The studies that OSHA relied on in Section V.A., Risk Assessment leverage data from multiple surveillance databases (e.g., BLS SOII, workers' compensation claims databases, and hospital discharge data) that have inclusion criteria that OSHA preliminarily concludes would clearly indicate that captured cases of HRIs represent material impairment of health. For example, the estimated number of work-related HRIs reported in the BLS SOII capture only those that involved days away from work (*Note:* For 2021–2022 biennial data, SOII additionally reports cases involving job restriction or transfer). Similarly, hospital discharge datasets would represent only cases that involved an emergency department visit and/or inpatient hospitalization. While workers' compensation eligibility varies, all of the claims would involve either a visit with a medical professional and/or lost worktime. HRIs resulting in lost work time and/or the need for medical care beyond first aid clearly constitute material harm.

However, HRIs constituting material harm are not limited to those rising to the level of lost work time and/or the need to seek care from a medical professional. Based on the evidence discussed in this and other sections of this preamble, OSHA has preliminarily concluded that many of the HRIs associated with workplace exposure to heat hazards constitute material harm, even if they are not captured in the databases OSHA relied on in its risk assessment. OSHA recognizes that many of these HRIs may be reversible, particularly if early intervention is provided. Nonetheless, OSHA presents evidence in Section IV., Health Effects that these HRIs can be debilitating. In addition to lost work time and the need for treatment by a medical professional, HRIs can cause reduction or loss of the worker's normal functional capacity in work tasks and loss of productivity. Additionally, where preventive action or early treatment is not provided, these disorders can rapidly progress to more serious conditions, and have the potential to result in permanent damage to organs, causing short-, medium-, and

long-term health effects, or death. Thus, while some of the health effects OSHA has identified may not rise to the level of material harm in all cases, the agency believes that each can be material in severe cases.

B. Significant Risk

Peer-reviewed studies and State or national statistics are available to demonstrate the high incidence of work-related HRIs occurring among workers exposed to heat hazards at work. Estimates of the risk of harm confronting exposed workers can be based directly on the rates of work-related HRIs currently being reported.

In Section V.A., Risk Assessment, of this preamble, OSHA evaluated the risk to workers of a heat-related injury, illness, or fatality. OSHA's analysis of BLS data indicated an annual average of 40 heat-related deaths (2011–2022) and 3,389 HRIs involving days away from work (2011–2020) among U.S. workers. These annual heat-related death and HRI numbers alone clearly constitute a significant risk and are in line with OSHA's significant risk findings in previous safety standards (see, e.g., Confined Spaces in Construction, 80 FR 25366, 25371 (May 4, 2014); Electric Power Generation, Transmission, and Distribution; Electrical Protective Equipment, 79 FR 20316, 20321–20322 (April 11, 2014); Cranes and Derricks in Construction, 75 FR 47906, 47913 (Aug. 9, 2010)). However, as discussed in Section V.A., Risk Assessment, many of the sources that OSHA reviewed reported HRI data in terms of incidence rates, and OSHA has considered these rates in assessing significant risk, to the extent they capture populations that are actually exposed to hazardous occupational heat.

Unfortunately, the available data is insufficient to precisely estimate the risk to only workers who are exposed to hazardous occupational heat. But by examining incidence estimates derived from various datasets, including State workers' compensation systems, OSHA was able to determine a range of HRI incidence rates among workplaces where employees are likely to be exposed to heat in their job. In Section V.A., Risk Assessment, OSHA identified various sector incidence estimates of HRI over a working lifetime (i.e., 45 years), including: 234 to 1,737 cases per 100,000 workers in agriculture, forestry, fishing, and hunting; 63 to 545 cases per 100,000 workers in construction; 131 to 396 cases per 100,000 workers in administrative and support and waste management and remediation services; 49.5 to 171 cases per 100,000 workers in transportation and warehousing; and

513 cases per 100,000 workers in utilities, among others. The working lifetime incident rates were even higher in specific industries, such as an estimated 3,479 cases of HRI per 100,000 workers for farm labor contractors and crew leaders and 2,439 cases per 100,000 structural steel and precast concrete workers over a working lifetime of 45 years (see Section V. A., Risk Assessment, table V–1). OSHA preliminarily concludes that these incidence rates, though as explained below substantially underestimate actual risk, are the best available evidence and sufficient to make a finding of significant risk of HRIs among workers who are exposed to occupational heat.

While the data are not sufficient to develop a single point estimate of the risk posed to heat-exposed workers, OSHA has preliminarily determined that the available data from BLS and workers' compensation claims support an estimate of working lifetime risk of HRI ranging from 135 cases per 100,000 workers (calculated based on the BLS average estimated annual incidence of HRIs for all workers for 2011–2020) to 3,479 cases per 100,000 workers (based on workers' compensation claims). Even the lowest estimate within this range exceeds the 1/1000 threshold that OSHA has historically found to clearly constitute a significant risk.

As noted above, OSHA believes that these data from BLS and workers' compensation claims substantially understate the true risk to workers. For one, the inclusion criteria for the surveillance systems used to estimate incidence would exclude a large proportion of HRI cases. For instance, prior to this year, the BLS SOII only reported the estimated number of HRIs that involved days away from work, which may be less than 50% of all OSHA-recordable work-related HRIs (see, e.g., BLS, IIF Latest Numbers for 2022, <https://www.bls.gov/iif/latest-numbers.htm>). Additionally, the majority of incidence estimates identified by OSHA are based on the risk of HRIs confronting an entire working population (e.g., all workers in a particular industry or sector), both exposed and non-exposed. Clearly, the risk of experiencing a work-related HRI is considerably higher among the subset of workers exposed to heat hazards in their jobs than it is for the rest of the working population. For example, the annual BLS incidence estimates are susceptible to understating risk in this way because when BLS calculates annual incidence estimates, it captures the entire U.S. workforce in the denominator, which includes a large

number of unexposed workers (*e.g.*, office workers in climate-controlled buildings). Consequently, the working lifetime risk of HRI estimate based on BLS's annual incidence estimates (*i.e.*, 135 cases per 100,000 workers), also substantially underestimates the true risk for heat-exposed workers. There is also a large body of literature demonstrating the general underreporting of work-related injuries and illnesses, the findings of which OSHA believes would also apply to HRIs. See Section V.A., Risk Assessment, for additional discussion of underreporting of heat-related fatalities and HRIs.

As discussed in Section V.C., Risk Reduction, dozens of peer-reviewed studies and multiple authoritative bodies (*e.g.*, NIOSH, ACGIH, ANSI/ASSP) indicate that the provisions outlined in this proposed rule would, if promulgated, substantially reduce risk to workers. A large body of data demonstrates that workplace interventions—such as rest breaks, cool drinking water, acclimatization, shade, and fans—can be very effective in reducing heat strain, which is responsible for causing HRIs. This reduction in heat strain and/or reduction in HRI risk has been shown in studies that have examined the impact of interventions in an experimental setting, as well as studies that have documented reductions in HRI prevalence following the implementation of heat injury and illness prevention measures. OSHA preliminarily concludes that implementation of the proposed standard will result in a substantial reduction in HRIs (range of estimates: 37–96%) and heat-related fatalities (range of estimates: 99.8–100%) in employees who would be covered under the proposed standard.

C. Preliminary Conclusions

OSHA preliminarily concludes that HRIs associated with workplace exposure to heat hazards constitute material harm. Further, based on the evidence discussed in this section, the agency preliminarily concludes that heat-exposed workers are at significant risk of experiencing a work-related HRI or heat-related death, and compliance with the proposed standard would substantially reduce that risk.

VII. Explanation of Proposed Requirements

A. Paragraph (a) Scope and Application

Paragraph (a) establishes the scope of the proposed standard. Paragraph (a)(1) would require all employers subject to

OSHA's jurisdiction—including general industry, construction, maritime, and agriculture—to comply with the proposed requirements, subject to the exemptions in proposed paragraphs (a)(2) and (3). The scope of the proposed standard applies to a wide range of sectors that include both indoor and outdoor work areas. The proposed standard aims to provide protections while accounting for the different work areas, anticipated exposures, and other conditions in these sectors.

Paragraph (a)(2) describes the exemptions for the proposed standard based on work activities. Employers would be responsible for determining which work activities are covered by the standard. Although an employer may have some work activities exempt from the proposed standard, other activities may be covered (except for organizations whose primary function is the performance of firefighting. See the discussion of paragraph (a)(2)(iii) below). Under paragraph (a)(3), if an employer's employees exclusively perform the work activities in paragraphs (a)(2)(i) through (vi), then that employer would be exempt from this proposed standard.

Paragraph (a)(2)(i) would exclude work activities for which there is no reasonable expectation of exposure at or above the initial heat trigger. This exception recognizes that some workplaces would not reasonably be expected to reach or exceed the initial heat trigger (*e.g.*, because of their location and/or seasonal variations in temperature). This exclusion may apply to work activities such as operating seasonal businesses outdoors (*e.g.*, during winter months), when temperatures are lower than the initial heat trigger. For instance, if a business that exclusively operates an outdoor holiday market during the winter season in a location where daily high temperatures are always below the initial heat trigger, this standard would not apply to work activities performed at that market.

Paragraph (a)(2)(ii) would exclude short duration employee exposures at or above the initial heat trigger of 15 minutes or less in any 60-minute period. OSHA has preliminarily concluded that intermittent exposures within this duration are not likely to significantly raise core body temperature and result in heat-related injuries and illnesses (HRIs). Numerous studies (many described in Section V.C., Risk Reduction) evaluated the effect of hotter temperatures on participants' core body temperatures under various scenarios (*e.g.*, clothing type, level of activity, work/rest periods, acclimatization

status) of different durations. Overall, evidence suggests that heat exposure of 15 minutes or less does not tend to cause an elevation of at least 1 °C (1.8 °F) in participants' core body temperatures, which would be indicative of potential heat stress (McLellan & Selkirk, 2006; Meade et al., 2016b; Lamarche et al., 2017; Seo et al., 2019; Kaltsatou et al., 2020; Notley et al., 2022a; Notley et al., 2022b).

This exemption recognizes that while typical work activities may take place below the initial heat trigger, employees may experience short exposures to heat at various times during their shift. For example, an employer who is otherwise exempt from the standard but has employees who occasionally walk to collect mail outside in temperatures at or above the initial heat trigger for 15 minutes or less in any 60-minute period, would still be exempt. This exemption is consistent with the scope exemptions of Colorado, Washington, and Oregon's State standards (7 Colo. Code Regs. section 1103–15:3 (2023); Wash. Admin. Code 296–307–09710 (2023); Or. Admin. R. 437–002–0156 (2024)).

In addition, in order for this exemption to apply for employees whose work activities are primarily performed in air-conditioned vehicles, employers must ensure employees are not exposed to temperatures at or above the initial heat trigger for more than 15 minutes in any 60-minute period. For instance, where an employee who drives an air-conditioned vehicle repeatedly exits the vehicle to deliver product in temperatures at or above the initial heat trigger, this activity would only be exempt from the standard if cumulative exposure in any 60-minute period at or above the initial heat trigger is for 15 minutes or less. If delivery tasks, such as unloading product from the vehicle and moving product to its destination, occur at or above the initial heat trigger for more than 15 minutes in any 60-minute period, these work activities would be covered by the standard.

Paragraph (a)(2)(iii) would exclude organizations whose primary function is the performance of firefighting. It would also exclude emergency response activities of workplace emergency response teams, emergency medical services (EMS), or technical search and rescue;⁴ and any emergency response

⁴ “Technical search and rescue” refers to a type of emergency service that utilizes special knowledge and skills and specialized equipment to resolve unique or complex search and rescue situations, such as rope rescue, vehicle/machinery rescue, structural collapse, trenches, and technical water rescue. OSHA intends the phrase to have the

activities already covered under 29 CFR 1910.120, 1910.146, 1910.156, part 1915, subpart P, 1926.65, and 1926.1211. Fire departments, workplace emergency response teams, EMS, and technical search and rescue are covered by OSHA's proposed Emergency Response standard (89 FR 7774, Feb. 5, 2024), which would replace the existing Fire Brigades standard, 29 CFR 1910.156. The update to 29 CFR 1910.156 would expand coverage from only fire brigades, industrial fire departments, and private or contractual type fire departments, to include protections for all employees who perform firefighting, EMS, or technical search and rescue, as part of their regularly assigned duties as well as employees who are members of a workplace emergency response team. If the Emergency Response standard is finalized before this proposed standard, OSHA intends to revise this exemption to reflect the updated 29 CFR 1910.156.

The exemption would apply to all activities (including, *e.g.*, training activities) at organizations whose primary function is the performance of firefighting. In order to comply with the proposed updates to 29 CFR 1910.156, firefighting organizations would have programs in place that address heat-related hazards for their employees.

For employers with employees who perform emergency response activities as members of workplace emergency response teams (*i.e.*, groups of employees who prepare for and respond to emergency incidents at their workplace as a collateral duty to their regular daily work assignments; see 89 FR at 7803), or who perform emergency medical services or technical search and rescue, this exemption would only apply when employees are performing emergency response activities. This means during periods while these employees are performing other duties unrelated to emergency response, employers would be required to comply with the provisions of the standard, unless subject to another exemption. For example, employees who are part of a manufacturing plant's emergency response team would be exempt from the standard while responding to an incident, such as a medical emergency, but would be covered by the standard when performing their regular daily work assignments. All other employees not engaged in emergency response would also be covered by this proposed standard. Although OSHA is proposing to exempt fire departments entirely, the agency is not proposing to entirely

exempt organizations that have employees who perform EMS or technical search and rescue. This is because many organizations who perform EMS (*e.g.*, hospitals) or technical search and rescue also conduct many other activities unrelated to emergency response and OSHA intends these other activities to be covered by this proposed standard unless another exemption applies.

The Emergency Response proposal includes several hazard assessment and risk management requirements that would encompass heat hazards faced by emergency responders (see 89 FR at 7813–7814). Further, in the NPRM for Emergency Response, OSHA noted this rulemaking on heat illness prevention and invited comment on whether the agency should include specific requirements related to heat for some non-emergency activities of emergency responders. At the same time, the agency recognized that at times emergency responders must perform their duties regardless of environmental conditions (89 FR at 7801). OSHA has preliminarily concluded that it is appropriate to address any heat-related hazards posed by emergency response activities in this separate rulemaking.

This proposed standard would also not apply to employees when they are undertaking emergency response activities under 29 CFR 1910.120, 1910.146, 1910.156, subpart P, 1926.65, and 1926.1211. Many of these standards provide employees protection from heat exposure during emergency activities. In addition, OSHA believes that the emergency nature of these activities warrant special consideration and the agency is therefore exempting them from this proposed standard. However, this proposed standard would otherwise apply to these employees during non-emergency regular operations unless another exemption applies. For example, with regard to the Hazardous Waste Operations and Emergency Response Standard (HAZWOPER) (29 CFR 1910.120 and 1926.65), which covers employees who are exposed or potentially exposed to hazardous substances and engaged in one of the operations as specified by 29 CFR 1910.120(a)(1)(i) through (v) and 1926.65(a)(1)(i) through (v), such as clean-up operations, employees would only be exempt when responding to emergency situations and would be covered by the standard when participating in general hazardous waste operations.

Paragraph (a)(2)(iv) would exclude work activities performed in indoor work areas or vehicles where air-conditioning consistently keeps the

ambient temperature below 80 °F. OSHA specifies using ambient temperature, as most heating, ventilation, and air-conditioning (HVAC) systems automatically report ambient temperature. Properly functioning HVAC units also regulate indoor humidity levels, which would result in similar measures of ambient temperature and heat index.

This exemption would only apply to indoor work areas and vehicles that are consistently below an ambient temperature of 80 °F. The employer must ensure that the air-conditioning system consistently maintains an ambient temperature below 80 °F during work activities for the exemption to apply. OSHA recognizes that there may be unexpected malfunctions of air-conditioning systems that result in periods of time without air-conditioning before a system is repaired. In these situations, OSHA would expect that the employer takes steps to expeditiously repair the air-conditioning system and return the workplace to an ambient temperature below 80 °F.

Paragraph (a)(2)(v) would exclude telework (*i.e.*, work done from home or another remote location of the employee's choosing). OSHA generally does not hold employers liable for employees' home offices and conditions of the telework environment (see CPL 02-00-125, available at <https://www.osha.gov/enforcement/directives/cpl-02-00-125>). However, only the work activities employees perform while teleworking would be exempt and employers would be required to comply with the standard when employees are on site if other exemptions do not apply. For example, the standard would not cover work activities conducted at an employee's home on Tuesdays and Thursdays in a given week but would cover the employee's work activities at their employer's office on Mondays, Wednesdays, and Fridays (unless another exemption applies).

Paragraph (a)(2)(vi) would exclude sedentary work activities at indoor work areas that only involve some combination of the following: sitting, occasional standing and walking for brief periods of time, and occasional lifting of objects weighing less than 10 pounds. The exemption is intended to apply to work sites such as offices where employees perform sedentary work activities for extended periods of time (*e.g.*, all or most of the workday). This exemption only applies to indoor work activities, which are not generally subject to factors such as solar radiation, which are common in outdoor exposures. OSHA preliminarily concludes that employees engaged in

same meaning as used in the proposed Emergency Response standard (see 89 FR 7804).

indoor sedentary work activities are at lower risk of heat-related injury and illness, as production of metabolic heat is not substantially elevated. Experimental studies of groups exposed to heat (111.4 °F (44 °C), 30% relative humidity) while resting in a seated position indicate core body temperature does not rise more than 1 °C (1.8 °F) over multiple hours (Kenny et al., 2017; Notley et al., 2020). In addition to sitting, the exemption allows for indoor work activities to include occasional standing and walking for brief periods of time, and occasional lifting of objects weighing less than 10 pounds. When using the term “occasional” OSHA means up to one-third of the workday (BLS, 2021), however these activities could only be performed for brief periods of time over the course of the day for the exemption to apply. For example, work activities performed at a desk indoors, where the employee is seated and performing computer work for the majority of their shift, but with occasional standing, as well as walking short distances (e.g., to use the photocopier, to collect office mail), would be exempt from the standard.

In addition, this exemption would apply to indoor operation of vehicles while seated. For example, operation of a forklift inside of a warehouse while seated would be considered an indoor sedentary work activity and would be exempt. However, if a forklift operator’s duties involved loading and unloading heavy objects (greater than 10 pounds), they would not be exempt from the standard. Other examples of activities that would be exempt include indoor operation of reach trucks, tow trucks, pallet trucks, golf carts, and other vehicles where employees are seated.

This exemption would apply where employees are engaged in sedentary work activities regardless of indoor temperature. While employees performing these activities are likely at lower risk of experiencing heat-related injury and illness, OSHA seeks comment as to whether the sedentary work activities exemption should be limited to work activities performed in indoor environments below a specified threshold temperature (e.g., the high heat trigger) or whether this exemption should account for certain workplace conditions. For example, should this exemption cover an employer with employees who meet the criteria in this proposed exemption, but whose work area is near a heat generating process and impacted by radiant heat?

Paragraph (a)(3) specifies that employers whose employees all exclusively perform activities described in paragraphs (a)(2)(i) through (vi) are

exempt from this standard. Employers may have employees who would be exempt from the standard (e.g., employees working indoors where air-conditioning consistently keeps the ambient temperature below 80 °F), as well as employees who would be covered by the standard (e.g., employees harvesting produce outdoors). These employers would be required to comply with the provisions of the standard for the employees who perform work activities that are covered by the standard. However, some employers may only have employees that exclusively perform work activities that are exempt from the proposed standard. For example, an employer with employees who all either telework from home or other locations of their choosing or work inside a building with air-conditioning that consistently keeps the ambient temperature below 80 °F would be exempt from the standard.

I. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Whether any of the proposed exclusions of emergency response activities already covered under the standards listed in proposed paragraph (a)(2)(iii) should be covered by this proposed standard. If so, provide evidence and describe reason for why these activities should not be excluded;
- Where an employer relies on the exemption in proposed paragraph (a)(2)(iv) to exclude work activities performed in indoor work areas or vehicles where air-conditioning consistently keeps the ambient temperature below 80 °F, whether the standard should address situations where the air-conditioning system does not function properly and the ambient temperature reaches or exceeds 80 °F; for example, should certain requirements of the standard apply in this scenario? Additionally, whether the standard should specify how long the air-conditioning system can be out of order before the exemption no longer applies;
- Whether the description of sedentary work in the proposed standard is appropriate, and if not, what revisions would be appropriate;
- Whether the standard should exempt all sedentary work activities indoors or limit the exemption to only activities performed below an upper limit (e.g., below the high heat trigger) at or above which the exemption would no longer apply, and if so, what the upper limit should be and what evidence exists demonstrating that even sedentary work performed indoors can

be a hazard to workers at or above that limit; and

- Whether the exemption for sedentary work activities should be expanded to include work performed outdoors.

B. Paragraph (b) Definitions

Paragraph (b) defines several terms used in the proposed standard. First, it defines *Acclimatization* to mean the body’s adaptation to work in the heat as a person is exposed to heat gradually over time, which reduces the strain caused by heat stress and enables a person to work with less chance of heat illness or injury.

Section V.C., Risk Reduction contains more information on effectiveness of acclimatization. This definition is included because paragraph (e)(7) of the proposed standard establishes requirements to protect new and returning employees who are not acclimatized. Proposed paragraph (e)(7) requires that employers implement one of two acclimatization protocols for new and returning employees when the initial heat trigger is met or exceeded. Under paragraph (j), employers must implement acclimatization protocols at no cost to the employee. In addition, proposed paragraph (h)(1)(iii) requires that employees be trained that lack of acclimatization is a risk factor for HRI.

Ambient temperature means the temperature of the air surrounding a body. Other terms for ambient temperature include “air temperature” or “dry bulb temperature.” Ambient temperature is measured by a standard thermometer and often what people refer to when using the term “temperature.” Ambient temperature is defined because it is used in the definitions for *heat index* and *wet bulb globe temperature*, in addition to proposed paragraphs (a) *Scope and application*, (d) *Identifying heat hazards*, (e) *Requirements at or above the initial heat trigger*, and (f) *Requirements at or above the high heat trigger*.

Cooling personal protective equipment (PPE) means equipment that is worn to protect the user against heat-related injury or illness. This definition is included to clarify the requirement under proposed paragraph (e)(1) that if the employer provides employees with cooling PPE, the cooling properties must be maintained during use.

Cooling PPE is gear designed to help maintain a safe body temperature for individuals working in hot environments or engaged in physically demanding activities. Cooling PPE typically employs various technologies to facilitate heat dissipation and

enhance comfort, such as water absorption crystals or phase change materials (PCM) which draw heat away from the wearer. Cooling bandanas and neck wraps are worn around the neck and can be soaked in cold water. Additionally, other types of clothing may incorporate materials that have cooling properties.

Heat index means the National Weather Service heat index, which combines ambient temperature and humidity. It provides a number that can be used to indicate how hot it feels. There are several tools for measuring heat index in both indoor and outdoor work areas. For outdoor work areas, the OSHA–NIOSH Heat Safety Tool app and other phone-based weather apps can be used to show the heat index by location as well as hourly forecasts. For indoor work areas, employers can enter measurements of humidity and ambient temperature into the NOAA Heat Index Calculator. There are also monitoring devices that report heat index. *Heat index* is defined because the term is used in definitions of *high heat trigger* and *initial heat trigger*. The term is also used in proposed paragraphs (c) *Heat injury and illness prevention plan*, (d) *Identifying heat hazards*, and (e) *Requirements at or above the initial heat trigger*.

High heat trigger means a heat index of 90 °F or a wet bulb globe temperature (WBGT) equal to the NIOSH Recommended Exposure Limit. See explanations for the definitions of *wet bulb globe temperature (WBGT)* and *Recommended Exposure Limit (REL)* for more information about those terms. OSHA is including a definition for high heat trigger because exposures at or above the high heat trigger would require the implementation of a number of controls, in addition to the controls that would be implemented under the initial heat trigger in proposed paragraph (e). The controls implemented under the initial heat trigger are described below under the definition for *Initial Heat Trigger*. The additional controls that would be implemented under the high heat trigger under proposed paragraph (f) include required rest breaks, observation for signs and symptoms, hazard alerts, and warning signs for excessively high heat areas. See Section VII.F., Explanation of Proposed Requirements for more information on these controls. The scientific basis supporting the establishment of the high heat trigger at a heat index of 90 °F or a WBGT equal to the NIOSH REL is explained in Section V.B., Basis for Initial and High Heat Triggers.

Indoor/indoors means an area under a ceiling or overhead covering that restricts airflow and has along its entire perimeter walls, doors, windows, dividers, or other physical barriers that restrict airflow, whether open or closed. Possible examples for indoors include work in a garage, even if the garage door is open; the interior of a warehouse, even if multiple doors are open on loading docks; and a shed with four walls and a ceiling, even if the windows are open. Construction activity is considered to be work in an indoor environment when performed inside a structure after the outside walls and roof are erected. This definition is included because the term is used in definitions for *outdoor/outdoors*, and proposed paragraphs (a) *Scope and application*, (d) *Identifying heat hazards*, (e) *Requirements at or above the initial heat trigger*, (f) *Requirements at or above the high heat trigger*, and (i) *Recordkeeping*.

Initial heat trigger means a heat index of 80 °F or a WBGT equal to the NIOSH Recommended Alert Limit (RAL). See explanations for the definitions of *wet bulb globe temperature (WBGT)* and *Recommended Alert Limit (RAL)* for more information about those terms. OSHA is including a definition for *initial heat trigger* because exposures at or above the initial heat trigger would require the implementation of a number of controls under proposed paragraph (e), including requirements for drinking water, break area(s) for indoor and outdoor work sites, indoor work area controls, acclimatization of new and returning employees, rest breaks if needed to prevent overheating, effective communication, and maintenance of PPE cooling properties if PPE is provided. See Section VII.E., Explanation of Proposed Requirements for more information on these controls. The scientific basis supporting the establishment of the initial heat trigger at a heat index of 80 °F or a wet bulb globe temperature (WBGT) equal to the NIOSH RAL is explained in detail in Section V.B., Basis for Initial and High Heat Triggers.

Outdoor/outdoors means an area that is not indoors, as defined above. The definition also specifies that vehicles operated outdoors are considered outdoor work areas for purposes of this standard unless exempted by paragraph (a)(2). Examples of outdoor work include tasks performed in agricultural fields and under canopies and pavilions. This term is defined because it is used in proposed paragraphs (d) *Identifying heat hazards*, (e) *Requirements at or above the initial heat trigger*, and (h) *Training*.

Radiant heat means heat transferred by electromagnetic waves between surfaces. This definition further notes that sources of radiant heat include the sun, hot objects, hot liquids, hot surfaces, and fire.

Radiant heat is transferred from a hotter object to a cooler object. The transfer of radiant heat can occur across distances and does not require objects to touch each other. Infrared radiation is a common source of radiant heat that is encountered in foundries, and in iron, steel, and glass industries (NIOSH, 2016). Sources of exposure to radiant heat in the workplace can include furnaces, ovens, and combustion. *Radiant heat* is defined because it is included in the definition for *wet bulb globe temperature (WBGT)* and is used in paragraph (e) *Requirements at or above the initial heat trigger*.

Recommended Alert Limit (RAL) means the NIOSH-recommended heat stress alert limits for unacclimatized workers. OSHA is proposing to incorporate by reference NIOSH Publication No. 2016–106 Criteria for a Recommended Standard: Occupational Exposure to Heat and Hot Environments (NIOSH, 2016). OSHA is including a definition for RAL because the initial heat trigger incorporates the NIOSH RAL. Thus, several provisions of the standard are triggered by either a heat index of 80 °F or a wet bulb globe temperature (WBGT) equal to the NIOSH RAL. See *Explanation of Proposed Requirements for Definitions (initial heat trigger, wet bulb globe temperature)* and proposed paragraph (e), *Requirements at or above the Initial heat trigger* for more details.

NIOSH (2016) developed the RAL to protect most healthy non-acclimatized employees from adverse effects of heat stress and recommends that total heat exposure for non-acclimatized employees be controlled to maintain combinations of environmental and metabolic heat below the applicable RAL in order to maintain thermal equilibrium. Environmental exposures are based on WBGT, which accounts for the contributions of ambient temperature, radiant heat, humidity, and wind speed. Metabolic heat production is estimated by workload. The RAL assumes employees are wearing “the conventional one-layer work clothing ensemble,” but NIOSH provides guidance for adjusting the WBGT based on the types of clothing or PPE worn. The formula for calculating the RAL is: $RAL [^{\circ}C - WBGT] = 59.9 - 14.1 \log_{10}M[W]$, where M is metabolic rate in watts (W).

Recommended Exposure Limit (REL) means the NIOSH-recommended heat

stress exposure limits for acclimatized workers. OSHA is proposing to incorporate by reference NIOSH Publication No. 2016–106 Criteria for a Recommended Standard: Occupational Exposure to Heat and Hot Environments (NIOSH, 2016). OSHA is including a definition for REL because the high heat trigger incorporates the NIOSH REL. Thus, several provisions of the standard are triggered by either a heat index of 90 °F or a wet bulb globe temperature (WBGT) equal to the NIOSH REL. See *Explanation of Proposed Requirements for Definitions (high heat trigger, wet bulb globe temperature)* and proposed paragraph (f), *Requirements at or above the high heat trigger* for more details.

NIOSH (2016) developed the REL to protect most healthy acclimatized employees from adverse effects of heat stress and recommends that total heat exposure for acclimatized employees be controlled to maintain combinations of environmental and metabolic heat below the applicable REL in order to maintain thermal equilibrium. Environmental exposures are based on WBGT, which accounts for the contributions of ambient temperature, radiant heat, humidity, and wind speed. Metabolic heat production is estimated by workload. The REL assume employees are wearing “the conventional one-layer work clothing ensemble,” but NIOSH provides guidance for adjusting WBGT based on the types of clothing or PPE worn. The formula for calculating the REL is: $REL [^{\circ}C - WBGT] = 56.7 - 11.5 \log_{10} M[W]$, where M is metabolic rate in watts (W).

Shade is defined as the blockage of direct sunlight, such that objects do not cast a shadow in the area of blocked sunlight. This definition is included to clarify the requirements for use of shade as a control in outdoor break areas under proposed paragraph (e)(3)(i). Shade can be artificial or naturally occurring. See *Explanation of Proposed Requirements* for paragraph (e)(3).

Signs and symptoms of heat-related illness means the physiological manifestations of a heat-related illness and includes headache, nausea, weakness, dizziness, elevated body temperature, muscle cramps, and muscle pain or spasms. This term is used throughout the proposal to refer to a range of signs and symptoms that may result from a variety of heat-related illnesses (see Section IV., Health Effects for a detailed discussion of heat-related illnesses and the accompanying symptoms). This term is defined to provide clarity about scenarios for which an employer must develop procedures for responding to employees experiencing signs and symptoms of

heat-related illness in their heat emergency response plan, as well as the scenarios that an employer would be required to take specific actions to aid affected employees under proposed paragraph (g). This definition also provides clarity on the requirements to train employees on signs and symptoms of heat-related illness (see proposed paragraph (h)(iv)) and monitor employees for signs and symptoms of heat-related illness (see proposed paragraph (f)(3)).

Signs and symptoms of a heat emergency means the physiological manifestations of a heat-related illness that require emergency response and include loss of consciousness (*i.e.*, fainting, collapse) with excessive body temperature, which may or may not be accompanied by vertigo, nausea, headache, cerebral dysfunction, or bizarre behavior. This could also include staggering, vomiting, acting irrationally or disoriented, having convulsions, and (even after resting) having an elevated heart rate. This term is defined to provide clarity about scenarios for which an employer must develop procedures to respond to employees experiencing signs and symptoms of a heat emergency in their heat emergency response plan, as well as the scenarios in which an employer would be required to take specific actions to aid affected employees under proposed paragraph (g). This definition also provides clarity on the requirements to train employees on signs and symptoms of heat-related illness and which ones require immediate emergency action (see proposed paragraph (h)(iv)).

Vapor-impermeable clothing means full-body clothing that significantly inhibits or completely prevents sweat produced by the body from evaporating into the outside air. The definition further indicates that examples include encapsulating suits, various forms of chemical resistant suits, and other forms of non-breathable PPE. This definition is included because under proposed paragraph (c)(3) employers that have employees who wear vapor-impermeable clothing would be required to evaluate heat stress hazards resulting from these clothing and implement policies and procedures based on reputable sources to protect employees while wearing this clothing. Vapor-impermeable clothing is also referred to as “vapor barrier” clothing. It is a type of protective clothing that employers may provide to employees to protect them from chemical, physical, or biological hazards for work tasks such as hazardous waste clean-up. Examples include metallic reflective clothing or

chemical resistant clothing made from plastics such as vinyl or nylon-reinforced polyethylene (Mihal, 1981). Materials made from 100% high density polyethylene (*e.g.*, Tyvek®) that allow water vapor and gases to pass through are not vapor-impermeable, but lamination of the materials with some substances such as polyvinyl chloride (PVC) can change the breathability of the materials and render them vapor-impermeable (DuPont, 2024; Paull and Rosenthal, 1987). Because the proposed definition indicates “full-body clothing”, it would not include vapor-impermeable PPE that covers small areas of the body (*e.g.*, gloves, boots, aprons, leggings, gauntlets). However, clothing such as boots and gloves made from vapor-impermeable materials such as rubber may be part of whole-body, vapor-impermeable clothing ensembles (Mihal, 1981; Paull and Rosenthal, 1987). Employers could check product information provided by manufacturers to determine if clothing worn by their employees qualifies as vapor-impermeable clothing.

Vehicle means a car, truck, van, or other motorized means of transporting people or goods. Other examples may include a forklift, reach truck, tow truck, pallet truck, or bus, among others. In addition, vehicles may also include equipment such as a bulldozer, road grader, farm tractor, or crane. Under the proposed definitions, a vehicle would be a *work area* when a worker’s work activities occur in the vehicle.

Wet Bulb Globe Temperature (WBGT) is a heat metric that takes into account ambient temperature, humidity, radiant heat from sunlight or artificial heat sources, and air movement. It can be measured in both indoor and outdoor work areas, however there are separate formulas depending on whether the device is being used indoors or outdoors. WBGT is used by NIOSH and ACGIH in their guidance for evaluating occupational heat stress. The term is defined because it is used in the definitions for the high and initial heat triggers and in proposed paragraphs (c) *Heat injury and illness prevention plan* and (d) *Identifying heat hazards*.

Work area means an area where one or more employees are working within a work site. This includes any area where an employee performs any work-related activity. A work area may be located at the employer’s premises or other locations where an employee may be engaged in work-related activities or is present as a condition of their employment. Work area is defined because it is referenced in several provisions of the proposed standard, including (a) *Scope and application*, (c)

Heat injury and illness prevention plan (HIIPP), (d) Identifying heat hazards, (e) Requirements at or above the initial heat trigger, (f) Requirements at or above the high heat trigger, and (i) Recordkeeping.

Work site means a physical location (e.g., fixed, mobile) where the employer's work or operations are performed. It includes outdoor and indoor areas, individual structures or groups of structures, and all areas where work or any work-related activity occurs (e.g., taking breaks, going to the restroom, eating, entering or exiting work). The work site includes the entirety of any space associated with the employer's operations (e.g., workstations, hallways, stairwells, breakrooms, bathrooms, elevators) and any other space that an employee might occupy in arriving, working, or leaving. A work site may or may not be under the employer's control. Work site is defined because it is referenced in several provisions of the proposed standard including Heat Injury and Prevention Plan (HIIPP) (proposed paragraph (c)), Identifying heat hazards (proposed paragraph (d)), Requirements at or above the initial heat trigger (proposed paragraph (e)), Requirements at or above the high heat trigger (proposed paragraph (f)), Heat illness and emergency response and planning (proposed paragraph (g)), and Training (proposed paragraph (h)).

I. Requests for Comments

OSHA requests comments as to whether the proposed definitions are appropriate, and whether any additional terms should be defined in the standard.

C. Paragraph (c) Heat Injury and Illness Prevention Plan

Proposed paragraph (c) includes provisions for the development and implementation of a work site heat injury and illness prevention plan, referred to as a "HIIPP" or "plan" for the remainder of this section, as well as requirements regarding what would need to be in the plan. The development of a HIIPP, including comprehensive policies and procedures, is necessary to ensure that all affected employees, including exposed workers, supervisors, and heat safety coordinators, understand where heat hazards exist at the workplace and the workplace-specific measures that must be utilized to address those hazards. The NIOSH Criteria Document provides information on the importance of a HIIPP to reduce the risk of heat-related injuries and illness (NIOSH, 2016). Requiring a HIIPP is also consistent with regulations from several of the States that have

enacted or proposed heat-specific standards. There is a plan requirement in existing heat standards from California (Cal. Code of Regs. tit. 8, section 3395 (2005)), Washington (Wash. Admin. Code sections 296–62–095 through 296–62–09560; 296–307–097 through 296–307–09760 (2023)); and Oregon (Or. Admin. R. 437–002–0156 (2022); Or. Admin. R. 437–004–1131 (2022)). Maryland and Nevada proposed heat standards that would also require a HIIPP (MD, 2024; NV, 2022). Additionally, this requirement aligns with the recommendations from the NACOSH Heat Injury and Illness Prevention Work Group, where the group provided a list of potential elements to include in a HIIPP. All the requirements in paragraph (c) would have to be included in the employer's HIIPP.

Paragraph (c)(1) would require employers to develop and implement a comprehensive HIIPP for each work site. Under proposed paragraph (b), a work site is defined as a physical location (e.g., fixed, mobile) where the employer's work or operations are performed. If an employer has multiple work sites that are substantially similar, the HIIPP may be developed by work site type rather than by individual work sites so long as any site-specific information is included in the plan (e.g., phone numbers and addresses or site-specific heat sources). For example, if an employer has developed a corporate HIIPP that includes information about job tasks or exposure scenarios that apply at multiple work sites, this information can be used in the development of HIIPPs for individual work sites. When employees are in work areas not controlled by the employer (like private residences), employers would need procedures for how they will ensure compliance with the standard (e.g., ensure that effective communication is being maintained (proposed paragraph (f)(3)(iii)) and employees are receiving hazard alerts to remind them of protections such as the importance of drinking plenty of water, their right to take breaks, and locations of break sites and drinking water (proposed paragraph (f)(4)). These employers must include such policies and procedures in their HIIPP to protect their employees entering those locations not controlled by the employer.

Proposed paragraph (c)(2) specifies the contents of the HIIPP. Proposed paragraph (c)(2)(i) would require the HIIPP to include a comprehensive list of the types of work activities covered by the plan. For example, a landscaping company could indicate that all employees conducting outdoor work at

or above the initial heat trigger for at least 15 minutes in any 60-minute period (e.g., lawn care workers, gardeners, stonemasons, and general laborers) would be covered by the HIIPP. (See proposed paragraphs (a)(2)(i), (ii), and (iv) and *Explanation for Proposed Requirements* for Paragraph (a) *Scope and Application* for more detail about coverage under the standard.) Paragraph (c)(2)(ii) would require the inclusion of the policies and procedures that are necessary to comply with the requirements of this proposed standard. See *Explanation of Proposed Requirements* for paragraphs (d) through (j) for examples of how employers could comply with the proposed provisions. OSHA understands that a HIIPP must be adaptable to the physical characteristics of the work site and the job tasks performed by employees, as well as the hazards identified by the employer when designing their HIIPP. Employers could also include other policies, procedures, or information necessary to comply with any applicable Federal, State, or local laws, standards, and guidelines in their HIIPPs. Paragraph (c)(2)(iii) would require that employers identify the heat metric (i.e., heat index or wet bulb globe temperature) that the employer will monitor to comply with paragraph (d). For more information on heat metrics, see *Explanation for Proposed Requirements* for Paragraph (b) *Definitions for heat index and WBGT*.

Paragraph (c)(3) would require that, in cases where employees wear vapor-impermeable clothing (also called vapor barrier clothing), employers must evaluate heat stress hazards resulting from this clothing and implement policies and procedures based on reputable sources to protect employees while wearing these clothing. The employer must include these policies and procedures and document the evaluation in the HIIPP. Under proposed paragraph (b), *vapor-impermeable clothing* is defined as full-body clothing that significantly inhibits or completely prevents sweat produced by the body from evaporating into the outside air. The definition further indicates that examples include encapsulating suits, various forms of chemical resistant suits, and other forms of non-breathable PPE. For more information on vapor-impermeable clothing, see the *Explanation for Proposed Requirements* for paragraph (b) *Definitions*. This attention to vapor-impermeable clothing is essential given that significant or complete inhibition of sweat evaporation can greatly increase the potential for heat stress and

resulting heat strain and HRI (Mihal, 1981).

The requirement that employers evaluate heat stress and develop policies and procedures to protect employees based on reputable sources allows for flexibility, given that there is variability in duration of use of the vapor-impermeable clothing and that workload also varies across job tasks and occupations. Examples of reputable sources employers can consult to assess heat stress and develop policies and procedures to protect employees wearing vapor-impermeable clothing include recommendations by NIOSH (2016) and ACGIH (2023). An example of a policy employers might adopt to protect employees wearing vapor-impermeable clothing is implementing the protections in the standard at a lower temperature threshold. Such an approach has been used in State standards such as the Washington heat standard for outdoor workplaces (Wash. Admin. Code 296–307–09747 (2023)). In Washington State’s heat standard, employers must implement certain controls when employees are wearing vapor barrier clothing, and the temperature is above 52 °F. Paragraph (c)(3) does not apply to vapor-permeable clothing or PPE such as cotton coveralls, SMS polypropylene or polyolefin coveralls, double layer woven clothing, or wool shirts (ACGIH, 2023; ACGIH, 2017; NIOSH, 2016).

Paragraph (c)(3) would require the employer to document in the HIIPP the hazard evaluation performed to comply with this provision and to include in the HIIPP the policies and procedures developed to protect employee’s wearing vapor-impermeable clothing. Although OSHA is not specifying a particular form for the required hazard evaluation, an effective hazard evaluation would include a review of environmental heat exposures, a review of the high-risk area(s), tasks, and occupations, and an evaluation of the length of time and intensity of task when wearing vapor-impermeable clothing. Policies and procedures should include communication of the status of planned or completed actions to employees who may have to wear vapor-impermeable clothing to complete work tasks. For more information on identifying heat hazards, see *Explanation of Proposed Requirements* for paragraph (d) below.

Under proposed paragraph (c)(4), an employer with more than 10 employees would be required to develop and implement a written HIIPP. While OSHA has concluded that a HIIPP is necessary for all employers covered by the standard, OSHA has determined that

only employers with more than 10 employees need to have a written plan. This cutoff of 10 employees is consistent with OSHA’s practice of allowing employers with 10 or fewer employees to communicate their emergency action plans (29 CFR 1910.38) and fire prevention plans (29 CFR 1910.39) orally to employees. OSHA expects that small employers with 10 or fewer employees are likely to have less complicated HIIPPs and will communicate with employees verbally. The agency does not believe that there is a high likelihood of misunderstanding when employers communicate their HIIPPs to employees verbally. As a result, OSHA does not believe the added burden on small employers of establishing a written plan is necessary. However, small employers may opt to create a written HIIPP if they find doing so is helpful in developing and implementing their plans.

In contrast, the agency is concerned that when employers have more than 10 employees, there is likely sufficient complexity in the employer’s operation that putting the HIIPP in writing is necessary to establish clear expectations and prevent miscommunication. For example, employers with more than 10 employees may have employees working in multiple locations or on multiple shifts, increasing the likelihood that verbally communicating the employer’s HIIPP will be ineffective. Therefore, OSHA preliminarily finds that having a written HIIPP that employees of larger employers can easily access is essential to ensure those employees are informed about policies, programs, and protections implemented by their employers to protect them from hazardous heat exposure.

An employer may have already developed and implemented a HIIPP. Existing plans may fulfill some of the requirements in this section. It is not OSHA’s intent for employers to duplicate current effective HIIPPs, but each employer with a current HIIPP would have to evaluate that plan for completeness to ensure it satisfies all the requirements of this section. Employers with existing plans would be required to modify and/or update their current HIIPP plans to incorporate any missing required elements and provide training on these new updates or modifications to all employees (see the *Explanation of Proposed Requirements* for Paragraph (h) *Training*). Employers with more than 10 employees would have to ensure their existing HIIPP is in writing.

Paragraph (c)(5) would require the employer to designate one or more workplace heat safety coordinators to

implement and monitor the HIIPP. Any employee(s) capable of performing the role who receives the training required by proposed paragraphs (h)(1) and (2) can be designated heat safety coordinator(s). This employee(s) does not need to be someone with specialized training. The heat safety coordinator(s) could be a supervisor or an employee that the employer designates. The heat safety coordinator(s) must have the authority to ensure compliance with all aspects of the HIIPP. This requirement would ensure heat safety coordinators can take prompt corrective measures when hazards are identified. Proposed paragraph (c)(5) would also require that for employers with more than 10 employees, the identity of the heat safety coordinator(s) must be documented in the written HIIPP. Employers must designate a heat safety coordinator(s) to implement and monitor the HIIPP plan, but the exact responsibilities of a heat safety coordinator(s) may vary based on the employer and work site. Some possible duties of the heat safety coordinator(s) could include conducting regular inspections of the work site to ensure the HIIPP is being implemented appropriately and to monitor the ongoing effectiveness of the plan. During such inspections, the heat safety coordinator(s) could observe employees to ensure they are protecting themselves by frequently drinking water or taking rest breaks that employers would be required to provide.

Under proposed paragraph (c)(6), the employer would be required to seek the input and involvement of non-managerial employees and their representatives, if any, in the development and implementation of the HIIPP. An employer could seek feedback from employees through a variety of means, including safety meetings, a safety committee, conversations between a supervisor and non-managerial employees, a process negotiated with the exclusive bargaining agent (if any), or any other similarly interactive process. The method of soliciting employee input is flexible and may vary based on the employer and the work site. For example, a large employer with many employees may find a safety committee with representatives from various job categories combined with anonymous suggestion boxes to be more effective than individual conversations between supervisors and non-managerial employees. In the case of a unionized workplace, a safety committee established through a collective bargaining agreement may be the appropriate source for this input,

based on the definition and scope of the committee's work. In contrast, a small employer might determine that an ongoing interactive process between the employer and employees (e.g., regular safety meetings) is a more effective means of soliciting employee feedback. OSHA understands employees often know the most about potential hazards associated with their jobs. As such, employee participation is a key component of effective safety and health programs.

Paragraph (c)(7) would require the employer to review and evaluate the effectiveness of the HIIPP whenever a heat-related injury or illness occurs that results in death, days away from work, medical treatment beyond first aid, or loss of consciousness, but at least annually. Following each review, the employer would be required to update the HIIPP as necessary. The employer would have to seek input and involvement of non-managerial employees and their representatives, if any, during any reviews and updates. OSHA preliminarily finds that a heat-related illness or injury that results in death, days away from work, medical treatment beyond first aid, or loss of consciousness warrants an evaluation of the HIIPP because it could potentially indicate a deficiency of the HIIPP. Additionally, the heat safety coordinator might learn of a deficiency during an inspection or from another employee. OSHA expects that employers would immediately address any identified deficiencies and update the HIIPP accordingly. Under proposed paragraph (h)(4)(iv), all employees would have to be retrained following a heat-related injury or illness that results in death, days away from work, medical treatment beyond first aid, or loss of consciousness, and under proposed paragraph (h)(4)(ii) employees would have to be retrained if identification of a deficiency results in an update to the HIIPP. OSHA preliminarily finds that effective heat injury and illness prevention plans would require periodic evaluation to ensure they are implemented as intended and continue to achieve the goal of preventing heat injury and illness and promoting workplace safety and health. This re-evaluation can result in improvements in controls to help reduce hazards.

Paragraph (c)(8) would require the employer to make the HIIPP readily available at the work site to all employees performing work at the work site. The HIIPP would have to be readily accessible during each work shift to employees when they are in their work area(s). Paper copies, electronic access (i.e., accessible via smart phone) and

other alternatives to maintaining paper copies of the HIIPP are permitted as long as no barriers to immediate employee access in each work site are created by such options.

Paragraph (c)(9) would require the employer to ensure the HIIPP is available in a language each employee, supervisor, and heat safety coordinator understands. Under proposed paragraph (c)(4), this would require written translations of the plan in all languages that employees, supervisors, and heat safety coordinators understand. Employers could comply with this requirement by utilizing one of the numerous translator programs available online if the employer has a way to ensure accuracy of the translated materials. In cases where an employee, supervisor, or heat safety coordinator can read and comprehend English, but prefers to read in another language, the employer would have no obligation to provide a written translation of the plan in that individual's preferred language. If one or more employees are not literate, the employer would have to ensure that someone is available to read the written plan in a language that each employee understands. Likewise, for employers who have less than 10 employees, the employer would have to ensure that someone is available to explain the plan in a language that each employee, supervisor, and heat safety coordinator understands. OSHA expects that an individual who speaks employees' languages will be available in all workplaces since effective communication between individuals such as employers, supervisors, and employees would need to occur in order for employees to understand the details about the work tasks they need to complete.

I. Requests for Comments

OSHA requests comments and evidence regarding the following:

- The approaches that stakeholders are taking to assess heat stress and prevent HRI in employees wearing vapor-impermeable clothing;
- Whether OSHA should specify a temperature that would trigger all or certain requirements of the standard for employees wearing vapor-impermeable clothing;
- Additional approaches that OSHA should consider to protect employees wearing vapor-impermeable clothing;
- Whether the proposed requirement to seek input and involvement from non-managerial employees and their representatives under paragraph (c)(6) is adequate, or whether the explanation should be expanded or otherwise amended (and if so, how and why);

- Whether OSHA should define "employee representative" and, if so, whether the agency should specify that non-union employees can designate a non-employee third-party (e.g., a safety and health specialist, a worker advocacy group, or a community organization) to provide expertise and input on their behalf;

- Whether it is reasonable to require the HIIPP be made available in a language that each employee, supervisor, and heat and safety coordinator understands;

- What methods and programs are available to provide employees documents and information in multiple languages, whether there are languages for which these resources are not available, and how employers can provide adequate quality control to ensure that the translations are done properly; and

- Whether individuals are available at workplaces to provide verbal translations of the plan for employees who are not literate or do not speak English.

D. Paragraph (d) Identifying Heat Hazards

Proposed paragraph (d) sets forth requirements for assessing where and when employees are exposed to heat at or above the initial and high heat triggers. It would require employers with outdoor work sites to monitor heat conditions at outdoor work areas by tracking local heat index forecasts or measuring the heat metric of their choosing (heat index or wet bulb globe temperature (WBGT)). It would require employers with indoor work sites to identify work areas where there is a reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger and implement a plan for monitoring these areas to determine when exposures above the initial and high heat triggers occur, using the heat metric of their choosing (heat index or WBGT). Determining when employees are exposed to heat at or above the initial and high heat triggers is critical for ensuring that employees are provided with appropriate protections (outlined in paragraphs (e) and (f)).

Proposed paragraph (d)(1) would require employers whose employees perform work outdoors to monitor the heat conditions at the work areas where employees are working. Employers would have two options for complying with this requirement—tracking local heat index forecasts provided by National Weather Service (NWS) or other reputable sources or making on-

site measurements using monitoring device(s).

Employers who choose to track local forecasts would need to consult a reputable source for local heat index forecasts such as their local NWS Weather Forecast Office, the OSHA–NIOSH Heat Safety Tool cell phone application, or another weather forecast website or cell phone application. When using these sources, employers would need to accurately enter the location of the work area. The OSHA–NIOSH Heat Safety Tool (and other cell phone applications) will automatically use GPS to determine the user's location, so the forecast may be inaccurate if using the tool at home and employers will need to manually enter the work area location in these situations.

Employers who choose to conduct on-site monitoring would need to set up monitoring devices at or as close as possible to the work area. This could mean setting up the device(s) on a tripod a few yards away from an employee. When there are multiple work areas at the same work site, the employer could use a single monitoring device to measure heat exposure for multiple work areas if there is no reasonable anticipation that the heat exposure will differ between work areas. For example, if employees are harvesting crops on different fields but are within a mile of one another under similar work conditions, the employer could use a single monitoring device. If there is reasonable anticipation that employees at a work site have different levels of exposure, employers could measure the exposure at the work area of the employee(s) reasonably expected to have the highest exposure and apply that value to all employees at the work site instead of measuring the exposure for each work area.

Employers using heat index as their heat metric could either use heat index monitors or measure temperature and humidity with separate devices. In the latter situation, these employers would need to use a heat index calculator, such as the one provided on the NWS website (NWS, 2023), to calculate heat index from the separate temperature and humidity readings. Employers using WBGT as their heat metric would need to take into account differences in solar radiation and wind between work areas when deciding whether a single measurement could be used for multiple work areas. For example, measurements of WBGT in a work area in the shade should not be applied to another work area that is not in the shade. Regardless of which metric they choose to use, employers conducting on-site monitoring should consult user manuals

and ensure devices are calibrated and in working order. Employers should follow the device manufacturer's manual when conducting monitoring.

Proposed paragraph (d)(2) would require employers whose employees perform work outdoors to consult the weather forecast or their monitoring device(s)—whichever they are using to comply with paragraph (d)(1)—frequently enough to determine with reasonable accuracy when conditions at the work area reach the initial and high heat triggers. Employers consulting forecasts would need to check the forecast as close to the start of the work shift as possible to determine whether and when the heat index at the work area may be at or above the initial or high heat triggers. Depending on the forecast or conditions at the work site, the employer then may or may not need to conduct further monitoring during the day. If, for example, the employer consulted the OSHA–NIOSH Heat Safety Tool before the work shift and it indicated that the heat index would exceed the initial heat trigger but not the high heat trigger during the last four hours of the work shift, the employer would need to either: (1) implement control measures in accordance with paragraph (e) for those four hours, or (2) consult the Heat Safety Tool again later in the day and implement control measures in accordance with paragraph (e) only for the hours during which real-time conditions reported by the application exceed the initial heat trigger (which may be more or less than four hours if the forecast earlier in the day underestimated or overestimated the heat index). However, if the employer consulted the OSHA–NIOSH Heat Safety Tool before the work shift and it indicated that the heat index would be close to the initial heat trigger but not exceed it, employers would need to check the forecast again later in the day to determine whether the trigger was exceeded. Employers would need to use short-term forecasts (*i.e.*, hourly) rather than long-term forecasts (*e.g.*, weekly, monthly) to comply with proposed paragraphs (d)(1) and (2). Ultimately, the employer is responsible for ensuring that the controls required at the initial and high heat trigger are in place when those triggers are met, and they should make decisions regarding the frequency of monitoring with this in mind.

Likewise, employers who conduct on-site monitoring in order to comply with paragraph (d)(1) will need to develop a reasonable measurement strategy that is adapted to the expected conditions. If forecasts provide no suggestion that the initial heat trigger could be reached

during the work shift, an employer may not need to take any measurements. Where temperatures are expected to approach the initial or high heat triggers, several measurements may be necessary, particularly as the hottest part of the day approaches. For example, if the employer measures at 10 a.m. and the heat index is very close but below the initial heat trigger, the employer would likely need to either check again sometime shortly thereafter or assume that the trigger is exceeded. WBGT accounts for additional parameters—air speed and radiant heat—so employers using WBGT may need to make additional measurements when these conditions change at the work site.

Proposed paragraphs (d)(3)(i) and (ii) outline the requirements for assessing heat hazards in indoor work sites, which differ slightly from the requirements for outdoor work sites, in that employers would need to identify the work areas where they reasonably expect employees to be exposed to heat at or above the initial heat trigger and then create a monitoring plan to determine when employees in those work areas are exposed to heat at or above the initial and high heat triggers.

Employers could determine which work areas are expected to have employee exposure at or above the initial heat trigger by consulting various data sources, such as previously collected monitoring data, site or process surveys, employee interviews and input, and heat injury and illness surveillance data. Work areas near heat-generating machinery are one example of where there may be a reasonable expectation of employee exposure at or above the initial heat trigger. In addition to heat-generating equipment, employers must determine whether there is a reasonable expectation that an increase in the outdoor temperature would increase temperatures in their indoor work site, thereby exposing employees to heat at or above the initial heat trigger.

Employers would be required to develop a monitoring plan that covers each work area they identified in the prior step. The monitoring plan is intended to determine when employees are exposed (*e.g.*, specific times of day, during certain processes, certain months of the year) to heat at or above the initial and high heat triggers for each work area. When developing a monitoring plan(s), employers would need to take into account the circumstances that could impact heat conditions specific to each work area and work site. The monitoring plan(s) would need to be included in the employer's HIIPP.

In complying with proposed paragraph (d)(3)(ii), employers would need to outline in their monitoring plan how they will monitor either heat index or WBGT using on-site monitors that are set up at or as close as possible to the work area(s) identified under paragraph (d)(3)(i). OSHA intends the phrase “as close as possible” to mean the closest possible location that won’t otherwise create inaccurate measurements. The employer should ensure that their monitoring plan outlines the appropriate frequency of measurements, which should be of sufficient frequency to determine with reasonable accuracy employees’ exposure to heat. For example, if the employer determines there is only a reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger when a certain process is happening or during certain times of the year, then they would only need to monitor when that process is happening or during that time of the year.

Employers using heat index as their heat metric could either use heat index monitors or measure temperature and humidity with separate devices. In the latter situation, these employers would need to use a heat index calculator, such as the one provided on the NWS website (NWS, 2023), to calculate heat index from the separate temperature and humidity readings. Employers using WBGT as their heat metric would need to take into account differences in radiant heat and air movement between work areas when deciding whether a single measurement can be used for multiple work areas. For example, measurements of WBGT in a work area without a radiant heat source should not be applied to another work area that is near a radiant heat source. Regardless of which metric they choose to use, employers should consult user manuals and ensure devices are calibrated and in working order. Employers should follow the device manufacturer’s manual when conducting monitoring.

If there are multiple work areas where there is a reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger at a work site, the employer could conduct representative sampling instead of taking measurements at each individual work area. If using this approach, the employer would be required to sample the work area(s) expected to be the hottest. For example, this may involve monitoring the work area closest to a heat-generating process. The employer cannot put a monitoring device in a work area known or expected to be cooler and consider that representative of other work areas.

If any changes occur that could increase employee exposure to heat (*i.e.*, a change in production, processes, equipment, controls, or a substantial increase in outdoor temperature which has the potential to increase heat exposure indoors), proposed paragraph (d)(3)(iii) would require that the employer must evaluate any affected work area(s) to identify where there is reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger. Examples of changes that could increase employee exposure to heat include the installation of new equipment that generates heat in a work area that didn’t previously have heat-generating equipment or a local heat wave that increases the heat index in a warehouse without air-conditioning. The employer would be required to update their monitoring plan or develop and implement a monitoring plan, in accordance with paragraph (d)(3)(ii), to account for any increases in heat exposure.

Proposed paragraph (d)(3)(iv) would require employers to involve non-managerial employees (and their representatives, if applicable) in the determination of which work areas have a reasonable expectation of exposing employees to heat at or above the initial heat trigger (which is described in paragraph (d)(3)(i)). Employers would also be required to involve non-managerial employees (and their representatives, if applicable) in developing and updating the monitoring plan(s) outlined in paragraph (d)(3)(ii) through (iii). One example of this involvement would be employees providing input in identifying processes or equipment that give off heat and times of the day or year when certain areas of the building feel uncomfortably hot and warrant monitoring. Employees are often the most knowledgeable about the conditions in which they work and their involvement will help ensure the accuracy and sufficiency of the employer’s monitoring plan(s).

Proposed paragraph (d)(4) specifies that the heat metric (*i.e.*, heat index or WBGT) that the employer chooses to monitor determines the applicable initial and high heat triggers under the standard. Specifically, as defined in paragraph (b), if the employer chooses to monitor heat index, they would be required to use the initial heat trigger of 80 °F (heat index) and the high heat trigger of 90 °F (heat index). If the employer chooses to use WBGT, they would be required to use the NIOSH Recommended Alert Limit (RAL) as the initial heat trigger and the NIOSH Recommended Exposure Limit (REL) as the high heat trigger. As outlined in

paragraph (c), the employer would be required to identify which heat metric they are monitoring in their HIIPP. If they do not do this, proposed paragraph (d)(4) specifies that the initial and high heat trigger will be based on the heat index.

Proposed paragraph (d)(5) would provide an exemption from monitoring requirements for employers who choose to assume that their employees are exposed to heat at or above both the initial and high heat triggers. In these cases, employers would not need to conduct monitoring, but they would be required to provide all controls outlined in paragraphs (e) and (f) while making this assumption. For the period of time that employers choose to make this assumption and are therefore exempt from monitoring requirements, they would not be required to keep records of monitoring data (see paragraph (i), Recordkeeping).

I. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Whether the proposed requirement to monitor outdoor work areas with “sufficient frequency to determine with reasonable accuracy employees’ exposure to heat” is adequate or whether the standard should specify an interval of monitoring (and if so, what frequency and why);
- Whether OSHA should specify an interval of monitoring for indoor work areas (and if so, what frequency and why);
- Whether the standard should include a specific increase in outdoor temperature that would trigger the requirements in paragraph (d)(3)(iii) for indoor work areas, rather than the trigger being a “substantial increase”, and if so, what magnitude of increase;
- Whether there could be situations in which a lack of cellular service prevents an employer from using weather forecasts or real-time predictions, and if so, what alternatives would be appropriate;
- Whether the standard should require specifications related to monitoring devices (*e.g.*, in accordance with user manuals, properly calibrated) and whether the standard should specify a permissible accuracy level for monitoring devices; and
- Whether the standard should further specify which sources of forecast data employers can use to comply with paragraph (d)(1)(i) and if so, what criteria should be used.

E. Paragraph (e) Requirements at or Above the Initial Heat Trigger

I. Timing

Paragraph (e) of the proposed standard would establish requirements when employees are exposed to heat at or above the initial heat trigger. As discussed in Section V.B., Basis for Initial and High Heat Triggers, OSHA has preliminarily determined that the experimental and observational evidence support that heat index triggers of 80 °F and 90 °F are highly sensitive and therefore highly protective of employees. Exposures at or above the initial heat trigger, a heat index of 80 °F or a corresponding wet bulb globe temperature equal to the NIOSH Recommended Alert Limit, would require the employer to provide the protections outlined in paragraphs (e)(2) through (10).

The employer would only be required to provide the specified protections during the time period when employees are exposed to heat at or above the initial heat trigger. In many cases, employees may only be exposed at or above the initial heat trigger for part of their work shift. For example, employees who work outdoors may begin work at 9 a.m. and finish work at 5 p.m. If their exposure is below the initial heat trigger from 9 a.m. until 12 p.m., and at or above the initial heat trigger from 12 p.m. to 5 p.m., the employer would only be required to provide the protections specified in this paragraph from 12 p.m. to 5 p.m. Additional protective measures, outlined in paragraph (f) *Requirements at or above the high heat trigger*, would be required when employees are exposed to heat at or above the high heat trigger.

II. Drinking Water

Paragraph (e)(2) of the proposed standard would establish requirements for drinking water when employees are exposed to heat at or above the initial trigger. The proposed requirements of paragraph (e)(2) are in addition to the requirements in existing OSHA sanitation standards applicable to the employer, including the general industry sanitation standard (29 CFR 1910.141); construction industry sanitation standard (29 CFR 1926.51); field sanitation standard (29 CFR 1928.110); shipyard employment sanitation standard (29 CFR 1915.88); marine terminals sanitation standard (29 CFR 1917.127); and temporary labor camp standard (29 CFR 1910.142). In addition to requirements for drinking water, these standards require access to toilet facilities, which is important to

ensure that employees are not discouraged from drinking adequate amounts of drinking water. As discussed in Risk Reduction, Section V.C., drinking water has been shown to be an effective intervention for preventing dehydration, heat strain, and HRI. It allows employees to replace fluids lost by sweat and is necessary to maintain blood volume for cardiovascular function and thermoregulation.

Proposed paragraph (e)(2)(i) would require that employers provide access to potable water that is placed in locations readily accessible to employees. To ensure employees have sufficient drinking water whenever needed, the drinking water should be located as close as possible to employees, to facilitate rapid access. Employers could comply with this provision by providing water coolers or food grade jugs on vehicles if drinking water fountains or taps are not nearby, or by providing bottled water or refillable water bottles so that employees always have access to water. Employers supplying water through a common source such as a tap or jug would have to provide a means for employees to drink the water. This could include providing disposable cups or single-user refillable water bottles. Under OSHA's sanitation standards, common drinking cups or other shared utensils are prohibited. Open containers such as barrels, pails, or tanks for drinking water from which water must be dipped or poured, whether or not they are fitted with a cover, are also prohibited under these standards. In cases where employers provide single-user, refillable water bottles, they should keep extra bottles or disposable cups on hand in case employees misplace or forget to bring the bottle the employer provided them.

OSHA notes that water would not be readily accessible if it is in a location inaccessible to employees (e.g., the drinking water fountain is inside a locked building or trailer). Water would also not be readily accessible if it is placed at a distant or inconvenient location in relation to where employees work. OSHA expects that employers will have incentive to place the drinking water as close to employees as feasible to minimize the amount of time needed to access water, which must be paid. Explanation of Proposed Requirements for paragraph (j) *Requirements implemented at no cost to employees*.

Proposed paragraph (e)(2)(ii) would require that employers provide access to potable water that is suitably cool. As discussed in Risk Reduction, Section V.C., the temperature of drinking water impacts hydration levels, as cool or cold

water has been found to be more palatable than warm water, thus leading to higher consumption of cool water and decreased risk of dehydration. Additional evidence highlighted in Risk Reduction, Section V.C., shows that cool fluid ingestion has beneficial effects for reducing heat strain. The requirement that drinking water be "suitably cool" is consistent with OSHA's existing field sanitation standard (29 CFR 1928.110(c)(1)(ii)) and with California's heat standard for outdoor workplaces (Cal. Code Regs. tit. 8, section 3395). OSHA has previously stated that to be suitably cool, the temperature of the water "must be low enough to encourage employees to drink it and to cool the core body temperature" (Field Sanitation, 52 FR 16050, 16087 (May 1, 1987)). Employers could comply with this provision by providing drinking water from a tap or fountain that maintains a cooler temperature, providing water in coolers or by providing ice or ice packs to keep drinks cool.

In addition to providing palatable and potable water, the NACOSH Heat Injury and Illness Prevention Work Group recommended that employers consider providing electrolyte supplemental packets that can be added to water or electrolyte-containing sports drinks (NACOSH Working Group on Heat, 2023). While employers could choose to offer electrolyte supplements or electrolyte-containing sports drinks, they would not be required under the standard. Providing electrolyte supplements or sports drinks alone would not meet the proposed requirement. OSHA has preliminarily determined that electrolyte supplementation may not be necessary in a majority of situations if workers are consuming adequate and regular meals (NIOSH, 2017a). OSHA has also received feedback from stakeholders that some workers may be unable to consume certain electrolyte supplements or solutions due to their sugar content.

Proposed paragraph (e)(2)(iii) would require that employers provide access to one quart of drinking water per employee per hour. Employers could comply with this provision by providing access to a drinking water tap or fountain that has a continuous supply of drinking water, or providing coolers or jugs that are replenished with water as the quantity diminishes. As discussed in more detail in Section V.C., Risk Reduction, that volume of water intake ensures adequate replenishment of fluids lost through sweat to avoid a substantial loss in total body water content for employees working in the

heat. OSHA is specifying the amount of water that employers need to provide to employees, not an amount that employees need to drink. However, as discussed in the Explanation of Proposed Requirements for paragraphs (f)(3) and (h), the employer must inform employees of the importance of drinking water to prevent HRIs during initial training, annual refresher training, and whenever the high heat trigger is met.

Finally, in accordance with paragraph (j) of the proposed standard, all drinking water requirements must be implemented at no cost to employees. Accordingly, employers may not charge employees for the drinking water required by paragraph (e)(2) nor for the equipment or supplies needed to access it.

A. Requests for Comments

OSHA requests comments and information on the following:

- Whether OSHA should require a specific temperature or ranges of temperature for drinking water as some State regulations do (*e.g.*, Colorado requires that drinking water is kept 60 °F or cooler);
- Whether the agency should require the provision of electrolyte supplements/solutions in addition to water;
- Whether the requirement to provide a minimum of 1 quart per hour per employee is appropriate; and
- Whether there are any challenges to providing the required amount of drinking water (*e.g.*, for employees who work on foot in remote areas) and, if so, alternatives that OSHA should consider.

III. Break Area(s) at Outdoor Work Sites

Paragraph (e)(3) contains the proposed requirements for outdoor break areas when temperatures meet or exceed the initial heat trigger. Adequate break areas where employees can hydrate, remove PPE, and cool down is considered a vital component in preventing HRIs and necessary part of a multilayered strategy to control exposure to high heat. The requirements for both outdoor and indoor break areas in this proposed standard are in addition to employers' obligations under OSHA's sanitation standards (29 CFR 1910.141, 1915.88, 1917.127, 1918.95, 1926.51, 1928.110). Because the sanitation standards address workplace hazards other than heat exposure, employers must continue to comply with their obligations under those standards. OSHA highlights these sanitation standards because employees are likely to eat and drink water in the indoor break areas, which

may implicate certain provisions of these standards.

Specifically, proposed paragraph (e)(3) requires employers to provide one or more employee break areas at outdoor work sites that can accommodate the number of employees on break, is readily accessible to the work area(s) and has either shade (paragraph (e)(3)(i)), or air-conditioning if in an enclosed space (paragraph (e)(3)(ii)). As explained more in detail in Section V.C., Risk Reduction, shade reduces exposure to radiant heat which can contribute to heat stress and lead to heat strain and HRI. Further, air-conditioning is effective in reducing heat stress and resulting heat strain because it reduces exposure to heat. Accordingly, OSHA has preliminarily determined that requirements for break areas, including the use of controls to facilitate cooling while employees are on break, are effective at preventing HRIs among workers and should be included in the proposed standard. This determination is supported by NIOSH's criteria for a recommended standard, several State standards, and existing guidance (Cal. Code Regs. tit. 8, section 3395 (2024); 7 Colo. Code Regs. section 1103–15:3 (2023); Or. Admin. R. 437–002–0156 (2024); Or. Admin. R. 437–004–1131 (2024); Wash. Admin. Code 296–307–09747 (2023); NIOSH, 2016).

Proposed paragraph (e)(3) would require the employer to ensure the break area(s) can accommodate all employees on break. This provision is intended to ensure that all employees taking rest breaks that employers would need to provide under proposed paragraphs (e)(8) and (f)(2) are able to do so in an appropriate break area(s). If the break area cannot accommodate the number of employees on break, some employees may not have access to adequate cooling controls while on break, increasing their risk of HRIs. In addition, adequate space allows for ventilation and airflow, contributing to a more effective cooling.

While OSHA is not proposing a minimum square footage requirement per employee, break areas that can only fit the anticipated number of employees on break if employees stand shoulder to shoulder, or in such close proximity that heat cannot dissipate, would not be large enough to accommodate the number of employees on break. Break areas that are not large enough to allow employees to move in and out freely or access necessary amenities, such as water and air-conditioning or shade, would also not be considered large enough to accommodate the number of employees on break.

Proposed paragraph (e)(3) does not require that the break area(s) be able to

accommodate an employer's entire workforce at the same time. However, the employer must evaluate the needs of the work site and ensure the break area(s) is large enough to accommodate all employees reasonably expected to be on break at the same time. When making this determination, employers would need to consider factors such as how many employees are reasonably expected to be taking breaks to prevent overheating under proposed paragraph (e)(8) at any given time, as well as the breaks required under proposed paragraph (f)(2) (*e.g.*, are paragraph (f)(2) breaks staggered or will large groups of employees be taking them at the same time?). However, the minimum frequency and duration of breaks under paragraph (f)(2) must be met.

Similarly, where an employer has multiple break areas on-site, OSHA does not expect each of these multiple break areas to be able to accommodate an employer's entire workforce. Instead, OSHA expects that employers who utilize multiple break areas will determine the number of employees anticipated to access each break area and ensure the break areas are sufficient in size to accommodate the need for break space in each location. When making this determination, employers would need to consider factors such as the distribution of employees across different areas and any employee movement throughout the areas during a work shift.

OSHA also acknowledges that some employers may have facilities where both outdoor and indoor work occurs. OSHA requests comments on whether the agency should permit all employees in these facilities to utilize indoor break areas.

Proposed paragraph (e)(3) would require that break areas be readily accessible to the work area(s). It is important that break areas be readily accessible to ensure that employees can take breaks promptly, particularly in situations where employees are experiencing early symptoms of HRIs, as quick access to a break area can help limit the further progression of illness. In addition, break areas within close proximity to employees encourages use. OSHA does not expect the employer to have break areas located immediately adjacent to every employee and understands that exact distance may vary depending on factors such as the size and layout of the workplace, the number of employees, and the nature of the work being performed.

Locations that are so far from work area(s) that they deter employees from taking breaks would not be considered readily accessible. When determining

the location of the break area(s), the employer would be expected to evaluate the duration of travel to the area. Break areas requiring more than a few minutes to reach would increase the heat stress on employees as they walk to the area and thus not be considered reasonably accessible. The break area must be situated close enough to work areas to minimize the time and effort required for employees to access it. Break areas should be as close as possible to employees so that an employee in distress could easily access the area to promptly cool down. OSHA expects that employers will have incentive to place the break areas as close as practical to the work areas to minimize travel time, which must be paid (see Explanation of Proposed Requirement for paragraph (j) *Requirements implemented at no cost to employees*).

For mobile work sites, such as in road construction or utility work, the employer would be expected to relocate the break area as needed to ensure it is readily accessible to employees or ensure each work site has its own break area for use. This requirement would also apply to large work sites where employees are continually changing their work area, such as in agricultural work. The employer would be required to pay employees their normal rate of pay for time to get to the break area, as well as the time on break (see the *Explanation of the Proposed Requirements for paragraph (j)*).

In addition to ensuring the break area(s) is large enough to accommodate all employees on break and readily accessible to the work area(s), employers would have to provide at least one of the following: shade (paragraph (e)(3)(i)); or air-conditioning, if in an enclosed space (paragraph (e)(3)(ii)). As discussed above, break areas are intended to provide employees a spot to cool down and reduce body temperature. Also, controls such as shade and air-conditioning are proven methods to prevent HRIs. Without controls such as these in place, break areas could become uncomfortable and even continue to expose individuals to the risk of HRI. OSHA understands that the scope of the standard includes a broad variety of outdoor industries, and that even within one industry, workplaces can be vastly different. The proposed requirements for outdoor break areas give employers flexibility in their compliance.

Paragraph (e)(3)(i) of the proposal outlines the requirements for employers who use shade. The provision would require that the break area have artificial shade (e.g., tent, pavilion) or natural shade (e.g., trees), but not shade from

equipment, that provides blockage of direct sunlight and is open to the outside air. By incorporating shade into break areas, whether through natural foliage, awnings, or umbrellas, employees are able to reduce exposure to radiant heat and benefit from conditions that are more conducive to increasing evaporative cooling as air moves across the skin. The benefits of shaded break areas have also been recognized by several States and incorporated into State standards, including California, Colorado, Oregon, and Washington (Cal. Code Regs. tit. 8, section 3395 (2024); 7 Colo. Code Regs. section 1103–15:3 (2023); Or. Admin. R. 437–002–0156 (2024); Or. Admin. R. 437–004–1131 (2024); Wash. Admin. Code 296–307–09747 (2023)).

To ensure shade is effective, OSHA would require the shade to block direct sunlight for the break area. OSHA does not expect employers to measure shade density using shade meters or solarimeters. As defined under proposed paragraph (b) *Shade* means the blockage of direct sunlight, such that objects do not cast a shadow in the area of blocked sunlight. Therefore, verifying that employees' shadows are obstructed from being visible due to the presence of shade would be sufficient. In addition, shaded break area(s) must be open to the outside air. To satisfy this requirement, the shaded break area must be sufficiently open to the outside air to ensure that air movement across the skin (promoting the evaporation of sweat) can occur and to prevent the buildup of humidity and heat that can become trapped due to limited airflow and stagnant air. For example, a pop-up canopy with one enclosed side would comply with the provisions for a shade structure; however, a closed trailer having four sides and a roof would not. Employers could also incorporate other cooling measures, such as fans or misting devices, in their shaded break area, although the proposed standard does not require them to do so.

Both portable and fixed shade would be permitted to comply with the proposed requirements under (e)(3)(i). However, as stated above, employers must ensure shaded break areas remain readily accessible to employees. At mobile work sites or work sites where employee move to various locations throughout the day, such as, but not limited to those commonly found in agriculture, landscaping, forestry, and utility work, employers would need to ensure that shade structures are relocated near the work area as needed or that natural sources of shade (e.g., from trees) are readily available at each work location. OSHA understands that

in some mobile outdoor work environments shade structures may not be practical and employers may wish to utilize the flexibility of shade provided by large vehicles that are already on-site. Large vehicles such as trucks and vans which are used to transport employees or goods to the work site, but not as part of the work itself could be used as shade as long as the vehicle is not running. OSHA is not allowing the use of equipment used in work process, such as tractors, for shade due to the risk of accidental run-overs caused by the start-up and movement from operators who are not aware of the presence of workers nearby. Additionally, equipment used in work processes is likely to emit radiant heat after use, which may impede employee cooling. However, shade provided by buildings could be used, provided it is reasonably accessible to employee work areas. Additionally, as previously explained, the break area(s) must be large enough to accommodate all employees on break. Therefore, employers utilizing shade cast by buildings or trees would need to consider the path of shade movement throughout the day to ensure adequate areas of shade coverage are maintained and the shade is able to accommodate all employees on break.

Paragraph (e)(3)(ii) of the proposal describes the requirements for the use of air-conditioned break areas. Specifically, the proposed provision indicates that a break area could be an area that has air-conditioning if that area is in an enclosed space like a trailer, vehicle, or structure. As with the shaded areas, the air-conditioned break area would need to be large enough to accommodate the number of employees on rest breaks and be readily available. The use of air-conditioned spaces is consistent with State requirements and existing guidance. In their State regulations, both Colorado and Washington include the use of an air-conditioned site, such as a vehicle or structure, as an alternative to providing shade for employee rest breaks (7 Colo. Code Regs. section 1103–15:3 (2023); WA, 2008b; Wash. Admin. Code 296–307–09747 (2023)). It is well established that the use of air-conditioned spaces reduces the air temperature employees are exposed to (NIOSH, 2016).

Employers using air-conditioned vehicles as a break area would need to ensure that the vehicle remains readily available during work periods when the initial heat trigger is met or exceeded. For mobile employees, such as delivery drivers, employers could have employees take breaks in an air-conditioned convenience store,

restaurant, or similar establishment as long as all other requirements for break areas are met.

A. Requests for Comments

OSHA seeks comments and additional information whether it should further specify break area requirements (e.g., square footage per employee), and what those requirements should be. Also, OSHA seeks additional comments on break areas where employers have both indoor and outdoor work areas including:

- Whether OSHA should maintain separate break area requirements for these employees;
 - Whether OSHA should allow outdoor employees in these facilities to utilize indoor break areas under paragraph (e)(4); and
 - Whether OSHA should limit the use of indoor break areas to those that are equipped with air-conditioning.
- OSHA seeks comments and additional information regarding the use of shade, including:
- Whether OSHA appropriately defined shade; if not, how should OSHA define shade for outdoor break areas;
 - Whether there are situations where shade is not protective and should not be permitted; and in these cases, what should be required for break areas;
 - Whether there are additional options for shade that are protective, but which OSHA has not included;
 - Whether there are situations when trees are not appropriate for use as shade and other measures should be required;
 - Whether there are situations when employers should be permitted to use equipment as shade; in those situations, how would employers mitigate other safety concerns such as run-over incidents;
 - Whether there are situations when employers should not be able to use large vehicles as shade or concerns, including those related to safety, with generally allowing the use of large vehicles for shade; and
 - Whether there are situations when artificial shade should not be permitted, such as during high winds.

OSHA seeks comments and additional information regarding the use of air-conditioned spaces, including:

- Whether OSHA should define or specify the levels at which air-conditioning must operate; and
- Whether OSHA should require that break rooms and vehicles used for breaks be pre-cooled prior to the start of the employee's break.

OSHA seeks comments and additional information regarding the use of other cooling strategies (beside shade and air-

conditioning) that could be used in break areas, including:

- Whether there are other control options that would be both as effective as shade at reducing heat strain and feasible to implement;
- OSHA seeks comments and additional information regarding break area requirements for mobile workers:
- OSHA did not include separate requirements and seeks additional information on the feasibility and effectiveness of the proposed controls listed under paragraph (e)(3) including the use of vehicles as a break area; and
 - Whether there are control options OSHA should require for vehicles, either when used for work activities or when used as a break area.

IV. Break Area(s) at Indoor Work Sites

Paragraph (e)(4) of the proposed standard outlines the requirements for break areas at indoor work sites. Specifically, it would require that the employer provide one or more area(s) for employees to take breaks (e.g., break room) that is air-conditioned or has increased air movement and, if appropriate, de-humidification; can accommodate the number of employees on break; and is readily accessible to the work area(s). As explained above in the *Explanation of Proposed Requirements* for paragraph (e)(3), the requirements for both outdoor and indoor break areas in this proposed standard are in addition to employers' obligations under OSHA's sanitation standards (29 CFR 1910.141, 1915.88, 1917.127, 1918.95, 1926.51, 1928.110).

Information regarding compliance with the requirements that break area(s) be large enough to accommodate all employees on break and readily accessible can be found in the *Explanation of Proposed Requirements* for paragraph (e)(3). Break area(s) at indoor work sites will often likely be specific rooms in a facility (e.g., a break room). To ensure that the break areas are readily accessible, employers would need to make sure that employees can enter the break areas for heat-related breaks (e.g., keep the break room unlocked).

At indoor work sites, the break area(s) must be air-conditioned or have a combination of increased air movement and, if appropriate, de-humidification. The importance and effectiveness of air-conditioning and air movement in preventing HRIs were explained above in the *Explanation of Proposed Requirements* for paragraph (e)(3). OSHA is requiring de-humidification, if appropriate, in addition to increased air movement because humidity levels directly impact the body's ability to cool

itself through evaporation. Humidity control is integrated into modern air-conditioning units and therefore OSHA is only requiring de-humidification to be implemented in high temperature and high humidity environments when employers are relying on increased air movement to comply with this requirement. To determine when de-humidification may be appropriate in the context of fan use, employers should consult the *Explanation of Proposed Requirements* for paragraph (e)(6).

To comply with the requirements under proposed paragraph (e)(4), employers who operate in arid environments could use evaporative or "swamp" coolers as a form of air-conditioning. Note, however, that such coolers are not effective in humid environments. It is also important to note that OSHA is not requiring employers install a permanent cooling system. The use of portable air-conditioning units or high-powered fans and portable dehumidifiers in designated break areas could also be used to comply with requirements for break areas under the proposed standard. As discussed in the *Explanation of Proposed Requirements* for paragraph (e)(6), fan use when ambient temperatures exceed 102 °F has been demonstrated to be harmful under some conditions and employers must evaluate humidity levels to determine if fan use should be avoided.

Under the proposal, indoor break area(s) do not necessarily need to be located in a separate room but can be integrated within the main workspace. For example, in a manufacturing facility, there could be a designated corner or section within the main production area where employees could take their breaks. This break area could be demarcated by partitions, screens, or signage to distinguish it from the active work zones and be equipped with fans. Alternatively, an employer, who is unable to establish a break area in their main workroom because of sensitive or hazardous work equipment or processes, can establish a break area in a separate area away from the work zone, provided that area is readily accessible to employees. Regardless of where a break area is located, the break area must allow employees to cool down effectively and drink water to hydrate.

For indoor workplaces that experience temperatures above the heat triggers but have employees who spend part of their time in air-conditioned control booths or control rooms and part of their time in other, hotter areas of the facility, the employer could utilize the control booth/room as a break area and

would not need to provide a separate break area for those employees. Control booths/rooms are commonly found in industries such as manufacturing, food processing, electronics assembly, processing facilities, power plants, water treatment plants, and more. Furthermore, these spaces would qualify as break areas for other employees provided that the requirements for size and location are met. Control booths/rooms that are locked or have restricted accessibility would not be acceptable under the proposal.

A. Requests for Comments

OSHA seeks comments and additional information regarding the use of engineering controls for indoor break areas, including:

- Whether OSHA should specify how effective engineering controls need to be in cooling the break area(s), including other measures determining effectiveness beyond temperature and humidity;
- Whether OSHA should define a temperature differential between work areas and break areas; and
- Whether OSHA should specify a temperature that break areas must be kept below.

OSHA seeks comments and additional information regarding the use of other cooling strategies (besides fans and air-conditioning) that could be used in break areas, including:

- Whether there are other control options that would be both effective at reducing heat strain and feasible to implement.

OSHA did not include an option for the use of outdoor break areas for indoor work sites and seeks comment and information on the use of outdoor break areas for employees in indoor work sites, including:

- Whether there are situations where an outdoor break area could be more effective at cooling and should be permitted; and
- Whether certain conditions must be provided for these outdoor break areas.

OSHA seeks additional comments on break areas where employers have both indoor and outdoor work areas. See *Explanation of Proposed Requirements* paragraph (e)(3), *Requests for Comments*.

V. Indoor Work Area Controls

Paragraph (e)(5) contains the proposed requirements for indoor work area controls when temperatures meet or exceed the initial heat trigger. Indoor work areas would be required to be equipped with a combination of increased air movement and, if

appropriate, de-humidification (paragraph (e)(5)(i)); air-conditioning (paragraph (e)(5)(ii)); or, in the case of radiant heat sources, other cooling measures that effectively reduce employee exposure to radiant heat in the work area (paragraph (e)(5)(iii)). The importance and effectiveness of air-conditioning and air movement (including dehumidification) in preventing HRIs were explained above in the *Explanation of Proposed Requirements* for paragraphs (e)(3). In addition to these, OSHA is permitting the use of other control measures for radiant heat sources because these controls result in less heat being radiated to employees.

As discussed above in the *Explanation of Proposed Requirements* for paragraph (d)(3)(i), employers would be expected to determine which work areas of indoor work sites, if any, are reasonably expected to meet or exceed the initial heat trigger. For work areas at or above the trigger, such as those near heat-generating machinery, paragraph (e)(5) would require employers to implement work area controls. OSHA understands that effective control methods can vary based on workspace circumstances and the nature of the heat source and is therefore giving employers options regarding indoor work area controls. However, each work area with exposures at or above the initial heat trigger would need to be equipped with at least one control option. Additionally, employers could choose to use a combination of control measures.

Employers could use increased air movement (e.g., fans) and, if appropriate, de-humidification, or air-conditioning to cool the work area under paragraphs (e)(5)(i) and (ii). Under paragraph (e)(5)(i), fans could be used to increase the air movement in the work area. Employers could use overhead ceiling fans, portable floor fans, or other industrial fans to comply. Employers could also increase the air flow using natural ventilation by opening doors and windows, or vents, to allow fresh air to flow into the space, but only when doing so would be comparable to the use of fans. Natural ventilation would not be acceptable if it does not produce air movement equivalent to a fan, or if the outdoor temperature is such that natural ventilation increases the work area temperature.

Depending on the type of work being done and the location of employees in a facility, employers could choose to use ventilation to cool the entire space or just those areas where employees are present. Although paragraph (e)(5) only

applies to work areas, it may be more efficient for the employer to implement the control for an entire space. With either strategy, the employer should consider the facility layout, equipment placement, and potential obstructions to ensure optimal airflow when determining where to place fans. For example, an employer could use fans to cool a warehouse by strategically positioning them near entrances and exits to create airflow and facilitate the circulation of fresh air into the warehouse. Additionally, utilizing high-velocity fans along aisles or in areas where employees are concentrated can help dissipate heat and provide a cooling effect. Conversely, if employees only work in a discrete area(s) of a facility, an employer may choose to only provide fans in those work areas. For example, the employer could place fans in the area where employees are stationed. Adjustable fans or fans with oscillating features could be used in those areas to allow employers to direct airflow where it is most needed. Additionally, employers could consider installing overhead fans or mounting fans on adjustable stands to ensure optimal coverage and airflow distribution.

As discussed in the *Explanation of Proposed Requirements* for paragraph (e)(4), employers using fans or relying on natural ventilation in humid environments would still be expected to decrease humidity levels where appropriate. OSHA is not proposing a specific temperature or humidity level be maintained in the work areas; however, employers should ensure that the combination of air movement and humidity level effectively reduces employees' heat strain. As discussed in the *Explanation of Proposed Requirements* for paragraph (e)(6), OSHA has preliminarily determined that under some conditions, fan use may be harmful when ambient temperatures exceed 102 °F and employers must evaluate humidity levels to determine if fan use is harmful when temperatures reach this threshold. Employers should consult the *Explanation of Proposed Requirements* for paragraph (e)(6) to determine when de-humidification may be appropriate in the context of fan use.

Under paragraph (e)(5)(ii) employers could use air-conditioning to meet the requirement for controlling heat exposures in indoor work areas. In arid environments, evaporative coolers, also known as "swamp coolers," could be used and would be considered air-conditioners, even if portable. It is important to note that while an employer may choose to provide air-conditioning to the entire facility, they

would not be required to do so under the proposed standard. Employers who choose to provide air-conditioning under paragraph (e)(5)(ii) would only need to implement it in areas where employees work and are exposed to temperatures above the initial heat trigger. Similar to fan use, if employees only work from fixed or designated locations in the workplace, the employer would only need to provide air-conditioning to those spaces under paragraph (e)(5)(ii). For example, if employees work only from a control booth or control room, employers could choose to install air-conditioning in the control booth or control room to comply with paragraph (e)(5)(ii). Similarly, portable air-conditioning units could be used throughout the facility to cool smaller areas where employees work. For example, an employer could position portable evaporative coolers near the entrance of a loading dock to provide immediate relief from the heat when an employee is loading or unloading goods inside the building, or a machine shop may choose to use portable air-conditioners around the workstation to cool the employee. Alternatively, a manufacturing facility may choose to install a small, air-conditioned control booth for operators to work from. All of these options would be acceptable under the proposal.

Under paragraph (e)(5)(iii), in indoor work areas with radiant heat sources, employers could choose to implement other measures that effectively reduce employee exposure to radiant heat in the workplace. Paragraph (e)(5)(iii) would allow the use of controls such as shielding or barriers, isolation, or other measures that effectively reduce employee exposure to radiant heat, in areas where employees are exposed to radiant heat created by heat-generating processes. The use of control methods for radiant heat is consistent with guidance issued by Minnesota regarding the implementation of their heat standard (MNOSHA, 2009). Options for complying with this proposed provision

could include installing shielding or barriers that are radiant-reflecting to reduce the amount of radiant heat to which employees would otherwise be exposed; isolating the source of radiant heat, such as using thermal insulation on hot pipes and surfaces; increasing the distance between employees and the heat source; and modifying the hot process or operation.

If the employer chooses to utilize radiant heat controls under paragraph (e)(5)(iii) in lieu of air-conditioning or fan use, the controls would need to effectively reduce employee exposure to radiant heat. For example, in facilities with industrial ovens, kilns, or process heat, employees may be exposed to radiant heat during loading, unloading, or maintenance tasks. Installing shielding around these heat sources can help protect employees from radiant heat during these tasks. In another example, an employer may choose to install heat-resistant barriers or insulating materials around welding stations to contain heat and prevent its transmission to adjacent work areas.

A. Requests for Comments

OSHA seeks comments and additional information regarding the use of engineering controls for indoor work areas, including:

- Whether the standard should specify how effective engineering controls need to be in cooling the work area(s);
- Whether there are other control options (besides fan use or air-conditioning) that would be both effective at reducing heat strain and feasible to implement in cases where indoor employees are exposed to ambient heat; and
- Whether there are work areas where maintaining a high ambient temperature is necessary for the work process and, if so, how OSHA should address these work areas in the standard.

VI. Evaluation of Fan Use

Paragraph (e)(6) of the proposed standard would require employers using fans under certain conditions to determine if fan use is harmful. Specifically, when ambient temperatures exceed 102 °F (39.0 °C), employers using fans to comply with paragraphs (e)(4) or (5) would be required to evaluate the humidity levels at the work site and discontinue the use of fans if the employer determines that fan use is harmful.

As discussed in Section V.C., Risk Reduction, researchers in the past 10 years have increasingly evaluated the conditions under which fan use becomes harmful, using both experimental and modeling approaches. Most of this work has assumed individuals are seated and at rest; to OSHA's knowledge, only one paper has evaluated the threshold at which fans become harmful for individuals performing physical work (Foster et al., 2022a). The impact of fans is determined by both air temperature and humidity, as well as factors influencing sweat rates. Researchers have demonstrated that neither heat index nor ambient temperature alone can be used to determine beneficial versus harmful fan use; instead, ambient temperature and relative humidity must both be known (Morris NB et al., 2019; Foster et al., 2022a).

The 102 °F threshold in proposed paragraph (e)(6) is derived from Figure 4 of Foster et al. 2022a and represents the lowest ambient temperature at which fan use has been demonstrated to be harmful in the researchers' model. As proposed, paragraph (e)(6) does not specify how employers must make the determination whether fan use is harmful above this threshold. However, using the other results from Figure 4 of Foster et al. 2022a, OSHA has developed the following table which identifies scenarios where the agency believes fan use would or would not be harmful:

Fan speed: 3.5 m/s		
Ambient temperature	Humidity range: fan use allowed	Humidity range: turn off fans
102.2 °F (39 °C)	15–85%	<15% or >85%.
104.0 °F (40 °C)	20–80%	<20% or >80%.
105.8 °F (41 °C)	30–65%	<30% or >65%.
107.6 °F (42 °C)	30–65%	<30% or >65%.
109.4 °F (43 °C)	35–60%	<35% or >60%.
111.2 °F (44 °C)	35–55%	<35% or >55%.
113.0 °F (45 °C)	40–55%	<40% or >55%.
>113.0 °F (>45 °C)	Discontinue all fan use	Discontinue all fan use.

Using the information from this table, an employer could identify the row most closely matching the ambient temperature of the work or break area and then find the corresponding humidity range for when fans are acceptable to use. For example, if the ambient temperature of the work or break area is 104 °F and the relative humidity is 50%, fans could be used. However, if the ambient temperature of the work or break area is 108 °F and the relative humidity is 70%, fans should not be used.

A. Requests for Comments

OSHA recognizes that there are several limitations with the analyses by Foster et al. 2022a, and the application of those results for this purpose. For one, the model results reported by Foster et al. assume “light clothing” only and not “work clothing,” which would be more similar to a typical work uniform than the “light clothing.” While the empirical evidence that the researchers collected on individuals wearing “work clothing” is largely consistent with the modeled results presented for “light clothing,” there are some differences, such as the finding that fans are never beneficial at or above an ambient temperature of 45 °C (113.0 °F) when wearing “work clothing” (which OSHA has reflected in the table). The authors’ recommendations for fan use also included a category that represented scenarios in which fans have a “minimal impact” (*i.e.*, the effect of fans on body heat storage is close to zero). OSHA has combined this category with the category for scenarios in which fans are beneficial to produce the table above. Another limitation is the assumption of a sweat rate of approximately 1 liter per hour (the group average from empirical trials in the same study). However, factors such as acclimatization status, age, and medical history can influence sweat rates, which would influence when fan use is beneficial (see Figure 6 [panels a and b] from Foster et al., 2022a). Finally, Foster et al. tested a fan with a velocity of 3.5 meters per second. OSHA has preliminarily determined that this is a reasonable assumption but acknowledges that varying wind velocity would also influence when fan use is beneficial (see Figure 6 [panel c] from Foster et al., 2022a).

OSHA understands the complexity and uncertainty around an evaluation of fan use and is therefore considering a simplified approach for employers to use. OSHA is requesting comments on this simplified approach and the assumptions underlying it.

More specifically, OSHA requests comments regarding its preliminary determinations on fan use and seeks the following information:

- Whether OSHA has appropriately derived recommendations for fan use from Foster et al., 2022a, and whether additional data or research should be used to supplement or revise the recommendations;
- Whether OSHA should include the above table derived from Foster et al., 2022a, or a similar table, in paragraph (e)(6), either as a mandatory requirement or as a compliance option; and,
- Whether the standard should require alternative methods for cooling employees when fans are harmful, and if so, what alternative control measures should be used.

VII. Acclimatization

Paragraph (e)(7) of the proposed standard would establish requirements to protect new and returning employees who are not acclimatized. Evidence indicates that new and returning employees are at increased risk for HRIs. As explained in Section V.C., Risk Reduction, employees who are new on the job are often overrepresented in HRI and heat-related fatality reports. Additionally, the NACOSH Heat Injury and Illness Prevention Work Group recommended acclimatization protections for new and returning employees, such as heightened monitoring (NACOSH Working Group on Heat, 2023), and NIOSH recommends an acclimatization plan that gradually increases new employees’ work in the heat starting with 20% of the usual work duration and increasing by no more than 20% on each subsequent day (NIOSH, 2016). For returning employees, NIOSH recommends an acclimatization plan that starts with no more than 50% of the usual work duration of heat exposure that then gradually increases on each subsequent day (NIOSH, 2016). Therefore, OSHA has preliminarily determined that the requirements in paragraph (e)(7) are important for preventing HRIs and fatalities from occupational heat exposures among these employees.

Proposed paragraph (e)(7)(i) would require that employers implement one of two options for an acclimatization protocol for new employees during their first week on the job. The first option that an employer may choose, under proposed paragraph (e)(7)(i)(A) (Option A), is a plan that, at a minimum, includes the measures required at the high heat trigger set forth in paragraph (f), when the heat index is at or above the initial heat trigger during the

employee’s first week of work. Proposed paragraph (f)(2) requires a minimum 15-minute paid rest break at least every two hours in the break area that meets the requirements of the proposed standard, proposed paragraph (f)(3) requires observation for signs and symptoms of heat-related illness, and proposed paragraph (f)(4) requires providing hazard alerts with specified information about heat illness prevention and how to seek help if needed. See the *Explanation of Proposed Requirements* for paragraph (f), *Requirements at the high heat trigger*, for a detailed explanation of the requirements of that section. Option A gives employers flexibility to choose an option that works best for their work site while still making sure that employees are informed, are under observation, and receive breaks, all of which will help better equip employers and employees to monitor and mitigate the effects of heat exposure in situations where the gradual acclimatization option may not be practical. While this option does not require gradual exposure, OSHA believes that, in situations where gradual exposure may not be practical, rest breaks, observation, and hazard alerts will help protect new workers as they adjust to heat during their first week of work.

The second option that an employer may choose, under proposed paragraph (e)(7)(i)(B) (Option B), would require a gradual exposure to the heat at or above the initial heat trigger to allow for acclimatization to the heat conditions of the workplace. The gradual exposure protocol would involve restricting employee exposure to heat to no more than 20% of a normal work shift exposure duration on the first day of work and increasing exposure by 20% of the work shift exposure duration on each subsequent day from day 2 through 4. This is consistent with NIOSH’s recommended acclimatization plan for new employees (NIOSH, 2016).

Employers may satisfy Option B requirements by utilizing some of the employees’ work time in ways that do not require exposure to heat at or above the initial heat trigger. Examples include completing training activities or filling out work-related paperwork in an air-conditioned building. Employers may also fulfill this requirement through task replacement, whereby an employee completes another necessary task in an area that does not require exposure to heat at or above the initial heat trigger (*e.g.*, office work).

Additionally, if the temperature of the work site fluctuates such that the initial heat trigger is only exceeded for a portion (*e.g.*, 2 hours) of the work shift

on some or all of the days during the initial week of work, employers choosing Option A would only be required to implement the requirements of paragraph (f) during those time periods. If they choose the gradual heat exposure option for acclimatization, employers would need to coordinate the employees' heat exposure for those days with the parts of the day that are expected to meet or exceed the initial heat trigger.

Under proposed paragraph (j), employers would be required to implement the acclimatization protocols at no cost to employees. This means that employers could not relieve employees from duty after the allotted time of heat exposure under the acclimatization protocol and not pay them for the remainder of the work shift. Because benefits would also be considered compensation, this would mean that an employer could not use an employee's paid leave to cover the hours not worked during the acclimatization period.

Proposed paragraph (e)(7)(ii) would require that employers implement one of two options for an acclimatization protocol for returning employees who have been away from the job for more than 14 days, during their first week back on the job.

The first option that an employer may choose, under proposed paragraph (e)(7)(ii)(A) (Option A), is an employer-developed plan, that at a minimum, includes the measures that would be required under proposed paragraph (f) whenever the initial heat trigger is met or exceeded, during the employee's first week of returning to work. See explanation above for new employees and the *Explanation of Proposed Requirements* for paragraph (f), *Requirements at the High Heat Trigger*, of the proposed standard for a detailed explanation of the requirements of that section.

The second option that an employer may choose under proposed paragraph (e)(7)(ii)(B) (Option B), is a protocol that requires a gradual exposure to heat at or above the initial heat trigger to allow for acclimatization to the heat conditions of the workplace. The gradual exposure protocol would restrict employee exposure to heat to no more than 50% of a normal work shift exposure duration on the first day of work, 60% on the second day of work, and 80% of the third day of work. This is consistent with NIOSH's recommended acclimatization plan for returning employees (NIOSH, 2016). Employers may satisfy these requirements by utilizing employees' work time in ways that do not require heat exposure at or

above the initial heat trigger, as described above for new employees.

For occupations where returning employees may have shift schedules such as two weeks on and then two weeks off, the acclimatization protocol requirement would not go into effect because the two weeks off would not exceed 14 days. However, in situations where time off exceeds 14 days, the requirement would apply.

Proposed paragraph (e)(7)(iii) would set forth an exception to acclimatization requirements of paragraphs (e)(7)(i) and (ii) if the employer can demonstrate that the employee consistently worked under the same or similar conditions as the employer's working conditions within the previous 14 days. Same or similar conditions means that new employees must have been doing work tasks that are similar or higher in level of exertion to the tasks that are required in the new job and that they conducted these tasks in similar or hotter heat conditions than the new job (e.g., at or above the heat index for current conditions in the new job). Employers should not assume that employees who recently came from climates that are perceived to be similar or hotter (e.g., Mexico) were actually exposed to similar or hotter conditions because climate can vary dramatically based on factors such as elevation levels and humidity. Therefore, employers could check weather records to determine heat indices for the location that the employee worked at during the previous two weeks to determine if the employee was actually exposed to conditions at least as hot as in the new position.

In determining if tasks the employee conducted in the past two weeks were similar or higher in level of exertion to the tasks that are required in the new job, employers could generally consider factors such as weight carried and intensity of activity (e.g., walking versus climbing). For example, picking tomatoes and picking watermelons would generally not be considered similar tasks because of the heavier weight of the watermelons. However, picking tomatoes and picking cucumbers could generally be considered similar tasks if other job conditions are similar. Installing telephone wires on poles and laying out communication wires in a trench dug using machinery would generally not be considered similar to laying out communication wires in a trench dug manually because of the greater work intensity involved with digging a trench manually. Laying communication wire in a pre-dug trench and conducting inspections on the ground might be considered similar tasks if both tasks

primarily involve walking. Landscaping work involving weeding and laying out mulch versus hand digging trenches for drainage systems would generally not be considered similar tasks because of the greater work involved in digging trenches. However, hand digging trenches for drainage and hand digging holes to install trees and shrubs could generally be considered similar tasks if those are the primary tasks performed throughout the workday.

The employee must have engaged in similar work activities in the similar heat conditions consistently over the preceding 14 days. OSHA intends "consistently" to mean the employee engaged in the task for at least two hours per day on a majority of the preceding 14 days. This aligns with recommendations from NIOSH (NIOSH, 2016).

Examples of when this exception would not apply include when new employees' previous positions, which included similar heat conditions and exertion levels, ended longer than 14 days ago, when new employees' previous positions ended within the last 14 days and involved similar work tasks but in cooler conditions, or when new employees' previous positions ended within the last 14 days and involved hotter conditions but less exertion. The exemption would also not apply if new employees' previous positions ended less than 14 days ago but they were not performing similar work tasks in similar heat conditions for at least two hours per day on a majority of the preceding 14 days.

To demonstrate that a new employee consistently worked under the same or similar conditions as the employer's working conditions within the prior 14 days, the employer could obtain information directly from the new employee to confirm the requirements of proposed paragraph (e)(7) are met considering the explanation of same or similar working conditions provided above. The employer could ask questions verbally or in writing about the prior work (i.e., timing, location, duration, type of work). If an employer asked new employees "in the past 14 days, did you consistently work under the same or similar conditions as the employer" but did not ask for any supporting details, the requirement would not be satisfied.

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Data or examples of successful implementation of an acclimatization program;

- Whether the term “same or similar conditions” is sufficiently clear so that employers know when the exception to the acclimatization requirement would apply for new employees, and if not, how should OSHA clarify the requirement;
 - Whether a minimum amount of heat exposure to achieve acclimatization should be specified under Option B, the gradual acclimatization option;
 - Whether the requirement to demonstrate that an employee consistently worked under the same or similar conditions as the employer’s working conditions within the prior 14 days is sufficiently clear, and if not, how should OSHA clarify the requirement;
 - Whether the standard should require acclimatization protocols during local heat waves, and if so, how OSHA should define heat waves;
 - Whether the standard should require annual acclimatization of all employees at the beginning of each heat season (*e.g.*, the first hot week of the year) and approaches for doing so;
 - Examples that OSHA should consider of acclimatization protocols for industries or occupations where it may not be appropriate for an employee to conduct heat-exposed work tasks during the first week on the job (*e.g.*, what activities would be appropriate for these workers to achieve acclimatization);
 - Data or examples that OSHA should consider in determining if acclimatization should be required in certain situations for existing employees and examples of successful acclimatization programs for such employees;
 - Which option (*i.e.*, following requirements of the high heat trigger or gradual increase in exposure to work in heat) presented in the proposal would employers implement and whether the standard should include other options;
 - Whether the standard should include any additional acclimatization requirements for employees returning after less than 14 days away from work after acute illnesses that may put them at increased risk of heat-related illness (*i.e.*, illnesses involving fever or gastrointestinal infections), and if so, suggestions and evidence for the additional requirements; and
 - Considering that employees starting or returning when the heat index is above 90 °F would not receive unique acclimatization benefits if the employer chose Option A, whether the standard should specify additional requirements for these scenarios, such as breaks that are more frequent or of longer duration.
- OSHA has concerns that the proposed exception in paragraph (e)(7)(iii) could

create incentives for employees to lie and/or employers to pressure employees to lie about their acclimatization status. For example, an employer could pressure an employee to report that they consistently worked under the same or similar conditions within the prior 14 days, so that the employer does not need to comply with paragraph (e)(7) during the employee’s first week on the job. These incentives could put new and returning employees at increased risk because they are not receiving appropriate protection based on their acclimatization status. OSHA seeks comments and evidence on the likelihood of this happening and what OSHA could do to address these potential troubling incentives.

VIII. Rest Breaks if Needed

Proposed paragraph (e)(8) would require employers to allow and encourage employees to take paid rest breaks in break areas that would be required under paragraphs (e)(3) or (4) if needed to prevent overheating. As discussed in Section V.C., Risk Reduction, rest breaks have been shown to be an effective intervention for preventing HRI by allowing employees to reduce their work rate and body temperature. Rest breaks allow employees time to hydrate and cool down in areas that are shaded, air-conditioned, or cooled with other measures. Therefore, OSHA preliminary finds that allowing employees to take rest breaks when they are needed to prevent overheating is an important control for preventing or reducing HRIs in the workplace.

Providing employees the opportunity to take unscheduled rest breaks to prevent overheating helps to account for protecting employees who vary in susceptibility to HRI and address scenarios where employees might experience increased heat strain. For example, unscheduled rest breaks may help to protect employees who are more susceptible to HRI for reasons such as chronic health conditions, recent recovery from illness, pregnancy, prior heat-related illness, or use of certain medications (see Section IV.O., Factors that Affect Risk for Heat-Related Health Effects). Unscheduled rest breaks may also help reduce heat strain in employees who are assigned new job tasks that are more strenuous than the tasks they were performing. Additionally, rest breaks would allow employees an opportunity to remove any PPE that may be contributing to heat strain.

Under proposed paragraph (e)(8), employees would be allowed to decide on the timing and frequency of

unscheduled rest breaks to prevent overheating. However, unscheduled rest breaks must be heat-related (*i.e.*, only if needed to prevent overheating). In addition, if the work process is such that allowing employees to leave their work station at their election would present a hazard to the employee or others, or if it would result in harm to the employer’s equipment or product, the employer could require the employee to notify a supervisor and wait to be relieved, provided a supervisor is immediately available and relieves the employee as quickly as possible.

An example of a scenario where an employee may decide they need a rest break is if the employee experiences certain symptoms that suggests the employee is suffering from excessive heat strain but does not have an HRI that would need to be addressed under proposed paragraph (g)(2) (*e.g.*, excessive thirst, excessive sweating, or a general feeling of unwellness that the employee attributes to heat exposure). However, rest breaks to prevent overheating do not need to be tied to onset of symptoms. For example, if an employee starts to have trouble performing a task on a hot day that they do not normally have trouble performing, that may be a sign they need a break. OSHA expects that most unscheduled rest breaks to prevent overheating would typically last less than 15 minutes. In some cases, a rest break that extends beyond 15 minutes or frequent unscheduled rest breaks may be a sign that the employee may be experiencing an HRI.

As noted, proposed paragraph (e)(8) requires employers to both encourage and allow employees to take a paid rest break if needed. Employers can encourage employees to take rest breaks by periodically reminding them of that option. Although employers must allow employees to take breaks if the employee determines one is needed, nothing precludes an employer from asking or directing an employee to take an unscheduled paid rest break if the employer notices signs of excessive heat strain in an employee.

Slowing the pace of work would not be considered a rest break, and as specified in proposed paragraph (e)(8), rest breaks if needed must be provided in break areas required under paragraph (e)(3) or (4) (see *Explanation of Proposed Requirements* for paragraphs (e)(3), *Break area(s) at outdoor work sites* and (e)(4), *Break area(s) at indoor work sites* for additional discussion of break areas and *Explanation of Proposed Requirements* for paragraph

(f)(2), *Rest breaks*, for additional discussion related to rest breaks.)

Proposed paragraph (e)(8) would require that employees be paid during the time they take rest breaks needed to prevent overheating. OSHA preliminary finds it is important that these breaks be paid so that employees are not discouraged from taking them. The reason for requiring these breaks be paid is further explained in the *Explanation of Proposed Requirements* for paragraph (j), *Requirements implemented at no cost to employees*, including the importance of the requirement and how employers can ensure that employees are compensated to ensure they are not financially penalized for taking breaks that would be allowed or required under the proposed standard.

Evidence indicates that employees are often reluctant to take breaks and thus, are not likely to abuse the right to take rest breaks if needed to prevent overheating; to the contrary, the evidence shows that employees are more likely to continue working when they should take a rest break to prevent overheating. A review of the evidence showing that many employees are reluctant to take rest breaks is included in the *Explanation of Proposed Requirements* for paragraph (f)(2) *Rest breaks*.

A. Requests for Comments

OSHA seeks comments and information on the proposed requirement to provide employees with rest breaks if needed to prevent overheating, including:

- If there are specific signs or symptoms that indicate employees need a rest break to prevent overheating;
- If employers currently offer rest breaks if needed to prevent overheating, and if so, whether employees take rest breaks when needed to prevent overheating;
- The typical duration of needed rest breaks taken to prevent overheating; and
- Any challenges to providing rest breaks if needed to prevent overheating.

In addition, OSHA encourages stakeholders to provide information and comments on the questions regarding compensation of employees during rest breaks in the *Explanation of Proposed Requirements* for paragraph (j), *Requirements implemented at no cost to employees*.

IX. Effective Communication

Paragraph (e)(9) of the proposed standard establishes requirements for effective communication at the initial heat trigger. Early detection and treatment of heat-related illness is critical to preventing the development

of potentially fatal heat-related conditions, such as heat stroke (see Section V., Health Effects). Effective two-way communication provides a mechanism for education and notification of heat-related hazards so that appropriate precautions can be taken. It also provides a way for employees to communicate with the employer about signs and symptoms of heat-related illness, as well as appropriate response measures (e.g., first aid, emergency response).

The NACOSH Heat Injury and Illness Prevention Work Group recommended that elements of a proposed standard for prevention of HRIs address communication needs to meet the objective of monitoring the work site to accurately assess conditions and apply controls based on those conditions. The Work Group recommended addressing communications needs for tracking to facilitate monitoring and check-ins so that employees can report back to employers (NACOSH Working Group on Heat, 2023).

OSHA preliminarily finds that two-way, regular communication is a critical element of HRI prevention. Paragraph (e)(9) requires the employer maintain effective, two-way communication with employees and regularly communicate with employees. The means of communication must be effective. In some cases, voice (or hand signals) may be effective, but if that is not effective at a particular workplace (e.g., if employees are not close together and/or not near a supervisor), then electronic means may be needed to maintain effective communication (e.g., handheld transceiver, phone, or radio). If the employer is communicating with employees by electronic means, the employer must respond in a timely manner for communication to be effective (e.g., providing a phone number for employees to call would not be effective if no one answers or responds in a timely manner).

The means of communication must also be “two-way” (i.e., a way for the employer to communicate with employees, and for employees to communicate with the employer). This is important because this provides a means for employees to reach the employer when someone is exhibiting the signs and symptoms of heat-related illness.

Paragraph (e)(9) also requires that employers regularly communicate with employees. The employer could comply with this requirement by regularly reaching out to employees, or setting up a system by which employees are required to make contact, or check in, with the employer. However, it is the

employer’s responsibility to ensure that regular communication is maintained with employees (e.g., every few hours). If a system is chosen whereby the employer requires employees to initiate communication with the employer, and if the employer does not hear from the employee in a reasonable amount of time, the employer must reach out to the employee to ensure that they are not experiencing heat-related illness symptoms. Employers must ensure that when it is necessary for an employee to leave a message (e.g., text) with the employer, the employer will respond, if necessary, in a reasonable amount of time.

This proposed requirement also applies for employees who work alone on the work site. This means that the communication system chosen by the employer must allow for communication between these employees and the employer, although the means may be different than for employees who work on a work site with multiple employees (e.g., by electronic means).

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- How employers currently communicate with employees working alone, including any challenges for effectively communicating with employees working alone and any situations where communication with employees working alone may not be feasible; and
- Whether OSHA should specify a specific time interval at which employers must communicate with employees and, if so, what the interval should be, and the basis for such a requirement.

X. Personal Protective Equipment (PPE)

Paragraph (e)(10) of the proposed standard would require employers to maintain the cooling properties of cooling PPE if provided to employees. The proposed standard does not require employers to provide employees with cooling PPE. However, if employers do provide cooling PPE, they must ensure the PPE’s cooling properties are maintained at all times during use. It is critical that employers who provide cooling PPE maintain the equipment’s cooling properties; when these properties are not maintained, the defective equipment can heighten the risk of heat injury or illness with continued use. Reports from employees indicate that the use of cooling PPE, such as cooling vests, is burdensome and increases heat retention once the

cooling properties are lost or ice packs have melted (Chicas et al., 2021).

A. Requests for Comments

OSHA requests comments and evidence as to whether there are any scenarios in which wearing cooling PPE is warranted and feasible and OSHA should require its use.

F. Paragraph (f) Requirements at or Above the High Heat Trigger

I. Timing

Paragraph (f) of the proposed standard would establish requirements when employees are exposed to heat at or above the high heat trigger. As discussed in Section V.B., Basis for Initial and High Heat Triggers, OSHA has preliminarily determined that the experimental and observational evidence support that heat index triggers of 80 °F and 90 °F are highly sensitive and therefore highly protective of employees. Exposures at or above the high heat trigger, a heat index of 90 °F, or a corresponding wet bulb globe temperature equal to the NIOSH Recommended Exposure Limit, would require the employer to provide the protections outlined in paragraphs (f)(2) through (5). These protections would be in addition to the measures required by paragraph (e) *Requirements at or above the initial heat trigger*, which remain in effect after the high heat trigger is met.

The employer would only be required to provide the protections specified in paragraph (f) during the time period when employees are exposed to heat at or above the high heat trigger. In many cases, employees may only be exposed at or above the high heat trigger for part of their work shift. For example, employees may begin work at 9 a.m. and finish work at 5 p.m. If their exposure is below the high heat trigger from 9 a.m. until 2 p.m., and at or above the high heat trigger from 2 p.m. to 5 p.m., the employer would only be required to provide the protections specified in this paragraph from 2 p.m. to 5 p.m. Protective measures outlined in paragraph (e) *Requirements at or above the initial heat trigger*, would be required at any time when employees are exposed to heat at or above the initial heat trigger.

II. Rest Breaks

Proposed paragraph (f)(2) specifies the minimum frequency and duration for rest breaks that would be required (*i.e.*, 15 minutes every two hours) when the high heat trigger is met or exceeded and provides clarification on requirements for those rest breaks.

A. Background on the Provision

As discussed in Section V.C., Risk Reduction, rest breaks have been shown to be an effective intervention for preventing HRI by allowing employees to reduce their work rate and body temperature. Rest breaks also allow employees time to hydrate and cool down in areas that are shaded, air-conditioned, or cooled with other measures. OSHA preliminarily finds there are at least two reasons that warrant the inclusion of rest breaks at a minimum frequency and duration when the high heat trigger is met or exceeded. The first is that heat strain is greater in employees exposed to higher levels of heat. (See Section IV., Health Effects).

The second is that the available evidence shows many employees are not taking adequate or enough rest breaks. This evidence shows that while workers paid on a piece-rate basis (*e.g.*, compensated based on factors such as quantity of produce picked, jobs completed, or products produced) may be especially reluctant to take breaks because of financial concerns (Lam et al., 2013; Mizelle et al., 2022; Iglesias-Rios et al., 2023; Spector et al., 2015; Wadsworth et al., 2019), a significant portion of employees paid on an hourly basis are also not taking adequate breaks for other reasons such as pressure from co-workers or supervisors, high work demands, or attitudes related to work ethics (Arnold et al., 2020; Wadsworth et al., 2019). For example, Langer et al. (2021) surveyed 507 Latinx California farmworkers (77% paid hourly) during the summers of 2014 and 2015, when California regulations to protect employees from heat required employers to provide rest breaks if needed but did not require rest breaks at a minimum frequency and duration; 39% of surveyed employees reported taking fewer than 2 rest breaks (not including lunch) per day. Additionally, in a study of 165 legally employed child Latinx farm employees (64% hourly workers) ranging in age from 10–17 years in North Carolina, 88% reported taking breaks in shade, but based on some interviews, the breaks appeared to be of short duration (*e.g.*, “for some five minutes;” “you can take a break whenever you want . . . not for a long time . . . if you wanna get a drink of water only for a couple of minutes, three or five”) (Arnold et al., 2020). The children who were interviewed by Arnold et al. (2020) reported pressure to keep up with the pace of work and being discouraged to take breaks by co-workers or supervisors. In interviews of 405 migrant farmworkers in Georgia,

20% reported taking breaks in the shade (Fleischer et al., 2013).

In a study of 101 farmworkers (61% paid hourly) in the Florida/Georgia region, Luque et al. (2020) reported that only 23% took breaks in the shade. The need for breaks was supported by observations that while some employees carried water bottles, most were only seen drinking during rest breaks. In another study, focus group discussions with piece-rate farm employees revealed that many expressed concerns about possible losses in earnings and that they might be replaced by another employee if they took breaks. Many such employees brought their own water to work to reduce the time they are not picking produce (Wadsworth et al., 2019). In that same study by Wadsworth et al. (2019), piece rate farmworkers also described “their desire to be seen as a good worker, with great fortitude.” Good workers were described by the farmworkers as those who “work fast and do not slow things down and jeopardize success for the group. They continue working in spite of the conditions or how they feel.” (Wadsworth et al., 2019, p. 224). A case study highlighted in the NIOSH criteria document discusses a migrant farmworker who died from HRI after he continued to work despite a supervisor instructing him to take a break because he was working slowly (NIOSH 2016, pp. 46–47). On the day of his death, the heat index ranged from 86 to 112 °F.

Evidence supporting the need for required rest breaks is not limited to farmworkers. For example, a NIOSH health hazard evaluation (HHE) indicated that truck drivers for an airline catering facility often skipped breaks they were allowed to take between deliveries in an air-conditioned room at the catering facility to keep up with job demands (NIOSH, 2016, p. 44). Such attitudes appear common in employees of all sectors. Phan and Beck (2023) surveyed 107 office workers, and 25–33% of those employees reported they skipped breaks because of a high workload, not wanting to lose momentum, or to reduce the amount of work to be completed in the future. A number of informal surveys reported similar findings for office and remote workers. In those surveys, many employees (approximately 40%) skip some breaks, particularly lunch breaks (Tork, June 14, 2021; Joblist, July 5, 2022). Common reasons for skipping lunch breaks included work demands and feelings of guilt or being judged for taking a break (Tork, June 14, 2021; Joblist, July 5, 2022). One survey also reported that a major reason why many employees do not take paid time off is

because of concerns for coworkers (Joblist, July 5, 2022). Although these informal surveys cover employees who would likely not be covered by the scope of this proposed standard, these informal surveys echo the findings of the studies in the preceding paragraphs and show that employees generally do not take rest breaks or other paid time off.

Studies of presenteeism (*i.e.*, working while ill or injured) suggest that employees may be more likely to ignore signs of excessive heat strain than they are to take breaks needed to prevent overheating. Hemp (October 2004, pp. 3–4) stated “[u]nderlying the research of presenteeism is the assumption that employees do not take their jobs lightly, that most of them need and want to continue working if they can.” Although financial reasons such as lack of paid leave are often drivers of presenteeism, non-financial considerations also play a major role. One study analyzed presenteeism in many of the industries covered by the proposed standard including in the categories of agriculture, utilities, manufacturing, transportation and storage, and construction (Marklund et al., 2021). Non-financially related reasons for presenteeism reported by Marklund et al. (2021) were not wanting to burden coworkers, perception that no one else can do the work, enjoyment of work, not wanting to be perceived as lazy or unproductive, and pride. Similar reasons were reported in other studies including wanting to spare co-workers from additional work, pressure from coworkers, strong teamwork and good relationships with coworkers, examples set by management, institutional loyalty, or a perception that taking time off is underperformance (Garrow, February 2016; Lohaus et al., 2022).

The proposed requirement to include mandatory rest breaks is consistent with recommendations by authoritative sources. For example, NIOSH recommends mandatory rest breaks (NIOSH, 2016, p. 45; NIOSH, 2017b, p.1). Additionally, ACGIH (2023) lists “appropriate breaks with shade” as an essential element of a heat stress management program. The NACOSH Working Group on Heat also recommended that scheduled, mandatory rest breaks be provided without retaliation (NACOSH Working Group on Heat, 2023, pp. 6–7).

OSHA examined a number of studies to determine an appropriate frequency and duration of rest breaks. First, a series of laboratory studies by Notley et al. (2021; 2022a, b) provide insight on the appropriate frequency of rest breaks. In those studies, unacclimatized

participants wearing a single clothing layer exercised at a moderate intensity level until stay time was reached (*i.e.*, core temperatures reached 38 °C (100.4 °F) or increased by at least 1 °C) at various ambient temperatures and at a relative humidity of 35% (Notley et al., 2021; 2022a, b).¹ In a study of younger (18–30 years old) and older men (50–70 years old), data from all participants were pooled to calculate initial stay times of 111 minutes at ambient conditions of 34.1 °C (93.4 °F) (heat index = 93.9 °F) and 44 minutes at ambient conditions of 41.4 °C (106.5 °F) (heat index = 119.8 °F) (Notley et al., 2022b). In a study of unacclimatized younger men (mean age 22 years), older men (mean age 58 years), and older men with diabetes (mean age 60 years) or hypertension (mean age 61 years), median stay times were 128 minutes at 36.6 °C (97.9 °F) (heat index = 101.5 °F) and 68 minutes at 41.1 °C (106.5 °F) (heat index = 118.5 °F) (Notley et al., 2021). In a third study, unacclimatized men and women were able to work for a median time of 117 minutes at 36.6 °C (97.9 °F) (heat index = 101.5 °F) and 63 minutes at 41.4 °C (106.5 °F) (heat index = 119.8 °F) (Notley et al., 2022a). Overall, the results of these studies support work times ranging from 111 minutes to 128 minutes at heat indices of 93.9 °F to 101.5 °F and 44 to 68 minutes at heat indices of 118.5 °F to 119.8 °F.

Two laboratory studies support a preliminary conclusion that rest breaks contribute to the protection of workers from the effects of heat (Uchiyama et al., 2022; Smallcombe et al., 2022). These studies were conducted over periods that could represent all or part of a workday, with light exertion exercise conducted under hot conditions (*e.g.*, 37 °C (98.6 °F) and 40% relative humidity (heat index = 106 °F)) in Uchiyama et al. (2022), and moderate to heavy exertion exercise conducted under four conditions: 15 °C (59 °F) and 50% relative humidity (referent group, heat index not relevant), 35 °C (95 °F) 50% relative humidity (heat index = 105 °F); 40 °C (104 °F) and 50% relative humidity (heat index = 131 °F); and 40 °C (104 °F), and 70% relative humidity (heat index=161 °F) in Smallcombe et al. (2022). In both studies, breaks were provided in air-conditioned or cooler areas. The studies show little evidence of excessive heat strain in participants as mean core temperatures remained within 1 °C of 37.5 °C (99.5 °C) (ACGIH, 2023, p. 244). Uchiyama et al. (2022) evaluated two work/rest protocols, including one in which participants exercised for 1 hour,

rested for 30 minutes, exercised for 1 hour, rested for 15 minutes, and then exercised for another hour; increases in mean core temperatures were less than 1 °C above mean baseline temperature (37.2 °C) in five of the six time points reported and slightly exceeded a 1 °C increase at 180 minutes, the final time point of measurement (38.29 °C). OSHA finds these work/rest cycles to be similar to a late morning period of work, followed by a 30-minute lunch and then an early afternoon work/rest period, although acknowledges that the duration between rest periods is longer in the proposed rule than in this study. Also, in the Uchiyama et al. (2022) study, a lack of heat strain was also observed in a protocol consisting of 1 hour of work and 15 minutes rest, followed by three half hour work periods separated by 10-minute rest periods and, and a final half hour work period.

The Smallcombe et al. (2022) study most closely reflected a typical workday because it was conducted over a 7-hour period with cycles of 50-minute work/10-minute rest and a 1-hour lunch. Participants were tested under one referent conditions and three hot temperature conditions and average rectal temperature remained at or below 38 °C (100.4 °F) in all groups during each exercise period at heat indices ranging from 105 °F to 161 °F (table S2).

Overall, OSHA preliminarily finds that these studies show that 15-minute rest breaks would offer more protection for employees than shorter duration rest breaks, because the frequency of rest breaks in these studies by Uchiyama et al. (2022) and Smallcombe et al. (2022) was greater than what OSHA is proposing and rest breaks were provided in air-conditioned or cooler areas. OSHA expects some employees will not have access to air-conditioned areas during break periods. OSHA acknowledges uncertainties in determining a precise rest break frequency and duration, but preliminarily concludes that a minimum of a 15-minute rest break every two hours would be highly protective in many circumstances at or above the high heat trigger, while offering employers administrative convenience. For example, other approaches such as adjusting rest break frequency and duration based on weather conditions, work intensity, or protective clothing are likely to be difficult for many employers to implement. A 15-minute break every two hours is administratively convenient to implement because, as explained below, a standard meal break could qualify as a rest break, and

therefore, assuming an 8-hour workday with a meal break in the middle of the day, paragraph (f)(2) would only require two other breaks, one break in the morning and a second break in the afternoon, assuming the high heat trigger is met or exceeded the entire day.

The frequency and duration of these proposed rest breaks are within the ranges of frequencies and durations required by four U.S. States that have finalized regulations protecting against HRI by requiring rest breaks under high heat conditions. First, the California regulation for outdoor employees requires a minimum ten-minute rest period every two hours for agricultural employees, when temperatures reach or exceed 95 °F (Cal. Code Regs. tit. 8, section 3395 (2024)). Second and similarly, the Colorado regulation for agricultural employees requires a minimum 10-minute rest period every two hours under increased risk conditions that include a temperature at or above 95 °F (7 Colo. Code Regs. section 1103–15:3 (2023)). Third, in Oregon rules applying to agriculture as well as indoor and outdoor workplaces, employers can select from three different options for work-rest periods at high heat, including: (1) an employer-designed program with a minimum of a 10-minute break every two hours at a heat index of 90 °F or greater and a 15-minute break every hour at a heat index of 100 °F or greater, with possible increased frequency and duration of breaks based on PPE use, clothing, relative humidity, and work intensity; (2) development of work/rest schedules based on the approach recommended by NIOSH (see NIOSH, 2016), or (3) a simplified rest break schedule that calls for a 10-minute break every two hours, with durations and frequencies of rest breaks increasing with increases in heat index (Or. Admin. R. 437–002–0156 (2024); Or. Admin. R. 437–004–1131 (2024)). Fourth and finally, for outdoor workplaces, Washington requires a minimum 10-minute rest period every two hours at an air temperature at or above 90 °F and a minimum 15-minute rest period every hour at an air temperature at or above 100 °F (Wash. Admin. Code 296–307–09747 (2023)).

A NIOSH guidance document recommends work/rest cycles for employees wearing “normal clothing” that considers temperature adjusted for humidity levels and cloud cover and work intensity; in that guidance, when the need for rest cycles is triggered, work/rest cycles range from 45 minutes work/15 minutes rest to 15 minutes work/45 minutes rest, with extreme cautioned urged under some conditions (NIOSH, 2017b).

OSHA acknowledges the requirements of some States and recommendations by NIOSH to increase frequency and duration of rest breaks as heat conditions increase, but OSHA has preliminarily decided on a more simplified approach, in part because of implementation concerns raised by stakeholders, such as difficulty in implementing a more complex approach (e.g., longer and more frequent rest breaks with increasing temperature), and interference with certain types of work tasks (e.g., continuous production work and tasks such as pouring concrete that could be disrupted by more frequent breaks). In addition, the requirement to continue providing paid breaks if needed above the high heat trigger, coupled with the requirement to encourage employees to take these breaks, will help ensure that any employee that needs an additional break can take one. However, OSHA acknowledges that, for the reasons discussed above, this encouragement may become more vital as the temperature increases to ensure that employees don't forego the breaks they are entitled to. OSHA welcomes comment and data on the appropriateness of this approach.

B. Complying With Rest Break Provisions

The required break periods under paragraph (f)(2) are a minimum. Nothing in the proposed standard would preclude employers from providing longer or more frequent breaks. Additionally, employers would need to comply with paragraph (e)(8) (i.e., providing rest breaks if needed to prevent overheating), which may include situations where employees need more frequent or longer break periods. Paragraph (f)(2) requires employers to ensure that employees have at least one break that lasts a minimum of 15 minutes every two hours when the high heat trigger is met or exceeded. The requirement is in addition to employers' obligation under paragraph (e)(8) to allow and encourage rest breaks if needed to prevent overheating, which continues after the high heat trigger is met. However, if an employee takes a rest break under paragraph (e)(8) that lasts at least 15 consecutive minutes, that would impact when the employer would next need to provide a break under paragraph (f)(2). For example, if the high heat trigger is exceeded for an entire 8-hour work day, and the employee takes a 15-minute break after their first hour of work because they need one to prevent overheating, the employer would not be required to provide another 15-minute

break under paragraph (f)(2) for the next two hours. However, the employer's ongoing obligation under paragraph (e)(8) would remain. Employers would also need to comply with paragraph (g)(2) (i.e., relieving an employee from duty when they are experiencing signs and symptoms of heat-related illness).

Under proposed paragraph (f)(2), when the high heat trigger is met or exceeded, employers would be required to provide a minimum 15-minute paid rest break at least every two hours in the break area that would be required under paragraph (e)(3) or (4). These rest breaks would be mandatory, and the employer would need to ensure that rest breaks are taken as required.

Proposed paragraphs (f)(2) and (e)(8) would require that employees be paid during rest breaks. As discussed further in the *Explanation of Proposed Requirements* for paragraph (j), *Requirements implemented at no cost to employees*, OSHA finds it important that employees be paid during the time they are taking breaks that are mandatory or needed to prevent overheating so that employees are not financially penalized and thus discouraged from taking advantage of those protections. See *Explanation of Proposed Requirements* for paragraph (j) for *Requirements implemented at no cost to employees* for a discussion of approaches employers can take to ensure that both hourly employees and piece rate employees are compensated for time on rest breaks.

Rest breaks are not the same as slowing down or pacing. In addition, performing a sedentary work activity, even if done in an area that meets the requirements of a break area under proposed paragraphs (e)(3) or (4), would not be considered a rest break under the proposed standard. This ensures that employees can rest (thus modulating increases in heat strain) and hydrate during that rest break.

OSHA recognizes that providing a rest break every two hours might be challenging for some employers. However, employers could consider approaches such as staggering employee break times, within the required two-hour period, to ensure that some employees are always available to continue working. In other cases, employers who have concerns about employee safety, such as having to climb up and down from high locations to take a break, might be able to provide portable shade structures, if safe to use under the conditions (e.g., elevation, wind conditions). In addition, employers could consider scheduling work tasks during cooler parts of the day to avoid required rest breaks.

Proposed paragraphs (f)(2)(i) indicates that a meal break that is not required to be paid under law may count as a rest break. Whether a meal break must be paid is governed by other laws, including State laws. Under the Federal Fair Labor Standards Act, bona fide meal periods (typically 30 minutes or more) generally do not need to be compensated as work time (see 29 CFR 785.19). The employee must be completely relieved from duties for the purpose of eating regular meals. Furthermore, an employee is not relieved if they are required to perform any duties, whether active or inactive, while eating.

Proposed paragraphs (f)(2)(ii) and (iii) further clarify that total time of the rest break would not include the time that employees take to put on and remove PPE or the time to walk to and from the break area. OSHA preliminarily finds it important to exclude this time from the 15-minute rest period so employees have the full 15 minutes to cool down.

C. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Stakeholders' experiences with rest breaks required under law or by the employer, including successes and challenges with such approaches;
- Whether there is additional evidence to support a 15-minute rest break every 2 hours as effective in reducing heat strain and preventing HRIs;
- Whether OSHA should consider an alternative scheme for the frequency and/or duration of rest breaks under paragraph (f)(2). If so, what factors (such as weather conditions, intensity of work tasks, or types of clothing/PPE) should it be based on and why;
- Whether varying frequency and duration of rest breaks based on factors such as the heat index would be administratively difficult for employers to implement and how any potential administrative concerns could be addressed;
- Whether employees could perform certain sedentary work activities in areas that meet the proposed requirements for break areas without hindering the effectiveness of rest breaks for preventing HRI, including examples of activities that would or would not be acceptable; and
- Whether OSHA should require removal of PPE that may impair cooling during rest breaks.

III. Observation for Signs and Symptoms

Paragraph (f)(3) of the proposed standard would establish requirements for observing employees for signs and

symptoms of heat-related illness when the high heat trigger is met or exceeded. As explained in Section IV., Health Effects, heat-related illnesses can progress to life-threatening conditions if not treated properly and promptly. Therefore, it is important to identify the signs and symptoms of heat-related illness early so appropriate action can be taken to prevent the condition from worsening. OSHA preliminarily finds that observation for signs and symptoms of heat-related illness in employees is a critical component of heat injury and illness prevention.

NIOSH recommends observation for signs and symptoms of heat-related illness by a fellow worker or supervisor (NIOSH, 2016). The NACOSH Heat Injury and Illness Prevention Work Group also provided recommendations related to observation for signs and symptoms of heat-related illness in its recommendations to OSHA on potential elements of heat injury and illness prevention standard. The NACOSH Work Group recommended that there be additional requirements for workers who work alone since a buddy system is not possible in those cases, including a communication system with regular check-ins (NACOSH Working Group on Heat, 2023).

Paragraph (f)(3) would require that the employer implement at least one of two methods of observing employees for signs and symptoms of heat-related illness, with a third option for employees who work alone at a work site. As defined under proposed paragraph (b), *Signs and symptoms of heat related illness* means the physiological manifestations of a heat-related illness and includes headache, nausea, weakness, dizziness, elevated body temperature, muscle cramps, and muscle pain or spasms.

The first option, under proposed paragraph (f)(3)(i), that an employer may choose is to implement a mandatory buddy system in which co-workers observe each other. Employers could satisfy this requirement by pairing employees as "buddies" to observe each other for signs and symptoms of heat-related illness. Co-workers assigned as buddies would need to be in the same work area so that it is possible for them to observe each other. Co-workers could also use visual cues or signs and/or verbal communication to communicate signs and symptoms of heat-related illness to each other.

The second option, under proposed paragraph (f)(3)(ii), that the employer may choose is for observation to be carried out by a supervisor or heat safety coordinator. If the employer chooses this option, proposed paragraph (f)(3)(ii)

specifies that no more than 20 employees can be observed per supervisor or heat safety coordinator. OSHA preliminarily finds that it is important to limit the number of employees being observed to ensure that each employee is receiving the amount of observation needed to determine if they are experiencing any signs and symptoms of heat-related illness. Supervisors or heat safety coordinators would need to be in a position to observe the employees they are responsible for observing for signs and symptoms (e.g., in close enough proximity to communicate with and see) when observing for signs/symptoms. The supervisor or heat safety coordinator could have other tasks or work responsibilities while implementing the observation role, but they must be able to be within close enough proximity to communicate with and see those they are observing and be able to check in with the employee regularly (e.g., every two hours). When the high heat trigger is met, employers would still be responsible for meeting the proposed requirements of paragraph (e)(9), *Effective Communication*. Employees need to have a means of effective communication with a supervisor (e.g., phone, radio) and employers must regularly communicate with employees at or above both the initial and high heat triggers.

Because symptoms of heat-related illness may not be outwardly visible (e.g., nausea, headache), employers should ensure employees are asked if they are experiencing any signs and symptoms. This is especially true if the employee shows changes in behavior such as working more slowly or dropping things because this could indicate that the employee is experiencing heat-related illness but not recognizing it. It is also important that employees report any signs and symptoms they are experiencing or that they observe in others in order to prevent development of potentially life-threatening forms of heat-related illness (see proposed paragraph (h)(1)(x), *Training*). Additionally, as discussed below, certain signs and symptoms indicate a heat-related emergency.

Employees who work alone at a work site do not have a co-worker, supervisor, or heat safety coordinator present who can observe them to determine if they are experiencing signs and symptoms of heat-related illness. For employees working alone at a work site, the employer would instead need to comply with proposed paragraph (f)(3)(iii) and maintain a means of effective, two-way communication with those employees and make contact with them at least

every two hours. This means that employers must not only reach out to lone employees, but also receive a communication back from the employees. Receiving communication back from the employee allows the employee to report any symptoms. If no communication is received, this may be a sign that the employee is having a problem.

Under proposed paragraph (h)(1)(iv), employers would be required to train employees on signs and symptoms of heat-related illness and which ones require immediate emergency action. Proposed paragraph (b) defines *signs and symptoms of a heat emergency* as physiological manifestations of a heat-related illness that requires emergency response and includes loss of consciousness (*i.e.*, fainting, collapse) with excessive body temperature, which may or may not be accompanied by vertigo, nausea, headache, cerebral dysfunction, or bizarre behavior. This could also include staggering, vomiting, acting irrationally or disoriented, having convulsions, and (even after resting) having an elevated heart rate. Employer obligations when an employee is experiencing signs and symptoms of a heat-related illness or heat emergency are addressed under proposed paragraph (g).

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Stakeholders' experiences with implementing observational systems such as those that OSHA is proposing and examples of the implementation of other observational systems for signs and symptoms of heat-related illness that OSHA should consider;

- Data of the effectiveness of such observation systems;

- The frequency at which observation as described in this section should occur;

- Whether there are alternative definitions of signs and symptoms of heat-related illness that OSHA should consider;

- Whether employers should be able to select a designee to implement observation in situations where it may not be possible to have a supervisor or heat safety coordinator present;

- Possible logistical concerns regarding proposed requirements for communication at least every two hours for employees who work alone at the work site; whether there are examples of successful implementation of these types of communication systems; examples of the types of technologies or modes of communication that most effectively support this type

communication; and whether there are innovative approaches for keeping employees working alone safe from HRI and allowing for prompt response in an emergency; and

- For employees who work alone at the work site, whether the employer should know the location of the employee at all times.

IV. Hazard Alert

Paragraph (f)(4) of the proposed standard would require employers to issue a hazard alert to employees prior to a work shift or when employees are exposed to heat at or above the high heat trigger.

As explained in Section IV., Health Effects, hazardous heat can lead to sudden and traumatic injuries and heat-related illnesses can quickly progress to life threatening forms if not treated properly and promptly. To protect employees, it is not sufficient to respond to HRIs after they occur. Prevention of HRIs is critical. A hazard alert will help prevent HRIs by notifying employees of heat hazards, providing information on HRI prevention, empowering employees to utilize preventative measures, and providing practical information about how to access prevention resources (*e.g.*, drinking water, break areas to cool down) and seek help in case of emergency.

Heat alert programs have been identified as important prevention strategies (NIOSH, 2016; Khogali, 1997). NIOSH identified heat alert programs as a strategy to prevent excessive heat stress and recommended that heat alert programs be implemented under certain high heat conditions (NIOSH, 2016, p. 10). NIOSH further describes an example of an effective heat alert program, drawing in part on recommendations described by Dukes-Dobos (1981). Effective elements of a hazard alert program include similar elements to the proposed provision (f)(4), such as “Establish[ing] criteria for the declaration of a heat alert” and “Procedures to be followed during the state of [the] [h]eat [a]lert” (*e.g.*, reminding employees to drink water) (NIOSH, 2016, pp. 80–81).

Employees may face pressure or incentives to work through hazardous heat which can increase their risk of heat-related illness; some employees also may not recognize that they are developing signs and symptoms of a heat-related illness (see Section IV., Health Effects). The hazard alert provision would require that employers provide information about prevention measures, including employees' right to take rest breaks if needed, at the

employees' election, and the rest breaks required by paragraph (f)(2), which will empower employees to utilize the preventative measures available. This requirement would also enable effective response in the event of a heat emergency by requiring employers to remind employees in advance of its heat emergency procedures.

OSHA preliminarily finds that the hazard alert requirement in proposed paragraph (f)(4) is an important strategy for the prevention of HRIs. The provision includes minimum requirements for the hazard alert and provides flexibility for employers in how they implement the provision. Additionally, employers may choose to include additional information in the alert that is appropriate for their work sites.

Paragraph (f)(4) would require that prior to the work shift or upon determining the high heat trigger is met or exceeded, the employer must notify employees of specific information relevant to the prevention of heat hazards. Specifically, the employer would be required to notify employees of the following: the importance of drinking plenty of water; employees' right to, at employees' election, take rest breaks if needed and the rest breaks required by paragraph (f)(2); how to seek help and the procedures to take in a heat emergency; and for mobile work sites, information on the location of break area(s) required by paragraph (e)(3) or (4) and drinking water required by paragraph (e)(2). Because the location of break area(s) and drinking water may change frequently for mobile work sites, it is important to make sure employees at those work sites are reminded of their location on high heat days. Mobile work sites include work sites that change as projects progress or when employees relocate to a new project (*e.g.*, landscaping, construction).

Paragraph (f)(4) would require the employer to issue the hazard alert prior to the work shift or upon determining the high heat trigger is met or exceeded. However, issuing the alert prior to the start of the work shift would not be required unless exposures will be at or above the high heat trigger at the start of the work shift. If the start of the work shift is below the high heat trigger and the hazard alert is not issued at the start of the work shift, then the hazard alert must be issued when the high heat trigger is met and ideally before exposure occurs. For example, if a work shift runs from 8 a.m. to 5 p.m. and the high heat trigger is not met until 10 a.m., the employer must either issue the alert at the beginning of the work shift, or issue the alert when the high heat

trigger is met at 10 a.m. If an employer regularly communicates with an employee via a particular means of communication and uses that form of communication to issue the alert, then the employer can presume the notification was received. If, however, the employer has reason to believe the hazard alert was not received, they would need to take additional steps to confirm.

Employers could satisfy the requirements of this provision by posting signs with the required information at locations readily accessible and visible to employees. For example, some employers may choose to post signs at the entrance to the work site. Signs are not an option for all employers as they may not be sufficient to ensure employees receive the hazard alert (e.g., employers with mobile employees or employees who work alone on a work site). Additionally, signs may not be an option for employers who choose not to provide the hazard alert at the start of the work shift. For example, posting a sign at the entrance to the work site would not be sufficient to ensure employees are notified after all employees have already entered the work site. Employers may also satisfy the hazard alert notification requirement by issuing the alert electronically (e.g., via email, text message) or through verbal means (e.g., an in-person meeting, radio or voicemail). Employers may be able to use the system they have in place to meet the requirements of paragraph (e)(9) for effective, two-way communication with employees to issue the hazard alert.

For any method the employer chooses to issue the hazard alert notification, the hazard alert must be sufficient to ensure all employees are notified of the information in paragraphs (f)(2)(i) through (iv). To ensure this, the hazard alert must be issued in languages and at a literacy level understood by employees.

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Whether any additional information should be required in the hazard alert;
- The frequency of the hazard alert, particularly in locations that frequently exceed the high heat trigger; and
- Any alternatives to a hazard alert requirement that OSHA should consider.

V. Excessively High Heat Areas

Paragraph (f)(5) of the proposed standard would require that employers place warning signs at indoor work

areas with ambient temperatures that regularly exceed 120 °F. The warning signs must be legible, visible, and understandable to employees entering the work area. Specifying the requirement for warning signs ensures that all employees and contractors at the work site are aware of areas with excessively high heat. Warning signs signal a hazardous situation that, if not avoided, could result in death or serious injury and, if employees need to enter the areas, serve as a reminder to take appropriate precautions.

The warning signs must be legible, visible, and understandable to employees entering the work areas. The sign must be in a location that employees can clearly see before they enter the excessively high heat area. To maintain visibility of the warning signs, employers must ensure that there is adequate lighting in the area to read the signs and that the signs are not blocked by items that would prevent employees from seeing them. The signs would have to be legible (e.g., writing or print that can be read easily). The proposed standard does not specify contents of the sign, but signs could include a signal word such as “Danger”, the hazard (e.g., “High Heat Area”), possible health effects (e.g., May Cause Heat-Related Illness or Death), information pertaining to who is permitted to access the area (e.g., Authorized Personnel Only), and what precautions entrants would have to take to safely enter the area. Employees must be able to understand the signs. Therefore, the signs must be printed in a language or languages that all potentially exposed employees understand. If it is not practical to provide signs in a language or languages spoken by all employees, employers still must ensure all employees understand what the signs mean. Employers could do this by training on what the warning signs mean and providing those employees with information regarding the extent of the hazardous area as indicated on the signs.

Employers would have to place warning signs at indoor work areas with ambient temperatures that regularly exceed 120 °F. The term “regularly” means a pattern or frequency of occurrence rather than isolated incidents. This would mean that the indoor work areas experience temperatures exceeding 120 °F on a frequent or recurring basis, such as daily during certain seasons or under specific operational conditions. The process of identifying heat hazards pursuant to proposed paragraph (d) may help employers identify excessively high heat areas. Under proposed paragraph

(d)(3), employers would be required to identify each work area(s) where employees are reasonably expected to be exposed to heat at or above the initial heat trigger and develop a monitoring plan. If, while monitoring, an employer determines temperatures in an indoor work area regularly exceed the 120 °F threshold, then the employer would need to ensure that warning signs are placed at that work area to alert employees to the potential hazards associated with such extreme temperatures.

If an employer’s work site contains an excessively high heat area(s), the employer must train employees in the procedures to follow when working in these areas (see proposed provision (h)(1)(xvi)).

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Whether OSHA should further specify the required location of warning signs;
- Whether OSHA should specify the wording/contents of the warning signs; and
- Whether OSHA should consider defining “excessively high heat area” as something other than a work area in which ambient temperatures regularly exceed 120 °F; and evidence available to support a different temperature threshold or other defining criteria.

G. Paragraph (g) Heat Illness and Emergency Response and Planning

Paragraph (g) of the proposed standard would establish requirements for heat illness and emergency response and planning. It would require that employers develop and implement a heat emergency response plan as part of their HIIPP, as well as specify what an employer’s responsibilities would be if an employee experiences signs and symptoms of heat-related illness or a heat emergency. Effective planning and emergency response measures can minimize the severity of heat-related illnesses when they occur and allow for more efficient access to medical care when needed.

Proposed paragraph (g)(1) specifies that the employer would be required to develop and implement a heat emergency response plan as part of their HIIPP and specifies the elements that would be required in an employer’s emergency response plan. Because the emergency response plan is part of the HIIPP, some of the requirements in paragraph (c) are relevant to the emergency response plan. For example, the employer would need to seek the input and involvement of non-

managerial employees and their representatives, if any, in the development and implementation of the emergency response plan (see proposed paragraph (c)(6)). See *Explanation of Proposed Requirements* for paragraph (c), for a detailed explanation of the requirements that apply to the HIIPP. Only one plan would be required for each employer (*i.e.*, for the whole company). However, if the employer has multiple work sites that are distinct from each other, the plan would be tailored to each work site or type of work site. For instance, if an employer has employees engaged in work activities outdoors on a farm, as well as employees loading and unloading product from vehicles at various locations, the employer could have one emergency response plan with the specifications for each of these types of work sites represented. Employers may also choose to include other elements in the plan to account for any work activities unique to their workplace.

Proposed paragraph (g)(1)(i) would require employers to include a list of emergency phone numbers (*e.g.*, 911, emergency services) in their emergency response plan. Indicating the most appropriate phone number(s) to contact in the case of an emergency helps ensure medical support and assistance are provided timely and efficiently during a heat emergency. Examples of other phone numbers for assistance aside from 911 that employers might include in the plan are those for on-site clinicians or nurses to be contacted if an employee is experiencing signs and symptoms of a heat-related illness.

Proposed paragraph (g)(1)(ii) would require employers to include a description of how employees can contact a supervisor and emergency medical services in their emergency response plan. Because time is of the essence in emergency situations, it is important that employees know beforehand how to contact a supervisor and emergency medical services in the event of a heat emergency. For example, if employees do not have phone service or access to a phone to call for medical help, but they do have access to other means of communication such as radios, walkie-talkies, personal locator beacons, and audio signals, the employer's plan would describe how to use these other means of communication to contact a supervisor and emergency medical services.

Proposed paragraph (g)(1)(iii) would require the emergency response plan to include the individual(s) designated to ensure that heat emergency procedures are invoked when appropriate. Clearly assigning this responsibility to an

individual(s) can reduce confusion and allow for swift action in the event of a heat emergency. Employers with multiple work sites or dispersed work areas may not be able to ensure heat emergency procedures are invoked without designating different individuals for each work site/area. For example, an employer with work activities inside two factories in different geographic locations would need to designate an individual(s) to ensure heat emergency procedures are invoked at each factory location.

Proposed paragraph (g)(1)(iv) would require the emergency response plan to have a description of how to transport employees to a place where they can be reached by an emergency medical provider. Planning for where employees can access emergency medical services can ensure aid is provided efficiently. This is especially important for employers with employees engaging in work activities in remote locations, where medical services cannot reach them. For example, an employee working in an area of a farm not easily accessible by vehicle or an employee in a difficult to reach location inside a building being constructed.

Proposed paragraph (g)(1)(v) would require the emergency response plan to include clear and precise directions to the work site, including the address of the work site, which can be provided to emergency dispatchers. For certain work sites that are remote/hard to reach or do not have an address, GPS coordinates may be necessary to share with emergency responders, or a description of how to get to their location from the main road, entrance, building, etc. If an employee's work site changes frequently, the emergency response plan would need to include a clear strategy to account for their changing locations and ensure directions to the work site are readily accessible when needed to provide to emergency dispatchers.

Proposed paragraph (g)(1)(vi) would require the emergency response plan to include procedures for responding to an employee experiencing signs and symptoms of heat-related illness, including heat emergency procedures for responding to an employee with suspected heat stroke. Prior development of emergency response procedures can ensure assistance and medical attention are provided efficiently and quickly. In developing the procedures, OSHA expects that employers would look to resources such as OSHA guidance (*e.g.*, www.osha.gov/heat-exposure/illness-first-aid) and NIOSH recommendations (NIOSH, 2016) for more information.

The proposed standard does not require employers to develop a plan for each work site. However, the employer's emergency response plan(s) must contain all the information required by paragraphs (g)(1)(i) through (vi), some of which will vary based on work site. The employer may be able to incorporate the information needed for different work sites into the same emergency response plan. For instance, if an employer has employees engaged in work activities outdoors on a farm, as well as employees loading and unloading product from vehicles at various locations, the employer could have one emergency response plan with the specifications for each of these types of work sites represented. Employers may also choose to include elements beyond those required by paragraphs (g)(1)(i) through (vi) in their plan to account for any work activities unique to their workplace.

Proposed paragraph (g)(2) specifies the actions employers would be required to perform if an employee is experiencing signs and symptoms of heat-related illness. Under proposed paragraph (b) *signs and symptoms of heat-related illness* means the physiological manifestations of a heat-related illness and includes headache, nausea, weakness, dizziness, elevated body temperature, muscle cramps, and muscle pain or spasms.

Proposed paragraph (g)(2)(i) would require employers to relieve from duty employees who are experiencing signs and symptoms of heat-related illness. Relieving the employee from duty would allow the employer to address the heat-related illness according to the procedures outlined in proposed paragraphs (g)(2)(ii) through (v). This relief from duty, including the time it takes to address the heat-related illness according to the procedures outlined in proposed paragraphs (g)(2)(ii) through (v), must be with pay and must continue at least until symptoms have subsided.

Proposed paragraph (g)(2)(ii) would require that employers monitor employees who are experiencing signs and symptoms of heat-related illness, and proposed paragraph (g)(2)(iii) would require employers to ensure that employees who are experiencing signs and symptoms of heat-related illness are not left alone. Continuous monitoring of employees who are experiencing signs and symptoms of a heat-related illness is important to ensure that if the employee's condition progresses to a heat emergency, someone is there to observe it and quickly respond.

Proposed paragraph (g)(2)(iv) would require employers to offer employees who are experiencing signs and

symptoms of heat-related illness on-site first aid or medical services before ending any monitoring. This requirement is intended to be consistent with existing first aid standards (e.g. 29 CFR 1910.151, 1915.87, 1926.23 and 1926.50), which require accessibility of medical services and first aid to varying degrees depending on the industry or whether the workplace is near an infirmary, clinic or hospital. Proposed paragraph (g)(2)(iv) would not add new requirements for staff to be fully trained in first aid. Employers would offer the first aid or medical resources they have available to employees on site to the extent already required by first aid standards and follow the procedures developed in paragraph (g)(1)(vi) as applicable.

Proposed paragraph (g)(2)(v) would require employers to provide employees who are experiencing signs and symptoms of heat-related illness with means to reduce their body temperature. Examples of means to reduce body temperature are instructing those employees to remove all PPE and heavy outer clothing (e.g., heavy/impermeable protective clothing) and moving them to a cooled or shaded area (e.g., the break areas required under paragraphs (e)(3) and (4)) where they can sit and drink cool water. If the employer has cooling PPE (e.g., cooling bandanas or neck wraps, and vests and cooling systems such as hybrid personal cooling systems (HPCS), and fans) available on site, those could also be used to cool employees as well. (For information related to the requirement to reduce an employee's body temperature in the case of a heat emergency, see discussion below.)

Proposed paragraph (g)(3) specifies the actions employers would have to perform if an employee is experiencing signs and symptoms of a heat emergency. Proposed paragraph (b) defines *signs and symptoms of a heat emergency* as the physiological manifestations of a heat-related illness that requires emergency response and includes loss of consciousness (i.e., fainting, collapse) with excessive body temperature, which may or may not be accompanied by vertigo, nausea, headache, cerebral dysfunction, or bizarre behavior. This could also include staggering, vomiting, acting irrationally or disoriented, having convulsions, and (even after resting) having an elevated heart rate.

Proposed paragraph (g)(3)(i) would require employers to take immediate actions to reduce the employee's body temperature before emergency medical services arrive. Rapid cooling of body temperature during a heat emergency is

essential because the potential for organ damage and risk of death increase in a short period of time, often before medical personnel can respond, transport, and treat the affected individual (Belval et al., 2018). Immersion in ice water or cold water has been reported to have the fastest cooling rates (McDermott et al., 2009b; Casa et al., 2007). However, OSHA realizes that immersing an employee in a tub of ice/cold water is not an option that will be available at most work sites. Other, more practical methods of reducing employee body temperature using materials that employers are likely to have, or are similar to materials that an employer is likely to have, on site have been reported to be highly effective in preventing death from exertional heat stroke. DeGroot et al. (2023) reported survival of 362 of 363 military personnel who were suffering from exertional heat stroke and were treated with strategically placed "ice sheets" (i.e., bed sheets soaked in ice water). McDermott et al. (2009a) reported 100% survival in nine marathon runners who were suffering from exertional heat stroke and treated by dousing with cold water and rubbing of ice bags over major muscle groups. Another possible approach is the tarp-assisted cooling oscillation (TACO) method that involves wrapping the affected individual in a tarp with ice (Luhning et al., 2016).

Proposed paragraph (g)(3)(ii) would require employers to contact emergency medical services immediately for employees experiencing signs and symptoms of a heat emergency, and proposed paragraph (g)(3)(iii) would require employers to also perform the activities described in paragraphs (g)(2)(i) through (iv) to aid an employee during a heat emergency until emergency medical services arrives. Some heat-related illnesses can quickly progress and become fatal (see Section IV., Health Effects). The severity and survival of heat stroke is highly dependent on how quickly effective cooling and emergency medical services are provided (Vicario et al., 1986; Demartini et al., 2015; Belval et al., 2018).

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Whether OSHA should require a minimum duration of time an employee who has experienced signs and symptoms of heat-related illness must be relieved from duty, and what an appropriate duration of time would be before returning employees to work;
- Whether OSHA should add or remove any signs or symptoms in the

definitions of *signs and symptoms of heat-related illness* and *signs and symptoms of a heat emergency* in proposed paragraph (b). If so, provide clear and specific evidence for inclusion or exclusion;

- Whether paragraph (g)(3)(i) should require specific actions that the employer must take to reduce an employee's body temperature before emergency medical services arrive, rather than merely requiring unspecified "immediate actions". If so, describe those specific actions; and

- Whether paragraph (g)(3)(i) should prohibit certain actions to reduce an employee's body temperature before emergency medical services arrive. If so, indicate if there is evidence or observations that certain actions are not helpful or are counterproductive.

H. Paragraph (h) Training

Paragraph (h) of the proposed standard establishes requirements for training on HRI prevention. It addresses the topics to be addressed in training, the types of employees who are to be trained, the frequency of training, triggers for supplemental training, and how training is to be conducted. OSHA regularly includes training requirements in its standards to ensure employees understand the hazards addressed by the standard, the protections they are entitled to under the standard, and the measures to take to protect themselves. Here, OSHA believes that it is essential that employees are trained on heat-related hazards and how to identify signs and symptoms of HRIs as well as on the requirements of the proposed standard and the employer's heat-related policies and procedures. This training ensures that employees understand heat hazards and the workplace specific control measures that would be implemented to address the hazard. The effectiveness of the proposed standard would be undermined if employees did not have sufficient knowledge and understanding to identify heat hazards and their health effects or sufficient knowledge and understanding of their employer's policies and procedures for addressing those hazards.

Surveys and interviews with diverse working populations highlight the need for additional education and training on HRIs and prevention strategies amongst employees (Luque et al., 2020; Smith et al., 2021; Fleischer et al., 2013; Stoecklin-Marois et al., 2013; Langer et al., 2021; Jacklitsch et al., 2018). The NACOSH Heat Injury and Illness Prevention Work Group recommended that both workers and supervisors are trained in heat illness and injury

prevention strategies. Additionally, the Work Group recommended that the training program includes the following elements: identification of hazards; mitigation of hazards through prevention; reporting of signs and symptoms; and emergency response. OSHA preliminarily finds that effective training is an essential element of any heat injury and illness prevention program and that the requirements in proposed paragraph (h) are necessary and appropriate to ensure the effectiveness of the standard as a whole.

Proposed paragraph (h)(1) establishes the initial training requirements for all exposed employees. It would require employers to ensure that each employee receives, and understands, training on the topics outlined in proposed paragraphs (h)(1)(i) through (xvi) prior to the employee performing any work at or above the initial heat trigger. Requiring that initial training occur before employees perform any work at or above the initial heat trigger ensures that the employees have all the knowledge necessary to protect themselves prior to their exposure to the hazard.

This provision, like paragraphs (h)(2) through (h)(4), would require employers to ensure that employees, including supervisors and heat safety coordinators, understand the training topics. While OSHA does not mandate testing or specific modes of ascertaining employee understanding of the training materials, OSHA expects that all required training will include some measure of comprehension. Different ways that employers could ensure comprehension of the training materials include a knowledge check (e.g., written or oral assessment) or discussions after the training. Post training assessments may be particularly useful for ensuring employee participation and comprehension when employers offer online training. Proposed paragraph (h)(5), discussed below, includes additional requirements for presentation of the training.

Proposed paragraph (h)(1)(i) would require employers to provide training on heat stress hazards. Heat stress is the total heat load on the body. There are three major types of hazards which contribute to heat stress: (1) environmental factors such as high humidity, high temperature, solar radiation, lack of air movement, and process heat (i.e., radiant heat produced by machinery or equipment, such as ovens and furnaces), (2) use of personal protective equipment or clothing that can inhibit the body's ability to cool itself, and (3) the body's metabolic heat (i.e., heat produced by the body during

work involving physical activity and exertion). Employers should make employees aware of all the sources of heat at the workplace that contribute to heat stress.

Proposed paragraph (h)(1)(ii) would require employers to provide training on heat-related injuries and illnesses. See Section IV., Health Effects, for a discussion of HRIs. Examples of heat-related illnesses include heat stroke, heat exhaustion, heat cramps, heat syncope, and rhabdomyolysis. Heat-related injuries that could result from heat illness include slips, trips, falls, and other injuries that could result from the mishandling of equipment due to the effects of heat stress.

Proposed paragraph (h)(1)(iii) would require employers to provide training on risk factors for heat-related injury or illness, including the contributions of physical exertion, clothing, personal protective equipment, a lack of acclimatization, and personal risk factors (e.g., age, health, alcohol consumption, and use of certain medications). As noted above, physical exertion, clothing, and personal protective equipment all increase an employee's heat load. More information on acclimatization and how it affects risk is included in Section V.C., Risk Reduction, and more information about personal risk factors is included in Section IV.O., Factors that Affect Risk for Heat-Related Health Effects.

Proposed paragraph (h)(1)(iv) would require employers to provide training on signs and symptoms of heat-related illness and which ones require immediate emergency action. As defined in proposed paragraph (b), *signs and symptoms of heat-related illness* means the physiological manifestations of a heat-related illness and includes headache, nausea, weakness, dizziness, elevated body temperature, muscle cramps, and muscle pain or spasms. Also defined in proposed paragraph (b), *signs and symptoms of a heat emergency* means the physiological manifestations of a heat-related illness that requires emergency response and includes loss of consciousness (i.e., fainting, collapse) with excessive body temperature, which may or may not be accompanied by vertigo, nausea, headache, cerebral dysfunction, or bizarre behavior. This could also include staggering, vomiting, acting irrationally or disoriented, having convulsions, and (even after resting) having an elevated heart rate. Employers must train employees on how to identify these signs and symptoms of heat-related illness in themselves and their coworkers and when to employ the employer's emergency response

procedures, as required under proposed paragraph (g). That provision specifies the actions that an employer must take both when an employee experiences signs and symptoms of a heat-related illness and when an employee experiences signs and symptoms of a heat emergency. For further discussion see the *Explanation of Proposed Requirements for Paragraph (g)*.

Proposed paragraphs (h)(1)(v) through (vii) would require employers to train employees on the importance of removing PPE that may impair cooling during rest breaks, taking rest breaks to prevent heat-related illness or injury, and that rest breaks are paid, and drinking water to prevent heat-related illness or injury. Removing PPE when possible, allows employees to cool down faster during rest breaks. As discussed in Section V.C., Risk Reduction, drinking adequate amounts of water and taking rest breaks are important for reducing heat strain that could lead to HRI. Training on these topics could give the employer an opportunity to address common misperceptions regarding heat, such as that drinking cold water in the heat is harmful. In addition, proposed paragraph (h)(1)(viii) and (ix) would require that employers train employees on where break areas and employer provided water are located. This would ensure employees are aware of the locations of break areas and water and encourage their effective utilization.

Proposed paragraph (h)(1)(x) would require employers to train employees on the importance of reporting signs and symptoms of heat-related illnesses that they experience personally or those they observe in co-workers. Training employees to be observant of and to report early any signs and symptoms of heat-related illnesses they see at the workplace is a key factor to identifying and addressing potential heat-related incidents before they result in a serious illness or injury. In addition, employers should ensure that employees are familiar with the employer's own procedures for reporting signs and symptoms of a heat emergency or heat-related illness pursuant to its heat emergency response plan as required in proposed paragraph (g).

Proposed paragraph (h)(1)(xi) would require employers to train employees on all the policies and procedures applicable to the employee's duties, as indicated in the work site's HIIPP. Employees play an important role in effective implementation of the employer's work site-specific policies and procedures to prevent heat-related illnesses and injury, and training on these policies and procedures is

necessary to ensure that they are implemented effectively. OSHA recognizes that employees perform various duties and therefore likely need different types of training, and the proposed requirement allows employers flexibility to account for these differences in their training programs. Thus, certain components of the training may need to be tailored to an employee's assigned duties. For example, while all employees would require training on recognizing signs and symptoms of heat-related illness, employees observing a co-worker as part of buddy system under proposed paragraph (f)(3)(i) may require additional training on how to report signs and symptoms according to the policies and procedures established and implemented by the employer. In another example, the individual designated by the employer to ensure that emergency procedures are invoked when appropriate under proposed paragraph (g)(1)(iii) might require more detailed training on the employer's heat emergency response procedures. Another example could be training employees who wear vapor-impermeable clothing on the policies and procedures the employer has implemented to protect them under proposed paragraph (c)(3).

Proposed paragraph (h)(1)(xii) would require employers to train employees on the identity of the heat safety coordinator. Under proposed paragraph (c)(5), the heat safety coordinator would be designated to implement and monitor the HIIPP and would be given authority to ensure compliance with the HIIPP. Therefore, employees could contact the heat safety coordinator to ask questions about the HIIPP, to provide feedback on the policies and procedures, or report possible deficiencies with implementation of the HIIPP. Employers should encourage employees to contact the heat safety coordinator for these reasons. To ensure that employees are able to contact the heat safety coordinator, employers could provide the name of the individual and other information needed to contact them as part of the training required under this paragraph.

Proposed paragraph (h)(1)(xiii) would require employers to train employees on the requirements of this standard. While proposed paragraph (h)(1)(xi) would require training on all policies and procedures applicable to an employee's duties as noted in the employer's HIIPP, training under (h)(1)(xiii) would ensure that employees are familiar with all requirements of this proposed standard. For example, employees would have to be informed of the requirements related

to employee participation, including in the development, implementation, review and update of the HIIPP under proposed paragraph (c), and identifying work areas with reasonable expectations of exposures at or above the initial heat trigger, and in developing and updating the monitoring plan under proposed paragraph (d). Employees would also need to be informed that requirements of the proposed standard would be implemented at no cost to employees under proposed paragraph (j). The proposed provision would also ensure that employees are made familiar with the employer's heat-related policies and procedures.

Proposed paragraph (h)(1)(xiv) would require employers to train employees on how to access the work site's HIIPP. If relevant this would include training on how to access both digital or physical copies.

Proposed paragraph (h)(1)(xv) would require employers to train employees on their right to protections under this standard (*e.g.*, rest breaks, water), and that employers are prohibited from discriminating against any employee for exercising those rights. Employees' right to be free from retaliation for availing themselves of the protections of the standard or for raising safety concerns comes from section 11(c) of the OSH Act, 29 U.S.C. 660(c), and requiring employers to train on these protections is consistent with the purpose of that provision. Proposed paragraph (h)(1)(xv) is also consistent with section 8(c)(1) of the Act, 29 U.S.C. 657(c)(1), which directs the Secretary to issue regulations requiring employers to keep their employees informed of their protections under the Act and any applicable standards, through posting of notices or "other appropriate means." This training ensures that employees know that they have a right to the protections required by the standard. Having employers acknowledge and train their employees about their rights under this standard provides assurance that employees are aware of the protections afforded them and encourages them to exercise their rights without fear of reprisal. They may otherwise fear retaliation for utilizing the protections afforded them under the standard or for speaking up about workplace heat hazard concerns. This fear would undermine the effectiveness of the standard because employee participation plays a central role in effectuating the standard's purpose.

Proposed paragraph (h)(1)(xvi) would require that if the employer is required under paragraph (f)(5) to place warning signs for excessively high heat areas,

they would be required to train employees on procedures to follow when working in these areas. These procedures could include, but are not limited to, any PPE that might be required when working in those areas, if relevant, and reminders to remove PPE when taking rest breaks in break areas and should reinforce employees' access to rest breaks in break areas, required under paragraph (f)(2), and drinking water, required under paragraph (e)(2), as appropriate.

Proposed paragraph (h)(2) would require the employer to ensure that each supervisor responsible for supervising employees performing any work at or above the initial heat trigger and each heat safety coordinator receives training on, and understands, both the topics outlined in paragraph (h)(1) and the topics outlined in paragraphs (h)(2)(i) and (ii). Proposed paragraph (h)(2)(i) would require the employer to train supervisors and heat safety coordinators on the policies and procedures developed to comply with the applicable requirements of this standard, including the policies and procedures for monitoring heat conditions developed to comply with paragraphs (d)(1) and (d)(3)(ii). Proposed paragraph (h)(2)(ii) would require the employer to train supervisors and heat safety coordinators on procedures they would have to follow if an employee exhibits signs and symptoms of heat related illness, which an employer is required to develop for its HIIPP pursuant to proposed paragraph (g)(1)(vi). This would ensure effective and rapid treatment and care for employees experiencing signs and symptoms of heat-related illness. OSHA included these proposed provisions to ensure that supervisors and heat safety coordinators receive additional training needed to perform their duties as specified in the proposed standard.

Proposed paragraph (h)(3) would require the employer to ensure that each employee receives annual refresher training on, and understands, the subjects addressed in paragraph (h)(1) of the proposed standard. This paragraph would also require that each supervisor and heat safety coordinator additionally receive annual refresher training on, and understands, the topics addressed in paragraph (h)(2). OSHA preliminarily finds that annual training is needed to refresh and reinforce an employee's recollection and knowledge about the topics addressed in this paragraph. This proposed provision also indicates that for employees who perform work outdoors, the employer must conduct the annual refresher training before or at the start of the heat season. This can

vary depending on the weather conditions in the geographic region where the employer is located. Accordingly, OSHA intends this requirement to be flexible and to allow employers leeway to determine the start of the heat season, so long as those determinations are reasonable. For example, in northern States such as Michigan, employers might find it best to do annual training before the time when temperatures commonly reach the initial heat trigger or above. In those cases, temperatures are likely to be below the initial heat trigger for a substantial portion of the year and employees are likely to need reminders of all policies and procedures related to heat, both for the initial and high heat triggers. Employers can determine when heat season is for them based on normal weather patterns and would be required to conduct training prior to or at the start of the heat season. In most instances, OSHA expects that employers would do this no sooner than 30 days before the start of their heat season, so that employees can recall training materials easily, rather than for example, 6-months before the start of heat season. For new employees at outdoor work sites, this may result in some employees receiving the annual refresher training less than a year after the initial training.

Proposed paragraph (h)(4) specifies when supplemental training would be required. Proposed paragraph (h)(4)(i) would require the employer to ensure that employees promptly receive and understand additional training whenever changes occur that affect the employee's exposure to heat at work (e.g., new job tasks, relocation to a different facility or area of a facility). For example, if an employee is assigned to a new task or workstation that exposes them to high process heat or to outdoor work where the employee is exposed to hazardous heat, and such employee was not previously trained on the necessary topics required under this paragraph, then the employer would have to provide that employee with the requisite training. Similarly, if an employee is assigned to a new work area to which different heat-related policies and procedures apply, they would need to be trained on these area-specific policies and procedures. Additional examples could include when an employer's work site experiences heat waves, when new heat sources are added to the workplace, or when employees are assigned to a new task where they need to wear vapor-impermeable PPE (i.e., non-breathable). In these instances, the training required

under this provision would have to comport with the requirements of the rest of this paragraph.

Proposed paragraph (h)(4)(ii) would require that each employee promptly receives, and understands, additional training whenever changes occur in policies and procedures addressed in paragraph (h)(1)(xi) of this proposed standard. Proposed paragraph (c) would require employers to monitor their HIIPP to ensure ongoing effectiveness. When doing so, the employer may find that the policies and procedures are inadequate to protect employees from heat hazards. If so, the employer would have to update those policies and procedures. When this happens, employers would be required to train all employees on the new or altered policies and procedures so that the employees are aware of the new policies and procedures and how to follow them to reduce their risk of developing heat-related illnesses and injuries.

Proposed paragraph (h)(4)(iii) would require that each employee promptly receives, and understands, additional training whenever there is an indication that an employee(s) has not retained the necessary understanding. Examples of this would include employees who appear to have forgotten signs and symptoms of heat-related illnesses or how to respond when an employee is experiencing those signs and symptoms. It is essential that employees remain familiar with training they have received so they continue to have the knowledge and skills needed to protect themselves and possibly co-workers from heat hazards. Supplemental training under paragraph (h)(4)(iii) must be provided to those employees who have demonstrated a lack of understanding or failure to follow the employer's heat policies and procedures or comply with the requirements of this proposed standard.

Proposed paragraph (h)(4)(iv) would require that each employee promptly receives, and understands, additional training whenever a heat-related injury or illness occurs at the work site that results in death, days away from work, medical treatment beyond first aid, or loss of consciousness. Occurrences of these types of heat-related injuries and illnesses could indicate that one or more employees are not following policies and procedures for preventing or responding to heat-related illnesses and injuries. After a heat-related illness or injury in the workplace occurs that meets the requirements of proposed paragraph (h)(4)(iv), OSHA expects that each employee would receive supplemental training. This training

could be a "lessons learned" or "alert" type training.

Both initial and supplemental training are important components of an effective heat injury and illness prevention program. Initial training provides employees with the knowledge and skills they need to protect themselves against heat hazards, and also emphasizes the importance of following workplace policies and procedures in the HIIPP. Supplemental training ensures employees continue to have the knowledge and skills they need to protect themselves from heat hazards. It provides an opportunity to present new information that was not available during the initial training or that becomes relevant when an employee's duties change. Additionally, supplemental training is necessary when an employee demonstrates that they have not retained information from the initial training (e.g., by failing to follow appropriate policies and procedures). Supplemental training does not necessarily need to include all information covered in the initial training, as only some policies or procedures may need to be reviewed, and employees will receive a full refresher training annually.

Proposed paragraph (h)(5) would require that all training provided under paragraphs (h)(1) through (4) is provided in a language and at a literacy level each employee, supervisor, and heat safety coordinator understands. In addition, the provision would require that the employer provide employees with an opportunity for questions and answers about the training materials. For the training to be effective, the employer must ensure that it is provided in a manner that the employee is able to understand. Employees have varying educational levels, literacy, and language skills, and the training must be presented in a language, or languages, and at a level of understanding that accounts for these differences. This may mean, for example, providing materials, instruction, or assistance in Spanish rather than English if the employees being trained are Spanish-speaking and do not understand English. The employer is not required to provide training in the employee's preferred language if the employee understands both languages; as long as the employee is able to understand the material in the language used, the intent of the proposed standard would be met. As explained above with respect to paragraph (h)(1), OSHA does not mandate testing or specific modes of ascertaining employee understanding of the training materials, but expects that

all required training will include some measure of comprehension.

The proposed provision does not specify the manner in which training would be delivered. Employers may conduct training in various ways, such as in-person (e.g., classroom instruction or informal discussions during safety meetings/toolbox talks), virtually (e.g., videoconference, recorded video, online training), using written materials, or any combination of those methods. However, this paragraph would require the employer to provide an opportunity for employees to ask questions regardless of the medium of training. It is critical that trainees have the opportunity to ask questions and receive answers if they do not fully understand the material that is presented to them. If it is not possible to have someone present or available during the training, employers could provide the contact information of the individual that employees can contact to answer their questions (e.g., an email or telephone contact). OSHA expects employers to make an effort to respond to questions promptly.

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Whether the agency should require other training topics in the standard;
- Whether the inclusion of separate training requirements for supervisors and heat safety coordinators is appropriate, or whether the duty-specific training requirements in proposed paragraph (h)(1) are sufficient;
- Whether the agency has identified appropriate triggers for supplemental training;
- Whether the agency should require annual refresher training or whether the more performance-based supplemental training requirements are sufficient; and
- Whether the agency should specify certain criteria that define the start of heat season.

I. Paragraph (i) Recordkeeping

Paragraph (i) of the proposed standard would require certain employers to create written or electronic records of on-site temperature measurements and establishes the duration of time that employers must retain those records. Specifically, it applies to employers that have indoor work areas where there is a reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger, and that are therefore required to conduct on-site temperature measurements under paragraph (d)(3)(ii). These employers must have and maintain written or electronic records of these

measurements. Under paragraph (i), employers must retain these records for a minimum of six months.

Maintaining these records, whether written or electronic, serves several purposes. It will assist OSHA in determining conditions at the work site, which will facilitate OSHA's ability to verify employers' compliance with the standard's provisions. Additionally, these records may facilitate employers identifying trends in indoor temperatures and their effect on employee health and safety. In the event of a heat-related injury or illness, these records can help employers assess the conditions at the time of the injury or illness in order to prevent such an event from recurring.

Paragraph (i) applies to indoor work areas only. This is because employers cannot accurately rely on weather forecasting to predict and monitor temperatures in these areas like they can for outdoor work areas. It is therefore not possible for OSHA or the employer to recreate historic temperature records for indoor work areas in the absence of on-site temperature measurement records. OSHA has preliminarily determined that six months is an appropriate timeframe for records retention because this is the maximum time permitted for an OSHA investigation (see 29 U.S.C. 658(c)). There are several commercially available heat monitoring devices that are capable of maintaining electronic logs of recorded measurements for six months (ERG, 2024b). Therefore, employers can comply with the recordkeeping requirement by using monitoring devices with sufficient storage capability. Alternatively, employers could comply by creating and maintaining written records based on monitoring devices that do not have digital recording capabilities.

A. Requests for Comments

OSHA requests comments and evidence regarding the following:

- Whether six months is an appropriate and feasible duration of time to maintain records of monitoring data;
- Whether permitting employers to maintain records on devices that store data locally is appropriate; and
- Whether the standard should require retention of any other records, and if so, for what duration.

J. Paragraph (j) Requirements Implemented at no Cost to Employees

Proposed paragraph (j) provides that implementation of all requirements of the standard must be at no cost to employees, including paying employees

their normal rate of pay when compliance requires employee time. This provision is included to make it clear that the employer is responsible for all costs associated with implementing the standard, including not only direct monetary expenses to the employee, but also reasonable time to perform required tasks and training.

This proposed requirement is consistent with the OSH Act, which requires employers to ensure a safe and healthful workplace. The OSH Act reflects Congress's determination that the costs of compliance with the Act and OSHA standards are part of the cost of doing business and OSHA may foreclose employers from shifting those costs to employees (see *Am. Textile Mfrs. Inst., Inc. v. Donovan*, 452 U.S. 490, 514 (1981); *Phelps Dodge Corp. v. OSHRC*, 725 F.2d 1237, 1239–40 (9th Cir. 1984); see also *Sec'y of Labor v. Beverly Healthcare-Hillview*, 541 F.3d 193, 198–201 (3d Cir. 2008)). The proposed requirement is also consistent with OSHA's longstanding practice in prior rulemakings. See, e.g., *Employer Payment for Personal Protective Equipment*; 72 FR 64342, 64344 (Nov. 15, 2007); *Occupational Exposure to Bloodborne Pathogens*, 56 FR 64004, 64125 (Dec. 1991). The intent of proposed paragraph (j) is that the standard be implemented at no cost to employees because employer payment for items, such as access to water and shade, is necessary to ensure employees are provided safe working conditions and are protected from the hazard of heat stress. Employees are more likely to take advantage of various workplace protections if such protections are provided at no cost to them. Moreover, as explained in Section VIII., Distributional Analysis, workers from underserved populations are disproportionately exposed to occupational heat hazards. For all workers, but particularly more vulnerable workers, protection from occupational hazards must not depend on workers' ability to pay for those protections. In indicating that the implementation of all requirements of this standard must be at no cost to the employee, OSHA considers costs to include not only direct monetary expenses to the employee, but also the time and other expenses necessary to perform required tasks.

The following discussion highlights specific proposed requirements in paragraphs (c) *Heat injury and illness prevention plan*, (d) *Identifying heat hazards*, (e) *Requirements at or above the initial heat trigger*, (f) *Requirements at or above the high heat trigger*, (g) *Heat illness and emergency response*

and planning, and (h) *Training*. This discussion is illustrative of the requirement that employees are not to bear the costs of implementing the standard. However, the requirement in proposed paragraph (j) applies to all provisions of the proposed standard, including employee time spent to implement or comply with those provisions.

Proposed paragraphs (c)(6) and (7) would require employers to seek the input and involvement of non-managerial employees and their representatives, if any, in the development and implementation of the heat injury and illness prevention plan (HIIPP) and during any reviews or updates of the HIIPP. Similarly, proposed paragraph (d)(3)(iv) would require the employer to seek the input and involvement of non-managerial employees and their representatives, if any, when evaluating the work site to identify work areas with a reasonable expectation of exposures at or above the initial heat trigger and in developing and updating monitoring plans. Under these paragraphs, the employer would be required to cover the expenses of non-managerial employees such as any travel costs that may be necessary, and to pay employees their normal rate of pay for the time necessary to engage in the development, implementation, and the required reviews and updates of the employer's HIIPP and monitoring plan.

Proposed paragraph (e)(2) would require the employer to provide access to potable water for drinking that is placed in locations readily accessible to the employee, suitably cool, and of sufficient quantity to provide access to 1 quart of drinking water per employee per hour. To ensure this is provided at no cost to employees, the employer would not only need to pay for the water, its container, and the means to utilize the water (cups, bottles, etc.) but would be required to pay employees their normal rate of pay for time necessary to consume water and any time that may be necessary to travel to and from the location where water is provided. For example, if an employee works in an area where water cannot be made available due to safety considerations (e.g., certain areas in foundries) or because of the presence of toxic materials, and must walk to a water fountain in a break room to obtain water, the employer would be required to pay the employee for the time required to walk to the water fountain, consume water, and return to the work area.

Proposed paragraph (e)(7) would require employers to implement an acclimatization protocol for new and

returning employees when they would be exposed to heat at or above the initial heat trigger except when the employer can demonstrate the employee consistently worked under the same or similar conditions as the employer's working conditions within the prior 14 days. An acclimatization protocol sets forth the process whereby employees gradually adapt to work in the heat. Proposed paragraph (e)(7)(i) specifies the acclimatization protocol for new employees exposed to heat at or above the initial heat trigger during their first week on the job. The employer would have a choice to either: (A) implement an acclimatization plan that, at minimum, would include the measures in proposed paragraph (f) (i.e., rest breaks, observation for signs and symptoms of heat-related illness, a hazard alert, and warning signs at excessively high heat areas); or (B) provide for gradual acclimatization to heat in which employee exposure to heat is restricted to no more than 20% of a normal work shift exposure duration on the first day of work, 40% on the second day of work, 60% of the third day of work, and 80% on the fourth day of work. Proposed paragraph (e)(7)(ii) specifies the acclimatization protocol for returning employees (i.e., employees who have been away (e.g., on vacation or sick leave) for more than 14 days) exposed to heat at or above the initial heat trigger during their first week back on the job. The employer would have a choice to either: (A) implement an acclimatization plan that, at minimum, would incorporate the measures in proposed paragraph (f) whenever the heat index is at or above the initial heat trigger during the employee's first week upon returning to work; or (B) provide for gradual acclimatization to heat in which employee exposure to heat is restricted to no more than 50% of a normal work shift exposure during the first day of work, 60% on the second day of work, and 80% on the third day of work.

An employer who chooses to provide a plan for gradual acclimatization to heat in which employee exposure to heat is restricted would be required to compensate the employee for the hours they would typically be expected to work, i.e., the employee's normal full shift, after acclimatization. For example, if a new employee would be expected to work 8 hours on a normal shift after acclimatization and the new employee would be restricted to 50% exposure during the normal work shift or 4 hours on the first day, the employer would be required to compensate the employee at their normal rate of pay for the full 8

hours even if the employee worked for only 4 hours.

OSHA anticipates that many employers would provide employees with other work (e.g., work activities performed in indoor work areas or vehicles where air-conditioning consistently keeps the ambient temperature below 80 °F, sedentary work activities at indoor work sites) during the acclimatization period when they are restricted from duties that involve exposure to heat at or above the initial heat trigger. Employees would still be able to work a full 8-hour shift as long as their duration of exposure to heat at or above the initial heat trigger is limited to the specified duration.

Proposed paragraphs (e)(8) and (f)(2) would require that employees be paid during the rest breaks required by those provisions. OSHA finds it important that employees be paid during the breaks to which they are entitled under the standard so that employees are not financially penalized and thus discouraged from taking advantage of those protections. For employees compensated on an hourly basis, this means employees would need to receive the same hourly rate of pay during rest breaks required by paragraphs (e)(8) and (f)(2) as they would receive while working.

Some employees are paid on a piece-rate basis, meaning they are compensated based on factors such as jobs completed, quantity of produce picked, or products produced. Examples of employees compensated on a piece-rate basis include agricultural employees paid by the pound of produce picked, mechanics paid for each type of job completed (e.g., oil change or tune-up), warehouse employees paid by the number and size of orders filled, manufacturing employees paid by the number of products manufactured, or construction employees paid by the size and type of job completed. Employees paid on a piece-rate basis may be especially reluctant to take breaks. In a study by Wadsworth et al., 2019, focus group discussions with piece-rate farm employees revealed that many expressed concerns about possible losses in earnings and that they might be replaced by another employee if they took breaks, and many such employees brought their own water to work to reduce the time they are not picking produce.

To ensure piece rate employees are not discouraged from taking rest breaks, the proposed standard would require employers to compensate them at their normal rate of pay for time necessary for rest breaks. In the context of piece rate

employees and for purposes of this proposed standard, OSHA intends the phrase “normal rate of pay” to mean the rate that results from the following approach, which has also been adopted by the State of California (Cal. Lab. Code section 226.2 (eff. Jan 1, 2021)): employers would determine the normal rate of pay for piece-rate employees by dividing the total weekly pay by the total hours worked during the work week, not including heat-related rest breaks. That value would be multiplied by the total time of heat-related rest breaks to determine how much employees need to be paid for those breaks. For example, if a piece-rate employee works a 5-day work week, 8 a.m. to 4:30 p.m. with a 30-minute unpaid lunch break from 12–12:30 each day, and earns \$600 in piece rate pay for the week, and under proposed paragraph (f)(2) the employer would be obligated to provide two 15-minute heat-related rest breaks per day (*i.e.*, the employee is exposed at or above the high heat trigger from 8 a.m. to 4:30 p.m. each day), that employee would receive a normal rate of pay of \$16/hour for heat-related rest breaks based on the following formula:

Formula for Heat-Related Rest Break Compensation of Piece-rate Employees

$$\frac{\text{Total heat-related rest break time/week} = 0.5 \text{ hours/day} \times 5 \text{ days/week} = 2.5 \text{ hours/week}}{\text{Hours worked, excluding non-meal heat-related breaks} = 40 \text{ hours} - 2.5 \text{ hours} = 37.5 \text{ hours}}$$

$$\text{Heat-related rest break compensation per hour} = \$600 \div 37.5 \text{ hours} = \$16/\text{hour}$$

For an employee who also took rest breaks needed to prevent overheating under proposed paragraph (e)(8), the time of those rest break(s) would be added to the total heat-related rest break time per week to calculate the employee's normal rate of pay. OSHA has preliminarily determined that this approach accurately represents the normal rate of pay for piece-rate workers and thereby ensures that these workers would not lose pay when taking advantage of the standard's protection.

Proposed paragraph (g)(2)(i) would require that an employee experiencing signs and symptoms of heat-related illness must be relieved from duty. The proposed standard would require the employer to pay employees their normal pay while they are relieved from duty until the signs and symptoms subside.

Proposed paragraph (h) would establish requirements for training on heat hazards and associated protective measures. All training provided by the

employer to meet the requirements of the standard would be required to be provided at no cost to the employee. The employer would be required to pay employees for time spent in training, including any time needed to travel to and from training.

A. Requests for Comments

OSHA requests comments and information on the following:

- Whether OSHA should consider an alternative approach to calculating normal rate of pay for piece-rate employees, and what those alternative approaches are;
- Whether OSHA should make the calculation for piece rate workers' normal rate of pay explicit in paragraph (j); and
- Whether proposed paragraph (j) mandating that requirements be implemented at no cost to employees is adequate, or whether there are other potential costs to employees that OSHA should take into consideration.

K. Paragraph (k) Dates

Paragraph (k) of the proposed standard would establish the effective date for the final standard and the date for compliance with the requirements specified in the standard. In paragraph (k)(1), OSHA proposes an effective date 60 days after the date of publication of the final standard in the **Federal Register**. This period is intended to allow affected employers the opportunity to familiarize themselves with the standard.

Paragraph (k)(2) of the proposed standard would require employers to comply with all requirements of the standard 90 days after the effective date (150 days after the date of publication of the final standard in the **Federal Register**). The proposed compliance date is intended to allow adequate time for employers to undertake the necessary planning and preparation steps to comply with the standard. OSHA has preliminarily concluded that 90 days is sufficient time for employers to develop a heat injury and illness prevention plan (HIIPP), identify heat hazards in their workplace(s), implement the protective measures required under the standard, and provide required training to employees.

A. Requests for Comments

OSHA solicits comment on the adequacy of the proposed effective and compliance dates. OSHA aims to ensure that protective measures are implemented as quickly as possible, while also ensuring that employers have sufficient time to implement these measures. In addition, the agency is

interested in whether there are any circumstances that would warrant an alternative timeframe for compliance, including a shorter timeframe, and seeks comment on approaches that would phase in requirements of the standard.

L. Paragraph (l) Severability

The severability provision, paragraph (l) of the proposed standard, serves two purposes. First, it expresses OSHA's intent that the general presumption of severability should be applied to this standard; *i.e.*, if any section or provision of the proposed standard is held invalid or unenforceable or is stayed or enjoined by any court of competent jurisdiction, the remaining sections or provisions should remain effective and operative. Second, the severability provision also serves to express OSHA's judgment, based on its technical expertise, that each individual section and provision of the proposed standard remains workable in the event that one or more sections or provisions are invalidated, stayed, or enjoined; thus, the severance of any provisions, sections, or applications of the standard will not render the standard ineffective or unlawful as a whole. Consequently, the remainder of the standard should be allowed to take effect.

With respect to this rulemaking, it is OSHA's intent that all provisions and sections be considered severable. In this regard, the agency intends that: (1) in the event that any provision within a section of the standard is stayed, enjoined, or invalidated, all remaining provisions within remain workable and shall remain effective and operative; (2) in the event that any whole section of the standard is stayed, enjoined, or invalidated, all remaining sections remain workable and shall remain effective and operative; and (3) in the event that any application of a provision is stayed, enjoined, or invalidated, the provision shall be construed so as to continue to give the maximum effect to the provision permitted by law.

Although OSHA always intends for a presumption of severability to be applied to its standards, the agency has opted to include an explicit severability clause in this standard to remove any potential for doubt as to its intent. OSHA believes that this clarity is useful because of the multilayered programmatic approach to risk reduction it proposes here. The agency has preliminarily determined that the suite of programmatic requirements described in Section VII., Explanation of Proposed Requirements, is reasonably necessary and appropriate to protect employees from the significant risks posed by exposure to heat in the

workplace. While OSHA preliminarily finds that these requirements substantially reduce the risk of occupational injury and illness from exposure to heat when implemented together, the agency also believes that each individual requirement will independently reduce this risk to some extent, and that each requirement added to the first will result in a progressively greater reduction of risk. For example, should a reviewing court find the requirement of paragraph (f)(2), requiring 15 minute rest breaks every two hours in high heat conditions invalid for some reason, the remainder of controls required by the standard in those conditions would still provide necessary protections to employees, and OSHA would intend that the rest of the standard should stand. Therefore, OSHA intends to have as many of the protective measures in this standard implemented as possible to reduce employees' risk of occupational injury, illness, and death from exposure to heat. Should a court of competent jurisdiction determine that any provision or section of this standard is invalid on its face or as applied, the court should presume that OSHA would have issued the remainder of the standard without the invalidated provision(s) or application(s). Similarly, should a court of competent jurisdiction determine that any provision, section, or application of this standard is required to be stayed or enjoined, the court should presume that OSHA intends for the remainder of the standard to take effect. See, e.g., *Am. Dental Ass'n v. Martin*, 984 F.2d 823, 830–31 (7th Cir. 1993) (affirming and allowing most of OSHA's bloodborne pathogens standard to take effect while vacating application of the standard to certain employers).

VIII. Preliminary Economic Analysis and Initial Regulatory Flexibility Analysis

OSHA has examined the impacts of this rulemaking as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (January 18, 2011), Executive Order 14094 entitled "Modernizing Regulatory Review" (April 6, 2023), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96354), section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995; Pub. L. 104–4), and Executive Order 13132 on Federalism (August 4, 1999).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is

necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity).⁵ The Executive Order 14094 entitled "Modernizing Regulatory Review" (hereinafter, the Modernizing E.O.) amends section 3(f)(1) of Executive Order 12866 (Regulatory Planning and Review). The amended section 3(f) of Executive Order 12866 defines a "significant regulatory action" as an action that is likely to result in a rule: (1) having an annual effect on the economy of \$200 million or more in any 1 year (adjusted every 3 years by the Administrator of the Office of Information and Regulatory Affairs (OIRA) for changes in gross domestic product), or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, territorial, or Tribal governments or communities; (2) creating a serious inconsistency or otherwise interfering with an action taken or planned by another agency; (3) materially altering the budgetary impacts of entitlement grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) raise legal or policy issues for which centralized review would meaningfully further the President's priorities or the principles set forth in this Executive Order, as specifically authorized in a timely manner by the Administrator of OIRA in each case.

A regulatory impact analysis (RIA) must be prepared for regulatory actions that are significant per section 3(f)(1) (\$200 million or more in any 1 year). OMB's OIRA has determined this rulemaking is significant per section 3(f)(1) as measured by the \$200 million or more in any 1 year. Accordingly, OSHA has prepared this Preliminary Economic Analysis (PEA)⁶ that to the best of the agency's ability presents the costs and benefits of the rulemaking. OIRA has reviewed this proposed standard, and the agency has provided the following assessment of its impact.

⁵ While OSHA presents the following analysis under the requirements of Executive Orders 12866 and 13563, the agency ultimately cannot simply maximize net benefits due to the overriding legal requirements in the OSH Act.

⁶ OSHA historically has referred to their regulatory impact analyses (RIAs) as Economic Analyses in part because performing an analysis of economic feasibility is a core legal function of their purpose. But a PEA (or Final Economic Analysis) should be understood as including an RIA.

A. Market Failure and Need for Regulation

I. Introduction

Executive Order 12866 (58 FR 51735 (September 30, 1993)) and Executive Order 13563 (76 FR 3821 (January 18, 2011)) direct regulatory agencies to assess whether, from a legal or an economic view, a Federal regulation is needed to the extent it is not "required by law." Executive Order 12866 states: "Federal agencies should promulgate only such regulations as are required by law, are necessary to interpret the law, or are made necessary by compelling public need, such as material failures of private markets to protect or improve the health and safety of the public, the environment, or the well-being of the American people." This Executive Order further requires that each agency "identify the problem that it intends to address (including, where applicable, the failures of private markets or public institutions that warrant new agency action)" and instructs agencies to "identify and assess available alternatives to direct regulation." (58 FR 51735 (September 30, 1993)). This section addresses those issues of market failure and alternatives to regulation as directed by the Executive Order.

OSHA is proposing a new standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings (29 CFR 1910.148) because the agency has preliminarily determined, based on the evidence in the record, that there is a compelling public need for a comprehensive standard addressing employees' occupational exposure to hazardous heat. OSHA presents the legal requirements governing this standard and its preliminary findings and conclusions supporting the proposed standard in Section II., Pertinent Legal Authority, and throughout other sections of the preamble.

As detailed in Section VIII.B., Profile of Affected Industries, OSHA has preliminarily determined that millions of employees are exposed to occupational heat hazards that place them at a significant risk of serious injury, illness, and death. Employees exposed to heat suffer higher rates of non-fatal heat-related injuries and illnesses (HRIs) and heat-related fatalities, including heat stroke, heat exhaustion, heat syncope, rhabdomyolysis, heat cramps, hyponatremia, heat edema, and heat rash; and heat-related injuries, including falls, collisions, and other workplace accidents (see Section IV., Health Effects for additional information). OSHA estimates that the

proposed standard would prevent 531 heat-related fatalities (of the estimated 559 annual fatalities) and 16,027 HRIs per year (of the estimated 24,656 annual HRIs).

These estimates have potential limitations. The parameters used to estimate the magnitude of underreporting of HRIs and the effectiveness of the proposed standard have considerable uncertainty. Furthermore, these estimates do not account for other expected benefits from the rule (e.g., reduction in indirect traumatic injuries due to heat and reduction in worker disutility). For additional discussion see Sections VIII.E.IV., Additional Unquantified Potential Benefits and VIII.E.V., Uncertainty in Benefits.

OSHA has also preliminarily determined that the standard is technologically and economically feasible (see Section IX., Technological Feasibility and Section VIII.D., Economic Feasibility). The agency not only finds that this proposed standard is necessary and appropriate to ensure the safety and health of employees exposed to heat, as required by the OSH Act, but also demonstrates, in this section, that this standard corrects a market failure in which labor markets fail to adequately protect employee health and safety.

Even a perfectly functioning market maximizes efficient allocation of goods and services at the expense of other important social values to which the market (as reflected in the collective actions of its participants) is indifferent or undervalues. In such cases, government intervention might be justified to address a compelling public need. The history and enactment of the OSH Act indicate a Congressional view that American markets undervalued occupational safety and health when it set forth the Act's protective purposes and authorized the Secretary of Labor to promulgate occupational safety and health standards.

As discussed in this section, OSHA concludes there is a demonstrable failure of labor markets to protect employees from exposure to significant, unnecessary risks from heat exposure. The agency recognizes that many firms and governments have responded to the risks from heat exposure by implementing control programs for their employees. Information that OSHA has collected suggests that many employees with occupational exposure to hazardous heat currently receive some level of protection against heat hazards and some existing control programs may be as protective as the proposed standard. Nevertheless, the effectiveness of labor markets in providing the level

of employee health and safety required by the OSH Act is not universal, as many other employers in the same sectors fail to provide their employees with adequate protection against heat hazards. This is evidenced by the documented injuries, illnesses, and deaths discussed throughout this preamble. Accordingly, the existence of adequate protections in some workplaces speaks to the feasibility of the standard, not necessarily to the lack of need.

In this case, OSHA has preliminarily determined that protections are needed to ensure the safety and health of employees exposed to heat. This section is devoted to showing that markets fail with respect to optimal risk for occupational exposure to heat hazards. Other sections of this preamble address whether, given that markets fail, a new regulation is needed.

The discussion below considers why labor markets, as well as information dissemination programs, workers' compensation systems, and tort liability options, each may fail to protect employees from heat hazards, resulting in the need for a more protective OSHA standard.

II. Labor Market Imperfections

Under suitable conditions, a market system is economically efficient in the following sense: resources are allocated where they are most highly valued; the appropriate mix of goods and services, embodying the desired bundle of characteristics, is produced; and further improvements in the welfare of any member of society cannot be attained without making at least one other member worse off.

Economic theory, supported by empirical data, posits that, in the labor market, employers and their potential employees bargain over the conditions of employment, including not only salary and other employee benefits, but also occupational risks to employee safety and health. Employers compete among themselves to attract employees. In order to induce potential employees to accept hazardous jobs, employers must offer a higher salary—termed a “wage premium for risk” or “risk premium” for short—to compensate for the additional job risk.⁷ Because employers must pay higher wages for

⁷ The concept of compensating wage differentials for undesirable job characteristics, including occupational hazards, goes back to Adam Smith's *The Wealth of Nations*, which was originally published in 1776. More recent empirical investigation has tended to validate the core theory, with the acknowledgement of labor market imperfections, as otherwise noted in this section (e.g., Lavetti, 2023).

more hazardous work, they have an incentive to make the workplace safer by making safety-related investments in equipment and training or by using more costly but safer work practices. According to economic theory, the operation of the labor market will provide the optimal level of occupational risk when each employer's additional cost for job safety just equals the avoided payout in risk premiums to employees (Lavetti, 2023). The theory assumes that each employer is indifferent to whether it pays the higher wage or pays for a safer or more healthful workplace but will opt for whichever costs less or improves productivity more.

For the labor market to function in a way that leads to optimal levels of occupational risk, three conditions must be satisfied. First, potential employees and employers must have the same, perfect information—that is, they must be fully informed about their workplace options, including job hazards, or be able to acquire such information. Second, participants in the labor market must directly bear all the costs and obtain all the benefits of their actions. In other words, none of the direct impacts of labor market transactions can be externalized to outside parties. Third, the relevant labor markets must be perfectly competitive, which requires a large number of employers, a large number of employees, and other conditions such that no individual economic agent is able to influence the risk-adjusted wage, and such that the risk-adjusted wage, net of other amenities, is equal to the marginal revenue associated with their output (Card, 2022).

The discussion below examines (1) imperfect information, (2) externalities, and (3) imperfect competition in the labor market in more detail, with particular emphasis on employee exposure to heat hazards, as appropriate.⁸

A. Imperfect Information

As described below, imperfect information about job hazards is present at several levels that reinforce each other: employers frequently lack knowledge about workplace hazards and how to reduce them; employees are often unaware of the workplace risks to which they are exposed; and employees typically have difficulty in understanding the risk information they are able to obtain. Imperfect information at these various levels has likely

⁸ The section on workers' compensation insurance later in this section identifies and discusses other related market imperfections.

impeded the efficient operation of the labor market regarding workplace risk because employees—unaware of job hazards—do not seek, or receive, full compensation for the risks they bear. As a result, even if employers have full knowledge about the risk, their employees do not. If employees do not have full knowledge about the risk, employers have less incentive to invest in safer working conditions than they would in the presence of full information since wages are suppressed below what full knowledge by the employees would yield.

I. Lack of Employer Information

In the absence of regulation, employers may lack economic incentives to optimally identify the safety and health risks that their employees face.⁹ Furthermore, employers have an economic incentive to withhold the information they do possess about job hazards from their employees, whose response would be to demand safe working conditions or higher wages to compensate for the risk. Relatedly, in the absence of regulation, employers, as well as third parties, may have fewer incentives to develop new technological solutions to protect employees on the job.¹⁰

This suggests that, without regulation, and the incentives that come with it, many employers are unlikely to make themselves aware of the magnitude of heat-related safety and health risks in the workplace or of the availability of effective ways of ameliorating or eliminating these risks. OSHA believes that requiring employers to monitor heat conditions will help to alleviate situations in which employers and/or employees may not realize situations when heat becomes hazardous.

II. Lack of Employee Information About Health Hazards

Markets cannot adequately address the risks of occupational heat exposure if employees and employers are unaware of the changes in risk brought about by an employer's actions or inaction. Even if employees and employers are aware of a risk, the employer may have limited economic motivation to install controls unless the employees are able to accurately assess

the effects of those controls on their occupational risks.

Accordingly, even if employees have a general understanding that they are at increased risk of injury or illness from occupational exposure to heat, it is unrealistic to expect, absent mandatory regulatory requirements, that they know the precise risks associated with different exposure levels or the exposures they are experiencing, much less that they can use that knowledge to negotiate a significant reduction in exposures and other protections or (if more desirable) trade it for greater hazard pay.

Both experimental studies and observed market behavior suggest that individuals have considerable difficulty rationally processing information about low-probability, high-consequence events such as occupational fatalities and long-term disabilities.¹¹ For example, many individuals may not be able to comprehend or rationally act on risk information when it is presented, as risk analysis often is, in mathematical terms—a 1/1,000 versus a 1/10,000 versus a 1/100,000 annual risk of death from occupational causes.

Of course, in the abstract, many of the problems that employers and employees face in obtaining and processing occupational risk can lead employees to overestimate as well as underestimate the risk. However, some of the impacts of heat exposure may be sufficiently infrequent, unfamiliar, or unobvious that many employees (and at least some employers) may be completely unaware of the risk, and therefore will underestimate it.

In addition, for markets to optimally address this risk, employees need to be aware of the changes in risk brought about by an employer's actions. Even if employees are aware of a risk, the employer may have limited economic motivation to install controls or implement protective measures unless the employees are able to accurately assess the effects of those controls or measures on their occupational risks. Furthermore, there is substantial evidence that most individuals are unrealistically optimistic, even in high-stakes, high-risk situations and even if they are aware of the statistical risks (Thaler and Sunstein, 2009). Although the agency lacks specific evidence on the effect of these attitudes on assessing occupational safety and health risks, this suggests that some employees underestimate their own risk of work-

related injury or illness and, therefore, even in situations where they have the bargaining power to do so, may not bargain for or receive adequate compensation for bearing those risks. Finally, the difficulty that employees have in distinguishing marginal differences in risk at alternative worksites, both within an industry and across industries, creates a disincentive for employers to incur the costs of reducing workplace risk.

B. Externalities

Externalities arise when an economic transaction generates direct positive or negative spillover effects on third parties not involved in the transaction. The resulting spillover effect, which leads to a divergence between private and social costs, undermines the efficient allocation of resources in the market because the market is imparting inaccurate cost and price signals to the transacting parties. Applied to the labor market, when costs are externalized, they are not reflected in the decisions that employers and their potential employees make—leading to allocative distortions in that market.

Negative externalities exist in the labor market because many of the costs of occupational injury and illness are borne by parties other than individual employers or employees. The major source of these negative externalities is the occupational injury or illness cost that workers' compensation does not cover.¹² Employees and their employers often bear only a portion of these costs. Outside of workers' compensation, employees incapacitated by an occupational injury or illness and their families often receive health care, rehabilitation, retraining, direct income maintenance, or life insurance benefits, much of which are paid for by society through Social Security and other social insurance and social welfare programs.¹³

Furthermore, substantial portions of the medical care system in the United States are heavily subsidized by the

⁹ Other private parties may lack sufficient incentives to invest resources to collect and analyze occupational risk data due to the public-good nature of the information. See Ashford and Caldart (1996).

¹⁰ For evidence of regulatory stimuli inducing innovations to improve employee health and safety, see, for example, Ashford et al. (1985), as well as more recent evidence from OSHA's regulatory reviews under section 610 of the RFA (5 U.S.C. 610).

¹¹ The literature documenting risk perception problems is extensive. See the classic work of Tversky and Kahneman (1974). For a recent summary of risk perception problems and their causes (Thaler and Sunstein, 2009).

¹² Workers' compensation is discussed separately later in this section. As described there, in many cases (particularly for smaller firms), the premiums that an individual employer pays for workers' compensation are only loosely related, or unrelated, to the occupational risks that that employer's employees bear. In addition, workers' compensation does not cover chronic occupational diseases in most instances. For that reason, negative externalities tend to be a more significant issue in the case of occupational exposures that result in diseases.

¹³ In addition, many occupational injuries and most occupational illnesses are not processed through the workers' compensation system at all. In these instances, employees receive care from their own private physician rather than from their employer's physician.

government so that part of the medical cost of treating injured or ill employees is paid for by the rest of society (Nichols and Zeckhauser, 1977). To the extent that employers and employees do not bear the full costs of occupational injury and illness, they will ignore these externalized costs in their labor market negotiations. The result may be an inefficiently high level of occupational risk.

C. Imperfect Competition

In the idealized labor market, the actions of large numbers of buyers and sellers of labor services establish the market-clearing, risk-compensated wage, so that individual employers and employees effectively take that wage as given. However, the labor market is not one market, but many markets differentiated by location, occupation, and other factors; entrants in the labor market face search frictions because of limited information on employment options; and, furthermore, in wage negotiations with their own employees, employers are typically in an advantageous position relative to all other potential employers (e.g., Card, 2022). In these situations, discussed below, employers may have sufficient power to influence or to determine the wage their employees receive. This may undermine the conditions necessary for perfect competition and can result in inadequate compensation for employees exposed to workplace hazards. Significant unemployment levels, local or national, may also undermine the conditions necessary for adequate compensation for exposure to workplace hazards (Hirsch et al., 2018).

Beyond the classic—but relatively rare—example of a town dominated by a single company, there is significant evidence that some employers throughout the economy are not wage-takers but, rather, face upward-sloping labor supply curves and enjoy some market power in setting wages and other conditions of employment.¹⁴ An important source of this phenomenon is the cost of a job search and the employer's relative advantage, from size and economies of scale, in acquiring labor market information.¹⁵ Another potentially noteworthy problem in the

labor market is that, contrary to the model of perfect competition, employees with jobs cannot without cost quit and obtain a similar job at the same wage with another employer. Employees leaving their current job may be confronted with the expense and time requirements of a job search, the expense associated with relocating to take advantage of better employment opportunities, the loss of firm-specific human capital (i.e., firm-specific skills and knowledge that the employee possesses¹⁶), the cost and difficulty of upgrading job skills, and the risk of a prolonged period of unemployment. Finally, employers derive market power from the fact that a portion of the compensation their employees receive is not transferable to other jobs. Examples include job-specific training and associated compensation, seniority rights and associated benefits, and investments in a pension plan.

Under the conditions described above, employers would not have to take the market-clearing wage as given but could offer a lower wage than would be observed in a perfectly competitive market,¹⁷ including less than full compensation for workplace health and safety risks. As a result, relative to the idealized competitive labor market, employers would have less incentive to invest in workplace safety. In any event, for reasons already discussed, an idealized wage premium is not an adequate substitute for a workplace that puts a premium on health and safety.

III. Non-Market and Quasi-Market Alternatives

The following discussion considers whether non-market and quasi-market alternatives to the proposed standard would be capable of protecting employees from heat hazards. The alternatives under consideration are information dissemination programs, workers' compensation systems, and tort liability options.

A. Information Dissemination Programs

One alternative to OSHA's proposed standard could be the dissemination of information, either voluntarily or through compliance with a targeted mandatory information rule, akin to OSHA's Hazard Communication standard (29 CFR 1910.1200), which would provide more information about the safety and health risks associated with exposure to environmental heat.

Better informed potential employees could more accurately assess the occupational risks associated with different jobs, thereby facilitating, through labor market transactions, higher risk premiums for more hazardous work and inducing employers to make the workplace less hazardous. The proposed standard recognizes the link between the dissemination of information and workplace risks by requiring that employees exposed to heat be provided with information and training about the risks they encounter and ways to mitigate those risks. There are several reasons, however, why reliance on information dissemination programs alone would not yield the level of employee protection achievable through the proposed standard, which incorporates hazard communication as part of a comprehensive approach designed to control the hazard in addition to providing for the disclosure of information about it.

First, in the case of voluntary information dissemination programs, absent a regulation, there may be significant economic incentives, for all the reasons discussed in section VIII.A.II. above, for the employer *not* to gather relevant exposure data or distribute occupational risk information so that the employees would not change jobs or demand higher wages to compensate for their newly identified occupational risks.

Second, even if employees were better informed about workplace risks and hazards, all of the defects in the functioning of the private labor market previously discussed—the limited ability of employees to evaluate risk information, externalities, and imperfect competition—would still apply. Because of the existence of these defects, better information alone would not lead to wage premiums for risk that would incentivize employers to make workplaces safer, in accordance with compensating differentials theory (Lavetti, 2023). Regardless, as mentioned above in section VIII.A.I., even the level of employee safety and health attained by the wage premium under efficient markets may be lower than the level justified by other important social values that efficient markets may undervalue. Finally, as discussed in Section VIII.E., Benefits, a number of additional safety provisions under the proposed standard would complement information and training provided by other regulatory vehicles.

Thus, while improved access to information about heat-related hazards can provide for more rational decision-making in the private labor market,

¹⁴ See Borjas (2000), Ashenfelter et al. (2010), and Boal and Ransom (1997). The term “monopsony” power or “oligopsony” power are sometimes applied to this situation.

¹⁵ See Borjas (2000). As supplemental authorities, Weil (2014) presents theory and evidence both in support of this proposition and to show that, in many situations, larger firms have more market power than smaller firms, while Boal and Ransom (1997) note that the persistent wage dispersion observed in labor markets is a central feature of equilibrium search models.

¹⁶ MacLeod and Nakavachara (2007) note the correlation between firm-specific skills and relatively high income.

¹⁷ For a graphical demonstration that an employer with monopsony power will pay less than the competitive market wage, see Borjas (2000).

OSHA concludes that information dissemination programs would not, by themselves, produce an adequate level of employee protection.

B. Workers' Compensation Systems

Another theoretical alternative to OSHA regulation could be to determine that no standard is needed because State workers' compensation programs augment the workings of the labor market to limit occupational risks to employee safety and health. After all, one of the objectives of the workers' compensation system is to shift the costs of occupational injury and illness from employees to employers in order to induce employers to improve working conditions. Two other objectives relevant to this discussion are to provide fair and prompt compensation to employees for medical costs and lost wages resulting from workplace injury and illness and, through the risk-spreading features of the workers' compensation insurance pool, to prevent individual employers from suffering a catastrophic financial loss (Ashford, 2007).

OSHA identifies two primary reasons, discussed below, why the workers' compensation system has fallen short of the goal of shifting to employers the costs of workplace injury and illness—including, in particular, the costs of employee exposure to heat-related hazards. As a result, OSHA concludes that workers' compensation programs alone do not adequately protect employees.

I. Limitations on Payouts

The first reason that employers do not fully pay the costs of work-related injuries and illnesses under the workers' compensation system is that, even for those claims that are accepted into the system, States have imposed significant limitations on payouts. Depending on the State, these limitations and restrictions include:

- Caps on wage replacement based on the average wage in the State rather than the injured employee's actual wage;
- Restrictions on which medical care services are compensated and the amount of that compensation;
- No compensation for non-pecuniary losses, such as pain and suffering or impairment not directly related to earning power;
- Either no, or limited, cost-of-living increases;
- Restrictions on permanent, partial, and total disability benefits, either by specifying a maximum number of weeks for which benefits can be paid or by imposing an absolute ceiling on dollar payouts; and

- A low absolute ceiling on death benefits.

II. A Divergence Between Workers' Compensation Premiums and Workplace Risk

The second reason workers' compensation does not adequately shift the costs of work-related injuries and illnesses to employers is that the risk-spreading objective of workers' compensation conflicts with, and ultimately helps to undermine, the cost-internalization objective.¹⁸ For the 99 percent of employers who rely on workers' compensation insurance,¹⁹ the payment of premiums represents their primary cost for occupational injuries and illnesses, such as heat-related injuries and illnesses. However, the mechanism for determining an employer's workers' compensation insurance premium typically fails to reflect the actual occupational risk present in that employer's workplace.

Approximately 85 percent of employers have their premiums set based on a "class rating," which is based on *industry* illness and injury history. Employers in this class are typically the smallest firms and represent only about 15 percent of employees (Ashford, 2007). Small firms are often ineligible for experience rating because of insufficient claims history or because of a high year-to-year variance in their claim rates. These firms are granted rate reductions only if the experience of the entire class improves. The remaining 14 percent of employers, larger firms representing approximately 70 percent of employees, have their premiums set based on a combination of "class rating" and "experience rating," which adjusts the class rating to reflect a firm's individual claims experience. A firm's experience rating is generally based on the history of workers' compensation payments to employees injured at that firm's workplace, not on the quality of the firm's overall employee protection program or safety and health record. Thus, for example, the existence of circumstances that may lead to catastrophic future losses are not included in an experience rating—only

actual past losses are included.²⁰ Insurance companies do have the right to refuse to provide workers' compensation insurance to an employer—and frequently exercise that right based on their inspections and evaluations of a firm's health and safety practices. However, almost all States have assigned risk pools that insist that any firm that cannot obtain workers' compensation policies from any insurer must be provided workers' compensation insurance at a State-mandated rate that reflects a combination of class and experience rating. Workers' compensation insurance does protect individual employers against a catastrophic financial loss due to work-related injury or illness claims. As a result of risk spreading, however, employers' efforts to reduce the incidence of occupational injuries and illnesses are not fully reflected in reduced workers' compensation premiums. Conversely, employers who devote fewer resources to promoting employee safety and health may not incur commensurately higher workers' compensation costs. This creates a type of moral hazard, in that the presence of risk spreading in workers' compensation insurance may induce employers to make fewer investments in equipment and training to reduce the risk of workplace injuries and illnesses.

In short, the premiums most individual employers pay for workers' compensation insurance coverage do not reflect the actual cost burden those employers impose on the worker's compensation system. Consequently, employers considering measures to lower the incidence of workplace injuries and illnesses can expect to receive a less-than-commensurate reduction in workers' compensation premiums. Thus, for all the reasons discussed above, the workers' compensation system does not provide adequate incentives to employers to control occupational risks to worker safety and health.

C. Tort Liability Options

Another alternative to OSHA regulation could be for employees to use the tort system to seek redress for work-related injuries and illnesses, including heat-related ones.²¹ A tort is a civil

¹⁸ Recall from the earlier discussion of externalities that the failure to internalize costs leads to allocative distortions and inefficiencies in the market.

¹⁹ Only the largest firms, constituting approximately 1 percent of employers and representing approximately 15 percent of employees, are self-insured. These individual firms accomplish risk-spreading as a result of the large number of employees they cover (Ashford, 2007). From 2000 to 2020, the share of Workers' Compensation Benefits paid by self-insured employers rose from 22.0 percent to 24.7 percent (Murphy and Wolf, 2022).

²⁰ In order to spread risks in an efficient manner, it is critical that insurers have adequate information to set individual premiums that reflect each individual employer's risks. As the preceding discussion has made clear, by and large, they do not. In that sense, insurers can be added to employers and employees as possessing imperfect information about job hazards.

²¹ The OSH Act does not provide a private right of action that would allow affected workers to sue

wrong (other than breach of contract) for which the courts can provide a remedy by awarding damages. The application of the tort system to occupational injury and illness would allow employees to sue their employer, or other responsible parties where applicable (e.g., “third parties” such as suppliers of hazardous material or equipment used in the workplace) to recover damages. In theory, the tort system could shift the liability for the direct costs of occupational injury and illness from the employee to the employer or to other responsible parties. In turn, the employer or third parties would be induced to improve employee safety and health.

With limited exceptions, the tort system has not been a viable alternative to occupational safety and health regulation. In addition, State statutes make workers’ compensation the “exclusive remedy” for work-related injuries and illnesses. Workers’ compensation is essentially a type of no-fault insurance. In return for employers’ willingness to provide, through workers’ compensation, timely wage-loss and medical coverage for workers’ job-related injuries and illnesses, regardless of fault, employees are barred from suing their employers for damages, except in cases of intentional harm or, in some States, gross negligence (Ashford and Caldwell, 1996). Even in cases of gross negligence where it is possible for employees to sue, establishing gross negligence in these incidences is complicated by heat conditions as these conditions may be temporary and localized, and not necessarily measured at the time of incident. Practically speaking, in most cases, workers’ compensation is the exclusive legal remedy available to employees for workplace injuries and illnesses.

Employees are thus generally barred from suing their own employers in tort for occupational injuries or illnesses but may attempt to recover damages for work-related injuries and illnesses, where applicable, from third parties through the tort system. However, it is unlikely that a third party could be successfully sued for workplace exposure to hazardous heat since there is no third party responsible for exposing employees to dangerous conditions in these circumstances. This means that even this inadequate remedy would be unavailable to employees injured from heat exposure.

In sum, the use of the tort system as an alternative to regulation is severely limited because of the “exclusive remedy” provisions in workers’ compensation statutes; because of the various legal and practical difficulties in seeking recovery from responsible third parties or the lack of a responsible third party altogether; and because of the substantial costs associated with a tort action. The tort system, therefore, does not adequately protect employees from exposure to hazards in the workplace.

IV. Summary

OSHA’s primary reasons for proposing this standard are based on the requirements of the OSH Act, which are discussed in Section II., Pertinent Legal Authority. As shown in the preamble to the proposed standard and this PEA, OSHA has determined that employees in many industries are exposed to safety and health hazards from exposure to environmental and process heat in the workplace. This section has shown that labor markets—even when augmented by information dissemination programs, workers’ compensation systems, and tort liability options—still operate at a level of risk for these employees that is higher than socially optimal due to a lack of information about safety and health risks, the presence of externalities or imperfect competition, and other factors discussed above.

B. Profile of Affected Industries

I. Introduction

This section presents a profile of the entities and employees for all industries that would be affected by OSHA’s proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings. OSHA first outlines all industries that would be subject to the proposed standard. Next, OSHA summarizes the number of entities and employees that would be exempt from this proposed standard based on coverage under existing standards, jurisdiction of local or State government entities, or based on one of the exemptions in paragraph (a)(2) of this proposed standard. Lastly, OSHA provides summary statistics for the affected entities,²² including the number of affected entities and the number of affected employees. This information is provided for each industry (1) in total, (2) for small entities as defined by the Regulatory Flexibility Act (RFA) and by the Small

Business Administration (SBA), and (3) for very small entities with fewer than 20 employees.

II. Potentially Affected Industries and Employees

This section characterizes the industries and employees that are likely to be affected by the proposed standard.

A. Potentially Affected Industries

OSHA broadly characterizes industries that are potentially within the scope of the regulatory framework as core industries²³ and all other covered industries. OSHA considers core industries to be those industries where employees have the most exposure to heat-related hazards, such as through exposure to high outdoor temperatures, radiant heat sources, or insufficient temperature control or ventilation in indoor work settings. Core industries include:

- Agriculture, Forestry, and Fishing;
- Building Materials and Equipment Suppliers;
- Commercial Kitchens;
- Construction;
- Drycleaning and Commercial Laundries;
- Landscaping and Facilities Support;
- Maintenance and Repair;
- Manufacturing;
- Oil and Gas;
- Postal and Delivery Services;
- Recreation and Amusement;
- Sanitation and Waste Removal;
- Telecommunications;
- Temporary Help Services;
- Transportation;
- Utilities; and
- Warehousing.

While employee exposure to heat-related hazards is expected to be more frequent in the core industries, employees in all other industries within the agency’s jurisdiction have the potential to experience occupational heat-related hazards and would also be covered by this proposed standard, with the exception of employers that meet

²³ To identify core industries, OSHA reviewed multiple sources. The agency reviewed its OSHA Information System (OIS) database to identify industries with fatal and non-fatal heat-related injuries and illnesses. In addition, OSHA identified occupations with the most exposure to heat-related hazards by analyzing (1) occupational information on outdoor work settings from the Occupational Information Network (O*NET) and (2) occupation-level data from the Occupational Requirements Survey (ORS) on exposure to process heat. Occupations flagged by those two data sources were then mapped to detailed 2012 North American Industry Classification System (NAICS) codes using the Occupational Employment and Wage Statistics (OEWS). Finally, OSHA evaluated industries that were included in OSHA’s National Emphasis Program for Outdoor and Indoor Heat Related Hazards, ANPRM comments, and stakeholder comments.

their employers for safety hazards subject to the Act (see *Am. Fed. of Gov. Employees, AFL-CIO v. Rumsfeld*, 321 F.3d 139, 143–44 (DC Cir. 2003)).

²² Spreadsheet detailing all calculations discussed in this analysis are available in Analytical Support for OSHA’s Preliminary Economic Analysis for the Heat Injury and Illness Prevention (OSHA, 2024c).

the criteria for one of the scope exemptions in paragraph (a)(2) (discussed in detail in section VII.A., and below). For example, there are certain jobs, such as maintenance and landscaping occupations, regardless of the industry in which they are performed, that require physical exertion which may increase the risk of heat stress.

Most of the economic data on number of firms, number of establishments, employment,²⁴ and annual receipts are sourced from the Census Bureau's Statistics of U.S. Businesses (SUSB) 2017 dataset (Census Bureau, 2021a). SUSB²⁵ presents these data²⁶ by North American Industry Classification System (NAICS) code, employee class size, and State. Unlike most other standards that OSHA proposes, costs will differ not just by industry, but also by the geographical location of workplaces due to variations in environmental conditions. See discussion of geographic location later in this section.

The SUSB glossary (Census Bureau, 2024b) defines the following terms as follows. Establishments are defined as an economic unit, typically a single physical location where business is conducted, services are performed, or industrial operations occur. Firms are legal business organizations and may consist of a single establishment or multiple establishments under common ownership or control. Employment is a measure of paid full- and part-time employees, including employees on paid sick leave, holidays, and vacations.²⁷ Annual receipts are defined as operating revenue for goods and services summed by industry, net of

taxes collected from customers or clients.

There are instances where estimates are left undisclosed in the SUSB dataset because there are only a few companies in a certain industry in a given State. Relying solely on SUSB datafiles would result in an undercount of the potentially affected employers and employees due to the undisclosed data. For this reason, OSHA attempted to fill in these data gaps in these undisclosed industries with alternative data sources. These industries with data gaps are listed below, along with the alternative sources and methods for estimating the number of firms, number of establishments, employment, and annual receipts. OSHA welcomes additional data sources or alternative methodologies to fill these data gaps.

Agriculture: Most agricultural industries are not included in the SUSB dataset,²⁸ so OSHA used the Department of Agriculture's 2017 Census of Agriculture (USDA, 2019) to derive estimates of the necessary industry profile information. OSHA used the count of farms from chapter 2, table 44 "Farms by North American Industry Classification System" to represent the number of establishments for each agricultural industry. OSHA assumed that the number of firms is equal to the number of establishments.²⁹ OSHA used industry-level estimates of "workers" on hired labor farms and "total sales" from chapter 1, table 75 "Summary by North American Industry Classification System" to represent employment counts and annual receipts, respectively. OSHA welcomes feedback on alternative sources, estimation methods, and assumptions for estimations of firms, establishments, and employment in the agricultural sector.

Local Government³⁰: The SUSB dataset excludes most government entities, including local governments. OSHA primarily relied on data from three alternative sources for local government estimates. To estimate the

number of government entities, number of establishments, and employment, OSHA used the county-, city-, and town-level data from the Census Bureau's Government Units Survey (GUS) for 2022 (Census Bureau, 2023d) by State to estimate the number of firms per State. Then, OSHA assumed that each entity represented one firm which was equal to one establishment.³¹ Since the GUS data do not include estimates for local government employment by State, OSHA used the 2022 Census of Governments' Survey of Public Employment & Payroll local employment data (Census Bureau, 2023b) to develop these estimates. OSHA distributed these local employees based on a ratio of local government employees to population served within each State as provided in the GUS, resulting in an estimate of employment for each local government entity within the GUS. These estimates were summed to the State level for OSHA's analysis.

OSHA's estimate for annual receipts per government entity also required two steps. First, OSHA estimated the average annual receipts per resident by State. The estimate was equal to the ratio of total local government receipts in the datasets found in the Census Bureau's 2021 Annual Survey of State and Local Government Finances (Census Bureau, 2023a) to the total population served in the GUS dataset. Then, OSHA multiplied the population associated with each government entity captured in the GUS with the ratio from step one to arrive at an estimate of total annual receipts per government entity. OSHA again aggregated these estimates to the State level for this analysis.

OSHA welcomes feedback on alternative sources, estimation methods, and assumptions for estimations of firms, establishments, and employment in local governments.

State Government: State government entities are excluded from the SUSB dataset, so OSHA relied on two alternative data sources for counts of firms and establishments, employment, and annual receipts. OSHA assumed that each State government is equal to one firm and that each State government firm is equal to one State government establishment.³²

OSHA used the total State government full-time and part-time employment data from the 2022 Census of Governments' Survey of Public

²⁴ For some industry-state combinations, the total employment in the SUSB data was less than the number of establishments. For these cases, OSHA adjusted total employment so that total employment is equal to the number of establishments.

²⁵ SUSB covers most NAICS industries excluding Crop and Animal Production (NAICS 111, 112); Rail Transportation (NAICS 482); Postal Service (NAICS 491); Pension, Health, Welfare, and Other Insurance Funds (NAICS 525110, 525120, 525190); Trusts, Estates, and Agency Accounts (NAICS 525920); Offices of Notaries (NAICS 541120); Private Households (NAICS 814); and Public Administration (NAICS 92). SUSB also excludes most establishments reporting government employees. (<https://www.census.gov/programs-surveys/susb/about.html>) To the extent that there are some establishments reporting government employees that are also captured in Government Units Survey or the Census of Governments database, OSHA's estimates may overstate the number of covered employees and establishments.

²⁶ These annual SUSB figures are based on the counts of these variables during the week of March 12th of the reference year.

²⁷ Employment includes salaried officers and executives and excludes sole proprietors and partners of unincorporated businesses.

²⁸ The NAICS industries that were estimated using this method are Oilseed and Grain Farming (111100), Vegetable and Melon Farming (111200), Fruit and Nut Tree Farming (111300), Greenhouse, Nursery, and Floriculture (111400), Other Crop Farming (111900), Cattle Ranch and Farming (112100), Hog and Pig Farming (112200), Poultry and Egg Production (112300), Sheep and Goat Farming (112400), Aquaculture (112500), and Other Animal Production (112900).

²⁹ Family farms account for 96 percent of all U.S. farms (<https://www.nass.usda.gov/Newsroom/archive/2021/01-22-2021.php>).

³⁰ In this analysis, OSHA only considered government entities in OSHA state plan states. See section VIII.B.III.H. later in this section for a discussion of exemptions based on OSHA jurisdiction.

³¹ To the extent that there are multiple establishments for a single local government entity, this method underestimates the number of establishments.

³² To the extent that state governments have multiple establishments, this method underestimates the number of establishments.

Employment & Payroll (Census Bureau, 2023b) to represent State government employment estimates. OSHA used the State government revenues estimated in the Census Bureau's 2021 Annual Survey of State and Local Government Finances (Census Bureau, 2023a) to estimate annual receipts for State governments.

OSHA welcomes feedback on alternative sources, estimation methods, and assumptions for estimations of firms, establishments, and employment in State governments.

Rail Transportation,³³ *Postal Service, and Insurance and Employee Benefit Funds*: SUSB data relied upon for the majority of the estimates in this industry profile do not include estimates for a small subset of non-agricultural industries: Rail Transportation (NAICS 4821), Postal and Delivery Services

(NAICS 4911), and Insurance and Employment Benefit Funds (NAICS 5251). The economic data estimates for these three industries were derived from the Quarterly Census of Employment and Wages (QCEW) collected by the Bureau of Labor Statistics (BLS). OSHA used industry-level establishment and employment counts by State from the 2022 QCEW dataset (BLS, 2023f). OSHA assumed that each establishment was also a unique firm,³⁴ thus each firm equals one establishment. While the QCEW does not present revenue data, it does include total annual wages by industry and State. OSHA used the ratio of receipts to wages from the SUSB dataset for each State to convert the QCEW wage data into annual receipts by industry and State.

OSHA welcomes additional data sources or alternative methodologies to

fill data gaps in the SUSB data for industries including agriculture, local and State governments. The agency is particularly interested in data and information on the number of firms, establishments, and employment. OSHA has assumed that one establishment is equal to one firm in industries where data on this parameter are not available including in governments, agriculture, postal services, and rail transportation. The agency welcomes comment on this approach and suggestions for alternative approaches.

B. States and Geographic Regions.

For this PEA, OSHA categorized States into geographic regions based on the National Weather Service (NWS) regions.³⁵ Table VIII.B.1. presents the grouping of States into these regions.

TABLE VIII.B.1—STATES AND GEOGRAPHIC REGIONS

Alaskan	Central	Eastern	Pacific	Southern	Western
Alaska	Colorado Iowa Illinois Indiana Kansas Kentucky Michigan Minnesota Missouri North Dakota Nebraska South Dakota Wisconsin	Connecticut Delaware District of Columbia Maine Maryland Massachusetts New Hampshire New Jersey New York North Carolina Ohio Pennsylvania Rhode Island South Carolina Vermont Virginia West Virginia	American Samoa Guam Hawaii Northern Mariana Islands	Alabama Arkansas Florida Georgia Louisiana Mississippi New Mexico Oklahoma Puerto Rico Tennessee Texas U.S. Virgin Islands	Arizona California Idaho Montana Nevada Oregon Utah Washington Wyoming

Source: NWS, 2024b.

C. Potentially Affected Employees Based on Work Conditions

OSHA estimated the number of potentially affected employees across all affected industries based on their work conditions. To do so, OSHA used a combination of O*NET, Occupational Requirement Survey (ORS), and Occupational Employment and Wage Statistics (OEWS) program data. Employment is characterized using the Standard Occupational Classification

(SOC) detailed occupations (*i.e.*, six-digit SOC code).

O*NET (O*NET, 2023) provides data on the percent of employees in a given occupation that work in certain climatic work conditions for specified frequencies.³⁶ The climatic work conditions that OSHA evaluated in this analysis are (1) Indoors, Environmentally Controlled; (2) Indoors, Not Environmentally Controlled; (3) Outdoors, Exposed to

Weather; and (4) Outdoors, Under Cover. For modeling purposes, OSHA mapped the O*NET frequency categories (O*NET, 2023) to number and percentages of work days worked in certain climatic work conditions, as shown in table VIII.B.2. For the purposes of this analysis, OSHA assumes that employees in work conditions (2), (3), and (4) are in-scope of the proposed standard unless they meet exemptions discussed later.

³³ The Federal Railroad Administration (FRA) has promulgated regulations requiring the use of environmental controls to address heat hazards in three specific, limited contexts: non-steam-powered locomotives purchased or remanufactured after June 8, 2012 (49 CFR 229.119(g)), camp cars (49 CFR 228.313(c)), and certain on-track roadway maintenance machines (49 CFR 214.505(a)). OSHA's standard would apply to the working conditions of railroad employees in all other

contexts, including within trains and machinery not covered by these regulations and during all outdoor work.

³⁴ To the extent that there are multiple establishments per firm, this will lead to an overestimate. OSHA welcomes feedback on this assumption and information on alternative data sources for the number of firms in these industries.

³⁵ In the NWS groupings, three states were divided between two regions: Georgia (Eastern and

Southern), Kentucky (Central and Eastern), and Wyoming (Central and Western). OSHA assigned these states to a single region, with Georgia assigned to the Southern region, Kentucky to the Central region, and Wyoming to the Western region.

³⁶ These frequency categories are defined as: (1) "Never;" (2) "Once a year or more but not every month;" (3) "Once a month or more but not every week;" (4) "Once a week or more but not every day;" (5) "Every day."

TABLE VIII.B.2—FREQUENCY OF WORK IN CERTAIN CONDITIONS

Category No.	O*NET frequency category name	Minimum number of days for category	Maximum number of days for category	Estimated percentage of days ^a
1	Never	0	0	0
2	Less than Monthly	1	<12	2.60
3	Less than Weekly	12	<50	12.40
4	Less than Daily	50	<250	60
5	Every Day	250	250	100

Sources: Frequency categories are defined by O*NET Online Resource Center (O*NET, 2023). Estimated percentage of days are based on methodology from Park et al. (2021).
^a These percentages are based on a 250-day work year.

There are multiple SOC occupation codes for which the O*NET dataset does not provide the percentages of employees in an occupation for each of these brackets. In these instances, OSHA used the average frequency of work in these conditions from similar SOC occupation codes as representative of the missing SOC occupation code to estimate the frequency of work in these conditions for occupations with missing data.

Using the percentages of each occupation within the frequency categories and the estimated percentages of days worked by category presented in the table above, OSHA estimated the percentage of employees that would be working regularly in certain climatic work conditions by occupation. OSHA then multiplied these percentages by the percentage of total industry employment in a given occupation from the 2022 OEWS dataset (BLS, 2023c). The aggregation of these products by 4-digit NAICS code yields OSHA’s estimate of the percentage of all employees in a given industry that work in the four climatic work conditions.

OSHA assumes that employees working indoors in environmentally controlled workspaces are not covered under the proposed standard unless they are exposed to process heat (e.g., kitchens, foundries). It is possible that employees exposed to process heat in

indoor work settings are counted in the O*NET data as being in climatic work condition (2) Indoors, Not Environmentally Controlled, and therefore already captured in counts of potentially affected employees. However, to account for the possibility that some employees exposed to process heat are categorized in climatic work condition (1) Indoors, Environmentally Controlled (which is possible if survey respondents considered areas that were environmentally controlled but hot due to process heat to be within the definition of environmentally controlled), OSHA relied on the ORS dataset (BLS, 2023d) to identify occupations exposed to process heat. To the extent that employees exposed to process heat are included in both climatic work condition (2) Indoors, Not Environmentally Controlled and the ORS data on exposure to extreme heat, this method may overstate the number of employees exposed to process heat. The ORS dataset contains estimates for the percent of employees that are exposed (or not) to extreme heat.³⁷ The ORS data are available by SOC occupation code, although not all SOC codes have an estimate available for all data series. Similar to the estimation for climatic conditions described above, the percentage of employees exposed to extreme heat was multiplied by the

percentage of total industry employment in a given occupation from the 2022 OEWS dataset (BLS, 2023c), resulting in an estimate of the percentage of employees by industry exposed to process heat.

OSHA acknowledges that the temperature criteria for the ORS definition of exposure to extreme heat has a higher temperature criterion than the proposed standard’s initial heat trigger of 80 °F, which, to the extent employees are not otherwise included in this analysis because they are in climatic work condition (2) Indoors, Not Environmentally Controlled, may result in an undercount of employees exposed to process heat.

The percentage of employees exposed to process heat using this method was added to the percentage of employees in exposed climatic conditions to determine the total percentage of employees exposed to heat for all affected industries.³⁸ To estimate the total number of potentially affected employees for each industry, OSHA multiplied the percentage of total exposed employees in the industry by the OEWS for May 2022 (BLS, 2023c) employment totals for that industry.

Table VIII.B.3. shows a summary of potentially affected firms, establishments, and employees across all these industries by region.

TABLE VIII.B.3—INDUSTRY PROFILE SUMMARIZED BY REGION

Region	Entities	Establishments	Employees
Alaskan	18,563	21,940	314,444
Central	1,578,125	1,906,757	32,567,699
Eastern	2,157,549	2,631,175	47,954,519
Pacific	33,857	40,139	704,767
Southern	1,776,945	2,205,794	38,771,537
Western	1,432,624	1,720,933	29,839,496

³⁷ ORS considers extreme heat present when (1) employees’ exposure is related to critical tasks and not due to weather and (2) the atmosphere is dry with temperatures above 90 °F, or the atmosphere

is humid with temperatures above 85 °F (BLS, 2021).

³⁸ To the extent that the employees exposed to process heat are already accounted for as being in one of the affected climatic conditions (indoors-not

environmentally controlled, outdoors- exposed to weather, and outdoors- under cover), this method may overestimate the percentage of employees and establishments that are affected by the proposed standard.

TABLE VIII.B.3—INDUSTRY PROFILE SUMMARIZED BY REGION—Continued

Region	Entities	Establishments	Employees
Total	6,997,663	8,526,738	150,152,463

Source: OSHA, based on BLS, 2023c; BLS, 2023f; Census Bureau, 2021a; Census Bureau 2023a; Census Bureau, 2023b; Census Bureau, 2023d; Census Bureau, 2023a; USDA, 2019; and USFA, 2019.

III. Entities Not Covered by the Proposed Standard

The proposed standard would apply to all employers in the industries outlined in Section VIII.B.II., Potentially Affected Industries and Employees, unless they have a workforce that is exclusively performing work activities that meet one or more of following definitions: (1) work activities for which there is no reasonable expectation of exposure at or above the initial heat trigger; (2) work activities where the employee is exposed to temperatures above the initial heat trigger for fifteen minutes or less in any sixty-minute period; (3) emergency response activities of workplace emergency response teams or any emergency response activities already covered under 29 CFR 1910.120, 1910.146, 1910.156, part 1915, subpart P, 1926.65, and 1926.1211; (4) work activities performed in indoor work areas or vehicles where air conditioning consistently keeps ambient temperature below 80 °F; (5) telework; and (6) sedentary work activities in indoor work areas where the work only involves some combination of the following: sitting, occasional standing and walking for brief periods of time, and occasional lifting of objects weighing less than ten pounds. Employees that are exclusively performing these types of work activities are also exempt from this standard. Where employers and employees are outside OSHA's jurisdiction, they are also not covered by the standard and OSHA's estimates of the types and number of such employers and employees is discussed in this section.

A. Work Activities With No Reasonable Expectation of Exposure at or Above Initial Heat Trigger

OSHA assumes that the estimates of affected employees cover all employees potentially affected by the proposed standard (reported in Section VIII.B.II., Potentially Affected Industries and Employees) and excludes those employees who are exempt under the scope exemption for work activities with no reasonable expectation of exposure at or above the initial heat trigger. Employees that are working in "Indoors, Environmentally Controlled" settings as identified by the O*NET data are considered out of scope based on this exemption unless they are also exposed to process heat. OSHA believes that this methodology, combined with the additional exemptions discussed below, removes from scope the employees who would fall under this exemption and thus does not make any additional adjustments for this specific exemption.

B. Short Duration Exposure at or Above Initial Heat Trigger

To estimate the number of employees that might be exposed to temperatures at or above the initial heat trigger for fifteen minutes or less in any sixty-minute period, OSHA relied on the ORS dataset. For indoor work settings, OSHA used the percentages of employees not exposed to extreme heat and the percentage of employees seldomly³⁹ exposed to extreme heat as reflective of those employees that are exposed to temperatures at or above the initial heat trigger for fifteen minutes or less in any sixty-minute period. For outdoor work settings, OSHA used the percentages of

employees that either do not work outdoors or seldomly work outdoors to estimate the number of employees exposed to temperatures at or above the initial heat trigger for fifteen minutes or less in any sixty-minute period. OSHA added the percentages for each SOC occupation code (OSHA, 2024d).

Using the 2022 OEWS data (BLS, 2023c) described in Section VIII.B.II., Potentially Affected Industries and Employees, OSHA multiplied the percentage of total industry employment in a given occupation and the summation of the percentages of employees in that same occupation that are either not exposed or seldomly exposed to extreme heat to estimate the percentage of employees in an SOC occupation code in a certain industry that meet the exemption criteria for indoor employees. These estimates were aggregated for each 4-digit NAICS industry to estimate the percentage of total employment in that industry that is exposed to temperatures at or above the initial heat trigger for fifteen minutes or less in any sixty-minute period. For 4-digit NAICS industries otherwise captured in OSHA's economic analysis that are not available in the OEWS dataset, OSHA used the average percentage of employees meeting this definition within the same industry sector (2-digit NAICS). This same process also applies for the percentages of employees that either do not work outdoors or seldomly work outdoors.

Table VIII.B.4. shows the number of employees that OSHA estimates are exempt from the proposed standard because of qualification as employees with only short duration exposure.

TABLE VIII.B.4—SUMMARY OF EMPLOYEES EXEMPT DUE TO SHORT DURATION EXPOSURE

Region	Indoor employees	Outdoor employees
Alaskan	199,838	27,312
Central	21,511,842	2,957,214
Eastern	32,085,256	4,285,342
Pacific	458,099	66,205
Southern	25,520,407	3,497,694
Western	19,598,994	2,676,549

³⁹ ORS defines seldom as spending up to two percent of total time working in extreme heat, or

less than ten minutes daily, less than 45 minutes weekly, or less than one week annually (BLS, 2021).

TABLE VIII.B.4—SUMMARY OF EMPLOYEES EXEMPT DUE TO SHORT DURATION EXPOSURE—Continued

Region	Indoor employees	Outdoor employees
Total	99,374,435	13,510,315

Source: OSHA, based on Census Bureau, 2021a; USDA, 2019; Census Bureau, 2023a; Census Bureau, 2023d; USFA, 2023; BLS, 2023c; and BLS, 2023d.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

C. Emergency Response Activities

OSHA's proposed standard exempts organizations whose primary function is the performance of firefighting; emergency response activities of workplace emergency response teams, emergency medical services, or technical search and rescue; and any emergency response activities already covered under 29 CFR 1910.120, 1910.146, 1910.156, part 1915, subpart P, 1926.65, and 1926.1211. See the *Explanation of the Proposed Requirement* for Paragraph (a) Scope for a full discussion of this exemption.⁴⁰

To identify exempt career firefighters, OSHA used the U.S. Fire Administration's National Fire Department Registry (USFA, 2023) to determine the number of firefighters in each State. Each fire department recorded in the National Fire Department Registry is considered a firm in the industry profile and each fire station is considered an establishment. Employment figures are based on the aggregation of counts of active career firefighters. Volunteer and paid-per-call

firefighters are not included as employees in the data on government employees that form the basis of OSHA's estimates of government employees, so no adjustment was made to employment regarding these responders. (See OSHA–2007–0073–0118, chapter VII, for additional information). OSHA welcomes comment on these estimates including whether there are additional types of establishments or employees who should be considered out of scope for this analysis and suggestions on methodologies that could better represent this exemption.

D. Sedentary Work Activities at Indoor Work Areas

To estimate the number of employees engaged in indoor sedentary work activities as defined in the proposed standard, OSHA used ORS and OEWS data. The ORS dataset includes estimates for the percent of employees involved in work where the strength required is considered sedentary.⁴¹ These data are available by SOC code,

although not all codes have an estimate available for all data series.

As described in section VIII.B.III.B., OEWS provides employment data for all SOC occupation codes within each 4-digit NAICS industry. OSHA multiplied the percentage of total industry employment in a given occupation by the percentage of employees in a given SOC code considered sedentary (OSHA, 2024d). Similar to the estimates for short duration exposure, these percentages were aggregated for each 4-digit NAICS industry to estimate the percentage of total employment in that NAICS industry that is considered sedentary. For 4-digit NAICS industries otherwise captured in OSHA's economic analysis that are not available in the OEWS dataset, OSHA used the average percentage of employees meeting this definition within the same sector.

Table VIII.B.5. shows the number of employees that OSHA estimates are exempt from the proposed standard because their work is sedentary.

TABLE VIII.B.5—SUMMARY OF SEDENTARY EMPLOYEES EXEMPT FROM THE PROPOSED STANDARD

Region	Employees
Alaskan	66,112
Central	7,236,687
Eastern	11,038,630
Pacific	142,075
Southern	8,543,839
Western	6,830,356
Total	33,857,699

Source: OSHA, based on Census Bureau, 2021a; USDA, 2019; Census Bureau, 2023a; Census Bureau, 2023d; USFA, 2023; BLS, 2023c; and BLS, 2023d.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

E. Telework

To estimate the number of employees working remotely, OSHA used the 2022 BLS Business Response Survey (BRS) data (BLS, 2024a) on telework. The BRS provides percentages of employment by sector that are working remotely, on-site

(i.e., non-remote work), or hybrid. OSHA applied these percentages of employment by sector to the employment data derived from the sources outlined in Section VIII.B.II., Potentially Affected Industries and Employees. Remote employees are considered exempt from the proposed

standard and hybrid employees are considered exempt from the proposed standard during the time they are teleworking.

Table VIII.B.6. shows the number of employees that OSHA estimates work remotely, hybrid, and on-site.

⁴⁰ OSHA did not attempt to adjust the share of employee's time spent engaged in emergency response activities and aside from firefighters, did not remove any employees from the scope of the standard due to this exemption. To the extent that

there are additional establishments where employees exclusively perform emergency response activities, this analysis may overstate the number of affected establishments and employees.

⁴¹ Sedentary work involves less than or equal to one-third of the workday standing while only seldomly or occasionally lifting or carrying up to ten pounds.

TABLE VIII.B.6—SUMMARY OF ON-SITE, REMOTE, AND HYBRID EMPLOYEES

Region	Remote	Hybrid	On-site
Alaskan	9,933	93,485	206,311

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

F. Indoor Work Areas Where Temperature Is Maintained Below 80 °F

To estimate the number of establishments that might qualify as having indoor work areas where the ambient temperature is maintained below 80 °F (26.7 °C), OSHA used the Energy Information Administration (EIA) Commercial Buildings Energy Consumption Survey (CBECS) data (EIA, 2022). The CBECS data provide estimates on the number of buildings by building activity with some percentage of cooled floorspace. OSHA assumed that buildings with at least 51 percent of floorspace cooled qualify as

establishments where work activities take place in ambient temperatures below 80 °F (26.7 °C). OSHA assumed that employees likely work in environmentally controlled areas of buildings regardless of what percent of floorspace is cooled. For example, loading docks, storage areas, or areas where processes are automated may not be cooled but they also may not be regular work locations for employees.⁴² OSHA mapped these building activities to sectors to estimate the percentage of establishments in a given sector that would fit the definition of this exemption. These estimates were applied to the number of

establishments, as well as the number of firms, to determine those firms and establishments that are exempt from the proposed standard based on this exemption. OSHA welcomes comment on whether this is a reasonable assumption. If not, the agency welcomes comment on more appropriate methodologies or data source that might better allow OSHA to estimate which establishments would be covered by this proposed standard.

Table VIII.B.7. shows the number of firms and establishments where the ambient temperature indoors is maintained below 80 °F (26.7 °C).

TABLE VIII.B.7—SUMMARY OF ENTITIES AND ESTABLISHMENTS WITH SUFFICIENT ENVIRONMENTAL CONTROLS

Eastern	1,362,384	1,739,119
Pacific	20,783	25,630
Southern	1,096,146	1,428,219
Western	922,625	1,146,582
Total	4,296,908	5,495,610

Source: OSHA, based on Census Bureau, 2021a; Census Bureau, 2023a; Census Bureau, 2023d; EIA, 2022; USDA, 2019; and USFA, 2023.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

G. Employees Working in Cooled Vehicles

To estimate the number of employees working in cooled vehicles, OSHA first estimated the percentage of employees working in vehicles by NAICS code. The estimated percentage of drivers is based on the percentage of total industry employment in occupations that involve driving. OSHA acknowledges that some non-driving occupations may work in vehicles and assumes that these occupations are already captured in estimates of other work conditions (e.g., they may be included in the group

working indoors in environmentally controlled settings or working outdoors in covered areas). OSHA determined that the following SOC occupation codes represent occupations that involve driving vehicles exposed to outdoor heat conditions for most of their work activities:

- Postal Service Mail Carriers (43–5052);
- Agricultural Equipment Operators (45–2091);
- Paving, Surfacing, and Tamping Equipment Operators (47–2071);
- Pile Driver Operators (47–2072);

- Operating Engineers and Other Construction Equipment Operators (47–2073);

- Ambulance Drivers and Attendants, Except Emergency Medical Technicians (53–3011);

- Driver/Sales Workers (53–3031);
- Heavy and Tractor-Trailer Truck Drivers (53–3032);

- Light Truck Drivers (53–3033);
- Bus Drivers, School (53–3051);
- Bus Drivers, Transit and Intercity (53–3052);

- Shuttle Drivers and Chauffeurs (53–3053);
- Taxi Drivers (53–3054); and

OSHA is counting too few establishments as covered, this would mean that the affected employees are concentrated into fewer establishments than they truly are and the average cost per establishment may be too high.

⁴² To the extent this assumption is incorrect, this may result in too few establishments being considered in-scope of this proposed standard which potentially underestimates total establishment-based costs. However, this

adjustment does not affect the number of covered employees who are included or excluded based on their job characteristics. The estimated employees who are covered by this proposed standard are distributed among the covered establishments. If

• Refuse and Recyclable Material Collectors (53–7081).

OSHA then multiplied the percentage of total industry employment comprised of these SOC occupation codes by the percentage of drivers in vehicles with sufficiently cooled vehicle cabs. In the absence of data on the percentage of

vehicles with sufficiently cooled vehicle cabs, OSHA estimates that 34 percent of postal service (Hooker and Baker, 2023) and assumes that 50 percent of all other delivery service drivers work in sufficiently cooled vehicle cabs. OSHA welcomes additional data on the percent

of vehicle cabs that are sufficiently cooled for all types of drivers.

Table VIII.B.8. shows the total number of employees working as drivers and those OSHA estimates to be in-scope (*i.e.*, those who are not working in sufficiently cooled vehicle cabs).

TABLE VIII.B.8—SUMMARY OF DRIVERS, TOTAL AND IN-SCOPE

Region	Drivers	In-scope drivers
Alaskan	10,572	5,419
Central	1,062,955	543,165

Pacific	21,039	10,736
Southern	1,249,063	637,255
Western	963,917	490,865
Total	4,809,165	2,456,292

Source: OSHA, based on Census Bureau, 2021a; Census Bureau, 2023a; U.S. Census Bureau, 2023d; Hooker and Baker, 2023; USDA, 2019; and USFA, 2023.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

H. Exemptions Based on OSHA Jurisdiction

Beyond the exemptions laid out in the scope section of the proposed regulatory text, OSHA must factor in jurisdictional considerations when determining those establishments and employees that are in scope of the proposed standard. A subset of public entities is considered in-scope depending on whether or not the public entity is located in an OSHA State Plan State. Those public entities that are in non-State Plan States, as well as their employees, are considered out

of scope. The following States and territories have State Plans: ⁴³ Alaska, Arizona, California, Connecticut, Hawaii, Illinois, Indiana, Iowa, Kentucky, Maine, Maryland, Massachusetts, Michigan, Minnesota, Nevada, New Jersey, New Mexico, New York, North Carolina, Oregon, Puerto Rico, South Carolina, Tennessee, U.S. Virgin Islands, Utah, Vermont, Virginia, Washington, and Wyoming.

I. Summary of Exempt Employees

Table VIII.B.9. summarizes the total number of employees estimated to be exempt from the proposed standard by each exemption. OSHA welcomes comment and feedback on whether the approaches detailed above used to estimate the number of employees affected by the proposed standard's exemptions are appropriate. The agency welcomes additional data or information on how to appropriately account for the exemptions in the proposed standard.

TABLE VIII.B.9—SUMMARY OF EMPLOYEES BY EXEMPTION TYPE BY REGION

Region	Indoor short duration	Outdoor short duration	Sedentary	Remote	Hybrid	Drivers
Alaskan	199,838	27,312	66,112	9,933	93,485	5,153
Central	21,511,842	2,957,214	7,236,687	1,100,860	10,324,319	519,790
Eastern	32,085,256	4,285,342	11,038,630	1,716,903	15,412,798	732,767
Pacific	458,099	66,205	142,075	22,912	195,421	10,302
Southern	25,520,407	3,497,694	8,543,839	1,391,099	12,060,519	611,808
Western	19,598,994	2,676,549	6,830,356	1,100,879	9,289,249	473,052
Total	99,374,435	13,510,315	33,857,699	5,342,586	47,375,792	2,352,873

Source: OSHA, based on BLS, 2023c; BLS, 2023d; BLS, 2024a; Census Bureau, 2021a; Census Bureau, 2023a; Census Bureau, 20203b; Hooker and Baker, 2023; USDA, 2019; and USFA, 2023.

Note: Many employees fit multiple exemption types outlined in this table. The total number of exempt employees is less than the summation of employees across all exemption types. Due to rounding, figures in the columns and rows may not sum to the totals shown.

OSHA welcomes comment and feedback on whether these approaches to estimate the number of employees affected by the proposed standard's exemptions are appropriate. The agency welcomes additional data or information on how to appropriately

account for the exemptions in the proposed standard.

IV. Affected Employees

The categories that employees impacted by the proposed exemptions fall into are likely to overlap. Employees that perform office work may (1) work

indoors in climate control, (2) only perform sedentary work activities, and (3) may occasionally work remotely. In these situations, such employees may be included in the total estimate for each of these exemptions discussed above, therefore simply adding the totals of

⁴³ Seven of these—Connecticut, Illinois, Maine, Massachusetts, New Jersey, New York, and U.S.

Virgin Islands—only cover public sector employees. The private sector employees in those states are

covered by Federal OSHA and have been included in this analysis.

those exemptions may overstate the number of exempt employees. This section adjusts for that overlap and presents the number of estimated employees by work condition. This section also presents estimates on the number of affected employees by work shift which is used for specific cost estimates discussed in Section VIII.C., Costs of Compliance.

A. Affected Employees by Work Conditions

This section estimates the percentage of affected employees by work conditions, using the number of employees potentially exposed to heat from section VIII.B.II. and the exemptions outlined in section VIII.B.III. OSHA recognizes that some employees are likely to fall under multiple exemptions. For example, an employee that teleworks and performs sedentary work in a climate-controlled environment is included in three exemption categories (telework, sedentary, and no reasonable expectation of exposure to heat). To avoid double-counting employees, OSHA relied on the following method to estimate the number of affected employees.

First, the agency excluded public-sector employees that are not within OSHA's jurisdiction, as discussed in section VIII.B.III.H. After excluding employees outside OSHA's jurisdiction, the agency applied the estimated percentages of employees engaged in sedentary work, as estimated in section VIII.B.III.D., to the percentage of employees working in indoor, not environmentally controlled work conditions since those employees performing sedentary work indoors are exempt regardless of the presence of climate control. OSHA assumes that the majority of employees estimated to be exempt due to telework, detailed in section VIII.B.III.E., are also captured by the sedentary work exemption, and therefore did not make an additional adjustment for these employees.

Next, OSHA applied the estimated percentage of employees exposed to extreme heat according to the ORS data (BLS, 2023d) to the percentage of employees working in indoor, environmentally controlled work conditions to account for employees exposed to process heat who are covered by this proposed standard. The percentages of outdoor employees (both under cover and exposed to weather) are

adjusted to remove from scope employees that have short duration outdoor exposure as estimated in section VIII.B.III.B. OSHA assumed that indoor employees that are exempt based on short duration exposure are likely to be captured in the sedentary work exemption and did not make an additional adjustment for these employees.

These percentages were aggregated for each 4-digit NAICS industry to estimate the percentage of total employment in that industry that work in either indoor, environmentally controlled conditions (while only accounting for those employees that are exposed to process heat); indoor, not environmentally controlled conditions (while only accounting for those employees that are not sedentary); or outdoor conditions. For 4-digit NAICS industries otherwise captured in OSHA's economic analysis that are not available in the OEWS dataset, OSHA used the average percentage of employees meeting these definitions within the same sector.

Table VIII.B.10. shows the number of employees that are considered within the scope of the proposed standard, broken out by work conditions.

TABLE VIII.B.10—SUMMARY OF EMPLOYEES BY WORK CONDITION

Region	Indoor, not environmentally controlled	Indoor, process heat	Outdoor	Total

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

B. Affected Employees by Shift Type

To estimate the number of employees that work during certain periods of the day and therefore during different heat conditions, OSHA used the American Time Use Survey (ATUS) for 2017–2018 (BLS, 2023a). The ATUS outlines the percent of employees that work certain shifts by sector. For the purposes of estimating the variations in heat exposure over the course of a day, OSHA has categorized these into three shifts: daytime, evening, and overnight. OSHA mapped work shifts defined in the ATUS to these three categories in the following sections.

I. Daytime

The daytime work shift category corresponds to the regular daytime schedule grouping in the ATUS. The ATUS defines regular daytime schedule as having a majority of respondents that worked between 6 a.m. and 6 p.m. For this analysis, employees categorized as daytime employees are assumed to work between 8 a.m. and 4 p.m. to adjust for overlap with the other work shift categories.

II. Evening

The evening work shift category corresponds to the evening shift in the ATUS. The evening schedule is defined as having respondents work a majority

of the time between 2 p.m. and midnight. For this analysis, employees categorized as evening employees are assumed to work between 4 p.m. and midnight.

III. Overnight

The overnight work shift category corresponds to the night shift in the ATUS. The night schedule is defined as having respondents work a majority of the time between 9 p.m. and 8 a.m. For this analysis, employees categorized as overnight employees are assumed to work between midnight and 8 a.m.

IV. Other Shift Categories

There are additional shift groups in the ATUS whose definitions do not fit neatly into a certain timeframe (*e.g.*, rotating, irregular, split shift, other). The percentages of employees that fit these additional groups were evenly distributed across the other categories.

V. Estimates of the Number of In-Scope Employees by Work Shift

Estimating the number of employees that work certain shifts is important because some requirements of the proposed standard are dependent on whether the heat index is at or above a trigger while employees are working.

Employees working in the early afternoon will be exposed to warmer temperatures than those working during the evening or night hours, and thus will more often qualify for a required rest break, as an example.

Table VIII.B.11. shows the number of employees that OSHA estimates work certain work shifts.

B. Determining Entity Size

OSHA also estimates the number of firms, establishments, and employees that are considered small by both SBA regulations in 13 CFR 121.201 and the Regulatory Flexibility Act (RFA). Private entities are defined as small according to various employment- or revenue-based definitions by 6-digit NAICS code as laid out in the SBA table of size standards (SBA, 2023). Public entities (or “small governments”) are defined as small if they serve a population of less than 50,000.⁴⁴ OSHA also looks at the economic impacts on very small entities, which, for all industries, the agency defines as those employing fewer than 20 employees.

For this PEA, OSHA analyzed costs at the 4-digit NAICS code and State level. Since there are no SBA definitions of small entities at the 4-digit level, OSHA aggregated the number of firms, establishments, and employees within each 6-digit NAICS industry to the 4-digit level. For employee-based SBA definitions, OSHA summed all economic data within employee-class sizes below the SBA-determined cut-off number of employees. For revenue-based definitions, OSHA summed all economic data for all employee-class sizes under the largest employee-class size where the average revenue per firm was under the SBA-determined cut-off revenue. Where available, SUSB data is used to estimate firms, establishments, and employees by size class. As discussed in section VIII.B.II., there are some NAICS industries that are unavailable in the SUSB, so OSHA used alternative data sources, as discussed in section VIII.B.II.A., to estimate employment and establishment counts by size class in those instances.

For the private sector industries that were missing from the SUSB dataset due

to data disclosure limitations, OSHA estimated the percentage of employment and establishments in each size class category using SUSB data where available for the sector and then applied that to the total counts of employment and establishments described in Section VIII.B.II., Potentially Affected Industries and Employees. OSHA used data from the Census of Agriculture (USDA, 2019) to estimate the industry characteristics for NAICS industries within the agriculture sector and QCEW data for the remaining NAICS industries that were missing size class information due to data disclosure limitations.

Local government data were drawn from the Census Bureau’s (2023) GUS data for 2022 (BLS, 2023d). The data include the 2021 population of each city, county, and town served by the listed local governments. Using the GUS data, OSHA found that, of the 38,736 local governments listed, 18,028 are in State Plan States and 16,893 of these have a population of less than 50,000 and are, thus, considered small. No State governments are considered small under the RFA definition.

Based on the exemption for emergency response activities, OSHA estimated the number of fire departments that serve small governmental jurisdictions and the number of firefighters that they employ. To derive these estimates, OSHA estimated the median population served per fire department employee and used that to estimate how many employees a department would need to employ to serve a population greater than 50,000. OSHA used data from two Firehouse Magazine surveys to determine the median population served per employee for career and mixed fire departments at various employment size classes to extrapolate to the entire universe of fire

departments. Part 1 of the 2021 National Run Survey (Firehouse Magazine, 2022b) presents data from 229 career fire departments’ statistics about population and staffing. Similarly, the 2021 Combination Fire Department Run Survey (Firehouse Magazine, 2022a) has mixed fire department data. Estimates of the median population served per employee derived from both surveys are multiplied by the number of employees for each department in the U.S. Fire Administration’s (USFA, 2022) registry data (used for the Fire Department profile (see Section VIII.B.II., Potentially Affected Industries and Employees)) within each employee size class to determine how many departments serve populations of fewer than 50,000. These estimated counts of employees and fire departments corresponding to those departments were removed from the count of employees, entities, and establishments at affected small governments.

C. Summary of Small and Very Small Entities

Table VIII.B.13. presents the number of small firms and establishments and the number of very small firms and establishments, as well as the number of employees estimated to work for these small and very small entities. In some industries with revenue-based SBA thresholds for small entities, the counts of small affected firms (establishments) are less than the counts for very small firms (establishments). This occurs when some very small firms (establishments) have revenue that exceeds the small entity revenue threshold and are therefore not included in the counts of small firms (establishments).

TABLE VIII.B.13—PROFILE OF SMALL AND VERY SMALL AFFECTED ENTITIES, ESTABLISHMENTS, AND EMPLOYEES, BY CORE INDUSTRY AND REGION

Region	Small (SBA/RFA)			Very small (<20)		
	Entities	Establishments	Employees	Entities	Establishments	Employees
Agriculture, Forestry, and Fishing						
Alaskan	475	478	831	466	466	544
Central	24,294	24,322	149,091	15,065	15,065	55,208
Eastern	16,193	16,208	115,421	12,736	12,738	53,826
Pacific	199	199	1,399	138	138	1,082
Southern	26,346	26,377	169,979	17,326	17,331	62,951

⁴⁴ The RFA also includes small organizations defined as any not-for-profit enterprise which is independently owned and operated and is not dominant in its field. Traditionally, OSHA considers all non-profit organizations to be small entities based on this definition. This has the effect of including some very large organizations in the analysis of small entities (e.g., some major hospital

systems with tens of thousands of employees are non-profit entities) thus skewing the costs and impacts for the average small entity. For this analysis, OSHA did not separately assess impacts on non-profit entities. To the extent that non-profit entities are similar in size to small-for-profit entities (either based on the number of employees or revenues), the costs and impact estimates would be

consistent. The costs of this proposed standard are largely employee based and the agency has not found there to be feasibility concerns for entities of any size. Including large non-profits in the profile of SBA/RFA defined small entities would not alter the findings of the Initial Regulatory Flexibility Analysis (See section VIII.F.).

C. Costs of Compliance

I. Introduction

This section presents OSHA's preliminary analysis of the compliance costs associated with the proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings.

OSHA estimates that the proposed standard would cost annually \$7.8 billion (in 2023 dollars) at a discount rate of 2 percent. On average, the annualized cost per establishment is estimated to be \$3,085.⁴⁵ All costs were annualized using a discount rate of 2 percent, consistent with OMB Circular A-4 (OMB, 2023).⁴⁶ A 10-year period is used to annualize one-time costs or other costs that do not occur every year. Note that the benefits of the proposed standard, discussed in Section VIII.E., Benefits, are also annualized over a 10-year period. Therefore, the time horizon of OSHA's complete analysis of this proposed standard is 10 years. Employment and production in affected sectors are implicitly held constant over this time horizon for purposes of the analysis.

While some employers may be able to make fixed investments to reduce their marginal per-employee costs (e.g., on-site freezers, air conditioning) as a result of the proposed standard, for the purposes of this cost analysis OSHA assumes that employers do not make these adjustments. This assumption may result in an overestimate of the costs of compliance (e.g., for some firms it may be less costly to install air conditioning rather than increasing rest break time for employees). The agency also did not explore all potential societal costs (i.e., those that do not affect the proposed standard's economic feasibility). OSHA welcomes comment on other impacts the rule may have on employees that the agency has not considered in this preliminary analysis but should consider in the final analysis.

The remainder of this section is organized as follows: first, OSHA discusses cost assumptions used in the analysis, followed by the derivation of

the wage rates used to estimate labor costs. Next, OSHA presents unit and total costs by affected industry sector and region and by applicable provision of the proposed standard. The final section presents the total costs of the proposed standard for all affected entities and employees as well as those that meet the SBA/RFA definitions of small entities and those with fewer than 20 employees. Discussion of burden reducing regulatory alternatives and regulatory options that may increase costs of compliance are discussed in Section VIII.F.II.G., Alternatives and Regulatory Options to the Proposed Rule.

II. Cost Assumptions

This section describes the cost assumptions used in this analysis including those relevant to baseline conditions, temperature, and heat-related incidence rates. OSHA welcomes comment on all assumptions and estimates discussed in this section. Additional data or suggestions on methodological changes the agency should consider are also welcome.

A. Baseline Non-Compliance Rates

The estimated costs of the proposed standard are measured against the baseline activities of the affected industries, including core and non-core industries (see Section VIII.B., Profile of Affected Industries for a discussion and definition of core industries). The baseline for this analysis includes existing conformity ("compliance") with the provisions of the proposed standard. Compliance costs are estimated only for "non-compliant" entities with practices that currently do not conform to the proposed standard and who would therefore incur costs to comply with it.

OSHA developed baseline non-compliance rates (percent of non-compliant entities) based on a review of existing State requirements (e.g., State heat standards, non-heat-specific paid rest break State laws⁴⁷), State-level workforce characteristics (e.g., prevalence of piece-rate pay, collective bargaining), and other industry practices when employees are exposed to heat-related hazards in the workplace, datasets and reports detailing current

practices within specific industries, feedback from participants in the Small Business Advocacy Review (SBAR) Panel, and professional expertise of OSHA staff. OSHA prioritized the use of State-specific data sources wherever possible; however, in the absence of State-specific data, national data sources were used to develop baseline non-compliance rates. In some instances, no data were available to develop baseline non-compliance rates for certain provisions within certain industries. In these cases, OSHA assumed default non-compliance rates for those industries, in some cases distinguishing between core and non-core industries (see section VIII.B.II.A. for more information on core industries). For certain provisions (i.e., heat hazard evaluation and acclimatization), OSHA believes that non-compliance rates among core industries may be lower than those within non-core industries (i.e., employers in core industries are doing more of what OSHA would require under this proposed standard) because core industries have more affected employees, and more heat-related hazards present in their work processes. For this reason, core industries may be more likely to have policies and procedures in place to protect employees from heat-related hazards on their work sites than employers in non-core industries who may be less aware of heat hazards present in their workplace. However, for other provisions (e.g., providing drinking water and rest break policies) current employment practices are affected by factors beyond heat; therefore, OSHA assumes default non-compliance rates for all industries, assuming they are the same for core and non-core industries.

Some States already have heat standards that address some or all settings in the State. While the agency estimates that all covered employers would incur some costs to comply with this proposed standard, employers in States that have heat standards will likely have lower compliance costs since they are already doing some of what would be required by OSHA. This is reflected in this analysis. Table VIII.C.1. shows the States with existing State heat standards and the corresponding industries and work settings within the scope of those State standards.

⁴⁵ Spreadsheet detailing all calculations discussed in this analysis are available in Analytical Support for OSHA's Preliminary Economic Analysis for the Heat Injury and Illness Prevention (OSHA, 2024c).

⁴⁶ Section VIII.C.V., Total Costs, presents total annualized costs, discounted (2 percent over a 10-year period) and undiscounted.

⁴⁷ In most cases, Federal law does not require the provision of rest breaks, see <https://www.dol.gov/general/topic/workhours/breaks>.

TABLE VIII.C.1—STATES AND INDUSTRIES WITH EXISTING STATE HEAT STANDARDS

Sector	State	Source
Outdoor Settings—NAICS 11, 23, 2111, 213111, 213112, 561730 ^a .	California	Cal. Code of Regs. tit. 8, section 3395 (2005).
Indoor and Outdoor Settings—NAICS11	Colorado	7 Colo. Code Regs. section 1103–15 (2022).
Indoor Settings—All Sectors	Minnesota	Minn. R. 5205.0110 (1997).
Indoor and Outdoor Settings—All sectors	Oregon	Or. Admin. R. 437–002–0156 (2022); Or. Admin. R. 437–004–1131 (2022).
Outdoor Settings—All Sectors	Washington	Wash. Admin. Code sections 296–62–095 through 296–62–09560; 296–307–097 through 296–307–09760 (2023).

^a California's standard only covers outdoor workers within select industries within sector 11. Covered agricultural sectors include 1111, 1112, 1113, 1114, 1119, 1121, 1122, 1123, 1124, 1125, 1129, 1151, and 1152.

Since all affected establishments would need to incur some cost to develop a HIIPP that meets OSHA's requirements, OSHA assumes that even

establishments with existing HIIPPs in place would incur costs to review and modify their HIIPP to meet OSHA's requirements. Table VIII.C.2. shows the

percentages of establishments estimated to have existing HIIPPs in place in certain industries and States.

TABLE VIII.C.2—PERCENTAGE OF ESTABLISHMENTS WITH EXISTING HEAT INJURY AND ILLNESS PREVENTION PLANS

Sector	State	Percent of establishments	Source
NAICS 11, 23, 2111, 213111, 213112, 4841, 4842, 4884, 4889, 561730 ^a .	California	^b 100.0	Cal. Code of Regs. tit. 8, section 3395 (2005).
Sector 11	Colorado	100.0	7 Colo. Code Regs. section 1103–15 (2022).
All Sectors	Minnesota	100.0	Minn. R. 5205.0110 (1997).
All Sectors	Oregon	100.0	Or. Admin. R. 437–002–0156 (2022); Or. Admin. R. 437–004–1131 (2022).
All Sectors	Washington	100.0	Wash. Admin. Code sections 296–62–095 through 296–62–09560; 296–307–097 through 296–307–09760 (2023).
Sectors 23 and 31–33	National	75.0	OSHA Estimate.
Core Industries	National	50.0	OSHA Estimate.
Non-Core Industries	National	10.0	OSHA Estimate.

^a California's standard only covers select industries within sector 11. Covered agricultural sectors include 1111, 1112, 1113, 1114, 1119, 1121, 1122, 1123, 1124, 1125, 1129, 1151, and 1152.

^b California's standard specifies that 6-digit NAICS industries 213111, 213112, and 561730 need to follow the requirements of that rule. Since OSHA analyzes costs and economic impacts for this proposed standard at the 4-digit NAICS level, OSHA assumes that only a subset of NAICS 2131 and 5617 in California are already compliant with the requirements of OSHA's proposed standard. For NAICS 2131, OSHA assumes that 40 percent of NAICS 2131 are already compliant (since 213111 and 213112 represent two of the five 6-digit NAICS within the 4-digit NAICS 2131). For NAICS 5617, OSHA assumes that 20 percent of NAICS 5617 are already compliant (since 561730 represents one of the five 6-digit NAICS within the 4-digit NAICS 5617).

Table VIII.C.3. shows the estimated baseline non-compliance rates for rest breaks at both the initial and high heat triggers by State. OSHA estimated State-level non-compliance rates for rest breaks at the initial and high heat triggers based on a review of existing State requirements (State heat standards, non-heat-specific paid rest break State laws), State-level workforce characteristics (prevalence of piece-rate pay, collective bargaining), and existing paid rest breaks in collective bargaining agreements (Justia, 2022; DOL, 2023a; DOL, 2023b; NCFH, 2022; Gittleman and Pierce, 2013; Adams et al. 2009; Hirsch et al., n.d.; DOL, 2024b).

For each State, the State-level non-compliance rate for initial heat trigger rest breaks is assumed to be equal to the percentage of non-union piece-rate

workers in that State.⁴⁸ Based on review of existing collective bargaining agreements, feedback from Small Entity Representatives during the SBAR Panel process reporting high current compliance with if-needed rest breaks (which is also consistent with worker surveys such as Mirabelli et al. (2010) and Langer et al. (2021) reporting high current compliance with if-needed rest breaks), and evidence that piece-rate workers are incentivized to work faster and take fewer rest breaks than non-piece-rate workers as reported in focus group discussions with U.S. farmworkers (Wadsworth et al., 2019; Lam et al., 2013), OSHA assumes that, nationwide, all non-piece-rate workers and workers affiliated with a union (both piece-rate and non-piece-rate) are

already allowed rest breaks if needed from their employer.

State-level non-compliance rates for high heat trigger rest breaks were calculated based on the State or territory's current paid rest break laws, State heat standards, prevalence of rest breaks in collective bargaining agreements, and the share of employees affiliated with a union (by membership or representation).⁴⁹ The rationale

⁴⁹ Detailed formulas are available in Noncompliance Rates for Rest Breaks (OSHA, 2024e). In estimating unit costs of compliance with the high heat trigger breaks, OSHA estimates that employers that are fully noncompliant in outdoor and indoor settings will incur 47 minutes and 41 minutes per employee, respectively. However, in the State-level baseline compliance calculations OSHA assumes that employers (indoor and outdoor) that offer 47 minutes of break plus travel time are 100 percent compliant with the high heat trigger breaks. This simplifying assumption results in an underestimate of baseline compliance for

⁴⁸ Detailed formulas are available in Noncompliance Rates for Rest Breaks (OSHA, 2024e).

behind the formulas is as follows. Non-union piece-rate employees in any State are likely the least protected, currently assumed to be taking zero breaks at the high heat trigger.⁵⁰ Non-union non-piece-rate employees are likely most protected in States with a heat standard (*i.e.*, these employees are getting most required scheduled rest breaks in addition to if-needed rest breaks), less protected in States with some non-heat-related paid break law (these workers are getting some scheduled rest breaks), and the least protected in States with no paid break law (these employees may be getting no scheduled rest breaks). Also, in any State, OSHA assumes that employees (both piece-rate and non-

piece-rate) affiliated with a union are more protected than non-union employees by being provided some scheduled as well as if-needed rest breaks. Collective bargaining agreements differ across employers and States; however, collective bargaining agreements are likely more protective (meaning employees covered by a union are likely to get more scheduled rest breaks) in States with a heat standard or non-heat-related paid break law than in States with no paid break law.

OSHA acknowledges that there is limited information on current baseline non-compliance rates for rest breaks in (1) States without existing rest breaks laws and (2) States with existing rest

break laws. OSHA welcomes feedback on the assumptions and estimates of rest break non-compliance by State (and territory) described above. OSHA is soliciting feedback on whether the assumptions regarding compliance differences by workforce characteristics (*e.g.*, piece rate workers, union work, State break laws, State heat laws) are reasonable or if there are alternative methods, sources of data, or assumptions that should be considered. OSHA is especially interested in existing research or data sources that can be used to evaluate the impact of rest breaks in States with existing requirements.

TABLE VIII.C.3—REST BREAK NON-COMPLIANCE RATES BY STATE AND TERRITORY

State	Initial heat trigger (%)	High heat trigger (%)
Alabama	6.3	67.7
Alaska	6.0	^a 65.7
American Samoa ^b	6.2	67.1
Arkansas	6.4	68.3
Arizona	6.6	70.0
California	5.7	13.7
Colorado	6.3	15.3
Connecticut	6.0	65.9
District of Columbia	6.3	67.9
Delaware	6.3	67.9
Florida	6.6	69.7
Georgia	6.6	69.5
Guam ^b	6.2	67.1
Hawaii	4.8	58.4
Idaho	6.6	69.5
Illinois	5.8	28.4
Indiana	6.1	66.3
Iowa	6.3	67.6
Kansas	6.0	66.2
Kentucky	6.0	29.0
Louisiana	6.6	69.6
Maine	6.4	68.2
Maryland	6.2	29.8
Massachusetts	5.9	65.6
Michigan	5.6	63.2
Minnesota	5.9	28.6
Mississippi	6.0	66.2
Missouri	5.9	65.5
Montana	6.0	66.0
Nebraska	6.4	68.4
Nevada	5.6	27.4
New Hampshire	6.4	68.4
New Jersey	5.5	62.9
New Mexico	6.4	68.7
New York	5.2	61.1
North Carolina	6.7	70.4
North Dakota	6.4	68.3
Northern Mariana Islands ^b	6.2	67.1
Ohio	6.0	65.6
Oklahoma	6.6	69.6
Oregon	5.9	5.9
Pennsylvania	5.8	64.9
Puerto Rico ^b	6.2	67.1
Rhode Island	5.9	65.0
South Carolina	6.7	70.6
South Dakota	6.7	70.5

indoor employers—employers with indoor workers that are technically currently 100 percent compliant by already providing 41 minutes of break time (including travel time) are calculated as being 87

percent compliant (41 minutes provided/47 minutes), instead of 100 percent (fully compliant).

⁵⁰ This assumption may overestimate non-compliance of employers of piece-rate workers in

states that have laws requiring paid rest breaks for piece-rate workers (in all sectors for California, in the agricultural sector for Washington State).

TABLE VIII.C.3—REST BREAK NON-COMPLIANCE RATES BY STATE AND TERRITORY—Continued

State	Initial heat trigger (%)	High heat trigger (%)
Tennessee	6.4	68.6
Texas	6.6	69.7
Utah	6.5	68.8
U.S. Virgin Islands ^b	6.2	67.1
Vermont	5.8	64.9
Virginia	6.6	69.9
Washington	5.5	13.3
West Virginia	6.0	66.0
Wisconsin	6.2	67.1
Wyoming	6.6	69.5

^a The weather data (discussed in Section VIII.B., Profile of Affected Industries) do not show Alaska meeting or exceeding the high heat trigger. However, OSHA applied the same assumptions used for other States to arrive at a non-compliance rate for Alaska that would be applied if there were exposure to heat at or above the high heat trigger. In the current analysis, the cost for high heat trigger rest breaks is zero for employers in Alaska. In the event that the estimation methodology for exposure to heat used in the final analysis is changed in a manner that results in employees in Alaska being found to be exposed to heat at or above the high heat trigger, this non-compliance rate will be applied in those situations.

^b Rest break non-compliance rates for U.S. territories were imputed using the employment-weighted average of the non-compliance rates of the States without any paid break law.

Source: OSHA estimates based on Justia, 2022; DOL, 2023a; DOL, 2023b; NCFH, 2022; Gittleman and Pierce, 2013; Adams et al. 2009; Hirsch et al., n.d.; DOL, 2024b; formulas in OSHA, 2024e.

Table VIII.C.4. shows the estimated baseline non-compliance rates for all other requirements of the proposed standard. Within certain provisions, OSHA outlines different non-compliance rates for certain requirements under each provision (*e.g.*, OSHA found that some State rules

require initial training on heat-related hazards for employees but do not require refresher training).

OSHA welcomes feedback on the baseline non-compliance estimates that are detailed in table VIII.C.4. OSHA seeks information and feedback on the following topics: alternative sources; existing employer practices in States

with or without existing heat regulations; variation in non-compliance based on employer size, industry, and occupation; and the assumption that non-core industries tend to have lower baseline compliance (and higher non-compliance) than core industries.

^a OSHA assumes that all employers will need to develop a HIIPP, either by creating a new HIIPP or reviewing and updating an existing HIIPP to comply with the proposed standard. More discussion of the calculation of HIIPP total costs can be found in section VIII.C.V.B.

^b The California State rule only covers select industries within sector 11. Covered agricultural sectors include NAICS 1111, 1112, 1113, 1114, 1119, 1121, 1122, 1123, 1124, 1125, 1129, 1151, and 1152.

^c California's standard specifies that 6-digit NAICS 213111, 213112, and 561730 need to follow the requirements of that rule. Since OSHA analyzes costs and economic impacts for this proposed standard at the 4-digit NAICS level, OSHA assumes that only a subset of NAICS 2131 and 5617 in California are already compliant with the requirements of OSHA's proposed standard. For NAICS 2131, OSHA assumes that 40 percent of NAICS 2131 are already compliant (since NAICS 213111 and 213112 represent two of the five 6-digit NAICS within the 4-digit NAICS 2131). For NAICS 5617, OSHA assumes that 20 percent of NAICS 5617 are already compliant (since NAICS 561730 represents one of the five 6-digit NAICS industries within the 4-digit NAICS 5617). Using these assumptions, 60 percent of NAICS 2131 and 80 percent of NAICS 5617 are considered non-compliant.

^d Only covers NAICS industry groups 1111, 1112, 1113, 1114, 1119, 1121, 1122, 1123, 1151, and 1152 within sector 11.

^e Compliance with the effective communication provision of the proposed standard requires employers to maintain two-way communication with employees and to regularly communicate with employees. For the purposes of this cost analysis, OSHA assumes that 50 percent of employers are currently compliant with the provision. OSHA also assumes that half of the remaining non-compliant employers currently engage in one-way communication (from supervisor to employee) and would only incur costs for the employee's time communicating with or responding to the supervisor, which is reflected in the different non-compliance estimates (for employer and supervisor) for effective communication.

B. Cost Savings

OSHA also considers potential cost savings from the proposed standard as a result of requiring employers to provide employees if-needed or scheduled rest breaks (see appendix A at the end of this section for additional details on the assumptions and estimates discussed in this section). The best available evidence indicates that when employees are exposed to heat and are not allowed to take rest breaks or adjust their work hours, they must

pace themselves (*i.e.*, work more slowly) to counteract the effects of heat exposure. OSHA has preliminarily determined that when employees are offered rest breaks, cost savings will accrue to employers who are currently noncompliant with the rest break requirements because their employees will work more efficiently (*i.e.*, pace themselves less) during work time not spent on rest breaks. For the purposes of this analysis, OSHA assumes that when calculating the unit cost of rest

break requirements, these accrued cost savings partially offset the wage cost of the employee's time spent in required rest breaks.

OSHA has estimated how many minutes of work time are lost due to employees pacing themselves when the heat index is equal to the initial and high heat triggers.⁵¹ OSHA bases these

⁵¹ The extent of labor productivity loss due to pacing is evaluated when the heat index is equal to the initial or high heat triggers. However, the

Continued

estimates on empirical studies and assumed that the employees in these studies represent a nationwide average employee (for any State, industry, type of worksite, etc.). Some studies included employees who took no rest breaks. Some studies included employees who took only if-needed rest breaks but not scheduled rest breaks, and others included employees who took both if-needed and scheduled rest breaks. OSHA found that there was a decrease in pacing among employees who took if-needed rest breaks and a greater decrease in pacing among those who took scheduled rest breaks as well as if-needed rest breaks, as compared with employees who took no rest breaks. Reductions in pacing at the initial heat trigger from adding if-needed rest breaks and reductions in pacing at the high heat trigger from adding scheduled rest breaks are translated into equivalent minutes of work time saved as a share of the full unit time-cost of these rest breaks, which are then monetized to derive total labor costs saved for employers.

C. Temperature

Some of the requirements of the proposed standard would only be required when the heat index meets or exceeds a certain heat trigger (*i.e.*, the initial heat trigger at 80 °F or the high heat trigger at 90 °F). Requirements

dependent on the heat index meeting or exceeding certain triggers include, among other things:

- Rest breaks (at both the initial and high heat triggers),
- Acclimatization (at the initial heat trigger),
- Effective communication (initial heat trigger),
- Observation for signs and symptoms (high heat trigger), and
- Hazard Alert (high heat trigger).

In order to calculate the number of times these costs would be incurred by entities on a state-by-state basis, OSHA used heat index data from the NOAA Local Climatological Data (LCD) for 2020 through 2022 (NOAA, 2023b). The LCD data included heat index measurements on an hourly basis for NWS stations across the country. Due to limited data availability, OSHA reviewed a subset of 245 weather stations, ultimately analyzing 238 stations for the calculation. For each station, OSHA determined the number of workday⁵² hours that met or exceeded each of the heat triggers within each shift type as outlined in Section VIII.B., Profile of Affected Industries. From here, OSHA took the average of the number of workday hours meeting or exceeding each of the heat triggers across stations in each State.⁵³ OSHA excluded seven of the 245 stations for which 10 percent or more of

all heat index measurements across all three years of data analyzed were missing.⁵⁴ OSHA also evaluated the temperature data to identify States with relatively low levels of humidity⁵⁵ (Arizona, Nevada, New Mexico, and Utah) to inform costs related to dehumidification. OSHA used outdoor weather data as a proxy for high heat conditions in indoor settings without adequate climate control. Logically, where a building does not have air conditioning, there is a correlation between the temperature indoors and the temperature outdoors. This may overstate or understate the effects of outdoor temperature on indoor temperatures. A well-insulated building without air conditioning may be cooler than the outside environment, but a poorly insulated, poorly ventilated building that absorbs considerable direct sunlight may be hotter. Even though exposure to process heat may be exacerbated by outdoor temperatures (*e.g.*, on a hot day existing climate control may be inadequate in a hot kitchen), there may be instances where exposure to process heat occurs on relatively cool days. The agency lacks data to make a finer estimate than using outdoor weather as a proxy for indoor heat conditions but welcomes data and suggestions for improved estimation methodology. The results of this analysis are presented in table VIII.C.5.

TABLE VIII.C.5—AVERAGE ANNUAL HOURS EXCEEDING HEAT TRIGGERS BY STATE AND WORK SHIFT

State	Daytime shift		Evening shift		Overnight shift

Illinois	446	123	205	44	36	2
Indiana	413	113	214	43	28	2
Kansas	565	242	334	108	57	1

annual number of work hours used in the calculation of total labor cost savings from the required rest breaks capture work hours when the heat index is at or above the triggers (see discussion of temperature data in the following section VIII.C.II.C.). That is, in the calculation of the total labor cost savings, for example, a worker exposed to 95 °F heat index is assumed to lose the same amount of labor productivity as a worker exposed to 90 °F heat index (the high heat trigger). This discrepancy and other simplifying assumptions would result in potential misestimate of labor

productivity losses from pacing and therefore potential misestimate of total labor cost savings, as discussed in more detail in appendix A.

⁵² Workday hours in the LCD data are defined as hours on weekdays Monday through Friday for each shift type.

⁵³ OSHA acknowledges that this may be imprecise in states where the climate varies widely between different parts of the state. However, the agency lacks data that would allow for employers and employees to be more precisely located within a given state. OSHA welcomes comment on this

issue and suggestions for methodologies to more precisely represent employee exposure within States.

⁵⁴ Based on this methodology, seven stations were excluded: McGrath, AK; St. Paul Island, AK; North Little Rock, AR; Eureka, CA; Marquette, MI; Minneapolis, MN; and Mt. Washington, NH.

⁵⁵ OSHA acknowledges that due to intrastate variation in climatic conditions, this method may underestimate the number of geographic areas that have relatively low humidity.

D. Heat-Related Illnesses—Counts and Incidence Rates

The provisions of the proposed standard addressing Heat Illness and Emergency Response and Planning would require establishments to develop and implement a plan to treat employees experiencing heat-related illnesses, including heat emergencies. The proposed standard requires additional actions for employers when the heat-related illness is considered a heat emergency; therefore, it is important to estimate separately the incidents of heat-related illnesses that are heat emergencies and those that are not heat emergencies. Using the methods detailed in Section VIII.E., Benefits, OSHA estimated the average expected annual number of heat-related illnesses by industry sector after the implementation of the proposed standard, including adjustments for effectiveness and undercount as described below. Using the estimates of

heat-related fatal and non-fatal illnesses by industry sector from the Bureau of Labor Statistics (BLS) Census of Fatal Occupational Injuries (CFOI) (BLS, 2024c) and Survey of Occupational Injuries and Illnesses (SOII) from 2011–2022 (BLS, 2023b), OSHA assumed an undercount by a factor of 7.5 for non-fatal heat-related illnesses and 3 for fatal heat-related illnesses. As also discussed in Section V.C., Risk Reduction and Section VIII.E., Benefits, OSHA also assumed an effectiveness rate of 95 percent in reducing heat-related fatal illnesses and 65 percent for non-fatal illnesses. Finally, since costs are dependent on the severity of illness, OSHA assumed that 5.3 percent⁵⁶ of heat-related illnesses are emergencies,

⁵⁶ OSHA estimated the percentage of heat-related illnesses that would be considered emergencies using Harduar Morano and Watkins (2017). Using their results reported in table 2 in that paper, OSHA calculated the percentage of all HRIs reviewed (emergency room visits, hospitalizations, and deaths) that were coded as heat stroke (5.3 percent).

and all others are considered non-emergencies for this analysis. Then, the number of estimated incidents for each sector was divided by the number of establishments deemed in-scope of the proposed standard to calculate the estimated per-establishment incident rate for each sector. OSHA welcomes feedback on the data, assumptions, and methods used to estimate the number of heat-related illnesses (emergencies and non-emergencies) by sector, as well as the per-establishment incidence rates by sector.

Table VIII.C.6. shows the total estimated number of heat-related illness emergencies and non-emergencies anticipated annually with the proposed standard in place for each sector, as well as per-establishment incidence rates for each sector.⁵⁷

⁵⁷ This assumes that rates in the future will be the same as rates in the recent past. This may be inaccurate if rates are reduced due to the efficacy

Continued

OSHA welcomes feedback on the assumptions, methods of estimation, and data used to estimate per-establishment incidence rates

(emergencies and non-emergencies) for each sector. OSHA acknowledges the possibility that there may be variability in underreporting by industry sector,

occupation, or some other measure and welcomes additional data or information on that possibility.

III. Labor Rates

Labor costs associated with the proposed standard are derived using wage data from BLS' cross-industry Occupational Employment and Wage Statistics (OEWS) for May 2022 (BLS, 2023c). For the purposes of this cost analysis, two employee types are used to represent affected employees: "designated person" and "at-risk worker." For each industry sector, OSHA estimated the average hourly wage for these two employee types.

For the purpose of estimating costs, wages for the designated person position were derived by filtering the OEWS data for occupations that included "Manager," "Supervisor," or "Director" in their Standard Occupational Classification (SOC) title and then reviewing those occupations to identify those that may be expected to directly supervise employees exposed to heat-related hazards.⁵⁸ Occupations used in the analysis include those (1) that have detailed occupation codes (i.e., six-digit SOC code), (2) deemed to supervise potentially at-risk employees, (3) with recorded employment numbers, and (4) with recorded median hourly wage data. For these occupations, OSHA calculated the percentage of each

industry sector's total available employment that each detailed occupation represented. OSHA then calculated the weighted average hourly wage for each sector using the product of these percentages and the corresponding median hourly wage estimates from the OEWS. OSHA assumes that the average hourly wages calculated for each represent those for designated workers. OSHA acknowledges that this method of estimation may lead to an overestimate in wage costs as the designated person does not necessarily have to be a supervisor, manager, or director in all cases. For this analysis, OSHA also uses these wages developed for designated persons to represent supervisors' wages. OSHA welcomes feedback on the assumptions, methods, and data used to estimate the wages of a designated person.

Wages for at-risk workers are calculated using a process similar to the process used to calculate the number of affected employees in section VIII.B.IV.A. The main differences for determining the wages for at-risk workers are that the methodology for estimating wages uses OEWS data at the 2-digit NAICS sector level instead of the

4-digit NAICS industry group level and that some occupations that are otherwise used to determine the percentage of employees that are exposed to heat-related hazards are not included for the wage calculation because the relevant employment and/or wage data are undisclosed. OSHA calculated the percentage of a given sector's at-risk employment made up by each SOC code and multiplied this percentage by the hourly median wage from OEWS. Finally, OSHA summed these products for each sector to estimate the weighted average hourly wage for at-risk workers in each sector.

OSHA uses the estimated hourly wage rates to calculate a loaded wage rate that includes three types of cost: hourly base wage, fringe benefits, and overhead costs.

For the calculation of fringe benefit costs, OSHA used data from BLS' Employer Costs for Employee Compensation (ECEC) for December 2023 (BLS, 2024b) to determine that fringe benefits can be estimated as 45 percent of base wages or 31.1 percent of total compensation.

OSHA also accounts for indirect expenses that cannot be tied to producing a specific product or service, called overhead costs. Common

of this proposed standard or if rates increase if more workers are exposed to hot environments.

⁵⁸ Although for purposes of this cost analysis OSHA distinguishes between a "designated person" and "at-risk workers," this terminology is not intended to suggest that supervisors or managers

who supervise workers exposed to heat related hazards are not themselves also "at risk" when exposed to the same hazards.

examples include rent, utilities, and office equipment. There is no consensus on the cost elements that fit this definition and the lack of a common definition has led to a wide range of overhead estimates. Consequently, the treatment of overhead costs needs to be case-specific. In this analysis, OSHA used an overhead rate of 17 percent of base wages (EPA, 2002; Rice, 2002). This 17 percent rate is based on an estimate of overhead costs for safety and health professionals in large private organizations. This overhead rate is consistent with, for example, the overhead rate used in the Final

Economic Analysis (FEA) in support of OSHA's 2023 final rule amending its occupational injury and illness recordkeeping (88 FR 47254) and the economic feasibility analysis in support of OSHA's 2021 Healthcare Emergency Temporary Standard (Healthcare ETS).⁵⁹ (86 FR 32376). OSHA expects that this rate is likely an overestimate in this context, as this reflects a component of *average* overhead; in this case, however, the agency anticipates that, for example, designated persons and at-risk workers will be able to work within the general physical infrastructure in which they currently

operate. A rate of 17 percent of base wages is equivalent to 11.71 percent of the hourly wage rate with fringe applied.⁶⁰

To calculate the fully loaded hourly labor cost, OSHA added the three components together: base wages + fringe benefits (31.1 percent of total compensation) + applicable overhead (17 percent of base wages). Table VIII.C.7. shows the loaded hourly wages used in the analysis. OSHA welcomes feedback on the assumptions, methods, and data used to estimate the wages of a designated person and at-risk worker.

TABLE VIII.C.7—WAGE RATES USED IN THE ANALYSIS

62	17.56	45.0	11.7	28.48

⁵⁹ See the FEAs in in the Improved Tracking of Workplace Injuries and Illnesses FEA (<https://www.govinfo.gov/content/pkg/FR-2023-07-21/pdf/2023-15091.pdf>) and the feasibility analysis support of OSHA's 2021 Healthcare ETS (86 FR 32376) (<https://www.govinfo.gov/content/pkg/FR-2021-06-21/pdf/2021-12428.pdf>). The methodology was modeled after an approach used by the EPA. More information on this approach can be found at: U.S.

Environmental Protection Agency, "Wage Rates for Economic Analyses of the Toxics Release Inventory Program," June 10, 2002 (Ex. 2066). This analysis itself was based on a survey of several large chemical manufacturing plants: Heiden Associates, *Final Report: A Study of Industry Compliance Costs Under the Final Comprehensive Assessment Information Rule*, Prepared for the Chemical

Manufacturers Association, December 14, 1989, Ex. 2065.

⁶⁰ The fringe-adjusted overhead rate, 11.71%, is calculated as 68.9 percent * 17 percent, *i.e.*, the percent of wages that are the base hourly rate exclusive of fringe (68.9 percent) multiplied by the overhead rate as a percentage of base hourly wages (17 percent).

TABLE VIII.C.7—WAGE RATES USED IN THE ANALYSIS—Continued
[2023\$]

Sector	Median hourly wage ^a	Fringe ^b (%)	Fringe-adjusted overhead ^c (%)	Loaded hourly wage ^d
71	15.55	45.0	11.7	25.21
72	14.88	45.0	11.7	24.13
81	21.17	45.0	11.7	34.33
92	31.28	45.0	11.7	50.72

Source: OSHA estimate derived from BLS, 2023c; BLS, 2024b; O*NET, 2023; EPA, 2002; and Rice, 2002.

^aMedian hourly wage rates are drawn from BLS' sector-level OEWS for May 2022. For the designated person, the wages represent a weighted average of wage across SOC codes that would directly supervise potentially at-risk workers. For the at-risk worker, the wages reflect weighted averages between SOC codes that are deemed in-scope for this proposed standard.

^bThe fringe rate is drawn from BLS' ECEC for December 2023 (BLS, 2024b).

^cThe overhead rate is derived from EPA (2002) and Rice (2002).

^dThe loaded hourly wage = median hourly wage * (1 + fringe rate) * (1 + fringe-adjusted overhead rate).

IV. Estimated Unit Costs of Compliance

This section presents the estimated unit costs of the proposed standard by industry sector and proposed provision. Unless otherwise noted in this section, the time estimates for complying with proposed provisions are based on OSHA's professional expertise, considering what the proposed standard requires and estimates of the hours necessary to comply with similar requirements in other OSHA rules. OSHA welcomes comment on all

estimates discussed here. Additional data or suggestions on methodological changes the agency should consider are also welcome.

A. Rule Familiarization

All employers affected by the proposed standard would need to review the requirements under the proposed standard. While some employers will read the standard, many will likely rely on compliance assistance documents prepared by

OSHA or by trade or industry associations that will provide the needed information in a simpler manner that would take less time to review and digest than the regulatory language. OSHA estimates that rule familiarization would take a designated person one hour to complete. Table VIII.C.8. shows the unit costs for rule familiarization by industry sector.

B. Heat Injury and Illness Prevention Plan (HIIPP)

TABLE VIII.C.8—UNIT COSTS—RULE FAMILIARIZATION
[2023\$]

81	1.0	54.45	Designated Person	Establishment	One-Time.
92	1.0	73.10	Designated Person	Establishment	One-Time.

Source: OSHA estimate derived from BLS, 2023c; BLS, 2024b; O*NET, 2023; EPA, 2002; and Rice, 2002.

Under paragraph (c) of the proposed standard, employers must create a written HIIPP,⁶¹ with the input from employees. OSHA acknowledges that some employers may already have an existing HIIPP that may only need to be

modified to comply with the proposed standard. The HIIPP must include:

- A comprehensive list of the types of work activities covered by the plan;
- All policies and procedures necessary to comply with the requirements of this proposed standard including those to protect employees

while wearing vapor-impermeable clothing; and

- Identification of the heat metric (*i.e.*, heat index or wet bulb globe temperature) the employer will monitor to identify heat hazards.

Further, the employer must designate one or more heat safety coordinators to implement and monitor the HIIPP, make

⁶¹ Employers with 10 or fewer employees do not have to write out their HIIPP.

the HIIPP readily available to all employees in a language that all employees understand, and review the HIIPP whenever a heat-related incident occurs those results in death, days away from work, medical treatment beyond first aid, or loss of consciousness. The review of the HIIPP must occur at least annually.

For employers with an existing HIIPP in place, OSHA assumes that employers will designate someone to review their HIIPP and make any modifications necessary to comply with the proposed standard. OSHA estimates this process will require 2.5 hours of the designated person's time. Employers that do not have an existing HIIPP could either choose to use a HIIPP template (for example, one provided by OSHA as part of rollout materials or one from a trade organization) or write a HIIPP from scratch. Because writing a HIIPP from scratch without the help of a template would be considerably more onerous, OSHA expects that most employers would not choose this option and would, instead, opt to use a template which the agency estimates would require approximately six hours of a designated person's time to locate,

review, identify relevant sections, and fill in worksite-specific information on hazards, controls, and procedures. For employers that are exempt from writing their HIIPP (*i.e.*, those with ten or less employees) OSHA assumes that they will spend four hours using a template to guide their creation of a HIIPP. OSHA assumes that five percent of employers will have complex or unique situations where a template would not be usable. For these employees, OSHA estimates that it will take 30 hours of a designated person's time to prepare the HIIPP. OSHA welcomes comments and input on these estimates and assumptions. The agency would like information and data on how these estimates correspond to the costs incurred by employers who have developed written HIIPPs, whether the time estimates are reasonable, and what method employers have taken when developing their plans.

Additionally, the proposed standard would require employers to review and update the HIIPP periodically. Regardless of how employers develop or modify their HIIPPs initially, OSHA estimates that the process of reviewing and updating the HIIPP would take the

person designated on average one hour per year to do so.

The proposed standard would also require that employers involve non-managerial employees in the creation or initial modification of the HIIPP, as well as in the process of periodically reviewing and updating the HIIPP. OSHA assumes that a representative group of employees (four employees per establishment) will take one hour each during the initial development of the HIIPP to provide feedback, regardless of whether the employer has an existing HIIPP. This same representative group of employees would take 20 minutes each during the review and update of the HIIPP to provide feedback. OSHA welcomes comments and input on these estimates and assumptions. The agency would like information and data on how these estimates correspond to the costs incurred by employers who have developed written HIIPPs, whether the time estimates are reasonable, and what method employers have taken when developing their plans.

Table VIII.C.9. shows the units costs for developing and updating the HIIPP by industry sector.

C. Identifying Heat Hazards

The proposed standard would require employers to assess where and when employees are exposed to temperatures at or above the initial and high heat triggers. For outdoor work sites, the proposed standard would require employers to monitor heat conditions using either local heat index forecasts or on-site measurement of heat index or wet bulb globe temperature (WBGT). OSHA assumes that all outdoor

employers without current monitoring practices will choose the option to monitor local forecasts since the time necessary to do so would be minimal (and many individuals check local forecasts regularly without regard to this proposed standard). Employers may have a designated person at each work site track local forecasts of ambient temperature and humidity provided by the National Weather Service (NWS) (or others) to determine the daily maximum

heat index, which the employer would then use to determine which protocols are triggered, if any. For this analysis, OSHA assumes that employers, on average, will take approximately 15 seconds twice a day to monitor the local forecast via a smart phone app.

Alternatively, employers can set up monitoring devices as close as possible to the work area to conduct on-site monitoring. Employers may choose between measuring the heat index or

WBGT using monitoring devices. Employers with indoor work sites do not have the option of monitoring local weather forecasts. The first approach, measuring the heat index, would require the employer to designate someone to take measurements of the heat index, or to measure separately the ambient temperature and humidity to calculate heat index (if needed, using the OSHA–NIOSH Heat Safety Tool App as a calculator or the online calculator available from the NWS). OSHA estimates that on average, it will take the designated person 1 minute each time they measure the heat index or ambient temperature and humidity, including calculating the heat index (e.g., by consulting the OSHA–NIOSH App or NWS’s online calculator). OSHA also assumes that measurements will be taken on average twice per work day (260 days per year) and that employers using this approach will use a temperature and humidity logger that is capable of automatically uploading relevant environmental information for recordkeeping purposes. OSHA assumes that the designated person will spend 15 minutes to read the logger’s user manual. OSHA also assumes that all indoor employers without current monitoring in place will adopt this option.

The second approach, measuring the WBGT, would require the employer to designate someone to take measurements of wet bulb globe

temperature. This approach would require the purchase of one WBGT thermometer for each worksite and some of a designated person’s time to read the thermometer manual. OSHA assumes that no employers will adopt this option, however some employers may already be using this method. Those employers can continue to use this method under this proposed standard and are not estimated to incur any costs to do so since they are already in compliance.

Employers with indoor work sites would be required to conduct a hazard evaluation to identify the work areas where there is a reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger. OSHA estimates that conducting the hazard evaluation would require about 3 hours in total.

Employers would be required to seek the input and involvement of non-managerial employees and their representatives, if any, when evaluating the work site to identify work areas with a reasonable expectation of exposures at or above the initial heat trigger and in developing and updating monitoring plans. The time to develop monitoring plans, as well as the time for employee input, is already captured within the time estimate for HIIPP development and employee involvement in HIIPP development. Otherwise, OSHA estimates that employee input for evaluating work sites would require 15

minutes per employee providing input. For this analysis, OSHA assumes four employees per establishment would provide input.

The proposed standard would allow employers to forgo taking measurements if they assume that a work area meets or exceeds both heat triggers. Employers that elect to do this would not incur monitoring costs. These employers would be required to comply with all control measures required at both the initial and high heat triggers as though they took a measurement that meets or exceeds the high heat trigger. OSHA assumes that no employers will newly adopt this option, because the Annual monitoring cost per establishment is relatively low compared to the costs to implement other parts of the rule that would be required for employers choosing this option. Most employers will find it less expensive to monitor temperatures and implement the requirements when a trigger is met or exceeded. OSHA welcomes feedback on this assumption, specifically the types of employers that might forgo monitoring and assume that their workplace is at or above both heat triggers.

Table VIII.C.10. shows the labor-based unit costs for identifying heat hazards by industry sector. Table VIII.C.11. shows the equipment costs that employers would incur to comply with the requirements for identifying heat hazards.

D. Requirements at or Above the Initial Heat Trigger

When employees are exposed to heat at or above the initial heat trigger, the proposed standard includes provisions related to drinking water, break areas, work area controls, acclimatization, rest breaks, and effective communication. The costs associated with the evaluation of fan use in paragraph I(6) are included as part of the planning and hazard evaluation discussed in section VIII.C.IV.C. OSHA has not included costs related to cooling PPE as included in proposed paragraph I(e)(10). Based on feedback from Small Entity Representatives who spoke on the topic during the SBAR Panel process, OSHA believes that use of cooling PPE is not widespread. Where employers are requiring or permitting the use of cooling PPE, OSHA expects that these employers will train employees to remove the PPE once it loses its cooling properties and will include this requirement in their HIIPPs. The cost for this would be included in the costs associated with proposed paragraphs (c) and (h).

I. Drinking Water

Employers would be required to provide access to one quart (32 fluid ounces) of suitably cool drinking water per employee per hour for the entire shift. To comply with this requirement

at both outdoor and indoor work sites, OSHA assumes employers would purchase 40-quart water coolers (with spigots) sufficient to provide the required amount of water. For this analysis, OSHA estimates that the cost of one 40-quart cooler is incurred for every 40 employees. Employers are assumed to purchase one reusable water bottle per employee. Because existing OSHA standards already require employers to provide drinking water, OSHA assumes that nearly all employers currently provide water to their employees. The costs incurred to comply with this proposed standard are assumed to be a result of employers not providing the quantity of water specified by the proposed standard.

II. Break Area(s) at Outdoor Work Sites

For outdoor work sites, OSHA would require employers to provide employees working outdoors with a break area. Break areas must be readily accessible to the work area and able to accommodate the number of employees on break. Additionally, break areas must have artificial or natural shade, or be an air-conditioned space (e.g., trailers, vehicles, structures). OSHA assumes that employers without existing break areas will use artificial shade in the form of a 12x12 foot tent that all employees on break can reasonably access.

III. Break Area(s) and Work Area(s) at Indoor Work Sites

OSHA would require employers with indoor work sites to provide employees at those sites with a break area. These break areas must be readily accessible to the work area and able to accommodate the number of employees on break. This space must be air-conditioned or have increased air movement and, if appropriate, de-humidification. OSHA assumes that employers without existing air-conditioned breakrooms will designate a room or an area large enough to accommodate employees on break and that these areas will contain adequate fans and dehumidifiers. Further, employers would be required to provide measures that reduce employee exposure to heat in the work area. One of the ways employers can comply with this requirement is by providing increased air movement and, if appropriate, de-humidification. Adequate fans and dehumidifiers could be used to comply with this requirement. Overall, OSHA assumes that, in all States and territories in the U.S., the average employer that does not already have air conditioning, fans, or dehumidifiers in place will provide two fans per ten employees and, in States where humid conditions may occur, the average employer would also provide two dehumidifiers per ten employees.

IV. Acclimatization

The proposed standard would require employers to adopt protections for new and returning employees who may not be acclimatized to working in the heat at or above the initial heat trigger during their first week on the job or their first week back on the job after an employee is away from work for more than 14 days. For new employees, OSHA assumes that employers would implement a plan that incorporates the measures required in paragraph (f) when the initial heat trigger is met or exceeded during the first week of work. For purposes of estimating the cost of compliance with this provision, OSHA calculated the cost of rest breaks and observation for signs and symptoms during an employee's first week. While paragraph (f) also requires a hazard alert, OSHA assumes that the hazard alert can be provided by the designated person while conducting observation or during training (for new employees).

The cost of rest breaks and observation during the first week of work, assuming 8-hour shifts that coincide with heat index measurements that meet or exceed the initial heat trigger but do not meet the high heat trigger, equates to roughly 41.75 minutes per day for every new indoor employee and 47.75 minutes per day for every new outdoor employee during the employee's first week on the job. These estimates are the same for returning employees during their first week after returning to work when the heat index is at or above the initial heat trigger. No additional costs were estimated for new or returning employees when the temperature meets or exceeds the high heat trigger, as employers are already required to follow the high heat procedures.

OSHA did not make an additional adjustment for cost savings (see Appendix A at the end of this section for a description of cost savings methodology) as the conditions of those additional rest breaks are different (*i.e.*, different temperature range-rest break combination) than those at which the estimates of labor productivity loss due to pacing in the heat were calculated. To the extent that pacing is reduced for employees undergoing acclimatization protocols, this could overstate the costs of acclimatization. OSHA welcomes comment on this issue and whether the agency should extend the potential cost

savings from reduced pacing to workers during their acclimatization period.

V. Rest Breaks if Needed

The proposed standard would require that employers allow and encourage their employees to take paid rest breaks if needed once the initial heat trigger is met or exceeded to prevent overheating. OSHA assumes that, per 8-hour shift, at-risk employees will take one 10-minute if-needed rest break.⁶² OSHA estimates, on average, an additional two minutes for indoor employees per break and an additional four minutes for outdoor employees per break to account for the time to walk to and from the break area.⁶³ OSHA welcomes feedback on the assumption that an average employee will take one ten-minute if-needed rest break when the temperature is at or above the initial heat trigger and the assumptions for travel time to and from the break area for indoor and outdoor settings.

OSHA has preliminarily determined that when employees are offered rest breaks, cost savings will accrue to employers currently noncompliant with the rest break requirements, as their employees will work more efficiently during the work time not spent on rest breaks (*i.e.*, pace less). At the initial heat trigger, some of the estimated unit cost for if-needed rest breaks (*i.e.*, 10 minutes plus travel time) will be offset by this reduction in pacing, which OSHA considers as cost savings for employers.

For the purposes of calculating accrued employer cost savings, OSHA

⁶² If-needed rest breaks by new and returning employees when the temperature meets or exceeds the initial heat trigger and is below the high heat trigger are accounted for in the acclimatization costs (section VIII.C.IV.D.IV). To avoid double counting, if-needed rest breaks were not costed for these employees during their first week of work (for new hires) or the first week back from leave (for returning workers).

⁶³ These estimates of time needed to walk to and from the break area are meant to be averages across all workers in all settings. In some large indoor settings like warehouses or large manufacturing facilities, the break area may be further from the work areas than other indoor settings where the break area may be directly adjacent to work areas. In outdoor settings, OSHA expects the employer will use a mobile break area set up that allows the break area to be relocated as close as possible to the location employees are working on a given day. However, OSHA recognizes that it may not always be possible to have a break area immediately adjacent to all outdoor work area(s) and some outdoor work sites may have workers spread over relatively large areas (*e.g.*, some agricultural settings, large-scale infrastructure construction projects), which could result in slightly longer times needed to walk to and from the break area.

defined three groups of employees with varying existing break levels (see the introduction in appendix A at the end of this section for detailed definitions of each group). Group 1 corresponds to employees at establishments that do not currently provide rest breaks when the initial heat trigger is met or exceeded. Group 2 corresponds to employees at establishments that do provide if-needed rest breaks when the initial heat trigger is met or exceeded, but do not have required rest breaks for when the high heat trigger is met or exceeded. Group 3 captures employees at establishments that have already implemented rest breaks protocols that meet the rest break requirements outlined in this proposed standard.⁶⁴

As mentioned in section VIII.C.II.B. and detailed further in appendix A at the end of this section, OSHA estimated the minutes spent pacing for each of the three groups when they are working at or above the initial heat trigger. Table VIII.C.12. below shows the time (minutes) per 8-hour shift that OSHA estimates employees in each group currently spend pacing when the initial heat trigger is met or exceeded. Using these estimates, OSHA assumes that with the implementation of if-needed rest breaks, all employees in Group 1 (*i.e.*, not currently taking any breaks) will behave like Group 2 (*i.e.*, those currently taking if-needed rest breaks at or above the initial heat trigger but not scheduled rest breaks at or above the high heat trigger), reducing their pacing (working more efficiently) by 14.0 – 11.2 = 2.8 minutes per shift at the initial heat trigger.

For outdoor employees, this reduction in pacing translates into accrued cost savings of 20 percent (2.8 minutes of pacing reduced/14 minutes of if-needed rest break time⁶⁵) of the unit time-cost per break. This effectively reduces the unit cost of if-needed rest breaks for outdoor employees from 14 to 11.2 minutes. Similarly, for indoor employees, this reduction in pacing reduces the unit time-cost by 2.8/12 = 23.33 percent, from 12⁶⁶ to 9.2 minutes per 8-hour shift.

⁶⁴ OSHA estimates that approximately 6.1% of employees are in Group 1, 46.9% are in Group 2, and the remaining 47.0% are in Group 3.

⁶⁵ 10 minutes of if-needed rest break time and 4 minutes of travel time.

⁶⁶ 10 minutes of if-needed rest break time and 2 minutes of travel time.

TABLE VIII.C.12—LABOR PRODUCTIVITY LOSS FROM PACING ABOVE INITIAL HEAT TRIGGER BEFORE AND AFTER IMPLEMENTATION OF REQUIRED IF NEEDED REST BREAKS AND LABOR COST SAVINGS PER 8-HOUR SHIFT PER EMPLOYEE

Group	Group description	Labor productivity loss from pacing before required initial heat trigger rest breaks (minutes)	Labor productivity loss from pacing after required initial heat trigger rest breaks (minutes)	Estimated labor cost savings (minutes)
Group 1	Employees at establishments that do not currently provide any rest breaks.	14.0	11.2	2.8
Group 2	Employees at establishments that provide rest breaks that meet the initial heat trigger rest break requirements, but not the high heat trigger rest break requirements.	11.2	11.2	0.0
Group 3	Employees at establishments that provide rest breaks that meet the initial and high heat trigger rest break requirements.	0.0	0.0	0.0

Source: OSHA estimate.

Note: OSHA estimates that approximately 6.1 percent of employees are in Group 1, 46.9 percent are in Group 2, and 47.0 percent are in Group 3.

VI. Effective Communication

Employers would be required to maintain a means of effective two-way communication with employees whenever the initial heat trigger is met or exceeded. OSHA assumes that a designated person would communicate with each employee three times for every 8-hour shift that meets or exceeds the initial heat trigger and would spend 15 seconds on each communication. At-risk workers are assumed to spend the same amount of time in communication

with the designated person. It is assumed that all employers and employees have a current method for effective two-way communication (*e.g.*, cell phones, walkie talkies) that may be currently used to communicate information about work-related concerns and that these methods may be used when the initial heat trigger is met or exceeded. OSHA welcomes comments on existing methods of two-way communication between employees and employers.

Table VIII.C.13. shows the unit costs for the requirements at or above the initial heat trigger by industry sector. The rest break unit costs reported in table VIII.C.13. do not reflect the cost savings offset discussed above. Table VIII.C.14. shows the equipment costs (water coolers, water bottles, pedestal fans, dehumidifiers, and tents for artificial shade) that employers would incur to comply with the requirements when the initial heat trigger is met or exceeded.

E. Requirements At or Above the High Heat Trigger

When the high heat trigger is met or exceeded, this proposed standard includes provisions related to rest breaks, observation of employees for signs and symptoms of heat illness, hazard alerts, and excessively high heat areas.

I. Rest Breaks

When the high heat trigger is met or exceeded, employers would be required to provide a minimum of 15-minute paid rest breaks at least every two hours. The proposed standard specifies that a meal break may count as a rest break, even if it is not otherwise required by law to be paid. For this analysis, OSHA assumes two paid 15-minute rest breaks and an unpaid meal break per at-risk worker per 8-hour shift where the high heat trigger is met or exceeded. At the high heat trigger, employers must also provide if-needed rest breaks (as part of the requirements of the initial heat trigger). Therefore, OSHA assumes that when the high heat trigger is met or exceeded, in addition to 30 minutes per 8-hour shift of scheduled rest break time, at-risk workers would take a five-minute if-needed rest break. The travel time to walk to and from the break area is also accounted for and OSHA assumes two minutes for indoor employees and four minutes for outdoor employees per rest break.

Similar to the discussion in section VIII.C.IV.D.V., OSHA estimated the amount of time that employees spend pacing themselves when the high heat trigger is met or exceeded over an 8-hour shift (see table VIII.C.15.). These estimates reflect three groups of employees based on their respective establishments' estimated compliance with the rest break requirements outlined in this proposed standard. Group 1 corresponds to employees at establishments that do not currently provide rest breaks that meet the requirements when the initial heat trigger is met. Group 2 corresponds to employees at establishments that do provide if-needed rest breaks when the initial heat trigger is met or exceeded, but do not have required rest breaks for when the high heat trigger is met or exceeded. Group 3 captures employees at establishments that have already implemented rest breaks protocols that meet the initial and high heat trigger rest break requirements outlined in this proposed standard.

Based on the estimates for pacing mentioned in section VIII.C.II.B. and detailed further in appendix A at the end of this section, OSHA estimated the reduction in pacing at the high heat trigger; the estimates for pacing for each group are shown in table VIII.C.15. OSHA estimated that with the implementation of scheduled rest breaks as well as if-needed rest breaks at the high heat trigger, employees in Group 1

(i.e., that are currently noncompliant with scheduled rest breaks as well as if-needed rest breaks) will behave like those in Group 3 (i.e., rest break protocols are consistent with the requirements of the standard at both triggers) and therefore their pacing reduces by $40.6 - 8.4 = 32.2$ minutes. This reduction in pacing translates into $32.2/47 = 68.51$ percent of the unit time-cost for rest breaks of 47 minutes and $32.2/41 = 78.53$ percent out of the unit time-cost for rest breaks of 41 minutes saved for outdoor and indoor employees, respectively.

Based on the estimates for pacing mentioned in section VIII.C.II.B. and detailed further in appendix A at the end of this section and displayed in table VIII.C.15., OSHA estimates that with the implementation of scheduled rest breaks at the high heat trigger, employees in Group 2 (i.e., that are currently noncompliant with only scheduled rest breaks and currently compliant with if-needed rest breaks) will now behave like those in Group 3 and for those employees pacing is reduced by $39.5 - 8.4 = 31.1$ minutes per shift. This reduction in pacing (i.e., increase in worker efficiency) translates into $31.1/47 = 66.17$ percent of the unit time-cost of 47 minutes⁶⁷ ($31.1/41 = 75.85$ percent out of the unit time-cost of 41 minutes⁶⁸) saved for outdoor (indoor) employees that are currently in Group 2.⁶⁹

⁶⁷ $2 \times (15\text{-minute scheduled break} + 4\text{-minute travel time}) + 1 \times (5\text{-minute if-needed rest break} + 4\text{-minute travel time})$.

⁶⁸ $2 \times (15\text{-minute scheduled break} + 2\text{-minute travel time}) + 1 \times (5\text{-minute if-needed rest break} + 2\text{-minute travel time})$.

⁶⁹ For Group 2 as well as Group 1, for presentation purposes, the denominator over which unit time cost savings is translated as a share of the unit time cost of high heat trigger rest breaks is presented as 47 minutes for outdoor employees (41 minutes for indoor employees). The fact that employees in Group 2 are already spending some portion of the 47 minutes or 41 minutes in if-

needed rest breaks is already reflected in the estimated (State-level) share of employees in Group 2, which is equivalent to the difference between the (State-level) non-compliance rate for high heat trigger rest breaks (scheduled as well as if-needed rest breaks) and the (State-level) non-compliance rate for initial heat trigger rest breaks (if-needed rest breaks). Most of the employees in Group 2 (approximately 74 percent) are estimated to be already taking if-needed rest breaks but not scheduled breaks. The rest of the employees in Group 2 are, in addition to if-needed rest breaks, also already taking partial scheduled breaks that fall short of (i.e., are not fully compliant with) the scheduled breaks that are required in the proposed

standard. The purpose of such classification of employees already taking partial scheduled breaks as part of Group 2 (employees at establishments that do not have required rest breaks for when the high heat trigger is met or exceeded) is to avoid overcomplicating the computation and presentation of the cost savings. Such classification may potentially result in the overestimation of cost savings from the high heat trigger rest breaks. However, as mentioned throughout this section, there are also reasons why the cost savings are also potentially underestimated (e.g., due to temperature data limitations as mentioned in section VIII.C.II.B.).

TABLE VIII.C.15—LABOR PRODUCTIVITY LOSS FROM SPENT PACING AT HIGH HEAT TRIGGER BEFORE AND AFTER IMPLEMENTATION OF REQUIRED IF-NEEDED AND SCHEDULED REST BREAKS PER 8-HOUR SHIFT PER EMPLOYEE

Group	Group description	Labor productivity loss from pacing at before required high heat trigger rest breaks (minutes)	Labor productivity loss from pacing after required high heat trigger rest breaks (minutes)	Estimated labor cost savings (minutes)
Group 1	Employees at establishments that do not currently provide any rest breaks.	40.6	8.4	32.2
Group 2	Employees at establishments that provide rest breaks that meet the initial heat trigger rest break requirements.	39.5	8.4	31.1
Group 3	Employees at establishments that provide rest breaks that meet the initial and high heat trigger rest break requirements.	8.4	8.4	0.0

Source: OSHA estimate.

Note: OSHA estimates that approximately 6.1 percent of employees are in Group 1, 46.9 percent are in Group 2, and 47.0 percent are in Group 3.

II. Observation for Signs and Symptoms

Employers would be required to observe employees for signs and symptoms of heat-related illness at or above the high heat trigger. The proposed standard provides options for complying with this requirement, including a mandatory buddy system and observation of employees by a supervisor or heat safety coordinator. Additionally, the proposed standard has a provision for communication with employees who are lone workers every 2 hours. OSHA assumes that all employers will use supervisors⁷⁰ to conduct observation of employees⁷¹ (with one supervisor or heat safety coordinator responsible for observing no more than 20 employees). OSHA estimates this option would require 15 seconds of the designated person's time three times per employee for every 8-hour shift that meets or exceeds the high heat trigger. This observation requirement would also take 15 seconds of each at-risk worker's time three times for every 8-hour shift that meets or exceeds the high heat trigger.

III. Hazard Alert

When the high heat trigger is met or exceeded, OSHA would require employers to notify employees of the importance of staying hydrated, their right to take breaks, procedures to take in a heat emergency, and the locations of break areas and drinking water (for mobile work sites). OSHA estimates that it would take five minutes one time for a designated person to prepare and deliver the first notification message to employees for the year or heat season, and that for each subsequent notification, the designated person will use the same format and spend 30 seconds to update and resend the alert for each 8-hour shift at or above the initial heat trigger. OSHA assumes the time for at-risk workers to review the hazard alert is negligible and thus is not estimated to require any time.

IV. Warning Signs for Excessively High Heat Areas

For indoor workplaces, employers would be required to place warning signs at areas with ambient

temperatures that regularly exceed 120 °F. OSHA assumes that this requirement imposes costs only to certain industries that are likely to have radiant heat sources (e.g., furnaces, hot water systems, ovens, smelting processes). OSHA assumes that this control would require 1–2 warning signs for each establishment in industries where radiant heat sources are likely present (or an average of 1.5 signs per establishment). OSHA estimates it would take a designated person 5 minutes to install each sign.

Table VIII.C.16. shows the unit costs for the requirements under the high heat trigger conditions by industry sector. The rest break unit costs reported in table VIII.C.16. do not reflect the cost savings offset discussed above. Table VIII.C.17. shows the equipment costs that employers would incur in order to comply with the requirements when the high heat trigger is met or exceeded.

TABLE VIII.C.16—LABOR-BASED UNIT COSTS—REQUIREMENTS AT OR ABOVE THE HIGH HEAT TRIGGER [2023\$]

Sector	Hours	Unit cost	Labor category	Basis	Frequency
Rest Breaks at High Heat Trigger—Indoor					
11	0.68	\$18.31	At-Risk Worker	Employee	Daily at High Heat Trigger.
21	0.68	31.74	At-Risk Worker	Employee	Daily at High Heat Trigger.
22	0.68	51.61	At-Risk Worker	Employee	Daily at High Heat Trigger.
23	0.68	30.03	At-Risk Worker	Employee	Daily at High Heat Trigger.
31–33	0.68	25.07	At-Risk Worker	Employee	Daily at High Heat Trigger.
42	0.68	28.93	At-Risk Worker	Employee	Daily at High Heat Trigger.
44–45	0.68	17.96	At-Risk Worker	Employee	Daily at High Heat Trigger.

⁷⁰ For this analysis, OSHA uses the wages developed for designated persons to represent supervisors' time as well.

⁷¹ OSHA was unable to estimate the number of affected lone workers. OSHA assumes that the cost of lone workers communication with supervisors is the same as the cost of observation for the purposes

of this analysis. The agency welcomes comment on this assumption and additional data that would allow OSHA to better estimate the costs for communication with lone workers.

F. Heat Illness and Emergency Response and Planning

In addition to requirements for a heat emergency response plan that employers must include in their HIIPP, OSHA would require employers to undertake certain activities for any at-risk worker experiencing signs and symptoms of heat-related illness, including requiring immediate action appropriate to the severity of the illness or emergency. There are other methods to cool an individual experiencing a heat emergency, but OSHA is estimating costs here assuming that employers will implement the method recommended by the U.S. Army (Department of the Army, 2023). The agency welcomes comment on this issue and information on methods currently used for cooling.

In the case of a non-emergency heat-related illness, OSHA estimates that a designated person will spend 45 minutes per incident monitoring the employee. When an employee is suspected of a heat emergency, the

proposed standard would require immediate action to reduce body temperature. OSHA estimates this would take 12.5 minutes per incident (based on Casa et al., 2007), accompanied by an immediate call to emergency medical services (EMS) taking an estimated 2 minutes.⁷² For any employee experiencing a heat emergency working in a location that is off a roadway that needs EMS, a designated person will spend time transporting the employee to a location where EMS can reach them. OSHA estimated that, on average, it will take a designated person 30 minutes to transport an employee per incident.⁷³ Finally, OSHA would require employers to have a way to reduce an employee's body temperature when necessary. OSHA assumes that employers will use two sets of four bed sheets⁷⁴ that have been wetted and cooled per employee experiencing a heat emergency, with one set on the employee and one set in a cooler such that they can be swapped every three minutes. OSHA further

assumes that employers will need to have supplies on hand to potentially handle two incidents concurrently. In all, this means that an employer would need 16 sheets (8 per individual to cool two individuals, where four sheets can be cooled while four are used which can then be switched and reused in a cycle of cooling then using the sheets) and two coolers at their establishment, as well as six seven-pound bags of ice⁷⁵ for each 8-hour shift that meets or exceeds the initial heat trigger.

See table VIII.C.6. for anticipated annual incidence rates by sector used in this analysis. Table VIII.C.18. shows the unit costs for the requirements to respond to and plan for heat-related illnesses by severity of illness and industry sector. Table VIII.C.19. shows the equipment costs that employers would incur in order to perform emergency response procedures in the event of a heat-related illness by severity of illness (emergency or non-emergency).

TABLE VIII.C.18—LABOR-BASED UNIT COSTS—HEAT ILLNESS AND EMERGENCY RESPONSE AND PLANNING
[2023\$]

Sector	Hours	Unit cost	Labor category	Basis	Frequency
Medical Response—Non-Emergency					
11	0.75	\$37.37	Designated Person	Incident	Annual.

⁷² OSHA estimates that a heat emergency will require less time from a designated person because, in a heat emergency, the affected employee will be transported to a medical facility by EMS rather than monitored for the duration at the work site.

⁷³ This time estimate includes time for the designated person to return to the work site.

⁷⁴ This assumption is based on guidance from the U.S. Army on treatment of heat casualties. The guidance suggests treating an ill person with two sheets, one to wrap their body and the other for their head, and to rotate between four sets of two sheets every three minutes (Department of the Army, 2023).

⁷⁵ OSHA assumes that approximately 50 percent of employers will make and/or store ice on their premises using existing freezers and/or ice machines.

TABLE VIII.C.19—EQUIPMENT-BASED UNIT COSTS—HEAT ILLNESS AND EMERGENCY RESPONSE AND PLANNING
[2023\$]

Item	Units	Unit cost	Total cost	Basis	Frequency
Ice Sheets	16.0	\$9.99	\$159.84	Establishment	One-Time.
Ice	6.0	^a 0.69	4.14	Establishment	Daily at Initial Heat Trig- ger.
Ice Cooler	2.0	31.70	63.40	Establishment	One-Time.

Source: OSHA based on Amazon.com, Inc., 2024c; W.W. Grainger, Inc., 2024; and Walmart Inc., 2024.

^a Under the assumption that approximately 50 percent of employers will make and/or store ice on their premises using existing freezers and/or ice machines, half of the unit cost of a seven-pound bags of ice = \$1.38 ÷ 2 = \$0.69 is reported.

G. Training

The proposed standard would require employers to develop and implement a training program for employees and supervisors. Training would be required at certain frequencies, including initially (*e.g.*, prior to any work at or above the initial heat trigger), annual refresher training, and supplemental training when necessary (*e.g.*, following each heat-related incident at the work site, new job tasks, or changes in employer policies and procedures). OSHA assumes the training program would be developed and implemented by a designated person.

OSHA estimates a designated person would spend four hours developing the initial employee training program, 30 minutes preparing for the initial employee training sessions, and one hour administering each initial training

session.⁷⁶ OSHA estimates that a designated person would spend 15 minutes preparing for the refresher employee training(s) and 30 minutes conducting each refresher employee training. Finally, OSHA estimates that all employees would spend one hour each for the initial employee training and 30 minutes each for every refresher employee training.

For the supervisor and heat safety coordinator training, OSHA estimates that a designated person would spend four hours developing the initial training, 15 minutes preparing, and one hour per session to deliver the initial supervisor training. OSHA estimates that each supervisor and heat safety coordinator would spend one hour attending the supervisor training. For supervisor refresher training, OSHA estimates that a designated person would spend 15 minutes preparing for

the refresher training and 30 minutes conducting the refresher training. Each supervisor and heat safety coordinator would spend 30 minutes attending the supervisor refresher training.

Finally, OSHA estimates that a designated person would spend 15 minutes preparing supplemental employee training and 30 minutes conducting each supplemental employee training. Each employee would spend 30 minutes attending the employee supplemental training. For this analysis, OSHA assumes that these supplemental trainings would be conducted by one percent of establishments each year and that one percent of employees would attend these supplemental trainings.

Table VIII.C.20. shows the unit costs for the training requirements by industry sector.

⁷⁶ OSHA expects to provide training materials and templates. To the extent that employers are able to incorporate and develop training using those

materials and templates, this estimate may overstate the amount of time needed to develop training. OSHA welcomes comment on this issue, how

training is generally developed, how long that development takes, and/or information about any other costs related to training development.

Source: OSHA estimate derived from BLS, 2023c; BLS, 2024b; O*NET, 2023; EPA, 2002; and Rice, 2002.

H. Recordkeeping

The proposed standard would require that indoor work area measurements be retained for 6 months. OSHA assumes

that employers would purchase a wireless temperature and humidity data logger described in section VIII.C.IV.C. (with the costs accounted for there) to meet this requirement. Since employers

would purchase data loggers that can automatically record the heat index measurements in and around a work site, OSHA assumes employers would

incur no additional cost to comply with this recordkeeping requirement.

V. Estimated Total Costs of Compliance

This section summarizes the estimated total costs of compliance with the proposed standard. The total costs are generally calculated by multiplying the basis for each cost (the number of affected establishments or affected employees as shown in Section VIII.B. Profile of Affected Industries) by the unit costs shown in section VIII.C.IV. Each of these costs are then multiplied by their corresponding non-compliance rates (as shown in section VIII.C.II.A.) to determine total compliance-adjusted costs.

Many costs in this analysis are incurred one time, and most others are either annual or can be annualized based on days of exposure or events that happen multiple times per year. For the purposes of this cost analysis, total costs are annualized based on several assumptions, such as estimates of the number of hours at or above both heat triggers and incidence rates for HRIs and heat-related fatalities (see Section

VIII.C.II., Cost Assumptions for additional detail). The exceptions are the identification and evaluation of heat-exposed work areas for indoor work sites and the corresponding employee involvement in that work area evaluation, which are assumed to impact 20 percent of establishments each year. Based on that assumption, OSHA estimates that these costs are both incurred every five years. In order to present compliance costs and benefits estimates on a consistent basis across proposed standard provisions, they are presented as annualized costs.

For each provision described below, this analysis annualizes one-time costs using a 2 percent discount rate over a 10-year period. For the two costs incurred every five years, OSHA calculated the present value of these costs assuming that they would be incurred in the first year and the sixth year after adoption of the proposed standard using a 2 percent discount rate. Using the present value of these costs, OSHA then annualized using a 2 percent discount rate. Annualized one-time and annual costs, plus the

annualized period costs, are then summed to estimate total annualized costs.

For each provision in the proposed standard, OSHA also calculated the estimated total annualized undiscounted costs, using the same method as above but assuming a 0 percent discount rate over a 10-year period.

A. Rule Familiarization

All affected establishments would incur rule familiarization costs. To calculate the total cost of rule familiarization, OSHA multiplies the number of affected establishments from table VIII.B.12. in Section VIII.B., Profile of Affected Industries, by the unit costs presented in table VIII.C.8. As all affected employers incur this cost, no compliance adjustment is necessary. Table VIII.C.21. shows the annualized one-time, annual, and total annualized costs for each of these requirements by industry category, discounted (2 percent over a 10-year period) and undiscounted.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

B. Heat Injury and Illness Prevention Plan (HIIPP)

All affected establishments would incur costs for developing a HIIPP. For those establishments that already have a HIIPP, they are expected to review their HIIPP and make any modifications necessary to match the requirements outlined in this proposed standard. Section VIII.C.II.A. discusses the

percentages of establishments with HIIPPs already in place in certain industries and States.

The proposed standard does not require establishments with ten or less employees to develop their HIIPP in writing. For the purpose of this analysis, OSHA assumed that all affected establishments with ten or less employees would choose to use OSHA's

template to guide their development of an unwritten HIIPP. Of the remaining establishments that do not have an existing HIIPP and have more than ten employees, OSHA assumes that, as discussed in section VIII.C.IV.B., 90 percent of these establishments without an existing plan would choose the less burdensome option of using OSHA's

template, while the other 10 percent would write their HIIPP from scratch.⁷⁷

Affected establishments would have to review and update their HIIPPs annually. The time to perform this requirement (one hour) does not depend on the option that establishments choose when initially developing their HIIPP.

The proposed standard would also require that non-managerial employees be involved in the development, review, and update of the HIIPP. As discussed in section VIII.C.IV.B., OSHA assumed that four employees per establishment would spend one hour providing input on the development of the HIIPP and 20 minutes on the review and update of their establishments' HIIPP. These time

estimates are assumed to be the same regardless of the option that the establishment chooses when developing, reviewing, and updating their HIIPP. Table VIII.C.22. shows the annualized one-time, annual, and total annualized costs for each of these requirements by industry category, discounted (2 percent over a 10-year period) and undiscounted.

⁷⁷ The percentage of establishments overall that will choose to write a HIIPP from scratch as reported in section VIII.C.IV.B. is estimated using these assumptions. The percentage of

establishments choosing to write the HIIPP from scratch is equal to the estimated percentage of establishments without an existing HIIPP (50 percent) multiplied by the percentage of

establishments without a HIIPP that will write from scratch (10 percent), resulting in an estimate of 5 percent.

C. Identifying Heat Hazards

Establishments would be expected to monitor environmental conditions in and around work areas under the proposed standard for both indoor and outdoor work sites. As outlined in section VIII.C.IV.C., establishments with outdoor work sites could track local forecasts to meet this requirement, while establishments with indoor work sites are assumed to use temperature and data loggers to monitor environmental conditions. For this analysis, OSHA assumes one work area per establishment. OSHA estimates the number of establishments with outdoor and indoor work areas by estimating the percentage of employees in each industry that are estimated as indoor and outdoor employees affected by the proposed standard. OSHA multiplies the total number of affected

establishments by the percentages of indoor and outdoor employees to determine the number of indoor and outdoor establishments and then multiplies these counts of indoor and outdoor establishments by their respective unit costs for indoor and outdoor environmental monitoring (with the unit costs for outdoor establishments being lower than for indoor establishments).

Indoor establishments would also need to identify work areas that pose heat-related risks to employees. OSHA assumes that 20 percent of establishments will need to reevaluate work areas due to changes to work processes that may result in increased heat-related exposure for employees every year. OSHA therefore has estimated that this indoor work area evaluation would be incurred every five years at each establishment. Similar to

the development and review of the HIIPP, the proposed standard would require employee involvement in these work-area evaluations. OSHA again assumes that four employees per establishment would make up a representative sample of employees that could provide input. Since these work-area evaluations are expected to occur every five years, OSHA assumed that the cost for these work-area evaluations would occur in the first and sixth years after the proposed standard's implementation. OSHA determined the present value of these costs using a 2 percent discount rate. Once adjusted for compliance, OSHA annualized the present value of these costs for inclusion in the total annualized costs for this provision.

Table VIII.C.23. shows the annualized costs for each of these requirements by industry category, discounted (2 percent

over a 10-year period) and undiscounted.

Source: OSHA estimate.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.**D. Requirements at or Above the Initial Heat Trigger****I. Drinking Water**

All affected establishments would be required to provide sufficiently cool water to their affected employees. In order to meet this requirement, OSHA assumes that establishments would purchase one 40-quart cooler for every 40 employees. These establishments would also purchase reusable water bottles for each affected employee.

II. Break Area(s) at Outdoor Work Sites

All affected establishments would also have to provide break areas for affected employees. At establishments with outdoor work sites, OSHA assumes that each establishment would purchase a twelve-by-twelve-foot tent as a means of providing artificial shade. OSHA assumes that establishments would incur this cost one time.

III. Break Area(s) and Work Area(s) at Indoor Work Sites

Establishments with indoor work sites would purchase one industrial pedestal fan and one dehumidifier that provide sufficient air movement and humidity control in break areas for every 10 employees. Establishments with indoor work sites would also have to purchase these same control measures for work areas for every 10 employees. However, OSHA does not capture a cost for dehumidifiers for establishments with indoor work sites in the four least humid States in the U.S. (Arizona, Nevada, New Mexico, and Utah).

IV. Acclimatization

Both new and returning employees would undergo acclimatization during their first week of work when the initial heat trigger is met or exceeded during that first week. To calculate acclimatization costs, OSHA multiplied the unit costs for acclimatization shown in section VIII.C.IV.D.IV., by the number of new employees and by the number of returning employees. OSHA calculates the number of new employees using BLS' Job Openings and Labor Turnover

Survey (JOLTS) (BLS JOLTS, 2024). OSHA used the JOLTS hire rates from June through August for 2023 by sector to represent the percentage of employees that are new and join their respective employers when the initial heat trigger is met or exceeded. OSHA lacks data that would allow further refinement of this estimate. Calculating the number of new employees based on those hired in June through August may not accurately represent the universe of employees who will need acclimatization. This assumption may underestimate the number of newly hired employees in areas where the heat season is longer but might overestimate the number in areas where the weather is cooler for more of the year. OSHA also heard from Small Entity Representatives during the SBAR Panel process that they purposefully avoid hiring new employees during times when temperatures are high in order to avoid the difficulties and costs of acclimatization. Therefore, again, using the JOLTS data for this timeframe may overstate the number of employees who will need acclimatization. OSHA also applies this assumption to employees working indoors in settings without adequate climate control but, as discussed above in section VIII.C.II.C., acknowledges that this assumption that outdoor heat translates to indoor heat may over- or understate the temperatures indoors. The agency welcomes comment on this estimate as well as data that would allow this parameter to be better estimated.

To calculate the number of returning employees, OSHA assumed that two percent of all employees not newly hired would qualify as returning employees (*i.e.*, those returning to work from an absence of more than 14 days during a time when the initial or high heat trigger are met). OSHA welcomes comment on this estimate and information or data sources that might better allow the agency to identify employees returning from absences of more than 14 days. Next, OSHA multiplied the two percent by one minus the annual hire rate according to

the JOLTS data by sector. OSHA then multiplied this product by the ratio of the summer hire rate to annual hire rate to arrive at the percentage of employees returning to work when the initial heat trigger is met or exceeded during their first week back.

V. Rest Breaks if Needed

To calculate the cost for if-needed rest breaks when the initial heat trigger is met or exceeded, OSHA first calculated the number of rest breaks that affected employees would be expected to take annually. OSHA used the number of work hours in a given State for each work shift type (daytime, evening, and overnight) that met or exceeded the initial heat trigger but did not meet or exceed the high heat trigger. The estimated number of hours was then normalized to 8-hour work shift equivalents by dividing the number of hours meeting or exceeding the initial heat trigger (but not meeting the high heat trigger) by eight.⁷⁸ OSHA then multiplied these 8-hour work shift equivalents, the number of affected employees, and the corresponding unit costs for rest breaks for indoor and outdoor employees as shown in section VIII.C.IV.D.V. to determine total costs for rest breaks at the initial heat trigger.

As discussed in section VIII.C.IV.D.V. and detailed further in appendix A at the end of this section, OSHA estimates that under the proposed standard, the reduction in time spent on pacing (*i.e.*, the increase in worker efficiency) will partially offset the added cost of time

⁷⁸ By assuming full, 8-hour work shifts at or above the heat trigger(s), this methodology may overstate the number of breaks employers need to provide since there may be some days where the heat triggers are met or exceeded but for shorter periods of time. For example, if the high heat trigger is met or exceeded for less than two hours, the requirement to provide a scheduled rest break would not be triggered. Additionally, employees exposed to heat at or above the initial heat trigger for shorter periods of time are likely to need fewer if-needed rest breaks. A scheduled lunch break in the middle of the day may also be sufficient to satisfy the break requirement on days when the high heat trigger is met for only a portion of the day. OSHA welcomes comment on this methodology and recommendations on alternative approaches.

spent on if-needed rest breaks when the initial heat trigger is met or exceeded for employees in Group 1 (*i.e.*, currently noncompliant with if-needed rest breaks as well as scheduled rest breaks), by 20 percent and 23.33 percent for outdoor and indoor employees, respectively. Combining this estimated partial offset of the unit cost of if-needed rest breaks as required by the proposed standard with data on the industry-level and/or State-level number of in-scope employees (discussed in Section VIII.B., Profile of Affected Industries), baseline non-compliance rates (discussed in section VIII.C.II.A.), and State-level exposure to heat at or above the initial heat trigger (discussed in section

VIII.C.II.C.), OSHA estimates that approximately 21.78 percent of the total cost of compliance with if-needed rest breaks when the initial heat trigger is met or exceeded (approximately \$0.0875 billion out of \$0.402 billion) could be offset by avoided labor productivity losses due to pacing (*i.e.*, avoided losses in worker efficiency).

VI. Effective Communication

Employers would also be required to effectively communicate with affected employees when the initial heat trigger is met or exceeded. OSHA first calculated the number of times a designated person would have to perform this duty by estimating the

number of hours annually that meet or exceed the initial heat trigger for each State. OSHA then normalized these estimates to reflect 8-hour work shift equivalents. These 8-hour work shift equivalents are then multiplied by the number of affected employees and the unit costs as shown in Section VIII.C.IV.D.VI., Effective Communication, of 15 seconds every two hours of both a designated person's and at-risk employee's time.

Table VIII.C.24. shows the annualized one-time, annual, and total annualized costs for each of these requirements by industry category and region, discounted (2 percent over a 10-year period) and undiscounted.

Source: OSHA estimate.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

E. Requirements at or Above the High Heat Trigger

I. Rest Breaks

All affected establishments would need to provide affected employees with rest breaks when the high heat trigger is met or exceeded. These rest breaks are different from those at the initial heat trigger in that they are scheduled, reoccurring at least every two hours. Employees would still be allowed rest breaks if needed as outlined under the initial heat trigger requirements, although OSHA estimates that these if-needed rest breaks would be shorter when the high heat trigger is met or exceeded because affected employees would also receive scheduled rest breaks (refer to section VIII.C.IV.E.I. for more details on the time estimated for high heat trigger rest breaks).

Similar to the initial heat trigger rest breaks, OSHA calculated total high heat trigger rest break costs by estimating the number of hours by work shift type (daytime, evening, and overnight) in a given State that meets or exceeds the high heat trigger and normalizing these estimates to 8-hour work shift equivalents. These 8-hour work shift equivalents are then multiplied by the number of affected employees and the unit costs for both indoor and outdoor work conditions.

As discussed in section VIII.C.IV.E.I., and detailed further in appendix A at

the end of this section, OSHA estimates that under the proposed standard, the reduction in time spent on pacing (*i.e.*, the increase in worker efficiency) will partially offset the added cost of time spent on if-needed rest breaks as well as scheduled rest breaks when the high heat trigger is met or exceeded for employees in Group 1 (*i.e.*, currently noncompliant with if-needed rest breaks as well as scheduled rest breaks). OSHA also estimates that reduced pacing (*i.e.*, increase in worker efficiency) will partially offset the added cost of scheduled rest breaks when the high heat trigger is met or exceeded for employees in Group 2 (*i.e.*, that are currently noncompliant with only scheduled rest breaks and currently compliant with if-needed rest breaks). Combining this estimated partial offset of the unit costs of rest breaks required when the high heat trigger is met or exceeded with data on the industry-level and/or State-level number of in-scope employees (discussed in section VIII.B.), baseline non-compliance rates (discussed in section VIII.C.II.A.), and State-level exposure to temperatures at or above the high heat trigger (discussed in section VIII.C.II.C.), OSHA estimates that approximately 71.72 percent of the total cost of compliance with rest breaks when the high heat trigger is met or exceeded (approximately \$9.92 billion out of \$13.83 billion) could be offset by

avoided labor productivity losses due to pacing (*i.e.*, avoided losses in worker efficiency).

II. Observation for Signs and Symptoms

OSHA calculates the total costs for observing signs and symptoms when the high heat trigger is met or exceeded by multiplying the unit costs for both the designated person and at-risk worker by the number of affected employees and the number of 8-hour work shift equivalents. The method to calculate the number of work-shift equivalents is the same approach used in the calculation of total costs for rest breaks.

III. Hazard Alert

OSHA also calculates the total costs for notifying employees of high heat conditions using 8-hour work shift equivalents. OSHA multiplies these 8-hour work shift equivalents by the number of affected establishments and the corresponding unit cost for a designated person to perform this requirement.

IV. Warning Signs for Excessively High Heat Areas

OSHA assumed that the cost of placing warning signs for excessively high heat areas is only applicable to industries assumed to have radiant heat sources (as outlined in OSHA, 2024c and discussed in section VIII.C.IV.E.IV.). To calculate total costs of this provision,

OSHA multiplies the number of affected establishments with radiant heat sources by the unit cost for a warning sign. Similarly, OSHA multiplies the number of affected establishments by the unit cost for a designated person to place that warning sign in an excessively high heat area.

Table VIII.C.25. shows the annualized one-time, annual, and total annualized

costs for each of these requirements by industry category and region, discounted (2 percent over a 10-year period) and undiscounted. Note that the best available evidence OSHA employed in this analysis showed no days exceeding the high heat trigger in Alaska and therefore, the agency estimated that most industries in Alaska

will not have costs of compliance for requirements at or above the high heat trigger. This may understate the effects in establishments where employees are exposed to process heat. However, OSHA identified no data that would allow an adjustment for this consideration but welcomes comment on the issue.

F. Heat Illness and Emergency Response and Planning

All covered employers would be required to respond when employees are experiencing signs and symptoms of heat-related illness or when there is a heat-related emergency at their work sites.

OSHA calculates the total costs associated with responding to heat-related illnesses by multiplying the labor-based unit cost by the number of affected establishments and the number of heat-related illnesses per establishment (shown in table VIII.C.6.).

OSHA calculates the total costs associated with responding to heat-related emergencies as a sum of total labor-based costs and capital-based costs. Total labor-based costs are

calculated by multiplying the labor-based unit costs by the number of affected establishments and the number of heat-related emergencies per establishment (also shown in table VIII.C.6.). As discussed in section VIII.C.6.), labor-based unit costs incurred during heat-related emergencies consist of reducing an employee's body temperature before emergency medical services arrive as well as contacting emergency medical services and transporting employees to a place where they can be reached by an emergency medical provider. Total capital-based costs are calculated by multiplying the capital-based unit costs by the number of affected establishments. As discussed in section VIII.C.6.), capital-based unit costs consist of ice, ice sheets, and ice

coolers. Cost frequency is assumed to be one-time for purchases of ice sheets and ice coolers and the costs of purchasing ice when the initial heat trigger is met or exceeded are calculated on an annual basis. OSHA assumes that ice costs are incurred only when the initial heat trigger is met or exceeded. Using this assumption, OSHA multiplied the number of 8-hour work shift equivalents by the number of affected establishments and the unit cost for ice to determine the total annual costs associated with ice purchases.

Table VIII.C.26. shows the annualized one-time, annual, and total annualized costs for each of these requirements by industry category and region, discounted (2 percent over a 10-year period) and undiscounted.

Source: OSHA estimate.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.

G. Training

All affected establishments would be required to provide training on heat-related hazards to at-risk workers and designated persons both upon promulgation and periodically thereafter.⁷⁹ OSHA calculates the total costs of each training requirement by either multiplying the number of affected establishments by the corresponding unit costs or multiplying the number of affected employees by the

corresponding unit costs. The unit costs to undergo employee trainings (initial, annual refresher, and supplemental) are employee-based and are combined with the number of affected employees. All other training-related unit costs are establishment-based (developing, preparing, conducting employee training (initial, annual refresher, supplemental) and supervisor training (initial, annual refresher)) and are combined with the number of affected establishments. OSHA assumes that one

percent of affected establishments would incur the establishment-based cost of supplemental trainings annually. Additionally, OSHA assumes employers would incur the cost of providing supplemental training to one percent of employees annually.

Table VIII.C.27. shows the annualized one-time, annual, and total annualized costs for each of these requirements by industry category, discounted (2 percent over a 10-year period) and undiscounted.

⁷⁹Employers would be required to conduct refresher trainings annually for both at-risk workers and designated persons. Supplemental trainings would also be required for at-risk workers when

either (1) worker(s) heat exposure changes, (2) policies and procedures change, (3) worker(s) does not retain information, or (4) a heat-related injury or illness occurs that results in death, days away

from work, medical treatment beyond first aid, or loss of consciousness.

Source: OSHA.

Note: Due to rounding, figures in the columns and rows may not sum to the totals shown.**H. Recordkeeping**

The proposed standard would require affected indoor establishments to maintain environmental measurements for six months. Certain models of environmental monitoring equipment can automatically upload measurements taken to a recordkeeping database. OSHA assumes that establishments required to maintain these records would purchase a wireless temperature

and humidity data logger with this capability (cost captured under the Identifying Heat Hazards provision in section VIII.C.V.C.). For this reason, OSHA assumes that establishments would not incur an additional cost to maintain these records beyond the time required to take the measurements themselves (also captured in section VIII.C.V.C.).

I. Total Costs of the Proposed Standard

Accounting for the costs associated with all provisions, OSHA estimates that annualized costs, using a 2 percent discount rate over a ten-year period, would equal 7.8 billion. Table VIII.C.28. shows the total costs of the proposed standard by industry category and region. Table VIII.C.29. shows the total costs of the proposed standard by provision.

VI. Sensitivity Analysis

In this section, OSHA presents the results of five sensitivity analyses where isolated changes were made to the parameter (cost model inputs) assumptions that were used to estimate the total costs of the proposed standard. The methodology and calculations underlying the estimates of the costs are

generally linear and additive in nature. Thus, the sensitivity of the results and conclusions of this analysis will generally be proportional to isolated variations of a particular input parameter. For example, if the estimated time that an employee spends in annual training was doubled, the corresponding labor costs would double as well.

OSHA evaluated a series of five such changes in cost input parameters to illustrate how these adjustments would impact the estimated total costs of the proposed standard. The requirements of the proposed standard work collectively to produce the benefit of avoided HRIs and heat-related fatalities. The agency is unable to directly attribute avoided

HRIs and heat-related fatalities to any specific provision so is unable to analyze the impact that these isolated changes to parameters might have on benefits.

In the first of five sensitivity tests, OSHA decreased the estimated percentage of buildings with adequate cooling, which is an input into calculating the number of indoor in-scope firms and establishments. For this analysis, OSHA reduced the number of buildings that are cooled under an assumption that all employees work in areas that are adequately cooled only if at least 70 percent of their floorspace cooled (versus the assumption that this condition is met when at least 50 percent of the floorspace is cooled). OSHA used 60 percent of the percentage of buildings with 51 to 99 percent of floorspace cooled according to CBECS data for 2018 plus the percentage of buildings with 100 percent of floorspace cooled to estimate the percentage of establishments that are adequately cooled under this sensitivity analysis. For example, if the percentage of buildings with 51 to 99 percent of floorspace cooled is 25 percent and the percentage of buildings with 100 percent of floorspace cooled is 50 percent, the estimate used in the primary cost analysis is 75 percent of buildings where all employees work in spaces that are adequately cooled, while the sensitivity analysis assumes that the percentage is 65 percent. Table VIII.C.30. shows that the estimated costs

of compliance would increase costs by \$585 million annually, or by about 7.5 percent.

In the second sensitivity test, OSHA decreased the estimated non-compliance rates (i.e., assumed higher baseline compliance) for rest breaks at both heat triggers by half. OSHA included this sensitivity test due to uncertainty surrounding the current provision of rest breaks by employers for non-heat related reasons (e.g., union contracts, existing State laws) that may result in an underestimate of baseline compliance. As a result of this adjustment, estimated annualized total costs decreased by nearly \$2.1 billion annually, or approximately 27.0 percent (see table VIII.C.30.).

In the third sensitivity test, OSHA assumed that all employers without an existing HIIPP will opt to use the OSHA provided template to develop their HIIPP, rather than a portion of establishments opting to write a HIIPP from scratch. Table VIII.C.30. shows that this assumption would lower the estimate annualized costs by \$7.8 million, or about 0.1 percent.

For the fourth sensitivity analysis, OSHA increased the estimated travel time to rest breaks by one minute for employees working indoors and two minutes for employees working outdoors, thus increasing travel time to 3 minutes for indoor employees and 6 minutes for outdoor employees. As shown in table VIII.C.30., the increase in

travel time to rest breaks would increase estimated annualized costs by approximately \$1.4 billion, or by about 18.1 percent.

The final sensitivity test looks at the percent of productivity recovered as a result of rest breaks. OSHA has incorporated the potential cost reduction from decreased worker pacing—offsetting about 70 percent of the labor cost of rest breaks.⁸⁰ However, this analysis rests on specific assumptions and is dependent on the extent of the available literature, in which heat and productivity were assessed in different settings with different break policies, but break policies did not vary within the same setting. An alternative calculation, provided in appendix A, suggests that this offset may be even greater—up to 100 percent of the time spent for rest breaks being recovered through improved labor productivity.⁸¹ Assuming that scheduled rest breaks offset pacing 100 percent for workers above the high heat trigger, the cost of this proposed standard would decrease by about \$2.5 billion making the total costs around \$7.8 – \$2.5 = \$5.3 billion.

OSHA welcomes input from the public regarding all aspects of this sensitivity analysis, including any data or information regarding the accuracy of the preliminary estimates of compliance costs and benefits and how the estimates of costs may be affected by varying assumptions and methodological approaches.

TABLE VIII.C.30—RESULTS FROM SENSITIVITY ANALYSES OF ISOLATED CHANGES TO COST MODEL PARAMETERS

Impact variable	OSHA's primary estimate	Sensitivity test assumption	Impact to annualized costs	Percentage impact to costs	Adjusted annualized costs
Percentage of buildings cooled by industry.	Using CBECS data, considered all buildings with at least 51 percent of floorspace cooled as adequately cooled.	Using CBECS data, considered buildings with 70 percent of floorspace cooled as adequately cooled.	\$585,344,087	7.48	\$8,409,005,725
Rest break non-compliance rates ...	As detailed in table VIII.C.3. Rest Break Non-Compliance Rates by State and Territory.	Reduce the rates in table VIII.C.3. Rest Break Non-Compliance Rates by State and Territory by 50 percent (i.e., assume higher baseline compliance).	– 2,113,058,097	– 27.01	5,710,603,541
Percentage of establishments without existing HIIPP that will use OSHA template.	90 percent of all employers with more than 10 employees, all employers with 10 or less employees.	100% of all employers	– 7,832,568	– 0.10	7,815,829,070
Travel time to/from rest break area	2 minutes for indoor and 4 minutes for outdoor.	3 minutes for indoor and 6 minutes for outdoor.	1,418,460,548	18.13	9,242,122,186
Recovered break time through improved productivity.	~70% of break time offset by increased productivity.	100% of break time offset by increased productivity.	2,500,000,000		5,300,000,000

Source: OSHA estimate.

⁸⁰ See Section VIII.C.VI., Sensitivity Analysis for a discussion of potential underestimation of levels of current compliance with the rest break requirements of the proposed standard and the

impacts alternative noncompliance rates might have on the estimated costs of the proposed standard.

⁸¹ As described in the discussion of additional unquantified potential benefits, a reduction of

pacing from increased rest breaks could potentially increase production and revenue.

D. Economic Feasibility

I. Introduction

As explained in Section II., Pertinent Legal Authority, to demonstrate that a standard is economically feasible, “OSHA must construct a reasonable estimate of compliance costs and demonstrate a reasonable likelihood that these costs will not threaten the existence or competitive structure of an industry, even if it does portend disaster for some marginal firms.” *Lead I*, 647 F.2d at 1272. OSHA standards therefore satisfy the economic feasibility criterion so long as they do not cause massive economic dislocations within a particular industry or imperil the very existence of the industry. *Lead II*, 939 F.2d at 980; see also *Asbestos I*, 499 F.2d. at 478.

In this feasibility analysis, when OSHA speaks of the costs of complying with the proposed standard as a percent of revenues, it is referring to the costs of complying with 29 CFR 1910.148 for the subset of those establishments that will incur obligations under the proposed standard, as opposed to the costs as a percent of *all* establishments in an industry, whether they are directly affected or not. This avoids underestimating the average per-establishment cost used in the feasibility analysis, even while it may overstate the impact on the industry as a whole. Based on the analysis below, OSHA preliminarily concludes that the proposed standard is economically feasible.

II. OSHA’s Screening Test for Economic Feasibility

To determine whether a standard is economically feasible, OSHA typically begins by using a screening test to determine whether the costs of the standard are beneath the threshold level at which the economic viability of an affected industry might be threatened. The screening test is a revenue test. While there is no firm rule on which to base the threshold, OSHA generally considers a standard to be economically feasible for an affected industry when the annualized costs of compliance are less than one percent of annual revenues for the average establishment in an industry that incurs an obligation. The one-percent revenue threshold is intentionally set at a low level so that OSHA can confidently assert that the standard is economically feasible for industries that are below the threshold (*i.e.*, industries for which the costs of compliance are less than one percent of annual revenues). To put the one percent threshold into perspective, across the wide swath of affected

industries, prices (and therefore revenues), particularly in the recent past, are generally observed to change by considerably more than one percent per year.⁸² ⁸³

Another and less reliable screening test that OSHA traditionally used to consider whether a standard is economically feasible for an affected industry is whether the costs of compliance are less than ten percent of annual profits for the average establishment (see, *e.g.*, OSHA’s economic analysis of its 2016 *Occupational Exposure to Respirable Crystalline Silica* (Silica) rulemaking, 81 FR 16286, 16533 (Mar. 25, 2016); upheld in *N. Am.’s Bldg. Trades Unions v. OSHA*, 878 F.3d 271, 300 (D.C. Cir., 2017)). The ten-percent profit test was intended to be at a sufficiently low level to allow OSHA to identify industries that might require further examination. Specifically, the profit screening was primarily used to alert OSHA to potential impacts on industries where demand does not allow for ready absorption of new costs (*e.g.*, industries with foreign competition where the American firms would incur costs that their foreign competitors would not because they are not subject to OSHA requirements). In addition, setting the threshold for the profit test low provided an additional basis for concluding that the standard would be economically feasible for industries below that threshold, without further evaluation. OSHA notes that this profit screen relied on accounting profit (revenues minus explicit costs) versus the superior profit measurement of economic profit (revenues minus explicit costs minus implicit costs).

For this proposed standard, OSHA has discontinued the use of its profit screening test for the following reasons. First, OSHA has been virtually alone among Federal agencies in consistently using a profitability test (comparing costs to profits) as part of its regulatory impact analyses. The agency could find no evidence that other Federal regulatory agencies are being asked to examine feasibility based on profits. OSHA infers that the silence on the use of the profitability test among all other Federal regulatory bodies implies that the revenue test is sufficient. Even OSHA’s sister agency, the Mine Safety and Health Administration (MSHA), does not rely on a profitability test despite very similar statutory language

that also requires an economic feasibility determination for its regulations.⁸⁴

Secondly, eliminating the profit test avoids OSHA’s reliance on published IRS corporate net income data that lack transparency, comprehensive coverage within industries, and statistical reliability for industries where sample sizes may be statistically inadequate. Furthermore, because firms typically have an incentive to minimize their tax burden, it is reasonable to expect that some of the reported accounting data may have been strategically adjusted to reduce reported profits and their associated tax implications. Business profits are much more likely to reflect such strategic accounting than business revenues. It is therefore unsurprising that OSHA is the lone outlier by including profit screens in its economic analysis. As the Environmental Protection Agency (EPA) noted in its economic impact analysis supporting the *National Air Emission Standards for Hazardous Air Pollutants: Halogenated Solvent Cleaning* (72 FR 25138 (May 3, 2007))⁸⁵, when explaining its reliance on a “sales test” (revenue) and rejecting the use of industry profits as part of its determination of the impact of its regulation on small businesses, “revenues or sales data is commonly available data for entities normally impacted by EPA regulations and profits data normally made available is often not the true profits earned by firms due to accounting and tax considerations.” EPA also noted that “firms and entities often have ways available in the tax code to reduce their reported profits; thus, using reported profits may lead to an overestimate of the economic impact of a regulation to an affected firm or entity and their consumers.” OSHA is aware of no other publicly available source of business income data.

Even to the extent that firms are not manipulating profit data for tax purposes, profit data are often not accurately aligned with a firm’s financial status for purposes of evaluating the economic impact of an OSHA standard. For example, a firm that had already invested a significant amount of capital to voluntarily adopt all of the controls proposed by OSHA’s

⁸² For data on Consumer Price Index (CPI) changes over time, see BLS’s CPI website at <https://www.bls.gov/cpi/>.

⁸³ For data on Producer Price Index (PPI) changes over time, see BLS’s PPI website at <https://www.bls.gov/ppi/>.

⁸⁴ The Mine Act instructs the Secretary to “set standards which most adequately assure on the basis of the best available evidence that no miner will suffer material impairment of health or functional capacity.” 30 U.S.C. 811(a)(6)(A). It goes on to say that “[i]n addition to the attainment of the highest degree of health and safety protection for the miner, other considerations shall be . . . the feasibility of the standards.”

⁸⁵ Available at https://www.epa.gov/sites/default/files/2020-07/documents/halogenated-solvent_eia_neshap_final_05-2007.pdf.

standard could show only marginal profit after accounting for those expenses, suggesting that it would be economically infeasible for that firm to comply with OSHA's standard. Yet, in reality, its ability to comply with OSHA's standard could not be questioned because compliance had already been accomplished.

OSHA is required to make its determinations on the best available evidence, and OSHA's experience has been that the profit screen has amounted to little more than a distraction that unhelpfully flags industries for time-consuming analyses, while not actually aiding the agency in identifying industries for which standards would be economically infeasible. For example, the profit screen can produce the unhelpful result of flagging industries with significant numbers of nonprofit or not-for-profit organizations, as well as failing (at least for tax purposes) enterprises reporting negative profits. The revenue screen is obviously more useful for evaluating the economic impact of the standard on such entities.

Another example of the inefficiency of the profit screen is that it often requires OSHA to manipulate data to adjust for the underlying limitations of the profit data sources to perform the screening analysis at all. If significant adjustments are necessary, the result becomes less meaningful. As a case in point, this proposed standard would affect nineteen 4-digit NAICS industries in the Agriculture, Forestry, Fishing and Hunting sector (NAICS 11). No profit data are available at the 4-digit level for any of the 19 industries, and, since 2013, about half of the profit data at the 3-digit level are missing. OSHA's traditional process for adjusting data to perform the profit screen is to substitute data from the next highest level of NAICS codes (focusing on a broader swath of industries). In order for OSHA to include these industries in a profit screen for this rulemaking, OSHA would have had to apply the 2-digit profit rate to all 19 industries, which are as different as logging and aquaculture with the result potentially flagging economic distress for one industry that is actually the result of more drastic economic problems in an entirely different industry (e.g., flagging impacts on aquaculture that would actually result from a decrease in logging profits).

OSHA also notes that it gathers additional information about potential economic impacts directly from small not-for-profit entities and small businesses as part of its compliance with the Small Business Regulatory

Enforcement Fairness Act (SBREFA), discussed in more detail later in this analysis. OSHA is one of only a handful of agencies required to engage in this process, which along with the opportunity for public comment on proposed standards and the accompanying economic analysis, provides an additional avenue for the agency to identify potential significant economic impact not flagged via the revenue screen. Avoiding the red herrings produced by the profit screen allows the agency to focus its resources on areas where the best evidence indicates that a standard may truly pose economic feasibility issues for an industry.

Third, compounding underlying issues with profit reporting is the reality that current IRS data are measurably different and inferior to pre-2013 IRS profit data because the more recent data are presented at a more aggregated level (e.g., at the 2-digit rather than 6-digit NAICS level). These changes to the IRS data make them incompatible with performing this type of screening analysis. Up to this point, where OSHA presented a profit screening analysis, the agency was relying on data from 2003 through 2013. At this point, it is difficult to assume that profit data from those years are meaningfully representative of current industry activity. Accordingly, revenues are a more accurate measure than profits for evaluating economic feasibility and those data are regularly collected and reported by agencies such as the Census Bureau. Therefore, the appropriate economic feasibility test will be the revenue test for most or all covered industries.

OSHA judges that the revenue test can stand alone in playing the signaling role that it has long served in tandem with the profit screen, given the latter's increasing unreliability. That is, a standard is not necessarily judged economically infeasible for the industries that do not pass the initial revenue screening test (i.e., those for which the costs of compliance with the standard are one percent or more of annual revenues) nor did previous OSHA analyses declare a standard infeasible based on one or more industries failing the profit screening test. Instead, OSHA normally views industries failing one or both tests as requiring additional examination as to whether the standard would be economically feasible (see *N. Am.'s Bldg. Trades Unions v. OSHA*, 878 F.3d at 297). OSHA therefore conducts further analysis of the industries that "fail" the screening tests to evaluate whether the standard would threaten

the existence or competitive structure of those industries (see *United Steelworkers of Am., AFL-CIO-CLC v. Marshall*, 647 F.2d 1189, 1272 (D.C. Cir. 1980)) and the agency will continue to do so for industries that fail the revenue screening test. There are fluctuations of prices over time with a general inflationary long-term trend upward, and they include effects such as the pass-through of costs and modifications in tax accounting procedures. Using the cost-to-profit test has never led to the conclusion that a standard will eliminate an industry or significantly alter its competitive structure, and as described above, that test is increasingly limited given the lack of data available. Instead, the revenue test is sufficient to signal to OSHA where it should look more carefully at one or more industries to assess feasibility.

III. Time Parameters for Analysis

OSHA's economic analyses almost always measure the costs of a standard on an annual basis, conducting the screening tests by measuring the cost of the standard against the annual revenues for a given industry. One year is typically the minimum period for evaluating the status of a business; for example, most business filings for tax or financial purposes are annual in nature.

Some compliance costs are up-front costs and others are spread over the duration of compliance with the standard; regardless, the costs of the standard overall will not typically be incurred or absorbed by businesses all at once. For example, the initial capital costs for equipment that will be used over many years are typically addressed through installments over a year or more to leverage loans or payment options to allow more time to marshal revenue and minimize impacts on reserves.

This proposed standard would include permanent requirements to protect employees from hazards of heat stress in the workplace. Thus, for this proposed standard, OSHA has based its analysis of economic feasibility on annual costs and revenues. As noted earlier in this feasibility analysis, this is consistent with OSHA's typical methodology for analyzing economic feasibility (e.g., OSHA's final Silica rule, 81 FR 16533).

IV. Data Used for the Feasibility Screening Test

OSHA presents the estimated costs of complying with this proposed standard in *Costs of Compliance* (Section VIII.C., Costs of Compliance) and table VIII.D.1. In this section presents a summary of those costs, including average cost per establishment and total annual costs, by

4-digit NAICS code. OSHA relies on these estimated costs in its examination of feasibility, using the test described above.

Most revenue numbers used to determine cost-to-revenue ratios were obtained from the 2017 SUBS (Census Bureau, 2021a). This is the most current information available from this source, which OSHA considers to be the best available source of revenue data for U.S. businesses. OSHA adjusted these figures to 2023 dollars using the Bureau of Economic Analysis's GDP deflator (BEA, n.d.), which is OSHA's standard source for inflation and deflation analysis (See Section VIII.C., Costs of Compliance for a full discussion of data sources and methodology). For industries that are unavailable in the SUBS dataset, OSHA sourced revenue data from a variety of other sources. These industries are listed below, along with the alternative sources and methods for estimating annual revenues.

Agriculture: As most agricultural industries are not included in the SUBS dataset,⁸⁶ OSHA used the Department of Agriculture's 2017 Census of Agriculture (USDA, 2017) to derive estimates of annual revenues. Specifically, OSHA used industry-level estimates of "total sales" from chapter 1, table 75 "Summary by North American Industry Classification System" to represent annual revenues. Since these "total sales" data are combined for Aquaculture (NAICS 1125) and Other Animal Production (NAICS 1129), OSHA based NAICS 1125 revenues on NOAA Fisheries' Aquaculture website, which estimated U.S. aquaculture production at \$1.5 billion (NOAA, 2023a). For NAICS 1129, OSHA subtracted this \$1.5 billion from the Agriculture Census "total sales" estimate for NAICS 1125 and 1129. OSHA adjusted these figures to 2023 dollars using the BEA's GDP deflator.

Local Government: OSHA relied on data from three alternative sources for local government estimates. To estimate total receipts for local government entities, OSHA first estimated the average annual receipts per resident by State. The estimate was equal to the ratio of total local government receipts in the datasets found in the Census Bureau's 2021 Annual Survey of State and Local Government Finances

(Census Bureau, 2023a) to the total population served in the GUS dataset. OSHA then multiplied the population associated with each government entity captured in the GUS with the ratio from step one to arrive at an estimate of total annual receipts per government entity.

State Government: OSHA used the State government revenues estimated in the Census Bureau's 2021 Annual Survey of State and Local Government Finances (Census Bureau, 2023a) to estimate annual receipts for State governments. For U.S. territories, OSHA used point estimates from other sources (American Samoa Department of Commerce, 2021; Guam Governor's Office, 2024; CNMI Department of Commerce, 2017; Financial Oversight and Management Board for Puerto Rico, 2023; USVI's Governor's Office, 2024). OSHA adjusted these figures to 2023 dollars using the BEA's GDP deflator.

Rail Transportation,⁸⁷ Postal Service, and Insurance and Employee Benefit Funds: A small subset of non-agricultural industries are also unavailable in the SUBS dataset. These industries are Rail Transportation (NAICS 4821), Postal and Delivery Services (NAICS 4911), and Insurance and Employment Benefit Funds (NAICS 5251). The economic data estimates for these three industries were derived from the Quarterly Census of Employment and Wages (QCEW) collected by the Bureau of Labor Statistics (BLS). While the QCEW does not present revenue data, it does include total annual wages by industry and State. OSHA used the ratio of receipts to wages from the SUBS dataset for corresponding sector-level data (e.g., the ratio applied to wage data for NAICS 5251 is based on receipts and wage data for sector 52 in the SUBS dataset) to convert the 2022 QCEW wage data (BLS, 2023f) into annual receipts by industry and State.

A large percentage of the costs of this proposed standard are variable costs because they depend primarily on the number and types of employees at an establishment. While fixed cost can be more limiting in terms of options for businesses, most of the costs of this standard are not fixed. Instead, most of the compliance costs vary with the level

and type of output and employment at an establishment.

In general, "[w]hen an industry is subjected to a higher cost, it does not simply swallow it; it raises its price and reduces its output, and in this way shifts a part of the cost to its consumers and a part to its suppliers." *Am. Dental Ass'n v. Sec'y of Labor*, 984 F.2d 823, 829 (7th Cir., 1993). Increases in prices in industries with elastic demand typically result in reduced quantity demanded, but rarely eliminate all demand for the product. Increases in costs can also be passed along, but with a likely reduction in output.

A reduction in output could happen in a variety of ways: individual establishments could reduce their level of service or production, both of which take the form of a reduction of employee hours; some marginal establishments could close; or in the case of an industry with high turnover of establishments, new entry could be delayed until demand equals supply. In many cases, a decrease in overall output for an industry will be a combination of all three kinds of reductions. The primary means of achieving the reduction in output most likely depends on the rate of turnover of establishments in the industry and on the form that the costs of the regulation take.

There are two situations typically mentioned when an industry subject to regulatory costs might be unable to pass those costs on: (1) foreign competition not subject to the regulation; or (2) domestic competition from other firms or other industries, not subject to the regulation, that produce goods or services that are close substitutes. Otherwise, when all affected domestic industries are covered by a standard and foreign businesses must also comply with the standard or are unable to compete effectively, the ability of a competing industry to offer a substitute product at a lower price is greatly diminished.

V. Factors That Indicate the Ability To Absorb or Pass on the Costs of the Proposed Standard

As discussed above, when all establishments in an affected industry are covered by and required to comply with a standard, none of the competitors gain any economic advantage from the standard and the ability of a competitor to offer a substitute product or service at a lower price is greatly diminished. OSHA believes this is the case for the industries covered by the proposed standard. The scope of proposed 29 CFR 1910.148 is broad. The proposed standard applies, with certain exceptions, to each setting where any

⁸⁶ The NAICS industries that were estimated using this method are Oilseed and Grain Farming (111100), Vegetable and Melon Farming (111200), Fruit and Nut Tree Farming (111300), Greenhouse, Nursery, and Floriculture (111400), Other Crop Farming (111900), Cattle Ranch and Farming (112100), Hog and Pig Farming (112200), Poultry and Egg Production (112300), Sheep and Goat Farming (112400), Aquaculture (112500), and Other Animal Production (112900).

⁸⁷ The FRA has promulgated regulations requiring the use of environmental controls to address heat hazards in three specific, limited contexts: non-steam-powered locomotives purchased or remanufactured after June 8, 2012 (49 CFR 229.119(g)), camp cars (49 CFR 228.313(c)), and certain on-track roadway maintenance machines (49 CFR 214.505(a)). OSHA's standard would apply to the working conditions of railroad employees in all other contexts, including within trains and machinery not covered by these regulations and during all outdoor work.

employee is exposed to heat above a specified threshold, with the result that if an employer enters such a setting, it must comply with the standard. Hence, given the proposed standard's broad applicability, any employer in a particular industry, including domestic competitors providing similar services or goods, would equally be subject to the proposed standard. This negates the potential for substitution by an industry not subject to the standard.

In addition, and as discussed below, OSHA has concluded that many employers that provide services affected by the proposed standard are generally not subject to international competition (e.g., personal services, such as child care, healthcare services and healthcare support services, and building support services like landscaping and maintenance) because they must be performed domestically. Thus, for those industries, competition from foreign entities that would not also be subject to this proposed standard and its related costs is not a factor.

Finally, while OSHA has attempted to quantify the more obvious cost savings associated with compliance with the proposed standard, in terms of a wage cost offset from increased labor productivity, there are more subtle benefits to reducing heat stress, which suggests that the actual net costs of the proposed standard will be lower than the cost estimates in Section VIII.C., Costs of Compliance used to demonstrate economic feasibility. These cost savings are difficult to quantify and include increased labor supply and decreased disutility to employees. For additional discussion of this issue, see Section VIII.D., Benefits. The economic advantages of increasing the retention of employees by reducing peak heat stressors has been noted in numerous articles, and while difficult to quantify, would tend to counteract the relatively more obvious costs of intervention (e.g., Glaser et al., 2022).

VI. Economic Feasibility Screening Analysis

This section summarizes OSHA's economic feasibility findings for specific industries covered by the proposed standard. As stated previously, the agency has historically used the two screening tests (costs less than one percent of revenue and costs less than ten percent of profit) as an initial indicator of economic feasibility; however, as discussed earlier, OSHA has discontinued use of the profit screening test because of its serious flaws. In this section, OSHA identifies and discusses the industries that fall above the threshold level for the

revenue screening test. OSHA also identifies and discusses industries where small and very small industries fall above the threshold.

A. Economic Feasibility Screening Analysis: All Establishments

Table VIII.D.1. shows that for the majority of industries, as defined by covered NAICS codes, the cost-to-revenue ratios are below OSHA's screening threshold of one percent, with an average cost for all 298 affected industries of 0.04 percent of revenues. This means that if the average firm needed to absorb the costs of the standard (rather than passing the costs through to other parties), this would amount to an additional four cent burden on \$100 of revenue and suggests that compliance with this proposed standard would be feasible for all of these industries.

Five of the 298 industries are estimated to have costs equal to or greater than one percent of revenues. They are all in either agriculture or in-person health care or social assistance services. Two agricultural industries, Sheep and Goat Farming (NAICS 1124) and Other Animal Production (NAICS 1129) were found to have costs above one percent of revenues among affected establishments. Three health care and social assistance industries, Individual and Family Services (NAICS 6241), Vocational Rehabilitation Services (NAICS 6243), and Child Care Services (NAICS 6244) were also found to have costs above one percent of revenues.

Some industries, such as agriculture, would be expected to have relatively large impacts under the proposed standard, due to the prevalence of outdoor work. Nonetheless, the costs of their compliance with the proposed standard would not generally be expected to exceed one percent of revenues when all cost offsets (e.g., current practices to address heat hazards, productivity gains outside of rest breaks) are considered, based on available empirical evidence. For example, the Fair Food Program in Florida (Rivero and Uzcategui, 2024), which encompassed a number of labor benefits (e.g., wage bonuses) in addition to heat stress protection, resulted in price increases of only one extra cent per pound of tomatoes,⁸⁸ for a total

⁸⁸ This measure is an increase in price, not costs. The pass through of costs could be less than 100 percent due to competition. However, since a portion of the one-cent premium is used to pay a worker bonus, one can infer that the increase in cost of compliance is likely less than one-cent and that pass-through of costs to firms is greater than 100 percent.

average price of about \$2 per pound,⁸⁹ to cover the cost of the protections and benefits to employees. This suggests that the net cost of robust heat illness protections may be less than 0.5 percent of revenues in an industry and geographic region that would be most significantly affected by the proposed standard. Sheep and Goat Farming (NAICS 1124) and Other Animal Production (NAICS 1129), which both have costs greater than one percent of revenues, are both heavily weighted to very small family-owned farms (USDA, 2019). Due to a Congressional budget rider, OSHA is not able to expend funds on enforcement activities for small farms. Only about 5 percent of sheep and goat farms are something other than family-owned farms (*i.e.*, partnerships or corporations). The data for other animal production and aquaculture farms are combined and reported as a single industry. For those two industries combined, 10 percent of farms are something other than family-owned farms. Given the economies of scale necessary for aquaculture, it's likely that these account for more of the corporate farms in the combined Other Animal Production and Aquaculture data, meaning more farms in NAICS 1129 may be family-owned farms than appear to be in the combined data. Based on the 2017 Census of Agriculture (USDA, 2019), about 12,000 of about 93,000 total sheep and goat farms have hired labor and those have on average 2 hired laborers. For other animal production and aquaculture combined, about 41,000 farms out of about 222,000 total farms report having hired labor and have on average 3 hired laborers. Based on the size and organization of these farms, and because a longstanding appropriations rider generally prevents OSHA from enforcing its standards against most small farm operations with 10 or fewer employees, it is unlikely OSHA would enforce the proposed standard in those industries.

Aside from the issues discussed previously, the agency believes some of these industries are unlikely to have as large of a cost as a percentage of revenue as presented, in part due to inflexibility in the cost analysis regarding the amount of time spent outside in heat in a nondiscretionary manner. For example, even if the assumption that employees in healthcare or child care services spend a large percentage of their time outside is realistic under normal circumstances, these employees would likely limit their time outside in high heat situations if only to protect

⁸⁹ As of December 2023, <https://fred.stlouisfed.org/series/APU0000712311>.

those in their care. This is also true in livestock industries that have existing recommendations for shade and shelter for livestock under extreme heat conditions.⁹⁰ If the costs of complying with this proposed standard were onerous, limiting employee exposure to the outdoors during times of extreme heat would be a costless method to comply with the standard and could possibly result in these employers being

fully exempt from the standard (*e.g.*, if the employer limited employee's outdoor exposure to meet the exemption for short duration employee exposure). OSHA believes that these five industries have estimated costs that exceed one percent of revenue as a result of data limitations, rather than a real finding of infeasibility. Therefore, OSHA has preliminarily determined that the proposed rule is economically feasible.

The agency welcomes public comment on what the likely practical effects of the proposed standard would be in these various industries. To the extent commenters believe the proposed standard poses an issue of economic feasibility, the agency welcomes comment on how the proposed standard should be modified to achieve greater feasibility.

TABLE VIII.D.1—ECONOMIC IMPACTS ON ESTABLISHMENTS AFFECTED BY THE PROPOSED STANDARD WITH COSTS CALCULATED USING A 2% DISCOUNT RATE

NAICS	Industry	Establishments	Total annualized costs	Average annualized cost per establishment	Average revenue per establishment	Costs as % of revenue
1111	Oilseed and Grain Farming	19,259	\$22,566,188	\$1,172	\$1,039,788	0.11

B. Economic Feasibility Screening Analysis: Small and Very Small Entities

The preceding discussion focused on the economic viability of each affected industry in its entirety, including entities of all sizes. Even though OSHA has found that the proposed standard does not threaten the economic viability of these industries, the agency also examines whether there is still a possibility that the competitive structure of these industries could be significantly altered. For instance, in some industries, if most or all small firms in that industry would have to close, it could reasonably be concluded that the competitive structure of the industry had been affected by the proposed standard.

To address this possibility, OSHA examines the average compliance costs per affected small entity and very small entity for each industry covered under the final standard. See Section VIII.B., Profile of Affected Industries for a discussion of OSHA's methodology for estimating the number of small and very small entities.

As with its analysis of all establishments, the agency relies on a screening test—costs less than one percent of revenue—to evaluate the impacts on small and very small entities.⁹¹ As with the screening tests for establishments of all sizes, in cases where the small and very small entities in particular industries are above the threshold level for the primary screening test, OSHA will investigate further.

⁹¹ The agency calculates the average per-entity revenues for small and very small entities in each NAICS industry in the same manner that it calculated the average per-establishment revenues for its analysis of all establishments, above.

OSHA notes that cost impacts for affected small or very small entities will generally tend to be somewhat higher, on average, than the cost impacts for the average business in those affected industries. That is to be expected. After all, smaller businesses typically suffer from diseconomies of scale in many aspects of their business, leading to lower revenue per dollar of cost and higher average costs. Small businesses are able to overcome these obstacles by providing specialized products and services, offering local service and better service, or otherwise creating a market niche for themselves. In a dynamic environment, they also tend to benefit from less institutional inertia. The higher cost impacts for smaller businesses estimated for this standard generally fall within the range observed in other OSHA standards, and OSHA is not aware of any record of major industry failures resulting from those standards.⁹² For industries that are below the thresholds for the cost-to-revenue test, the agency concludes that the costs of complying with the proposed standard are unlikely to threaten the survival of small entities or very small entities and are, consequently, unlikely to alter the competitive structure of the affected industries.

As discussed further in Section VIII.F., Initial Regulatory Flexibility Analysis, the agency is required by the Regulatory Flexibility Act to determine whether a proposed standard would

⁹² For example, OSHA's economic analysis for the agency's 2016 Silica rule showed cost-to-revenue ratios as high as 1.29 percent for small entities and 2.09 percent for very small entities (see OSHA's *Final Economic and Regulatory Flexibility Analysis* for its Silica rule, chapter VI, tables VI-7 and VI-8, pp. VI-87–VI-94, Document ID OSHA-2010-0034-4247, attachment 6).

likely have a significant economic impact on a substantial number of small entities. As an extension of the feasibility screening analysis, the agency also performed a screening analysis of costs as a percentage of revenues of small entities. Table VIII.D.2. and table VIII.D.3. show that parallel to the previous analysis of costs as percent of average revenues for all establishments, for all but seven (out of 298) of the covered NAICS industries, the cost-to-revenue ratios are generally well below OSHA's screening threshold of one percent, suggesting that compliance with this standard would be feasible for small and very small entities in all of these industries. Since the impact is somewhat higher on average to small entities, two industries, Home Health Care Services (NAICS 6216) and Other Residential Care Facilities (NAICS 6239), had costs marginally above one percent, in addition to the five listed previously for the feasibility screening test for all establishments. A slightly different mix (four of 298) presents for Very Small Entities, the two agriculture industries listed previously and two of the four health care and social service industries, Other Residential Care Facilities (NAICS 6239) and Child Care Services (NAICS 6244) having costs of more than one percent as a percent of revenues.

While the impacts are marginally greater for small entities, the general profile does not differ significantly from the issues with larger entities, suggesting that the proposed standard does not pose unique challenges for small entities. (This result is consistent with the costs being overwhelmingly employee based, as opposed to establishment based (see Section VIII.C., Costs of Compliance)).

Table VIII.D.2. shows that the estimated average cost of complying with the proposed standard for the average small entity in all industries covered by the standard is \$1,946 annually, and table VIII.D.3. shows that the estimated average cost of the standard for the average very small entity is \$1,178 annually.

The tables further show that for all small entities in covered NAICS industries, the cost-to-revenue ratios are below OSHA's one percent screening threshold, except for the seven industries previously discussed, suggesting that compliance with this proposed standard would be feasible for small entities in these industries.

As is typical with new requirements, the costs will be borne primarily by those businesses that have lagged in implementing safety measures. See *Lead I*, 647 F.2d at 1265 ("It would appear to be consistent with the purposes of the

[OSH] Act to envisage the economic demise of an employer who has lagged behind the rest of the industry in protecting the health and safety of employees and is consequently financially unable to comply with new standards as quickly as other employers.'") (quoting *Indus. Union Dep't, AFL-CIO v. Hodgson*, 499 F.2d 467, 478 (D.C. Cir. 1974)). Indeed, one of the main differentiations between businesses similarly situated in the same industry, where one would be exempt from this proposed standard while the other would not, would be in situations where one employer has invested in air conditioning that keeps their facility below the heat trigger while the other has forgone those investments. The businesses that have already incurred many of the costs of compliance will presumably be at low risk of going out of business as a result

of the standard. Even when small or very small entities in particular industries are above the revenue screening threshold, it would be very unlikely that this proposed standard would result in the alteration of the economic structure of these industries based on the failure of most or all of the small or very small entities in those industries.

Moreover, OSHA has considered input from SBA-defined small entities who participated in the SBREFA process, with regard to the potential provisions of a regulatory framework for a heat standard. OSHA's adjustments to the regulatory framework presented during the panel, along with a set of regulatory alternatives and options drafted and analyzed in response to recommendations from the SBAR Panel, are also discussed in Section VIII.F., Initial Regulatory Flexibility Analysis.

E. Benefits

I. Introduction

OSHA’s proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings is a crucial step towards ensuring the health, safety, and well-being of employees with occupational exposure to hazardous heat. Compliance with this standard is projected to yield substantial health and safety benefits, primarily through the reduction of occupational non-fatal heat-related injuries and illnesses (HRIs) and heat-related fatalities. These include severe conditions such as heat stroke, which can be fatal if not promptly treated, and heat exhaustion, which can lead to more serious complications if ignored. To estimate the health and safety benefits of this standard, OSHA has conducted an analysis of data on workplace incidents involving exposure to heat. In this section, OSHA will first present the available BLS data on HRIs and heat-related fatalities. After that, there is a discussion of underreporting issues surrounding these data which leads to a presentation of OSHA’s underreporting adjusted count of HRIs and heat-related fatalities. Even with this adjustment, there remains a great deal of uncertainty surrounding the extent of underreporting, other parameters used in this estimation of health and safety benefits, as well as additional potential benefits, all of which the agency discusses next in an uncertainty analysis. Finally, this section includes a sensitivity analysis that calculates the potential benefits of this standard assuming different parameters to demonstrate the range of potential quantifiable benefits.

II. Fatal and Non-Fatal Heat-Related Injuries and Illnesses

OSHA estimated the potential benefits of the proposed standard by determining the number of HRIs and heat-related fatalities that could be prevented through its provisions. This estimation was based on data regarding occupational fatalities and HRIs resulting from exposure to environmental heat. OSHA conducted this analysis using data from the BLS Injuries, Illnesses, and Fatalities (IIF) program. The IIF program collects data annually through two major surveys: the Census of Fatal Occupational Injuries (CFOI) and the Survey of Occupational Injuries and Illnesses (SOII). OSHA identified the number of heat-related fatalities and HRIs by searching BLS’ CFOI and SOII databases for incidents captured under BLS event or exposure

classification code 531—Exposure to Environmental Heat.

A. Heat-Related Fatalities

The CFOI, a Federal/State cooperative program, aims to provide accurate, comprehensive, and timely information on occupational fatalities. According to the CFOI data, between 1992 and 2022, there were 1,042 fatal cases due to employee exposure to environmental heat (BLS, 2024c). As depicted in table VIII.E.1., while the annual number of heat-related fatalities has fluctuated over this 31-year period, a gradual increasing trend in the annual average is evident.

TABLE VIII.E.1—OCCUPATIONAL FATALITIES: EXPOSURE TO ENVIRONMENTAL HEAT, ALL OWNERSHIPS, U.S.

Source: BLS, 2024c.

To assess recent trends, OSHA focused its analysis on heat-related fatalities between 2011 and 2022. Over this 12-year timeframe, BLS CFOI data reported a total of 479 work-related fatalities from exposure to environmental heat, an average of 40 fatalities per year. OSHA also evaluated the fatality counts by industry. Due to BLS publication guidelines, some

industry-level estimates were not publishable, denoted by dashes in the BLS tables. OSHA used the BLS data to estimate the number of fatalities by industry for those cases. OSHA used four steps to estimate the number of industry fatalities in years with undisclosed BLS data.

First, OSHA reviewed the total annual number of heat-related fatalities in all industries, comparing this total to the sum of annual total fatalities in private industry and government. In all cases where the sum of the fatalities in the two categories did not match the total annual fatalities, one of the categories had an undisclosed annual fatality count. Therefore, OSHA assumed that the fatality count for the undisclosed estimate was equal to the difference between total annual fatalities and the fatalities in the published estimate (total for private industry or government). For example, in 2020, the total number of fatalities in all industries was 56, the total number of fatalities in private industry was 52, and the total in government was undisclosed. OSHA estimated that the number of heat-related fatalities in government was equal to the difference, four.

Second, OSHA reviewed the total heat-related deaths in all private industry and compared to the sum of heat-related fatalities in private goods-producing industries and private service-producing industries combined. Since these two groups cover all private industry, the numbers are expected to be equal. In 2019–2022, the data for both categories (goods-producing and service-providing) was undisclosed. OSHA estimated the number of fatalities for both categories for 2019–2022. Using the data from 2011–2018, OSHA divided the average percentage of heat-related private industry fatalities that were attributable to each group, estimating that 63 percent of private industry fatalities were in goods-producing industries and the remaining 37 percent were in service-producing industries. In each of the four years with undisclosed data, OSHA estimated the total fatalities in goods-producing and service-providing industries by multiplying each percentage by the total number of private industry annual heat-related fatalities. For example, in 2019, OSHA estimates that 63 percent of the private industry fatalities, 25.3 fatalities, are in goods-producing industries.

Next, OSHA reviewed the super-sectors within private goods-producing and private service-providing industries, comparing the total annual fatalities in each category to the sum of the annual fatalities of the lower, more

detailed underlying super-sectors.⁹³ In years where the comparison showed a mismatch due to undisclosed data, OSHA estimated the data for the undisclosed super-sectors by distributing the difference between the total annual fatalities and the sum of fatalities in the underlying super-sectors across the super-sectors with undisclosed data. More specifically, the estimate for these undisclosed super-sectors was set equal to the difference described above multiplied by the percentage of non-fatal heat-related incidents⁹⁴ by super-sector. This percentage is calculated by the estimate of average annual heat-related non-fatal injuries and illnesses within the super-sector divided by the average total number of heat-related incidents in the category in which it belongs (*i.e.*, goods-producing or service-providing).

Finally, OSHA examined the annual fatality counts for government and used a different method to estimate fatalities due to the differences in scope between SOII and CFOI.⁹⁵ For each year, OSHA calculated the difference between the total annual heat-related fatalities in

government and the sum of annual fatality counts by all government ownership types (Federal, State, and local). OSHA assumed this difference represents the number of fatalities for ownership types with undisclosed yearly estimates. OSHA evenly distributed the difference across all government ownerships with undisclosed estimates for that year. For example, in 2020 there were four total heat-related fatalities in all government. Since none of the government ownership types had disclosed estimates, OSHA estimated that local, State, and Federal Government had 1.3 (4/3) fatalities each. Table VIII.E.2. presents the total estimated fatality counts for 2011 to 2022 by industry groups.

Further analysis of the data revealed that an estimated 88.1 percent or 422 of these fatalities occurred within private industry, while 11.9 percent or 57 fatalities were recorded in Federal, State, and local governments. Within the private industry, the Goods Producing industries accounted for 262 of these estimated fatalities, with

Construction accounting for 162 of the incidents within that sector. Natural Resources and Mining (which includes agriculture) and Manufacturing accounted for 52 and 49 of the estimated fatalities within the Goods-Producing industries respectively. Additionally, 160 of the 422 fatalities in private industry occurred in the Service-Providing industries, which includes super-sectors such as Trade, Transportation and Utilities, Leisure and Hospitality, and Professional and Business Services. Professional and Business Services (this NAICS super-sector can include disparate occupations, including janitors, material movers, groundskeeping workers, office clerks, security guards, architects, accountants, engineers, general managers, waste collectors, and lawyers) made up nearly 45 percent of all fatalities within the Service Providing industries, accounting for 71 of the 160 fatalities within this group. These findings are detailed below in table VIII.E.2., illustrating the distribution of fatalities across different sectors and industries.

TABLE VIII.E.2—ESTIMATED OCCUPATIONAL FATALITIES BY INDUSTRY: EXPOSURE TO ENVIRONMENTAL HEAT, NUMBER AND PERCENT, ALL OWNERSHIPS, U.S.
[2011–2022]

Industry	Estimated total number of fatalities	Percent of total fatalities
Total Injuries Fatalities	479	
Private Industry ^a	422	88.1
Goods Producing Industries ^{b,c}	262	54.8
Natural Resources and Mining	52	10.8
Construction	162	33.7
Manufacturing	49	10.3
Service Providing Industries ^{b,c}	160	33.3
Trade, Transportation and Utilities	45	9.4
Information	7	1.4
Financial Activities	5	1.0
Professional and Business Services	71	14.8
Education and Health Services	7	1.4
Leisure and Hospitality	15	3.2
Other Services	10	2.0
Government ^{a,d}	57	11.9
Federal Government	26	5.5
State Government	10	2.1
Local Government	21	4.3

Source: OSHA derived estimates based on BLS, 2024c.

^a OSHA estimated years with undisclosed data using the difference between total annual fatalities and the sum of private industry and government fatalities.

^b OSHA estimated years with undisclosed estimates for goods-producing industry totals and service-providing industry totals by comparing the annual sum of both categories to the total annual private industry fatalities and adjusting for the average percentage of private industries that fall within each category.

^c For years with undisclosed data in the underlying super-sectors within these categories, OSHA estimated the number of fatalities by multiplying the number of fatalities unaccounted for in the published data by a ratio of the non-fatal heat-related injuries and illnesses for the super-sector.

⁹³ The underlying super-sectors of Goods-Producing Industries are Natural Resources and Mining (includes agriculture), Construction, and Manufacturing. The underlying super-sectors within Service-Providing industries are Trade, Transportation, and Utilities; Information; Financial

Activities; Professional and Business Services; Education and Health Services; Leisure and Hospitality; and Other Services.

⁹⁴ The percentage of total domain-level non-fatal heat-related incidents by super-sector was

calculated using the SOII data from 2011–2022, described in more detail in section VIII.E.II.B., below.

⁹⁵ SOII excludes Federal Government ownership and CFOI does not.

^d Estimates for the three different government ownership codes with annual undisclosed data were estimated by distributing the residual between the total annual government fatalities and the sum of published fatalities at the more detailed government ownership level, evenly across all government ownership types with undisclosed estimates.

B. Non-Fatal Heat-Related Injuries and Illnesses (HRIs)

The BLS SOII is a Federal/State cooperative program that publishes estimates on non-fatal occupational injuries and illnesses, including HRIs.

From 2011 to 2022, SOII recorded a total of 39,450 HRIs that required days away from work, averaging 3,288 HRIs per year (BLS, 2023b; BLS, 2023g; and BLS, 2023h). As detailed in table VIII.E.3., 35.8 percent of these HRIs required only one day away from work to recover after

the incident, 21.5 percent required two days, and 23.9 percent needed three to five days. The remaining 18.8 percent of cases needed six or more days away from work for recovery from injuries and illnesses caused by exposure to environmental heat.

TABLE VIII.E.3—NON-FATAL OCCUPATIONAL INJURIES AND ILLNESSES REQUIRING DAYS AWAY FROM WORK: EXPOSURE TO ENVIRONMENTAL HEAT, NUMBER AND PERCENT, ALL OWNERSHIPS, U.S.

[2011–2022]

	Number of non-fatal injuries and illnesses	Percent of total non-fatal injuries and illnesses
Total Non-Fatal Injuries and Illnesses	39,450	
Number of days away from work:		
Cases involving 1 day	14,130	35.8
Cases involving 2 days	8,500	21.5
Cases involving 3–5 days	9,440	23.9
Cases involving 6–10 days	3,660	9.3
Cases involving 11–20 days	1,760	4.5
Cases involving 21–30 days	480	1.2
Cases involving 31 or more days	1,500	3.8
Median days away from work ^a	2	

Source: OSHA calculations based on BLS, 2023b; BLS, 2023g; and BLS, 2023h.

Note: Because of rounding and data exclusion of nonclassifiable responses, data may not sum to the totals. Days away from work include those that result in days away from work with or without job transfer or restriction.

^a Median days away from work is the measure used to summarize the varying lengths of absences from work among the cases with days away from work. Half the cases involved more days and half involved less days than a specified median. Median days away from work are represented in actual values.

Table VIII.E.4. details the BLS' SOII estimates of annual incidence rates of HRIs between 2011 and 2022. Over this

period, the average estimated annual incidence rate is 3 cases per 100,000 full-time workers for HRIs. This

incidence rate indicates the annual frequency of injuries and illnesses due to heat exposure.

TABLE VIII.E.4—NON-FATAL OCCUPATIONAL INJURIES OR ILLNESSES: EXPOSURE TO ENVIRONMENTAL HEAT, NUMBER AND ANNUAL INCIDENCE RATES PER 100,000 WORKERS, ALL OWNERSHIPS, U.S.

[2011–2022]

Year	Number of non-fatal injuries or illnesses	Incidence rate per 100,000 full-time workers
2011	4,420	4
2012	4,170	4
2013	3,160	3
2014	2,660	2
2015	2,830	3
2016	4,110	4
2017	3,180	3
2018	3,950	3
2019	3,080	3
2020	2,330	2
2021 & 2022	5,560	2
Total Non-Fatal Injuries and Illnesses, All Ownerships	39,450	
Average Non-Fatal Injuries and Illnesses Per Year	3,288	3

Source: BLS, 2023b; BLS, 2023g; and BLS, 2023h.

Note: Starting with 2021, BLS published data biennially. The number of HRIs reported for 2021 and 2022, is a biennial estimate.

Table VIII.E.5. presents the number of HRIs by industry from 2011 to 2022. Similar to the findings illustrated in table VIII.E.2., table VIII.E.5.

demonstrates that the majority of HRIs also occur predominantly within private industry, accounting for 79.9 percent or 31,510 of the 39,450 non-fatal injuries

and illnesses. Twenty-one percent of HRIs occurred within State and local governments, accounting for 7,930 of all HRIs. Within private industry, more

than half of all recorded HRIs occurred in the Service Providing sector, which accounted for 18,460 of the total 31,510 HRIs recorded. The Trade, Transportation, and Utilities industry (which includes Wholesale Trade, Retail Trade, Transportation and Warehousing,

and Utilities) made up 8,010 of HRIs within the Service Providing sector, followed by Professional and Business Services, and Leisure and Hospitality with 4,260, and 1,790 HRIs, respectively. The Goods Producing sector accounted for 13,050 of the total

HRIs within private industry, most of which occurred within the Construction and Manufacturing industries, with 6,130 and 5,100 non-fatal cases respectively.

TABLE VIII.E.5—NON-FATAL OCCUPATIONAL INJURIES AND ILLNESSES BY INDUSTRY: EXPOSURE TO ENVIRONMENTAL HEAT, NUMBER AND PERCENT, ALL OWNERSHIPS, U.S.
[2011–2022]

Industry	Number of injuries and illnesses	Percent of total injuries and illnesses
Total Injuries and Illnesses	39,450

State Government	1,490	3.8
Local Government	6,440	16.3

Source: OSHA calculation from BLS, 2023b; BLS, 2023g; and BLS, 2023h.

Note: Because of rounding and data exclusion for detailed categories that did not meet the BLS publication guidelines, data may not sum to the totals. The SOII excludes all work-related fatalities as well as non-fatal work injuries and illnesses to the self-employed, to workers on farms with 10 or fewer employees, to private household workers; to volunteers, and to Federal Government workers.

C. Underreporting

Based on an analysis of relevant academic literature (discussed in detail in Section V.A., Risk Assessment), OSHA has determined that heat-related occupational fatalities and HRIs are underreported due to (1) employers not being fully compliant with recordkeeping rules, (2) employees not reporting cases to their employers, (3) a lack of identifying heat as the cause of a heat-related injury or illness, and (4)

the scope and inclusion criteria of the various surveillance data.

I. Underreporting of Heat-Related Fatalities

BLS CFOI is well-regarded as the most complete and authoritative source on fatal workplace injuries and estimates of its magnitude of underreporting of occupational fatalities do not exist. However, there may be factors specific to heat-related fatalities that make CFOI

particularly likely to misclassify the cause of death as being due to some other cause. This could mean that heat-related fatalities may be historically excluded from CFOI (e.g., cause of death is listed as cardiac arrest) or listed under another, not heat-specific Occupational Injury and Illness Classification System (OIICS) category (e.g., a worker faints due to heat exposure, falls from a height, and subsequently suffers a fatal traumatic injury). Additionally, as

discussed in Section V.A., Risk Assessment, the documentation upon which BLS relies to code occupational fatalities (e.g., death certificates, coroner reports) may have limitations for heat-related fatalities due to the lack of expertise or experience of the individual determining the cause of death and whether the individual witnessed the events preceding the fatality. Therefore, OSHA has preliminarily determined that there is reason to believe that the number of heat-related fatalities in CFOI are undercounted, but precise estimates of this quantification do not exist.

II. OSHA's Underreporting Adjustment—Heat-Related Fatalities

Heat-related fatalities are often identified in public health surveillance through review of International Classification of Diseases (ICD) codes listed in death certificates, which are known to be limited in their capture of heat as a cause-of-death (Shen et al., 1998). However, epidemiologists have increasingly used statistical techniques to identify excess deaths attributable to heat, both globally and in the United States, regardless of the cause-of-death listed on the death certificate. A recent study from 2020 estimated that, on average, 5,608 excess deaths were the result of heat each year between 1997 and 2006 in the 297 counties examined (representing approximately 62 percent of the U.S. population) or 9,045 excess deaths per year when extrapolated to the full nation (Weinberger et al., 2020). Estimates for similar time periods using the death certificate approach ranged from 618 to 658 heat-related deaths per year across the U.S. (Xu, 2012; Fowler et al., 2013). This would suggest that nationally heat-related deaths may be 13.7-to-14.6 fold undercounted. However, it is unclear if this ratio could be applied to CFOI estimates of occupational heat-related fatalities, as it is not clear what proportion of these excess deaths occurred among workers. Recent evidence from Mexico indicates that heat-related excess deaths are concentrated among working-age individuals and children (preprint by Wilson et al., 2024). If the same pattern holds in the U.S., then the undercounting estimates above (13.7–14.6) might be understating the magnitude of the undercount for workers. However, another recent study that examined heat-related excess deaths in Europe found that these deaths were predominantly concentrated among individuals over the age of 65 (Ballester et al., 2023). If this pattern were true for the U.S., the undercounting estimates above might be overstating the magnitude of

undercounting for workers. These two studies had important differences in methodology (e.g., use of exposure metric, use of observational weather data, and age groups analyzed) and underlying population (e.g., age distribution), and the researchers were not able to characterize work-related deaths. Given that the proportion of work-related deaths among the total estimated excess heat-related deaths in the U.S. is unknown, OSHA did not adjust the ratio derived from comparing Weinberger et al.'s estimates to Xu and Fowler et al.'s counts. Therefore, for this analysis, OSHA estimates that occupational fatalities due to heat are undercounted by a factor of 14. Additional values of the undercount—both higher and lower—are presented later in this section in a sensitivity analysis. OSHA welcomes comment on the estimates of avoided fatalities, the underreporting adjustment, data sources, and methodologies employed here. The agency welcomes additional studies that OSHA should consider and comment on whether there are more appropriate underreporting factors that should be used to adjust reported fatalities in the final economic analysis.

III. Underreporting of Non-Fatal HRIs

As discussed in Section V.A., Risk Assessment, researchers and government agencies have long acknowledged the shortcomings of BLS's SOII in accurately estimating all non-fatal occupational injuries and illnesses. One limitation is the scope of cases for which BLS has historically reported enough information to identify HRIs—only those cases involving days away from work.⁹⁶ Another limitation of SOII is the reliance on employer-reported data, as research has demonstrated that employers are not always fully compliant with recordkeeping rules. Quantifying the magnitude of the undercounting of SOII is difficult, but comparisons to workers' compensation and other databases provide some context for the potential magnitude of undercounting.

IV. OSHA's Underreporting Adjustment—Non-Fatal HRIs

The best available estimates of the magnitude of the underreporting of injuries and illnesses comes from a 2014 study funded by BLS that compared State-based surveillance data from California (specifically the Workers'

Compensation Information System, data from healthcare facilities across the State, and Doctors' First Reports of Occupational Illness or Injury) to BLS SOII microdata for both carpal tunnel syndrome and amputations from 2007–2008 (Joe et al., 2014). In this study, researchers linked individual cases in each dataset to the corresponding case in other datasets to obtain a better estimate of the total number of cases for each outcome occurring in California during this time. They found that the State-based data sources contained 5 times more amputations and 10 times more carpal tunnel syndrome cases than were reported in the BLS SOII data. Joe et al. (2014) also found that about 30 percent of SOII cases were not captured in the State database which suggests that both sources are failing to capture some injuries.

While Joe et al. (2014) was not specific to heat, a more recent study from California compared the number of HRI claims in the State's Workers' Compensation Information System to the estimated number of HRIs reported in BLS SOII for the same years (2009–2017) (Heinzerling et al., 2020). Heinzerling et al. found 3–6 times the number of HRI cases estimated by SOII in the State's workers' compensation database each year. While this study did not match individual cases as was done in Joe et al. (2014), it is reasonable to assume that similar to the findings in that study, some HRIs that were captured by the SOII data were not captured by the State's workers' compensation data. This would mean that there are even more cases in the State database that are not captured in SOII (which would mean the undercount estimate of 3–6 times is an underestimate). It is also possible that the workers' compensation database examined by Heinzerling et al. (2020) is missing HRIs. In Joe et al., 2014, approximately 54–74 percent of cases identified in the healthcare facility data were only found in that dataset and 46 percent of cases identified in the Doctors' First Reports data were found only in that dataset. This suggests that the number of cases Heinzerling et al. (2020) identified in the workers' compensation data that they compared to BLS SOII may itself have been an undercount.

Finally, simply comparing the total number of recorded occupational fatalities annually to the total number of annual recorded non-fatal injuries and illnesses suggests potentially significant underreporting of HRIs. For each occupational death in 2022, there were about 965 medically consulted work-related injuries (4,695 fatalities to

⁹⁶ BLS expanded their publication of case and demographic data for injury and illness cases involving days of job transfer or restriction (DJTR) with the introduction of biennial estimates in 2021–2022. (<https://www.bls.gov/iif/notes/2022/biennial-estimates.htm>).

4,530,000 medically consulted injuries based on data from the National Safety Council (NSC, n.d.). In 2022, for each occupational fatality, there were about 639 recordable injuries and illnesses (5,486 fatalities to 3.5046 million recordable cases (BLS, 2024c; BLS, 2023b)). This ratio is generally consistent across a number of specific causes or types of occupational fatalities and non-fatal injuries and illnesses. Similarly, for heat-specific cases, a ratio of 1,000 emergency department visits and hospitalizations per 1.4 fatalities was reported in a 2011 analysis by the Florida Department of Health (Florida DOH, 2011; also discussed in Section V.A., Risk Assessment). As such, the ratio of heat-related fatalities to HRIs (about 82 HRIs for every one fatality) from the data that OSHA is relying on for its estimate of benefits indicates an unusually low number of HRIs. Based on the reported number of occupational heat-related fatalities (which OSHA believes, and research supports, is an underestimate) of 40 per year, the expected number of HRIs would be around 38,000 per year versus the 3,288 reported annual HRIs (assuming the relationship between fatalities and non-fatal injuries and illnesses is similar for heat-related fatalities and injuries and illnesses and the all-cause mortality and injury and illness numbers).

Based on these studies, OSHA has preliminarily determined that the range of estimates reported in Joe et al. (2014) (i.e., 5–10 times more cases than in the SOII data) are the best available estimates on the magnitude of undercounting of occupational injuries and illnesses by BLS SOII. These values are supported by Heinzerling et al. (2020) which found 3–6 times the number of HRI cases but which had limitations likely leading to an underestimation of the magnitude. OSHA welcomes comment on this adjustment, submission of additional data or studies that would help the agency refine this estimate, and suggestions on alternative methodologies.

V. Underreporting-Adjusted HRIs and Heat-Related Fatalities

Based on this analysis, OSHA estimates that HRIs are undercounted by a factor of 7.5 (mid-point of 5 and 10) and heat-related fatalities are undercounted by a factor of 14. Applying these factors to BLS' reported 39,450 HRIs and 479 fatalities, OSHA estimates an underreporting adjusted total of 295,875 HRIs and a total of 6,706 heat-related fatalities from 2011 to 2022, an annual average of 24,656 and 559 per year respectively. Additional values of

the undercount—both higher and lower—are presented later in this section in a sensitivity analysis.

III. Monetized Health and Safety Benefits

As explained in Section V.C., Risk Reduction, OSHA has preliminarily determined, based on a review of academic literature on the effectiveness of heat injury and illness prevention methods, that full compliance with this proposed standard would reduce heat-related fatalities by 99.8–100 percent and HRIs by 37–96 percent. For this benefits analysis, OSHA is assuming an effectiveness of 95 percent for fatalities and 65 percent of HRIs. The effect of different assumptions on the outcome of this benefits analysis are discussed below in the sensitivity analysis.

Applying the undercount adjustment to BLS-reported heat-related fatalities and HRIs discussed above by factors of 14 and 7.5 respectively, OSHA estimates that the proposed standard will prevent 531 heat-related fatalities per year (of the estimated 559 fatalities) and 16,027 HRIs per year (of the estimated 24,656 HRIs) under the assumptions of 95 percent effectiveness for heat-related fatalities and 65 percent effectiveness for HRIs.⁹⁷ Using the 2022 estimate of the value of a statistical life (VSL) developed by the Department of Transportation (DOT)⁹⁸ and converting to 2023 dollars using the GDP deflator (BEA, 2024), \$13.77 million, OSHA estimates the monetized benefits from avoided fatal heat-related incidents in the first year would be \$7.310 billion. OSHA monetized benefits of avoided HRIs using the midpoint of the range of the value of a statistical injury (VSI) cited in Viscusi and Gentry (2015), converted to 2023 dollars using the GDP deflator, \$116,588 per injury.⁹⁹ The estimated monetized benefits from avoided HRIs are \$1.869 billion per

⁹⁷ OSHA assumes that the proposed standard is equally effective at preventing fatalities and HRIs that are currently reported in the economic data and those that are currently unreported. The agency welcomes comment on this assumption.

⁹⁸ Available at <https://www.transportation.gov/office-policy/transportation-policy/revised-departmental-guidance-on-valuation-of-a-statistical-life-in-economic-analysis> (DOT, 2024). The 2022 estimate was based on a comprehensive 2021 Department of Transportation guidance update, available at <https://www.transportation.gov/sites/dot.gov/files/2021-03/DOT%20VSL%20Guidance%20-%202021%20Update.pdf> (DOT, 2021).

⁹⁹ OSHA welcomes comment regarding this VSI estimate and whether it is an appropriate value given that HRIs may be less severe than other injuries and illnesses typically considered in the VSI derivation. The agency welcomes suggestions on alternative VSI estimates for HRIs as well as supporting data, methodologies, or studies that would help the agency refine this estimate.

year. Total benefits each year for avoided heat-related fatalities and HRIs are \$9.179 billion.

IV. Additional Unquantified Potential Benefits

OSHA believes the proposed standard may provide several additional potential benefits beyond the avoided direct heat-related fatalities and HRIs captured in the monetized health and safety benefits. These potential benefits include avoided indirect fatal and non-fatal injuries related to heat exposure, increased labor supply, and increased utility for employees. The agency's estimate of monetized health and safety benefits has not incorporated benefits for these factors. The values presented here are shown to demonstrate the potential magnitude of these benefits but are highly uncertain and, therefore, not incorporated into the main quantified estimate of the benefits of this proposed standard.

A. Indirect Fatalities and Non-Fatal Injuries

As discussed in detail in Section V.A., Risk Assessment, and Section IV., Health Effects, workers face additional risks from working in hot environments other than the direct physical effects of heat on the employee's body. Indirect injuries that are caused by the physiological effects of heat stress, but are not themselves, heat exhaustion or heat stroke (i.e., falling, motor vehicle accidents, etc.). Direct HRIs and fatalities are those caused by the effects of heat on the body without the involvement of other factors. The underreporting adjustments in the benefits analysis may not capture or only capture some of the underreporting of indirect HRIs and heat-related fatalities. Researchers have used the natural fluctuations in temperatures to conduct quasi-experimental studies examining the relationship between heat and workers' compensation claims for traumatic injuries (Spector et al., 2016; Calkins et al., 2019; Dillender, 2019; Park et al., 2021; Negrusa et al., 2024). These papers' findings suggest that there may be many workers' compensation claims that are heat-related but not coded as such. For instance, Park et al. (2021) estimated that approximately 20,000 injuries per year in California between 2001 and 2018 were caused by hotter temperatures (relative to "optimal" temperature). For comparison, for a similar time period (2000–2017), Heinzerling et al. (2020) only identified an average of 889 HRI workers' compensation claims per year in California (a 22-fold difference),

suggesting that relying on workers' compensation claims for HRIs alone does not capture the higher incidence of injuries of other kinds where heat may have played a role. OSHA has not included a quantified value of potentially avoided indirect heat-related fatalities and non-fatal occupational injuries, but these studies suggest that heat may contribute to additional impacts on employees and that these impacts may be significant. Because of this, the benefits of this proposed standard may be greater than what OSHA estimates in the primary estimate.

If the relationship between directly- and indirectly-caused heat-related non-fatal injuries found in Park et al. (2021) was representative of the true relationship, the number of occupational direct and indirect heat-related non-fatal injuries may be as high as 72,000 annually (based on the BLS-reported annual non-fatal injuries of 3,288 and an estimate of 22 indirect heat-related injuries per 1 direct heat-related injury). Assuming the proposed standard prevented 65 percent of these indirect non-fatal injuries, it might prevent a total of 47,000 indirect non-fatal injuries each year. Monetizing those avoided injuries would represent about an additional \$5.5 billion in benefits (using a VSI of \$116,588 per avoided injury). If the relationship between non-fatal injuries and fatalities seen for occupational injuries and fatalities in general of one fatality for every 1,000 injuries holds for these accidents, this means that there might be 72 indirect heat-related fatalities annually.¹⁰⁰ Given that these are caused by different factors besides heat and so may be preventable at lower rates than direct heat-related fatalities, assuming preventability equal to the preventability of non-fatal injuries, this proposed standard might prevent an additional 46 indirect heat-related fatalities annually. Monetized, this would mean additional benefits of \$644 million.

B. Worker Disutility and Decreased Labor Supply

There is a lengthy economic literature that suggests that humans have strong preferences for not being exposed to extreme temperatures. Roback (1982)

and Sinha et al. (2018) used revealed preference techniques and found that most people experience non-trivial direct disutility¹⁰¹ from exposure to extreme temperatures and that they are willing to pay non-trivial amounts to mitigate those exposures where they can. Studies of real world responses to extreme temperatures including Graff Zivin and Neidell (2014) and Rode et al. (2022) found that workers decrease the amount of labor they are willing to supply (i.e., for workers who are able to do so, they will shorten their work day or choose to not work on a certain day) when temperatures are extreme (with a greater decrease in labor supplied when temperatures are extremely hot versus when they are extremely cold) suggesting that workers prefer to forgo wages rather than be exposed to extreme temperatures. In cases where labor markets are imperfectly competitive, workers might benefit from this proposed standard because they do not have the option to avoid exposure to extreme temperatures, even if they were willing to forgo wages (for more on the implications of imperfect labor market competition for compensating differentials, see, e.g., Burdett and Mortensen, 1998; Sorkin, 2018). While the interventions in this proposed standard will not eliminate the need for work to be performed in hot environments, to the extent that these interventions mitigate some of the physical discomfort caused by heat, employees may experience a decrease in the disutility they face due to working in hot environments.

While an individual's utility or disutility is difficult to measure, Li et al. (2020) found that people expressed a willingness to pay (WTP) between \$2.60 and \$4.60 per day to avoid a hot day. WTP may not already be satisfied in the labor market as a result of imperfect competition, imperfect information, binding minimum wages, or other features of the market. This is not perfectly analogous to utility but gives a range for the value that individuals place on avoiding excessive heat. Assuming a point estimate of a WTP of \$3 per day¹⁰² to mitigate the physical

discomfort of working in hot environments, all employees in the scope of this proposed standard receiving heat protections for 30 days on average would equal benefits of \$3.236 billion. Employees in many parts of the country work in hot conditions for many more than 30 days, meaning that, if benefits to workers to mitigate the negative physical effects of heat that do not rise to the level of a heat injury or illness were captured and monetized, the benefits of this proposed standard may be even greater than those shown by the monetized safety and health benefits.

Graff Zivin and Neidell (2014) found that workers with high exposure to heat reduced their labor supply by as much as one hour per day when the temperatures were above 85°F.¹⁰³ Based on an average loaded hourly wage of \$43.60 (the average for all at-risk workers in the scope of the proposed standard), if employees working in the hottest environments (assumed here to be the sum of workers exposed to process heat and outdoor workers) supply 5 additional hours of labor each over the course of a year, they would cumulatively receive additional wages of \$3.877 billion. Measures that improve the comfort of employees and reduce the negative physical effects of heat could easily result in the small increase in labor supply discussed here. As mentioned previously, employers benefit when employees produce more so the benefits of increased labor supply would be more than just the increased wages paid to employees—employers' revenue would increase because of increased employee output as well.

V. Uncertainty

A few factors contribute to uncertainty in the estimates of the benefits of this proposed standard including potential underreporting of heat-related fatalities and HRIs, uncertainty of the effectiveness of the

might be higher. Second, those surveyed by Li et al. (2020) were not necessarily workers who were working in high heat. Employee's WTP for heat mitigating measures might be higher than a general individual's WTP to avoid hot days in general since employees have to perform physical labor in those hot environments and because employees have less control over workplace factors like resting, clothing choices, or the ability to stay inside or to relocate somewhere with air conditioning. Finally, those surveyed by Li et al. (2020) may have included nonworking individuals who may have a lower income and therefore a lower WTP than individuals who are working for wages.

¹⁰³ Note that this change in labor supply refers to real world effects seen where workers choose to work fewer hours when temperatures are excessively hot or cold (e.g., ending their workday early, choosing to not work on certain days) and is different from the productivity effects of rest breaks discussed elsewhere.

¹⁰⁰ This calculation uses a more generalized ratio of occupational injuries to fatalities than those discussed previously based on NSC and BLS data (NSC, n.d.; BLS, 2023b; BLS, 2024c). If the NSC-derived ratio of 965 injuries to one fatality were more accurate, there could be about 75 indirect heat-related fatalities annually. If the BLS-derived ratio of 639 injuries to one fatality were correct, the indirect heat-related fatalities could be around 113 annually.

¹⁰¹ In economic terms, disutility is the negative or harmful effects of some activity or economic transaction. In economics, individuals are assumed to try to maximize their utility (and conversely minimize their disutility).

¹⁰² This assumes a value on the lower end of what Li et al. (2020) estimated since this proposed standard will not entirely remove most employees from hot environments. There are arguments to be made that this might be an underestimate for a few reasons. First, people have a higher WTP to avoid very high temperatures so where this proposed standard improves conditions for employees exposed to very high temperatures, their WTP

interventions required by the proposed standard, and potential benefits of improved labor productivity.

A. Underreporting

As discussed earlier, OSHA believes the number of HRIs and heat-related fatalities estimated from the BLS data is likely underestimated compared to the true number of HRIs and heat-related fatalities in the United States. Research suggests that HRIs and heat-related fatalities are underreported in multiple datasets (e.g., BLS CFOI, BLS SOII, workers' compensation claims data, and hospital discharge data). The general underreporting and undercounting of occupational injuries and illnesses has been a topic of multiple government reports (e.g., Ruser, 2008; Miller, 2008; GAO, 2009; Wiatrowski, 2014). While there is a good deal of agreement that some level of underreporting exists for occupational injuries and illnesses in general and HRIs specifically, there is uncertainty regarding the magnitude of underreporting. OSHA has adjusted for underreporting of HRIs and heat-related fatalities but there remains a wide range of estimates of underreporting in the research. There still remains a high level of uncertainty in these estimates and the magnitude of underreporting is potentially considerably higher than what OSHA has estimated. If the HRIs were underreported by a factor of 10 rather than 7.5 (which is plausible based on the available evidence) and this proposed standard has the same effectiveness, it could prevent about an additional 11,500 HRIs which could account for an additional \$1.342 billion in benefits.

B. Program Effectiveness

As explained above, for this benefits analysis, OSHA assumes that the proposed standard will be 65 percent effective in curbing HRIs. This topic, the relevant literature, and how the agency arrived at its estimates of the standard's effectiveness are discussed in-depth in Section V.C., Risk Reduction. As discussed previously, OSHA found that the literature on this issue lacks certainty. Few studies included a concurrent control group, rather most studies looked at rates of HRI before and after an intervention in the same group. Studies were generally performed on specific industries, or in specific settings, and the effectiveness of the intervention might be higher or lower than the study average across the firms and employees covered by this rulemaking. Additionally, no study tested an intervention that would exactly match the controls required by the proposed standard. For example,

McCarthy et al. (2019) report a 60–90 percent decrease in the odds of HRI among municipal outdoor workers in Texas after a Heat Stress Awareness Program (HSAP) intervention was implemented in 2011. However, this study lacked a control group that received no intervention making it difficult to determine if the reported effectiveness could be attributed to the intervention. While OSHA assumed the effectiveness of the proposed standard in preventing HRIs to be on the lower end of what McCarthy et al. (2019) found, there is evidence that the effectiveness of heat interventions may be much higher than that (See Section V.C., Risk Reduction, for additional discussion).

If the proposed standard were more effective at preventing heat-related fatalities and HRIs than OSHA estimates in this analysis (and based on available evidence this is plausible, see Section V.C., Risk Reduction) and prevented all fatalities (100 percent versus 95 percent) and 10 percent more HRIs (75 percent versus 65 percent), the proposed standard might prevent 28 more fatalities and about 2,500 more non-fatal injuries and illnesses annually. Monetized, this represents approximately an additional \$672 million in benefits.

C. Labor Productivity Losses

As discussed above in section VIII.E.IV.A., OSHA has preliminarily determined, based on numerous studies, that there are labor productivity losses from working in the heat that can be partially recovered through the provision of rest breaks. However, precisely defining the magnitude of labor productivity losses that could be recuperated under the proposed standard is difficult with the current research available. This analysis rests on specific assumptions and is dependent on the extent of the available literature, in which heat and productivity were assessed in different settings with different break policies, but break policies did not vary within the same setting. OSHA mentions those impacts here, as well, to acknowledge the uncertainty associated with those estimates. This factor is examined in the sensitivity analysis in Section VIII.C. Costs of Compliance (section VIII.C.VI).

VI. Sensitivity Analysis

OSHA considers the rate of effectiveness of the various measures of this proposed standard a major source of uncertainty in the calculation of benefits. OSHA has compiled a sensitivity analysis to illustrate the range that could depict the benefits

estimate. As shown below in table VIII.E.6. for the low estimate, OSHA estimated program effectiveness to be 50 percent for HRIs and 90 percent for heat-related fatalities (as opposed to the primary estimate of 65 percent effectiveness for HRI prevention and 95 percent effectiveness for fatality prevention). For the high estimate, OSHA estimated 100 percent effectiveness for the prevention of both heat-related fatalities and HRIs by the proposed standard (as opposed to the primary estimate of 65 percent effectiveness for HRI prevention and 95 percent effectiveness for fatality prevention).

At the 50 percent level of effectiveness, OSHA calculated monetized benefits of avoided HRIs of \$1.437 billion. At the 90 percent level of effectiveness, OSHA calculated monetized benefits of avoided heat-related fatalities of \$6.926 billion. Both estimates use the same VSI and VSL discussed above. Total monetized benefits at the 50 and 90 percent level of effectiveness are \$8.363 billion per year.

At the 100 percent level of effectiveness, the monetized benefits of avoided HRIs are \$2.875 billion per year. The monetized benefits of avoided heat-related fatalities at the same level of effectiveness are \$7.696 billion. Both estimates use the same VSI and VSL discussed above. Total monetized benefits per year for the 100 percent level of effectiveness are \$10.570 billion.

The sensitivity analysis also looked at the impact on the estimated number of avoided HRIs and heat-related fatalities under different assumptions of underreporting, specifically (1) alternative assumptions for the underreporting related to HRIs, assuming factors of 2 or 10 or no underreporting and (2) alternative assumptions regarding the underreporting of heat-related fatalities, assuming that heat-related fatalities were underreported by factors of 3 or 15 or not underreported at all. The estimated number of avoided HRIs and avoided heat-related fatalities under these alternative assumptions of underreporting are presented in tables VIII.E.6. and VIII.E.7. with OSHA's primary estimate of effectiveness as well as under the low and high levels of effectiveness discussed above.

Total monetized benefits per year from avoided heat-related fatalities and HRIs under different assumptions of program effectiveness and underreporting are presented in Table VIII.E.8.

TABLE VIII.E.6—SENSITIVITY ANALYSIS—HRIS

	Primary estimate (65% effectiveness)	Low estimate (50% effectiveness)	High estimate (100% effectiveness)
Cases—No underreporting adjustment	2,137	1,644	3,288
Cases—Low underreporting (2X)	4,274	3,288	6,575
Cases—High underreporting (10X)	21,369	16,438	32,875
Cases—Primary estimate underreporting (7.5X)	16,027	12,328	24,656
Monetized benefits, no underreporting adjustment	\$249,133,988	\$191,641,529	\$383,283,058
Monetized benefits, low underreporting (2X)	\$498,267,975	\$383,283,058	\$766,566,116
Monetized benefits, high underreporting (10X)	\$2,491,339,876	\$1,916,415,290	\$3,832,830,579
Monetized benefits, OSHA primary estimate underreporting (7.5X)	\$1,868,504,907	\$1,437,311,467	\$2,874,622,934

TABLE VIII.E.8—SENSITIVITY ANALYSIS—TOTAL ESTIMATED BENEFITS

	Primary underreporting estimate	No underreporting	Low underreporting	High underreporting
Monetized Health and Safety Benefits				
Low Effectiveness	\$8,363,511,307	\$686,370,089	\$1,867,468,738	\$9,337,343,690
High Effectiveness	10,570,400,534	932,981,458	2,415,661,316	12,078,306,579
OSHA Primary Estimate Effectiveness	9,179,493,627	771,347,468	2,064,908,415	10,324,542,076

Source: OSHA estimate.

VII. Conclusion

Uncertainty as to the magnitude of underreporting and uncertainty as to the effectiveness of the interventions prescribed by this proposed standard create substantial uncertainty in the calculation of monetized benefits. Additional uncertainty is added by the magnitude of labor productivity benefits from the required rest breaks. With the caveat of multiple areas of uncertainty, OSHA preliminarily concludes that this proposed standard would have an estimated \$9.179 billion in total annualized benefits.

F. Initial Regulatory Flexibility Analysis, Small Business Regulatory Enforcement Fairness Act, and Executive Order 13272 (Proper Consideration of Small Entities in Agency Rulemaking)

I. Introduction

The RFA, 5 U.S.C. 601 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act of 1996, Public Law 104–121 (Mar. 29,

1996), hereafter jointly referred to as the RFA, requires Federal agencies to consider the economic impact of a proposed rulemaking on small entities. The RFA states that whenever a Federal agency is required to publish a general notice of proposed rulemaking, the agency must prepare and make available for public comment an initial regulatory flexibility analysis (IRFA) (5 U.S.C. 603(a)). Pursuant to section 605(b), instead of an IRFA, the head of an agency may certify that the proposed rule will not have a significant economic impact on a substantial number of small entities. A factual basis must support a certification. If the head of an agency makes a certification, the agency shall publish such certification in the **Federal Register** at the time of publication of a general notice of proposed rulemaking or at the time of publication of the final rule (5 U.S.C. 605(b)).

To determine whether OSHA can certify that the proposed standard for

Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings will not have a significant economic impact on a substantial number of small entities, OSHA has developed a screening test to consider the minimum threshold effects of the proposed rule on small entities. This screening test is similar in concept to the revenue test used in Section VIII.D., Economic Feasibility, to identify minimum threshold effects to demonstrate economic feasibility. However, for this IRFA the screening test is applied not to all establishments but to small entities (called “small business concerns” by SBA).

OSHA is not able to certify that the proposed rule will not result in a significant economic impact on a substantial number of small entities, thus triggering the need for an IRFA. Under the provisions of the RFA, as amended in 1996, each such analysis shall contain:

1. A description of the reasons why action by the agency is being considered;

2. A succinct statement of the objectives of, and legal basis for, the proposed rule;

3. A description of and, where feasible, an estimate of the number of small entities to which the proposed rule will apply;

4. A description of the projected reporting, recordkeeping, and other compliance requirements of the proposed rule, including an estimate of the classes of small entities that will be subject to the requirements and the type of professional skills necessary for the preparation of the report or record;

5. An identification, to the extent practicable, of all relevant Federal rules which may duplicate, overlap, or conflict with the proposed rule; and

6. A description and discussion of any significant alternatives to the proposed rule which accomplish the stated objectives of applicable statutes and which minimize any significant economic impact of the proposed rule on small entities, such as:

(a) The establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities;

(b) The clarification, consolidation, or simplification of compliance and reporting requirements under the rule for such small entities;

(c) The use of performance rather than design standards; and

(d) An exemption from coverage of the rule, or any part thereof, for such small entities (5 U.S.C. 603, 607). The RFA further states that the required elements of the IRFA may be performed in conjunction with or as part of any other agenda or analysis required by any other law if such other analysis satisfies the provisions of the IRFA (5 U.S.C. 605). The remaining sections of this chapter address each of the components listed above.

II. Initial Regulatory Flexibility Analysis

A. Description of the Reasons Why Action by the Agency Is Being Considered

Heat is the leading cause of death among all weather-related phenomena in the United States. Excessive heat exacerbates existing health conditions (e.g., asthma and heart disease) and can cause heat stroke and even death if not treated properly and promptly. Heat-related illnesses are adverse clinical health outcomes that occur due to exposure to heat (e.g., heat exhaustion or heat stroke). A heat-related injury is an injury linked to heat exposure (e.g.,

a fall that occurred while a person was experiencing dizziness related to heat exposure).

Employees in both outdoor and indoor work settings without adequate climate controls are at risk of hazardous heat exposure, which may lead to heat-related illnesses and injuries (HRIs). Certain heat-generating processes, machinery, and equipment (e.g., hot tar ovens, furnaces) can also cause HRIs when effective cooling measures are not in place. Some groups, such as pregnant employees, may be more likely to experience adverse health effects from heat. In contrast, others are disproportionately employed in work settings with a higher risk of HRI, such as workers of color in essential jobs.

The BLS SOII estimates that there have been 39,450 work-related HRIs involving days away from work between 2011 and 2022, for an average of 3,288 HRIs of this severity occurring per year during this period. Additionally, according to the BLS CFI, exposure to environmental heat has killed 479 U.S. workers from 2011–2022, with an average of 40 fatalities per year during that period. As explained in Section V.A., Risk Assessment, these statistics likely do not capture the true magnitude and prevalence of heat-related injuries, illnesses, and fatalities. OSHA's estimates of the annual incidents of heat-related fatalities and HRIs and the number the agency expects will be avoided by this proposed standard can be found in Section VIII.E., Benefits.

OSHA has developed and published recommendations for heat injury and illness prevention. However, in the absence of a Federal standard, multiple States have issued regulations to address heat hazards in the workplace. Five States have enacted laws that aim to protect employees exposed to heat: Minnesota (Minn. R. 5205.0110); California (Cal. Code of Regs. title 8, section 3395); Washington (Wash. Admin. Code sections 296–62–095 through 296–62–09560; 296307–097 through 296–307–09760); Oregon (Or. Admin. R. 437–002–0156; Or. Admin. R. 437004–1131); and Colorado (7 Colo. Code Regs section 1103–15.3).

OSHA has received multiple petitions to promulgate a heat injury and illness prevention standard in recent years, including in 2018 from Public Citizen, on behalf of approximately 130 organizations. Members of Congress have also urged OSHA to initiate rulemaking for a Federal heat standard.

In the **Federal Register**, OSHA published an advance notice of proposed rulemaking (ANPRM) for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings on October

27, 2021 (86 FR 59309). From the ANPRM, OSHA initiated the rulemaking process to consider a heat-related injury and illness prevention standard. The standard would set forth the employer's obligations and the measures necessary to protect employees to reduce the number of HRIs and fatalities more effectively among workers. The goal is to prevent or reduce the number of occupational HRIs and fatalities caused by exposure to hazardous heat.

OSHA has developed potential options for various elements of a heat-specific standard using: stakeholder comments from the ANPRM; academic literature; best practices from State heat-specific standards; recommendations from the National Institute for Occupational Safety and Health (NIOSH) and the National Advisory Committee on Occupational Safety and Health (NACOSH); and other input from experts, stakeholders, and the public.

As described in the benefits analysis in Section VIII.E., Benefits, OSHA estimates that approximately 559 heat-related fatalities and approximately 24,656 HRIs among employees occur annually. However, as explained in that section, OSHA also believes there remains a great deal of uncertainty surrounding the extent of underreporting and other parameters used in this estimate.

B. Statement of the Objectives of and Legal Basis for the Proposed Rule

The objective of the proposed standard is to reduce the number of HRIs and fatalities due to exposure to hazardous heat occurring among employees in the course of their work. This objective would be achieved by requiring employers to establish heat injury and illness prevention plans (HIIPPs); identify and monitor heat hazards, provide rest breaks, adequate water, and training; plan for, and be ready to respond to, heat emergencies; and take other steps to ensure that employees can perform their duties safely.

The legal basis for the rulemaking is discussed in depth in Section II., Pertinent Legal Authority. In short, Congress enacted the Occupational Safety and Health (OSH) Act of 1970 (29 U.S.C. 651 *et seq.*), “to assure so far as possible every working man and woman in the Nation safe and healthful working conditions and to preserve our human resources” (29 U.S.C. 651(b)). To that end, Congress authorized the Secretary of Labor “to set mandatory occupational safety and health standards applicable to businesses affecting interstate commerce” (29 U.S.C. 651(b)(3); see also 29 U.S.C. 655(b)).

The OSH Act imposes several requirements OSHA must satisfy before adopting a safety standard. Among other things, the standard must provide a high degree of employee protection, substantially reduce a significant risk to workers, be technologically feasible, and be economically feasible (see 58 FR 16612, 16614–16 (Mar. 30, 1993); *Int'l Union, United Auto., Aerospace & Agric. Implement Workers of Am. v. OSHA*, 37 F.3d 665, 668–69 (D.C. Cir. 1994)). A standard is technologically feasible if the protective measures it requires already exist, can be brought into existence with available technology, or can be created with technology that is reasonably expected to be developed (see *Am. Iron and Steel Inst. v. OSHA*, 939 F.2d 975, 980 (D.C.

Cir. 1991)). In determining economic feasibility, OSHA must consider the cost of compliance in an industry rather than on individual employers. In its economic analyses, OSHA “must construct a reasonable estimate of compliance costs and demonstrate a reasonable likelihood that these costs will not threaten the existence or competitive structure of an industry, even if it does portend disaster for some marginal firms” (*Am. Iron and Steel Inst.*, 939 F.2d at 980, quoting *United Steelworkers of Am. v. Marshall*, 647 F.2d 1189, 1272 (D.C. Cir. 1980)).

C. Description and Estimate of the Number of Small Entities to Which the Proposed Rule Will Apply

Section VIII.B., Profile of Affected Industries, of this PEA presents OSHA’s

preliminary analysis of the type and number of small entities to which the proposed rule would apply. To estimate the number of small entities potentially affected by this rulemaking, OSHA used definitions developed by SBA for each sector as well as the definition of a small government and small non-profit entity according to the RFA. OSHA estimates the proposed rule would affect approximately 2.0 million small entities. Across these small entities, roughly 16.2 million employees would be protected by the proposed rule. Table VIII.F.1. presents counts of small and very small entities, establishments, and employees by industry and region.

E. Description of the Projected Reporting, Recordkeeping, and Other Compliance Requirements of the Proposed Rule

OSHA calculates costs for small entities, as defined by SBA (SBA, 2023) and the RFA, and for “very small” entities, defined by OSHA as those with fewer than 20 employees, in each industry. To estimate costs for these small and very small entities, OSHA first calculates for each 4-digit NAICS industry and State combination, the average one-time cost per establishment, average annual cost per establishment, average one-time cost per employee, and average annual cost per employee for each provision. Since OSHA assumes the indoor work area hazard evaluation

is completed every five years, average per-establishment and average per-employee costs are taken for the corresponding cost items. OSHA then multiplies these estimates by the number of small, affected establishments or affected employees at small establishments to derive one-time and annual costs for each provision of the proposed standard. One-time costs are annualized to determine total annualized costs by provision of the proposed standard. This same methodology is applied to the very small business analysis.

Table VIII.F.2. below shows across all provisions of the proposed rule, that small entities are estimated to incur annualized costs of approximately \$3.9

billion for 2.0 million entities while 1.8 million very small entities are estimated to incur annualized costs of about \$2.2 billion. The costs by provision are shown below while the detailed discussion of the unit costs, other parameters, and methodology are included in Section VIII.C., Costs of Compliance. Requirements at or above the high heat trigger (which includes requirements for rest breaks) are the most expensive provision for small entities, accounting for almost half of overall costs. The second most expensive provision of this proposed rule for small entities is the requirements at or above the initial heat trigger provision, which accounts for about 12.5 percent of costs overall.

Source: OSHA.

^a The total costs with cost savings accounts for the potential labor productivity loss avoided by having more efficient and effective rest breaks required by the proposed standard than are currently taken.

Table VIII.F.4. presents the average costs per small entity, while table VIII.F.5. presents the average costs per very small entity. On average, nearly 2.0 million small entities are estimated to incur costs of \$1,950 annually to comply with the proposed standard. Fishing (NAICS 1141) are estimated to have the lowest costs of compliance of the covered small entities—\$461 on average annually to comply with the proposed rule. The small entities with the largest costs, Psychiatric and Substance Abuse Hospitals (NAICS 6222), would spend an estimated \$118,974 annually to comply with the proposed standard.

On average, about 1.8 million very small entities are estimated to incur costs of \$1,182 annually to comply with the proposed standard. The smallest average costs per very small entity are incurred by Fishing (NAICS 1141)—estimated to be \$459 on average annually to comply with the proposed standard. The highest average costs for very small establishments are incurred by Specialty (except Psychiatric and Substance Abuse) Hospitals (NAICS 6223) and are estimated to be about \$45,066 annually.

The potential small entity impacts of the proposed rule were derived based

on the methodology detailed in Section VIII.D., Economic Feasibility. Table VIII.F.5. shows that, while small entities in most industries are estimated to have costs that are well below one percent of revenue, a few are estimated to experience costs that exceed one percent of revenues. Costs as a percentage of revenues for these entities vary from less than 0.01 percent for Tobacco Manufacturing (NAICS 3122) and Petroleum and Coal Products Manufacturing (NAICS 3241) to 2.84 percent for Child Care Services (NAICS 6244). Note that the costs in these tables were annualized using a 2 percent discount rate. The impacts for very small entities can be seen in table VIII.F.6.

As with the small entity impact analysis, the very small entity impact analysis shows that, in the majority of industries, the average impacts per entity are well below the one percent threshold. Impacts range from 0.01 percent for a few industries such as Petroleum and Coal Products Manufacturing (NAICS 3241), and Motor Vehicle.

As discussed in depth in Section VIII.D., Economic Feasibility, the agency believes some of the estimated impact in some of these industries is likely

overstated, due to inflexibility in the cost analysis regarding the amount of time spent outside in heat in a nondiscretionary manner. For example, even if the assumption that these employees spend a large percentage of their time outside is realistic under normal circumstances, childcare providers and in-person health care providers would likely limit their time outside in high heat situations if only to protect those in their care. If the costs of complying with this proposed standard were onerous, limiting employee exposure to the outdoors during times of extreme heat would be a costless method to comply with the standard and could possibly result in these employers being fully exempt from the standard (e.g., if the employer limited employee's outdoor exposure to meet the exemption for short duration employee exposure). OSHA's cost estimates did not take changes in employee scheduling into account and therefore may have overestimated costs to employers whose employees have discretion regarding the amount of time they spend outside.

NAICS 1124 Sheep and Goat Farming and NAICS 1129 Other Animal Production are both heavily weighted to very small family-owned farms (USDA,

2019). Due to a Congressional budget rider, OSHA is not able to expend funds on enforcement activities for small farms. Only about 5 percent of sheep and goat farms and 12 percent of combined Other Animal Production and Aquaculture are something other than family-owned farms (*i.e.*, partnerships or corporations). (Given the economies of scale necessary for aquaculture, it's likely that these account for more of the corporate farms in the combined Other Animal Production and Aquaculture data meaning more farms in NAICS 1129 may be family-owned farms than

appear to be in the combined data.) Based on the Census of Agriculture, about 20,000 of about 79,000 total sheep and goat farms have hired labor and those have 2 hired laborers on average. For other animal production and aquaculture combined, about 35,000 farms out of about 190,000 total farms report having hired labor and have an average of 3.5 hire laborers. Based on the size and organization of these farms, it is unlikely OSHA would be enforcing this standard on those industries so they would not incur compliance costs. OSHA welcomes feedback on this

analysis of the impact on small and very small entities

The costs of this proposed standard are largely employee-based and the agency has not found there to be feasibility concerns for entities of any size. Therefore, the agency believes that including large non-profits in the profile of SBA/RFA defined small entities would not alter the findings of the Initial Regulatory Flexibility Analysis. OSHA welcomes comment regarding the inclusion of large non-profits in the profile of SBA/RFA defined small entities.

F. Federal Rules Which May Duplicate, Overlap, or Conflict With the Proposed Rule

The Regulatory Flexibility Act (RFA) requires that the agency's initial regulatory flexibility Analysis identify, "to the extent practicable, . . . all relevant Federal rules which may duplicate, overlap or conflict with the proposed rule" (5 U.S.C. 603(b)(5)). Below, OSHA discusses whether the rules it has identified would duplicate,

overlap, or conflict with the options for a potential standard as outlined above. While some Federal rules may have overlapping requirements, OSHA did not identify any rules that would conflict with the proposed standard. The agency therefore believes that no Federal rules would prevent compliance with the proposed standard.

I. Other Federal Agency Rules

The first Federal rules that OSHA identified are regulations promulgated

by the Environmental Protection Agency (EPA) under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) (7 U.S.C. 136 *et seq.*). The Worker Protection Standard (WPS) (40 CFR part 170) is designed to protect agricultural workers from "unreasonable adverse effects of pesticides" (80 FR 67496); however, there are some provisions of the WPS addressing heat hazards associated with PPE use required by that standard. The WPS requires that employers implement "appropriate" or

“sufficient” measures to prevent heat-related illness when workers must wear PPE (40 CFR 170.507, 170.605). The WPS also requires employers to ensure pesticide handlers are trained on how to recognize, prevent, and provide first aid treatment for heat-related illnesses (40 CFR 170.501). Although there may be some overlap between these requirements and some elements of the proposed standard (e.g., training), OSHA is not aware of any conflicts. OSHA’s proposed standard would be entirely consistent with EPA’s requirements around PPE considerations and training for pesticide handlers. Additionally, the WPS, designed to protect workers from pesticide exposure, does not obviate the need for OSHA’s proposed standard, designed to protect workers from hazardous heat. A multitude of factors, including PPE, can contribute to heat injury and illness.

The second set of Federal rules that OSHA identified are Department of Transportation (DOT) regulations. The Federal Motor Carrier Safety Administration (FMCSA) requires drivers of vehicles with gross vehicle weight ratings of 26,001 pounds or more to be instructed about extreme driving conditions, including high heat, to obtain commercial driver’s licenses (49 CFR part 380). FMCSA’s regulations might overlap with OSHA’s proposed rule to the extent they require some training for a limited group of individuals. However, these regulations would not conflict with OSHA’s proposed rule, nor do they obviate the need for a comprehensive OSHA standard with provisions specifically designed to protect workers exposed to a broad range of hazardous heat conditions.

II. OSHA Standards

OSHA does not have any standards that specifically address workplace exposure to hazardous heat. However, OSHA has identified some current standards applicable to some issues related to hazardous heat. These standards, described below, do not conflict with the proposed rule, nor do they obviate the need for an OSHA standard addressing occupational exposure to hazardous heat.

The first set of standards OSHA identified are the sanitation standards (29 CFR 1910.141, 1926.51, 1915.88, 1917.127, 1918.95, 1928.110). Among other things, these standards require employers to provide employees with readily accessible potable drinking water and access to toilet facilities. The field sanitation standard for agriculture also requires employers to notify

employees of the location of water and the importance of drinking water frequently, especially on hot days (29 CFR 1928.110(c)(4)). These existing standards and the provisions of the proposed rule do not conflict, nor do these existing standards obviate the need for a heat-specific standard. While OSHA’s sanitation standards require employers to make drinking water available to employees, their primary purpose is to ensure sanitary conditions in the workplace and they do not include the same level of specificity for provision of water as the proposed standard (e.g., specific quantity of water to be provided).

The second set of standards OSHA has identified are specific to pulp and paper and textile mills. These standards require that exposed water pipes that carry either steam or hot water and are located close to working platforms be guarded to prevent contact (29 CFR 1910.261(k)(11), 1910.262). These standards are primarily concerned with burn and scalding-related hazards to employees. However, when employers guard these pipes by using insulating material, they may also help protect their workplace from increases in temperatures that may, in some cases, induce HRIs. Thus, the existing standards and the proposed standard would be complementary in nature.

The third set of standards that OSHA has identified are two broadly applicable standards that may apply to some heat-related hazards—the Recordkeeping standard (29 CFR 1904.7) and the Safety Training and Education standard for construction (29 CFR 1926.21). OSHA’s Recordkeeping standard requires employers to record and report injuries and illnesses, including heat-related injuries and illnesses, that meet recording criteria. This proposed standard does not include additional requirements for recording and reporting injuries and illnesses and therefore does not duplicate or conflict with 29 CFR 1904.7. OSHA’s Safety Training and Education standard requires employers in the construction industry to train employees in the recognition, avoidance, and prevention of unsafe conditions in their workplaces. However, the standard does not specifically identify hazardous heat as a hazard for which workers need training, nor does it establish heat-specific training requirements.

These standards might, in some cases, overlap with some of the provisions of the proposed standard. However, they do not duplicate or conflict with the proposed standard. OSHA believes that a comprehensive standard addressing

HRIs is necessary to ensure that all employers take all appropriate measures to protect workers from the hazards associated with exposure to hazardous heat. If specific requirements of any final heat standard were to directly overlap with more general requirements in other existing standards, the specific requirements would apply in lieu of the more general requirements, unless otherwise noted (see 29 CFR 1910.5(c)(1)); see also the discussion of the continued applicability of the sanitation standards in the *Explanation of Proposed Requirements* for paragraph (e)(2), Drinking Water).

G. Alternatives and Regulatory Options to the Proposed Rule

This section presents regulatory alternatives and options to the proposed OSHA Heat Injury and Illness Prevention standard and OSHA’s responses to the findings and recommendations of the SBAR panel.

Under the RFA, a regulatory alternative is one that would accomplish the stated objectives of the proposed standard and that would minimize or reduce economic impact of the proposed rule on small entities. A regulatory alternative can reduce the impact on businesses of all sizes, and it need not focus solely on small entities. OSHA also presents regulatory options. Regulatory options would increase the burden of compliance on affected entities and therefore do not meet the definition of a regulatory alternative set out in the RFA. Nevertheless, the agency presents them in this section to provide notice of potential alternate approaches and to solicit comment on these options. Table VIII.F.1. presents these options and alternatives. The assumptions and parameters for estimating the impact of these options and alternatives is discussed below the table.

OMB Circular A–4 (2023) directs agencies, for purposes of complying with E.O. 12866, to identify key attributes or provisions of a proposed standard and examine options for each “including: the proposed or finalized option; at least one option that achieves additional benefits (and presumably costs more due to, for example, greater stringency); and at least one option that costs less (and presumably generates fewer benefits due to, for example, less stringency).” For this proposed standard, OSHA identified requirements for rest breaks and for written HIIPPs as the key provisions for purposes of its E.O. 12866 analysis. The requirements of the proposed standard work in concert to produce the benefit of avoided HRIs and fatalities. The agency is unable to directly attribute avoided

HRIs and fatalities to any specific provision so is unable to discuss the differences in the benefits of alternatives other than based on the assumption that more stringent options might increase benefits while less stringent alternatives might decrease benefits.

As shown in table VIII.F.6, an option to require high heat triggered rest breaks every hour, is the costliest, incurring an additional \$23.0 billion annually compared to the proposed requirement of rest breaks every two hours. The alternative that would reduce the

compliance costs the most would be one that required 10-minute high heat triggered rest breaks (versus the 15-minute rest breaks required in the proposed standard), which results in approximately \$3.2 billion less in compliance costs per year.

TABLE VIII.F.6—COSTS FOR REGULATORY OPTIONS AND ALTERNATIVES
[2023\$]

Description	In-scope entities	In-scope establishments	In-scope employees	Annualized costs (2%)	Difference
Proposed standard as written	2,230,750	2,535,774	35,954,325	\$7,823,661,638	\$0
Review HIIPP at least every other year instead of at least annually	2,230,750	2,535,774	35,954,325	7,737,630,422	–86,031,216
No written HIIPP required for <20 employees instead of <10 employees	2,230,750	2,535,774	35,954,325	7,821,535,276	–2,126,362
All establishments write HIIPP regardless of number of employees	2,230,750	2,535,774	35,954,325	7,839,027,706	15,366,068
At or above the high heat trigger, 15-minute rest break at least every hour instead of at least every two hours	2,230,750	2,535,774	35,954,325	30,821,032,888	22,997,371,249
At or above the high heat trigger, 10-minute rest break at least every two hours instead of 15-minute rest break at least every two hours ...	2,230,750	2,535,774	35,954,325	4,601,335,411	–3,222,326,227
Refresher trainings at least every other year instead of annually	2,230,750	2,535,774	35,954,325	7,585,132,580	–238,529,059

Source: OSHA.

I. Regulatory Options

a. Regulatory Option 1—All Establishments Write HIIPPs Regardless of Number of Employees

This alternative assumes that all establishments have their HIIPP in writing compared to the proposed standard where establishments with ten or fewer employees do not need to have their HIIPP in writing. All establishments with ten or fewer employees that do not have an existing HIIPP in place are modeled as either using OSHA's template (six hours of a designated person's labor time) or writing their HIIPP from scratch (30 hours) in the same proportions that were assumed for establishments of other sizes.

This regulatory option would add about \$15.4 million in additional costs. OSHA believes that having a written plan is an important tool in protecting employees from heat and other workplace hazards. However, experience has shown that for the smallest employers, employees and supervisors or owners are working closely enough together that the details of safety plans can be readily communicated between individuals. The agency believes that written plans are not necessary for employers with 10 or fewer employees and that this is a useful way to reduce the burden on the smallest employers (although they would still need to have a HIIPP as required by this proposed standard).

b. Regulatory Option 2—At or Above the High Heat Trigger 15-Minute Rest Break at Least Every Hour

The proposed standard would require employers to provide a 15-minute rest break at least every two hours when the high heat trigger is met. This option would require employers to instead provide a 15-minute rest break to their at-risk employees at least every hour where the high heat trigger is met. As such, the cost for rest breaks would be incurred six times during an 8-hour work shift where the high heat trigger is met (excluding rest breaks before lunch and at the end of the workday).

This option would add considerable costs to this proposed standard—nearly \$23.0 billion. As discussed throughout this preamble, OSHA believes that rest breaks are a crucial tool to protect employees from heat injury and illness. As discussed in Section VII.F., Paragraph (f) Requirements at or above the High Heat Trigger, at the high heat trigger, evidence supports providing 15-minute rest breaks where employees are provided with shade, water, and a chance to shed PPE in order to reduce their body temperature every two hours.

c. Regulatory Option 3—Upper Bound Heat Index for Sedentary Work Exemption

When calculating the costs of requirements under the high heat trigger, this alternative leaves in-scope those employees who are considered sedentary but who work in non-climate-controlled indoor work conditions

where temperatures are reasonably expected to meet or exceed the high heat trigger (*i.e.*, a heat index of 90 °F). This scope change results in more employees qualifying for high heat trigger rest breaks and requiring more observation time from designated persons. This option is estimated to increase the costs of the proposed standard by about \$1.27 million.

d. Regulatory Option 4—Medical Surveillance

Under the medical surveillance alternative, OSHA adds a requirement that all at-risk employees receive and complete a medical screening questionnaire to determine whether an employee may be predisposed to heat-related health risks. This questionnaire is assumed to take 15 minutes. All at-risk employees are assumed to take this questionnaire in the first year. Only new employees (as determined by using the annual hire rates for each sector) are modeled to take this questionnaire in subsequent years.

OSHA also assumes that employees screened as having a predisposition to heat-related health risks (assumed to be 23 percent of all at-risk employees) undergo a medical examination. This medical examination would take one hour of an at-risk worker's labor time. The cost of the medical examination itself, which the employer would need to cover at no cost to the employee, is estimated to cost \$501.28.

Based on these assumptions, this option would increase the costs of the proposed standard by about \$2.5 billion.

The proposed standard currently includes a suite of controls that OSHA has preliminarily determined would confer a high level of protection to all workers, irrespective of individual risk factors.

II. Alternatives

a. Alternative 1—Review HIIPP at Least Every Other Year

Under this regulatory alternative, establishments would need to review their HIIPP at least every other year instead of at least annually. Therefore, OSHA assumes that costs would be incurred every other year including both a designated person's time and the time of employees involved in the plan review and update as estimated in Section VIII.C., Costs of Compliance.

As shown in table VIII.F.6., this alternative would reduce the cost of the proposed standard by about \$86 million. OSHA believes it is important that the written program be reviewed and updated annually to ensure that any deficiencies are identified and remedied promptly. This also maintains consistency with other OSHA standards that require annual program review and update.

b. Alternative 2—No Written HIIPP Required for Establishments With <20 Employees

This alternative adjusts the number of establishments that do not need to have their HIIPP in writing from establishments with ten or fewer employees to those with 20 or fewer employees and would reduce the cost of the proposed standard by about \$2.1 million.

As discussed above, OSHA believes that the smallest employers can effectively administer a program that is not written. However, the agency believes that this is less effective for a slightly larger employer and, given the fact that employers with between 10 and 20 employees represents a proportionately large group of covered employers, OSHA believes there are

benefits to requiring a written program for this group of employers.

c. Alternative 3—10-Minute Rest Breaks at the High Heat Trigger

This alternative revises the rest break requirements at the high heat trigger to require 10-minute rest breaks every two hours rather than 15-minute rest breaks. The time to walk to and from rest areas are maintained at two minutes for indoor employees and four minutes for outdoor employees.

This alternative reduces the cost of the proposed standard by about \$3.2 billion. OSHA has proposed 15-minute rest breaks based on the available literature on rest break efficacy (see Section VII.F., Paragraph (f) Requirements at or above the High Heat Trigger).

d. Alternative 4—Refresher Trainings at Least Every Other Year

Instead of annual refresher trainings, this alternative assumes refresher trainings take place every other year for both at-risk employees and designated persons. This alternative would reduce the cost of the proposed standard by about \$238.5 million. Training is a highly effective method to protect workers from workplace hazards and regular refresher training is necessary to reinforce the topics of the training. Training must be frequent enough that employees maintain the knowledge necessary to recognize heat-related hazards and to understand and comply with the employer's HIIPP. OSHA has preliminarily determined that annual training is necessary for employees to maintain the requisite knowledge and that it is particularly important for outdoor workers to receive this training before the start of each heat season.

e. Alternative 5—95-Degree High Heat Trigger

The high heat trigger is increased from 90 degrees to 95 degrees under this alternative. Revising the high heat trigger upward results in fewer hours for which establishments need to

implement required procedures under these high heat conditions and, thus, results in lower costs.

As shown in table VIII.F.6., this alternative would reduce costs by about \$1.9 billion (although this is a highly uncertain estimate). However, OSHA has preliminarily determined that a high heat trigger of a heat index of 90 °F would be highly protective and higher triggers may not be adequate for preventing HRIs (see Section V.B., Basis for Initial and High Heat Triggers).

f. Alternative 6—Acclimatization for Employees Returning After 30 Days Away

The amount of time away from work that qualifies an employee as a returning employee is adjusted from 14 days to 30 days under this alternative. While OSHA assumes that two percent of all employees would qualify as returning employees given the 14-day qualifying period, the agency assumes half a percent of employees would qualify with a 30-day period.

OSHA estimates that this alternative would reduce the cost of the proposed standard by about \$850,000. Again, this is a highly uncertain estimate given the lack of data on the number of workers who are away from work for two weeks and those away for 30 days during heat season. This affects a small population, and OSHA has proposed the more protective approach of requiring acclimatization for workers who have been away for 14 consecutive days.

Are there additional burden reducing alternatives that the agency should include that would impact costs to entities? If so, what burden reducing alternatives would be most useful to assess these impacts on entities? The agency would welcome any suggestions in this area.

H. SBAR Panel Recommendations

Table VIII.F.7. lists the SBAR Panel recommendations and OSHA's responses to these recommendations.

TABLE VIII.F.7—OSHA'S RESPONSES TO THE SBAR PANEL RECOMMENDATIONS

Number	Finding	Recommendation	OSHA's response
1	SERs expressed concern that the potential standard should not be a "one size fits all" approach and that it would be difficult for a standard to reasonably and effectively cover heat hazards in all settings and all regions of the U.S. SERs agreed that an OSHA standard should be flexible with a programmatic approach that allows employers to tailor their program to their particular workplace. SERs thought this flexibility was necessary for employers to prevent heat-related injuries and illnesses in their workplace most effectively. Some SERs thought the employer should determine what approaches should be implemented to address heat based on the conditions in their work settings as long as those approaches adhere to the regulatory framework. One SER asked whether the regulatory text, like the regulatory framework provided to SERs, could list multiple options employers can choose from.	The Panel recommends that OSHA's standard include performance-based provisions where practical to allow employers to tailor their heat injury and illness prevention program to their setting and situations, including the local climate and the type of work being performed, and also taking into consideration the size and complexity of the employer's operations. To the extent practicable, the Panel recommends that OSHA offer multiple methods of compliance with provisions of a heat standard. In light of input received from SERs, the Panel recommends that OSHA consider whether the heat trigger levels presented in the regulatory framework—both the initial and high heat triggers—are too low, and also recommends that the agency present these heat triggers as simply as possible to avoid confusion. The Panel also recommends that OSHA provide the methodology used to select the heat triggers, including any scientific evidence or other supporting data, along with consideration of potential alternatives.	The agency has drafted a proposed standard that ensures flexibility for workplaces. By incorporating elements that can be tailored to the workplace, OSHA is effectively addressing concerns of applicability to various workplace settings while establishing minimum requirements that are intended to ensure the heat injury and illness prevention program remains effective and accessible to employees. For example, the proposed standard does not apply to indoor workplaces where air conditioning consistently keeps the ambient temperature below 80°F; the proposed standard only requires employers with 10 or more employees to have a written plan, allows employers to choose the heat metric that works best for their workplace, and make other determinations based on their employee operations. OSHA requests further comment on the flexibility of the provisions included in the proposed heat standard.
2	SERs felt that the heat triggers that OSHA had suggested in the regulatory framework were too low and questioned whether the heat triggers were appropriate across different regions of the U.S. Some SERs reported finding OSHA's table of heat triggers presented in the regulatory framework and the use of an initial and a high heat trigger to be confusing and stressed that OSHA should keep the requirements simple. SERs also asked how the heat triggers had been determined and whether they were scientifically based. However, other SERs supported having two trigger levels and some reported that they had already implemented policies based on multiple trigger points already. Some SERs suggested using the National Weather Service heat advisory as a single measure for a heat trigger tailored to local conditions.	The Panel recommends that OSHA clearly present the data being used to justify a potential standard. The Panel recommends that OSHA thoroughly explore whether and how the injury, illness, and fatality data support the promulgation of a heat standard. The Panel also recommends that OSHA reconsider or simplify recordkeeping of temperature monitoring and not require documentation of rest breaks unless the agency can show that such a requirement is necessary or appropriate to protect workers. The Panel also recommends that OSHA reconsider other potential recordkeeping to determine if those are necessary or appropriate and whether they positively impact worker safety and health.	The agency has provided a discussion of the methodology for determining the initial and high heat triggers in Section V.B., Basis for Initial and High Heat Triggers, which cites both observational and experimental evidence. OSHA simplified the triggers that were initially presented in the regulatory framework; there are no longer ambient temperature triggers or separate, lower forecast triggers. OSHA has also provided evidence that higher triggers, including the NWS heat advisories, would not be protective enough.
2	A few SERs voiced strong concerns about the underlying data on heat-related injuries and illnesses. SERs felt that the numbers of illnesses, injuries, and fatalities reported in the BLS data are low relative to the total number of employees nationally, suggesting that any action or change is unnecessary. One SER thought that the number of heat illnesses and injuries is statistically insignificant, given the millions of workers in the labor force. SERs requested clarification on these data including requests that the data on heat-related injury and illness be published in the record by detailed industry.	The Panel recommends that OSHA clearly present the data being used to justify a potential standard. The Panel recommends that OSHA thoroughly explore whether and how the injury, illness, and fatality data support the promulgation of a heat standard.	The agency has provided a discussion of the data on occupational heat-related injuries, illnesses, and fatalities in Section V.A., Risk Assessment, and Section VIII.E., Benefits, including the significant likelihood of under-reporting of such data. The agency relied on publicly available data from BLS, State health departments, and the peer-reviewed literature. OSHA discusses the need for the standard in Section III.B., Need for Proposal, and whether the threshold for agency action is met in Section VI., Significance of Risk.
3	Many SERs questioned whether the recordkeeping requirements that OSHA had suggested were necessary. Some SERs thought they would have to hire additional staff or take time away from other safety initiatives to complete the paperwork outlined in the regulatory framework. SERs thought that documenting rest breaks would be infeasible, and that recordkeeping of daily temperature monitoring was unnecessary and would be burdensome to comply with.	The Panel recommends that OSHA reconsider or simplify recordkeeping of temperature monitoring and not require documentation of rest breaks unless the agency can show that such a requirement is necessary or appropriate to protect workers. The Panel also recommends that OSHA reconsider other potential recordkeeping to determine if those are necessary or appropriate and whether they positively impact worker safety and health.	OSHA is proposing requirements in this section, based in part on feedback, which will allow more flexibility for workplaces. Employers of only indoor workplaces will be required to create written or electronic records of on-site temperature measurements and retain these records for a minimum of six months. Employers have flexibility on how they can comply with the recordkeeping requirement by using monitoring devices with sufficient storage capability, or employers could comply by creating and maintaining written records based on monitoring devices that do not have digital recording capabilities. OSHA has determined that this provision would have a positive impact on worker safety and health by assisting OSHA in determining conditions at the worksite, and aiding employers to identify trends in indoor temperatures and their effect on employee health and safety. In part based on feedback, OSHA is not requiring documentation of rest breaks.

TABLE VIII.F.7—OSHA'S RESPONSES TO THE SBAR PANEL RECOMMENDATIONS—Continued

Number	Finding	Recommendation	OSHA's response
4	SERs raised concerns about recordkeeping of heat related injuries and illnesses requiring only first aid. Other SERs asked why OSHA is considering requiring records of first-aid-only injuries and illnesses that are heat-related while not requiring records of first-aid-only injuries and illnesses that are not heat-related. Some SERs stated it was unclear what first aid means regarding heat illness with one SER wondering whether asking workers to take a break and hydrate because they appear to be hot would need to be captured as a first-aid incident.	The Panel recommends that OSHA not include a requirement for recording first-aid-only heat-related illnesses or injuries unless the agency can demonstrate some particular circumstances where such a requirement is necessary or appropriate to protect workers when such records are not required under OSHA's general injury and illness recordkeeping regulation.	OSHA is not proposing to require additional injury and illness reporting beyond what is required by the existing Recordkeeping standard (29 CFR 1904.7). The only proposed recordkeeping requirement applies to monitoring data collected for indoor work areas.
5	Many SERs reported already monitoring the temperature at their facility or job sites. SERs relied on various heat assessment methods including the OSHA/NIOSH Heat Safety Tool App, local weather forecasts, the National Weather Service's online calculator or measuring temperature with standard thermometers, heat index monitors, or wet bulb globe thermometers. Some SERs thought terms like "wet/dry bulb temperature" and "heat index" would be confusing while other SERs thought that measurements with a WBGT was complicated and may be difficult for some employers to use. SERs told the Panel about some difficulties they have with measuring temperature at their locations. SERs with indoor worksites said that the temperature can vary across different parts of their facility. SERs with workers who are mobile and work at many different locations or elevations throughout the day said that temperature monitoring was a challenge for them because of various complicating factors.	The Panel recommends that OSHA allow flexibility in monitoring methods and not mandate a single method that employers must use to measure heat in their workplace or on their worksite. The Panel also recommends that OSHA clarify how and when temperature monitoring must occur for all employers but especially for those with indoor settings and those with mobile workforces.	The agency has drafted a proposed standard that would provide flexibility to employers in both what heat metric they can use and how they are required to monitor the worksite (including allowing outdoor employers to use the forecast instead of on-site monitoring). OSHA provides guidance on how and when monitoring must occur.
6	The majority of the SERs said that they allowed their employees to take rest breaks when they needed to, but many objected to OSHA including a specific frequency or duration of breaks in a rule. Some SERs said that shorter, more frequent breaks might be ideal sometimes, while others said that the intensity of the job or other personal, physiological characteristics may make more frequent breaks necessary. Some SERs thought that giving 15-minute breaks every two hours would be unworkable in their situation. SERs in construction and manufacturing reported that there were times that work could not simply stop while workers took breaks (e.g., while pouring concrete, during certain industrial processes). In these cases, SERs reported that they rotated workers between more and less strenuous tasks. SERs with workers who wear complex PPE (e.g., construction, tree care, electric power) reported that their employees sometimes prefer to finish their work rather than stop for a break which would require removing and redonning their PPE. SERs whose employees worked at heights (e.g., roofing, telecommunications towers) expressed concern that these employees could be put in more danger if they were required to climb down from their working position for a break and back up afterwards. These SERs wondered if breaks needed to occur in a certain location like a shaded area on the ground or in an air-conditioned vehicle. A number of other SERs similarly wondered whether they had to provide air-conditioned break areas and require their employees take rest breaks in those areas. Some SERs said that their workers preferred to take breaks in non-air-conditioned spaces like shaded outdoor areas. A few SERs wondered whether other activities including things like downtime while waiting for materials to be delivered, toolbox talks or job briefings, engaging in non-strenuous work tasks, or driving between jobs could be considered breaks.	The Panel recommends that OSHA consider allowing employers some flexibility, to the extent feasible within the constraints of the OSH Act, in the frequency of any rest breaks required in a rule. The Panel also recommends that OSHA clarify where workers can take breaks and provide the maximum flexibility possible to employers to determine what works best for their employees and situation. The Panel further recommends that OSHA clarify what, if any, activities employees can engage in during rest breaks.	The proposed standard only requires rest breaks at the initial heat trigger when they are needed to prevent overheating. Under the high heat trigger, a minimum of a 15-minute paid rest break would be required every two hours because of increased risk of HRI at and above the high heat trigger, but some flexibility is provided by allowing a meal break to count as a rest break. Proposed provisions under the initial heat trigger specify the requirements for indoor and outdoor break areas and provide flexibility by allowing employers to choose from different options of cooling methods in the break area (e.g., shade OR air conditioning for outdoor break areas; air conditioning OR increased air movement and, if appropriate, de-humidification for indoor break areas). The summary and explanation for rest breaks under the high heat triggers clarifies that no work activities would be allowed during rest breaks.

7
SERs universally reported supplying drinking water to their employees generally with reusable bottles and water coolers, single use water bottles, or plumbed fountains or faucets. While SERs acknowledged the necessity of supplying drinking water, some objected to some of the specified potential requirements in the regulatory framework. One SER felt that the amount of water specified as required was too much. Some SERs thought that the phrase "suitably cool" was vague and did not take into account employee preferences for their water temperature.

8
Many SERs objected to OSHA's option in the regulatory framework for gradual acclimatization to heat, requiring employees to gradually ramp up their exposure to heat over the course of a few days. Several SERs said that if they force employees to work fewer hours due to acclimatization requirements, these workers might just quit and look elsewhere for work. Other SERs reported that they must pay their union laborers for a minimum of four hours regardless of whether they worked that full time meaning that the SERs would be paying for time not worked during the acclimatization period. Other SERs said it would not be possible to move workers to light duty jobs during the acclimatization period either because they did not have enough of that type of work or because light duty tasks were not available at their workplaces. Some SERs thought that strictly prescribed acclimatization requirements were unnecessary because new workers they hired were either from the area and used to the weather, were coming from jobs where they performed similar tasks in similar conditions, or only those who were fit and able to work in hot weather would "self-select" into the types of jobs they offered. Many SERs reported having some form of enhanced supervision or "buddy system" for workers who were acclimatizing to the hot working conditions. Some said that new workers worked alongside supervisors during their first weeks on the job which allowed for supervision of their heat tolerance. Others said that the training process where new employees are learning and working up to doing the jobs fully and on their own serves as an acclimatization process.

9
SERs raised a number of concerns about applying a heat standard to workers who work alone and workers who move between job locations throughout the day. SERs mentioned that they were not sure how they would have to monitor the temperature when workers were working at multiple locations since employees could cover a large range with varying climate conditions throughout their workday. One SER said it was not clear what areas need to be routinely monitored if the work site is not fixed while others were concerned that tracking the temperature forecasts and relevant heat triggers for the worksite that each worker or crew is visiting that day would be difficult. SERs said that such tracking becomes a greater challenge if each worker or crew visits multiple worksites within a day. SERs were also concerned that it would be difficult to monitor workers who work alone. SERs mentioned that it would be difficult to ensure that employees are taking required breaks with one SER saying that they believed this would become more difficult if mandated rest break durations depend on whether the temperatures were at or above the initial heat trigger or high heat trigger. Other SERs mentioned the difficulty of monitoring employees for signs and symptoms of heat injury and illness when employees are working alone. While some had equipment that monitored an employee's movement and reported to the employer if that movement stopped or procedures for regular check-ins via phone or tablet applications, other SERs said that they would not be able to implement a buddy system or close supervision of employees given the work arrangements.

OSHA is including the term "suitably cool" in the proposed standard to provide flexibility to employers and maintain consistency with the field sanitation standard (29 CFR 1928.110), which has incorporated a "suitably cool" requirement since it was promulgated in 1987. The phrase is also used in California's heat standard for outdoor workplaces (Cal. Code Regs. tit. 8, section 3395). As discussed in Risk Reduction, Section V.C., the temperature of drinking water impacts hydration levels, as cool or cold water has been found to be more palatable than warm water, thus leading to higher consumption of cool water and decreased risk of dehydration. Additional evidence highlighted in Section V.C., Risk Reduction, shows that cool fluid ingestion has beneficial effects for reducing heat strain. OSHA provides additional guidance on what it considers "suitably cool" in the Explanation of Proposed Requirements section of the proposed provision. OSHA is specifying the amount of water that employers need to provide to employees, not an amount that employees need to drink. OSHA provides guidance for how employers can comply with the provision of 1 quart of cool water every hour.

OSHA preliminarily finds that acclimatization is an effective preventative measure for preventing HRI and fatalities in unacclimatized workers. The proposed standard provides options for how to protect unacclimatized workers. The proposed standard provides a gradual exposure option as well as an option for employers to implement the requirements at the high heat trigger during an employee's first week of work. OSHA requests further comment on the proposed acclimatization provision and on a number of topics relating to acclimatization, including acclimatization during heat waves, acclimatization following illness, requests for examples of existing acclimatization programs and the clarity of the explanation of "similar heat conditions."

OSHA is proposing to establish heat triggers using a measurement of the Heat Index which is more readily available through local forecast data or heat monitoring apps. As discussed in this preamble, employers do not need to monitor all work locations continuously and are only required to verify whether the temperature exceeds the triggers in order to implement the applicable protective measures. OSHA recognizes that employees working alone can be at a greater risk for HRI due to the lack of immediate assistance or interventions. Therefore, OSHA has proposed that the employer maintain a form of two-way communication and regularly communicate with employees. When the high heat trigger is met or exceeded, the proposed standard would further require employers to stay in contact at least every two hours with employees working alone. Requirements for safety and health procedures when employees are working alone are not unique to this rule. OSHA believes that the employer responsibilities outlined under the proposal are necessary to ensure the safety of workers.

The Panel recommends that OSHA consider eliminating or better defining the term "suitably cool" to provide clarity and take employee needs and preferences into account. The Panel also recommends that OSHA provide clarity on methods for complying with any potential requirements related to the provision of water and allow for flexibility, when appropriate, in the amount of water required to be provided.

The Panel recommends that OSHA provide multiple options for acclimatization in the rule to allow employers flexibility in determining the best method for acclimatizing their workers.

The Panel recommends that OSHA address the unique situations of employers whose employees work alone and/or travel to many worksites each day and offer flexibility to these employers and clarify the employer's responsibilities for employees in these circumstances.

TABLE VIII.F.7—OSHA'S RESPONSES TO THE SBAR PANEL RECOMMENDATIONS—Continued

Number	Finding	Recommendation	OSHA's response
10	Almost all SERs agreed that training is one of the most important steps an employer can take to prevent heat injury and illness in their workers. SERs mentioned that they already provide some form of training on heat injury and illness prevention including recognition of signs and symptoms and how to respond and other topics including the importance of staying hydrated (electrolytes or water); working at a comfortable pace; contacting a supervisor to get an extra break or water; accessing and locations of cool down areas; sleeping well and being well rested; acclimatizing; and medical treatment of heat-related illnesses and injury. Training was reported to be provided in both formal and informal settings including regular training classes and tailgate or toolbox talks. Several SERs felt that a heat standard be centered around training; one SER thought that a heat standard should mandate training while questioning the necessity and usefulness of other potential requirements. SERs reported a mix of informal and formal heat injury and illness prevention programs. Some said that they do not have a program that is in written form; while others said they have a written program that is relatively short in length (i.e., in bullet points). SERs were largely supportive of the idea of a written program or plan. SERs said that they believe a written plan could be beneficial and one SER said that their heat plan reduced the number of first-aid and more serious safety incidents, reduced workers' compensation costs, and maybe improved absenteeism. SERs said that employers should have flexibility to develop and implement such plans. Some SERs supported the potential exemption in the regulatory framework for very small employers (e.g., those with 10 or fewer employees) from the requirement for the plan to be in writing; one SER stated that requiring a written plan would place significant burden on these employers. Most SERs agreed that, if the standard required updates of a written plan, that requirement should be for annual reviews and updates. One SER commented that they believed option to review and update "whenever necessary to ensure ongoing effectiveness" or "whenever a heat-related illness or injury occurs" were vague and/or unclear.	The Panel recommends that OSHA include a robust training provision in a heat standard. The Panel also recommends that OSHA continue to provide support for employer training efforts by providing training materials, sample curriculum, videos, and/or other methods.	OSHA preliminarily finds that it is necessary to train employees so they can recognize heat-related hazards and understand the appropriate steps they can take to minimize potential health effects in themselves and coworkers. Training on the employer's policies and procedures to address heat hazards would be an essential part of this proposed standard because it would help to ensure that employees understand heat hazards, the workplace-specific control measures that would be implemented to address the hazard, and the requirements of the proposed standard. OSHA has provided guidance on how employers can comply with the training provision and expects to provide sample training materials and other compliance assistance products to assist employers in implementing the requirements of the proposed standard if promulgated.
11	SERs reported a mix of informal and formal heat injury and illness prevention programs. Some said that they do not have a program that is in written form; while others said they have a written program that is relatively short in length (i.e., in bullet points). SERs were largely supportive of the idea of a written program or plan. SERs said that they believe a written plan could be beneficial and one SER said that their heat plan reduced the number of first-aid and more serious safety incidents, reduced workers' compensation costs, and maybe improved absenteeism. SERs said that employers should have flexibility to develop and implement such plans. Some SERs supported the potential exemption in the regulatory framework for very small employers (e.g., those with 10 or fewer employees) from the requirement for the plan to be in writing; one SER stated that requiring a written plan would place significant burden on these employers. Most SERs agreed that, if the standard required updates of a written plan, that requirement should be for annual reviews and updates. One SER commented that they believed option to review and update "whenever necessary to ensure ongoing effectiveness" or "whenever a heat-related illness or injury occurs" were vague and/or unclear.	The Panel recommends that OSHA include a requirement for a written heat injury and illness prevention program that allows employers the flexibility to tailor their plans to their specific industry, location, and activities. The Panel also recommends that OSHA consider an exemption for very small employers from the requirement for the plan to be in writing. The Panel further determines that it is appropriate to do otherwise, review and update of the plan be required annually and if updates are required in additional situations that those situations be clearly delineated to reduce confusion and ambiguity.	OSHA is proposing a requirement for a heat injury and illness prevention plan (HIPLP) as a provision of the standard. The proposed HIPLP requirement allows employers the flexibility to tailor their plans to their specific industry location and work activities. OSHA understands that a HIPLP must be adaptable to the physical characteristics of the work site and the job tasks performed by employees, as well as the hazards identified by the employer when designing their HIPLP. To increase flexibility, in cases where employers have multiple work sites that are substantially similar, the HIPLP may be developed by work site type rather than by individual work sites so long as any site-specific information is included in the plan (e.g., phone numbers and addresses). The proposed HIPLP requirement is consistent with the SBAR Panel's recommendation and requires that only employers with more than 10 employees need to have a written plan. For employers with 10 or fewer employees, the agency does not believe that there is a high likelihood of misunderstanding when employers communicate their HIPLPs to employees verbally. Employers with existing plans would be required to modify and/or update their current HIPLP plans to incorporate any missing required elements and provide training on these new updates or modifications to all employees. Furthermore, to delineate requirements surrounding HIPLP reviews and updates more clearly, OSHA is proposing to require the employer to review and evaluate the effectiveness of the HIPLP whenever a heat-related injury or illness occurs that results in death, days away from work, medical treatment beyond first aid, or loss of consciousness, but at least annually. Following each review, the employer would be required to update the HIPLP as necessary. OSHA preliminarily finds that a heat-related injury that results in death, days away from work, medical treatment beyond first aid or loss of consciousness warrants an evaluation of the HIPLP because it could potentially indicate a deficiency of the HIPLP. OSHA provides more information in Section VII.C., Explanation of Proposed Requirements, of the HIPLP requirement. All time and cost estimates provided in the SER background document were reviewed and revised for the NPRM where appropriate with consideration for SERs feedback and experience. As a result, travel time (time spent going to and from the break area) is added to the rest break costs. OSHA is not proposing additional requirements for recordkeeping for heat-related illnesses or injuries in the proposed standard, so it no longer requires a cost estimate. For some estimates, OSHA's review determined that the estimates in the SER background document were appropriate (e.g., outdoor monitoring costs). In other cases, OSHA determined that the estimates in the SER background document overestimated costs or did not account for overlap between provisions and therefore reduces the estimates (e.g., indoor hazard assessment).
12	SERs disagreed with some specific time and cost estimates that were provided in the SER background document. SERs thought that OSHA's estimates for the amount of time it would take to develop the written plan and to conduct the hazard analysis were both too low as were the estimates related to monitoring of employees, measuring or calculating the heat index or temperature, and recording heat-related illnesses or injuries. One SER said that OSHA's estimate of breaks was too low because it only counted the break time but did not account for the time spent going to and from the break area.	The Panel recommends that OSHA review time and cost estimates in the economic analysis and revise where appropriate to take the experience and feedback of the SERs into account.	

13	Most SERs with indoor settings reported using some form of ventilation and air movement to cool their facilities. However, many of these SERs said it would be infeasible to lower the temperature using air-conditioning because their buildings were too large to do this effectively. A few SERs said they are limited in where they can place fans due to work processes or risk of contamination of materials or the air. Some SERs also said that they could not use some of the engineering controls discussed in the background documents such as misting fans (which could introduce slipping hazards or damage materials) or portable shelters (which cannot be used on work surfaces such as roofs). Other SERs discussed the difficulties of implementing engineering controls in buildings they do not own or when working on in-progress construction projects. SERs also questioned whether some administrative controls suggested in the background materials would work for their setting. While some SERs said they adjusted work start and stop times to avoid working during the hottest part of the day, some SERs said they were unable to do so, for example, because they could not work too early in residential areas or because employees preferred a later start time. Some SERs said they used text messages or other electronic communications to remind employees of or alert them to heat hazards. Some SERs whose employees spend a significant part of their day driving worried that sending their employees electronic notifications would distract them and put them at risk of motor vehicle accidents. Many SERs were, however, supportive of the idea of monitoring employees for signs and symptoms of heat illness and injury. Some SERs reported that they utilized a "buddy system" where employees monitored each other, or supervisors monitored employees, for signs and symptoms of heat illness or injury. Some SERs said they have found this practice very useful in reducing illnesses and injuries related to heat. Some SERs reported that they use technology like electronic monitors or check-ins via cell phone or tablet although SERs whose employees are mobile reported that that can be difficult if the employee is in a location with limited cell service. SERs suggested that biometric monitors or self-monitoring of urine color to determine hydration levels could be useful as well.	The Panel recommends that OSHA offer as much flexibility as possible to allow employers to implement engineering and administrative controls that are feasible and appropriate for their workplace and activities.	OSHA has drafted the rule to allow maximum flexibility in implementing engineering controls while still protecting workers. The agency has attempted to minimize feasibility issues by providing employers with multiple engineering control options for compliance, allowing them to select the controls that can be most effectively implemented. OSHA believes that the proposed control options are important and needed to adequately protect workers from HRTs as discussed in the <i>Explanation of Proposed Requirements</i>.

G. Distributional Analysis

I. Impact of Heat on Underserved Populations

Executive Order 13985, “Advancing Racial Equity and Support for Underserved Communities through the Federal Government,” directs Federal agencies to conduct an equity assessment on a subset of the agencies’ programs and policies. OSHA has chosen to include an equity assessment regarding the proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings and the potential impact on economically or historically underserved populations. The purpose of an equity assessment is to analyze the distribution of regulatory impacts across individuals, households, and businesses/industries, with particular attention to economically or historically underserved or vulnerable groups. This assessment, which is entirely separate from OSHA’s legal findings and rationale supporting the proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings, concludes that the proposed standard would have a positive impact on underserved populations (e.g., low-income and Hispanic workers) by providing workplace protections from extreme temperatures that have a disproportionate impact on occupations held by individuals from underserved communities.

A. Heat Exposure of Workers by Socioeconomic Status

Extreme temperatures affect the entire economy and pose a significant risk to individuals employed in workplaces (see Section II.B., Need for Proposal and Section II.C., Events Leading to the Proposal). This threat is unevenly distributed across demographic and socioeconomic groups, exacerbating inequalities. Individuals from underserved populations are more likely to work in occupations with heat-related risks (Ndugga et al., 2023). Evidence from the American Community Survey covering 2018–2022 (Ruggles et al., 2024) suggests that workers from historically underserved groups in core industries (see Section VIII.B.II.A., Potentially Affected Industries) have greater exposure to occupational heat-

related hazards, with more severe outcomes that impact their ability to work. That includes, for example, exposure to high outdoor temperatures, radiant heat sources, or insufficient temperature control or ventilation in indoor work settings. The methodology to estimate exposure by demographic group is outlined in detail in appendix C.

Figure VIII.G.1 shows that workers from low-income households are disproportionately exposed to heat-related hazards in (1) indoor work settings that emit heat during the production process, (2) indoor work settings that have inadequate climate control, or (3) outdoor work settings (see exposure definitions in Section VIII.B., Profile of Affected Industries). This is non-trivial as occupational injuries and illnesses cost the average worker \$35,000 with wide-reaching health impacts including the threat of death (Leigh, 2011; Ndugga and Artiga, 2023; Park et al., 2021).¹⁰⁴ Thus, workers from low-income households who are often challenged with affording in-home air conditioning (Mann and Schuetz, 2022) face a concurrent burden: threat of costly workplace heat hazards.

Workers from low-income households are most vulnerable to occupational heat exposure across all phases of their careers. For example, workers aged 16 to 64 from households in the lowest income deciles face elevated indoor and outdoor exposure to heat-hazards (see Figure VIII.G.2.). The highest levels of exposure occur among workers aged 35–54 earning less than \$60,000 (approximately 15 percent in indoor and outdoor workplaces). This high level of exposure occurs during these workers’ peak earning years, posing a threat to not only health but also lifetime earnings which can facilitate socioeconomic mobility (see Figure VIII.G.2., Panels B and C).

Figures VIII.G.3. and VIII.G.4. show that there is variation in exposure

¹⁰⁴ Note that this estimated cost to workers is different from the Value of a Statistical Injury (VSI) used to estimate benefits in Section VIII.E., Benefits. The VSI is an estimate of individuals’ desire to avoid an illness or injury and calculates the willingness to pay to avoid said illness or injury. The \$35,000 quoted reflects the average social cost of a workplace injury reported to workers compensation in 2021\$.

among low-income workers by sex, ethnicity, and race. While low-income individuals from some underserved backgrounds have heat hazard exposure levels exceeding 10 percent of the worker population (e.g. workers identifying as female, Black, multi-racial), male and Hispanic workers have the highest level of exposure to workplace heat hazards. Men earning less than \$60,000 are nearly twice as likely to be exposed to workplace heat-related hazards than women, peaking at 17 percent for men working in non-climate controlled indoor settings and 19 percent for men working in outdoor settings.¹⁰⁵ Similarly, respective exposure to workplace heat hazards ranges from 16 percent to 19 percent in non-climate controlled indoor and outdoor settings among low-income Hispanic workers.

Despite evidence of elevated exposure along the socioeconomic gradient, research finds that many of the most vulnerable workers have minimal to no workplace protections to manage occupational heat stress (Morrissey-Basler et al., 2024; Luque et al., 2019; Flocks et al., 2013). Although workers are aware of the health consequences of exposure to occupational heat stress, they report a feeling of lack of control over the condition of their work setting (Flocks et al., 2013). In the absence of formal workplace protections, some vulnerable workers assume responsibility for and implement heat stress management practices to preserve their well-being rather than view the employer as the arbitrator for protection against occupational heat hazards (Luque et al., 2019). Some of these worker-initiated heat stress prevention strategies may not be grounded in evidence-based science. Lack of employer safeguards against elevated temperature can, in turn, reinforce disparities in occupational heat exposure that leave the most vulnerable workers overexposed to preventable heat-induced injuries, illnesses, and fatalities.

BILLING CODE 4510–26–P

¹⁰⁵ For context, in 2022, the median annual earnings of men in the United States was \$62,350 (Ruggles et al., 2024).

BILLING CODE 4510-26-C

B. Productivity and Health Effects

The figures above show the fraction of workers who are exposed to workplace

heat-related hazards and therefore likely to be covered by the proposed standard. Under an assumption that benefits of the standard correspond 1-for-1 to

coverage, this fraction can be translated into the fraction of workers benefiting from the standard. In other words, translating the results from the figures

into benefits from the standard in terms of increased productivity, improved health, or other outcomes makes the assumption that all work-related exposure to heat is explained by industry and occupation. This assumption could over- or under-state the exposure to heat on the job that workers face. As a recent study of heat and occupational injuries discusses (Park et al., 2021), if there are compensating differentials for the risk associated with heat exposure, then workers exposed to the risk would be paid higher wages. This could be the case even within industry and occupation categories. Alternatively, if workers and employers negotiate over total compensation from income and amenities, then a worker could receive both lower wages and higher heat exposure (a workplace disamenity) due to imperfectly competitive labor markets¹⁰⁶ (Burdett and Mortensen, 1998; Sorkin, 2018).

Existing studies on workplace-related heat exposure do not currently say which of these two possibilities holds within industry and occupation groups. A recent review summarizes research on the effect of temperature on labor productivity (Lai et al., 2023). The focus of the literature has been on educational outcomes, cross-country comparisons, or cross-industry effects. Recent work on intensive-margin labor supply (i.e., hours worked) and heat exposure in the U.S. shows that whether or not the industry of workers is controlled for in the statistical model does not largely change the estimated effect of heat exposure on time spent working (Neidell et al., 2021). This result indicates that industry-level differences in exposure to heat do not fully capture the effect of heat on labor supply. The study does not control for occupation group, so exposure within versus across occupations cannot be parsed.

An analysis of workplace injuries and heat exposure in California examines the distribution of heat-related occupational injuries (Park et al., 2021). The analysis is done using California

Department of Workers' Compensation data, and the injuries are geocoded at the zip code of the worksite. In an analysis that controls for zip code-by-month and county-by-month-by-year fixed effects (as well as precipitation), the authors find that for the average worker, injuries go up on days with temperature above 90 °F. The increase in injuries is 36 percent larger for workers in the lowest income quintile compared to workers in the highest income quintile.¹⁰⁷ The analysis also examines effects by worker age and sex. It finds that workers younger than 30 years of age are 3 times more likely to experience a workplace injury on a day about 90 °F compared to a worker older than 60.¹⁰⁸ Male workers are 2.3 times more likely to experience injury compared to female workers.¹⁰⁹

If the controls in the statistical model substantially account for differences in heat exposure due to industry and occupation (for instance, because industries and occupations are segmented across zip codes), then the effect would suggest that the distribution of exposure percentages could be a lower bound on the distribution of realized benefits from the proposed standard stemming from reduced workplace injuries. Further analysis that explicitly accounts for industry and occupation-based exposure to heat would be useful to determining the extent to which workers within industry and occupation groups are differentially affected by heat-related occupational injuries.

II. Averted Injuries, Illnesses, and Fatalities by Socioeconomic Status

Table VIII.G.1. shows the estimated number of workplace heat-related injuries and illnesses (HRI) as well as heat-related fatalities averted by the proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings.¹¹⁰ Table VIII.G.1., columns 1 and 3, present the pre-standard estimate of HRI and heat-

related fatalities. HRI and heat-related fatalities are concentrated among workers who are low-income, in peak earning years (aged 35–54), male, or Hispanic. These vulnerable populations averaged 1,066 HRI and 7 heat-related fatalities each year.

The Agency provides an example of the downstream impact of these consequential health events on firm costs in table VIII.G.2. The estimated cost to the employer of an HRI, such as heat prostration (or exhaustion), is \$79,081 assuming a 3 percent profit margin.^{111 112} Thus populations with more HRI elevate firm cost (see table VIII.G.2., column 2). The extent to which the employer bears the full costs depends on the nature of their workers' compensation insurance policy. Nonetheless, the demographically disaggregated cost of projected HRI suggests that concentrated efforts to reduce events among the most vulnerable populations can serve as a meaningful mechanism to reduce firm cost.

The Agency estimates that the proposed standard will reduce HRI and heat-related fatalities among exposed workers by 65 and 95 percent, respectively (for more discussion, see Section VIII.E., Benefits). Table VIII.G.1., columns 2 and 4, present the projected average number of HRI and heat-related fatalities averted by demographic group. The largest benefits are accrued to populations with heightened exposure: low-income, in peak earning years (aged 35–54), male, and Hispanic workers. This, in the case of heat prostration (or exhaustion), translates into an approximate 34 percent reduction in total firm costs among the respective demographic groups with heightened exposure (see table VIII.G.2., column 5).

¹¹¹ Total costs include a direct cost of \$37,658 and indirect costs of \$41,423.

¹¹² The estimate is derived using OSHA's Safety Pays Program's "Estimated Costs of Occupational Injuries and Illnesses and Estimated Impact on Company's Profitability Worksheet" <https://www.osha.gov/safetypays/estimator>. The tool projects and estimates of how injuries and illnesses may impact company's profitability. The above example assumes a 3 percent profit margin for heat prostration (or exhaustion) that cost \$79,081 (i.e., includes a direct cost of \$37,658 and indirect costs of \$41,423).

¹⁰⁶ The existence of jobs with different working conditions, in conjunction with variation in worker preferences, could in effect be the source of firms' power in the labor market that allows them to lower wages in the first place (Card et al., 2018).

¹⁰⁷ The point estimate for workers in the lowest quintile indicates a 0.0735 increase in injuries per day above 90 °F for the lowest quintile and a 0.0541 increase for workers in the highest quintile.

¹⁰⁸ A point estimate of 0.0773 versus 0.0257.

¹⁰⁹ A point estimate of 0.0837 versus 0.0359.

¹¹⁰ The methodology to derive exposure is detailed in appendix C.

Source: OSHA calculations using OSHA's Safety Pays Program's "Estimated Costs of Occupational Injuries and Illnesses and Estimated Impact on Company's Profitability Worksheet" <https://www.osha.gov/safetypays/estimator>.

Note: OSHA's Safety Pays tool projects how injuries and illnesses may impact company's profitability. The above example assumes a 3 percent profit margin for heat prostration (or exhaustion) that cost \$79,081 (i.e., includes a direct cost of \$37,658 and indirect costs of \$41,423). The extent to which the employer pays the direct costs depends on the nature of the employer's workers' compensation insurance policy. The employer always pays the indirect costs.

III. Which business owners are impacted by the proposed standard?

Figure VIII.G.5 shows, for owner-operated firms in industries affected by the proposed standard, ownership by demographic group in 2022. The analysis focuses on owner-operated firms because they are recorded in ACS data along with owner characteristics. As such, analysis of owner-operated firms cannot be generalized to the entire set of affected industries, but sheds light on an important subset of these affected industries.

In general, the distribution of costs (see Section VIII.C., Costs of Compliance) are expected to have differential effects on firms in industries with different characteristics. In a highly competitive product market with many competitor suppliers of nearly identical goods or services, there will be limited pass-through of regulatory costs assessed on only a subset of firms to consumers in the form of higher prices, as individual firms lack the market power to shift prices. If firms raised prices, consumers would simply shift consumption to other firms not burdened by similar costs (e.g., because they operate in temperate climate) that do not raise prices. Were firms earning almost zero profits prior to the imposition of these regulatory costs, it would be possible that these firms would shut down (and other producers would likely expand operations, as demand shifted to them). However, evidence on firm revenues in these industries indicates that firms will largely be able to bear these costs

without shutting down (see Section VIII.D., Economic Feasibility).

However, the assumption of perfectly competitive markets is not realized in the actual economy. To the extent that markets are less competitive, costs will be passed through in some combination to both consumers and firm owners, depending on the price elasticity of demand and the price elasticity of supply. In addition, frictions in the labor market will dictate how much of the costs are borne by workers, e.g., in the form of reduced pay or benefits. The difference in VSL for individuals who change and those that maintain the same job can inform estimates of the share of costs passed through to firm owners, workers, and consumers across industries in scope of this standard (see for example, Kniesner et al.'s 2012). Kniesner et al (2012) estimates a job switcher-derived VSL between \$6.1 million and \$10 million (in 2001 dollars) with a weighted average across job switchers and non-switchers is between \$4.4 million and \$5.5 million; the difference between these paired VSL estimates may approximate the average, over the first eight post-implementation years, of the portion of per-avoided-fatality benefits that accrues to workers without being offset by wage reductions. The benefits of the proposed standard could partially accrue in the form of increased productivity from workers less affected by heat. If firms are currently not offering the privately optimal level of workplace heat safety protection (e.g., due to principal-agent problems), these productivity gains could even theoretically exceed the

increased costs borne by the firm. The magnitude of this effect determines whether firms are net better-off or worse-off, given both costs and increased productivity, as a result of the proposed standard (see sections VIII.G.I., and VIII.G.II.).

The Census Bureau's 2022 American Business Survey (Census Bureau and National Center for Science and Engineering Statistics, 2023) covers economic and demographic characteristics for businesses and business owners by sex, ethnicity, race, and veteran status. Tables VIII.G.3. and VIII.G.4., derived from the survey, show that owners from historically underrepresented populations (e.g., women and racial minorities) tend to be less profitable and have heightened concerns about the financial viability of their business (see tables VIII.G.3. and VIII.G.4.). These firms command 30–45 percent of the market.¹¹³ Most owners were high-earning, non-Hispanic White males over the age of 34.

Taken together, this evidence suggests that the net benefits of the proposed standard for different groups (e.g., high-income and low-income populations) depend on how market competitiveness, elasticities of supply and demand, and the composition of groups affected by the standard's costs compare to the distribution of the standard's benefits for those groups (as discussed in sections VIII.G.I. and VIII.G.II.).

Note: Data are preliminary and will be revised when the final 2023 Annual Business Survey results are published. Firms were asked to report the percentage of ownership, sex, ethnicity, and race, for up to four persons owning the largest percentages in the business. A firm could be tabulated in more than one racial group for the following reasons: the sole owner was reported to be of more than one race; the majority owner was reported to be of more than one race; or a majority combination of owners was reported to be of more than one race. Firms classified as minority are those classified as any race and ethnicity combination other than non-Hispanic and White. For more information about the survey, visit <https://www.census.gov/programs-surveys/abs.html>. Unpublished estimates derived from this table by subtraction are subject to these same limitations and should not be attributed to the Census Bureau.

Table VIII.G.4. Business Profitability in 2022 By Sex, Race, Ethnicity, Minority Status and Veteran Status

	Business had profits, losses, or broke even			
	Percent of employer firms			
	Profits	Losses	Break even	Total
Total	65.6	19.6	14.8	100.0
Sex				
Female	63.2	21.3	15.5	100.0
Male	66.7	18.6	14.7	100.0
Equally male/female	65.1	20.1	14.8	100.0

IV. Conclusion

The proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings is well-positioned to protect the most at-risk workers, across the socioeconomic gradient. In response to the advance notice of proposed rulemaking (ANPRM) for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings, members of Congress emphasized that “jobs at the highest risk of heat stress illness and death are disproportionately held by workers of color” and occupational risk from heat is the “greatest for low-income workers” (OSHA–2021–0009–0266; 0270), a concern that was echoed by other commenters, including legal experts (see, e.g., OSHA–2021–0009–0524), employee representatives (see, e.g., OSHA–2021–0009–0661), and advocacy groups (see, e.g., OSHA–2021–0009–0655; 0712). Commenters also called for a heat standard that minimizes risks of “. . . compounding language, social service access, and wealth-building barriers” (OSHA–2021–0009–0522). The proposed standard reinforces occupational heat hazard protections for all workers through the adoption of agile and culturally attunable provisions. For example, the provisions:

- Requiring training on occupational heat-related risks and protections covered by this standard (e.g., rest breaks, water) to employees upon hire and each year can enhance knowledge of heat safe work practices, reducing risk of HRIs among less experienced or vulnerable workers;
- Requiring the provision of training in a language and literacy level appropriate for staff along with the opportunities for questions and answers ensures heat protections (e.g., paid rest breaks, cool drinking water) are understood and accessible to all; and
- Requiring an acclimatization protocol along with paid rest breaks that include adequate drinking water, shade (or air conditioning), and medical attention (if necessary) at initial and high heat triggers foster non-exploitive treatment of non-salaried vulnerable workers (e.g., farmworkers).

The provisions have economic effects extending beyond the direct benefits to workers in affected industries. Heat is the leading cause of weather-related deaths, estimated to cost the U.S. \$1 billion in excess health care costs each year with a projection to potentially reach \$14.5 trillion in economic damages via factors impacting the economic production over the next fifty years (Woolf et al., 2023; Deloitte, 2022). The standard is projected to reduce

occupational heat-induced deaths which can offset the estimated health costs due to weather. The proposed standard is primed for responsiveness to workers of all levels of social vulnerability while counteracting the broader economic costs of extreme temperatures.

H. Appendix A. Description of the Cost Savings Approach

I. Introduction

This appendix details the underlying calculations of the potential cost savings from the proposed standard as a result of requiring employers to provide employees if-needed or scheduled rest breaks. The best available evidence indicates that when employees are exposed to heat and are not allowed to take rest breaks or adjust their work hours, they must pace themselves (i.e., work more slowly) to counteract the effects of heat exposure. OSHA has preliminarily determined that when employees are offered rest breaks, cost savings will accrue to employers currently noncompliant with the rest break requirement because employees will work more efficiently during the work time not spent on rest breaks (i.e., pace less), effectively replacing pacing with if-needed or scheduled rest breaks. First, for the three groups defined below, OSHA estimated the percentage of productivity loss at the initial heat trigger using the Heat Index (HI) option (i.e., (HI) at or above 80 °F) and above the high heat trigger (i.e., HI at or above 90 °F). These estimates were then translated to equivalent lost minutes of work time in an 8-hour work shift.

When working in hot conditions, OSHA assumes that employees can take three different measures to avoid overheating:

- (1) *Measure #1: Employees pace themselves*; for example, an employee shovels gravel at a slower pace in hot conditions than they would in cooler conditions.
- (2) *Measure #2: Employees take rest breaks if needed*; for example, an employee leans on their shovel for a few minutes at a time whenever they feel overwhelmed by the heat, which they otherwise would not do in cooler conditions.
- (3) *Measure #3: Employees take scheduled rest breaks*; for example, twice a day, for 15 minutes at a time, an employee sits in a cool or shaded area to drink water and recover from the heat.

Depending on what is allowed by their employers, employees can take multiple measures to avoid overheating (i.e., they are not mutually exclusive).

Three groups of employees were defined based on possible combinations of measures:

(1) *Group #1: Employees who only use pacing* (Measure #1). These employees do not take any rest breaks, possibly because their employer does not allow them to take breaks.

(2) *Group #2: Employees who take rest breaks if needed* (Measure #2) and use *pacing* (Measure #1). These employees are allowed to take brief, unscheduled breaks by their employer. However, these rest breaks may not be long or frequent enough to allow for a full recovery from the heat exposure (return to normal body temperature of 98.6°F (37°C)). Therefore, these employees still display residual pacing while they work.

(3) *Group #3: Employees who take scheduled rest breaks* (Measure #3), may take *rest breaks if needed* (Measure #2), and use *pacing* (Measure #1). These employees are allowed to take scheduled rest breaks, which may allow them to rehydrate and rest in a cool or shaded area, as well as rest breaks if needed. However, these rest breaks do not entirely eliminate productivity loss, as these employees also display residual pacing, though it is expected to be to a lesser extent than employees in Group #2.

II. Primary Approach

This section describes the method that OSHA used to estimate labor productivity losses that result from pacing due to heat exposure. First, the general approach is summarized, next the general assumptions of the analysis are outlined, and then the calculations are detailed for Groups 1, 2, and 3.

A. Summary of Approach

For the primary approach, OSHA searched for studies that examined how working in hot vs. cool conditions affect employee productivity. Eastern Research Group (ERG) performed several literature searches (ERG, 2022a; ERG, 2022b; ERG, 2022c) and identified a total of 71 unique studies that could inform the relationship between heat and various outcomes (e.g., labor productivity, heat strain). OSHA also reviewed the reference lists of these studies and identified an additional 37 studies that were potentially relevant to this topic. This yielded a total of 108 studies considered for inclusion for the purposes of estimating the impact of rest breaks on labor productivity at the initial heat and high heat triggers. Generally, studies were excluded if they did not meet the inclusion criteria listed below (more detailed reasons for exclusion are listed in table VIII.H.A.3.).

- Measured labor productivity over a range of temperatures, so that a comparison could be made between a cool (REF) condition below the initial heat trigger (*i.e.*, HI at or above 80 °F), and a HOT condition(s) above the high heat trigger (*i.e.*, HI at or above 90 °F).

- Provided enough information on weather conditions so that HI could be estimated, even if based on historical weather data.

- Collected labor productivity data.
- Reported labor productivity as output per worker, per hour, or per day.
- Provided information as to whether breaks were offered, and if so, how long and frequent the breaks were.

Once studies were identified for inclusion, each included study was

evaluated for four key pieces of information:

(1) Which measure(s) employees took to avoid overheating (Measures #1, #2, and/or #3), allowing the assignment of employees to Groups #1, #2, or #3.

(2) Weather data that describe the cool condition, or the referent (REF) condition. This could be when the HI was lowest, or when output was highest (*i.e.*, 100% productivity). The HI was calculated based on the ambient or dry bulb temperature (T_a or T_d , respectively) and the relative humidity (RH).

(3) Weather data that describe the HOT condition(s). This could be when the HI was highest, or at which output was lowest (*i.e.*, 50% lower output means 50% productivity). Again, HI was calculated to ensure that the HOT

condition(s) exceeded both the initial and high heat triggers.

(4) Labor productivity at both the REF and HOT conditions, so that the loss in labor productivity (%) could be divided by the difference in HI (°F) and expressed as a rate of lost labor productivity per 1°F HI.

After calculating the rate of labor productivity loss per 1 °F HI, OSHA calculated the (cumulative) labor productivity loss as a percentage relative to the REF condition at the initial heat trigger (HI of 80 °F) and high heat trigger (HI of 90 °F). This labor productivity loss was then translated into equivalent minutes of lost work time by multiplying by an 8-hour work shift (480 minutes).

TABLE VIII.H.A.1—SUMMARY TABLE

Group	Study	HI at REF	HI at HOT	Productivity loss per 1 °F HI above REF (%)	Productivity loss at initial heat trigger	Productivity loss at high heat trigger
1	LoPalo, 2023	66.1 °F	105.2 °F	0.35	23.4 min (4.9%)	40.2 min (8.4%)
	Foster et al., 2021	76.8 °F	161.4 °F	0.73	11.3 min (2.4%)	46.4 min (9.7%)
	Hanna, 2004	79.2 °F	122.3 °F	0.86	3.3 min (0.7%)	44.5 min (9.3%)
	Somanathan et al., 2021	63.4–82 °F	90–105.8 °F	0.29	18.0 min (3.8%)	31.3 min (6.5%)
	Group Mean: 0.56%				14.0 min	40.6 min
2	Ioannou et al., 2017	72.1–75.6 °F	96.9–103.1 °F	0.73	22.3 min (4.6%)	57.4 min (12.0%)
	Sahu et al., 2013	85.5 °F	116.6 °F	1.00	0 min (0%)	21.6 min (4.2%)
	Group Mean: 0.865%				11.2 min	39.5 min
3	Dally et al., 2018	88.3 °F	102.6 °F	1.03	0 min (0%)	8.4 min (1.8%)
	Group Mean: 1.03%				0 min	8.4 min

B. General Assumptions

When estimating labor productivity loss in each study, OSHA made the following assumptions:

a. Unless otherwise specified, productivity at or below the REF condition is 100%.

b. Above the REF condition, the relationship between HI and labor productivity loss is linear, *i.e.*, the rate of loss (per 1 °F HI) is a constant. Therefore, the productivity loss function for any firm can be fully characterized by two parameters: the REF condition and the rate of loss.

c. Employees in Group 2 are allowed to take up to 10 minutes of rest breaks if needed (with 2–4 minutes of travel time to/from break areas).

d. Employees in Group 3 are allowed to take 30 minutes of scheduled rest breaks, along with 5 minutes of rest breaks if needed (with 2–4 minutes of travel time to/from break areas for each break).

e. An employee's expected productivity loss from pacing, given a specific temperature and the employer's rest break policy, can be estimated by the average productivity loss measured in studies where that rest break policy is in effect. In other words, the set of studies with each group fully characterizes the productivity loss that would be experienced by employees at a firm that offered the associated rest break policy, regardless of what rest break policy it currently offers.

f. An employee's expected productivity gains from taking new or newly scheduled rest breaks (versus not taking breaks or taking only if-needed breaks) can be estimated by differences in productivity losses due to pacing, as measured at the initial temperature (*i.e.*, trigger) at which the rest break policy goes into effect.¹¹⁴

¹¹⁴ All else equal, using the initial temperature (*i.e.*, trigger) rather than the temperature inputs used elsewhere in this PEA will yield underestimates of the effects reported in table VIII.H.A.1. When subsequently performing subtraction (for expressing productivity differences across Groups), there is ambiguity about the direction of misestimation—because the difference between two underestimated amounts may be over- or underestimated.

C. Productivity Loss Estimates by Group

I. Group 1 Studies

LoPalo (2023) assessed the effects of temperature on the productivity of 9,000 Demographic and Health Surveys interviewers in 46 countries. Interviewers were paid an hourly wage and were assumed to be acclimatized because they were “recruited within a region of a country as much as possible so that the interviewer [did] not seem foreign to the respondent” (p. 197). The author concluded that “high temperatures are detrimental to productivity, with interviewers experiencing a 13.6 percent loss in interviews per hour on days over 85 °F wet bulb” (pp. 208–209).

The author clarifies, “more specifically, I estimate the effect of daily average wet bulb temperature falling into a certain bin on my outcome variable of interest, relative to an excluded bin of 50–60 °F (50–60 °F wet bulb corresponds with a median dry bulb temperature of 66 °F in my sample)” (p. 205). Thus, a dry bulb temperature (T_d) of 66 °F was selected for the calculation of the heat index (HI) for the REF condition. Per Figure 1 (p. 203), in this sample, a T_d of 66 °F yields a wet bulb temperature of 55 °F when RH is 80%. Therefore, OSHA used 80% RH for the calculation of HI. A T_d of 66 °F and 80% RH yielded an HI of 66.1 °F for the REF condition.

The author created bins of both T_d and wet bulb temperature; the highest bin for T_d was ‘≤95 °F’. Therefore, a T_d of 95 °F was used to calculate the HI for the HOT condition. The author states, “the highest daily average wet bulb temperature in my sample is 87.7 °F, while the highest daily average dry bulb temperature is 102.6 °F” (p. 206). Per Figure 1 (p. 203), in this sample, a T_d of 102.6 °F yields a wet bulb temperature of 87.7 °F when RH is 50%. Therefore, OSHA used 50% RH for the calculation of HI. A T_d of 95 °F and 50% RH yielded an HI of 105.2 °F for the HOT condition.

Finally, the productivity loss from the REF condition to the HOT condition was estimated. In table 2. (p. 209), the author provides a regression estimate for each bin of dry bulb temperature to indicate its effect on the number of interviews completed per hour. The estimate in Column 2 (–0.135, or 13.5% loss) accounted for both T_d and high humidity and most closely matched the estimate in Column 4 for wet bulb temperature (–0.136, or 13.6% loss). Therefore, OSHA selected the estimate for T_d and high humidity, which yielded a rate of productivity loss of 0.35% per 1 °F HI.

Relative to the REF condition (66.1 °F HI), the productivity loss at the initial heat trigger (80 °F HI) is 4.87%. For an 8-hour work shift (480 minutes), this translates to a loss of 23.4 minutes.

Relative to the REF condition (66.1 °F HI), the productivity loss at the high heat trigger (90 °F HI) is 8.37%. For an 8-hour work shift (480 minutes), this translates to a loss of 40.2 minutes.

Foster et al. (2021) assessed the effects of temperature on physical work capacity (PWC) of 40 unacclimatized young adult males at 22 different combinations of air temperature (T_a) and relative humidity (RH). First, the authors measured maximal PWC (i.e., 100% productivity) at a T_a of 59 °F and RH of 50%. Then, the authors assessed PWC under various conditions, with T_a ranging from 77 °F to 122 °F and RH ranging from 20% to 80%.

To determine an appropriate REF condition, OSHA plotted the low-clothing coverage estimates from table 2. (p. 1222) and found a sigmoidal curve. That is, as T_a increased from 59 °F to 77 °F, the curve was nearly flat, indicating minimal productivity decline. Then, at a T_a of 77 °F (and 50% RH), productivity began to decline in a nearly perfect linear fashion ($R^2 = 0.99$). Therefore, the REF condition was selected as a T_a of 77 °F and RH of 50%. This combination yielded an HI of 76.8 °F for the REF condition.

The combination of temperature and humidity that corresponded the greatest productivity loss (66%) along the linear portion of the curve was a T_a of 104 °F and RH of 70%. This combination yielded an HI of 161.4 °F for the HOT condition.

The productivity loss from the REF condition to the HOT condition was estimated. In table 2. (p. 1222), the authors reported that at the REF condition (T_a 77 °F, RH 50%), PWC was 96%, and at the HOT condition (T_a 104 °F, RH 70%), PWC was 34%. This yielded a rate of productivity loss of 0.73% per 1 °F HI.

Relative to the REF condition (76.8 °F HI), the productivity loss at the initial heat trigger (80 °F HI) is 2.35%. For an 8-hour work shift (480 minutes), this translates to a loss of 11.3 minutes.

Relative to the REF condition (76.8 °F HI), the productivity loss at the high heat trigger (90 °F HI) is 9.67%. For an 8-hour work shift (480 minutes), this translates to a loss of 46.4 minutes.

Hanna (2004) assessed the effects of temperature on the productivity of two electrical journeymen in a climatic chamber at various combinations of T_a (ranging from –10 °F to 110 °F, in increments of 10 °F) and RH (ranging from 40% to 80%, in increments of 10%). The journeymen were assessed for their performance of a routine work task (installing duplex receptacles) over a total of 6 days of testing. The author stated that “for the purpose of this study, the average number of receptacles installed in one hour during the first day of work measurement at 70 °F and 60% RH is expressed as 100% productivity.”

However, per Chart 2–1 (p. 15), productivity clearly only began to decline at a T_a of 80 °F and RH of 30%. Therefore, the REF condition was selected as a T_a of 80 °F and RH of 30%. This combination yielded an HI of 79.2 °F for the REF condition.

$$\frac{(96 - 34)\%}{|76.8 - 161.4|^\circ\text{F}} = 0.73\% \text{ per } 1^\circ\text{F HI}$$

$$\frac{0.73\%}{1^\circ\text{F HI}} * (80 - 76.8)^\circ\text{F HI} = 2.35\% \quad 2.35\% * 480 \text{ minutes} = 11.3 \text{ minutes}$$

$$\frac{0.73\%}{1^\circ\text{F HI}} * (90 - 76.8)^\circ\text{F HI} = 9.67\% \quad 9.67\% * 480 \text{ minutes} = 46.4 \text{ minutes}$$

According to table 2.3. (p. 11), the combination of temperature and humidity that corresponded the greatest productivity loss (38%) was a T_a of 110 °F and RH of 30%. This combination

yielded an HI of 122.3 °F for the HOT condition.

The productivity loss from the REF condition to the HOT condition was estimated. In table 2.3. (p. 11), the authors reported that at the REF

condition (T_a 80 °F, RH 30%), productivity was 99%, and at the HOT condition (T_a 110 °F, RH 30%), productivity was 62%. This yielded a rate of productivity loss of 0.86% per 1 °F HI.

$$\frac{(99 - 62)\%}{|79.2 - 122.3|^\circ\text{F}} = 0.86\% \text{ per } 1^\circ\text{F HI}$$

Relative to the REF condition (79.2 °F HI), the productivity loss at the initial heat trigger (80 °F HI) is 0.69%. For an

8-hour work shift (480 minutes), this translates to a loss of 3.3 minutes.

$$\frac{0.86\%}{1^\circ\text{F HI}} * (80 - 79.2)^\circ\text{F HI} = 0.69\%$$

$$0.69\% * 480 \text{ minutes} = 3.3 \text{ minutes}$$

Relative to the REF condition (79.2 °F HI), the productivity loss at the high heat trigger (90 °F HI) is 9.27%. For an

8-hour work shift (480 minutes), this translates to a loss of 44.5 minutes.

$$\frac{0.86\%}{1^\circ\text{F HI}} * (90 - 79.2)^\circ\text{F HI} = 9.27\%$$

$$9.27\% * 480 \text{ minutes} = 44.5 \text{ minutes}$$

Somanathan et al. (2021) assessed the productivity of indoor workers in cloth-weaving, garment-sewing, and steel mill industries in India. OSHA only analyzed garment-sewing workers, who were “paid monthly wages” (p. 1803), and their productivity was assessed as “actual hourly output, when controlled for the target [output]” from “103 sewing lines over a period of 730 days during the calendar years of 2012 and 2013” (p. 1804). OSHA excluded

workers from the cloth weaving industry because productivity was not reported for the full range of temperatures (Figure 1C, p. 1808). OSHA also excluded certain garment plants and the steel mill, as these facilities were climate-controlled (p. 1806), and workers experienced limited variations in temperature.

The authors reported productivity as a function of daily maximum temperature (T_a) in Figure 1 (p. 1808).

Temperature data came from “recordings from public weather stations within the cities where . . . garment-sewing factories are located” (p. 1806), *i.e.*, the National Capital Region (NCR), Hyderabad, and Chhindwara. The authors created temperature bins for each industry, as well as the equivalent bins based on wet-bulb temperature (WBT), which accounts for both T_a and RH (appendix, p. 3).

	Garment-sewing (inside NCR)		Garment-sewing (outside NCR)	
	Temperature bin	Equivalent WBT bin	Temperature bin	Equivalent WBT bin
REF	<19 °C	<15 °C	<27 °C	<23 °C.
HOT	>33 °C	>25.5 °C	>33 °C	>29 °C.
Max	>35 °C	>27 °C	>35 °C	>31 °C.

To calculate the HI for the REF condition in the garment-sewing industry, the T_a for the lowest bin was used and RH was calculated using the

equation below (provided by the authors). Inside the NCR, the T_a was 66.2 °F (19 °C) and RH was calculated at 18%, yielding an HI of 63.4 °F for the

REF condition. Outside the NCR, the T_a was 80.6 °F (27 °C) and RH was calculated as 56%, yielding an HI of 82 °F for the REF condition.

$$WBT = 0.567T_a + 0.216 \left(\frac{RH}{100} * 6.105 * \exp \left(\frac{17.27T_a}{237.7 + T_a} \right) \right) + 3.38$$

To calculate the HI for the HOT condition in the garment-sewing industry, the T_a for the second highest bin was used because this is where

productivity losses reached a maximum and plateaued (Figure 1A–B, p. 1808). RH was again calculated using the equation above. Inside the NCR, the T_a

was 91.4 °F (33 °C) and RH was calculated at 31%, yielding an HI of 90 °F for the HOT condition. Outside the NCR, the T_a was also 91.4 °F (33 °C) and

RH was calculated as 64%, yielding an HI of 105.8 °F for the HOT condition.
The productivity losses from the REF conditions to the HOT conditions were estimated using data from Figure A.3

(appendix, p. 6). For garment workers inside the NCR, the authors reported that at the HOT condition, there was a 12% loss in productivity, which yields a rate of 0.45% per 1 °F HI. Outside the

NCR, the authors reported that at the HOT condition, there was a 3% loss in productivity, which yields a rate of 0.13% per 1 °F HI.

Inside NCR: $\frac{(100-88)\%}{|63.4-90|^{\circ}\text{F}} = 0.45\% \text{ per } 1^{\circ}\text{F HI}$ Outside NCR: $\frac{(100-97)\%}{|82-105.8|^{\circ}\text{F}} = 0.13\% \text{ per } 1^{\circ}\text{F HI}$

Mean: $\frac{(0.45+0.13)\% \text{ per } 1^{\circ}\text{F HI}}{2} = 0.29\% \text{ per } 1^{\circ}\text{F HI}$

Relative to the REF condition, inside the NCR, productivity loss at the initial heat trigger (80 °F HI) was 7.49%. For

an 8-hour work shift (480 minutes), this translates to a loss of 35.9 minutes. Outside the NCR, productivity loss is

assumed to be 0% because the REF (82 °F HI) was above the initial heat trigger. The mean loss is 18.0 minutes.

Inside NCR: $\frac{0.45\%}{1^{\circ}\text{F HI}} * (80 - 63.4)^{\circ}\text{F HI} = 7.49\%$ $7.49\% * 480 \text{ minutes} = 35.9 \text{ minutes}$

Outside NCR: 0 minutes

Mean: $\frac{(35.9+0) \text{ minutes}}{2} = 18.0 \text{ minutes}$

Relative to the REF condition, inside the NCR, productivity loss at the high heat trigger (90 °F HI) was 12.0%. For

an 8-hour work shift (480 minutes), this translates to a loss of 57.6 minutes. Outside the NCR, productivity loss at

the high heat trigger was 1.0%, or a loss of 4.8 minutes. The mean loss is 31.3 minutes.

Inside NCR: $\frac{0.45\%}{1^{\circ}\text{F HI}} * (90 - 63.4)^{\circ}\text{F HI} = 12.0\%$ $12.0\% * 480 \text{ minutes} = 57.6 \text{ minutes}$

Outside NCR: $\frac{0.13\%}{1^{\circ}\text{F HI}} * (90 - 82)^{\circ}\text{F HI} = 1.04\%$ $1.04\% * 480 \text{ minutes} = 5.0 \text{ minutes}$

Mean: $\frac{(57.6+5.0) \text{ minutes}}{2} = 31.3 \text{ minutes}$

Ioannou et al. (2017) assessed the effects of temperature on the productivity of 7 grape-picking workers in Cyprus over 4 study days: two in the summer (August 17–18, 2016) and two in the autumn (October 11–12, 2016). The workers were “healthy and heat-acclimatized” (p. 332), and their pay system was not specified. They were “officially not provided with any breaks other than the lunch break” (p. 338) but did take “irregular work breaks . . . defined as any unprescribed work cessation determined by workers’ own

judgment, and not based on specific time intervals or instructions” (p. 333). Productivity was assessed as “the number of boxes full of grapes picked by the entire group in each hour divided by the number of workers” (p. 333).
The authors reported hourly productivity as a function of wet bulb globe temperature (WBGT). The calculation of WBGT was based on weather data (including *T_a* and RH) from the Paphos International Airport in Cyprus. OSHA accessed the same historical weather data

(wunderground.com) for the 4 study days and calculated the hourly HI (based on *T_a* and RH) for each study day. On October 11 and 12, the highest HI was still below the high heat trigger (83.8 °F and 85.6 °F, respectively) and would have required extrapolation to estimate the rate of productivity loss. Therefore, only weather and productivity data from August 17 and 18 was considered. The lowest HI for each day served as the REF condition for that day; the REF HI for August 17 was 75.6 °F (based on a *T_a* of 75 °F and

73% RH), and the REF HI for August 18 was 72.1 °F (based on a T_a of 72 °F and 69% RH).

The highest HI for each day served as the HOT condition. The HOT HI for August 17 was 96.9 °F (based on a T_a of 86 °F and 74% RH), and the HOT HI

for August 18 was 103.1 °F (based on a T_a of 88 °F and 75% RH).

The productivity loss from the REF condition to the HOT condition for the 2 study days (August 17–18) was estimated by plotting the hourly HI against the productivity data (boxes per

hour) in Figure 6 (p. 337). The rate of productivity loss was 0.65% per 1 °F HI for August 17, and 0.81% per 1 °F HI on August 18, which yielded a mean rate of 0.73% per 1 °F HI.

$$\text{August 17: } \frac{(100-86.1)\%}{|75.6-96.9|^\circ\text{F}} = 0.65\% \text{ per } 1^\circ\text{F HI} \quad \text{August 18: } \frac{(100-74.9)\%}{|72.1-103.1|^\circ\text{F}} =$$

$$0.81\% \text{ per } 1^\circ\text{F HI}$$

$$\text{Mean: } \frac{(0.65+0.81)\% \text{ per } 1^\circ\text{F HI}}{2} = 0.73\% \text{ per } 1^\circ\text{F HI}$$

Relative to the REF conditions, the productivity loss at the initial heat trigger (80 °F HI) was 2.87% for August

17 and 6.40% for August 18. For an 8-hour work shift (480 minutes), this translates to a loss of 13.8 and 30.7

minutes, respectively, and a mean loss of 22.3 minutes.

$$\text{August 17: } \frac{0.65\%}{1^\circ\text{F HI}} * (80 - 75.6)^\circ\text{F HI} = 2.87\% \quad 2.87\% * 480 \text{ minutes} =$$

$$13.8 \text{ minutes}$$

$$\text{August 18: } \frac{0.81\%}{1^\circ\text{F HI}} * (80 - 72.1)^\circ\text{F HI} = 6.40\% \quad 6.40\% * 480 \text{ minutes} =$$

$$30.7 \text{ minutes}$$

$$\text{Mean: } \frac{(13.7+30.7) \text{ minutes}}{2} = 22.3 \text{ minutes}$$

Relative to the REF conditions, the productivity loss at the high heat trigger (90 °F HI) was 9.40% for August 17 and

14.5% for August 18. For an 8-hour work shift (480 minutes), this translates to a loss of 45.1 and 69.6 minutes,

respectively, and a mean loss of 57.4 minutes.

$$\text{August 17: } \frac{0.65\%}{1^\circ\text{F HI}} * (90 - 75.6)^\circ\text{F HI} = 9.40\% \quad 9.40\% * 480 \text{ minutes} =$$

$$45.1 \text{ minutes}$$

$$\text{August 18: } \frac{0.81\%}{1^\circ\text{F HI}} * (90 - 72.1)^\circ\text{F HI} = 14.5\% \quad 14.5\% * 480 \text{ minutes} =$$

$$69.6 \text{ minutes}$$

$$\text{Mean: } \frac{(45.1+69.6) \text{ minutes}}{2} = 57.4 \text{ minutes}$$

Sahu et al. (2013) assessed the effects of temperature on the productivity of 48 male rice harvesters in Bengal, India from April to June in 2011. Workers were paid on a piece-rate system, and their acclimatization status was not specified. They were allowed to take

“small breaks (3–6 min) between work tasks [that] were included as part of the normal work time management” (p. 426). Productivity was assessed as the “hourly number of bundles divided by the number of workers to calculate the average hourly productivity per worker”

(p. 426). The authors measured both T_a and WBGT in the farm fields and estimated the relationship between them (Figure 1, p. 427).

The authors only reported productivity as a function of WBGT (Figure 4, p. 428). First, the WBGT when

productivity was highest (25.7 °C) and lowest (30.9 °C) was identified. Then the regression equation from Figure 1 was used to estimate T_a based on WBGT. Finally, to estimate RH, historical weather data “from the nearby weather station at Kolkata Dum-Dum airport” (p. 426) was used, upon which the authors had also relied. OSHA identified the days from April through June 2011 that matched the T_a for

highest productivity (80.6 °F) and lowest productivity (97.4 °F) at 6 a.m. (when T_a was measured for the first hour of work), and then used the corresponding level of RH. This yielded an HI of 85.5 °F for the REF condition (based on a T_a of 80.6 °F and 80% RH), and an HI of 116.6 °F for the HOT condition (based on a T_a of 97.4 °F and 56% RH).

OSHA estimated productivity loss from the REF condition to the HOT condition based on the productivity data (rice bundles per hour) for the first hour of work in Figure 4 (p. 428). Workers harvested 92 rice bundles per hour at the REF condition (i.e., 100% productivity), and 63.8 bundles per hour at the HOT condition (i.e., 69% productivity). This yielded a rate of productivity loss of 1.00% per 1 °F HI.

$$\frac{(100 - 69)\%}{|85.5 - 116.6|^\circ\text{F}} = 1.00\% \text{ per } 1^\circ\text{F HI}$$

The productivity loss at the initial heat trigger (80 °F HI) is assumed to be 0% because the REF condition, at which

productivity was assumed to be 100%, is higher than the initial heat trigger. Relative to the REF condition (85.5 °F HI), the productivity loss at the high

heat trigger (90 °F HI) is 4.50%. For an 8-hour work shift (480 minutes), this translates to a loss of 21.6 minutes.

$$\frac{1.00\%}{1^\circ\text{F HI}} * (90 - 85.5)^\circ\text{F HI} = 4.50\% \quad 4.50\% * 480 \text{ minutes} = 21.6 \text{ minutes}$$

III. Group 3 Studies

Dally et al. (2018) assessed the effects of temperature on the productivity of 4,095 sugarcane cutters in Guatemala from November 2015 to May 2016. Workers received “a base wage regardless of the amount of sugarcane harvested” (p. 3) and were acclimatized (i.e., they completed a “one week acclimatization period in November” (p. 3). They worked a “ten-hour shift (p. 3) and were allowed to “take three 20-minute breaks and one 60-minute lunch break in the provided shade during the work shift” (p. 4). The authors reported

daily productivity as the “average daily tons cut per workday” (p. 4). The authors collected data on T_a , RH, and WBGT using the Cengicaña weather station located close to the sugarcane fields.

Using historical weather data (collected at 15-minute intervals) from the Cengicaña weather station, T_a and RH were used to calculate HI for each day of the harvest season. OSHA identified the days with the highest and lowest HI based on the 75th percentile of each day, which provided the range of temperatures that most closely

corresponded to the extreme values of daily productivity (as compared with mean HI or max HI). This yielded an HI of 88.3 °F for the REF condition and an HI of 102.6 °F for the HOT condition.

The productivity loss from the REF condition to the HOT condition was estimated based on the productivity data (tons of sugarcane per day) in Figure 2 (p. 7). Workers harvested 6.0 tons per day at the REF condition (i.e., 100% productivity), and 5.42 tons per day at the HOT condition (i.e., 90.3% productivity). This yielded a rate of productivity loss of 0.68% per 1 °F HI.

$$\frac{(100 - 90.3)\%}{|88.3 - 102.6|^\circ\text{F}} = 0.68\% \text{ per } 1^\circ\text{F HI}$$

However, the sugarcane cutters were given a total of 60 minutes of rest breaks (3x20 minutes) over the course of a 9-hour work shift, while the proposed rule would require a total of 35 minutes of rest breaks (2x15-minute scheduled rest

breaks and 5 minutes of rest breaks if needed) over the course of an 8-hour work shift at the high heat trigger. Therefore, OSHA assumed that the rate of productivity loss should be multiplied by 1.52, or the ratio of the

percentages of the work shift spent in breaks for these two scenarios. This yielded an adjusted rate of productivity loss of 1.03% per 1 °F HI.

$$\text{Dally et al. (2018): } \frac{60 \text{ min}}{540 \text{ min}} = 11.1\% \quad \text{Proposed Rule: } \frac{35 \text{ min}}{480 \text{ min}} = 7.3\%$$

$$\frac{11.1\%}{7.3\%} = 1.52$$

$$0.68\% * 1.52 = 1.03\% \text{ per } 1^\circ\text{F HI}$$

Relative to the REF condition (88.3 °F HI), the productivity loss at the high heat trigger (90 °F HI) is 1.75%. For an

8-hour work shift (480 minutes), this translates to a loss of 8.4 minutes.

$$\frac{1.03\%}{1^{\circ}\text{F HI}} * (90 - 88.3)^{\circ}\text{F HI} = 1.75\%$$

$$1.75\% * 480 \text{ minutes} = 8.4 \text{ minutes}$$

III. Findings of Primary Approach

This appendix presents OSHA's estimates of the labor productivity loss resulting from pacing (*i.e.*, working slowly during the work time not spent on breaks) when the heat index is equal to the initial and high heat triggers. This appendix also presents OSHA's estimates of the decrease in pacing with the introduction of if-needed and scheduled breaks—the findings of the primary approach suggest that employees pace less (*i.e.*, work more efficiently) with if-needed rest breaks, and that scheduled rest breaks further reduce pacing (*i.e.*, employees become even more efficient). These estimated labor productivity losses from pacing were translated to and presented as equivalent lost minutes of work time in an 8-hour work shift.

At the initial heat trigger, employees given if-needed rest breaks are estimated to pace less (*i.e.*, work more efficiently) by an average of 2.8 minutes (per 8-hour shift) compared to those not given if-needed rest breaks. At the high heat trigger, employees given both scheduled and if-needed rest breaks are estimated to pace less (*i.e.*, work more efficiently) by an average of 32.2 minutes (per 8-hour shift) compared to those not given neither if-needed nor scheduled rest breaks and by an average of 31.1 minutes (per 8-hour shift) compared to those given only if-needed rest breaks.

IV. Alternate Approaches Under Consideration

OSHA has preliminarily determined that the assumptions made in the

primary approach are plausible and appropriate. However, OSHA recognizes that the limited scope of available evidence affects the extent to which these key assumptions can be tested. For example, none of the available studies directly compared rest break policies in the same setting, so the estimates of cost savings are based on differences in productivity losses across settings. OSHA is considering alternate approaches with varying assumptions, such as the extent to which productivity losses in one setting, given a certain rest break policy, may be representative of such losses in other settings.

One alternate approach modifies some of the key assumptions made in the primary approach, while still relying on the same set of studies. Specifically, this approach retains Assumptions (a) through (d) and Assumption (f), but it replaces Assumption (e) with the following:

e.1. An employee's expected productivity loss from pacing, given a specific temperature and the employer's break policy, is estimated by taking the average REF condition observed in studies where that break policy is in effect, along with the average productivity loss per degree observed across all studies.

e.2. An employee's expected productivity gains from taking rest breaks do not exceed the productivity losses that are observed when they work at a slower pace and do not take rest breaks. In other words, if a rest break policy yielded an overall net increase in productivity, employers would already

offer these rest breaks. Gains can be estimated by differences in productivity losses due to pacing, as measured at the initial temperature (*i.e.*, trigger) at which the rest break policy goes into effect.

Compared with those of the primary approach, the above alternate assumptions are more relaxed in some ways and stronger in others. In particular, the assumption that productivity losses per degree are estimated in a pooled fashion, but REF conditions are not, implies that all productivity gains associated from reduced pacing come in the form of a shift in the productivity loss function. This assumption addresses the potential concern that differences in work conditions other than temperature (such as sun exposure or work demands) limit the applicability of any findings on productivity loss to other work settings.

Under this alternate approach, OSHA expects that productivity losses at the initial and high heat triggers will be larger for employees in Group 1, and they will be smaller for employees in Groups 2 and 3 (see table VIII.H.A.2).¹¹⁵ This means that under these assumptions, even greater cost savings could accrue to employers if they offered rest breaks if needed at the initial heat trigger, and scheduled rest breaks as well as if-needed rest breaks at the high heat trigger. OSHA welcomes feedback on this alternate approach and has not yet calculated how it would impact the total cost of the proposed standard.

TABLE VIII.H.A.2—SUMMARY TABLE OF ALTERNATE APPROACH

Group	HI at REF (average within group)	Productivity loss per 1°F HI above REF (pooled average for all groups) (%)	Productivity loss at initial heat trigger (min.)	Productivity loss at high heat trigger (min.)
1	73.7 °F	0.71	21.5	55.6
2	79.7 °F	0.71	1.0	35.1
3	88.3 °F	0.71	0	5.8

The average HI at REF uses the midpoint for each study in cases where a range was specified. The average productivity loss is the pooled average from table VIII.H.A.1.

¹¹⁵ Not reflected in table VIII.H.A.2 is the possibility that the exclusion criteria listed in table

VIII.H.A.3 may need to be reconsidered if the cost savings estimation approach is revised.

In both the primary approach and the secondary approach (immediately above), the REF condition—which is, loosely, the minimum temperature at which heat begins to cause productivity loss—is assumed to differ across Groups. The two estimation approaches diverge in that the per-degree rate of loss in conditions above REF is always 0.71% in the secondary approach but is allowed to differ by Group in the primary.¹¹⁶ A tertiary approach would reverse which parameter is estimated in a pooled manner; the REF condition would be the same across Groups, while the per-degree rate of loss would differ. As shown in table VIII.H.A.1., however,

the per-degree rate of loss is estimated to increase with amounts of rest, so this approach would yield an estimate of productivity-related costs, rather than cost savings. Although this result is not plausible, it illustrates some of the uncertainties about data and quantitative methods used in this appendix.

A pooled regression could address some of these challenges by producing a single estimate representing the relationship between temperature and productivity loss that does not differ by break policy, then separately producing estimates as to how each rest break policy might improve productivity. OSHA is considering an additional

alternate approach that would incorporate regression analysis and might, as part of such analysis, relax the assumption regarding the linearity of the relationship between temperature and productivity loss. That is, a nonlinear specification could address the potential concern that productivity losses may become increasingly severe as the temperature exceeds the initial heat and high heat triggers.

In sum, OSHA welcomes feedback on the primary cost savings approach and the alternate approaches. OSHA also welcomes suggestions for other approaches to estimate cost savings related to the provision of rest breaks.

I. Appendix B. Review of Literature on Effects of Heat Exposure on Non-Health Outcomes

I. Introduction

A large literature from multiple disciplines (economics, occupational health, physiology) documents the negative effects of heat exposure on human health, such as mortality, injuries, and illnesses (for detailed discussion, see Section IV., Health Effects and Section V.A., Risk Assessment).

There is also a large literature that documents the negative effects of heat exposure on a broad range of non-health outcomes with potential economic implications (Heal and Park, 2016; Lai et al., 2023).

This document serves several purposes. First, this document synthesizes and summarizes the findings from multiple disciplines regarding the effects of heat exposure on non-health outcomes with potential economic implications. In particular, this document aims to examine a broad set of non-health outcomes that are potentially relevant to OSHA’s economic analysis for the proposed standard for Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings. Although the discussion centers around labor productivity, other outcomes are also discussed, including but not limited to labor supply, mental performance, economic output, and worker utility. This document also aims to clarify terminology, given that different terms have been used interchangeably in the existing literature (Dasgupta et al., 2021, p. e457).¹¹⁷

¹¹⁷ For example, Burke et al. (2023) conducted a meta-analysis of 22 studies as part of their literature review of existing evidence of “labor productivity response to temperature.” Some of these studies reported effects on mental performance or effects on economic output without clearly delineating the contribution of labor productivity. Changes in mental performance (e.g., error rates) may not directly reflect the magnitude of changes in labor productivity; for example, a 50% decrease in the error rate does not necessarily mean a 50% increase in labor productivity (Fisk, 2000, pp. 555–556). Flouris et al. (2018) conducted a meta-analysis of 111 studies on the effects of heat exposure on

Studies summarized in this document were identified as follows. Eastern Research Group (ERG) performed several literature searches (ERG, 2022a; ERG, 2022b; ERG, 2022c) that could inform the relationship between heat and various outcomes (e.g., labor productivity, heat strain). Among these studies, studies reporting non-health outcomes were considered relevant. Studies reporting health outcomes like heat strain and work-related HRIs were not considered relevant, and readers are referred to relevant sections of the preamble for more detail. OSHA also independently identified additional studies pertaining to non-health outcomes. During this process, studies about general population-related outcomes (e.g., heat-related mortality for general population beyond workers) were considered irrelevant.

This document is organized as follows. Section VIII.I.II. summarizes the literature’s findings on the negative effects of heat exposure on non-health outcomes with potential economic implications, especially labor productivity. Section VIII.I.III. summarizes the literature’s findings on the role of workplace characteristics in the labor productivity effects of heat exposure. Section VIII.I.IV. concludes.

II. Effect of Heat Exposure on Non-Health Outcomes

This section summarizes the literature’s findings on the negative effects of heat exposure on non-health outcomes that could translate into economic costs: labor supply, labor productivity, mental performance, economic output, and worker utility.¹¹⁸

workers’ outcomes, 11 of which were related to “productivity loss.” Some of these studies reported effects on self-perceived labor productivity or labor supply.

¹¹⁸ In general, the findings in this appendix (and other PEA sections that discuss benefits that are excluded from the primary benefits quantification) may be interrelated, such that simply summing the effects identified could lead to some amount of double-counting or other mis-counting.

A. Labor Supply

Literature has documented the negative effects of heat exposure on labor supply (hours worked), by increasing absenteeism due to illness or injury (Ioannou et al., 2022, p. 80) or increasing disutility of labor (working in the heat causes discomfort so workers increasingly avoid spending time at work at higher temperatures) (Lai et al., 2023, p. 222).

Many studies found that heat exposure increased absenteeism due to illness or injury in their evaluation of multiple types of health information datasets, such as workers’ compensations claims data, emergency department visits and hospital discharge datasets (for more detail, see Section IV., Health Effects and Section V.A., Risk Assessment).

Many studies in the economics literature found evidence that heat exposure led workers to allocate less hours to work (potentially due to absenteeism from illness or injury, increased disutility of work, or both). Graff Zivin and Neidell (2014) used data from the American Time Use Survey (ATUS) to find that workers in “high-risk industries” (agriculture, forestry, fishing, hunting, mining, construction, manufacturing, transportation, utilities) reduced their time allocated to labor by one hour when daily maximum ambient temperatures exceeded 85 °F (29.4 °C) compared to the 76 °F–80 °F (24.4 °C–26.7°C) range. Almost all the decrease in the time allocated to labor happened at the end of the day when fatigue from prolonged exposure to heat has likely set in. They also found that that most of the decreased time allocated to labor was diverted to indoor leisure. They did not find evidence that workers worked longer during cooler days to make up for reduced work hours during hot days. Rode et al. (2022) compiled time use and labor force survey data from seven countries (Brazil, France, India, Mexico, Spain, UK, USA) and found that a day at daily maximum ambient temperature 104 °F (40 °C) lead to 28.65 fewer minutes worked per worker compared to a day at 80.6 °F (27 °C) for “high-risk

industries” (agriculture, mining, construction, manufacturing); the corresponding decline was insignificant for workers in “low-risk industries” (p. 21). Garg et al. (2020a) found in Chinese time use survey data that an additional day with an average ambient temperature above 80 °F (26.7 °C) reduced weekly work time by 1.2 hours. They also found limited evidence for this reduced work time being substituted by increased non-work time such as time spent on childcare and household chores.¹¹⁹

The effect of heat exposure on labor supply likely depends on the incentive structures¹²⁰ for these workers and their economic dependence on the income arising from their work (Lai et al., 2023). Using daily attendance records from selected manufacturing firms in India, Somanathan et al. (2021) found that elevated temperatures in the current or preceding week reduced labor supply¹²¹ (which the authors interpreted as possibly both increased absenteeism from illness or injury and increased disutility of labor), and the effect was stronger for workers with paid leave. Such dependence on specific incentive structures might explain the differences in results across studies. For example, Cai et al. (2018) examined worker attendance data from administrative records and found that neither the attendance decision nor the working hours of workers in a manufacturing facility in China were affected by temperature, likely because the workers were paid by piece-rate. Neidell et al. (2021) found in ATUS data that the relationship between hours worked and temperature depended on overall economic conditions. They found that during economic expansions, each additional degree above daily maximum ambient temperature 90 °F (32.2 °C) reduced the average workday by 2.6 minutes. On the other hand, no significant relationship was found between temperature and hours worked during economic recessions. Such lack of evidence of reduction in work hours on hotter days during weak labor market conditions suggests that the negative

relationship between temperature and work hours is likely driven by changes in labor supply (from worker) rather than labor demand (from employer).

There are several reasons for the need for caution in interpreting the studies reporting effects of heat exposure on labor supply (or employment in general).

First, the results presented in most of these studies could be driven by changes in labor demand as well as labor supply (Graff Zivin and Neidell, 2014, p. 4). Some studies did try to differentiate labor supply and demand, such as estimating the effect across business cycles (Neidell et al., 2021) or estimating wage effects as well as employment effects (e.g., Colmer, 2021; Jessoe et al., 2018).

Second, most economics studies reporting the negative effect of heat exposure on labor supply using data on hours worked did not disentangle the contribution of absenteeism due to illness or injury from the contribution of disutility from working in the heat. The distinction is important because improving workplace conditions may increase labor supply beyond reducing time lost to illness or injury.

Third, it is not very clear if reduced work time always has negative implications for worker welfare. Reduced work time on hot days such as cessation of work might be beneficial for workers if fewer workers are exposed to high temperatures that put their health at risk (Ireland et al., 2024, p. 18). However, if the lost work time is not compensated, workers face a tradeoff between health risk and earnings risk, both of which negatively affects the workers’ welfare (EPA, 2021, p. F–3). Rode et al. (2022)’s theoretical framework also presented a similar tradeoff facing workers between decreased earnings and increased disutility of labor in face of higher temperatures. Their theoretical framework is based on their interpretation of their empirically-estimated decline in labor supply due to higher temperatures (discussed above) as uncompensated lost work time—workers choose to work less due to increased disutility of labor but at the cost of foregoing earnings. Based on this theoretical framework, they derived the willingness-to-pay to avoid the increased disutility of labor from higher temperatures (defined as the increase in the wage rate that is needed to offset the increased disutility of labor).

Fourth, the definition of work hours varies by dataset. Some datasets include, for example, paid or unpaid leave (Somanathan et al., 2021) or while other datasets include time spent on job

search¹²² (studies that use the ATUS such as Graff Zivin and Neidell, 2014; Neidell et al., 2021; Rode et al., 2022). How work hours are defined has implications for the worker welfare effects of heat exposure. For example, as discussed above, worker welfare could depend on whether the reduced work hours from heat exposure are compensated (e.g., worker leaves work early forgoing pay versus using paid leave). See Eldridge et al. (2022) for more examples of various definitions of work hours across datasets.

B. Labor Productivity

Numerous studies have documented the negative effects of heat exposure on labor productivity. Using direct measures of labor productivity (units of output produced per hour) and proxies of labor productivity (physical work capacity, physical activity, and self-perceived labor productivity), studies across various disciplines (e.g., physiology, occupational health, and economics) have found that heat exposure reduces labor productivity (Ioannou et al., 2022; Morrissey et al., 2021a; Mattke et al., 2007).

This section focuses on micro-level evidence across various disciplines based on laboratory or occupational settings. Studies reporting potential macro-level evidence on labor productivity based on macroeconomic proxies of labor productivity (e.g., per capita value added, revenue, payroll) are discussed in section VIII.II.D.

Overall, studies reported varying estimates of effects of heat exposure on labor productivity depending on the specific sectors and heat conditions (e.g., presence of indoor radiant heat, differences in regional climate between the U.S. and non-U.S. countries). Section VIII.I.III. discusses in more detail workplace factors that affect the literature’s estimates of the effect of heat exposure on labor productivity, such as contractual structures and adaptation measures that affect workers’ incentives and ability to be productive in the heat.

¹¹⁹ The authors found that higher temperatures reduce time spent on childcare by households without cooling technology (insignificant effect on households with cooling technology). They also found that higher temperatures reduce time spent on childcare by women (insignificant effect for men).

¹²⁰ The role of workplace incentives in the labor productivity effects of heat exposure is discussed later in section VIII.I.III.B.

¹²¹ This study’s worker attendance data technically measures only whether the worker is present or absent that day (Somanathan et al., 2021, p. 1811). It is unclear if and how their attendance data captures cases where the worker is only partially present, and leaves work early that day.

¹²² Using the ATUS and following the “same methodology employed by” Graff Zivin and Neidell (2014). Neidell et al. (2021) defined “work” as “all activities under the ‘work and work-related activities’ major category,” which “in addition to time spent at the workplace, [. . .] also includes time devoted to other income-generating activities as well as job searching” (p. 2). Rode et al. (2022) also uses the same category to calculate time spent on work: “Total work is calculated as the sum of all time spent engaged in sub-activities listed under Category 5, Work and Work-Related Activities. Relevant sub-categories include time spent in work itself, income-generating activities, socializing as a part of work, job searching, and other miscellaneous work-related activities” (p. 52).

I. Direct Measures of Labor Productivity

Labor productivity is a “measure of economic performance that compares the amount of goods and services produced (output) with the amount of labor hours worked to produce that output” and is a “ratio of output to hours worked” (BLS, 2020a). Changes in labor productivity “reflect the changes in output that is not explained by the change in hours worked” (BLS, 2020a). Studies have documented the effects of heat exposure on labor productivity in different work settings in both U.S. and non-U.S. countries. Most of these studies are occupational studies with the exception of one laboratory-based study involving simulated work.

Some studies discussed in this section technically reported changes in an average worker’s output per day or week, not output per hour. These studies are discussed in this section in the context of labor productivity based on their evidence that changes in their reported outcomes are likely being driven by changes in worker output per hour, not by changes in daily or weekly hours worked.

a. Agriculture.

Many studies analyzing the labor productivity effects of heat exposure are based on agricultural work settings, given the agricultural sector’s high level of heat exposure and the feasibility of tracking individual production levels.

Using daily production data of Indian rice harvesters, Sahu et al. (2013) reported a 5% decline in labor productivity (rice bundles per worker per hour) for each additional degree above 26 °C WBGT. Using daily production data of sugarcane cutters in Nicaragua, Hansson et al. (2024) reported that relative to below 82.4 °F (28 °C) WBGT, labor productivity (bundles per worker per day) decreased by 2.5% at 82.4 °F–84.2 °F (28 °C–29 °C) WBGT, by 5% at 86 °F–87.8 °F (30 °C–31 °C) WBGT, and by 8.3% at above 87.8 °F (31 °C) WBGT. Using daily production data of maize farmers in Nigeria, Sadiq et al. (2019) reported that for every 1.8 °F (1 °C) increase in WBGT, labor productivity (ridges tilled or hoed per worker per hectare) decreased by 23% although their reported labor productivity effects of higher temperature could be confounded by the effects of fatigue over the workday. Using daily production data of sheep shearers and retrospective temperature records of a “Bureau of Meteorology recording station” in Australia, Gun and Budd (1995) reported that the labor productivity (number of sheep shorn per worker per

hour) declined by approximately 7% per 1.8 °F (1 °C) increase in ambient temperature¹²³ although the estimated effect was not statistically significant. Using daily production data of Guatemalan sugarcane workers, Dally et al. (2018) reported that a day with 95th percentile WBGT of 34 °C was associated with an estimated cumulative loss in labor productivity of 0.59 tons of cut sugarcane per worker per day over the following five days compared to a day with 95th percentile WBGT of 29 °C (approximately 0.59/5.7=10.35% of the average production per worker per day).

Based on data from tree fruit harvesters in Washington State, Quiller et al. (2017) found that increasing daily maximum WBGT was associated with decreasing labor productivity (weight of fruit bins collected per worker per hour). However, this association became statistically insignificant after controlling for potential confounders such as price paid per bin and shift duration. The lack of evidence could also be due to relatively cool climate of Washington State—the time-weighted average WBGT was 72.1 °F (22.3 °C) and 60.6 °F (15.9 °C) in each of the months studied.

b. Manufacturing

Several studies that directly measure labor productivity are based on manufacturing settings, likely due to feasibility of tracking individual production levels.

Using daily production data from a non-climate-controlled paper cup manufacturing setting in China, Cai et al. (2018) reported that daily maximum ambient temperatures above 95 °F (35 °C) resulted in an approximately 8.5% decrease in labor productivity (output per worker per day) relative to the baseline range of 75 °F–79 °F (23.9 °C–26.1 °C). Using daily production data from a rubber compound manufacturing plant in Sri Lanka, Meegahapola and Prabodanie (2018) reported that high temperature ranges, 105.8 °F–113 °F (41 °C–45 °C) and 96.8 °F–104 °F (36 °C–40 °C), reduced labor productivity (kilogram per worker per hour), by 22% and 18% respectively, relative to the baseline temperature range of 89.6 °F–95 °F (32 °C–35 °C). Using weekly production data of brick molders and carriers in India, Sett and Sahu (2014) found that for each 1.8 °F (1 °C) increase in ambient temperature, labor productivity (number of bricks molded or carried per worker per week) declined by 0.8%. Using daily worker-level production data from selected

manufacturing firms in India, Somanathan et al. (2021) found that labor productivity (output per worker per day) declines in higher outdoor temperatures, falling 2.7% per 1.8 °F (1 °C) increase in daily maximum ambient temperature above 77 °F (25 °C).

c. Other Sectors

Direct units of output are harder to measure in most other sectors, so comparatively fewer studies have been produced in other industries.

Observing call center workers in California, Federspiel et al. (2004) found that time to finish tasks (post-talk wrap-up to process information) increased by 16% when the ambient temperature increased from 73.4 °F to 77.7 °F (23 °C to 25.4 °C). Niemelä et al. (2002) also analyzed workers at two call centers. In one call center, they compared labor productivity (number of calls per hour) between two different temperature zones in the building. In another cell center, they introduced an intervention (installation of air-conditioning) and compared labor productivity before and after the intervention. They reported that labor productivity in both call centers decreased by 5% to 7% at ambient temperatures over 77 °F (25 °C), although other seasonal changes likely confounded their results. From data on Demographic and Health Surveys (DHS) interviewers from 46 developing countries, LoPalo (2023) estimated the effects of heat exposure on DHS interviewers’ labor productivity (number of surveys completed per hour). Exploiting variation in weather within a region of a country, survey waves, and interviewers, they found interviews per hour were fewer by 13.6% on days over 85 °F (29.4 °C) wet bulb relative to days between 50 °F (10 °C) and 60 °F (15.6 °C) wet bulb. Hanna (2004) conducted an experiment in an environmental test chamber with journeymen electricians installing duplex receptacles on work panels. While their laboratory setting did not allow effects of real-world workplace factors that affect labor productivity, the controlled environment tracked heat exposure in detail by ambient temperature and humidity level. The study found that maximum labor productivity (number of receptacles installed per hour) was achieved at ambient temperature between 40 °F (4.4 °C) and 70 °F (21.1 °C) with relative humidity below 80%. At 70% relative humidity, labor productivity decreased by 10% when ambient temperature increased from 70 °F (21.1 °C) to 90 °F (32.2 °C) (and by 23% when ambient temperature increased to 100 °F (37.8 °C)). They also found that higher

¹²³ This corresponds to a linear approximation of the results presented in Figure 5 of the study.

relative humidity reduced labor productivity further at elevated ambient temperatures.

II. Proxies for Labor Productivity

This section summarizes findings of studies that report “alternative” measures of labor productivity, such as physical work capacity, physical activity, and self-perceived labor productivity.

a. Physical Work Capacity, Exposure-Response Functions

Work capacity or physical work capacity is the potential to perform work under specified set of environmental conditions (*e.g.*, WBGT) and physical condition of the worker (*e.g.*, core body temperature, heart rate) (Ioannou et al., 2022, p. 75; Bröde et al., 2018, p. 332). Loss of work capacity occurs as a physiological response to heat exposure where the worker reduces physical activity to avoid negative health effects (*e.g.*, increases in core body temperature or heart rate beyond the safe limit) (Kjellstrom et al., 2014).

Several studies have derived exposure-response functions that represent the relationship between heat exposure and work capacity. Exposure-response functions in the occupational health literature fall into two groups (Borg et al., 2021). The first group of exposure-response functions are based on empirical data (*e.g.*, Kjellstrom et al., 2014; Foster et al., 2021). The second group are based on recommended work-rest ratios in existing work-rest guidelines by NIOSH, ACGIH, and ISO (*e.g.*, Kjellstrom et al., 2009b; Dunne et al., 2013).

b. Empirically-Derived Exposure-Response Functions

As part of the High Occupational Temperature Health and Productivity Suppression (Hothaps) Programme, Kjellstrom et al. (2014) derived an exposure-response function (henceforth “Hothaps function”) linking WBGT to work capacity for three levels of work intensity (200 W, 300 W, 400 W) based on the empirical data involving acclimatized male workers in Wyndham (1969) (miners in South Africa) and Sahu et al. (2013) (rice harvesters in India).

Foster et al. (2021) derived an exposure-response function (henceforth “PWC function”) linking varying environmental conditions to work capacity based on empirical data collected from one-hour trials involving young, unacclimatized males performing physical work in climatic chambers. In this study, work capacity is defined as the “maximum physical

work output that can be reasonably expected from an individual performing moderate to heavy work over an entire shift.” More specifically, Foster et al. (2021) aimed to measure the amount of work that can be performed across varying environmental conditions (*e.g.*, combinations of air temperature and relative humidity) while maintaining a fixed heart rate at a maximally acceptable level (*e.g.*, 130 beats per minute) as a “surrogate for self-paced physical workloads.” Smallcombe et al. (2022) replicated the environmental conditions of Foster et al. (2021) and computed work capacity during 6 work-rest cycles of 50-minute work/10-minute rest, with a 1-hour break after the first 3 cycles.

There are some benefits of evaluating the work capacity effects of heat exposure. Heat exposure-work capacity response functions (exposure-response) could be applied to macroeconomic data and models to estimate the economic impact of heat exposure (more examples of studies that borrow these exposure-response functions are discussed more detail below in section VIII.I.II.D.II.). Like Foster et al. (2021) and Smallcombe et al. (2022), work capacity could also be measured through laboratory experiments in controlled environments, reducing the influence of confounders and making their results generalizable across various environmental conditions.

However, there are caveats with interpreting the effects of heat exposure on work capacity reported in the studies above.

First, they may underestimate the labor productivity effects observed in actual work settings for several reasons (Ioannou et al., 2022). Heat exposure could reduce labor productivity not only through reduced work capacity but also other factors such as increased central fatigue and reduced cognitive performance. Also, as discussed more below in section VIII.I.II.B., workplace factors such as wage structure may not always incentivize workers to sustain high levels of effort at the maximum capacity every day throughout the entire shift.

Second, these studies may also overestimate the labor productivity effects observed in actual work settings where self-pacing is more limited. Although self-pacing is observed in most workplaces, there are some workplaces where ability to self-pace is limited, such as emergency response activities or work performed on commission (Ioannou et al., 2022).

Third, some studies assume what is the physically maximally acceptable level (*e.g.*, 130 beats per minute) which

may not be appropriate for every worker. From the perspective of applying their findings to actual work settings, “it is not clear how various physiological (dehydration, cardiac fatigue, poor sleep quantity/quality) and psychological (motivation, anxiety) states impact upon what a worker deems as an acceptable working heart rate” (Ioannou et al., 2022).

c. Guideline-Based Exposure-Response Functions

The second group of exposure-response functions are based on recommended work-rest ratios in existing work-rest guidelines set by NIOSH, ACGIH, and ISO (*e.g.*, Kjellstrom et al., 2009b; Dunne et al., 2013).

There are several reasons for the need for caution when interpreting the guideline-based exposure-response functions.

First, work-rest guidelines represent the “the proportions of work hours during which workers need to take rest periods, depending on work intensity and WBGT, in order to avoid the core body temperature exceeding 38 °C for an average worker” (Kjellstrom et al., 2009a). Exposure-response functions based on work-rest guidelines are “highly conservative because their objective is to minimize the risk of core body temperature of the average worker exceeding 38 °C” (Foster et al., 2021). Guideline-based exposure-response functions therefore show greater declines in work capacity in higher temperatures than the empirically-derived functions (Kjellstrom et al., 2014, p. 17; Morrissey et al., 2021a, Figure 3).

Second, work-rest guidelines prescribe how much a worker should reduce their work capacity at different levels of heat exposure. They do not represent the causal effect of heat exposure on work capacity (Foster et al., 2021, p. 1216).

d. Physical Activity

Some studies tracked the participants’ level of physical activity, based on methods such as direct observation of work activities (that are then categorized into direct work, indirect work, and idle time), time-motion analysis (video recording movements that are then paired with metabolic equivalents) and accelerometers tracking data (step counts per minute which are also paired with metabolic equivalents). Although these methods do not directly track any effects on output, they measure changes in levels of labor input. A major advantage of these methods is that study participants are monitored in their

actual working conditions, reflecting behavioral thermo-regulation (*e.g.*, self-pacing and varying clothing insulation) and endogenous changes in effort in response to workplace incentives like piece-rate pay (Ioannou et al., 2022).

Li et al. (2016) and Yi and Chan (2017) directly observed rebar construction workers whose activities are categorized into direct work (activities that directly and productively contribute to task completion, *i.e.*, steel bar reinforcement), indirect work (support activities that do not directly or productively contribute to task completion, such as walking with tools/materials or empty-handed, waiting for materials to be lifted, discussing tasks with foreman/coworkers), or idle time (personal time and non-utilization time due to work stoppage from any cause). Observing the activities of rebar construction workers in Hong Kong, Yi and Chan (2017) found that a 1.8 °F (1 °C) increase in hourly average WBGT was associated with an approximately 2.8 percentage-point (%p) decrease in the share of direct work time (corresponding to $2.8/64 = 4.38\%$ of the average share of direct work time;¹²⁴ effects on the rest of the categories were not reported). Observing the activities of rebar construction workers in China, Li et al. (2016) reported that a 1.8 °F (1 °C) increase in hourly average WBGT was associated with a 0.57 %p decrease in the share of direct work time (corresponding to $0.57/74 = 0.77\%$ of the average share of direct work time) and a 0.74 %p increase in the share of idle time (corresponding to $0.74/11 = 6.72\%$ of the average share of idle time) (0.18 %p decrease was also observed in the share of indirect work time, but the effects were not significant). Unlike Yi and Chan (2017) that controlled for when the temperature was measured during the workday, a caveat with Li et al. (2016) is that their reported effects of higher temperatures could be confounded by effects of fatigue over the workday.

Using time-motion analysis on a sample of construction workers in Spain over two days, Flouris et al. (2020) found that the workers take longer irregular breaks during the hotter day, Day 1 with a WBGT range 71.2 °F–99.1 °F (21.8 °C–37.3 °C). They found a 4.7-fold difference between the time lost

due to irregular work breaks on a hot day (Day 1) compared to a cool day (Day 2), with a WBGT range 71.4 °F–88.9 °F (21.9 °C–31.6 °C). Moreover, they also found that a planned break intervention providing hydration to workers could partially offset these irregular breaks.

Mitchell et al. (2018) used accelerometer data to track the physical activity of Californian farmworkers for one work shift each in the summers of 2014 and 2015. They found that an 18 °F (10 °C) increase in median WBGT reduced physical activity by 135 counts per minute compared to an average of 347 counts per minute across all participants (equivalent to a 3.9% decrease per 1.8 °F (1 °C) WBGT).

There are some caveats with using physical activity as a measure of labor productivity.

First, physical activity measures the amount of labor inputs instead of actual output. Some studies such as Ioannou et al. (2022) considered the focus on labor inputs rather than production output as an advantage; for instance, expressing labor productivity as the amount of crop produced implies constant availability and equal distribution of crops across the tested piece of land. However, changes such as unequal crop availability are not problematic unless they are systematically correlated with changes in heat exposure.

Second, for studies based on accelerometer data, without information if other production inputs exist and how they affect output (*e.g.*, capital), the relationship between physical activity (counts per minute) and labor productivity is uncertain. For example, suppose there are two workplaces exposed to the same temperature and workers display the same level of physical activity but one workplace has machines that assist the workers. Given the same level of temperature and physical activity, the workplace that has machines available could achieve higher labor productivity.

e. Self-Perceived Labor Productivity

Based on worker surveys, some studies document effects of heat on self-perceived labor productivity, partly due to the comparative ease of obtaining such measurements. Compared to actual production data, the self-perceived measures are a less accurate measure of output and can be affected by other factors that impact an individual's self-perceived labor productivity, such as individual's level of awareness of heat stress.

Krishnamurthy et al. (2017) administered a standardized high occupational temperature health and productivity suppression questionnaire

to 84 steel factory workers in India. Overall, 1% reported taking sick leave due to heat, 10.6% reported being less productive due to heat, and 27% reported that it took longer to complete the same tasks during summer compared to cooler seasons. Of the 27% who reported labor productivity losses, 91% were exposed to direct radiational heat during steel melting. This reduction in labor productivity occurred due to high heat and heavy workload despite taking rest breaks allowed by the management after the hot job was performed (work-rest regimen: 75% work, 25% rest, each hour). Workers reported drinking high quantities of water and rested in shade, but these actions did not abate the effects of heat due to the high ambient humidity which limits sweat evaporation and evaporative cooling. This study did not have a direct control group to compare the actual efficacy of these cooling mechanisms.

Zander et al. (2015) conducted an online survey of 1,726 Australian workers and found that 70% of all surveyed workers reported productivity losses due to heat, corresponding to the majority (93%) of those that reported being stressed by heat at work. In comparison, 7% of respondents reported being absent from work at least one day in the previous 12 months due to heat, being absent for 4.4 days on average. Also focusing on understanding the impact of heat on Australian workers, Singh et al. (2015) interviewed key stakeholders (representatives for occupational safety and health, unions, industry, and government organizations) that reported labor productivity loss due to heat exposure, but the results were mostly qualitative and based on a small sample of 20 stakeholders.

Pogačar et al. (2019) surveyed 70 workers in Greece and 216 workers in Slovenia and found that most workers in both Greece (69%) and Slovenia (71%) reported that they felt heat stress during heat waves had a “significant impact” on their productivity. Additionally, 60% of workers in Greece and 74% in Slovenia reported that heat stress significantly impacts their “well-being.”¹²⁵ These two studies did not directly track the actual temperature exposure of these workers and instead relied on the workers' own recollection of the workplace temperatures (*e.g.*, “warm,” “hot,” “very hot”).

Langkulsen et al. (2010) analyzed a total of 21 Thai workers from four industrial sites and one agricultural site. Onsite measurements found that the

¹²⁴ The study's abstract reported the share of direct work time “decreasing by 0.33%” per 1.8 °F (1 °C) WBGT increase—OSHA conjectures that this statement meant that the estimated 2.8 %p decrease is 3.3% of the predicted average share of direct work time at 22.28 °C WBGT (lowest observed WBGT in their data) according to their regression model where the covariates are held at their sample average values (some of which are not reported in the study).

¹²⁵ Authors are not specific what “well-being” means.

workers were exposed to WBGT ranging from 78.8 °F to 94.3 °F (25.6 °C to 34.6 °C). For 4 of the 5 sites, the study assessed the workers' self-perceived labor productivity, which revealed large differences between sectors. While workers in 2 of the 4 sites that assessed self-perceived labor productivity reported losses of self-perceived labor productivity ranging from 10% to 60%, workers in the other two sites reported no losses when exposed to similar heat (e.g., agriculture). In general, the largest losses in self-perceived labor productivity were from sites that had access to shade and indoors, even sites with air-conditioning in some cases. The small sample size across diverse sites may limit the ability to generalize these results.

Surveying farmers in Nepal, Budhathoki and Zander (2019) reported that perceived labor productivity loss was strongly associated with the perceived levels of heat stress. Moreover, respondents with "access to actual weather information"¹²⁶ were more likely to perceive labor productivity losses from heat than those without this information, indicating that level of individuals' awareness potentially affects their self-reported assessments of labor productivity.

III. Occupational Versus Laboratory Settings

Studies discussed above in sections VIII.I.II.B.I. and VIII.I.II.B.II. were conducted either in occupational settings or laboratory settings. Both settings have advantages and disadvantages.

Laboratory settings grant a high degree of internal validity because the experiments are more easily reproducible and represent a direct causal effect of heat that removes the influence of confounders (Ioannou et al., 2022). While laboratory-based studies provide a relevant benchmark for the effects of heat on productivity observed in actual work settings, they are limited in the generalizability of their findings to different settings (Somanathan et al., 2021). In occupational settings, labor productivity effects of heat would depend on the physical and behavioral aspects of employment, such as the wage contract, particularities of production processes, management techniques, and mechanization, which are not accounted for by laboratory studies (Somanathan et al., 2021).

¹²⁶ Authors are not specific what "access to actual weather information" means.

C. Mental Performance (Cognitive Function, Decision-Making).

The literature has documented the effect of heat exposure on mental performance in academic, athletic, and work settings.¹²⁷ These studies often use the term "performance" with the intent to "include a broader range of effects [such as test scores] than would be indicated by [labor] productivity" (Heal and Park, 2013, p. 10).

In a meta-analysis of 22 studies categorized into reaction time, attention/perceptual tasks, mathematical processing, or "reasoning, learning, memory," Pilcher et al. (2002) reported that a WBGT of 90 °F (32.2 °C) or greater was associated with a 14.9% decrease in performance compared to "neutral temperature conditions" defined as WBGT from 60 °F to 69 °F (15.6 °C to 20.6 °C). Moreover, they also report that these estimates are also affected by the duration of exposure to the heat conditions, the duration of exposure prior to the task onset, the type of task, and the task duration, which can explain the variability of results in the literature discussed below (test scores, athletic performance, workplace performance).

I. Test Scores

Several studies found negative effects of heat exposure on cognitive test performance.¹²⁸ Using student-exam level panel data of high school exit exam scores from New York City high schools (Regents Exams) from 1998 to 2011, Park (2022) found that a 1°F (0.56 °C) higher average exam-time ambient temperature reduces performance by 0.9% of a standard deviation. Using panel data of individual-level cognitive test scores administered at respondents' homes for children as part of the National Longitudinal Survey of Youth (NLSY79), Graff Zivin et al. (2018) found that an additional 1.8°F (1 °C) of average daily ambient temperature

¹²⁷ Reduced mental performance due to heat exposure (e.g., mistakes, inattention, long reaction time) is also linked to increased heat-related injuries—for a detailed discussion, see Section IV.P., Heat-Related Injuries.

¹²⁸ Literature has also found evidence of heat exposure on longer-term outcomes such as student learning and adult earnings. Cho (2017) reported effects of summertime heat exposure on national college entrance exam scores in South Korea (administered nationwide in November). Park et al. (2020) reported effects of cumulative heat exposure from hotter days during the prior school year on PSAT exam scores of U.S. high school students. Garg et al. (2020b) reported effects of hotter days during the prior school year on academic achievement for Indian children in primary and secondary school. Isen et al. (2017) reported effects of heat exposure in utero on adult earnings in U.S. employer-employee matched longitudinal data from the Census Bureau's Longitudinal Employer-Household Dynamics (LEHD) program.

above 69.8 °F (21 °C) reduced math performance by 0.219 percentile point (no significant effects found for reading). Using student-exam level panel data of national college entrance exam scores in China, Graff Zivin et al. (2020) found that a 1.8 °F (1 °C) higher average exam-period (2 days) ambient temperature reduced performance by 0.34%. Using panel data of individual-level cognitive test scores administered at respondents' homes for adults as well as children as part of a nationally representative biennial longitudinal survey in China, Zhang et al. (2024) found that a test day with an average ambient temperature above 89.6 °F (32 °C), relative to a day in the 71.6 °F–75.2 °F (22 °C–24 °C) range, leads to a reduction in math performance by 6.6% of a standard deviation (no significant effects found for reading).

II. Athletic Performance

Several studies found negative effects of heat exposure on athletic performance, despite this discussion being grouped with studies on mental performance, athletic performance is likely related to both mental and physical performance (Burke et al., 2023, p. 11).

Using athlete-contest level panel data of 3,196 professional archers in China from 2010 to 2016, Qiu and Zhao (2022) found a negative effect of higher daily heat index on performance. Relative to the baseline heat index range of 64.4 °F–71.6 °F (18 °C–22 °C),¹²⁹ the study found that at sample average wind speed of 2.35 meters per second, average score decreased by approximately 3% when the heat index was 78.8 °F–93.2 °F (26 °C–34 °C) and by 10.4% when the heat index exceeded 93.2 °F (34 °C). They also found that the effect of higher heat index on performance was less negative for top performers (defined as athletes whose performance index, defined as their average scores in all contests in previous competitions, exceeds the 90th percentile).

Using athlete-competition level panel data on 3.5 million collegiate track and field performances from 2005 to 2019, Sexton et al. (2022) found a nonlinear relationship between daily average ambient temperature and performance. Performance of sprint and strength events improved with increasing temperatures up to 75 °F (23.9 °C), after which decline in performance was

¹²⁹ To compute heat indices below 80 °F (26.7 °C), Qiu and Zhao (2022) used the following formula: $HI = 0.5 * (T + 61.0 + [(T - 68.0) * 1.2] + RH * 0.094)$, where HI is heat index in Fahrenheit, T is ambient temperature in Fahrenheit, and RH is relative humidity in percentage (p. 1159, footnote 18).

insignificant; on the other hand, performances in endurance events declined significantly when temperatures were above 60 °F (15.6 °C), by 5 percentage points for each 5 °F (2.78 °C) increase in daily average ambient temperature relative to the baseline temperature range of 55 °F–60 °F (12.8 °C–15.6 °C).

Using player-match level panel data on 177,000 tennis matches from 2002 to 2017, Burke et al. (2023) found negative effects of heat exposure on the performance of professional tennis players (e.g., more double faults, more match retirement, shorter rallies, less total distance run). They reported a “roughly 0.5% decline” in player performance per 1.8 °F (1 °C) increase in average ambient temperature of the day of the match. They also found that the effects of heat exposure on performance were less negative for players ranked in the top 10. They also noted that their estimated effect of heat exposure on professional tennis players, which the authors considered as “high-wage settings,” is about “half of the roughly 1.0%” decline in labor productivity per 1.8 °F (1 °C) increase in ambient temperature that they estimated from their meta-analysis of 22 studies. The authors conducted the meta-analysis as part of their literature review of existing evidence of labor productivity effects of heat exposure, which focused on “lower-wage settings.”

III. Workplace Performance

Focusing on studies based on actual office work or laboratory experiments that resemble office work, Seppänen et al. (2006) conducted a meta-analysis of 24 published studies, concluding that performance decreased with a temperature above 73.4 °F to 75.2 °F (23 °C to 24 °C). The tasks analyzed include text processing, simple calculations (addition, multiplication), length of telephone customer service time, and total handling time per customer for call center workers, making them comparable to cognitive tasks conducted in other studies. They estimated a non-linear relationship between performance and heat: performance decreased by 9% at 86 °F (30 °C) compared to an optimal level of 69.8 °F to 71.6 °F (21 °C to 22 °C).

Some studies found evidence that heat exposure affects the mental performance of outdoor workers. Bendak et al. (2022) conducted a longitudinal empirical study to assess how high ambient temperatures affect construction workers’ performance on a variety of tasks measuring reaction time,

finding that task performance was lower in high ambient temperatures.

However, their analysis compared summer and winter months; therefore, the results are possibly confounded by seasonality effects. Similarly, Mazlomi et al. (2017) reported that workplace heat conditions measured by WBGT were negatively correlated with foundry plant workers’ performance in cognitive tests. In contrast, Spector et al. (2018) found no association between maximum work-shift WBGT and post-shift reaction time or postural sway for 46 tree fruit harvesters in Washington State.

D. Economic Output

Studies that documented the economic output effects of heat exposure fall into two groups. The first group of studies directly estimated the effect on heat exposure using plant/firm-level and region-level output data. The second group of studies borrowed heat exposure-work capacity response functions from the occupational health literature (which are derived from empirical data or existing ACGIH/NIOSH/ISO work-rest guidelines) and assumed workers are behaving according to these exposure-response functions.

I. Studies Directly Estimating the Effect on Heat Exposure Using Economic Output Data

Numerous studies in the economics literature found evidence of negative output effects of heat exposure at the plant/firm-level and region-level.

This section does not focus on studies about the effects of higher temperatures on economic output through other channels such as agricultural yield, productivity of capital (e.g., faster depreciation of infrastructure), labor reallocation, energy demand, and international trade.

This section focuses on studies that used panel data to analyze changes (e.g., daily, weekly, quarterly, yearly) in temperature and outcomes of interest across space (e.g., plant/firm, region) and time. By controlling for time-invariant differences across space that may be confounded with temperature, the panel data approach helps to address some concerns over omitted variable bias associated with cross-sectional studies (Auffhammer, 2018, p. 43; Massetti and Mendelsohn, 2018, p. 327).

a. Plant/Firm-Level Output Effects

Several studies found economic output effects of heat exposure using plant/firm-level panel data. Cachon et al. (2012) followed 64 automobile manufacturing plants in the U.S. from

1994 to 2005 and found that a week with six or more days with a daily maximum ambient temperature exceeding 90 °F (32.2 °C) reduced weekly production by 8%. The findings control for potential confounders such as changes in national demand and seasonality in demand for specific types of automobiles. However, the data did not allow the study to distinguish the contribution of labor productivity and labor supply. Information on the extent of indoor climate controls in these manufacturing plants was also not available.

Somanathan et al. (2021) estimated the output effects of heat exposure at different levels of aggregation (worker, plant, district) and found that their estimated effects are all of similar magnitude. Using daily worker-level production data from selected manufacturing firms in India, they found that daily output per worker declined in higher outdoor temperatures, falling 2.7% per 1.8 °F (1 °C) increase in daily maximum ambient temperature above 77 °F (25 °C) (this study was also mentioned above in section VIII.I.II.B.1.). Using annual plant-level output data from a nationally representative panel of manufacturing plants in India, they found that annual plant-level output (measured by value added, defined as the difference between total output and the value of intermediate inputs) decreased by 2.1% per 1.8 °F (1 °C) increase in the annual average of the daily maximum ambient temperature. Under the specification of the Cobb-Douglas function, they reported that changes in labor input as opposed to capital input explains these declines in plant-level output.¹³⁰ Using annual district-level manufacturing sector GDP data from a sample of 438 districts in India, they found that annual district-level manufacturing output decreased by 3.5% per 1.8 °F (1 °C) increase in the annual average of the daily maximum ambient temperature. The authors further noted that the magnitude of their estimated effects mirrored the country-level estimates of output effects in the literature (country-level studies are described in more detail in section VIII.I.II.D.1.b., below), which they interpreted as evidence heat exposure affects output through labor productivity.

¹³⁰ Assuming the specification of the Cobb-Douglas production function, Somanathan et al. (2021) also found that changes in labor input (measured by number of full-time workers) as opposed to capital input (measured by net value of equipment of machinery at the start of each year) explained the negative effect of higher temperature on plant-level output.

Using daily production line-level data from garment factories around Bangalore, India, Adhvaryu et al. (2020) found that production line efficiency (measured as ratio of realized output to target output) decreased in higher outdoor temperatures, by 2.1% for per 1.8 °F (1 °C) increase in daily average WBGT above 66.2 °F (19 °C). They did not find significant effects of higher temperatures on worker attendance, providing further support that labor productivity effects were likely the reason behind the observed relationship. Using annual firm-level data from the annual survey of industrial firms that are “above-scale” (with sales over a certain threshold) in China from 1998 to 2007 and assuming the specification of the Cobb-Douglas function, Zhang et al. (2018) found an inverted U-shaped relationship between temperature and total factor productivity (TFP) and output in the Chinese manufacturing sector. They found that, relative to a year with an extra day of average ambient temperature of 50 °F–60 °F (10 °C–15.6 °C), a year with an extra day over 90 °F (32.2 °C) had lower annual firm-level TFP by 0.56% and lower firm-level output (measured by value added, defined as the difference between total output and the value of intermediate inputs) by 0.45%. They also found that the TFP effects and output effects of temperature are of similar magnitude for both labor-intensive and capital-intensive firms, suggesting that both labor productivity and capital productivity were affected by heat exposure.

Using the same dataset as Zhang et al. (2018), Chen and Yang (2019) found that a 1.8°F (1°C) increase in the average summer temperature (3-month average of daily average ambient temperatures for months June through August) decreased value added per worker by 3.4% to 4.5%. They also found two potential channels through which higher temperatures reduce output: decrease in firm investment and increase in inventory levels.

Using annual firm-level data on revenue per worker in the manufacturing and services sectors from 15 developed and developing countries, Nath (2020) found a stronger negative effect of an extra hot day (a day with maximum ambient temperature of 104 °F (40 °C) relative to a day of 86 °F (30 °C)) on annual revenue per worker for poorer countries (*i.e.*, lower purchasing power parity (PPP)-adjusted GDP per capita). They also found that the decline in revenue per worker was driven by changes in both the numerator (annual revenue) and denominator (annual

employment), where the change in the numerator was greater than that of the denominator.

There are several caveats with studies reporting plant/firm-level output effects of heat exposure. First, although some studies identified labor productivity as the main mechanism for their findings (Somanathan et al., 2021; Adhvaryu et al., 2020; Nath, 2020), the literature overall is inconclusive regarding the extent to which the effects are driven by labor productivity (versus other channels such as labor supply and capital).

Second, some studies used outdoor heat conditions as a proxy for indoor heat conditions to estimate the labor productivity effects of heat exposure in indoor work settings. However, indoor heat conditions may not be perfectly correlated with outdoor heat conditions, especially with the presence of heat-generating lighting and machines and the unknown extent of indoor climate controls (Cachon et al., 2012; Adhvaryu et al., 2020).¹³¹

b. Region-Level Output Effects

Several studies found economic output effects of heat exposure using region-level panel data. Some studies used county-level or State-level panel data to estimate the effects of heat on economic output. Deryugina and Hsiang (2014) used U.S. county-level panel data of annual total personal income per capita and daily weather from 1969 to 2011 to find that average per-day personal income per capita declines 1.68% per 1.8 °F (1 °C) increase in daily average ambient temperature above 59 °F (15 °C). Behrer and Park (2017) used U.S. county-level panel data of annual non-agricultural payroll per capita and daily weather from 1986 to 2011 to find that an additional hot day (a day of daily maximum ambient temperature above 95 °F (35 °C) relative to a day of 70 °F–79 °F (21.1 °C–26.1 °C)) reduced annual payroll per capita by 0.04%. Colacito et al. (2019) used U.S. State-level panel data of State GDP (*i.e.*, gross State product) and daily weather to find that annual growth rate of a State's output declined by 0.15–0.25 percentage point per 1 °F (0.56 °C) increase in the average summer ambient temperature (three-month average of daily average ambient temperatures for months July through September).

¹³¹ Using indoor temperature data that was not available during the period when labor productivity effects were analyzed and was available only afterwards, Adhvaryu et al. (2020) reported a high but imperfect pass-through of 79% of outdoor ambient temperature to indoor ambient temperature.

Some studies used country-level panel data to estimate the effects of heat on economic output. Hsiang (2010) found for a panel of 28 Caribbean-Basin countries from 1970 to 2006 that annual output decreased by 2.4% per 1.8 °F (1 °C) increase in the average annual ambient temperature and the effects were driven by temperature changes during the hottest season (September through November). Furthermore, the study highlighted the similarity between their estimated output effects of temperature and the worker productivity effects of temperature reported in the “ergonomics and physiology” literature as evidence for labor productivity being an important channel underlying the economic effects of heat exposure. Dell et al. (2012) found for a panel of 124 countries from 1950 to 2003 that higher temperatures affected growth rates as well as level of output, but only in poor countries, defined as “having below-median PPP-adjusted per capita GDP in the first year the country enters the dataset.” They found that 1.8 °F (1 °C) higher annual average ambient temperature in poor countries was associated with 2.04% lower annual average growth in industrial output (growth in value added in mining, manufacturing, construction, electricity, water, and gas sectors). Some studies also found a nonlinear effect of temperature on economic output, implying that higher temperature negatively affects poor countries that tend to be hot and positively affects rich countries that tend to be cold (Heal and Park, 2016, p. 356). Heal and Park (2013) found for a panel of 134 countries from 1950 to 2006 that the response of annual real GDP per capita to annual average ambient temperature is nonlinear, that is, an inverted U-shaped response peaking at around 59 °F–68 °F (15 °C–20 °C). Burke et al. (2015) found for a panel of 166 countries from 1960 to 2010 an inverted U-shaped response of annual average GDP per capita to annual average temperature peaking at 55.4 °F (13 °C).

There are several caveats with studies reporting region-level output effects of heat exposure.

First, there is uncertainty regarding the extent to which labor productivity alone can explain the decline in output due to heat exposure (Lai et al., 2023). On the one hand, several studies highlighted labor productivity as an important if not the main channel through which heat exposure negatively affects output (*e.g.*, Hsiang, 2010; Somanathan et al., 2021; Dell et al., 2014). On the other hand, due to the less frequent measurements of output (*e.g.*,

weekly, monthly, yearly), it is unclear if the results were driven by reductions in labor supply, labor productivity, labor demand, capital productivity, firm investment, increase in firm costs, or “some combination of all of these” (Behrer et al., 2021). For example, the estimated changes in output could be capturing demand-side factors either positively or negatively correlated with temperature (e.g., demand for ice cream increases with temperature; demand for outdoor recreation decreases with temperature) (Behrer and Park, 2017, p. 16). Changes in payroll may also not necessarily capture only changes in labor productivity but also capture changes in labor supply and increased firm costs (e.g., increased costs due to higher utilization of air-conditioning reducing firm profits or net income) (Behrer and Park, 2017, p. 13).

Second, although some of these studies found effects of heat-exposure on nonagricultural output, these observed associations may be in part due to the non-agricultural sectors facing less demand as a spillover effect of agricultural yield reductions from the agricultural sector (Dell et al., 2012, p. 85; Heal and Park, 2016, p. 9).

II. Studies Borrowing Exposure-Response Functions From Occupational Health Literature

Section VIII.I.II.D.II. discussed studies that directly estimated the relationship between heat exposure and economic output and tried to uncover the underlying the potential mechanisms such as labor productivity.

This section discusses other studies that borrowed heat exposure-work capacity response (exposure-response) functions that were derived by existing studies in the occupational health literature. Applying these functions to the worker population of interest (e.g., outdoor workers nationwide), these studies derived economy-wide labor productivity loss and the associated economic cost in terms of lost wages or lost output.

As discussed in the section VIII.I.II.B.I.a., exposure-response functions in the occupational health literature fall into two groups. The first group of exposure-response functions are based on empirical data (e.g., Hothaps function derived in Kjellstrom et al., 2014; PWC function derived in Foster et al., 2021). The second group of exposure-response functions are based on recommended work-rest ratios in existing work-rest guidelines by NIOSH, ACGIH, and ISO (e.g., Kjellstrom et al., 2009b; Dunne et al., 2013).

These empirically-derived or guideline-based exposure-response

functions from the occupational health literature were applied by several studies to macroeconomic data and models to estimate the economic impact of heat exposure. These studies fall into three groups: the first group of studies (e.g., Orlov et al., 2019; Morabito et al., 2020; Nelson et al., 2024) borrowed the empirically-derived functions; the second group of studies (e.g., DARA, 2012; Vanos et al., 2019; Takakura et al., 2017; Atlantic Council, 2022; de Lima et al., 2021) borrowed the guideline-based functions; and the third group of studies (e.g., Kjellstrom et al., 2018; ILO, 2019; Atlantic Council, 2021; Romanello et al., 2023; Dasgupta et al., 2021) borrowed and combined empirically-derived functions with the guideline-based functions.

There are some caveats with studies relying on existing exposure-response functions to estimate the economic impact of heat exposure. First, empirically-derived exposure-response functions are context-specific (e.g., the Hothaps function is based on data from acclimatized outdoor workers in hotter regions; the PWC function is based on data from unacclimatized young adults in indoor climatic chambers). Studies relying on empirically-derived functions are effectively assuming that the average worker behaves as predicted by these context-specific functions.

Second, existing work-rest guidelines were designed to increase work-rest ratios to minimize heat-related illnesses (Borg et al., 2021, p. 12) and were never intended to estimate the casual effect of heat exposure on work capacity (Foster et al., 2021, p. 1216). Studies relying on guideline-based exposure-response functions effectively assumed that the average worker behaves according to the recommended work-rest ratios. Therefore, these studies reported larger economic costs associated with lost work capacity from heat than what is reported by empirical studies (Borg et al., 2021, p. 12).

E. Worker Utility

Higher temperatures not only reduce labor supply and labor productivity, but also “cause discomfort” (Graff Zivin and Neidell, 2014, p. 1) or “make work more arduous” for those able to work (Rode et al., 2022, p. 3). Several studies have indeed found evidence that workers dislike working in the heat, suggesting the negative effects of heat exposure on worker utility.

Some studies found evidence of the negative effect of heat exposure on worker utility based on worker surveys. Krishnamurthy et al. (2017) reported that about a quarter of surveyed steel factory workers in India reported social

impacts on their personal lives attributable to occupational heat stress. Reported impacts include the time and resources spent coping with the heat and the excessive exhaustion impeding the engagement in family and social interactions outside work. Such responses highlight a potential mechanism through which heat increases disutility of labor. LoPalo (2023) also found that in higher temperatures, household survey interviewers worked longer hours (by starting earlier in the day and spending more time on each interview) to avoid working during hotter times of the day and to also meet their daily target number of completed interviews, suggesting a loss in the welfare of the interviewer through a loss of leisure hours.

Some workers even reported intentions to change jobs due to heat exposure, as expressed in an online survey conducted by Zander et al. (2015), showing that 27% of the surveyed Australian workers exposed to heat said they would eventually change jobs because of heat at their workplace. In contrast, only 8% of the surveyed workers who are sometimes exposed to heat said they considered this option, and those rarely exposed only expressed this 2% of the time. On the other hand, Kahn (2016) highlighted an example of market failure where employers having monopsony power in local labor markets can still hire workers at low wages for “unpleasant” jobs exposed to heat without adequate worker protection measures in place, such as large warehouses without air-conditioning (p. 171).

Interpreting their empirically-estimated decline in labor supply in higher temperatures as workers choosing to work less in the heat at the cost of foregoing pay (discussed above in section VIII.I.II.A.), Rode et al. (2022) derived the willingness-to-pay to avoid the increased disutility of working in higher temperatures (defined as the increase in the wage rate that is needed to offset the increased disutility of labor).

F. Summary of Section VIII.I.II

The literature documents effects of heat exposure on outcomes with economic consequences. Effects are observed in a variety of occupational settings, suggesting that the effects of heat exposure are widespread across a broad range of tasks that rely on physical or cognitive skills and that heat exposure affects workers in both indoor and outdoor settings. In particular, the literature recognizes labor productivity as a potential channel through which

heat exposure affects economic outcomes.

III. Workplace Characteristics and Labor Productivity Effects of Heat Exposure

The literature's varying estimates of the effect of heat exposure on labor productivity could be attributed to differences in workplace characteristics, such as incentive structures and availability of adaptation measures (Park et al., 2021, p. 8, footnote 13). These workplace characteristics should be considered when interpreting the variation in estimates of the labor productivity-related effects of heat exposure in the literature (Heal and Park, 2016, p. 350). This section focuses on studies that reported labor productivity (discussed in section VIII.I.II.B., above) but also includes some studies that are potentially related to labor productivity, such as studies on mental performance (discussed in section VIII.I.II.C., above) or studies on economic output effects that are potentially linked to labor productivity (discussed in section VIII.I.II.D.I., above).

A. Incentive Structures

Depending on the physical and behavioral aspects of the workplace, workers and management could be incentivized to change the level of effort, affecting the estimated labor productivity effect of heat exposure. Workplace factors that affect incentives include wage structure (e.g., piece-rate, hourly rate, annual salary), management techniques, mechanization, and other factors not accounted for by laboratory studies (Somanathan et al., 2021).

One of the most analyzed workplace factors in the literature is piece-rate pay. Quiller et al. (2017) found null effects of heat on labor productivity (measure by weight of fruit bins collected per hour) for a sample of piece-rate paid tree fruit harvesters in Washington State, after adjusting for confounders such as price paid per bin and shift duration. Mitchell et al. (2018) used accelerometer data from farm workers in California to find, even after adjusting for confounders, negative effects of heat on labor productivity (measured by physical activity intensity, *i.e.*, step counts per minute, converted into metabolic equivalents) and that the effects were less negative for male workers paid by piece-rate. Such small or zero labor productivity effects could reflect compensatory effort on part of workers incentivized to be as productive as possible, the health and safety consequences of which should not be overlooked (Park et al., 2021, p. 8, footnote 13). Piece-rate workers being

incentivized to work fast and take few rest breaks even under heat exposure have been evidenced in focus group discussions with U.S. farmworkers (Wadsworth et al., 2019; Lam et al., 2013).

Several studies also found that, due to physiological constraints, piece-rate workers cannot increase their effort infinitely in the heat. Stevens (2017) found that higher piece-rates induced increases in labor productivity of blueberry pickers in California at ambient temperatures below 60 °F but not at higher temperatures. Masuda et al. (2021) also found in a field experiment in Indonesia that increasing the piece-rate did not increase effort, as measured by the proportion of time spent in moderate and vigorous activity through an accelerometer. This evidence is consistent with workers facing binding physiological constraints that prevent them from exerting additional effort in response to higher piece-rates at high temperatures.

In their findings of the labor productivity effects of environmental conditions, some studies also addressed the possibility that piece-rate workers' labor productivity could decline further if they are subject to State minimum wage laws (e.g., Stevens, 2017 in the context of heat; Graff Zivin and Neidell, 2012 in the context of ozone pollution). Hypothetically, compared to when not guaranteed a minimum wage, higher temperatures could lead piece-rate workers to exert less effort and therefore result in greater decline in labor productivity.

From data on Demographic and Health Surveys (DHS) interviewers from 46 developing countries, LoPalo (2023) found nuanced adjustments in effort by DHS interviewers. DHS interviewers are paid a fixed daily wage (*i.e.*, not piece-rate) but are still monitored by supervisors to ensure they meet the target number of completed interviews. Under this contractual structure, higher temperatures result in lower labor productivity in terms of number of completed interviews per hour—interviewers are able to maintain the same daily number of completed interviews but at the cost of a longer shift from trying to avoid working in the heat (by starting work earlier and spending more time on each interview). They also found that data quality problems (e.g., missing responses) become more frequent on hotter days, suggesting that workers shift effort away from production quality, which is less noticeable to supervisors, to production quantity, which is more noticeable.

B. Adaptation

Regarding adaptation measures¹³² alleviating the negative labor productivity-related effects of heat exposure, the most analyzed in the literature are the adoption of engineering controls. Using microdata from selected manufacturing plants in India, Somanathan et al. (2021) found that climate controls in the workplace eliminated declines in labor productivity due to elevated temperatures but did not eliminate declines in labor supply (based on worker attendance records). The authors conjectured declines in labor supply persisted despite climate-controlled conditions at work because workers presumably continued to be exposed to high temperature at home and outside. Adhvaryu et al. (2020) found in line-level production data from Indian garment factories that the introduction of LED lighting (that replaced compact fluorescent lighting which generates more heat) helped to alleviate the negative effect of high outdoor temperatures on production line efficiency. Using panel data of individual-level cognitive test scores administered at respondents' homes for adults as well as children as part of a

¹³² Some studies reporting economic output effects (discussed above in section VIII.I.II.D.I.) found heterogeneous effects of temperature depending on regional climate. They found that hotter regions displayed smaller declines in output to higher temperatures, suggesting that their findings could reflect adaptation in these regions. For example, Chen and Yang (2019) found lower sensitivity in the response of value added per worker to higher temperatures among plants associated with a single firm in warmer locations in China and raised the possibility of adaptation measures such as avoiding work during hottest times of the day playing a role. Zhang et al. (2023) used Chinese province-level panel data of construction labor productivity (defined as the ratio of the total value of output to the number of laborers in construction enterprises) and quarterly weather to find an inverted U-shaped relationship between quarterly construction labor productivity and quarterly average ambient temperature that peaked at higher temperatures in hotter regions (79.25 °F (26.25 °C) in eastern regions versus 68 °F (20 °C) for central and western regions). They conjectured that workers in hotter regions are more adapted to high temperatures so that the peak temperature after which their labor productivity started to decline was higher. Behrer and Park (2017) used U.S. county-level panel data of annual non-agricultural payroll per capita and daily weather to find that the negative effect of an additional hot day on annual payroll per capita was smaller in hotter counties (in the top quartile of the U.S. average ambient temperature distribution). They suggested that such attenuated effects of heat exposure in hotter regions can be explained by the larger presence of air-conditioning in these regions, as evidenced by region-level data on percentage of households and commercial buildings with air-conditioning. Heal and Park (2013) also found in country-level panel data that annual real GDP per capita was less negatively affected by heat exposure in hot countries where air-conditioning was more prevalent.

nationally representative biennial longitudinal survey in China, Zhang et al. (2024) found that their estimated effect of higher temperatures on math test scores was less negative by 36.6% for households with air-conditioning.

Some studies that found negative effects of heat exposure on athletic performance also evaluated the effects of acclimatization.¹³³ Using athlete-competition level panel data on collegiate track and field performances, Sexton et al. (2022) found that hotter average ambient temperatures at the home institution in the week prior to the competition (“precompetition temperatures”) mitigated performance loss from high competition temperatures. They reported that for hot competitions with daily average ambient temperatures exceeding 70 °F (21.1 °C), performance loss from high competition temperature decreases by 1.6%–3.5% per 1.8 °F (1 °C) increase in temperature difference between the precompetition and competition temperatures. On the other hand, using athlete-contest level panel data of Chinese professional archers, Qiu and Zhao (2022) did not find evidence that heat exposure within several months prior to a competition improved competition performance in the heat. Qiu and Zhao (2022) however found evidence of benefits of “longer-term acclimatization”; athletes that trained in the southern provinces of China, where hot days are more common, were less affected by heat exposure than those trained in the northern provinces. From player-match level panel data of professional tennis players, Burke et al. (2023) also did not find evidence of benefits of acclimatization; players who played their previous match in higher temperatures did worse in their current match. Burke et al. (2023) also did not find evidence of benefits of “long-term exposure to heat”; players born or residing in locations of higher temperatures did not appear to be less affected by higher temperatures during the match. Burke et al. (2023) conjectured that their lack of evidence of benefits of acclimatization compared to Sexton et al. (2022) could be because their proxy of acclimatization captured players playing an actual match in high temperatures, while acclimatization could be “more effective during

repeated episodes of more restrained effort, as emphasized in most sports heat acclimatization protocols (p. 12).”

C. Summary of Section VIII.I.III

To summarize, workplace incentives and availability of adaptation measures affect the estimated labor productivity-related effects of heat exposure documented in the literature.

IV. Conclusion

The available literature on the effects of heat exposure on non-health outcomes suggests that heat exposure can lead to decreased labor productivity as well as to reduced labor supply, mental performance, economic output, and worker utility. It also indicates that existing workplace characteristics such as incentive structures and adoption of adaptation measures should be considered when evaluating these negative non-health consequences of heat exposure.

J. Appendix C. Heat Exposure Methodology Used in Distributional Analysis

The following steps were taken to quantify the fraction of workers benefiting from the proposed standard in different demographic and economic categories.

I. ACS Data Processing

The analysis uses data from the Census Bureau’s American Community Survey (ACS) from 2018 to 2022 (Ruggles et al., 2024). 2022 is the most recent available year of ACS data. ACS data provide worker-level information on demographic and economic characteristics. The following demographic and economic characteristics are recorded in the ACS: age; race and ethnicity; sex; total family income; industry; occupation; the presence of a disability related to cognition, physical activity, mobility, self-care, vision, or hearing; and U.S. citizenship. In addition, LGBTQ+ status was inferred from cases where an individual was living (married or unmarried) with a same-sex partner.

Only data for employed workers 16 years or older was used. The ACS variables were processed as follows. Age was grouped into 10-year bins (with age 65+ as the top bin). Race and ethnicity variables were coded into the groups

Hispanic, Black, Asian (including Pacific Islander), White (non-Hispanic), and other groups. Total family income was converted into deciles. Presence of a disability was coded into a single indicator variable for the presence of any disability. Sex and the presence of a same-sex partner required no further processing.

II. Merging ACS Data With Heat Exposure Measures

Calculations of workers likely to be affected by the proposed standard from Section VIII.B., Profile of Affected Industries were next merged with the ACS data. Fractions of workers exposed to heat by industry and occupation was used. In Section VIII.B., Profile of Affected Industries, exposure was calculated at the 4-digit NAICS level and with detailed (6-digit) SOC codes. To consistently merge with the ACS, these affected workers were aggregated to the 2-digit NAICS code by 4-digit SOC code level.¹³⁴ The aggregation was done by calculating weighted average fraction of workers exposed to heat in outdoor settings and indoor settings (separately due to process heat or inadequate climate control) in each industry-occupation pair. The weights were number of workers in each 4-digit by 6-digit category, as calculated in Section VIII.B., Profile of Affected Industries. The worker-level ACS data were then merged with the industry-by-occupation exposure fractions.

III. Calculate Exposure by Demographic and Economic Group

For each dimension of heterogeneity described above, the average share of exposed workers was calculated. The average exposure was weighted by the person-weights in the ACS to generate representative values for the U.S.

The result is a figure like figure VIII.J.1. shown below. The figure shows the percent of workers exposed to outdoor heat across total family income deciles. The deciles are given on the x-axis along with the range of income they represent, and the y-axis is the percentage of workers. The figure VIII.J.1. shows that about 13 percent of workers in low-income deciles are exposed to outdoor heat on the job while about 7 percent of workers in the highest income decile are exposed.

¹³³ In the context of labor supply, Graff Zivin and Neidell (2014) found that their estimated negative effect of heat exposure on labor supply was smaller in August compared to June, suggesting that workers became less sensitive to heat exposure as higher temperatures became more common. As another test for effects of acclimatization, they also found that the negative effect of heat exposure on labor supply was smaller in “warm counties”

compared to “cool counties” (defined as counties in the highest and lowest third of historical July–August temperatures, respectively), although the estimated difference was not statistically significant.

¹³⁴ ACS includes 4-digit NAICS codes and detailed (6-digit) SOC codes for some industries and occupations. However, given that ACS uses

different industry and occupation definitions than NAICS and SOC, many industries and occupations are only consistently coded at the 2- or 4-digit level respectively. For example, in the ACS, all construction workers are only classified at the 2-digit NAICS level (NAICS 23). Aggregation to the 2-digit NAICS code and 4-digit SOC code level ensures consistency across workers.

Figure VIII.J.1. Example of Workers with Heat Exposure in Outdoor Work Settings by Total Family Income Decile

K. Appendix D. Definitions of Core Industry Categories Used in Cost Analysis

TABLE VIII.K.1—IN-SCOPE CORE INDUSTRIES BY CORE INDUSTRY CATEGORIES

Core industry category	4-Digit NAICS	NAICS title
Agriculture, Forestry, and Fishing	111100	Oilseed and Grain Farming.
Agriculture, Forestry, and Fishing	111200	Vegetable and Melon Farming.
Agriculture, Forestry, and Fishing	111300	Fruit and Tree Nut Farming.
Agriculture, Forestry, and Fishing	111400	Greenhouse, Nursery, and Floriculture Production.
Agriculture, Forestry, and Fishing	111900	Other Crop Farming.
Agriculture, Forestry, and Fishing	112100	Cattle Ranching and Farming.
Agriculture, Forestry, and Fishing	112200	Hog and Pig Farming.
Agriculture, Forestry, and Fishing	112300	Poultry and Egg Production.
Agriculture, Forestry, and Fishing	112400	Sheep and Goat Farming.
Agriculture, Forestry, and Fishing	112500	Aquaculture.
Agriculture, Forestry, and Fishing	112900	Other Animal Production.
Agriculture, Forestry, and Fishing	113100	Timber Tract Operations.
Agriculture, Forestry, and Fishing	113200	Forest Nurseries and Gathering of Forest Products.
Agriculture, Forestry, and Fishing	113300	Logging.
Agriculture, Forestry, and Fishing	114100	Fishing.
Agriculture, Forestry, and Fishing	114200	Hunting and Trapping.
Agriculture, Forestry, and Fishing	115100	Support Activities for Crop Production.
Agriculture, Forestry, and Fishing	115200	Support Activities for Animal Production.
Agriculture, Forestry, and Fishing	115300	Support Activities for Forestry.
Building Materials and Equipment Suppliers	423300	Lumber and Other Construction Materials Merchant Wholesalers.
Building Materials and Equipment Suppliers	423700	Hardware, and Plumbing and Heating Equipment and Supplies Merchant Wholesalers.
Building Materials and Equipment Suppliers	423900	Miscellaneous Durable Goods Merchant Wholesalers.
Building Materials and Equipment Suppliers	444100	Building Material and Supplies Dealers.
Building Materials and Equipment Suppliers	532400	Commercial and Industrial Machinery and Equipment Rental and Leasing.
Commercial Kitchens	311800	Bakeries and Tortilla Manufacturing.
Commercial Kitchens	722300	Special Food Services.
Commercial Kitchens	722400	Drinking Places (Alcoholic Beverages).
Commercial Kitchens	722500	Restaurants and Other Eating Places.
Construction	236100	Residential Building Construction.
Construction	236200	Nonresidential Building Construction.
Construction	237100	Utility System Construction.
Construction	237200	Land Subdivision.
Construction	237300	Highway, Street, and Bridge Construction.
Construction	237900	Other Heavy and Civil Engineering Construction.
Construction	238100	Foundation, Structure, and Building Exterior Contractors.
Construction	238200	Building Equipment Contractors.
Construction	238300	Building Finishing Contractors.

TABLE VIII.K.1—IN-SCOPE CORE INDUSTRIES BY CORE INDUSTRY CATEGORIES—Continued

Core industry category	4-Digit NAICS	NAICS title
Construction	238900	Other Specialty Trade Contractors.
Construction	541300	Architectural, Engineering, and Related Services.
Drycleaning and Commercial Laundries	812300	Drycleaning and Laundry Services.
Landscaping and Facilities Support	561200	Facilities Support Services.
Landscaping and Facilities Support	561700	Services to Buildings and Dwellings.
Landscaping and Facilities Support	561900	Other Support Services.
Landscaping and Facilities Support	812200	Death Care Services.
Landscaping and Facilities Support	812900	Other Personal Services.
Maintenance and Repair	811100	Automotive Repair and Maintenance.
Maintenance and Repair	811300	Commercial and Industrial Machinery and Equipment (except Automotive and Electronic) Repair and Maintenance.
Maintenance and Repair	811400	Personal and Household Goods Repair and Maintenance.
Manufacturing	311100	Animal Food Manufacturing.
Manufacturing	311200	Grain and Oilseed Milling.
Manufacturing	311300	Sugar and Confectionery Product Manufacturing.
Manufacturing	311400	Fruit and Vegetable Preserving and Specialty Food Manufacturing.
Manufacturing	311500	Dairy Product Manufacturing.
Manufacturing	311600	Animal Slaughtering and Processing.
Manufacturing	311700	Seafood Product Preparation and Packaging.
Manufacturing	311900	Other Food Manufacturing.
Manufacturing	312100	Beverage Manufacturing.
Manufacturing	312200	Tobacco Manufacturing.
Manufacturing	313100	Fiber, Yarn, and Thread Mills.
Manufacturing	313200	Fabric Mills.
Manufacturing	313300	Textile and Fabric Finishing and Fabric Coating Mills.
Manufacturing	314100	Textile Furnishings Mills.
Manufacturing	314900	Other Textile Product Mills.
Manufacturing	315100	Apparel Knitting Mills.
Manufacturing	315200	Cut and Sew Apparel Manufacturing.
Manufacturing	315900	Apparel Accessories and Other Apparel Manufacturing.
Manufacturing	316100	Leather and Hide Tanning and Finishing.
Manufacturing	316200	Footwear Manufacturing.
Manufacturing	316900	Other Leather and Allied Product Manufacturing.
Manufacturing	321100	Sawmills and Wood Preservation.
Manufacturing	321200	Veneer, Plywood, and Engineered Wood Product Manufacturing.
Manufacturing	321900	Other Wood Product Manufacturing.
Manufacturing	322100	Pulp, Paper, and Paperboard Mills.
Manufacturing	322200	Converted Paper Product Manufacturing.
Manufacturing	323100	Printing and Related Support Activities.
Manufacturing	324100	Petroleum and Coal Products Manufacturing.
Manufacturing	325100	Basic Chemical Manufacturing.
Manufacturing	325200	Resin, Synthetic Rubber, and Artificial and Synthetic Fibers and Filaments Manufacturing.
Manufacturing	325300	Pesticide, Fertilizer, and Other Agricultural Chemical Manufacturing.
Manufacturing	325400	Pharmaceutical and Medicine Manufacturing.
Manufacturing	325500	Paint, Coating, and Adhesive Manufacturing.
Manufacturing	325600	Soap, Cleaning Compound, and Toilet Preparation Manufacturing.
Manufacturing	325900	Other Chemical Product and Preparation Manufacturing.
Manufacturing	326100	Plastics Product Manufacturing.
Manufacturing	326200	Rubber Product Manufacturing.
Manufacturing	327100	Clay Product and Refractory Manufacturing.
Manufacturing	327200	Glass and Glass Product Manufacturing.
Manufacturing	327300	Cement and Concrete Product Manufacturing.
Manufacturing	327400	Lime and Gypsum Product Manufacturing.
Manufacturing	327900	Other Nonmetallic Mineral Product Manufacturing.
Manufacturing	331100	Iron and Steel Mills and Ferroalloy Manufacturing.
Manufacturing	331200	Steel Product Manufacturing from Purchased Steel.
Manufacturing	331300	Alumina and Aluminum Production and Processing.
Manufacturing	331400	Nonferrous Metal (except Aluminum) Production and Processing.
Manufacturing	331500	Foundries.
Manufacturing	332100	Forging and Stamping.
Manufacturing	332200	Cutlery and Handtool Manufacturing.
Manufacturing	332300	Architectural and Structural Metals Manufacturing.
Manufacturing	332400	Boiler, Tank, and Shipping Container Manufacturing.
Manufacturing	332500	Hardware Manufacturing.
Manufacturing	332600	Spring and Wire Product Manufacturing.
Manufacturing	332700	Machine Shops; Turned Product; and Screw, Nut, and Bolt Manufacturing.
Manufacturing	332800	Coating, Engraving, Heat Treating, and Allied Activities.
Manufacturing	332900	Other Fabricated Metal Product Manufacturing.
Manufacturing	333100	Agriculture, Construction, and Mining Machinery Manufacturing.
Manufacturing	333200	Industrial Machinery Manufacturing.

999300	Local Government.

IX. Technological Feasibility

A. Introduction

The Occupational Safety and Health Administration (OSHA) is proposing a *Heat Injury and Illness Prevention* standard that will require employers, whose employees are occupationally exposed to hazardous heat, to develop and implement a heat injury and illness prevention plan. As part of the plan,

this proposed standard will require employers to implement control measures to mitigate the risk to workers from occupational exposure to heat when temperatures exceed specified triggers.

As discussed in Section II., Pertinent Legal Authority, OSHA must prove, by substantial evidence in the rulemaking record, that its standards are technologically and economically

feasible, which the Supreme Court has defined as “capable of being done, executed, or effected” (*American Textile Mfrs. Inst. v. Donovan (Cotton Dust)*, 452 U.S. 490, 508–09 (1981)). A standard is technologically feasible if the protective measures it requires already exist, can be brought into existence with available technology, or can be created with technology that can reasonably be expected to be developed

(*United Steelworkers v. Marshall (Lead I)*, 647 F.2d 1189, 1272 (D.C. Cir. 1980), *cert. denied*, 453 U.S. 913 (1981); *Am. Iron & Steel Inst. v. Occupational Safety & Health Admin. (Lead II)*, 939 F.2d 975, 980 (D.C. Cir. 1991)). OSHA has reviewed the requirements that would be imposed by the proposed Heat Injury and Illness Prevention standard and assessed the technological feasibility of complying with its requirements. As a result of this review, OSHA has preliminarily determined that achieving compliance with the proposed standard is technologically feasible.

B. Methodology

For this proposed standard, OSHA evaluated the provisions to identify which requirements proposed the implementation of engineering control measures or would address facility and equipment related aspects of heat illness prevention, as opposed to those that would establish programs, processes, or procedures. OSHA also reviewed the workplace control practices currently in place across the affected industries as well as the recommended practices of

industry trade associations and standards-setting organizations.

For this technological feasibility analysis, OSHA grouped establishments by indoor work settings based on the similarity of worker exposure sources (*i.e.*, equipment or processes that generate heat versus ambient heat) and outdoor work settings, including mobile or transient sites, with exposure primarily to ambient heat and heat-generating processes. These work settings, and examples of occupations found in these settings, are outlined in table IX–1 below.

TABLE IX–1—FACILITY TYPES ANALYZED IN OSHA’S PRELIMINARY TECHNOLOGICAL FEASIBILITY ANALYSIS

Work setting	Heat source	Example facility types/occupations
Indoors	Heat Generating Processes	• Commercial Laundry and Drycleaning • Commercial Kitchens • Foundries • Manufacturing (Paper Mills, Wood Processing, Chemical Processing) • Maintenance and Repair Service • Warehouses
	Ambient Heat	
Outdoors	Ambient Heat at Fixed Locations	• Sales Related Industries • Airline Ground Workers • Building Material and Equipment Suppliers • Maintenance and Repair Service • Recreation and Amusement • Sales Related Industries
	Ambient Heat at Transient and Mobile Work Sites	• Agriculture, Forestry, and Fishing • Construction • Landscaping and Facilities Support • Logging/Forestry • Oil and Gas Extraction and Support Service • Postal and Delivery Services • Sanitation and Waste Removal • Transportation (Land, Water, and Rail), including Scenic and Sightseeing • Telecommunications and Utility Workers
	Heat Generating Processes	• Asphalt Paving • Cement Kilns

C. Environmental Monitoring

The proposed rule includes requirements for employers to monitor environmental conditions in order to determine whether certain controls to protect employees exposed to heat at or above the trigger level, expressed in terms of heat index or wet bulb globe temperature (WBGT), need to be implemented. The proposed rule also requires employers utilizing fans in indoor work areas or break areas to identify any such areas where the ambient temperature (AT) exceeds 102 °F in order to evaluate whether fan use may be harmful. As part of OSHA’s assessment of the technological feasibility of these proposed requirements, the agency must determine whether available methods exist for measuring heat index, WBGT, and AT. As explained below, all three

metrics can be monitored via instruments currently on the market.

I. Heat Index

Heat Index (HI) is meant to reflect the temperature that the body “feels,” by combining ambient temperature and either dew point temperature, or more commonly relative humidity (RH) (Anderson et al., 2013; NWS, 2024c; Steadman, 1979). The underlying formula for heat index is complex and uses several assumptions, including human body mass and height, clothing, amount of physical activity, individual heat tolerance, sunlight and ultraviolet radiation exposure, and wind speed. In the HI formula, the coefficients have been determined through empirical studies and mathematical modeling to approximate how humidity influences the effect of temperature. Different coefficients can vary depending on the

unit of temperature and the formula might differ slightly between regions or meteorological agencies.

While calculating HI involves a fairly complex equation, methods for determining the HI using the ambient temperature (AT) and RH are widely available and simple to use. The most accurate way to determine the HI at work sites is through the use of direct read monitoring devices. These types of devices are readily available on the market (ERG, 2024b). The handheld devices, commonly called heat-stress monitors or heat index monitors, measure the AT, RH, and dew point, and provide the HI. These devices provide real-time, on-site measurements and can be used both indoors and outdoors. Conversely employers could use psychrometers and thermometers to measure AT and RH, then calculate the HI using any of the tools described

below. Both psychrometers and thermometers are available in digital and analog versions. For outdoor work sites, employers could also use local forecast weather data to obtain the AT and RH. This information can then be used to estimate the HI for a particular location using available charts and calculators. However, because local forecast conditions may not reflect actual working conditions indoors, OSHA is not proposing to permit the use of forecast data to determine indoor HI.

The National Weather Service (NWS) has two charts available on their website which employers can use to determine the HI, the Heat Index Chart and the Heat Index Chart for Low Humidity Locations.¹³⁵ The Heat Index Charts can be used for environments with RH ranging from 5% to 100%. To find the HI using the chart the employer must first determine the AT and RH. The HI is located in the cell where the two values meet on the chart. The National Weather Service (NWS) also has a calculator available on their website that allows users to calculate HI by entering in the temperature and humidity or dew point.¹³⁶ However, this calculator notes that results using temperatures and RH outside of the range of the NWS heat index chart may not be accurate.

Another way employers can determine the HI is through the OSHA–NIOSH Heat Safety Tool,¹³⁷ which allows users to access HI data from a mobile phone. The Heat Safety Tool pulls hourly forecasts specific to the inputted outdoor location from the NWS to estimate the local heat index. This tool is available for both Android and Apple mobile devices and can be downloaded from the app stores, as well as the OSHA website. As previously mentioned, while the tool is useful for outdoor work environments, local weather data may not accurately reflect indoor working conditions or situations where heat is also generated as part of the work process.

OSHA has preliminarily concluded that conducting exposure assessments to determine the HI is technologically feasible for most operations, most of the time.¹³⁸ HI is simple, easy-to-understand, and easily accessible. For

indoor workplaces employers will need to take on-site measurements to determine the HI. This can be done using either direct reading instruments currently on the market or by measuring AT and RH with psychrometers and thermometers and using charts or online calculators to calculate the HI. OSHA seeks additional information and comments on the feasibility of measuring HI in different environments, including indoor environments and where heat-generating processes occur.

II. Wet Bulb Globe Temperature (WBGT)

WBGT is a measure of heat exposure that incorporates the impact of sunlight and wind, in addition to temperature and humidity. It was derived in the 1950s to track exposure and limit heat-related illness (HRI) among the U.S. Armed Services (Budd, 2008). WBGT is calculated as the weighted average of globe temperature, wet bulb temperature, and dry bulb temperature, and accounts for AT, RH, wind speed, and solar radiation. WBGTs are measured with specialized equipment currently available on the market.

Indeed, both NIOSH REL's and ACGIH TLV's for heat stress are based on WBGT readings. Also, OSHA currently collects WBGT readings during inspections to evaluate the potential hazard from exposure to heat in accordance with procedures for performing workplace assessments in the OSHA Technical Manual (OTM), section III., chapter 4.

A standard WBGT instrument has a 0.15-meter, or 6-inch, black globe to measure globe temperature and a wetted thermometer to measure the natural wet bulb temperature (Budd, 2008). Various WBGT monitors have been developed, many of which use a smaller black globe and/or a relative humidity sensor in place of a wetted thermometer. Relative humidity measurements are used to calculate wet bulb temperature based on psychometric principles. Some well-known WBGT monitors include the QUESTemp series by TSI and smaller handheld devices such as that made by Kestrel (ERG, 2024b).

Although several accurate WBGT monitoring devices are available, OSHA notes that some lower-cost devices may not be sufficient to accurately measure employees' heat exposure. Non-standard monitors can be found for a lower cost, but they may not fully align with traditional WBGT thermometer measurements. Some devices may be designed to be more conservative in their measurements than others. In a review of WBGT, Budd (2008) identified key limitations of this standard equipment to measure WBGT. Four of

the main concerns were inconsistent equilibration times, insufficiently robust calibration procedures, and the use of non-standard globe thermometers and natural wet bulb thermometers. Smaller bulbs typically result in shorter equilibration times, which make readings more sensitive to short-term changes in environmental conditions than larger bulbs. However, few peer-reviewed studies have been published evaluating these potential sources of error and OSHA anticipates technology has likely improved since Budd's evaluation in 2008. Given these technical considerations—including equilibration times and the need for robust calibration procedures—the use of WBGT on-site will require training to properly operate. The extent of the training would vary depending on the type of monitor.

OSHA has preliminarily determined that instruments to accurately monitor WBGT are commercially available. OSHA seeks additional comments on the use of WBGT and to identify situations in which WBGT would or would not be practical or pose challenges for employers to measure.

III. Ambient Temperature (AT)

AT is the air temperature measured using a thermometer. The primary types of thermometers used for measuring AT are liquid-in-glass thermometers, electrical thermocouples, and resistance thermometers (thermistors). Each of these types of thermometers are commercially available in a wide variety of designs. The States with permanent outdoor occupational heat standards, California and Washington, currently use fixed value thresholds of AT, further indicating the feasibility of this metric (California Occupational Safety & Health Administration, 8 CCR 3395; Washington Division of Occupational Safety and Health, WA Admin. Code 296–62–095). Based on the widespread public availability of thermometers to measure AT, OSHA has preliminarily determined that it is technologically feasible for employers to assess AT in their workplace.

IV. Preliminary Findings on Environmental Monitoring

Several different types of instruments and methods to determine the Heat Index and WBGT are commercially available. These include the Kestrel and QuesTemp currently used by OSHA, in addition to various mobile device applications supported by NWS and NIOSH. At outdoor work sites, employers have the option of tracking local heat index forecasts provided by the NWS or other reputable sources in

¹³⁵ The NWS charts contain risk categories that may not align with the proposed rule as OSHA is not relying on the risk categories noted in the chart.

¹³⁶ <https://www.wpc.ncep.noaa.gov/html/heatindex.shtml>.

¹³⁷ <https://www.osha.gov/heat/heat-app>.

¹³⁸ OSHA notes that Oregon currently uses HI thresholds in its state standard, which is further evidence that the measurements are feasible. OR Admin. Code 437–002–0156 (indoor and outdoor) and 437–004–1131 (agriculture).

lieu of measuring for Heat Index or WBGT. In addition, thermometers to measure AT are widely available. Because the technology necessary to comply with the proposed standard currently exists and is commercially available, OSHA preliminarily concludes that the proposed standard's monitoring requirements are technologically feasible.

D. Engineering Controls

Engineering controls are measures that reduce, isolate, or remove a hazard from the workplace. These engineering controls can be used to reduce exposure to heat without relying on changes in employee behavior. Therefore, engineering controls are often the most effective type of control to address workplace hazards and can also be a cost-effective layer of protection. The following are some examples of engineering controls that may reduce heat stress:

- Use air-conditioning,
- Increase general ventilation,
- Provide cooling fans,¹³⁹
- Run local exhaust ventilation where heat is produced (e.g., laundry vents),
- Use reflective shields to block radiant heat,
- Insulate hot surfaces (e.g., furnace walls),
- Stop leaking steam,
- Provide shade for outdoor work sites.

Under the proposed standard, when exposures to heat exceed specified triggers, employers must implement feasible controls to reduce employee's exposures to heat. The requirements for the use of engineering controls differ based on the location of work, whether indoors or outdoors. For indoor work sites, employers are required to provide a break area and ensure that work areas exceeding the trigger are equipped with air-conditioning, fans and ventilation, or in the case of radiant heat, other controls to reduce heat exposure. For outdoor work sites, employers are required to provide a break area with either shade or air-conditioning.

I. Workers Exposed to Heat Generating Process

As shown in Table IX-1—Facility Types Analyzed in OSHA's Preliminary Technological Feasibility Analysis, employees in both indoor and outdoor work operations can be exposed to heat from work processes. Radiant heat can be generated by equipment and processes such as, but not limited to, cement kilns, asphalt paving equipment,

commercial laundry machines, ovens in kitchen and bakery operations, foundries and other furnaces, and steam pipes. Under the proposed rule, OSHA is requiring employers to cool each indoor work area using either controls that increase evaporative heat loss from the worker (such as air-conditioning or fans) or through controls that remove the worker's exposure to radiant heat in the workspace. Because OSHA anticipates that the use of fans, dehumidifiers, and air-conditioning to control exposures from heat generating processes will be implemented in a similar manner to those controlling for ambient temperature exposures, the discussion on feasibility of those controls is contained in Section IX.D.II.A, Indoor Workspaces. OSHA requests comments on the appropriateness of this determination and seeks information on situations where the use of fans and air-conditioning would differ.

The engineering approaches to controlling radiant heat gain to the worker can be divided into two categories, those that reduce the amount of radiant heat in the workspace or those that shield the worker from the radiant heat source itself. Researchers suggest the following actions for reducing radiant heat exposures: interpose line-of-sight barriers; insulation, reflective shield and/or metallic reflecting screen, heat reflective clothing; mechanical ventilation (fans, blowers, chillers, etc.), air-conditioning where possible, and locating hot process away from work areas (NIOSH, 2016; Chesson, 2012).

Reducing radiant heat in the workspaces typically requires at least one of the following actions: lowering the process temperature, which may not be compatible with the temperature requirement of the manufacturing processes; relocating or isolating the heat source; insulating or cooling the heat source; or changing the emissivity of the hot surface by coating the material. Engineering controls for shielding the work from the radiant heat requires placing line-of-sight radiant reflective barriers or shielding between the heat source and the worker.

Of these control methods, radiant reflective shielding is generally the easiest to install. NIOSH notes that radiant reflective shielding can reduce the radiant heat load by as much as 80% to 85% (NIOSH, 2016). Employers who choose to install shielding will need to consider work process flows so that

placement does not interfere with the work. Remotely operated tongs, metal chain screens, or air or hydraulically activated doors that are opened only as needed are some of the possibilities.

Isolating the source could involve construction of walls or other containment around hot equipment or process such as erecting barriers around a kiln that control heat transfer to nearby work areas (NIOSH, 2016). Morris et al. noted that "investigations into reducing the solar (radiative) heat load on workers is promising, revealing that work capacity can be more than doubled with the removal of an external radiative load," and further explained that radiation screens can be used within manufacturing shops to shield workers from heat originating from hot machinery (Morris et al., 2020). Another example of isolating the source would be installing insulation around pipes and similar equipment in the workplace that emits heat. Similarly, because leaks from steam valves and steam lines in manufacturing processes can contribute to heat stress by increasing water vapor in the air, eliminating these sources of water vapor can help reduce the overall vapor pressure in the air and thereby increase evaporative heat loss by facilitating the rate of evaporation of sweat from the skin (NIOSH, 2016). OSHA requests comments and data on other methods employers have utilized to isolate radiant heat from heat-generating processes.

Examples of waste heat recovery technology include recovery of heat from steam through condensation that would otherwise be released into the workspace. Heat recovery systems improve energy efficiency by utilizing heat transfer from hot liquids or gases and recover heat that would otherwise go to waste. Some commercial building ventilation systems use heat exchangers to transfer heat from exhaust air to the fresh intake air (NIOSH, 2016).

With regards to modifying the process or operation, OSHA notes that lowering the process temperature may not be compatible with process requirements. However, there might be ways of using materials with lower melting points or chemicals with faster curing times thereby reducing overall radiant heat production. This might also include modifying the process and work practices by limiting the time required to complete certain tasks or automating certain tasks, such as collecting samples.

¹³⁹It should be noted that under certain conditions the use of fans may contribute to heat

strain (Morris, 2021). See further discussion in the

Explanation of Proposed Requirements for paragraph (e)(6), Evaluation of fan use.

TABLE IX–2—HEAT GENERATING PROCESS CONTROLS

Controls	Examples
Local exhaust ventilation (LEV) at heat-generating sources.	• LEV designed and installed at points of high heat or moisture production (such as exhaust hoods in laundry rooms or steam presses, commercial kitchen exhaust hoods). • Similar to LEV used to capture air contaminants. Dampeners and hood vary depending on moisture level of air.
Installation of waste heat recovery technology	• Used with LEV to convert heat to energy that is fed back into the system. ○ <i>Regenerative and recuperative burners</i>: Capture and use the waste heat from the hot flue gas from the combustion process. ○ <i>Tube heat exchangers</i>: Recover low to medium waste heat are mainly used for heating liquids.
Isolating the source of radiant heat	• Process enclosures around heat producing components. • Containment of heat producing equipment in rooms without workers.
Shielding or barriers that are radiant-reflecting or heat-absorbing.	• Shielding to stop radiant heat from reaching workstations. ○ <i>Reflective Shield</i>: Stainless steel, aluminum or other bright metal surfaces reflect heat back towards the source. ○ <i>Absorbent shields</i>: Water-cooled jackets made of black-surfaced aluminum absorb and carry away heat.
Thermal insulation on hot surfaces (e.g., steam pipes)	• Reducing the radiant heat emission from hot surfaces. ○ Covering hot surfaces with sheets of low emissivity material or paint that reduces the amount of heat radiated from this hot surface into the workplace. • Insulating Hot Surfaces. ○ Insulation reduces the heat exchange between the source of heat and the work environment.
Increasing the distance between workers and the heat source.	• Moving the workstation further away from the heat source. • Repositioning controls a cooler location.

A. Preliminary Feasibility Finding for Heat Generating Processes.

The proposed rule does not specify which of the engineering controls must be used for indoor workplaces. It only requires that employers implement other measures that reduce employee exposure to radiant heat in the work area as an alternative option to the use of fans or air-conditioning. OSHA has preliminarily determined that there are a number of technologically feasible engineering controls available to employers. Employers are free to choose any combination that effectively reduces exposures. Based on the discussion above, OSHA has preliminarily determined that there are no technological hurdles to compliance with this requirement for indoor workplaces.

OSHA acknowledges the limited information available on working outdoors near heat generating processes. OSHA seeks information and data on whether and under what circumstances the control options used to reduce exposure to radiant heat in indoor work areas might also be feasible for outdoor work settings.

II. Workers Exposed to Ambient Heat

A. Indoor Workplaces

Employees in indoor workplaces, such as maintenance facilities, and warehousing, can be exposed to HRIs when ambient temperatures increase.

See Table IX–1—Facility Types Analyzed in OSHA’s Preliminary Technological Feasibility Analysis. Due to factors such as building materials, insulation, and reduced air movement, the air temperatures in indoor workplaces without air-conditioning can in some cases exceed the temperature outdoors. The proposed rule would require that employers reduce these exposures by utilizing controls to cool the work area and provide a break area that is air-conditioned or has an alternate means of providing air movement and, if appropriate, humidity control to promote evaporative and convective cooling.

In response to the advance notice of proposed rulemaking (ANPRM) and previous Requests for Information (RFI), OSHA received numerous comments on the use of engineering controls for preventing heat-related injury and illness in both indoor and outdoor work settings. The most mentioned engineering controls were the provision of air-conditioning, fans, swamp coolers (i.e., evaporative coolers), portable air-conditioners, access to air-conditioned zones, air-conditioned tents/trailers and shaded areas. (e.g., Document ID 0094; 0206; 0278, Att. 1; 0392; 0448, Att. 1; 0523, Att. 1; 0551; 0562; 0588; 0610, Att. 1; 0637, Att. 1; 0679, Att. 1). Some commenters mentioned specific types of devices that could be used, such as portable air-conditioning units and

evaporative coolers. (e.g., Document ID 0445; 0595, Att. 1; 0612, Att. 1). For preventing humid working conditions, commenters suggested the use of dehumidifiers. (Document ID 0661, Att. 1). OSHA discusses the feasibility of these controls below.

Some commenters suggested other controls, such as architectural controls like altering roofs to reflect solar radiation using reflective materials, green roofs, rooftop sprinklers, or painting roofs white. Also suggested was the use of light-colored building material, green infrastructure, pervious pavements, external awnings, and window coverings to aid in mitigating indoor heat. While OSHA understands that the use of these controls may assist an employer in reducing ambient heat exposures in the workplace, this analysis focuses on the engineering controls outlined specifically in the regulatory text of the proposed rule. OSHA notes, however, that the proposed standard does not prohibit the use of other controls in addition those specified in the standard.

I. Air-Conditioning

Air-conditioning is one of the options to control heat in the workplace and is the most effective way to reduce heat strain because it reduces the heat exposure directly (Day et al., 2019; Jay et al., 2019; Morris et al., 2020; Morrissey et al., 2021b). Air-conditioning technology is widely

available and currently in use in many workplaces. However, OSHA understands that the use of air-conditioning to address heat hazards may not be practical in all occupational settings, such as outdoors or in large factories, and alternative control strategies need to be implemented (Foster et al., 2020; Mekjavic et al., n.d.; Morris et al., 2020).

HEAT-SHIELD, a research program funded by the European Union, evaluated strategies for the reduction of heat illness in the manufacturing industry (Mekjavic et al., n.d.). Researchers from the Heat Shield project successfully implemented several heat stress mitigating strategies within a manufacturing plant producing automobile rear lights. To aid in enhanced evaporative heat loss by the workers, the production hall was fitted with a system of ducts to increase the cooling air flow to the production hall and local workstations. The ducts were installed so that the air flow in the plant could be individually adjusted at the local workstations; alternatively, individual workers could also use an electrical fan in proximity to their workstation to increase the air flow (Mekjavic et al., n.d.). The study does not indicate what method of cooling was used to cool the air provided (conditioned, evaporative cooling, etc.). However, OSHA believes that similar designs could be implemented in manufacturing facilities using conditioned air.

In response to the ANPRM, some commenters stated that temperature controls or air-conditioning systems are not feasible in many industrial settings and in large industrial plants that include tens of thousands of square feet of floor space, specifically foundries, forge shops, and other workplaces with hot work processes (e.g., Document ID 0277). Bakeries and dairy product manufacturers were specifically mentioned as having unique circumstances because of the need to offset carbon monoxide and heat emitted during the baking or production process for employee safety, and due to food safety concerns (Document ID 0699, Att. 1). Another commenter added that environmental temperature controls may not be feasible in some areas that are designed to be open or partially open to the outside. Installing air-conditioning in all work areas would not be physically possible and could be cost prohibitive (Document ID 0657, Att. 1; 0684, Att. 1; 710, Att. 1; 0724, Att. 1). This sentiment was also echoed in available literature. Mekjavic et al. noted that due to design elements of some manufacturing facilities, such as

minimal insulation, the economic burden renders the installation of facility wide air-conditioning as not possible (Mekjavic et al., n.d.). OSHA understands this concern and is therefore not requiring all employers to install air-conditioning throughout their facility.

However, OSHA recognizes that air-conditioning can be installed in some indoor locations and is effective at reducing the exposure to ambient heat in the workplace. A feasibility study presented at the 10th International Livestock Environment Symposium compared the costs and benefits of air-conditioning to an evaporative cooling system in a large dairy barn (measuring 43.3m by 25.6m) (Li et al., 2018). The researchers simulated summer conditions in barns across Tampa, FL; Sacramento, CA; Syracuse, NY; and Madison, WI. They determined that air-conditioning was capable of maintaining maximum indoor temperatures of 23 °C to 27.4 °C (74.3 °F to 81.3 °F) (Li et al., 2018).

Another study conducted by Morrissey et al. (2021b) provided a flow chart for selecting appropriate heat controls and included air-conditioning as a recommended option for all work sites with access to power. Anderson and Souza (2017) specifically identify air-conditioning (*i.e.*, bulk air cooling, spot air coolers, and air-conditioned cabins) as a heat management strategy for underground mines. In addition, several commenters on the ANPRM noted that some indoor facilities do provide areas for employees to take breaks in temperature-controlled environments, indicating that an air-conditioned break area is capable of being installed for cooling in indoor work environments (Document ID 0612, p. 2; 0680, p. 10; 0691, pp. 10–11; 0777, Att. 2, p. 33; 1071, p. 2; 1072, pp. 1, 4).

Despite common statements of its efficacy in review articles and studies, air-conditioning as a control to reduce heat exposure at the workplace is not commonly evaluated in the occupational setting. It is unclear if the very definition of air-conditioning (an approach that directly removes heat) or feasibility limitations might explain the limited nature of this body of literature. Therefore, OSHA is seeking information regarding the current use of air-conditioning in the industries covered under the scope of the rulemaking.

II. Humidity Control

For indoor work sites, OSHA is proposing to require employers who do not provide air-conditioned break areas or workspaces to implement humidity control (when appropriate) in

conjunction with some form of air movement in those spaces. An article by D. Jeff Burton, P.E. CIH, published in the Occupational Health and Safety magazine reviewed the use of dehumidification to maintain acceptable indoor air quality in occupational settings (Burton, 2006). In addition to dehumidification approaches utilizing existing HVAC systems, the article noted that stand-alone dehumidifiers are commercially available and can be used where HVAC systems do not effectively control humidity (Burton, 2006). Indeed, OSHA expects that in most cases employers will use one of the many stand-alone dehumidifier models on the market to achieve the humidity control required by the proposed standard. In addition, in facilities with processes that produce moisture, exhaust systems can often be used to remove moist air and eliminate humidity gain.

III. Fans

Another engineering control identified by OSHA is the use of fans to help circulate air. Fans do not necessarily lower temperature but can make it easier for the body to dissipate heat. Depending on the work setting, fans can be used before work, during work, or during rest breaks. Information contained in the rulemaking docket indicates fans can be easily implemented in a variety of work environments. Large ceiling fans can be installed to increase air movement. In certain facilities, pedestal fans can be used to provide air movement at workstations. Some commenters mentioned that they use fans for air circulation in indoor facilities (e.g., Document ID 0277, 0283). During the SBREFA hearings, one SER reported that they open the doors in the mornings and use large ceiling fans to draw cooler air into the building, and then shut the doors in the afternoons to reduce the infiltration of hot outside air into the building. (Document ID 1081, p. 29).

Several studies evaluated by OSHA indicate that fan usage in industrial settings is prevalent. A recent J.J. Keller Center for Market Insights Pulse Poll indicates that 65% of employers provide fans, ventilation, or reflective shields to help control exposures to heat stress (JJ Keller, 2022).

As mentioned above, HEAT-SHIELD evaluated strategies for the reduction of heat illness in the manufacturing industry (Mekjavic et al., n.d.). To aid in enhanced evaporative heat loss by the workers, the production hall was fitted with a system of ducts to increase the cooling air flow to the production hall

and local workstations. In addition, some workers utilized electrical fans in proximity to their individual workstations to increase the air flow (Mekjavic et al., n.d.).

A 2021 study by Morris et al. determined that facilitated ventilation, through the use of electric fans, supports convective and/or evaporative heat loss and lowers occupational heat strain at a considerably lower operation and production cost compared to air-conditioning. The authors noted that fans were also easier to personalize cooling by directing air flow towards specific workers, rather than cooling an entire area; they could be transported to remote workspaces and could be used both during work and at specific cooling areas where workers take intermittent cooling breaks (Morris et al., 2021).

Fans have even been incorporated into chairs as demonstrated by Watanabe et al. (2009). In this study, researchers evaluated thermal comfort using chairs with attached fans under various climactic conditions, while participants performed light office tasks such as word processing. One control chair and two “fan chair” designs were assessed; each “fan chair” had a fan under the seat and behind the backrest and received a positive response from the worker. Morris et al. (2020) also noted the relevance of chair fans, stating that “miniature electrical fans could be incorporated into chairs, for seated workers, to deliver effective cooling while minimizing disturbances to the work environment” (Morris et al., 2020).

There is an additional body of research investigating fans as a heat control in large dairy barns due to the sensitivity of cow productivity to heat stress. Although not directly applicable to HRI reduction in humans, as with air-conditioning described above, this research provides insight into the extent to which industrial fans can be installed in large barn or warehouse-like structures (Calegari et al., 2012; Correa-Calderon et al., 2004; Davidson et al., 2021; Drwencke et al., 2020; Ortiz et al., 2010; Shiao et al., 2011; Urdaz et al., 2006).

Evidence of the existing use of fans in occupational settings can be seen in existing State requirements and in some collective bargaining agreements. For example, Minnesota’s standard governing indoor ventilation and temperature includes a provision for providing indoor ventilation and acceptable temperature ranges in places of employment to prevent employee exposure to indoor environmental heat conditions (MN Admin. Code 5205.0110). In addition, comments from the Teamsters in response to the

ANPRM included examples of collective bargaining agreements that demonstrate steps employers have taken to address occupational HRIs (Document ID 0707, pp. 14–17). Items included provisions for work area ventilation when the plant is hot and the installation of fans to reduce excess heat or humidity in work rooms. Employers covered under these agreements may already be in compliance with some of the requirements of the proposal.

Although fan use can be effective at reducing heat stress, fans may introduce additional hazards in some workplaces due to the increase in air movement. In indoor settings where air contamination is a concern, the use of fans may interfere with existing ventilation and increase worker exposure to hazards. OSHA acknowledges that in some cases, the work site may need to be evaluated to ensure that the use of fans does not interfere with existing ventilation designed for the control of dust and other air contaminants. OSHA seeks comments on work settings where the use of fans is not feasible due to contamination concerns and requests additional information on what controls, including the use of air-conditioning, employers use to prevent heat-related illnesses in these settings.

In addition, research has shown that under certain conditions (e.g., high temperatures), fan use can increase the hazard of heat strain. See Section V.C., Risk Reduction for a more detailed discussion of fan use alone during elevated temperature events. OSHA requests comments on indoor work settings that may experience temperatures above 102°F and seeks information on what controls employers implement when fan use is contraindicated or when temperatures exceed 102°F.

IV. Evaporative Coolers

Another engineering control, evaporative coolers, work by using a fan to pass air over a pad or ceramic surface saturated with water. The evaporation of the water reduces the air temperature. In warm dry climates, evaporative coolers can be used to lower air temperatures as much as 20°F (USGS). They consume much less energy than air-conditioning and can be used in buildings with openings to the outside. However, because evaporative coolers cool through increasing air humidity, they are not as effective at relative humidity above 60%.

A NIOSH Health Hazard Evaluation (HHE) conducted in September 2006 demonstrates the feasibility of evaporative cooler use in indoor workspaces. The evaluation was

conducted at a glass manufacturing facility in Indiana. In the hot end of the glass-making process, raw materials (recycled glass, sand, soda ash, and limestone) were melted together in a gas furnace at temperatures of 2,300 °F to 2,800 °F (Dowell & Tapp, 2007). The company used various controls in the hot end of the plant during the hot summer months to reduce the risk of heat-related illness. The controls included fans which supplied cooler air from the basement of the facility (man coolers), and evaporative cooling fans (swamp coolers) (Dowell & Tapp, 2007).

Furthermore, portable evaporative coolers are also commercially available for use expanding the ability for implementation in various work settings. These coolers can lower air temperatures by up to 18 °C (33 °F) and cover up to 6,500 sq ft area, requiring only a power outlet and water supply.

V. Preliminary Feasibility Finding for Indoor Workplaces

OSHA has determined that requirements for the use of engineering controls indoors under the proposed standard are technologically feasible for most operations, most of the time. For break areas, the proposed rule allows employers to utilize available air-conditioning systems or a combination of air movement and humidity control to promote evaporative cooling. The latter can be achieved with widely available fans and humidity control devices. For indoor work areas, OSHA has provided the employer with multiple control options for compliance with the proposed rule, allowing them to tailor the controls to the individual workplaces. Information obtained through the SBREFA process, comments, and research into existing control use indicate that many employers are already utilizing some combination of the required control options. OSHA seeks additional comments on its assumptions and other control options for these workers. Based on the discussion above, OSHA has determined that there are no technological hurdles to compliance with this requirement in the proposed rule.

B. Outdoor Workplaces

For outdoor workplaces, the primary sources of exposure to heat hazards are ambient heat and direct sunlight. Under the proposed rule, OSHA is requiring employers to provide a break area with shade or air-conditioning.

I. Shade

As discussed in Section V., Risk Assessment, access to shade can reduce

the risk of HRI by decreasing exposure to solar radiation and, in turn, reducing overall heat load. Research has found that total heat exchange is greater in shaded conditions than sunny conditions (Otani et al., 2021), indicating that access to shaded areas may reduce HRI. For outdoor workers exposed to direct sunlight, a commonly used engineering control is the use of a shelter or canopy to provide a shaded area for rest breaks. A wide variety of portable pop-up canopies are commercially available that can be easily set up and moved around for mobile work sites. Note that the proposed rule would not allow mobile equipment or machinery to be used to provide shade for rest breaks due to the potential safety hazards from unintended or accidental start up and movement of the equipment and the potential for equipment to release radiant heat.

Working or resting in the shade can reduce the risk of HRI by decreasing exposure to solar radiation and reducing overall heat load. This control is applicable to all outdoor industries and is a key component of OSHA's "Water. Rest. Shade." Heat Campaign guidance. The feasibility of providing shade for rest periods is demonstrated by OSHA enforcement data. During inspections conducted under the 2023 Heat National Emphasis Program, OSHA Compliance Officers completed a questionnaire regarding work site conditions. Over 1,300 responses were received indicating that 96% of employers inspected provided access to cool shaded areas (OSHA, 2023b). Several States, including California, Oregon, Colorado and Washington, have also incorporated requirements to provide shade into their heat-specific standards.¹⁴⁰ While the scope of coverage varies by State, these standards require employers to provide workers with shade structures for rest breaks to recover from the heat. In addition, Maryland and Nevada proposed rules that would also require employers to provide access to shade.¹⁴¹

The addition of shaded break areas has been demonstrated as an integral part of a heat health plan to improve worker performance in the agricultural sector (Bodin et al., 2016; Morris et al., 2020; Glaser et al., 2022). Bodin et al. (2016) implemented a water, rest, and shade campaign with 56 Salvadoran sugarcane workers two months into the

harvest season. Workers were provided a canopy for shaded breaks, insulated water bladders, and fixed break times. A qualitative study of the intervention reported consistent use of the shaded canopies and high worker satisfaction. A similar study of sugar cane workers conducted in 2022 indicated that workers were provided with break periods under adequate natural shade or tents that were designed to be moved easily to accompany the mobile workforce throughout each day. Tents were constructed from a netted fabric, open on two sides to provide adequate ventilation, and provided with stools for seated, shaded rest (Glaser et al., 2022).

OSHA acknowledges that providing stationary shading outdoors may be difficult in some settings, particularly where work crews are highly mobile, such as in agricultural work. Even so, several studies indicate the widespread use of shade among agricultural workers. Fleischer et al. (2013) conducted a cross-sectional survey on HRI symptoms and working conditions in Georgia in 2011. Of the 405 farmworkers who completed the survey, 27% reported not having access to shade, indicating that some form of shade is available in the majority of these work environments. A study by Bethel et al. (2017) comparing conditions for outdoor agricultural workers in Oregon and Washington found that workers in Oregon more frequently reported the presence of shade structures¹⁴² and workers in Washington more often reported access to shade from trees.¹⁴³ In Oregon, workers more frequently reported using shade structures and cars with air-conditioning compared with workers in Washington.¹⁴⁴ However, the study was subject to several limitations. First, different methods of data collection were used in Oregon and Washington, which could have led to information bias. Participants in Washington completed a self-administered survey on touchscreen tablets at the work site, whereas participants in Oregon completed a personal interview administered by research staff at the housing facility. Second, participants were recruited differently in the two States, via outreach workers in Oregon and via employers and supervisors in Washington. Next, the conditions in which participants in the two States worked were vastly different.

Specifically, participants in Washington primarily picked tree fruit in orchard settings, which provided a natural form of shade, whereas participants in Oregon primarily harvested blueberries with little shade (Bethel et al., 2017).

The Fair Food Program is a partnership between growers and agriculture workers that includes safety and health standards which require participating employers to provide shade, water, bathrooms, and rest breaks. According to their 2021 report, 100% of Participating Growers have purchased and distributed shade structures to their crews, and they have observed steady increases in the quality of shade units at many growers' operations, including custom designs built to withstand field conditions. (Fair Foods Standards Council, 2021)

During the SBREFA hearings, some SERs with outdoor settings reported using engineering controls such as natural shade (e.g., trees and dense vegetation), pop-up canopies, umbrellas, and portable shades. Some SERs with outdoor settings said they believed some engineering controls including shade and fans were infeasible for their workplace. (Document ID 1081, p. 30).

II. Air-Conditioning for Outdoor Workers

Access to air-conditioning for outdoor work settings is primarily provided through the use of vehicles, trailers, and near-by buildings. OSHA understands that the use of air-conditioning has limited applications for outdoor workplaces. However, evidence in the docket indicates that it is feasible for a variety of outdoor situations.

A 2018 study by Methner and Eisenberg evaluated the risk of HRI for employees engaged in strenuous work in an extremely hot outdoor environment, a park during summer months. Worker tasks included landscaping, demolition, and bricklaying. Park policy included the use of motor vehicles with air-conditioning as a cool-down area for breaks in remote locations where access to cooled buildings was limited (Methner and Eisenberg, 2018). As mentioned above Bethel et al. (2017) found that some workers in Oregon and Washington have access to cars with air-conditioning (14% vs. 3%).

The use of portable air-conditioning units and vehicles with air-conditioning for cooling is also supported by multiple ANPRM commentors. In response to OSHA's request for information on control options for outdoor work, the City of Phoenix commented that portable air-conditioning units are available and have received positive

¹⁴⁰ (CA 8 CCR 3395; OR Admin. Code 437-002-0156 and 437-004-1131; CO 7 CCR 1103-15.3; and WA Admin. Code 296-62-09535).

¹⁴¹ Maryland COMAR 09.12.32; and Nevada Proposed Regulation LCB File No. R053-20.

¹⁴² 29% use in Oregon vs. 5% in Washington.

¹⁴³ 92% in Washington vs. 47% in Oregon.

¹⁴⁴ In Oregon, 26% of workers reported using shade structures and 14% used cars with air conditioning, compared to 3% and 6% (respectively) in Washington.

responses from employees. The International Brotherhood of Electrical Workers (IBEW), AFL–CIO also indicated that employees in the utilities industry use a wide variety of cooling methods including air-conditioning in trucks or trailers.

During the SBREFA hearings, many SERs with outdoor work settings reported having air-conditioned vehicles or trailers on site that workers can use to cool down. When SERs were polled at two sessions, September 12th and 13th, on the types of engineering controls that are used “to mitigate the impact of heat exposure to employees that work outdoors,” two-thirds (66.7%) of the 30 responders reported using an “air-conditioned space.” (Document ID 1081, p. 30).

OSHA requests comments on additional ways employers have utilized air-conditioning for outdoor workers and obstacles encountered, if any.

III. Preliminary Feasibility Finding for Outdoor Workplaces

OSHA has preliminarily determined that requirements for the use of engineering controls for outdoor break areas under the proposed standard are technologically feasible for most operations, most of the time. Information obtained through the SBREFA process, comments, and research into existing control use indicate that many employers are already utilizing some form of shade or air-conditioned space for employee cooling. For those remaining employers, OSHA anticipates they can quickly come into compliance through the implementation of shade or air-conditioned vehicles, trailers and other spaces, as described above. OSHA seeks additional comments on its assumptions and other control options for these workers. Based on the discussion above, OSHA has determined that there are no technological hurdles to compliance with this requirement.

C. Mobile Workplaces

Options for the use of engineering controls for mobile work sites where the work is not performed at a fixed location are similar to other outdoor work sites. Portable canopies can be used to provide a shaded area for breaks. Where electricity is available, trailers with air-conditioning can be used as cool-down areas for rest breaks. Air-conditioned vehicle cabs can also be used.

OSHA found several examples in which employers agreed to provide shade for outdoor workers as part of contract negotiations around working conditions. As previously mentioned,

the Teamsters submitted comments on the ANPRM that included examples of language from collective bargaining agreements demonstrating steps employers have taken to address occupational HRIs. Language included requirements for construction drivers, employees suffering from heat illness believing a preventative recovery period is needed or feeling the need to protect themselves from overheating, are required to be provided access to an area with shade that is either open to the air or provided with ventilation for a period of no less than five minutes (Document ID 0707, p. 16).

I. Preliminary Feasibility Finding for Mobile Workplaces

OSHA has preliminarily determined that there are no technological hurdles for the implementation of controls for workers with mobile work sites. Based on the discussion above, OSHA has preliminarily determined that it is technologically feasible, using commercially available products and technology, for employers with mobile work sites to provide workers with shaded or air-conditioned break areas. OSHA seeks comment on this determination and additional data and information on other feasible control options available for these mobile work sites.

E. Preliminary Feasibility Findings

OSHA has reviewed the requirements that would be imposed by the proposed standard and has determined that achieving compliance with the proposed standard is technologically feasible most of the time, in most of the establishments and operations covered by the standard. As discussed above, the proposed rule is largely programmatic and offers the employer several control options. Under the proposed rule, employers can determine the controls best suited for their unique work environment in order to comply with the requirements for controls at break areas and work areas. Not all practices, procedures, or controls identified in this technological feasibility analysis will be necessary at all establishments: the proposed standard provides flexibility for employers to tailor their procedures, practices, and controls to the needs of their facility based on an assessment specific to that facility. Moreover, readily available and currently used technology is capable of meeting these requirements.

As part of this analysis, OSHA reviewed the heat injury and illness prevention practices currently in place across the affected industries as well as the recommended practices of industry

trade associations and standards-setting organizations. On the basis of current compliance found by OSHA, widespread familiarity with the concepts and procedures contained in the proposed rule, and the availability of control options, OSHA has determined the requirements of the proposed rule are capable of being done by most employers, most of the time and therefore preliminarily determined that compliance with the proposed rule is technologically feasible.

F. Requests for Comments

OSHA requests comments on the appropriateness of the preliminary determinations contained in this analysis.

Regarding the feasibility of monitoring, OSHA seeks additional comments and information regarding:

- The feasibility of measuring HI in indoor environments and where heat-generating processes occur.
- The use of WBGT including the identification of situations in which WBGT would or would not be practical or pose challenges for employers to measure.

Regarding the feasibility of controls, OSHA seeks additional comments and information on the following:

- Whether there are other controls or technologies that may be available to protect workers against heat hazards.
- The technological feasibility of other engineering control options not discussed here for indoor, outdoor, and mobile work sites.
- The feasibility of dehumidification as a control option for indoor workplaces.
- Areas where employers have determined that isolation of heat producing equipment is not feasible and alternatives employers have utilized to reduce employee exposures.
- The current use of air-conditioning in the industries covered under the scope of the rulemaking.
- Additional ways employers have utilized air-conditioning for outdoor workers and obstacles encountered, if any.
- The current use and application of fans in both indoor and outdoor settings.
- Work settings where the use of fans is not feasible due to contamination concerns and information on what controls, including the use of air-conditioning, employers use to prevent HRIs in these settings.
- Indoor work settings without heat-generating processes that may experience temperatures above 102 °F and information on what controls employers implement when fan use is

contraindicated or when temperatures exceed 102 °F.

X. Additional Requirements

A. Unfunded Mandates Reform Act, 2 U.S.C. 1501 *et seq.*

OSHA reviewed this proposed rule according to the Unfunded Mandates Reform Act of 1995 (UMRA) (2 U.S.C. 1501 *et seq.*) and Executive Order 12875 (58 FR 58093). Section 202 of the UMRA, 2 U.S.C. 1532, requires agencies to assess the anticipated costs and benefits of a rule that includes a Federal mandate that may result in expenditures in any one year by State, local, and Tribal governments, in the aggregate, or by the private sector, of at least \$100 million, adjusted annually for inflation. In 2024, that threshold is \$183 million.

Although OSHA may include compliance costs for affected State Plan governmental entities in its analysis of the expected impacts associated with a proposal, this proposed rule does not place a mandate on State or local government, for purposes of the UMRA. See the discussion below in Section X.H., Federalism.

The OSH Act does not cover Tribal governments in the performance of traditional governmental functions, but it does cover Tribal governments when they engage in activities of a commercial or service character (see *Menominee Tribal Enters. v. Solis*, 601 F.3d 669 (7th Cir. 2010); *Reich v. Mashantucket Sand & Gravel*, 95 F.3d 174, 180 (2nd Cir. 1996)). However, the cost of the proposed rule for these covered activities by a Tribal government would not meet the threshold established in the UMRA. As noted below, OSHA also reviewed this rulemaking in accordance with Executive Order 13175 on Consultation and Coordination with Indian Tribal Governments (65 FR 67249 (November 9, 2000)) and determined that it does not have “tribal implications” as defined in that Executive Order.

Based on the analysis presented in the Preliminary Economic Analysis and Initial Regulatory Flexibility Analysis, Section VIII. of this preamble, OSHA concludes that the proposed rule would impose a Federal mandate on the private sector of \$100 million or more annually, adjusted for inflation. The Preliminary Economic Analysis constitutes the written statement containing a qualitative and quantitative assessment of the anticipated costs and benefits required under section 202(a) of the UMRA (2 U.S.C. 1532(a)).

B. Consultation and Coordination With Indian Tribal Governments/Executive Order 13175

OSHA reviewed this proposed rule in accordance with Executive Order 13175, Consultation and Coordination with Indian Tribal Governments, 65 FR 67249 (Nov. 6, 2000), and determined that it does not have “tribal implications” as defined in that order. As explained above, the OSH Act does not cover Tribal governments in the performance of traditional governmental functions, so except to the extent a tribe is engaged in activities covered by this proposed rule that would fall outside of a traditional government function (*i.e.*, activities of a commercial or service character), the proposed rule would not have substantial direct effects on one or more Indian tribes in their sovereign capacity, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes (see E.O. 13175 section 1(a)).

Section 5 of the Executive Order requires agencies to consult with Tribal officials early in the process of developing regulations that: (1) have Tribal implications, impose substantial direct compliance costs on Indian governments, and are not required by statute; or (2) have Tribal implications and preempt Tribal law (E.O. 13175 section 5(b), (c)). The Executive Order requires that such consultation occur to the extent practicable.

On May 15, 2024, OSHA held a listening session with Tribal representatives regarding this Heat Injury and Illness Prevention in Outdoor and Indoor Work Settings rulemaking. OSHA provided an overview of the rulemaking effort and sought comment on what, if any, Tribal implications would result from the rulemaking. A summary of the meeting and list of attendees can be viewed in the docket (DOL, 2024a).

C. Consultation With the Advisory Committee on Construction Safety and Health

Under 29 CFR parts 1911 and 1912, OSHA must consult with the Advisory Committee on Construction Safety and Health (ACCSH), established pursuant to section 107 of the Contract Work Hours and Safety Standards Act (40 U.S.C. 3704), in setting standards for construction work. Specifically, 29 CFR 1911.10(a) requires the Assistant Secretary to provide ACCSH with any proposal (along with pertinent factual information) and give ACCSH an opportunity to submit

recommendations. See also 29 CFR 1912.3(a).

At a public meeting on April 24, 2024, OSHA presented to ACCSH its framework for a proposed rule for heat injury and illness prevention in outdoor and indoor work settings. The Committee then passed unanimously a motion recommending that OSHA proceed expeditiously with proposing a standard on heat injury and illness prevention. The Committee also recommended that OSHA consider the feedback and questions discussed by Committee members during the meeting in formulating the proposed rule (see the minutes from the meeting, Docket No. 2024–0002). OSHA has considered the Committee’s feedback in the development of this proposal.

D. Environmental Impacts

OSHA reviewed the proposed rule according to the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. 4321 *et seq.*), the regulations of the Council on Environmental Quality (CEQ) (40 CFR chapter V, subchapter A), and the Department of Labor’s NEPA procedures (29 CFR part 11). Pursuant to 29 CFR 11.10 and consistent with CEQ regulations, the promulgation, modification, or revocation of any safety standard is categorically excluded from the requirement to prepare an environmental assessment under NEPA absent extraordinary circumstances indicating the need for such an assessment. OSHA finds that this proposed rule presents no such extraordinary circumstances.

E. Consensus Standards

OSHA must consider adopting existing national consensus standards that differ substantially from OSHA’s proposed standard if the consensus standard would better effectuate the purposes of the Act (see 29 U.S.C. 655(b)(8); see also National Technology Transfer and Advancement Act of 1995, Pub. L. 104–113, section 12(d), 15 U.S.C. 272 Note). Whenever an OSHA rule differs substantially from a national consensus standard, OSHA must publish in the **Federal Register** a statement of the reasons why the rule will better effectuate the purposes of the Act than the national consensus standard (29 U.S.C. 655(b)(8)). In the development of the proposed rule, OSHA reviewed the ANSI/ASSP national consensus Standard for Heat Stress Management in Construction and Demolition Operations, A10.50–2024. Many of the proposed provisions are consistent with the ANSI/ASSP standard, although there are some

differences in the details of the provisions, particularly in the scope of the standard, as well as requirements for measurements, heat trigger levels, hydration, rest breaks, medical surveillance, PPE, recordkeeping, and a qualified person.

Regarding the scope of the standard, while the ANSI/ASSP standard applies only to employers in construction and demolition operations, the OSHA proposed standard applies to all employers in general industry, construction, maritime, and agriculture, with some exceptions (as discussed in Section VII.A., Paragraph (a) Scope and application, in Section VII., Explanation of Proposed Requirements). While both the ANSI/ASSP standard and the OSHA proposed standard would require employers to develop a written heat stress management program and acclimatization plan, the ANSI/ASSP standard requires a competent person to perform a heat stress task hazard analysis and indicates that workers' heat exposure should be assessed by use of the WBGT index or other heat stress index that accounts for climatic and metabolic heat sources and modification of heat transfer from the worker by extra clothing or PPE. The OSHA proposed standard requires that employers monitor heat conditions but allows employers more flexibility to determine workers' heat exposure. For example, in outdoor work areas, the OSHA proposed standard allows employers to track local heat index forecasts or measure heat index or WBGT, while for indoor work areas the OSHA proposed standard requires the employer to identify work areas with hazardous heat exposure and develop and implement a monitoring plan that includes measurement of heat index or WBGT. For workplaces in which employees wear vapor-impermeable clothing, the employer's HIHP must specify procedures to protect employees while wearing vapor-impermeable clothing. OSHA is allowing employers this additional flexibility to determine workers' heat exposure through multiple options based on feedback from public commenters and small entity representatives that WBGT can be technically challenging to measure accurately and that, for outdoor work areas, weather forecasts are readily available and easy to monitor (see Section IX., Technological Feasibility). In addition, with the exception of Minnesota, none of the current or proposed heat-specific State regulations rely on WBGT.

With respect to the heat trigger levels at which certain control measures are specified, the ANSI/ASSP standard and

OSHA proposed standard also deviate slightly. While the ANSI/ASSP standard sets an action level of WBGT adjusted for clothing type (clothing-adjusted WBGT) of 70 °F or heat index adjusted for radiant heat (adjusted heat index) of 80 °F, the OSHA proposed standard specifies an initial heat trigger of WBGT equal to the NIOSH RAL or a heat index (unadjusted) of 80 °F. The ANSI/ASSP standard's moderate hazard action level is a clothing-adjusted WBGT of 80 °F or an adjusted heat index of 95 °F, while the OSHA proposed standard specifies a high heat trigger of WBGT equal to NIOSH REL or a heat index (unadjusted) of 90 °F. Additionally, the ANSI/ASSP standard has an extreme hazard action level of a clothing-adjusted WBGT of 87 °F or an adjusted heat index of 110 °F, at which point ANSI/ASSP recommends stopping work that requires high strenuous workload. While the ANSI/ASSP and OSHA initial and high heat triggers are similar, OSHA is not specifying a third trigger in its proposed standard. This decision is in line with recommendations from the SBAR Panel to keep the heat triggers simple to understand (see SBAR Panel findings and recommendations, Section VIII., Preliminary Economic Analysis and Initial Regulatory Flexibility Analysis). Adding a third trigger could also add considerable costs. As explained in Section V.B., Basis for Initial and High Heat Trigger, OSHA's proposed triggers are based on observational and laboratory evidence and, the agency believes, represent a highly sensitive and appropriate screening threshold for heat stress controls in the workplace. OSHA has preliminarily determined that these thresholds are protective for workers and achievable for employers.

With regards to hydration, both the ANSI/ASSP standard and the OSHA proposed standard would require that employees have access to suitably cool water that is free of charge, in close proximity to working areas, and of sufficient quantity. The ANSI/ASSP standard, however, additionally requires that employees shall have access to electrolyte replenishment beverages when they are involved with heavy work activities for greater than two hours. The OSHA proposed standard does not have this requirement, as the agency heard from an ACCSH member that electrolyte replenishment beverages can contain sugar that cannot be consumed by all workers. NIOSH, in its hydration fact sheet, recognizes that sports drinks with balanced electrolytes can replace salt lost in sweat, but similarly notes that heavy consumption will add calories due to the added sugar.

NIOSH also points out, "In general, eating regular meals with adequate water is sufficient to maintain water and electrolyte balance" (NIOSH, 2017a). As a result, the OSHA proposed rule does not require employers to provide electrolyte replenishment beverages but OSHA notes in this preamble that employers may provide electrolyte replenishment beverages in addition to water if they choose to do so (see Section VII., Explanation of Proposed Requirements). OSHA also requests comment on whether the agency should require the provision of electrolyte supplements/solutions in addition to water.

Another deviation between the ANSI/ASSP standard and the OSHA proposed standard exists in the requirement for rest breaks. While both the ANSI/ASSP standard and the OSHA proposed standard require employers to provide shaded rest and hydration break areas at or above the action level or initial heat trigger, respectively, the ANSI/ASSP standard recommends, but does not require, scheduled rest breaks at the moderate hazard action level (a clothing-adjusted WBGT or 80 °F or an adjusted heat index of 95 °F). OSHA's proposed standard requires employers to provide a rest break if needed to prevent overheating at or above the initial heat trigger, as well as a rest break of at least 15 minutes every two hours at or above the high heat trigger. Rest breaks, particularly in combination with water and shade, have been shown in multiple scientific studies to reduce the risk of heat-related fatality and HRI (see Section V.C., Risk Reduction) and therefore OSHA is requiring rest breaks in the proposed standard.

Regarding medical surveillance, the ANSI/ASSP standard indicates that a medical surveillance program (e.g., a comprehensive work and medical history, a comprehensive physical exam, an assessment of any personal risk factors, and the ability to wear PPE) should be established for all workers covered by the standard, while the OSHA proposed standard does not have a medical surveillance requirement. Similarly, while both the ANSI/ASSP standard and the OSHA proposed standard require that an employee exhibiting signs or symptoms of heat illness be monitored and not left alone or sent home without being offered on-site first aid and, if necessary, emergency medical services, the ANSI/ASSP standard further requires that a supervisor or team member be trained in first aid and certified in cardiopulmonary resuscitation (CPR) and the use of the automated external defibrillator (AED) when a medical

professional is not available on-site. Due to the widespread scope of the OSHA proposed standard, the agency believes that a requirement for medical surveillance or for certification of supervisors or team members in CPR and AED would be impractical and could add considerable costs. In addition, OSHA also heard a comment from a construction industry representative during the ACCSH consultation that requiring medical surveillance would also be logistically difficult (see the minutes from the meeting, Docket No. 2024-0002).

With respect to PPE, the ANSI/ASSP standard requires the implementation of heat stress controls following the hierarchy of controls, with engineering controls implemented first, followed by administrative controls, and then cooling PPE. While the OSHA proposed standard specifies the use of engineering controls and administrative controls, it does not require the use of cooling PPE. OSHA believes that cooling PPE—such as a cooling vest—has the potential to become hazardous as the cooling properties dissipate. As a result, the OSHA proposed standard requires that employers who choose to provide cooling PPE to their employees ensure that the cooling properties of the PPE are maintained at all times during use (see Section VII.E., Paragraph (e) Requirements at or above the Initial Heat Trigger).

With regards to recordkeeping, the ANSI/ASSP standard requires employers to keep a written inventory of local conditions at the work site that affect or increase the potential for heat stress only as long as the hazard exists or as required by law. The OSHA proposed standard is more specific, requiring that employers maintain written or electronic records of indoor work area measurements for 6 months (see Section VII.I., Paragraph (i) Recordkeeping). OSHA believes this specificity increases clarity for employers.

Finally, the ANSI/ASSP standard requires a qualified person “who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience, has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.” The ANSI/ASSP standard requires that the qualified person assist with the development and review of the heat stress management program, the use and interpretation of the WBGT, and the development and review of the first aid and emergency action plan, as well as providing guidance or in-person support

to the competent person on implementation of the program as needed. The OSHA proposed standard does not have a requirement for a qualified person. Due to the widespread scope of the proposed standard, OSHA does not believe that it would be feasible to require all covered employers to hire a qualified person as contemplated by the ANSI/ASSP standard. Instead, the proposed standard requires the designation of one or more heat safety coordinators who are trained in and responsible for ensuring compliance with all requirements of the employer’s HIIPP. OSHA also plans to provide compliance assistance materials such as a model HIIPP and other materials.

OSHA also notes that there are some requirements in its proposed standard that are not required by the ANSI/ASSP standard. Specifically, the OSHA proposed standard contains a hazard alert provision that requires employers to notify employees that the high heat trigger has been met or exceeded (see Section VII.F., Paragraph (f) Requirements at or above the High Heat Trigger). The OSHA proposed standard also requires that employers place warning signs at indoor areas with ambient temperatures that regularly exceed 120°F (see Section VII.F., Paragraph (f) Requirements at or above the High Heat Trigger). OSHA believes that these additional requirements are important for the protection of workers from heat hazards in the workplace.

OSHA has preliminarily determined that the proposed standard would be highly effective at addressing the risk of occupational heat exposure while remaining workable across the many different work contexts covered by the proposal. As such, OSHA believes that the standard as proposed will best effectuate the OSH Act’s purpose of ensuring safe and healthful working conditions.

F. Incorporation by Reference

OSHA is proposing to incorporate by reference NIOSH Publication No. 2016-106. Criteria for a Recommended Standard: Occupational Exposure to Heat and Hot Environments, February 2016. In this publication, NIOSH provides recommendations for an occupational standard for workers exposed to heat, including the NIOSH Recommended Alert Limit (RAL) and Recommended Exposure Limit (REL). OSHA is proposing the RAL as an option for the initial heat trigger and the REL as an option for the high heat trigger (see Section VII.B., Paragraph (b) Definitions).

NIOSH Publication No. 2016-106 is available to download for free on NIOSH’s website (<https://www.cdc.gov/niosh/docs/2016-106>) and linked from OSHA’s website (<https://www.osha.gov/heat-exposure/standards>). It is also available in the rulemaking docket for this proposed standard (Docket ID OSHA-2021-0009-0050).

G. Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045, on Protection of Children from Environmental Health Risks and Safety Risks, as amended by Executive Orders 13229 and 13296, requires that Federal agencies provide additional evaluation of economically significant regulatory actions that concern an environmental health or safety risk that an agency has reason to believe may disproportionately affect children. This proposed rule is intended to protect United States workers from occupational hazards. OSHA has preliminarily determined that the proposed rule will not disproportionately affect children or have any adverse impact on children. Because workers in the industries covered by this proposed rule may include older children, the proposed rule could have a protective effect on these older children in the workforce by reducing the possibility of heat-related injury or illness. Accordingly, E.O. 13045, Protection of Children from Environmental Health Risks and Safety Risks, requires no further agency action or analysis.

H. Federalism

The agency reviewed this proposed rule in accordance with Executive Order 13132 on Federalism (64 FR 43255, (August 10, 1999)), which, among other things, is intended to “ensure that the principles of federalism established by the Framers guide the executive departments and agencies in the formulation and implementation of policies.” The E.O. generally allows Federal agencies to preempt State law only as provided by Congress or where State law conflicts with Federal law. In such cases, Federal agencies must limit preemption of State law to the extent possible. The E.O. also requires that agencies consult with States on rules that have “federalism implications,” which are those that have “substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.”

This proposed rule complies with E.O. 13132. The hazards addressed by this proposed rule and its goal of protecting workers from exposure to hazardous heat are national in scope and the proposed rule does not include “federalism implications” as defined in the E.O. Under section 18 of the OSH Act (29 U.S.C. 667), Congress expressly provided that States may adopt, with Federal approval, a plan for the development and enforcement of occupational safety and health standards. OSHA refers to the occupational safety and health plans that have been submitted by States and approved by OSHA as “State Plans.” Occupational safety and health standards developed by States with OSHA-approved State Plans must be at least as effective in providing safe and healthful employment and places of employment as the Federal standards. Subject to these requirements, these States are free to develop and enforce their own occupational safety and health standards. The choice to adopt a State Plan is part of the statutory scheme and is not mandatory, so there are no federalism implications for States that choose to do so.

In States without OSHA-approved State Plans, the States are not employers under to the OSH Act and the proposed rule would therefore not have a substantial direct effect on them (29 U.S.C. 652(5)). The following section addresses the effect of the proposed rule on States with OSHA-approved State Plans.

I. Requirements for States With OSHA-Approved State Plans

When Federal OSHA promulgates a new standard or a more stringent amendment to an existing standard, States and U.S. Territories with OSHA-approved State Plans must either amend their standards to be identical to or “at least as effective as” the new standard or amendment or show that an existing State Plan standard covering this area is already “at least as effective” as the new Federal standard or amendment (29 CFR 1953.5(b)). State Plan adoption must be completed within six months of the promulgation date of the final Federal rule.

Of the 29 States and Territories with OSHA-approved State Plans, 22 cover both public and private-sector employees: Alaska, Arizona, California, Hawaii, Indiana, Iowa, Kentucky, Maryland, Michigan, Minnesota, Nevada, New Mexico, North Carolina, Oregon, Puerto Rico, South Carolina, Tennessee, Utah, Vermont, Virginia, Washington, and Wyoming. The remaining seven States and Territories

cover only State and local government employees: Connecticut, Illinois, Maine, Massachusetts, New Jersey, New York, and the Virgin Islands.

OSHA preliminarily concludes that this proposed rule would increase protections beyond those provided by most current standards in State Plans. Therefore, within six months of any final rule’s promulgation date, States with OSHA-approved State Plans would be required to adopt standards that are identical to or “at least as effective” as this rule, unless they demonstrate that such amendments are not necessary because their existing permanent standards are already “at least as effective” in protecting workers. OSHA seeks comment on this assessment of its proposal.

J. OMB Review Under the Paperwork Reduction Act of 1995

A. Overview

The proposed Heat Injury and Illness Prevention Standard contains collection-of-information requirements that are subject to the Office of Management and Budget (OMB) review and approval under the Paperwork Reduction Act of 1995 (PRA), 44 U.S.C. 3501 et seq. and its implementing regulations at 5 CFR part 1320. The PRA defines a collection-of-information as the obtaining, causing to be obtained, soliciting, or requiring the disclosure to third parties or the public of facts or opinions by or for an agency regardless of form or format. (See 44 U.S.C. 3502(3)(A)). The collection of information requirements specified in the proposal would reduce the risk of death, serious injury, and illness by ensuring that employers develop and implement a worksite heat injury and illness prevention plan (HIIPP), review and evaluate the effectiveness of the HIIPP, designate one or more heat safety coordinators to implement and monitor the HIIPP, and develop and implement a heat illness emergency response plan to respond to employees experiencing signs and symptoms of heat related illnesses for indoor and outdoor conditions. OSHA is requesting OMB approval of the proposed Information Collection Request (ICR) and a new OMB Control Number for this ICR currently under OMB Control Number 1218–0NEW.

Under the PRA, a Federal agency cannot conduct or sponsor a collection of information unless OMB approves it, and the agency displays a currently valid OMB control number (44 U.S.C. 3507). Also, notwithstanding any other provision of law, no employer shall be subject to penalty for failing to comply

with a collection of information if the collection of information does not display a currently valid OMB control number (44 U.S.C. 3512).

B. Solicitation of Comments

In accordance with the PRA (44 U.S.C. 3506(c)(2) and 3507(d)), OSHA submitted the collection-of-information requirements identified in the NPRM to OMB for review. The agency solicits comments on the collection-of-information requirements and estimated burden hours associated with these requirements, including comments on the following items:

- Whether the proposed collections of information are necessary for the proper performance of the agency’s functions, including whether the information is useful;
- The accuracy of OSHA’s estimate of the burden (time and cost) of the proposed collections of information, including the validity of the methodology and assumptions used;
- The quality, utility, and clarity of the information collected; and
- Ways to minimize the compliance burden on employers, for example, by using automated or other technological techniques for collecting and transmitting information (78 FR 56438).

C. Proposed Collection of Information Requirements

As required by 5 CFR 1320.5(a)(1)(iv) and 1320.8(d)(1), the following paragraphs provide information about this ICR.

1. *Title:* Heat Injury and Illness Prevention Standard (29 CFR 1910.148).

2. *Description of the ICR:* The proposal would add new collection-of-information requirements to protect indoor and outdoor workers from hazardous heat.

3. *Brief Summary of the Collection of Information Requirements:* The proposed Heat Injury and Illness Prevention Standard ICR adds new collection-of-information requirements that would ensure that employers develop and implement a worksite heat injury and illness prevention plan, review and evaluate the effectiveness of the HIIPP, designate one or more heat safety coordinators to implement and monitor the HIIPP, and develop and implement a heat illness emergency response plan for employees experiencing signs and symptoms of heat related illnesses for indoor and outdoor workers. Specifically, the proposed collection-of-information requirements contained in the proposed rule for the Heat Injury and Illness Prevention Standard are listed in table X.J–1.

TABLE X.J-1—PROPOSED COLLECTION-OF-INFORMATION REQUIREMENTS FOR HEAT INJURY AND ILLNESS PREVENTION

	Section	Collection-of-information requirements
1	§ 1910.148(c)(1) through (4).	Paragraphs (c)(1) through (4) would require employers to develop and implement a heat injury and illness prevention plan (HIIPP), which must include a list of covered activities, the policies and procedures necessary to comply with the proposed standard, the heat metric the employer will use to comply with paragraph (d), and policies and procedures related to the use of vapor-impermeable clothing, if applicable. For employers with more than 10 employees, the HIIPP must be in writing.
2	§ 1910.148(c)(5)	Paragraph (c)(5) would require the employer to designate one or more heat safety coordinators to implement and monitor the HIIPP.
3	§ 1910.148(c)(6) and (7)	Paragraphs (c)(6) and (7) would require the employer to seek the input and involvement of non-managerial employees in the development and implementation of the HIIPP, and to review and evaluate the effectiveness of the HIIPP at least annually and whenever a heat-related illness or injury occurs that results in days away from work, medical treatment beyond first aid, or loss of consciousness.
4	§ 1910.148(c)(8) and (9)	Paragraphs (c)(8) and (9) would require the employer to make the HIIPP readily available at the work site in a language each employee, supervisor, and heat safety coordinator understands.
5	§ 1910.148(d)(3)	Paragraph (d)(3) would require the employer, at indoor work sites, to identify each work area(s) where there is a reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger. For each work area identified, the employer would be required to develop and implement a monitoring plan that includes measuring heat index or wet bulb globe temperature. Employers would also be required to evaluate any affected work area(s) and update their monitoring plan whenever there is a change in production, processes, equipment, controls, or a substantial increase in outdoor temperature which has the potential to increase heat exposure indoors. The employer would be required to seek the input and involvement of non-managerial employees when identifying work areas with a reasonable expectation of exposure at or above the initial heat trigger and in developing and updating monitoring plans.
6	§ 1910.148(e)(7)	Paragraph (e)(7) would require the employer, when the initial heat trigger is met or exceeded, to implement an acclimatization protocol for each new employee and each returning employee (i.e., who has been away from work for more than 14 days) during their first week on the job. Employers would be required to choose either a plan that would incorporate the control measures required when the high heat trigger is met or exceeded, or a gradual acclimatization plan that would slowly increase the employee's exposure to heat each day. The requirement would not apply if the employer can demonstrate that the employee consistently worked under the same or similar conditions within the past 14 days.
7	§ 1910.148(e)(9)	Paragraph (e)(9) would require the employer, when the initial heat trigger is met or exceeded, to maintain a means of effective, two-way communication with employees and regularly communicate with employees.
8	§ 1910.148(f)(4)	Paragraph (f)(4) would require the employer, prior to the work shift or upon determining that the high heat trigger is met or exceeded, to notify employees of the importance of drinking plenty of water, employees' right to take rest breaks if needed and required rest breaks, how to seek help and the procedures to take in a heat emergency, and, for mobile work sites, the location of break area(s) and drinking water.
9	§ 1910.148(f)(5)	Paragraph (f)(5) would require the employer to place a legible, visible, and understandable warning sign at indoor work areas with ambient temperatures that regularly exceed 120 °F.
10	§ 1910.148(g)(1)	Paragraph (g)(1) would require employers, as part of their HIIPP, to develop and implement a heat emergency response plan that includes a list of emergency phone numbers, a description of how employees can contact a supervisor and emergency medical services, individual(s) designated to ensure that heat emergency procedures are invoked when appropriate, a description of how to transport employees to a place where they can be reached by emergency medical services, clear and precise directions to the work site, and procedures for responding to an employee experiencing signs and symptoms of heat-related illness or a heat emergency.
11	§ 1910.148(g)(3)	Paragraph (g)(3) would require the employer, if an employee is experiencing signs and symptoms of a heat emergency, to take immediate actions to reduce the employee's body temperature and immediately contact emergency medical services, as well as relieving them from duty, monitoring them, ensuring they are not left alone, and offering them on-site first aid and medical services.
12	§ 1910.148(i)(1)	Paragraph (i)(1) would require employers to have written or electronic records of on-site measurements at indoor work areas, and to retain those records for 6 months.

4. OMB Control Number: 1218–ONEW.

5. Affected Public: Business or other for-profit.

6. Number of Respondents: 2,535,775.

7. Frequency of Responses: On occasion, annually.

8. Number of Responses: 1,699,783,434.

9. Average Time per Response: Varies.

10. Estimated Total Burden Hours: 27,803,599.

11. Estimated Costs (capital-operation and maintenance): \$24,040,064.

D. Submitting Comments

Members of the public may comment on the collection of information requirements in this proposed standard by sending their comments to the Office of Information and Regulatory Affairs, Attn: OMB Desk Officer for the Department of Labor, OSHA Regulation Identifier Number (RIN) (1218–AD39), by email: OIRA_submission@omb.eop.gov. Please limit the comments to only those addressing the collection of information requirements in the proposed Heat Injury and Illness Prevention standard (i.e., proposed § 1910.148). OSHA encourages

commenters also to submit their comments on these collection of information requirements to the rulemaking docket (OSHA–2021–0009), along with their comments on other parts of the proposed standard. For instructions on submitting these comments to the docket, see the sections of this **Federal Register** document titled **DATES** and **ADDRESSES**. Comments submitted in response to this document are public records; therefore, OSHA cautions commenters about submitting personal information, such as Social Security numbers and dates of birth.

E. Docket and Inquiries

To access the docket to read or download comments and other materials related to this paperwork determination, including the complete ICR, use the procedures described under the section of this document titled **ADDRESSES**. You may obtain an electronic copy of the complete ICR by going to the website at <https://www.reginfo.gov/public/do/PRAMain>, then select “Department of Labor” under “Currently Under Review”, then click on “submit”. This will show all of the Department’s ICRs currently under review, including the ICRs submitted for proposed rulemakings. To make inquiries, or to request other information, contact Ms. Seleda Perryman, Directorate of Standards and Guidance, Occupational Safety and Health Administration, U.S. Department of Labor; telephone (202) 693–4131; email perryman.seleda.m@dol.gov.

XI. Authority and Signature

This document was prepared under the direction of Douglas L. Parker, Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor, 200 Constitution Ave. NW, Washington, DC 20210. It is issued under the authority of sections 4, 6, and 8 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, and 657); 5 U.S.C. 553, Secretary of Labor’s Order No. 8–2020 (85 FR 58383), and 29 CFR part 1911.

List of Subjects in 29 CFR Parts 1910, 1915, 1917, 1918, 1926, and 1928

Heat-related injuries and illnesses, Heat stress, Incorporation by reference, Occupational safety and health, Safety.

Signed at Washington, DC.

Douglas L. Parker,

Assistant Secretary of Labor for Occupational Safety and Health.

Amendments to Standards

For the reasons set forth in the preamble, OSHA proposes to amend 29 CFR parts 1910, 1915, 1917, 1918, 1926, and 1928 as follows:

PART 1910—OCCUPATIONAL SAFETY AND HEALTH STANDARDS

Subpart A—General

■ 1. The authority citation for part 1910, subpart A, is revised to read as follows:

Authority: 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31159), 4–2010 (75 FR 55355), 1–2012 (77 FR 3912), or 8–2020 (85 FR

58393), as applicable. Sections 1910.6, 1910.7, 1910.8 and 1910.9 also issued under 29 CFR 1911. Section 1910.7(f) also issued under 31 U.S.C. 9701; 29 U.S.C. 9a; 5 U.S.C. 553; Public Law 106–113 (113 Stat. 1501A–222); Public Law 11–8 and 111–317; and OMB Circular A–25 (dated July 8, 1993) (58 FR 38142, July 15, 1993).

■ 2. Amend § 1910.6 to subpart A by revising the introductory text of paragraph (z) and adding paragraph (z)(4) to read as follows:

§ 1910.6 Incorporation by reference.

* * * * *

(z) National Institute for Occupational Safety and Health (NIOSH), 1600 Clifton Road, Atlanta, GA 30329; website: www.cdc.gov/niosh.

* * * * *

(4) NIOSH Publication No. 2016–106. Criteria for a Recommended Standard: Occupational Exposure to Heat and Hot Environments, February 2016; IBR approved for § 1910.148(b).

* * * * *

Subpart J—General Environmental Controls

■ 3. The authority citation for part 1910, subpart J, is revised to read as follows:

Authority: 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31159), 4–2010 (75 FR 55355), 1–2012 (77 FR 3912) or 8–2020 (85 FR 58393), as applicable.

Sections 1910.141, 1910.142, 1910.145, 1910.146, 1910.147, and 1910.148 also issued under 29 CFR part 1911.

■ 4. Add § 1910.148 to subpart J to read as follows:

§ 1910.148 Heat Injury and Illness Prevention.

(a) *Scope and application.* (1) Except as otherwise provided in this paragraph (a), this standard applies to all employers.

(2) This standard does not apply to the following:

(i) Work activities for which there is no reasonable expectation of exposure at or above the initial heat trigger;

(ii) Short duration employee exposures at or above the initial heat trigger of 15 minutes or less in any 60-minute period;

(iii) Organizations whose primary function is the performance of firefighting; emergency response activities of workplace emergency response teams, emergency medical services, or technical search and rescue; and any emergency response activities already covered under 29 CFR 1910.120, 1910.146, 1910.156, part 1915, subpart P, 1926.65, and 1926.1211;

(iv) Work activities performed in indoor work areas or vehicles where air-conditioning consistently keeps the ambient temperature below 80 °F;

(v) Telework (*i.e.*, work done from home or another remote location of the employee's choosing); and

(vi) Sedentary work activities at indoor work areas that only involve some combination of the following: sitting, occasional standing and walking for brief periods of time, and occasional lifting of objects weighing less than 10 pounds.

(3) Employers whose employees all exclusively perform activities described in paragraphs (a)(2)(i) through (vi) of this section are exempt from this standard.

(b) *Definitions.* The following definitions apply to this standard:

Acclimatization means the body's adaptation to work in the heat as a person is exposed to heat gradually over time, which reduces the strain caused by heat stress and enables a person to work with less chance of heat illness or injury.

Ambient temperature means the temperature of the air surrounding a body. It is also called "air temperature" or "dry bulb temperature."

Cooling personal protective equipment (PPE) means equipment worn to protect the user against heat injury or illness.

Heat index means the National Weather Service heat index, which combines ambient temperature and humidity.

High heat trigger means a heat index of 90 °F or a wet bulb globe temperature equal to the National Institute for Occupational Safety and Health (NIOSH) Recommended Exposure Limit (REL).

Indoor/indoors means an area under a ceiling or overhead covering that restricts airflow and has along its entire perimeter walls, doors, windows, dividers, or other physical barriers that restrict airflow, whether open or closed.

Initial heat trigger means a heat index of 80 °F or a wet bulb globe temperature equal to the NIOSH Recommended Alert Limit (RAL).

Outdoor/outdoors means an area that is not indoors. For purposes of this standard, vehicles operated outdoors are considered outdoor work areas unless exempted by paragraph (a)(2) of this section.

Radiant heat means heat transferred by electromagnetic waves between surfaces. Sources of radiant heat include the sun, hot objects, hot liquids, hot surfaces, and fire.

Recommended Alert Limit (RAL) means the NIOSH-recommended heat

stress alert limits for unacclimatized workers, see NIOSH Publication No. 2016–106 (incorporated by reference, see § 1910.6).

Recommended Exposure Limit (REL) means the NIOSH-recommended heat stress exposure limits for acclimatized workers, see NIOSH Publication No. 2016–106 (incorporated by reference, see § 1910.6).

Shade means the blockage of direct sunlight, such that objects do not cast a shadow in the area of blocked sunlight.

Signs and symptoms of a heat emergency means the physiological manifestations of a heat-related illness that requires emergency response and includes loss of consciousness (*i.e.*, fainting, collapse) with excessive body temperature, which may or may not be accompanied by vertigo, nausea, headache, cerebral dysfunction, or bizarre behavior. This could also include staggering, vomiting, acting irrationally or disoriented, having convulsions, and (even after resting) having an elevated heart rate.

Signs and symptoms of heat-related illness means the physiological manifestations of a heat-related illness and includes headache, nausea, weakness, dizziness, elevated body temperature, muscle cramps, and muscle pain or spasms.

Vapor-impermeable clothing means full-body clothing that significantly inhibits or completely prevents sweat produced by the body from evaporating into the outside air. Examples include encapsulating suits, various forms of chemical resistant suits, and other forms of nonbreathable PPE.

Vehicle means a car, truck, van, or other motorized means of transporting people or goods.

Wet bulb globe temperature (WBGT) means a heat metric that takes into account ambient temperature, humidity, radiant heat from sunlight or artificial heat sources, and air movement.

Work area means an area where one or more employees are working within a work site.

Work site means a physical location (*e.g.*, fixed, mobile) where the employer's work or operations are performed.

(c) *Heat injury and illness prevention plan.* (1) The employer must develop and implement a work site heat injury and illness prevention plan (HIIPP) with site-specific information.

(2) The HIIPP must include:

(i) A comprehensive list of the types of work activities covered by the plan;

(ii) All policies and procedures necessary to comply with the requirements of this standard; and

(iii) An identification of the heat metric (*i.e.*, heat index or wet bulb globe temperature) the employer will monitor to comply with paragraph (d) of this section.

(3) If the employer has employees who wear vapor-impermeable clothing, the employer must evaluate heat stress hazards resulting from these clothing and implement policies and procedures based on reputable sources to protect employees while wearing these clothing. The employer must include these policies and procedures and document the evaluation in the HIIPP.

(4) If the employer has more than 10 employees, the HIIPP must be written.

(5) The employer must designate one or more heat safety coordinators to implement and monitor the HIIPP. The identity of the heat safety coordinator(s) must be documented in any written HIIPP. The heat safety coordinator(s) must have the authority to ensure compliance with all aspects of the HIIPP.

(6) The employer must seek the input and involvement of non-managerial employees and their representatives, if any, in the development and implementation of the HIIPP.

(7) The employer must review and evaluate the effectiveness of the HIIPP whenever a heat-related illness or injury occurs that results in death, days away from work, medical treatment beyond first aid, or loss of consciousness, but at least annually. Following each review, the employer must update the HIIPP as necessary. The employer must seek input and involvement of non-managerial employees and their representatives, if any, during any reviews and updates.

(8) The employer must make the HIIPP readily available at the work site to all employees performing work at the work site.

(9) The HIIPP must be available in a language each employee, supervisor, and heat safety coordinator understands.

(d) *Identifying heat hazards*—(1) *Outdoor work.* The employer must monitor heat conditions at outdoor work areas by:

(i) Tracking local heat index forecasts provided by the National Weather Service or other reputable sources; or

(ii) At or as close as possible to the work area(s), measuring the following:

(A) Heat index, or ambient temperature and humidity measured separately to calculate heat index; or

(B) Wet bulb globe temperature.

(2) *Frequency of outdoor monitoring.* The employer must monitor with sufficient frequency to determine with

reasonable accuracy employees' exposure to heat.

(3) *Indoor work.* (i) At indoor work sites, the employer must identify each work area(s) where there is a reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger.

(ii) The employer must develop and implement a monitoring plan covering each work area identified in paragraph (d)(3)(i) of this section to determine when employees are exposed to heat at or above the initial and high heat triggers. The employer must include the monitoring plan in the HIIPP and the monitoring plan must include measuring one of the following at or as close as possible to the work area(s) identified in paragraph (d)(3)(i) of this section:

(A) Heat index, or ambient temperature and humidity measured separately to calculate heat index; or

(B) Wet bulb globe temperature.

(iii) Whenever there is a change in production, processes, equipment, controls, or a substantial increase in outdoor temperature which has the potential to increase heat exposure indoors, the employer must evaluate any affected work area(s) to identify where there is reasonable expectation that employees are or may be exposed to heat at or above the initial heat trigger. The employer must update their monitoring plan or develop and implement a monitoring plan, in accordance with paragraph (d)(3)(ii) of this section, to account for any increases in heat exposure.

(iv) The employer must seek the input and involvement of non-managerial employees and their representatives, if any, when evaluating the work site to identify work areas with a reasonable expectation of exposures at or above the initial heat trigger and in developing and updating monitoring plans in accordance with paragraphs (d)(3)(i) through (iii) of this section.

(4) *Heat metric.* The heat metric the employer chooses to monitor will determine the applicable initial and high heat triggers for purposes of this standard. If the employer does not identify their choice of heat metric in the HIIPP or monitor as required by paragraph (d) of this section, the initial and high heat triggers will be the heat index values identified in the definitions.

(5) *Exemption from monitoring.* The employer can assume that the temperature at a work area is at or above both the initial heat and high heat triggers instead of conducting on-site measurements or tracking local forecasts. In such cases, the employer

must provide all control measures outlined in paragraphs (e) and (f) of this section.

(e) *Requirements at or above the initial heat trigger*—(1) *Timing.* The employer must implement the controls described in this paragraph (e) when employees are exposed to heat at or above the initial heat trigger.

(2) *Drinking water.* The employer must provide access to potable water for drinking that is:

(i) Placed in locations readily accessible to the employee;

(ii) Suitably cool; and

(iii) Of sufficient quantity to provide access to 1 quart of drinking water per employee per hour.

Note 1 to paragraph (e)(2). The requirements of this paragraph (e)(2) are in addition to the requirements in the sanitation standard applicable to the employer (29 CFR 1910.141, 1915.88, 1917.127, 1918.95, 1926.51, 1928.110) and the temporary labor camps standard (29 CFR 1910.142).

(3) *Break area(s) at outdoor work sites.* The employer must provide one or more area(s) for employees to take breaks that can accommodate the number of employees on break, is readily accessible to the work area(s), and has at least one of the following:

(i) Artificial shade (*e.g.*, tent, pavilion) or natural shade (*e.g.*, trees), but not shade from equipment, that provides blockage of direct sunlight and is open to the outside air; or

(ii) Air-conditioning, if in an enclosed space like a trailer, vehicle, or structure.

(4) *Break area(s) at indoor work sites.* The employer must provide one or more area(s) for employees to take breaks (*e.g.*, break room) that is air-conditioned or has increased air movement and, if appropriate, de-humidification, can accommodate the number of employees on break, and is readily accessible to the work area(s).

(5) *Indoor work area controls.* The employer must provide one of the following at each work area identified in paragraph (d)(3)(i) of this section:

(i) Increased air movement, such as fans or comparable natural ventilation, and, if appropriate, de-humidification;

(ii) Air-conditioned work area; or

(iii) In cases of radiant heat sources, other measures that effectively reduce employee exposure to radiant heat in the work area (*e.g.*, shielding/barriers, isolating heat sources).

(6) *Evaluation of fan use.* At ambient temperatures above 102 °F, if the employer is providing fans to comply with paragraph (e)(4) or (5) of this section, the employer must evaluate the humidity to determine if fan use is harmful, and if the employer determines

that it is, the employer must discontinue fan use.

(7) *Acclimatization*—(i) *New employees*. The employer must implement one of the following acclimatization protocols for each employee during their first week on the job:

(A) A plan that, at minimum, incorporates the measures in paragraph (f) of this section whenever the heat index is at or above the initial heat trigger during the employee's first week of work; or

(B) Gradual acclimatization to heat in which the employee's exposure to heat is restricted to no more than: 20% of a normal work shift exposure duration on the first day of work, 40% on the second day of work, 60% of the third day of work, and 80% on the fourth day of work.

(ii) *Returning employees*. The employer must implement one of the following acclimatization protocols for each employee who has been away (e.g., on vacation or sick leave) for more than 14 days during their first week back on the job:

(A) A plan that, at minimum, incorporates the measures in paragraph (f) of this section whenever the heat index is at or above the initial heat trigger during the employee's first week upon returning to work; or

(B) Gradual acclimatization to heat in which employee exposure to heat is restricted to no more than: 50% of a normal work shift exposure duration on the first day of work, 60% on the second day of work, and 80% of the third day of work.

(iii) *Exception to acclimatization requirements*. The requirements of paragraphs (e)(7)(i) and (ii) of this section do not apply if the employer can demonstrate the employee consistently worked under the same or similar conditions as the employer's working conditions within the prior 14 days.

(8) *Rest breaks if needed*. The employer must allow and encourage employees to take paid rest breaks in the break area required by paragraph (e)(3) or (4) of this section if needed to prevent overheating.

(9) *Effective communication*. The employer must maintain a means of effective, two-way communication with employees (e.g., by voice or electronic means (such as a handheld transceiver, phone, or radio)) and regularly communicate with employees.

(10) *Personal protective equipment (PPE)*. If the employer provides employees with cooling PPE, the employer must ensure the cooling properties of the PPE are maintained at all times during use.

(f) *Requirements at or above the high heat trigger*—(1) *Timing*. In addition to the controls required by paragraph (e) of this section, the employer must implement the controls described in this paragraph (f) when employees are exposed to heat at or above the high heat trigger.

(2) *Rest breaks*. The employer must provide employees a minimum 15-minute paid rest break at least every two hours in the break area required by paragraph (e)(3) or (4) of this section, subject to the following:

(i) A meal break may count as a rest break, even if it is not otherwise required by law to be paid;

(ii) Periods during which employees are donning and doffing personal protective equipment (e.g., coveralls) must not count towards the total time provided for rest breaks; and

(iii) The time for employees to walk to and from the break area is not included in the time provided for rest breaks.

(3) *Observation for signs and symptoms*. The employer must implement at least one of the following methods of observing employees for signs and symptoms of heat-related illness:

(i) A mandatory buddy system in which co-workers observe each other; or

(ii) Observation by a supervisor or heat safety coordinator, with no more than 20 employees observed per supervisor or heat safety coordinator.

(iii) For employees who are alone at a work site, the employer must maintain a means of effective, two-way communication with those employees (e.g., by electronic means (such as a handheld transceiver, phone, or radio)) and make contact with the employees at least every two hours.

(4) *Hazard Alert*. Prior to the work shift or upon determining the high heat trigger is met or exceeded, the employer must notify employees of the following:

(i) The importance of drinking plenty of water;

(ii) Employees' right to, at employees' election, take rest breaks if needed and the rest breaks required by paragraph (f)(2) of this section;

(iii) How to seek help and the procedures to take in a heat emergency; and

(iv) For mobile work sites, the location of break area(s) required by paragraph (e)(3) or (4) of this section and drinking water required by paragraph (e)(2) of this section.

(5) *Excessively high heat areas*. The employer must place warning signs at indoor work areas with ambient temperatures that regularly exceed 120 °F. The warning signs must be

legible, visible, and understandable to employees entering the work areas.

(g) *Heat illness and emergency response and planning*. (1) As part of their HIIPP, the employer must develop and implement a heat emergency response plan that includes:

(i) A list of emergency phone numbers (e.g., 911, emergency services);

(ii) A description of how employees can contact a supervisor and emergency medical services;

(iii) Individual(s) designated to ensure that heat emergency procedures are invoked when appropriate;

(iv) A description of how to transport employees to a place where they can be reached by an emergency medical provider;

(v) Clear and precise directions to the work site, including the address of the work site, which can be provided to emergency dispatchers; and

(vi) Procedures for responding to an employee experiencing signs and symptoms of heat-related illness, including heat emergency procedures for responding to an employee with suspected heat stroke.

(2) If an employee is experiencing signs and symptoms of heat-related illness, the employer must:

(i) Relieve them from duty;

(ii) Monitor them;

(iii) Ensure they are not left alone;

(iv) Offer them on-site first aid or medical services before ending monitoring; and

(v) Provide them with the means to reduce their body temperature.

(3) If an employee is experiencing signs and symptoms of a heat emergency, the employer must:

(i) Take immediate actions to reduce the employee's body temperature before emergency medical services arrive;

(ii) Contact emergency medical services immediately; and

(iii) Perform activities described in paragraphs (g)(2)(i) through (iv) of this section.

(h) *Training*—(1) *Initial training*. Prior to any work at or above the initial heat trigger, the employer must ensure that each employee receives training on, and understands, the following:

(i) Heat stress hazards;

(ii) Heat-related injuries and illnesses;

(iii) Risk factors for heat-related injury or illness, including the contributions of physical exertion, clothing, personal protective equipment, a lack of acclimatization, and personal risk factors (e.g., age, health, alcohol consumption, and use of certain medications);

(iv) Signs and symptoms of heat-related illness and which ones require immediate emergency action;

(v) The importance of removing personal protective equipment that may impair cooling during rest breaks;

(vi) Importance of taking rest breaks to prevent heat-related illness or injury, and that rest breaks are paid;

(vii) Importance of drinking water to prevent heat-related illness or injury;

(viii) The location of break areas;

(ix) The location of employer-provided water;

(x) The importance of employees reporting any signs and symptoms of heat-related illness they may experience, and those they observe in co-workers;

(xi) All policies and procedures that are applicable to the employee's duties, as indicated in the work site's HIIPP;

(xii) The identity of the heat safety coordinator(s);

(xiii) The requirements of this standard;

(xiv) How the employee can access the work site's HIIPP; and

(xv) Employees have a right to the protections required by this standard (e.g., rest breaks, water) and employers are prohibited from discharging or in any manner discriminating against any employee for exercising those rights.

(xvi) If the employer is required by paragraph (f)(5) of this section to place warning signs for excessively high heat areas, they must train employees in the procedures to follow when working in these areas.

(2) *Supervisor training.* The employer must ensure that each supervisor responsible for supervising employees performing any work at or above the initial heat trigger and each heat safety coordinator receives training on, and understands, both the topics outlined in paragraph (h)(1) of this section and the following:

(i) The policies and procedures developed to comply with the applicable requirements of this standard, including the policies and procedures for monitoring heat conditions developed to comply with paragraphs (d)(1) and (d)(3)(ii) of this section; and

(ii) The procedures the supervisor or heat safety coordinator must follow if an employee exhibits signs and symptoms of heat-related illness.

(3) *Annual refresher training.* The employer must ensure that each employee receives annual training on, and understands, the subjects addressed in paragraph (h)(1) of this section. The employer must also ensure that each supervisor and heat safety coordinator additionally receives annual training on, and understands, the topics addressed in paragraph (h)(2) of this section. For employees who perform work outdoors,

the employer must conduct the annual refresher training before or at the start of heat season.

(4) *Supplemental training.* The employer must ensure that each employee promptly receives, and understands, additional training whenever:

(i) Changes occur that affect the employee's exposure to heat at work (e.g., new job tasks);

(ii) The employer changes the policies or procedures addressed in paragraph (h)(1)(xi) of this section;

(iii) There is an indication that the employee has not retained the necessary understanding; or

(iv) A heat-related injury or illness occurs at the work site that results in death, days away from work, medical treatment beyond first aid, or loss of consciousness.

(5) *Presentation.* Training must be provided in a language and at a literacy level each employee, supervisor, and heat safety coordinator understands. The employer must provide employees with an opportunity for questions and answers about the training materials.

(i) *Recordkeeping.* If the employer conducts on-site measurements at indoor work areas pursuant to paragraph (d)(3)(ii) of this section, they must have written or electronic records of those indoor work area measurements and retain those records for 6 months.

(j) *Requirements implemented at no cost to employees.* The implementation of all requirements of this standard must be at no cost to employees, including paying employees their normal rate of pay when compliance requires employee time.

(k) *Dates—(1) Effective date.* This standard is effective [60 days after date of publication of the final rule in the **Federal Register**].

(2) *Compliance date.* Employers must comply with all requirements of this standard by [150 days after date of publication of the final rule in the **Federal Register**].

(l) *Severability.* Each provision within this standard is separate and severable from the other provisions. If any provision of this standard is held to be invalid or unenforceable on its face, or as applied to any person, entity, or circumstance, or is stayed or enjoined, that provision shall be construed so as to continue to give the maximum effect to the provision permitted by law, unless such holding shall be one of utter invalidity or unenforceability, in which event the provision shall be severable from this standard and shall not affect the remainder of the standard.

PART 1915—OCCUPATIONAL SAFETY AND HEALTH STANDARDS FOR SHIPYARD EMPLOYMENT

■ 5. The authority citation for part 1915 continues to read as follows:

Authority: 33 U.S.C. 941; 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31160), 4–2010 (75 FR 55355), 1–2012 (77 FR 3912), or 8–2020 (85 FR 58393); 29 CFR part 1911; and 5 U.S.C. 553, as applicable.

Subpart F—General Working Conditions

■ 6. Add § 1915.95 to subpart F to read as follows:

§ 1915.95 Heat Injury and Illness Prevention.

The requirements applicable to shipyard employment under this section are identical to the requirements set forth at 29 CFR 1910.148.

PART 1917—MARINE TERMINALS

■ 7. The authority citation for part 1917 continues to read as follows:

Authority: 33 U.S.C. 941; 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31160), 4–2010 (75 FR 55355), 1–2012 (77 FR 3912), or 8–2020 (85 FR 58393), as applicable; and 29 CFR part 1911.

Sections 1917.28 and 1917.31 also issued under 5 U.S.C. 553.

Section 1917.29 also issued under 49 U.S.C. 1801–1819 and 5 U.S.C. 553.

Subpart B—Marine Terminal Operations

■ 8. Add § 1917.32 to subpart B to read as follows:

§ 1917.32 Heat injury and illness prevention.

The requirements applicable to marine terminals under this section are identical to the requirements set forth at 29 CFR 1910.148.

PART 1918—SAFETY AND HEALTH REGULATIONS FOR LONGSHORING

■ 9. The authority citation for part 1918 continues to read as follows:

Authority: 33 U.S.C. 941; 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31160), 4–2010 (75 FR 55355), 1–2012 (77 FR 3912), or 8–2020 (85 FR 58393), as applicable; and 29 CFR 1911.

Sections 1918.90 and 1918.110 also issued under 5 U.S.C. 553.

Section 1918.100 also issued under 49 U.S.C. 5101 *et seq.* and 5 U.S.C. 553.

■ 10. Add subpart L to read as follows:

Subpart L—Occupational Health and Environmental Controls

Sec.

1918.111 through 1918.147 [Reserved]
1918.148 Heat injury and illness prevention.

§ 1918.148 Heat injury and illness prevention.

The requirements applicable to longshoring operations and related employments under this section are identical to the requirements set forth at 29 CFR 1910.148.

PART 1926—SAFETY AND HEALTH REGULATIONS FOR CONSTRUCTION

■ 11. The authority citation for part 1926 continues to read as follows:

Authority: 40 U.S.C. 3704; 29 U.S.C. 653, 655, and 657; and Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31159), 4–2010 (75 FR 55355), 1–2012 (77 FR 3912), or 8–2020 (85 FR 58393), as applicable; and

29 CFR part 1911, unless otherwise noted Sections 1926.58, 1926.59, 1926.60, and 1926.65 also issued under 5 U.S.C. 553 and 29 CFR part 1911.

Section 1926.61 also issued under 49 U.S.C. 1801–1819 and 5 U.S.C. 553.

Section 1926.62 also issued under sec. 1031, Public Law 102–550, 106 Stat. 3672 (42 U.S.C. 4853).

Section 1926.65 also issued under sec. 126, Public Law 99–499, 100 Stat. 1614 (reprinted at 29 U.S.C.A. 655 Note) and 5 U.S.C. 553.

Subpart D—Occupational Health and Environmental Controls

■ 12. Add § 1926.67 to subpart D to read as follows:

§ 1926.67 Heat injury and illness prevention.

The requirements applicable to construction work under this section are identical to the requirements set forth at 29 CFR 1910.148.

PART 1928—OCCUPATIONAL SAFETY AND HEALTH STANDARDS FOR AGRICULTURE

■ 11. The authority citation for part 1928 continues to read as follows:

Authority: Sections 4, 6, and 8 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's

Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 4–2010 (75 FR 55355), or 8–2020 (85 FR 58393), as applicable; and 29 CFR 1911.

Section 1928.21 also issued under 49 U.S.C. 1801–1819 and 5 U.S.C. 553.

■ 12. Amend § 1928.21 by:

■ a. In paragraph (a)(8)(i), removing the word “and” at the end of the paragraph;

■ b. Revising paragraph (a)(8)(ii); and

■ c. Adding paragraph (a)(9).

The revision and addition read as follows:

§ 1928.21 Applicable standards in 29 CFR part 1910.

(a) * * *

(8) * * *

(ii) Agricultural establishments that maintain a temporary labor camp, regardless of how many employees are engaged on any given day in hand-labor operations in the field; and

(9) Heat injury and illness prevention—§ 1910.148 of this chapter with respect to requirements applicable to agricultural operations.

Department of the Interior

Bureau of Safety and Environmental Enforcement

30 CFR Part 250

Oil and Gas and Sulfur Operations in the Outer Continental Shelf—High Pressure High Temperature Updates; Final Rule

DEPARTMENT OF THE INTERIOR**Bureau of Safety and Environmental Enforcement****30 CFR Part 250**

[Docket ID: BSEE–2021–0003; EEEE500000 245E1700D2 ET1SF0000.EAQ000]

RIN 1014–AA49

Oil and Gas and Sulfur Operations in the Outer Continental Shelf—High Pressure High Temperature Updates

AGENCY: Bureau of Safety and Environmental Enforcement, Interior.

ACTION: Final rule.

SUMMARY: The Department of the Interior (DOI or Department), through the Bureau of Safety and Environmental Enforcement (BSEE), is adding requirements for new or unusual technology, including equipment used in high pressure high temperature (HPHT) environments; revising and reorganizing the information submission requirements for a project's Conceptual Plans and Deepwater Operations Plan (DWOP); and requiring independent third parties to review certain information prior to submission to BSEE. This final rule will improve operational and environmental safety and human health, while providing consistency and clarity to industry regarding the equipment and operational requirements as well as the submissions that are necessary so that BSEE can review and consider for approval proposed projects that would use new or unusual technology.

DATES: This final rule is effective on October 29, 2024. The incorporation by reference of certain material listed in this rule is approved by the Director of the Federal Register as of October 29, 2024.

FOR FURTHER INFORMATION CONTACT: For questions, contact Kirk Malstrom, Regulations and Standards Branch, (202) 258–1518, or by email: regs@bsee.gov.

SUPPLEMENTARY INFORMATION:

Executive Summary

This final rule will improve operational safety and human health and environmental protections, while providing industry with clarity and consistency regarding the equipment, operational requirements, and submissions that are necessary for BSEE to review and approve operations using new or unusual technology. BSEE considers new or unusual technology to include equipment or procedures that

the offshore oil and gas industry has not used previously or extensively under the anticipated operating conditions or has not used previously in a particular BSEE Outer Continental Shelf (OCS) Region, or that have operating characteristics outside the performance parameters established in 30 CFR part 250.

Currently, operations and equipment used in HPHT environments are relatively new on the United States OCS. In general, an HPHT environment is present when well conditions have pressures greater than 15,000 pounds per square inch absolute (psia) or have a temperature greater than 350 degrees Fahrenheit. Historically, most oilfield equipment has not been designed to withstand such high pressures and temperatures. Working in an HPHT environment therefore increases operational complexity because HPHT-associated operations require the use of equipment that exists at the limits of current technology and lacks a long operational history. Due to limited industry experience in HPHT environments, few industry standards directly address HPHT equipment and operations. Currently, BSEE carefully reviews HPHT projects on a case-by-case basis. To date, BSEE has received several applications for projects in HPHT environments and anticipates HPHT project interest to increase due to equipment technological advancements and industry capabilities to develop resources in these environments.

For new or unusual technology projects, including HPHT projects, BSEE regulations currently:

- Require submission of information in a sequence that is not conducive to BSEE's review and consideration for approval of new or unusual technology projects because these projects typically require a more immediate BSEE review and approval than the regulations currently allow; and
- Lack specific equipment requirements because the technology is new and there are few applicable industry standards.

To address these issues, this final rulemaking:

- Requires the submission of information in a sequence that provides both operators¹ and BSEE

¹ BSEE administers the Departmental regulations at 30 CFR part 250, which generally apply to "a lessee, the owner or holder of operating rights, a designated operator or agent of the lessee(s). . . ." 30 CFR 250.105 (definition of "you"). For convenience, this preamble will refer to these regulated entities as "operators" unless otherwise indicated.

the ability to evaluate whether a new or unusual technology project is economically and operationally feasible;

- Clarifies that equipment or procedures used for operations in an HPHT environment are considered new or unusual technology.
- Adds specific equipment requirements, particularly for barriers, through new regulations and the incorporation of applicable industry standards; and
- Requires Independent Third Party (I3P) review of operator submissions, in certain cases, or provides BSEE with the ability to require I3P review, to ensure project viability and safety.

Currently, the DWOP process requires information to be submitted in two distinct phases: the Conceptual Plan phase and the DWOP phase. This final rule maintains the two phase DWOP process and adds additional requirements to each phase that will enable BSEE to thoroughly review proposed new or unusual technology projects. The final rule defines three types of Conceptual Plans: a Project Conceptual Plan, a New or Unusual Technology Conceptual Plan, and a New or Unusual Technology Barrier Equipment Conceptual Plan. A Project Conceptual Plan will be required for any project planned in water depths greater than 1000 feet or that will include the use of subsea tieback development technology, regardless of water depth. A New or Unusual Technology Conceptual Plan will be required for any project or system involving New or Unusual Technology equipment or procedures. A New or Unusual Technology Barrier Equipment Conceptual Plan will be required for any project or system involving new or unusual technology identified as a primary or secondary barrier to isolate a hydrocarbon pressure source from people and the environment. An operator must submit the applicable Conceptual Plan(s) based on the specifics of the proposed project.

The information specific to HPHT projects submitted in the applicable Conceptual Plan(s) will be evaluated for adequacy prior to approval. The final rule's establishment of three new types of Conceptual Plans and the associated new timing requirements established in § 250.226 (e.g., BSEE must approve your Conceptual Plan(s) before the Bureau will approve any associated permit) will provide both operators and BSEE with the ability to evaluate early in the project planning process, before permit approval, whether a new or unusual technology project is economically and operationally feasible. In the final rule,

the DWOP phase, during which the DWOP is reviewed, will take place after the Conceptual Plan(s) have been approved and the system design has been substantially completed.

In addition, this final rule revises 30 CFR part 250, subpart B (“Plans and Information”) and the DWOP process to incorporate BSEE’s Barrier Concept into the requirements, including for new or unusual technology projects. The Barrier Concept is a holistic approach to the barrier system based on BSEE’s determination that abnormal conditions and/or failures are potential risks in a well or pipeline system. When an abnormal condition or failure occurs, it must be detectable, and upon detection, its source must be isolated behind redundant barriers. BSEE considers a barrier or barrier system to be any engineered equipment, materials, component, or assembly that is intended to contain a hydrocarbon pressure source(s) to prevent harm to people or the environment. This final rule defines the types of equipment that BSEE considers to be sufficient barriers and how barriers must be used. The final rule also includes portions of the Barrier Concept in the DWOP process under the New or Unusual Technology Barrier Equipment Conceptual Plan as a means of ensuring that new or unusual technology projects include sufficient barriers, which will enhance protections for people and the environment. This rule incorporates into the regulations the existing BSEE policy on the Barrier Concept discussed in Notice to Lessees (NTLs) 2009–G36, *Using Alternate Compliance in Safety Systems for Subsea Production Operations*; 2019–G02, *Guidance for Information Submissions Regarding Proposed High Pressure and/or High Temperature (HPHT) Well Design, Completion, and Intervention Operations*; and 2019–G03, *Guidance for Information Submissions Regarding Site Specific and Non-Site Specific HPHT Equipment Design Verification Analysis and Design Validation Testing*.

Furthermore, this final rule revises the DWOP process to require I3P review of equipment or procedures identified in a New or Unusual Technology Barrier Equipment Conceptual Plan. This final rule also allows BSEE to require an operator to use an I3P to review certain equipment or procedures identified in a New or Unusual Technology Conceptual Plan. Independent third parties have been used as a longstanding industry practice to support verifications that ensure project viability and safety. I3P review provides an additional review in circumstances where proposed equipment or processes may be

technically complex and require a high degree of specialized engineering knowledge, expertise, and experience to evaluate.

I. Background

A. BSEE Statutory and Regulatory Authority and Responsibilities

The applicable authority for this rulemaking is the Outer Continental Shelf Lands Act (OCSLA), 43 U.S.C. 1331–1356a. OCSLA, enacted in 1953 and substantially revised it in 1978, authorizes the Secretary of the Interior (Secretary) to lease the OCS for mineral development and to regulate oil and gas exploration, development, and production operations on the OCS. The Secretary delegated authority to perform certain of these functions to BSEE.

To carry out its responsibilities, BSEE regulates offshore oil and gas operations to enhance the safety of exploration for and development of oil and gas on the OCS, ensure that those operations protect the environment, and implement advancements in technology. BSEE also conducts onsite inspections to ensure compliance with regulations, lease terms, and approved plans and permits. Detailed information concerning BSEE’s regulations and guidance to the offshore oil and gas industry may be found on BSEE’s website at: <https://www.bsee.gov/guidance-and-regulations>.

BSEE’s regulatory program covers a wide range of OCS facilities and activities, including drilling, completion, workover, production, pipeline, and decommissioning operations. This rule is applicable to operations that involve deepwater development projects, subsea tieback development technology, or projects or systems that use new or unusual technology.

B. Purpose and Summary of the Rule

The purpose of this rule is to improve the requirements and information submission process for oil and gas operations in deepwater and for operations that propose the use of new

or unusual technology equipment or procedures. The final rule achieves this purpose by adding requirements for new or unusual technology projects, including HPHT projects, reorganizing the deepwater project information submission process, and requiring I3P review of certain submissions.

Together, these regulations will better ensure that operators consider and submit sufficient information to BSEE at an early enough stage in the process so that operators and BSEE can adequately address any issues concerning equipment selection, design, and fabrication.

C. Summary of Documents Incorporated by Reference

The Office of the **Federal Register** has regulations concerning incorporation by reference. 1 CFR part 51. These regulations require that, for a final rule, agencies must discuss in the preamble to the rule the way in which materials that the agency incorporates by reference are reasonably available to interested persons and how interested parties can obtain the materials. Additionally, the preamble to the rule must summarize the material. 1 CFR 51.5(b). The text immediately below summarizes the documents incorporated by reference in 30 CFR 250.198 and the changes to the regulatory text. This section of the preamble concludes with a discussion regarding the availability of the documents that are incorporated by reference.

API Spec. 6A, *Specification for Wellhead and Christmas Tree Equipment*, Twentieth Edition, October 2010; Addendum 1, November 2011; Errata 2, November 2011; Addendum 2, November 2012; Addendum 3, March 2013; Errata 3, June 2013; Errata 4, August 2013; Errata 5, November 2013; Errata 6, March 2014; Errata 7, December 2014; Errata 8, February 2016; Addendum 4, June 2016; Errata 9, June 2016; Errata 10, August 2016.

This specification defines requirements for the design of valves, wellheads, and Christmas tree equipment that is used during drilling and production operations. This specification includes requirements related to dimensional and functional interchangeability, design, materials, testing, inspection, welding, marking, handling, storing, shipment, purchasing, repair, and remanufacture. This document is currently incorporated by reference elsewhere in 30 CFR part 250, and BSEE is adding a reference to this standard in existing §§ 250.518 and 250.619.

American National Standards Institute (ANSI)/API Specification (Spec.) 11D1, *Packers and Bridge Plugs, Third Edition, April 2015, Errata 1, August 2019.*

This specification provides minimum requirements and guidelines for packers and bridge plugs used downhole in oil and gas operations. The performance of this equipment is often critical to maintaining well control during drilling and production operations. This specification provides requirements for the design, design verification and validation, materials, documentation and data control, repair, shipment, and storage of packers and bridge plugs. This document is currently incorporated by reference, and BSEE is updating this standard from the second to the third edition.

API Spec. 17D, *Design and Operation of Subsea Production Systems—Subsea Wellhead and Tree Equipment*, Second Edition, *Reaffirmed November 2018, Addendum 1, September 2015; Errata, September 2011; Errata 2, January 2012; Errata 3, June 2013; Errata 4, July 2013; Errata 5, October 2013; Errata 6, August 2015; Errata 7, October 2015.*

This specification provides requirements for subsea wellheads, mudline wellheads, and drill-through mudline wellheads, as well as vertical and horizontal subsea trees. These devices are located on the seafloor, and, therefore, ensuring the safe and reliable performance of this equipment is extremely important. This specification identifies the tooling necessary to handle, test, and install the equipment. It also specifies the parameters for design, material, welding, quality control (including factory acceptance testing), marking, storing, and shipping for both individual sub-assemblies (used to build complete subsea tree assemblies) and complete subsea tree assemblies. This document is currently incorporated by reference elsewhere in 30 CFR part 250, and BSEE is adding references to this standard in existing §§ 250.518 and 250.619.

NACE Standard MR0175–2003, *Standard Material Requirements, Metals for Sulfide Stress Cracking and Stress Corrosion Cracking Resistance in Sour Oilfield Environments*, Revised January 17, 2003.

This standard describes general principles and provides requirements and recommendations for the selection and qualification of metallic materials for equipment used in oil and gas production, and in natural-gas sweetening plants, in hydrogen sulfide (H₂S)-containing environments, where the failure of such equipment can pose a risk to the health and safety of the

public and personnel or to the environment. Application of this standard can help avoid costly corrosion damage to equipment. This standard supplements, but does not replace, the material requirements contained in applicable design codes, standards, or regulations. This standard also addresses all mechanisms of cracking that can be caused by H₂S, including sulfide stress cracking, stress corrosion cracking, hydrogen-induced cracking and stepwise cracking, stress-oriented hydrogen-induced cracking, soft zone cracking, and galvanically induced hydrogen stress cracking. This standard does not include and is not intended to include design specifications. This document is currently incorporated by reference elsewhere in 30 CFR part 250, and BSEE is adding references of this standard in existing §§ 250.518 and 250.619.

The American Petroleum Institute (API) provides free online public access to view read-only copies of its key industry standards, including a broad range of technical standards. All API standards that are safety-related and that are incorporated into Federal regulations are available to the public for free viewing online in the Incorporation by Reference Reading Room on API's website at: <https://publications.api.org>. In addition to the free availability of these standards for viewing on API's website, hardcopies and printable versions are available for purchase from API. The API website address to purchase standards is: <https://www.api.org/products-and-services/standards/purchase>.

NACE International (NACE) standards can be accessed through the American National Standards Institute (ANSI). The ANSI Incorporated by Reference (IBR) Portal provides access to many standards that have been incorporated by reference in the U.S. Code of Federal Regulations (CFR). These standards incorporated by the U.S. government in rulemakings are offered at no cost in "read only" format and are presented for online reading. However, there are no print or download options. The website can be accessed at: <https://ibr.ansi.org>.

For the convenience of the viewing public who may not wish to purchase or view the incorporated documents online, the documents may be inspected at BSEE's offices at: 1919 Smith Street, Suite 14042, Houston, Texas 77002 (phone: 1–844–259–4779), or 45600 Woodland Road, Sterling, Virginia 20166 (email: regs@bsee.gov), by appointment only. An appointment is required to ensure personnel are available to accommodate the request

and to account for competing agency obligations or concerns, including those related to public health and natural disasters. Additional information about where these documents can be inspected or purchased can be found at § 250.198, *Documents incorporated by reference*, or by sending a request by email to regs@bsee.gov.

II. Discussion of Public Comments on the Proposed Rule

In response to the proposed rule, BSEE received 9 sets of submitted comments containing general statements, specific comments on the proposed provisions, and discussions of provisions not included in the proposed rule. Comments included submittals from the following entities: 1 manufacturer, 5 companies, 1 industry organization, 1 non-governmental organization, and 1 classification society. All relevant comments are posted at the *Federal eRulemaking* portal: <https://www.regulations.gov>. To access the comments at that website, enter BSEE–2021–0003 in the Search box. BSEE reviewed all comments submitted, and this section of the preamble contains brief summaries of the relevant comments, as well as BSEE's responses.

BSEE received multiple comments expressing general support for the proposed rule. Some of the commenters who expressed general support for the proposed rule also provided specific detailed comments, which we have addressed further in section III of this preamble. While these commenters voiced support broadly for certain proposed changes, some of them also disagreed with other specific proposals and provided suggested revisions. Multiple commenters also provided statements or comments that were not relevant to the proposed rule, and therefore BSEE is not addressing them in this final rule.

General Comments

Summary of comments related to incremental submission of plans: Multiple commenters suggested that BSEE clarify the regulations to allow for incremental submission of certain plans.

Response: BSEE disagrees with the commenters' suggestions to allow for incremental submission of certain plans. Incremental submission of plans would complicate the BSEE approval process and require additional BSEE time and resources to verify compliance with all requirements. This piecemeal approach increases the potential for errors or gaps within the plans, which may delay project implementation. The DWOP process is purposefully divided into

multiple plans to allow BSEE approval of certain operations as the project is developed. For example, BSEE approval of certain Conceptual Plans would allow for the wells to be completed or the installation of certain equipment, while BSEE approval of the DWOP would allow for well production. BSEE requires all pertinent information associated with the applicable plans within the DWOP process to be submitted as required in §§ 250.220 through 250.248. Furthermore, the final rule provides clarity for the appropriate timing and submission requirements for all plans covered under the DWOP process (e.g., see revisions to §§ 250.201, 250.220, 250.225, and 250.226). This final rule also clarifies that not all projects will require the submittal of each of the three Conceptual Plans and a DWOP. Specifically, certain New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Equipment Conceptual Plans may not be required to have an associated Project Conceptual Plan or DWOP.

Comments Related to the Independent Third Party (I3P)

Summary of comments: Multiple commenters expressed concerns that the proposed rule would substantially expand the role of I3Ps beyond the scope of expected duties. The commenters also requested clarification regarding the role and expected deliverables of I3Ps, including I3P actions concerning verification, validation, and certification and how those fit in with the terms “fit for purpose” and “fit for service.”

Response: BSEE agrees with the commenters that the I3P requirements should be clarified and throughout this rulemaking has revised the roles and expected responsibilities for I3Ps. For example, BSEE has provided supplemental regulatory text that clarifies the meaning of the terms “fit for purpose” and “fit for service” and to identify that an I3P makes a “fit for purpose” determination and an operator makes a “fit for service” determination. These added definitions are consistent with the guidance of BSEE NTL Nos. 2019–G02 and 2019–G03.

In response to the comments, BSEE has also removed the term “certification” as it pertains to determining what is “fit for purpose” and “fit for service” and is clarifying that a statement from the appropriate entity is sufficient instead of a certification statement.² BSEE has also

removed the term “certification” as it pertains to I3Ps throughout Subpart B. See Section III of this preamble for a complete discussion regarding the updated I3P expectations and requirements.

Summary of comment: A commenter acknowledged that I3Ps can be a powerful tool, but stated that BSEE must ensure that the criteria for third party reviewers is sufficient.

Response: BSEE agrees with the commenter that I3Ps can be a useful tool for added review and verifications. In this final rule, BSEE has clarified the I3P qualifications and expectations to help ensure appropriately qualified entities are performing this important work and that BSEE has clear oversight of the process.

Summary of comments related to continued use of NTLs: Multiple commenters expressed concerns with consistency between existing BSEE guidance (NTL No. 2019–G02 and NTL No. 2019–G03) and the proposed rule and were unsure as to whether BSEE intended to replace or supplement the BSEE guidance.

Response: BSEE has made many revisions throughout the final rule to provide consistency with existing BSEE guidance in the NTLs. For example, BSEE has added the definitions of “fit for purpose” and “fit for service” to the final rule to provide that consistency (see Section III of this preamble for discussions on consistency and clarification of the content of the guidance documents). If the NTLs conflict with this final rule, the final rule is controlling, and BSEE will revise the NTLs, as necessary.

Summary of comments related to significance determination: A commenter asserted that the rule was incorrectly identified as a non-significant action. The commenter asserted that the rule includes several significant alterations to the DWOP process currently used by both the oil and natural gas industry and BSEE, including a substantial expansion of the circumstances that would trigger the DWOP process, as well as an expansion of the circumstances that would require review by I3Ps. The commenter requested that BSEE reevaluate the significance analysis.

Response: The Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget determined that this rule is not significant for purposes of Executive Order 12866, as amended. BSEE disagrees with the commenter’s

to the government are actionable under 18 U.S.C. 1001.

assertion that the rule should be considered significant. The DWOP process that is clarified in this rule is the same process that BSEE has been using to review new and unusual technologies and new and unusual technologies barriers for more than 20 years. Under its current regulations, BSEE has established conditions of approval through the DWOP process under the authority of § 250.141, “May I ever use alternate procedures or equipment?”, to enable it to review and approve applications using new technologies. In response to the commenters request to reevaluate the significance criteria, BSEE has conducted a final analysis of the regulations, and OIRA confirmed that this final rule is not a significant regulatory action. A summary of that analysis can be found in Section V of this preamble.

Summary of comments related to grandfathering ongoing approvals and actions: Multiple commenters expressed concerns that the proposed rule would impact and significantly delay ongoing approval for projects that have already been proposed and subject to BSEE review before the effective date of the rule, or for equipment that has already been reviewed by BSEE. The commenters identified that some of the projects have already undergone years of review.

Response: BSEE agrees with the commenters and revised § 250.201 by adding new paragraph (d) to clarify that all plans covered under the DWOP process that are initially submitted after the effective date of this rule must comply with the requirements of this subpart. DWOPs that were submitted to BSEE for approval prior to the effective date of this rule, including revised or amended DWOPs, do not have to follow the new DWOP process and may continue to follow the process that was in effect before the effective date of these final regulations. BSEE considers Conceptual Plans and DWOPs to be submitted when BSEE receives the initial submittal. BSEE will work on a case-by-case basis to ensure there are no significant delays for those ongoing projects or reviews. BSEE may allow review pursuant to the new regulations if such a review is requested by the operator.

Comments Related to the Use of New or Unusual Technology

Summary of comments: A commenter requested that BSEE not classify equipment or procedures used in an HPHT environment as new or unusual technology, as the HPHT technology is expanding and maturing.

² Notwithstanding this terminology change, operators and I3Ps should be aware that willfully and knowingly making materially false statements

Response: BSEE disagrees with the commenter and does not consider HPHT equipment to be fully mature. BSEE considers HPHT equipment to be potentially high risk because it requires complex material selection, material testing, design analysis, and validation testing. BSEE understands and supports many engineering standards that are being updated to address HPHT design. However, at this point BSEE intends for operations in an HPHT environment to be fully reviewed and approved to ensure safety and environmental protection. BSEE will continue to evaluate HPHT projects, and at an appropriate time may revise the regulations to remove HPHT from being considered new or unusual technology once BSEE determines that it is fully established.

Summary of comments: Multiple commenters recommended that BSEE provide means to communicate about equipment or procedures that are or are not considered new or unusual technology and a means for equipment or procedures initially deemed to be new or unusual technology to later be deemed as falling outside the definition of “new or unusual technology.”

Response: BSEE is not developing a list of equipment or procedures considered to be new or unusual technology. It is impractical for BSEE to list every potential piece of equipment or procedure that may fall under the definition of new or unusual technology as there may be an infinite number of variations of each type of equipment or procedure. Furthermore, BSEE reviews each piece of equipment and procedure individually to ensure that the equipment or procedure is appropriate for the specific project proposed. This rule sets the parameters of what is considered new or unusual technology. BSEE anticipates that over time, consistently successful implementation of certain new or unusual technologies will lead to BSEE revising the criteria for determining what is considered new or unusual technology. After appropriate experience and analysis of data, in a future rulemaking BSEE may decide to no longer treat certain equipment or procedures used in an HPHT environment as new or unusual technology. For example, BSEE has become familiar with the freestanding hybrid riser (FSHR) systems and does not consider that equipment new or unusual technology. In 2019, BSEE removed many of the FSHR prescriptive requirements and associated certifications from the DWOP (see 84 FR 21932).

Summary of comments: Multiple commenters expressed concerns that

only operators can propose the use of new or unusual technology under the DWOP process.

Response: The current regulatory structure focuses on entities—such as lessees, operators, and grant holders—that submit permits to BSEE for review and approval; this final rule, therefore, focuses on regulation of those entities that use the permitting processes.

Summary of comments: Multiple commenters expressed concerns that the full DWOP process should not be required to facilitate review of new or unusual technology and recommended that BSEE provide clear expectations and timing for all plans covered under the DWOP process and actions or operations that can be taken during the process.

Response: In this final rule, BSEE has clarified the DWOP process and the timing associated with each Conceptual Plan and the DWOP, as applicable. BSEE has revised multiple sections to reflect the appropriate timing (including what actions or operations can be taken during the DWOP process) and submission requirements for all plans covered under the DWOP process (e.g., see revisions to §§ 250.201, 250.220, 250.225, and 250.226). BSEE has also clarified in other sections (see, e.g., § 250.220) that certain New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Equipment Conceptual Plans (which may be used for drilling and decommissioning) may not be required to have an associated Project Conceptual Plan or DWOP. This clarification helps limit burdens on industry, as not every proposed use of new or unusual technology will require the submission of all plans defined in the DWOP process; only those plans that are applicable will be required. There is a difference between the DWOP process and submitting a DWOP. The DWOP process identifies the overarching requirements for all associated plans (i.e., the Project Conceptual Plan, New or Unusual Technology Conceptual Plan, New or Unusual Technology Barrier Equipment Conceptual Plan, and the DWOP). The DWOP itself is just one plan included within the DWOP process. BSEE expects operators to follow the DWOP process as appropriate, which may only require the submittal of a certain Conceptual Plan.

Summary of comments: A commenter expressed concerns that the proposed rule is overly prescriptive when identifying new or unusual technology and barriers. This commenter expressed that the proposed rule may limit or stifle innovation.

Response: BSEE disagrees with the commenter's concerns that the rule is overly prescriptive. These regulations outline the requirements and expectations for using new or unusual technology. These regulations will not limit or stifle innovation because BSEE uses the DWOP process to evaluate and approve new or unusual technology, not to limit the type of technology that may be submitted. BSEE has worked successfully with industry for many years to implement new or unusual technology, and BSEE will continue to work with any operator on the proposed use of any new or unusual technology, even if that use is not explicitly identified in the regulations. If an operator has any questions about the applicability of the regulations to any new or unusual technology or how the process will work for a specific equipment or process, that operator may contact the appropriate Regional Supervisor for guidance and actions on a case-by-case basis.

Summary of comments related to overlap between the contents of Conceptual Plans and the DWOP: Multiple commenters expressed concerns that there is significant overlap among the Conceptual Plans and the DWOP requirements for the submission of information.

Response: BSEE agrees in part that the Conceptual Plans and the DWOP may require the submission of similar information. However, the final rule will not significantly change the contents and requirements of the Project Conceptual Plan and the DWOP. This final rule clarifies the nature of the required information submitted with each Conceptual Plan and DWOP (see revisions to §§ 250.227 through 250.242). BSEE recognizes that the New and Unusual Technology Conceptual Plan and New and Unusual Barrier Equipment Technology Conceptual Plan have potentially similar requirements relative to the Project Conceptual Plan and DWOP. However, the Conceptual Plans require the general operational concepts and basis of design while the DWOP identifies the specific design, fabrication, installation, and operational requirements for the equipment.

Summary of comments: Multiple commenters requested that BSEE provide guidance for using alternate procedures or equipment requests for using industry standards not incorporated by BSEE. A commenter also recommended BSEE make the process for granting alternate procedures or equipment and departure requests transparent to the public.

Response: Current BSEE regulations already outline the requirements for

alternate procedures or equipment and departures in accordance with §§ 250.141 and 250.142, respectively. In reference to the transparency of the alternate procedure or equipment and departure requests, BSEE posts approval information on the BSEE website at: <https://www.data.bsee.gov/Company/Approvals/Default.aspx>.

Summary of comments: A commenter requested that BSEE increase inspections, develop procedures to effectively enforce safety violations, and improve oversight measures to fulfill its mandate.

Response: This rulemaking clarifies the DWOP process to ensure BSEE receives proper information to evaluate and approve new or unusual technology. BSEE has an established inspection program independent of the DWOP process to help ensure compliance with the regulations and enforce safety requirements. The equipment approved by BSEE through the DWOP process will be inspected pursuant to the existing inspection program. This rule does not alter the existing inspection program for the actual operations. That inspection program is outside of the scope of this rulemaking. However, BSEE is always seeking to improve its regulatory oversight and enforcement and appreciates receiving relevant recommendations.

Summary of comments: A commenter expressed concern that the confidential and intellectual information submitted throughout the DWOP process should be safeguarded and not released to the public domain.

Response: BSEE agrees with the commenter's concerns about the release of confidential business information and will withhold such information from public disclosure in accordance with law (see, e.g., the Freedom of Information Act, 5 U.S.C. 552).

Summary of comment: A commenter requested that BSEE provide guidelines for how long DWOP process review is anticipated to take to better align schedules leading to first production.

Response: BSEE cannot provide timelines for DWOP process review. The review time for the DWOP process is handled on a case-by-case basis, as each process is unique to a particular project. The size of the project and complexity of the project, equipment, and processes all factor into the length of time necessary for DWOP process review.

Summary of Comments Related to Economic Data

A commenter stated that the Proposed Rule is expected to increase the cycle time by one to two years for new major

capital projects due to the magnitude of detailed information that is required to be submitted with Conceptual Plans, both for projects of a conventional nature and for projects that involve the use of "new or unusual technology" (as defined in the Proposed Rule). The commenter asserted that this increased cycle time for a project will impact the economics and delay the schedule of the project.

The commenter also stated that the scope of Supplemental DWOP is expanded well beyond the current requirements, and Table 2 of the Initial Regulatory Impact Analysis does not take this into account since it holds flat the number of Supplement DWOPs (312) to the Baseline for DWOP Revisions for Equipment Change (312). The commenter asserted that the change in scope could well cause the number of Supplement DWOPs to double over the baseline. The commenter further asserted that this would cause the 10-year cost reported in Table 7 for both industry and government to be under reported.

Response: BSEE disagrees with the assertion that the rule will lead to substantial delays in capital projects. Industry is already submitting much of the project information for BSEE approval, so the burden is not anticipated to be significant. Based on the Final Regulatory Impact Analysis (RIA), the overall reporting burden on industry is expected to be an additional 67 hours per report compared to the baseline, which is not reasonably likely to delay or increase the cycle time for HPHT investment or deployment.

BSEE also disagrees with the commenter's assertion that the rule will expand the scope and lead to large increases in the number of Supplemental DWOP Reports compared to the baseline. BSEE has clarified that certain Conceptual Plans must be submitted for each piece of equipment at an assembly level. This final rule also clarifies the scope of § 250.247 and identifies what conditions require operators to submit Supplemental DWOPs consistent with the existing longstanding practice for submittal of a Supplemental DWOP. The DWOP process clarified in this rule is the same process that BSEE has been using to review new and unusual technologies and new and unusual technologies barriers for many years. Under existing regulations, BSEE has established conditions of approval for new technologies for more than 20 years through the DWOP process under the authority of § 250.141, "May I ever use alternate procedures or equipment?" BSEE expects that the increased clarity

regarding requirements and submission expectations provided by this rule may in fact decrease the number of Supplemental DWOPs that will need to be submitted. A supplement to a DWOP is required for applicable development projects when there are certain changes or additions that have not been approved by BSEE. The Supplemental DWOP will only be as complex as the equipment or systems not covered in the approved DWOP. BSEE uses this supplemental process to ensure that all applicable equipment is properly reviewed and approved before installation, well completion, or production.

III. Section-by-Section Summary and Responses to Comments on the Proposed Rule

BSEE is finalizing revisions to the following regulations:

Subpart A—General

Definitions (§ 250.105)

Summary of Proposed Rule Revisions

BSEE proposed to add definitions for "BOP [blowout preventer] systems and related equipment" and "HPHT environment."

The proposed definition of "BOP systems and related equipment" included all pressure controlling and pressure containing well control equipment that may or will be exposed to the well's maximum anticipated surface pressure (MASP) during any phase of operation (i.e., drilling, completion, workover, intervention, or abandonment). The proposed definition also explained that well control equipment includes equipment that is installed for the purpose of pressure control and containment when it becomes necessary to physically enter a well bore during drilling, completion, workover, intervention, or abandonment modes of operation. The proposed definition of "BOP systems and related equipment" is consistent with how BSEE defined the term in NTL No. 2019-G03.

The proposed definition of HPHT environment was moved from § 250.804(b) to this section and revised to refer to well conditions: (1) that require equipment assigned a pressure rating greater than 15,000 psia or temperature rating greater than 350 degrees Fahrenheit; (2) where the MASP or shut in tubing pressure (SITP) is greater than 15,000 psia at the seafloor for a well with a subsea wellhead or at the surface for a well with a surface wellhead; or (3) with a flowing temperature greater than 350 degrees Fahrenheit measured at the seafloor for

a well with a subsea wellhead or at the surface for a well with a surface wellhead. The proposed definition is consistent with BSEE's current definition of HPHT environments in existing § 250.804(b) and is identical to the definition in NTL No. 2019–G03.

Summary of Final Rule Revisions

BSEE is finalizing the proposed revisions to § 250.105 with minor clarifications. BSEE is revising the proposed definition of *BOP systems and related equipment* to clarify that well control equipment includes equipment that is installed for the purpose of pressure control and “pressure” containment. This revision clarifies the original intent of the proposed definition.

BSEE is also revising the proposed definition of *HPHT environment* to clarify that the criteria for evaluating MASP, SITP, and flowing temperatures are evaluated “at” the seafloor instead of “on” the seafloor. The temperature measuring device may be several feet above the actual seafloor. The device is generally located on the subsea tree and can be as high as 25 feet above the mudline.

Summary of comments: A commenter expressed concerns that BSEE is not including in the rule all of the definitions contained in the existing BSEE NTL Nos. 2019–G02 and 2019–G03.

Response: BSEE does not agree that adding all of the definitions from the NTLs are necessary. BSEE has determined that some of the definitions in the NTL are more appropriate in the context of the associated guidance contained in the NTLs. However, as described in Section III of this preamble and in response to comments, BSEE has revised the definitions of “BOP systems and related equipment” and “HPHT environment” in the proposed rule for consistency with BSEE NTL Nos. 2019–G02 and 2019–G03. The referenced NTLs were created prior to significant BSEE HPHT reviews occurring. Now that BSEE has been reviewing HPHT projects for several years, we have identified what information is pertinent for regulation. BSEE will revise the existing NTLs, as necessary, to provide

additional guidance for HPHT operations. The content of the existing applicable NTLs may still be relevant, but they may be revised to reflect the content incorporated into these regulations and updated processes.

Summary of comments: A commenter expressed concerns that the definition of *BOP systems and related equipment* is too broad and may be interpreted to include equipment beyond what is traditionally considered a BOP system.

Response: BSEE disagrees with the commenter. BSEE considers any piece of temporary equipment used to contain or control well bore fluids and pressure during drilling, completions, workover, intervention, or abandonment operations to be part of the BOP systems or related equipment. The concept of BOP system and related equipment has been utilized for many years in the existing BSEE regulations (see previous § 250.732(c) and existing § 250.735). The definition of BOP systems and related equipment provides clarity consistent with the use of the term as identified in the regulations and is not intended to significantly alter or expand the scope of the definition. If there are any questions about what equipment is properly defined as part of a BOP system or related equipment, please contact the appropriate BSEE Regional Supervisor.

Summary of comments: A commenter stated that the definition of HPHT environment needs further clarity regarding the terms MASP and “flowing temperature” to ensure it is applied appropriately.

Response: BSEE disagrees with the commenter that the definition needs to be revised to further explain the terminology of the definition. This definition of HPHT environment is consistent with the definition of an HPHT environment in current regulations (see § 250.804(b)) and with BSEE's longstanding approach for considering HPHT environment criteria, including the use of the NTLs that further clarify applicable terms like MASP (e.g., BSEE NTL No. 2019–G03). This rule is not changing the meaning of any terms used within that definition, and their meanings will continue consistent with the current regulations

and guidance. If there are any questions about what is considered an HPHT environment, please contact the appropriate BSEE Regional Supervisor.

Service Fees (§ 250.125)

Summary of Proposed Rule Revisions

BSEE proposed to revise paragraph (a)(2) of § 250.125 by adding new service fees for BSEE review of submittals associated with the DWOP process. Specifically, BSEE proposed adding service fees for processing a Project Conceptual Plan, New or Unusual Technology Conceptual Plan, New or Unusual Technology Barrier Conceptual Plan, revised DWOP, Combined Conceptual Plan/DWOP, and Supplemental DWOP. BSEE also proposed revising the cost recovery fee amount for DWOP approval to reflect current BSEE review and processing timeframes. These service and cost recovery fees would cover BSEE's costs for administrative and technical review of each identified submittal and processing.

Summary of Final Rule Revisions

BSEE is finalizing the service fee categories as proposed with one minor textual revision in paragraph (a)(2) of § 250.125. BSEE revised the fourth category to include the word “Equipment” to make it consistent with the title of that Conceptual Plan. BSEE is also revising all the proposed service fee amounts listed in paragraph (a)(2) to more accurately reflect the revised processes and the estimated BSEE review time for the listed services. For example, BSEE now expects a separate New or Unusual Technology Barrier Equipment Conceptual Plan for each separate piece of applicable equipment and has reduced the service fee amount accordingly. Each project may require a different number of New or Unusual Technology Barrier Equipment Conceptual Plans based on the equipment being used. Accordingly, the new fee reflects the BSEE evaluation time per plan and not per project, which was the basis of the fee initially analyzed in the proposed rule. The service fee amounts are revised as follows:

Service—processing of the following:	Proposed fee amount	Final fee amount
(2) Deepwater Operations Plan (DWOP) Process:		
(i) Project Conceptual Plan	\$2,510	\$2,697
(ii) New or Unusual Technology Conceptual Plan	32,611	7,964
(iii) New or Unusual Technology Barrier Equipment Conceptual Plan	71,570	15,104
(iv) DWOP	13,907	10,647
(v) Revised DWOP	896	963
(vi) Combined Conceptual Plan/DWOP	8,959	13,856

Service—processing of the following:	Proposed fee amount	Final fee amount
(vii) Supplemental DWOP	8,959	9,626

Summary of comments: A commenter recommended that BSEE add a fee schedule for an Original Equipment Manufacturer (OEM) to submit a generic equipment plan.

Response: BSEE disagrees with the commenter regarding requiring an OEM to submit an equipment plan and to add a service fee for such a filing. The DWOP process requires submittal of the appropriate plans and permits (see § 250.201) by those entities who are covered under the definition of “you,” which includes a lessee or designated operator. BSEE is not including the OEM as an entity to submit plans because an OEM is not the end user of the equipment. BSEE will review plans specific to each project and prefers not to review generic equipment plans in addition to the project-specific plans, as doing so would duplicate the review burden on BSEE.

Summary of comments: A commenter expressed concerns that only one service fee should apply to each Conceptual Plan covering the whole project regardless of the number of pieces of equipment or components covered by the plan.

Response: BSEE agrees in part with the commenter as only one service fee is required for each applicable Conceptual Plan (see §§ 250.227(t), 250.228(a)(15), and 250.229(j)). BSEE, however, does not agree that all Conceptual Plans can cover multiple pieces of equipment. For example, BSEE now expects a separate New or Unusual Technology Barrier Equipment Conceptual Plan for each separate piece of applicable equipment and has reduced the service fee amount accordingly (see §§ 250.226(b)(5) and 250.226(c)(5)). Because the nature of plan submittals and the number of plans may vary for each project, BSEE has determined that a service fee for BSEE review on a per-plan basis more accurately reflects the resources expended than a service fee on a per-project basis.

Documents Incorporated by Reference (§ 250.198)

Summary of Proposed Rule Revisions

BSEE proposed to revise paragraph (e)(82) of § 250.198, which currently incorporates ANSI/API Spec. 6A, *Specification for Wellhead and Christmas Tree Equipment*, to add new references to §§ 250.518 and 250.619,

making this standard applicable to completion and workover operations. The proposed changes to this paragraph are administrative and reflect the substantive changes made to §§ 250.518 and 250.619 that incorporate by reference this standard and are addressed further in the section-by-section discussion for these two sections.

BSEE also proposed to revise paragraph (e)(86) of § 250.198 to update the incorporation of ANSI/API Spec. 11D1 to the third edition of that standard. BSEE reviewed the new edition and the differences between the second and third editions of ANSI/API Spec. 11D1 and determined that the third edition is appropriate to incorporate into the regulations. The ANSI/API Spec. 11D1 third edition now includes an improved testing procedure for design verification and validation of packers and bridge plugs. The most significant change from the second edition to the third edition was the addition of the enhanced validation of the testing processes.

BSEE also proposed to revise paragraph (e)(91) of § 250.198, which currently incorporates ANSI/API Spec. 17D, *Design and Operation of Subsea Production Systems—Subsea Wellhead and Tree Equipment, Second Edition*, to add new references to §§ 250.518 and 250.619, making this standard applicable to completion and workover operations. The proposed changes to this paragraph are administrative and reflect the substantive changes made to §§ 250.518 and 250.619 that incorporate by reference this standard and are addressed further in the section-by-section discussion for these two sections.

BSEE also proposed to revise paragraph (i)(1) of § 250.198, which currently incorporates NACE Standard MR0175–2003, *Standard Material Requirements, Metals for Sulfide Stress Cracking and Stress Corrosion Cracking Resistance in Sour Oilfield Environments, Revised January 17, 2003*, to add new references to §§ 250.518 and 250.619, making this standard applicable to completion and workover operations. The proposed changes to this paragraph are administrative and reflect the substantive changes made to §§ 250.518 and 250.619 that incorporate by reference this standard and are addressed further in the section-by-

section discussion for these two sections.

Summary of Final Rule Revisions

BSEE did not receive any comments on the incorporation by reference of the proposed industry standards in this section and is including the proposed language in the final rule without change.

Summary of comments: Multiple commenters expressed general support for BSEE updating out of date standards and requested BSEE to consider many additional standards to be incorporated into the regulations.

Response: BSEE supports the actions of ensuring referenced standards are not out of date and reflect the recent editions; however, BSEE cannot add new standards to this rulemaking without specifically identifying them for public comment. BSEE may consider all of the recommended standards for incorporation in future BSEE rulemaking actions.

Summary of comments: A commenter expressed concerns that reliance on industry standards undermines safety.

Response: BSEE follows the policies of OMB circular A–119, which directs agencies to use voluntary consensus standards in lieu of government-unique standards, except when they are inconsistent with law or otherwise impractical. BSEE recognizes the positive contribution of standards development and related activities. When properly conducted, standards development can increase productivity and efficiency in government and industry, expand opportunities for international trade, conserve resources, improve health and safety, and protect the environment. BSEE has reviewed the incorporated standards to ensure that they provide the necessary level of safety. BSEE also complies with the requirements to utilize standards according to the National Technology Transfer and Advancement Act (Pub. L. 104–113 (March 7, 1996)).

Subpart B—Plans and Information

This final rule will restructure Subpart B—*Plans and Information*, under the following undesignated headings to assist the reader in finding the subject matter provisions they are looking for in the regulations:

—GENERAL INFORMATION;
—BARRIER EQUIPMENT AND SYSTEMS;

—ACTIVITIES AND POST-APPROVAL REQUIREMENTS FOR THE EP, DPP, DWOP, AND DOCD;
 —DEEPWATER OPERATIONS PLAN (DWOP) PROCESS;
 —CONCEPTUAL PLANS; and
 —DWOP APPROVAL.

General Information

Definitions (§ 250.200)

Summary of Proposed Rule Revisions

BSEE proposed to revise paragraph (a) of § 250.200 by adding the acronym HPHT. BSEE also proposed to revise paragraph (b) of § 250.200 by adding, revising, or removing the following definitions, as noted:

—Add a definition for *Barrier categorization* to identify barriers as one of the following two categories:

Category 1 Barrier, which would mean any equipment, component, or assembly that functions as part of a primary barrier during any operational phase of its life cycle. The operational phases of the barrier equipment, component, or assembly are drilling, completion, workover, intervention, injection, production, or abandonment; and

Category 2 Barrier, which would mean any equipment, component, or assembly that normally functions as part of a secondary barrier system in all operational phases of its life cycle, except when a primary barrier fails. The operational phases of the barrier equipment, component, or assembly are drilling, completion, workover, intervention, injection, production, or abandonment. BSEE may consider non-barrier structural components of a barrier system as Category 2 barriers if failure of that structural component could reasonably result in a primary barrier failure.

—Add a definition for *Primary Barrier system*, which would mean the component or group of components that are designated as the principle means of isolating the source of hydrocarbons and/or pressure from people and the environment.

—Add the definition for *Secondary Barrier system*, which would mean the component or group of components that are designated as the secondary means of isolating the source of hydrocarbons and/or pressure from people and the environment.

—Revise the definition for *New or unusual technology* to include equipment or procedures used for any drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning,

or abandonment operation that meets any of the following criteria:

(1) Has not been approved for use or used extensively in a BSEE OCS Region;
 (2) Has not been approved for use or used extensively under the anticipated operating conditions;

(3) Has operating characteristics that are outside the performance parameters established in 30 CFR part 250;

(4) Will operate in an HPHT environment as defined in proposed § 250.105; or

(5) Is part of a primary or secondary barrier system that uses materials, design analysis techniques, validation testing methods, or manufacturing processes not addressed in existing industry standards.

—Replace the definition for *non-conventional production or completion technology with subsea tieback development technology*. The definition of *subsea tieback development technology* would still include the current examples of floating production systems, tension leg platforms, spars, Floating Production Storage and Offloading Vessel (FPSO) systems, guyed towers, compliant towers, subsea manifolds, and would add subsea wells, hybrid wells, and other subsea completion components to the list of examples.

—Remove the definitions of *modification*, *offshore vehicle*, *resubmitted OCS plan*, *revised OCS plan*, and *supplemental OCS plan*.

Summary of Final Rule Revisions

BSEE received and considered comments on this section and is finalizing the proposed § 250.200 with the following clarifying revisions:

—Adding the acronym for Independent Third Party (I3P). This addition helps provide clarity for this common term used in the regulations.

—Revising the definition of *Category 1 Barrier* to remove “system” from the term. BSEE is removing this term because it is unnecessary to define from a system level and is sufficient to define on an individual level. BSEE wants to ensure the flexibility to review the appropriately identified equipment even if only a single piece of equipment.

—Revising the definition of *Category 2 Barrier* to clarify that it means any equipment, component, or assembly that normally functions as part of a secondary barrier “during any” operational phase instead of “in all” operational phases. This revision clarifies when a Category 2 Barrier should be used. BSEE also is

clarifying that BSEE may consider non-barrier structural components of a barrier system as a Category 2 Barrier if failure of this structural component could reasonably result in a “primary” barrier failure. This revision clarifies the consideration of a Category 2 Barrier to be consistent with its definition and applicability only when there is a Primary Barrier failure instead of any barrier failure.

—Adding the definition of *Fit for Purpose* to mean a determination made by an I3P at the conclusion of I3P review that the barrier equipment design has been verified and validated in conformance with recognized engineering standards and any additional project specification requirements; that the material selection, design verification analysis, design validation testing, and quality control are appropriate to justify the technical specifications; and that the technical specifications meet or exceed a project’s site specific functional requirements. The addition of this definition provides clarity about the expectations and actions of an I3P and is consistent with the associated revisions to §§ 250.226 and 250.230 through 250.233.

—Adding the definition of *Fit for Service* to mean a determination made by the operator that the material selection, design verification analysis, design validation testing, and quality control of the barrier equipment is appropriate to justify the technical specifications and that the technical specifications meet or exceed a project’s site-specific functional requirements. This addition provides clarity about the expectations and actions of an operator when providing required determinations for a site-specific project and is consistent with the associated requirements of the DWOP process.

—Revising the definitions of *Primary Barrier* and *Secondary Barrier* by removing the terms “system”, “or group of components”, and “of hydrocarbons and/or pressure”, resulting in the defined terms meaning the equipment, material, component, or assembly that is designated as the primary or secondary means of isolating the hydrocarbon pressure source from people and the environment. These revisions provide clarity and consistency with other applicable definitions (e.g., *Category 1 Barrier* and *Category 2 Barrier*) and with how the terms are used in § 250.206. Also based on comments, BSEE clarified the applicability of the barriers encompassing those that isolate a

“hydrocarbon pressure source.” This clarification confirms the original intent of the definitions, further ensuring personnel safety and environmental protection from the potential release of hydrocarbons.

—Revising the definition of *Subsea Tieback Development Technology* by removing an unnecessary acronym and adding production risers and export risers to the list of applicable technology. These identified risers have always been an integral part of subsea tieback development technology and BSEE is adding them for clarification.

Summary of comments: Multiple commenters expressed concerns that the definition of “New or unusual technology” is too broad and would unnecessarily expand the application of the DWOP process. Commenters also expressed concerns that the language “used extensively”, which is used in the definition for “New and unusual technology”, is vague and gives no criteria as to when equipment will no longer be considered new or unusual in the context of HPHT equipment. Some commenters recommended that the definition of new or unusual technology should not include equipment covered by industry standards.

Response: BSEE disagrees in part with the commenters’ concerns. BSEE recognizes that the definition in this rule expands the scope of what is considered new or unusual technology; however, this expansion helps cover the critical projects, equipment, or procedures identified by BSEE that must follow the DWOP process. BSEE has determined that this expanded scope is necessary to ensure safe operations in HPHT environments.

To clarify the scope, BSEE has also revised other definitions in this final rule to clarify the equipment, materials, components, or assemblies that may be used (e.g., Category 1 and 2 Barriers, Primary and Secondary Barriers, and Subsea Tieback Development Technology). BSEE has also successfully used the longstanding definition of “New or unusual technology” in the current regulations in § 250.200, which already uses the language “used extensively” as part of the definition. Accordingly, BSEE does not agree that the term will be too vague for its intended purposes.

In this rule BSEE is not using industry standards as a criterion for determining new or unusual technology. Multiple standards could be used for one piece of equipment, and BSEE has not incorporated into the regulations every potential industry standard. Also, BSEE

may not have reviewed or evaluated the standards not incorporated in the regulations prior to Conceptual Plan or DWOP submittal, and standards generally do not address site specific reviews of the equipment. New technology applications are individualized even when the same idea is used in different locations. BSEE needs to ensure the equipment or procedures are appropriate for the conditions in which they will be used. Once industry and BSEE understand the full risks and mitigations from the specific application and use, then BSEE may determine that the equipment no longer needs to be categorized as new or unusual technology.

Summary of comments: Multiple commenters expressed concerns with the expectations of the I3P and operators for determining what is “fit for purpose” and “fit for service,” respectively. The commenters recommended that BSEE clarify the differences between determining what is “fit for purpose” and what is “fit for service,” consistent with BSEE guidance.

Response: BSEE agrees with the commenters, and the final rule now includes definitions for both terms. The addition of these definitions provides clarity and certain expectations for the I3P or operator conducting the relevant determinations. The added definitions are consistent with the guidance of BSEE NTL Nos. 2019–G02 and 2019–G03, with minor corresponding edits to reflect their applicability specific to the DWOP process.

Summary of comments: A commenter expressed concerns that the proposed rule extends the barrier envelope beyond the scope of isolating pressure systems from hydrocarbons.

Response: BSEE agrees with the commenter. BSEE has revised the definitions of primary and secondary barriers to clarify applicability to hydrocarbon pressure sources. These revisions to the definitions clarify BSEE’s original intent and limit the scope of the primary and secondary barriers to only hydrocarbon pressure sources.

What plans and information must I submit before I conduct any activities on my lease or unit? (§ 250.201)

Summary of Proposed Rule Revisions

BSEE proposed to revise existing paragraph (a) of § 250.201 to reflect the creation of the New or Unusual Technology Conceptual Plan, the New or Unusual Technology Barrier Conceptual Plan, and the Project Conceptual Plan. This section provides

general information about each plan and identifies when BSEE approval is necessary. BSEE proposed paragraph (a) to clarify when each plan approval is required for certain activities. An operator is only required to submit the applicable Conceptual Plan(s). Each of these Conceptual Plans are standalone plans and are not contingent upon approval of each other.

BSEE also proposed to remove existing paragraph (c), which includes the limiting information provisions. The limiting information provisions allow the Regional Director to limit the amount of information or analyses required to be included with the submitted plans or documents, covered by Subpart B of 30 CFR part 250, under certain conditions. The narrower scope of the information described in the proposed rule aligns with the Bureau’s roles, authorities, and regulations established in 2011 when BSEE separated from the Bureau of Ocean Energy Management (BOEM) (see 76 FR 64432).

Summary of Final Rule Revisions

BSEE received and considered comments on this section and is finalizing the proposed section with the following revisions based on the comments received:

- In paragraph (a), BSEE is adding “(or relevant portions thereof)” after the listed plans. This addition clarifies that certain lease activities can be conducted if the appropriate portions of the Conceptual Plans are submitted to BSEE and approved as identified in § 250.226;
- In the table under paragraph (a)(1), BSEE is revising the information under the heading “Additional information” to designate the first paragraph as (a)(1)(i) and clarifying that the New or Unusual Technology Conceptual Plan must be approved by BSEE before it will approve any associated application or permit involving the use of new or unusual technology. BSEE is also adding new paragraphs (a)(1)(ii), (iii), and (iv) to clarify that the New or Unusual Technology Conceptual Plan may be independent of a project Conceptual Plan or DWOP, that BSEE will not approve the Conceptual Plan until all associated I3P Reports (if required) are submitted and reviewed by BSEE, and that the Conceptual Plan may not contain equipment identified as a primary or secondary barrier;
- In the table under paragraph (a)(2), and throughout the rule, BSEE is revising the name of the New or Unusual Technology Barrier Conceptual Plan to New or Unusual

Technology Barrier Equipment Conceptual Plan. This revision is made based on comments received to clarify the scope of the plan and to be consistent with the terminology and use of equipment covered by the plan. BSEE is also clarifying that the New or Unusual Technology Barrier Equipment Conceptual Plan requirements apply to new or unusual technology “that is identified” as barrier equipment. The final rule also revises paragraph (a)(2)(ii) to state that this type of plan must be approved “by BSEE before it will approve any associated application or permit application (e.g., pipeline, platform, APD, APM) involving the use of new or unusual technology identified as barrier equipment as applicable for the permit scope.” The final rule also adds new paragraph (a)(2)(iii), which states that BSEE will not approve this Conceptual Plan until all associated I3P Reports are submitted and reviewed by BSEE. These additions clarify the BSEE Conceptual Plan approval process and submittal requirements associated with the applicable Conceptual Plans. These additions are based on comments received and are consistent with the relevant revisions to the associated plans covered under § 250.226 (“When and how must I submit each applicable Conceptual Plan?”);

—In the table under paragraph (a)(3), BSEE is clarifying that the Project Conceptual Plan may include certain new or unusual technology. BSEE is also revising the information under the heading “Additional information” to designate the proposed paragraph as (a)(3)(i), removing the incorrect reference to the Application for Permit to Drill (APD), and adding new paragraph (a)(3)(ii) to clarify that BSEE must approve any relevant new or unusual technology associated with completion operations before BSEE approves the Project Conceptual Plan. These additions clarify the BSEE Project Conceptual Plan approval process and submittal requirements associated with the Project Conceptual Plans. These revisions ensure proper information has been approved or is included with in the applicable Conceptual Plan for BSEE approval. These additions are based on comments received and are consistent with the relevant revisions to the Conceptual Plans covered under § 250.226 (“When and how must I submit each applicable Conceptual Plan?”). BSEE removed the incorrect reference to the APD because it is not applicable to the

Project Conceptual Plan and activities covered under that plan;

- In the table under paragraph (a)(4)(i), BSEE removed the reference to the new or unusual technology barrier equipment because it is redundant with the definition of new or unusual technology; and
- BSEE added new paragraph (d) to clarify that all DWOP process plans initially submitted after the effective date of this rule must comply with the requirements of this subpart.

Summary of comments: A commenter expressed concerns that the terms used in the table are not consistent with the definitions and requested that BSEE provide clarification on when lease activities can commence under each applicable plan.

Response: BSEE agrees with the commenter and has revised the table to reflect the additional information associated with the applicable plans. BSEE has also revised § 250.226 to further reflect the actions that may be taken at each step of each applicable plan (see the applicable discussions of § 250.226 in Section IV of this preamble). The revisions to this section and § 250.226 further clarify the original intent of the proposed rule and the ability to conduct certain lease activities associated with the applicable plans.

Summary of comments: A commenter requested that BSEE limit the request of additional information at the Conceptual Plan stage to the adequacy of the requirements included in the plan and the adequacy of the documentation or verification of details.

Response: BSEE agrees in part with the commenter and expects the request for additional information under paragraph (b) to be limited to that applicable information needed to evaluate the proposed plan or permit. However, no revisions to this paragraph are necessary as the context of the current provisions are limited already to the scope of the associated plan or permit covered under paragraph (a).

How must I protect the rights of the Federal government? (§ 250.202)

Summary of Proposed Rule Revisions

BSEE proposed to move the content of existing § 250.204 to this section without revision.

BSEE did not receive any comments on this proposed section and is including the proposed language in the final rule without change.

Are there special requirements if my well affects an adjacent property? (§ 250.203)

Summary of Proposed Rule Revisions

BSEE proposed to move the content of existing § 250.205 to this section without revision.

BSEE did not receive any comments on this proposed section and is including the proposed language in the final rule without change.

Requirements for High Pressure High Temperature (HPHT) Barrier Equipment (§ 250.204)

Summary of Proposed Rule Revisions

BSEE proposed this new section to clarify what information an operator would be required to submit to BSEE if the operator plans to install HPHT barrier equipment. This section cross-references the applicable DWOP process requirements associated with the New or Unusual Technology Barrier Equipment Conceptual Plan (e.g., §§ 250.229 and 250.242). These additions are necessary to help ensure that the equipment is fit for service in the specific HPHT environment. BSEE’s review and approval of information submitted during the DWOP process is intended to occur in conjunction with BSEE’s review and approval of associated applications or permits (e.g., APD, Application for Permit to Modify (APM), pipeline, and production safety system).

Summary of Final Rule Revisions

Based on comments received, BSEE is revising this section to reflect the sequential order of submission of the applicable plans and permits and clarify that if an operator plans to install HPHT barrier equipment, then it must submit information with its applicable Project Conceptual Plan, New or Unusual Technology Barrier Equipment Conceptual Plan, DWOP, and applicable permit(s). BSEE also clarified the last sentence of the section to include §§ 250.229 and 250.242 as examples “(e.g.,)” of the applicable DWOP Process requirements.

Summary of comments: A commenter expressed concerns that this section is inconsistent with other submittal requirements. The commenter also stated that certain uses of HPHT barrier equipment do not require every step in the DWOP Process.

Response: BSEE agrees in part with the commenter and is ensuring that this section lists all plans that would be applicable to the use of HPHT barrier equipment. BSEE disagrees with the commenter that revisions are necessary

to demonstrate that only parts of the DWOP process apply. The last sentence of this section already states that the operator must follow the applicable DWOP process requirements. This does not mean that every DWOP process step must be followed as there are situations where certain parts may not be required. For example, certain New or Unusual Technology Barrier Equipment Conceptual Plans do not require submittal of a DWOP. BSEE is revising the last sentence of the paragraph to include a general reference to §§ 250.229 and 250.242 as examples of possible DWOP process requirements.

BSEE proposed to reserve § 250.205 and this section is reserved in this regulation.

Barrier Equipment and Systems

What equipment does BSEE consider to be a barrier? (§ 250.206)

Summary of Proposed Rule Revisions

BSEE proposed that this section codify some of the barrier concepts from BSEE NTL No. 2009–G36. Many parts of existing BSEE regulations under 30 CFR part 250, subparts D, E, F, G, H, J, and Q, are dedicated to establishing barrier requirements. This section would clarify that BSEE considers a barrier or barrier system to be any engineered equipment, materials, component, or assembly that is installed to contain a hydrocarbon pressure source(s) to prevent harm to people or the environment. BSEE recognizes barriers that are either non-mechanical or mechanical in nature, permanently or temporarily installed, pressure controlling, and/or pressure containing barriers. Pressure controlling barriers must be able to be activated on demand. The proposed rule also clarified that barriers or barrier systems are required to be able to function and/or be pressure tested repeatedly to defined acceptance criteria. If the barrier or barrier system is classified as Safety and Pollution Prevention Equipment (as described under § 250.801(a)), then it must also be compliant with the leak test requirements established in Subpart H of 30 CFR part 250. Any specific engineered equipment, materials, components, or assembly that exist within a barrier system that are not tested would not be considered a barrier. This section would not alter or impact any existing regulation; it only documents a principle that is the basis of many BSEE regulations.

Summary of Final Rule Revisions

BSEE received multiple comments on this section and has revised the language in the final rule with the

following revisions based on those comments.

- BSEE is making this section consistent with the revisions to the definitions under § 250.200 and clarifying that barriers are installed to contain hydrocarbon pressure sources to prevent harm to people and the environment. This revision clarifies the purpose of barriers and provides consistent terminology;
- Removing the parenthetical that non-mechanical or mechanical in nature barriers are only recognized by BSEE as barriers. BSEE removed this parenthetical to avoid confusion and be consistent with the definitions and terms defined in Subpart B of 30 CFR part 250 and in § 250.200;
- Adding an example of activating a barrier on demand to include the parenthetical “(i.e., closed by an operator or automated safety system).” This was added to provide guidance and clarity to the intent of activation of a barrier and does not change the associated requirement;
- Revising the second to last sentence to clarify that operators must function test and pressure test any pressure controlling barriers and adding that the operator must also pressure test any pressure containing barrier to defined acceptance criteria that can be repeated. BSEE clarified these requirements to eliminate confusion about the types of testing that is applicable to only pressure controlling as opposed to pressure containing barriers. BSEE does not specify the exact testing requirements or testing timeframes in order to not limit the use of new or unusual technology, such as single use barrier technology. However, the operator must identify and demonstrate the defined acceptance criteria to ensure that the barrier or barrier system can be used as designated; and
- Removing the last proposed sentence because Safety and Pollution Prevention Equipment is already covered under 30 CFR part 250, subpart H and is unnecessary in Subpart B.

Summary of comments: A commenter recommended clarifying that the barriers discussed in this section apply to hydrocarbon sources to prevent the requirements being taken out of context for including other non-barrier pressure containing components.

Response: BSEE agrees with the commenter and removed the words “or other” to clarify that the barriers are installed to contain hydrocarbon pressure sources. BSEE has revised this section to ensure consistency with the

definitions of applicable terms and clarify that the barrier envelope covered by these definitions is limited to hydrocarbon pressure sources. These revisions to this section and corresponding edits to the definitions section clarify BSEE's original intent and limit the applicable scope of the barrier or barrier system to only hydrocarbon pressure sources.

Summary of comments: A commenter requested BSEE to clarify the term “activated on demand.”

Response: BSEE agrees with the commenter and clarified the term “activated on demand” by providing a parenthetical that includes “closed by an operator or automated safety system.” This clarification does not change the meaning or intent of the proposed requirements and only provides two examples of what is meant by the term activated on demand.

Summary of comments: Multiple commenters expressed concerns with the purpose of function testing and pressure testing of barriers and suggested that function testing and pressure testing are only used for determining failures.

Response: BSEE agrees in part with the commenters that function testing and pressure testing help determine failures; however, BSEE also uses pressure testing and function testing to help ensure that the barrier or barrier system is capable of being used as designed for the specific conditions. This section does not specify any specific function testing or pressure testing acceptance criteria. BSEE clarified these requirements to eliminate confusion about the types of testing that is applicable to only pressure controlling as opposed to pressure containing barriers. BSEE does not want to limit the use of new or unusual technology, such as single use barrier technology, by specifying the exact testing requirements or testing timeframes. However, the operator must identify and demonstrate the defined acceptance standard to ensure that the barrier or barrier system can be used as designated.

How must barrier systems be used? (§ 250.207)

Summary of Proposed Rule Revisions

BSEE proposed to require operators to install and maintain a primary and secondary barrier system to prevent a loss of containment during any operational phase of a well, flowline, pipeline, production, or riser system. It is BSEE's goal to prevent loss of containment by minimizing single point failures wherever possible. Given the

probability that any barrier may fail during its service life due to age, corrosion, wear, damage, the environment, or accidents, the best mitigation is redundancy. This section would not alter or impact any existing regulation; it only documents a principle that is the basis of many BSEE regulations.

Summary of Final Rule Revisions

BSEE did not receive any comments on this proposed section and is including the proposed language in the final rule without change.

Activities and Post-Approval Requirements for the EP (Exploration Plan), DPP (Development and Production Plan), DWOP, and DOCD (Development Operations Coordination Document)

How must I conduct activities under an approved EP, DPP, or DOCD? (§ 250.208)

Summary of Proposed Rule Revisions

BSEE proposed that this section be similar to the language in 30 CFR 550.280, *How must I conduct activities under the approved EP, DPP, or DOCD?* During the 2011 regulatory split between BSEE and BOEM, the content of this section was inadvertently removed from 30 CFR part 250; however, the content is still applicable to BSEE and should be included in 30 CFR part 250, as well as in 30 CFR part 550.

Summary of Final Rule Revisions

BSEE received and considered a comment regarding this proposed provision and includes the proposed language in the final rule with the minor wording change to paragraph (a)(2) to state that the actions “may” result in the lack of compensation and to fix an incorrect citation. BOEM removed 30 CFR 556.77 from the regulations; the new applicable regulation is 30 CFR 556.1102.

Summary of comment: A commenter expressed concerns that the proposed language does not reflect that lease cancellation and right-of-way forfeiture occur through a judicial process and that the last sentence in paragraph (a)(2) is not compatible with 30 CFR 550.185(b) and 30 CFR 556.77 because those provisions do not categorically preclude compensation in all circumstances.

Response: BSEE disagrees with the commenter in part. The language in paragraph (a)(2), like 30 CFR 550.280(a)(2), accurately reflects the language in 43 U.S.C. 1334(c) or (d), 30 CFR 550.185, and 30 CFR 556.1102.

This addition to the BSEE regulations is not intended to alter any applicable judicial process or change the longstanding requirements of the BOEM regulations. Pursuant to the commenter’s suggestion, BSEE has revised the regulation to reflect that the actions “may” result in the lack of compensation.

What must I do to conduct activities under the approved EP, DPP, or DOCD? (§ 250.209)

Summary of Proposed Rule Revisions

The content of this proposed section would be similar to the language in 30 CFR 550.281, *What must I do to conduct activities under the approved EP, DPP, or DOCD?*, paragraphs (a) and (b). During the 2011 regulatory split between BSEE and BOEM, the content of this section was inadvertently removed from this part; however, the content is still applicable to BSEE and should be included in 30 CFR part 250, as well as in 30 CFR part 550.

Summary of Final Rule Revisions

BSEE did not receive any comments on this proposed section and is including the proposed language in the final rule without change.

Do I have to conduct post-approval monitoring? (§ 250.210)

Summary of Proposed Rule Revisions

BSEE proposed to move this section from § 250.282. BSEE also proposed to add revisions to clarify that the Regional Supervisor may direct operators to conduct monitoring programs in association with their approved EP, DPP, DWOP, or DOCD.

Summary of Final Rule Revisions

BSEE received and considered a comment regarding this proposed provision and includes the proposed language in the final rule without change.

Summary of comment: A commenter stated that paragraph (b) is vague and ambiguous and fails to put industry on notice of the standards with which it must comply. The commenter recommended that BSEE revise this paragraph to clarify the requirements for preparing and submitting monitoring plans.

Response: BSEE disagrees with the commenter and has successfully used the language regarding monitoring programs as a longstanding requirement (see previous § 250.282). For example, BSEE has successfully directed the use of monitoring programs to minimize the risk of vessel strikes to protected species and provided clarifying guidance for

implementing those monitoring programs (see BSEE NTL No. 2012–G01).

What are my new or unusual technology failure reporting requirements? (§ 250.211)

Summary of Proposed Rule Revisions

BSEE proposed to clarify the new or unusual technology failure reporting requirements. Currently, BSEE does not receive new or unusual technology failure data associated with approved DWOPs; however, BSEE has recently requested new or unusual technology failure data as a condition of DWOP approval. The proposed section would require an operator to notify BSEE within 30 days of a failure and provide a written report identifying the root causes of the failure. This new section is intended to provide BSEE with a better understanding of operational limitations of equipment associated with an approved DWOP.

Existing failure and incident reporting requirements in §§ 250.188, *What incidents must I report to BSEE and when must I report them?*; 250.730, *What are the general requirements for BOP systems and system components?*; and 250.803, *What SPPE failure reporting procedures must I follow?*, may be used to help fulfill the new or unusual technology failure reporting requirements of this section. This section is not a substitute for other currently applicable failure or incident reporting requirements.

Summary of Final Rule Revisions

Based on comments received, BSEE is revising this section by clarifying the definition of a failure to include any condition that prevents the equipment from meeting its functional specification. The final rule also removes the terms “recovered and repaired or replaced” as elements the proposed rule listed as triggering a requirement to notify the Regional Supervisor. BSEE is also revising the term “written report” to “failure analysis report” and clarifies that an operator must provide the failure analysis report as soon as it is available following the notification and that the failure analysis report must include any results and potential root causes. These revisions provide consistency with the same terminology and expectations for failure reporting used throughout BSEE regulations (e.g., §§ 250.188, 250.730 and 250.803).

Summary of comments: A commenter stated that the proposed rule is too broad and would capture non-failures. For example, the commenter stated that

simply needing to recover equipment does not mean the equipment experienced a failure and does not provide a distinction between failure notification and submission of a failure report.

Response: BSEE agrees with the commenter and has revised the definition of failure in this section to mean any condition that prevents the equipment from meeting its functional specification. BSEE also removed the requirement for reporting if the new or unusual technology has to be recovered and repaired or replaced. This revision is necessary for consistency with similar terminology used throughout BSEE regulations and within the failure reporting requirements and submissions to BSEE. BSEE also revised this section to provide clarity that the failure analysis report must be submitted as soon as available following the notification. BSEE requires submittal of the failure notice first and then submittal of the failure analysis, thereby providing a clear order for submittal of failure information to BSEE.

Summary of comments: A commenter expressed concerns that a root cause analysis may not always be possible.

Response: BSEE agrees with the commenter and understands that there are circumstances where a root cause analysis may not be possible. Therefore, BSEE has revised this section to clarify that the report must include any results and potential root causes for the failure. BSEE values failure data and uses the failure information, including root causes, to identify failure trends and potential issues.

BSEE proposed to reserve §§ 250.212–250.219, and these sections are reserved in this regulation.

Deepwater Operations Plan (DWOP) Process

What is the DWOP process? (§ 250.220)

Summary of Proposed Rule Revisions

BSEE proposed to move the content from § 250.286 to this section and include the following revisions and additions:

Proposed paragraph (a) of § 250.220 would clarify that the DWOP process is not only used for review of subsea tieback development technology, but also applies to deepwater development projects and other projects or systems that use new or unusual technology during any phase of drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment operations. These additions clarify when the DWOP process is necessary and correspond

with the proposed additions of the new or unusual technology requirements.

Proposed paragraph (b) would add that the DWOP process does not replace other BSEE applications or permits (e.g., APD, APM, pipeline, and platform). Other minor revisions to this paragraph reflect the corresponding additions to the proposed new or unusual technology requirements for the DWOP process.

Proposed paragraph (c) would clarify that the DWOP process consists of two phases: the Conceptual Plans and the DWOP. The current DWOP regulations do not differentiate between the DWOP process and the DWOP plan itself, as they currently use the term DWOP to refer to both. This proposed section would clarify the terms and is intended to reduce confusion about the different phases of the DWOP process. The proposed DWOP requirements are not intended to require the submittal of a DWOP for operations not currently covered under the DWOP plan stage (e.g., drilling and decommissioning), but would require submittal of the appropriate Conceptual Plan. Proposed §§ 250.227 through 250.229 would identify the contents of the Conceptual Plans. Proposed §§ 250.236 through 250.242 would identify what the DWOP must contain.

Summary of Final Rule Revisions

Based on comments received, BSEE is finalizing this proposed section and including a new paragraph (d) to clarify that not all projects will require the submittal of all three Conceptual Plans and a DWOP. Specifically, this revision clarifies that projects requiring New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Equipment Conceptual Plans may not be required to have an associated Project Conceptual Plan or DWOP.

Summary of comments: Multiple commenters expressed concerns that the proposed rule lacks clarity for how the DWOP process is fully used for all applicable types of operations and if each step of the DWOP process is required for every type of equipment or operation.

Response: BSEE agrees with the commenters and has revised this section by adding new paragraph (d) and the respective DWOP process sections to add clarity that not all projects will require the submittal of each Conceptual Plan and DWOP. There are circumstances when only a New or Unusual Technology Conceptual Plan or a New or Unusual Technology Barrier Equipment Conceptual Plan is required to be submitted to BSEE without a Project Conceptual Plan or

DWOP. For applicability requirements, see § 250.225 for each Conceptual Plan and § 250.235 for the DWOP.

When must I use the DWOP process? (§ 250.221)

Summary of Proposed Rule Revisions

BSEE proposed to move the content from § 250.287 to this section and to clarify that the DWOP process is applicable to any project in water depths greater than 1000 feet and to any project that will include the use of subsea tieback development technology, regardless of water depth, or new or unusual technology for any drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment operations. These revisions provide consistency and reflect corresponding additions to the proposed new or unusual technology and DWOP process requirements.

BSEE has always required DWOPs when a development is situated in water depths of 1000 feet or greater or when subsea tieback development technology is used in any water depth. BSEE proposes to promulgate regulations that include our existing practices regarding the expansion of new or unusual technology. BSEE also proposed to add requirements for the DWOP process when any new or unusual technology is used for drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment projects. This would provide consistency for all new or unusual technology reviews.

Summary of Final Rule Revisions

BSEE received comments on this section as proposed and is finalizing it with a minor revision to paragraph (b) to remove the words “you must.” This paragraph was intended to be a suggestion for operators to contact BSEE if they have any questions about the classification of certain technology and is not a requirement.

Summary of comments: Multiple commenters requested that BSEE list or create a database that indicates what equipment, components, or procedures are considered new or unusual technology or new or unusual barrier technology.

Response: BSEE disagrees with this comment and is not developing a database to list every new or unusual technology. It is the operator’s responsibility to ensure any new or unusual technology is appropriately identified and approved by BSEE before operational use. Also, such a database may be of limited use as each OEM may

have unique equipment designs and individual components do not necessarily all work together for specific projects.

Summary of comments: A commenter expressed concerns that this section would unnecessarily expand the complete DWOP process to cover operations not previously covered by the process and would create redundant filings and impose undue burdens.

Response: BSEE disagrees with the commenter. BSEE has clarified in other sections (see § 250.220(d)) that projects requiring New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Equipment Conceptual Plans (which may be used for drilling and decommissioning) may not be required to have an associated Project Conceptual Plan or DWOP. This clarification will eliminate any undue burden on industry by only requiring submission of the applicable plans in the DWOP process.

BSEE proposed to reserve §§ 250.222–250.224, and these sections are reserved in this regulation.

Conceptual Plans

What are the types of Conceptual Plans that I must submit? (§ 250.225)

Summary of Proposed Rule Revisions

BSEE proposed a new section that would identify the three types of proposed Conceptual Plans:

- A Project Conceptual Plan would be required for any project that is planned in water depths greater than 1000 feet or will include the use of subsea tieback development technology, regardless of water depth (see proposed § 250.221 paragraphs (a)(1) and (2));
- A New or Unusual Technology Conceptual Plan would be required for any project or system that involves equipment or systems that are considered new or unusual technology (see proposed § 250.200 for the definition of new or unusual technology); and
- A New or Unusual Technology Barrier Conceptual Plan would be required for any project or system involving new or unusual technology that is also identified as a primary or secondary barrier (see proposed § 250.200 for the definition of primary or secondary barriers).

This proposed section would add clarity by describing the proposed types of Conceptual Plans. The proposed requirements for each Conceptual Plan are discussed in the applicable corresponding sections, §§ 250.227 through 250.229. An operator must

submit the applicable Conceptual Plan(s) based on specifics of the proposed project. The operator may be required to submit multiple Conceptual Plans.

Summary of Final Rule Revisions

BSEE received comments on this section and is finalizing the proposed content with the following revisions based on the comments:

- Paragraph (a) is revised by adding clarification that a Project Conceptual Plan is also required if the project will use new or unusual technology for completion, injection, production, pipeline, or platform projects. This addition clarifies the scope of the Project Conceptual Plan and how applicable new or unusual technology fits within that plan. A Project Conceptual Plan would not be needed when new or unusual technology is being used for drilling or decommissioning operations.
- Paragraph (b) is revised by making the first sentence consistent with the definition of new or unusual technology by changing the proposed phrase “involves equipment or systems” to “involves equipment or procedures”. BSEE is also adding the clarification that the New or Unusual Technology Conceptual Plan is applicable for drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment operations. This revision clarifies the scope of operations covered under the New or Unusual Technology Conceptual Plan.
- Paragraph (c) is revised to also clarify that the New or Unusual Technology Barrier Equipment Conceptual Plan is applicable for drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment operations. This revision clarifies the scope of operations covered under the New or Unusual Technology Barrier Equipment Conceptual Plan. BSEE also added “Equipment” to the title of the plan to clarify the distinctions between this plan and the New or Unusual Technology Conceptual Plan.

Summary of comments: Multiple commenters expressed concerns that the proposed activities of drilling and decommissioning cannot be covered under a Project Conceptual Plan and is outside the scope of previous BSEE guidance and practice. The commenters also expressed concerns that, if a Project Conceptual Plan is required for drilling operations, that requirement could not be met before drilling.

Response: BSEE agrees with the commenters and has revised this section to clarify that a Project Conceptual Plan is not required for certain operations (e.g., drilling and decommissioning). This clarification is consistent with BSEE guidance and the original scope of the Project Conceptual Plan. BSEE does not share the commenters’ concerns about timing requirements prior to drilling the well because drilling operations are not covered under the Project Conceptual Plan. BSEE has also further clarified in § 250.226 when each applicable Conceptual Plan is required and the timing of conducting certain operations covered under each plan.

Summary of comments: A commenter asked if a non-site-specific voluntary equipment Conceptual Plan and the well design Conceptual Plan will still be part of the HPHT approval process (see BSEE NTL No. 2019–G02 and 2019–G03).

Response: Non-site-specific voluntary equipment Conceptual Plans are not required. Operators should plan to submit site-specific equipment qualification for their HPHT project pursuant to §§ 250.228 and 250.229 as applicable. The identified content of the Well Design Conceptual Plans is still part of the HPHT process pursuant to the applicable regulations referenced in BSEE NTL 2019–G02 (e.g., see §§ 250.420, 250.462, 250.505, 250.514, 250.518, 250.605, 250.613, 250.614, and 250.732).

Summary of comments: A commenter expressed concerns that the proposed rule is unclear regarding overlap between the proposed New or Unusual Technology Conceptual Plan and the New or Unusual Technology Barrier Conceptual Plan. The commenter requested that BSEE clarify that barrier equipment would only require the New or Unusual Technology Barrier Conceptual Plan and not the New or Unusual Technology Conceptual Plan.

Response: BSEE agrees in part with the commenter and has revised the name of the New or Unusual Technology Barrier Conceptual Plan to the New or Unusual Technology Barrier Equipment Conceptual Plan. This revision clarifies the scope of the New or Unusual Technology Barrier Equipment Conceptual Plan and uses consistent terminology and descriptions of equipment covered by the plan. If a New or Unusual Technology Barrier Equipment Conceptual Plan is required, the operator would not have to also submit a New or Unusual Technology Conceptual Plan for the same equipment (see revisions to § 250.201).

When and how must I submit each applicable Conceptual Plan? (§ 250.226)

Summary of Proposed Rule Revisions

BSEE proposed to move the content from §§ 250.288 and 250.290 to § 250.226, with revisions to clarify that an operator must submit its Conceptual Plans to the Regional Supervisor after the operator decides on the general concept(s) for a project or system, and before it begins final engineering design of the equipment, well, well safety control system, or subsea production systems. These revisions would help ensure that the operator considers the information associated with the proposed Conceptual Plans when submitting an associated application or permit application (e.g., APD, APM, pipeline, platform). BSEE proposed to add a table to organize and clarify information associated with the three types of proposed Conceptual Plans as follows:

Proposed paragraph (a) of § 250.226 would include content from § 250.290 and would further clarify that BSEE must approve a Project Conceptual Plan before an operator may complete a production or injection well or install a tree.

Proposed paragraph (b) would add the following requirements regarding a New or Unusual Technology Conceptual Plan:

- The operator may not install any new or unusual technology until BSEE approves the New or Unusual Technology Conceptual Plan;
- BSEE must approve the New or Unusual Technology Conceptual Plan before BSEE will approve any associated application or permit (e.g., pipeline, platform, APD, APM); and
- The Regional Supervisor may require the operator to use an I3P to perform certain functions and verifications in accordance with § 250.231, as applicable. This addition would allow I3P services to assist BSEE's review of new or unusual technology that may involve technically complex engineering and require a high degree of specialized engineering knowledge, expertise, and experience to evaluate thereby helping to ensure that BSEE conducts appropriate reviews of new or unusual technology plans.

Proposed paragraph (c) would add the following requirements regarding a New or Unusual Technology Barrier Conceptual Plan:

- The operator must submit a New or Unusual Technology Barrier Conceptual Plan for any project or system involving new or unusual

technology that is also identified as a primary or secondary barrier;

- BSEE must approve the New or Unusual Technology Barrier Conceptual Plan prior to new or unusual technology barrier equipment installation;
- BSEE must approve the new or unusual technology barrier equipment before BSEE will approve any associated application or permit application (e.g., pipeline, platform, APD, APM); and
- An operator submitting a New or Unusual Technology Barrier Conceptual Plan must use an I3P to perform certain functions and verifications in accordance with proposed § 250.231,

What are the I3P review requirements for Conceptual Plan reviews?

Summary of Final Rule Revisions

Based on comments received, BSEE is finalizing the proposed content with the following revisions:

- Revising the introductory paragraph by removing the term “begin final” engineering design and replacing it with “finalize.” This revision clarifies the intent of the submittal timing requirement concerning Conceptual Plans. BSEE wants to ensure that engineering design is not complete before BSEE approves the concept in case any change is required.
- Paragraph (b)—Revising the order of content under the table heading “Additional information” and adding paragraphs (b)(1)(i), (ii), and (iii), paragraph (b)(3), and (b)(4) to read as follows: (1) Operations and approval timing requirements are as follows:
 - (i) You may not install any new or unusual technology until BSEE approves your New or Unusual Technology Conceptual Plan;
 - (ii) You may not complete any production or injection well or install a tree before BSEE has approved all New or Unusual Technology Conceptual Plans associated with all well completion equipment and the Project Conceptual Plan; and
 - (iii) BSEE must first approve your New or Unusual Technology Conceptual Plan associated with subsea production systems before the DWOP may be approved. You may install this new or unusual technology following BSEE permit approval (e.g., pipeline application) and prior to DWOP approval.
- (2) The Regional Supervisor may require the operator to use an I3P to perform certain functions and verifications in accordance with § 250.231, as applicable.

(3) BSEE will not approve a New or Unusual Technology Conceptual Plan until you submit and BSEE reviews all I3P Reports (if any required).

(4) BSEE must approve your New or Unusual Technology Conceptual Plan before approval of any associated application or permit (e.g., pipeline application, platform application, APD, APM).

(5) You must submit separate New or Unusual Technology Conceptual Plans for each piece of equipment at an assembly level (e.g., BOP, tree, wellhead system, or tubing head spool).

These revisions clarify certain expectations and timing for applicable submittals associated with the New or Unusual Technology Conceptual Plan.

—Paragraph (c)—Revising paragraphs (c)(2), (c)(3), and (c)(4) and adding paragraphs (c)(2)(i), (ii), and (iii) and paragraph (c)(5) to read as follows:

(c)(2) Operations and approval timing requirements are as follows:

(i) BSEE must approve your New or Unusual Technology Barrier Equipment Conceptual Plan prior to you installing new or unusual technology identified as barrier equipment

(ii) You may not complete any production or injection well or install the tree before BSEE has approved all the New or Unusual Technology Barrier Equipment Conceptual Plans associated with all well completion equipment and the Project Conceptual Plan, and

(iii) BSEE must first approve your New or Unusual Technology Barrier Equipment Conceptual Plan associated with subsea production systems before the DWOP may be approved. You may install this equipment with BSEE permit approval (e.g., pipeline application) and prior to DWOP approval.

(3) BSEE must first approve your New or Unusual Technology Barrier Equipment Conceptual Plan before BSEE will approval any associated application or permit application (e.g., pipeline application, platform application, APD, APM).

(4) BSEE will not approve New or Unusual Technology Barrier Equipment Conceptual Plans until you submit and BSEE reviews all required I3P Reports pursuant to § 250.231.

(5) You must submit separate New or Unusual Technology Barrier Equipment Conceptual Plans for each piece of equipment at an assembly level (e.g. BOP, tree, wellhead system, tubing head spool).

These revisions clarify certain expectations and timing for applicable submittals associated with the New or Unusual Technology Barrier Equipment Conceptual Plan.

Summary of comments: Multiple commenters expressed concerns that it is unrealistic to submit all the applicable Conceptual Plan information before beginning final engineering design.

Response: BSEE agrees in part with the commenters and has revised this section to clarify the expectation that applicable Conceptual Plans require submittal of the plans before finalizing the engineering designs. This revision clarifies the intent of the submittal timing requirement concerning Conceptual Plans. BSEE wants to ensure that engineering design is not complete before BSEE approves the concept in case any change is required. This revision also provides latitude for the operators to make the determination of what constitutes a finalized engineering design.

Summary of comments: Multiple commenters expressed concerns that the proposed rule establishes unrealistic sequencing for Conceptual Plan approvals and requested clarification to ensure certain operations (e.g., drilling) can commence as appropriate before BSEE approval of certain plans (e.g., Project Conceptual Plan and DWOP).

Response: BSEE agrees in part with the commenter and has clarified the expectations in this section and timing requirements associated with each applicable Conceptual Plan. BSEE has also revised multiple other sections to also reflect the appropriate timing and submission requirements for all plans covered under the DWOP process (e.g., see revisions to §§ 250.201, 250.220, and 250.225).

What must the Project Conceptual Plan contain? (§ 250.227)

Summary of Proposed Rule Revisions

BSEE proposed to require a Project Conceptual Plan to include the basis of design that the operator would use to develop the field. Proposed paragraphs (a), (b), (c), and (i)(1) of § 250.227 would reflect the content of existing § 250.289. In addition, BSEE proposed that the section would require the operator to include certain information in the Project Conceptual Plan, including, but not limited to, information such as facility descriptions, schedule of development activities, certain schematics, and well information.

Summary of Final Rule Revisions

Based on comments received, BSEE is finalizing the content of proposed § 250.227 with the following revisions:

—Redesignating proposed paragraphs (i)(5) as (j), (j) through (q) as (k) through (r) respectively, and (r) as (t).

—Adding new paragraph (s) to list requests for any alternate procedures or equipment or departure requests associated with the applicable Conceptual Plans needed for well completion operations.

—Revising paragraphs (c), (d), (f), (i), (j), and (q) as follows:

Paragraph (c)—clarifies that BSEE expects the “estimated” distance from each well.

Paragraph (d)—changes the requirement from a confirmation that the subsea production safety system will comply with 30 CFR part 250, subpart H to a statement that the subsea production safety system will be designed to comply with Subpart H.

Paragraph (f)—clarifies that for a subsea tieback to an existing facility the operator must submit: a description of known structural modifications needed to accommodate the tieback, including a statement about whether these may be minor or major modifications; the BSEE-approved service life of the existing facility; and a description of how modifications will be evaluated for effects on the BSEE-approved service life.

Paragraph (i)—clarifies (i)(1) to include a “proposed” well location plot; (i)(2) to include a “conceptual” subsea field schematic containing infrastructure as applicable and adds additional examples, including manifolds, subsea booster pumps, and high integrity pressure protection systems; and (i)(4) to include “proposed” wellbore and completion schematics.

Paragraph (j)—clarifies that BSEE expects only a description of the drilling and completion systems.

Paragraph (q)—removes the term “activities” because some of the listed items are not activities but are physical objects. BSEE also added risers to the list of examples applicable to new or unusual technology.

BSEE understands that certain information is not finalized at this stage of a project, and these revisions clarify the BSEE intent to reflect information that is available or that can be available for the Project Conceptual Plan.

Summary of comments: Multiple commenters requested that BSEE clarify the informational requirements for the Project Conceptual Plan. The commenters expressed concerns that specific information may not be precisely known at this stage and may be more appropriate for the DWOP.

Response: BSEE agrees with the commenters that certain types of information may not be available at this stage of a project and has revised this

section to better reflect the submission of information that is appropriate and available at the Project Conceptual Plan stage (e.g., the “estimated” distance from each well, a description of only “known” modifications to a facility, schematics including the “proposed” well locations, and a “description” of the drilling system). These revisions clarify the submission requirements and help alleviate the commenters’ concerns regarding information availability for the Project Conceptual Plan.

Summary of comments: A commenter expressed concerns that the term “Basis of Design” means different things to different operators and recommended that BSEE remove the term.

Response: BSEE agrees that the term “Basis of Design” can mean different things depending on the components in question and their application. BSEE does not agree that removing the term is necessary because it is a common conceptual term well understood in the industry. BSEE is involved with operators in the early stages of HPHT projects, and uncertainties regarding terminology can easily be addressed on a case-by-case basis to ensure submittals fulfill regulatory requirements.

What must the New or Unusual Technology Conceptual Plan contain? (§ 250.228)

Summary of Proposed Rule Revisions

BSEE proposed paragraph (a) of § 250.228 to require certain information to be included in the New or Unusual Technology Conceptual Plan including, but not limited to, how the New or Unusual Technology Conceptual Plan fits within the overall site-specific project, a description of the technology, information on inspection and testing capabilities, risk assessments and failure mode analysis, operating procedures, and schematics.

BSEE proposed paragraph (b) to allow for the Regional Supervisor to require the use of an I3P according to proposed § 250.230 if the system or equipment requires a high degree of specialized or technically complex engineering knowledge, expertise, and experience to evaluate, or is not addressed in existing industry standards. This addition would help BSEE ensure that the equipment or process is appropriate for use in the specific environmental and operating conditions. In addition, the Regional Supervisor would be able to require operators to follow I3P requirements under § 250.231, on a case-by-case basis. Finally, this section proposed to instruct operators to direct any questions about I3P requirements for New or Unusual

Technology Conceptual Plans to the Regional Supervisor.

Summary of Final Rule Revisions

Based on comments received, BSEE is finalizing the content of proposed § 250.228 with the following revisions:

- Paragraphs (a)(5) and (a)(5)(ii) add the requirement to describe not only the barrier, but also the “safety” system as applicable. Paragraph (a)(11) clarifies the detailed schematic is applicable to identifying all components. Paragraph (a)(13) clarifies that the list of alternate procedures or equipment requests and departure request required are those applicable to the new or unusual technology proposed in a New or Unusual Technology Conceptual Plan. And finally, paragraph (a)(14) removes the requirements for a “certification” and requires instead a statement that the technology is fit for service.
- Paragraphs (b) and (b)(1) fix incorrect cross references since the final rule updated the applicable section numbers, and make some grammatical improvements.

Summary of comments: A commenter suggested that BSEE should move this section and section § 250.229 outside of the DWOP process and expressed concerns that these sections expand the circumstances in which the DWOP process is required.

Response: BSEE disagrees with the commenter that this section should be moved outside of the DWOP process. However, in light of these concerns, BSEE has clarified the applicability of each Conceptual Plan to relevant operations. BSEE has clarified in other sections (e.g., see § 250.220) that projects requiring certain New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Equipment Conceptual Plans (which may be used for drilling and decommissioning) may not be required to have an associated Project Conceptual Plan or DWOP. This clarification helps limit the burden on industry as not every project using new or unusual technology requires every plan covered under the DWOP process.

Summary of comments: Multiple commenters expressed concerns that the proposed rule inadvertently requires I3P to certify “fit for service,” a standard ostensibly outside the I3P’s expertise. The commenters also expressed concerns with the “certification” statement associated with both “fit for purpose” and “fit for service” determinations and suggested that BSEE remove the term “certification” from the requirements.

Response: BSEE agrees with the commenters that there is confusion surrounding the terminology of “fit for purpose” and “fit for service” and how the I3P provides appropriate verifications and reviews. BSEE has therefore added definitions of both “fit for purpose” and “fit for service” to clarify who is responsible for each statement. In response to the comments, BSEE has also removed the term “certification” as it pertains to fit for purpose and fit for service and is clarifying that a statement from the I3P or operator respectively is sufficient. Such a statement is within the scope of the I3P’s expertise.

Summary of comments: A commenter expressed concern with the discretion of the Regional Supervisor to require an I3P. The commenter stated that this provision does not provide any regulatory certainty when an I3P will be required. The commenter also expressed concerns that the Regional Supervisor discretion for the use of an I3P may cause setbacks or inefficiencies to the Conceptual Plan process.

Response: The existing HPHT regulation (e.g., § 250.232) and NTLs provide guidelines for I3P report requirements. BSEE has incorporated most of the I3P guidance from the existing NTLs into these regulations, which provide clarity regarding when an I3P is required. Under § 250.228(b), BSEE may require I3P reports for this type of Conceptual Plan when the operator proposes to use a “system or equipment [that] requires a high degree of specialized or technically complex engineering knowledge, expertise, and experience to evaluate, or if existing industry standards do not address the system or equipment you propose to use.” BSEE is retaining this discretion to allow it to adjust to equipment development and maturation over time. BSEE encourages operators to reach out to the Regional Supervisor early in the project development process to get additional clarity regarding when an I3P will be necessary (§ 250.228(b)(2)). BSEE will notify the operator at the earliest possible stage to help ensure there are no setbacks or delays with I3P applicability in the Conceptual Plan approval.

What must the New or Unusual Technology Barrier Equipment Conceptual Plan include? (§ 250.229)

Summary of Proposed Rule Revisions

BSEE proposed this section to require the following information to be included in the New or Unusual Technology Barrier Conceptual Plan: a description of how the New or Unusual

Technology Barrier Conceptual Plan fits within the overall site specific project; a diagram depicting the primary and secondary barriers; a list of the engineering standards that will be used in the equipment’s material selection and qualification, design verification analysis, and design validation testing; a list of the functional requirements (i.e., environmental, and physical loads (magnitude and frequency)) for which the barrier equipment is being designed; a description of the barrier equipment’s safety critical functions, (i.e., function(s) performed by or inherent to the equipment enabling it to achieve or maintain a safe state); an I3P nomination; an I3P verification plan; and I3P reports as required in proposed § 250.232.

BSEE also proposed paragraph (l) to clarify that, after BSEE receives all of the required I3P reports, the operator must submit a certification statement that the barrier equipment is fit for service in the applicable environment (for the specific project location).

Summary of Final Rule Revisions

Based on comments received, BSEE is finalizing the proposed content with the following revisions.

- Throughout the rule—renaming the New or Unusual Technology Barrier Conceptual Plan as the New or Unusual Technology Barrier Equipment Conceptual Plan. This revision clarifies that this Conceptual Plan applies only to barrier equipment.
- Paragraph (b)—requiring a detailed schematic instead of a diagram.
- Paragraph (e)—clarifying that the list of alternate procedures or equipment requests and departure requests required are those applicable to the new or unusual technology barrier equipment proposed in the New or Unusual Technology Barrier Equipment Conceptual Plan.
- Fixing incorrect cross references due to renumbering certain sections in this final rule.
- Removing the I3P reports under proposed paragraph (j) and the fit for service statement in proposed paragraph (l), then moving that information to its own new section (see § 250.230). As a result of removing the content, BSEE is also redesignating proposed paragraph (k) as (j).

Summary of comments: A commenter requested clarification that HPHT barrier equipment intended for 20K completions (for example, HPHT wellheads or production liners) can be installed during the 15K drilling phase

prior to approval of the New or Unusual Technology Barrier Equipment Conceptual Plan.

Response: An operator may install HPHT barrier equipment prior to approval of the New or Unusual Technology Barrier Equipment Conceptual Plan prior to the HPHT phase of operations, if all wellheads and casings are approved by BSEE in the applicable application or permit (for example see § 250.410 for APDs and §§ 250.465 and 250.513 for APMs). However, all 20K well construction components are subject to equipment qualification review and BSEE approval prior to entering the HPHT phase of operations (see § 250.229). If components are installed but are denied Conceptual Plan approval, the well will not be allowed to enter the HPHT phase of operation.

When are you required to submit an I3P Report? (§ 250.230)

Summary of Final Rule Revisions

This is a new section for this final rule that contains the information previously covered under proposed § 250.229 paragraphs (j) and (l). This section clarifies that submittal of the I3P reports is required in § 250.229 and when required by BSEE pursuant to § 250.228. BSEE added this section because I3P reports can be applicable to both a New or Unusual Technology Barrier Equipment Conceptual Plan, as well as a New or Unusual Technology Conceptual Plan.

Summary of Comments

BSEE did not receive any comments on the proposed content covered in this new section. BSEE did receive other I3P-related comments, and those comments are discussed in the appropriate sections (e.g., see §§ 250.228 and 250.231).

What are the requirements for the Independent Third Party (I3P) nomination? (§ 250.231)

Summary of Proposed Rule Revisions

BSEE proposed this section to outline the requirements for the operator's nomination of an I3P to be used in conjunction with applicable Conceptual Plans. Paragraph (a) would add the nomination criteria for the I3P to review the design verification and design validation classification of the OEM, including that the I3P must be a technical classification society, a licensed professional engineering firm, or a registered professional engineer capable of providing the required certifications and verifications. This paragraph would also clarify that the

I3P nomination must be submitted to BSEE for approval and must include the following information:

- Previous experience in third-party verification or experience in the design, fabrication, or installation of applicable offshore oil and gas equipment;
- Technical capabilities of the individual or the primary staff for the specific project;
- Size and type of organization or corporation;
- In-house availability of, or access to, appropriate technology to review the specific project (this should include computer programs, hardware, and testing materials and equipment as applicable);
- Ability to perform the I3P functions for the specific project considering current commitments (e.g., project timelines, schedules, and personnel availability); and
- Previous experience with BSEE requirements and procedures.

This proposed section would help ensure that BSEE is informed of the I3P competencies and show that the I3P is qualified to perform the required verifications and certifications of Subpart B.

Paragraph (b) would require that operators allow the I3P to access all associated documentation and equipment related to items in proposed § 250.229(i) to perform the complete reviews in accordance with proposed § 250.231. This may include OEM documents or access to the fabrication and manufacturing locations. The operator is responsible for ensuring that the I3P has the appropriate information to complete the required verifications and certifications. This documentation is necessary for the I3P to conduct its review and verify, as appropriate, that the equipment is designed and manufactured to operate within its specified operating limits.

Multiple I3Ps may be used to conduct the applicable verifications. These proposed revisions are not intended to limit the number of I3Ps, as operators may need multiple I3Ps to cover multiple types of equipment covered under all applicable Conceptual Plans.

Summary of Final Rule Revisions

Due to the addition of new § 250.230, BSEE is renumbering this section as § 250.231. Based on comments received and after review of comments, BSEE is also revising this section as follows:

- Paragraph (a) is removing the term “when required by BSEE” because it is redundant of the requirements for I3P nominations under the applicable

Conceptual Plans. BSEE is also removing the reference to I3P “certifications” and clarifies that the I3P provides verifications and validations in line with the expectations of the I3P. BSEE is clarifying that the operator must submit the I3P nomination(s) within the applicable Conceptual Plan for separate BSEE acceptance before BSEE will approve the applicable Conceptual Plan. This clarification was added because I3P nominations can be applicable to both the New or Unusual Technology Barrier Equipment Conceptual Plan as well as the New or Unusual Technology Conceptual Plan. Lastly, BSEE is also clarifying the list of appropriate technology in paragraph (a)(4) by removing “testing materials” and that the appropriate technology is not limited to what is listed.

- Paragraph (b) is fixing certain cross references and clarifying that you must ensure the I3P has access to relevant OEM documentation, including relevant documentation and data labeled as confidential and proprietary. BSEE also wants to ensure the I3P has access to the OEM fabrication and manufacturing locations only if necessary to review the data. These revisions will help ensure the I3P has access to data necessary to provide the required verifications and validations.

- Paragraph (c) is added to clarify that an operator may propose to use an I3P previously accepted by BSEE for the same project, and not submit the items required under paragraph (a), if the BSEE-accepted I3P qualifications are still valid and applicable. The operator must also provide evidence of the previous I3P nomination acceptance. These additions help streamline the use of I3Ps within a project and reduce unnecessary submittal of duplicative information.

Summary of comments: A commenter expressed concerns with the term “when required by BSEE” and requested it to be removed. The commenter stated this change is necessary because the I3P requirements are sufficiently covered within the applicable Conceptual Plan requirements.

Response: BSEE agrees with the commenter and has removed the term “when required by BSEE” from the introductory paragraph to § 250.231. It is not necessary to include this term, as the I3P nomination requirement is sufficiently covered under the applicable Conceptual Plans.

Summary of comments: Multiple commenters requested clarification on

the BSEE expectations and actions for the I3P nominations.

Response: BSEE agrees with the commenters and has revised § 250.231(a) to clarify that operators must submit the I3P nominations before BSEE will approve the applicable Conceptual Plan.

Summary of comments: Multiple commenters expressed concerns with allowing I3Ps unrestricted access to OEM fabrication and manufacturing locations.

Response: BSEE agrees in part with the commenters' concerns over I3P access to OEM locations and has revised this section to reflect that the I3P needs access to review equipment and data, particularly with respect to the elements described in § 250.229(i) concerning the I3P verification plan. BSEE wants to ensure that the appropriate equipment and data are available to the I3Ps to conduct the required verifications and validations of the project.

Summary of comments: A commenter expressed concerns with the in-house availability of testing materials. The commenter was concerned that the I3P can require re-verification and re-testing as part of the validation at their own facilities.

Response: BSEE agrees in part with the commenter's concerns and would not expect an I3P to require re-verification or re-testing at its own facility. BSEE has removed the reference to testing materials from the list of availability of appropriate I3P technology. BSEE is removing this reference to help limit any misconceptions regarding the I3P reviews. It is BSEE's expectation that I3Ps will have the appropriate technology to be able to conduct the required verifications and validations of the specific project.

Summary of comments: Multiple commenters expressed concerns with the term "certification" associated with I3P capabilities and suggested BSEE to remove the term "certification" from the requirements.

Response: BSEE agrees with the commenters that there is confusion surrounding the terminology of certification for I3Ps. BSEE has added definitions of "fit for purpose" to clarify I3P requirements and expectations. In response to the comments, BSEE has also removed the term "certification" as it pertains to I3P qualifications.

Summary of comments: A commenter expressed concerns that the I3P nomination process is too onerous and that BSEE should streamline the requirements to be more consistent with BSEE guidance.

Response: BSEE agrees in part with the commenter and is adding § 250.231(c) to clarify that the operators may propose to use a previously accepted I3P from the same project if the qualifications are still valid. This revision will help streamline the use of existing I3Ps within a project and help limit unnecessary duplicative submissions of the nomination information. This is consistent with current practice (previous § 250.732(b)) and BSEE guidance.

Summary of comments: A commenter expressed concerns that this section implies that multiple I3Ps can be nominated and that equipment, assembly, or systems should be verified and validated by the same I3P.

Response: BSEE disagrees with the commenter's concerns regarding use of multiple I3Ps for different verifications and validations. Only one I3P is required for nomination per applicable Conceptual Plan at a time for the requirements under this section (see, e.g., § 250.229(h)). This section defines the qualifications for acceptable I3Ps. However, the operator retains the ability to propose different I3Ps for different equipment or new technologies within the same project. For example, a classification society may be a better I3P for a floating production facility, and a professional engineering firm maybe a better I3P for a riser design.

What are the I3P review requirements for Conceptual Plan reviews? (§ 250.232)

Summary of Proposed Rule Revisions

BSEE proposed to identify the requirements for the I3P review. Paragraph (a) would require the I3P to review the following information regarding the applicable equipment or system:

- Basis of design, technical specification (if known at this point in the design process), and functional requirements (i.e., environmental and physical loads (magnitude and frequency));
- Risk assessment and failure mode analysis;
- Material specification, selection, qualification, and testing;
- Design verification analysis, including a structural/strength analysis and fatigue assessment and/or analysis;
- If fatigue is identified as a potential failure mode in the required fatigue assessment and/or analysis, the plan to record and gather data (i.e., load monitoring) in order to conduct a future fatigue analysis;
- Design validation testing; and
- Fabrication, quality management system, and inspection and test

plan(s) that identifies the quality control/quality assurance process, and inspection of the final products.

Paragraph (b) would require the I3P to submit a report to BSEE documenting the review of each item covered under paragraph (a) of this section. This paragraph would also require each report to identify all OEM and operator documents used during the I3P reviews.

Paragraph (c) would require the I3P to submit a final report to BSEE that summarizes each of the review requirements covered under paragraph (a) of this section. This paragraph would also require the final report to include the equipment and/or system's technical specifications, including a certification statement that the equipment and/or system is fit for purpose for the technical specification by the I3P, and verification that the equipment's technical specifications meet or exceed the project's functional requirements, including a certification statement by the I3P that the equipment and/or system is fit for purpose for the proposed project.

Paragraph (d) would clarify that, for any subsequent I3P review of equipment and/or system's technical specification that was previously approved in the operator's New or Unusual Technology Barrier Conceptual Plan, the Regional Supervisor may accept a final report in accordance with § 250.231(c), including the existing certification covered under paragraph (c)(1) of this section, in lieu of reports required in paragraph (b). The I3P would be required to submit an updated certification statement in accordance with § 250.231(c)(2) for the specific project.

This section would require I3P review of all New or Unusual Technology Category 1 or Category 2 barrier equipment to help minimize the risk of loss of containment on new barrier equipment through reliance on the principle of qualified redundant barrier systems. The concept of using an I3P review process has been used in the regulations for various operations (e.g., §§ 250.420, 250.732, and 250.914 through 250.918). The I3P review process within § 250.231 would be the same process described in NTL 2019–G03, "Guidance for Information Submissions Regarding Site Specific and Non-Site Specific HPHT Equipment Design Verification Analysis and Design Validation Testing." The industry is currently using this NTL for the design verification and validation analysis for HPHT barrier equipment that will be used in the Gulf of Mexico. The verification processes in this section would be similar to the basic

engineering design and manufacturing methodologies found in many existing engineering standards.

Summary of Final Rule Revisions

Due to the addition of new § 250.230, BSEE is renumbering this section as § 250.232. Based on comments received and after review of comments, BSEE is also revising this section as follows:

- The introductory paragraph clarifies the applicability of I3P for the applicable Conceptual Plan. This revision is necessary to clarify that different Conceptual Plans may have I3P requirements (e.g., the New or Unusual Technology Conceptual Plan or the New or Unusual Technology Barrier Equipment Conceptual Plan);
- Paragraph (a)(1) clarifies the technical specifications are applicable to the equipment and the functional requirements are applicable to the specific project and changed the “i.e.” to an “e.g.” because the parenthetical provides examples;
- The contents under proposed paragraphs (c)(1) and (c)(2) are now located under paragraph (b), and the term “certification” was removed to clarify the I3P is required to provide statements regarding “fit for purpose” determinations; and
- The contents under proposed paragraph (d) are now redesignated as paragraph (c) and modified to clarify that for any new project, the operator may use previous I3P reviews of equipment or a system’s technical specifications that was approved in a previous Conceptual Plan. This section would also clarify the intent of the proposed rule by adding paragraphs (d)(1), (d)(2), and (d)(3) to require the operator to submit certain information to the Regional Supervisor to demonstrate the previous I3P review is still valid (i.e., a statement that the previous summaries of paragraph (a) and the previous fit for purpose statement are still valid, verification that the equipment technical specifications meet or exceed the project’s functional requirements, and a statement by the I3P that the equipment or system is fit for purpose for the proposed project).

Summary of comments: A commenter suggested that BSEE should explicitly state that equipment that has been previously verified and validated through appropriate industry standards and reviewed by an I3P should be exempted from further I3P review, unless there are substantive design changes, such as a major change to the technical specification.

Response: BSEE agrees in part with the commenter and has revised paragraph (d) to clarify the requirements for an operator to use previously approved I3P reviews for any new project. BSEE also clarified the information necessary to demonstrate that the previous I3P reviews are still valid for the project. These revisions would help streamline the use of previously approved I3Ps and limit unnecessary and duplicative submittals for I3P reviews and ensure that the proper information is submitted to demonstrate that previously approved I3P reviews are still valid.

Summary of comments: Multiple commenters expressed concerns with the “certification” statement associated with both fit for purpose and fit for service and suggested BSEE remove the term “certification” from the requirements.

Response: BSEE agrees with the commenters that there is confusion surrounding the terminology of certification for fit for purpose. In response to the comments, BSEE has removed the term “certification” as it pertains to “fit for purpose” determinations and is clarifying that a statement from the I3P is sufficient instead of a certification. This revision is consistent with the addition of the definition of “fit for purpose” and clarifies the role of the I3P for certain reviews.

Summary of comments: A commenter expressed concerns with the requirements to provide a fatigue assessment or analysis and that the requirements are ambiguous and unclear. The commenter believes that such ambiguity could lead to inefficiencies and additional work that will further delay field and lease development.

Response: BSEE views fatigue assessment or analysis as an important tool for HPHT qualification. Operators should engage early with equipment manufacturers to ensure the proper analysis is being performed. Fatigue assessment is not a new concept and is well understood by the industry. BSEE is not defining these terms because of the broad range of potential equipment or facilities covered under the project. BSEE has successfully used similar concepts for fatigue evaluation in existing regulations (see § 250.908) and does not expect the identified terms to delay field or lease development based on previous Conceptual Plan and DWOP experience.

General requirements for any I3P report. (§ 250.233)

Summary of Proposed Rule Revisions

BSEE proposed to clarify expectations for the I3P reports. The proposed rule proposed to require that an I3P report must be a standalone document that clearly summarizes the verification work performed and must contain a sufficient level of detail (i.e., quantitative information) and clarity to establish the basis of the I3P’s findings and recommendation(s). Each report would be required to identify the OEM or operator documents reviewed, the detailed I3P review, and convey the results of the I3P’s review without requiring BSEE to review any other referenced document. This section would establish basic expectations for I3P reports and provide consistency and uniformity for operator submittals and BSEE reviews. These reports are an important tool for BSEE to conduct appropriate reviews and it is imperative to ensure that these reports are comprehensive and clear. These reports also contain information necessary for audit purposes.

Summary of Final Rule Revisions

Due to the addition of new § 250.230, BSEE is renumbering this section as § 250.233 and fixing any applicable cross references. Based on comments received and after review of comments, BSEE is also revising this section to clarify that the I3P reports must clearly summarize the required verification and validation work of the I3P. BSEE is also removing the proposed requirement that the I3P reports need to include the I3P recommendations. These revisions clarify the role of the I3P and provide consistency with the expectations of the I3P actions throughout this rulemaking.

Summary of comments: Multiple commenters expressed concerns that the requirement to include I3P recommendations in the reports are beyond the scope of the I3P duties for reviewing for conformance with the specified requirements.

Response: BSEE agrees with the commenters and has removed the term “recommendations” from the regulatory requirements for I3P reports. BSEE wants to be consistent with the expectations and required actions for I3Ps when conducting required verifications and validations.

BSEE proposed to reserve § 250.234, and this section is reserved in this regulation.

DWOP Approval

When and how must I submit the DWOP? (§ 250.235)

Summary of Proposed Rule Revisions

BSEE proposed to move the content from § 250.291 and revise the section to clarify that a DWOP must be submitted to the Regional Supervisor after BSEE has approved the operator's project Conceptual Plan and the operator has substantially completed system design and before the operator conducts post-completion installation activities for a deepwater development project or for any project that will involve the use of subsea tieback development technology in any water depth, which may include new or unusual technology or new or unusual technology barrier equipment. This section would also clarify that operators cannot begin production from the well until BSEE approves the DWOP. The revisions to this section would help ensure that there is enough time for BSEE to review a DWOP, including resolution of any potential issues, prior to DWOP approval. The operator should consider the DWOP requirements when beginning to procure or fabricate the safety and operational systems (other than a tree, because operators may install a tree after Conceptual Plan approval), production platforms, pipelines, or other parts of the production system.

Summary of Final Rule Revisions

BSEE is reorganizing this section to provide clarification for the DWOP requirements. Based on comments received and after review of comments, BSEE is revising this section as follows:

Under newly designated paragraph (a), BSEE is clarifying that the operator must submit the DWOP before conducting installation activities post-well completion. BSEE is also adding paragraph (a)(3) to clarify that an operator must submit the DWOP for an HPHT development project, any project using Category 1 or 2 new or unusual technology barrier equipment, or any project that uses new or unusual technology that may impact the safety critical function of Category 1 or 2 barrier equipment regardless of water depth. These revisions clarify what projects are applicable to the DWOP submission and are consistent with BSEE experience and approvals of DWOPs.

BSEE is also clarifying under newly designated paragraph (b) that the operator may install subsea systems and associated pipelines once they have applicable BSEE permit and Conceptual Plan approval. This clarification helps

establish the order of operations and actions that can be taken before DWOP approval.

Summary of comments: A commenter expressed concerns that this section is unclear about the use of the DWOP and the New or Unusual Technology Conceptual Plan or the New or Unusual Barrier Equipment Conceptual Plan and requested BSEE to clarify the DWOP requirements.

Response: BSEE agrees in part with the commenter and has revised this section to clarify that the DWOP submission is applicable to HPHT development projects, as well as any project that uses Category 1 or 2 new or unusual technology barrier equipment, or any project that uses new or unusual technology that may impact the safety critical function of Category 1 or 2 barrier equipment regardless of water depth. This clarification helps identify how the DWOP is applicable to certain project that use HPHT equipment and new or unusual technology barrier equipment. This revision also provides clarity and consistency with the definitions of certain barrier equipment and associated Conceptual Plan requirements.

Summary of comments: Multiple commenters expressed concerns with lack of clarity regarding which actions or operations can commence at various stages of DWOP approval.

Response: BSEE agrees with the commenters and has revised paragraph (a) of this section to clarify that the operator must submit the DWOP before conducting installation activities after well completion. BSEE is also revising paragraph (b) of this section to clarify that the operator may install subsea systems and associated pipelines once the operator has the approval of the applicable BSEE permit(s) and Conceptual Plan(s). However, the operator may not begin production from the well until BSEE approves the DWOP. These revisions provide clarity and consistency with current BSEE practices and expectations of the DWOP approval process.

What information must I submit with the DWOP? (§ 250.236)

Summary of Proposed Rule Revisions

This proposed section is organizational in nature and would identify the types of information that the operator must submit with the DWOP by adding a table that lists the applicable sections and the information to be included. In this section, BSEE would reorganize and breakout the DWOP requirements by topic, as reflected in paragraphs (a) through (f).

These revisions would improve clarity for applicable information requirements.

Summary of Final Rule Revisions

BSEE did not receive any comments on these provisions of the proposed rule and includes the proposed language in the final rule without change.

What general information must my DWOP include? (§ 250.237)

Summary of Proposed Rule Revisions

BSEE proposed to identify the general information that an operator would be required to submit in the DWOP. The content of paragraphs (a) and (b) of this proposed section would be moved from current § 250.292(o) and (q). This section would add paragraph (c) to require the submission of a list of any associated industry standards not incorporated in the regulations that the operator will use for project design or operation.

Summary of Final Rule Revisions

Based on comments received and after review of comments, BSEE is revising paragraph (a) by clarifying that the DWOP must include a list of requests for any alternate procedures or equipment or departure requests in accordance with §§ 250.141 and 250.142, respectively, and a list of any identified alternate procedures or equipment or departures that the operator may request. BSEE is also clarifying that if a Conceptual Plan was previously approved for the project that already included the alternate procedures or equipment or departure requests in accordance with §§ 250.141 and 250.142 for the specific equipment identified in a Conceptual Plan, those do not need to be listed in the DWOP unless the same alternate procedure or equipment request or departure request is needed for a different piece of equipment for post completion activities. These revisions provide clarification of the context and expectations for including requests covered under §§ 250.141 and 250.142 in the DWOP.

Summary of comments: Multiple commenters expressed concerns with submittal of duplicative information regarding the applicable alternate procedures or equipment and departure requests already identified in approved associated Conceptual Plans.

Response: BSEE agrees with the commenters and has revised this section to clarify the required submittal of alternate procedures or equipment and departure requests. BSEE has also clarified that those requests approved in the associated Conceptual Plans do not

need to be submitted in the DWOP unless the same alternate procedure or equipment or departure requests are needed for a different piece of equipment for post-completion activities. BSEE does not expect operators to submit information of which they are unaware. However, if an operator is aware that it is reasonably likely to submit such information or departure request in the future, it is beneficial to include it in the DWOP at this stage to help streamline DWOP approval.

What well or completions information must my DWOP include? (§ 250.238)

Summary of Proposed Rule Revisions

BSEE proposed to move the content from current § 250.292 and include a revision to paragraph (c) to clarify that this section requires information in the operator's DWOP about the design and fabrication of each wellbore riser system deployed from a floating production facility or TLP. This revision would clarify that these informational requirements apply to wellbore risers as components of the well and resolve confusion regarding the general term "riser" and its applicability of multiple types of risers (e.g., pipeline risers and wellbore risers) used on the OCS.

Summary of Final Rule Revisions

BSEE did receive a comment on these provisions of the proposed rule but is including the proposed language in the final rule without change.

Summary of comments: A commenter expressed concerns that the information requested in paragraphs (a) and (b) are duplicative and unclear.

Response: BSEE disagrees with the commenter. These are longstanding requirements and have been successfully used in each applicable DWOP. Paragraph (a) is typically a summary narrative with a graphical representation of the wellbore that identifies casing and completion components, among other characteristics. Paragraph (b) provides further detail on the systems used for drilling and completion that result in the final schematic configuration. These requirements are not duplicative and have been used in existing regulations to allow for variations in well proposals and information requests. The information identified in these paragraphs is essential to ensure consistency with the activities to be addressed in the associated well permits.

What structural information must my DWOP include? (§ 250.239)

Summary of Proposed Rule Revisions

BSEE proposed to move the content from current § 250.292 to this section and would include a revision to paragraph (b) to clarify that the design, fabrication, installation, and monitoring information would be required for the tendon or mooring systems, including the turret or buoy system, as applicable. This revision would reflect current equipment and operations common to DWOP approvals.

Summary of Final Rule Revisions

BSEE did not receive any comments on the content of the proposed provisions; however, BSEE moved the phrase "including any major modifications," to the end of the introductory paragraph to clarify the intent of the paragraph.

What Production Safety System information must my DWOP include? (§ 250.240)

Summary of Proposed Rule Revisions

BSEE proposed in this section to identify the production safety system information that an operator would be required to submit in the DWOP, as applicable, to align with the activities the operator plans to address in the associated production safety systems application. The content of paragraphs (a), (b), (c), (d), and (e)(3) of this proposed section would be moved from current § 250.292. The additions to this proposed section would require submission of the following information:

- In paragraph (e)(1)—Methods, frequency, and acceptance criteria for testing the underwater safety valves (USVs), surface controlled subsurface safety valves (SCSSVs), and boarding shutdown valves;
- In paragraph (e)(2)—The function and testing of the host facility emergency shutdown device (ESD) system and its interface to the subsea system; and
- In paragraph (f)—Information on the design, operation, maintenance, personnel competency, and testing of the subsea leak detection system to protect the subsea field/infrastructure (e.g., trees, manifolds, jumpers). BSEE proposed that operators must include procedures for how to operate the system, ensure system functionality, identify a leak, and take action when a leak is identified.

Summary of Final Rule Revisions

Based on comments received and after review of comments, BSEE is removing

the statement "including a table summarizing the curtailment of production and offloading based on operational considerations" from paragraph (a) and moving it to paragraph (b). This revision is necessary because those operations are covered under paragraph (b). BSEE is also revising paragraph (e) to remove the term "certification" to be consistent with other required statements and the use of certifications.

Summary of comments: A commenter expressed concerns that the information in paragraph (a) regarding the table summarizing the curtailment of production and offloading is unclear and may not be applicable.

Response: BSEE agrees with the commenter and is removing the statement "including a table summarizing the curtailment of production and offloading based on operational considerations" from paragraph (a) and moving it to paragraph (b). This information is more applicable to the contents of paragraph (b).

Summary of comments: Multiple commenters expressed concerns with the use of a certification statement for compliance with Subpart H.

Response: BSEE agrees with the commenters and has removed the term "certification" from paragraph (e). BSEE will still require a statement that the production safety systems will comply with Subpart H. Subpart H contains the requirements for production safety systems and a certification is not necessary at this stage. BSEE wants to ensure that the safety system requirements are considered at this stage of the DWOP process.

Summary of comments: A commenter requested that BSEE clarify if a description of the leak detection system or the actual procedures are required.

Response: BSEE disagrees with the commenter that the language is unclear. The regulations in § 250.240(f) require the submittal of information concerning both the leak detection system itself and procedures for how to operate the system, ensure system functionality, identify a leak, and the actions to take when a leak is identified.

What subsea systems and pipeline information must my DWOP include? (§ 250.241)

Summary of Proposed Rule Revisions

BSEE proposed to identify the subsea systems and associated pipeline systems information that must be included in a DWOP. The content of paragraphs (c)(2)(i), (ii), and (iii) of this proposed section would be moved from current

§ 250.292. Proposed paragraph (a) would require the operator to identify the information common to the subsea system and the associated pipeline system, which constitute all or part of a single project development covered by the DWOP and is consistent with activities addressed in an associated pipeline application, and would require the submission of the following:

- A subsea field schematic depicting the planned subsea development equipment and infrastructure, including wells/trees, non-pipe subsea equipment, pipeline route(s), pipeline riser systems, umbilical(s), and platform footprint;
- A description of the subsea development project detailing the subsea and pipeline equipment design criteria and analysis procedures (including industry standards, pressure and temperature ratings, materials selection), testing methods, and general operational procedures;
- A description of the fabrication and assembly/testing location of subsea trees, pipelines, and non-pipe subsea equipment (manifold, pipeline end manifold, pipeline end termination assembly, subsea pumps, suction piles, etc.);
- A summary of the subsea tieback development technologies' Integrity Management Program, including a plan for inspection and monitoring to support assessment of system condition. This should include, but not be limited to, the in-service inspections or surveys of hull and topsides structures, tendons, moorings, and pipelines and/or wellbore riser systems to assess and analyze component condition after each significant environmental event (e.g., hurricane, earthquake, loop and eddy currents, or mudslide) impacting the system, or once every 10 years, whichever occurs first; and
- A summary of safety and environmental controls.

Proposed paragraph (b) would require submission of the following information about subsea systems that constitute all or part of a single project development covered by the DWOP, as applicable:

- System control type (i.e., direct hydraulic or electro-hydraulic);
- Well tree(s), wellhead, and non-pipe equipment general arrangement drawings and schematics, with size and valve type annotations to illustrate the tree and other equipment in operation;
- Estimated shut-in tubing pressure for the proposed well(s), including the calculations used to arrive at the

estimate, specifying true vertical depth, reservoir pressure, and the fluid gradient used, or a brief discussion of the pressure volume temperature (PVT) data used for estimation;

- Wellbore static bottomhole temperature and the estimated flowing temperature at the tree, including a description of the method used to calculate this estimate;
- A description of the umbilical(s) and umbilical connection(s), including an umbilical cross-section schematic;
- A description of the chemical or other injection systems and/or enhanced recovery systems the operator plans to use;
- A description of the corrosion monitoring and prevention/inhibition processes;
- Details of any re-furbished and/or re-certified equipment that would be used; and
- A schedule of development activities, including well completion, facility installation, and anticipated date of first oil.

Proposed paragraph (c) would require an operator to include pipeline information in its DWOP to align with the activities to be addressed in the associated pipeline application(s), including:

- Design and fabrication information for each pipeline riser system;
- For projects that will use a pipeline free standing hybrid riser (FSHR) on a permanent installation that uses a buoyancy air can suspended from the top of the riser, the operator would be required to provide the following information in its DWOP as part of the discussion required by paragraph (b)(1) and (2) of § 250.241: a detailed description and drawings of the FSHR, buoy, and the associated connection system; detailed information regarding the system used to connect the FSHR to the buoyancy air can, and associated redundancies; and descriptions of the monitoring system and monitoring plan for the pipeline FSHR and the associated connection system for fatigue, stress, and any other abnormal condition (e.g., corrosion) that may negatively impact the riser system's integrity; and
- Pipeline and pipeline riser installation methods.

Submission of this information is consistent with what BSEE currently requires in the DWOP (and has historically required). The proposed requirements would clarify general language in the existing regulation by adding specificity regarding scope.

Summary of Final Rule Revisions

Based on comments received and after review of comments, BSEE is revising paragraph (a)(4) to clarify that the operator must also include in the integrity management plan a description of how it will determine when a significant environmental event has occurred and how it will respond to such an event. This revision would help identify and properly account for integrity management through significant environmental events. BSEE is also revising paragraph (c)(1) to only require "general" design and fabrication information for pipelines. This revision addresses a situation where some of the specific design and fabrication information may not be available at this stage. For the purposes of the DWOP, the general design and fabrication information is sufficient.

Summary of comments: Multiple commenters expressed concerns that certain information requested in this section is duplicative with information covered under Conceptual Plans or the associated permits or applications.

Response: BSEE disagrees with this comment. This section covers the DWOP submittal, which presents information from a whole project perspective. Conversely, Conceptual Plans focus on an individual component or assembly.

Summary of comments: A commenter recommended that BSEE require that operators' integrity management plans state their process for determining significant environmental events.

Response: BSEE agrees with the commenter and has revised paragraph (a)(4) to require the operator to also provide a description in the integrity management plan of how it will determine that significant environmental events have occurred, and how it will respond to such an event. This revision clarifies the scope of the integrity management plan. It is BSEE's intent to ensure that operators discuss, plan for, and address the impacts of the significant environmental events.

Summary of comments: A commenter asked for clarification as to the source of the 10-year assessment.

Response: Based on BSEE experience with assessing facilities or equipment through their entire lifecycle, the assessment cycle of 10 years in paragraph (a)(4) of this section is an incremental approach to platform service life extension and monitoring. Often, operators ask for infinite or significant years of increased life. BSEE's approach has been to approve fewer years—either 5 or 10—and revisit

the calculations and inspection data later to ensure there are no significant changes. BSEE will remain consistent with that approach and utilize the identified assessment cycle. As BSEE gains more experience with the assessments, BSEE will evaluate the efficiency of the assessment cycle and may revise it as appropriate.

Summary of comments: A commenter asked if the NTLs help define the affected area for inspections and assessments after a significant environmental event.

Response: BSEE will continue to use the guidance of an NTL to help identify the affected area of the significant environmental event (e.g., see NTL No. 2021–G02). This information is very useful to focus the inspections and assessments to those areas potentially impacted by the significant environmental events.

Summary of comments: A commenter expressed concerns that it is not practical to directly monitor stress and fatigue in all components. The commenter also stated that the assessment for stress should be determined based on observed responses and analytical assessment.

Response: BSEE disagrees with the commenter's concerns and is not revising this section based on this comment. It is BSEE's expectations that the operator must identify how it will monitor the FSHR and associated connection system. BSEE does not want to limit how an operator conducts the appropriate monitoring to ensure riser system integrity.

What new or unusual technology information must my DWOP include? (§ 250.242)

Summary of Proposed Rule Revisions

BSEE proposed in this section to identify the new or unusual technology information that must be included in the DWOP, including the information referenced in the applicable Conceptual Plan. Proposed paragraph (a) would require the submission of a description of any new or unusual technology being used in a development project, including a reference to previously approved New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Conceptual Plans.

Proposed paragraph (b) would require submission of a description of any new or unusual technology not covered under the New or Unusual Technology Conceptual Plan or New or Unusual Technology Barrier Conceptual Plan. It would also require an operator to include the same applicable information as required in §§ 250.228 or 250.229.

Summary of Final Rule Revisions

BSEE did not receive any comments on the substance of the provision of this section and is finalizing the proposed revisions with administrative changes to reflect the revisions to the name of the New or Unusual Technology Barrier Equipment Conceptual Plan, as discussed previously in this preamble.

Summary of comments: A commenter asked what service fee would be required if an operator needed to submit the description of any new or unusual technology not previously approved in the applicable Conceptual Plan.

Response: BSEE will require the service fees listed in § 250.125 for the plans required under the DWOP Process for the specific project proposed.

BSEE proposed to reserve §§ 250.243–250.244, and these sections are reserved in this regulation.

May I combine the Project Conceptual Plan and the DWOP? (§ 250.245)

Summary of Proposed Rule Revisions

BSEE proposed to move to this section the content from current § 250.294, which addresses when an operator may submit a combined Conceptual Plan and DWOP, and proposed to include the following revisions:

The introductory paragraph would be revised to clarify that, if the operator's development project meets the criteria in proposed paragraphs (a) and (b) of this section, an operator may submit a combined Conceptual Plan and DWOP that complies with all applicable requirements for both, on or before the deadline for submitting the Conceptual Plan, as described in proposed § 250.226. Existing paragraph (a), which allows the operator to submit a combined Conceptual Plan and DWOP if the project is located in water depths of less than 400 meters (1,312 feet), would be removed.

Existing paragraph (a) would be replaced with existing paragraph (b), which allows a combined plan if the project is similar to projects involving subsea tieback development technology for which the operator has obtained approval previously. BSEE proposed to add a new paragraph (b) to allow for the submission of a combined Conceptual Plan and DWOP if the project does not involve either new or unusual technology or a new platform. As previously stated at the beginning of the paragraph, the operator must meet the criteria in paragraph (a) and (b) of proposed § 250.245 in order to be able to submit a combined Conceptual Plan and DWOP.

These revisions would provide clarity for operators to streamline the process, when appropriate, and would reflect conforming edits for new or unusual technology. These revisions would reflect current BSEE acceptance of combined submission of the Conceptual Plan and DWOP in certain situations.

Summary of Final Rule Revisions

BSEE received a comment on these provisions and is making a revision based on that comment. BSEE is changing the heading to read: “May I combine the Project Conceptual Plan and the DWOP?” and is revising the introductory paragraph accordingly. BSEE is clarifying that that the “Project” Conceptual Plan can be combined with the DWOP.

Summary of comments: A commenter suggested that BSEE add the term “project” to the reference to the Conceptual Plans.

Response: BSEE is revising this section to clarify that a Project Conceptual Plan may be combined with the DWOP if the project meets the required criteria. This revision is consistent with paragraph (b) that prohibits the combination of a Conceptual Plan and DWOP if the project involves new or unusual technology.

When must I revise my DWOP? (§ 250.246)

Summary of Proposed Rule Revisions

BSEE proposed to move to this section the content from current § 250.295 and to clarify when revision to an approved Conceptual Plan or DWOP is necessary. Revision is necessary when there are changes in the development project that alter the proposed plan or procedures, but that do not involve a physical alteration of the equipment on the platform or the seabed. As explained below, a supplement is required when changes involve a physical alteration of the equipment on the platform or the seabed. This section and the following section are intended to reduce confusion by helping operators determine when a revision or a supplement to the applicable Conceptual Plan or DWOP is necessary.

Summary of Final Rule Revisions

Based on comments received and review of the comments, BSEE is revising this section to clarify when a revision to a DWOP is necessary. BSEE removed the reference to revising the Conceptual Plan as it is not applicable to this section and clarified that revisions are necessary only to the

approved DWOP to reflect any material change to the plan.

Summary of comments: A commenter expressed concerns that requiring a revision to the plan for “any changes” is too broad and burdensome.

Response: BSEE disagrees with the commenter and wants to ensure the information contained in the DWOP is accurate and consistent with the applicable approved permit or application. BSEE has clarified the difference between a revision and supplement and has revised the service fees to adequately reflect the appropriate level of actions necessary to complete the revision or supplement. However, BSEE also clarified that any material change to the plan would require a revision. This clarification is consistent with the language of the previous regulations (see previous § 250.295).

Summary of comments: A commenter expressed concerns that revisions to the Conceptual Plans are not applicable to this section and should be removed.

Response: BSEE agrees with the commenter and is removing the reference to Conceptual Plan revisions. Revisions to the Conceptual Plans are outside the scope of this section and it is unnecessary to include them in this section.

When must I supplement my DWOP? (§ 250.247)

Summary of Proposed Rule Revisions

BSEE proposed in this section to identify when an operator must supplement the approved DWOP to reflect additions or changes in the development project.

Proposed paragraph (a) would require the operator to submit a supplement to the DWOP to reflect any additions or changes in the development project that physically alter the platform, process facilities, equipment, or systems approved in the original Conceptual Plan or DWOP. If a Supplemental DWOP proposes the addition of any wells (e.g., a new subsea field) not approved in the original DWOP, the operator may not complete or produce from the new well(s) until BSEE approves the Supplemental DWOP.

Proposed paragraph (b) would require a supplement to the DWOP for additions or changes that involve the addition of any new or unusual technology to the project that was not previously approved under the New or Unusual Technology Conceptual Plan, New or Unusual Technology Barrier Conceptual Plan, or DWOP. This proposed paragraph would also clarify that the operator may not install any new or

unusual technology until BSEE approves the Supplemental DWOP.

This section would be added to clarify when operators must submit supplemental DWOPs. This section and the section above are intended to reduce confusion by helping operators determine when a revision or a supplement to the DWOP is necessary.

Summary of Final Rule Revisions

Based on comments received and review of the comments, BSEE is revising paragraph (a) by removing the references to “platform” and “process facilities” from the list of items that, if physically altered, would require a supplement to the DWOP and then clarifying that it applies to equipment or systems upstream of the boarding shutdown valve approved in the DWOP. BSEE is also removing the reference of supplementing the DWOP based on the equipment and systems approved in the original Conceptual Plan as it is not applicable to this section.

BSEE is also revising paragraph (b) to clarify that under the situation where there is an addition of new or unusual technology not previously covered under an applicable Conceptual Plan or DWOP, an operator may not install any new or unusual technology until BSEE approves the applicable Conceptual Plan and supplemental DWOP. This revision is necessary to ensure the new or unusual technology follows the appropriate process including the applicable Conceptual Plan approval.

Summary of comments: Multiple commenters expressed concerns that the language describing a supplement to the DWOP is too broad and needs clarification concerning when a supplement is required.

Response: BSEE agrees in part with the commenters and is revising this section to clarify when a supplement to the DWOP is required by removing the references to “platform” and “process facility” and clarifying that a supplement requirement applies only when there is a physical change to the equipment or systems upstream of the boarding shutdown valve. This clarification establishes when a supplemental DWOP is necessary based on the scope of the equipment listed. For example, BSEE would not expect a supplement of your DWOP for changing decking on a platform.

What information must I include in my Supplemental DWOP? (§ 250.248)

Summary of Proposed Rule Revisions

BSEE proposed to describe the information that must be included in the supplement to the DWOP referenced in proposed § 250.247.

Proposed paragraph (a) would require the same information for the wells or equipment as required in the applicable Conceptual Plan and DWOP requirements in Subpart B. This addition would ensure consistency between the initial and supplemental submissions.

Proposed paragraph (b) would describe information for each applicable Conceptual Plan or DWOP section that is being impacted by the addition or change.

Proposed paragraph (c) would require documents demonstrating payment of the new service fee for BSEE’s review and processing of a supplemental DWOP, as listed in the proposed revisions to § 250.125.

Summary of Final Rule Revisions

BSEE did not receive any comments on the content of this section and is finalizing the provision as proposed.

Subpart D—Oil and Gas Drilling Operations

Hydrogen sulfide (§ 250.490)

Summary of Proposed Rule Revisions

BSEE proposed to revise paragraph (p) of this section, which addresses metallurgical properties of equipment used in an H₂S environment. BSEE proposed revising the paragraph to state that if operating in a zone with H₂S present or when the concentration of H₂S in the produced fluid may exceed 0.05 pounds per square inch (psi) partial pressure of H₂S, the operator must use equipment that is constructed of materials with metallurgical properties that resist or prevent sulfide stress cracking (also known as hydrogen embrittlement, stress corrosion cracking, or H₂S embrittlement), chloride-stress cracking, hydrogen-induced cracking, and other failure modes.

BSEE also proposed to revise this section to be consistent with the requirements of NACE Standard MR0175–2003, “*Standard Material Requirements, Metals for Sulfide Stress Cracking and Stress Corrosion Cracking Resistance in Sour Oilfield Environments*,” Revised January 17, 2003, incorporated by reference at existing §§ 250.490 and 250.901 and NTL 2009–G31. Section 250.490 paragraph (p) currently requires that the tubing and casing be designed for NACE requirements, but incorrectly refers only to “H₂S present” as the concentration necessary to trigger this requirement. “H₂S present” is defined in existing § 250.490 paragraph (b) as “could potentially result in atmospheric concentration of 20 ppm or more of H₂S.” BSEE proposed language to clarify

that in either “H₂S present” conditions or when H₂S concentrations in the produced fluid exceed 0.05 psi partial pressure of H₂S, the operator must use equipment that is constructed of materials with certain metallurgical properties, in accordance with NACE Standard MR0175–2003.

Summary of Final Rule Revisions

BSEE is including the proposed language in the final rule without change.

Summary of comments: A commenter recommended that BSEE reference NACE MR0175 in the introductory text to paragraph (p).

Response: BSEE is not including the reference to NACE MR0175 in the introductory text to this paragraph in the final rule because it is currently referenced in existing paragraph (p)(2). BSEE already requires BOP system components, wellhead, pressure-control equipment, and related equipment exposed to H₂S-bearing fluids to be in conformance with NACE Standard MR0175. BSEE also requires conformance with NACE MR0175 in other subparts of the BSEE regulations as it pertains to other equipment (e.g., see §§ 250.518(a)(2) and 250.619(a)(2) for tubing requirements).

Subpart E—Oil and Gas Well-Completion Operations

Tubing and wellhead equipment (§ 250.518)

Summary of Proposed Rule Revisions

BSEE proposed to revise paragraph (a) of § 250.518 to include the following:

- The tubing string must be evaluated for burst, collapse, and axial loads with appropriate safety and design factors for the pressure and temperature environments of the completion, production, shut-in, and injection load cases;
- The tubing string materials must be appropriate for the environment. The operator must follow NACE Standard MR0175–2003 (as incorporated by reference in § 250.198) when H₂S concentration may equal or exceed 0.05 psi partial pressure; and
- The tubing string threaded connectors must be appropriate for the loads identified in proposed paragraph (a)(1).

These revisions would reflect essential well design elements addressed in industry standards. Current regulations discuss well design specific to casing, but little is provided for tubing design, which is equally critical for well integrity. Regulations currently establish H₂S concentrations

that constitute a specific threat to personnel and establish concentrations that trigger enactment of H₂S protocols. Additional requirements added to this section would address H₂S impacts to equipment integrity, as these components must function as barriers to personnel and the environment. Section 250.490 paragraph (p) currently requires that the tubing and casing be designed for NACE requirements, but incorrectly refers only to “H₂S present” as the concentration necessary to trigger this requirement. “H₂S present” is defined in existing § 250.490 paragraph (b) as “could potentially result in atmospheric concentration of 20 ppm or more of H₂S.” BSEE proposed to clarify that, in either “H₂S present” conditions or when H₂S concentrations in the produced fluid exceed 0.05 psi partial pressure of H₂S, the operator must use equipment that is constructed of materials with certain metallurgical properties, in accordance with NACE Standard MR0175–2003.

BSEE also proposed to revise paragraph (c) of this section to include the design and testing of the wellhead, tree, and related equipment in accordance with ANSI/API Spec. 6A (as incorporated by reference in § 250.198) or ANSI/API Spec. 17D (as incorporated by reference in § 250.198), as applicable. The proposed rule would also add paragraphs (c)(1), (2), and (3) to clarify that:

- Newly completed dry trees (e.g., fixed, hybrid, or mudline suspension) for production or injection wells must be equipped with a minimum of one master valve and one surface safety valve (SSV), installed above the master valve, in the vertical run of the tree;
- Newly completed subsea production or injection wells must be equipped with a minimum of one USV installed in the horizontal or vertical run of the tree (e.g., vertical or horizontal subsea trees); and
- Newly completed wells with a mudline suspension conversion to a subsea tree must have a minimum of two casing strings tied back and sealed below the tubing head. At a minimum, the production casing and the next outer casing must be tied back to the wellhead to ensure annular isolation.

BSEE proposed adding paragraph (c)(3) because ANSI/API Spec. 17D does not address mudline suspension conversion to a subsea tree with more than one casing tieback. The proposed revisions would also codify similar language from NTL 2006 G–20, which would establish a requirement for a

minimum of two casing strings tied back and sealed below the tubing head for a mudline suspension conversion to a subsea tree.

BSEE proposed revising paragraph (d) to clarify that both the subsurface safety equipment and surface safety equipment must comply with applicable requirements of Subpart H.

Summary of Final Rule Revisions

BSEE received a comment on this section, but is not making any revisions based on that comment. BSEE is finalizing the proposed content with a clarification in paragraph (a)(1) that the tubing string must be evaluated with appropriate safety factors and material design factors. This revision clarifies this regulation with the correct usage of terms for engineering analysis.

Summary of comments: A commenter expressed concerns that certain content in this section is redundant of the requirements of Subpart D and should be removed.

Response: BSEE disagrees with the commenter and is not removing the content. Finalizing the regulation based on the proposed language helps ensure consistency among the different subparts and considerations for operations when H₂S is present.

Subpart F—Oil and Gas Well-Workover Operations

Tubing and wellhead equipment (§ 250.619)

Summary of Proposed Rule Revisions

BSEE proposed to revise paragraph (a) of § 250.619 to include the following:

- The tubing string must be evaluated for burst, collapse, and axial loads with appropriate safety and design factors for the pressure and temperature environments of the completion, production, shut-in, and injection load cases;
- The tubing string materials must be appropriate for the environment. The operator must follow NACE Standard MR0175–2003 (as incorporated by reference in § 250.198) when H₂S concentration may equal or exceed 0.05 psi partial pressure; and
- The tubing string threaded connectors must be appropriate for the loads identified in proposed paragraph (a)(1).

Additional requirements BSEE proposed to add to this section address H₂S impacts to equipment integrity, as these components must function as barriers to personnel and the environment. BSEE proposed to clarify that in either “H₂S present” conditions or when H₂S concentrations in the

produced fluid exceed 0.05 psi partial pressure of H₂S, the operator must use equipment that is constructed of materials with certain metallurgical properties, in accordance with NACE Standard MR0175–2003.

BSEE also proposed to revise paragraph (c) to include the design and testing of the wellhead, tree, and related equipment in accordance with ANSI/API Spec. 6A (as incorporated by reference in § 250.198) or ANSI/API Spec. 17D (as incorporated by reference in § 250.198), as applicable. This section would also add paragraphs (c)(1), (2), and (3) to clarify that:

- Newly completed dry trees (*e.g.*, fixed, hybrid, or mudline suspension) for production or injection wells must be equipped with a minimum of one master valve and one SSV, installed above the master valve, in the vertical run of the tree;
- Newly completed subsea production or injection wells must be equipped with a minimum of one USV installed in the horizontal or vertical run of the tree (for vertical or horizontal subsea trees); and
- Newly completed wells with a mudline suspension conversion to a subsea tree must have a minimum of two casing strings tied back and sealed below the tubing head. At a minimum, the production casing and the next outer casing must be tied back to the wellhead, to ensure annular isolation.

BSEE proposed to revise paragraph (d) to clarify that surface safety equipment must be installed, maintained, and tested in accordance with applicable sections of Subpart H, in addition to the subsurface safety equipment.

Summary of Final Rule Revisions

BSEE did not receive any comments on this section and is finalizing the proposed content with the same clarification identified in § 250.518 in paragraph (a)(1) that the tubing string must be evaluated with appropriate safety factors and material design factors. This revision clarifies this regulation with the correct usage of terms for engineering analysis and is consistent with similar requirements in § 250.518.

Subpart G—Well Operations and Equipment

What information must I submit for BOP systems and system components? (§ 250.731)

Summary of Proposed Rule Revisions

BSEE proposed to revise existing paragraph (c)(4) of § 250.731 to update a cross-reference to the definition of

HPHT in accordance with proposed § 250.105.

Summary of Final Rule Revisions

BSEE did not receive any comments on this provision of the proposed rule and is including the proposed language in the final rule without change.

What are the independent third party requirements for BOP systems and system components? (§ 250.732)

Summary of Proposed Rule Revisions

BSEE proposed to revise existing paragraph (c) of § 250.732 to reflect the addition of the new or unusual technology and new or unusual technology barrier requirements in Subpart B. BSEE proposed to delete the independent third-party requirements under existing paragraph (c) because that information would be covered under the new DWOP process requirements. These proposed revisions would connect the HPHT permitting (*e.g.*, APD) requirements and the DWOP process requirements and would improve BSEE's review and decision process. BSEE proposed these revisions to help ensure that the specified equipment is fit for service in the environmental conditions reasonably expected at the operation's site.

BSEE also proposed to remove duplicative requirements now covered under the DWOP new or unusual technology barrier requirements and would provide greater detail considering that the Conceptual Plan review occurs before use of HPHT equipment and would occur before application review. BSEE proposed to consolidate the language and refer to the applicable new or unusual technology barrier requirements and would specify that BSEE would require Conceptual Plan and appropriate permit approval before equipment installation. This addition would provide clarification to operators unfamiliar with the applicable DWOP requirements.

Summary of Final Rule Revisions

Based on comments received and review of the comments, BSEE is revising paragraphs (c)(4) and (c)(5) to remove the term “certification” to be consistent with other required statements and the use of certifications. BSEE is also revising paragraph (c) to clarify that the operator may not deploy the proposed BOP system and related equipment that will or may be exposed to an HPHT environment until BSEE approves the appropriate Conceptual Plan and permits (*e.g.*, APD and APM). This clarification helps ensure the correct use of terminology and

description of equipment or systems. For example, BSEE does not have a definition of “HPHT BOP system,” so that term was removed.

BSEE also fixed incorrect cross references throughout this section based on the updates to Subpart B.

Summary of comments: Multiple commenters expressed concerns with the use of the term “related equipment” as it relates to BOP systems and asserted that this section is limited to BOP equipment.

Response: BSEE disagrees with the commenters, as “BOP systems and related equipment” has been defined in § 250.105, and BSEE is not making changes to this section based on this comment. BSEE defines “BOP systems and related equipment” to be all pressure controlling and pressure containing well control equipment that may or will be exposed to the well's MASP during drilling, completion, workover, intervention, or abandonment. Well control equipment includes equipment that is installed for the purpose of pressure control and pressure containment when it becomes necessary to physically enter a well bore during drilling, completion, workover, intervention, or abandonment modes of operation. This definition makes it clear what is included in “BOP systems and related equipment.”

Summary of comments: A commenter expressed concerns that it is unclear how MASP is determined for all the stated operations and requested BSEE clarify how to determine MASP.

Response: BSEE disagrees with the commenter and is not making changes to this section based on this comment. Information regarding how to determine MASP is already identified in multiple BSEE regulations (*e.g.*, see § 250.730).

Summary of comments: Multiple commenters expressed concerns with the use of a certification statement for compliance with Subpart H.

Response: BSEE agrees with the commenters and has removed the term “certification” from paragraph (c). BSEE will still require a statement in accordance with §§ 250.230 and 250.232. BSEE wants to ensure consistency with the use of I3P statements.

Summary of comments: A commenter requested clarification about when the Conceptual Plans are required for HPHT operations discussed in this section.

Response: BSEE has determined that no clarification is needed in this section. As stated in this section, the operator cannot deploy the proposed HPHT BOP system and related equipment until BSEE approves the New or Unusual Technology Barrier

Equipment Conceptual Plan and appropriate permit. Also, BSEE requires certain actions listed in paragraph (c) before beginning any operation in an HPHT environment. If the operations are not in an HPHT environment as defined by BSEE, then paragraph (c) is not applicable. This section is only applicable to operations in an HPHT environment and all non-HPHT new or unusual technology will need to follow the New or Unusual Technology Barrier Equipment Conceptual Plan process in Subpart B.

Subpart H—Oil and Gas Production Safety Systems

Additional Requirements for Subsurface Safety Valves (SSSVs) and Related Equipment Installed in High Pressure High Temperature (HPHT) Environments (§ 250.804)

Summary of Proposed Rule Revisions

BSEE proposed to remove and reserve this section. The existing requirements from this section would be addressed under proposed §§ 250.105 and 250.204.

Summary of Final Rule Revisions

BSEE did not receive any comments on this proposed section and is finalizing the proposed removal and reservation of this section without change.

IV. Derivation Table

The following table is intended to provide information about the derivation of the requirements in Subpart B. This table provides guidance on the following:

- The destination of various existing requirements.
- The organization and content of the proposed revisions.

This table does not provide definitive or exhaustive guidance and should be used in conjunction with the section-by-section discussion and regulatory text of this proposed rule.

The proposed rule would make changes as outlined in the following table:

Current regulations section	Final rule section	Nature of change
Subpart A: 250.804	250.105	Moves the definition of HPHT to make it applicable to all operations, not just production.
Subpart B: 250.200	250.200	Adds definitions for “barrier categorization,” “primary barriers,” “secondary barriers,” and “new or unusual technology”.
250.201	250.201	Adds information about the three new Conceptual Plans and when submittal of each plan is required.
250.204	250.202	Moved without revision.
250.205	250.203	Moved without revision.
New	250.204	Clarifies what information must be submitted to BSEE if an operator plans to install HPHT barrier equipment.
New	250.206	Codifies some of the barrier concepts from existing BSEE guidance.
New	250.207	Requires the installation and maintenance of a primary and secondary barrier system to contain the source.
550.280	250.208	Includes similar content with minor formatting changes to reflect BSEE applicability.
550.281(a) and (b)	250.209	Includes similar content with minor formatting changes to reflect BSEE applicability.
250.282	250.210	Includes similar content with minor formatting changes to reflect BSEE applicability.
New	250.211	Clarifies the new or unusual technology failure reporting requirements.
250.286	250.220	Clarifies the addition of new or unusual technology, and the operations that could be covered under the DWOP Process.
250.287	250.221	Includes similar content and clarify when the DWOP Process is applicable.
New	250.225	Identifies the 3 new Conceptual Plans.
250.288 and 250.290	250.226	Includes similar content and clarify when to submit the applicable Conceptual Plans.
250.289	250.227	Includes content from existing paragraphs (a), (b), (c), (i)(1), and specify the content of the Project Conceptual Plan.
New	250.228	Specifies the content of the New or Unusual Technology Conceptual Plan.
New	250.229	Specifies the content of the New or Unusual Technology Barrier Equipment Conceptual Plan.
New	250.230	Specifies the submittal timing for I3P Reports.
New	250.231	Specifies the I3P nomination requirements.
New	250.232	Specifies the I3P requirements for applicable Conceptual Plan review.
New	250.233	Clarifies the I3P Report expectations.
250.291	250.235	Includes similar content and clarify DWOP submittals to reflect new or unusual technology additions.
New	250.236	Adds a table listing the applicable sections with corresponding information for the DWOP content.
250.292	250.237	Includes content from existing paragraphs (a), (b) and clarify the general DWOP requirements.
250.292	250.238	Includes content from existing paragraphs (a), (b), (c) and clarify the completions information DWOP requirements.
250.292	250.239	Includes content from existing paragraphs (a), (b), (c) and clarify the structural information DWOP requirements.
250.292	250.240	Includes content from existing paragraphs (a), (b), (c), (d), (e)(3) and clarify the production safety system information DWOP requirements.
250.292	250.241	Includes content from existing paragraphs (c)(2)(i), (ii), (iii) and clarify the subsea systems and pipeline information DWOP requirements.
New	250.242	Clarifies the new or unusual technology information DWOP requirements.

Current regulations section	Final rule section	Nature of change
250.294	250.245	Includes similar content and clarify when an operator can combine the Project Conceptual Plan and the DWOP.
250.295	250.246	Includes similar content and clarify when a revised DWOP is necessary.
New	250.247	Clarifies when a supplemental DWOP is necessary.
New	250.248	Clarifies the content of a supplemental DWOP.

V. Procedural Matters

Regulatory Planning and Review (Executive Orders (E.O.) 12866, 14094, and 13563).

E.O. 12866, *Regulatory Planning and Review*, as amended by E.O. 14094, provides that OMB's Office of Information and Regulatory Affairs (OIRA) will review all significant regulatory actions. A significant regulatory action is one that is likely to result in a rule that:

- Has an annual effect on the economy of \$200 million or more (adjusted every 3 years by the Administrator of OIRA for changes in gross domestic product); or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, territorial, or tribal governments or communities;
- Creates a serious inconsistency or otherwise interferes with an action taken or planned by another agency;
- Materially alters the budgetary impacts of entitlement grants, user fees, loan programs or the rights and obligations of recipients thereof; or
- Raises legal or policy issues for which centralized review would meaningfully further the President's priorities or the principles set forth in E.O. 12866, as specifically authorized in a timely manner by the Administrator of OIRA in each case.

OIRA has determined that this final rule is not significant under E.O. 12866.

In support of that conclusion, BSEE prepared a final Regulatory Impact Analysis (RIA) to assess the anticipated costs and potential benefits of the rulemaking. The RIA estimates that the increase in annualized costs, compared with the baseline in the absence of the proposed rule, is \$6.6 million per year. Over the period 2025–2034, those costs are estimated to have a total present value of \$64.0 million undiscounted, \$57.5 million discounted at 2 percent, and \$59.3 million discounted at 2

percent with a capital displacement adjustment. The RIA for this rulemaking can be found in the docket at <https://www.regulations.gov/> (Docket ID: BSEE–2021–0003).

As required by the Independent Offices Appropriation Act (IOAA), as amended (31 U.S.C. 9701), the rule will establish new fees for BSEE's review and processing of several types of operator submissions and reports. This rule will add service fees for processing a Project Conceptual Plan, New or Unusual Technology Conceptual Plan, New or Unusual Technology Barrier Equipment Conceptual Plan, revised DWOP, Combined Conceptual Plan/DWOP, and Revised or Supplemental DWOP. This rule will also revise the cost recovery fee amount for DWOP review. The final rule will increase, and not adversely affect, the government's receipt of user fees. BSEE's economic analysis projects that, altogether, the fees anticipated to be collected under the proposal over a 10-year period (2025–2034) would exceed the baseline fees collected by approximately \$1.6 million (undiscounted).

The rulemaking will improve operational and environmental safety and human health for deepwater development projects and other projects or systems that use new or unusual technology, not only by providing clarity and regulatory certainty regarding the information submission process, but also by ensuring that additional regulatory requirements and that New or Unusual Technology Barrier Equipment Conceptual Plans are reviewed by I3Ps, as well as providing BSEE discretion to require I3P review of New or Unusual Technology Conceptual Plans. BSEE has not monetized or quantified the benefits of the new submission process, the new requirements for new or unusual technology projects, including HPHT projects, and I3P reviews. BSEE believes that by updating references to industry standards and giving greater clarity to requirements for submissions for new or

unusual technology and HPHT projects and plans, the final rule promotes the objectives of E.O. 13563, including a reasoned determination that its benefits justify its costs (recognizing that some benefits and costs are difficult to monetize or quantify).

Executive Order 13563, Improving Regulation and Regulatory Review, reaffirms the principles of E.O. 12866 while calling for improvements in the Nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. E.O. 13563 directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this final rule in a manner consistent with these requirements.

Regulatory Flexibility Act

The *Regulatory Flexibility Act* (RFA), 5 U.S.C. 601–612, requires agencies to analyze the economic impact of regulations when there is likely to be a significant economic impact on a substantial number of small entities and allows an agency to certify a rule, in lieu of preparing an analysis, if the regulation will not have such an economic impact.

BSEE considers a rule to have an impact on a “substantial number of small entities” when the total number of small entities impacted by the rule is equal to or exceeds 10 percent of the relevant universe of small entities in a given industry. The relevant small-size criteria for affected operators and firms likely to help prepare reports are presented in Table 1 below.

TABLE 1—SMALL-ENTITY CRITERIA FOR AFFECTED FIRMS

Industry sector		Small-entity criteria
211120	Crude petroleum extraction	1,250 employees.
211130	Natural gas extraction	1,250 employees.
213111	Drilling oil and gas wells	1,000 employees.
541330	Engineering services (for the I3P or other reports)	\$16.5 million/year revenues.

Using these criteria, BSEE estimates that the final rule will affect about 23 companies over the next 10 years (2025–2034), of which approximately 12 (52 percent) of the potentially impacted businesses are considered small; the rest are considered large businesses. All of the operating businesses meeting the U.S. Small Business Administration classification are potentially impacted; therefore, BSEE expects that the rule will affect a substantial number of small entities.

As noted in the E.O. 12866 discussion, the final rule will result in increased costs to firms from HPHT and new or unusual technology reporting requirements and increased service fees, including mandatory I3P nominations and reports. The increase in cost borne by industry includes cost of submissions, preparation, and cost recovery fees. BSEE has evaluated quantifiable costs and benefits and has estimated that there are quantified costs to industry from the final provisions. BSEE has estimated the annualized

industry costs by business size in Table 2. The percent of the total industry cost impacts to small operators was estimated based on their percentage of overall revenues. These revenues were estimated by applying Census Statistics of U.S. Businesses revenue estimates by employment ranges to each impacted operator. Based on historical information, BSEE estimates that small companies will bear 8 percent of the industry costs from this rule and large companies will bear the remaining 92 percent.

TABLE 2—TOTAL 10-YEAR INDUSTRY COSTS ASSOCIATED WITH FINAL RULE (2025–2034)
[Undiscounted annualized \$]

Company size	Percent of revenues	Industry rulemaking costs
Small Companies	8	\$505,733
Large Companies	92	5,812,764
Total	100	6,318,497

Table 3 presents the average industry cost and revenue per firm and the numbers of firms classified as small or large. This is presented in Table 3, which illustrates that on a per-firm basis the new reporting costs that will be imposed on small firms by the new requirements, at \$42,123 per year, will represent approximately 0.015 percent

of revenue. BSEE uses a threshold of 1 percent of annual revenues to determine the significance of costs on entities; therefore, the new reporting costs are not deemed to be a significant impact. BSEE therefore projects that the final rule is not likely to have a significant economic impact on a substantial number of small entities. Although it is

not likely required because of this projection, BSEE has conducted a regulatory flexibility analysis (RFA), which provides information on the impact of the final rule on small entities. It is contained in the RIA, which can be found in the docket at <https://www.regulations.gov/> (Docket ID: BSEE–2021–0003).

TABLE 3—AVERAGE ANNUAL INDUSTRY COST AND REVENUE PER FIRM
[Undiscounted annualized \$]

Company size	Count	Average annualized industry cost per firm	Average annual revenue per firm	Cost as percent of revenue
Small Companies	12	\$42,123	\$283,524,338	0.015
Large Companies	11	528,456	3,555,005,441	0.015

Unfunded Mandates Reform Act of 1995

This final rule would not impose an unfunded mandate on State, local, or tribal governments or the private sector of more than \$195 million per year. The final rule will not have a significant or unique effect on State, local, or tribal governments or the private sector. A statement containing the information required by Unfunded Mandates Reform

Act (2 U.S.C. 1531 *et seq.*) is not required.

Takings Implication Assessment (E.O. 12630)

Under the criteria in E.O. 12630, this final rule does not have significant takings implications. The rule is not a governmental action capable of interference with constitutionally

protected property rights. A Takings Implication Assessment is not required.

Federalism (E.O. 13132)

Under the criteria in E.O. 13132, this final rule does not have federalism implications. This final rule will not substantially and directly affect the relationship between the Federal and State governments. To the extent that State and local governments have a role

in OCS activities, this final rule will not affect that role. A federalism assessment is not required.

Civil Justice Reform (E.O. 12988)

This final rule complies with the requirements of E.O. 12988. Specifically, this rule:

- (1) Meets the criteria of section 3(a) requiring that all regulations be reviewed to eliminate errors and ambiguity and be written to minimize litigation; and
- (2) Meets the criteria of section 3(b)(2) requiring that all regulations be written in clear language and contain clear legal standards.

Consultation With Indian Tribes (E.O. 13175)

BSEE strives to strengthen its government-to-government relationships with Tribal Nations and Alaska Natives through a commitment to consultation with the Tribes and recognition of their right to self-governance and Tribal sovereignty. BSEE is also respectful of its responsibilities for consultation with Alaska Native Claims Settlement Act (ANCSA) Corporations. In 2022, BSEE notified Tribal Nations and ANCSA Corporations of multiple BSEE rulemakings in development, including this final rule, and invited further government-to-government consultations on any subjects in the regulatory agenda at a Tribe's or ANCSA Corporation's request. BSEE received written comments on the regulatory agenda from the Mashpee Wampanoag Tribe, Native Village of Kotzebue, and Choctaw Nation of Oklahoma, and held a subsequent informational meeting with the Choctaw Nation of Oklahoma. None of the Tribes submitted comments or requested further consultations pertaining to this final rule. Under the criteria in E.O. 13175 and DOI's Policies on Consultation with Indian Tribes and Consultation with Alaska Native Claims Settlement Act Corporations (512 DM 4 and 512 DM 6, respectively), we have evaluated this final rule and determined that it has no substantial direct effects on federally recognized Indian Tribes.

National Technology Transfer and Advancement Act (NTTAA)

BSEE complies with the National Technology Transfer and Advancement Act (NTTAA) (15 U.S.C. 3701 *et seq.*) requirement that an agency "use standards developed or adopted by voluntary consensus standards bodies rather than government-unique standards, except where inconsistent with applicable law or otherwise impractical." (OMB Circular A-119 at p.

13). BSEE also complies with the Office of the Federal Register (OFR) regulations governing incorporation by reference. (See, 1 CFR part 51.) Those regulations also specify the process for updating an incorporated standard at 1 CFR 51.11(a), and BSEE complies with those requirements, including seeking approval by OFR for a change to a standard incorporated by reference in a final rule.

Paperwork Reduction Act (PRA) of 1995

This final rule contains existing and new information collection (IC) requirements for regulations at 30 CFR part 250, subpart B, *Plans and Information*, and submission to the OMB for review under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*) is required. Therefore, BSEE will submit an IC request to OMB for review and approval and request a new OMB control number. Once the 1014-AA49 final rule is effective, we will discontinue the hour burdens and non-hour cost burdens from current 1014-0024 (22,458 hours, \$32,391 non-hour cost burden, expiration December 31, 2024), 30 CFR part 250, subpart B, *Plans and Information*. BSEE will keep the new number associated with this rulemaking. We may not conduct or sponsor, and you are not required to respond to, a collection of information, unless it displays a currently valid OMB control number.

The final regulations will establish new and/or revise current requirements in Subpart B, *Plans and Information*, by revising regulations regarding the Deepwater Operations Plan (DWOP) Process and information submittal and approval process, which includes Conceptual Plans and DWOPs; adding requirements for HPHT barrier equipment and systems and new or unusual technology; and requiring, or providing BSEE with the option to require, independent third-party reviews of Conceptual Plans and DWOPs.

This final rule revises all the proposed service fees listed in § 250.125(a)(2) to reflect the revised processes more accurately, as identified in the other applicable discussions in Section III of this preamble and the estimated BSEE review time for the listed services.

The following provides a breakdown of the paperwork hour burdens and non-hour cost burdens for this final rule. While some sections are being moved from existing Subpart B requirements, it is noted that the burden in proposed § 250.210 (current § 250.282) is covered under BOEM's 1010-0151. Accordingly, new burdens for BSEE are being added.

As discussed in the Section-by-Section analysis above, and in the supporting statement available at [RegInfo.gov](https://www.reginfo.gov), this rule will add/revise:

[New requirements, due to the final rule, are shown in **bold**]

250.210—This section will be revised and moved from existing § 250.282. It will include minor revisions to clarify that the Regional Supervisor may direct operators to conduct monitoring programs in association with their approved EP, DPP, DWOP, or DOCD (+12 burden hours).

250.211—This section is new and will clarify the new or unusual technology failure reporting requirements and will require notification to BSEE within 30 days of the failure and provision of a written report identifying the root causes of the failure (+400 burden hours and \$47,216 in non-hour cost burdens).

250.221(b)—This section will be revised and moved from existing § 250.287. It will clarify that the DWOP process is applicable to any project that will include the use of new or unusual technology (+6 burden hours).

250.226—This section will be revised and moved from existing §§ 250.288 and 250.290. It will add two new Conceptual Plans: New or Unusual Technology Conceptual Plan and New or Unusual Technology Barrier Equipment Conceptual Plan. There are also three new Cost Recovery Fees (§ 250.125—Service Fees) associated with each Conceptual Plan (+39 burden hours and \$297,568 non-hour cost burdens).

250.227—This section will be revised and moved from existing § 250.289. It will list additional information to be submitted with a Project Conceptual Plan and will add new Independent Third Party (I3P) costs for various reviews, certifications, verifications, etc. (+320 burden hours and \$37,776 non-hour costs burden).

250.228—This section is new and will list the various submissions required with a New or Unusual Technology Conceptual Plan and will add new I3P costs for various reviews, certifications, verifications, etc. (+3,600 burden hours and \$676,130 non-hour costs burden).

250.229—This section is new and lists the various submissions required with a New or Unusual Technology Barrier Equipment Conceptual Plan and will add new I3P costs for various reviews, certifications, verifications, etc. (+9,360 burden hours and \$2,955,719 non-hour costs burden).

250.230—This section is new and will require operators submit I3P Reports for any equipment identified in the New or Unusual Technology Barrier Equipment Conceptual Plan and when required by

Regional Supervisor (Fit for service statement) (+25 burden hours).

250.231(a)—This section is new and will outline the requirements for the operator to nominate an I3P to be used in conjunction with applicable Conceptual Plans, including that the I3P must be a technical classification society, a licensed professional engineering firm, or a registered professional engineer capable of providing the required certifications and verifications (+9 burden hours).

250.231(b)—This section is new and will add the required information that the I3P is to review (+16,660 burden hours).

250.231(c)—This section is new and will require operators to provide evidence of previous I3P nomination acceptance to utilize a previously BSEE accepted I3P from the same project (+100 burden hours).

250.232(b); 250.233—These sections are new and will require the I3P to submit a report documenting the review of each item and identify all OEM and operator documents used during the reviews (+60 burden hours).

250.232(c), (d); 250.233—These sections are new and will require the I3P to submit a final report that

summarizes each review requirement under (a) of this section and will also require the summary report to include the equipment and/or system's technical specifications, including a statement that the equipment and/or system is fit for purpose for the technical specification by the I3P, and verification that the equipment's technical specifications meet or exceed the project's functional requirements including a statement that the equipment and/or system is fit for purpose (+9 burden hours).

250.235; 250.236; 250.237; 250.238; 250.239; 250.240; 250.241; 250.242; 250.204; and 732(c)—These sections will be revised and moved from existing §§ 250.291 and 250.292. These will identify when and how to submit a DWOP; and what general information, well or completions information, structural information, production safety system information, subsea systems, and pipeline information to submit with DWOPs (+1,070 burden hours and \$756,210 non-hour costs burden).

250.245—This section will be revised and moved from existing § 250.294. It will be revised to clarify that operators may submit a combined Project

Conceptual Plan/DWOP, with all applicable requirements for both, on or before the deadline for submitting the Conceptual Plan (+428 burden hours and \$27,712 non-hour costs burden).

250.246—This section will be revised and moved from existing § 250.295. It will be revised to clarify when a revision to a Conceptual Plan or DWOP is necessary (+80 burden hours and \$1,926 non-hour costs burden).

250.247; 250.248—This section is new and will identify when an operator must supplement the DWOP to reflect additions or changes in the development project and will add the required information that must be included in the supplement to the DWOP. It will also require a supplement to the DWOP when a project change involves the addition of any new or unusual technology that was not previously covered under the New or Unusual Technology Conceptual Plan, New or Unusual Technology Barrier Equipment Conceptual Plan, or DWOP (+3,990 burden hours and \$756,210 non-hour costs burden).

This rule also edits and updates citations to §§ 250.731(c) and 250.732(c). No burden changes are being requested.

BURDEN BREAKDOWN

Citation 30 CFR part 250, subpart B and NTLs	Reporting & recordkeeping requirement	Hour burden	Average number of annual responses annual	Burden hours
			Non-hour cost burdens	

General Information

200 thru 248	General departure and alternative compliance requests not specifically covered elsewhere in subpart B regulations.	Burden covered under 1014–0022.	0
201 thru 248	Submission of plans, documents/information with applicable permit (New or Unusual Technology (NUT) Conceptual Plans (CPs), NUT Barrier Equipment CP, Project CP, and DWOP); any additional information required by Reg. Sup.	Burden included with specific requirements below.	0

Post-Approval Requirements for the EP (Exploration Plan), DPP (Development and Production Plan), Deep Water Operations Plan (DWOP), and DOCD (Development Operation Coordination Document) [for BSEE apps/permits which include drilling, workovers, production, pipelay, facility installation, and decommissioning, etc.]

210	Retain monitoring data/information; make available to BSEE if requested.	.5	2 retentions	1
	Submit monitoring plan for approval	.5	2 plans	1
	Submit monitoring reports and data	5	2 reports	10
211	Notify Reg. Sup. w/in 30-days of NUT failure; provide failure analysis report including and results & findings of root cause analysis.	200	2 reports	400
\$23,608 I3P × 2 reports = \$47,216.				

Deepwater Operations Plan (DWOP) Process

221(b)	Contact the Reg. Sup. for guidance if you are unsure if your project contains subsea tieback development technology or NUT.	15 min	25 inquiries	6
226	Submit Project CP for approval including additional information requested.	2	8 plans	16
			\$2,697 Fee × 8 plans = \$21,576.	
	Submit NUT CP for approval including additional information requested.	1	10 plans	10

BURDEN BREAKDOWN—Continued

Citation 30 CFR part 250, subpart B and NTLs	Reporting & recordkeeping requirement	Hour burden	Average number of annual responses annual	Burden hours
			Non-hour cost burdens	
			\$7,964 Fee × 10 plans = \$79,640.	
	Submit NUT Barrier Equipment CP for approval including additional information requested.	1	13 plans	13
			\$15,104 Fee × 13 plans = \$196,352.	
227; 226; 201; 204	Submit w/Project Conceptual Plan, an explanation of the general design basis and philosophy, and all required information, including but not limited to: overviews, system control type, estimated distances, subsea production safety Statement, descriptions, structural modifications, installation information, modification statements, schedules, schematics, estimated pressures or discussion of PVT, temperature ratings, etc., the pay.gov confirmation receipt and any additional information required.	40	8 plans	320
			\$4,722 I3P costs × 8 plans = \$37,776.	
228 ; 226; 201; 204	Submit w/NUT CP, all required information, including but not limited to descriptions, discussions, demonstrations, inspection and testing capabilities, risk assessment, operating procedures, history of the technology, design verifications/testing, schematics, justifications, certifications, list alternative compliance procedures/departures, and any additional information required. Use of an I3P if required, Contact Reg. Sup., for questions related to I3P verifications, the pay.gov confirmation receipt and any additional information required.	360	10 plans	3,600
			\$67,613 I3P costs × 10 plans = \$676,130.	
229 ; 226; 201; 204	Submit w/NUT Barrier Equipment CP, all required information, including but not limited to: detailed schematics, lists of barriers, engineering standards, functional requirements, descriptions, I3P nominations and verification plans, I3P Reports, certification statements, the pay.gov confirmation receipt and any additional information required.	720	13 plans	9,360
			\$227,363 I3P costs × 13 plans = \$2,955,719.	
230 ; 732(c)	Submit I3P Reports required for any equipment identified in NUT Barrier Equipment CP and when required by Regional Supervisor. (Fit for service statement).	.5	50 reports	25
231(a)	Submit I3P nomination capable to certify and verify documentation, I3P must be technical class. Society, licensed PE firm, or registered PE. Make all documentation and equipment available to I3P.	30 min	17 nominations	9
231(b)	I3P must review information of the applicable equipment and/or system; including but not limited to basis of design, technical specs., & function requirements, etc., all required info.	980	17 submissions	16,660
231(c)	Provide evidence of previous I3P nomination acceptance to utilize a previously BSEE accepted I3P from the same project.	5	20 nominations	100
232(b); 233	Submit report documenting the review of each item covered under 250.232(a). Report must identify all OEM and Operator documents reviewed.	30 min	119 reports	60
232(c), (d); 233; 732(c)	Submit a final report summarizing the review requirements, including equipment and/or system's technical specifications, certification statements and verifications w/sufficient level of detail (e.g., quantitative information). (Fit for purpose statement).	30 min	17 reports	9
235; 236 ; 237; 238; 239; 240; 241, 242, 204 ; 732(c).	Submit DWOP for approval; include all required information, and the pay.gov confirmation receipt.	214	5 plans	1,070
			\$10,647 Cost Recovery Fee × 5 plans = \$53,235.	
			\$25,024 I3P costs × 5 plans = \$125,120.	
245	Submit a combined Project CP/DWOP for approval on or before deadline for submitting CP.	214	2 plans	428
			\$13,856 Cost Recovery Fee × 2 plans = \$27,712.	
246	Submit a revised DWOP	40	2 plan revisions	80
			\$963 Cost Recovery Fee × 2 plan revs. = \$1,926.	

BURDEN BREAKDOWN—Continued

Citation 30 CFR part 250, subpart B and NTLs	Reporting & recordkeeping requirement	Hour burden	Average number of annual responses annual	Burden hours
Non-hour cost burdens				
247 248	Submit supplements to DWOP reflecting additions or changes; include same information for wells or equipment as required per CP and DWOP, descriptions for each CP or DWOP section being impacted, and the pay.gov confirmation receipt.	133	30 supp	3,990
			\$9,626 Cost Recovery Fee × 30 supp. = \$288,780.	
			\$15,581 I3P costs × 30 submissions = \$467,430.	
Total for Subpart B			374 responses	36,168 Burden hours.
			\$4,978,612 Non-hour Cost Burdens.	

Title of Collection: 30 CFR part 250, subpart B, *Plans and Information*.

OMB Control Number: 1014–0032.

Form Number: None.

Type of Review: New.

Respondents/Affected Public:

Potential respondents comprise Federal OCS oil, gas, and sulfur lessees/operators and holders of pipeline rights-of-way.

Total Estimated Number of Annual Respondents: Currently there are approximately 555 Federal OCS oil, gas, and sulfur lessees and holders of pipeline rights-of-way. Not all the potential respondents will submit information at any given time, and some may submit multiple times.

Total Estimated Number of Annual Responses: 374.

Estimated Completion Time per Response: Varies from 15 minutes to 980 hours depending on activity.

Total Estimated Number of Annual Burden Hours: 36,168.

Respondent's Obligation: Responses are mandatory.

Frequency of Collection: Generally, on occasion and as required in the regulations.

Total Estimated Annual Non-hour Burden Cost: \$4,978,612.

In addition, the PRA requires agencies to estimate the total annual reporting and recordkeeping non-hour cost burden resulting from the collection of information, and we solicit your comments on this item. For reporting and recordkeeping only, your response should split the cost estimate into two components: (1) total capital and startup cost component; and (2) annual operation, maintenance, and purchase of service component. Your estimates should consider the cost to generate, maintain, and disclose or provide the information. You should describe the methods you use to estimate major cost

factors, including system and technology acquisition, expected useful life of capital equipment, discount rate(s), and the period over which you incur costs. Generally, your estimates should not include equipment or services purchased: (1) before October 1, 1995; (2) to comply with requirements not associated with the information collection; (3) for reasons other than to provide information or keep records for the Government; or (4) as part of customary and usual business or private practices.

As part of our continuing effort to reduce paperwork and respondent burdens, we invite the public and other Federal agencies to comment on any aspect of this information collection, including:

(1) Whether the collection of information is necessary, including whether the information will have practical utility;

(2) The accuracy of our estimate of the burden for this collection of information;

(3) Ways to enhance the quality, utility, and clarity of the information to be collected; and

(4) Ways to minimize the burden of the collection of information on respondents.

Send your comments and suggestions on this information collection by the date indicated in the **DATES** section to the Desk Officer for the Department of the Interior at OMB–OIRA at (202) 395–5806 (fax) or via the *RegInfo.gov* portal (online). You may view the information collection request(s) at <http://www.reginfo.gov/public/do/PRAMain>. Please provide a copy of your comments to the BSEE Information Collection Clearance Officer (see the **ADDRESSES** section). You may contact Kye Mason, BSEE Information Collection Clearance Officer at kye.mason@bsee.gov with any

questions. Please reference Final Rule 1014–AA49, Oil and Gas and Sulfur Operations in the Outer Continental Shelf—30 CFR part 250, subpart B, *Plans and Information* (OMB Control No. 1014–0032), in your comments.

National Environmental Policy Act of 1969 (NEPA)

BSEE determined that this action is covered under a Categorical Exclusion as defined by NEPA at 43 CFR 46.205. Pursuant to 43 CFR 46.210(i) and 516 Departmental Manual 15.4(C)(1), BSEE determined that the final action is categorically excluded from detailed review under NEPA (42 U.S.C. 4321 *et seq.*). BSEE has determined that the final rule meets the criteria set forth at 43 CFR 46.210(i) for a Departmental Categorical Exclusion in that this final rule is “of an administrative, financial, legal, technical, or procedural nature. . . .” Further, BSEE has determined that the final rule does not involve any of the extraordinary circumstances listed in 43 CFR 46.215 that would require further analysis under NEPA. The final rule is an administrative change and does not authorize any activities on the OCS. It involves the review of Conceptual Plans and specialized requirements associated with deepwater needs (*e.g.*, special moorings, fittings, production equipment, HPHT items, etc.); however, actual approval of Conceptual Plans and DWOPs is for administrative purposes and does not directly lead to OCS activity that can result in environmental impacts. The Conceptual Plans and DWOPs only lead to an action once they are included and addressed in an Exploration Plan (EP), Development Operations Coordination Document (DOCD), or Development and Production Plan (DPP) and subsequent permit applications. EPs, DOCDs, DPPs,

as well as the subsequent well and facility permit applications, are reviewed under site-specific NEPA analyses. Only EPs, DOCDs, and DPPs include the detailed information to fully assess future environmental impacts. If an operator chooses to modify their Conceptual Plans, DWOPs, or proposed technology or submit a new one for an activity that has already been reviewed and approved under the respective EP, DOCD, or DPP, then the operator must submit a revised EP, DOCD, or DPP in accordance with 30 CFR 550.283, which may trigger additional NEPA analysis.

Data Quality Act

In developing this rule, we did not conduct or use a study, experiment, or survey requiring peer review under the Data Quality Act (Pub. L. 106–554, app. C, sec. 515, 114 Stat. 2763, 2763A–153–154).

Effects on the Nation's Energy Supply (E.O. 13211)

This final rule is not a significant energy action under the definition in E.O. 13211 and it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. A Statement of Energy Effects is not required.

Severability

If a court holds any section or paragraph of this rule or their applicability to any person or circumstance invalid, the remainder of this rule and their applicability to other persons or circumstances will not be affected.

List of Subjects in 30 CFR Part 250

Administrative practice and procedure, Continental shelf, Environmental impact statements, Environmental protection, Government contracts, Incorporation by reference, Investigations, Oil and gas exploration, Outer continental shelf—mineral resources, Outer continental shelf—rights-of-way, Penalties, Pipelines, Reporting and recordkeeping requirements, Sulfur.

This action by the Deputy Assistant Secretary is taken herein pursuant to an existing delegation of authority.

Steven H. Feldgus,

Principal Deputy Assistant Secretary, Land and Minerals Management.

For the reasons stated in the preamble, the Bureau of Safety and Environmental Enforcement (BSEE) amends 30 CFR part 250 as follows:

PART 250—OIL AND GAS AND SULFUR OPERATIONS IN THE OUTER CONTINENTAL SHELF

■ 1. The authority citation for part 250 continues to read as follows:

Authority: 30 U.S.C. 1751, 31 U.S.C. 9701, 33 U.S.C. 1321(j)(1)(C), 43 U.S.C. 1334.

Subpart A—General

■ 2. Amend § 250.105 by adding definitions for “BOP systems and related equipment” and “HPHT environment” in alphabetical order to read as follows:

§ 250.105 Definitions.

* * * * *

BOP systems and related equipment includes all pressure controlling and pressure containing well control equipment that may or will be exposed to the well's MASP during drilling, completion, workover, intervention, or abandonment. Well control equipment includes equipment that is installed for the purpose of pressure control and pressure containment when it becomes necessary to physically enter a well bore during drilling, completion, workover, intervention, or abandonment modes of operation.

* * * * *

HPHT environment means when one or more of the following well conditions exist:

(1) The drilling, completion, workover, intervention, injection, production, or abandonment of the well requires pressure controlling or pressure containing equipment, including well control equipment, assigned a pressure rating greater than 15,000 psia or a temperature rating greater than 350 degrees Fahrenheit;

(2) The MASP or SITP is greater than 15,000 psia at the seafloor for a well with a subsea wellhead or at the surface for a well with a surface wellhead; or

(3) The flowing temperature is greater than 350 degrees Fahrenheit at the seafloor for a well with a subsea wellhead or at the surface for a well with a surface wellhead.

* * * * *

■ 3. Amend § 250.125 by revising paragraph (a)(2) to read as follows:

§ 250.125 Service fees.

(a) * * *

Service—processing of the following:	Fee amount	30 CFR citation (§)
(2) Deepwater Operations Plan (DWOP) Process:		
(i) Project Conceptual Plan	\$2,697	250.226
(ii) New or Unusual Technology Conceptual Plan	7,964	250.226
(iii) New or Unusual Technology Barrier Equipment Conceptual Plan	15,104	250.226
(iv) DWOP	10,647	250.235
(v) Revised DWOP	963	250.246
(vi) Combined Project Conceptual Plan/DWOP	13,856	250.245
(vii) Supplemental DWOP	9,626	250.247
* * * * *		

* * * * *

■ 4. Amend § 250.198 by revising the introductory text and paragraphs (e)(82), (86), (91), and (i)(1) to read as follows:

§ 250.198 Documents incorporated by reference.

Certain material is incorporated by reference into this part with the

approval of the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. All approved material is available for inspection at BSEE and at the National Archives and Records Administration (NARA). Contact BSEE at: the Houston BSEE office at 1919 Smith Street Suite 14042, Houston, Texas 77002; 1–844–259–

4779. For information on the availability of this material at NARA, visit www.archives.gov/federal-register/cfr/ibr-locations or email: fr.inspection@nara.gov. The material may be obtained from the following sources:

■ 5. Revise subpart B to read as follows:

Subpart B—Plans and Information

General Information

Sec.

250.200 Definitions.

250.201 What plans and information must I submit before I conduct any activities on my lease or unit?

250.202 How must I protect the rights of the Federal government?

250.203 Are there special requirements if my well affects an adjacent property?

250.204 Requirements for high pressure high temperature (HPHT) barrier equipment.

250.205 [Reserved]

Barrier Equipment and Systems

250.206 What equipment does BSEE consider to be a barrier?

250.207 How must barrier systems be used?

Activities and Post-Approval Requirements for the EP, DPP, DWOP, and DOCD

250.208 How must I conduct activities under an approved EP, DPP, or DOCD?

250.209 What must I do to conduct activities under the approved EP, DPP, or DOCD?

250.210 Do I have to conduct post-approval monitoring?

250.211 What are my new or unusual technology failure reporting requirements?

250.212–250.219 [Reserved]

Deepwater Operations Plan (DWOP) Process

250.220 What is the DWOP process?

250.221 When must I use the DWOP process?

250.222–250.224 [Reserved]

Conceptual Plans

250.225 What are the types of Conceptual Plans that I must submit?

250.226 When and how must I submit each applicable Conceptual Plan?

250.227 What must the Project Conceptual Plan contain?

250.228 What must the New or Unusual Technology Conceptual Plan contain?

250.229 What must the New or Unusual Technology Barrier Equipment Conceptual Plan include?

250.230 When are you required to submit an I3P Report?

250.231 What are your requirements for the Independent Third Party (I3P) nomination?

250.232 What are the I3P review requirements for Conceptual Plan reviews?

250.233 General requirements for any I3P Report.

250.234 [Reserved]

DWOP Approval

250.235 When and how must I submit the DWOP?

250.236 What information must I submit with the DWOP?

250.237 What general information must my DWOP include?

250.238 What well or completions information must my DWOP include?

250.239 What structural information must my DWOP include?

250.240 What production safety system information must my DWOP include?

250.241 What subsea systems and pipeline information must my DWOP include?

250.242 What New or Unusual Technology information must my DWOP include?

250.243–250.244 [Reserved]

250.245 May I combine the Project Conceptual Plan and the DWOP?

250.246 When must I revise my DWOP?

250.247 When must I supplement my DWOP?

250.248 What information must I include in my Supplemental DWOP?

Subpart B—Plans and Information

General Information

§ 250.200 Definitions.

Acronyms and terms used in this subpart have the following meanings:

(a) Acronyms used frequently in this subpart are listed alphabetically below:

(1) BOEM means Bureau of Ocean Energy Management of the U.S. Department of the Interior.

(2) BSEE means Bureau of Safety and Environmental Enforcement of the U.S. Department of the Interior.

(3) CID means Conservation Information Document.

(4) CZMA means Coastal Zone Management Act.

(5) DOCD means Development Operations Coordination Document.

(6) DPP means Development and Production Plan.

(7) DWOP means Deepwater Operations Plan.

(8) EIA means Environmental Impact Analysis.

(9) EP means Exploration Plan.

(10) ESA means Endangered Species Act.

(11) HPHT means High Pressure High Temperature

(12) I3P means Independent Third Party

(13) MMPA means Marine Mammal Protection Act.

(14) NPDES means National Pollutant Discharge Elimination System.

(15) NTL means Notice to Lessees and Operators.

(16) OCS means Outer Continental Shelf.

(b) Terms used in this subpart are listed alphabetically below:

Amendment means a change you make to an EP, DPP, or DOCD that is pending before BOEM for a decision (see 30 CFR 550.232(d) and 30 CFR 550.267(d)).

Barrier categorization includes identifying barriers as one of the following two types of categories:

Category 1 Barrier means any equipment, component, or assembly that functions as part of a primary barrier during any operational phase of its life cycle. The operational phases of the barrier equipment, component, or assembly are drilling, completion, workover, intervention, injection, production, or abandonment.

Category 2 Barrier means any equipment, component, or assembly that normally functions as part of a secondary barrier during any operational phase of its life cycle, except when a primary barrier fails. The operational phases of the barrier equipment, component, or assembly are drilling, completion, workover, intervention, injection, production, or abandonment. BSEE may consider non-barrier structural components of a barrier system as a Category 2 Barrier if failure of this structural component could reasonably result in a Primary Barrier failure.

Fit for Purpose means a determination made by an I3P at the conclusion of I3P review that the barrier equipment design has been verified and validated in conformance with recognized engineering standards and any additional project specification requirements; that the material selection, design verification analysis, design validation testing, and quality control are appropriate to justify the technical specifications; and that the technical specifications meet or exceed a project's site specific functional requirements.

Fit for Service means a determination made by the operator that the material selection, design verification analysis, design validation testing, and quality control of the barrier equipment is appropriate to justify the technical specifications and that the technical specifications meet or exceed a project's site-specific functional requirements.

New or unusual technology means equipment or procedures used for any drilling, completion, workover, intervention, injection, production,

pipeline, platform, decommissioning, or abandonment operations that meet any of the following criteria:

- (1) Has not been approved for use or used extensively in a BSEE OCS Region;
- (2) Has not been approved for use or used extensively under the anticipated operating conditions;
- (3) Has operating characteristics that are outside the performance parameters established in this part;
- (4) Will operate in an HPHT environment as defined in § 250.105; or
- (5) Is part of a primary or secondary barrier system that uses materials, design analysis techniques, validation testing methods, or manufacturing processes not addressed in existing industry standards.

Primary Barrier means the equipment, material, component, or assembly that is designated as the principal means of isolating the hydrocarbon pressure source from people and the environment.

Secondary Barrier means the equipment, material, component, or assembly that is designated as the

secondary means of isolating the hydrocarbon pressure source from people and the environment.

Subsea tieback development technology means, but is not limited to, floating production systems, tension leg platforms, spars, Floating Production Storage and Offloading (FPSO) systems, guyed towers, compliant towers, subsea manifolds, subsea wells, hybrid wells, production risers, export risers, and other subsea completion or production components that rely on a remote site or host facility for utility and well control services.

§ 250.201 What plans and information must I submit before I conduct any activities on my lease or unit?

(a) *Plans and permits.* Before you conduct the activities on your lease or unit listed in the following table, you must submit, and BSEE must approve, the listed plans (or relevant portions thereof), and any applicable permits. Your plans and applicable permits may cover one or more leases or units.

You must have BSEE approval of a(n) . . .	Before you . . .	Additional information
(1) New or Unusual Technology Conceptual Plan.	install the new or unusual technology	(i) Must be approved by BSEE before it will approve any associated application or permit (e.g., pipeline, platform, APD, APM) involving the use of new or unusual technology. (ii) May be independent of a project Conceptual Plan or DWOP. (iii) BSEE will not approve this Conceptual Plan until all associated I3P Reports (if required) are submitted and are reviewed by BSEE. (iv) May not contain equipment identified as a primary or secondary barrier.
(2) New or Unusual Technology Barrier Equipment Conceptual Plan.	install the new or unusual technology that is identified as barrier equipment.	(i) Is required for any project or system involving new or unusual technology that is also identified as a primary or secondary barrier. (ii) Must be approved by BSEE before it will approve any associated application or permit (e.g., pipeline, platform, APD, APM) involving the use of new or unusual technology identified as barrier equipment as applicable for the permit scope. (iii) BSEE will not approve this Conceptual Plan until all associated I3P Reports are submitted and reviewed by BSEE.
(3) Project Conceptual Plan	conduct post-drilling installation or well completion activities for a deepwater development project, or for any project that will involve the use of a subsea tieback development technology in any water depth, which may include new or unusual technology.	(i) Must be approved before well completion permit approval (e.g., APM). (ii) Any relevant new or unusual technology associated with completion operations must be approved by BSEE before project Conceptual Plan approval.
(4) Deepwater Operations Plan (DWOP).	(i) conduct post-completion installation activities for a deepwater development project, or for any project that will involve the use of a subsea tieback development technology in any water depth, which may include new or unusual technology; and (ii) initiate production activities.	Must include reference to all applicable, previously approved Conceptual Plans for the associated development project.

(b) *Submitting additional information.* On a case-by-case basis, the Regional Supervisor may require you to submit additional information if the Regional Supervisor determines that it is

necessary to evaluate your proposed plan or permit.

(c) *Referencing.* In preparing your proposed plan or permit, you may reference information and data

discussed in other plans or permits you previously submitted or that are otherwise readily available to BSEE.

(d) All plans listed under paragraph (a) of this section that are initially

submitted after October 29, 2024 must comply with the requirements of this subpart.

§ 250.202 How must I protect the rights of the Federal government?

(a) To protect the rights of the Federal government, you must either:

(1) Drill and produce the wells that the Regional Supervisor determines are necessary to protect the Federal government from loss due to production on other leases or units or from adjacent lands under the jurisdiction of other entities (e.g., State and foreign governments); or

(2) Pay a sum that the Regional Supervisor determines as adequate to compensate the Federal government for your failure to drill and produce any well.

(b) Payment under paragraph (a)(2) of this section may constitute production in paying quantities for the purpose of extending the lease term.

(c) You must complete and produce any penetrated hydrocarbon-bearing zone that the Regional Supervisor determines is necessary to conform to sound conservation practices.

§ 250.203 Are there special requirements if my well affects an adjacent property?

For wells that could intersect or drain an adjacent property, the Regional Supervisor may require special measures to protect the rights of the Federal government and objecting lessees or operators of adjacent leases or units.

§ 250.204 Requirements for high pressure high temperature (HPHT) barrier equipment.

If you plan to install HPHT barrier equipment, you must submit information with your applicable Project Conceptual Plan, New or Unusual Technology Barrier Equipment Conceptual Plan, DWOP, and applicable permit(s) that demonstrates the equipment is fit for service in the applicable HPHT environment. You must follow the applicable DWOP Process requirements (e.g., §§ 250.229 and 250.242).

§ 250.205 [Reserved]

Barrier Equipment and Systems

§ 250.206 What equipment does BSEE consider to be a barrier?

A barrier or barrier system is any engineered equipment, material, component, or assembly that is installed to contain a hydrocarbon pressure source(s) to prevent harm to people or the environment. BSEE only recognizes barriers that are either permanently or temporarily installed, pressure controlling, and/or pressure containing.

You must be able to activate pressure controlling barriers on demand (i.e., closed by an operator or automated safety system). You must function test and pressure test any pressure controlling barriers or barrier systems to defined acceptance criteria that can be repeated. You must pressure test any pressure containing barrier or barrier system to defined acceptance criteria that can be repeated.

§ 250.207 How must barrier systems be used?

You must install and maintain a primary and a secondary barrier system (redundant barriers) to prevent a loss of containment during any operational phase of a well, flowline, pipeline, production, or riser system.

Activities and Post-Approval Requirements for the EP, DPP, DWOP, and DOCD

§ 250.208 How must I conduct activities under an approved EP, DPP, or DOCD?

(a) *Compliance.* You must conduct all of your lease and unit activities according to your approved EP, DPP, or DOCD and any approval conditions. If you fail to comply with your approved EP, DPP, or DOCD:

(1) You may be subject to BSEE enforcement action, including civil penalties; and

(2) The lease(s) involved in your EP, DPP, or DOCD may be forfeited or cancelled under 43 U.S.C. 1334(c) or (d). If this happens, you may not be entitled to compensation under 30 CFR 550.185(b) and 30 CFR 556.1102.

(b) *Emergencies.* Nothing in this subpart or in your approved EP, DPP, or DOCD relieves you of or limits your responsibility to take appropriate measures to meet emergency situations. In an emergency situation, the Regional Environmental Officer may approve or require departures from your approved EP, DPP, or DOCD.

§ 250.209 What must I do to conduct activities under the approved EP, DPP, or DOCD?

(a) *Approvals and permits.* Before you conduct activities under your approved EP, DPP, or DOCD you must obtain the following approvals and or permits, as applicable, from the District Manager or BSEE Regional Supervisor:

(1) Approval of Applications for Permits to Drill (APDs) (see § 250.410);

(2) Approval of production safety systems (see § 250.800);

(3) Approval of new platforms and other structures (or major modifications to platforms and other structures) (see § 250.905);

(4) Approval of applications to install lease term pipelines (see § 250.1007); and

(5) Other permits, as required by applicable law.

(b) *Conformance.* The activities proposed in these applications and permits must conform to the activities described in detail in your approved EP, DPP, or DOCD.

§ 250.210 Do I have to conduct post-approval monitoring?

The Regional Supervisor may direct you to conduct monitoring programs, including monitoring in accordance with the ESA and the MMPA, in association with your approved EP, DPP, DWOP, or DOCD. You must retain copies of all monitoring data obtained or derived from your monitoring programs and make them available to BSEE upon request. The Regional Supervisor may require you to:

(a) Submit monitoring plans for approval before you begin work; and

(b) Prepare and submit reports that summarize and analyze data and information obtained or derived from your monitoring programs. The Regional Supervisor will specify requirements for preparing and submitting these reports.

§ 250.211 What are my new or unusual technology failure reporting requirements?

If you have an approved new or unusual technology and it experiences a failure (i.e., any condition that prevents the equipment from meeting its functional specification) during or post-installation, you must notify the applicable Regional Supervisor within 30 days of the failure. You must also provide a failure analysis report as soon as it is available following notification. The failure analysis report must include any results of and potential root cause(s) of the failure. You must also follow all applicable failure or incident reporting requirements associated with the failure (e.g., §§ 250.188, 250.730, and 250.803).

§§ 250.212–250.219 [Reserved]

Deepwater Operations Plan (DWOP) Process

§ 250.220 What is the DWOP process?

(a) The DWOP process consists of providing sufficient information from a total system approach for BSEE to review:

(1) A deepwater development project, or

(2) A subsea tieback development technology, or

(3) Any other project or system that uses new or unusual technology during any phase of the following operations: drilling, completion, workover, intervention, injection, production,

pipeline, platform, decommissioning, or abandonment.

(b) The DWOP process does not replace but complements other submittals required by the regulations, such as BOEM EPs, DPPs, and DOCDs, or BSEE applications and/or permits (e.g., APD, Application for Permit to Modify (APM), pipeline application, and platform application). BSEE will use the information in your DWOP process to determine whether the project will be developed in an acceptable manner, particularly with respect to operational safety and environmental protection involved with a deepwater development project, subsea tieback development technology, or new or unusual technology.

(c) The DWOP process consists of two phases:

(1) *The Conceptual Plans.* The Conceptual Plans outline certain equipment and process specifications, operational concepts, and basis of design that you plan to use for project development, and for applicable equipment design, installation, and operation. Sections 250.227 through 250.229 prescribe what each of the Conceptual Plans must contain. Each Conceptual Plan may be submitted separately or combined as applicable; and

(2) *The DWOP.* The DWOP identifies specific design, fabrication, installation and operational requirements for equipment, systems, and activities as applicable in §§ 250.236 through 250.242.

(d) You must submit to BSEE the applicable plan(s) covered under the

DWOP process as appropriate (see § 250.225 for Conceptual Plan requirements and § 250.235 for DWOP requirements). Certain projects requiring New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Equipment Conceptual Plans may not be required to have an associated Project Conceptual Plan or DWOP.

§ 250.221 When must I use the DWOP process?

(a) You must use the DWOP process for any project that meets any of the following criteria:

(1) Is planned in water depths greater than 1000 ft;

(2) Will use subsea tieback development technology, regardless of water depth; or

(3) Will use any new or unusual technology for any drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment project.

(b) If you are unsure if your project will use subsea tieback development technology or new or unusual technology, contact the Regional Supervisor for guidance.

§§ 250.222–250.224 [Reserved]

Conceptual Plans

§ 250.225 What are the types of Conceptual Plans that I must submit?

There are three types of Conceptual Plans:

(a) A Project Conceptual Plan is required for any project that is planned in water depths greater than 1000 feet,

will use subsea tieback development technology, or will use new or unusual technology for completion, injection, production, pipeline, or platform operations;

(b) A New or Unusual Technology Conceptual Plan is required for any project or system that involves equipment or procedures that are considered new or unusual technology (see § 250.200 for the definition of new or unusual technology) for drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment operations; and

(c) A New or Unusual Technology Barrier Equipment Conceptual Plan is required for any project or system involving new or unusual technology that is also identified as a primary or secondary barrier (see § 250.200 for the definition of primary and secondary barriers) for drilling, completion, workover, intervention, injection, production, pipeline, platform, decommissioning, or abandonment operations.

§ 250.226 When and how must I submit each applicable Conceptual Plan?

You must submit each applicable Conceptual Plan to the Regional Supervisor after you have decided on the general concept(s) for a project or system, and before you finalize engineering design of the equipment, well, well safety control system, or subsea production systems. You must submit, for BSEE approval, each Conceptual Plan according to the following table:

Conceptual plan type	Where to find the description (§)	Additional information
(a) Project Conceptual Plan	250.227	You may not complete any production or injection well or install the tree before BSEE has approved the Project Conceptual Plan.
(b) New or Unusual Technology Conceptual Plan.	250.228	(1) Operations and approval timing requirements are as follows: (i) You may not install any new or unusual technology until BSEE approves your New or Unusual Technology Conceptual Plan, (ii) You may not complete any production or injection well or install a tree before BSEE has approved all New or Unusual Technology Conceptual Plans associated with all well completion equipment and the Project Conceptual Plan, and (iii) BSEE must first approve your New or Unusual Technology Conceptual Plan associated with subsea production systems before the DWOP may be approved. You may install this new or unusual technology following BSEE permit approval (e.g., pipeline application) and prior to DWOP approval. (2) The Regional Supervisor may require the operator to use an I3P to perform certain functions and verifications in accordance with § 250.231, as applicable. (3) BSEE will not approve a New or Unusual Technology Conceptual Plan until you submit and BSEE reviews all I3P Reports (if any required). (4) BSEE must approve your New or Unusual Technology Conceptual Plan before it will approve any associated application or permit application (e.g., pipeline application, platform application, APD, APM). (5) You must submit separate New or Unusual Technology Conceptual Plans for each piece of equipment at an assembly level (e.g., BOP, tree, wellhead system, or tubing head spool).

Conceptual plan type	Where to find the description (§)	Additional information
(c) A New or Unusual Technology Barrier Equipment Conceptual Plan.	250.229	(1) You must submit a New or Unusual Technology Barrier Equipment Conceptual Plan for any project or system involving new or unusual technology that is also identified as a primary or secondary barrier. (2) Operations and approval timing requirements are as follows: (i) BSEE must first approve your New or Unusual Technology Barrier Equipment Conceptual Plan prior to you installing new or unusual technology identified as barrier equipment, (ii) You may not complete any production or injection well or install the tree before BSEE has approved all the New or Unusual Technology Barrier Equipment Conceptual Plans associated with all well completion equipment and the Project Conceptual Plan, and (iii) BSEE must first approve your New or Unusual Technology Barrier Equipment Conceptual Plan associated with subsea production systems before the DWOP may be approved. You may install this equipment after BSEE permit approval (e.g., pipeline application) and prior to DWOP approval. (3) BSEE must first approve your New or Unusual Technology Barrier Equipment Conceptual Plan before it will approve any associated application or permit application (e.g., pipeline application, platform application, APD, APM). (4) All new or unusual technology identified as barrier equipment requires the use of an Independent Third Party (I3P) to perform certain functions and verifications in accordance with § 250.231. BSEE will not approve New or Unusual Technology Barrier Equipment Conceptual Plans until you submit and BSEE reviews all required I3P Reports pursuant to § 250.231. (5) You must submit separate New or Unusual Technology Barrier Equipment Conceptual Plans for each piece of equipment at an assembly level (e.g., BOP, tree, wellhead system, tubing head spool).

§ 250.227 What must the Project Conceptual Plan contain?

In the Project Conceptual Plan, you must explain the basis of design that you will use to develop the field. You must include the following information:

(a) An overview of the development concept(s);

(b) The system control type (*i.e.*, direct hydraulic or electro-hydraulic);

(c) The estimated distance from each of the wells to the host platform, and umbilical length(s);

(d) A statement that the subsea production safety system will be designed to comply with Subpart H of this part;

(e) For a new facility, a description of the type of facility you plan to install (e.g. spar, tension leg platform (TLP), FPSO, etc.);

(f) For a subsea tie back to an existing facility:

(1) A description of known structural modifications that you will need to make to accommodate the tieback, including a statement about whether these accommodations constitute minor or major modifications,

(2) The BSEE-approved service life of the existing facility, and

(3) A description of how you will evaluate whether the modifications may affect the BSEE-approved service life.

(g) A statement regarding whether the host facility will be manned or unmanned;

(h) A schedule of development activities, including well completion, facility installation, and date of first oil;

(i) Schematics, including:

(1) A proposed well location plat,

(2) A conceptual subsea field schematic depicting the planned development infrastructure that contains (as applicable) the wells, pipelines, manifolds, subsea booster pumps, high integrity pressure protection system, riser systems, umbilical(s), and facility footprint,

(3) The surface or subsea tree, and

(4) A proposed wellbore and completion schematic for a typical well (including Surface Controlled Subsurface Safety Valve (SCSSV) location and chemical injection points; and depiction or description of gas zones, if any, behind the production casing or production liner and how those gas zones will be isolated).

(j) A description of the drilling and completion systems;

(k) The estimated shut-in tubing pressure for the proposed well(s), including the calculation used to arrive at the estimate, specifying true vertical depth (TVD), reservoir pressure, and the fluid gradient used, or a brief discussion of the pressure volume temperature (PVT) data used for estimation;

(l) The wellbore static bottomhole temperature and the estimated flowing temperature at the tree;

(m) The pressure and temperature rating of the tree and wellhead;

(n) Whether there will be corrosive production (e.g., hydrogen sulfide (H₂S), Carbon dioxide (CO₂), Mercury (Hg) or

injection fluids (e.g., acid)), including concentrations;

(o) Whether any of the proposed equipment will be re-furbished and re-certified;

(p) Whether enhanced recovery is planned for the early life of the project;

(q) Whether any new or unusual technology will be used to develop your project involving the following: drilling, completion, injection, production, risers, pipelines, or platforms;

(r) Whether the well(s) will include smart completion technology;

(s) A list of requests for any alternate procedures or equipment in accordance with § 250.141 and request for departures in accordance with § 250.142 associated with your applicable Conceptual Plans; and

(t) Documentation demonstrating payment of the service fee listed in § 250.125.

§ 250.228 What must the New or Unusual Technology Conceptual Plan contain?

(a) You must include the following information, as applicable, in your New or Unusual Technology Conceptual Plan:

(1) How the New or Unusual Technology Conceptual Plan fits within your overall site specific project, if applicable, including an overview of the project development concepts.

(2) A description of the technology and specific conditions under which it will be used;

(3) A description of shut-in capabilities and procedures;

(4) A description of redundancies of critical components or systems that will be used;

(5) A discussion of how the new or unusual technology could impact the barrier or safety system, if any, including:

(i) The detection method for new or unusual technology failure;

(ii) A description of how barriers or safety systems function to a fail-safe state when impacted by new or unusual technology failure;

(6) Information on inspection and testing capabilities;

(7) A risk assessment and failure mode analysis;

(8) Operating procedures;

(9) A history of development and application of the technology;

(10) The basis of design, including design verification and validation testing;

(11) Detailed schematics identifying all components;

(12) A justification for new or unusual technology use, and any additional information required for a complete review;

(13) A list of requests for alternate procedures or equipment in accordance with § 250.141 and request for departures in accordance with § 250.142 needed for the new or unusual technology proposed in your New or Unusual Technology Conceptual Plan;

(14) A statement that the technology is fit for service in the applicable environment (for the specific project at location); and

(15) Documentation demonstrating payment of the service fee listed in § 250.125.

(b) The Regional Supervisor may require the use of an I3P according to § 250.231 if the system or equipment you propose to use requires a high degree of specialized or technically complex engineering knowledge, expertise, and experience to evaluate, or if existing industry standards do not address the system or equipment you propose to use.

(1) The Regional Supervisor may also require you to follow the I3P requirements according to § 250.232, as applicable, on a case-by-case basis.

(2) If you have any questions about I3P requirements for the New or Unusual Technology Conceptual Plan, contact the applicable Regional Supervisor.

§ 250.229 What must the New or Unusual Technology Barrier Equipment Conceptual Plan include?

Your New or Unusual Technology Barrier Equipment Conceptual Plan must include the following information:

(a) A description how the New or Unusual Technology Barrier Equipment Conceptual Plan fits within your overall site-specific project, if applicable. You must include an overview of the project development concepts and a proposed schedule for submittal of associated Conceptual Plans;

(b) Detailed schematics depicting the primary and secondary barriers that include all components, assemblies, or sub-assemblies, each labeled and categorized as a Category 1 barrier or Category 2 barrier;

(c) A list of the primary and secondary barriers that includes all components, assemblies, or sub-assemblies specifying each assigned barrier as either a Category 1 barrier or Category 2 barrier;

(d) A list of the engineering standards that will be used in the equipment's material selection and qualification, design verification analysis, and design validation testing;

(e) A list of requested alternate procedures or equipment in accordance with § 250.141 and requested departures in accordance with § 250.142 needed for the new or unusual technology barrier equipment proposed in your New or Unusual Technology Barrier Equipment Conceptual Plan;

(f) A list of the functional requirements (e.g., environmental and physical loads (magnitude and frequency)) for which the barrier equipment is being designed;

(g) A description of the equipment's safety critical functions, (e.g., function(s) performed by or inherent to the equipment enabling it to achieve or maintain a safe state);

(h) An I3P nomination, in accordance with § 250.231(a);

(i) An I3P verification plan that includes the following:

(1) A discussion of the equipment's material selection and qualification;

(2) A discussion of the equipment's design verification analyses;

(3) A discussion of the equipment's design validation testing;

(4) An explanation of why the analyses, processes, and procedures ensure that the equipment is fit for service in the applicable environment; and

(5) Details regarding how the I3P will address the additional items listed in § 250.232.

(j) Documentation demonstrating payment of the service fee listed in § 250.125.

§ 250.230 When are you required to submit an I3P Report?

You must submit to BSEE any I3P reports required in § 250.232 for any

equipment identified in your New or Unusual Technology Barrier Equipment Conceptual Plan and when required by the Regional Supervisor. BSEE will not approve your associated Conceptual Plan until BSEE reviews the required I3P Reports.

§ 250.231 What are your requirements for the Independent Third Party (I3P) nomination?

In accordance with each applicable Conceptual Plan, you must:

(a) Nominate I3P(s) to review the design verification and design validation documentation of the Original Equipment Manufacturer (OEM). Your I3P must be a technical classification society, a licensed professional engineering firm, or a registered professional engineer capable of providing the required verifications and validations. You must submit your I3P nomination(s) within the applicable Conceptual Plan for separate BSEE acceptance before BSEE will approve the applicable Conceptual Plan. Your I3P nomination must include the following descriptions:

(1) Previous experience in third-party verification and validation or experience in the design, fabrication, and installation of applicable offshore oil and gas equipment;

(2) Technical capabilities of the individual or the primary staff for the specific project;

(3) Size and type of organization or corporation;

(4) In-house availability of, or access to, appropriate technology to review the specific project. This should include, but not limited to, computer programs, hardware, and equipment as applicable;

(5) Ability to perform the I3P functions for the specific project considering current commitments (e.g., project timelines, schedules, and personnel availability); and

(6) Previous experience with BSEE requirements and procedures.

(b) You must ensure that the I3P has access to all associated documentation and equipment related to items listed on the I3P verification plan defined at § 250.229(i) and necessary for performance of complete reviews in accordance with § 250.232, including relevant OEM documentation (including documentation and data labeled as confidential and proprietary) and access to the OEM fabrication and manufacturing locations if such access is necessary to review the data.

(c) If your project involves submittal of multiple Conceptual Plans, you may propose to use the services of an I3P previously accepted by BSEE for the same project, and not submit the items

required under paragraph (a), if the BSEE-accepted I3P's qualifications are still valid and applicable to provide the required verifications and validations. You must submit documentation regarding the previous I3P nomination acceptance.

§ 250.232 What are the I3P review requirements for Conceptual Plan reviews?

In accordance with each applicable Conceptual Plan, the I3P must:

(a) Review the following information regarding the applicable equipment and/or system:

(1) Basis of Design, technical specification of the equipment (if known at this point in the design process) and functional requirements of the specific project (e.g., environmental and physical loads (magnitude and frequency));

(2) Risk assessment and failure mode analysis;

(3) Material specification, selection, qualification, and testing;

(4) Design verification analysis, including:

(i) Structural/strength analysis, and
(ii) Fatigue assessment and/or analysis.

(5) If fatigue is identified as a potential failure mode, as identified in the fatigue assessment and/or analysis in paragraph (a)(4) of this section, the plan to record and gather data (load monitoring) in order to conduct a future fatigue analysis;

(6) Design validation testing; and
(7) A fabrication, quality management system, and inspection and test plan that identifies the quality control/quality assurance process, and inspection of the final products.

(b) Submit a report to BSEE documenting the review of each item

covered under paragraph (a) of this section. Each report must clearly identify all OEM and operator documents used during the I3P review. The report must also include:

(1) The equipment and/or system's technical specifications, including a statement that the equipment and/or system is fit for purpose for the technical specification by the I3P; and

(2) Verification that the equipment's technical specifications meet or exceed the project's functional requirements, including a statement that the equipment and/or system is fit for purpose for the proposed project by the I3P.

(c) For any new project, you may use previous I3P reviews of equipment and/or systems technical specification that was approved in a previous Conceptual Plan. The Regional Supervisor may accept a final report in accordance with paragraph (c) of this section that includes the following:

(1) A statement that the previous report submitted pursuant to of paragraph (b) of this section remains valid;

(2) Verification that the equipment's technical specifications meet or exceed the proposed project's functional requirements; and

(3) A statement by the I3P that the equipment and/or system is fit for purpose for the proposed project.

§ 250.233 General requirements for any I3P Report.

An I3P Report as required in § 250.232 must be a standalone document that clearly summarizes the required verification and validation work performed and must contain a sufficient level of detail (e.g.,

quantitative information) and clarity to establish the basis of the I3P's findings. Each report must identify the OEM or operator documents reviewed, describe the detailed I3P review, and convey the results of the I3P's review without requiring BSEE to review of any other referenced documents.

§ 250.234 [Reserved]

DWOP Approval

§ 250.235 When and how must I submit the DWOP?

(a) You must submit the DWOP to the Regional Supervisor after BSEE has approved your Project Conceptual Plan and you have substantially completed system design, and before you conduct installation activities post-well completion for:

(1) A deepwater development project;

(2) A project that will use subsea tieback development technology in any water depth; or

(3) An HPHT development project, any project that uses Category 1 or 2 new or unusual technology barrier equipment, or any project that uses new or unusual technology that may impact the safety critical function of Category 1 or 2 barrier equipment regardless of the water depth.

(b) You may install subsea systems and associated pipelines after you have received applicable BSEE permit(s) and Conceptual Plan approvals. However, you may not begin production from the well until BSEE approves your DWOP.

§ 250.236 What information must I submit with the DWOP?

Your DWOP must contain the following information, as applicable:

Information that you must include with your DWOP	Where to find the description (§)
(a) General information	250.237
(b) Well or completion information	250.238
(c) Structural information	250.239
(d) Production safety system information	250.240
(e) Subsea system and pipeline information	250.241
(f) New or unusual technology information	250.242

§ 250.237 What general information must my DWOP include?

You must include the following general information in your DWOP, as applicable:

(a) A list of requests for any alternate procedures or equipment in accordance with § 250.141 and requests for departures in accordance with § 250.142 applicable to the DWOP, and a list of any identified alternate procedures or

equipment or departures for which you may request approval in any future applicable permit or application. You do not need to list alternative procedures or equipment or departure requests that were previously submitted and approved for the same project's Conceptual Plans unless the same alternate procedures or equipment or departure requests are needed for a

different piece of equipment for post-completion activities.

(b) Documentation demonstrating payment of the service fee listed in § 250.125; and

(c) A list of any associated industry standards not incorporated in the regulations that you are using for your project design or operation.

§ 250.238 What well or completions information must my DWOP include?

You must include the following information in your DWOP, as applicable, to be consistent with the activities to be addressed in the associated well permit(s):

- (a) A description and schematic of the typical wellbore, casing, and completion;
- (b) Information concerning the drilling and completion systems; and
- (c) Design and fabrication information for each wellbore riser system (e.g., drilling, completion, workover, intervention, injection, or production) deployed from a floating production facility or TLP.

§ 250.239 What structural information must my DWOP include?

You must include the following information in your DWOP, as applicable, to align with the activities to be addressed in the associated platform application, including any major modifications:

- (a) Structural design, fabrication, and installation information;
- (b) Design, fabrication, installation, and monitoring information on the tendon, or mooring systems, including the turret or buoy system, if applicable; and
- (c) Information on any active station keeping system(s) involving thrusters or other means of propulsion.

§ 250.240 What production safety system information must my DWOP include?

You must include the following information in your DWOP, as applicable, to be consistent with the activities you plan to address in the associated production safety system application:

- (a) A general description of the operating procedures;
- (b) Information about the design, fabrication, and operation of an offshore system for transferring produced hydrocarbons to a transport vessel, including a table summarizing the curtailment of production and offloading based on operational considerations;
- (c) A description of the process facility installation and commissioning procedure;
- (d) A safety analysis flow diagram of the production system from the SCSSV downstream to the first item of separation equipment;
- (e) A statement that the surface and/or subsea safety system and emergency support systems will comply with Subpart H of this part. This statement must include:
 - (1) The methods, frequency, and acceptance criteria for testing the

underwater safety valves (USVs), SCSSVs, and boarding shutdown valves;

(2) A description of the function and testing of the host facility Emergency Shutdown Device (ESD) system and its interface to the subsea system; and

(3) If applicable, a description of the surface and/or subsea safety system and emergency support systems not covered in Subpart H of this part. If you propose to use systems not covered in Subpart H of this part, you must request an approval of alternate procedures or equipment according to § 250.141, and you must also include a table that depicts what valves will close, at what times, and for what events or reasons; and

(f) Information regarding the design, operation, maintenance, personnel competency, and testing of your subsea leak detection system to protect your subsea field/infrastructure (e.g., trees, manifolds, jumpers). You must include a description of the procedures regarding how you will operate the system, ensure system functionality, identify a leak, and the actions you will take if a leak is identified.

§ 250.241 What subsea systems and pipeline information must my DWOP include?

(a) You must include the following information common to the subsea system and the associated pipeline systems, which constitute all or part of a single project development covered by the DWOP and/or is consistent with activities addressed in your associated pipeline application, as applicable:

- (1) The subsea field schematic depicting the planned subsea development equipment and infrastructure, including wells/trees, non-pipe subsea equipment, pipeline route(s), pipeline riser systems, umbilical(s), and platform footprint;
- (2) A description of the subsea development project detailing the subsea and pipeline equipment design criteria and analysis procedures (including industry standards, pressure and temperature ratings, materials selection), testing methods, and general operational procedures;
- (3) A description of the fabrication and assembly/testing location of subsea trees, pipelines, and non-pipe subsea equipment (manifold, Pipeline End Manifold (PLEM), Pipeline End Termination (PLET), Subsea Umbilical Termination Assembly (SUTA), subsea pumps, suction piles, etc.);
- (4) A summary of the Integrity Management Program for subsea tieback development technologies, including a plan for inspection and monitoring to support assessment of the condition of

the systems a minimum of once every 10 years. This should include, but is not limited to, the in-service inspections or surveys of hull and topsides structures, tendons, mooring, and pipeline and/or wellbore riser systems to assess component condition by inspection and analysis after each significant environmental event (e.g., hurricane, earthquake, loop and eddy currents, or mudslide) impacting the system, or once every 10 years, whichever occurs first. You must also include in your Integrity Management Plan a description of how you will determine significant environmental events; and

(5) A summary of safety and environmental controls.

(b) You must include the following information about subsea systems that constitute all or part of a single project development covered by the DWOP:

- (1) The system control type (e.g., direct hydraulic or electro-hydraulic);
- (2) Well tree(s), wellhead, and non-pipe equipment general arrangement drawings and schematics, with size and valve type annotations to illustrate the tree and other equipment in operation;
- (3) The estimated shut-in tubing pressure for the proposed well(s), including the calculation used to arrive at the estimate, specifying TVD, reservoir pressure, and the fluid gradient used, or a brief discussion of the PVT data used for estimation;
- (4) The wellbore static bottomhole temperature and the estimated flowing temperature at the tree, including a description of the method used to calculate this estimate;
- (5) A description of the umbilical(s) and umbilical connection(s), including an umbilical cross-section schematic;
- (6) A description of the chemical or other injection systems and/or enhanced recovery systems you plan to use;
- (7) A description of the corrosion monitoring and prevention/inhibition processes;
- (8) Details of any re-furbished and/or re-certified equipment you plan to use; and
- (9) A schedule of development activities, including well completion, facility installation, and anticipated date of first oil.

(c) You must include the following pipeline information in your DWOP, as applicable, to be consistent with your associated pipeline application(s):

- (1) General design and fabrication information for each pipeline riser system;
- (2) If you propose to use a pipeline free standing hybrid riser (FSHR) on a permanent installation that uses a buoyancy air can suspended from the top of the riser, you must provide the

following information in your DWOP as part of the discussions required by paragraphs (b)(1) and (2) of this section:

- (i) A detailed description and drawings of the FSHR, buoy, and the associated connection system;
- (ii) Detailed information regarding the system used to connect the FSHR to the buoyancy air can, and associated redundancies; and

- (iii) Descriptions of your monitoring system and monitoring plan for the pipeline FSHR and the associated connection system for fatigue, stress, and any other abnormal condition (*e.g.*, corrosion), that may negatively impact the riser system's integrity.

(3) Pipeline and pipeline riser installation methods.

§ 250.242 What New or Unusual Technology information must my DWOP include?

You must include the following new or unusual technology information in your DWOP, as applicable:

(a) A description of any new or unusual technology being used in your development project, including a reference to previously approved New or Unusual Technology Conceptual Plans or New or Unusual Technology Barrier Equipment Conceptual Plans.

(b) A description of any new or unusual technology not covered under the New or Unusual Technology Conceptual Plan or New or Unusual Technology Barrier Equipment Conceptual Plan. You must include the same applicable information as required in §§ 250.228 or 250.229.

§ § 250.243 and 250.244 [Reserved]

§ 250.245 May I combine the Project Conceptual Plan and the DWOP?

If your development project meets the following criteria, you may submit a combined Project Conceptual Plan/DWOP that complies with all applicable requirements for both, on or before the deadline for submitting the Project Conceptual Plan, as described in § 250.226:

- (a) The project is similar to projects involving subsea tieback development technology for which you have obtained approval previously, and
- (b) The project does not involve either new or unusual technology or a new platform.

§ 250.246 When must I revise my DWOP?

You must revise your approved DWOP to reflect any material change to the plan that does not involve a physical alteration of the equipment on the platform or the seabed.

§ 250.247 When must I supplement my DWOP?

You must supplement your DWOP to reflect additions or changes in your development project that:

(a) Physically alter the equipment or systems upstream of your boarding shut down valve, approved in your DWOP. If a Supplemental DWOP includes the addition of a well or wells (*e.g.*, a new subsea field) not approved in your original DWOP, you may not complete or produce from the new well(s) until BSEE approves the Supplemental DWOP; or

(b) Involves the addition of any new or unusual technology to your project that was not previously covered under the New or Unusual Technology Conceptual Plan, New or Unusual Technology Barrier Equipment Conceptual Plan, or DWOP. You may not install any new or unusual technology until BSEE approves the applicable Conceptual Plan and Supplemental DWOP.

§ 250.248 What information must I include in my Supplemental DWOP?

You must include the following information, as applicable, in your Supplemental DWOP:

(a) The same information for your wells or equipment as required in the applicable Conceptual Plan and DWOP requirements in this subpart;

(b) A description of each applicable Conceptual Plan or DWOP section that is being impacted by the addition or change; and

(c) Documentation demonstrating payment of the service fee listed in § 250.125.

Subpart D—Oil and Gas Drilling Operations

- 6. Amend § 250.490 by revising paragraph (p) introductory text to read as follows:

§ 250.490 Hydrogen sulfide.

* * * * *

(p) *Metallurgical properties of equipment.* When operating in a zone with H₂S present or when the concentration of H₂S in the produced fluid may exceed 0.05 psi partial pressure of H₂S, you must use equipment that is constructed of materials with metallurgical properties that resist or prevent sulfide stress cracking (also known as hydrogen embrittlement, stress corrosion cracking, or H₂S embrittlement), chloride-stress cracking, hydrogen-induced cracking, and other failure modes. You must do all of the following:

* * * * *

Subpart E—Oil and Gas Well-Completion Operations

- 7. Amend § 250.518 by revising paragraphs (a), (c), and (d) to read as follows:

§ 250.518 Tubing and wellhead equipment.

(a) No tubing string may be placed in service or continue to be used unless such tubing string has the necessary strength and pressure integrity and is otherwise suitable for its intended use.

(1) The tubing string must be evaluated for burst, collapse, and axial loads with appropriate safety factors and material design factors for the pressure and temperature environments of the completion, production, shut-in, and injection load cases.

(2) The tubing string materials must be appropriate for the environment. You must follow NACE Standard MR0175–2003 (incorporated by reference in § 250.198) when H₂S concentration may equal or exceed 0.05 psi partial pressure.

(3) The tubing string threaded connectors must be appropriate for the loads identified in paragraph (a)(1) of this section.

* * * * *

(c) You must design and test the wellhead, tree, and related equipment in accordance with ANSI/API Spec. 6A (incorporated by reference in § 250.198) or ANSI/API Spec. 17D (incorporated by reference in § 250.198), as applicable. The wellhead, tree, and related equipment must have a pressure rating greater than the maximum anticipated surface pressure and must be designed, installed, operated, maintained, and tested to achieve and maintain pressure containment and pressure control.

(1) Newly completed dry trees (*e.g.*, fixed, hybrid, or mudline suspension) for production or injection wells must be equipped with a minimum of one master valve and one surface safety valve (SSV), installed above the master valve, in the vertical run of the tree.

(2) Newly completed subsea production or injection wells must be equipped with a minimum of one USV installed in the horizontal or vertical run of the tree (*e.g.*, vertical or horizontal subsea trees).

(3) Newly completed wells with a mudline suspension conversion to a subsea tree must have a minimum of two casing strings tied back and sealed below the tubing head. At a minimum, the production casing and the next outer casing must be tied back to the wellhead, to ensure annular isolation.

(d) You must install, maintain, and test surface and subsurface safety equipment in accordance with the

applicable requirements in subpart H of this part.

* * * * *

Subpart F—Oil and Gas Well-Workover Operations

■ 8. Amend § 250.619 by revising paragraphs (a), (c), and (d) to read as follows:

§ 250.619 Tubing and wellhead equipment.

* * * * *

(a) No tubing string may be placed in service or continue to be used unless such tubing string has the necessary strength and pressure integrity and is otherwise suitable for its intended use.

(1) The tubing string must be evaluated for burst, collapse, and axial loads with appropriate safety factors and material design factors for the pressure and temperature environments of the completion, production, shut-in, and injection load cases.

(2) The tubing string materials must be appropriate for the environment. You must follow NACE Standard MR0175–2003 (incorporated by reference in

§ 250.198) when H₂S concentration may equal or exceed 0.05 psi partial pressure.

(3) The tubing string threaded connectors must be appropriate for the loading identified in paragraph (a)(1) of this section.

* * * * *

(c) You must design and test the wellhead, tree, and related equipment in accordance with ANSI/API Spec. 6A (incorporated by reference in § 250.198) or ANSI/API Spec. 17D (incorporated by reference in § 250.198), as applicable. The wellhead, tree, and related equipment must have a pressure rating greater than the shut-in tubing pressure and must be designed, installed, operated, maintained, and tested so as to achieve and maintain pressure containment and pressure control.

(1) Dry trees (*e.g.*, fixed, hybrid, or mudline suspension) for production or injection wells must be equipped with a minimum of one master valve and one surface safety valve (SSV), installed above the master valve, in the vertical run of the tree.

(2) Subsea production or injection wells must be equipped with a minimum of one USV installed in the horizontal or vertical run of the tree (for vertical or horizontal subsea trees).

(3) Wells with a mudline suspension conversion to a subsea tree must have a minimum of two casing strings tied back and sealed below the tubing head. At minimum, the production casing and the next outer casing must be tied back to the wellhead, to ensure annular isolation.

(d) You must install, maintain, and test surface and subsurface safety equipment in accordance with the applicable requirements in subpart H of this part.

* * * * *

Subpart G—Well Operations and Equipment

■ 9. Amend § 250.731 by revising paragraph (c)(4) to read as follows:

§ 250.731 What information must I submit for BOP systems and system components?

* * * * *

You must submit:

Including:

(c) * * * (4) If using a subsea BOP, a BOP in an HPHT environment as defined in § 250.105, or a surface BOP on a floating facility, the BOP has not been compromised or damaged from previous service.

* * * * *

■ 10. Amend § 250.732 by revising paragraph (c) to read as follows:

§ 250.732 What are the independent third party requirements for BOP systems and system components?

* * * * *

(c) Before you begin any operations in an HPHT environment, as defined by § 250.105, with the proposed equipment, you must include the following in your applicable permit:

(1) The I3P certification required in § 250.731(c);

(2) A description of any new or unusual technology being used;

(3) A reference to the previously approved associated New or Unusual Technology Barrier Equipment Conceptual Plan;

(4) The final report and statements in accordance with § 250.232(c); and

(5) The fit for service statement required in § 250.230.

You may not deploy your proposed BOP systems and related equipment that will or may be exposed to an HPHT environment until BSEE approves the

New or Unusual Technology Barrier Equipment Conceptual Plan and appropriate permits (*e.g.*, APD and APM).

* * * * *

Subpart H—Oil and Gas Production Safety Systems

§ 250.804 [Removed and Reserved]

■ 11. Remove and reserve § 250.804.

Environmental Protection Agency

40 CFR Part 52

Air Plan Approval; Ohio; Regional Haze Plan for the Second
Implementation Period; Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA–R05–OAR–2021–0544; FRL–12175–01–R5]

Air Plan Approval; Ohio; Regional Haze Plan for the Second Implementation Period

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing to approve the Ohio regional haze state implementation plan (SIP) revision submitted by the Ohio Environmental Protection Agency (Ohio or Ohio EPA) on July 30, 2021, which Ohio EPA supplemented on August 6, 2024, as satisfying applicable requirements under the Clean Air Act (CAA) and EPA's Regional Haze Rule for the program's second implementation period. EPA proposes to find that Ohio's SIP submission addresses the requirement that States must periodically revise their long-term strategies for making reasonable progress towards the national goal of preventing any future, and remedying any existing, anthropogenic impairment of visibility, including regional haze, in mandatory Class I Federal areas, and also addresses other applicable requirements for the second implementation period of the regional haze program. EPA is taking this action pursuant to sections 110 and 169A of the CAA.

DATES: Written comments must be received on or before September 30, 2024.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–R05–OAR–2021–0544 at <https://www.regulations.gov> or via email to langman.michael@epa.gov. For comments submitted at *Regulations.gov*, follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from the docket. EPA may publish any comment received to its public docket. Do not submit to EPA's docket at <https://www.regulations.gov> any information you consider to be confidential business information (CBI), Proprietary Business Information (PBI), or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include

discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods, please contact the person identified in the **FOR FURTHER INFORMATION CONTACT** section. For the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <https://www.epa.gov/dockets/commenting-epa-dockets>.

FOR FURTHER INFORMATION CONTACT: Alisa Liu, Air and Radiation Division (AR–18J), Environmental Protection Agency, Region 5, 77 West Jackson Boulevard, Chicago, Illinois 60604, (312) 353–3193, liu.alisa@epa.gov. The EPA Region 5 office is open from 8:30 a.m. to 4:30 p.m., Monday through Friday.

SUPPLEMENTARY INFORMATION: Throughout this document whenever “we,” “us,” or “our” is used, we mean EPA.

I. What action is EPA proposing?

On July 30, 2021, Ohio EPA submitted a revision to its SIP to address regional haze for the second implementation period and supplemented it on August 6, 2024. Ohio EPA made this SIP submission to satisfy the requirements of the CAA's regional haze program pursuant to CAA sections 169A and 169B and 40 CFR 51.308. EPA proposes to find that the Ohio regional haze SIP submission for the second implementation period meets the applicable statutory and regulatory requirements and thus proposes to approve Ohio's submission into its SIP.

II. Background and Requirements for Regional Haze Plans

A. Regional Haze Background

In the 1977 CAA Amendments, Congress created a program for protecting visibility in the nation's mandatory Class I Federal areas, which include certain national parks and wilderness areas.¹ CAA 169A. The CAA establishes as a national goal the “prevention of any future, and the remedying of any existing, impairment of visibility in mandatory class I Federal areas which impairment results from manmade air pollution.” CAA 169A(a)(1). The CAA further directs EPA to promulgate regulations to assure reasonable progress toward meeting this national goal. CAA 169A(a)(4). On December 2, 1980, EPA promulgated regulations to address visibility impairment in mandatory Class I Federal areas (hereinafter referred to as “Class I areas”) that is “reasonably attributable” to a single source or small group of sources. (45 FR 80084, December 2, 1980). These regulations, codified at 40 CFR 51.300 through 51.307, represented the first phase of EPA's efforts to address visibility impairment. In 1990, Congress added section 169B to the CAA to further address visibility impairment, specifically, impairment from regional

¹ Areas statutorily designated as mandatory Class I Federal areas consist of national parks exceeding 6,000 acres, wilderness areas and national memorial parks exceeding 5,000 acres, and all international parks that were in existence on August 7, 1977. CAA 162(a). There are 156 mandatory Class I areas. The list of areas to which the requirements of the visibility protection program apply is in 40 CFR part 81, subpart D.

haze. CAA 169B. EPA promulgated the Regional Haze Rule (RHR), codified at 40 CFR 51.308,² on July 1, 1999. (64 FR 35714, July 1, 1999). These regional haze regulations are a central component of EPA's comprehensive visibility protection program for Class I areas.

Regional haze is visibility impairment that is produced by a multitude of anthropogenic sources and activities which are located across a broad geographic area and that emit pollutants that impair visibility. Visibility impairing pollutants include fine and coarse particulate matter (PM) (*e.g.*, sulfates, nitrates, organic carbon, elemental carbon, and soil dust) and their precursors (*e.g.*, sulfur dioxide (SO₂), nitrogen oxides (NO_x), and, in some cases, volatile organic compounds (VOC) and ammonia (NH₃)). Fine particle precursors react in the atmosphere to form fine particulate matter (PM_{2.5}), which impairs visibility by scattering and absorbing light. Visibility impairment reduces the perception of clarity and color, as well as visible distance.³

To address regional haze visibility impairment, the 1999 RHR established an iterative planning process that requires both States in which Class I areas are located and States "the emissions from which may reasonably be anticipated to cause or contribute to any impairment of visibility" in a Class I area to periodically submit SIP revisions to address such impairment.

² In addition to the generally applicable regional haze provisions at 40 CFR 51.308, EPA also promulgated regulations specific to addressing regional haze visibility impairment in Class I areas on the Colorado Plateau at 40 CFR 51.309. The latter regulations are applicable only for specific jurisdictions' regional haze plans submitted no later than December 17, 2007, and thus are not relevant here.

³ There are several ways to measure the amount of visibility impairment, *i.e.*, haze. One such measurement is the deciview, which is the principal metric used by the RHR. Under many circumstances, a change in one deciview will be perceived by the human eye to be the same on both clear and hazy days. The deciview is unitless. It is proportional to the logarithm of the atmospheric extinction of light, which is the perceived dimming of light due to its being scattered and absorbed as it passes through the atmosphere. Atmospheric light extinction (b^{ext}) is a metric used to for expressing visibility and is measured in inverse megameters (Mm⁻¹). EPA's Guidance on Regional Haze State Implementation Plans for the Second Implementation Period ("2019 Guidance") offers the flexibility for the use of light extinction in certain cases. Light extinction can be simpler to use in calculations than deciview, since it is not a logarithmic function. See, *e.g.*, 2019 Guidance at 16, 19, <https://www.epa.gov/visibility/guidance-regional-haze-state-implementation-plans-second-implementation-period>, EPA Office of Air Quality Planning and Standards, Research Triangle Park (August 20, 2019). The formula for the deciview is $10 \ln(b^{ext})/10 \text{ Mm}^{-1}$. 40 CFR 51.301.

CAA 169A(b)(2);⁴ *see also* 40 CFR 51.308(b), (f) (establishing submission dates for iterative regional haze SIP revisions); (64 FR 35714 at 35768, July 1, 1999). Under the CAA, each SIP submission must contain "a long-term (ten to fifteen years) strategy for making reasonable progress toward meeting the national goal," CAA 169A(b)(2)(B); the initial round of SIP submissions also had to address the statutory requirement that certain older, larger sources of visibility impairing pollutants install and operate the best available retrofit technology (BART). CAA 169A(b)(2)(A); 40 CFR 51.308(d), (e). States' first regional haze SIPs were due by December 17, 2007, 40 CFR 51.308(b), with subsequent SIP submissions containing updated long-term strategies originally due July 31, 2018, and every ten years thereafter. (64 FR at 35768, July 1, 1999). EPA established in the 1999 RHR that all States either have Class I areas within their borders or "contain sources whose emissions are reasonably anticipated to contribute to regional haze in a Class I area"; therefore, all States must submit regional haze SIPs.⁵ *Id.* at 35721.

Much of the focus in the first implementation period of the regional haze program, which ran from 2007 through 2018, was on satisfying States' BART obligations. First implementation period SIPs were additionally required to contain long-term strategies for making reasonable progress toward the national visibility goal, of which BART is one component. The core required elements for the first implementation period SIPs (other than BART) are laid out in 40 CFR 51.308(d). Those provisions required that States containing Class I areas establish reasonable progress goals (RPGs) that are measured in deciviews (dv) and reflect the anticipated visibility conditions at the end of the implementation period including from implementation of States' long-term strategies. The first planning period RPGs were required to provide for an improvement in visibility for the most impaired days over the period of the implementation plan and ensure no

⁴ The RHR expresses the statutory requirement for States to submit plans addressing out-of-state class I areas by providing that States must address visibility impairment "in each mandatory Class I Federal area located outside the State that may be affected by emissions from within the State." 40 CFR 51.308(d) and (f).

⁵ In addition to each of the fifty States, EPA also concluded that the Virgin Islands and District of Columbia must also submit regional haze SIPs because they either contain a Class I area or contain sources whose emissions are reasonably anticipated to contribute regional haze in a Class I area. *See* 40 CFR 51.300(b) and (d)(3).

degradation in visibility for the least impaired days over the same period. In establishing the RPGs for any Class I area in a State, the State was required to consider four statutory factors: the costs of compliance, the time necessary for compliance, the energy and non-air quality environmental impacts of compliance, and the remaining useful life of any potentially affected sources. CAA 169A(g)(1); 40 CFR 51.308(d)(1).

States were also required to calculate baseline (using the five year period of 2000–2004) and natural visibility conditions (*i.e.*, visibility conditions without anthropogenic visibility impairment) for each Class I area, and to calculate the linear rate of progress needed to attain natural visibility conditions, assuming a starting point of baseline visibility conditions in 2004 and ending with natural conditions in 2064. This linear interpolation is known as the uniform rate of progress (URP) and is used as a tracking metric to help States assess the amount of progress they are making towards the national visibility goal over time in each Class I area.⁶ 40 CFR 51.308(d)(1)(i)(B), (d)(2). The 1999 RHR also provided that States' long-term strategies must include the "enforceable emissions limitations, compliance, schedules, and other measures as necessary to achieve the reasonable progress goals." 40 CFR 51.308(d)(3). In establishing their long-term strategies, States are required to consult with other States that also contribute to visibility impairment in a given Class I area and include all measures necessary to obtain their shares of the emission reductions needed to meet the RPGs. *See* 40 CFR 51.308(d)(3)(i), (ii). The provisions of 40 CFR 51.308(d) also contain seven additional factors States must consider in formulating their long-term strategies, 40 CFR 51.308(d)(3)(v), as well as provisions governing monitoring and other implementation plan requirements. 40 CFR 51.308(d)(4).

⁶ EPA established the URP framework in the 1999 RHR to provide "an equitable analytical approach" to assessing the rate of visibility improvement at Class I areas across the country. The start point for the URP analysis is 2004 and the endpoint was calculated based on the amount of visibility improvement that was anticipated to result from implementation of existing CAA programs over the period from the mid-1990s to approximately 2005. Assuming this rate of progress would continue into the future, EPA determined that natural visibility conditions would be reached in 60 years, or 2064 (60 years from the baseline starting point of 2004). However, EPA did not establish 2064 as the year by which the national goal *must* be reached. 64 FR at 35731–32. That is, the URP and the 2064 date are not enforceable targets but are rather tools that "allow for analytical comparisons between the rate of progress that would be achieved by the State's chosen set of control measures and the URP." (82 FR 3078 at 3084, January 10, 2017).

Finally, the 1999 RHR required States to submit periodic progress reports—SIP revisions due every five years that contain information on States' implementation of their regional haze plans and an assessment of whether anything additional is needed to make reasonable progress, *see* 40 CFR 51.308(g),(h)—and to consult with the Federal Land Manager(s) ⁷ (FLMs) responsible for each Class I area according to the requirements in CAA 169A(d) and 40 CFR 51.308(i).

On January 10, 2017, EPA promulgated revisions to the RHR, (82 FR 3078, January 10, 2017), that apply for the second and subsequent implementation periods. The 2017 rulemaking made several changes to the requirements for regional haze SIPs to clarify States' obligations and streamline certain regional haze requirements. The revisions to the regional haze program for the second and subsequent implementation periods focused on the requirement that States' SIPs contain long-term strategies for making reasonable progress towards the national visibility goal. The reasonable progress requirements as revised in the 2017 rulemaking (referred to here as the 2017 RHR Revisions) are codified at 40 CFR 51.308(f). Among other changes, the 2017 RHR Revisions adjusted the deadline for States to submit their second implementation period SIPs from July 31, 2018, to July 31, 2021, clarified the order of analysis and the relationship between RPGs and the long-term strategy, and focused on making visibility improvements on the days with the most anthropogenic visibility impairment, as opposed to the days with the most visibility impairment overall. EPA also revised requirements of the visibility protection program related to periodic progress reports and FLM consultation. The specific requirements applicable to second implementation period regional haze SIP submissions are addressed in detail below.

EPA provided guidance to the states for their second implementation period SIP submissions in the preamble to the 2017 RHR Revisions as well as in subsequent, stand-alone guidance documents. In August 2019, EPA issued "Guidance on Regional Haze State Implementation Plans for the Second Implementation Period" ("2019

Guidance").⁸ On July 8, 2021, EPA issued a memorandum containing "Clarifications Regarding Regional Haze State Implementation Plans for the Second Implementation Period" ("2021 Clarifications Memo").⁹ Additionally, EPA further clarified the recommended procedures for processing ambient visibility data and optionally adjusting the URP to account for international anthropogenic and prescribed fire impacts in two technical guidance documents: the December 2018 "Technical Guidance on Tracking Visibility Progress for the Second Implementation Period of the Regional Haze Program" ("2018 Visibility Tracking Guidance"),¹⁰ and the June 2020 "Recommendation for the Use of Patched and Substituted Data and Clarification of Data Completeness for Tracking Visibility Progress for the Second Implementation Period of the Regional Haze Program" and associated Technical Addendum ("2020 Data Completeness Memo").¹¹

As explained in the 2021 Clarifications Memo, EPA intends the second implementation period of the regional haze program to secure meaningful reductions in visibility impairing pollutants that build on the significant progress States have achieved to date. The Agency also recognizes that analyses regarding reasonable progress are State-specific and that, based on States' and sources' individual circumstances, what constitutes reasonable reductions in visibility impairing pollutants will vary from State-to-State. While there exist many opportunities for States to

leverage both ongoing and upcoming emission reductions under other CAA programs, the Agency expects States to undertake rigorous reasonable progress analyses that identify further opportunities to advance the national visibility goal consistent with the statutory and regulatory requirements. *See generally* 2021 Clarifications Memo. This is consistent with Congress's determination that a visibility protection program is needed in addition to the CAA's National Ambient Air Quality Standards (NAAQS) and Prevention of Significant Deterioration (PSD) programs, as further emission reductions may be necessary to adequately protect visibility in Class I areas throughout the country.¹²

B. Roles of Agencies in Addressing Regional Haze

Because the air pollutants and pollution affecting visibility in Class I areas can be transported over long distances, successful implementation of the regional haze program requires long-term, regional coordination among multiple jurisdictions and agencies that have responsibility for Class I areas and the emissions that impact visibility in those areas. To address regional haze, States need to develop strategies in coordination with one another, considering the effect of emissions from one jurisdiction on the air quality in another. Five regional planning organizations (RPOs),¹³ which include representation from State and Tribal governments, EPA, and FLMs, were developed in the lead-up to the first implementation period to address regional haze. RPOs evaluate technical information to better understand how emissions from State and Tribal land impact Class I areas across the country, pursue the development of regional strategies to reduce emissions of particulate matter and other pollutants leading to regional haze, and help States meet the consultation requirements of the RHR.

The Lake Michigan Air Directors Consortium (LADCO) is an RPO that includes the States of Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin. LADCO's work is a

EPA Office of Air Quality Planning and Standards, Research Triangle Park (July 8, 2021).

¹⁰ Technical Guidance on Tracking Visibility Progress for the Second Implementation Period of the Regional Haze Program. <https://www.epa.gov/sites/default/files/2021-03/documents/tracking.pdf> EPA Office of Air Quality Planning and Standards, Research Triangle Park. (December 20, 2018).

¹¹ Recommendation for the Use of Patched and Substituted Data and Clarification of Data Completeness for Tracking Visibility Progress for the Second Implementation Period of the Regional Haze Program. <https://www.epa.gov/visibility/memo-and-technical-addendum-ambient-data-usage-and-completeness-regional-haze-program> EPA Office of Air Quality Planning and Standards, Research Triangle Park (June 3, 2020).

⁷ EPA's regulations define "Federal Land Manager" as "the Secretary of the department with authority over the Federal Class I area (or the Secretary's designee) or, with respect to Roosevelt-Campobello International Park, the Chairman of the Roosevelt-Campobello International Park Commission." 40 CFR 51.301.

¹² See, e.g., H.R. Rep. No. 95–294 at 205 ("In determining how to best remedy the growing visibility problem in these areas of great scenic importance, the committee realizes that as a matter of equity, the national ambient air quality standards cannot be revised to adequately protect visibility in all areas of the country."), ("the mandatory class I increments of [the PSD program] do not adequately protect visibility in class I areas").

¹³ RPOs are sometimes also referred to as "multi-jurisdictional organizations," or MJOs. For the purposes of this notice, the terms RPO and MJO are synonymous.

collaborative effort of State governments, Tribal governments, and various Federal agencies established to initiate and coordinate activities associated with the management of regional haze, visibility, and other air quality issues in the Midwest. Along with the six LADCO States, participants in LADCO's Regional Haze Technical Workgroup include EPA, U.S. National Parks Service (NPS), U.S. Fish and Wildlife Service (FWS), and U.S. Forest Service (USFS).

III. Requirements for Regional Haze Plans for the Second Implementation Period

Under the CAA and EPA's regulations, all 50 States, the District of Columbia, and the U.S. Virgin Islands were required to submit regional haze SIPs satisfying the applicable requirements for the second implementation period of the regional haze program by July 31, 2021. Each State's SIP must contain a long-term strategy for making reasonable progress toward meeting the national goal of remedying any existing and preventing any future anthropogenic visibility impairment in Class I areas. CAA 169A(b)(2)(B). To this end, 40 CFR 51.308(f) lays out the process by which States determine what constitutes their long-term strategies, with the order of the requirements in 40 CFR 51.308(f)(1) through (3) generally mirroring the order of the steps in the reasonable progress analysis¹⁴ and (f)(4) through (6) containing additional, related requirements. Broadly speaking, a State first must identify the Class I areas within the State and determine the Class I areas outside the State in which visibility may be affected by emissions from the State. These are the Class I areas that must be addressed in the State's long-term strategy. See 40 CFR 51.308(f), (f)(2). For each Class I area within its borders, a State must then calculate the baseline, current, and natural visibility conditions for that area, as well as the visibility improvement made to date and the URP. See 40 CFR 51.308(f)(1). Each State having a Class I area and/or emissions that may affect visibility in a Class I area must then develop a long-term strategy that includes the enforceable emission limitations, compliance schedules, and other measures that are necessary to make reasonable progress in such areas. A reasonable progress determination is based on applying the four factors in

CAA section 169A(g)(1) to sources of visibility-impairing pollutants that the State has selected to assess for controls for the second implementation period. Additionally, as further explained below, the RHR at 40 CFR 51.308(f)(2)(iv) separately provides five "additional factors"¹⁵ that States must consider in developing their long-term strategies. See 40 CFR 51.308(f)(2). A State evaluates potential emission reduction measures for those selected sources and determines which are necessary to make reasonable progress. Those measures are then incorporated into the State's long-term strategy. After a State has developed its long-term strategy, it then establishes RPGs for each Class I area within its borders by modeling the visibility impacts of all reasonable progress controls at the end of the second implementation period, *i.e.*, in 2028, as well as the impacts of other requirements of the CAA. The RPGs include reasonable progress controls not only for sources in the State in which the Class I area is located, but also for sources in other States that contribute to visibility impairment in that area. The RPGs are then compared to the baseline visibility conditions and the URP to ensure that progress is being made towards the statutory goal of preventing any future and remedying any existing anthropogenic visibility impairment in Class I areas. 40 CFR 51.308(f)(2) and (3).

In addition to satisfying the requirements at 40 CFR 51.308(f) related to reasonable progress, the regional haze SIP revisions for the second implementation period must address the requirements in 40 CFR 51.308(g)(1) through (5) pertaining to periodic reports describing progress towards the RPGs, 40 CFR 51.308(f)(5), as well as requirements for FLM consultation that apply to all visibility protection SIPs and SIP revisions. 40 CFR 51.308(i).

A State must submit its regional haze SIP and subsequent SIP revisions to EPA according to the requirements applicable to all SIP revisions under the CAA and EPA's regulations. See CAA 169A(b)(2); CAA 110(a). Upon EPA approval, a SIP is enforceable by the Agency and the public under the CAA. If EPA finds that a State fails to make a required SIP revision, or if EPA finds that a State's SIP is incomplete or disapproves the SIP, the Agency must promulgate a Federal implementation plan (FIP) that satisfies the applicable requirements. See CAA 110(c)(1).

A. Identification of Class I Areas

The first step in developing a regional haze SIP is for a State to determine which Class I areas, in addition to those within its borders, "may be affected" by emissions from within the State. In the 1999 RHR, EPA determined that all States contribute to visibility impairment in at least one Class I area and explained that the statute and regulations lay out an "extremely low triggering threshold" for determining "whether States should be required to engage in air quality planning and analysis as a prerequisite to determining the need for control of emissions from sources within their State." 64 FR 35714 at 35720–22, July 1, 1999.

A State must determine which Class I areas must be addressed by its SIP by evaluating the total emissions of visibility impairing pollutants from all sources within the State. While the RHR does not require this evaluation to be conducted in any particular manner, EPA's 2019 Guidance provides recommendations for how such an assessment might be accomplished, including by, where appropriate, using the determinations previously made for the first implementation period. See 2019 Guidance at 8–9. In addition, the determination of which Class I areas may be affected by a State's emissions is subject to the requirement in 40 CFR 51.308(f)(2)(iii) to "document the technical basis, including modeling, monitoring, cost, engineering, and emissions information, on which the State is relying to determine the emission reduction measures that are necessary to make reasonable progress in each mandatory Class I Federal area it affects."

B. Calculations of Baseline, Current, and Natural Visibility Conditions; Progress to Date; and the Uniform Rate of Progress

As part of assessing whether a SIP submission for the second implementation period is providing for reasonable progress towards the national visibility goal, the RHR contains requirements in 40 CFR 51.308(f)(1) related to tracking visibility improvement over time. The requirements of this section apply only to States having Class I areas within their borders; the required calculations must be made for each such Class I area. EPA's 2018 Visibility Tracking Guidance¹⁶ provides recommendations

¹⁴ EPA explained in the 2017 RHR Revisions that we were adopting new regulatory language in 40 CFR 51.308(f) that, unlike the structure in 51.308(d), "tracked the actual planning sequence." (82 FR 3091, January 10, 2017).

¹⁵ The five "additional factors" for consideration in section 51.308(f)(2)(iv) are distinct from the four factors listed in CAA section 169A(g)(1) and 40 CFR 51.308(f)(2)(i) that States must consider and apply to sources in determining reasonable progress.

¹⁶ The 2018 Visibility Tracking Guidance references and relies on parts of the 2003 Tracking Guidance: "Guidance for Tracking Progress Under the Regional Haze Rule," which can be found at

to assist States in satisfying their obligations under 40 CFR 51.308(f)(1); specifically, in developing information on baseline, current, and natural visibility conditions, and in making optional adjustments to the URP to account for the impacts of international anthropogenic emissions and prescribed fires. See 82 FR 3078 at 3103–05, January 10, 2017.

The RHR requires tracking of visibility conditions on two sets of days: the clearest and the most impaired days. Visibility conditions for both sets of days are expressed as the average deciview index for the relevant five-year period (the period representing baseline or current visibility conditions). The RHR provides that the relevant sets of days for visibility tracking purposes are the 20 percent clearest (the 20 percent of monitored days in a calendar year with the lowest values of the deciview index) and 20 percent most impaired days (the 20 percent of monitored days in a calendar year with the highest amounts of anthropogenic visibility impairment).¹⁷ 40 CFR 51.301. A State must calculate visibility conditions for both the 20 percent clearest and 20 percent most impaired days for the baseline period of 2000–2004 and the most recent five-year period for which visibility monitoring data are available (representing current visibility conditions). 40 CFR 51.308(f)(1)(i) and (iii). States must also calculate natural visibility conditions for the clearest and most impaired days,¹⁸ by estimating the conditions that would exist on those two sets of days absent anthropogenic visibility impairment. 40 CFR 51.308(f)(1)(ii). Using all these data, States must then calculate, for each Class I area, the amount of progress made since the baseline period (2000–2004) and how much improvement is left to achieve to reach natural visibility conditions.

Using the data for the set of most impaired days only, States must plot a

<https://www.epa.gov/sites/default/files/2021-03/documents/tracking.pdf>.

¹⁷ This action also refers to the 20 percent clearest and 20 percent most anthropogenically impaired days as the “clearest” and “most impaired” or “most anthropogenically impaired” days, respectively.

¹⁸ The RHR at 40 CFR 51.308(f)(1)(ii) contains an error related to the requirement for calculating two sets of natural conditions values. The rule says, “most impaired days or the clearest days” where it should say “most impaired days and clearest days.” This is an error that was intended to be corrected in the 2017 RHR Revisions but did not get corrected in the final rule language. This is supported by the preamble text at 82 FR 3098: “In the final version of 40 CFR 51.308(f)(1)(ii), an occurrence of “or” has been corrected to “and” to indicate that natural visibility conditions for both the most impaired days and the clearest days must be based on available monitoring information.”

line between visibility conditions in the baseline period and natural visibility conditions for each Class I area to determine the URP—the amount of visibility improvement, measured in dv, that would need to be achieved during each implementation period to achieve natural visibility conditions by the end of 2064. The URP is used in later steps of the reasonable progress analysis for informational purposes and to provide a non-enforceable benchmark against which to assess a Class I area’s rate of visibility improvement.¹⁹ Additionally, in the 2017 RHR Revisions, EPA provided States the option of proposing to adjust the endpoint of the URP to account for impacts of anthropogenic sources outside the United States and/or impacts of certain types of wildland prescribed fires. These adjustments, which must be approved by EPA, are intended to avoid any perception that States should compensate for impacts from international anthropogenic sources and to give States the flexibility to determine that limiting the use of wildland-prescribed fire is not necessary for reasonable progress. See 82 FR 3078 at 3107, January 10, 2017, footnote 116.

EPA’s 2018 Visibility Tracking Guidance can be used to help satisfy the 40 CFR 51.308(f)(1) requirements, including in developing information on baseline, current, and natural visibility conditions, and in making optional adjustments to the URP. In addition, the 2020 Data Completeness Memo provides recommendations on the data completeness language referenced in 40 CFR 51.308(f)(1)(i) and provides updated natural conditions estimates for each Class I area.

C. Long-Term Strategy for Regional Haze

The core component of a regional haze SIP submission is a long-term strategy that addresses regional haze in each Class I area within a State’s borders and each Class I area that may be affected by emissions from the State. The long-term strategy “must include the enforceable emissions limitations, compliance schedules, and other measures that are necessary to make reasonable progress, as determined pursuant to (f)(2)(i) through (iv).” 40 CFR 51.308(f)(2). The amount of progress that is “reasonable progress” is based on applying the four statutory

¹⁹ Being on or below the URP is not a “safe harbor”; *i.e.*, achieving the URP does not mean that a Class I area is making “reasonable progress” and does not relieve a State from using the four statutory factors to determine what level of control is needed to achieve such progress. See, *e.g.*, 82 FR 3078 at 3093, January 10, 2017.

factors in CAA section 169A(g)(1) in an evaluation of potential control options for sources of visibility impairing pollutants, which is referred to as a “four-factor” analysis. The outcome of that analysis is the emission reduction measures that a particular source or group of sources needs to implement to make reasonable progress towards the national visibility goal. See 40 CFR 51.308(f)(2)(i). Emission reduction measures that are necessary to make reasonable progress may be either new, additional control measures for a source, or they may be the existing emission reduction measures that a source is already implementing. See 2019 Guidance at 43; 2021 Clarifications Memo at 8–10. Such measures must be represented by “enforceable emissions limitations, compliance schedules, and other measures” (*i.e.*, any additional compliance tools) in a State’s long-term strategy in its SIP. 40 CFR 51.308(f)(2).

The construct of 40 CFR 51.308(f)(2)(i) provides the requirements for the four-factor analysis. The first step of this analysis entails selecting the sources to be evaluated for emission reduction measures; to this end, the RHR requires States to consider “major and minor stationary sources or groups of sources, mobile sources, and area sources” of visibility impairing pollutants for potential four-factor control analysis. 40 CFR 51.308(f)(2)(i). A threshold question at this step is which visibility impairing pollutants will be analyzed. As EPA previously explained, consistent with the first implementation period, EPA generally expects that each State will analyze at least SO₂ and NO_x in selecting sources and determining control measures. See 2019 Guidance at 12, 2021, Clarifications Memo at 4. A State that chooses not to consider at least these two pollutants should demonstrate why such consideration would be unreasonable. 2021 Clarifications Memo at 4.

While States have the option to analyze *all* sources, the 2019 Guidance explains that “an analysis of control measures is not required for every source in each implementation period,” and that “[s]electing a set of sources for analysis of control measures in each implementation period is . . . consistent with the Regional Haze Rule, which sets up an iterative planning process and anticipates that a state may not need to analyze control measures for all its sources in a given SIP revision.” 2019 Guidance at 9. However, given that source selection is the basis of all subsequent control determinations, a reasonable source selection process “should be designed and conducted to ensure that source selection results in a

set of pollutants and sources the evaluation of which has the potential to meaningfully reduce their contributions to visibility impairment.” 2021 Clarifications Memo at 3.

EPA explained in the 2021 Clarifications Memo that each State has an obligation to submit a long-term strategy that addresses the regional haze visibility impairment that results from emissions from within that State. Thus, source selection should focus on the in-state contribution to visibility impairment and be designed to capture a meaningful portion of the State’s total contribution to visibility impairment in Class I areas. A State should not decline to select its largest in-state sources on the basis that there are even larger out-of-state contributors. 2021 Clarifications Memo at 4.²⁰

Thus, while States have discretion to choose any source selection methodology that is reasonable, whatever choices they make should be reasonably explained. To this end, 40 CFR 51.308(f)(2)(i) requires that a State’s SIP submission include “a description of the criteria it used to determine which sources or groups of sources it evaluated.” The technical basis for source selection, which may include methods for quantifying potential visibility impacts such as emissions divided by distance metrics, trajectory analyses, residence time analyses, and/or photochemical modeling, must also be appropriately documented, as required by 40 CFR 51.308(f)(2)(iii).

Once a State has selected the set of sources, the next step is to determine the emissions reduction measures for those sources that are necessary to make reasonable progress for the second implementation period.²¹ This is accomplished by considering the four factors—“the costs of compliance, the time necessary for compliance, and the energy and non-air quality environmental impacts of compliance, and the remaining useful life of any

existing source subject to such requirements.” CAA 169A(g)(1). EPA has explained that the four-factor analysis is an assessment of potential emission reduction measures (*i.e.*, control options) for sources; “use of the terms ‘compliance’ and ‘subject to such requirements’ in section 169A(g)(1) strongly indicates that Congress intended the relevant determination to be the requirements with which sources would have to comply to satisfy the CAA’s reasonable progress mandate.” 82 FR 3078 at 3091, January 10, 2017. Thus, for each source it has selected for four-factor analysis,²² a State must consider a “meaningful set” of technically feasible control options for reducing emissions of visibility impairing pollutants. *Id.* at 3088. The 2019 Guidance provides that “[a] state must reasonably pick and justify the measures that it will consider, recognizing that there is no statutory or regulatory requirement to consider all technically feasible measures or any particular measures. A range of technically feasible measures available to reduce emissions would be one way to justify a reasonable set.” 2019 Guidance at 29.

EPA’s 2021 Clarifications Memo provides further guidance on what constitutes a reasonable set of control options for consideration: “A reasonable four-factor analysis will consider the full range of potentially reasonable options for reducing emissions.” 2021 Clarifications Memo at 7. In addition to add-on controls and other retrofits (*i.e.*, new emissions reduction measures for sources), EPA explained that States should generally analyze efficiency improvements for sources’ existing measures as control options in their four-factor analyses, as in many cases such improvements are reasonable given that they typically involve only additional operation and maintenance costs. Additionally, the 2021

Clarifications Memo provides that States that have assumed a higher emissions rate than a source has achieved or could potentially achieve using its existing measures should also consider lower emissions rates as potential control options. That is, a State should consider a source’s recent actual and projected emission rates to determine if it could reasonably attain lower emission rates with its existing measures. If so, the State should analyze the lower emission rate as a control option for reducing emissions. 2021 Clarifications Memo at 7. EPA’s recommendations to analyze potential efficiency improvements and achievable lower emission rates apply to both sources that have been selected for four-factor analysis and those that have forgone a four-factor analysis on the basis of existing “effective controls.” See 2021 Clarifications Memo at 5, 10.

After identifying a reasonable set of potential control options for the sources it has selected, a State then collects information on the four factors with regard to each option identified. EPA has also explained that, in addition to the four statutory factors, States have flexibility under the CAA and RHR to reasonably consider visibility benefits as an additional factor alongside the four statutory factors.²³ The 2019 Guidance provides recommendations for the types of information that can be used to characterize the four factors (with or without visibility), as well as ways in which States might reasonably consider and balance that information to determine which of the potential control options is necessary to make reasonable progress. See 2019 Guidance at 30–36. The 2021 Clarifications Memo contains further guidance on how States can reasonably consider modeled visibility impacts or benefits in the context of a four-factor analysis. 2021 Clarifications Memo at 12–13, 14–15. Specifically, EPA explained that while visibility can reasonably be used when comparing and choosing between multiple reasonable control options, it should not be used to summarily reject controls that are reasonable given the four statutory factors. 2021 Clarifications Memo at 13. Ultimately, while States have discretion to reasonably weigh the factors and to determine what level of control is needed, 40 CFR 51.308(f)(2)(i) provides that a State “must include in its implementation plan a description of . . . how the four factors were taken into consideration in selecting the

²⁰ Similarly, in responding to comments on the 2017 RHR Revisions, EPA explained that “[a] state should not fail to address its many relatively low-impact sources merely because it only has such sources and another state has even more low-impact sources and/or some high impact sources.” Responses to Comments on Protection of Visibility: Amendments to Requirements for State Plans; Proposed Rule (81 FR 26942 at 26987–88, May 4, 2016).

²¹ The CAA provides that, “[i]n determining reasonable progress there shall be taken into consideration” the four statutory factors. CAA 169A(g)(1). However, in addition to four-factor analyses for selected sources, groups of sources, or source categories, a State may also consider additional emission reduction measures for inclusion in its long-term strategy, *e.g.*, from other newly adopted, on-the-books, or on-the-way rules and measures for sources not selected for four-factor analysis for the second planning period.

²² “Each source” or “particular source” is used here as shorthand. While a source-specific analysis is one way of applying the four factors, neither the statute nor the RHR requires States to evaluate individual sources. Rather, States have “the flexibility to conduct four-factor analyses for specific sources, groups of sources or even entire source categories, depending on state policy preferences and the specific circumstances of each state.” 82 FR 3078 at 3088, January 10, 2017. However, not all approaches to grouping sources for four-factor analysis are necessarily reasonable; the reasonableness of grouping sources in any particular instance will depend on the circumstances and the manner in which grouping is conducted. If it is feasible to establish and enforce different requirements for sources or subgroups of sources, and if relevant factors can be quantified for those sources or subgroups, then States should make a separate reasonable progress determination for each source or subgroup. 2021 Clarifications Memo at 7–8.

²³ See, *e.g.*, Responses to Comments on Protection of Visibility: Amendments to Requirements for State Plans; Proposed Rule (81 FR 26942, May 4, 2016), Docket Number EPA–HQ–OAR–2015–0531, U.S. Environmental Protection Agency at 186; 2019 Guidance at 36–37.

measure for inclusion in its long-term strategy.”

As explained above, 40 CFR 51.308(f)(2)(i) requires States to determine the emission reduction measures for sources that are necessary to make reasonable progress by considering the four factors. Pursuant to 40 CFR 51.308(f)(2), measures that are necessary to make reasonable progress towards the national visibility goal must be included in a State’s long-term strategy and in its SIP.²⁴ If the outcome of a four-factor analysis is a new, additional emission reduction measure for a source, that new measure is necessary to make reasonable progress towards remedying existing anthropogenic visibility impairment and must be included in the SIP. If the outcome of a four-factor analysis is that no new measures are reasonable for a source, continued implementation of the source’s existing measures is generally necessary to prevent future emission increases and thus to make reasonable progress towards the second part of the national visibility goal: preventing future anthropogenic visibility impairment. *See* CAA 169A(a)(1). That is, when the result of a four-factor analysis is that no new measures are necessary to make reasonable progress, the source’s existing measures are generally necessary to make reasonable progress and must be included in the SIP. However, there may be circumstances in which a State can demonstrate that a source’s existing measures are *not* necessary to make reasonable progress. Specifically, if a State can demonstrate that a source will continue to implement its existing measures and will not increase its emissions rate, it may not be necessary to have those measures in the long-term strategy to prevent future emissions increases and future visibility impairment. EPA’s 2021 Clarifications Memo provides further explanation and guidance on how States may demonstrate that a source’s existing measures are not necessary to make reasonable progress. *See* 2021 Clarifications Memo at 8–10. If the State can make such a demonstration, it need

not include a source’s existing measures in the long-term strategy or its SIP.

As with source selection, the characterization of information on each of the factors is also subject to the documentation requirement in 40 CFR 51.308(f)(2)(iii). The reasonable progress analysis, including source selection, information gathering, characterization of the four statutory factors (and potentially visibility), balancing of the four factors, and selection of the emission reduction measures that represent reasonable progress, is a technically complex exercise, but also a flexible one that provides States with bounded discretion to design and implement approaches appropriate to their circumstances. Given this flexibility, 40 CFR 51.308(f)(2)(iii) plays an important function in requiring a State to document the technical basis for its decision making so that the public and EPA can comprehend and evaluate the information and analysis the State relied upon to determine what emission reduction measures must be in place to make reasonable progress. The technical documentation must include the modeling, monitoring, cost, engineering, and emissions information on which the State relied to determine the measures necessary to make reasonable progress. This documentation requirement can be met through the provision of and reliance on technical analyses developed through a regional planning process, so long as that process and its output has been approved by all State participants. In addition to the explicit regulatory requirement to document the technical basis of their reasonable progress determinations, States are also subject to the general principle that those determinations must be reasonably moored to the statute.²⁵ That is, a State’s decisions about the emission reduction measures that are necessary to make reasonable progress must be consistent with the statutory goal of remedying existing and preventing future visibility impairment.

The four statutory factors (and potentially visibility) are used to determine what emission reduction measures for selected sources must be included in a State’s long-term strategy for making reasonable progress. Additionally, the RHR at 40 CFR 51.308(f)(2)(iv) separately provides five

“additional factors”²⁶ that States must consider in developing their long-term strategies: (1) Emission reductions due to ongoing air pollution control programs, including measures to address reasonably attributable visibility impairment; (2) measures to reduce the impacts of construction activities; (3) source retirement and replacement schedules; (4) basic smoke management practices for prescribed fire used for agricultural and wildland vegetation management purposes and smoke management programs; and (5) the anticipated net effect on visibility due to projected changes in point, area, and mobile source emissions over the period addressed by the long-term strategy. The 2019 Guidance provides that a State may satisfy this requirement by considering these additional factors in the process of selecting sources for four-factor analysis, when performing that analysis, or both, and that not every one of the additional factors needs to be considered at the same stage of the process. *See* 2019 Guidance at 21. EPA provided further guidance on the five additional factors in the 2021 Clarifications Memo, explaining that a State should generally not reject cost-effective and otherwise reasonable controls merely because there have been emission reductions since the first planning period owing to other ongoing air pollution control programs or merely because visibility is otherwise projected to improve at Class I areas. Additionally, States generally should not rely on these additional factors to summarily assert that the State has already made sufficient progress and, therefore, no sources need to be selected or no new controls are needed regardless of the outcome of four-factor analyses. 2021 Clarifications Memo at 13.

Because the air pollution that causes regional haze crosses State boundaries, 40 CFR 51.308(f)(2)(ii) requires a State to consult with other States that also have emissions that are reasonably anticipated to contribute to visibility impairment in a given Class I area. Consultation allows for each State that impacts visibility in an area to share whatever technical information, analyses, and control determinations may be necessary to develop coordinated emission management strategies. This coordination may be managed through inter- and intra-RPO consultation and the development of

²⁴ States may choose to, but are not required to, include measures in their long-term strategies beyond just the emission reduction measures that are necessary for reasonable progress. *See* 2021 Clarifications Memo at 16. For example, States with smoke management programs may choose to submit their smoke management plans to EPA for inclusion in their SIPs but are not required to do so. *See, e.g.,* 82 FR 3078 at 3108–09, January 10, 2017, (requirement to consider smoke management practices and smoke management programs under 40 CFR 51.308(f)(2)(iv) does not require States to adopt such practices or programs into their SIPs, although they may elect to do so).

²⁵ *See Arizona ex rel. Darwin v. U.S. EPA*, 815 F.3d 519, 531 (9th Cir. 2016); *Nebraska v. U.S. EPA*, 812 F.3d 662, 668 (8th Cir. 2016); *North Dakota v. EPA*, 730 F.3d 750, 761 (8th Cir. 2013); *Oklahoma v. EPA*, 723 F.3d 1201, 1206, 1208–10 (10th Cir. 2013); *cf. also Nat’l Parks Conservation Ass’n v. EPA*, 803 F.3d 151, 165 (3d Cir. 2015); *Alaska Dep’t of Envtl. Conservation v. EPA*, 540 U.S. 461, 485, 490 (2004).

²⁶ The five “additional factors” for consideration in section 51.308(f)(2)(iv) are distinct from the four factors listed in CAA section 169A(g)(1) and 40 CFR 51.308(f)(2)(i) that States must consider and apply to sources in determining reasonable progress.

regional emissions strategies; additional consultations between States outside of RPO processes may also occur. If a State, pursuant to consultation, agrees that certain measures (e.g., a certain emission limitation) are necessary to make reasonable progress at a Class I area, it must include those measures in its SIP. 40 CFR 51.308(f)(2)(ii)(A). Additionally, the RHR requires that States that contribute to visibility impairment at the same Class I area consider the emission reduction measures the other contributing States have identified as being necessary to make reasonable progress for their own sources. 40 CFR 51.308(f)(2)(ii)(B). If a State has been asked to consider or adopt certain emission reduction measures, but ultimately determines those measures are not necessary to make reasonable progress, that State must document in its SIP the actions taken to resolve the disagreement. 40 CFR 51.308(f)(2)(ii)(C). EPA will consider the technical information and explanations presented by the submitting State and the State with which it disagrees when considering whether to approve the State's SIP. *See Id.*; 2019 Guidance at 53. Under all circumstances, a State must document in its SIP submission all substantive consultations with other contributing States. 40 CFR 51.308(f)(2)(ii)(C).

D. Reasonable Progress Goals

Reasonable progress goals “measure the progress that is projected to be achieved by the control measures States have determined are necessary to make reasonable progress based on a four-factor analysis.” 82 FR 3078 at 3091, January 10, 2017. Their primary purpose is to assist the public and EPA in assessing the reasonableness of States' long-term strategies for making reasonable progress towards the national visibility goal. *See* 40 CFR 51.308(f)(3)(iii) and (iv). States in which Class I areas are located must establish two RPGs, both in dv—one representing visibility conditions on the clearest days and one representing visibility on the most anthropogenically impaired days—for each area within their borders. 40 CFR 51.308(f)(3)(i). The two RPGs are intended to reflect the projected impacts, on the two sets of days, of the emission reduction measures the State with the Class I area, as well as all other contributing States, have included in their long-term strategies for the second implementation period.²⁷ The RPGs also

account for the projected impacts of implementing other CAA requirements, including non-SIP based requirements. Because RPGs are the modeled result of the measures in States' long-term strategies (as well as other measures required under the CAA), they cannot be determined before States have conducted their four-factor analyses and determined the control measures that are necessary to make reasonable progress. *See* 2021 Clarifications Memo at 6.

For the second implementation period, the RPGs are set for 2028. Reasonable progress goals are not enforceable targets, 40 CFR 51.308(f)(3)(iii); rather, they “provide a way for the states to check the projected outcome of the [long-term strategy] against the goals for visibility improvement.” 2019 Guidance at 46. While States are not legally obligated to achieve the visibility conditions described in their RPGs, 40 CFR 51.308(f)(3)(i) requires that “[t]he long-term strategy and the reasonable progress goals must provide for an improvement in visibility for the most impaired days since the baseline period and ensure no degradation in visibility for the clearest days since the baseline period.” Thus, States are required to have emission reduction measures in their long-term strategies that are projected to achieve visibility conditions on the most impaired days that are better than the baseline period and shows no degradation on the clearest days compared to the clearest days from the baseline period. The baseline period for the purpose of this comparison is the baseline visibility condition—the annual average visibility condition for the period 2000–2004. *See* 40 CFR 51.308(f)(1)(i), 82 FR 3078 at 3097–98, January 10, 2017.

So that RPGs may also serve as a metric for assessing the amount of progress a State is making towards the national visibility goal, the RHR requires States with Class I areas to compare the 2028 RPG for the most impaired days to the corresponding point on the URP line (representing visibility conditions in 2028 if visibility were to improve at a linear rate from conditions in the baseline period of 2000–2004 to natural visibility conditions in 2064). If the most

other States, and other on-going emissions changes, a particular State's RPGs may not reflect all control measures and emissions reductions that are expected to occur by the end of the implementation period. The 2019 Guidance provides recommendations for addressing the timing of RPG calculations when States are developing their long-term strategies on disparate schedules, as well as for adjusting RPGs using a post-modeling approach. 2019 Guidance at 47–48.

impaired days RPG in 2028 is above the URP (*i.e.*, if visibility conditions are improving more slowly than the rate described by the URP), each State that contributes to visibility impairment in the Class I area must demonstrate, based on the four-factor analysis required under 40 CFR 51.308(f)(2)(i), that no additional emission reduction measures would be reasonable to include in its long-term strategy. 40 CFR 51.308(f)(3)(ii). To this end, 40 CFR 51.308(f)(3)(ii) requires that each State contributing to visibility impairment in a Class I area that is projected to improve more slowly than the URP provide “a robust demonstration, including documenting the criteria used to determine which sources or groups [of] sources were evaluated and how the four factors required by paragraph (f)(2)(i) were taken into consideration in selecting the measures for inclusion in its long-term strategy.” The 2019 Guidance provides suggestions about how such a “robust demonstration” might be conducted. *See* 2019 Guidance at 50–51.

The 2017 RHR, 2019 Guidance, and 2021 Clarifications Memo also explain that projecting an RPG that is on or below the URP based on only on-the-books and/or on-the-way control measures (*i.e.*, control measures already required or anticipated before the four-factor analysis is conducted) is not a “safe harbor” from the CAA's and RHR's requirement that all States must conduct a four-factor analysis to determine what emission reduction measures constitute reasonable progress. The URP is a planning metric used to gauge the amount of progress made thus far and the amount left before reaching natural visibility conditions. However, the URP is not based on consideration of the four statutory factors and therefore cannot answer the question of whether the amount of progress being made in any particular implementation period is “reasonable progress.” *See* 82 FR at 3093, 3099–3100; 2019 Guidance at 22; 2021 Clarifications Memo at 15–16.

E. Monitoring Strategy and Other State Implementation Plan Requirements

The provisions of 40 CFR 51.308(f)(6) require States to have certain strategies and elements in place for assessing and reporting on visibility. Individual requirements under this section apply either to States with Class I areas within their borders, States with no Class I areas but that are reasonably anticipated to cause or contribute to visibility impairment in any Class I area, or both. A State with Class I areas within its borders must submit with its SIP revision a monitoring strategy for

²⁷ RPGs are intended to reflect the projected impacts of the measures all contributing States include in their long-term strategies. However, due to the timing of analyses, control determinations by

measuring, characterizing, and reporting regional haze visibility impairment that is representative of all Class I areas within the State. SIP revisions for such States must also provide for the establishment of any additional monitoring sites or equipment needed to assess visibility conditions in Class I areas, as well as reporting of all visibility monitoring data to EPA at least annually. Compliance with the monitoring strategy requirement may be met through a State's participation in the Interagency Monitoring of Protected Visual Environments (IMPROVE) monitoring network, which is used to measure visibility impairment caused by air pollution at the 156 Class I areas covered by the visibility program. 40 CFR 51.308(f)(6), (f)(6)(i), (f)(6)(iv). The IMPROVE monitoring data is used to determine the 20 percent most anthropogenically impaired and 20 percent clearest sets of days every year at each Class I area and tracks visibility impairment over time.

All States' SIPs must provide for procedures by which monitoring data and other information are used to determine the contribution of emissions from within the State to regional haze visibility impairment in affected Class I areas. 40 CFR 51.308(f)(6)(ii), (iii). The provisions of 40 CFR 51.308(f)(6)(v) further require that all States' SIPs provide for a statewide inventory of emissions of pollutants that are reasonably anticipated to cause or contribute to visibility impairment in any Class I area; the inventory must include emissions for the most recent year for which data are available and estimates of future projected emissions. States must also include commitments to update their inventories periodically. The inventories themselves do not need to be included as elements in the SIP and are not subject to EPA review as part of the Agency's evaluation of a SIP revision.²⁸ All States' SIPs must also provide for any other elements, including reporting, recordkeeping, and other measures, that are necessary for States to assess and report on visibility. 40 CFR 51.308(f)(6)(vi). Per the 2019 Guidance, a State may note in its regional haze SIP that its compliance with the Air Emissions Reporting Rule (AERR) in 40 CFR part 51, subpart A satisfies the requirement to provide for an emissions inventory for the most recent year for which data are available. To satisfy the requirement to provide estimates of future projected emissions, a State may explain in its SIP how projected emissions were developed for

use in establishing RPGs for its own and nearby Class I areas.²⁹

Separate from the requirements related to monitoring for regional haze purposes under 40 CFR 51.308(f)(6), the RHR also contains a requirement at 40 CFR 51.308(f)(4) related to any additional monitoring that may be needed to address visibility impairment in Class I areas from a single source or a small group of sources. This is called "reasonably attributable visibility impairment."³⁰ Under this provision, if EPA or the FLM of an affected Class I area has advised a State that additional monitoring is needed to assess reasonably attributable visibility impairment, the State must include in its SIP revision for the second implementation period an appropriate strategy for evaluating such impairment.

F. Requirements for Periodic Reports Describing Progress Towards the Reasonable Progress Goals

The provisions of 40 CFR 51.308(f)(5) require a State's regional haze SIP revision to address the requirements of paragraphs 40 CFR 51.308(g)(1) through (5) so that the plan revision due in 2021 will serve also as a progress report addressing the period since submission of the progress report for the first implementation period. The regional haze progress report requirement is designed to inform the public and EPA about a State's implementation of its existing long-term strategy and whether such implementation is in fact resulting in the expected visibility improvement. See 81 FR 26942, 26950, May 4, 2016, (82 FR 3078 at 3119, January 10, 2017). To this end, every State's SIP revision for the second implementation period is required to describe the status of implementation of all measures included in the State's long-term strategy, including BART and reasonable progress emission reduction measures from the first implementation period, and the resulting emissions reductions. 40 CFR 51.308(g)(1) and (2).

A core component of the progress report requirements is an assessment of changes in visibility conditions on the clearest and most impaired days. For second implementation period progress reports, 40 CFR 51.308(g)(3) requires States with Class I areas within their borders to first determine current visibility conditions for each area on the most impaired and clearest days, 40 CFR 51.308(g)(3)(i), and then to

calculate the difference between those current conditions and baseline (2000–2004) visibility conditions to assess progress made to date. See 40 CFR 51.308(g)(3)(ii). States must also assess the changes in visibility impairment for the most impaired and clearest days since they submitted their first implementation period progress reports. See 40 CFR 51.308(g)(3)(iii), (f)(5). Since different States submitted their first implementation period progress reports at different times, the starting point for this assessment will vary State by State.

Similarly, States must provide analyses tracking the change in emissions of pollutants contributing to visibility impairment from all sources and activities within the State over the period since they submitted their first implementation period progress reports. See 40 CFR 51.308(g)(4), (f)(5). Changes in emissions should be identified by the type of source or activity. The provisions of 40 CFR 51.308(g)(5) also address changes in emissions since the period addressed by the previous progress report and requires States' SIP revisions to include an assessment of any significant changes in anthropogenic emissions within or outside the State. This assessment must explain whether these changes in emissions were anticipated and whether they have limited or impeded progress in reducing emissions and improving visibility relative to what the State projected based on its long-term strategy for the first implementation period.

G. Requirements for State and Federal Land Manager Coordination

CAA section 169A(d) requires that before a State holds a public hearing on a proposed regional haze SIP revision, it must consult with the appropriate FLM or FLMs; pursuant to that consultation, the State must include a summary of the FLMs' conclusions and recommendations in the notice to the public. Consistent with this statutory requirement, the RHR also requires that States "provide the [FLM] with an opportunity for consultation, in person and at a point early enough in the State's policy analyses of its long-term strategy emission reduction obligation so that information and recommendations provided by the [FLM] can meaningfully inform the State's decisions on the long-term strategy." 40 CFR 51.308(i)(2). Consultation that occurs 120 days prior to any public hearing or public comment opportunity will be deemed "early enough," but the RHR provides that in any event the opportunity for consultation must be provided at least 60 days before a public hearing or

²⁹ *Id.*

³⁰ EPA's visibility protection regulations define "reasonably attributable visibility impairment" as "visibility impairment that is caused by the emission of air pollutants from one, or a small number of sources." 40 CFR 51.301.

²⁸ See "Step 8: Additional requirements for regional haze SIPs" in 2019 Guidance at 55.

comment opportunity. This consultation must include the opportunity for the FLMs to discuss their assessment of visibility impairment in any Class I area and their recommendations on the development and implementation of strategies to address such impairment. 40 CFR 51.308(i)(2). For EPA to evaluate whether FLM consultation meeting the requirements of the RHR has occurred, the SIP submission should include documentation of the timing and content of such consultation. The SIP revision submitted to EPA must also describe how the State addressed any comments provided by the FLMs. 40 CFR 51.308(i)(3). Finally, a SIP revision must provide procedures for continuing consultation between the State and FLMs regarding the State's visibility protection program, including development and review of SIP revisions, five-year progress reports, and the implementation of other programs having the potential to contribute to impairment of visibility in Class I areas. 40 CFR 51.308(i)(4).

IV. EPA's Evaluation of Ohio's Regional Haze Submission for the Second Implementation Period

A. Background on Ohio's First Implementation Period SIP Submission

Ohio submitted its regional haze SIP for the first implementation period for 2007–2018 to EPA on December 31, 2008. Based on the failure to submit a complete SIP addressing all elements of 40 CFR 51.308, EPA issued a finding of failure to submit on January 9, 2009. 74 FR 2392, January 15, 2009.

On March 11, 2011, Ohio submitted an updated first implementation period regional haze SIP, and EPA finalized a limited approval on May 29, 2012. 77 FR 39177, July 2, 2012.

In a separate action, EPA finalized a limited disapproval of Ohio's March 11, 2011, regional haze SIP because of deficiencies arising from the remand of the Clean Air Interstate Rule (CAIR). EPA promulgated a Federal Implementation Plan (FIP) to replace Ohio's reliance on CAIR with the Cross-State Air Pollution Rule (CSAPR). 77 FR 33642, June 7, 2012.

On April 14, 2014, Ohio submitted a revision to its March 11, 2011, regional haze SIP and supplemented it on July 27, 2015, to extend the compliance date for the non-EGU BART emission limits for SO₂, which EPA approved on February 22, 2016. 81 FR 11445, March 4, 2016.

On November 30, 2016, Ohio EPA submitted a second revision to change reliance on CAIR to reliance on the CSAPR, which EPA approved on April

30, 2018, converting EPA's limited approval/limited disapproval of Ohio's March 11, 2011, regional haze SIP to a full approval, and withdrawing the FIP provisions that addressed the limited disapproval. See 83 FR 21719, May 10, 2018. The requirements for regional haze SIPs for the first implementation period are contained in 40 CFR 51.308(d) and (e). 40 CFR 51.308(b).

Pursuant to 40 CFR 51.308(g), Ohio was also responsible for submitting a five-year progress report as a SIP revision for the first implementation period, which it did on March 11, 2016. EPA approved this five-year progress report as a revision to the Ohio SIP at 40 CFR 52.1870(e) on December 8, 2017 (82 FR 60543, December 21, 2017).

B. Ohio's Second Implementation Period SIP Submission and EPA's Evaluation

In accordance with CAA sections 169A and the RHR at 40 CFR 51.308(f), Ohio EPA submitted a revision to the Ohio SIP on July 30, 2021, to address its regional haze obligations for the second implementation period, which runs through 2028. Ohio EPA supplemented its SIP submittal on August 6, 2024. Ohio initiated an FLM consultation process and provided three public comment periods on the regional haze SIP for the second implementation period. The first public comment period on the initial SIP revision ran from May 10, 2021 through June 28, 2021, and a public hearing was held on June 14, 2021. The second public comment period, limited to proposed emission limitations for three sources, ran from January 16, 2024 through March 18, 2024, and a public hearing was held on March 18, 2024. The third public comment period, regarding draft administrative orders effectuating the proposed emission limitations for the three sources, ran from June 6, 2024 through July 8, 2024, and a public hearing was held on July 9, 2024. Ohio received and responded to comments from FLMs and the public. Ohio included the comments and responses in Appendices K1–K4, L1–L4, M1–M3, N1–N2, O, and P9–P12 of its July 30, 2021, submission and in Appendices C3, C4, C7, C8, E2, E3, F2, F3, F4, F5, and G of its August 6, 2024, supplement.

The following sections describe Ohio's SIP submission, including Ohio's assessment of progress made since the first implementation period in reducing emissions of visibility impairing pollutants, and the visibility improvement progress at nearby Class I areas. Also described is Ohio's August 6, 2024 supplement, which provides

administrative orders effectuating emission limitations for three sources to be incorporated into the regulatory portion of Ohio's SIP at 40 CFR 52.1870(d). This action also contains EPA's evaluation of Ohio's submission against the requirements of the CAA and the RHR for the second implementation period of the regional haze program.

C. Identification of Class I Areas

The provisions of section 169A(b)(2) of the CAA require each State in which any Class I area is located or “the emissions from which may reasonably be anticipated to cause or contribute to any impairment of visibility” in a Class I area to have a plan for making reasonable progress toward the national visibility goal. The RHR implements this statutory requirement at 40 CFR 51.308(f), which provides that each State's plan “must address regional haze in each mandatory Class I Federal area located within the State and in each mandatory Class I Federal area located outside the State that may be affected by emissions from within the State,” and (f)(2), which requires each State's plan to include a long-term strategy that addresses regional haze in such Class I areas.

Ohio has no Class I areas within its borders that are among the 156 mandatory Class I Federal areas where EPA deemed visibility to be an important value. See 40 CFR part 81, subpart D. Thus, Ohio EPA only considered out-of-state mandatory Class I Federal areas covered under the RHR.

Ohio is a member of LADCO and participated in its regional approach for developing a strategy for making reasonable progress towards the national visibility in the northern Midwest Class I areas. Ohio EPA reviewed technical analyses conducted by LADCO to determine what Class I areas outside the State are affected by Ohio emission sources. For the second regional haze implementation period, LADCO used the Comprehensive Air Quality Model with extensions Particulate Matter Source Apportionment Tool (PSAT). LADCO tagged States and regions as well as individual point sources and inventory source groups to apportion emissions to States and regions. LADCO assessed relative visibility impacts in 2028 by projecting representative emissions inventories and known emission controls from 2016.³¹ A group of RPOs,

³¹ See appendix A of Ohio EPA's SIP submittal. Details of the analysis and source-apportioned visibility contributions at Class I areas within the LADCO region for regional haze second planning period are documented in LADCO's modeling

States, and EPA established 2016 as the base year for a national air quality modeling platform for future ozone, PM_{2.5}, and regional haze SIP development because of fairly typical ozone conditions and wildfire conditions.³² LADCO relied upon EPA's inventory estimates for 2016 and 2028 for most emission sectors as described in EPA's September 19, 2019, "Availability of Modeling Data and Associated Technical Support Document for the EPA's Updated 2028 Visibility Air Quality Modeling," (EPA's Updated 2028 Visibility Air Quality Modeling).³³ For Electric Generating Units (EGUs), LADCO used forecasts from the Eastern Regional Technical Advisory Committee (ERTAC) based on continuous emissions monitoring data from 2016 instead of the Integrated Planning Model used in EPA's 2016 modeling platform. LADCO also incorporated State-reported changes to EGUs received through September 2020 to estimate 2028 EGU emissions.

Ohio identified affected Class I areas where progress toward natural visibility conditions may be impacted by emissions from sources in Ohio. Ohio reviewed technical analyses conducted by LADCO and other RPOs to determine which Class I areas outside the State are affected by Ohio emission sources.

For the second implementation period, Ohio used LADCO's modeled emissions projections for 2028 as a framework to assess the potential for changes in visibility-impairing emissions. Like the metrics used in the first implementation period,³⁴ Ohio EPA retained the 2 percent light extinction threshold for determining Ohio's contribution to visibility at Class I areas. LADCO's modeling results showed that a 2 percent light extinction threshold, when applied to all six LADCO States and seven other States, would account for 92 percent or more of the total light extinction at the Class I areas located in the LADCO States on the most impaired days. When applying the 2 percent total light extinction threshold, Ohio identified 17 Class I

areas affected by Ohio emission sources for the second implementation period. These Class I areas, along with Ohio's 2028 projected contributions to visibility impairment, are: Sipsey Wilderness Area in Alabama (2.3 percent); Cohutta Wilderness Area in Georgia (2.1 percent); Mammoth Cave National Park in Kentucky (5.9 percent); Seney Wilderness Area in Michigan (2.0 percent); Great Gulf Wilderness Area (2.5 percent) and Presidential Range—Dry River Wilderness in New Hampshire (2.5 percent); Brigantine Wilderness Area in New Jersey (4.3 percent); Linville Gorge (3.8 percent) and Shining Rock Wilderness Areas (2.8 percent) and Swanquarter National Wildlife Refuge in North Carolina (3.6 percent); Great Smoky Mountains National Park (2.3 percent) and Joyce-Kilmer-Slickrock Wilderness Area in Tennessee (2.3 percent); Lye Brook Wilderness Area in Vermont (3.3 percent); James River Face Wilderness Area (6.5 percent) and Shenandoah National Park in Virginia (10.5 percent); and Dolly Sods (13.1 percent) and Otter Creek Wilderness Areas (13.1 percent) in West Virginia.³⁵ Based on the adjusted URP glidepaths for each of these Class I areas provided in EPA's Updated 2028 Visibility Air Quality Modeling, visibility conditions, as depicted in Table 1 of Ohio's SIP submission, are projected to be below their respective glidepaths in 2028. Visibility conditions at Dolly Sods and Otter Creek Wilderness Areas, the Class I areas impacted most significantly by Ohio, are projected to be approximately 5 dv below their respective glidepaths in 2028.

D. Calculations of Baseline, Current, and Natural Visibility Conditions; Progress to Date; and the Uniform Rate of Progress

The provisions of 40 CFR 51.308(f)(1) require States to determine the following for "each mandatory Class I Federal area located within the State": baseline visibility conditions for the most impaired and clearest days, natural visibility conditions for the most impaired and clearest days, progress to date for the most impaired and clearest days, the differences between current visibility conditions and natural visibility conditions, and the URP. This section also provides the option for States to propose adjustments to the URP line for a Class I area to account for visibility impacts from anthropogenic

sources outside the United States and/or the impacts from wildland prescribed fires that were conducted for certain, specified objectives. 40 CFR 51.308(f)(1)(vi)(B).

Ohio has no mandatory Class I areas within its borders to which the requirements of the visibility protection program apply in 40 CFR part 81, subpart D, and therefore, 40 CFR 51.308(f)(1) and its requirements do not apply.

E. Long-Term Strategy for Regional Haze

Each State having a Class I area within its borders or emissions that may affect visibility in a Class I area must develop a long-term strategy for making reasonable progress towards the national visibility goal. CAA 169A(b)(2)(B). As explained in the Background section of this notice, reasonable progress is achieved when all States contributing to visibility impairment in a Class I area are implementing the measures determined through application of the four statutory factors to sources of visibility impairing pollutants to be necessary to make reasonable progress. 40 CFR 51.308(f)(2)(i). Each State's long-term strategy must include the enforceable emission limitations, compliance schedules, and other measures that are necessary to make reasonable progress. 40 CFR 51.308(f)(2). All new (*i.e.*, additional) measures that are the outcome of four-factor analyses are necessary to make reasonable progress and must be in the long-term strategy. If the outcome of a four-factor analysis and other measures necessary to make reasonable progress is that no new measures are reasonable for a source, that source's existing measures are necessary to make reasonable progress, unless the State can demonstrate that the source will continue to implement those measures and will not increase its emission rate. Existing measures that are necessary to make reasonable progress must also be in the long-term strategy. In developing its long-term strategies, a State must also consider the five additional factors in 40 CFR 51.308(f)(2)(iv). As part of its reasonable progress determinations, the State must describe the criteria used to determine which sources or group of sources were evaluated (*i.e.*, subjected to four-factor analysis) for the second implementation period and how the four factors were taken into consideration in selecting the emission reduction measures for inclusion in the long-term strategy. 40 CFR 51.308(f)(2)(iii).

technical support document (TSD), dated June 17, 2021.

³⁴ See Section III.2. and Appendix A of Ohio's SIP submission for LADCO's technical support document and supporting materials.

³⁵ The list of Class I areas impacted by Ohio, including the 2028 projections for visibility on the 20 percent most impaired days and Ohio's contribution, is found in Table 1 of Ohio's SIP submission.

1. Selection of Sources for Analysis

This section summarizes how Ohio EPA's SIP submission addressed the requirements of 40 CFR 51.308(f)(2)(i) of the Regional Haze Rule. Specifically, it describes the criteria Ohio EPA used to determine the selection of sources or groups of sources it evaluated for an analysis of potential emission control measures. States may rely on technical information developed by the RPOs of which they are members to select sources for four-factor analysis and to conduct that analysis, as well as to satisfy the documentation requirements under 40 CFR 51.308(f).

In selecting sources to determine possible additional control measures during the second planning period, Ohio EPA considered NO_x, SO₂, PM_{2.5}, and NH₃, which are direct or precursor pollutants than can impair visibility. Based on EPA's Updated 2028 Visibility Air Quality Modeling showing that the EGU and non-EGU point source sectors contribute 37 to 76 percent of the visibility impact at Class I areas impacted by Ohio sources, Ohio found it reasonable to focus on point sources for the second implementation period.

To assist States with their source selection, LADCO generated source lists based on total process-level emissions (Q) divided by distance (d) to the nearest Class I area, where Q/d was used as a surrogate quantitative metric of visibility impact. Total emissions of Q refer to the sum of NO_x, SO₂, PM_{2.5}, and NH₃. The National Emissions Inventory Collaborative 2016 alpha inventory was selected by participants in the LADCO Regional Haze Technical Workgroup for the Q/d analysis in 2018 as the best available inventory at that time. LADCO identified unit level sources above Q/d thresholds of 1, 4, and 10, providing key information the States could use to select potential sources to be subject to the four-factor analysis. For details on the data and methods used in the Q/d analysis, see LADCO's October 14, 2020, technical memorandum "Description of the Sources and Methods Used to Support Q/d Analysis for the 2nd Regional Haze Planning Period" and section 5 of LADCO's June 17, 2021, Technical Support Document "Modeling and Analysis for Demonstrating Reasonable Progress for the Regional Haze Rule 2018–2028 Planning Period," (LADCO's 2021 TSD) contained in appendix A and B of Ohio's SIP submission.

In addition to LADCO's Q/d analysis, Ohio EPA compared point source inventories from the 2017 National Emissions Inventory (NEI) and the 2018 Ohio Emissions Inventory System

(EIS)³⁶ with the emissions used in LADCO's analysis. For sources where Q was greater than 500 tons per year for the sum of NO_x, SO₂, PM_{2.5}, and NH₃ in either the emissions data from the 2016 alpha inventory, 2017 NEI, or 2018 Ohio EIS, Ohio calculated updated Q/d values to determine if any additional sources would be identified beyond those in LADCO's list. However, the process did not result in the identification of any additional sources. As such, Ohio EPA relied upon the Q/d information developed by LADCO to select emission units for further analysis.

Ohio EPA began by using a unit Q/d greater than 5 as a threshold for selecting sources for further evaluation. Then on May 12, 2020, and October 2, 2020, Ohio received lists of sources recommended for four-factor analyses that were prepared by NPS and USFS, respectively, and are included in Appendices K2, K3, and K4 in Ohio's SIP submission. The list from NPS identified facilities with emissions comprising 80 percent of Ohio's total Q based on only SO₂ and NO_x that covered a mix of years from 2014 to 2017, whereas the list from USFS identified facilities with a Q/d greater than 8 as calculated by LADCO with the addition of VOC to represent 80 percent of Ohio's total Q at the closest Class I area to Ohio managed by USFS, the Dolly Sods Wilderness Area. While Ohio EPA's primary approach was to consider Q/d on an individual unit basis, the FLM's consideration of Q/d on a facility-wide basis prompted Ohio to include facility-wide contribution as an additional consideration. As such, Ohio EPA added a secondary selection criterion for facility-wide Q/d and developed a two-tiered approach to capture significant point source emissions in Ohio for further analysis. Ohio EPA's first tier identified individual units with a Q/d greater than 5 for a potential four-factor analysis. For facilities with Q/d greater than 10, Ohio EPA's second tier selected individual units with Q/d greater than 4 for a potential four-factor analysis. This secondary selection criteria resulted in the addition of two units to Ohio EPA's initial list for a total of 38 units at 16 facilities, accounting for 73 percent of the total Q for all sources in Ohio with Q greater than 0.1 tons per year, including 80 percent of SO₂, 57 percent

of NO_x, 47 percent of PM_{2.5}, and 23 percent of NH₃.

Using this two-tiered approach, Ohio EPA identified the following facilities and units: Avon Lake Power Plant Unit B012; Cardinal Power Plant Units B001, B002, B009; Carmeuse Lime, Inc.—Maple Grove Operations Units P003, P004; Conesville Power Plant Units B004, B007, B008; City of Orrville Department of Public Utilities Units B001, B004; Dover Municipal Light & Power Plant Unit B004; DP&L, J.M. Stuart Generating Station Units B001, B002, B003, B004; DP&L, Killen Generating Station Unit B001; FirstEnergy Generation LLC—Bay Shore Plant Unit B006; General James M. Gavin Power Plant Units B003, B004; Haverhill Coke Company LLC Unit P902; Miami Fort Power Station Units B015, B016; Ohio Valley Electric Corp.—Kyger Creek Station Units B001, B002, B003, B004, B005; P.H. Glatfelter Company—Chillicothe Facility Units B002, B003; W.H. Sammis Plant Units B007, B008, B009, B010, B011, B012, B013; and Zimmer Power Station Unit B006.

Ohio then refined the list above by considering whether units had permanently shut down, accepted a commitment to permanently shut down by 2028, converted to natural gas only, converted to limited use, accepted new emission limits, or had existing effective controls such that, in all these cases, a full four-factor analysis would likely result in a conclusion that no further controls are necessary. For units accepting a commitment to permanently shut down by 2028 or to comply with new emission limits by 2025, Ohio issued Director's Final Findings and Orders (DFFO) and requested they be incorporated into its SIP to ensure that the measures become permanent and federally enforceable. For units that had already permanently shut down or had converted to natural gas or limited use, Ohio ensured measures were permanent and federally enforceable through Ohio's permitting process under its SIP approved Permit to Install (PTI) program and its title V program. Ohio has PTI rules under Ohio Administrative Code (OAC) Chapter 3745–31 that have been approved into Ohio's SIP at 40 CFR 52.1870 as well as a federally approved title V operating permit program set forth at 40 CFR part 70. When an owner or operator certifies a permanent shutdown and notifies Ohio EPA, the unit cannot resume operation without being considered a new source subject to the Federal New Source Review (NSR) requirements. Ohio's rules at OAC 3745–31 prevent installation or

³⁶ Ohio EPA's Emission Inventory System (EIS) is a compilation of data describing emissions from different sources of air pollution. Ohio EPA's EIS data and reports are available at <https://epa.ohio.gov/divisions-and-offices/air-pollution-control/reports-and-data/emission-inventory-system>.

modification and subsequent operation of a new source without a new permit.

Of the emission units that had already permanently shut down during the second implementation period, 12 met Ohio's two-tier Q/d source selection criteria. For Conesville Power Plant, coal-fired boiler B007 permanently shut down on May 31, 2019, and coal-fired boilers B004 and B008 permanently shut down on May 31, 2020. DP&L—J.M. Stuart Generating Station permanently shut down its coal-fired boiler B001 on September 30, 2017, and boilers B002, B003, and B004 on June 1, 2018. DP&L—Killen Generating Station also shut down its coal-fired boiler B001 on June 1, 2018. W.H. Sammis Plant permanently shut down its coal-fired boilers B007, B008, B009, and B010 on May 31, 2020.³⁷

Of the units that met Ohio's Q/d source selection criteria but had not yet permanently shut down by Ohio's SIP submittal date in 2021, 3 units accepted enforceable commitments to permanently shut down by 2028: Miami Fort Power Station's coal-fired boilers B015 and B016 and Zimmer Power Station's coal-fired boiler B006. On September 29, 2020, the owner of Miami Fort and Zimmer Power Stations announced plans to permanently shut down these units. In lieu of a four-factor analysis, Ohio determined that these permanent shutdowns were necessary for reasonable progress. As such, on July 9, 2021, Ohio EPA issued DFFOs which established enforceable commitments for the shutdown of these three units by January 1, 2028, and requested that the DFFOs be approved into Ohio's SIP at 40 CFR 52.1870(d) for EPA approved State source-specific requirements.³⁸

Units that met Ohio's Q/d source selection criteria but have since converted from coal to natural gas or limited use include the non-EGUs at P.H. Glatfelter Company—Chillicothe Facility Units B002 and B003 as well as the EGUs at the City of Orrville Department of Public Utilities Units B001 and B004. P.H. Glatfelter

Company, now Pixelle Specialty Solutions LLC, converted units B002 and B003 to natural gas on May 31, 2016, and September 6, 2016, respectively. The conversions were part of a strategy to address BART requirements under the first implementation planning period as well as Boiler Maximum Achievable Control Technology (Boiler MACT) under permit PTI P0118906. Following the conversions, SO₂ emissions from P.H. Glatfelter Company units B002 and B003 decreased from 2,873 tons per year (tpy) and 5,708 tpy in 2016 to 1 tpy and 1 tpy in 2018, respectively, and NO_x emissions decreased from 412 tpy and 691 tpy in 2016 to 134 tpy and 195 tpy in 2018, respectively. Similarly, the City of Orrville Department of Public Utilities converted B004 to natural gas on December 20, 2016, and converted B001 to a limited use boiler beginning January 31, 2017, to comply with requirements of Boiler MACT and the Data Requirements Rule (DRR) for the SO₂ NAAQS designation process under permit PTI P0124959 and title V Permit No. P0125633. Following the conversions, SO₂ emissions from B001 and B004 decreased from 3,846 tpy and 3,030 tpy in 2016 to 275 tpy and 0 tpy in 2018, respectively, and NO_x emissions decreased from 647 tpy and 510 tpy in 2016 to 57 tpy and 20 tpy in 2018, respectively. For both facilities, reversing the conversion back to coal or fulltime use would require approval for a modification of its federally enforceable permit.

Beyond the 15 units shutting down and 4 units converting to natural gas or limited use as described above, Ohio EPA also evaluated 13 units at 5 facilities for existing effective controls. As explained in EPA's July 8, 2021, Clarifications Memo (section 4.1), a "source's existing measures are generally needed to prevent future visibility impairment (*i.e.*, to prevent future emission increases) and thus necessary to make reasonable progress." Measures that are necessary to make reasonable progress must be included in the SIP. However, if a State can demonstrate that a source will continue to implement its existing measures and will not increase its emission rate, it may not be necessary to require those measures under the regional haze program in its long-term strategy or SIP in order to prevent future emission increases.

The units that Ohio identified with existing effective controls are FirstEnergy Generation LLC—Bay Shore Plant Unit B006; Haverhill Coke Company LLC Unit P902; and W.H. Sammis Plant Units B011, B012, B013.

Ohio provided a weight-of-evidence demonstration as each unit has consistently implemented their existing measures and have achieved, using those measures, a reasonably consistent emission rate. With historical data from 2016 through 2019 showing reasonably consistent emission rates and 2028 projections from LADCO showing rates consistent with 2016, Ohio demonstrated that NO_x and SO₂ emission rates for these units are not expected to increase in the future. As such, except where expressly noted below for Cardinal Power Plant, Ohio Valley Electric Corp.—Kyger Creek Station, and General James M. Gavin Power Plant, Ohio determined the existing measures are not necessary to make reasonable progress or prevent future emission increases and, thus, do not need to be included in the regulatory portion of the SIP.

FirstEnergy Generation LLC—Bay Shore Plant Unit B006 is a fluidized bed boiler with limestone injection and a baghouse. The operational nature of this process, whereby calcium sulfate is formed in the boiler and is captured in the baghouse, results in approximately 94 percent removal of SO₂ and a SO₂ emission rate of 0.34 pounds per million British thermal units (lbs/MMBtu) or less. Unit B006 operates with low combustion temperatures along with very low nitrogen content petroleum coke fuel, which have resulted in NO_x emission rates of 0.08 lbs/MMBtu and less from 2016 to 2019. The facility's title V permit contains both SO₂ and NO_x emission limits as well as a requirement for 90 percent SO₂ reduction. Given the reasonably consistent emission rates, the permitted emission limitations, and the operational nature of the process in which SO₂ is inherently controlled and NO_x has a low formation potential, Ohio determined that B006 is effectively controlled and that a full four-factor analysis would likely result in the conclusion that no further controls are necessary for reasonable progress.

Haverhill Coke Company LLC Unit P902 is a coke battery with SO₂ controls installed in 2007 with design control efficiency of 92 percent. Under the terms of a Federal consent decree entered in 2014 and amended in 2018,³⁹ portions of which were incorporated into the facility's title V permit, Heat Recovery Steam Generators were

³⁷ Each of these units have been certified by the source owner or operator as retired under the provisions for Retired Unit Exemptions in the Acid Rain Program and/or CSAPR NO_x and SO₂ Trading Programs. The Retired Unit Exemption prohibits these units from emitting SO₂, NO_x, or both starting on the day the exemption takes effect. See 40 CFR 72.8, 40 CFR 97.405, 40 CFR 97.505, 40 CFR 97.605, 40 CFR 97.705, 40 CFR 97.805. Copies of the Retired Unit Exemption forms for each of these units are included in the docket. Also included in the docket is a copy of the list of retired generators from the Pennsylvania-New Jersey-Maryland Interconnection (PJM) Regional Transmission Organization (RTO), which includes each of these units as well.

³⁸ Appendix C of Ohio's July 30, 2021, SIP revision contains the DFFOs issued for the Miami Fort and Zimmer Power Stations.

³⁹ *United States of America, the State of Illinois and the State of Ohio v. Gateway Energy & Coke Company, LLC, Haverhill Coke Company, LLC and Suncoke Energy, Inc.* (S.D. Illinois Case No. 3:13-cv-00616-DH-SCW), entered on November 10, 2014, as amended on June 5, 2015, and July 10, 2018.

installed on P902. This resulted in further SO₂ emission reductions from 1,183 tpy in 2016 to 777 tpy in 2019. With SO₂ controls demonstrating greater than 90 percent effectiveness, title V permit limits, and consent decree requirements resulting in decreasing emissions, Ohio EPA determined that P902 is effectively controlled.

While W.H. Sammis Plant permanently shut down coal-fired Units B007, B008, B009, and B010 in 2020 as noted above, there are three remaining coal-fired Units B011, B012, B013 operating with an SO₂ emission limit of 0.130 lbs/MMBtu under the terms of a Federal consent decree,⁴⁰ which was incorporated into the facility's title V permit. For NO_x control, a selective non-catalytic reduction (SNCR) system was installed on B011 in 2006, and selective catalytic reduction (SCR) systems with at least 90 percent control efficiency were installed on B012 and B013 in 2010, all of which must be operated continuously under the Federal consent decree. Flue Gas Desulfurization (FGD) systems with 95 percent SO₂ control efficiency were installed on each unit in 2010. With SO₂ and NO_x controls achieving greater than 90 percent control efficiency, title V SO₂ permit limits below the 0.2 lbs/MMBtu limit in the Mercury and Air Toxics Standards for coal-fired EGUs, and reasonably consistent emission rates showing no increasing future trends, Ohio EPA determined that B012 and B013 are effectively controlled as described in the 2019 Guidance. For B011 with a Q/d of 5, Ohio determined that although the existing SNCR does not meet the examples of in the 2019 Guidance, its year-round operation and an emission rate consistently between 0.13 and of 0.15 lbs/MMBtu with no future projected increase indicate that a full four-factor analysis would likely result in the conclusion that no further controls are necessary.

Of the 13 units that Ohio initially identified with existing effective controls, there were 8 units for which Ohio later provided, in its August 6, 2024, supplement, new enforceable measures necessary for reasonable progress as described below: Cardinal Power Units B001, B002, B009; and Ohio Valley Electric Corp.—Kyger Creek Station Units B001, B002, B003, B004, B005.

Cardinal Power Plant operates three coal-fired boilers: B001, B002, and

B009. For NO_x control, SCRs with approximately 90 percent control efficiency were installed on all three boilers in 2003. The SCRs must be continuously operated under the terms of their PTI permits and a Federal consent decree.⁴¹ From 2016–2019, the SCRs have consistently achieved NO_x emission rates of 0.09 lbs/MMBtu and lower. For SO₂ control, FGD systems with approximately 95 percent control efficiency were installed on B001 in 2008, on B002 in 2007, and on B009 in 2011. The FGD systems must be operated continuously under the terms of the same Federal consent decree that were incorporated into their PTI permits. The permitted SO₂ emission limits were set at 1.056 lbs/MMBtu for B001 and B002 as well as 0.66 lbs/MMBtu for B009. From 2016–2019, the FGDs have consistently achieved SO₂ emission rates at or below 0.24 lbs/MMBtu for B001, 0.27 lbs/MMBtu for B002, and 0.15 for B009. With FGD systems achieving at least 90 percent effectiveness that were installed since 2007 and emission rates that were reasonably consistent from 2016 to 2019 with no projected increase, Ohio determined that the units were effectively controlled as described in the 2019 Guidance.

Subsequently, on August 6, 2024, Ohio EPA submitted a supplement to its July 30, 2021, Regional Haze SIP after going through FLM consultation and two public notice and comment periods. Units B001, B002, and B009 combined are subject to a SO₂ emission limit of 4,858.75 lbs/hour as a rolling, thirty-day average that was derived as a part of the attainment demonstration for the Steubenville, OH–WV 2010 1-hour SO₂ nonattainment area. The SO₂ limit became effective on July 5, 2019 and was approved into Ohio's SIP, effective November 21, 2019.⁴² 84 FR 56385, October 22, 2019. Ohio EPA submitted its August 6, 2024, supplement to incorporate the SO₂ limit through a DFFO into the SIP for Regional Haze purposes and to ensure reasonable progress by maintaining the existing measures.

⁴¹ *United States, et al. v. American Electric Power Service Corp., et al.*, S.D. Ohio Civil Action Nos. C2–99–1250, C2–99–1182, C2–05–360, and C2–04–1098 entered on December 10, 2007, and substantively modified on July 17, 2019 (AEP Consent Decree). Ohio provided a link to the AEP Consent Decree and modification, which are included in the docket.

⁴² For the technical justification and development methodology behind the SO₂ limit, Ohio EPA provided a link to its June 2019 Redesignation Request and Maintenance Plan for the Ohio Portion of the Steubenville, OH–WV 1-hour SO₂ Nonattainment Area, a copy of which is provided in the docket.

Ohio Valley Electric Corp.—Kyger Creek Station operates five coal-fired boilers: B001, B002, B003, B004, and B005. For SO₂ control, FGD systems operating year-round with 97 percent control efficiency were installed on B001 and B002 in 2012 and on B003, B004, and B005 in 2011. Under its title V permit, the facility demonstrates compliance with the Mercury and Air Toxics Standard through the SO₂ emission limit of 0.2 lbs/MMBtu. For NO_x control, SCRs with 70–90 percent efficiency were installed on B001 and B002 in 2002 and on B003, B004, and B005 in 2003. Together with overfire air systems, the SCRs achieve an average 87 percent NO_x control efficiency. Ohio EPA recognized that the SCRs do not meet the 90 percent control efficiency examples of effectively controlled units in the 2019 Guidance and that NO_x emission control is limited by ammonia slip and mercury oxidation that jeopardize compliance with the Mercury and Air Toxics Standards. Since Ohio submitted its SIP in 2021, Kyger Creek enhanced its preventative maintenance and made process improvements to increase the reliability of the urea injection system. This is expected to increase both seasonal and year-round NO_x removal efficiency. To ensure that these recent improvements are sustained going forward, Ohio EPA adopted NO_x emission limits of 0.4 lbs/MMBtu on a 720-operating rolling hourly average for each stack: Common Stack 12 for combined emissions from B001 and B002 and Common Stack 35 for combined emissions from B003, B004, and B005. Both stacks are equipped with continuous emissions monitoring systems. The limits were developed by analysis of NO_x emission rates from 2018 to 2023, prior to and following system improvements, and represent a reduction from the previous permitted limit of 0.84 lbs/MMBtu. As such, in the supplement that Ohio EPA submitted on August 6, 2024, Ohio requested to incorporate the new NO_x emission limit of 0.4 lbs/MMBtu for both Common Stacks 12 and 35 into Ohio's SIP at 40 CFR 52.1870(d) through a DFFO for Regional Haze purposes to ensure reasonable progress by maintaining the recent improvements.

After refining the list of 38 units identified by Ohio's Q/d source selection threshold and addressing 32 of those as described above, Ohio EPA provided four-factor analyses for the remaining 6 units at the following 4 facilities: Avon Lake Power Plant Unit B012; Carmeuse Lime, Inc.—Maple Grove Operations Units P003 and P004; Dover Municipal Light & Power Plant

⁴⁰ *United States of America, et al. v. Ohio Edison Company, et al.*, U.S. District Court for the Southern District of Ohio, Eastern Division, Civil Action No. C2–99–1181, entered on March 18, 2005. Ohio EPA provided a link to the Consent Decree, a copy of which is provided in the docket.

Unit B004; and General James M. Gavin Power Plant Units B003 and B004. The emission units that Ohio selected for a four-factor analysis are described below.

Consistent with the first regional haze implementation period, Ohio EPA focused on NO_x and SO₂ emissions in considering potential additional control measures at these four facilities. As demonstrated by the analysis in LADCO's Technical Support Document of the IMPROVE monitoring data, the NO_x and SO₂ emissions lead to the formation of the particulate species of nitrate and sulfate that currently contribute more to visibility impairment in the LADCO Class I Areas than PM_{2.5}, NH₃, and VOC. The LADCO Class I Areas consist of Boundary Waters Canoe Area Wilderness and Voyageurs National Park in Minnesota, as well as Isle Royale National Park and Seney Wilderness Area in Michigan. Additionally, in Table 20 of its submittal, Ohio EPA provided 2017 NEI data for Ohio point sources, showing smaller VOC, PM, and NH₃ emissions relative to NO_x and SO₂ emissions. For this reason, Ohio EPA chose to focus on reducing emissions of NO_x and SO₂, which the 2019 Guidance recommended would be a reasonable approach for the second implementation period. *See* 2019 Guidance at page 12. Nevertheless, Ohio considered emissions from each of the regional haze precursors NO_x, SO₂, PM_{2.5}, NH₃ and VOC in the source selection process. As shown in Table 4 of its submittal, the sources meeting Ohio's primary and secondary Q/d selection criteria account for 38 units at 16 facilities, representing 80 percent of SO₂ emissions, 57 percent of NO_x emissions, 47 percent of PM_{2.5} emissions, and 23 percent of NH₃ emissions for all sources with a sum of SO₂, NO_x, PM_{2.5}, and NH₃ emissions from 2016 greater than 0.1 tpy. The background on each of the 6 units selected for a four-factor analysis is described below.

Avon Lake Power Plant

Avon Lake Power Plant is an EGU, and Unit B012 is a 6,040 MMBtu/Hour pulverized coal-fired boiler that was installed in 1970. For NO_x control, B012 is equipped with low-NO_x cell burners and overfire air. For SO₂ control, Avon Lake Power Plant accepted a federally enforceable SO₂ emissions limit of 9,600 lbs/hr on a 1-hour average basis for all SO₂-emitting sources at the facility (B010, B012, B013, B015, and B016) to satisfy requirements under the DRR for the 2010 SO₂ NAAQS designation

process.⁴³ *See* 83 FR 40723, August 16, 2018. The facility's title V permit P0085253, effective April 18, 2017, contains a SO₂ permit limit for B012, which was reduced from the previous limit of 4.65 lbs/MMBtu to a new combined SO₂ permit limit on B010 and B012 of 1.59 lbs/MMBtu as a rolling, 30-day average. To comply with the new SO₂ emissions limits, the facility switched to a blend of Western Bituminous and Powder River Basin coal in 2016, which contributed to reductions in annual SO₂ emissions for B012 from 8,862 tpy in 2016 to 1,597 tpy in 2019, lowered the SO₂ emission rate from 1.60 lbs/MMBtu in 2016 to 0.70 lbs/MMBtu in 2019, and reduced Q/d from 32 in 2016 to 7 in 2019.

Carmeuse Lime, Inc.—Maple Grove Operations

Carmeuse Lime, Inc.—Maple Grove Operations is a lime manufacturing plant. Unit P003 and Unit P004 both consist of a rotary kiln and cooler as well as a shared stack for emissions. P003 and P004 burn coal, petroleum coke, and/or natural gas. For PM control, both units have baghouses, however, there are no add-on controls for SO₂ or NO_x. Although both units were subject to a best available control technology analysis under the Federal PSD program in 2002–2003 when lime manufacturing operations were restarted, no add-on control technologies for NO_x or SO₂ were found to be cost-effective. However, SO₂ at both units is inherently controlled when calcium-rich lime kiln dust chemically absorbs the SO₂ in the flue gas, which is then removed in the baghouse. NO_x emissions at both units are controlled by good combustion practices.

Limits on SO₂ and NO_x are included in the facility's title V Permit P0125171. The permit includes a maximum sulfur content limit for fuel of 5.50 percent for coal and 6.50 percent for coke by weight. P003 and P004 are subject to SO₂ limits of 1,102 lbs/hour and 4,826.80 tons per rolling, 12-month period. P003 and P004 are also subject to NO_x limits of 1,234.90 lbs/hour and 5,408.90 tons per rolling 12-month period.

Dover Municipal Light & Power Plant

Dover Municipal Light & Power Plant is a coal-fired electrical generating

plant. Unit B004 is a 247 MMBtu/hour coal-fired stoker boiler that was installed in 1962 that uses natural gas as a backup fuel. Under title V Permit P0090810, B004 is subject to SO₂ emissions limit of 4.60 lbs/MMBtu.

General James M. Gavin Power Plant

General James M. Gavin Power Plant is a coal-fired electrical generating plant. Unit B003 and Unit B004 are both 11,936 MMBtu/hr pulverized coal-fired, dry-bottom boilers installed in 1974. For SO₂, wet FGD systems with 95 percent control efficiency were installed on B003 in 1994 and on B004 in 1995. NO_x emissions for B003 and B004 are controlled through the use of low NO_x burners and SCR, achieving 91 percent control efficiency. The FGDs and SCRs are operated continuously under the terms of the facility's title V Permit P0089258 and the Federal AEP Consent Decree. A federally enforceable SO₂ emission limit of 7.41 lbs/MMBtu applies to both B003 and B004 under the title V permit. From 2016 to 2019, SO₂ emission rates have ranged from 0.27 to 0.37 lbs/MMBtu for B003 and 0.29 to 0.39 lbs/MMBtu for B004, while NO_x emission rates have remained between 0.10 and 0.11 for both units during the same time period.

2. Emission Measures Necessary To Make Reasonable Progress

The provisions of 40 CFR 51.308(f)(2)(i) require States to evaluate and determine the emission reduction measures that are necessary to make reasonable progress by applying the four statutory factors to sources in a control analysis. The emission reduction measures that are necessary to make reasonable progress must be included in the long-term strategy. 40 CFR 51.308(f)(2).

Ohio EPA's four-factor analyses are described below for each of the 6 units identified through its Q/d source selection process. This includes units that had not already permanently shut down, accepted an enforceable commitment to permanently shut down or comply with new limits, converted to natural gas or limited use, or had existing effective controls.

Avon Lake Power Plant

Avon Lake Power Plant Unit B012 was selected for a four-factor analysis based on 2016 emissions resulting in a Q/d of 32. Avon Lake evaluated B012 for both NO_x and SO₂ controls.

Avon Lake evaluated wet FGD and a spray dryer absorber (SDA) for SO₂ control. Capital costs were estimated at \$417,000,000 for SDA and \$483,000,000 for wet FGD. Annual operating costs

⁴³ Ohio's January 13, 2017, submittals for the 2010 SO₂ NAAQS DRR describing the AERMOD Modeling Results for Avon Lake Power Plant with the derivation of the limits of 1.59 lbs/MMBtu and 9,600 lbs/hour as the resulting critical emissions value is available at <https://www.epa.gov/so2-pollution/so2-data-requirements-rule-january-13-2017-state-submittals-ohio>.

were estimated at \$44,500,000 for SDA and \$51,600,000 for wet FGD. Based on a remaining useful life of either 20 or 30 years and retrofit factors of 1.2 and 1, the cost effectiveness was estimated at \$19,500/ton and \$22,600/ton for wet FGD for 2,284 tpy in potential emission reductions from either control option.

For NO_x control, Avon Lake evaluated SNCR and SCR with capital costs ranging from \$13,000,000 for SNCR to \$191,000,000 for SCR, while annual operating costs were estimated at \$1,679,100 for SNCR and \$25,600,000 for SCR. Cost effectiveness was estimated at \$10,200/ton for SNCR for 164 tpy in potential emission reductions and \$26,700/ton for SCR for 959 tpy in reductions. Installation time was estimated at 5 years for SO₂ controls and 2 to 5 years for SNCR and SCR, respectively. Impacts from energy requirements, solid waste, and ammonia usage were also evaluated.

Carmeuse Lime, Inc.—Maple Grove Operations

Carmeuse Lime, Inc.—Maple Grove Operations Units P003 and P004 were selected for a four-factor analysis.

The evaluation of SO₂ controls at Units P003 and P004 included conditioning tower slurry injection, DSI, and wet scrubbers. Capital costs for each unit were estimated at \$14,437,783 for conditioning tower slurry injection, \$16,960,653 for DSI, and \$23,784,927 for wet scrubbers. Annual costs were estimated at \$3,982,597 for conditioning tower slurry injection, \$9,140,819 for DSI, and \$6,305,184 for wet scrubber. The cost effectiveness values at Units P003 and P004, respectively, were estimated for conditioning tower slurry injection at \$3,266 and \$3,274/ton, DSI at \$5,857 and \$5,862/ton, and wet scrubbing at \$4,506 and \$4,043/ton SO₂. Potential SO₂ emission reductions for each unit P003 and P004, respectively, were 1,221 and 1,216 tpy for conditioning tower slurry injection, 1,566 and 1,559 tpy for DSI, and 1,559 and 1,559 tpy for wet scrubbing.

Switching fuel to solely natural gas was also evaluated and found to be technically infeasible due to the insufficient supply of natural gas in the region as well as the impact on the production process that would result from altering the product chemistry and capacity. The switch to natural gas would fundamentally change the production process since the flame temperature would be lower, altering product chemistry and quality, changing the thermal profile of the kiln, and reducing production capacity.

For NO_x, several control options were evaluated, including preheater

installation, low-NO_x burners, SCR, and SNCR. However, no options were determined to be technically feasible beyond current operation under good combustion practices. Despite the concerns about technical feasibility, Carmeuse Lime, Inc.—Maple Grove Operations performed a four-factor analysis on the addition of tail-end SCR, which would have required the installation of an SO₂ wet scrubber upstream and stack gas reheat downstream. Estimated capital costs for Units P003 and P004 were \$16,878,012 and \$16,722,674, respectively, while estimated annual costs were \$11,596,001 and \$11,431,638, resulting in cost effectiveness values of \$10,419 and \$11,484/ton NO_x.

Both SO₂ and NO_x analyses considered a remaining useful life of 20 or 25 years, a 4 to 5 year installation time, and energy and non-air quality environmental impacts. In addition to the consideration of candidate control options, Carmeuse Lime, Inc.—Maple Grove Operations considered visibility impact and noted that an analysis done during the first implementation period shows that the facility is located outside the area of influence for the closest Class I area, the Dolly Sods Wilderness Area, and that it was not one of the four sources in Ohio identified by VISTAS in their June 22, 2020, request as a source that strongly contributes to regional haze.

Dover Municipal Light & Power Plant

Dover Municipal Light & Power Plant Unit B004 was selected for a four-factor analysis based on 2016 emissions resulting in a Q/d of 7 and the absence of existing SO₂ add-on controls. The unit is controlled with a baghouse for PM, activated carbon for mercury, and DSI for hydrogen chloride.

The evaluation of SO₂ controls considered fuel switching, DSI, wet FGD, and SDA. The City of Dover determined that switching from the current low sulfur coal to natural gas was infeasible, not only because it would require major changes to the boiler's burner design and an additional mile of natural gas pipeline, but also because of the insufficiency of a natural gas supply. For the other control options, capital costs were estimated at \$2,640,000 for DSI, \$28,110,269 for wet FGD, and \$24,274,288 for SDA. Annual costs were estimated at \$1,558,509 for DSI, \$4,615,991 for wet FGD, and \$4,030,803 for SDA. The cost effectiveness and potential reductions in SO₂ emissions were estimated at \$2,985/ton for 522 tpy with DSI, \$5,016/ton for 920 tpy with wet FGD, and \$4,402/ton for 916 tpy with SDA.

The analyses considered a remaining useful life of 30 years, a 5-year installation time, as well as energy and non-air quality environmental impacts. Dover Municipal Light & Power Plant also compared annualized compliance costs as a percentage of sales for each control option, which resulted in 6.2 percent for DSI and 18.5 percent for wet FGD. Citing to guidance for the Regulatory Flexibility Act,⁴⁴ Dover Municipal Light & Power Plant observed that EPA has employed discretion in not proceeding with rulemakings that regulate only a small number of small businesses with annualized compliance costs as a percentage of sales greater than 3 percent. As such, Dover Municipal Power & Light Plant noted that as a non-profit governmental organization, the costs of any of the controls evaluated would threaten the viability of the plant, with the options of wet FGD and SDA almost certainly resulting in closure.

General James M. Gavin Power Plant

General James M. Gavin Power Plant was selected for a four-factor analysis based on 2016 emissions resulting in a Q/d above Ohio's threshold for Units B003 and B004 as well as the relative impact of this source on visibility impairment.

For NO_x, Ohio EPA determined that the units were effectively controlled. This determination considered that the SCRs were installed in 2001, are operated continuously, and achieve 91 percent control efficiency with low NO_x burners. In addition, Ohio found that the emission rates, which ranged between 0.10 and 0.11 lbs/MMBtu from 2016 to 2019, were reasonably consistent and that no increase in those rates was projected into 2028.

SO₂ was considered in the four-factor analysis since the current FGDs were installed in 1994–1995 before the beginning of the first implementation period. General James M. Gavin Power Plant evaluated fuel switching, retrofitting new dry FGD, retrofitting new wet FGD, and making operational improvements to the existing wet FGD. General James M. Gavin Power Plant currently burns eastern bituminous coal with a sulfur content of 3.9 to 4.2 percent. Switching to lower sulfur coal was considered technically infeasible due to operational issues from a higher ash content causing slagging issues and overburdening the electrostatic precipitator (ESP), thereby decreasing

⁴⁴ EPA Office of Policy, Economic and Innovation, "Final Guidance for EPA Rulewriters: Regulatory Flexibility Act as Amended by the Small Business and Regulatory Enforcement Fairness Act," November 30, 2006.

its control efficiency. Switching to natural gas was precluded since natural gas is not currently available at the site, and the nearest pipeline 10 miles away does not have the capacity to supply the required loading to the plant.

In terms of add-on SO₂ controls, the existing DSI systems designed for SO₃ emissions control were evaluated for collateral removal of SO₂. However, the analysis determined that modifying operational parameters with higher sorbent injection rates required for significant SO₂ emissions control would overburden the ESP in handling particulate emissions. Similarly, the analysis found that installation of a new SDA would require replacing the existing ESP and would offer no advantage compared to the existing wet FGD. In 2019, General James M. Gavin Power Plant made significant expenditures to upgrade and optimize the existing wet FGD systems which improved control efficiency to 95 percent. With the significant recent expenditures for the upgrades and the lack of technically feasible options for further optimization, the analysis cited to the 2019 Guidance in determining that replacing the existing wet FGD was not a practical option and that additional controls were unlikely to be reasonable. *See* 2019 Guidance at 22–23.

In December 2023, General James M. Gavin Power Plant provided to Ohio EPA a supplemental analysis with new information on \$9.3 million in additional upgrades and improvements to their FGD systems made since 2020, many of which occurred after Ohio EPA submitted its Regional Haze SIP in July 2021. Additionally, General James M. Gavin Power Plant evaluated whether the facility could, at a reasonable cost, achieve a consistently lower SO₂ emission rate either through existing measures or potential low-cost upgrades. Although no additional upgrades were found to be feasible based on the custom-build nature of the FGD systems and the recent improvements, General James M. Gavin Power Plant identified the feasibility of consistently achieving a lower SO₂ emission rate as a result of the recent upgrades based on 2019–2023 emissions data, load variability, coal content and supply. To ensure that the recent improvements are maintained going forward, Ohio adopted new SO₂ emission limits of 0.75 lbs/MMBtu on a rolling 30-operating day average for both B003 and B004, representing a reduction from the former SO₂ limits of 7.41 lbs/MMBtu. To ensure the new SO₂ limits are permanent and federally enforceable, Ohio EPA submitted the August 6, 2024, supplement to

incorporate the new SO₂ limits through a DFFO into the SIP at 40 CFR 52.1870(d) for Regional Haze purposes.

Ohio's Evaluation of the Four-Factor Analyses

In considering the four-factor analyses for each of the four facilities described above, Ohio determined that additional add-on controls are not cost-effective and thus not necessary for reasonable progress in the second planning period. In making its determination, Ohio evaluated the analyses of energy and solid waste impacts from increased power usage and generation of solid waste and wastewater. Ohio evaluated capital and operating costs, costs per ton of pollutant removed, and potential emission reductions, and took under consideration compliance costs/sales ratios. To compare the candidate control options at a facility, Ohio estimated the visibility benefit of potential emission reductions as a part of a weight-of-evidence approach to be considered alongside, not instead of, the four statutory factors. In determining the maximum visibility benefit at any Class I area in 2028, Ohio used source apportionment modeling conducted by VISTAS⁴⁵ and scaled the modeled visibility impacts to the expected emissions reductions from the potential controls evaluated, which ranged from 0.001 to 0.180 Mm⁻¹ at Avon Lake Power Plant, 0.192 to 0.246 Mm⁻¹ at Carmeuse Lime, Inc.—Maple Grove, and 0.041 to 0.072 Mm⁻¹ at Dover Municipal Power & Light Plant. Ohio also pointed to the State's progress report in its regional haze SIP revision for the second planning period, showing emission trends with significant reductions of 90 percent SO₂ and 57 percent NO_x from 2005 to 2017. Looking forward to 2028, Ohio identified additional emission reductions that will be achieved in the second planning period through measures identified in the long-term strategy, which are discussed below.

Ohio concluded that on-the-books and on-the-way controls identified in the State's long-term strategy, including the DFFOs for permanent shutdowns at Miami Fort Power Plant and Zimmer Power Station as well as the DFFOs for SO₂ and NO_x limits at Cardinal Power Plant, General James M. Gavin Power

Plant, and Ohio Valley Electric Corp.—Kyger Creek, are necessary to achieve reasonable progress at the Class I areas impacted by emissions from Ohio.

3. Ohio's Long-Term Strategy

Each State's long-term strategy must include the enforceable emission limitations, compliance schedules, and other measures that are necessary to make reasonable progress. 40 CFR 51.308(f)(2). After considering information regarding existing effective controls, analyses under the four statutory factors in 40 CFR 51.308(f)(2)(i), and the five additional factors in 40 CFR 51.308(f)(2)(iv) in addition to other requirements in 40 CFR 51.308(f)(2)(ii) described below, Ohio determined the State's long-term strategy for the second implementation planning period is comprised of the following measures to make reasonable progress.⁴⁶ These measures represent reductions beyond those planned in the first implementation planning period with numerous changes in emissions and emission limits since the first implementation planning period, as well as emission reductions due to ongoing air pollution control programs and permanent shutdowns. Except as noted below for the DFFOs and Ohio's Beneficiary Mitigation Plan for the Volkswagen Settlement, the following measures in Ohio's long-term strategy are already permanent and federally enforceable. Ohio EPA requested that the DFFOs be incorporated into the regulatory portion of Ohio's SIP at 40 CFR 52.1870(d) to ensure that they will also be federally enforceable and permanent for regional haze purposes.

On-the-books controls for the long-term strategy in the 2nd implementation period include:

- Permanent shutdown of Conesville Power Plant Units B004, B007, and B008
- Permanent shutdown of DP&L J.M. Stuart Units B001, B002, B003, and B004
- Permanent shutdown of DP&L J.M. Killen Unit B001
- Permanent shutdown of W.H. Sammis Plant Units B007, B008, B009, and B010
- National Emission Standards for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines
- Control of Hazardous Air Pollutants from Mobile Sources (also known as the Federal Mobile Source Air Toxics Rules)

⁴⁵ "The VISTAS Regional Haze Project," <https://metro4-sesarm.org/content/vistas-regional-haze-program>; "Task 7—PSAT Source Apportionment Modeling/Tagging," <https://www.metro4-sesarm.org/content/task-7-source-apportionment-modelingtagging>; "PSAT Source Apportionment Modeling Results Report—August 2020," https://www.metro4-sesarm.org/sites/default/files/VISTAS%20Task%207%20PSAT_20200831.pdf.

⁴⁶ The measures listed in Ohio's long-term strategy are described in Ohio's SIP submission in Section III.3(e)(5) and III.5(e).

- Mercury and Air Toxics Standards (40 CFR 63, subpart UUUUU)
- Federal Oil and Natural Gas Industry Standards
- NO_x Emission Standards for New Commercial Aircraft Engines (40 CFR 87, 40 CFR 1068)
- NESHAPs for Industrial, Commercial, and Institutional Area Source Boilers, Major Source Boilers (40 CFR 63)
- New Source Performance Standards (NSPS) for Commercial and Industrial Solid Waste Incinerators (CISWI) (40 CFR 60, subpart CCCC, 40 CFR 60, subpart DDDD)
- NSPS for New Residential Wood Heaters (40 CFR 60, subpart AAA)
- SO₂ Data Requirements Rule (40 CFR 51)
- Ohio's Beneficiary Mitigation Plan for the Volkswagen Settlement (84 FR 43508, August 21, 2019)

On-the-way controls for the long-term strategy that reflect additional emission reductions expected by 2028 include:

- Revised CSAPR Update (40 CFR 97, subpart GGGGG)
- DFFO for Miami Fort Power Station, providing for the permanent shutdown of coal-fired Boilers B015 and B016, and for Zimmer Power Station, providing for the permanent shutdown of coal-fired Boiler B006
- DFFO for Cardinal Power Plant, providing for an SO₂ emission limit on coal-fired Boilers B001, B002, and B009
- DFFO for Ohio Valley Electric Corp.—Kyger Creek, providing for a new NO_x emission limit on coal-fired Boilers B001, B002, B003, B004, and B005
- DFFO for General James M. Gavin Power Plant, providing for a new SO₂ emission limit on coal-fired Boilers B003 and B004

4. EPA's Evaluation of Ohio's Compliance With 40 CFR 51.308(f)(2)(i)

EPA proposes to find that Ohio has satisfied the requirements of 40 CFR 51.308(f)(2)(i) related to evaluating sources and determining the emission reduction measures that are necessary to make reasonable progress by considering the four statutory factors. Ohio's selection of sources and evaluation of control measures was reasonable and consistent with the requirements of 40 CFR 51.308(f)(2)(i).

For Ohio's source selection methodology, Ohio EPA targeted the sources with the highest potential to impair visibility at mandatory Class I areas. Ohio EPA included a thorough description of its source selection methodology. Starting with LADCO's calculations for Q/d based on 2016 data, Ohio EPA compared more recent point

source inventories from the 2017 NEI and 2018 Ohio EIS to determine if updated Q/d values on a unit basis would identify additional sources for selection. Then, in response to other methods used by NPS and USFS to identify sources for further evaluation, Ohio EPA modified its source selection process by adding a secondary criterion for a facility-wide Q/d. Ohio EPA's two-tiered approach broadened its source selection process and identified individual units with a Q/d greater than 5 as well as units with a Q/d greater than 4 at facilities with a Q/d greater than 10. Using this source selection methodology, Ohio EPA selected 38 units at 16 facilities for further analysis, accounting for 80 percent of SO₂ and 57 percent of NO_x for point sources with Q greater than 0.1 tpy.

In determining which facilities to evaluate through a four-factor analysis, Ohio EPA refined the list of sources selected using its Q/d thresholds by providing adequate justification for no further analysis where sources had accepted an enforceable commitment for SO₂ or NO_x limits, permanently shut down, accepted an enforceable commitment to permanently shut down by 2028, converted to natural gas or limited use, or had existing effective controls.

For selected sources that had accepted an enforceable commitment for SO₂ or NO_x limits, Ohio issued DFFOs to be incorporated into its SIP at 40 CFR 52.1870(d) for 10 units at 3 facilities: Cardinal Power Units B001, B002, and B009; Ohio Valley Electric Corp.—Kyger Creek Station Units B001, B002, B003, B004, and B005; and General James M. Gavin Power Plant Units B003 and B004. These limits in the DFFOs ensure recent improvements in emission controls are maintained and that the measures are permanent and federally enforceable for regional haze purposes.

For selected sources that had permanently shut down or had accepted an enforceable commitment to permanently shut down by 2028, Ohio identified 15 units at 6 facilities: Conesville Power Plant Units B004, B007, and B008; DP&L J.M. Stuart Units B001, B002, B003, and B004; DP&L JM Killen Unit B001; W.H. Sammis Plant Units B007, B008, B009, and B010; Miami Fort Power Station Units B015 and B016; and Zimmer Power Station Unit B006. Based on 2016 inventories, the permanent shutdown of these units represents federally enforceable and permanent emission reductions from some of Ohio's largest sources as follows. In 2019 and 2020, the shutdowns at Conesville Power Plant Units B004, B007, and B008 achieved

emission reductions of 5,013 tpy SO₂ and 5,981 tpy NO_x. In 2017 and 2018, the shutdowns at DP&L, J.M. Stuart Generating Station achieved emission reductions of 9,005 tpy SO₂ and 5,466 tpy NO_x. In 2018, the shutdown at DP&L, Killen Generating Station achieved emission reductions of 10,130 tpy SO₂ and 6,057 tpy NO_x. In 2020, the shutdowns at W.H. Sammis Plant achieved reductions of 2,996 tpy SO₂ and 1,634 NO_x. By 2028, under the DFFOs, the shutdowns at Miami Fort Power Station will achieve emission reductions of 10,214 tpy SO₂ and 5,052 tpy NO_x, while the shutdown at Zimmer Power Station will achieve emission reductions of 9,973 tpy SO₂ and 5,458 tpy NO_x. Together, these shutdowns will reduce SO₂ by over 47,000 tpy and NO_x by over 33,000 tpy and represent emission reductions of 32 percent SO₂ and 32 percent NO_x from all point sources in Ohio with total emissions of SO₂, NO_x, PM, and NH₃ greater than 0.1 tpy based on 2016 emissions.

For selected sources that converted to natural gas or limited use under enforceable permit conditions, Ohio identified conversions at 4 units within 2 facilities, where add-on controls or more stringent limits would not be necessary for reasonable progress. Compared to 2016 base-year emissions, the conversions at the City of Orrville Department of Public Utilities Units B001 and B004 reduced SO₂ emissions by 6,601 tpy, and the conversions at P.H. Glatfelter Company—Chillicothe Facility B002 and B003 reduced SO₂ emissions by 8,579 tpy. Together, in addition to the emission reductions from the shutdowns mentioned above, these conversions represent an additional 10 percent reduction in SO₂ emissions from all point sources in Ohio with total emissions of SO₂, NO_x, PM, and NH₃ greater than 0.1 tpy.

For selected sources that had existing effective controls, Ohio sufficiently provided a weight-of-evidence demonstration as described in the 2021 Clarifications Memo for 5 units at 3 facilities: FirstEnergy Generation LLC—Bay Shore Plant Unit B006; Haverhill Coke Company LLC Unit P902; and W.H. Sammis Plant Units B011, B012, B013. Ohio documented that these units are effectively controlled for SO₂ and NO_x by inherent process or control systems installed during the first implementation period with greater than 90 percent control efficiency as well as federally enforceable limits in Federal consent decrees or limits below levels recommended in the 2019 Guidance as potentially existing effective controls. With reasonably

consistent trends in emission rates, Ohio also adequately demonstrated that the existing measures for these units are not necessary to make reasonable progress or prevent future emission increases and, thus, do not need to be included in the regulatory portion of the SIP.

Of all the 38 emission units Ohio identified through its Q/d source selection process listed above, Ohio relied upon the following specific control measures at 25 units in its long-term strategy in addition to the other Federal regulations and State programs included. For 12 of those units, Ohio's long-term strategy relies upon permanent shutdowns that have already occurred during the 2nd implementation period. For the other 13 units, Ohio EPA provided DFFOs with enforceable commitments for either SO₂ limits or NO_x limits by 2025 or permanent shutdowns by 2028 to be incorporated into Ohio's SIP for regional haze purposes at 40 CFR 52.1870(d).

For the remaining 13 emission units that Ohio EPA identified through its Q/d source selection process, Ohio did not rely on new or existing measures as part of the long-term strategy to make reasonable progress in the second planning period. At 4 of those units, Ohio EPA documented enforceable conversions to natural gas or limited use. At another 5 of those units, Ohio provided a weight of evidence demonstration and determined their existing measures are not necessary to make reasonable progress or prevent future emission increases. At the other 4 units, Ohio provided four-factor analyses. Each of these analyses considered all four statutory factors and appropriately followed the methods in the EPA Air Pollution Control Cost Manual.⁴⁷ The lowest cost control options in the four-factor analyses outlined the potential for emission reductions at each unit for Avon Lake Power Plant of 2,284 tpy SO₂ for \$19,500/ton, Dover Municipal Power & Light Plant of 522 tpy SO₂ for \$2,985/ton, and at Carmeuse Lime, Inc.—Maple Grove Operations of 1,221 and 1,216 tpy SO₂ for \$3,226/ton and \$3,274/ton, respectively. With the emission reductions from already implemented shutdowns and fuel conversions, Ohio made a reasoned determination that additional add-on controls are not cost effective and thus not necessary for

reasonable progress in the second planning period.

The permanent shutdown of 15 units at 6 large EGUs during the second implementation period represents large enforceable reductions in SO₂ and NO_x from Ohio sources that had impacted the same Class I areas that are impacted by the 4 units evaluated in the four-factor analyses. With a relatively small potential for additional emission reductions identified in the four-factor analyses compared to those of the shutdowns and fuel conversions already taking place, Ohio EPA provided a reasoned basis for its conclusions to not require additional controls at those 4 units for the second implementation period.

Overall, 29 out of 38 coal-fired units above Ohio's Q/d threshold either converted to natural gas or limited use, accepted enforceable limits, or have or will permanently shut down by 2028. The trends in NO_x and SO₂ emissions noted in Ohio's progress report discussed below demonstrate how Ohio's long-term strategy will continue to make significant reductions during the second implementation period. The shutdowns will reduce statewide SO₂ by over 47,000 tpy and NO_x by over 33,000 tpy, and the conversions to natural gas add another 15,000 tpy of SO₂ reductions to that total. Together, these shutdowns and fuel conversions represent statewide emission reductions of 43 percent SO₂ and 32 percent NO_x from point sources in Ohio with total emissions of SO₂, NO_x, PM, and NH₃ greater than 0.1 tpy based on 2016 emissions. Ohio's plan shows that these measures will achieve substantial SO₂ and NO_x emission reductions beyond those included in its first implementation period. These shutdowns, conversions, and committed controls contribute to Ohio's emission reductions and the associated visibility improvements at the affected Class I areas for the second implementation planning period.

EPA proposes to find that the shutdowns and conversions noted above that have already taken place during the second planning period are already federally enforceable and permanent and do not need to be included in the regulatory portion of the SIP. For the upcoming permanent shutdowns and committed controls provided for in the DFFOs, EPA proposes to find that those are necessary for reasonable progress and must be included in the SIP and made federally enforceable and permanent. For the other 9 coal-fired units, Ohio EPA determined that no additional controls would be necessary for reasonable progress in the second

planning period based on existing effective controls that have achieved reasonably consistent emission rates that are not expected to increase in the future.

EPA proposes to find that Ohio has satisfied the requirements of 40 CFR 51.308(f)(2)(i) related to evaluating sources and determining the emission reduction measures that are necessary to make reasonable progress by applying the four statutory factors to sources in a control analysis. Ohio EPA's SIP submission, as supplemented, reasonably applied the Q/d source selection process in relying on the closest Class I areas and the emissions of NO_x, SO₂, PM_{2.5}, NH₃ and VOC. Ohio EPA examined a reasonable set of sources, including sources identified by FLMs. In addition, Ohio EPA adequately explained its decision to focus on the two pollutants—SO₂ and NO_x—that currently drive visibility impairment within the LADCO region. EPA proposes to find that Ohio EPA adequately supported its conclusions for its top-impacting sources in determining permanent and federally enforceable shutdowns, controls, and fuel conversions necessary for reasonable progress. EPA is basing this proposed finding on the State's examination of its largest operating EGU and non-EGU sources. EPA proposes to find the State's approach reasonable because it demonstrated that these sources with the greatest modeled impacts on visibility, as well as other sources above the State's Q/d threshold that might be expected to impact visibility, either have shut down, accepted an enforceable commitment to shut down by 2028, accepted new emission limits by 2025, converted to natural gas or limited use, or have existing effective controls.

As part of the State's long-term strategy, Ohio EPA submitted 4 DFFOs providing legally binding, enforceable commitments upon the owners or operators of the facilities, and any subsequent owner or operator, at the State level under Ohio Revised Code 3704.03 and 3745.01. Since Ohio is relying on these 4 DFFOs to make reasonable progress as part of its long-term strategy for the second implementation period, Ohio EPA requested the incorporation of the DFFOs into the Ohio SIP to ensure that they are federally enforceable and permanent for regional haze purposes. The first DFFO was effective on July 9, 2021, and provides for the shutdown of Miami Fort Power Station Units B015 and B016 and Zimmer Power Station Unit B006 by no later than January 1, 2028. The other three DFFOs provide for

⁴⁷ See EPA Air Pollution Control Cost Manual, available at <https://www.epa.gov/economic-and-cost-analysis-air-pollution-regulations/cost-reports-and-guidance-air-pollution>.

SO₂ emission limits at Cardinal Power Plant Units B001, B002, and B009 and General James M. Gavin Power Plant Units B003 and B004 as well as a NO_x emission limit Ohio Valley Electric Corp.—Kyger Creek Units B001, B002, B003, B004, and B005. These three DFFOs became effective July 26, 2024, when they were entered into the Ohio EPA Director's journal, and compliance begins on January 1, 2025. Based on the discussion herein, these 4 DFFOs provide an adequate technical and legal basis for source-specific measures that are consistent with the CAA requirements and EPA's Regional Haze Rule. As such, EPA proposes to approve Ohio EPA's request and incorporate by reference these 4 DFFOs into the SIP.

5. Consultation With States

The consultation requirements of 40 CFR 51.308(f)(2)(ii), provides that States must consult with other States that are reasonably anticipated to contribute to visibility impairment in a Class I area to develop coordinated emission management strategies containing the emission reductions measures that are necessary to make reasonable progress. The provisions of 40 CFR 51.308(f)(2)(ii)(A) and (B) require States to consider the emission reduction measures identified by other States as necessary for reasonable progress and to include agreed upon measures in their SIPs, respectively. The provisions of 40 CFR 51.308(f)(2)(ii)(C) speak to what happens if States cannot agree on what measures are necessary to make reasonable progress. States may satisfy the requirement of 40 CFR 51.308(f)(2)(ii) to engage in interstate consultation with other States that have emissions that are reasonably anticipated to contribute to visibility impairment in a given Class I area under the auspices of intra- and inter-RPO engagement.

Although Ohio has no mandatory Class I Federal areas within its borders, Ohio has previously been shown to have sources with emissions that impact visibility at downwind mandatory Class I Federal areas. Ohio EPA consulted with other States to develop a coordinated emission management approach to its regional haze SIP and to address Ohio's impact on nearby Class I areas. Ohio EPA participated in the LADCO and inter-RPO processes, which developed the technical information needed for such coordinated strategies.

Ohio participated in the LADCO Regional Haze Technical Workgroup meetings with other LADCO States, FLMS, and EPA Region 5. Through LADCO, Ohio also consulted with other States and Tribes.

Ohio EPA received and responded to requests from MANE-VU and VISTAS on behalf of the States in their RPOs. On August 25, 2017, Ohio EPA received the "Statement of the Mid-Atlantic/Northeast Visibility Union (MANE-VU) Class I Area States concerning a Course of Action in Contributing States Located Upwind of MANE-VU toward Assuring Reasonable Progress for the Second Regional Haze Implementation Period (2018–2028)," (2017 MANE-VU Ask).⁴⁸ MANE-VU is the RPO for the Northeastern and Mid-Atlantic States and Tribal Governments, which include: Connecticut, Delaware, the District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Penobscot Indian Nation, Rhode Island, St. Regis Mohawk Tribe, and Vermont. For the second implementation period, MANE-VU performed contribution analyses to identify source and State-level contributions to visibility impairment and the need for interstate consultation. MANE-VU used the results of these analyses to determine emission units in various States that have a potential for visibility impacts of 3.0Mm⁻¹ or greater using action 2015 emissions from EGUs and 2011 emissions from other sources. For Ohio, MANE-VU identified 8 units at the following facilities: Avon Lake Power Plant (Unit 12), General James M. Gavin Power Plant (Units 1 and 2), and Muskingum River (Units 1, 2, 3, 4, and 5). The five specific parts of the 2017 MANE-VU Ask requested Ohio and other upwind States to pursue specific emission management strategies to meet the 2028 reasonable progress goals for the second regional haze implementation period. On December 20, 2017, LADCO responded to the MANE-VU Ask, indicating that LADCO did not agree with MANE-VU's impact assessment results and recommended that MANE-VU use emissions estimates that, in the opinion of LADCO, better reflect the current state of knowledge.⁴⁹ On December 29, 2017, Ohio EPA also responded to the 2017 MANE-VU Ask to address the requests and alleged inaccuracies regarding Ohio sources,

⁴⁸ MANE-VU's "2017 Statement of the Mid-Atlantic/Northeast Visibility Union (MANE-VU) Class I Area States concerning a Course of Action in Contributing States Located Upwind of MANE-VU toward Assuring Reasonable Progress for the Second Regional Haze Implementation Period (2018–2028)" dated August 25, 2017, which includes a link to MANE-VU's contribution analyses report at <http://www.otcair.org/manevu>, is provided as appendix M1 to Ohio's Regional Haze SIP submission in the docket.

⁴⁹ LADCO's December 20, 2017, response to the MANE-VU Ask is found in appendix M2 of Ohio's Regional Haze SIP revision submittal in the docket.

which did not include recent permanent shutdowns or fuel conversions and resulted in modeling that overestimated Ohio's contribution.⁵⁰

MANE-VU Ask 1 requested that States "ensure the most effective use of control technologies on a year-round basis to consistently minimize emissions of haze precursors, or obtain equivalent alternative emission reductions" at EGUs "with a nameplate capacity larger than or equal to 25 MW with already installed NO_x and/or SO₂ controls." MANE-VU Ask 2 requested four-factor analyses be performed for any source modeled by MANE-VU that has the potential for a visibility impact greater than 3.0 Mm⁻¹. In response to both MANE-VU Asks 1 and 2, Ohio EPA referred to its Q/d source selection process and four-factor analyses, where Ohio made a determination of existing effective controls or provided a four-factor analysis for the sources identified by MANE-VU: Avon Lake Power Plant and General James M. Power Plant, with the exception of Muskingum River Power Plant, which permanently shut down in 2015.

MANE-VU Ask 3 requested States pursue, before 2028, an ultra-low sulfur fuel oil standard for #2 distillate oil of 0.0015 percent sulfur by weight or 15 ppm, for #4 residual oil of 0.25–0.5 percent sulfur by weight, and for #6 residual oil of 0.3–0.5 percent sulfur by weight. Ohio responded to MANE-VU Ask 3 by explaining that these fuel types do not comprise a significant portion of fuel usage in Ohio, and as such, would have little impact on visibility and would not warrant further evaluation and standard setting.

MANE-VU Ask 4 requested States lock in lower emission rates for SO₂, NO_x, and PM at EGUs and sources with more than 250 MMBtu/hour heat input that have switched to lower emitting fuels by updating permits, enforceable agreements, and/or rules. Ohio responded to MANE-VU Ask 4 that, in most cases, switches to lower emitting fuels have already been incorporated into Ohio's federally enforceable permits, however, lowering emission rates for such facilities across the board is not required or appropriate.

MANE-VU Ask 5 requested States include, in their Regional Haze SIP revision, measures to decrease energy demand by improved energy efficiency and to increase use of Combined Heat and Power and distributed generation technologies, such as fuel cells, wind,

⁵⁰ Ohio EPA's December 29, 2017, Technical Response Letter to the 2017 MANE-VU Ask is found in appendix M3 of Ohio's Regional Haze SIP revision in the docket.

and solar. Ohio responded to MANE–VU Ask 5, noting that Ohio EPA lacks the legislative authority to set energy policy, but encourages energy efficiency through efforts such as Ohio’s Encouraging Environmental Excellence Program.⁵¹

MANE–VU issued a second statement to Ohio EPA, similar to the one discussed above and also dated August 25, 2017, entitled, “Statement of the Mid-Atlantic/Northeast Visibility Union (MANE–VU) Concerning a Course of Action Within MANE–VU Toward Assuring Reasonable Progress for the Second Implementation Period (2018–2028).”⁵² Ohio EPA responded to MANE–VU’s request, noting that even though Ohio’s source selection process did not result in the selection of peaking combustion turbines for four-factor analysis, Ohio considered such NO_x controls and did not find the measures necessary for Ohio sources during the second implementation period.

On June 22, 2020, the VISTAS RPO sent a letter to Ohio EPA on behalf of Alabama, Georgia, North Carolina, South Carolina, Tennessee, Virginia, and West Virginia.⁵³ VISTAS shared with Ohio EPA the results of a technical analyses identifying Ohio sources to which VISTAS attributed significant impacts on visibility impairment at Class I areas within the VISTAS states. VISTAS’ analyses identified sources with a sulfate or nitrate impact greater than 1.00 percent of the total sulfate plus nitrate point source visibility impairment on the 20 percent most impaired days for each Class I area. For Ohio, VISTAS identified the following four sources: Ohio Valley Electric Corp.—Kyger Creek Station, Cardinal Power, General James M. Gavin Power Plant, and Zimmer Power Station. VISTAS requested that Ohio conduct a reasonable progress analysis for each of the four sources, and, if Ohio determined that a four-factor analysis was not warranted, provide a rationale.

On October 29, 2020, Ohio EPA responded to VISTAS request by providing information for each of the four sources on emissions controls,

control efficiencies, permitted limits, consent decree provisions, and trends in emission rates and annual emissions from 2016 to 2019.⁵⁴ Citing to examples in the 2019 Guidance of sources with effective emission controls, Ohio replied to VISTAS that, other than Zimmer Power Station, each of the other sources have existing effective controls with FGD or SCR with at least 90 percent effectiveness, and that a four-factor analysis would likely result in the conclusion that no further controls are necessary. For Zimmer Power Station, Ohio EPA confirmed that the facility announced it would permanently shut down in 2027, and that discussions were underway to secure the upcoming shutdown in an enforceable commitment such that a four-factor analysis would not be warranted.

In addition to the measures identified by MANE–VU and VISTAS above, Ohio reviewed the Regional Haze SIPs for other States, that were available at the time, to ensure appropriate consideration was given to measures determined necessary by other States for similar types of sources as those selected by Ohio for four-factor analysis, which were EGUs and lime manufacturing plants.

EPA proposes to find that Ohio has satisfied the consultation requirements of 40 CFR 51.308(f)(2)(ii). Ohio has met the 40 CFR 51.308(f)(2)(ii)(A) and (B) requirements with its participation in the LADCO consultation process plus its individual consultation meetings with contributing States. There were no disagreements with another State, therefore 40 CFR 51.308(f)(2)(ii)(C) does not apply to Ohio.

The requirements of 40 CFR 51.308(f)(2)(iii) provide that a State must document the technical basis for its decision making to determine the emission reductions measures that are necessary to make reasonable progress. The documentation requirement of 40 CFR 51.308(f)(2)(iii) provides that States may meet their obligations to document the technical bases on which they are relying to determine the emission reductions measures that are necessary to make reasonable progress through an RPO, as long as the process has been “approved by all State participants.” Ohio documented the technical basis, including the modeling, monitoring, engineering, costs, and emissions information that was relied on in determining the emission reduction measures that are necessary to make reasonable progress.

For modeling, Ohio EPA documented the modeling done by LADCO to determine visibility projections and contributions to impairment at the Class I areas. Ohio included justification for the 2016 base year selection and the 2028 emission projections based on ERTAC forecasts and State-reported changes.

For monitoring, Ohio described how ambient air quality monitoring data were analyzed to produce a conceptual understanding of the air quality problems contributing to haze as well as to project visibility conditions in 2028 through LADCO’s modeling and EPA’s Updated 2028 Visibility Air Quality Modeling. Ohio noted that LADCO relied upon the IMPROVE monitoring data to track the chemical composition of PM_{2.5} in haze at Class I areas in the LADCO region, which included ammonium nitrate, ammonium sulfate, elemental carbon, organic carbon, sea salt, and inorganic soil. Ohio EPA also pointed to its statewide monitoring network of EPA-approved monitors for ozone and PM_{2.5}, which Ohio continually reviews and uses to determine the contribution of emissions from sources within Ohio to visibility impairment at Class I areas in other States for SIP development.

For emissions information, Ohio EPA provided data for 2016 through 2019, the most recent data year available at the time, from various sources for each unit screened in using Ohio’s Q/d source selection threshold. Data from 2016 for annual emissions of NO_x, SO₂, PM_{2.5}, and NH₃ that was used by LADCO in the Q/d analysis relied upon the 2016 inventory developed by the National Emissions Inventory Collaborative described above. Emissions data for 2016–2019 for NO_x and SO₂ were obtained from EPA’s Clean Air Markets Database (CAMD) for sources that report emissions data to CAMD. To quantify emissions from sources that do not report to CAMD, data for 2017–2019 was obtained from Ohio EPA’s EIS. Ohio also provided an emissions summary by source category and pollutant obtained from the 2017 NEI, the most recent triennial NEI available at the time. For engineering and costs, Ohio EPA provided site-specific four-factor analyses, which evaluated potential engineering designs and costs for various NO_x and SO₂ emission control systems for 4 coal-fired EGUs at 3 different power plants (Avon Lake Power Plant, Dover Municipal Light & Power Plant, and General James M. Gavin Power Plant) and 2 coal-fired boilers at one lime manufacturing plant (Carmeuse Lime, Inc.—Maple Grove Operations). Additionally, Ohio EPA

⁵¹ Ohio’s Encouraging Environmental Excellence Program is available at <https://epa.ohio.gov/divisions-and-offices/environmental-financial-assistance/recognition-and-awards/e3-program>.

⁵² MANE–VU’s second statement dated August 25, 2017, entitled “Statement of the Mid-Atlantic/Northeast Visibility Union (MANE–VU) Concerning a Course of Action Within MANE–VU Toward Assuring Reasonable Progress for the Second Implementation Period (2018–2028)” is included as appendix O in Ohio’s Regional haze SIP revision included in the docket.

⁵³ VISTAS June 22, 2020, letter to Ohio EPA is included as appendix N1 in Ohio’s Regional Haze SIP revision included in the docket.

⁵⁴ Ohio’s October 29, 2020, response to VISTAS is included as appendix N2 to Ohio’s Regional Haze SIP revision included in the docket.

provided information to support to the incorporation of specific emissions rates in the long-term strategy and the SIP at 40 CFR 52.1870(d) at three power plants for the purposes of regional haze (Cardinal Power Plant, General James M. Gavin Power Plant, and Ohio Valley Electric Corp.—Kyger Creek Station). EPA proposes to find that such documentation of the technical basis of the long-term strategy satisfies the requirements of 40 CFR 51.308(f)(2)(iii).

The provisions of 40 CFR 51.308(f)(2)(iii) require that the emissions information considered to determine the measures that are necessary to make reasonable progress include information on emissions for the most recent year for which the State has submitted triennial emissions data to EPA (or a more recent year), with a 12-month exemption period for newly submitted data. As previously mentioned above, Ohio EPA participated in the development of technical analyses, including emission inventory information, by LADCO and its member States, and is relying in part on those analyses to satisfy the emission inventory requirements. Ohio EPA explained that emissions for the 2016 base year and the 2028 projected year used in LADCO's modeling address elements of 40 CFR 51.308(f)(6)(v) of the Regional Haze Rule, which requires that States provide recent and future year emissions inventories of pollutants anticipated to contribute to visibility impairment in any Class I areas. Ohio EPA's regional haze SIP revision for the second implementation period also included 2017 NEI emission data, which corresponds to the year of the most recent triennial NEI at the time of Ohio's SIP submission, as required under 40 CFR 51.308(f)(2)(iii) of the Regional Haze Rule. Based on Ohio EPA's consideration and analysis of the 2017 emission data in its SIP submittal, EPA proposes to find that Ohio has satisfied the emissions information requirement in 40 CFR 51.308(f)(2)(iii).

6. Five Additional Factors

In addition to the four statutory factors, States must also consider the five additional factors listed in 40 CFR 51.308(f)(2)(iv) in developing their long-term strategies.

As required by 40 CFR 51.308(f)(2)(iv)(A), Ohio EPA considered emission reductions due to ongoing air pollution control programs. Ohio EPA noted ongoing Federal and State emission control programs that have reduced and will continue to reduce visibility impairing pollutants from Ohio point and area sources as well as on-road and non-road mobile

sources in the second implementation period. For point sources, this included Federal provisions for title V permitting actions; Acid Rain Program; Boiler MACT; VOC MACT; Combustion turbine MACT; NSPS for New Residential Wood Heaters; NSPS for Commercial and Industrial Solid Waste Incinerators; NESHAPs for Industrial, Commercial, and Institutional Area Source Boilers, Major Source Boilers; NESHAP for Reciprocating Internal Combustion Engines; Mercury and Air Toxics Standards for power plants; oil and natural gas industry standards; SO₂ DRR; and Revised CSAPR Update. For area sources, regulations include national emission standards for aerosol coatings plus State regulations for Ohio's consumer product rules, Ohio's Architectural and Industrial Maintenance coatings rules, and Ohio's portable fuel container rules.

For on-road mobile sources, Ohio EPA cited to Federal regulations for the Motor Vehicle Emission Control Program—low sulfur gasoline and ultra-low sulfur diesel fuel; Control of Hazardous Air Pollutants from Mobile Sources; and NO_x Emission Standards for New Commercial Aircraft Engines. Among the controls for on-road mobile sources is the Ohio-administered Federal inspection and maintenance (I/M) program known as “E-check” in northeast Ohio, codified at Ohio Administrative Code 3745–26–01(Z). For non-road mobile sources, Ohio EPA cited to Federal regulations for the Clean Air Non-road Diesel Rule, Non-road Spark-Ignition Engines and Recreational Engine Standards, New Non-road Spark Ignition Engines, heavy-duty diesel engine standard/low sulfur fuel, railroad/locomotive standards, and commercial marine vessel engine standards. For both on-road and non-road mobile sources, Ohio EPA also provided information about Ohio's Beneficiary Mitigation Plan, which accepted and distributed funds from the Volkswagen settlement in 2018, resulting in benefits that compound over the lifetime of the equipment purchased or repowered. This included \$40 million to on-road fleets (school bus replacements, transit bus replacements, and class 4–8 local freight and port drayage trucks and shuttle buses), \$19 million to non-road equipment (tugboats, ferries, switcher locomotives, airport ground support, and port cargo handling equipment); and \$11.25 million for infrastructure to support Zero Emissions Vehicles.

As required by 40 CFR 51.308(f)(2)(iv)(B), Ohio's consideration of measures to mitigate the impacts of construction activities in its SIP

submission focus on windblown dust resulting from earth moving activities as a primary source of airborne particles. For work on construction sites where greater than one acre of land is disturbed, Ohio EPA points to general permits required under the National Pollutant Discharge Elimination System, which require best management practices to control soil erosion and stormwater runoff that are also effective in preventing and reducing airborne soil as particulate matter emissions.

Pursuant to 40 CFR 51.308(f)(2)(iv), Ohio EPA's SIP submission addressed schedules for source retirements, replacements, and natural gas conversions for 18 coal-fired units that are or will be permanent and federally enforceable during the second implementation period. As such, Ohio did not select these sources for a four-factor analysis. During the second implementation period, as enumerated above, 12 coal-fired EGUs have already permanently shut down, 3 coal-fired units converted to natural gas, and 3 coal-fired EGUs will permanently shut down by 2028. These retirements and conversions contribute to Ohio's emission reductions and the associated visibility improvements at the affected Class I areas for the second implementation period.

In considering smoke management for prescribed burns as required in 40 CFR 51.308(f)(2)(iv)(D), Ohio EPA referred to interrelated laws and regulations for management of air emissions from prescribed fires. Among the enforcing agencies is the Ohio Department of Natural Resources Division of Forestry, which has the authority under Ohio Revised Code (ORC) 1503.18⁵⁵ to ban outdoor burning statewide in unincorporated areas during certain months and times of the year and to provide waivers only for individuals who are Certified Prescribed Fire Managers. In addition, OAC 3745–19⁵⁶ “Open Burning Standards” regulates prescribed fires for horticultural, silvicultural, range, or wildfire management practices and requires applications for permission, which must specify methods to reduce air emissions and certify adherence to the requirements of OAC 3745–19. To put Ohio's contribution from prescribed fires into context, Ohio EPA also provided emissions data from the 2017

⁵⁵ Ohio Revised Code (ORC), title 15 Conservation of Natural Resources, Chapter 1503 Division of Forestry, Section 1503.18 is available at <https://codes.ohio.gov/ohio-revised-code/section-1503.18>.

⁵⁶ Ohio Administrative Code (OAC), Chapter 3745–19 Open Burning Standards is available at <https://codes.ohio.gov/ohio-administrative-code/chapter-3745-19>.

NEI showing that prescribed fire activity in the State constitutes less than 1 percent of total U.S. prescribed fire emissions.

As required by 40 CFR 51.308(f)(2)(iv), Ohio EPA considered the anticipated net effect on visibility improvements at the LADCO Class I Areas due to projected changes in emissions from point, area, and mobile sources during the second implementation period. For each potential control measure evaluated in the four-factor analyses, Ohio EPA projected the maximum estimated visibility benefit at any Class I area among the sources that were modeled, as listed in Table 18 of Ohio's SIP submission, to compare the relative control measures at a particular facility. Ohio considered cost-effectiveness along with time necessary to install controls, energy and non-air quality environmental impacts, and remaining useful life. Ohio found no potential new add-on controls necessary for reasonable progress.

Ohio EPA considered other projected changes in emissions that would affect visibility at the LADCO Class I Areas. The visibility improvement expected during the second implementation period was estimated using LADCO's 2016 base year and 2028 future year inventory components to simulate 2016 and 2028 air quality. As described above, for EGUs, projected changes for 2028 emissions in LADCO's modeling platform were based on ERTAC forecasts and State-reported changes. For most other emission sectors, LADCO relied upon EPA's 2016 and 2028 inventory estimates for projected changes. As Ohio EPA pointed out in section III.3(e)(5) of its SIP submission, these projected changes in EPA's 2016 and 2028 inventory estimates took into account Federal on-the-books controls, such as those listed in Ohio's long-term strategy above. In addition, as noted in section III.3(e)(5) of Ohio's SIP submission, improvements in visibility are also anticipated by the end of the second implementation period due to the upcoming permanent shutdowns of coal-fired EGUs at Miami Fort Power Station and Zimmer Power Station by 2028.

Ohio EPA also demonstrated that visibility conditions in the LADCO Class I Areas have shown continued improvement relative to baseline conditions. As depicted in LADCO's 2021 TSD, 2016 visibility impairment conditions at the LADCO Class I Areas on the 20 percent most impaired days as well as the 20 percent clearest days were below their respective glidepaths. By the end of the second

implementation period in 2028, both LADCO's projections and EPA's Updated 2028 Visibility Air Quality Modeling show 2028 visibility conditions will be below the URP glidepaths for the LADCO Class I Areas.

Ohio EPA concluded, in section V of its SIP submission, that when weighing the four-factor analyses and the five additional required factors, new add-on controls are not necessary to meet second implementation period regional haze SIP requirements beyond the measures included in Ohio's long-term strategy. Ohio's process for selecting sources for four-factor analyses represented 80 percent of the total SO₂ and 57 percent of NO_x for all sources with Q greater than 0.1 tons per year and provided an analytical means for refining the list based on shutdowns, conversions, and existing effective controls. For the add-on controls evaluated for the 6 units selected for four-factor analyses, Ohio considered the cost effectiveness, time necessary to install the controls, energy and solid waste impacts, the costs/sales ratio, and comparable visibility benefits in determining that the controls evaluated were not cost effective to achieve emission reductions during the second implementation period. Ohio EPA reflected upon the steady and significant improvement in visibility at each of the Class I areas impacted by sources in Ohio and noted that LADCO's modeling shows continued improvement with 2028 projections below their URP glidepaths. As discussed under the progress report elements below, from 2005 to 2017, Ohio's SO₂ emissions decreased by 90 percent while NO_x emissions decreased by 47 percent. During the second implementation period, the decreasing trend continues with the shutdowns of 12 coal-fired EGUs at 4 facilities and the upcoming permanent shutdowns of 3 more coal-fired EGUs at 2 power stations. Given all these factors, Ohio concluded that the on-the-books and on-the-way controls included in its long-term strategy, including the shutdowns and emission limits for NO_x and SO₂ in the DFFOs, are more than sufficient to make reasonable progress in the second implementation period. EPA proposes to find that Ohio reasonably considered and satisfied the requirements for each of the five additional factors in 40 CFR 51.308(f)(2)(iv) in developing its long-term strategy.

F. Reasonable Progress Goals

The provisions of 40 CFR 51.308(f)(3) contain the requirements pertaining to RPGs for each Class I area. Under 40 CFR 51.308(f)(3)(i), a State, in which a

mandatory Class I area is located, is required to establish RPGs—one each for the most impaired and clearest days—reflecting the visibility conditions that will be achieved at the end of the implementation period as a result of the emission limitations, compliance schedules and other measures required under paragraph (f)(2) to be in States' long-term strategies, as well as implementation of other CAA requirements. The long-term strategies as reflected by the RPGs must provide for an improvement in visibility on the most impaired days relative to the baseline period and ensure no degradation on the clearest days relative to the baseline period. The provisions of 40 CFR 51.308(f)(3)(ii) apply in circumstances in which a Class I area's RPG for the most impaired days represents a slower rate of visibility improvement than the uniform rate of progress calculated under 40 CFR 51.308(f)(1)(vi). Under 40 CFR 51.308(f)(3)(ii)(A), if the State in which a mandatory Class I area is located establishes an RPG for the most impaired days that provides for a slower rate of visibility improvement than the URP, the State must demonstrate that there are no additional emission reduction measures for anthropogenic sources or groups of sources in the State that would be reasonable to include in its long-term strategy. The provisions of 40 CFR 51.308(f)(3)(ii)(B) requires that if a State contains sources that are reasonably anticipated to contribute to visibility impairment in a Class I area in *another* State, and the RPG for the most impaired days in that Class I area is above the URP, the upwind State must provide the same demonstration. Because Ohio has no Class I areas within its borders to which the requirements of the visibility protection program apply in 40 CFR part 81, subpart D, Ohio is subject only to 40 CFR 51.308(f)(3)(ii)(B), but not 40 CFR 51.308(f)(3)(i) or (f)(3)(ii)(A).

Under 40 CFR 51.308(f)(3)(ii)(B), a State that contains sources that are reasonably anticipated to contribute to visibility impairment in a Class I area in another State for which a demonstration by the other State is required under 40 CFR 51.308(f)(3)(ii)(B) must demonstrate that there are no additional emission reduction measures that would be reasonable to include in its long-term strategy. Ohio's SIP submission at Table 1, section III(7)(b), and appendix A show that at each of the Class I areas impacted by emissions from Ohio, the 2028 projected visibility impairment is not above the adjusted URP glidepaths for the 20 percent most impaired days

and ensures no degradation on the 20 percent clearest days. Therefore, EPA proposes it is reasonable to assume that the demonstration requirement under 40 CFR 51.308(f)(3)(ii)(B) as it pertains to these areas will not be triggered.

EPA proposes to determine that Ohio has satisfied the applicable requirements of 40 CFR 51.308(f)(3) relating to RPGs.

G. Monitoring Strategy and Other Implementation Plan Requirements

The requirements of 40 CFR 51.308(f)(6) specify that each comprehensive revision of a State's regional haze SIP must contain or provide for certain elements, including monitoring strategies, emissions inventories, and any reporting, recordkeeping and other measures needed to assess and report on visibility. A main requirement of this subsection is for States with Class I areas to submit monitoring strategies for measuring, characterizing, and reporting on visibility impairment. Compliance with this requirement may be met through participation in the IMPROVE network.

The provisions of 40 CFR 51.308(f)(6)(i) require SIPs to provide for the establishment of any additional monitoring sites or equipment needed to assess whether reasonable progress goals to address regional haze for all mandatory Class I Federal areas within the State are being achieved. The provisions of 51.308(f)(6)(ii) require SIPs to provide for procedures by which monitoring data and other information are used in determining the contribution of emissions from within the State to regional haze visibility impairment at mandatory Class I Federal areas both within and outside the State. As noted above, Ohio does not have any mandatory Class I Federal areas located within its borders to which the requirements of the visibility protection program apply in 40 CFR part 81, subpart D. Therefore, 40 CFR 51.308(f)(6)(i) and (ii) do not apply.

The provisions of 40 CFR 51.308(f)(6)(iii) require States with no Class I areas to include procedures by which monitoring data and other information are used in determining the contribution of emissions from within the State to regional haze visibility impairment at Class I areas in other States. States with Class I areas must establish a monitoring program and report data to EPA that is representative of visibility at the Class I Federal areas. The IMPROVE network meets this requirement. Ohio EPA stated that, as a participant in LADCO, it reviewed information about the chemical

composition of baseline monitoring data at LADCO Class I Federal areas to understand the sources of haze causing pollutants. Ohio EPA does not operate any monitoring sites under the Federal IMPROVE program and, therefore, does not require approval of its monitoring network under the Regional Haze Rule. Ohio EPA relies upon participation in the IMPROVE network as part of the State's monitoring strategy for regional haze to review progress and trends in visibility at Class I areas that may be affected by emissions from Ohio, for comprehensive periodic revisions of this implementation plan, and for periodic reports describing progress towards the reasonable progress goals for those areas. Ohio also runs a monitoring network of EPA-approved monitors for ozone and PM_{2.5}, as described in section III(8)(c) of Ohio's SIP submission, which Ohio EPA uses to determine the contribution of emissions from sources within Ohio to visibility impairment at Class I areas in other States for SIP development.

The provisions of 40 CFR 51.308(f)(6)(iv) require the SIP to provide for the reporting of all visibility monitoring data to the Administrator at least annually for each Class I area in the State. As noted above, Ohio does not have any mandatory Class I Federal areas located within its borders to which the requirements of the visibility protection program apply in 40 CFR part 81, subpart D, and, therefore, 40 CFR 51.308(f)(6)(iv) does not apply.

The provisions of 40 CFR 51.308(f)(6)(v) require SIPs to provide for a statewide inventory of emissions of pollutants that are reasonably anticipated to cause or contribute to visibility impairment, including emissions for the most recent year for which data are available. Ohio EPA, as described in section III(8)(c)(ii) of its SIP submission, provided statewide emission inventories, including data from 2017 as the most recent year available at the time of the State's SIP submission, by complying with EPA's AERR. In 40 CFR part 51, subpart A, the AERR requires States to submit updated emissions inventories for criteria pollutants to EPA's Emissions Inventory System every three years. The emission inventory data is used to develop the NEI, which provides for, among other things, a triennial State-wide inventory of pollutants that are reasonably anticipated to cause or contribute to visibility impairment. Ohio's SIP submission, in section III(8)(b), includes a table of 2017 NEI data with source categories covering emissions from EGU point, non-EGU point, on-road, non-road, commercial marine vessels, dust,

and other for the following pollutants: SO₂, NO_x, PM_{2.5}, PM₁₀, VOC, and NH₃. To depict changes in emissions over time, Ohio EPA accompanied the 2017 NEI data with side-by-side comparisons comparing 2005 emissions for the same source categories and pollutants. Ohio EPA also provided a summary of SO₂, NO_x, PM_{2.5}, VOCs, and NH₃ emissions for 2016 that LADCO used in developing Q/d metrics and the 2016 base year emissions inventory to project emissions to year 2028. Additionally, as described in further detail under the progress report elements in section III(8)(b) of Ohio's SIP submission, Ohio EPA provided more recent data through 2019 from CAMD to depict trends in EGU emissions, which demonstrated a 94 percent decrease in SO₂ emissions and an 84 percent decrease in NO_x emissions from 2005 to 2019.

The provisions of 40 CFR 51.308(f)(6)(v) also require States to include estimates of future projected emissions and include a commitment to update the inventory periodically. For future projected emissions, Ohio relied on the LADCO modeling and analysis, which estimated 2028 projected emissions of SO₂ and NO_x for specific facilities in the LADCO States to provide an assessment of expected future year air quality based on 2016 emissions as well as ERTAC and State forecasts. In addition to Ohio's commitment to comply with the AERR to periodically update EPA's emission inventories for creating and analyzing the NEI, Ohio annually updates the State's own EIS for pollutants anticipated to cause or contribute to visibility impairment in Class I areas to support future regional haze progress reports and SIP revisions.

EPA proposes to find that Ohio has met the requirements of 40 CFR 51.308(f)(6) as described above, including through its continued participation in LADCO, its own statewide EIS, and its emissions reporting to EPA under AERR.

H. Requirements for Periodic Reports Describing Progress Towards the Reasonable Progress Goals

The provisions of 40 CFR 51.308(f)(5) require that periodic comprehensive revisions of States' regional haze plans also address the progress report requirements of 40 CFR 51.308(g)(1) through (5). The purpose of these requirements is to evaluate progress towards the applicable RPGs for each Class I area within the State and each Class I area outside the State that may be affected by emissions from within that State. The provisions of 40 CFR 51.308(g)(1) and (2) apply to all States

and require a description of the status of implementation of all measures included in a State's first implementation period regional haze plan and a summary of the emission reductions achieved through implementation of those measures. The provisions of 40 CFR 51.308(g)(3) apply only to States with Class I areas within their borders and requires such States to assess current visibility conditions, changes in visibility relative to baseline (2000–2004) visibility conditions, and changes in visibility conditions relative to the period addressed in the first implementation period progress report. The provisions of 51.308(g)(4) apply to all States and requires an analysis tracking changes in emissions of pollutants contributing to visibility impairment from all sources and sectors since the period addressed by the first implementation period progress report. This provision further specifies the year or years through which the analysis must extend depending on the type of source and the platform through which its emission information is reported. Finally, 40 CFR 51.308(g)(5), which also applies to all States, requires an assessment of any significant changes in anthropogenic emissions within or outside the State have occurred since the period addressed by the first implementation period progress report, including whether such changes were anticipated and whether they have limited or impeded expected progress towards reducing emissions and improving visibility.

Ohio's previous progress report, which was a 5-year progress report submitted as a SIP revision for the first implementation period on March 11, 2016, included emission inventories from 2002–2014 of NO_x and SO₂ for EGUs as well as inventories from 2005 and 2011 of NO_x, SO₂, PM_{2.5}, PM₁₀, VOC, and NH₃ for additional source categories: EGUs, non-EGUs, on-road, non-road, commercial marine vessels, and other. Based on CAMD data for emissions from EGUs covering the period 2002 to 2014, Ohio's 2016 5-year progress report showed a decrease in NO_x emissions by 76 percent and a decrease in SO₂ emissions by 75 percent. (82 FR 60543, December 21, 2017).

For the second implementation period SIP submittal, the 2019 Guidance recommends the progress report cover the first full year that was not incorporated into the previous progress report through a year that is as close as possible to the submission date of the SIP. 2019 Guidance at 55. Ohio's 2021 progress report, contained in section III(8)(b) of its SIP submission, covered

the measures and emissions reductions achieved from 2005 through 2019, including 2017 as the most recent NEI year available at the time for sector level emissions.

To address the progress report elements of 51.308(g)(1), Ohio EPA described the status of implementation of all measures in the long-term strategy under its first implementation period regional haze plan. These measures included several Federal measures, including CAIR and its successor CSAPR, to which Ohio attributed the majority of reductions in visibility-impairing emissions from the largest point-source sector, EGUs, during the first implementation period, along with the Acid Rain Program under title IV and the NO_x SIP Call. Additional on-the-books control measures that generated further emission reductions addressed mobile sources, such as on-road provisions under the Federal Motor Vehicle Emission Control Program for low-sulfur gasoline and ultra-low sulfur diesel fuel as well as the Ohio-administered Federal I/M program, E-check. Non-road Federal measures for mobile sources included the Clean Air Non-road Diesel Rule, the evaporative Large Spark Ignition and Recreational Vehicle standards, heavy-duty diesel engine standard for low-sulfur diesel fuel, railroad/locomotive standards, and commercial marine vessel engine standards. Measures for area sources included Ohio's consumer products rules for consumer solvents, Ohio's Architectural and Industrial Maintenance coatings rules, Ohio's portable fuel container rules, and NESHAP for aerosol coatings. Among the other measures, Ohio also included BART and Industrial Boiler MACT, which applied to only one EGU in the State.

As required by 40 CFR 51.308(g)(2), Ohio provided a summary of the emission reductions achieved through the measures outlined above from the first implementation period. As a result of these measures, NEI data from 2005 to 2017 from across all emission categories, discussed more fully below, show that Ohio's SO₂ emissions decreased by 90 percent, NO_x emissions decreased by 57 percent, VOC emissions decreased by 33 percent, and ammonia emissions decreased by 26 percent. The most significant emissions reductions from Ohio's SIP strategies were realized mainly as a result of CAIR and CSAPR, where CAMD data show that the EGU sector experienced a 94 percent decrease in SO₂ from 1,085,485 tpy in 2005 to 68,905 tpy in 2019 as well as an 84 percent decrease in NO_x from 255,000 tpy in 2005 to 40,493 tpy in

2019. EPA proposes to find that Ohio has met the requirements of 40 CFR 51.308(g)(1) and (2) because its SIP submission describes the measures included in the long-term strategy from the first implementation period, as well as the status of their implementation and the emission reductions achieved through such implementation.

The provisions of 40 CFR 51.308(g)(3) require States to assess Reasonable Progress Goals, including current visibility conditions and changes, for any Class I areas within the State. As described above, Ohio has no mandatory Class I Federal areas within its borders that are among the 156 mandatory Class I Federal areas where EPA deemed visibility to be an important value. Therefore, 40 CFR 51.308(g)(3) does not apply.

To address 40 CFR 51.308(g)(4), Ohio EPA provided an analysis, in section III.8(b)(iv) of its SIP submittal, tracking the change in emissions of NO_x, SO₂, PM_{2.5}, PM₁₀, NH₃, and VOC from all sources and activities in the State. Table 21 of Ohio's SIP submission documents changes in emissions of each of these pollutants for the EGU point, non-EGU point, on-road, non-road, commercial marine vessels, and other categories based on the NEIs from 2005 through 2017, the most recent NEI year available at the time for category level emissions. As a caveat, Ohio noted that there were several changes in the methodologies for estimating emissions between the 2005 and 2017 NEIs, such that they are not readily comparable as explained in EPA's 2017 National Emissions Inventory: January 2021 Updated Release, Technical Support Document.⁵⁷ Specifically, these inconsistencies resulted from changes in the reporting of the condensable portion of PM emissions, changes in the model used for on-road and non-road emissions, as well as improvements in methodologies for other sources such as paved and unpaved PM emissions, ammonia fertilizer and animal waste emissions, oil and gas production, residential wood combustion, solvents, industrial and commercial/institutional fuel combustion, and commercial marine vessel emissions. While Ohio EPA noted that the inventories are not directly comparable, 40 CFR 51.308(g)(4) does not require States to revise previous NEI year estimates to use the same methods as a more recent year.

⁵⁷ 2017 National Emissions Inventory: January 2021 Updated Release, Technical Support Document," EPA-454/R-21-001, February 2021. https://www.epa.gov/sites/default/files/2021-02/documents/nei2017_tsd_full_jan2021.pdf.

Ohio EPA's analysis of Table 21 documents overall emission reductions in NO_x and SO₂ across all source categories from the 2005 and 2017 NEIs, with a 90 percent reduction in SO₂ and 57 percent reduction in NO_x. Based on the 2005 and 2017 NEIs, Ohio documented decreases in NO_x emissions of 77 percent from EGU Point, 32 percent from non-EGU point, 49 percent from on-road, 55 percent from non-road, 38 percent from commercial marine vessels, and 44 percent from other categories. For SO₂, Ohio calculated decreases from the 2005 to 2017 NEIs of 92 percent from EGU point, 77 percent from non-EGU point, 87 percent from on-road, 99 percent from non-road, 92 percent from commercial marine vessels, and 36 percent from other categories. Overall reductions in VOC and NH₃ emissions, which Ohio EPA notes are less impactful on visibility in the LADCO Class I Areas, reached 33 percent and 26 percent, respectively, despite an apparent increase in EGU point source emissions in NH₃, which Ohio EPA attributes to changes in estimation methodologies at a few select facilities that Ohio EPA is investigating further. Similarly, while overall PM_{2.5} and PM₁₀ emissions appear to increase by 14 percent and 12 percent, respectively, Ohio EPA notes that a direct comparison between the 2005 and 2017 NEIs would be inaccurate because of the inconsistencies in PM reporting and changes in the modeling of emissions as explained above. In addition to the NEIs, Ohio EPA provided data, as noted earlier, with respect to EGUs that report to CAMD from 2005 to 2019, the most recent year available at the time, tracking the change in emissions and chronicling the decrease in SO₂ by 94 percent and the decrease in NO_x by 84 percent. EPA proposes to find that Ohio has satisfied the requirements of 40 CFR 51.308(g)(4) by tracking the change in emissions of NO_x, SO₂, PM_{2.5}, VOCs, and NH₃ identified by type of source since the first progress report.

To address 40 CFR 51.308(g)(5), Ohio EPA assessed significant changes in anthropogenic emissions since the first implementation period plan, within and outside of the State, including whether they were anticipated and whether they limited or impeded progress in improving visibility. Within the State, Ohio compared the 2005 and 2017 NEIs in Table 21 of its submittal to identify changes in anthropogenic emissions, finding that emissions significantly decreased across all categories for NO_x and SO₂. As previously mentioned,

these changes were anticipated and occurred mainly as a result of CSAPR as it replaced CAIR. Where emissions appeared to increase significantly, such as for NH₃ emissions from EGU-point source category, Ohio explained the changes occurred as a result the inconsistencies in the reporting, modeling, and methodologies used for the 2005 and 2017 NEI data sets as described above, and that Ohio is investigating the potential for the increases to be attributed to errors at a few select facilities. With the significant decreases in anthropogenic emissions of NO_x, SO₂, VOC, and NH₃ across all source categories from 2005 to 2017 NEIs, Ohio EPA found that no changes in anthropogenic emissions within or outside Ohio have occurred from 2005 to 2017 that would limit or impede progress in reducing pollutant emissions and improving visibility. Ohio noted that further improvements in visibility are anticipated with the emission reductions to be realized the Revised CSAPR Update along with the permanent shutdown of coal-fired boilers at Miami Fort Power Station and Zimmer Power Station. The emissions trend data in Ohio's SIP submission support an assessment that anthropogenic haze-causing pollutant emissions in Ohio have decreased during the reporting period and that changes in emissions have not limited or impeded progress in reducing pollutant emissions and improving visibility. EPA proposes to find that Ohio has met the requirements of 40 CFR 51.308(g)(5).

Following up on Ohio's 2021 progress report, in section III.8(b) of its SIP submission, Ohio EPA committed to submit a progress report for the second implementation period by January 31, 2025, to evaluate progress towards the reasonable progress goal for each mandatory Class I Federal area located within and outside the State that may be affected by emissions from within the State as required by 40 CFR 51.308(g).

I. Requirements for State and Federal Land Manager Coordination

CAA section 169A(d) requires States to consult with FLMs before holding the public hearing on a proposed regional haze SIP and to include a summary of the FLMs' conclusions and recommendations in the notice to the public. In addition, 40 CFR 51.308(i)(2)'s FLM consultation provision requires a State to provide FLMs with an opportunity for consultation that is early enough in the State's policy analyses of its emission

reduction obligation so that information and recommendations provided by the FLMs' can meaningfully inform the State's decisions on its long-term strategy. If the consultation has taken place at least 120 days before a public hearing or public comment period, the opportunity for consultation will be deemed early enough. Regardless, the opportunity for consultation must be provided at least 60 days before a public hearing or public comment period at the State level. The requirements of 40 CFR 51.308(i)(2) also provide two substantive topics on which FLMs must be provided an opportunity to discuss with States: assessment of visibility impairment in any Class I area and recommendations on the development and implementation of strategies to address visibility impairment. In 40 CFR 51.308(i)(3), States, in developing their implementation plans, are required to include a description of how they addressed FLMs' comments.

In development of its SIP submittal, Ohio participated with the FLMs in an early engagement process as well as a formal consultation process, sharing drafts of its SIP submission, reviewing information provided by the FLMs, and meeting to discuss the development of Ohio's proposed Regional Haze plan. On May 12, 2020, and October 2, 2020, Ohio received lists of sources recommended for four-factor analyses by NPS and USFS, respectively, which are included as Appendices K2 and K3 in Ohio's SIP submission. On October 8, 2020, Ohio EPA shared an early draft of its Regional Haze plan with USFS, FWS, and NPS for their review and comments. Following this early engagement process, Ohio initiated a formal consultation process with the FLMs on January 6, 2021, providing another draft of its Regional Haze plan and offering an opportunity for consultation in person. Ohio EPA initiated the early engagement process more than 120 days before the first public comment period on Ohio's plan and began the formal consultation process at least 60 days prior to the first public comment period on Ohio's plan as required by 40 CFR 51.308(i)(2). On February 10, 2021, USFS shared their comments on the draft plan with Ohio EPA, and NPS shared their comments with Ohio EPA on February 17, 2021, both of which are contained in Appendices L1, L2, L3 of Ohio's SIP submission. Ohio EPA's response to the FLM's comments from February 2021 are included as Appendix L4 of Ohio's SIP submittal as required by 40 CFR 51.308(i)(3).

On May 10, 2021, Ohio announced its initial public comment period and public hearing regarding the State's proposed SIP submittal for the second implementation period on Ohio EPA's Regional Haze website,⁵⁸ in the Ohio EPA Weekly Review,⁵⁹ and through electronic mailing lists to interested parties, including FLMs. The public notice included FLM's comments and Ohio EPA's response in the proposed SIP submission. The initial public comment period took place from May 10, 2021, through June 28, 2021, being extended beyond the original 30-day period by an additional two weeks, and a virtual and in-person public hearing was held on June 14, 2021. Following the public comment period, Ohio submitted its SIP revision to EPA on July 30, 2021.

Subsequently, in 2023 and 2024, Ohio EPA re-engaged with the FLMs on a proposed supplement to its July 30, 2021, SIP submission. As discussed above, Ohio EPA shared a proposed supplement with the FLMs that included an analyses and proposed emission limits for General James M. Gavin Power Plant, Cardinal Power Plant, and Ohio Valley Electric Corp.—Kyger Creek Station. For the proposed supplement, Ohio EPA provided a 45-day FLM consultation period from January 16, 2024, to March 1, 2024, that ran concurrently with an extended public comment period from January 16, 2024, to March 18, 2024, during which Ohio made the FLM comments available to the public on its website by March 5, 2024. A virtual and in-person public hearing on Ohio EPA's proposed supplement was held on March 18, 2024.

Following the second public comment period, Ohio EPA again re-engaged with the FLMs on proposed DFFOs that would effectuate the emissions limitations contained within the proposed supplement. After Ohio EPA and the FLMs agreed on a shortened FLM consultation period from May 3, 2024, to May 31, 2024, Ohio provided a third public comment period regarding draft DFFOs effectuating the proposed emission limitations from June 3, 2024, through July 8, 2024, and a virtual and in-person public hearing was held on July 8, 2024. Ohio EPA considered input from FLMs and the public provided during each of the three FLM consultation periods and three

public notice periods when finalizing this SIP revision.

As required by 40 CFR 51.308(i)(4), Ohio committed to continue consultation with States and FLMs on the development and review of any future plan revisions and progress reports, as well as other programs having the potential to contribute to visibility impairment in the mandatory Class I areas, including NSR sources that might impact visibility in Class I areas. Given Ohio EPA's actions recounted above, EPA proposes to find that Ohio has satisfied the requirements of 40 CFR 51.308(i) to consult with the FLMs on its regional haze SIP for the second implementation period.

V. Proposed Action

EPA proposes to approve Ohio's July 30, 2021, SIP submission, as supplemented on August 6, 2024, as satisfying the regional haze requirements for the second implementation period contained in 40 CFR 51.308(f).

VI. Statutory and Executive Order Reviews

Under the CAA, the Administrator is required to approve a SIP submission that complies with the provisions of the CAA and applicable Federal regulations. 42 U.S.C. 7410(k); 40 CFR 52.02(a). Thus, in reviewing SIP submissions, EPA's role is to approve State choices, provided that they meet the criteria of the CAA. Accordingly, this action merely proposes to approve State law as meeting Federal requirements and does not impose additional requirements beyond those imposed by State law. For that reason, this proposed action:

- Is not a "significant regulatory action" subject to review by the Office of Management and Budget under Executive Orders 12866 (58 FR 51735, October 4, 1993) and 14094 (88 FR 21879, April 11, 2023);
- Does not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*);
- Is certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*);
- Does not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4);
- Does not have Federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999);

- Is not subject to Executive Order 13045 (62 FR 19885, April 23, 1997) because it approves a State program;

- Is not a significant regulatory action subject to Executive Order 13211 (66 FR 28355, May 22, 2001); and

- Is not subject to requirements of Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because application of those requirements would be inconsistent with the CAA.

In addition, the SIP is not approved to apply on any Indian reservation land or in any other area where EPA or an Indian Tribe has demonstrated that a Tribe has jurisdiction. In those areas of Indian country, the rule does not have Tribal implications and will not impose substantial direct costs on Tribal governments or preempt Tribal law as specified by Executive Order 13175 (65 FR 67249, November 9, 2000).

Executive Order 12898 (Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, 59 FR 7629, February 16, 1994) directs Federal agencies to identify and address "disproportionately high and adverse human health or environmental effects" of their actions on communities with environmental justice (EJ) concerns to the greatest extent practicable and permitted by law. EPA defines EJ as "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies." EPA further defines the term fair treatment to mean that "no group of people should bear a disproportionate burden of environmental harms and risks, including those resulting from the negative environmental consequences of industrial, governmental, and commercial operations or programs and policies."

Ohio EPA did not evaluate EJ considerations as part of its SIP submittal; the CAA and applicable implementing regulations neither prohibit nor require such an evaluation. EPA did not perform an EJ analysis and did not consider EJ in this action. Due to the nature of the action being taken here, this action is expected to have a neutral to positive impact on the air quality of the affected area. Consideration of EJ is not required as part of this action, and there is no information in the record inconsistent with the stated goal of E.O. 12898 of achieving environmental justice for communities with EJ concerns.

LIST OF PUBLIC LAWS Note: No public bills which have become law were received by the Office of the Federal Register for inclusion	in today's List of Public Laws. Last List August 1, 2024	Public Laws Electronic Notification Service (PENS) PENS is a free email notification service of newly	enacted public laws. To subscribe, go to https://portalguard.gsa.gov/__layouts/PG/register.aspx. Note: This service is strictly for email notification of new laws. The text of laws is not available through this service. PENS cannot respond to specific inquiries sent to this address.
