizations; and preventing unnecessary or undue degradation.

Subpart 6102—Conservation Use To Achieve Ecosystem Resilience

The rule clarifies that conservation is a use on par with other uses of public lands under FLPMA's multiple use framework. FLPMA directs the BLM to manage the public lands in a manner that protects the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archaeological values, among other resources and values, and that protects certain public lands in their natural condition. The BLM implements this mandate through land use plan allocations, including designations, and other planning decisions that conserve public land resources, seeking to balance conservation uses with other uses, such as energy development and recreation. The BLM also complies with this mandate when issuing decisions that implement its land use plans. In these implementation decisions, including when authorizing projects, the BLM promotes conservation use by requiring appropriate mitigation of impacts to natural resources on public lands. The rule provides specific direction for implementing certain programs in a way that emphasizes conservation use and provides new tools and direction for managing conservation use to facilitate ecosystem resilience on public lands.

As described in detail in each section, the BLM updated the final rule in response to public comments to clarify processes, including how conservation uses would occur within and outside of land use planning processes; enumerate guiding principles for restoration and mitigation actions; and provide other adjustments to improve public understanding and agency implementation of the rule. The most significant change to this subpart is that the final rule establishes restoration and mitigation leases as two separate types of leases instead of providing simply for conservation leases available for both purposes (which was the approach in the proposed rule). The final rule expands the regulations governing these leases to provide a more comprehensive framework for implementation and respond to concerns heard from the public.

Section 6102.1—Protection of Landscape Intactness

The BLM changed the title of § 6102.1 from ''Protection of Intact Landscapes'' in the proposed rule to ''Protection of Landscape Intactness'' in the final rule. Public comments suggested that the rule distinguish intactness as a resource value from intact landscapes as delineated units. The change in the title of § 6102.1 reflects that landscape intactness is the resource value that the BLM is seeking to identify and protect. The final rule includes a definition of the term ''intactness'' to further guide implementation of this section. Section 6102.1(a) and (b) require the BLM to manage certain landscapes to protect their intactness and to seek to prioritize actions that conserve and protect landscape intactness. The following section, 6102.2, provides direction for the BLM to inventory and protect intactness on the public lands by identifying and managing intact landscapes in the land use planning process.

Section 6102.2—Management To Protect Intact Landscapes

The BLM revised § 6102.2 in response to public comments requesting clarity around how intact landscapes would be identified and managed within and outside of the land use planning process and to distinguish intactness as a resource value from intact landscapes as delineated units. The final rule establishes in § 6102.2(a) that the BLM will maintain an inventory of intactness on the public lands, in accordance with FLPMA's requirement that the BLM maintain an inventory of all public lands and their resources and other values.

In the land use planning process, § 6102.2(b) requires the BLM to use the intactness inventory, and other available information including habitat connectivity and migration corridor data, to identify intact landscapes, evaluate alternatives to manage intact landscapes, and identify which intact landscapes or portions of intact landscapes will be managed for protection. Furthermore, in the land use planning process, § 6102.2(c) requires the BLM to identify desired conditions and landscape objectives to guide implementation decisions regarding management of intact landscapes. In making management decisions for intact landscapes, the BLM will seek to work

with communities to identify the most suitable areas to protect as intact landscapes; consult with Tribes to identify opportunities for co-stewardship; establish partnerships; and monitor effectiveness of ecological protection activities.

In addition to the land use planning process described above, § 6102.2(d) requires authorized officers to prioritize acquisition of lands or interests in lands that would further protect and connect intact landscapes and functioning ecosystems, and § 6102.2(e) directs the BLM to develop a national system for collecting and tracking disturbance and intactness data and to use those data to minimize disturbance and improve ecosystem resilience. Data will be made available to the public.

Section 6102.3—Restoration

In the proposed rule, restoration was divided across three sections (Restoration, Restoration Prioritization, and Restoration Planning). The final rule keeps a Restoration section but combines the remaining two sections into a Restoration Prioritization and Planning section. The definition of restoration, critical to interpretation of this section, has been updated to provide that restoration actions include both passive and active measures that assist the recovery of an ecosystem that has been degraded, damaged, or destroyed. The definition has been further updated to clarify that the intent of restoration actions is the return of more natural, native ecological states. The final rule emphasizes the importance of restoration in achieving multiple use and sustained yield and requires a consideration of the causes of degradation, the recovery potential of an ecosystem, and the allowable uses in the governing land use plan, such as whether an area is managed for recreation or is degraded land prioritized for development, in determining restoration actions. Principles for restoration actions, which were previously located in the Restoration Planning section of the proposed rule, are now found in the Restoration section to clarify that such principles apply to all restoration actions.[14] The principles include direction to consult with Tribes to identify opportunities for co-stewardship or collaboration, similar to the direction provided for managing intact landscapes.

[14] The reference to ''low-tech restoration activities'' in section 6102.3(d) means the practice of using simple, low unit-cost, structural additions (*e.g.,* wood and beaver dams in streams) to mimic natural functions and promote specific processes.

Section 6102.3.1—Restoration Prioritization and Planning

A combined restoration prioritization and planning section at 6102.3.1 requires the identification of restoration outcomes in resource management plans. Consistent with these outcomes, the section requires the identification of priority landscapes for restoration at least every 5 years and provides for a number of considerations for authorized officers when doing so. The section requires the development of restoration plans at least every 5 years and enumerates criteria with which restoration goals, objectives, and management actions identified in the plans must adhere. Among other criteria, restoration plans must adhere to commonly accepted principles and standards within the field of ecological restoration. Lastly, the section requires authorized officers to track restoration implementation and progress against identified goals and assess why restoration outcomes are not being met and what, if anything, is additionally needed to achieve restoration goals.

Section 6102.4—Restoration and Mitigation Leasing

Section 302(b) of FLPMA (43 U.S.C. 1732(b)) grants the Secretary authority to regulate through appropriate instruments the use, occupancy, and development of the public lands. Under that broad authority, the rule provides a framework for the BLM to issue restoration and mitigation leases on public lands for the purpose of pursuing ecosystem resilience through mitigation and restoration actions. The BLM will determine whether a lease is an appropriate mechanism based on the context of each application for a proposed lease, consistent with the final rule.

The BLM received many comments on the leasing provisions in the proposed rule that resulted in changes in the final rule. These changes include: establishing restoration leases and mitigation leases rather than conservation leases, which as proposed would have been used for either purpose; enabling conservation districts and State fish and wildlife agencies to hold leases; including consideration of factors to incentivize lease proposals that collaborate with existing permittees and other affected interests and meet other desirable criteria; requiring lessees to report annually on lease activity; and providing for the BLM to waive or reduce the rent of a restoration lease if the lease is providing valuable benefit to the public lands and is not generating revenue.

Many commenters were concerned about public access to public lands that are leased for restoration or mitigation purposes and expressed concern that the rule's definition of ''casual use'' does not explicitly guarantee use for common activities. While the BLM did not change the definition of ''casual use'' in order to remain consistent with existing regulations, the final rule specifically states that a restoration or mitigation lease will not preclude access to or across leased areas for recreation use, research use, or other authorized use that is compatible with the restoration or mitigation activities.

Some commenters questioned whether the BLM through this rulemaking or subsequent land use planning would allocate public lands as available to or excluded from restoration and mitigation leasing. The final rule does not identify or limit public lands that could be leased for restoration or mitigation purposes. However, several provisions guide the evaluation of which lands are suitable for leasing. The rule requires the BLM to identify restoration priority landscapes, intact landscapes, and landscape-scale mitigation strategies, and these areas would be logical locations for leases to support restoration and mitigation efforts the agency is prioritizing. The rule also enumerates factors for evaluating lease proposals based on criteria that are expected to make leases more successful. The rule does not allow for leases to be issued where an existing, authorized, and incompatible use is occurring, effectively removing areas from consideration for at least some activities that could be authorized by a restoration or mitigation lease. Additionally, any restoration or mitigation lease would need to conform to the BLM's approved land use plan. These provisions collectively guide restoration and mitigation leases to the most suitable locations without requiring the BLM, in every instance, to undertake a plan amendment or revision to allocate lands as available for leasing.

The following paragraphs summarize the restoration and mitigation leasing provisions in the final rule.

Section 6102.4(a) authorizes the BLM to issue restoration and mitigation leases for the purpose of restoring degraded landscapes or mitigating impacts resulting from other land use authorizations. Entities that can hold restoration and mitigation leases include individuals, businesses, non-governmental organizations, Tribal governments, conservation districts, and State fish and wildlife agencies. Qualified entities for a mitigation lease to establish an in-lieu fee program

would be limited to non-governmental organizations, State fish and wildlife agencies, and Tribal government organizations. Leases cannot be held by foreign persons as that term is defined in 31 CFR 802.221. The BLM will rely on standard lease adjudication practices established in 43 CFR 2920 to determine if a lease applicant meets the preconditions in this part for a qualified entity. Restoration and mitigation leases will be issued for the necessary amount of time to meet the lease objective. A lease issued for restoration purposes can be issued for an initial term of up to 10 years, whereas a lease issued for mitigation purposes will be issued for a term commensurate with the impact it is mitigating. Activity on all leases will be reviewed for consistency with lease provisions at regular intervals and can be extended beyond their primary terms when extension is necessary to serve the purpose for which the lease was first issued. Section 6102.4(a)(4) precludes the BLM from issuing new authorizations to use the leased lands if the use would be incompatible with the authorized restoration or mitigation use set forth in the lease.

Section 6102.4(b) and (c) set forth the application process for restoration and mitigation leases. Applicants are required to submit detailed restoration or mitigation development plans that include information on outreach with existing permittees, lease holders, adjacent land managers or owners, and other interested parties. The authorized officer can require additional information such as environmental data and proof that the applicant has the technical and financial capability to perform the restoration and mitigation activities.

Section 6102.4(d) enumerates factors for the authorized officer to consider when evaluating a lease application. Those factors include: lease outcomes that are consistent with restoration principles established in the rule; lease outcomes tied to desired future conditions that are consistent with the management objectives and allowable uses in the governing land use plan, such as an area managed for recreation or degraded land prioritized for development; collaboration with existing permittees, leaseholders, and adjacent land managers or owners; outreach to or support from local communities; and consideration of environmental justice objectives.

Once a lease application is approved, § 6102.4(e) requires the applicant to provide the BLM with a monitoring plan and to report annually and at the end of the lease period on lease activity.

Section 6102.4(f) and (g) provide that restoration and mitigation leases do not entitle leaseholders to the exclusive use of the public lands and that other uses compatible with the objectives of the restoration or mitigation lease are explicitly allowed on leased lands. Consistent with other land use authorizations, such as rights-of-way, it is the BLM's view that no property interest is conveyed by issuing these leases. Section 6102.4(g) confirms that a restoration or mitigation lease will not preclude access to or across leased areas for casual use, recreation use, research use, or other use taken pursuant to a land use authorization that is compatible with the approved restoration or mitigation use.

Section 6102.4(j) directs that cost recovery, rents, and fees for restoration and mitigation leases will be governed by existing regulations at 43 CFR 2920.6 and 2920.8 and that the BLM will generally collect annual rental based on fair market value. Recognizing that restoration lessees are providing a service to the public and the BLM, the rule provides for waiving or reducing the rent of a restoration lease if a valuable benefit is being provided to the public and revenue is not being generated. This approach is consistent with the approach in waiving rents for rights-of-way in 43 CFR 2806.15. Although section 102 of FLPMA provides a policy preference for recovering fair market value for the use of the public lands (*see* 43 U.S.C. 1701(a)(9)), the BLM is not required to do so, especially in circumstances in which departing from charging a fair market value rent would further other policy priorities identified in section 102 of FLPMA. Here, the BLM has determined that allowing authorized officers the discretion to reduce or waive rent for restoration leases will assist in its effort to manage the public lands to protect the quality of ecological and other relevant values. (*See* 43 U.S.C. 1701(a)(8))

Section 6102.4.1—Termination and Suspension of Restoration and Mitigation Leases

The final rule makes only minimal changes to § 6102.4.1 from the proposed rule. Section 6102.4.1 outlines processes for suspending and terminating restoration and mitigation leases. Where the leaseholder fails to comply with applicable requirements, fails to use the lease for its intended purpose, or cannot fulfill the lease's purpose, the BLM may suspend or terminate the lease. An authorized officer must issue an immediate temporary suspension of a lease upon determination that a noncompliance issue adversely affects or poses a threat to public lands or public health or safety. Following termination of a lease, the leaseholder has sixty days to fulfill its obligation to reclaim the site (*i.e.,* return the site to its prior condition or as otherwise provided in the lease). That obligation is distinct from the goal of restoring the site to its ecological potential that underlies the lease.

Section 6102.4.2—Bonding for Restoration and Mitigation Leases

The final rule authorizes the BLM to require a bond for a restoration or mitigation lease involving surface-disturbing or active management activities, but does not require a bond in all cases as the proposed rule would have. Section 6102.4.2(a) directs that for mitigation leases, the lease holder will usually be required to provide letters of credit or establish an escrow account for the full amount needed to ensure the development plan meets all performance criteria. The final rule includes considerations for requiring a bond, such as the type and intensity of surface-disturbing activities, proposed use of experimental or non-natural restoration methods, and risks associated with the proposed actions.

Section 6102.4.2(b) through (d) establishes additional bonding provisions regarding statewide bonds, filing of bonds, and default and are unchanged from the proposed rule.

Section 6102.5—Management Actions for Ecosystem Resilience

The final rule includes minor updates to this section in response to comments suggesting more clarity around how the section connects to other sections of the rule. Commenters also recommended strengthening the focus on ecosystem resilience and emphasizing biodiversity as an important component of ecosystem resilience. This rule focuses primarily on supporting healthy and resilient ecosystems, which are the basis for multiple use and sustained yield and which, if achieved, will benefit biodiversity, water security, carbon sequestration, forage, and a host of other values.

Section 6102.5 sets forth a framework for the BLM to make informed management decisions based on science and data, including at the planning, permitting, and program levels, that would help to facilitate ecosystem resilience. As part of this framework, authorized officers are required to identify priority watersheds, landscapes, and ecosystems that require protection and restoration efforts; develop and implement protection,

restoration, mitigation, monitoring, and adaptive management strategies; [15] and share watershed condition assessment data with the public. The final rule cross-references these requirements listed in § 6102.5(a) with other sections of the rule that provide additional guidance on these management actions for ecosystem resilience.

Section 6102.5(b) requires the BLM to meaningfully consult with Tribes and Alaska Native Corporations and makes a change from the proposed rule that provides for Tribal input on whether actions are likely to substantially impact Tribes or Alaska Native Corporations. The rule also requires the BLM to respect and include Indigenous Knowledge in decision-making, including through Tribal co-stewardship, and updates provisions and definitions in the rule to reflect current departmental and agency guidance.

Consistent with applicable law and resource management plans, including, for example, where an area is managed for recreation or is degraded land prioritized for development, authorized officers are required to make every effort to avoid authorizing any use of the public lands that permanently impairs ecosystem resilience. Permanent impairment of ecosystem resilience would be difficult or impossible to avoid, for example, on lands on which the BLM has authorized intensive uses, including infrastructure and energy projects or mining, or where the BLM has limited discretion to condition or deny the use. Through this frame, the rule recognizes that the BLM may develop land use plans that prioritize degraded areas for development, such as in the Arizona Restoration Design Energy Project, or generally prioritize areas for utility-scale development, such as the Solar Energy Zones designated in the 2012 Western Solar Plan, and that the effects on ecosystem resilience in such a plan may be mitigated but will not be completely avoided. The rule also requires the authorized officer to provide justification for decisions that may impair ecosystem resilience. In other words, the rule does not prohibit land uses that impair ecosystem resilience; it requires avoidance as a general matter and an explanation if impairment cannot be avoided.

[15] Adaptive management is a system of management practices based on clearly identified outcomes and monitoring to determine whether management actions are meeting desired outcomes and, if not, facilitating management changes that will best ensure that outcomes are met or reevaluated. Adaptive management recognizes that knowledge about natural resource systems is sometimes uncertain (43 CFR 46.30).

To ensure the best available science is underpinning management actions, the rule requires the BLM to use national and site-based assessment, inventory, and monitoring data, along with other high-quality information, to evaluate resource conditions and inform decision-making.

Section 6102.5.1—Mitigation

The rule at § 6102.5.1(a) directs the BLM to apply the mitigation hierarchy to avoid, minimize, and compensate for adverse impacts to all public land resources, generally in that order. The rule states further that mitigation approaches or requirements may be identified in land use plans or other decision documents. Consistent with BLM's existing policy on mitigation (H–1794–1), which requires BLM to consider compensatory mitigation for important, scarce, or sensitive resources, § 6102.5.1(b) expands upon this direction by requiring that mitigation to address adverse impacts to such resources should be applied with the goal of eliminating, reducing, and/or offsetting impacts on the resource, consistent with applicable law. This facilitates BLM's compliance with its multiple-use and sustained yield mission by conserving such resources for future generations. Determining the maximum benefit to an impacted resource from a compensatory measure is often achieved by carefully identifying the type, location, timing, and other aspects of the compensatory mitigation measure. This assessment is conducted as standard practice in the BLM's NEPA analysis and decision documents.

The rule also identifies new principles at § 6102.5.1(c) to apply when implementing mitigation, including the need to ensure compensatory mitigation is commensurate with the impacts, and the use of adaptive management, landscape-scale approaches, high-quality information, and performance criteria and effectiveness monitoring.

At § 6102.5.1(d), the rule allows the BLM to approve and use third-party mitigation fund holders to administer funds for the implementation of compensatory mitigation programs or projects and specifies the type of actions third parties can perform with compensatory mitigation funding. Section 6102.5.1(e) establishes the requirements for different types of entities that could be considered and approved as mitigation fund holders. The mitigation fund holder could be a State or local government, if, among other requirements, that entity can demonstrate to the satisfaction of the BLM that it is acting as a fiduciary for the benefit of the mitigation project and site. The section also allows for a mitigation fund holder to be an entity that, among other requirements, qualifies for tax-exempt status and provides evidence it can successfully hold and manage mitigation accounts.

Sections 6102.5.1(f) through (i) provide further direction to authorized officers in managing mitigation leases and lease holders, including provisions to govern the collection of annual rent at fair market value for large or otherwise substantial compensatory mitigation programs or projects on public lands, including mitigation banks and in-lieu fee programs.

Subpart 6103 Managing Land Health To Achieve Ecosystem Resilience

Section 6103.1—Land Health Standards

Consistent with the proposed rule, § 6103.1 of the final rule directs that all program areas of the BLM must be managed in accordance with the fundamentals of land health, which are adopted, verbatim, from the fundamentals of rangeland health included at 43 CFR 4180.1 (2005). It does so by establishing a series of procedural requirements to guide the BLM's actions to address land health. The rule does not require that individual actions ''comply'' with the fundamentals of land health, nor does it require achievement of those fundamentals (as measured by the land health standards) as a precondition for any BLM decision.

The rule in this section directs authorized officers to adopt national land health standards across all ecosystems that provide consistency and conformance with the fundamentals of land health and facilitate progress toward meeting land health. Acknowledging the importance of standards in managing all of the BLM's programs in accordance with the fundamentals, the title of § 6103.1 has been changed to Land Health Standards. Section 6103.1 includes a new paragraph (b) describing the resources, processes, and values addressed through national land health standards as well as a new timeline at paragraph (e) to review and amend or supplement standards and a subsequent timeline to ensure standards remain sufficient. A new paragraph at § 6103.1(d) instructs authorized officers to incorporate geographically distinct land health standards when needed to address unique or rare ecosystem types that may not be addressed by the national standards. These new timelines in the final rule—along with additional

implementation specificity found in other land-health related sections of the rule—are introduced in response to comments that sought more clarity and specificity for how standards may be updated to serve as appropriate measures for the fundamentals. Section 6103.1(f) makes explicit that any new or amended land health standard must be approved by the BLM Director prior to implementation.

Section 6103.1.1—Management for Land Health

Section 6103.1.1(a) conveys the importance of assessing land health at a broad scale to manage for ecosystem resilience and provides that authorized officers should rely on assessments and evaluations conducted at such scales, as appropriate, to support decision-making. Section 6103.1.1(b) reinforces the direction that all BLM program areas must be managed to facilitate progress toward achieving land health standards. Section 6103.1.1(b)(1) requires authorized officers to apply existing standards in the administration of all BLM programs. Initially, this will mean applying the existing standards prepared pursuant to subpart 4180 of this chapter to all programs, *not just* grazing. Moving forward, consistent, national standards will be completed pursuant to procedures set out in this subpart, and not under the procedures set out in subpart 4180, and will then apply to all programs, *including* grazing. Section 6103.1.1(b)(2) directs programs to develop management guidelines, which are best practices in managing programs to achieve goals. Management guidelines are to be reviewed at least every 10 years consistent with review timelines in other sections that relate to land health. As with standards, existing management guidelines applicable to the grazing program will continue to apply. New and amended guidelines for grazing should be developed under the procedures in this subpart, and not subpart 4180. Sections 6103.1.1(c) and (d) require that land health be included in land use planning, primarily when identifying allocation decisions and actions that are anticipated to achieve land health outcomes, as well as any impediments in doing so.

Section 6103.1.2—Land Health Evaluations and Determinations

Section 6103.1.2(a) has been modified to require that authorized officers complete watershed condition assessments and land health evaluations at least every 10 years. Watershed condition assessments supplant land health assessments in the proposed rule and characterize resource conditions, while subsequent land health evaluations interpret assessment findings to draw conclusions about whether land health standards are being achieved consistent with the fundamentals of land health. This efficiency of process responds to many comments and concerns about the BLM's ability to complete land health assessments across broad spatial scales.

Direction to conduct watershed condition assessments and land health evaluations at broader spatial scales, as opposed to at the scale of an allotment or other more narrowly drawn boundary or project area, builds on best practices currently deployed by BLM field offices, responds to comments recommending landscape-scale approaches as a way to address the backlog of pending land health assessments and evaluations, and better serves efforts to understand and address land health conditions across management boundaries.

Section 6103.1.2(d) provides what must be incorporated when conducting land health evaluations, such as watershed condition assessments and high-quality information requirements. Section 6103.1.2(d) further clarifies the requirements for conducting land health evaluations, including that authorized officers document the rationale and findings as to whether each land health standard is achieved or making significant progress towards achievement.

Sections 6103.1.2(e), (f), and (g) describe the process after land health evaluations determine if resource conditions are or are not achieving or making significant progress toward achieving land health standards. When watershed condition assessments and land health evaluations find that resource conditions are achieving or making significant progress toward achieving land health, then project-level decisions should rely on such evidence where possible and appropriate. Section 6103.1.2(f) provides for tiering documentation and evidence from broad-scale assessments and evaluations for project-level decisions, such as grazing permit renewals, which promotes efficiency and streamlines decision-making. This provision responds to comments concerned with the existing backlog of assessments land health evaluations.

When watershed condition assessments and land health evaluations find that resource conditions are not achieving, or making significant progress toward achieving, land health standards, then causal factor determinations, as directed by § 6103.1.2(f), must be prepared no later than a year after the evaluation. Determinations document significant causal factors for non-achievement. Section 6103.1.2(f)(3) requires authorized officers to take appropriate action as soon as practicable to address nonachievement of land health standards when the significant causal factors include existing management practices or levels of use on public lands. However, as clarified in § 6103.1.2(f)(4), to the extent existing grazing management practices or levels of grazing use on public lands are significant causal factors preventing achievement of land health standards, authorized officers must also comply with the requirement for taking appropriate action set by § 4180.2(c) of this chapter, including that appropriate action be taken not later than the start of the next grazing year.

Further, as noted previously, appropriate actions in a specific situation will be informed and may be constrained by applicable law and the governing land use plan. For example, where a land use planning approach, such as BLM Arizona's Restoration Design Energy Project, is intended to support development of renewable energy on disturbed or previously developed sites, then appropriate actions would be designed to add measures that facilitate the progress of the affected lands toward meeting the applicable fundamentals of land health. However, these actions would be informed by the overall approach of identifying disturbed lands suitable for renewable energy development and applying measures consistent with those management decisions. This is consistent with the approach to incorporate design features into the Restoration Design Energy Project Record of Decision to reduce overall impacts to the lands identified for development. (See *https://eplanning.blm.gov/public_projects/nepa/79922/107093/131007/RDEP-ROD-ARMP.pdf*).

Section 6103.1.2(f)(5) identifies some appropriate actions that may be deployed to address practices and uses determined to be significant causal factors, consistent with applicable law, regulation, and the governing resource management plan and its management objectives, such as where an area is managed for recreation or is degraded land prioritized for development. For example, if a governing resource management plan identifies degraded lands for solar development and those areas are not meeting standards, the authorized officer should consider that land use planning decision in determining the appropriate action. In that circumstance, it would typically

not be appropriate to deny solar or wind use altogether, although design features or other mitigation measures may be applied. Section 6103.1.2(i) reinforces that appropriate actions must be consistent with existing resource management plans and notes that if planning decisions do not allow for appropriate actions to address significant causal factors, then an authorized officer may decide to amend or revise the applicable land use plan. However, whether to undertake a planning process is at the discretion of the authorized officer. Sections 6103.1.2 (j) and (k) respond to public comment by requiring annual, publicly available reporting on assessment, evaluation, and determination accomplishments; results; and actions.

Section 6103.2—Inventory, Assessment, and Monitoring

The final rule requires the BLM to complete watershed condition assessments every 10 years and consider them in multiple decision-making processes. New paragraphs at § 6103.2(a) further describe the purpose, process, and requirements of conducting watershed condition assessments in support of land use planning, protection of intact landscapes, managing for ecosystem resilience, informing restoration actions, and informing land health evaluations and determinations. In response to public comments encouraging consistency in analysis approach, standard data sources, and transparency, the final rule adds in § 6103.2(a) that the BLM must utilize multiple sources of high-quality information to understand conditions and trends relevant to land health standards and incorporate consistent analytical approaches, quantitative indicators, and benchmarks where practicable. It is anticipated that watershed condition assessments will frequently be completed not by BLM State Offices, but by national-level resources, such as the National Operations Center, utilizing standardized procedures and existing data and analyses and validated with local data and high-quality information as appropriate.

Section 6103.2(b) clarifies that the BLM's inventory of public lands includes both landscape components and core indicators that address land health fundamentals and requires the use of high-quality information and inventory, assessment, and monitoring information, including standardized quantitative monitoring data, remote sensing maps, and geospatial analyses, to inform decision-making across program areas. In response to public comments, the BLM clarified that this inventory specifically includes infrastructure and renewable resources and that it is available to the public (currently, *https://gbp-blm-egis.hub.arcgis.com/*). Section 6103.2(c) establishes principles to ensure that inventory, assessment, and monitoring activities are evidence-based, standardized, efficient, and defensible.

43 CFR Chapter II

Subpart 1610—Resource Management Planning

Section 1610.7–2—Designation of Areas of Critical Environmental Concern

The rule includes changes to the land use planning regulations to elaborate on the role ACECs play as the principal administrative designation for public lands where special management attention is required to protect important natural, cultural, and scenic resources and to protect against natural hazards. It reiterates FLPMA's requirement that the BLM give priority to the identification, evaluation, and designation of ACECs during the land use planning process and provides additional clarity and direction for complying with this statutory requirement. The rule codifies in regulation procedures for considering and designating potential ACECs that were, prior to promulgation of this rule, partially described in regulation and partially described in agency policy.

The BLM received many comments on the ACEC provisions of the proposed rule, and the final rule reflects changes the BLM made based on public comments. As described in more detail below, changes from the proposed rule include: providing for the BLM to implement temporary management for potential ACECs identified outside of an ongoing planning process, with public notice and periodic reevaluation; codification of research natural areas as a type of ACEC designated for the primary purpose of research and education on public lands, consistent with existing regulations and policy; a presumption that all areas found to meet all three ACEC criteria will be designated in the resource management plan; a management standard that requires the BLM to administer designated ACECs in a manner that conserves, protects, and enhances the relevant and important values; and a definition for the term ''irreparable damage.''

The final rule also confirms that proposed and existing ACECs being addressed in the planning process for a resource management plan or a plan amendment will be identified in all applicable **Federal Register** Notices and in public outreach materials. The BLM will not be required to produce separate notices specific to ACECs. The following paragraphs summarize the ACEC provisions in the final rule.

Section 1610.7–2(a) confirms that ACECs are the principal administrative designation for public lands where special management is required to protect and prevent irreparable damage to important resources. ACECs are considered and designated in land use planning processes, including resource management plan revisions and amendments.

Section 1610.7–2(b) requires authorized officers to identify, evaluate, and give priority to areas that have potential for designation and management as ACECs in the land use planning process, and it provides that proposed and existing ACECs that will be addressed in the planning process for a resource management plan, plan revision, or plan amendment will be identified in all applicable public notices.

Section 1610.7–2(c) requires authorized officers to identify areas that may be eligible for ACEC status early in the planning process and specifies the need to target areas for evaluation based on resource inventories, internal and external nominations, and existing ACEC designations.

Section 1610.7–2(d) outlines the three criteria that must be met for ACEC designation, which are relevance, importance, and special management attention. The rule provides that values and resources may have importance if they contribute to ecosystem resilience, landscape intactness, or habitat connectivity, in addition to other importance criteria. The final rule requires that values and resources have more than local importance to meet the importance criteria, a change from the proposed rule based on public comments. Special management attention prevents irreparable damage to the relevant and important values and would not be prescribed if the relevant and important values were not present. The rule defines ''irreparable damage'' in this context to mean: ''harm to a value, resource, system, or process that substantially diminishes the relevance or importance of that value, resource, system, or process in such a way that recovery of the value, resource, system, or process to the extent necessary to restore its prior relevance or importance is impossible.'' Requiring a finding that special management attention is necessary for ACEC designation is consistent with BLM practice and guidance but was not a feature of the

regulations prior to promulgation of this rule.

Section 1610.7–2(e) provides that the BLM may designate an ACEC research natural area (RNA) for an area that meets all three ACEC criteria set forth in § 1610.7–2(e) and is consistent with the purposes for research natural areas established in existing regulations at 43 CFR subpart 8223. These regulations allow the BLM to establish RNAs for the primary purpose of research and education on public lands having natural characteristics that are unusual or that are of scientific or other special interest. The BLM's current guidance, as set forth in the agency's Land Use Planning Handbook and ACEC Manual, considers RNAs as a type of ACEC that are to be designated following the ACEC designation process. The BLM has designated many ACEC RNAs in existing land use plans following this guidance. Because this rule is codifying the BLM's ACEC guidance and process, and in response to public comments on this topic, the final rule provides for this RNA designation.

Section 1610.7–2(f) provides that the boundaries of proposed ACECs shall be identified for public lands as appropriate to encompass the relevant and important values and geographic extent of the special management attention needed to provide protection.

Section 1610.7–2(g) requires the BLM to analyze in detail all potential ACECs that have relevant and important values in planning documents. In the land use planning process, the BLM evaluates the need for special management attention to protect the relevant and important values of potential ACECs, which could include other allocations and designations that would provide appropriate protection and prevent irreparable damage to the relevant and important values.

Section 1610.7–2(h) directs that an approved resource management plan, plan revision, or plan amendment will list all designated ACECs, identify their relevant and important values, and include the special management attention being provided to them.

Section 1610.7–2(i) establishes procedures for addressing potential ACECs that are identified outside of an ongoing planning process. The State Director has the discretion to determine the appropriate time to evaluate whether the nomination meets the relevant, important, and special management criteria identified in 1610.7–2(d)(1) through (3). If a potential ACEC nomination meets all three criteria specified in the regulations—that is, it has relevance and importance and needs special management attention—then the State Director will, at their discretion, either initiate a land use planning process to evaluate the potential ACEC for designation or provide temporary management consistent with the existing resource management plan to protect the relevant and important values from irreparable damage. The final rule clarifies that the authorized officer in this context would be the State Director, consistent with other portions of the rule addressing decisions on potential ACECs. If the BLM decides to implement temporary management, the BLM will comply with all applicable laws, including NEPA, notify the public, and reevaluate the area periodically to ensure temporary management is still necessary. This provision does not change the presumption that ACECs are nominated and addressed through resource management planning processes, and it does not require the BLM to evaluate ACEC nominations outside the planning process.

Section 1610.7–2(j) requires the State Director to: determine which ACECs to designate based on specific factors including a presumption that all potential ACECs that meet all three criteria will be designated; provide a justification and rationale in decision documents for decisions both to designate an ACEC and not to designate an ACEC; administer designated ACECs in a manner that conserves, protects, and enhances the relevant and important values and only allow casual use or uses that will ensure the protection of the relevant and important values; and prioritize acquisition of inholdings within ACECs and adjacent or connecting lands that also possess the relevant and important values of a specific ACEC. In response to comments, the final rule eliminated the requirement included in the proposed rule that State Directors provide annual reports describing activity plans and implementation actions for each ACEC in the State. Such reporting is more appropriately developed during implementation of the final rule and should remain within the discretion of the State Director.

Section 1610.7–2(k) authorizes the State Director to remove an ACEC designation in a land use planning process only when special management attention is not needed because another legally enforceable mechanism provides an equal or greater level of protection, or when the relevant and important values are no longer present, cannot be recovered, or have recovered to the point where special management is no longer necessary.

Section 1610.7–2(l) identifies terms that are used in the ACEC section—casual use, conserve, ecosystem resilience, intactness, landscape, monitoring, protect, and restore—and provides that they should be interpreted consistent with the definitions of those same terms in § 6101.4.

Severability

The provisions of the rule should be considered separately. If any portion of the rule were stayed or invalidated by a reviewing court, the remaining elements would continue to provide the BLM with important and independently effective tools to advance conservation on the public lands. In particular, revisions to existing planning regulations at 43 CFR part 1600 governing the designation and management of ACECs are separate from the balance of the rule, which promulgates the new 43 CFR part 6100. Within part 6100, the rule includes a number of aspects that function independently and hold independent utility. For example, the rule's provisions pertaining to the identification and management of intact landscapes and other values in land use planning and agency decision-making; its framework for third-party restoration and mitigation leasing; and its procedures for adopting national land health standards, assessing land health, and using those assessments to drive agency decisions operate as independent means to achieve the rule's overarching goal of facilitating conservation of the public lands. Hence, if a court prevents any provision of one part of this rule from taking effect, that should not affect the other parts of the rule. The remaining provisions would remain in force.

IV. Additional Response to Public Comments

The BLM received an initial total of 216,403 comments from regulations.gov. Further analysis showed that there were public comment submissions with multiple cosigners, sometimes several thousand on one submission, which were initially counted as separate submissions but ultimately identified as a single submission with multiple signatures. Therefore, although 216,403 voiced their opinion, the final count of comment letters came to 152,673. The comment letters on the proposed rule are available for viewing on the Federal e-rulemaking portal (*https://www.regulations.gov*) (search Docket ID: BLM–2023–0001).

The BLM has reviewed all public comments in the context of the proposed rule and the particular

solicitations for comment in its preamble. The BLM has made changes to the final rule based on the public comments that refine and further develop the concepts identified in the proposed rule. The BLM did not make wholesale changes or additions, even when prompted to do so by the public comments, that would have caused the final rule to materially alter the issues included in or substantially depart from the terms and substance of the proposed rule. Changes made are described in this section and the ''Section-by-Section Discussion of Final Rule and Revisions from the Proposed Rule'' section.

The following is a summary of significant issues raised in comments the BLM received on the proposed rule and responses to these comments. The comments highlighted in the following paragraphs fell into several categories: comments related to sections of the proposed rule; comments related to public lands uses and resources not addressed in the rule; and comments on the rulemaking process. See the Section-by-Section discussion for responses to public comments on specific sections of the proposed rule.

A. Conservation Leasing

Commenters generally sought a better understanding of many aspects of the conservation leasing proposal, including the purposes and uses of the leases, and identified the need for terminology that better reflects those purposes and uses. Commenters requested additional detail within the rule text for what would and would not be allowed under a conservation lease, clarification on the terms and duration of the leases, and information on how conservation leases would interact with existing uses such as grazing and recreation.

In response to these comments, the BLM updated the rule to provide clarity and specificity for the leasing program being established in the rule. Significantly, the final rule establishes two distinct types of leases in place of referring to ''conservation leases'': restoration leases and mitigation leases. Restoration leases can be used to facilitate restoration of land and resources by passively or actively assisting the recovery of an ecosystem; and mitigation leases can be used to offset impacts to resources resulting from other land use authorizations. Restoration can occur under a mitigation lease when restoration is a mitigation action being taken pursuant to the lease. The final rule enumerates factors for authorized officers to consider when evaluating lease proposals, such as whether the applicant is collaborating with existing permittees, whether the lease would advance environmental justice objectives, or whether the objectives of the proposed leases would be supported by current management of the lands. The final rule also enables conservation districts and State fish and wildlife agencies to hold restoration and mitigation leases and specifies that recreation uses would not generally be precluded by restoration or mitigation leases.

Many comments also asked about how conservation leases relate to valid existing rights and permitted uses, including grazing, mining, and oil and gas leasing. Restoration and mitigation leases would not disturb existing authorizations, valid existing rights, or State or Tribal land use management. If the proposed activities in a restoration or mitigation lease would conflict with existing authorizations, such as if a specific type of restoration would not be compatible with grazing and the proposed location is already subject to a grazing authorization, then the restoration or mitigation lease could not be issued on those particular lands unless the proposal were modified to eliminate the conflict. While an applicant might propose a lease to help achieve restoration or mitigation outcomes on public lands, the BLM retains discretion as to whether to issue a lease in response to a proposal.

Some commenters raised concerns about the ability of foreign entities to use conservation leases to block development of critical mineral or energy projects on public lands or to obtain conservation leases near military bases or other sensitive government installations. In response to these and other comments on the potential use of conservation leases in ways that would excessively interfere with other uses or to intentionally block development, the BLM clarified that restoration and mitigation leases may only be issued for two discrete purposes: restoration of degraded landscapes or mitigation to offset the impacts of development (6102.4(a)(1)). To specifically address concerns around foreign actors, the BLM also revised the rule to explicitly exclude foreign persons, as that term is defined in 31 CFR 802.221, from being qualified to hold a restoration or mitigation lease. The BLM will rely on its standard lease adjudication practices established in 43 CFR 2920 to determine if a lease applicant meets the preconditions for a qualified lease holder.

The final rule includes various other updates to the language throughout the text of the rule to provide readers with a clearer understanding of the goals and future implementation of the leasing program. For example, the final rule adopts principles for restoration and mitigation that provide additional structure for restoration and mitigation leases. The final rule also refines the BLM's discussion of intact landscapes and restoration priority landscapes, which would support identification of areas for restoration and mitigation leases.

Many commenters recommended that conservation leases should undergo NEPA analysis. A project-level decision to issue a restoration or mitigation lease will comply with NEPA, as is typically the case for Federal actions on public lands, and the BLM will prepare a NEPA analysis to support such project-level decisions when appropriate.

B. Restoration

Commenters provided a wide variety of comments on the topic of restoration. Comments generally related to one of three broad issues: the definition of restoration; the process by which restoration priorities are identified and the use of resource management plans (RMPs) in doing so; and conflicts that can arise in the application of restoration actions.

Several commenters expressed the need for clarifying the definition of restoration and suggested that it should include the concept of returning an area to its natural, native ecological state with several comments recommending that the BLM look to the Society for Ecological Restoration's ''International Principles and Standards for the Practice of Ecological Restoration'' for guidance.

Other commenters requested clarification as to where, how, and when restoration priorities are determined under the rule and called for transparency and public engagement in this process. Some comments also mentioned the use of resource management plans to identify and communicate restoration priorities and expressed concern that including restoration plans in RMPs could complicate and lengthen the RMP adoption or revision process. Other commenters, however, suggested that focusing on creating a 5-year schedule for restoration activities within RMPs is too narrow and proposed looking across watersheds (or subbasins or basins) to identify priorities at the state level, irrespective of RMP boundaries. They stated doing so may assist the BLM in better allocating limited restoration funds. Other comments suggested that restoration plans focus on implementation-level decisions rather than being incorporated into RMPs. One

comment suggested that each BLM district have a map identifying specific areas suitable for restoration measures.

Commenters expressed concerns about the practicalities and potential conflicts with implementing restoration across all BLM-administered lands. Comments discussed how in certain cases, restoration to a reference state may not be feasible or appropriate because the landscape has crossed an ecological threshold and is highly unlikely to be fully restored, or because the resource has high value or function and unique character that cannot be restored or replaced. Several comments discussed the proposed rule's treatment of land health standards in the context of restoration, noting that some restoration actions may not always have positive effects on land health and questioning whether achieving land health standards should be the sole purpose of restoration plans. Commenters raised examples of restoration projects in which the BLM removed pinyon-juniper forest through ecologically damaging practices such as chaining.

In response to comments, the BLM included a new provision within § 6102.3 (''Restoration'') to apply a set of principles to all restoration activities. These principles were largely identified in the draft rule in the context of planning for restoration. In response to comments, these principles now apply to all restoration actions and, among other purposes, seek to ensure that restoration actions directly address the causes of degradation and, importantly, take into consideration the recovery potential of the habitat. These principles will help the BLM target the right restoration actions in the right places, thereby reducing unintended outcomes and increasing the potential for successful restoration.

The principles also ensure that both passive and active management actions are allowable and promoted as restoration activities. Likewise, the definition of restoration has been changed to include explicit mention of both passive and active processes or actions and, in response to comments, include a stated goal of restoration actions to return ecosystems to a ''more natural, native ecological state.''

In response to comments on restoration prioritization and planning, the BLM revised the rule text to provide for the development of restoration plans outside of the RMP revision or amendment process. The final rule requires authorized officers to identify priority landscapes for restoration, consistent with existing, applicable RMP goals and objectives, and to prepare a restoration plan for those priority landscapes. Technical details, including for example geographic scale, for the development of restoration plans can be addressed through agency guidance. Such guidance may also address how to incorporate land health standards into restoration plans and may identify commonly accepted scientific standards within the field of ecological restoration for restoration work.

C. Mitigation

Generally, comments on the mitigation aspects of the rule could be grouped into three categories: the BLM's authority under FLPMA to require mitigation; the policies and practices that govern how the BLM will deploy mitigation, including use of the mitigation hierarchy; and the use of leases, as proposed by the rule, for mitigation purposes.

Many commenters expressed reservations about the BLM's mitigation management approach under the proposed rule, particularly how it might conflict with the multiple use mandate outlined in FLPMA. Critics argued that this could inadvertently prioritize resource preservation at the expense of a more comprehensive management approach, in particular with regard to grazing and recreation. Some commenters posited that the proposed mitigation standards are unlawful and reach beyond the BLM's authority under FLPMA and conflict with other statutory mandates. Other commenters conveyed the reverse, suggesting that the BLM's authority and responsibility to apply the mitigation hierarchy is central to managing for multiple use and sustained yield.

For the reasons discussed in more detail in the Background section above, FLPMA allows the BLM to balance the need for resource conservation alongside other uses as part of managing under principles of multiple use and sustained yield. In turn, FLPMA vests the BLM with broad authority to incorporate appropriate mitigation in its land use planning and to require other users of the public land to avoid, minimize, and compensate for resource impacts, as appropriate, from authorized uses. 43 U.S.C. 1712I, 1732(a)–(b); *see also* M–37039, The Bureau of Land Management's Authority to Address Impacts of its Land Use Authorizations through Mitigation, at 11–22 (Dec. 21, 2016) (reinstated by M–37075 (Apr. 15, 2022)) (''[The] BLM's charge under FLPMA to manage public lands based on principles of multiple use and sustained yield supports use of mitigation. The authority to evaluate and impose mitigation arises out of the broad authority FLPMA vests in the BLM to pursue congressional goals . . . for public lands. The BLM can evaluate and require mitigation through both the land use planning process and site-specific authorizations.'').

There were a number of comments regarding how and where the BLM would deploy mitigation under the proposed rule. Commenters recommended that the BLM amend the rule to require mitigation only to the extent practicable or reasonable and highlighted the need for the BLM to coordinate mitigation with local and State conservation plans. Many commenters were concerned that the use of compensatory mitigation would allow for development in sensitive areas that would otherwise not be allowed, such as ACECs or intact landscapes, and recommended that compensation should not be used to justify activities that could degrade these areas. Some commenters called on the BLM to require that compensatory mitigation measures ensure a net benefit for biodiversity, adhering to established international principles, or avoid the net loss of ecologically intact land. Some commenters narrowed their concern to how compensatory mitigation may specifically impact recreation, which can significantly degrade public resources, and urged that the rule not apply compensatory mitigation requirements to nonprofit organizations, and that ongoing trail use not be subject to such requirements.

In response to these comments, the BLM added mitigation principles to the final rule to provide a framework for how mitigation will be deployed under the rule, including through the mitigation hierarchy and mitigation leasing. The principles are consistent with agency policy and guidance for implementing mitigation, such as developing landscape-scale mitigation strategies, requiring performance criteria and effectiveness monitoring for mitigation programs and projects, and ensuring that compensatory mitigation is durable, additional, timely, and commensurate with adverse impacts. The final rule also confirms that the BLM will adhere to the mitigation hierarchy and that for important, scarce, or sensitive resources, the BLM will apply the mitigation hierarchy in the manner that achieves the maximum benefit to the impacted resource.

Many commenters emphasized the necessity of ensuring that any mitigation credits are based on completed restoration efforts that are actively functioning as habitat for native species impacted by development. These

commenters objected to permitting any proposal to issue credits based on future promises of restoration. Another commenter advocated for third-party mitigation fund holders to facilitate restoration on BLM-managed lands, specifically highlighting the role of private sector mitigation providers, including the ability for private third-party providers to hold mitigation funds. In response to comments, the BLM clarified the types of third-party entities it will allow to hold mitigation funds through a formal agreement. The mitigation fund holder could be a State or local government, if, among other requirements, that entity can demonstrate to the satisfaction of the BLM that it is acting as a fiduciary for the benefit of the mitigation project and site. The section also allows for a mitigation fund holder to be an entity that, among other requirements, qualifies for tax-exempt status and provides evidence it can successfully hold and manage mitigation accounts.

D. Land Health

Comments on aspects of land health in the proposed rule were diverse and focused on: BLM's capacity to evaluate land health across all BLM managed lands, the land health fundamentals, standards, and guidelines; the connection between land health and ecosystem resilience; the application of land health in resource decision-making; and questions about the role of Resource Advisory Councils.

Several commenters conveyed support for the proposal to apply the fundamentals of land health and related standards and guidelines to all BLM-managed public lands and uses, expanding them beyond their original application to rangelands and grazing.

In response to comments, the rule includes streamlined assessment processes applicable at broad spatial scales and a subsequent timeline to review whether such standards remain sufficient.

Commenters provided different recommendations as to how standards and guidelines should be updated. Some suggestions included tying new standards to quantifiable ecologically based performance metrics, specific ecoregions, specific resources, or local ecosystems and conditions. Whatever the outcome of new standards, many commenters conveyed a need for the BLM to provide the public the rationale for new standards and guidelines and clarity as to how they will be applied.

In response to comments, the final rule includes language adopting consistent national land health standards and an allowance to modify national standards to address unique and rare geographic needs.

A few commenters recommended the BLM use flexibility in land health standards to accommodate the diverse array of land uses, especially nonrenewable resources and those with potential surface-disturbing impacts. Various commenters expressed concern that expanding application of land health was unworkable as the BLM cannot meet the current demands for conducting land health analysis under 43 CFR Subpart 4180. To address this, commenters provided several recommendations, including setting appropriate monitoring frequencies, scales, and thresholds, with timelines for corrective actions and milestones. Additionally, commenters supported applying land health at the watershed rather than narrower or smaller scales (allotments, projects, etc.).

In response to comments, the final rule directs the BLM to establish nationally consistent land health standards and indicators and tiers land health standards directly from the fundamentals of land health in order to apply land health standards to a diverse array of land uses. Authorized officers must adopt the national standards and may also adopt geographically specific standards when necessary to evaluate rare or unique habitat or ecosystem types, such as permafrost. To address concerns about the BLM's capacity to apply land health standards to all program areas, the final rule allows field offices to use watershed condition assessments (completed every 10 years) as the baseline for land health evaluations. With watershed condition assessments, land health is assessed at a broad spatial and temporal scale, and may be supplemented by locally specific data.

Some commenters were confused about the role of the Resource Advisory Councils in the development of new standards and guidelines and sought clarification. Although the BLM engages with its Resource Advisory Councils on a wide range of issues, the rule does not require the engagement of Resource Advisory Councils in the development and supplementation of standards and guidelines.

E. Areas of Critical Environmental Concern

Various commenters advocated for strengthening the ACEC relevance and importance criteria, particularly by including habitat connectivity and biodiversity considerations, to ensure the protection of natural, cultural, and scenic resources. Additionally, many comments highlighted the importance of old-growth and mature forests and requested explicit language in the rule to protect and restore old-growth conditions through ACEC designation. The final rule establishes that a historic, cultural, or scenic value; a fish or wildlife resource; or a natural system or process has importance if it contributes to ecosystem resilience, landscape intactness, or habitat connectivity, among other importance criteria. While the final rule does not explicitly contemplate protection of old-growth forest conditions through ACEC designation, the rule specifically enables that management decision by identifying ecosystem resilience and landscape intactness as elements of the ACEC importance criterion. Other provisions in the final rule note that old-growth forests contribute to ecosystem resilience and landscape intactness, such as §§ 6101.2 and 6102.1.

Commenters recommended the final rule mandate more stringent management of designated ACECs in order to ensure protection of relevant and important values identified by the BLM. In response to these comments, the BLM added a management standard to the final rule to ensure ACEC values are appropriately managed for protection and clarified the presumption that a potential ACEC that meets all three criteria of relevance, importance, and needing special management attention will be designated in the land use plan.

Commenters raised concerns about ACEC nominations occurring outside of land use planning processes and that temporary management of potential ACECs would delay other land use authorizations such as renewable energy projects. Questions were raised about the responsibility to notify the public of temporary management decisions and whether temporary management must conform to the current resource management plan. Commenters were also generally interested in ensuring stakeholders and the public have adequate opportunities to participate in ACEC designation decisions.

Generally, the BLM addresses ACECs in the land use planning process. This is because designation of ACECs is intended to be a proactive land management decision to enhance management of important lands and resources. Such decisions should be made while also considering other potential management decisions that may affect those same lands and resources. In rarer situations, the BLM may identify a potential ACEC outside of the planning process and find that it needs special management attention to

ensure proper stewardship of resources and values the agency is charged with managing. In both contexts, the BLM must find that the lands at issue not only possess relevant and important values but also require special management attention. The final element of the standard for ACEC designation means more than finding special management attention will benefit the identified values; rather, it requires a finding that special management is necessary for their stewardship.

Within the land use planning process, the BLM has many tools at its disposal to provide necessary management of resources, ranging from special designation to more narrow management prescriptions. Outside of the planning process, temporary management of a potential ACEC may be the best option for addressing an area that has relevant and important values and requires special management attention to protect them. In those situations, under the final rule and consistent with existing guidance, the BLM may at the agency's discretion implement temporary management to protect the relevant and important values from irreparable damage until the BLM determines whether to designate the potential ACEC through a land use planning process. When implementing temporary management, the BLM would comply with applicable laws and regulations, notify the public, and reevaluate the decision periodically.

The BLM has the authority and the responsibility to mitigate impacts to public land resources from land use authorizations, including by avoiding, minimizing, and offsetting those impacts, independent of ACEC designation status. 43 U.S.C. 1732(a)–(b). Therefore, the BLM does not expect that an ACEC nomination or temporary management process will increase conflict where resources may be impacted by development proposals. Rather, the BLM intends these provisions of the rule to provide a proactive pathway for managing relevant and important values that require special management attention in the limited circumstances in which these values are identified outside of the planning process.

For example, if the BLM is evaluating a proposed development project and has not incorporated consideration of new ACEC designations into the NEPA process for that project, then it is anticipated that the BLM, consistent with existing guidance, would analyze potential impacts to resources and apply the mitigation hierarchy to address those impacts through the NEPA process rather than considering new ACEC designations as part of the ongoing NEPA process. This rule would not require the authorized officer to analyze ACEC nominations during that NEPA process. Rather, the State Director would have the discretion to determine when to evaluate ACEC nominations; the State Director could elect to defer that evaluation to an upcoming planning process. The State Director also would have the discretion to apply temporary management in the area, but only after determining that the area meets the relevance and importance criteria and that special management is necessary to protect the area's relevant and important values from irreparable damage. In other words, the State Director's discretion would include: continuing to process the project by deferring analysis of ACEC nominations; using the data related to ACEC nominations to inform the project analysis; and processing ACEC nominations and incorporating any temporary management into the project evaluation. In all circumstances, the BLM has the discretion to consider ACEC nominations and take steps to implement temporary management for relevant and important values or undertake a plan amendment process to designate new ACECs as outlined in the final rule. The BLM plans to provide additional guidance on situations in which an ACEC nomination overlaps with a pending development project application.

The final rule also emphasizes the ample opportunities for public notice and comment on the ACEC designation process through the resource management planning process, which requires robust public and stakeholder engagement as well as cooperation with local governments and consultation with Tribal governments (43 CFR 1610.2). The final rule confirms that proposed and existing ACECs being addressed by a resource management plan or a plan amendment will be identified in all applicable **Federal Register** Notices and in public outreach materials. The BLM will not, however, be required to continue to produce separate notices specific to ACECs which the BLM found to be duplicative and not in the public interest. The BLM will continue to provide the public with an opportunity to comment on proposed and existing ACECs through the land use planning and associated NEPA requirements for public involvement.

F. Intact Landscapes

Many commenters requested clarity on the rule provisions related to intactness, including how intact landscapes would be identified and managed. Comments recommended that a comprehensive inventory of intact landscapes be part of the land use planning process and that the rule make stronger commitments to prioritizing the conservation and protection of intact landscapes in order to advance the purpose of supporting ecosystem resilience. Additionally, commenters stressed the importance of incorporating community input.

Some commenters emphasized the need to consider other potential uses, such as renewable energy development, and the multiple use management approach when determining whether to manage certain landscapes for intactness. Several comments addressed the importance of acknowledging the human history of intact landscapes and incorporating the concept of cultural landscapes, as well as considering co-stewardship agreements for identified landscapes.

In response to these comments, the BLM updated the rule to clarify that ''landscape intactness'' is part of the resource inventory that is to be maintained and considered in accordance with FLPMA. The final rule also clarifies the land use planning process for this resource, which includes using the intactness inventory to identify and delineate intact landscapes, evaluating alternatives for managing the intact landscapes, and making management decisions for at least some of the intact landscapes or portions of intact landscapes that conserve their intactness. Habitat connectivity and migration corridor data would inform identification and management of intact landscapes, and the BLM would seek opportunities for Tribal co-stewardship in managing and protecting intact landscapes. The BLM anticipates that intact landscapes may vary widely in size and that not every acre of an intact landscape will be managed the same way, as the management focus would be on maintaining function of intact landscapes while facilitating multiple use and supporting sustained yield.

The identification of intact landscapes in the land use planning process would not necessarily preclude land use authorizations that would impair their intactness; rather the BLM would make management decisions for each landscape that would determine allowable uses. Some development could be compatible with management to conserve intactness, and intact landscapes may serve as desirable areas for restoration and mitigation leases. Once an intact landscape has been identified in a land use planning

process, the BLM would consider that resource and analyze potential impacts to it in the planning process and NEPA analysis to evaluate proposed uses, regardless of management decisions for the landscape, consistent with NEPA's requirement that the BLM analyze potential impacts from proposed actions.

G. Grazing

Commenters expressed concern regarding what they considered to be broad and ambiguous interpretations of terms ''conservation,'' ''intact landscapes,'' and ''ecosystem resilience,'' and for the potential for the proposed rule to limit or prohibit consumptive uses, such as grazing. The comments highlighted the need for clarity and consistency in definitions and objectives, suggesting modifications to acknowledge existing uses permitted under FLPMA.

The BLM also received a significant number of comments questioning how conservation leases relate to authorized grazing. Many comments highlighted the need to clarify how proposed conservation leases will interact with grazing management, particularly in cases where grazing may conflict with restoration goals.

In response to comments, the BLM made changes to the leasing section of the final rule. Those changes are summarized in the ''Section-by-Section Discussion of the Final Rule and Revisions from the Proposed Rule'' section and in the ''Conservation Leasing'' section of this discussion. Importantly, the BLM clarified that if proposed activities in a restoration or mitigation lease would conflict with existing authorizations, such as if a specific type of restoration would not be compatible with grazing and the proposed location is already subject to a grazing authorization, then a lease authorizing that type of restoration could not be issued on those particular lands. Additionally, the final rule elevates proposals for leases that can demonstrate collaboration with existing permittees, leaseholders, and adjacent land managers or owners and those that have support from local communities.

Commenters expressed different views as to whether grazing can be used as a land health solution, with some noting that grazing should be used as a land health management tool, while others stated that any use of grazing operations by the BLM to promote land health standards would likely preclude achieving land health goals. Some commenters argued that managed grazing can in fact achieve land health standards and that specific practices, such as targeted grazing, have been used to create fire breaks, manage invasive species, and promote land health. Other commenters argued that livestock grazing is incompatible with restoration and that grazing should be eliminated in areas undergoing restoration. This rule is not establishing or revising regulations governing the BLM's grazing program and does not contemplate using or not using grazing as a land health management tool. As previously discussed, conservation takes many forms on public lands, including in the ways grazing and many other uses are carried out. This rule focuses on conservation as a land use within the multiple use framework and develops the toolbox for conservation use that enables some of the many conservation strategies the agency employs to steward the public lands for multiple use and sustained yield. Grazing as a management tool may fit within these strategies.

Many commenters emphasized the impact that livestock grazing has had on BLM-managed public lands and the need for the BLM to commit to its responsibility under 43 CFR subpart 4180 to monitor achievement of rangeland health standards and manage for proper functioning conditions. One commenter noted that when an allotment fails to meet the standards, changes in grazing practices must be instituted to restore rangeland health. The BLM is not revising subpart 4180 as part of this rulemaking.

H. Recreation

Many commenters emphasized that outdoor recreation is dependent on healthy public lands and waters that provide desirable recreation experiences, which in turn support regional economic growth and help Americans connect with their public lands. They further noted that climate change is having a particular impact on outdoor recreation through drought and catastrophic wildfire, highlighting the need for resilient public lands that can continue to provide recreation opportunities in a changing future. These commenters requested the rule explicitly recognize the tie between landscape health and outdoor recreation and acknowledge that sustainable recreation is compatible with conservation use.

In response to comments, the final rule includes a new objective to: ''Provide for healthy lands and waters that support sustainable outdoor recreation experiences for current and future generations.'' The BLM views sustainable recreation as being compatible with conservation management, including specifically with restoration and mitigation leasing, protection of intact landscapes, management for land health, designation of ACECs, and other principles and management actions provided for in the rule. Furthermore, the BLM anticipates that outdoor recreation would benefit from these conservation measures and would be considered a reason to protect and restore certain landscapes. The additional objective at § 6101.2(g) aims to reflect this intent. The final rule does not specifically address recreation in more detail because the rule is not intended to establish regulations governing recreation use.

Some commenters raised concerns that the rule would reduce the amount of public land available for outdoor recreation. The rule would not change plans, policies, or programs governing recreation activities on public lands; recreation management would still be determined at the local level through land use planning and site-specific recreation management actions such as developed recreation sites, transportation system routes, or trails. As the BLM implements the rule, recreation management decisions will incorporate the objectives and principles set forth in the rule to support landscape health and ecosystem resilience. The rule is not intended to prevent or decrease outdoor recreation use; rather it ensures that recreation on public lands can be managed and grow sustainably while benefiting from the conservation of healthy lands and water.

I. Renewable Energy

Commenters raised concerns about the potential conflicts that could arise between the proposed rule and the BLM's ability to manage and promote renewable energy development. In response to comments, the BLM clarified mitigation language that would allow for renewable energy siting and development, or other kinds of projects, even when that development produces unavoidable impacts. Establishing methods to ensure impacts can be offset and expanding the ability to site compensatory mitigation on public lands through mitigation leases creates more opportunity to permit use while accounting for the unavoidable impacts of such use.

Commenters argued that application of land health standards to renewable energy projects as well as changes to identification and designation of ACECs may have the effect of significantly diminishing the BLM's ability to identify locations where it can permit renewable energy installations and

associated infrastructure. As noted in the discussion of the BLM's response to comments on ACECs, the BLM does not expect that ACEC designations or the potential for temporary management of proposed ACECs will increase conflict where resources may be impacted by development proposals. Rather, the BLM intends these provisions of the rule to provide a proactive pathway for managing relevant and important values that require special management attention, including in the limited circumstances in which these values are identified outside of the planning process.

Lastly, commenters conveyed concern that the proposed rule rested too much decision-making authority on BLM staff over a number of aspects of the rule and that such authority should reside with BLM State Directors. In response, the BLM clarified the responsibilities of Field Managers and State Directors in the ACEC section.

J. Cultural Resource Management

Some comments discussed the connection between cultural values and ecosystem resilience and requested an acknowledgement of this connection and clarity for whether and how the rule would incorporate cultural values or otherwise apply to cultural resource management. Commenters requested that the BLM consider how conservation strategies included in the rule intersect with cultural resources. Specifically, commenters recommended that the rule address American Indian contributions to stewarding the landscapes that the BLM now manages as public lands and may conserve through implementation of this rule, including Indigenous Knowledge and practices handed down over millennia. Commenters also recommended that lands that contain areas of sacred and ceremonial significance to Tribes should not be eligible for conservation leasing unless the purpose of the lease is directly related to those resources.

The BLM is committed to working with Tribes in the management of the public lands, which are the ancestral homelands of American Indian and Alaska Native Tribes. The BLM recognizes Indigenous Peoples have interacted with and stewarded the lands now managed as public lands since time immemorial. This human presence and stewardship continue to influence the lands addressed in the rule, including intact landscapes and ACECs.

Cultural resources can be and often are an essential component of functioning and productive ecosystems, and natural components of ecosystems can also be cultural resources. Some of the BLM's most intact and resilient ecosystems are often also locations with a high probability of containing cultural resources. Cultural and natural values of landscapes co-exist as reasons to protect and manage these landscapes, emphasizing the importance of Indigenous Knowledge and co-stewardship.

Actions and decisions aimed at restoring, maintaining, and conserving ecosystems and landscapes may inadvertently result in impacts to cultural resources. All such undertakings will be subject to section 106 of the NHPA, as well as NEPA. Through the section 106 process, the BLM will, in consultation with Tribes, State and Tribal Historic Preservation Officers, and interested parties, identify, evaluate, and resolve any adverse effects on historic properties. Any potential adverse effects to historic properties will be avoided, minimized, or otherwise mitigated in accordance with law, regulation, and policy. Effects to cultural resources that are not identified as historic properties under the NHPA will be considered and managed through land use plans and the NEPA process. In addition, the BLM will strive to consider and implement the new Best Practices Guide for Federal Agencies Regarding Tribal and Native Hawaiian Sacred Sites.[16]

K. Mature and Old-Growth Forests

Many comments were received emphasizing the need to protect old-growth and mature forests as part of meeting the rule's stated purpose of supporting ecosystem resilience on public lands. Commenters recommended adding provisions to the rule to establish emphasis areas for old-growth and mature forests, limit or prohibit tree cutting on BLM-managed lands, facilitate designation of old-growth forests as ACECs, and focus on climate sustainable logging. Commenters highlighted the scientific and social values of old-growth and mature forests and requested explicit language in the rule to protect these valuable ecosystems consistent with Executive Order 14072.

Executive Order 14072, *Strengthening the Nation's Forests, Communities, and Local Economies,* calls for defining, identifying, and inventorying the nation's old and mature forests and stewarding them for future generations to provide clean air and water, sustain plant and animal life, and respect their special importance to Tribal Nations, consistent with applicable law. The BLM is working with the U.S. Forest Service to implement the provisions in Executive Order 14072 related to mature and old-growth forests. In April 2023, the BLM and U.S. Forest Service released a definition framework and initial inventory of mature and old-growth forests on Federal lands, and the agencies are now analyzing threats to those forests pursuant to the Executive Order. The initial inventory identified 8.3 million acres of old-growth and 12.7 million acres of mature forest on BLM-administered lands, the majority of which are pinyon and juniper woodlands. Mature and old-growth forests and woodlands contribute to ecosystem resilience by providing wildlife habitat, clean water, carbon storage, and landscape intactness. They also have important social and cultural values.

The final rule facilitates conservation of BLM-managed forests and woodlands through multiple provisions, including those related to identification and protection of intact landscapes; conservation tools to protect certain lands and resources through land use planning; avoiding authorizing uses of the public lands that permanently impair ecosystem resilience; and co-stewardship opportunities with Tribes. In order to clarify this intent, the final rule specifically identifies conservation of old-growth forests within the objectives of the regulation. Because this is a procedural rule, establishing emphasis areas or other site-specific protections for old-growth forests is outside the scope of the rule.

L. Wild Horses and Burros

The BLM received comments on using the rule to change wild horse and burro management on public lands. Commenters recommended classifying wild horses and burros as a use of public lands, requiring the BLM to show that removal of livestock could not achieve the same objective as removal of wild horses and burros, restricting livestock grazing to reduce methane emissions and provide more forage for wild horses and burros, and allowing restoration and mitigation leases to be used to protect wild horse and burro habitat.

Management of wild horses and burros is governed by the Wild Free-Roaming Horses and Burros Act of 1971, as amended, and its implementing regulations (43 CFR part 4700). Wild horses and burros are managed in the

[16] Working Group of the Memorandum of Understanding Regarding Interagency Coordination and Collaboration for the Protection of Indigenous Sacred Sites (2023), *https://www.bia.gov/sites/default/files/media_document/sacred_sites_guide_508_2023-1205.pdf* (providing guidance on implementation of Executive Orders 13175, 13007, and 14096, and related policies).

areas where they are found, and decisions on herd management are made through the BLM's land use planning process. This rule does not authorize or mandate decisions to manage wild horses and burros. The rule does require the use of high-quality information that promotes reasoned, fact-based agency decisions in making land use allocations and other land use authorizations, including grazing authorizations. Restoration and mitigation leases are narrowly defined tools for restoring degraded landscapes or compensating for impacts of development and are not appropriate mechanisms for protecting wild horse and burro habitat.

M. NEPA Compliance for the Rule

A number of comments objected to the BLM's intent to rely on a categorical exclusion to comply with NEPA and called on the BLM to instead prepare an environmental assessment or environmental impact statement under NEPA.

The BLM has determined that the categorical exclusion set out at 43 CFR 46.210(i) applies to this rulemaking. That provision excludes from NEPA analysis and review actions that are ''of an administrative, financial, legal, technical, or procedural nature; or whose environmental effects are too broad, speculative, or conjectural to lend themselves to meaningful analysis and will later be subject to the NEPA process, either collectively or case-by-case.'' That categorical exclusion applies because the rule sets out a framework but is not self-executing in that it does not itself make substantive changes on the ground and will not (absent future decisions that implement the rule) restrict the BLM's discretion to undertake or authorize future on-the-ground action; thus, the rule is administrative or procedural in nature. Any future actions, including both land use planning and individual project-level decisions, including decisions to issue a restoration or mitigation lease, will be subject to the appropriate level of NEPA review at the time of that decision. Where the BLM will undertake such actions, which of the various tools provided in this rule it will use when doing so, and the particular methods and activities it will employ are unknown at this time, making the environmental effects associated with those future actions too speculative or conjectural to meaningfully evaluate now. The BLM has also determined that none of the extraordinary circumstances identified at 43 CFR 46.215 applies to this rulemaking.

N. Inventory, Assessment, and Monitoring

Public comments recommended that monitoring data and analyses should be made public to promote transparent decision processes. Commenters recommended emphasis on particular monitoring approaches and discouraged use of other approaches and requested more details on the monitoring implementation process and how it would tie to decision-making across different types of decisions. Commenters also recommended adding a process for monitoring prioritization.

Many commenters asked for clarification on watershed condition classifications, renamed ''watershed condition assessments'' in the final rule, including who would complete them and how often, what data they would include, whether outside partners would be engaged, and how they would tie to decision-making. Many recommended a nationally consistent process for completing watershed condition assessments in order to ensure that they were efficient and effective. Some asked how watershed condition assessments would interact with and inform the BLM land health process. Several questioned whether additional assessments were needed.

In response to public comments, the final rule clarifies that a focus of the rule is monitoring of infrastructure and renewable resources. It states that inventory, monitoring, and assessment information will be publicly available (currently, at the BLM Geospatial Business Platform Hub, *https://gbp-blm-egis.hub.arcgis.com/*), consistent with the Open Government Data Act, section 202(b). The final rule defines watershed condition assessments and specifies that they will be created using a consistent process and standardized data. The final rule recommends that high-quality information, including monitoring and watershed condition assessments, be used to inform many different types of decisions in the rule. Further details regarding inventory, assessment, and monitoring, including watershed condition assessments, may be addressed in implementation guidance.

Some comments questioned whether the monitoring provisions of the rule apply to cultural and paleontological resources. As stated in the Authority section of the final rule, implementation of the rule will be subject to and must be undertaken consistent with all applicable laws, which would include the NHPA and the PRPA.

O. Economic Analysis and Compliance With the Regulatory Flexibility Act

Many commenters insisted that the Regulatory Flexibility Act (RFA) required the BLM to prepare an initial regulatory flexibility analysis and, by extension, that this final rule would require a final regulatory flexibility analysis. Those commenters requested specific documentation and details of the economic impact on small businesses and other entities. Commenters stated that the BLM's certification that the rule would not have a significant economic impact on a substantial number of small entities lacked a proper factual basis.

The BLM disagrees with commenters' assertion that the RFA required for the proposed rule and so requires for this final rule a regulatory flexibility analysis. The BLM certified at the proposed rule stage and certifies again in promulgating this final rule that the rule will not have a significant economic impact on a substantial number of small entities. Under the Small Business Administration's (SBA) Guide for Federal Agencies to Comply with the Regulatory Flexibility Act, when certifying that a regulatory flexibility analysis is not required, the ''certification should contain a description of the number of affected entities and the size of the economic impacts and why either the number of entities or the size of the impacts justifies the certification.'' Here, the BLM has undertaken an economic threshold analysis and concluded that the magnitude of the impact on any individual or group, including small entities, is expected to be negligible (Economic Threshold Analysis). In support of this determination, the BLM followed SBA's certification checklist items.

The SBA's guidelines provide, ''The RFA does not define 'significant impact' or 'substantial number,' and it is the agencies' discretion on where to set these thresholds on a rule-to-rule basis based on their judgment.'' The BLM exercised its discretion to conclude that an initial regulatory flexibility analysis was not required for the proposed rule and that a final regulatory flexibility analysis is not required now.

V. Procedural Matters

Regulatory Planning and Review (Executive Orders 12866, 13563 and 14094)

Executive Order (''E.O.'') 12866, ''Regulatory Planning and Review,'' as supplemented and reaffirmed by E.O. 13563, ''Improving Regulation and Regulatory Review,'' 76 FR 3821 (Jan.

21, 2011) and amended by E.O. 14094, ''Modernizing Regulatory Review,'' 88 FR 21879 (April 11, 2023), requires agencies, to the extent permitted by law, to (1) propose or adopt a regulation only upon a reasoned determination that its benefits justify its costs (recognizing that some benefits and costs are difficult to quantify); (2) tailor regulations to impose the least burden on society, consistent with obtaining regulatory objectives, taking into account, among other things, and to the extent practicable, the costs of cumulative regulations; (3) select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity); (4) to the extent feasible, specify performance objectives, rather than specifying the behavior or manner of compliance that regulated entities must adopt; and (5) identify and assess available alternatives to direct regulation, including providing economic incentives to encourage the desired behavior, such as user fees or marketable permits, or providing information upon which choices can be made by the public. E.O. 12866, as amended by E.O. 14094, provides that the Office of Information and Regulatory Affairs (''OIRA'') in the Office of Management and Budget (''OMB'') will review all significant rules. Section 6(a) of E.O. 12866 also requires agencies to submit ''significant regulatory actions'' to OIRA for review. OIRA has determined that this final regulatory action constitutes a ''significant regulatory action'' within the scope of E.O. 12866.

E.O. 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the Nation's regulatory system to promote predictability, reduce uncertainty, and use the best, most innovative, and least burdensome tools for achieving regulatory ends. The E.O. directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rule making process must allow for public participation and an open exchange of ideas. The BLM has developed this rule in a manner consistent with these requirements.

Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) (5 U.S.C. 601 *et seq.*) generally requires that Federal agencies prepare a regulatory flexibility analysis for rules subject to the ''notice-and-comment'' rulemaking requirements found in the Administrative Procedure Act (5 U.S.C. 551 *et seq.*), if the rule would have a significant economic impact, whether detrimental or beneficial, on a substantial number of small entities. See 5 U.S.C. 601–612. Congress enacted the RFA to ensure that government regulations do not unnecessarily or disproportionately burden small entities. Small entities include small businesses, small governmental jurisdictions, and small not-for-profit enterprises.

For the purpose of conducting its review pursuant to the RFA, the BLM certifies that the rule would not have a ''significant economic impact on a substantial number of small entities,'' as that phrase is used in 5 U.S.C. 605. The rule does not affect any existing use of public lands, nor does it impose restrictions on future use. The rule modifies BLM decision-making processes and does not directly regulate any industry, but it may affect industries related to environmental restoration or mitigation activity or other sectors that rely on public lands management. The BLM does not expect those impacts to be significant. See the Economic Analysis, *Potential Impact on Small Entities,* for more information.

Congressional Review Act (CRA)

Pursuant to subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996 (also known as the Congressional Review Act), the Office of Information and Regulatory Affairs has determined that this rule does not meet the criteria set forth in 5 U.S.C. 804(2). This rule:

a. Does not have an annual effect on the economy of $100 million or more. The BLM did not estimate the annual benefits that this rule would provide to the economy. Please see the Economic Analysis for this rule for a more detailed discussion.

b. Will not cause a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions. The rule would benefit small businesses by streamlining the BLM's processes.

c. Does not have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises. The rule would not have adverse effects on any of these criteria.

Unfunded Mandates Reform Act (UMRA)

This rule does not impose an unfunded mandate on State, local, or Tribal governments, or the private sector of more than $100 million per year. The rule does not have a significant or unique effect on State, local, or tribal governments, or the private sector. Under the Unfunded Mandates Reform Act (UMRA) (2 U.S.C. 1531 *et seq.*), agencies must prepare a written statement about benefits and costs prior to issuing a proposed or final rule that may result in aggregate expenditure by State, local, and tribal governments, or the private sector, of $100 million or more in any 1 year.

This rule is not subject to those requirements of the UMRA. The rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local, and tribal governments, in the aggregate, or to the private sector in any one year. The rule would not significantly or uniquely affect small governments. A statement containing the information required by the UMRA is not required.

Government Actions and Interference With Constitutionally Protected Property Rights Takings (E.O 12630)

This rule does not effect a taking of private property or otherwise have taking implications under E.O. 12630. Section 2(a) of E.O. 12630 identifies policies that do not have takings implications, such as those that abolish regulations, discontinue governmental programs, or modify regulations in a manner that lessens interference with the use of private property. The rule will not interfere with private property. A takings implication assessment is not required.

Federalism (E.O 13132)

Under the criteria in Section 1 of E.O. 13132, this rule does not have sufficient federalism implications to warrant the preparation of a federalism summary impact statement. It does not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

The BLM received broad and general comments suggesting that E.O. 13132 requires preparation of a federalism summary impact statement with respect to this rule. In particular, some comments raised concerns that conservation leases (now titled

restoration and mitigation leases) could infringe on state and local authority. Executive Order 13132 generally prohibits Federal agencies from promulgating rules that might have a substantial direct effect on states or local governments, on the relationship between Federal and State governments, or on the distribution of power and responsibilities among the various levels of government, without meeting certain conditions, such as consulting with elected State and local government officials early in the process. In particular, administrative rules may not create substantial direct compliance costs for state or local governments that are not otherwise required by statute and may not expressly or impliedly preempt state law without Federal agencies undertaking additional processes. This rule will inform the BLM's management approach on federal land in the several states where BLM manages public land, but nothing in the rule, including its provisions for restoration and mitigation leasing, preempts state law or requires state or local governments to comply with specific provisions. Nor does the rule modify let alone reduce the role, under FLPMA, of state and local governments in land use planning. As a result, a federalism summary impact statement is not required.

Civil Justice Reform (E.O 12988)

This rule complies with the requirements of E.O. 12988. Specifically, this rule:

a. Meets the criteria of Section 3(a) requiring that all regulations be reviewed to eliminate errors and ambiguity and be written to minimize litigation; and

b. Meets the criteria of Section 3(b)(2) requiring that all regulations be written in clear language and contain clear legal standards.

Consultation and Coordination With Indian Tribes (E.O 13175 and Departmental Policy)

The Department of the Interior (DOI) endeavors to maintain and strengthen its government-to-government relationship with Indian Tribes through a commitment to consultation with Indian Tribes and recognition of their right to self-governance and tribal sovereignty. We have evaluated this rule under the DOI's consultation policy and under the criteria in E.O. 13175 and have determined that the rule has tribal implications.

In conformance with the Secretary's policy on Tribal consultation, the BLM sent letters to all Tribes at the beginning of the rulemaking process informing them of the proposed rule and inviting them to engage with BLM on their thoughts and concerns. The BLM received input from Tribal governments, Alaska Native Corporations, and Tribal entities in comments on the proposed rule, as well as in other meetings that included a broader range of topics, and incorporated their input in drafting the final rule. Consistent with the DOI's consultation policy (52 Departmental Manual 4) and the criteria in E.O. 13175, the BLM will continue to consult with federally recognized Indian Tribes on any proposal that may have Tribal implications.

Paperwork Reduction Act

The Paperwork Reduction Act (PRA) (44 U.S.C. 3501–3521) generally provides that an agency may not conduct or sponsor, and notwithstanding any other provision of law a person is not required to respond to, a collection of information, unless it displays a currently valid Office of Management and Budget (OMB) control number. This rule contains information collection requirements that are subject to review by the OMB under the PRA. Collections of information include any request or requirement that persons obtain, maintain, retain, or report information to an agency, or disclose information to a third party or to the public (44 U.S.C. 3502(3) and 5 CFR 1320.3(c)).

OMB has generally approved the existing information collection requirements contained in the BLM's regulations contained in 43 CFR subpart 1610 under OMB Control Number 1004–0212. The final rule would not result in any new or revised information collection requirements that are currently approved under that OMB Control Number.

For the reasons set out in the preamble, the BLM is amending 43 CFR by creating Part 6100 which would result in new information collection requirements that require approval by OMB. The information collection requirement contained in part 6100 will allow the BLM to issue a restoration or mitigation lease to qualified entities for the purpose of restoring degraded land or resources, or mitigation to offset the impacts of other land use authorizations. The new information collection requirements contained in the final rule are discussed below.

New Information Collection Requirements

§ 6102.4(b) and (c)—Restoration and Mitigation Leasing: Applications for restoration or mitigation leases shall be filed with the Bureau of Land Management office having jurisdiction over the public lands covered by the application. Applications for restoration or mitigation leases shall include a restoration or mitigation development plan which includes sufficient detail to enable the authorized officer to evaluate the feasibility, impacts, benefits, costs, threats to public health and safety, collaborative efforts, and conformance with BLM plans, programs, and policies, including compatibility with other uses. The development plan shall include but not be limited to:

- Results from available assessments, inventory and monitoring efforts, or other high-quality information that identify the current conditions of the site(s) of the proposed restoration or mitigation action;
- The desired future condition of the proposed lease area including clear goals, objectives, and measurable performance criteria needed to achieve the objectives;
- Justification for passive restoration or mitigation if proposed;
- A description of all facilities for which authorization is sought, including access needs and any other special types of authorizations that may be needed;
- A map of sufficient scale to allow the required information to be legible as well as a legal description of primary and alternative project locations;
- Justification of the total acres proposed for the restoration or mitigation lease;
- A schedule for restoration activities, if applicable; and
- Information on outreach conducted or to be conducted with existing permittees, lease holders, adjacent land managers or owners, and other interested parties.

§ 6102.4(c)(4)—Restoration and Mitigation Leasing (additional information): After review of the restoration or mitigation development plan, the authorized officer may require the applicant to provide additional high-quality information, if such information is necessary for the BLM to decide whether to issue, issue with modification, or deny the proposed lease. An application for the use of public lands may require documentation or proof of application for additional private, State, local or other Federal agency licenses, permits, easements, certificates, or other approval documents. The authorized officer may require evidence that the applicant has or prior to commencement of lease activities will have the technical and financial capability to operate, maintain, and terminate the authorized lease activities.

§ 6102.4(e)—Restoration and Mitigation Leasing/Monitoring Plan: If approved, the lease holder shall provide a monitoring plan that describes how the terms and conditions of the lease will be applied, the monitoring methodology and frequency, measurable criteria, and adaptive management triggers.

§ 6102.4(e)(1)—Restoration and Mitigation Leasing/Annual Report: The lease holder shall provide a lease activity report annually and at the end of the lease period. At a minimum, the report shall describe:

- the restoration or mitigation activities taken as of the time of the report;
- any barriers to meeting the stated purpose of the lease;
- proposed steps to resolve any identified barriers; and
- monitoring information and data that meet BLM methodology requirements and data standards (see § 6103.2(c)).

§ 6102.4.1(d)(3)—Termination and Suspension of Restoration and Mitigation Leases: Upon determination that there is noncompliance with the terms and conditions of a restoration or mitigation lease which adversely affects land or public health or safety, or impacts ecosystem resilience, the authorized officer shall issue an immediate temporary suspension. Any time after an order of suspension has been issued, the holder may file with the authorized officer a request for permission to resume. The request shall be in writing and shall contain a statement of the facts supporting the request.

§ 6102.4.2(a)—Bonding for Restoration and Mitigation Leases: Prior to the commencement of surface-disturbing activities, the authorized officer may require the restoration or mitigation lease holder to submit a reclamation, decommission, or performance bond conditioned upon compliance with all the terms and conditions of the lease covered by the bond. For mitigation leases, the lease holder will usually be required to provide letters of credit or establish an escrow account for the full amount needed to ensure the development plan meets all performance criteria.

§ 6102.5.1(d)—Mitigation—Approval of third parties as mitigation fund holders: § 6102.5.1(d) would allow in certain limited circumstances authorized officers to approve third parties as mitigation fund holders to establish mitigation accounts for use by entities granted land use authorizations by the BLM. The authorized officer will approve the use of a mitigation account by a permittee only if a mitigation fund holder has a formal agreement with the BLM.

§ 6102.5.1(e)—Mitigation—Approval of third parties as mitigation fund holders/State and local government agencies: State and local government agencies are limited in their ability to accept, manage, and disburse funds for the purpose outlined in § 6102.5.1 and generally should not be approved by the BLM to hold mitigation funds for compensatory mitigation sites on public or private lands. An exception may be made where a government agency is able to demonstrate, to the satisfaction of the BLM, that they are acting as a fiduciary for the benefit of the mitigation project or site, essentially as if they are a third party, and can show that they have the authority and perform the duties described in § 6102.5.1.

Information Collection Changes From Proposed to Final Rule:

The BLM introduced the following information collection requirements that were not in the proposed rule:

- Restoration and Mitigation Leasing/Monitoring Plan—43 CFR 6102.4(e);
- Restoration and Mitigation Leasing/Annual Report—43 CFR 6102.4(e)(1); and
- Mitigation/Approval third parties as mitigation fund holders/Annual Fiscal Reports—43 CFR 6102.5–1(e).

These ICs are necessary to provide monitoring mechanisms to help the BLM assure that we are achieving the desired outcomes of the restoration and mitigation plans.

The information collection requirements contained in this rule are needed to ensure that accountability through restoration monitoring and tracking is carried out effectively and that project goals are being met. The estimated annual information collection burdens for this rule are outlined below:

Collection of information	Number of responses	Time per response (hours)	Total hours
Restoration and Mitigation Leasing/Restoration or Mitigation Development Plan—43 CFR 6102.4(b) and (c)	10	10	100
Restoration and Mitigation Leasing/Additional Information 43 CFR 6102.4(c)(5)	8	25	200
Restoration and Mitigation Leasing/Monitoring Plan—43 CFR 6102.4(e)	9	5	45
Restoration and Mitigation Leasing/Annual Report—43 CFR 6102.4(e)(1)	9	2	18
Termination and Suspension of Restoration and Mitigation Leases/written request to resume or suspended activity—43 CFR 6102.4–1(d)(3)	1	240	240
Bonding for Restoration and Mitigation Leases—43 CFR 6102.4–2(a)	10	80	800
Mitigation/Approval third parties as mitigation fund holders—43 CFR 6102.5–1(e)	4	5	20
Mitigation/Approval third parties as mitigation fund holders—43 CFR 6102.5–1(g)	4	5	20
Mitigation/Approval third parties as mitigation fund holders/Annual Fiscal Reports—43 CFR 6102.5–1(e)	4	2	8
Mitigation/Approval third parties as mitigation fund holders/Annual Fiscal Reports—43 CFR 6102.5–1(e)	4	2	8

Information Collection Summary:

Title of Collection: Ecosystem Resilience (43 CFR part 6100).

OMB Control Number: 1004–0218.

Form Number: None.

Type of Review: New collection of information.

Respondents/Affected Public: Private sector businesses; Not-for-profit organizations; and State, local, or Tribal governments.

Respondent's Obligation: Required to Obtain or Retain a Benefit.

Frequency of Collection: On occasion; Annual.

Estimated Completion Time per Response: Varies from 5 hours to 240 hours per response, depending on activity.

Number of Respondents: 63.

Annual Responses: 63.

Annual Burden Hours: 1,459.

Annual Burden Cost: $0.

If you want to comment on the information-collection requirements in this rule, please send your comments and suggestions on this information-collection within 30 days of publication of this final rule in the **Federal Register**

to OMB by going to *www.reginfo.gov.* Click on the link, ''Currently under Review—Open for Public Comments.''

National Environmental Policy Act (NEPA)

This rule is excluded from review under the National Environmental Policy Act under Department Categorical Exclusion (CX) at 43 CFR 46.210(i). This CX covers policies, directives, regulations, and guidelines that are of an administrative, financial, legal, technical, or procedural nature or whose environmental effects are too broad, speculative, or conjectural to lend themselves to meaningful analysis and will later be subject to the NEPA process, either collectively or case-by-case. The BLM has documented this CX's applicability to this action and posted it for public review here in docket BLM–2023–0001 on regulations.gov.

Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use (E.O. 13211)

Federal agencies must prepare and submit to OMB a Statement of Energy Effects (SEE) for any significant energy action. A ''significant energy action'' is defined as any action by an agency that: (1) Is a significant regulatory action under Executive Order 12866, or any successor order, and is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) Is designated by the Administrator of OIRA as a significant energy action. This rule is a significant action under Executive Order 12866; however, this rule does not affect energy supply, distribution, or use, and OIRA has not designated it a significant energy action. Therefore, it is not a significant energy action under E.O. 13211, and a SEE is not required.

The BLM received many comments on its determination that this rule is not a significant energy action. Commenters stated that the proposed rule, particularly the regulations pertaining to ACECs and the establishment of a restoration and mitigation leasing program (conservation leasing in the proposed rule), would displace oil and gas production and mining for critical minerals on public lands. Commenters also expressed concern that ACEC designation and restoration and mitigation leases could preclude energy rights of way for transmission lines. Commenters requested more information on how the BLM determined that this rulemaking would not have a significant adverse effect on energy supply, distribution, or use, and specifically requested the BLM complete a SEE for this rulemaking.

The BLM disagrees that the rule would adversely impact the supply, distribution, or use of energy. No part of the rule would preclude the development or transmission of energy on or across public lands without due consideration of multiple use and sustained yield principles through BLM's existing decision-making processes, including the required public engagement. Restoration and mitigation leases may not be issued in areas where an existing and otherwise incompatible use is occurring; thus, they would not displace existing mineral leases or mining claims. Restoration and mitigation leases are a narrow tool which may only be issued to restore degraded landscapes or to offset impacts of other land use authorizations; they may not be used to ''block'' development of mineral resources on lands allocated to such use in the governing Resource Management Plan. In many cases, these leases will facilitate the development of energy on public lands by providing an avenue for developers to satisfy obligations to offset the impacts of energy development through compensatory mitigation.

The revised regulations for ACEC designation will not adversely affect the supply, distribution or use of energy on public lands. FLPMA has required that the BLM prioritize the designation and protection of ACECs since 1976, and the final rule does not change that requirement or the overall process and parameters for their designation and management. The BLM does not expect that ACEC designations or the potential for temporary management of proposed ACECs will increase conflict where resources may be impacted by development proposals. Rather, the BLM intends these provisions of the rule to provide a proactive pathway for managing relevant and important values that require special management attention in the limited circumstances in which these values are identified outside of the planning process. See Section IV, Response to Comments, part E., Areas of Critical Environmental Concern, for more information.

Clarity of This Regulation (Executive Orders 12866, 12988 and 13563)

We are required by Executive Orders 12866 (section 1(b)(12)), 12988 (section 3(b)(1)(B)), and 13563 (section 1(a)), and by the Presidential Memorandum of June 1, 1988, to write all rules in plain language. This means that each rule must: a) Be logically organized; b) Use the active voice to address readers directly; c) Use common, everyday words and clear language rather than jargon; d) Be divided into short sections and sentences; and e) Use lists and tables wherever possible.

Authors

The principal authors of this rule are: Patricia Johnston, BLM Division of Wildlife Conservation, Aquatics, and Environmental Protection; Darrin King, BLM Division of Regulatory Affairs; Chandra Little, BLM Division of Regulatory Affairs, assisted by the DOI Office of the Solicitor.

The action taken herein is pursuant to an existing delegation of authority.

List of Subjects in 43 CFR Part 1600

Administrative practice and procedure, Coal, Conservation, Environmental impact statements, Environmental protection, Intergovernmental relations, Preservation, Public lands.

This action by the Principal Deputy Assistant Secretary is taken pursuant to an existing delegation of authority.

Steven H. Feldgus,

Deputy Assistant Secretary for Land and Minerals Management.

Accordingly, for the reasons set out in the preamble, the Bureau of Land Management amends 43 CFR Chapter II as set forth below:

PART 1600—PLANNING, PROGRAMMING, BUDGETING

■ 1. The authority citation for part 1600 continues to read as follows:

Authority: 43 U.S.C. 1711–1712.

■ 2. Revise § 1610.7–2 to read as follows:

§ 1610.7–2 Designation of areas of critical environmental concern.

(a) An area of critical environmental concern (ACEC) designation is the principal BLM designation for public lands where special management is required to protect and prevent irreparable damage to important historic, cultural, or scenic values; fish or wildlife resources; or natural systems or processes or to protect life and safety from natural hazards. The BLM designates ACECs when issuing a decision to approve a resource management plan, plan revision, or plan amendment. ACECs shall be managed to protect the relevant and important values for which they are designated.

(b) In the land use planning process, authorized officers must identify, evaluate, and give priority to areas that have potential for designation and management as ACECs. Identification, evaluation, and priority management of

ACECs shall be considered during the development and revision of resource management plans and during amendments to resource management plans when such action falls within the scope of the amendment (*see* §§ 1610.4–1 through 1610.4–9). Proposed and existing ACECs that will be addressed by a resource management plan, plan revision, or plan amendment will be identified in all public notices required by this part (*see, e.g.,* § 1610.2).

(c) The authorized officer must facilitate the identification of eligible ACECs early in the land use planning process by:

(1) Analyzing inventory, assessment, and monitoring data to determine whether there are areas containing important historic, cultural, or scenic values; fish or wildlife resources; natural systems or processes; or natural hazards potentially impacting life and safety that are eligible for designation;

(2) Reevaluating existing ACECs in order to determine if the relevant and important values are still present and special management attention is still necessary; and

(3) Seeking nominations for ACECs, during public scoping, from the public, State and local governments, Indian Tribes, and other Federal agencies (*see* §§ 1610.2(c), 1602.5(b)(4) through (6)).

(d) To be designated as an ACEC, an area must meet the following criteria:

(1) *Relevance.* The area contains important historic, cultural, or scenic values; fish or wildlife resources; natural systems or processes; or natural hazards potentially impacting life and safety.

(2) *Importance.* A historic, cultural, or scenic value; a fish or wildlife resource; a natural system or process; or a natural hazard potentially impacting life and safety has importance if it has qualities of special worth, consequence, meaning, distinctiveness, or cause for concern; national or more than local importance, subsistence value, or regional contribution of a resource, value, system, or process; or contributes to ecosystem resilience, landscape intactness, or habitat connectivity. A natural hazard can be important if it is a significant threat to human life and safety.

(3) *Special management attention.* The important historic, cultural, or scenic values; fish or wildlife resources; natural systems or processes; or natural hazards potentially impacting life and safety require special management attention. ''Special management attention'' means management prescriptions that:

(i) Protect and prevent irreparable damage to the relevant and important values, or that protect life and safety from natural hazards; and

(ii) Would not be prescribed if the relevant and important values were not present. In this context, ''irreparable damage'' means harm to a value, resource, system, or process that substantially diminishes the relevance or importance of that value, resource, system, or process in such a way that recovery of the value, resource, system, or process to the extent necessary to restore its prior relevance or importance is impossible.

(e) The authorized officer may designate an ACEC research natural area if the area:

(1) Meets all of the criteria identified in § 1610.7–2(d)(1) through (3); and

(2) Is consistent with one or more of the primary purposes found at § 8223.0–5 of this chapter. A designated ACEC research natural area will be subject to the use restrictions at § 8223.1 of this title in addition to the special management attention prescribed by the authorized officer through land use planning.

(f) The boundaries of proposed ACECs shall be identified for public lands, as appropriate, to encompass the relevant and important values and geographic extent of the special management attention needed to provide protection.

(g) During a planning process, the planning documents must analyze in detail any proposed ACEC that has relevant and important values. Where the BLM has received ACEC proposals that do not have relevant and important values, the agency is not required to review those proposals in detail in planning documents. Through land use planning, the BLM will evaluate the need for special management attention to protect the relevant and important values, which could include other allocations and designations being considered, in order to provide for informed decision-making on the trade-offs associated with ACEC designation.

(h) The approved resource management plan, plan revision, or plan amendment shall list all designated ACECs, identify their relevant and important values, and include the special management attention, including management prescriptions for other uses, identified for each designated ACEC.

(i) ACEC nominations typically should be evaluated during a planning process. If a nomination for an ACEC is received outside of the planning process, the following provisions apply.

(1) The State Director will evaluate whether the relevant, important, and special management criteria identified in paragraph (d) of this section are met. The State Director will determine the appropriate time to complete this analysis. If the criteria identified in paragraph (d) of this section are met, then the State Director shall, at their discretion, either:

(i) Initiate a land use planning process; or

(ii) Provide temporary management consistent with the applicable resource management plan to protect the relevant and important values from irreparable damage. Any temporary management that is implemented would be in effect until the BLM either completes a land use planning process to determine whether to designate the area as an ACEC or, through periodic evaluation, finds designation is no longer necessary. The BLM will publish a public notice if temporary management is implemented.

(2) The State Director may defer evaluating the nomination to an upcoming planning process.

(j) The State Director shall:

(1) Determine which ACECs to designate based on:

(i) The presumption that all areas found to require special management attention will be designated;

(ii) The value of other resource uses in the area;

(iii) The feasibility of managing the designation; and

(iv) The relationship to other types of designations and protective management available.

(2) In the decision document for the resource management plan or plan amendment, provide a justification and rationale for both ACEC designation decisions and decisions not to designate a proposed ACEC.

(3) Administer designated ACECs in a manner that conserves, protects, and enhances the relevant and important values and only allow casual use or uses that will ensure the protection of the relevant and important values. This paragraph (j)(3) does not apply to those ACECs designated for natural hazards potentially impacting life and safety.

(4) Prioritize acquisition of inholdings within ACECs and adjacent or connecting lands identified as holding relevant and important values related to the designated ACEC.

(k) The State Director, through the land use planning process, may remove the designation of an ACEC, in whole or in part, only when:

(1) The State Director finds that special management attention is not needed because another legally enforceable mechanism provides an equal or greater level of protection; or

(2) The State Director finds that the relevant and important values are no longer present, cannot be recovered, or

have recovered to the point where special management is no longer necessary. The findings must be supported by data or documented changes on the ground.

(l) As used in this section, the terms casual use, conservation, ecosystem resilience, intactness, landscape, monitoring, protection, and restoration have the same meanings as in § 6101.4 of this chapter.

■ 3. Add part 6100 to read as follows:

PART 6100—ECOSYSTEM RESILIENCE

Subpart 6101—General Information

Sec.
6101.1 Purpose.
6101.2 Objectives.
6101.3 Authority.

6103.1.2 Land Health Evaluations and Determinations.
6103.2 Inventory, Assessment and Monitoring.

Authority: 16 U.S.C. 7202; 43 U.S.C. 1701 *et seq.*

PART 6100—ECOSYSTEM RESILIENCE

Subpart 6101—General Information

§ 6101.1 Purpose.

The BLM's management of public lands on the basis of multiple use and sustained yield relies on healthy landscapes and resilient ecosystems. The purpose of this part is to promote the use of conservation to ensure ecosystem resilience and prevent permanent impairment or unnecessary or undue degradation of public lands. This part discusses the use of protection and restoration actions, as well as tools such as watershed condition assessments, land health evaluations, inventory, assessment, and monitoring.

§ 6101.2 Objectives.

The objectives of this part are to:

(a) Achieve and maintain ecosystem resilience when administering Bureau programs; developing, amending, and revising land use plans; and approving uses on the public lands;

(b) Promote conservation by maintaining, protecting, and restoring ecosystem resilience and intact landscapes, including habitat connectivity and old-growth forests;

(c) Integrate the fundamentals of land health and related standards and guidelines into resource management for all uses and activities on BLM-managed lands;

(d) Incorporate inventory, assessment, and monitoring principles into decision-making and use this information to identify trends and implement adaptive management strategies;

(e) Accelerate restoration and improvement of degraded public lands, air, and waters to properly functioning and desired conditions;

(f) Manage for ecosystems and their components to adapt, absorb, or recover from the effects of disturbances or environmental change through conservation, protection, restoration, or improvement of essential structures, functions, and redundancy of ecological patterns across the landscape;

(g) Provide for healthy lands and waters that support sustainable outdoor recreation experiences for current and future generations;

(h) Prevent permanent impairment or unnecessary or undue degradation of public lands;

(i) Improve engagement and co-stewardship of public lands with Tribal entities and promote the use of Indigenous Knowledge in decision-making; and

(j) Advance environmental justice through restoration and mitigation actions.

§ 6101.3 Authority.

These regulations are issued under the authority of the Federal Land Policy and Management Act of 1976 (43 U.S.C. 1701 *et seq.*) as amended and section 2002 of the Omnibus Public Land Management Act of 2009 (16 U.S.C. 7202). Implementation of this part is subject to all applicable law.

§ 6101.4 Definitions.

As used in this part, the term:

(a) *Casual use* means any short-term, noncommercial activity that does not cause appreciable damage or disturbance to the public lands or their resources or improvements and that is not prohibited by closure of the lands to any such activity.

(b) *Conservation* means the management of natural resources to promote protection and restoration. Conservation actions are effective at building resilient lands and are designed to reach desired future conditions through protection, restoration, and other types of planning, permitting, and program decision-making.

(c) *Disturbance* means changes in environmental conditions, either discrete or chronic. Disturbances may be viewed as ''characteristic'' when ecosystems and/or species have evolved to survive, exploit, and even depend on a disturbance or ''uncharacteristic'' when attributes of the disturbance (*e.g.,* type, timing, frequency, magnitude, duration) are outside prevailing background conditions. Disturbances may be natural or human-caused.

(d) *Ecosystem resilience* means the capacity of ecosystems (*e.g.,* old-growth forests and woodlands, sagebrush core areas) to maintain or regain their fundamental composition, structure, and function (including maintaining habitat connectivity and providing ecosystem services) when affected by disturbances such as drought, wildfire, and nonnative invasive species.

(e) *Effects* means the direct, indirect, and cumulative impacts, as defined in 40 CFR 1508.1(g), from a public land use. Effects and impacts as used in these regulations are synonymous.

(f) *High-quality information* means information that promotes reasoned, evidence-based agency decisions. Information that meets the standards for objectivity, utility, and integrity as set forth in the Department's Information Quality Guidelines [17] qualifies as high-quality information. Indigenous Knowledge qualifies as high-quality information when it is gained by prior, informed consent free of coercion, and generally meets the standards for high-quality information.

(g) *Important, scarce, or sensitive resources:*

(1) ''Important resources'' means resources that the BLM has determined to warrant special consideration, consistent with applicable law.

(2) ''Scarce resources'' means resources that are not plentiful or abundant and may include resources that are experiencing a downward trend in condition.

[17] U.S. Department of the Interior, Information Quality Guidelines, *https://www.doi.gov/ocio/policy-mgmt-support/information-quality-guidelines.*

(3) ''Sensitive resources'' means resources that are delicate and vulnerable to adverse change, such as resources that lack resilience to changing circumstances.

(h) *Indigenous Knowledge* means a body of observations, oral and written knowledge, innovations, technologies, practices, and beliefs developed by Indigenous Peoples through interaction and experience with the environment. Indigenous Knowledge is applied to phenomena across biological, physical, social, cultural, and spiritual systems. Indigenous Knowledge can be developed over millennia, continue to develop, and include understanding based on evidence acquired through direct contact with the environment and long-term experiences, as well as extensive observations, lessons, and skills passed from generation to generation. Indigenous Knowledge is developed, held, and stewarded by Indigenous Peoples and is often intrinsic within Indigenous legal traditions, including customary law or traditional governance structures and decision-making processes. Other terms, such as Traditional Knowledge, Traditional Ecological Knowledge, Genetic Resources associated with Traditional Knowledge, Traditional Cultural Expression, Tribal Ecological Knowledge, Native Science, Indigenous Applied Science, Indigenous Science, and others, are sometimes used to describe this knowledge system.

(i) *In-lieu fee program* means a program involving the restoration, establishment, and/or enhancement and protection of resources at specific sites through funds paid to a local or State government agency, non-profit organization that qualifies for tax-exempt status in accordance with Internal Revenue Code (IRC) section 501(c)(3), or Tribal organization to satisfy compensatory mitigation requirements for adverse impacts resulting from BLM-authorized public land uses. Collected funds are pooled and expended on projects that provide compensatory mitigation for the same types of resource impacts. Similar to a mitigation bank, an in-lieu fee program sells mitigation credits to permittees whose obligation to provide compensatory mitigation is then transferred to the in-lieu program sponsor.

(j) *Intact landscape* means a relatively unfragmented landscape free of local conditions that could permanently or significantly disrupt, impair, or degrade the landscape's composition, structure, or function. Intact landscapes are large enough to maintain native biological diversity, including viable populations of wide-ranging species. Intact landscapes provide critical ecosystem services and are resilient to disturbance and environmental change and thus may be prioritized for conservation action. For example, an intact landscape would have minimal fragmentation from roads, fences, and dams; low densities of agricultural, urban, and industrial development; and minimal pollution levels.

(k) *Intactness* means a measure of the degree to which human influences, which can include invasive species and unnatural wildfire, alter or impair the structure, function, or composition of a landscape. Areas experiencing a natural fire regime can be intact.

(l) *Land health* means the degree to which the integrity of the soil, water, and ecological processes sustain habitat quality and ecosystem functions.

(m) *Landscape* means an area that is spatially heterogeneous in at least one factor of interest which may include common management concerns or conditions. The landscape is not defined by the size of the area, but rather by the interacting elements that are relevant and meaningful in a management context. Landscapes may be defined in terms of aquatic conditions, such as watersheds, or terrestrial conditions, such as ecoregions.

(n) *Mitigation* means:

(1) avoiding the impacts of a proposed action by not taking a certain action or parts of an action;

(2) minimizing impacts by limiting the degree or magnitude of the action and its implementation;

(3) rectifying the impact of the action by repairing, rehabilitating, or restoring the affected environment;

(4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and

(5) compensating for the impact of the action by replacing or providing substitute resources or environments. In practice, the mitigation sequence is often summarized as avoid, minimize, and compensate. The BLM generally applies mitigation hierarchically: first avoid, then minimize, and then compensate for any residual impacts from proposed actions.

(o) *Mitigation bank* means a site, or suite of sites, where resources are restored, established, enhanced, or protected for the purpose of providing compensatory mitigation for impacts to the same types of resources from BLM-authorized public land uses. In general, the sponsor of a mitigation bank sells mitigation credits to permittees whose obligation to provide compensatory mitigation is then transferred to the mitigation bank sponsor.

(p) *Mitigation fund* means an account established by a mitigation fund holder through a written agreement with the BLM. Permittees with compensatory mitigation requirements may deposit funds with the fund holder, when approved to do so by the BLM. Funds are then expended by the fund holder on projects that mitigate for the same types of resources that were impacted as a result of BLM-authorized land uses.

(q) *Mitigation strategies* means documents that identify, evaluate, and communicate potential mitigation needs and mitigation measures in a geographic area, at relevant scales, in advance of anticipated public land uses.

(r) ''Monitoring'' means the periodic observation and orderly collection of data to evaluate:

(1) existing conditions;

(2) the effects of management actions; or

(3) the effectiveness of actions taken to meet management objectives.

(s) *Permittee* means any person or other legal entity that has a valid permit, right-of-way grant, lease, or other BLM land use authorization.

(t) *Protection* means the act or process of conservation by maintaining the existence of resources while preventing degradation, damage, or destruction. Protection is not synonymous with preservation and allows for active management or other uses consistent with multiple use and sustained yield principles.

(u) *Public lands* means any surface estate or interests in the surface estate owned by the United States and administered by the Secretary of the Interior through the BLM without regard to how the United States acquired ownership.

(v) *Reclamation* means, when used in relation to individual project goals and objectives, practices intended to achieve an outcome that reflects the final goal to restore the character and productivity of the land and water. Components of reclamation include, as applicable:

(1) Isolating, controlling, or removing toxic or deleterious substances;

(2) Regrading and reshaping to conform with adjacent landforms, facilitate revegetation, control drainage, and minimize erosion;

(3) Rehabilitating fisheries or wildlife habitat;

(4) Placing growth medium and establishing self-sustaining revegetation;

(5) Removing or stabilizing buildings, structures, or other support facilities;

(6) Plugging drill holes and closing underground workings; and

(7) Providing for post-activity monitoring, maintenance, or treatment.

(w) *Restoration* means the process or act of conservation by passively or actively assisting the recovery of an ecosystem that has been degraded, damaged, or destroyed to a more natural, native ecological state.

(x) *Significant causal factor* means a use, activity, or disturbance that prevents an area from achieving or making significant progress toward achieving one or more land health standards. To be a significant factor, a use may be one of several causal factors in contributing to less-than-healthy conditions; it need not be the sole causal factor inhibiting progress toward the standards.

(y) *Significant progress* means measurable or observable changes in the indicators that demonstrate improved land health. Acceptable levels of change must be realistic in terms of the capability of the resource but must also be as expeditious and effective as practical.

(z) *Sustained yield* means the achievement and maintenance in perpetuity of a high-level annual or regular periodic output of the various renewable resources of BLM-managed lands consistent with multiple use and without permanent impairment of the productivity of the land. Preventing permanent impairment means that renewable resources are not permanently depleted and that desired future conditions are met for future generations. Ecosystem resilience is essential to the BLM's ability to manage for sustained yield.

(aa) *Unnecessary or undue degradation* means harm to resources or values that is not necessary to accomplish a use's stated goals or is excessive or disproportionate to the proposed action or an existing disturbance. Unnecessary or undue degradation includes two distinct elements: ''Unnecessary degradation'' means harm to land resources or values that is not needed to accomplish a use's stated goals. For example, approving a proposed access road causing damage to critical habitat for a plant listed as endangered under the Endangered Species Act that could be located without any such impacts and still provide the needed access may result in unnecessary degradation. ''Undue degradation'' means harm to land resources or values that is excessive or disproportionate to the proposed action or an existing disturbance. For example, approving a proposed access road causing damage to the only remaining critical habitat for a plant listed as endangered under the Endangered Species Act, even if there is not another location for the road, may result in undue degradation. The statutory obligation to prevent ''unnecessary or undue degradation'' applies when either unnecessary degradation or undue degradation, and not necessarily both, is implicated.

(bb) *Watershed condition assessment* means a process for assessing and synthesizing information on the condition of soil, water, habitats, and ecological processes within watersheds relative to the BLM's land health fundamentals. A watershed condition assessment may include assessment of one or more of watershed physical and biological characteristics, landscape intactness, and disturbances.

§ 6101.5 Principles for Ecosystem Resilience.

(a) Except where otherwise provided by law, public lands must be managed under the principles of multiple use and sustained yield.

(b) To ensure multiple use and sustained yield, the BLM's management must conserve the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; preserve and protect certain public lands in their natural condition (including ecological and environmental values); maintain the productivity of renewable natural resources in perpetuity; and consider the long-term needs of future generations, without permanent impairment of the productivity of the land.

(c) The BLM must conserve renewable natural resources at a level that maintains or improves future resource availability and ecosystem resilience, in a manner consistent with multiple use and sustained yield.

(d) Authorized officers must implement the foregoing principles through:

(1) Conservation as a land use within the multiple use framework, including in decision-making, authorization, and planning processes;

(2) Protection and maintenance of the fundamentals of land health and ecosystem resilience;

(3) Restoration and protection of public lands to support ecosystem resilience, including habitat connectivity and old-growth forests;

(4) Use of the full mitigation hierarchy to address impacts to species, habitats, and ecosystems from land use authorizations; and

(5) Prevention of unnecessary or undue degradation.

Subpart 6102—Conservation Use To Achieve Ecosystem Resilience

§ 6102.1 Protection of Landscape Intactness.

(a) The BLM must manage certain landscapes to protect their intactness, including habitat connectivity and old-growth forests. This requires:

(1) Maintaining ecosystem resilience and habitat connectivity through conservation actions;

(2) Conserving landscape intactness when managing compatible uses, especially where development or fragmentation that could permanently impair ecosystem resilience has the potential to occur on public lands;

(3) Maintaining or restoring resilient ecosystems through habitat and ecosystem restoration projects that are implemented over broader spatial and longer temporal scales;

(4) Coordinating and implementing actions across BLM programs, offices, and partners to protect intact landscapes; and

(5) Pursuing management actions that maintain or mimic characteristic disturbance, or mimic natural disturbance, when maintaining it is not possible.

(b) Authorized officers will seek to prioritize actions that conserve and protect landscape intactness in accordance with § 6101.2.

§ 6102.2 Management to Protect Intact Landscapes.

(a) The BLM will maintain an inventory of landscape intactness as a resource value using watershed condition assessments (*see* § 6103.2(a)) to establish a consistent baseline condition.

(b) When updating a resource management plan under part 1600 of this chapter, the BLM will use a baseline condition of intactness and available high-quality information about landscape intactness, such as watershed condition assessments, environmental disturbances, and monitoring (*see* § 6103.2), to:

(1) Identify and delineate boundaries for intact landscapes within the planning area, taking into consideration habitat connectivity and migration corridor data;

(2) Evaluate alternatives to protect intact landscapes or portions of the intact landscapes from activities that would permanently or significantly disrupt, impair, or degrade the ecosystem's structure or functionality of the intact landscapes; and

(3) Identify which intact landscapes or portions of intact landscapes will be managed for protection consistent with

the principles enumerated in § 6102.1(a).

(c) The BLM will identify desired conditions and landscape objectives to guide implementation of decisions regarding management of intact landscapes, habitat connectivity, and old-growth forests. As part of carrying out paragraph (b) of this section, the BLM will seek to:

(1) Establish partnerships to work across Federal and non-Federal lands to promote and protect intact landscapes;

(2) Work with communities to identify geographic areas important for their strategic growth and development in order to allow for better identification of the most suitable areas to protect intact landscapes and habitat connectivity;

(3) Consult with Tribes to identify opportunities for co-stewardship to protect intact landscapes (*see* § 6102.5(b)(4) through (6)); and

(4) Use high-quality information including standardized quantitative monitoring to evaluate the effectiveness of management actions for ecosystem resilience (*see* § 6103.2).

(d) When determining whether to acquire lands or interests in lands through purchase, donation, or exchange, authorized officers must prioritize the acquisition of lands or interests in lands that would further protect and connect intact landscapes and functioning ecosystems.

(e) Authorized officers must collect and track landscape intactness data to support minimizing surface disturbance and inform conservation actions. This information must be included in a publicly available national tracking system.

§ 6102.3 Restoration.

(a) The BLM must emphasize restoration on the public lands to achieve its multiple use and sustained yield mandate.

(b) In determining the restoration actions required to achieve recovery of ecosystems and promote resilience, the BLM must consider the causes of degradation, the recovery potential of the ecosystem, and the allowable uses in the governing land use plan, such as whether an area is managed for recreation or is degraded land prioritized for development. The BLM must then develop commensurate restoration goals and objectives (*see* § 6103.1.1).

(c) The BLM should employ management actions to promote restoration. Over the long-term, restoration actions must be durable, self-sustaining, and expected to persist in a manner that supports land health and ecosystem resilience.

(d) When designing and implementing restoration actions on public lands, including authorizing restoration leases, authorized officers must adhere to the following principles:

(1) Ensure that restoration actions address causes of degradation, focus on process-based solutions, and where possible maintain attributes and resource values associated with the potential or capability of the ecosystem;

(2) Ensure that actions are designed, implemented, and monitored at appropriate spatial and temporal scales using suitable treatments and tools to achieve desired outcomes;

(3) Coordinate and implement actions across BLM programs, with partners, and in consideration of existing uses to develop holistic restoration actions;

(4) Ensure incorporation of locally appropriate best management practices, high-quality information, and adaptive management that supports restoration;

(5) Identify opportunities to implement nature-based or low-tech restoration activities and use seed from native plants; and

(6) Consult with Tribes to identify opportunities for co-stewardship or collaboration (*see* § 6102.5(b)(4) through (6)).

§ 6102.3.1 Restoration Prioritization and Planning.

(a) Authorized officers must identify measurable and quantifiable restoration outcomes consistent with the restoration principles enumerated in § 6102.3 in all resource management plans.

(b) Authorized officers will, at least every 5 years, identify priority landscapes for restoration consistent with resource management plan objectives and the restoration principles enumerated in § 6102.3. In doing so, authorized officers must consider:

(1) Current conditions and causes of degradation as indicated by watershed condition assessments, existing land health assessments, evaluations, and determinations, and other high-quality information (*see* § 6103.2);

(2) The likelihood of success of restoration activities to achieve resource or conservation objectives including ecosystem resilience;

(3) Where restoration actions may have the most social and economic benefits or work to address environmental justice, including impacts on communities with environmental justice concerns; and

(4) Where restoration or mitigation can minimize or offset unnecessary or undue degradation, such as ecosystem conversion, fragmentation, habitat loss, or other negative outcomes that permanently impair ecosystem resilience.

(c) For priority landscapes identified in accordance with this subpart, authorized officers must periodically, and at least every 5 years, develop or amend restoration plans consistent with resource management plan objectives in accordance with part 1600 of this chapter. Each restoration plan must include goals, objectives, and management actions that are:

(1) Consistent with the restoration principles enumerated in § 6102.3;

(2) Commensurate with recovery potential;

(3) Evaluated against measurable objectives, including to facilitate adaptive management to achieve outcomes supporting ecosystem resilience (*see* subpart 6103);

(4) Developed consistent with scientifically accepted standards and principles for restoration; and

(5) Consistent with statewide and regional needs as identified in the assessment of priority landscapes for restoration as identified in this subpart.

(d) Authorized officers must track restoration implementation and progress toward achieving goals at appropriate temporal scales. If restoration goals are not met, authorized officers must assess why restoration outcomes are not being achieved and what, if any, additional resources or changes to management are needed to achieve restoration goals.

§ 6102.4 Restoration and Mitigation Leasing.

(a) The BLM may authorize restoration leases or mitigation leases under such terms and conditions as the authorized officer determines are appropriate for the purpose of restoring degraded landscapes or mitigating impacts of other uses.

(1) Restoration or mitigation leases on the public lands may be authorized for the following purposes:

(i) Restoration of land and resources by passively or actively assisting the recovery of an ecosystem that has been degraded, damaged, or destroyed to a more natural, resilient ecological state; and

(ii) Mitigation to offset impacts to resources resulting from other land use authorizations.

(2) Authorized officers may issue restoration or mitigation leases to any qualified entity that can demonstrate capacity for implementing restoration or mitigation projects (as appropriate) and meets the lease requirements. Consistent with the lease adjudication practices established in 43 CFR 2920, qualified entities for restoration or mitigation

leases may be individuals, businesses, non-governmental organizations, Tribal governments, conservation districts, or State fish and wildlife agencies. Qualified entities for a mitigation lease to establish an in-lieu fee program are limited to non-governmental organizations, State fish and wildlife agencies, and Tribal government organizations. Restoration and mitigation leases may not be held by a foreign person as that term is defined in 31 CFR 802.221.

(3) Restoration or mitigation leases shall be issued for a term consistent with the time required to achieve their objective.

(i) A lease issued for purposes of restoration may be issued for a maximum term of 10 years, and all activities taken under the lease shall be reviewed mid-term for consistency with the lease provisions.

(ii) A lease issued for purposes of mitigation shall be issued for a term commensurate with the impact it is mitigating, and all activities taken under the lease reviewed every 5 years for consistency with the lease provisions.

(iii) Authorized officers may renew a restoration or mitigation lease if necessary to serve the purpose for which the lease was first issued, provided that the lease holder is in compliance with the terms and conditions of the lease and renewal is consistent with applicable law. Such renewal can be for a period no longer than the original term of the lease.

(4) Subject to valid existing rights and applicable law, once the BLM has issued a lease, the BLM shall not issue new authorizations to use the leased lands if the use would be incompatible with the authorized restoration or mitigation use.

(5) No land use authorization is required under the regulations in this part for casual use of the public lands covered by a restoration or mitigation lease.

(b) The application process for a restoration or mitigation lease and for renewal of such a lease is as follows:

(1) An application for a restoration or mitigation lease must be filed using an approved application form with the Bureau of Land Management office having jurisdiction over the public lands covered by the application.

(2) The filing of an application gives the applicant no right to use the public lands.

(3) Acceptance of an application or approval of a lease is not guaranteed and is at the discretion of the authorized officer.

(4) Actions that pertain to or address geographic areas or resource conditions previously identified as needing restoration by the BLM through watershed condition assessments and existing land health assessments, land health evaluations, an existing restoration plan, a mitigation strategy, or high-quality inventory, assessment, and monitoring information shall be given priority for consideration (*see* subpart 6103).

(c) An application for a restoration or mitigation lease must comply with the following requirements:

(1) An application must include a restoration or mitigation development plan that describes the proposed restoration or mitigation use in sufficient detail to enable authorized officers to evaluate the feasibility, impacts, benefits, costs, threats to public health and safety, collaborative efforts, and conformance with BLM plans, programs, and policies, including compatibility with other uses.

(2) The development plan shall include, but not be limited to:

(i) Results from available assessments, inventory and monitoring efforts, or other high-quality information (*see* subpart 6103) that identify the current conditions of the site(s) of the proposed restoration or mitigation action;

(ii) The desired future condition of the proposed lease area including clear goals, objectives, and measurable performance criteria needed to determine progress toward achieving the objectives;

(iii) Justification for passive restoration or mitigation if proposed;

(iv) A description of all facilities for which authorization is sought, including access needs and any other special types of authorizations that may be needed;

(v) A map of sufficient scale to allow the required information to be legible as well as a legal description of primary and alternative project locations;

(vi) Justification of the total acres proposed for the restoration or mitigation lease;

(vii) A schedule for restoration activities if applicable; and

(viii) Information on outreach already conducted or to be conducted with existing permittees, lease holders, adjacent land managers or owners, and other interested parties.

(3) Restoration lease development plans must be consistent with § 6102.3 and mitigation lease development plans must be consistent with § 6102.5.1.

(4) Applicants must submit the following additional information, upon request of the authorized officer:

(i) Additional high-quality information, if such information is necessary for the BLM to decide whether to issue, issue with modification, or deny the proposed lease;

(ii) Documentation of or proof of application for any required private, State, local, or other Federal agency licenses, permits, easements, certificates, or other approvals; and

(iii) Evidence that the applicant has, or will have prior to commencement of lease activities, the technical and financial capability to operate, maintain, and terminate the authorized lease activities.

(d) When reviewing restoration and mitigation lease applications, authorized officers will consider the following factors, along with other applicable legal requirements, which will make lease issuance more likely:

(1) Lease outcomes that are consistent with the restoration principles in § 6102.3(d);

(2) Desired future conditions that are consistent with the management objectives and allowable uses in the governing land use plan, such as an area managed for recreation or prioritized for development;

(3) Collaboration with existing permittees, leaseholders, and adjacent land managers or owners;

(4) Outreach to or support from local communities; or

(5) Consideration of environmental justice objectives.

(e) If approved, the leaseholder shall provide a monitoring plan that describes how the terms and conditions of the lease will be applied, the monitoring methodology and frequency, measurable criteria, and adaptive management triggers.

(1) The lease holder shall provide a lease activity report annually and at the end of the lease period. At a minimum, the report shall specify:

(i) The restoration or mitigation activities taken as of the time of the report;

(ii) Any barriers to meeting the stated purpose of the lease;

(iii) Proposed steps to resolve any identified barriers; and

(iv) Monitoring information and data that meet BLM methodology requirements and data standards (*see* § 6103.2(d)).

(2) Additional requirements for development plans and monitoring plans for mitigation leases are provided in § 6102.5.1.

(f) An approved lease does not convey exclusive rights to use the public lands to the lease holder The authorized officer retains the discretion to determine compatibility of the renewal of existing authorizations and future land use proposals on lands subject to restoration or mitigation leases.

(g) A restoration or mitigation lease will not preclude access to or across leased areas for casual use, recreation use, research use, or other use taken pursuant to a land use authorization that is compatible with the approved restoration or mitigation use.

(h) Existing access that accommodates accessibility under section 504 of the Rehabilitation Act shall remain after a lease has been issued.

(i) A restoration or mitigation lease may only be amended, assigned, or transferred with the written approval of the authorized officer, and no amendment, assignment, or transfer shall be effective until the BLM has approved it in writing. Authorized officers may authorize assignment or transfer of a restoration or mitigation lease in their discretion if no additional rights will be conveyed beyond those granted by the original authorization, the proposed assignee or transferee is qualified to hold the lease, and the assignment or transfer is in the public interest.

(j) Administrative cost recovery, rents, and fees for restoration and mitigation leases will be governed by the provisions of 43 CFR 2920.6 and 2920.8, provided that the BLM may waive or reduce administrative cost recovery, fees, and rent of a restoration lease if the restoration lease is not used to generate revenue or satisfy the requirements of a mitigation program (*e.g.,* selling credits in an established market), and the restoration lease will enhance ecological or cultural resources or provide a benefit to the general public.

§ 6102.4.1 Termination and Suspension of Restoration and Mitigation Leases.

(a) If a restoration or mitigation lease provides by its terms that it shall terminate on the occurrence of a fixed or agreed-upon event, the restoration or mitigation lease shall automatically terminate by operation of law upon the occurrence of such event.

(b) A restoration or mitigation lease may be terminated by mutual written agreement between the authorized officer and the lease holder.

(c) Authorized officers have discretion to suspend or terminate restoration or mitigation leases under the following circumstances:

(1) Improper issuance of the lease;

(2) Noncompliance by the holder with applicable law, regulations, or terms and conditions of the lease;

(3) Failure of the holder to use the lease for the purpose for which it was authorized; or

(4) Impossibility of fulfilling the purposes of the lease.

(d) Upon determination that the holder has failed to comply with any terms or conditions of a lease and that such noncompliance adversely affects or poses a threat to land or public health or safety, or impacts ecosystem resilience, the authorized officer shall issue an immediate temporary suspension.

(1) The authorized officer may issue an immediate temporary suspension order orally or in writing at the site of the activity to the holder or a contractor or subcontractor of the holder, or to any representative, agent, employee, or contractor of any such holder, contractor, or subcontractor, and the suspended activity shall cease at that time. As soon as practicable, the authorized officer shall confirm the order by a written notice to the holder addressed to the holder or the holder's designated agent. The authorized officer may also take such action that the authorized officer considers necessary to address the adverse effects or threat to land or public health or safety or impacts to ecosystem resilience.

(2) The authorized officer may order immediate temporary suspension of an activity independent of any action that has been or is being taken by another Federal or State agency.

(3) Any time after an order of temporary suspension has been issued, the holder may file with the authorized officer a request for permission to resume activities authorized by the lease. The request shall be in writing and shall contain a statement of the facts supporting the request. The authorized officer may grant the request upon determination that the adverse effects or threat to land or public health or safety or impacts to ecosystem resilience are resolved.

(4) The authorized officer may render an order to either grant or deny the request to resume within 30 working days of the date the request is filed. If the authorized officer does not render an order on the request within 30 working days, the request shall be considered denied, and the holder shall have the same right to appeal as if an order denying the request had been issued.

(e) Process for termination or suspension other than temporary immediate suspension.

(1) Prior to commencing any proceeding to suspend or terminate a lease, the authorized officer shall give written notice to the holder of the legal grounds for such action and shall give the holder a reasonable time to address the legal basis the authorized officer identifies for suspension or termination.

(2) After due notice of termination or suspension to the holder of a restoration or mitigation lease, if grounds for suspension or termination still exist after a reasonable time, the authorized officer shall give written notice to the holder and refer the matter to the Office of Hearings and Appeals for a hearing before an administrative law judge pursuant to 43 CFR part 4. The authorized officer shall suspend or revoke the restoration or mitigation lease if the administrative law judge determines that grounds for suspension or revocation exist and that such action is justified.

(3) Authorized officers shall terminate a suspension order when they determine that the grounds for such suspension no longer exist.

(4) Upon termination of a restoration or mitigation lease, the holder shall, for 60 days after the notice of termination, retain authorization to use the associated public lands solely for the purposes of reclaiming the site to its pre-use conditions consistent with achieving land health fundamentals, unless otherwise agreed upon in writing or in the lease terms. If the holder fails to reclaim the site consistent with the requirements of the lease terms within a reasonable period, all authorization to use the associated public lands will terminate, but that shall not relieve the holder of liability for the cost of reclaiming the site.

§ 6102.4.2 Bonding for Restoration and Mitigation Leases.

(a) *Bonding obligations.* (1) Prior to the commencement of surface-disturbing or active management activities, the authorized officer may require the restoration or mitigation lease holder to submit a reclamation, decommission, or performance bond conditioned upon compliance with all the terms and conditions of the lease covered by the bond, as described in this subpart. For mitigation leases, the lease holder will usually be required to provide letters of credit or establish an escrow account for the full amount needed to ensure the development plan meets all performance criteria. The bond amounts shall be sufficient to ensure reclamation of the restoration and mitigation lease area(s) and the restoration of any lands or surface waters adversely affected by restoration or mitigation lease operations. Such restoration may be required after the abandonment or cessation of operations by the restoration or mitigation lease holder in accordance with, but not limited to, the standards and requirements set forth by authorized officers.

(2) Considerations for requiring a bond include, but are not limited to:

(i) The type and level of active restoration;

(ii) Amount and type of surface disturbing activity;

(iii) Proposed use of non-natural restoration methods, such as the use of pesticides;

(iv) Proposed use of experimental methods of restoration;

(v) Risk of compounding effects resulting from restoration activities, such as a proliferation of invasive species; and

(vi) Fire risk.

(3) Surety bonds shall be issued by qualified surety companies certified by the Department of the Treasury.

(4) Personal bonds shall be accompanied by:

(i) Cashier's check;

(ii) Certified check; or

(iii) Negotiable Treasury securities of the United States of a value equal to the amount specified in the bond. Negotiable Treasury securities shall be accompanied by a proper conveyance to the Secretary of full authority to sell such securities in case of default in the performance of the terms and conditions of a conservation use authorization.

(b) In lieu of bonds for each individual restoration or mitigation lease, holders may furnish a bond covering all restoration or mitigation leases and operations in any one State. Such a bond must be at least $25,000 and must be sufficient to ensure reclamation of all of the holder's restoration or mitigation lease area(s) and the restoration of any lands or surface waters adversely affected by restoration or mitigation lease operations in the State.

(c) All bonds shall be filed in the proper BLM office on a current form approved by the Office of the Director. A single copy executed by the principal or, in the case of surety bonds, by both the principal and an acceptable surety is sufficient. Bonds shall be filed in the Bureau State Office having jurisdiction of the restoration or mitigation lease covered by the bond.

(d) Default.

(1) Where, upon a default, the surety makes a payment to the United States of an obligation incurred under a restoration or mitigation lease, the face amount of the surety bond or personal bonds and the surety's liability thereunder shall be reduced by the amount of such payment.

(2) After default, where the obligation in default equals or is less than the face amount of the bond(s), the principal shall either post a new bond or restore the existing bond(s) to the amount previously held or a larger amount as determined by authorized officers. In lieu thereof, the principal may file separate or substitute bonds for each conservation use covered by the deficient bond(s). Where the obligation incurred exceeds the face amount of the bond(s), the principal shall make full payment to the United States for all obligations incurred that are in excess of the face amount of the bond(s) and shall post a new bond in the amount previously held or such larger amount as determined by authorized officers. The restoration of a bond or posting of a new bond shall be made within 6 months or less after receipt of notice from authorized officers.

(3) Failure to comply with these requirements may:

(i) Subject all leases covered by such bond(s) to termination under the provisions of this title;

(ii) Prevent the bond obligor or principal from acquiring any additional restoration or mitigation leases or interest therein under this subpart; and

(iii) Result in the bond obligor or principal being referred to the suspension and debarment program under 2 CFR part 1400 to determine if the entity will be suspended or debarred from doing business with the Federal Government.

§ 6102.5 Management Actions for Ecosystem Resilience.

(a) Authorized officers must:

(1) Identify priority watersheds, landscapes, and ecosystems that require protection and restoration efforts (*see* §§ 6102.2 and 6102.3.1);

(2) Develop and implement plans and strategies, including protection, restoration, and mitigation strategies that effectively manage public lands to protect and promote resilient ecosystems (*see* §§ 6102.1, 6102.3.1, 6102.5.1, 6103.1.2);

(3) Develop and implement monitoring and adaptive management strategies for maintaining sustained yield of renewable resources, accounting for changing landscapes, fragmentation, invasive species, and other disturbances (*see* § 6103.2);

(4) Report annually on the results of land health evaluations, and determinations (*see* § 6103.1.2);

(5) Ensure that watershed condition assessments incorporate consistent analytical approaches (*see* § 6103.2) both among neighboring BLM State Offices and with the fundamentals of land health; and

(6) Share watershed condition assessments in a publicly available national database to determine changes in watershed condition and record measures of success based on conservation and restoration goals.

(b) In taking management actions, and as consistent with applicable law and resource management plans, such as where an area is managed for recreation or is degraded land prioritized for development, authorized officers must:

(1) Make every effort to avoid authorizing uses of the public lands that permanently impair ecosystem resilience;

(2) Promote opportunities to support conservation and other actions that work toward achieving land health standards and ecosystem resilience;

(3) Issue decisions that promote the ability of ecosystems to passively recover or the BLM's ability to actively restore ecosystem composition, structure, and function;

(4) Meaningfully consult with Indian Tribes and Alaska Native Corporations during the decision-making process on actions that are determined, after allowing for Tribal input, to potentially have a substantial effect on the Tribe or Corporation;

(5) Allow State, Tribal, and local agencies to serve as joint lead agencies consistent with 40 CFR 1501.7(b) or as cooperating agencies consistent with 40 CFR 1501.8(a) in the development of environmental impact statements or environmental assessments;

(6) Respect Indigenous Knowledge, by:

(i) Improving engagement and expanding co-stewardship of public lands with Tribal entities;

(ii) Encouraging Tribes to suggest ways in which Indigenous Knowledge can be used to inform the development of alternatives, analysis of effects, and when necessary, identification of mitigation measures; and

(iii) Communicating to Tribes in a timely manner and in an appropriate format how their Indigenous Knowledge was included in decision-making, including addressing management of sensitive information;

(7) Seek opportunities to restore or protect ecosystem resilience when the effects of potential uses are unknown; and

(8) Provide justification for decisions that may impair ecosystem resilience.

(c) Authorized officers must use high-quality inventory, assessment, and monitoring data, as available and appropriate, to evaluate resource conditions and inform decision-making across program areas (*see* § 6103.2(c)), specifically by:

(1) Identifying clear goals or desired outcomes relevant to the management decision;

(2) Gathering high-quality information relevant to the management decision, including standardized quantitative monitoring data and data about land health;

(3) Selecting relevant indicators for each applicable management question (*e.g.,* land health standards, restoration effectiveness, assessments of intactness);

(4) Establishing a framework for translating indicator values to condition categories (such as quantitative monitoring objectives or science-based conceptual models); and

(5) Summarizing results and ensuring that a clear and understandable rationale is documented, explaining how the data were used to make the decision.

§ 6102.5.1 Mitigation.

(a) The BLM will apply the mitigation hierarchy to avoid, minimize, and compensate, as appropriate, for adverse impacts to resources when authorizing uses of public lands. As appropriate, the authorized officer may identify specific mitigation approaches or requirements to address resource impacts through land use plans or in other decision documents.

(b) For important, scarce, or sensitive resources, authorized officers shall apply the mitigation hierarchy with particular care, with the goal of eliminating, reducing, and/or offsetting impact on the resource, consistent with applicable law.

(c) When implementing the mitigation hierarchy, including authorizing mitigation leases, the BLM will:

(1) Use a landscape-scale approach to develop and implement mitigation strategies that identify mitigation needs and opportunities in a geographic area, including opportunities for the siting of large, market-based mitigation programs or projects (*e.g.,* mitigation banks) on public lands;

(2) Use high-quality information to inform the identification and analysis of adverse impacts, to determine appropriate mitigation programs or projects for those impacts, and to achieve appropriate and effective mitigation outcomes;

(3) Require identification of performance criteria for mitigation programs or projects, effectiveness monitoring of those performance criteria, and reports that assess the achievement of those performance criteria;

(4) Use adaptive management principles to guide and improve mitigation outcomes; and

(5) Ensure that any compensatory mitigation programs or projects are commensurate with the applicable adverse impacts and that the required compensatory mitigation programs and projects are durable, additional, and timely.

(6) As used in this section, the terms *additional, commensurate, durable,* and *timely* have the following definitions:

(i) *Additional* means the compensatory mitigation program or project's benefit is demonstrably new and would not have occurred without the compensatory mitigation measure.

(ii) *Commensurate* means the compensatory mitigation program or project is reasonably related and proportional to the adverse impact from authorizing uses of public lands.

(iii) *Durable* means the maintenance of the effectiveness of a mitigation program or project, including resource, administrative, and financial considerations.

(iv) *Timely* means the lack of a time lag between the impact to the resources and the achievement of the outcomes of the associated compensatory mitigation.

(d) The BLM may approve, through a formal agreement, a third-party mitigation fund holder to administer funds for the implementation of compensatory mitigation programs or projects. A BLM-approved third-party mitigation fund holder may:

(1) Collect mitigation funds from permittees;

(2) Manage funds in accordance with agency decision documents, use authorizations and applicable law; and

(3) Disperse those funds in accordance with agency decision documents, use authorizations, and applicable law.

(e) Approved third-party mitigation fund holders must file with the BLM annual fiscal reports. To qualify as a third-party mitigation fund holder, the entity must either:

(1) Qualify for tax-exempt status in accordance with Internal Revenue Code section 501(c)(3); provide evidence that they can successfully hold and manage mitigation accounts; be a public charity bureau for the State in which the mitigation area is located, or otherwise comply with applicable State laws; be a third party organizationally separate from and having no corporate or family connection to the entity accomplishing the mitigation program or project, BLM employees, or the permittee; adhere to generally accepted accounting practices that are promulgated by the Financial Accounting Standards Board, or any successor entity; and have the capability to hold, invest, and manage the mitigation funds to the extent allowed by law; or

(2) Be a State or local government agency, if the government agency is able to demonstrate, to the satisfaction of the BLM, that:

(i) it is acting as a fiduciary for the benefit of the mitigation project or site and can show that it has the authority and ability to collect the funds, protect the account from being used for purposes other than the management of the mitigation project or site, and disburse the funds to the entities conducting the mitigation project or management of the mitigation site;

(ii) it is organizationally separate from and has no corporate or family connection to the entity accomplishing the mitigation program or project, BLM employees, or the permittee; and

(iii) it adheres to generally accepted accounting practices that are promulgated by the Governmental Accounting Standards Board or any successor entity.

(f) Authorized officers will require mitigation leases and collect annual rent at fair market value for large or otherwise substantial compensatory mitigation programs or projects on public lands, including mitigation banks and in-lieu fee programs. Mitigation leases may be required for other compensatory mitigation projects on public lands at the discretion of the authorized officer.

(g) In addition to the general requirements for mitigation leases (§ 6102.4), in some circumstances, authorized officers may require that mitigation lease holders submit to the agency a formal agreement with a qualified mitigation fund holder as defined in paragraph (d) of this section.

(h) An application for a mitigation lease for a mitigation bank or an in-lieu fee program, in addition to the requirements in (§ 6102.4(c)), must also include sufficient information about the anticipated demand for and duration of the mitigation bank or in-lieu fee program, the anticipated types of mitigation projects that will be conducted, and the methods that will be used to generate, evaluate, assess, and maintain the mitigation projects.

(i) Authorized officers will ensure that compensatory mitigation programs and projects, including those with mitigation leases, are tracked in the appropriate BLM data systems.

Subpart 6103—Managing Land Health To Achieve Ecosystem Resilience

§ 6103.1 Land Health Standards.

(a) The BLM shall develop national land health standards that facilitate progress toward achieving the following fundamentals of land health across all ecosystems on lands managed by the BLM:

(1) Watersheds are in, or are making significant progress toward, properly functioning physical condition, including their upland, riparian-wetland, and aquatic components; soil and plant conditions support infiltration, soil moisture storage, and the release of water that are in balance with climate and landform and maintain or improve water quality, water quantity, and timing and duration of flow.

(2) Ecological processes, including the hydrologic cycle, nutrient cycle, and energy flow, are maintained, or there is significant progress toward their attainment, in order to support healthy biotic populations and communities.

(3) Water quality complies with State water quality standards and achieves, or is making significant progress toward achieving, BLM management objectives established in the land use plan, such as meeting wildlife needs.

(4) Habitats are, or are making significant progress toward being, restored or maintained for Federal threatened and endangered species, Federal proposed or candidate threatened and endangered species, and other special status species.

(b) Land health fundamentals will be advanced through national land health standards that, at a minimum, address the following resources, processes, and values:

(1) Upland hydrologic function;

(2) Riparian, wetland, and aquatic hydrologic function;

(3) Upland ecological processes and biotic communities, including connectivity, and intactness of native plant and animal habitats;

(4) Riparian, wetland, and aquatic ecological processes and biotic communities including condition, connectivity, and intactness of native plant and animal habitats;

(5) Water quality; and

(6) Habitat condition connectivity and intactness for Federal threatened and endangered species, Federal proposed or candidate threatened and endangered species, and other special status species.

(c) To facilitate land health evaluations, the national land health standards will include indicators that are broadly applicable across the major ecosystem or habitat types (*e.g.,* forest, rangeland, cold water fisheries) the BLM manages, and will include indicators derived from standardized datasets.

(d) Authorized officers must manage all program areas in accordance with the fundamentals of land health and standards, as provided in this subpart. Authorized officers must adopt the national standards and indicators, and may, when necessary, incorporate geographically distinct land health standards and indicators to evaluate rare or unique habitat or ecosystem types (*e.g.,* permafrost) if such habitats or ecosystems cannot be evaluated using the national land health standards and indicators.

(e) Rangeland health standards developed under 43 CFR subpart 4180 will be reviewed and amended or supplemented as necessary to incorporate the national standards and indicators within 3 years of the effective date of these regulations. Subsequently, authorized officers shall review all land health standards for sufficiency at least every 10 years.

(f) Amended land health standards must be approved by the appropriate BLM State Director prior to implementation.

§ 6103.1.1 Management for Land Health.

(a) To facilitate ecosystem resilience, authorized officers should use watershed condition assessments (*see* § 6103.2), and land health evaluations and causal factor determinations to support decision-making. Such action promotes efficiency, supports environmental analysis, and streamlines decision-making.

(b) To facilitate ecosystem resilience, authorized officers must manage all program areas to progress toward achieving land health standards.

(1) Authorized officers must apply approved land health standards, as revised from rangeland health standards previously established under subpart 4180 of this chapter (fundamentals of rangeland health), across all ecosystems managed by the BLM.

(2) Programs that authorize and manage uses or implement management actions on public land will develop management guidelines, which are best management practices designed to facilitate progress toward achievement and maintenance of land health standards.

(i) Authorized officers may develop or adopt additional management guidelines to address local ecosystems and management practices.

(ii) Programs and authorized officers will review management guidelines for sufficiency and make necessary revisions at least every 10 years in conjunction with the review of land health standards described in this subpart.

(c) Land use plans must identify the allocations and actions anticipated to achieve desired land health outcomes, including actions to maintain or restore land health in accordance with the land health standards. These actions include, but are not limited to, prioritizing development in degraded areas as well as prioritizing and implementing restoration actions (*see* § 6102.3).

(d) Land use plans shall identify statutory, regulatory, and other requirements that may prevent achievement of land health standards.

(1) Best management practices and mitigation measures to minimize effects to land health resulting from these requirements should be identified and required where practicable.

(2) Environmental effects analysis, consistent with NEPA requirements, for proposed management actions must consider effects to relevant land health standards.

§ 6103.1.2 Land Health Evaluations and Determinations.

(a) Authorized officers shall rely on watershed condition assessments when possible to complete land health evaluations for BLM-managed lands on a periodic basis, at least every 10 years (§ 6103.2).

(b) Authorized officers must determine the priority landscape and appropriate scale for completing land health evaluations based on resource concerns and, as necessary, to support decision-making processes.

(c) Authorized officers must consider available watershed condition assessments and existing land health assessments, evaluations, and determinations in the course of decision-making processes for all program areas.

(d) Land health evaluations interpret watershed condition assessments, including locally relevant high-quality information to draw conclusions about whether land health standards are achieved on public lands. In the course of conducting land health evaluations, authorized officers should:

(1) Consider multiple lines of evidence to evaluate achievement of each standard;

(2) Identify trends toward or away from desired conditions through analysis of high-quality information available over relevant time periods and spatial scales;

(3) Document the rationale and findings as to whether each land health standard is achieved or significant progress is being made towards its achievement; and

(4) Develop an interdisciplinary monitoring plan with quantitative objectives that can be measured to demonstrate significant progress when a land health evaluation report identifies that any standard is not achieved but significant progress is being made towards achievement.

(e) When conducting a land health evaluation, if the authorized officer

finds that resource conditions are achieving or making significant progress toward achieving land health standards, no additional land health analysis is needed to authorize a use or permit activities.

(f) When conducting a land health evaluation, if the authorized officer finds that resource conditions are not achieving or making significant progress toward achieving land health standards, a documented causal factor determination must be prepared as soon as practicable but no later than 1 year after completion of the land health evaluation identifying the nonachievement. Causal factor determinations use available data to identify significant causal factors and describe contributing causal factors or conditions leading to non-achievement of standards.

(1) If the authorized officer determines sufficient information exists to identify and address the significant causal factors preventing resources from achieving or making significant progress towards achieving land health standards, no further land health analysis is required to address such factors.

(2) If the authorized officer determines insufficient information exists to identify and address the significant causal factors preventing resources from achieving or making significant progress to achieving land health standards, additional information, assessment and evaluation may be needed at finer scale.

(3) The authorized officer must take appropriate actions to facilitate achievement or significant progress toward achievement of land health standards as soon as practicable, unless otherwise specified in the land use plan, or when significant causal factors are outside of BLM control (*e.g.,* lack of streamflow due to dewatering on connected lands not administered by the BLM).

(4) To the extent existing grazing management practices or levels of grazing use on public lands are identified as significant causal factors preventing resources from achieving or making significant progress towards achieving land health standards, authorized officers must proceed under § 4180.2(c) of this chapter. by taking appropriate action as soon as practicable but no later than the start of the next grazing year.

(5) Taking appropriate action means implementing actions that will result in significant progress toward achieving land health standards. Appropriate action must be consistent with applicable law, regulation, and the governing land use plan and its management objectives, such as where an area is managed for recreation or is degraded land prioritized for development. Appropriate actions may include, but are not limited to:

(i) Establishment or modification of terms and conditions for permits, leases, and other use authorizations;

(ii) Development and implementation of activity plans;

(iii) Implementation of adaptive management actions; and

(iv) Control of unauthorized use.

(g) Upon determining that significant causal factors other than current management practices are preventing achievement of land health standards, but are not outside of BLM control (*e.g.,* presence of invasive species), the authorized officer shall identify and prioritize appropriate actions that may result in significant progress toward achievement of land health standards (*see* § 6102.5).

(h) Subject to other applicable law, authorized officers may implement restoration plans, modify authorized uses, or implement other management actions to increase expediency and effectiveness of progress towards achieving land health standards, to protect areas achieving land health standards, or to meet other objectives.

(i) If current authorized uses are determined to be significant causal factors and the authorized officer determines appropriate action is needed, then appropriate action must be consistent with the governing land use plan. Changes to some types of authorized uses may first warrant an amendment to the land use plan to allow the authorized officer to adjust those uses sufficient to make progress toward meeting land health standards. However, whether to undertake a planning process is at the discretion of the authorized officer.

(j) Authorized officers will report annually on land health evaluation, and determination accomplishments; results; and actions taken to address areas not achieving or making progress toward achieving standards.

(k) The BLM will maintain and annually update a publicly available record of land health evaluation and determination results and management actions taken to facilitate progress toward achieving land health standards.

§ 6103.2 Inventory, Assessment, and Monitoring.

(a) Watershed condition assessments must be completed at least once every 10 years and used to inform land use planning, protect intact landscapes (§ 6102.2), manage for ecosystem resilience (§ 6102.5), inform restoration actions (§ 6102.3), and inform land health evaluations and determinations (§ 6103.1.1). Watershed condition assessments assess and synthesize information on the condition of soil, water, habitats, and ecological processes within watersheds relative to the BLM's land health fundamentals and the national land health standards. When conducting watershed condition assessments, the BLM must:

(1) Compile and analyze multiple sources of high-quality information to understand conditions and trends relevant to each land health standard, including remote sensing products, field-based data, and other data gathered through inventory, assessment, and monitoring activities; and

(2) Incorporate consistent analytical approaches, quantitative indicators, and benchmarks where practicable.

(b) The BLM will maintain a publicly available inventory of infrastructure and natural resources on public lands. This inventory must include both critical landscape components (*e.g.,* roads, land types, streams, habitats) and core indicators that address land health fundamentals.

(c) Authorized officers will use high-quality inventory, assessment, and monitoring information, including standardized quantitative monitoring data, remote sensing maps, and geospatial analyses, to inform decision-making across program areas, including, but not limited to:

(1) Authorization of permitted uses;

(2) Land use planning;

(3) Watershed condition assessments and land health evaluations;

(4) Restoration planning, including prioritization;

(5) Assessments of restoration effectiveness;

(6) Consideration of areas of critical environmental concern;

(7) Evaluation and protection of intact landscapes;

(8) Restoration and mitigation leasing; and

(9) Other decision-making processes.

(d) Authorized officers must inventory, assess, and monitor activities as necessary to inform the decision-making processes identified in paragraph (b) of this section and, in so doing, must employ the following:

(1) Interdisciplinary monitoring plans for providing data relevant to decision makers;

(2) Standardized field protocols and indicators to allow data comparisons through space and time in support of multiple management decisions;

(3) Appropriate sample designs to minimize bias and maximize applicability of collected data;

(4) Integration with remote sensing products to optimize sampling and calibrate continuous map products; and

(5) Data management and stewardship to ensure data quality, accessibility, and use.

Title 3—

The President

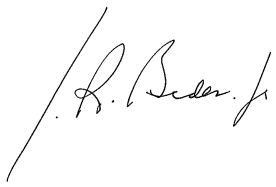
Notice of May 8, 2024

Continuation of the National Emergency With Respect to Securing the Information and Communications Technology and Services Supply Chain

On May 15, 2019, by Executive Order 13873, the President declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) to deal with the unusual and extraordinary threat to the national security, foreign policy, and economy of the United States constituted by the unrestricted acquisition and use of certain information and communications technology and services transactions.

The unrestricted acquisition or use in the United States of information and communications technology or services designed, developed, manufactured, or supplied by persons owned by, controlled by, or subject to the jurisdiction or direction of foreign adversaries augments the ability of these foreign adversaries to create and exploit vulnerabilities in information and communications technology or services, with potentially catastrophic effects. This threat continues to pose an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. For this reason, the national emergency declared on May 15, 2019, must continue in effect beyond May 15, 2024. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared in Executive Order 13873 with respect to securing the information and communications technology and services supply chain.

This notice shall be published in the *Federal Register* and transmitted to the Congress.



THE WHITE HOUSE,
May 8, 2024.

Presidential Documents

Notice of May 8, 2024

Continuation of the National Emergency With Respect to the Actions of the Government of Syria

On May 11, 2004, pursuant to his authority under the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) and the Syria Accountability and Lebanese Sovereignty Restoration Act of 2003 (Public Law 108–175), the President issued Executive Order 13338, in which he declared a national emergency with respect to the actions of the Government of Syria. The national emergency was modified in scope and relied upon for additional steps taken in Executive Order 13399 of April 25, 2006, Executive Order 13460 of February 13, 2008, Executive Order 13572 of April 29, 2011, Executive Order 13573 of May 18, 2011, Executive Order 13582 of August 17, 2011, Executive Order 13606 of April 22, 2012, and Executive Order 13608 of May 1, 2012.

The President took these actions to deal with the unusual and extraordinary threat to the national security, foreign policy, and economy of the United States constituted by the actions of the Government of Syria in supporting terrorism, maintaining its then-existing occupation of Lebanon, pursuing weapons of mass destruction and missile programs, and undermining United States and international efforts with respect to the stabilization and reconstruction of Iraq.

The regime's brutality and repression of the Syrian people, who have called for freedom and a representative government, not only endangers the Syrian people themselves, but also generates instability throughout the region. The Syrian regime's actions and policies, including with respect to chemical weapons and supporting terrorist organizations, continue to pose an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. As a result, the national emergency declared in Executive Order 13338, which was expanded in scope in Executive Order 13572, and with respect to which additional steps were taken in Executive Order 13399, Executive Order 13460, Executive Order 13573, Executive Order 13582, Executive Order 13606, and Executive Order 13608, must continue in effect beyond May 11, 2024. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared with respect to the actions of the Government of Syria.

In addition, the United States condemns the brutal violence and human rights violations and abuses of the Assad regime and its Russian and Iranian enablers. The United States calls on the Assad regime, and its backers, to stop its violent war against its own people, enact a nationwide ceasefire, facilitate the unhindered delivery of humanitarian assistance to all Syrians in need, and negotiate a political settlement in Syria in line with United Nations Security Council Resolution 2254. The United States will consider changes in policies and actions of the Government of Syria in determining whether to continue or terminate this national emergency in the future.

This notice shall be published in the *Federal Register* and transmitted to the Congress.

Presidential Documents

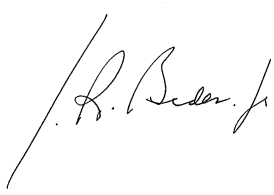
Notice of May 8, 2024

Continuation of the National Emergency With Respect to the Central African Republic

On May 12, 2014, by Executive Order 13667, the President declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701–1706) to deal with the unusual and extraordinary threat to the national security and foreign policy of the United States constituted by the situation in and in relation to the Central African Republic, which has been marked by a breakdown of law and order; intersectarian tension; the pervasive, often forced recruitment and use of child soldiers; and widespread violence and atrocities, including those committed by Kremlin-linked and Yevgeniy Prigozhin–affiliated entities such as the Wagner Group, and which threatens the peace, security, or stability of the Central African Republic and neighboring states.

The situation in and in relation to the Central African Republic continues to pose an unusual and extraordinary threat to the national security and foreign policy of the United States. For this reason, the national emergency declared in Executive Order 13667 on May 12, 2014, to deal with that threat must continue in effect beyond May 12, 2024. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared with respect to the Central African Republic.

This notice shall be published in the *Federal Register* and transmitted to the Congress.



THE WHITE HOUSE,

May 8, 2024.
