We remind interested parties that due to the relativity inherent in the development of RVUs, reductions in existing prices for any items in the direct PE database increase the pool of direct PE RVUs available to all other PFS services. Tables A–E8 and A–E9 also include the number of invoices received and the number of nonfacility allowed services for procedures that use these equipment items. We provide the nonfacility allowed services so that interested parties will note the impact the particular price might have on PE relativity, as well as to identify items that are used frequently, since we believe that interested parties are more likely to have better pricing information for items used more frequently. A single invoice may not be reflective of typical costs, and we encourage interested parties to provide additional invoices so that we might identify and use accurate prices in the development of PE RVUs.

In some cases, we do not use the price listed on the invoice that accompanies the recommendation because we identify publicly available alternative prices or information that suggests a different price is more accurate. In these cases, we include this in the discussion of these codes. In other cases, we cannot adequately price a newly recommended item due to inadequate information. Sometimes, no supporting information regarding the price of the item has been included in the recommendation. In other cases, the supporting information does not demonstrate that the item has been purchased at the listed price (for example, vendor price quotes instead of paid invoices). In cases where the information provided on the item allows us to identify clinically appropriate proxy items, we might use existing items as proxies for the newly recommended items. In other cases, we include the item in the direct PE input database without any associated price. Although including the item without an associated price means that the item does not contribute to the calculation of the final PE RVU for particular services, it facilitates our ability to incorporate a price once we obtain information and are able to do so.

(6) Service Period Clinical Labor Time in the Facility Setting

Generally speaking, our direct PE inputs do not include clinical labor minutes assigned to the service period because the cost of clinical labor during the service period for a procedure in the facility setting is not considered a resource cost to the practitioner since Medicare makes separate payment to the facility for these costs. We address code-specific refinements to clinical labor in the individual code sections.

(7) Procedures Subject to the Multiple Procedure Payment Reduction (MPPR) and the OPPS Cap

We note that the list of services for the upcoming calendar year that are subject to the MPPR on diagnostic cardiovascular services, diagnostic imaging services, diagnostic ophthalmology services, and therapy services; and the list of procedures that meet the definition of imaging under section 1848(b)(4)(B) of the Act, and therefore, are subject to the OPPS cap; are displayed in the public use files for the PFS proposed and final rules for each year. The public use files for CY 2025 are available on the CMS website under downloads for the CY 2025 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*. For more information regarding the history of the MPPR policy, we referred readers to the CY 2014 PFS final rule with comment period (78 FR 74261 through 74263).

Effective January 1, 2007, section 5102(b)(1) of the Deficit Reduction Act of 2005 (Pub. L. 109–171) (DRA) amended section 1848(b)(4) of the Act to require that, for imaging services, if—(i) The TC (including the TC portion of a global fee) of the service established for a year under the fee schedule without

application of the geographic adjustment factor, exceeds (ii) The Medicare OPD fee schedule amount established under the prospective payment system (PPS) for HOPD services under section 1833(t)(3)(D) of the Act for such service for such year, determined without regard to geographic adjustment under section 1833(t)(2)(D), the Secretary shall substitute the amount described in clause (ii), adjusted by the geographic adjustment factor under the PFS, for the fee schedule amount for such TC for such year. As required by section 1848(b)(4)(A) of the Act, for imaging services furnished on or after January 1, 2007, we cap the TC of the PFS payment amount for the year (prior to geographic adjustment) by the Outpatient Prospective Payment System (OPPS) payment amount for the service (prior to geographic adjustment). We then apply the PFS geographic adjustment to the capped payment amount. Section 1848(b)(4)(B) of the Act defines imaging services as ''imaging and computer-assisted imaging services, including X-ray, ultrasound (including echocardiography), nuclear medicine (including PET), magnetic resonance imaging (MRI), computed tomography (CT), and fluoroscopy, but excluding diagnostic and screening mammography.'' For more information regarding the history of the cap on the TC of the PFS payment amount under the DRA (the ''OPPS cap''), we referred readers to the CY 2007 PFS final rule with comment period (71 FR 69659 through 69662).

For CY 2025, we identified new and revised codes to determine which services meet the definition of ''imaging services'' as defined at section 1848(b)(4)(B) of the Act for purposes of this cap. Beginning for CY 2025, we proposed to include the following services on the list of codes to which the OPPS cap applies: CPT codes 0868T (*High-resolution gastric electrophysiology mapping with simultaneous patient-symptom profiling, with interpretation and report*), 0876T (*Duplex scan of hemodialysis fistula, computer-aided, limited (volume flow, diameter, and depth, including only body of fistula)*), 74263 (*Computed tomographic (ct) colonography, screening, including image postprocessing*), 92137 (*Computerized ophthalmic diagnostic imaging (eg, optical coherence tomography [OCT]), posterior segment, with interpretation and report, unilateral or bilateral; retina including OCT angiography*), 93896 (*Vasoreactivity study performed with transcranial Doppler study of intracranial arteries, complete (List separately in addition to code for primary procedure)*), 93897 (*Emboli detection without intravenous microbubble injection performed with transcranial Doppler study of intracranial arteries, complete (List separately in addition to code for primary procedure)*), and 93898 (*Venous-arterial shunt detection with intravenous microbubble injection performed with transcranial Doppler study of intracranial arteries, complete (List separately in addition to code for primary procedure)*). We believe that these codes meet the definition of imaging services under section 1848(b)(4)(B) of the Act, and thus, should be subject to the OPPS cap.

In the CY 2024 PFS final rule (88 FR 78894), we noted that in response to the CY 2024 PFS proposed rule, commenters requested that CMS remove CPT code 92229 (*Imaging of retina for detection or monitoring of disease; point-of-care autonomous analysis and report, unilateral or bilateral*) from the OPPS cap list because it does not include an associated PC or physician interpretation and it is primarily utilized in the physician office setting. We solicited comment on the appropriateness of applying the OPPS cap to services such as this for which the interpretation component is not captured by work RVUs, and the service is not split into technical and professional components. We are more broadly evaluating how services involving assistive technologies are most accurately valued. We note that the OPPS rate for this service is currently higher than what would be paid in a physician office setting, and therefore the OPPS cap does not currently apply to CPT code 92229 as of 2024.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters requested that CMS remove CPT code 92229 from the OPPS cap list because it does not include an associated professional component (PC) or physician interpretation, and it is primarily utilized in the physician office setting. Despite CPT codes 92227 (*Imaging of retina for detection or monitoring of disease; with remote clinical staff review and report, unilateral or bilateral),* 92228 (*Imaging of retina for detection or monitoring of disease; with remote physician or other qualified health care professional interpretation and report, unilateral or bilateral*), and 92229 all being in the same family of codes and representing the same imaging service, only differentiated by the modality of review and interpretation, commenters stated that CPT code 92229 falls outside the scope of the definition of ''imaging services'' under the DRA because it does not include a PC and TC split similar to the imaging technologies governed by section 5102(b) of the DRA. Commenters stated that ''the DRA is intended to apply to services typically performed in the hospitals, but CPT code 92229 is primarily done in the physician office setting,'' and therefore, commenters asserted that the code ''falls outside the intent of the law'' since CPT code 92229 is almost exclusively performed in physician office or clinic settings, not in hospital settings.

Response: We appreciate the commenters' feedback regarding CPT code 92229 and may consider the input for future rulemaking. We are always looking for ways to improve the accuracy of valuation and payment for services across settings. We note that the analogous CPT codes 92227 and 92228 are also typically performed in the physician office setting, at 92.1 percent and 81.5 percent, respectively, according to the RUC Database, similar to nearly every other ophthalmic code on the OPPS cap list. In response to the commenters' assertion about the DRA's application, we note that the amendments made to section 1848(b)(4) of the Act by section 5102(b)(1) of the DRA do not limit application of the OPPS cap to services typically performed in hospitals.

Comment: Some commenters expressed concern with the application of the OPPS cap to CPT code 74263 and stated that it would be a significant barrier to imaging centers providing this service because of the payment difference between the PFS payment amount and the OPPS payment amount, which has an estimated payment of $106.30. Commenters stated that if it were paid under the PFS without the cap, the technical component payment is estimated to be $566.22, and that the cap would likely diminish the benefit of our proposed expanded coverage for computed tomography colonography (CTC).

Some commenters requested that CMS exempt screening services such as CTC from the OPPS cap. Commenters stated that the DRA exempts screening and diagnostic mammography from the OPPS cap and that exemption likely demonstrates a concern specifically about the impact of the OPPS cap on screening and diagnostic services. Commenters stated that, given the prevalence of colon cancer and the

relatively new availability of colon cancer screening with CTC, it seems plausible and likely that if the OPPS cap were to be enacted today, Congress would have exempted additional screening services. Commenters also stated that, if an exemption is not statutorily allowed, CMS should assign a higher paying Ambulatory Payment Classification (APC), specifically APC 5524 Level 4 Imaging without Contrast that has a proposed 2025 OPPS payment amount of $544.85, which the commenters state is far more comparable to the resource-based 2024 PFS payment of $566.22.

Response: We appreciate the commenters' feedback regarding the application of the OPPS cap for CPT code 74263. We note that section 1848(b)(4)(B) of the Act specifically excludes diagnostic and screening mammography from the description of imaging services that are subject to the OPPS cap, and we do not have the statutory authority to exclude other services that are within the scope of the description of imaging services. We refer readers to the CY 2025 Hospital Outpatient Prospective Payment System (OPPS) Final Rule that is expected to be published in the **Federal Register** for more information regarding the APC assignment for this code.

We did not receive public comments on the other proposed additions to the OPPS cap list for CY 2025. After consideration of public comments, we are finalizing the addition of the services listed above to the list of codes to which the OPPS cap applies, as proposed.

4. Valuation of Specific Codes for CY 2025

(1) Skin Cell Suspension Autograft (CPT Codes 15011, 15012, 15013, 15014, 15015, 15016, 15017, and 15018)

In September 2023, the CPT Editorial Panel approved the creation of eight new CPT codes to describe skin cell suspension autograft (SCSA) procedures. The code set includes a 000-day global base code (CPT code 15011 (*Harvest of skin for skin cell suspension autograft; first 25 sq cm or less*)) and an add-on code (CPT code 15012 (*Harvest of skin for skin cell suspension autograft; each additional 25 sq cm or part thereof (List separately in addition to code for primary procedure)*)) describing the harvesting component of the procedure, an XXX global base code (CPT code 15013 (*Preparation of skin cell suspension autograft, requiring enzymatic processing, manual mechanical disaggregation of skin cells, and filtration; first 25 sq cm or less of harvested skin*) and an add-on code (CPT code 15014 (*Preparation of skin cell suspension autograft, requiring enzymatic processing, manual mechanical disaggregation of skin cells, and filtration; each additional 25 sq cm of harvested skin or part thereof (List separately in addition to code for primary procedure)*)) describing the preparation component of the procedure, and two 090-day global base codes and two add-on codes for the application component to distinguish between body areas: trunk, arms, and legs with CPT codes 15015 (*Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, trunk, arms, legs; first 480 sq cm or less*) and 15016 (*Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, trunk, arms, legs; each additional 480 sq cm or part thereof (List separately in addition to code for primary procedure)*); and face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, or multiple digits with CPT codes 15017 (*Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 480 sq cm or less*) and 15018 (*Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 480 sq cm or part thereof (List separately in addition to code for primary procedure)*).

We disagreed with the RUC-recommended work RVUs of 3.00, 2.00, 2.51, 2.00, 10.97, 2.50, 12.50, and 3.00 for CPT codes 15011 through 15018, respectively, and proposed contractor-pricing for these CPT codes due to concerns with the coding structure of the code family and the total physician time that results when these codes are billed multiple times on the same date of service for the typical patient.

We noted that our concerns with these CPT codes are expansive. Firstly, we noted that these CPT codes represent a segmentation of a single service that is performed sequentially on the same date of service. We solicited comment on whether the segmentation of the harvest, preparation, and application is necessary when these are sequential service parts of one episode of care and could be simplified by having just two codes that encompass all three service parts (harvest, preparation, and application), to differentiate the two different application areas. We also solicited comment on the base and add-on codes' incremental square centimeters, considering that the typical size treatment area described in the vignettes could result in the add-on codes being billed multiple times, particularly for the base application CPT code 15015 and add-on CPT code 15016. Based on the meeting notes from the September 2023 CPT Editorial Panel meeting, the specialty society initially structured their coding request to ''bundle'' the service components into fewer codes, but it is unclear to us why these codes were further segmented. We believed that the very large range of intraservice times from the 33 burn surgeons may have been exacerbated by the harvest, preparation, and application components of the service being segmented in this manner. Most notably, CPT code 15011, which describes the first 25 sq cm of harvest, base code, had an intraservice survey time range of 5 to 480 minutes, and CPT code 15017, which describes the first 480 sq cm of application to the face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, had an intraservice survey time range of 10 to 360 minutes.

We noted that the survey median intraservice times for CPT codes 15011 through 15018 contradict numerous publicly available sources that describe much lower times for this service or specific service parts. Most notably, the manufacturer of the RECELL Autologous Cell Harvesting Device (RECELL® System) used in this service, indicates that a suspension of Spray-On Skin™ Cells using a small sample of the patient's own skin for the treatment of thermal burn wounds and full-thickness skin defects is ''prepared and applied at the point of care in as little as 30 minutes.'' [11] Additionally, Temple University Hospital published a news article on December 20, 2019, just 11 months after the U.S. Food and Drug Administration (FDA) approval of the RECELL® System for the treatment of acute thermal second and third-degree burns in adult patients in January 2019, stating that the entire process of skin sample collection, enzyme solution preparation, and suspension spraying/application ''can take as little as 30 minutes'' and ''treat a wound up to 80 times the size of the donor skin sample.'' [12] Additionally, an article

[11] *https://avitamedical.com/.*

[12] Temple Burn Center Using Spray-On SkinTM Cells Technology to Offer Patients a New, Less Invasive Option for the Treatment of Severe Burns. (2019, December 20). *https://medicine.temple.edu/*

published in Europe PubMed Central states that the procedure takes approximately 30 minutes and is performed by a burn surgeon trained in how to use RECELL® System, and does not require specialized laboratory staff.[13] Additionally, a 2007 study aimed at comparing the results from the RECELL® System and the classic skin grafting for epidermal replacement in deep partial thickness burns showed a total procedure time of 59±4 minutes for the RECELL® System group.[14]

More granularly, the FDA's Instructions for Use of the RECELL® Autologous Cell Harvesting Device state that ''if a skin sample is harvested and processed according to these instructions, it should require between 15 and 30 minutes of contact with the Enzyme''.[15] Additionally, the National Institute for Health and Care Excellence (NICE) produced guidance on using the RECELL® System based on the consideration of evidence submitted and the views of expert advisers, and stated that the harvested skin is added to the proprietary enzyme solution in a processing unit and heated for 15 to 30 minutes to disaggregate the cells. The skin is then removed and scraped with a scalpel to develop a plume of cells. These cells are added to a buffer solution, aspirated and filtered to create a cell suspension that contains keratinocytes, melanocytes, fibroblasts and Langerhans cells.[16] We stated in the proposed rule that this correlates to the preparation component of the service described by CPT codes 15013 and 15014, for which the RUC recommended the survey median time of 33 and 28 minutes, respectively.

We stated in the proposed rule that we believe that the publicly available sources that make representations about the total service and preparation times contradict the RUC-recommended median times based on the survey of 33 burn surgeons. Moreover, when we considered how the add-on CPT codes 15012, 15014, 15016, and 15018 would be billed based on the typical patient described in the vignettes, we stated in the proposed rule that we believe the survey times are inflated compared to the publicly available sources, likely due to how the survey respondents considered the service given the segmentation of the code set. For example, the vignette for CPT code 15015 describing the application to the trunk, arms, and legs says ''A 35-year-old male sustained partial-thickness thermal burns on his trunk and arms measuring 3,600 sq cm. A skin cell suspension autograft is applied to 480 sq cm of the wound bed.'' Of the 33 burn surgeons surveyed, 96 percent found this vignette to be typical. Given the typical sq cm application area of 3,600 sq cm and the expansion ratio of harvested and prepared skin to treatment skin for application of 1:80, the typical episode of care would constitute 1 unit of both CPT codes 15011 and 15012 for harvesting, 1 unit of both CPT codes 15013 and 15014 for preparation, 1 unit of CPT code 15015 for the first 480 sq cm of application, and 7 units of CPT code 15016 for the remaining 3,120 sq cm of application area. When the RUC-recommended intraservice and total times (not including the post-operative visit time for CPT code 15015) for all the units billed on the same date of service as sequential service parts are summed, the intraservice time totals to 399 minutes and total time (not including the post-operative visit time included in the global period for CPT code 15015) totals to 529 minutes. The intraservice time total alone is nearly 6 and ⅔ hours.

We noted the RUC recommended that CPT codes 15011 through 15018 be placed on the New Technology list to be re-reviewed by the RUC for both work and PE for the September 2026 or January 2027 RUC meeting when 2025 Medicare utilization data is available, and at that time, the RUC would consider if other specialties were performing the service and if the service was performed in the non-facility setting. We look forward to re-reviewing these CPT codes when recommendations are re-submitted with more robust and inclusive survey data. In the meantime, we encourage the reconsideration of the family's coding structure by the CPT Editorial Panel given the challenging aspects of this service, including the fact that the current coding structure represents a severely segmented single episode of care with troublesome billing patterns for the typical patient, particularly for the add-on CPT code 15016 describing the additional 480 sq cm increments of application on the trunk, arms, and legs. This code is particularly concerning because the coding structure of the family requires 7 units of add-on CPT code 15016 to be billed for the typical patient. Similarly, the typical patient described in the vignettes for this family of codes would require 3 units of add-on CPT code 15018 due to the coding structure.

We also sought feedback on the recommended global period for CPT code 15013. The RUC recommended an XXX global period, which indicates that the global concept does not apply, but we believe a 000-day global period, indicating an endoscopic or minor procedure with related preoperative and postoperative relative values on the day of the procedure only in the fee schedule payment amount, may be more appropriate given the nature of the service (which is intertwined with the other codes in the series) and that the entire service cannot be completed without 15013. This would allow the entire service to run within a surgical global period.

We noted that we believe contractor-pricing is appropriate for CPT codes 15011 through 15018 until reconsideration of the coding structure and re-survey is complete, given the concerning aspects of the CPT codes. We noted that this service is currently billed for using contractor-priced CPT code 17999 (*Unlisted procedure, skin, mucous membrane and subcutaneous tissue*) and the eight new codes are expected to be a very low utilization.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported our proposal to contractor price these codes until reconsideration of the coding structure and re-survey is complete. In their comment letter, the AMA RUC confirmed that these codes will be re-reviewed in 2027. One commenter provided additional information regarding CMS' concerns with the coding structure and encouraged CMS to finalize the AMA RUC's recommendations instead of contractor pricing for these codes as interim values, citing the uncertainty and payment variability that is possible with contractor pricing. The commenter stated that the manufacturer's information mentions the minimum amount of time (that is, ''as little as''),

news/temple-burn-center-using-spray-skin-cells-technology-offer-patients-new-less-invasive-option.

and a maximum amount of time, potentially up to 60 minutes, to process a sample. The commenter stated that the time depends on skin thickness and how long it takes the enzyme to break it down and, depending on patient circumstances, the potential maximum amount of time to process a sample is no less relevant than the potential minimum amount of time.

Response: We thank commenters for the additional information they provided. However, we continue to have concerns about the coding structure and the valuations for the work and PE of these codes as described in the proposed rule. We recognize the commenter's citation of the manufacturer's information regarding minimum and maximum processing times but reiterate that this just one publicly available source of information and there are additional sources available. We also note that we value services based on the typical time for a service, not the minimum or maximum.

Based on the manufacturer's most recently updated Instructions for Use for a newly approved FDA device, RECELL GO®, processing typically takes ''around 35 minutes,'' [17] and we note that the new device will likely be considered by CPT and the AMA RUC during the codes' re-review. Additionally, another study published in the Annals of Surgery in September 2024 to determine the utility of Autologous Skin Cell Suspension (ASCS) in closing full-thickness (FT) defects from injury and infection showed mean size of ASCS application of 636 cm^2 with a range of 45 to 2212 cm^2, a mean surface area of the wounds grafted of 435 cm^2 with a range of 30 to 1608 cm^2, and a mean area of the donor site of 212 cm^2 with a range of 15 to 804 cm^2. The study also showed a mean surgical time of 71 minutes and total operating room time of 124 minutes using the RECELL® System.[18] Additionally, an interview of a physician about their clinical experience using RECELL® was recently published in the *Wound Care Learning Network* [19] that supports our concerns about the survey times. We note that this is only three additional sources that have become available since the proposed rule was published, therefore we continue to have concerns about the service times, segmentation of the coding, and billing patterns of the add-on codes based on the vignettes. After consideration of public comments, we are finalizing contractor pricing as proposed and look forward to reviewing these codes again after reconsideration of the coding structure and re-survey is complete. We encourage the consideration of the many publicly available sources of information when considering the base and add-on code structure of this family, and the time it takes to perform these services.

(2) Hand, Wrist, & Forearm Repair & Recon (CPT Codes 25310, 25447, 25448, and 26480)

In September 2022, the RUC referred CPT codes 26480 and 25447 to the CPT Editorial Panel for a code bundling solution. In May 2023, the CPT Editorial Panel approved a new bundled code (CPT code 25448) to report intercarpal or carpometacarpal joint suspension arthroplasty, including transfer or transplant of tendon, with interposition when performed while CPT code 25447 was revised to clarify that the code only included interposition of a tendon and not suspension. This family of codes was surveyed for the September 2023 RUC meeting.

We disagreed with the RUC-recommended work RVU of 9.50 for CPT code 25310 (*Tendon transplantation or transfer, flexor or extensor, forearm and/or wrist, single; each tendon*) and we instead proposed a work RVU of 9.00 based on the survey 25th percentile result. In reviewing CPT code 25310, we noted that the recommended intraservice time was unchanged at 60 minutes in the new survey; however, the RUC-recommended work RVU is increasing from the current 8.08 to 9.50. Although we did not imply that changes in work time as reflected in survey values must equate to a one-to-one or linear change in the valuation of work RVUs, we stated that we believed that since the two components of work are time and intensity, increases in the recommended work RVU should typically be reflected in increases in the surveyed work time. We recognized that the total time for CPT code 25310 was increasing from 235 minutes to 263 minutes (an increase of 12 percent) due to changes in the code's post-operative office visits which will now take place at a higher level. However, this again does not match the increase in the recommended work RVU, which is increasing from 8.08 to 9.50 (approximately 18 percent). We stated that it would be more accurate to propose the survey 25th percentile work RVU of 9.00 for CPT code 25310 which matches this increase in the total work time. We also noted that the intensity of CPT code 25310 was decreasing, not increasing, as recommended by the RUC which further suggested that a work RVU of 9.50 would not be appropriate for this code given the surveyed work times.

We disagreed with the RUC-recommended work RVU of 11.14 for CPT code 25447 (*Arthroplasty, intercarpal or carpometacarpal joints; interposition (eg, tendon)*) and we instead proposed a work RVU of 10.50 based on the survey 25th percentile result. In reviewing CPT code 25447, we noted that the recommended intraservice time was decreasing from 100 minutes to 75 minutes in the new survey; however, the RUC recommended maintaining the current work RVU of 11.14. Although we do not imply that changes in work time as reflected in survey values must equate to a one-to-one or linear change in the valuation of work RVUs, we believe that since the two components of work are time and intensity, decreases in the surveyed work time should typically be reflected in decreases to the work RVU. We recognize that the total time for CPT code 25447 is slightly increasing from 278 minutes to 281 minutes (an increase of about 1 percent) due to changes in the code's post-operative office visits which will now take place at a higher level. However, we believe that the sizable decrease in surveyed intraservice work time (a reduction of approximately 33 percent) better supports proposing the survey 25th percentile work RVU of 10.50 instead of maintaining the current work RVU of 11.14. We also disagreed with the RUC that the intensity of CPT code 25447 is unchanged due to increases in the post-operative work; we believe that the sizable decrease in surveyed intraservice work time indicates a modest decrease in intensity. We noted again that the intensity of CPT code 25310 is decreasing, not increasing, as recommended by the RUC which suggests that a similar pattern is likely taking place with clinically similar procedures elsewhere in the same code family.

We disagreed with the RUC-recommended work RVU of 13.90 for CPT code 25448 (*Arthroplasty, intercarpal or carpometacarpal joints; suspension, including transfer or transplant of tendon, with interposition, when performed*) and we instead proposed a work RVU of 11.85 based on the survey 25th percentile result. We

noted that the RUC typically values new codes such as CPT code 25448 using this survey 25th percentile work RVU as opposed to the survey median work RVU that it recommended. The RUC's recommendations stated that CPT code 25448 should be valued higher than CPT code 25447 due to having higher intensity, a relationship which is preserved at our proposed work RVUs of 11.85 and 10.50 respectively. The RUC also stated in its recommendations that CPT code 25448 should be valued higher than reference CPT code 29828 (*Arthroscopy, shoulder, surgical; biceps tenodesis*) because it has more intraservice time and total work time. However, the RUC also stated elsewhere in its recommendations that the arthroscopy described by CPT code 29828 is more intense than the arthroplasty procedures described by this family of codes, which we believe supports CPT code 29828 having a higher work RVU despite its lower work times. Based on this information, we believe that proposing the survey 25th percentile work RVU of 11.85 is the most accurate valuation for CPT code 25448.

We disagreed with the RUC-recommended work RVU of 9.50 for CPT code 26480 (*Transfer or transplant of tendon, carpometacarpal area or dorsum of hand; without free graft, each tendon*) and we instead proposed a work RVU of 9.00 based on the survey 25th percentile result. In reviewing CPT code 26480, we noted that the recommended intraservice time was unchanged at 60 minutes in the new survey; however, the RUC-recommended work RVU is increasing from the current 6.90 to 9.50. Although we do not imply that changes in work time as reflected in survey values must equate to a one-to-one or linear change in the valuation of work RVUs, we believe that since the two components of work are time and intensity, increases in the recommended work RVU should typically be reflected in increases in the surveyed work time. We recognize that the total time for CPT code 26480 is increasing from 227 minutes to 263 minutes (an increase of 16 percent) due to changes in the code's post-operative office visits which will now take place at a higher level. However, this again does not match the increase in the recommended work RVU, which is increasing from 6.90 to 9.50 (approximately 38 percent). We believe that it would be more accurate to propose the survey 25th percentile work RVU of 9.00 for CPT code 26480 which more closely matches this increase in the total work time. We also noted that CPT codes 25310 and 26480 were surveyed as having identical work times and identical survey 25th percentile and survey median work RVUs. We concur with the RUC that these two codes should be valued at the same work RVU; however, we continue to believe that the survey 25th percentile work RVU of 9.00 is a more accurate choice in both cases.

We proposed the RUC-recommended direct PE inputs for all four codes in the family without refinement.

Comment: Several commenters disagreed with the CMS proposed work RVU of 9.00 for CPT code 25310 and stated that CMS should instead finalize the RUC-recommended work RVU of 9.50. Commenters stated that the RUC's recommendation of the survey median work RVU of 9.50 more accurately described the physician work involved in furnishing this service. Commenters stated that the decrease in intensity of CPT code 25310 could be inferred from referencing the intraservice work per unit of time (IWPUT) formula, however commenters stated that the change could be attributed to an artifact of adding 38 minutes of postoperative visit time and increasing the level of the postoperative visits to the IWPUT formula, not due to an actual change in the intensity of performing the procedure itself. Commenters stated that the RUC provided compelling evidence that changes in time and technology during the postoperative period have increased the physician work of CPT code 25310 and that the change in total work for CPT code 25310 is driven by a change in the intensity of the postoperative work. Commenters emphasized that the increase in postoperative work for CPT code 25310 adds significantly to the current work RVU of this service. Commenters compared CPT code 25310 to reference CPT codes 26356 (*Repair or advancement, flexor tendon, in zone 2 digital flexor tendon sheath (eg, no man's land); primary, without free graft, each tendon*) and 66184 (*Revision of aqueous shunt to extraocular equatorial plate reservoir; without graft*), and stated that these reference codes supported the RUC's recommended work RVU of 9.50. Commenters also stated that the proposed work RVU of 9.00 for CPT code 25310 does not consider the intensity relativity of the RUC recommended work RVU of 9.50 to many other codes on the PFS and that finalizing this work RVU would create a rank order anomaly in terms of intensity. The commenters urged CMS to finalize the RUC's recommended work RVU of 9.50 for CPT code 25310.

Response: We disagree with the commenters and continue to believe that the proposed work RVU of 9.00 is a more accurate choice for CPT code 25310. We disagree with the statement from the commenters that the decrease in intensity for CPT code 25310 at the RUC's recommended work RVU of 9.50 is merely an ''artifact'' of adding 38 minutes of postoperative visit time and increasing the level of the postoperative visits. We have frequently been informed by the RUC and other interested parties that services with 10 and 90 day global periods must be evaluated in their entirety as part of magnitude estimation, and that it would be inappropriate to consider the postoperative visits as distinct from the rest of the procedure. We do not agree that the RUC's recommendation of increased postoperative visits for CPT code 25310 can be ignored when discussing the intensity of the procedure; as we stated in the proposed rule, the RUC recommended a decrease in intensity for this code which we believe better supports our proposed work RVU of 9.00. We do concur with the commenters that that changes in time and technology of the postoperative period have increased the physician work of CPT code 25310, which is why we proposed a work RVU of 9.00 as compared with the current work RVU of 8.08. The recommended work time in the service period for CPT code 25310 is decreasing relative to the current work time, which would not justify the work RVU increase that we proposed; we believe that the proposed work RVU increase from 8.08 to 9.00 accounts for this increase in the work carried out during the postoperative period.

We disagree with the commenters that reference CPT code 26356's work RVU of 9.56 justifies the recommended work RVU of 9.50 for CPT code 25310. While the two codes have similar work time values, CPT code 26356 has additional preservice and immediate postservice work time as compared with CPT code 25310. The RUC's recommendations also previously stated that CPT code 26356 is a more intensive service than CPT code 25310 which we believe supports proposing a lower work RVU for CPT code 25310. We also disagree with the commenters that the proposed work RVU of 9.00 for CPT code 25310 creates a rank order anomaly in terms of intensity. While it is true that the intensity for this code sits towards the lower end of the spectrum amongst 90 day global procedures with similar work time values, there are other CPT codes in this range with lower intensity values

such as CPT code 25116 (*Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis, fungus, Tbc, or other granulomas, rheumatoid arthritis); extensors, with or without transposition of dorsal retinaculum*) and 28485 (*e*). As such, CPT code 25310 would not create a rank order anomaly in terms of intensity. Furthermore, our proposed work RVU of 9.00 falls very much within the middle range of comparative work RVUs amongst 90 day global procedures with similar work time values. We note as well that commenters did not address our analysis of work time changes for CPT code 25310 discussed in the proposed rule: that the total time is increasing from 235 minutes to 263 minutes (an increase of 12 percent) which does not match the increase in the recommended work RVU, which is increasing from 8.08 to 9.50 (approximately 18 percent). We continue to believe that our proposal of the survey 25th percentile work RVU of 9.00 for CPT code 25310 is more accurate, which matches this increase in the total work time.

Comment: Several commenters disagreed with the CMS proposed work RVU of 10.50 for CPT code 25447 and stated that CMS should instead finalize the RUC-recommended work RVU of 11.14, which is the current work RVU for the service. Commenters stated that CPT code 25447 was last surveyed in 2005, and the specialties attested that the technique is the same, but physicians are now more familiar with the procedure and thus it may be performed in less work time. Commenters stated that the changes to the work and time of the postoperative care for CPT code 25447, along with higher surveyed preservice and immediate postservice time not recognized in 2005, offset the decrease in surveyed intraservice time. Commenters disagreed that there was a reduction in intensity for this code and stated that CMS' assumption of decreased intensity was mistaken; commenters stated that by maintaining the current work RVU of 11.14, the total global work and intraoperative intensity for CPT code 25447 would not change. Commenters referred to the top reference codes from the RUC survey and urged CMS to finalize the RUC's recommended work RVU of 11.14 for CPT code 25447.

Response: We disagree with the commenters and continue to believe that the proposed work RVU of 10.50 is more accurate for CPT code 25447. We disagree in particular with the commenters that by maintaining the current work RVU of 11.14, the intensity of CPT code 25447 does not change. The RUC survey found that the intraservice work time required to perform the procedure has decreased significantly, from 100 minutes previously to 75 minutes under the recent survey. The total time of the procedure remained essentially unchanged in the survey, previously 278 minutes and now slightly higher at 281 minutes. However, work time that was previously allocated to the intraservice period has now shifted to the preservice period and postoperative office visits. We do not agree that this represents ''no change'' in intensity, as additional time spent on preservice evaluation and postservice E/M visits take place at a lower intensity level than the intraservice performance of the arthroplasty itself. As we noted in the proposed rule, there is a sizable decrease in surveyed intraservice work time (a reduction of approximately 33 percent) for CPT code 25447, and since the statute requires that valuation should be based on time and intensity, we believe that this supports the proposed reduction to a work RVU of 10.50. We do not agree with the commenters that additional preservice work time and postoperative office visits are sufficient to offset this large decrease in the surveyed work time of the intraservice portion of the procedure. We continue to believe that our proposal of the survey 25th percentile work RVU of 10.50 for CPT code 25447 is the most accurate value.

Comment: Several commenters disagreed with the CMS proposed work RVU of 11.85 for CPT code 25448 and stated that CMS should instead finalize the RUC-recommended work RVU of 13.90. Commenters appreciated CMS recognizing the survey results but emphasized that the survey median work RVU of 13.90 was deemed more appropriate by the RUC to accurately describe the physician work involved in this new service. Commenters stated that the survey median work RVU of 13.90 supports relativity within the family and was warranted by the clinical complexity of the code. Commenters then described the clinical complexity of CPT code 25448, stating that this code encompasses the physician work of CPT code 25447 and the additional complex work of drilling and creating a hole through the base of the first metacarpal for passage of the radial half of the flexor carpi radialis from the second metacarpal to the first metacarpal. Commenters stated that this additional work beyond the work of CPT code 25447 is much more intense, resulting in a higher recommended value for surveyed code 25448 when compared with the other codes in the family. Commenters referred to the top reference codes from the RUC survey, such as CPT code 29298, and stated that the intensity of CPT code 25448 is not 50 percent of the intensity of CPT code 29828 as suggested by the CMS proposal. Commenters urged CMS to finalize the RUC's recommended work RVU of 13.90 for CPT code 25448.

Response: We disagree with the commenters and continue to believe that the proposed work RVU of 11.85 is more accurate for CPT code 25448. We would like to clarify for the commenters that we understand the RUC does not always recommend the survey 25th percentile work RVU for new codes. We noted in the proposed rule that the RUC ''typically'' values new codes such as CPT code 25448 using this survey 25th percentile work RVU to indicate that the use of the survey median in this case was unusually higher than most other recommendations for new codes. We concur with the commenters that CPT code 25448 requires additional work and has higher complexity than CPT code 25447. This is why we proposed a work RVU for CPT code 25448 which is 1.35 units higher than the work RVU for CPT code 25447, 11.85 as compared with 10.50, as well as why we proposed an intensity for CPT code 25448 which was higher than anything else in this code family. We believe that our proposed work RVU appropriate captures the increased work and intensity of CPT code 25448 relative to the other codes in this family.

We also disagree that the work and intensity of reference CPT code 29298 support the RUC's recommendation of a work RVU of 13.90 for CPT code 25448. As we wrote in the proposed rule, the RUC stated its recommendations that the arthroscopy described by CPT code 29828 is more intense than the arthroplasty procedures described by this family of codes, which we believe supports CPT code 29828 having a higher work RVU despite its lower work times. We also question whether CPT code 29298 is the best choice of comparator code in terms of work time with CPT code 25448; these two codes differ by about 15 percent in terms of both intraservice work time (90 minutes against 75 minutes) and total time (296 minutes against (252 minutes). This difference in surveyed work time makes direct comparisons on work and intensity more difficult; we believe that CPT code 25448 is more accurately compared to other 90 day globals with the same 90 minutes of intraservice time and similar total time. Our proposed work RVU of 11.85 falls very much in the middle of this group of related

services, and there are numerous other CPT codes with lower work RVUs and lower intensities than what we proposed (such as CPT codes 25608, 27339, and 28725). We continue to believe that our proposal of the survey 25th percentile work RVU of 11.85 for CPT code 25448 is the most accurate value.

Comment: Several commenters disagreed with the CMS proposed work RVU of 9.00 for CPT code 26480 and stated that CMS should instead finalize the RUC-recommended work RVU of 9.50. Commenters appreciated CMS recognizing the survey results but stated that the survey median work RVU of 9.50 was deemed more appropriate by the RUC to accurately describe the physician work involved in this service. Commenters echoed the earlier discussion of CPT code 25310, stating that global codes are made up of distinct packages of work and time and that the preservice and immediate postservice intensities have never been updated to match the increases over the years for E/M services. Commenters stated that the overall work per unit of time (WPUT) may be representative of time for services on a single date of service, but this same measure cannot be applied to varied services (evaluation, positioning, scrub/dress/wait, operation, recovery, ICU/hospital/office services) over a 90-day global period. Commenters stated that the level of visits has changed as supported by both medical decision-making and total time on the date of the encounter of CPT code 26480, and that the change in total work for CPT code 26480 is driven by a change in the intensity of the postoperative work. Commenters emphasized that the increase in postoperative work for CPT code 26480 adds significantly to the current work RVU of this service. Commenters also stated that the proposed work RVU of 9.00 for CPT code 26480 does not consider the intensity relativity of the RUC recommended work RVU of 9.50 to many other codes on the PFS and that finalizing this work RVU would create a rank order anomaly in terms of intensity. Commenters referred to the top reference codes from the RUC survey and urged CMS to finalize the RUC's recommended work RVU of 9.50 for CPT code 26480.

Response: We disagree with the commenters and continue to believe that the proposed work RVU of 9.00 is more accurate for CPT code 26480. As we noted in the proposed rule, CPT codes 25310 and 26480 were surveyed as having identical work times and identical survey 25th percentile and survey median work RVUs. We concur with the RUC that these two codes should be valued at the same work RVU; however, we continue to believe that the survey 25th percentile work RVU of 9.00 is more accurate in both cases. As such, many of the same comment responses provided earlier for CPT code 25310 equally apply to CPT code 26480.

We concur with the commenters that the postoperative visits have changed for CPT code 26480, however we disagree that intensity measures cannot be applied to varied services over a 90 day period. As we noted for CPT code 25310 above, we have frequently been informed by the RUC and other interested parties that services with 10 and 90 day global periods must be evaluated in their entirety as part of magnitude estimation, and that it would be inappropriate to consider the postoperative visits as distinct from the rest of the procedure. We do concur with the commenters that changes in time and technology of the postoperative period have increased the physician work of CPT code 26480, which is why we proposed a work RVU of 9.00 as compared with the current work RVU of 6.90. The recommended work time in the service period for CPT code 26480 is essentially unchanged relative to the current work time, which would not justify the work RVU increase that we proposed; we believe that the proposed work RVU increase from 6.90 to 9.00 accounts for this increase in the work carried out during the postoperative period.

We also disagree with the commenters that the proposed work RVU of 9.00 for CPT code 26480 creates a rank order anomaly in terms of intensity. Again, since CPT codes 25310 and 26480 were proposed at the identical work times and work RVUs, the comparisons with other codes across the wider PFS are exactly the same. While it is true that the intensity for these codes sits towards the lower end of the spectrum amongst 90 day global procedures with similar work time values, there are other CPT codes in this range with lower intensity values such as CPT code 25116 (*Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis, fungus, Tbc, or other granulomas, rheumatoid arthritis); extensors, with or without transposition of dorsal retinaculum*) and 28485 (*Open treatment of metatarsal fracture, includes internal fixation, when performed, each*). As such, CPT code 26480 would not create a rank order anomaly in terms of intensity. Furthermore, our proposed work RVU of 9.00 falls very much within the middle range of comparative work RVUs amongst 90 day global procedures with similar work time values, not anomalously low. We note as well that commenters did not address our analysis of work time changes for CPT code 26480 discussed in the proposed rule: that the total time is increasing from 227 minutes to 263 minutes (an increase of 16 percent) which does not match the increase in the recommended work RVU, which is increasing from 6.90 to 9.50 (approximately 38 percent). We continue to believe that our proposal of the survey 25th percentile work RVU of 9.00 for CPT code 26480 is more accurate, which more closely matches this increase in the total work time.

After consideration of the comments, we are finalizing the work RVUs for all four codes in the Hand, Wrist, & Forearm Repair & Recon family as proposed. We did not receive any comments on the direct PE inputs and we are also finalizing them as proposed.

(3) CAR–T Therapy Services (CPT Codes 38225, 38226, 38227, and 38228)

In September 2023, the CPT Editorial Panel deleted four category III codes (0537T–0540T) and approved the addition of four new codes (38225–38228) that describe only steps of the complex CAR–T Therapy process performed and supervised by physicians. The RUC recommended four different work RVUs for codes 38225, 38226, 38227, and 38228 and only recommended direct PE values for code 38228.

For CPT code 38225 (Chimeric antigen receptor T-cell (CAR–T) therapy; harvesting of blood-derived T lymphocytes for development of genetically modified autologous CAR–T cells, per day) the RUC recommended a work RVU of 1.94. For CPT code 38226 (*Chimeric antigen receptor T-cell (CAR–T) therapy; preparation of blood-derived T lymphocytes for transportation (eg, cryopreservation, storage)*) the RUC recommended a work RVU of 0.79. For CPT code 38228 (*Chimeric antigen receptor T-cell (CAR–T) therapy; CAR–T cell administration, autologous*) the RUC recommended a work RVU of 3.00. For CPT code 38227 (*Chimeric antigen receptor T-cell (CAR–T) therapy; receipt and preparation of CAR–T cells for administration*) the RUC recommended a work RVU of 0.80 and for CPT code 38227, we proposed the RUC-recommended work RVU of 0.80. We proposed the RUC-recommended work RVUs for CPT codes 38225, 38226, and 38228 respectively.

As mentioned previously, the RUC recommended direct PE values for only one code, CPT code 38228, and the RUC recommended that the non-facility PE

RVU for CPT codes 38225–38227 should be contractor-priced. However, contractor pricing can only be applied at the whole code level, not to a single component of the valuation. Therefore, for CPT codes 38225–38227 we treated these codes as having no recommended direct PE values and sought comment on direct PE values for these codes. We proposed the RUC-recommended direct PE inputs for CPT code 38228.

Comment: The majority of commenters supported our proposal to pay separately for these services under the PFS. However, some commenters also highlighted that the existing CAR–T codes, CPT codes 0537T–0539T, are currently not payable under the OPPS and recommended that CMS should assign active payment for CAR–T services under the OPPS as well. Additionally, a few commenters mentioned that currently these services are not payable under the PFS, and a commenter highlighted the ''N/A'' that is currently listed for non-facility PE RVUs for the current CAR–T codes (CPT codes 0537T–0539T) under the PFS.

Response: We thank the commenters for their support for our proposal and recommendation for the OPPS. As the commenters pointed out, the predecessor codes for CAR–T services (CPT codes 0537T–0539T) are not separately payable under the OPPS, and we note that these same codes similarly have a bundled status under the PFS (meaning they are subsumed within other codes and separate payment is not made for the services they describe). In the CY 2019 OPPS final rule, we stated that ''the procedures described by CPT codes 0537T, 0538T, and 0539T describe various steps required to collect and prepare the genetically modified T-cells, and Medicare does not generally pay separately for each step used to manufacture a drug or biological'' (83 FR 58905). In consideration of our current policies under both the PFS and the OPPS to not pay separately for the predecessor codes (CPT codes 0537T–0539T), we are not finalizing our proposal and will instead continue to bundle payment under the PFS for CAR–T services described under CPT codes 38225, 38226, and 38227. We believe that bundled status is appropriate for these codes in order to remain in alignment with OPPS to not pay separately for each step used to manufacture a drug or biological. We will display the RUC-recommended work RVUs for these three services, as we do for a number of other bundled services on the PFS, however they will remain non-payable. CPT code 38228 is the replacement code for Category III CPT code 0540T, which does not have bundled status, and therefore, we are finalizing active pricing for CPT code 38228 at the proposed work RVU of 3.00 and with the proposed direct PE inputs.

(4) Therapeutic Apheresis and Photopheresis (CPT Codes 36514, 36516, and 36522)

In the CY 2024 PFS final rule, we finalized CPT codes 36514 (*Therapeutic apheresis; for plasma pheresis*), 36516 (*Therapeutic apheresis; with extracorporeal immunoadsorption, selective adsorption or selective filtration and plasma reinfusion*), and 36522 (*Photopheresis, extracorporeal*) as potentially misvalued, as we believed there may have been a possible disparity with the clinical labor type (88 FR 78848). As a result, the PE clinical labor type was reviewed for these three codes at the January 2024 RUC meeting, with no work review. The PE Subcommittee and the RUC agreed that clinical staff code L042A (RN/LPN) did not appropriately represent the work of an Apheresis Nurse Specialist. There is not a clinical staff code for an Apheresis Nurse Specialist; however, the RUC agreed with the specialty societies' recommendation that the training and experience of an oncology nurse (clinical staff code L056A, RN/OCN) would more accurately reflect the work of an apheresis nurse for these CPT codes. The RUC submitted new PE recommendations for these three codes based on the use of the L056A clinical labor type.

We proposed the RUC-recommended direct PE inputs for CPT codes 36514, 36516, and 36522 without refinement. The RUC did not make recommendations and we did not propose any changes to the work RVU for CPT codes 36514, 36516, and 36522.

Comment: Commenters agreed with CMS' proposed direct PE inputs for the Therapeutic Apheresis and Photopheresis code family.

Response: We thank commenters for their support. After consideration of the public comments, we are finalizing the direct PE inputs as proposed.

(5) Intra-Abdominal Tumor Excision or Destruction (CPT Codes 49186, 49187, 49188, 49189, and 49190)

In May 2023, the CPT Editorial Panel created five new codes to describe the sum of the maximum length of intra-abdominal (that is, peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s) excised or destroyed: CPT code 49186 (*Excision or destruction, open, intra-abdominal (i.e., peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s), sum of the maximum length of tumor(s) or cyst(s); 5 cm or less*), CPT code 49187 (*Excision or destruction, open, intra-abdominal (i.e., peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s), sum of the maximum length of tumor(s) or cyst(s); 5.1 to 10 cm*), CPT code 49188 (*Excision or destruction, open, intra-abdominal (i.e., peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s), sum of the maximum length of tumor(s) or cyst(s); 10.1 to 20 cm*), CPT code 49189 (*Excision or destruction, open, intra-abdominal (i.e., peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s), sum of the maximum length of tumor(s) or cyst(s); 20.1 to 30 cm*), and CPT code 49190 (*Excision or destruction, open, intra-abdominal (i.e., peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s), sum of the maximum length of tumor(s) or cyst(s); greater than 30 cm*). These new CPT codes will replace existing CPT codes 49203 (*Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, 1 or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less*), 49204 (*Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, 1 or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5.1–10.0 cm diameter*), and 49205 (*Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, 1 or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor greater than 10.0 cm diameter*) that described tumor excision or destruction based on the size of the single largest tumor, cyst, or endometrioma removed, no matter the number of tumors. For CY 2025, the RUC recommended a work RVU of 22.00 for CPT code 49186, a work RVU of 28.65 for CPT code 49187, a work RVU of 34.00 for CPT code 49188, a work RVU of 45.00 for CPT code 49189, and a work RVU of 55.00 for CPT code 49190.

We proposed the RUC-recommended work RVUs of 22.00 for CPT code 49186, 28.65 for CPT code 49187, and 34.00 for CPT code 49188.

We disagreed with the RUC-recommended work RVU of 45.00 for CPT code 49189 and we proposed a work RVU of 40.00 based on the survey 25th percentile. Compared to the predecessor CPT code 49205, the intra-service time ratio for CPT code 49189 suggested a work RVU of 41.51 and the total time ratio suggested a work RVU of 38.02. These changes in surveyed work time as compared with predecessor CPT

code 49205 suggested that the recommended work RVU of 45.00 was inappropriately high. We also noted that the RUC recommended the survey 25th percentile work RVU for CPT codes 49186, 49187, and 49188. Therefore, we believed that proposing a work RVU of 40.00 for CPT code 49189 kept the valuation consistent with the other CPT codes in this family. Our proposed work RVU of 40.00 for CPT code 49189 was supported by the following reference CPT codes with similar intra-service time (310 minutes) and similar total time (814 minutes): reference CPT code 69970 (*Removal of tumor, temporal bone*) with a work RVU of 32.41 with 330 minutes intra-service time and 793 minutes of total time, and reference CPT code 33864 (*Ascending aorta graft, with cardiopulmonary bypass with valve suspension, with coronary reconstruction and valve-sparing aortic root remodeling (e.g., David Procedure, Yacoub Procedure)*) with a work RVU of 60.80 with 300 minutes of intra-service time and 838 minutes of total time. We believed the proposed work RVU of 40.00 was a more appropriate value overall than 45.00 when compared to the range of codes with similar intra-service time and similar total time.

We disagreed with the RUC-recommended work RVU of 55.00 for CPT code 49190 and we proposed a work RVU of 50.00 based on the survey 25th percentile. Compared to the predecessor CPT code 49205, the intra-service time ratio for CPT code 49190 suggested a work RVU of 48.21 and the total time ratio suggested a work RVU of 48.86. These changes in surveyed work time as compared with predecessor CPT code 49205 suggested that the recommended work RVU of 55.00 was inappropriately high. We also note again that the RUC recommended the survey 25th percentile work RVU for CPT codes 49186, 49187, and 49188. Therefore, we believed that proposing a work RVU of 50.00 for CPT code 49190 kept the valuation consistent with the other CPT codes in this family. Our proposed work RVU of 50.00 for CPT code 49190 was supported by the following reference CPT codes with similar intra-service time (360 minutes) and similar total time (1,046 minutes): reference CPT code 61598 (*Transpetrosal approach to posterior cranial fossa, clivus or foramen magnum, including ligation of superior petrosal sinus and/or sigmoid sinus*) with a work RVU of 36.53 with 377.7 minutes intra-service time and 1,048.1 minutes of total time, and reference CPT code 47140 (*Donor hepatectomy (including cold preservation), from living donor; left lateral segment only (segments II and III)*) with a work RVU of 59.40 with 355 minutes of intra-service time and 1,073 minutes of total time. We believed the proposed RVU of 50.00 was a more appropriate value overall than 55.00 when compared to the range of codes with similar intra-service time and similar total time.

We also noted that the RUC's recommendations for the first three codes in the family (CPT codes 49186–49188) maintained the same amount of intensity as their respective predecessor codes, and in fact slightly decreased in intensity in the case of CPT codes 49186 and 49187. However, the RUC recommended a notable increase in intensity for CPT codes 49189 and 49190 over predecessor code 49205 due to its selection of the survey median work RVU in both cases. We did not believe that this increase in intensity for CPT codes 49189 and 49190 was warranted due to their clinical similarities to the previous coding in the family, especially given that CPT code 49205 had the lowest intensity in the family. We believed that this intensity argument further supported our choice to propose the survey 25th percentile work RVU for these two codes, matching the RUC recommendations for CPT code 49186–49188.

We proposed the RUC-recommended direct PE inputs for CPT codes 49186, 49187, 49188, 49189, and 49190 without refinement.

The following is a summary of the comments we received and our responses.

Comment: The commenters overwhelmingly supported our proposal to accept the RUC recommended work RVUs for CPT codes 49186, 49187, and 49188.

Response: We thank the commenters for their support.

Comment: A few commenters disagreed with the proposed work RVUs of 40.00 for CPT code 49189 and 50.00 for CPT code 49190. The commenters stated that we failed to recognize the increased burden, intensity, and complexity of removing not just a single tumor, but for multiple tumors as represented by CPT codes 49189 and 49190. The commenters also stated that per the RUC's compelling evidence statements it is important to note that the technical difficulty increases as the tumor size increases.

Response: We disagree with the commenters and note that by using the survey 25th percentile for CPT codes 49189 and 49190, we did propose values with a higher intensity than their predecessor code, CPT code 49205. Although we agree that the intensity of CPT codes 49189 and 49190 has increased as compared with predecessor CPT code 49205, the intensity of these new codes is not high enough to support using the survey median for either of them. The changes in surveyed work time as compared with predecessor CPT code 49205 suggested that the survey median work RVUs of 45.00 for CPT code 49189 and 55.00 for CPT code 49190 recommended by the RUC were both inappropriately high. For example, in reviewing CPT code 49189 we noted that the recommended intraservice time as compared with predecessor CPT code 49205 was increasing from 225 minutes to 310 minutes (38 percent), and the recommended total time was increasing from 645 minutes to 814 minutes (26 percent); however, the RUC-recommended work RVU was increasing from 30.13 to 45.00, which is an increase of nearly 50 percent. We believe that since the two components of work are time and intensity, changes in the work time should be reflected in similar changes to the work RVU. Our proposal of a work RVU of 40.00 for CPT code 49189, an increase of approximately 33 percent, better matches these changes in surveyed work time relative to the predecessor code.

We also noted that the RUC recommended the survey 25th percentile work RVU for CPT codes 49186, 49187, and 49188 and we believe it would better support relativity to utilize the same survey 25th percentile work RVU for the final two codes in the family. Therefore, we continue to believe that a work RVU of 40.00 for CPT code 49189, and a work RVU of 50.00 for CPT code 49190, is more appropriate.

Comment: We received comments regarding the reference codes we used in our proposal for CPT codes 49189 and 49190. The reference codes we used to support the proposed work RVU of 40.00 for CPT code 49189 were CPT codes 69970 and 33864, and the reference codes we used in support of the proposed work RVU of 50.00 for CPT code 49190 were CPT codes 61598 and 47140. For CPT code 49189, the commenters agreed that CPT code 33864 was an appropriate reference code but disagreed with our use of CPT code 69970 as the other reference code in support of the proposed work RVU of 40.00 because it was valued nearly 30 years ago and it is not clear how the value for this service was established at that time. Likewise, for CPT code 49190, the commenters agreed that CPT code 47140 was an appropriate reference code but disagreed with our use of CPT code 61598 as the other reference code that supported the proposed work RVU

of 50.00 because it was valued 30 years ago.

Response: We disagree with the commenters and continue to believe that the work RVUs of 40.00 for CPT code 49189, and 50.00 for CPT code 49190, both based on the survey 25th percentile for each code, are appropriate. We note that the reference codes we chose were only used to show support for using the surveyed 25th percentile values from the RUC for CPT codes 49189 and 49190, and that we did not propose to crosswalk the RVUs from any reference codes to CPT code 49189 or CPT code 49190. Furthermore, we note that the commenters supported our use of CPT code 47140 as a reference code, even though it was last valued 21 years ago.

After consideration of the public comments, we are finalizing the work RVU values for the Intra-Abdominal Tumor Excision or Destruction code family (CPT codes 49186, 49187, 49188, 49189, and 49190) as proposed. We are also finalizing the direct PE inputs for CPT codes 49186, 49187, 49188, 49189, and 49190 as proposed.

(6) Bladder Neck and Prostate Procedures (CPT Codes 53865 and 53866)

In September 2023, the CPT Editorial Panel created two Category I CPT codes to describe the insertion or removal of a temporary device to remodel the bladder neck and prostate using pressure to create necrosis and relieve lower urinary tract symptoms (LUTS) secondary to benign prostate hyperplasia (BPH). These two new 000-day global Category I codes were surveyed and reviewed for the January 2024 RUC meeting.

At the January 2024 RUC meeting, the specialty society indicated that CPT code 53865's survey 25th percentile work RVU of 3.91 was too high for this procedure compared to other services in the physician fee schedule with similar intra-service time. The specialty society recommended, and the RUC agreed that the recommended work RVU for CPT code 53865 should be crosswalked to CPT code 52284 (*Cystourethroscopy, with mechanical urethral dilation and urethral therapeutic drug delivery by drug-coated balloon catheter for urethral stricture or stenosis, male, including fluoroscopy, when performed*). Because these procedures are similar in intensity and both require precise placement of an intraurethral device, we concur with the RUC and we are proposing the RUC recommended work RVU of 3.10 for CPT code 53865.

At the January 2024 RUC meeting, the specialty society indicated that CPT code 53866's survey 25th percentile work RVU of 2.00 was too high for this procedure compared to other services in the physician fee schedule with similar intra-service time. The specialty society recommended, and the RUC agreed, that CPT code 53866 should have a direct work RVU crosswalk to CPT code 27096 (*Injection procedure for sacroiliac joint, anesthetic/steroid, with image guidance (fluoroscopy or CT) including arthrography when performed*). We are proposing the RUC recommended work RVU of 1.48 for CPT code 53866.

We also proposed the RUC-recommended direct PE inputs for CPT codes 53865 and 53866 without refinement. However, we noted possible duplications in two of the supply items within CPT code 53865. Specifically, supply item SB027 (*gown, staff, impervious*) is already included in supply item SA042 (*pack, cleaning and disinfecting, endoscope*), and supply item SB024 (*gloves, sterile*) is included in supply items SA058 (pack, urology cystoscopy visit). We sought comments on whether a total of three SB027 impervious staff gowns and two SB024 pairs of sterile gloves would be typical and necessary when providing this procedure.

Comment: A commenter stated that they had completed over 150 sales of the iTind device (SD366), which is included as a direct PE input for CPT codes 53865 and 53866 at an ASP of $3,150, $3,350, or $3,420. The commenter requested that CMS increase the supply price for SD366 to its current sales price of $3,350 and submitted two invoices for use in updating supply pricing.

Response: We appreciate the submission of these additional invoices for assistance in pricing the SD366 supply item. After reviewing the invoices, we are finalizing an increase in the pricing of the SD366 supply from the proposed $2695 to $2972.50. This updated pricing is based on averaging together the price from all four invoices, two submitted by the RUC and two submitted by the commenter. We note that the difference in pricing for the SD366 supply on these invoices appears to be correlated with the quantity ordered, with a price of $3350 for the purchase of a single device as opposed to $2695 for ordering four devices together. We believe that averaging together these invoices will smooth out these quantity disparities and more closely reflect the typical market pricing.

(7) MRI-Monitored Transurethral Ultrasound Ablation of Prostate (CPT Codes 51721, 55881, and 55882)

At the April 2023 CPT Editorial Panel meeting, three new CPT codes were approved for MRI-monitored transurethral ultrasound ablation (TULSA). These codes were surveyed for the September 2023 RUC meeting and recommendations submitted to CMS for inclusion in the CY 2025 PFS proposed rule.

For CY 2025, we proposed the RUC-recommended work RVUs for all three CPT codes. However, we note that interested parties may have concerns regarding the experience of the survey respondents and the intra-service times provided in the survey data. We welcomed commenters to provide additional data that we could consider in the valuation of the work and direct PE inputs for these CPT codes. We proposed a work RVU of 4.05 for CPT code 51721 (*Insertion of transurethral ablation transducers for delivery of thermal ultrasound for prostate tissue ablation, including suprapubic tube placement during the same session and placement of an endorectal cooling device, when performed*), a work RVU of 9.80 for CPT code 55881 (*Ablation of prostate tissue, transurethral, using thermal ultrasound, including magnetic resonance imaging guidance for, and monitoring of, tissue ablation*), and a work RVU of 11.50 for CPT code 55882 (*Ablation of prostate tissue, transurethral, using thermal ultrasound, including magnetic resonance imaging guidance for, and monitoring of, tissue ablation; with insertion of transurethral ultrasound transducer for delivery of the thermal ultrasound, including suprapubic tube placement and placement of an endorectal cooling device, when performed*). We also proposed the RUC-recommended direct PE inputs for CPT codes 51721, 55881, and 55882 without refinement.

Comment: Some commenters disagreed with the proposed work RVUs for all three CPT codes in this family. These commenters reiterated concerns regarding the experience of the RUC survey respondents, stating that the intra-service times provided in the RUC survey data were too low and did not reflect the actual time needed to perform these very complex and critical procedures. Commenters recommended intra-service times based on their experience and internal tracking data. For CPT code 51721, the suggested intra-service times varied from 40 to 101 minutes, as opposed to the RUC-recommended 29 minutes. For CPT code 55881, the suggested intra-service

times varied from 140 to 279 minutes, as opposed to the RUC-recommended 120 minutes. For CPT code 55882, the suggested intra-service times varied from 170 to 317 minutes, as opposed to the RUC-recommended 125 minutes. Due to these increased intra-service times, the commenters also recommended a revised work RVU of 6.75 for CPT code 51721, 13.13 for CPT code 55881, and 16.20 for CPT code 55882.

Response: We thank commenters for their feedback and the additional data provided; however, we do not agree with the intra-service times or work RVUs that commenters recommended for this code family. The values that commenters provided were mixed, but mostly significantly higher than the proposed values. We believe that the RUC survey respondents were familiar with the technology and since these CPT codes were recently converted from Category III to Category I, the survey results will be more robust as utilization increases over time. We continue to believe that the RUC-recommended intra-service times and work RVUs accurately reflects the time and intensity involved with these services, as supported by the survey results and reference codes. We look forward to re-reviewing these CPT codes when they are re-submitted on the RUC's New Technology list.

Comment: Many commenters were supportive of the proposed work RVUs and direct PE inputs for this code family. These commenters also acknowledged concerns from interested parties regarding the survey respondents' experience and intra-service times, specifically noting that the RUC process relies upon the clinical expertise of its multidisciplinary physician representatives and that its members are impartial and free from the external influences of interested parties. Additionally, commenters highlighted that they anticipate an initial low utilization of these services that will increase over time, and since these codes are on the RUC's New Technology list, they will be re-reviewed in 3 years.

Response: We thank commenters for their support and additional information provided.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for all three codes in the MRI-Monitored Transurethral Ultrasound Ablation of Prostate family as proposed.

(8) Insertion of Cervical Dilator (CPT Code 59200)

In the CY 2024 PFS final rule, we finalized CPT Code 59200 (*Insertion of cervical dilator (e.g., laminaria, prostaglandin) (separate procedure)*) as potentially misvalued. The code is to be used to report the total duration of time spent on a patient history and physical, reviewing lab resulting, discussing risk and benefits of the procedure, obtaining consent, performing the procedure, and assessing the patient post-procedure. The RUC reviewed the work RVU and PE inputs for CPT code 59200 at their January 2024 meeting. We proposed the RUC-recommended work RVU of 1.20 for CPT code 59200. We also proposed the RUC-recommended direct PE inputs for CPT code 59200 without refinements.

Comment: Commenters agreed with CMS' proposed work RVU and direct PE inputs for this code family.

Response: We thank commenters for their support. After consideration of the public comments, we are finalizing the work RVU and direct PE inputs as proposed.

(9) Guided High Intensity Focused Ultrasound (CPT Code 61715)

In September 2023, the CPT Editorial Panel created a new Category I code to describe magnetic resonance image guided high intensity focused ultrasound intracranial ablation for treatment of a severe central tremor that is recalcitrant to other medical treatments. This service is typically performed by a neurosurgeon without the involvement of a separate radiologist. This new code replaces the existing Category III code 0398T.

We did not propose the RUC-recommended work RVU of 18.95 for CPT code 61715 and instead proposed a work RVU of 16.60 based on a crosswalk to CPT code 61626 (*Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; non-central nervous system, head or neck (extracranial, brachiocephalic branch)*), which describes a similar tumor destruction service that has similar time and intensity values to this service, and we support this value by referencing CPT code 33889 (*Open subclavian to carotid artery transposition performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision, unilateral*) and 33894 (*Endovascular stent repair of coarctation of the ascending, transverse, or descending thoracic or abdominal aorta, involving stent placement; across major side branches*). We do not believe that this service is significantly more intense than the key reference codes, CPT codes 61736 (*Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; single trajectory for 1 simple lesion*) and 61737 (*Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; multiple trajectories for multiple or complex lesion(s)*), as the RUC-recommended work value implies. Our proposed work RVU of 16.60 for CPT code 61715 largely matches the intensity of CPT code 61736 which we believe is a more accurate valuation for this service, as opposed to the RUC recommendation which would have significantly more intensity.

We proposed the RUC-recommended direct PE inputs for CPT code 61715 without refinement.

Comment: Many commenters disagreed with the CMS proposal of a work RVU of 16.60 for CPT code 61715. Commenters described the clinical benefits of CPT code 61715 as a non-invasive, real-time monitored and controlled acoustic surgery procedure that offers a treatment option for essential tremor in patients that are not candidates for, or do not want to undergo, open brain surgery. Commenters stated that this code is a complex procedure which requires a great deal of training and experience to develop expertise, and that it can be a lengthy and intense procedure taking a great deal of time to perform. Commenters objected to the CMS use of CPT code 61626 as a crosswalk for valuation, stating that this code was deemed ''Do Not Use to Validate for Physician Work'' in the RUC database and that the work time in this code was developed to be used for practice expense purposes only and has not been validated by the RUC. Commenters also stated that CPT code 61626 has been revised by the CPT Editorial Panel and surveyed by the RUC for the CPT 2026 cycle and should not be used as crosswalk during the re-review process.

Commenters disagreed with the other CMS reference codes by stating that they were less intense/complex to perform compared to CPT code 61715 despite having similar work time values. Commenters maintained that the two key reference codes from the survey, CPT codes 61736 and 61737, were appropriate comparators and that CPT code 61715 was more intensive that these survey references, both as indicated by the survey respondents and due to clinical reasons (due to the need for repeated neurologic assessments of the awake patients during treatment planning and delivery and because the

reference codes involve time for opening/closing that is of lower intensity than the treatment and not required as part of the work for the CPT code 61715). Commenters stated that a decline in reimbursement could adversely affect their ability to provide this vital treatment to Medicare patients and urged CMS to finalize the RUC's recommended work RVU of 18.95.

Response: We appreciate the additional discussion of the clinical nature of CPT code 61715 from the commenters and its intensity relative to the various reference codes discussed above. After consideration of the comments, we agree that CPT code 61715 is more accurately valued at the survey 25th percentile work RVU of 18.95 as recommended by the RUC based on their description of the complexity inherent to the procedure. We are finalizing this work RVU of 18.95 along with the proposed direct PE inputs for CPT code 61715.

(10) Percutaneous Radiofrequency Ablation of Thyroid (CPT Codes 60660 and 60661)

In January 2024, the RUC surveyed codes 60660 (*Ablation of 1 or more thyroid nodule(s), one lobe or the isthmus, percutaneous, including imaging guidance, radiofrequency*) and its respective add-on code 60661 (*Ablation of 1 or more thyroid nodule(s), additional lobe, percutaneous, with imaging guidance, radiofrequency (List separately in addition to code for primary service*) and recommended both work RVUs and PE values for this code family.

For CPT code 60660, the RUC recommended a work RVU of 5.75 and we proposed the RUC-recommended work RVU of 5.75.

For add-on code CPT 60661, the RUC recommended a work RVU of 4.25 and we proposed the RUC-recommended work RVU for this code. We also proposed the RUC-recommended direct PE values for both codes 60660 and 60661.

Comment: Many commenters supported the CMS proposal of the RUC-recommended work RVUs for CPT codes 60660 and 60661. These commenters urged CMS to finalize the values as proposed.

Response: We appreciate the support for our proposed work RVUs from the commenters.

Comment: Several commenters stated that they supported the proposed work RVUs for CPT codes 60660 and 60661, however the commenters expressed significant concerns regarding the reimbursement challenges faced by endocrinologists in private non-facility-based practices for the Radiofrequency Ablation (RFA) of thyroid nodules. The commenters stated that there are critical issues that need to be addressed to ensure continued access to this important procedure for patients in need. These issues included the high cost of the RF electrode which poses a significant financial burden on practices, a reimbursement gap for endocrinologists in non-facility-based practices, the upfront costs of RFA equipment and consumables which threaten to impact patient access to these services, and that there are sustainability concerns regarding the current reimbursement model for RFA procedures. The commenters urged CMS to reconsider the reimbursement framework for RFA procedures, taking into account the full range of practice expenses, including essential consumables like the RF electrode.

Response: We appreciate the additional information submitted by the commenters regarding the issues involving reimbursement for these radiofrequency ablation services. Although this discussion is beyond the scope of this particular code family, if the commenters believe that the valuation of the RF electrode (SD368) supply at $1995.00 does not reflect current market pricing, we would encourage them to submit invoices via email to the *PE_Price_Input_Update@cms.hhs.gov* inbox as described in the PE section of this final rule.

After consideration of the comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Percutaneous Radiofrequency Ablation of Thyroid family as proposed.

(11) Fascial Plane Blocks (CPT Codes 64466, 64467, 64468, 64469, 64473, 64474, 64486, 64487, 64488, and 64489)

In September 2023, the CPT Editorial Panel created six new Category I CPT codes, CPT code 64466 (*Thoracic fascial plane block, unilateral; by injection(s), including imaging guidance, when performed*), 64467 (*Thoracic fascial plane block, unilateral; by continuous infusion(s), including imaging guidance, when performed*), 64468 (*Thoracic fascial plane block, bilateral; by injection(s), including imaging guidance, when performed*), 64469 (*Thoracic fascial plane block, bilateral; by continuous infusion(s), including imaging guidance, when performed*), 64473 (*Lower extremity fascial plane block, unilateral; by injection(s), including imaging guidance, when performed*), and 64474 (*Lower extremity fascial plane block, unilateral; by continuous infusion(s), including imaging guidance, when performed*) to report thoracic or lower extremity fascial plane blocks, typically used for post-operative pain management. Four existing CPT codes describing transversus abdominis plane (TAP) blocks, 64486 (*Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)*), 64487 (*Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by continuous infusion(s) (includes imaging guidance, when performed)*), 64488 (*Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) bilateral; by injections (includes imaging guidance, when performed)*) 64489 (*Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) bilateral; by continuous infusions (includes imaging guidance, when performed)*), were included as part of this code family for RUC review in January 2024.

We proposed the RUC-recommended work RVU for all ten codes in this family. We proposed a work RVU of 1.50 for CPT code 64466, 1.74 for CPT code 64467, 1.67 for CPT code 64468, 1.83 for CPT code 64469, 1.34 for CPT code 64473, 1.67 for CPT code 64474, 1.20 for CPT code 64486, 1.39 for CPT code 64487, 1.40 for CPT code 64488, and 1.75 for CPT code 64489.

We also proposed the RUC recommended direct PE inputs for CPT codes 64467, 64468, 64469, 64474, 64487, 64488, and 64489. We disagreed with one of the RUC recommended direct PE inputs for CPT codes 64466, 64473, and 64486. The RUC stated they believe that there is a rounding error in the CA019 clinical labor time, ''Assist physician or other qualified healthcare professional—directly related to physician work time (67%)'', for these three codes. We disagreed with the RUC that there are rounding errors in these codes and we proposed to maintain the current 7 minutes of CA019 clinical labor time for CPT codes 64466, 64473, and 64486. We noted that this matches the pattern of CA019 clinical labor time for the rest of the codes in the family, which remained the same or slightly decreased in each case. This refinement to the CA019 clinical labor time also means that we proposed a decrease of 0.5 minutes to the equipment time for the stretcher (EF018) and 3-channel ECG (EQ011) which decreases from 25.5 to 25 minutes for these three codes. We proposed all of the other RUC-recommended direct PE inputs for CPT codes 64466, 64473, and 64486 without refinement.

Comment: Commenters agreed with CMS' proposed work RVU and direct PE inputs for this code family.

Response: We thank commenters for their support. After consideration of the public comments, we are finalizing the work RVU and direct PE inputs as proposed.

(12) Skin Adhesives (CPT Codes 64590 and 64595 and HCPCS Codes G0168, G0516, G0517, and G0518)

In April 2022, the RUC approved the use of SG007 (*adhesive, skin (Dermabond)*) for CPT code 64590 (*insertion or replacement of peripheral, sacral, or gastric neurostimulator pulse generator or receiver, requiring pocket creation and connection between electrode array and pulse generator or receiver*) and 64595 (*revision or removal of peripheral, sacral, or gastric neurostimulator pulse generator or receiver, with detachable connection to electrode array*). In April 2023, the PE Subcommittee reviewed the following six codes on the Medicare Physician Fee Schedule 64590, 64595, G0168, G0516, G0517, G0518 that utilize Dermabond (supply code S6007) in order to identify justification for its use versus the generic version and present its findings to the RUC for approval. The RUC reviewed all six codes for PE only and did not submit work recommendations.

For CPT codes 64590 and 64595 and HCPCS code G0168 (*Wound closure utilizing tissue adhesive(s) only*), the RUC recommended that CMS remove the supply input SG007 adhesive, skin (Dermabond) and add one unit of SH076 adhesive, cyanoacrylate (2ml uou). We proposed the RUC-recommended direct PE inputs for CPT codes 64590 and 64595 and HCPCS code G0168. Similarly, for HCPCS codes G0516 (*Insertion of non-biodegradable drug delivery implants, 4 or more (services for subdermal rod implant*), G0517 (*Removal of non-biodegradable drug delivery implants, 4 or more (services for subdermal implants*), and G0518 (*Removal with reinsertion, non-biodegradable drug delivery implants, 4 or more (services for subdermal implants*), the RUC recommended that CMS remove the supply input SG007 adhesive, skin (Dermabond) and add one unit of SH076 adhesive, cyanoacrylate (2ml uou). We proposed the RUC-recommended direct PE inputs for HCPCS codes G0516–G0518.

Comment: Commenters agreed with CMS' proposed direct PE inputs for this code family.

Response: We thank commenters for their support. After consideration of the public comments, we are finalizing the direct PE inputs as proposed. We did not propose and are not finalizing any changes to the work RVUs.

(13) Iris Procedures (CPT Codes 66680, 66682, and 66683)

In April 2023, the CPT Editorial Panel deleted three related Category III CPT codes, CPT code 0616T (*Insertion of iris prosthesis, including suture fixation and repair or removal of iris, when performed; without removal of crystalline lens or intraocular lens, without insertion of intraocular lens*), CPT code 0617T (*with removal of crystalline lens and insertion of intraocular lens*), and CPT code 0618T (with secondary intraocular lens placement or intraocular lens exchange). At the same time, CPT created a new Category I code 66683 (*Implantation of iris prosthesis, including suture fixation and repair or removal of iris, when performed*) which describes insertion of an artificial iris into an eye with a partial or complete iris defect due to a congenital defect or surgical or non-surgical trauma. The new Category I CPT code 66683 replaced the three Category III codes to simplify reporting. Concurrent with these updates, the RUC surveyed the two other 90-day global iris repair codes, CPT code 66680 (*Repair of iris, ciliary body (as for iridodialysis)*) and CPT code 66682 (*Suture of iris, ciliary body (separate procedure) with retrieval of suture through small incision (eg, McCannel suture)*).

We disagreed with the RUC-recommended work RVU of 10.25 for CPT code 66680. We proposed a work RVU of 7.97 for CPT code 66680 based on a crosswalk to CPT code 67904 (*Repair of blepharoptosis; (tarso) levator resection or advancement, external approach*). When we reviewed CPT code 66680, we found that the RUC recommended work RVU does not maintain relativity with other 90-day global period codes with the same intraservice time of 45 minutes and similar total time around 182 minutes. The total time ratio between the current time of 159 minutes and the recommended time established by the RUC survey of 182 minutes equals 1.145 percent. This ratio, 1.145 percent, when applied to the current work RVU of 6.39 would suggest a work RVU of 7.31 which is far below the RUC's recommended work RVU of 10.25. Based on this total time ratio, we believe a more appropriate work valuation for CPT code 66680 is 7.97 based on a crosswalk to CPT code 67904.

We disagreed with the RUC-recommended work RVU of 10.87 for CPT code 66682. We proposed a work RVU of 8.74 based on the total time ratio between the current time of 169.5 minutes and the recommended time established by the RUC survey of 202 minutes. This ratio equals 1.192 percent, and 1.192 percent of the current work RVU of 7.33 suggests a work RVU of 8.74 for CPT code 66682. When we reviewed CPT code 66682, we found that the recommended work RVU was higher than nearly all of the other 90-day global codes with similar time values. The RUC's recommended work RVU does not maintain relativity with other 90-day global period codes with the same intraservice time value of 45 minutes and similar total time of 202. We found that work RVU crosswalks to CPT codes of similar intraservice and total time were too low, such as CPT code 45171 with a work RVU of 8.13. A more appropriate work RVU for CPT code 66682 is 8.74 based on the total time ratio.

The RUC recommended a work RVU of 12.80 for CPT code 66683, the RUC survey 25th percentile result, with an intraservice time of 60 minutes and a total time of 224 minutes. We disagreed with the RUC-recommended work RVU of 12.80 for CPT code 66683. Although we disagreed with the RUC-recommended work RVU, we concurred that the relative difference in work between CPT codes 66682 and 66683 is equivalent to the recommended interval of 1.93 RVUs. Therefore, we proposed a work RVU of 10.67 for CPT code 66683, based on the recommended interval of 1.93 additional RVUs above our proposed work RVU of 8.74 for CPT code 66682. This work RVU of 10.67 falls between the work RVU values of existing codes with similar intraservice and total time values. For example, CPT code 65850 (60 minutes of intraservice time and 233 minutes of total time) has a work RVU of 11.39 and CPT code 24164 with the same intraservice time and 228 minutes of total time has a work RVU of 10.00. We believe that the work valuation of these CPT codes, which bracket our work RVU of 10.67, provide additional support for our valuation.

We also disagreed with the RUC's recommended work RVUs for the codes in this family because they suggest that there has been a tremendous increase in intensity as compared to how these services have historically been valued. CPT code 66680 is more than doubling in intensity at the RUC's recommended work RVU of 10.25, which we do not believe to be the case given that the code descriptor remains unchanged and the surveyed intraservice work time is unchanged at 45 minutes. This same pattern holds true for CPT code 66682, which would be increasing in intensity

by more than 50 percent at the RUC's recommended work RVU of 10.87, and which similarly has no change in its code descriptor and a modest increase in its surveyed work time. We concur that the intensity of these services has likely gone up over time, which is why we proposed modest intensity increases for both codes; however, we continue to disagree that the very substantial intensity increases recommended by the RUC would be accurate for this code family. We believe that our work RVUs are more in line with how these services have historically been valued and better maintain relativity with the rest of the fee schedule.

We proposed the direct PE inputs as recommended by the RUC for all three codes in the family without refinement.

Comment: We received a few comments opposed to our proposal. Of these commenters, most asserted that CMS should finalize the RUC-recommended work RVU values for CPT codes 66680 and 66682. Commenters asserted that the direct work RVU crosswalk that CMS proposed for CPT code 66680 was inappropriate because assigning a work RVU of 7.97 based on a crosswalk to CPT code 67904 does not maintain relativity with other 90-day global intraocular procedures with which CPT code 66680 should be compared. Commenters stated that the procedure described by CPT code 66680 has a much higher risk and requires greater intensity than extraocular procedures. They criticized the CMS methodology as relying too heavily on time and not enough on the overall intensity, which is higher on account of greater expectations for restoring normal anatomical relationships. These commenters also stated that the proposed work RVU of 8.74 for CPT code 66682 does not adequately account for the increase in intensity and complexity which has occurred since its prior valuation in 1992. In their public comment, the RUC objected to the proposed methodology for assigning a work RVU to CPT code 66682, stating that any mathematical or computational methodology other than magnitude estimation used to value physician work is inappropriate, and inconsistent with RBRVS principles.

All commenters urged CMS to finalize the RUC recommended work RVU value of 12.80 for CPT code 66683. One commenter stated that they agreed that the relative difference in work between CPT codes 66682 and 66683 is equivalent to the recommended interval of 1.93 RVUs between CPT codes 66682 and 66683. They felt this interval should be applied to the RUC-recommended work RVU for CPT code 66682. Another commenter disagreed, saying that the relative complexity of CPT code 66683 as compared to CPT code 66682 is significantly greater than the 1.93 work RVU difference as noted by the RUC and in the proposed work RVUs for CPT codes 66682 and 66683.

Response: We thank the commenters for their feedback. However, we disagree with the commenters and are finalizing the work RVUs for CPT codes 66680, 66682 and 66683 as proposed. We continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services. We reiterate that, consistent with the statute, we are required to value the work RVU based on the relative resources involved in furnishing the service, which include time and intensity. In accordance with the statute, we believe that changes in time and intensity must be accounted for when developing work RVUs. We recognize that it would not be appropriate to develop work RVUs solely based on time given that intensity is also an element of work, but in applying the time ratios, we are using derived intensity measures based on current work RVUs for individual procedures. When our review of recommended values reveals that changes in time are not accounted for in a RUC-recommended work RVU, the obligation to account for that change when establishing proposed and final work RVUs remains. We reiterate that we use time ratios to identify potentially appropriate work RVUs, and then use other methods (including estimates of work from CMS medical personnel and crosswalks to key reference or similar codes) to validate these RVUs. For more details on our methodology for developing work RVUs, we direct readers to the discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

We continue to disagree with the RUC and with commenters that the intensity for CPT code 66680 has more than doubled, given that the code descriptor remains unchanged and the surveyed intraservice work time is unchanged at 45 minutes. We also disagree with the RUC and with commenters that the intensity for CPT code 66682 has increased by more than 50 percent, given that CPT code 66682 has no change in its code descriptor and a modest increase in its surveyed work time. We noted in the proposed rule that we did not believe these substantial increases in intensity would be typical for these codes, and we did not receive new information from commenters that supported finalizing work RVUs that would warrant these intensity increases. We continue to believe that our proposed valuations, based on a crosswalk for CPT code 66680 and the use of a time ratio for CPT code 66682, more accurately value these codes since they do not result in the sizable increases in intensity as recommended by the RUC. We note again for commenters that the work RVU and the intensity are increasing for both CPT codes 66680 and 66682 at the values we proposed, as we recognize that these services now require additional work and intensity as compared with the time of their prior review.

For CPT code 66683, we agreed with commenters and the RUC that this code has greater intensity than CPT code 66682. Commenters agreed with our proposal that the relative difference in work between CPT codes 66682 and 66683 is equivalent to the recommended interval of 1.93 RVUs, only disagreeing on the work RVU of CPT code 66682 itself. We believe the use of an incremental difference between codes is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service. We continue to believe that our proposed work RVU of 10.67 for CPT code 66683 is the most accurate valuation for this code.

With regard to the commenters' concerns regarding clinically relevant relationships, we emphasize that we continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk. For more details on our methodology for developing work RVUs, we again direct readers to the discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

After consideration of the comments and as stated above, we are finalizing the work RVUs for CPT codes 66680, 66682 and 66683 as proposed. We are also finalizing the direct PE inputs as proposed for all three codes in the family without refinement.

(14) Magnetic Resonance Examination Safety Procedures (CPT Codes 76014, 76015, 76016, 76017, 76018, and 76019)

In September 2023, the CPT Editorial Panel created a new code family to describe magnetic resonance (MR) examination safety procedures and capture the physician work involving patients with implanted medical devices that require access to MR diagnostic procedures: CPT code 76014 (*MR safety implant and/or foreign body assessment by trained clinical staff, including identification and verification of implant components from appropriate sources (e.g., surgical reports, imaging reports, medical device databases, device vendors, review of prior imaging), analyzing current MR conditional status of individual components and systems, and consulting published professional guidance with written report; initial 15 minutes*), CPT code 76015 (*MR safety implant and/or foreign body assessment by trained clinical staff, including identification and verification of implant components from appropriate sources (e.g., surgical reports, imaging reports, medical device databases, device vendors, review of prior imaging), analyzing current MR conditional status of individual components and systems, and consulting published professional guidance with written report; each additional 30 minutes (List separately in addition to code for primary procedure)*), CPT code 76016 (*MR safety determination by a physician or other qualified health care professional responsible for the safety of the MR procedure, including review of implant MR conditions for indicated MR exam, analysis of risk versus clinical benefit of performing MR exam, and determination of MR equipment, accessory equipment, and expertise required to perform examination with written report*), CPT code 76017 (*MR safety medical physics examination customization, planning and performance monitoring by medical physicist or MR safety expert, with review and analysis by physician or qualified health care professional to prioritize and select views and imaging sequences, to tailor MR acquisition specific to restrictive requirements or artifacts associated with MR conditional implants or to mitigate risk of non-conditional implants or foreign bodies with written report*), CPT code 76018 (*MR safety implant electronics preparation under supervision of physician or other qualified health care professional, including MR-specific programming of pulse generator and/or transmitter to verify device integrity, protection of device internal circuitry from MR electromagnetic fields, and protection of patient from risks of unintended stimulation or heating while in the MR room with written report*), and CPT code 76019 (*MR safety implant positioning and/or immobilization under supervision of physician or qualified health care professional, including application of physical protections to secure implanted medical device from MR-induced translational or vibrational forces, magnetically induced functional changes, and/or prevention of radiofrequency burns from inadvertent tissue contact while in the MR room with written report*). For CY 2025, new CPT codes 76014 and 76015 are PE only services that represent the preparatory research and review completed by clinical staff (that is, MRI technologist and/or a medical physicist) that will be utilized by the physician or qualified health professional for the other four services (CPT codes 76016, 76017, 76018, and 76019) in this code family.

We proposed the RUC-recommended work RVU of 0.60 for CPT code 76016, the work RVU of 0.76 for CPT code 76017, the work RVU of 0.75 for CPT code 76018, and the work RVU of 0.60 for CPT code 76019.

We proposed the following refinements to the direct PE inputs. For CPT codes 76014, 76015, 76016, 76018, and 76019, we proposed to refine the clinical labor for the CA034 activity (*Document procedure (nonPACS) (e.g. mandated reporting, registry logs, EEG file, etc.)*) performed by the MRI Technologist from 2 minutes to 1 minute. We note that the clinical labor for the CA032 activity (*Scan exam documents into PACS. Complete exam in RIS system to populate images into work queue.*) included in the direct PE inputs for reference CPT code 70543 (*Magnetic resonance (e.g., proton) imaging, orbit, face, and/or neck; without contrast material(s), followed by contrast material(s) and further sequences*) was a similar clinical labor activity and had 1 minute of time. We also noted that the Medical Physicist had 1 minute of recommended clinical labor time for the CA034 activity for CPT code 76017. Therefore, we believed that the MRI Technologist should have the same time (1 minute) for the CA034 activity for the remaining codes in the family to maintain consistency across these services.

For CPT code 76015, we proposed to refine the clinical labor for the CA021 activity (*Perform procedure/service—NOT directly related to physician work time*) from 27 minutes to 14 minutes. We believed this clinical labor time should be double the 7 minutes assigned to the CA021 activity for CPT code 76014. The description for CPT code 76014 is for the ''initial 15 minutes'' and CPT code 76015 is for ''each additional 30 minutes,'' that is, double the time of CPT code 76014. We believed that the clinical labor associated with the CA021 activity should match this pattern in which CPT code 76015 contains double the time of CPT code 76014. This proposed refinement to the CA021 clinical labor also resulted in a proposed decrease to the equipment time for the Technologist PACS workstation (ED050) from 45 minutes to 32 minutes.

For CPT code 76017, the RUC recommended 13 minutes of equipment time for the Professional PACS Workstation (ED053) listed as a Facility PE input. We believed this was an unintended technical error and we proposed to remove this time from the direct PE inputs for CPT code 76017.

For CPT codes 76018 and 76019, we proposed to refine the clinical labor time for the CA024 activity (*Clean room/equipment by clinical staff*) from 2 minutes to 1 minute. According to the PE recommendations, only the new equipment code EQ412 (*Vitals monitoring system (MR Conditional)*) was being cleaned and not the entire room. We believed that 1 minute of clinical labor time would be typical for cleaning the EQ412 equipment. Our proposed clinical labor refinement also resulted in a proposed decrease to the equipment time for EL008 (*room, MR*) and EQ412 by 1 minute for these two codes.

For CPT code 76019, we proposed to remove supply item SL082 (*impression material, dental putty (per bite block)*). We believed this was an error since the PE recommendations did not list SL082 as one of the included supplies for CPT code 76019 and it did not appear as a supply input for any of the other codes in the family.

The following is a summary of the comments we received and our responses.

Comment: The commenters overwhelmingly supported our proposal of the RUC recommended work RVUs for CPT codes 76016, 76017, 76018, and 76019.

Response: We thank the commenters for their support.

Comment: The commenters agreed with the proposed PE refinement to remove equipment time for the Professional PACS Workstation (ED053) for CPT code 76017 in the facility setting and agreed this was an unintended technical error.

Response: We thank the commenters for their support.

Comment: For CPT codes 76018 and 76019, the commenters agreed with the proposed PE refinement to remove 1 minute of clinical labor time from the Clean room/equipment by clinical staff (CA024) task, as well as the resulting decrease in equipment time for equipment codes EL008 and EQ412.

Response: We thank the commenters for their support.

Comment: We received several comments that disagreed with our proposal to remove 1 minute of clinical labor time from the Document procedure (nonPACS) (CA034) task for CPT codes 76014, 76015, 76016, 76018, and 76019. The commenters stated that the RUC recommendation of 2 minutes was necessary by describing the various requirements the MRI technologist must perform and detailing the evaluation and written report that is part of the documentation process (for example, evaluate implant components, special positioning requirements, include clinical staff records, and implant status post procedure).

Response: We appreciate the submission of this additional information from the commenters regarding the tasks performed by the MRI technologist. We agree with the commenters that 2 minutes is necessary given the technologist must write a detailed report to include evaluated implant components, MR conditions for the requested exam, implant programming requirements, special positioning requirements, acceptable radiofrequency coils, and necessary personnel for the exam. Also, CPT code 76017 only requires 1 minute for CA034 because the medical physicist typically documents the procedure in tandem with the performance of the MR procedure and needs less time to complete documentation upon completion of the procedure. Therefore, we are finalizing the RUC recommendation of 2 minutes for clinical labor activity CA034 for CPT codes 76014, 76015, 76016, 76018, and 76019.

Comment: Several commenters disagreed with our proposal to reduce the clinical labor time for the Perform procedure/service—NOT directly related to physician work time (CA021) task from 27 to 14 minutes for CPT code 76015. The commenters stated that there is significantly more work for the MRI technologist with CPT 76015 compared to parent CPT code 76014 because the MRI technologist typically has to call the patient's primary care physician's office to obtain additional information and detailed history related to the implant, assess an implant where there may be no implant information readily available in the medical chart (or the patient does not have any implant information), and if there have been subsequent revision surgeries to the original implant.

Response: After reviewing the comments for clinical labor activity CA021 for CPT code 76015, we believe a 7-minute increase from the proposed 14 minutes to 21 minutes would be appropriate. We believe that there may be some duplicative work from parent CPT code 76014 and that a more appropriate time to accomplish the additional tasks would be 3 times the 7-minute value for CA021 assigned to parent CPT code 76014, instead of the full 27 minutes recommended by the RUC. Our finalized clinical labor time of 21 minutes for the CA021 activity for CPT code 76015 also results in an increase in equipment time from the proposed 32 minutes to 39 minutes for equipment code ED050.

Comment: The commenters disagreed with our proposal to remove supply item SL082 from the direct PE inputs for CPT code 76019 and stated that a typo occurred in the PE Summary of Recommendation (SOR) which did not correctly list this supply code as a direct PE input.

Response: We agree with the commenters that supply item SL082 should have been included in the PE SOR. Therefore, we are finalizing the inclusion of the RUC recommended PE input of supply item SL082 for CPT code 76019.

After consideration of the public comments for the Magnetic Resonance Examination Safety Procedures code family (CPT codes 76014, 76015, 76016, 76017, 76018, and 76019), we are finalizing the work RVU values for CPT codes 76016, 76017, 76018, and 76019 as proposed. For CY 2025, CPT codes 76014 and 76015 are PE only services and have no work RVUs. We are finalizing the RUC recommended direct PE input of 2 minutes for clinical labor activity CA034 for CPT codes 76014, 76015, 76016, 76018, and 76019. For CPT code 76015, we are finalizing 21 minutes for clinical labor activity CA021 and 39 minutes for equipment code ED050. For CPT code 76019, we are finalizing the inclusion of the RUC recommended PE input for supply item SL082. All remaining direct PE inputs for CPT codes 76014, 76015, 76016, 76017, 76018, and 76019 are finalized as proposed.

(15) Screening Virtual Colonoscopy (CPT Code 74263)

As outlined in section III.K. of this final rule, we proposed to exercise our authority at section 1861(pp)(1)(D) of the Act to update and expand coverage for colorectal cancer screening and adding coverage for the computed tomography colonography procedure. Accordingly, we assigned an active payment status for CPT code 74263 (Computed tomographic (ct) colonography, screening, including image postprocessing). We noted that, as proposed previously, the OPPS cap would apply to this code, and payment for the TC of this service would be capped at the OPPS payment rate.

Comment: Many commenters supported our proposal to assign active payment status to align with the expanded coverage proposal for CPT code 74263 although many also expressed concern with the application of the OPPS cap, and stated that it would be a significant barrier to imaging centers providing this service because of the payment difference between the PFS payment amount and the OPPS payment amount, which has an estimated payment of $106.30.

Response: We appreciate the commenters' support of the proposal to assign active payment status to align with the expanded coverage proposal for CPT code 74263. We direct readers to section III.K. of this final rule for more information regarding the proposal, including a summary of comments received, and section II.E.3.b.

7. Procedures Subject to the Multiple Procedure Payment Reduction (MPPR) and the OPPS Cap of This Final Rule for More Information About the OPPS Cap

After consideration of the public comments, we are finalizing the proposal to assign active payment status for CPT code 74263.

(16) Ultrasound Elastography (CPT Codes 76981, 76982, and 76983)

This code family was flagged for re-review at the April 2023 RUC meeting by the new technology/new services screen. Due to increased utilization of CPT code 76981 (*Ultrasound, elastography; parenchyma (eg, organ)*), the entire code family was resurveyed for the September 2023 RUC meeting. We proposed the RUC-recommended work RVUs of 0.59, 0.59, and 0.47 for CPT codes 76981, 76982 (*Ultrasound, elastography; first target lesion*), and 76983 (*Ultrasound, elastography; each additional target lesion (List separately in addition to code for primary procedure)*), respectively. We proposed

the RUC-recommended direct PE inputs for CPT codes 76981, 76982, and 76983 without refinement.

Comment: Commenters were supportive of our proposed RUC-recommended work RVUs and direct PE inputs for CPT codes 76981, 76982, and 76983.

Response: We appreciate the commenters' support and are finalizing the RUC-recommended work RVUs and direct PE inputs for CPT codes 76981, 76982, and 76983 as proposed.

(17) CT Guidance Needle Placement (CPT Code 77012)

CPT code 77012 (*Computed tomography guidance for needle placement (eg, biopsy, aspiration, injection, localization device), radiological supervision and interpretation*) was reviewed at the September 2023 RUC meeting to account for deferred updates to the vignette to reflect the typical patient until updated utilization data was available to reflect coding changes that occurred in 2019. We proposed the RUC-recommended work RVU of 1.50 for CPT code 77012.

We proposed to refine the equipment time for the CT room (EL007) to maintain the current time of 9 minutes. CPT code 77012 is a radiological supervision and interpretation (RS&I) procedure and there has been a longstanding convention in the direct PE inputs, shared by 38 other codes, to assign an equipment time of 9 minutes for the equipment room in these procedures. We made the same refinement in the CY 2019 PFS final rule (83 FR 59553 through 59554) and continue to believe that it would not serve the interests of relativity to increase the equipment time for the CT room in CPT code 77012 without also addressing the equipment room time for the other radiological supervision and interpretation procedures. In response to the CY 2019 proposal, several commenters stated that they agreed with CMS that other RS&I codes use the 9 minutes for room time as a precedent, but that it is specific to angiographic rooms. We agreed with the commenters that at least some portion of the procedure is performed in the CT room, but we continue to believe that it would not serve the interests of relativity to increase the equipment time for the CT room in CPT code 77012 without also addressing the equipment room time for the other radiological supervision and interpretation procedures in a more comprehensive fashion. We also disagreed with the commenters that this policy is specific to angiography rooms, as CPT codes 75989 (*Radiological guidance (ie, fluoroscopy, ultrasound, or computed tomography), for percutaneous drainage (eg, abscess, specimen collection), with placement of catheter, radiological supervision and interpretation*) and 77012 both employ CT rooms and currently utilize the standardized 9 minutes of equipment time, and CPT code 76080 (*Radiologic examination, abscess, fistula or sinus tract study, radiological supervision and interpretation*) employs a radiographic-fluoroscopic room with the 9 minute standard equipment time. We continue to believe that 9 minutes for EL007 is appropriate for this RS&I code; therefore, we are proposing to maintain the current equipment room time of 9 minutes for EL007 until this group of procedures can be subject to a more comprehensive review. We proposed all other RUC-recommended direct PE inputs for CPT code 77012.

Comment: Some commenters disagreed with our proposal to refine the equipment room time for the CT room (EL007) to maintain the current 9 minutes. Commenters reiterated that they believe the 9-minute convention only applies to RS&I codes in angiographic rooms, whereas this service is performed in a CT room. Commenters stated that 35 of the 38 RS&I codes are performed in the angiographic room, so the 9 minutes allocated is appropriate, and one code, CPT code 76080, is performed in the fluoroscopy room but is typically billed with CPT code 49424 (*Contrast injection for assessment of abscess or cyst via previously placed drainage catheter or tube (separate procedure)*) that also includes fluoroscopy room time. Commenters stated that the remaining two codes, CPT codes 77012 and 75989, are performed in the CT room and should have more than 9 minutes of room time.

Response: We continue to believe that it would not serve the interests of relativity to increase the equipment time for the CT room in CPT code 77012 without also addressing the equipment room time for the other radiological supervision and interpretation procedures in a more comprehensive fashion, especially considering commenters raised concerns about the equipment time for both CPT codes 77012 and 75989. Therefore, at this time, we continue to believe that 9 minutes for EL007 is appropriate for this RS&I code until this group of procedures can be subject to a more comprehensive review and are finalizing to maintain the current equipment room time of 9 minutes for EL007 as proposed. We are also finalizing the RUC-recommended work RVU of 1.50 as proposed.

(18) Telemedicine Evaluation and Management (E/M) Services (CPT Codes 98000, 98001, 98002, 98003, 98004, 98005, 98006, 98007, 98008, 98009, 98010, 98011, 98012, 98013, 98014, 98015, and 98016)

In February 2023, the CPT Editorial Panel added a new Evaluation and Management (E/M) subsection to the draft CPT codebook for Telemedicine Services. The Panel added 17 codes for reporting telemedicine E/M services: CPT code 98000 (*Synchronous audio-video visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.*); CPT code 98001 (*Synchronous audio-video visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.*); CPT code 98002 (*Synchronous audio-video visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.*); CPT code 98003 (*Synchronous audio-video visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high medical decision making. When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded. (For services 75 minutes or longer, use prolonged services code 99417));* CPT code 98004 (*Synchronous audio-video visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.*); CPT code 98005 (*Synchronous audio-video visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low medical decision making. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.*); CPT code 98006 (*Synchronous audio-*

video visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.); CPT code 98007 (*Synchronous audio-video visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high medical decision making. When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded.*); CPT code 98008 (*Synchronous audio-only visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination, straightforward medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.)*); CPT code 98009 (*Synchronous audio-only visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination, low medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.)*); CPT code 98010 (*Synchronous audio-only visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination, moderate medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.*); CPT code 98011 (*Synchronous audio-only visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination, high medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded. (For services 75 minutes or longer, use prolonged services code 99417)*); CPT code 98012 (*Synchronous audio-only visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination, straightforward medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 10 minutes must be exceeded.)*); CPT code 98013 (*Synchronous audio-only visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination, low medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.)*); CPT code 98014 (*Synchronous audio-only visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination, moderate medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.)*); CPT code 98015 (*Synchronous audio-only visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination, high medical decision making, and more than 10 minutes of medical discussion. When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded. (For services 55 minutes or longer, use prolonged services code 99417)*); CPT code 98016 (*Brief communication technology-based service (e.g., virtual check-in) by a physician or other qualified health care professional who can report evaluation and management services, provided to an established patient, not originating from a related evaluation and management service provided within the previous 7 days nor leading to an evaluation and management service or procedure within the next 24 hours or soonest available appointment, 5–10 minutes of medical discussion)*).

In April 2023, the AMA–RUC noted that the survey instrument they used to develop valuation recommendations for the telemedicine E/M codes did not include the time (when time is used for code selection) in the new telemedicine E/M services descriptors, or the E/M services displayed on the reference service list. The AMA–RUC made interim valuation recommendations and conducted a new survey for September 2023, which included the minimum required times in the code descriptors, and those minimum times were the same as appear in existing O/O E/M services code descriptors (CPT codes 99202–99205, 99212–99215); the new survey in September 2023 included code descriptors and times approved by the CPT Editorial Panel in May 2023. Also, additional specialties who perform E/M services participated in the second round of this survey. For CY 2025, the RUC recommended the following work RVUs: a work RVU of 0.93 for CPT code 98000, a work RVU of 1.6 for CPT code 98001, a work RVU of 2.6 for CPT code 98002, a work RVU of 3.50 for CPT code 98003, a work RVU of 0.70 for CPT code 98004, a work RVU of 1.30 for CPT code 98005, a work RVU of 1.92 for CPT code 98006, a work RVU of 2.60 for CPT code 98007, a work RVU of 0.90 for CPT code 98008, a work RVU of 1.60 for CPT code 98009, a work RVU of 2.42 for CPT code 98010, a work RVU of 3.20 for CPT code 98011, a work RVU of 0.65 for CPT code 98012, a work RVU of 1.20 for CPT code 98013.

In April 2023, the AMA–RUC Practice Expense Subcommittee approved the direct practice expense inputs as recommended by the specialty societies without modification, and CMS received these inputs as recommendations from the RUC. The specialty societies detailed their methodology for making some changes to specific clinical activity codes to adapt those clinical activity codes for telemedicine. The AMA edited both CA009 and CA013. The AMA revision to CA009 deletes, ''*greet patient, provide gowning*''; the AMA revision to CA013 deletes, ''Prepare room, equipment and supplies''. CA009 now reads, ''*Ensure appropriate medical records are available*'' and CA013 now reads, ''*Prepare patient for the visit (i.e. check audio and/or visual*''. The RUC, using the Practice Expense subcommittee recommendations, also recommended to CMS that a camera and microphone ''should be considered typical in the computer contained in the indirect overhead expense.'' This determination is consistent with CMS' longstanding position that items that are not specifically attributable to the individual services should not be included for valuation of specific codes.

The AMA–RUC recommended the direct practice expense inputs as submitted by the AMA-member specialty societies, and as affirmed by the AMA–RUC Practice Expense Subcommittee. All supply and equipment costs were zeroed out from the reference services, and as a result, the new telemedicine E/M codes did not include any supply or equipment costs in the recommended direct practice expense inputs that the AMA submitted to CMS. The direct PE inputs removed from the reference services to create the new telemedicine E/M codes are: CA010 (obtain vital signs), CA024 (clean room/equipment by clinical staff), SA047 (pack, EM visit), SM022 sanitizing cloth-wipe (surface, instruments, equipment), EQ189 (otoscope-ophthalmoscope [wall unit]), EF048 (Portable stand-on scale), and EF023 (table, exam).

Sixteen of the telemedicine E/M codes describe use of either audio-video or audio-only telecommunications technology to furnish the individual service. The CPT Editorial Panel finalized eight codes for synchronous audio-video services (CPT codes 98000 to 98007), and eight codes for synchronous audio-only services (CPT codes 98008 to 98014), and one code for an asynchronous service (CPT code 98016). The audio-video and audio-only code family subsets have parallel codes for new patients and established patients. Like other E/M codes, these codes may be reported based on the level of medical decision making (MDM) or total time on the date of the encounter. For each set of four codes, there is a code that may be reported for a straightforward, low, moderate and high level of MDM.

The CPT Editorial Panel also established new CPT code 98016 describing a brief virtual check-in encounter that is intended to evaluate the need for a more extensive visit (that is, a visit described by one of the office/outpatient E/M codes). The code descriptor for CPT code 98016 mirrors existing HCPCS code G2012 (*Brief communication technology-based service, e.g. virtual check-in, by a physician or other qualified health care professional who can report evaluation and management services, provided to an established patient, not originating from a related e/m service provided within the previous 7 days nor leading to an e/m service or procedure within the next 24 hours or soonest available appointment; 5–10 minutes of medical discussion*) and, per the CPT Editorial Panel materials, is intended to replace that code. As described in CPT Editorial Panel final edits, CPT code 98016 does not require the use of audio or video technology and is expected to be patient-initiated. Furnishing the complete service described by CPT code 98016 must involve 5–10 minutes of medical discussion (and the code descriptor does not include MDM as means of code selection). CPT code 98016 should not be reported if it originates from a related E/M service furnished within the previous 7 days, or, if the clinical interaction leads to another E/M or procedure within the next 24 hours or the soonest available appointment. The final CPT Editorial Panel draft language explains that if the virtual check-in described by CPT 98016 leads to an E/M visit in the next 24 hours, and if that E/M is reported based on time, then the time from the virtual check-in may be added to the time of the resulting E/M visit to determine the total time on the date of encounter for the resulting E/M. The RUC recommended a work RVU of 0.30 for 98016.

The CPT Editorial Panel also deleted three codes (99441–99443) for reporting telephone E/M services. We note that CPT codes 99441, 99442, and 99443, each are assigned provisional status on the Medicare telehealth services list and would return to bundled status when the telehealth flexibilities expire on December 31, 2024. For further background, we referred readers to our discussions in previous rulemaking, where CMS explains the rationale for this policy (88 FR 78871–78878).

CMS has a longstanding interpretation of section 1834(m) of the Act as specifying the circumstances under which Medicare makes payment for services that would otherwise be furnished in person but are instead furnished via telecommunications technology. Specifically, section 1834(m)(2)(A) of the Act expressly requires payment to the distant site physician or practitioner of an amount equal to the amount that such physician or practitioner would have been paid had such service been furnished without the use of a telecommunications system. This means that we must pay an equal amount for a service furnished using a ''telecommunications system'' as for a service furnished in person (without the use of a telecommunications system). In the CY 2019 PFS final rule, we stated that ''[w]e have come to believe that section 1834(m) of the Act does not apply to all kinds of physicians' services whereby a medical professional interacts with a patient via remote communication technology. Instead, we believe that section 1834(m) of the Act applies to a discrete set of physicians' services that ordinarily involve, and are defined, coded, and paid for as if they were furnished during an in-person encounter between a patient and a health care professional'' (83 FR 59483). Under this interpretation, services that are coded and valued based on the understanding that they are not ordinarily furnished in person, such as remote monitoring services and communication technology-based services, are not considered Medicare telehealth services under section 1834(m) of the Act, and thus, not subject to the geographic, site of service, and practitioner restrictions included therein.

Information provided to CMS from the RUC indicates that CPT codes 98000–98015 describe services that would otherwise be furnished in person, and as such the services described by these codes are subject to section 1834(m) of the Act. In the summary of the coding changes, the AMA states that these services are ''patterned after the in-person office visit codes.'' The draft CPT prefatory language states that ''[t]elemedicine services are used in lieu of an in-person service when medically appropriate to address the care of the patient and when the patient and/or family/caregiver agree to this format of care.'' The draft CPT prefatory language likewise states that when a telemedicine E/M is billed on the same day as another E/M service ''the elements and time of these services are summed and reported in aggregate, ensuring that any overlapping time is only counted once,'' which indicates that the work of the telemedicine E/M service is identical to the work associated with an in-person, non-telehealth E/M. The code descriptors and requirements for billing the codes generally mirror the existing office/outpatient E/M codes with the exception of the technological modality used to furnish the service. The audio-video telemedicine E/M codes have nearly identical recommended work RVUs to parallel office/outpatient E/M codes. In general, the audio-only telemedicine E/M codes have lower recommended work RVUs than parallel office/outpatient E/M codes. The RUC stated that this is because, when surveyed, specialty societies indicated that ''the audio-video and in-person office visits require more physician work than the audio-only office visits.''

Table 14 describes the similarities between 16 of 17 telemedicine E/M codes and the parallel office/outpatient E/M codes. The table shows that except for the element of ''modality'' (that is, audio-video or audio-only), the service elements of the new telemedicine E/M code family are no different than the O/O E/M codes (for each enumerated row 1 through 16 the columns display the analogous elements). When comparing code descriptors, as described at the start of this section,, the only difference (as represented in Table 14 when comparing the elements of E/M services represented by columns C, D, E, and F) is that these new telemedicine E/M code descriptors lead with the phrase ''synchronous audio-video'' or ''synchronous audio only'' before describing the visit in full exactly as the existing office/outpatient E/M visit codes describe a visit in the long descriptor of the analogous service.

TABLE 14: Comparison of Elements and Work RVU between Telemedicine E/M Codes (98000 through 98015) and Office/Outpatient E/M Codes (99202 through 99215)

	A	B	C	D	E	F	G	H
	Telemedicine E/M HCPCS	RUC-recommended Work RVU	Modality	Level of Medical Decision-Making	Time Threshold (minutes)	New or Established Patient?	Analogous Current Office/Outpatient E/M Code	Current Work RVU
1	98000	0.93	Audio/Video (A/V)	Straightforward	15	new	99202	0.93
2	98001	1.60	A/V	Low	30	new	99203	1.60
3	98002	2.60	A/V	Moderate	45	new	99204	2.60
4	98003	3.50	A/V	High	60	new	99205	3.50
5	98004	0.70	A/V	Straightforward	10	established	99212	0.70
6	98005	1.30	A/V	Low	20	established	99213	1.30
7	98006	1.92	A/V	Moderate	30	established	99214	1.92
8	98007	2.60	A/V	High	40	established	99215	2.80
9	98008	**0.90**	Audio-only	Straightforward	15	new	99202	0.93
10	98009	1.60	Audio-only	Low	30	new	99203	1.60
11	98010	**2.42**	Audio-only	Moderate	45	new	99204	2.60
12	98011	**3.20**	Audio-only	High	60	new	99205	3.50
13	98012	**0.65**	Audio-only	Straightforward	10	established	99212	0.70
14	98013	**1.20**	Audio-only	Low	20	established	99213	1.30
15	98014	**1.75**	Audio-only	Moderate	30	established	99214	1.92
16	98015	**2.60**	Audio-only	High	40	established	99215	2.80

There are services already describing audio-video and audio-only telemedicine E/M codes on the Medicare telehealth services list—the office/outpatient E/M code set—that can be furnished via synchronous two-way, audio/video communication technology generally and via audio-only communication technology under certain circumstances to furnish Medicare telehealth services in the patient's home for the purpose of diagnosis and treatment of a mental health disorder or SUD. Additionally, as stated above, section 1834(m)(2)(A) of the Act requires us to pay an equal amount for a service furnished using a ''telecommunications system'' as for a service furnished in person (without the use of a telecommunications system). Were we to accept the AMA's recommendations and add the telemedicine E/M codes to the Medicare telehealth services list, we would need to establish RVUs for the telemedicine E/M codes to equal the corresponding non-telehealth services to satisfy the requirements for payment under section 1834(m)(2)(A) of the Act.

We do not believe that there is a programmatic need to recognize the audio/video and audio-only telemedicine E/M codes for payment under Medicare. We proposed to assign CPT codes 98000–98015 a Procedure Status indicator of ''I'', meaning that there is a more specific code that should be used for purposes of Medicare, which in this case would be the existing office/outpatient E/M codes currently on the Medicare telehealth services list when billed with the appropriate POS code to identify the location of the beneficiary and, when applicable, the appropriate modifier to identify the service as being furnished via audio-only communication technology.

Section 4113 of the Consolidated Appropriations Act (CAA), 2023 extended the availability of Medicare telehealth services to beneficiaries regardless of geographic location or site of service by temporarily removing such statutory restrictions under section 1834(m) of the Act until the end of 2024. Under the current statute, the geographic location and site of service restrictions on Medicare telehealth services will once again take effect for services furnished beginning January 1, 2025. Although there are some important exceptions, including for behavioral health services and ESRD-related clinical assessments, most Medicare telehealth services will once again, in general, be available only to

beneficiaries in rural areas and only when the patient is located in certain types of medical settings. As previously discussed, the introduction of new CPT coding to describe telemedicine E/M services does not change our authority to pay for visits furnished through interactive communications technology in accordance with section 1834(m) of the Act. We recognize that there are significant concerns about maintaining access to care through the use of Medicare telehealth services with the expiration of the statutory flexibilities that were successively extended by legislation following the PHE for COVID–19. We understand that millions of Medicare beneficiaries have utilized interactive communications technology for visits with practitioners for a broad range of health care needs for almost 5 years. We sought comment from interested parties on our understanding of the applicability of section 1834(m) of the Act to the new telemedicine E/M codes, and how we might potentially mitigate negative impact from the expiring telehealth flexibilities, preserve some access, and assess the magnitude of potential reductions in access and utilization. On the latter point, we noted that we have developed PFS payment rates for CY 2025, including the statutory budget neutrality adjustment, based on the presumption that changes in telehealth utilization will not affect overall service utilization. We also noted that historically we have not considered changes in the Medicare telehealth policies to result in significant impact on utilization such that a budget neutrality adjustment will be warranted. However, we are unsure of the continuing validity of that premise under the current circumstances where patients have grown accustomed over several years to broad access to services via telehealth. We sought comment on what impact, if any, the expiration of the current flexibilities will be expected to have on overall service utilization for CY 2025. We referred readers to section e. of this final rule for our discussion of budget neutrality adjustments.

Given the similarity between CPT code 98016 and HCPCS code G2012, we proposed to accept the RUC-recommended values for CPT code 98016, and we proposed to delete HCPCS code G2012. For CPT code 98016, we proposed to accept the RUC-recommended work RVU of 0.30, and proposed the RUC-recommended direct PE inputs. We noted that our proposal does maintain the same direct PE inputs, which the RUC recommendations leave unchanged from the current G2012 in total amount, and allocate the same 3 minutes of time to the same level of staff (Clinical Staff code L037D, RN/LPN/MTA). We believe that the coding and payment recommendations for CPT code 98016, submitted to CMS by the AMA RUC, accurately reflect the resources associated with this service and believe that maintaining separate coding for purposes of Medicare payment could create confusion. We noted that, similar to our current policy for payment of HCPCS code G2012, CPT code 98016 will be considered a communication technology-based service that is not subject to the requirements in section 1834(m) of the Act applicable to Medicare telehealth services.

Comment: Many commenters, including specialty societies representing primary care and behavioral health practitioners, supported our proposal and stated that they agreed with CMS' interpretation of section 1834(m) of the Act. Given the limitations of the statute, these commenters stated that the office/outpatient E/M codes currently on the Medicare telehealth services list are sufficient to describe visits furnished to beneficiaries through telecommunications technology and that adopting the new telemedicine E/M codes would create confusion with the existing office/outpatient E/M codes already on the Medicare telehealth services list.

Other commenters, including the AMA, disagreed with our interpretation of Medicare telehealth services under section 1834(m) of the Act and stated that, as these codes describe a service that is definitionally not furnished in person, they would not be subject to the statutory restrictions. The AMA provided a detailed rebuttal of our proposal stating that the valuation of the telemedicine E/M codes reflects the use of telecommunications technology and as a result they are not ''coded and paid'' as though the service occurred in person. Furthermore, these commenters stressed that CMS should use every tool at its disposal to maintain access to Medicare telehealth services in the face of the expiration of the statutory flexibilities, and that by recognizing and making payment for the telemedicine E/M codes, CMS would preserve access to care for many beneficiaries.

Other commenters encouraged CMS, even if we do not pay separately for the telemedicine E/M codes, to publish values in our payment files in case private payors wish to recognize the codes. Lastly, a few commenters also suggested that it would be helpful to have educational materials to better inform interested parties on how to bill telehealth services appropriately.

Response: We thank commenters for their support for our proposal.

We do not find the comments put forth by the AMA and other commenters who opposed our proposal to be persuasive. They do not adequately address how or why the services described by the sixteen new telemedicine E/M codes are distinct from E/M services ordinarily furnished in person such that they are outside the scope of section 1834(m) of the Act. Except for the service delivery modality, the new telemedicine E/M codes appear to describe the same services that are provided in person and billed under the existing office/outpatient E/M codes (99202–99215) and expressly referenced in section 1834(m)(4)(F)(i) of the Act as telehealth services. Although commenters suggest that the services described by the two code sets are different because there are different resources (PE and work) involved in furnishing them, those differences merely reflect delivery of the services through different modalities (in person or as telehealth services). Moreover, under section 1834(m)(2)(A) of the Act, CMS is required to make payment for Medicare telehealth services, regardless of the resources involved in furnishing the telehealth service, at ''an amount equal to the amount that such physician or practitioner would have been paid under this title had such service been furnished without the use of a telecommunications system.'' As such, we do not believe that the differences in the resources involved in furnishing the same service in-person or via telehealth are a relevant consideration for purposes of payment for Medicare telehealth services. We are concerned that were we to accept the position that the new telemedicine E/M codes are not subject to section 1834(m) of the Act because the codes describe services that are ''inherently'' not a substitute for an in-person service, we would circumvent the express requirements of section 1834(m) of the Act simply by creating new parallel codes that describe the same services when furnished remotely using telecommunications technology.

We note in response to the comments requesting that CMS display RVUs for these services, the RVU values for these services are displayed in Addendum B of the PFS, which is available for download at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.* We will also consider issuing additional guidance and educational materials regarding appropriate billing for

Medicare telehealth services in the future.

Comment: Commenters were universally supportive of our proposal to replace HCPCS code G2012 with CPT code 98016.

Response: We thank commenters for their support.

After consideration of the comments, we are finalizing our proposal to not pay separately for CPT codes 98000, 98001, 98002, 98003, 98004, 98005, 98006, 98007, 98008, 98009, 98010, 98011, 98012, 98013, 98014, 98015, and to pay separately for CPT code 98016 in lieu of HCPCS G2012.

(19) Genetic Counseling Services (CPT Code 96041)

In September 2023, the CPT Editorial Panel deleted CPT code 96040 (*Medical genetics and genetic counseling services, each 30 minutes face-to-face with patient/family*) and created CPT code 96041 (*Medical genetics and genetic counseling services, each 30 minutes of total time provided by the genetic counselor on the date of the encounter*) for medical genetics and genetic counseling services to be provided by the genetic counselor. Prior to its deletion, CPT code 96040 will only be reported by genetic counselors for genetic counseling services, though genetic counselors are not among the practitioners who can bill Medicare directly for their professional services. As we stated in the CY 2012 PFS final rule (76 FR 73096 through 73097), physicians and NPPs who may independently bill Medicare for their services and who are counseling individuals will generally report office or other outpatient E/M CPT codes for office visits that involve significant counseling, including genetic counseling; therefore, CPT code 96040 was considered bundled into O/O E/M visits.

For CPT code 96041, we proposed the RUC-recommended direct PE inputs. We note that the code descriptor now specifies that the service is provided by a genetic counselor; therefore, we considered assigning Procedure Status ''X'' to CPT code 96041. Because the PE RVUs will not display for the code with that assignment and that may impact access to the service with other payors, we instead proposed bundled status (Procedure Status ''B'') for CPT code 96041 to maintain the status of predecessor CPT code 96040, and we sought feedback from interested parties regarding the appropriate procedure status for this code. CPT guidelines for CPT code 96041 state that a physician or other qualified healthcare professional (QHP) who may report evaluation and management services will not be able to report CPT code 96041. Instead, these physicians and QHPs will use the appropriate evaluation and management code.

Comment: A few commenters expressed disappointment that CMS did not propose to reintegrate the cost of the pedigree software subscription. As part of their revaluation of this service, the AMA RUC recommended the removal of the software as equipment based on their interpretation of CMS guidelines regarding what constitutes as direct versus indirect PE. Commenters stated that the software is a critical part of genetic counseling as it both creates the genetic family history and calculates risk based on validated models. The commenters also stated that cost of pedigree is very specialized and used exclusively for patient and family evaluations specific to genetic services and recommended that CMS consider re-including the cost of pedigree software that was included in the predecessor code.

Response: We disagree with the commenters that the costs associated with the pedigree system should be included as a direct PE input. We continue to believe that both the cloud-based pedigree subscription and the pedigree software previously included as a direct PE input for CPT code 96040 constitute forms of indirect PE. We note that there have been occasions in the past where we have finalized the inclusion of software as a direct PE expense if it met our criteria as typical and medically necessary for the service in question and could be individually allocable to a particular patient for a particular service, but we believe that the annual licensing requirements and costs for the cloud-based pedigree subscription are administrative costs that are not unique to individual procedures. Direct expense categories include clinical labor, medical supplies, and medical equipment. Indirect expenses include administrative labor, office expense, and all other expenses not directly allocable to an individual service.

Comment: In their comment letter, the AMA RUC reiterated their request for the establishment of a new clinical labor type for genetic counseling assistants (GCAs) but supported the crosswalk to Physical Therapy Assistant (L039B) and agreed that it is an appropriate proxy for the clinical labor rate per minute. The AMA RUC also supported our proposal to maintain the Procedure Status ''B'' of its predecessor CPT code 96040, and thanked CMS for publishing the values for other payors to be able to utilize. Numerous other commenters also supported the proposal to assign Procedure Status ''B'' to CPT code 96041.

Response: We appreciate the commenters' support and are finalizing the RUC-recommended direct PE inputs and Procedure Status ''B'' for CPT code 96041 as proposed.

(20) COVID Immunization Administration (CPT Code 90480)

On August 14, 2023, new CPT codes were created to consolidate over 50 previously implemented codes and streamline the reporting of immunizations for the novel coronavirus (SARS–CoV–2, also known as COVID–19). The CPT Editorial Panel approved the addition of a single administration code (CPT code 90480) for administration of new and existing COVID–19 vaccine products. The RUC reviewed the specialty societies' recommendations for this code at the September 2023 RUC meeting.

We proposed the RUC-recommended work RVU of 0.25 for CPT code 90480 (*Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS–CoV–2) (coronavirus disease [COVID–19]) vaccine, single dose*). We also proposed the RUC-recommended direct PE inputs for CPT code 90480 without refinement.

Comment: Several commenters stated their support for the proposed work RVU and thanked CMS for proposing the RUC recommendations.

Response: We appreciate the support from the commenters for our proposals.

Comment: Several commenters requested that CMS consider a longer phase-in period to implement the RUC-recommended work RVUs for COVID–19 vaccine administration to allow ample time for provider education and preparation for potential payment reductions. The commenters stated although CMS is proposing to maintain the $40 administration fee through the year in which Food and Drug Administration (FDA) rescinds the Emergency Use Authorization (EUA) Declaration, the commenters believe that, if it is adopted into the PFS, COVID–19 vaccine administration reimbursement rates would likely decline for providers serving patients with Medicaid and commercial insurance coverage. The commenters requested that CMS not list the RVUs for CPT code 90480 in the Physician Fee Schedule final rule until the EUA declaration is rescinded as the policy is counter to population health initiatives and could result in stakeholder confusion regarding the payment rate

for this code within the Medicare program versus other markets.

Response: We appreciate the feedback from the commenters and clarify that payment for CPT code 90480 is already addressed under previously finalized policies associated with the EUA declaration (see for example the vaccine pricing section of the CMS website at *https://www.cms.gov/medicare/payment/part-b-drugs/vaccine-pricing*). We agree with the commenters that it would avoid potential confusion if we do not display the RVUs for CPT code 90480 as payment will not be made using this valuation under the PFS. The proposal to assign separate pricing under the PFS for CPT code 90480 was an unintended error; we did not intend any confusion that may have been caused by the publication of these RVUs in the proposed rule.

After consideration of the comments, we are not finalizing the RUC-recommended work RVU and direct PE inputs for CPT code 90480 at this time. We refer readers to our current policies for paying for the service described by CPT code 90480, available at *https://www.cms.gov/medicare/payment/part-b-drugs/vaccine-pricing* as well as the discussion in section III.B of this final rule.

(21) Optical Coherence Tomography (CPT Codes 92132, 92133, 92134, and 92137)

At the February 2023 CPT Editorial Panel meeting, CPT code 92137 (*Computerized ophthalmic diagnostic imaging (eg, optical coherence tomography [OCT]), posterior segment, with interpretation and report, unilateral or bilateral; retina including OCT angiography*) was created in response to new technology that allows imaging of the retina using optical coherence tomography (OCT) with and without non-dye OCT angiography (OCT–A). This code family also includes CPT code 92132 (*Computerized ophthalmic diagnostic imaging (eg, optical coherence tomography [OCT]), anterior segment, with interpretation and report, unilateral or bilateral*), CPT code 92133 (*Computerized ophthalmic diagnostic imaging (eg, optical coherence tomography [OCT]), posterior segment, with interpretation and report, unilateral or bilateral; optic nerve*), and CPT code 92134 (*Computerized ophthalmic diagnostic imaging (eg, optical coherence tomography [OCT]), posterior segment, with interpretation and report, unilateral or bilateral; retina*). These codes were reviewed at the April 2023 RUC meeting. The RUC determined the survey results were inaccurate due to underestimation of time, so the entire code family was re-surveyed and reviewed at the September 2023 RUC meeting.

We proposed the RUC-recommended work RVUs for all codes within the Optical Coherence Tomography code family. We proposed a work RVU of 0.29 for CPT code 92132, a work RVU of 0.31 for CPT code 92133, a work RVU of 0.32 for CPT code 92134, and a work RVU of 0.64 for CPT code 92137. We also proposed the RUC-recommended direct PE inputs for all four codes in the family.

Comment: Commenters generally agreed with CMS' proposed work RVU and direct PE inputs. One commenter disagreed with CMS' proposed work RVUs for CPT codes 92132, 92133, and 92134 and urged CMS to maintain the current work RVUs for those codes and adopt the RUC-recommended work RVU for CPT code 92137.

Response: We thank commenters for their support. We also acknowledge the commenter's request to maintain the current work RVUs for CPT codes 92132, 92133, and 92134. We disagree with the commenter and continue to believe that the RUC-recommended work RVUs for these 3 codes, that are cross-walked from other codes with similar intensity and that align with the surveyed reduction of intraservice times, appropriately account for the physician work required to perform this service. After consideration of all comments, we are finalizing the work RVUs and direct PE inputs as proposed.

(22) Transcranial Doppler Studies (CPT Codes 93886, 93888, 93892, 93893, 93896, 93897, 93898, and 93890)

The RUC's Relativity Assessment Workgroup (RAW) requested action plans in September 2022 to determine if specific code bundling solutions should occur for CPT codes 93890/93886, 93890/93892, 93892/93886, and 93892/93890. The RAW referred this issue to the CPT Editorial Panel which created three new add-on codes to report when additional studies are performed on the same date of services as a complete transcranial Doppler study. The RUC reviewed these three new add-on codes, as well as CPT codes 93886, 93888, 93892 and 93893 for the September 2023 RUC meeting.

We proposed the RUC-recommended work RVU for all seven codes in the Transcranial Doppler Studies code family. We proposed a work RVU of 0.90 for CPT code 93886 (*Transcranial Doppler study of the intracranial arteries; complete study*), a work RVU of 0.73 for CPT code 93888 (*Transcranial Doppler study of the intracranial arteries; limited study*), a work RVU of 1.15 for CPT code 93892 (*Transcranial Doppler study of the intracranial arteries; emboli detection without intravenous microbubble injection*), a work RVU of 1.15 for CPT code 93893 (*Transcranial Doppler study of the intracranial arteries; venous-arterial shunt detection with intravenous microbubble injection*), a work RVU of 0.81 for CPT code 93896 (*Vasoreactivity study performed with transcranial Doppler study of intracranial arteries, complete*), a work RVU of 0.73 for CPT code 93897 (*Emboli detection without intravenous microbubble injection performed with transcranial Doppler study of intracranial arteries, complete*), and a work RVU of 0.85 for CPT code 93898 (*Venous-arterial shunt detection with intravenous microbubble injection performed with transcranial Doppler study of intracranial arteries, complete*). We also proposed the direct PE inputs as recommended by the RUC for all seven codes in this family.

We note that the billing instructions for this code family specify that the three new add-on codes should be used in conjunction with CPT code 93886, and that CPT code 93888 should not be used in conjunction with CPT codes 93886, 93892, 93893, 93896, 93897, and 93898. However, we believe that it would be beneficial for the CPT Editorial Panel to state more explicitly that CPT code 93897 should not be used in conjunction with CPT code 93892 and that CPT code 93898 should not be used in conjunction with CPT code 93893. The work performed in the add-on codes would be duplicative of the base codes in these situations and result in unnecessary overbilling of services.

Comment: Several commenters stated their support for the CMS proposal of the RUC's recommended work RVUs and direct PE inputs for these seven codes. Commenters also acknowledged the CMS recommendation to the AMA CPT Editorial Panel to more explicitly state that CPT code 93897 should not be used in conjunction with CPT code 93892 and CPT code 93898 should not be used in conjunction with 93893. Commenters stated that they were committed to providing education to their members on the appropriate use of the revised code set for 2025.

Response: We appreciate the support from the commenters for our proposals, as well as their recognition on the need for clarification on the billing of certain add-on codes.

Comment: Several commenters disagreed with the proposal of the RUC's recommended direct PE inputs, specifically the equipment times for the vascular ultrasound room (EL016) and

the technologist PACS workstation (ED050). Commenters stated that the RUC based its recommendations for the technical component of these codes on a small sample size survey distributed to selected members of three societies that are not representative of all transcranial doppler (TCD) practices. Commenters stated that they conducted a survey of their TCD-focused membership which found that the RUC—and now CMS—systematically overcounted time for the PACS workstation and undercounted time in the ultrasound room. Commenters stated that PAC workstation and ultrasound exam times can vary widely depending on the patient and results needing to be reviewed; staffing time and scheduling are a constant challenge due to these variables. Commenters urged CMS not to finalize the proposed changes to the TCD base codes and, at the least, CMS should conduct additional study before making any changes in light of the commenters' data from practitioners that frequently perform TCD.

Response: We understand the difficulty of determining accurate equipment times due to the variation that can take place depending on the patient and results needing review. For this reason, our PE methodology bases valuation on the typical case, understanding that some cases will involve fewer time/resources and other cases will be more complex and difficult. This is also why we typically use standardized formulas to calculate equipment times; we believe that the use of these standardized equipment time formulas allows for greater transparency and consistency in the assignment of equipment minutes based on clinical labor times across the wider PFS.

For the specific case of the codes in the TCD Studies family, the RUC recommended and we proposed equipment times based on these standard equipment time formulas. We specifically proposed equipment time for the vascular ultrasound room (EL016) based on the standard for highly technical equipment. As we have addressed in past rulemaking, we believe that certain highly technical pieces of equipment and equipment rooms are less likely to be used during all of the pre-service or post-service tasks performed by clinical labor on the day of the procedure (the clinical labor service period) and are typically available for other patients even when one member of clinical staff may be occupied with a pre-service or post-service task related to the procedure. Since the direct PE input database should reflect the typical resource costs of medical equipment, we believe that the reduced minutes and increased utilization rate for these highly technical equipment items are complementary, not contradictory (77 FR 69028).

The surveyed equipment times for the vascular ultrasound room (EL016) submitted by the commenter are all higher than our proposed equipment times based on the use of this standard for highly technical equipment. For example, the survey submitted by the commenter lists 61–65 minutes of equipment time for CPT code 93886 as opposed to our proposed 57 minutes. However, the total intraservice clinical labor time for CPT code 93886 is only 70 minutes which would mean that the vascular ultrasound room would be in use for nearly the entirety of this period if we were to use the commenter's equipment time suggestions. As we discussed above, we believe that many of the preservice and post-service clinical labor tasks typically take place outside of resource-intensive equipment rooms to maximize use of capital-intensive resources since monopolizing the room for fewer minutes per patient maximizes the availability of the machines. We do not believe that it would be typical to perform tasks such as Greeting/gowning the patient (CA009), Obtain vital signs (CA010), or Provide education/obtain consent (CA011) in the vascular ultrasound room, some or all of which would need to take if the survey times submitted by the commenter were to be true. Therefore, we continue to believe that the RUC's recommended equipment times, based on the use of standardized equipment time formulas, best reflect the typical case for these Transcranial Doppler Studies codes.

After consideration of the comments, we are finalizing the work RVU and direct PE inputs for the CPT codes in the Transcranial Doppler Studies family as proposed.

(23) RSV Monoclonal Antibody Administration (CPT Codes 96380 and 96381)

At the September 2023 CPT meeting, the CPT Editorial Panel created two codes to report passive administration of respiratory syncytial virus, monoclonal antibody, seasonal dose, with and without counseling. CPT codes 96380 and 96381 were reviewed the following week at the September 2023 RUC meeting and the RUC submitted recommendations to CMS.

We proposed the RUC-recommended work RVU of 0.24 for CPT code 96380 (*Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, with counseling by physician or other qualified health care professional*) and the RUC-recommended work RVU of 0.17 for CPT code 96381 (*Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection*). We understand that these are interim work recommendations from the RUC, and that the RUC intends to conduct a more complete review at a future RUC meeting which we will then consider in future rulemaking. We also proposed the direct PE inputs as recommended by the RUC for both codes.

Comment: A commenter stated that they supported these changes but recommended that the RUC conduct a more complete review for these codes.

Response: We appreciate the support for our proposed valuations from the commenter.

After consideration of the comments, we are finalizing the work RVU and direct PE inputs for the CPT codes in the RSV Monoclonal Antibody Administration family as proposed.

(24) Hyperthermic Intraperitoneal Chemotherapy (CPT Codes 96547 and 96548)

In September 2022, the CPT Editorial Panel created two time-based add-on Category I codes, CPT code 96547 (*Intraoperative hyperthermic intraperitoneal chemotherapy (HIPEC) procedure, including separate incision(s) and closure, when performed; first 60 minutes (List separately in addition to code for primary procedure)*) and CPT code 96548 (*Intraoperative hyperthermic intraperitoneal chemotherapy (HIPEC) procedure, including separate incision(s) and closure, when performed; each additional 30 minutes (List separately in addition to code for primary procedure)*), to report HIPEC procedures for 2024. At the January 2023 RUC meeting, the RUC reached the conclusion that the survey data was flawed due to a lack of work definition and guidelines, and the RUC recommended contractor pricing for CPT codes 96547 and 96548 for CY 2024 with further clarification from the CPT editorial panel. CMS proposed and finalized contractor pricing for CPT codes 96547 and 96548 for 2024. At the May 2023 CPT Editorial Panel meeting, new guidelines and descriptions of work activities were approved and the codes were resurveyed for the September 2023 RUC meeting with recommendations for national pricing.

We proposed the RUC-recommended work RVU of 6.53 for CPT code 96547

and the RUC-recommended work RVU of 3.00 for CPT code 96548. The RUC did not recommend, and we did not propose, any direct PE inputs for the Hyperthermic Intraperitoneal Chemotherapy codes (CPT codes 96547 and 96548).

Comment: Commenters agreed with CMS' proposed work RVU and direct PE inputs for this code family.

Response: We thank commenters for their support. After consideration of the public comments, we are finalizing the work RVU and direct PE inputs as proposed.

(25) Laser Treatment—Skin (CPT Codes 96920, 96921, and 96922)

In April 2022, the RUC referred CPT codes 96920 (*Excimer laser treatment for psoriasis; total area less than 250 sq cm*), 96921 (*Excimer laser treatment for psoriasis; 250 sq cm to 500 sq cm*), and 96922 (*Excimer laser treatment for psoriasis; over 500 sq cm*) to the CPT Editorial Panel to capture expanded indications beyond what was currently noted in the codes' descriptions to include laser treatment for other inflammatory skin disorders such as vitiligo, atopic dermatitis, and alopecia areata, which could result in changed physician work based on the expanded indications. The coding change application was subsequently withdrawn from the September 2023 CPT Editorial meeting when it was determined that existing literature was insufficient and did not support expanded indications at that time. Therefore, these CPT codes were re-surveyed and reviewed at the April 2023 RUC meeting without any revisions to their code descriptors.

We disagreed with the RUC-recommended work RVUs for CPT codes 96920, 96921, and 96922 of 1.00, 1.07, and 1.32, respectively. The RUC noted that there have been multiple reviews of these CPT codes, and the valuation of the codes is currently based on the original valuation over two decades ago in 2002 where the physician time values were lower than the current times. A subsequent review in 2012 adopted new survey times while maintaining the work RVUs from 2002 for CPT codes 96920 and 96922. The RUC noted that, for both CPT code 96920 and 96922 with the largest treatment area, the total times have not changed since first implemented more than 20 years ago. While we understand that the physician times have fluctuated over the course of several years and several reviews, yet the work RVUs have remained mostly constant as shown in Table 15, this was not addressed in the 2012 recommendations, and we believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. The work times currently associated with codes play a very important role in PFS ratesetting, both as points of comparison in establishing work RVUs and in the allocation of indirect PE RVUs by specialty. If we were to operate under the assumption that previously recommended work times had been routinely over or underestimated, this would undermine the relativity of the work RVUs on the PFS in general, in light of the fact that codes are often valued based on comparisons to other codes with similar work times. We also believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs.

TABLE 15: Physician Time and RVUs for CPT Codes 96920, 96921, and 96922

CPT Code		Intraservice Time	Total Time	RUC Recommended Work RVU
96920	2002	17	27	1.15
	Current (from 2012)	23	35	1.15
	Recommended	10	23	1.00
96921	2002	20	30	1.17
	Current (from 2012)	30	42	1.30
	Recommended	12	25	1.07
96922	2002	30	40	2.10
	Current (from 2012)	45	57	2.10
	Recommended	18	31	1.32

For CPT code 96920, we proposed a work RVU of 0.83 based on a crosswalk to CPT code 11104 (*Punch biopsy of skin (including simple closure, when performed); single lesion*), which has the same 10 minutes of intraservice time and 23 minutes of total time as CPT code 96920. We noted that of the 15 other 000-day global codes with a total time of 20 to 25 minutes, only four codes fall above the RUC-recommended work RVU of 1.00. While we understand that commenters will dispute the validity of the current time values, we note that the 2002 intraservice time was 17 minutes, which yields an intraservice time ratio between the 2002 intraservice time and the recommended intraservice time of 10 minutes of 0.68 work RVUs ((10 minutes/17 minutes) * 1.15). We noted our work RVU of 0.83 maintains the intensity associated with the 2002 review of CPT code 96920, which we believe to be more appropriate than the significant increase in intensity that results from the RUC-recommended work RVU of 1.00 which nearly doubles the current intensity of the code. We have no evidence to indicate that the intensity of CPT code 96920 is increasing to this degree given how the surveyed work time is substantially decreasing.

For CPT code 96921, we proposed a work RVU of 0.90 based on a total time ratio to CPT code 96920 ((25/23)*0.83) and a crosswalk to CPT code 11301 (*Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 0.6 to 1.0 cm*), which has 3 additional minutes of intraservice time and 1 additional minute of total time compared to CPT code 96921. We also noted that our work RVU of 0.90 for CPT code 96921 maintains the RUC-

recommended incremental difference between CPT codes 96920 and 96921 of 0.07 work RVUs. Like CPT code 96920, we understand that commenters will dispute the validity of the current time values, but we note that the 2002 intraservice time was 20 minutes, which yields an intraservice time ratio between the 2002 intraservice time and the recommended intraservice time of 12 minutes of 0.70 work RVUs ((12 minutes/20 minutes) * 1.17). Like CPT code 96920, we noted that work RVU of 0.90 for CPT code 96921 maintains the intensity associated with the 2002 review of CPT code 96921, which we believe is more appropriate than the intensity increase that results from the RUC-recommended work RVU of 1.07 which again nearly doubles the current intensity of the code.

For CPT code 96922, we proposed a work RVU of 1.15 based on the RUC-recommended incremental difference between CPT codes 96921 and 96922 of 0.25 work RVUs. Like CPT code 96920 and 96921, we understand that commenters will dispute the validity of the current time values, but we noted that the 2002 intraservice time was 30 minutes, which yields an intraservice time ratio between the 2002 intraservice time and the recommended intraservice time of 18 minutes of 1.26 work RVUs ((18 minutes/30 minutes) * 2.10). We note that the RUC recommended CPT code 96922 as having the lowest intensity of the three codes in this family and that our work RVU of 1.15 maintains in relationship to the other codes.

For the direct PE inputs, we proposed to refine the clinical staff time for the CA024 activity ''Clean room/equipment by clinical staff'' to the standard of 3 minutes for CPT codes 96920, 96921, and 96922. We noted that 3 minutes is the current CA024 time for these three CPT codes. A rationale for extending clinical staff beyond the standard 3 minutes for the CA024 activity was absent from the PE Summary of Recommendations; therefore, we believe the current and standard 3 minutes is more appropriate than the RUC-recommended 5 minutes. We also proposed equipment times of 36, 38, and 44 minutes for the power table (EF031) and exam light (EQ168) equipment for CPT codes 96920, 96921, and 96922, respectively, to account for the refinement for CA024 to the standard 3 minutes.

We also disagreed with the RUC-recommended creation of new supply items for the excimer laser and proposed to re-include the equipment time for the excimer laser (EQ161) using the current methodology where its cost is accounted for in the equipment of these CPT codes' direct PE. The RUC submitted recommendations to change this equipment item to new supply items to account for the per-use cost to rent the equipment, stating that the business model has changed from the standard equipment ownership that CMS recognizes using standardized equipment formulas to a per-use rental or subscription model. While we understand that there may have been a change in business model, we do not believe a rental, subscription, or per-use fee of an equipment item that is still available to be purchased and is already accounted for with our equipment methodology is appropriate, especially given its implications for direct PE costs for these CPT codes. Therefore, we proposed reincorporating equipment times of 36, 38, and 44 minutes for the EQ161 equipment for CPT codes 96920, 96921, and 96922, respectively, based on the refined service period clinical labor times. We proposed to remove the three pay-per-use excimer lasers listed as supplies and recommended by the RUC for these three codes.

We have repeatedly stated in past rulemaking that rental and licensing fees are typically considered forms of indirect PE under our methodology. In the CY 2020 PFS final rule, we omitted the inclusion of several invoices for the monthly rental price of a PET infusion cart (ER109), and only accounted for the four purchase invoices for the equipment. We noted as well for future reference that although we appreciated the submission of the rental invoices, we were unable to use invoices for a monthly rental fee to determine the typical purchase price for equipment. We believe that invoices for a monthly rental fee would not be representative of the purchase price for equipment, in the same fashion that the rental fee for a car differs from its purchase price (84 FR 62771). Similarly, while we appreciate the submission of per-use, rental, and partnership invoices for the excimer laser, we believe that the excimer laser is appropriately and adequately accounted for in the equipment formula and note that EQ161 has a very high cost per minute of $0.5895/minute. Compared to the nearly 700 other equipment items in our database, only 55 equipment items have higher costs per minute (based on our standardized formula which accounts for years of useful life, utilization rate, purchase price, and minutes per year of use, outlined in detail in section II.B. of this final rule, Determination of PE RVUs) and only 53 equipment items have higher purchase prices than the excimer laser at $151,200. We do not believe that CPT codes 96920 through 96922 should be valued based on a significantly more expensive pay-per-use rental version of the excimer laser when the same treatment is cheaper and available as a purchasable form of equipment.

Therefore, we sought comment on the difference in direct PE costs between the purchase and per-use rental of the laser. We noted that using the equipment cost per minute formula, outlined in detail in section II.B. of this final rule, Determination of PE RVUs, yields direct PE costs of about $21.22, $22.40, and $25.94 for CPT codes 96920, 96921, 96922, respectively. Alternatively, the new supply items for the per-use fee of the laser yielded direct PE costs of $80, $83, and $100 for CPT codes 96920, 96921, 96922, respectively. These direct PE disparities represent a 277 percent, 270.5 percent, and 285.5 percent increase for CPT codes 96920, 96921, 96922, respectively. Given this, we are interested in feedback from interested parties on the payment disparity between this equipment as a per-use or rental versus how we currently account for the purchase of equipment using the standard equipment formula, as we understand that both manufacturers and physicians may be inclined to shift to a per-use or rental business models to limit overhead for purchase and maintenance of expensive equipment.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters disagreed with the proposed work RVUs of 0.83, 0.90, and 1.15 for CPT codes 96920, 96921, and 96922, respectively, and encouraged CMS to finalize the RUC-recommended work RVUs of 1.00, 1.07, and 1.32, respectively. Some commenters disagreed with the crosswalks of CPT code 11104 to CPT code 96920, and CPT code 11301 to CPT code 96921, because the intensity of CPT codes 96920 and 96921 is greater than CPT codes 11104 and 11301 as excimer laser treatment requires a high amount of skill and precision to ensure that healthy tissues are not damaged and the procedure causes significant pain requiring patients to have numbing agents applied to their lesions. The commenters also stated that the excimer laser treatment occurs over a large body surface area and is associated with risks, including burns, swelling, and increased skin sensitivity to light.

Commenters also disagreed with our application of total time ratios to both the current times and original 2002 intraservice times, the latter of which the AMA RUC and commenters reiterate

that the current valuations are based on. Commenters disagreed with the use of total time ratios to account for changes in time as the physician times were increased in 2012 without a commensurate work RVU increase, untethering the current assigned times and work RVUs. In their comment letter, the AMA RUC stated that RUC recommended crosswalks already reflected significant decreases from the current valuations of these codes to reflect the differences in work in treating different body surface areas for this condition. Further, the RUC stated in its rationale that there have been multiple reviews of this code set, and the valuation of the codes is currently based on the original valuation over two decades ago in 2002, where the time was lower than the current times, therefore the current work RVUs are based on the lower 2002 times, not the current times. The AMA RUC reiterated their support of their recommended work RVU crosswalk of CPT code 96920 to CPT code 20606 with a work RVU of 1.00. For CPT code 96921, the AMA RUC reiterated their support of an incremental 0.07 work RVU difference between CPT codes 96920 and 96921 but disagreed with a starting point of 1.00 work RVUs for CPT code 96920.

Response: We agree that it is important to use the recent data available regarding work times, and we note that when many years have passed since work time has been measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. The work times currently associated with codes play a very important role in PFS ratesetting, both as points of comparison in establishing work RVUs and in the allocation of indirect PE RVUs by specialty. If we were to operate under the assumption that previously recommended work times had been routinely overestimated, this would undermine the relativity of the work RVUs on the PFS in general, in light of the fact that codes are often valued based on comparisons to other codes with similar work times. Such an assumption would also undermine the validity of the allocation of indirect PE RVUs to physician specialties across the PFS.

Instead, we believe that it is crucial that the code valuation process take place with the understanding that the existing work times that have been used in PFS ratesetting are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, so we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer readers to our discussion of the subject in the CY 2017 PFS final rule (81 FR 80273 through 80274).

We also continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services, particularly when the alternative values recommended by the RUC and other commenters do not account for survey information that suggests the amount of time involved in furnishing the service has changed significantly. Consistent with the statute, we are required to value the work RVU based on the relative resources involved in furnishing the service, which include time and intensity. In accordance with the statute, we believe that changes in time and intensity must be accounted for when developing work RVUs. When our review of recommended values reveals that changes in time are not accounted for in a RUC-recommended work RVU, the obligation to account for that change when establishing proposed and final work RVUs remains.

With regards to the current work RVUs and physician time becoming untethered, we refer readers back to our intraservice time ratios between the 2002 times and the RUC-recommended times, which result in lower work RVUs than our proposed work RVUs. We also reiterate that our proposed work RVUs maintains the intensity associated with the 2002 review of CPT codes 96920, which commenters and the AMA RUC assert that the work RVUs are tethered to the 2002 physician times.

With regards to the relativity of intensity and complexity of CPT codes 96920 compared to CPT code 11104, we continue to believe that the intensity of the two services are similar. Commenters stated that excimer laser treatment requires a high amount of skill and precision to perform to ensure that healthy tissues are not damaged, and the procedure causes significant pain that requires patients to have numbing agents applied to their lesions. Similarly, according to CPT code 11104's vignette and pre-service activities, deeply invasive basal or squamous cell carcinoma may be involved, therefore requiring similar skill and precision to perform, and CPT code 11104 involves the injection of the appropriate local anesthetic at the procedure site.

Similarly, we continue to believe that the intensity of CPT codes 96921 and 11301 are similar because CPT code 11301 requires significant skill and precision to perform based on the intraservice activities described and it also involves the injection of anesthetic into both subcutaneous and dermal compartments to facilitate the appropriate dermal depth removal.

We have no evidence to indicate that the intensity of CPT codes 96920 and 96921 is increasing to the degree that the AMA RUC recommended, given how the surveyed work time is substantially decreasing from both current and 2002 physician times. We also believe maintaining the intensities associated with the 2002 review for these codes is more appropriate than the significant intensity increases that results from the RUC-recommended work RVUs, particularly given the excimer laser manufacturer's comment stating that there has been no device or procedural change that would increase the intensity or decrease the physician times, as the RUC recommended.

Comment: One commenter stated that, although the April 2023 surveyed changes in physician time to perform the procedures resulted in reduced work RVU recommendations, the way the procedures are performed today are essentially unchanged from the earlier time study so reductions in physician time would not be expected, particularly in the amounts suggested by the surveys. The commenter believes the survey should be redone, with a population that reflects actual users of the device because there has been no device or procedural change that warrants such dramatic changes in treatment time.

Response: We acknowledge the commenter's concerns regarding the surveyed physician time decreases for CPT codes 96920 through 96922 and encourage the commenter to coordinate with the RUC to facilitate a reconsideration of the physician work times if the commenter believes the physician times reported by the surveys are incorrect.

Comment: The AMA RUC disagreed with our proposal to refine the clinical staff time for the CA024 activity ''Clean room/equipment by clinical staff'' to the

standard and current time of 3 minutes for CPT codes 96920, 96921, and 96922 because a rationale for increasing clinical staff time beyond the standard 3 minutes for the CA024 activity was absent from the PE Summary of Recommendations. The AMA RUC stated that, during the laser treatment, each treatment site is covered with mineral oil to aid in the transmission of ultraviolet laser light through psoriatic plaques and the patient is repeatedly repositioned which results in the mineral oil getting all over the treatment table and often on the floor. The commenter stated that, after treatment, multiple greasy topical medications are applied to the treated sites and the standard time for room and equipment cleaning of 3 minutes is inadequate to properly clean greasy surfaces. The commenter requested that we refine CA024 for the three codes to provide an additional 2 minutes that is required for this vital staff function.

Response: We appreciate the AMA RUC's clarification on the additional 2 minutes beyond the 3-minute standard for CA024. We note that we proposed to refine this activity to the standard because a rationale for increasing clinical staff time beyond the standard 3 minutes for the CA024 activity was absent from the PE Summary of Recommendations. We agree with the commenter that 5 minutes would be more appropriate to properly clean multiple greasy surfaces and are finalizing the RUC-recommended 5 minutes for CA024 for CPT codes 96920, 96921, and 96922. We note that, as a result of changing CA024, we are finalizing the equipment times of 38, 40, and 46 minutes for the power table (EF031) and exam light (EQ168) equipment for CPT codes 96920, 96921, and 96922, respectively, to account for the finalized refinement for CA024 to the RUC-recommended 5 minutes.

Comment: An excimer laser vendor commented that a dermatology office would need to perform at least 1,150 excimer laser procedures a year to breakeven on the purchase cost of an excimer laser. The commenter stated that the breakeven volume is approximately 3.5 times higher than the actual volume, with typical utilization of 344 treatments per excimer laser per year. The commenter stated that the PE cost for one excimer treatment should be no less than $90.45 to achieve breakeven on the purchase of an excimer laser.

The commenter also stated that, when the AMA RUC reviewed the cost of the excimer laser, it made changes to the cost elements that are not reflective of the actual sales cost of the excimer laser, or its cost of maintenance. The commenter suggested that the sales price has gone up, along with the increased costs associated with service, inflation, training. The excimer laser vendor also confirmed in their comment letter that although they sell the excimer laser to private dermatology practices and hospital facilities, it is not common. The commenter stated that about 900 devices of the 1,200 excimer lasers operating in the Unites States are based on the subscription model.

Another commenter supported our proposal to maintain the equipment time for EQ161 and remove the three pay-per-use excimer laser subscriptions from the list of supplies and stated that the equipment associated with these services can be purchased rather than leased, and a ''change in business model'' for some practices does not warrant a drastic shift in how the Agency reimburses for equipment costs borne by practices. Additionally, the commenter expressed concern that such a policy could alter market dynamics, pushing more vendors to compel physician practices into subscription models. The commenter stated that these models often lead to higher long-term costs, and diminished flexibility, as ongoing fees and usage restrictions can directly impact patient care. The commenter also stated that the dependency on vendors' subscription agreements can erode practices' control over essential equipment, resulting in unfavorable terms and potential price hikes over time. The commenter stated that subscription models may worsen disparities in access to advanced medical technologies, impede the adoption of innovative treatments, raise significant concerns about data security and privacy, and increase the risk of market monopolization, where a few vendors could dominate, driving up costs and limiting choices for practices. Lastly, the commenter stated that if CMS were to use vendor subscription charges as the basis for practice expense payments, there would be no market discipline and encourage vendors to increase subscription costs, knowing that the increased cost would be borne by CMS.

Response: We appreciate the commenter's support and input relating to our request for additional information regarding the difference in direct PE costs between the purchase and per-use rental of the laser and the payment disparity between this equipment as a per-use or rental versus how we currently account for the purchase of equipment using the standard equipment formula. We understand that both manufacturers and physicians may be inclined to shift to a per-use or rental business models to limit overhead for purchase and maintenance of expensive equipment. We also understand that as the PE data age, these issues involving subscriptions and other forms of digital tools become more complex. We look forward to continuing to seek out new data sources to help in updating the PE methodology.

We also acknowledge the excimer laser vendor's concern that the purchase price for the excimer laser has increased and the receipt of invoices related to the parts and labor for the maintenance of a purchased laser. However, we did not receive invoices that would be useful to update the purchase price, and that the maintenance of equipment is accounted for in our price per minute equation for equipment. We welcome additional information and invoices to substantiate the claim that the purchase price has increased. We determine the direct PE for a specific service by adding the costs of the direct resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing that service. We remind the commenter that we implemented a new methodology for calculating PE RVUs for CY 2007 where we utilize a ''bottom-up'' approach to calculate the direct costs instead of using the ''top-down'' approach to calculate the direct PE RVUs, under which the aggregate direct and indirect costs for each specialty are allocated to each individual service. Under the ''bottom up'' approach, we determine the direct PE by adding the costs of the resources (that is, the clinical staff, equipment, and supplies) typically required to provide each service. The resource costs are calculated using the refined direct PE inputs assigned to each CPT code in our PE database, which are based on our review of recommendations received from the AMA RUC. Therefore, we disagree with the commenter's suggestion to implement the ''breakeven cost'' of the excimer laser in the equipment formula.

While we understand that there may have been a change in business model, we do not believe a rental, subscription, or per-use fee of an equipment item that is still available to be purchased, as confirmed by the excimer laser vendor, and is already accounted for with our equipment methodology is appropriate, especially given its implications for direct PE costs for these CPT codes. We continue to believe that the excimer laser is appropriately and adequately accounted for in the equipment formula, which accounts for years of useful life, utilization rate, purchase price, interest rate, maintenance, and minutes per year

of use, discussed in detail in section II.B. of this final rule, Determination of PE RVUs, and note that EQ161 has a very high cost per minute of $0.5895/minute.

Comment: Most commenters disagreed with the CPT Editorial Panel's decisions regarding the codes' indications, which are currently limited to psoriasis only, stating that the changes have already had far reaching consequences. Commenters stated that the CPT Editorial Panel's decisions have negatively impacted a sizable portion of the patient population with inflammatory skin diseases, particularly for people with skin of color who are more susceptible to vitiligo. One commenter requested that CMS create a G code that is based on the 2022 CPT codes for the excimer laser to substitute for the 2024 revisions.

Response: We appreciate and acknowledge commenters' concerns regarding the CPT coding. However, based on our understanding, the coding change application was withdrawn from the September 2023 CPT Editorial Panel meeting when it was determined that existing literature was insufficient and did not support expanded indications at that time, and the codes were resurveyed at the April 2023 RUC meeting without any revisions to the code descriptors. Therefore, we disagree with the commenter that there is a programmatic need for a G code. We also note that concerns related to the CPT changes are considered out of scope for our proposal and we encourage the commenter to coordinate with the CPT Editorial Panel to address their concerns regarding the expanded indications for other inflammatory skin disorders such as vitiligo, atopic dermatitis, and alopecia areata. After consideration of public comments, we are finalizing the work RVUs and direct PE inputs for CPT codes 96920, 96921, 96922 as proposed with the exception of the finalized refinements of clinical staff time for the CA024 to 5 minutes and equipment times of 38, 40, and 46 minutes for the power table (EF031) and exam light (EQ168) equipment for CPT codes 96920, 96921, and 96922, respectively, to conform to the increased clinical staff time for CA024.

(26) Physical Medicine and Rehabilitation (CPT Codes 97012, 97014, 97016, 97018, 97022, 97032, 97033, 97034, 97035, 97110, 97112, 97113, 97116, 97140, 97530, 97533, 97535, 97537, and 97542 and HCPCS Code G0283)

The RUC's Health Care Professionals Advisory Committee (HCPAC) previously reviewed 19 physical medicine and rehabilitation codes in February 2017. In the CY 2024 PFS proposed rule, CMS received public nominations on these same 19 therapy codes as potentially misvalued (88 FR 78851 and 78852). An interested party asserted that the direct PE clinical labor minutes reflected inappropriate multiple procedure payment reductions (MPPR), which were duplicative of the CMS MPPR policy implemented in CMS' claims processing systems. CMS reviewed the clinical labor time entries for these 19 therapy codes and concluded that a payment reduction should not have been applied in some instances to the 19 nominated therapy codes' clinical labor time entries since the payment valuation reduction would be duplicative of the MPPR applied during claims processing. CMS indicated that the valuation of these services would benefit from additional review through the RUC's HCPAC valuation process; they were therefore reviewed by the HCPAC for PE only, with no work review, at the January 2024 RUC meeting for inclusion in the CY 2025 PFS proposed rule.

The HCPAC's direct PE recommendations were based on the typical number of services reported per session, which was 3.5 units according to CMS data, to ensure that there was no duplication in the standard inputs for preservice and postservice time. To account for the MPPR, the HCPAC determined that 3.5 codes are billed per session, with the first paid at 100% and the second and subsequent units paid at half and so forth for PE (for example, 1.00 + 0.5 + 0.5 + 0.25 = 2.25). This resulted in the HCPAC recommending that many of the standard clinical labor times be divided by 2.25 to account for the MPPR, such as taking the standard 3 minutes for greeting and gowning the patient and dividing it by 2.25 to arrive at the recommended time of 1.33 minutes (1.33 + 0.67 + 0.67 + 0.34 = 3 minutes). In most cases, the HCPAC recommended using the standard equipment time formula aside from a few exceptions such as the use of the whirlpool in CPT code 97022 which would require additional time for the cleaning of the equipment.

Following the January 2024 RUC meeting, representatives from the American Physical Therapy Association (APTA) and the American Occupational Therapy Association (AOTA) met with CMS to express concern with the HCPAC's recommended direct PE inputs for this family of codes. Representatives from these trade associations stated that the HCPAC had inappropriately recommended too few equipment minutes for these procedures. These interested parties requested utilizing an alternate equipment time formula for the 19 reviewed therapy codes based on adding together the intraservice work time together with the clinical labor for the preservice and postservice portion of the service period. For 17 of the 19 reviewed therapy codes, this alternate equipment time formula would result in an increase over the HCPAC's equipment time recommendations. Table 16 lists the direct PE costs of each HCPCS code under their current pricing, under the HCPAC recommendations, and the alternate APTA and AOTA recommendations:

TABLE 16: Direct PE Costs for Physical Medicine and Rehabilitation Codes

HCPCS	Current	HCPAC	APTA/AOTA	Utilization
97012	2.62	3.22	3.30	434,921
97014	3.60	4.16	4.33	ProcStat "I"
97016	2.94	3.50	3.67	876,440
97018	2.29	2.92	2.96	146,909
97022	8.04	7.27	7.18	135,480
97032	2.61	3.17	3.34	621,599
97033	6.61	6.74	6.90	33,953
97034	4.08	4.17	4.17	6,964
97035	4.03	4.41	4.65	1,358,936
97110	8.42	8.63	9.11	61,204,041
97112	10.23	9.87	11.08	24,990,205
97113	13.89	14.65	14.61	1,588,852
97116	8.35	8.58	9.03	4,011,592
97140	7.25	8.09	8.21	28,413,744
97530	15.01	14.38	16.40	29,187,934
97533	35.72	36.56	36.69	60,507
97535	11.50	11.64	12.67	3,118,258
97537	9.69	10.09	10.78	15,556
97542	9.26	9.41	10.42	98,989
G0283	3.60	4.16	4.33	5,721,078

After consideration of these recommendations, we proposed the direct PE inputs as recommended by the HCPAC for all 19 codes in the Physical Medicine and Rehabilitation code family. We believe that the HCPAC's equipment time recommendations better maintain relativity with the rest of the fee schedule through primarily using standard equipment time formulas, along with limited exceptions for additional equipment time in cases where more time for equipment cleaning or patient positioning would be typical. We also believe that the alternate equipment time formula recommended by APTA and AOTA leads to inconsistent equipment times for many of these procedures, such as recommending 23.98 equipment minutes for CPT code 97110 which is a timed code billed in 15-minute increments. Although we agreed that some additional equipment time beyond the timed 15 minutes will be typical for setup and cleaning, 9 additional minutes for each billing of CPT code 97110 did not appear to reflect typical equipment usage.

Given the complexity of determining appropriate direct PE inputs across multiple billings of these therapy codes, and the need to factor in the MPPR, we believe that this code family may benefit from additional review, specifically review focused on the subject of appropriate equipment minutes. The HCPAC review of these codes was primarily focused on the clinical labor portion of the PE inputs and the equipment times did not receive the same degree of scrutiny as the clinical labor. We believe that the HCPAC's recommended direct PE inputs are the most accurate values based on the current information that we have available, however this is a topic that may warrant additional review to ensure that this family of codes is properly valued.

Comment: A commenter stated that although there remains some uncertainty about the appropriate equipment minutes for this code set, the commenter applauded CMS and stated that they looked forward to final resolution on the subject of appropriate equipment minutes.

Response: We appreciate the support from the commenter.

Comment: Several commenters disagreed with the CMS proposal of the HCPAC's recommended direct PE inputs. Commenters questioned why it was appropriate to apply the MPPR first through the valuation of the direct PE inputs and then again during claims processing. Commenters stated that they remained confused as to whether considering the MPPR, and how it will reduce clinical labor times for the whole session across the provided codes, was appropriate for valuing each individual code. Commenters disagreed with the proposal of 1.33 minutes of clinical labor time for most of the tasks included in the reviewed therapy codes, stating that for the second and third services, there is only 40 seconds allotted to tasks such as positioning the patient, cleaning the separate equipment, or developing post-treatment recommendations. One commenter stated that spending one and a third minutes is inadequate for most, if not all, procedures and spending only 40 seconds is not a realistic allocation of time to ensure that a patient is appropriately and safely positioned. Commenters suggested that the clinical labor time for many of the labor tasks assigned 1.33 minutes should in fact be the full 3 minutes that other non-therapy procedures are allotted for similar clinical labor tasks. Commenters agreed that a more thorough discussion of these codes will be required at a future date, however the commenters did not wish to take these 19 codes back to the HCPAC until such time as it was clearer how clinical labor and equipment time should be calculated.

Response: Determining the proper valuation of the clinical labor, supply, and equipment inputs for these therapy services has been a difficult task due to multiple billings being typical for the same patient on the same day. We have a longstanding policy such that in cases where multiple services are typically furnished to a beneficiary on the same day, we believe that there is overlap between the two services in some of the activities furnished during the preservice evaluation and postservice time. For example, in cases where a service is typically furnished to a beneficiary on the same day as an E/M

service, we believe that there is overlap between the two services in some of the activities furnished during the preservice evaluation and postservice time. As such, we disagree with the commenters that it would be appropriate to allocate the full standard 3 minutes of clinical labor time for tasks such as greeting and gowning the patient (CA009), which would only take place one time. For therapy services which are typically billed in 3.5 sessions, this would result in 10.5 minutes of clinical labor time for the CA009 activity, which would be too high and not maintain relativity with other PFS services. At the same time, if we were to discount the clinical labor times too heavily by overapplying the MPPR, we run the risk of under-allocating sufficient clinical labor to cover the typical case, which could result in the safety issues identified by the commenters.

With this context in mind, we continue to believe that the direct PE inputs as recommended by the HCPAC are the most accurate values based on the current information that we have available. As we noted in the proposed rule, this is a topic that may warrant additional review to ensure that this family of codes is properly valued, both in terms of the equipment minutes discussed in the proposed rule and the clinical labor times raised by commenters. We agree with the observation from the commenters that discussing nineteen codes at the same time appears to have been significantly burdensome on the HCPAC, and we believe a more robust discussion might take place by reviewing fewer codes at a time. We remain open to further discussion of this subject with interested parties of how to most accurately capture the typical and medically necessary direct PE inputs for these therapy services in light of the challenges that they pose for valuation.

We wish to clarify for the commenters that we do not believe patient positioning and similar activities would typically take place in 40 seconds. We consistently proposed 1.33 minutes of clinical labor time for the ''Prepare, set-up and start IV, initial positioning and monitoring of patient'' (CA016) clinical labor task for these therapy codes based on the HCPAC's recommendation. As detailed in the proposed rule, this was based on dividing the standard clinical labor times by 2.25 to account for the MPPR, such as taking the standard 3 minutes and dividing it by 2.25 to arrive at the proposed time of 1.33 minutes (1.33 + 0.67 + 0.67 + 0.34 = 3 minutes). In other words, we believe that the standard 3 minutes of positioning time would typically take place over the course of a therapy session lasting roughly 45–60 minutes, as billed across the typical 3.5 services. We did not propose that patient positioning or room cleaning would typically take place in 40 seconds as several of the commenters suggested.

Comment: A few commenters asked CMS to use its authority to temporarily suspend, reduce, or defer the budget neutrality requirement for RVU adjustments to prevent further payment cuts to therapy services. One commenter stated that CMS should use its enforcement discretion and suspend the 50 percent PE reduction due to MPPR from the 19 therapy codes until the therapy codes have been properly valued.

Response: We remind the commenters that CMS does not have authority under section 1848 of the Act to suspend the budget neutrality requirement under section 1848(c)(2)(B)(ii)(II) of the Act.

After consideration of the comments, we are finalizing the direct PE inputs for the 19 CPT codes in the Physical Medicine and Rehabilitation family as proposed.

(27) Acupuncture—Electroacupuncture (CPT Codes 97810, 97811, 97813, and 97814)

In September 2022, the RUC's Relativity Assessment Workgroup identified the acupuncture codes with 2020 Medicare utilization over 10,000 where the service was surveyed by one specialty but is now performed by a different specialty. CPT codes 97810–97814 were selected and surveyed for the April 2023 RUC meeting.

For CY 2025, we proposed the RUC-recommended work RVUs for all four CPT codes. We proposed a work RVU of 0.61 for CPT code 97810 (*Acupuncture, 1 or more needles; without electrical stimulation, initial 15 minutes of personal one-on-one contact with the patient*), a work RVU of 0.46 for CPT code 97811 (*Acupuncture, 1 or more needles; without electrical stimulation, each additional 15 minutes of personal one-on-one contact with the patient, with re-insertion of needle(s) (List separately in addition to code for primary procedure)*), a work RVU of 0.74 for CPT Code 97813 (*Acupuncture, 1 or more needles; with electrical stimulation, initial 15 minutes of personal one-on-one contact with the patient*), and a work RVU of 0.47 for CPT code 97814 (*Acupuncture, 1 or more needles; with electrical stimulation, each additional 15 minutes of personal one-on-one contact with the patient, with re-insertion of needle(s) (List separately in addition to code for primary procedure)*). We also proposed the RUC-recommended direct PE inputs for CPT codes 97810, 97811, 97813 and 97814 without refinement.

Comment: Commenters agreed with the CMS proposed work RVUs and direct PE inputs for CPT codes 97810 and 97813.

Response: We thank commenters for their support.

Comment: Commenters disagreed with the proposed work RVUs for CPT codes 97811 and 97814, stating that reduction of the work RVUs could potentially discourage the delivery of acupuncture and limit the availability of this beneficial service to the elderly population. These commenters encouraged CMS to maintain the current work RVUs of 0.50 for CPT code 97811 and 0.55 for CPT code 97814.

Response: We appreciate the feedback but note that the RUC's Summary of Recommendations (SOR) for CPT codes 97811 and 97814, contained two key reference codes that appropriately support the proposed valuation for each code. Without additional data provided by the commenters, we continue to believe that the RUC-reviewed survey 25th percentile work RVU of 0.46 for CPT code 97811 and 0.47 for CPT 97814 accurately reflects the intra-service and total times for these codes.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for all four codes in the Acupuncture—Electroacupuncture family as proposed.

(28) Insertion, and Removal and Insertion of New 365-Day Implantable Interstitial Glucose Sensor System (HCPCS Codes G0564 and G0565)

In the CY 2023 PFS final rule (87 FR 6923), we revised national pricing for two Category III CPT codes that describe continuous glucose monitoring for a 180-day period. Category III CPT codes 0446T (*Creation of subcutaneous pocket with insertion of implantable interstitial glucose sensor, including system activation and patient training*) and 0448T (*removal of implantable interstitial glucose sensor with creation of subcutaneous pocket at different anatomic site and insertion of new implantable sensor, including system activation*) describe the services related to the insertion, and removal and insertion of an implantable 180-day interstitial glucose sensor from a subcutaneous pocket. The implantable interstitial glucose sensors are part of systems that can allow real-time glucose monitoring, provide glucose trend information, and signal alerts for detection and prediction of episodes of

low blood glucose (hypoglycemia) and high blood glucose (hyperglycemia).

Interested parties submitted a public comment in response to the CY 2025 PFS proposed rule that asked CMS to establish coding and payment similar to CPT codes 0446T and 0448T for services related to a newly FDA approved implantable 365-day continuous glucose monitoring system. The commenter stated that creating new coding will allow for continuity of this service during the manufacturer's transition from the 180-day monitoring service as described by the current codes, to the new 365-day monitoring service.

We agree with the commenters request and are establishing two new HCPCS codes to describe services related to the new 365-day monitoring service. Specifically, we are establishing HCPCS code G0564 (*Creation of subcutaneous pocket with insertion of 365-day implantable interstitial glucose sensor, including system activation and patient training*) and G0565 (*removal of implantable interstitial glucose sensor with creation of subcutaneous pocket at different anatomic site and insertion of new 365-day implantable sensor, including system activation*). We believe it is important for beneficiaries to have continued access to this valuable service during the transition from a 180 to 365-day monitoring period. HCPCS codes G0564 and G0565 are contractor priced and effective January 1, 2025. CPT codes 0446T and 0448T should continue to be used to bill for the 180-day continuous glucose monitoring service.

(29) Annual Alcohol Screening (HCPCS Codes G0442 and G0443)

In April 2022, the Relativity Assessment Workgroup identified services with Medicare utilization of 10,000 or more that have increased by at least 100 percent from 2015 through 2020, including HCPCS codes G0442 (*Annual alcohol misuse screening, 5 to 15 minutes*) and G0443 (*Brief face-to-face behavioral counseling for alcohol misuse, 15 minutes*). In September 2022, the RUC recommended that these services be surveyed for April 2023 after CMS published the revised code descriptor for HCPCS code G0442 in the CY 2023 PFS final rule (87 FR 69523).

We proposed the RUC-recommended work RVU of 0.18 for HCPCS code G0442 (*Annual alcohol misuse screening, 5 to 15 minutes*). We also proposed the RUC-recommended work RVU of 0.60 for HCPCS code G0443 (*Brief face-to-face behavioral counseling for alcohol misuse, 15 minutes*).

The RUC recommended an increase in the work RVU for HCPCS code G0443 from 0.45 to 0.60 which we believe is warranted based on time and intensity of the service in preventing alcohol misuse. In valuing this code, the time and work valuation is for separate and distinct services from same-day E/M services since HCPCS codes G0442 and G0443 are typically billed with an annual wellness visit (AWV) or office visit. We believe that the codes in the adjacent Behavioral Counseling & Therapy family, which includes HCPCS codes G0445 (*High intensity behavioral counseling to prevent sexually transmitted infection; face-to-face, individual, includes: education, skills training and guidance on how to change sexual behavior; performed semi-annually, 30 minutes*), G0446 (*Annual, face-to-face intensive behavioral therapy for cardiovascular disease, individual, 15 minutes*), and G0447 (*Face-to-face behavioral counseling for obesity, 15 minutes*), may be undervalued as their respective intensities may be lower than what is warranted for these services. We believe that the intensity for these G-codes may be more in line with the intensity of HCPCS code G0443 which we noted had an increase in intensity as recommended by the RUC. As such, we believe that the Behavioral Counseling & Therapy codes may benefit from additional review in the future to recognize the intensity of these services.

We proposed to maintain the current 15 minutes of clinical labor time for the CA021 ''Perform procedure/service—NOT directly related to physician work time'' activity for HCPCS code G0442. This clinical labor activity is specifically noted as not corresponding to the surveyed work time of 5 minutes, and we do not believe that it would be typical for the clinical staff to administer the questionnaire, clarify questions as needed, and record the answers in the patient's electronic medical record in the RUC-recommended 5 minutes. We believe that the current 15 minutes of clinical labor time would be more typical to ensure the accuracy of this screening procedure. We also proposed to maintain 15 minutes of corresponding equipment time for the EF023 exam table as a result of our proposed clinical labor time refinement. We proposed the RUC-recommended direct PE inputs for HCPCS code G0443 without refinement.

We thank the RUC for their review of this code family and for highlighting an important consideration specifically for services that fall under the Medicare preventive services benefit. We are now considering how best to implement and maintain payment for preventive services and may develop new payment policies in future rulemaking to address this issue more comprehensively to ensure consistent access to these services. We considered the recommended PE inputs for this code family, as well as for the Annual Depression Screening (HCPCS code G0444) and Behavioral Counseling & Therapy services (HCPCS codes G0445, G0446, and G0447) within this context, as noted below.

We received comments on this proposal. Below is a summary of the comments received.

Comment: Commenters generally supported the CMS proposal of the RUC's work RVU recommendations for HCPCS codes G0442 and G0443. Commenters noted the importance of improving rates in connection to strengthening access to care. Several commenters asked CMS to include other settings where these services can be furnished such as Certified Community Behavioral Health Clinics (CCBHCs) and Community Mental Health Centers (CMHCs) as they would anticipate this screening would be just as effective in a community setting and there may be cases where the entity may have an eligible practitioner on staff who is seeing an individual and recognizes that the annual screening and brief counseling is clinically appropriate for an individual in need. Another commenter asked CMS to continue to monitor research on alcohol screening, counseling, and treatment and incorporate research findings into the valuation and payment of these services.

Commenters also expressed overwhelming support regarding the proposed PE refinements, noting that it would not be typical for the clinical staff to administer the questionnaire, clarify questions as needed, and record the answers in the patient's electronic medical record in the 5 minutes recommended by the RUC. One commenter disagreed with the proposed PE refinements stating that this work was duplicative with the E/M visit that is being billed on the same day.

Response: We appreciate the support from commenters regarding the proposed work RVUs for HCPCS codes G0442 and G0443. We appreciate the commenters' suggestion of including CCBHCs and CMHCs as settings where these services can be performed. We note that practitioners who practice in these settings and who are enrolled in Medicare and able to bill directly for their services may be able to bill for HCPCS codes G0442 and G0443 under the PFS.

After consideration of public comments, we are finalizing the work RVUs for HCPCS codes G0442 and G0443 as proposed.

For the direct PE inputs, we agree with commenters that it would not be typical for the clinical staff to administer the questionnaire, clarify questions as needed, and record the answers in the patient's electronic medical record in the 5 minutes recommended by the RUC. Given the overwhelming support from commenters and the fact that these are preventative services, we are finalizing as proposed to maintain the current 15 minutes of clinical labor time for the CA021 ''Perform procedure/service—NOT directly related to physician work time'' activity for HCPCS code G0442. We are also finalizing to maintain 15 minutes of corresponding equipment time for the EF023 exam table because of our proposed clinical labor time refinement. We are finalizing the RUC-recommended direct PE inputs for HCPCS code G0443 without refinement.

(30) Annual Depression Screening (HCPCS Code G0444)

In 2012, HCPCS code G0444 (*Annual depression screening, 5 to 15 minutes*) was added to the PFS (77 FR 68955 and 68956) to report annual depression screening for adults in primary care settings that have staff-assisted depression care supports in place to assure accurate diagnosis, treatment and follow up. In April 2022, the Relativity Assessment Workgroup identified this service with Medicare utilization of 10,000 or more that have increased by at least 100 percent from 2015 through 2020. In September 2022, the RUC recommended that this service be surveyed for April 2023 after CMS published the revised code descriptor in the CY 2023 PFS final rule (87 FR 69523).

We proposed the RUC-recommended work RVU of 0.18 for HCPCS code G0444.

We proposed to maintain the current 15 minutes of clinical labor time for the CA021 ''Perform procedure/service—NOT directly related to physician work time'' activity for HCPCS code G0444. This clinical labor activity is specifically noted as not corresponding to the surveyed work time of 5 minutes, and we do not believe that it would be typical for the clinical staff to administer the questionnaire, clarify questions as needed, and record the answers in the patient's electronic medical record in the RUC-recommended 5 minutes. We believe that the current 15 minutes of clinical labor time would be more typical to ensure the accuracy of this screening procedure. We also proposed to maintain 15 minutes of corresponding equipment time for the EF023 exam table as a result of our clinical labor time refinement.

We received comments on our proposals. Below is a summary of the comments received.

Comment: Commenters generally supported the CMS proposal of the RUC's recommended work RVU for G0444. Several commenters asked CMS to include other settings where these services can be furnished such as Certified Community Behavioral Health Clinics (CCBHCs), Community Mental Health Centers (CMHCs), as well as substance use treatment settings, as they would anticipate this screening would be just as effective in a community setting and there may exist cases where the entity may have an eligible provider on staff who is seeing an individual and recognizes that the annual screening and brief counseling is clinically appropriate for an individual in need. A few commenters encouraged CMS to use the most recent data available to determine the appropriate payment for Mental Health (MH) and Substance Use Disorder (SUD) services to address workforce shortages. Commenters overwhelmingly agreed with CMS regarding the clinical labor time and stated that the current 15 minutes of clinical labor time would be more typical to ensure the accuracy of this screening procedure. One commenter disagreed with CMS' proposed refinements to the PE inputs stating this work was duplicative with the E/M that is being billed on the same day.

Response: We thank the commenters for their support of this proposal. We appreciate the commenters' suggestion of including CCBHCs and CMHCs as settings where these services can be performed. We note that practitioners who practice in these settings and who are enrolled in Medicare and able to bill directly for their services may be able to bill for these codes under the PFS.

After consideration of public comments, we are finalizing the work RVU for HCPCS code G0444 as proposed.

For the direct PE inputs, we thank the commenters for their support and agree with commenters that it would not be typical for the clinical staff to administer the questionnaire, clarify questions as needed, and record the answers in the patient's electronic medical record in the 5 minutes recommended by the RUC. Given the overwhelming support from commenters and the fact that this is a preventative service, we are finalizing as proposed to maintain the current 15 minutes of clinical labor time for the CA021 ''Perform procedure/service—NOT directly related to physician work time'' activity for HCPCS code G0444. We are also finalizing as proposed to maintain the 15 minutes of corresponding equipment time for the EF023 exam table because of our proposed clinical labor time refinement.

(31) Behavioral Counseling & Therapy (HCPCS Codes G0445, G0446, and G0447)

CMS created HCPCS codes G0445 (*High intensity behavioral counseling to prevent sexually transmitted infection; face-to-face, individual, includes education, skills training and guidance on how to change sexual behavior; performed semi-annually, 30 minutes*), G0446 (*Annual, face-to-face intensive behavioral therapy for cardiovascular disease, individual, 15 minutes*), and G0447 (*Face-to-face behavioral counseling for obesity, 15 minutes*) effective with the 2012 Medicare PFS (77 FR 68892). HCPCS codes G0445–G0447 were identified to be reviewed at the April 2023 RUC meeting because they were services with Medicare utilization of 10,000 or more that had increased by at least 100% from 2015 through 2020.

The specialty societies surveyed HCPCS codes G0445–G0447 for the April 2023 RUC meeting but did not obtain the required number of survey responses. After the resurvey, which occurred after the April 2023 RUC meeting, the specialty societies were again unable to achieve the required minimum number of survey responses for any of the codes in this family for the September 2023 RUC meeting. The RUC reviewed HCPCS codes G0445–G0447 at the September 2023 RUC meeting. Given the insufficient number of survey responses and considering that these are CMS-created time-based codes, the RUC determined it would be most appropriate to maintain the current work values and flagged these codes for review in 3 years. We proposed the RUC-recommended work RVU of 0.45 for each of these three HCPCS codes, G0445–G0447.

We did not propose the RUC-recommended direct PE inputs for these codes because of the insufficient number of survey responses, and further, we did not agree with some of the RUC's refinements to the direct PE inputs for this service. We did not propose the RUC-recommended direct PE inputs for G0445, G0446, and G0447, which include the SK062 patient education booklet being eliminated in favor of the SK057 paper, laser printing (each sheet) in the amount of 10 sheets and the equipment minutes being modified to equal the sum of clinical staff time plus the physician/QHP time

as reflected by the survey median. We do not agree that these changes are substantiated given the insufficient number of survey responses and we proposed to maintain the current values for each of these direct PE inputs.

We proposed the RUC recommended refinements to clinical staff time for HCPCS code G0445. We proposed to move two minutes from CA021 Perform procedure/service—NOT directly related to physician work time to CA035 Review home care instructions, coordinate visits/prescriptions. We agree with the RUC that this more accurately reflects the clinical work involved in arranging follow-up and/or referrals with clinical and community resources and providing educational materials. Currently, for HCPCS code G0445, PE includes a whip mixer (EP086) and biohazard hood (EP016) among the equipment assigned to the code. We also proposed the RUC recommendations to eliminate both of these pieces of equipment from the PE for HCPCS code G0445.

We noted that the Behavioral Counseling & Therapy code family (HCPCS codes G0445–G0447) should be reviewed in the future by the RUC and we anticipate the recommendations that will come from the review for this family.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters generally expressed support regarding the proposed PE refinements although one commenter disagreed with the proposed PE refinements, stating that this work was duplicative with the E/M visit that is being billed on the same day. Commenters recommended an increase in the work RVUs for HCPCS codes G0445–G0447 in alignment with HCPCS code G0443 (*Brief face-to-face behavioral counseling for alcohol misuse, 15 minutes*) to reflect the intensity of the services, stimulate additional access to these services, and maintain relativity across these codes. Commenters also noted the importance of improving the accuracy of the rates in order to strengthening access to care.

Response: We thank commenters for their support of our PE refinements. We disagree that the PE of the counseling service is duplicative of the E/M visit that is being billed on the same day, as the counseling service requires additional time and practice expense not originally accounted for in the valuation of the E/M visit that is billed on the same day. We appreciate the information that commenters provided regarding the proposed work RVU for HCPCS codes G0445–G0447. We were persuaded by commenters that these services should all be valued consistently to reflect the intensity of the service and to maintain relativity across these codes. We are finalizing 0.60 work RVUs for HCPCS code G0443 (Brief face-to-face behavioral counseling for alcohol misuse, 15 minutes).

After consideration of public comments, we are finalizing the work RVU of 0.60 for HCPCS codes G0445–G0447 and finalizing our PE and clinical staff time refinements as proposed.

(32) Autologous Platelet Rich Plasma (HCPCS Code G0465)

HCPCS code G0465 (*Autologous platelet rich plasma (prp) or other blood-derived product for diabetic chronic wounds/ulcers, using an fda-cleared device for this indication, (includes as applicable administration, dressings, phlebotomy, centrifugation or mixing, and all other preparatory procedures, per treatment)*) was created for CY 2022 (retroactively dated back to the effective date of the policy, April 13, 2021) and assigned contractor pricing (NCD 270.3, CR 12403).

Following the publication of the CY 2023 PFS proposed rule, we received two comments on the pricing of HCPCS code G0465, and the 3C patch system supply which is topically applied for the management of exuding cutaneous wounds, such as leg ulcers, pressure ulcers, and diabetic ulcers and mechanically or surgically debrided wounds (87 FR 69420). One commenter submitted invoices associated with the pricing of the 3C patch system (SD343) supply for which we established a price of $625.00 in the CY 2021 PFS final rule (85 FR 84498). The commenter requested that CMS update its supply database based on invoices submitted for SD343 to reflect an updated price of $750.00 per unit. The commenter also requested national pricing for HCPCS code G0465, expressing concern that insufficient payment disproportionately impacts vulnerable populations. The commenter requested a payment rate of $1,408.90 for HCPCS code G0465 in the office setting, stating that this rate would appropriately account for the purchase of the 3C patch, as well as the other related costs and supply inputs required for point of care creation and administration.

In response, we stated in the CY 2023 PFS final rule that we did not have enough information to establish national pricing at this time for HCPCS code G0465 (87 FR 69420). We stated that we would consider the commenters' feedback for future rulemaking while maintaining contractor pricing for CY 2023, which would allow for more flexibility for contractors to establish appropriate pricing using available information. We appreciated the invoice submission with additional pricing information for the SD343 supply and we updated our supply database for supply code SD343 at a price of $678.57 based on an average of the submitted invoices.

Since the publication of the CY 2023 PFS final rule, interested parties have continued to request national pricing for HCPCS code G0465 due to their perception of inconsistent and insufficient payment for this service by the MACs. CMS has asked the interested parties to engage with the MACs to establish adequate payment for HCPCS code G0465. The interested parties have continued to state that most MACs have not established consistent payment rates and the rates are heterogeneous; some are significantly below the cost of performing this service, leading to an unpredictable process and inadequate rates, creating barriers to access this service.

Due to these concerns, we proposed to establish national pricing for HCPCS code G0465 for CY 2025. We proposed to value HCPCS code G0465 using a crosswalk to CPT code 15271 (*Application of skin substitute graft to trunk, arms, legs, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area*), drawing from a selection of relevant studies.[20] [21] [22] [23] We proposed a work RVU of 1.50 for HCPCS code G0465 based on the crosswalk to CPT code 15271 because wound surface area sizes in current literature appear to be less than 100 sq cm for patients with diabetes and/or chronic ulcers. We also proposed to use the direct PE inputs included with CPT code 15271 for valuing HCPCS code G0465, with the additional inclusion of the 3C patch system (SD343) supply that we priced in CY 2023. We noted that the

payment includes debridement, which may involve a wound reaching the bone. Therefore, debridement may not be billed separately. In addition, we currently sought comments on other available crosswalks from the broader medical community. For example, CPT code 15277 (*Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children*) with a work RVU of 4.00 and CPT code 15273 (*Application of skin substitute graft to trunk, arms, legs, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children*) with a work RVU of 3.50 could also be viable crosswalk options. We solicited comments regarding our selection of CPT code 15271 as a crosswalk code, as well as general comments and available studies regarding the appropriate valuation of HCPCS code G0465.

Comment: While many commenters supported establishing national pricing for HCPCS code G0465 for CY 2025, they disagreed with the proposed crosswalk to CPT codes 15271, 15273, and 15277. Commenters asserted that these codes do not accurately reflect the work RVUs and non-facility PE RVUs required for providing this treatment in a physician office setting. Commenters stated that autologous blood-derived products are not skin substitutes, and therefore, the proposed skin substitute crosswalk codes do not adequately account for all the steps involved in preparing and delivering this wound care treatment. They highlighted that platelet-rich plasma (PRP) requires significant point-of-care preparation, unlike skin substitutes. According to the commenters, the physician work for G0465 includes multiple steps, such as drawing blood, preparing the blood-derived gel, and applying it to complex wounds—procedures that are more involved than applying a skin substitute. The commenters emphasized that the proposed work RVUs based on the crosswalks are too low and do not account for the substantial physician effort required. Several commenters instead suggested alternative crosswalks to CPT codes related to epidermal or dermal autografts, such as CPT codes 15110 (*Epidermal autograft, trunk, arms, legs; first 100 sq cm or less, or 1% of body area of infants and children*), 15115 (*Epidermal autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children*), 15120 (*Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)*), which they believe better align with the actual work involved.

Several commenters also stated that debridement is a crucial part of the physician's work when performing the service described by HCPCS code G0465, particularly for complex wounds that may involve tunneling or contact with bone. They emphasized that debridement, which is essential before each application of an autologous blood-derived product, should be factored into the RVU calculation for HCPCS code G0465. Commenters recommended considering relevant debridement codes, such as CPT codes 11042 (Debridement, subcutaneous tissue (*includes epidermis and dermis, if performed); first 20 sq cm or less*), 11043 (*Debridement, muscle and/or fascia (includes epidermis, dermis, and subcutaneous tissue, if performed); first 20 sq cm or less*), 11044 (*Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); first 20 sq cm or less*), and 97597 (*Debridement (e.g., high pressure waterjet with/without suction, sharp selective debridement with scissors, scalpel and forceps), open wound, (e.g., fibrin, devitalized epidermis and/or dermis, exudate, debris, biofilm), including topical application(s), wound assessment, use of a whirlpool, when performed and instruction(s) for ongoing care, per session, total wound(s) surface area; first 20 sq cm or less*). Assuming debridement is not separately payable, a few commenters suggested increasing the work RVUs for HCPCS code G0465 by incorporating values from these debridement codes.

In addition, some commenters stated that the proposed pricing for supply code SD343, the 3C patch system, is outdated and inaccurate. They stated that the SD343 supply does not reflect the typical supply costs for PRP services because certain necessary components for PRP preparation and application are not included in the 3C patch system. Commenters also asserted that only products with FDA-cleared indications for wound care should be included in the national pricing for HCPCS code G0465, and products that do not meet these requirements should be excluded. Commenters stated that there may be other products in the market that do not meet the NCD requirements and cautioned that these other products likely have vastly different costs than products that do meet the NCD requirements. Commenters stated that the FDA-cleared manufacturers sell their proprietary ingredients and supplies as a complete package, which are necessary for use in each manufacturer's process for creating the autologous blood-derived products, and they are not interchangeable between manufacturers. Commenters submitted a series of invoices and requested that CMS use them to update the pricing of the SD343 supply.

Response: We thank commenters for their feedback. We were persuaded by commenters that the higher work valuation would provide a more accurate crosswalk for HCPCS code G0465, as PRP may require more work and complexity in using these products. To ensure adequate valuation of both physician work and practice expense, we are modifying our original proposal and instead finalizing national pricing for HCPCS code G0465 for CY 2025 using a crosswalk to CPT code 15275 (*Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area*) instead of CPT code 15271 because we believe this code more accurately reflects the work involved in furnishing the service described by HCPCS code G0465.

After reviewing the invoices submitted by commenters, we agree that the pricing data indicates an increase in the typical price of the SD343 supply over time. Therefore, we are finalizing an increase in the supply price from $678.57 to $770.83, based on twelve submitted invoices. Where prices appear inaccurate, and direct inputs do not reflect the full range of available PRP products, we encourage interested parties to submit invoices or other relevant information by February 10th of the following year to improve pricing accuracy in the direct PE database, following a process similar to our consideration of RUC recommendations.

Lastly, while we acknowledge that the service provided under HCPCS code G0465 may differ from skin substitutes, we consider the work to be comparable, which is why we are using CPT code 15275 as the crosswalk. Because the code descriptor for HCPCS code G0465 includes description of all other preparatory procedures, we do not agree that the additional work described in the debridement codes referenced by commenters is not accounted for in the valuation of HCPCS code G0465. Therefore, we are finalizing a work RVU of 1.83 for HCPCS code G0465, which

is higher than the work RVU for CPT code 15271 as proposed, based on a crosswalk to CPT code 15275. Additionally, we are finalizing an increase in the supply price to $770.83, based on twelve submitted invoices.

(33) Temporary Female Intraurethral Valve-Pump (CPT Codes 0596T and 0597T)

In the CY 2024 PFS proposed rule, an interested party nominated two Category III CPT codes, CPT codes 0596T (*Initial insertion of temporary valve-pump in female urethra*) and 0597T (*Replacement of temporary valve-pump in female urethra*), as potentially misvalued. The nominator expressed concern about variability in MAC pricing for the contractor-priced service. Additionally, the nominator highlighted that the payment amounts determined by MACs were inadequately low and did not account for the time and effort required to furnish the services. In their submission, the nominator discussed their anticipated inputs for both codes. For CPT code 0596T, the nominator stated that a physician typically spends 60 minutes inserting the Vesiflo inFlow System. The nominator stated that CPT code 0596T included various supplies, equipment, and clinical labor time totaling $1,902.76, with the inflow supply items making up about 99 percent of the total cost of supplies. For CPT code 0597T, the nominator stated that a physician spends 25 minutes replacing the Vesiflo inFlow System and PE items were similar, with supplies, equipment and clinical labor time costing $505.30, with the inflow supply items making up about 98 percent of the total cost of supplies. We direct interested parties to the CY 2024 PFS final rule (88 FR 78850) for more detailed submission information regarding CPT codes 0596T and 0597T. After reviewing, we concluded that these codes were not potentially misvalued because they are Category III codes describing relatively new and low-volume services. Category III codes are contractor priced under the PFS, meaning that each MAC can establish pricing for the code within its jurisdiction, resulting in variability in payments.

This year, the nominator newly informed CMS that their analysis of national payment rates showed that in most CMS jurisdictions, not only are these codes misvalued, but in most cases, they are not valued at all, with fee schedule amounts in most CMS jurisdictions at or near zero dollars. The nominator further emphasized that three physician experts, all employed in major university medical centers, have highlighted the challenges posed by the combination of high supply costs and inadequate fee schedule payments, which have hindered their ability to provide services covered by these codes over several years. According to the nominator, these selected physicians also expressed frustration with the reluctance of MACs to address or discuss this issue. Moreover, the nominator highlighted high access barriers as a significant concern. These barriers primarily affect Medicare's most vulnerable beneficiaries, particularly women experiencing permanent urinary retention (PUR), although we note that no quantifiable evidence was provided to support these statements. We acknowledge and appreciate the nominator's efforts in reaching out to experts in the field and patients who rely on these services to elucidate their significant needs.

Since these two Category III CPT codes were not identified as potentially misvalued and were consequently priced by contractors, each MAC can set pricing for the code within its jurisdiction. This could result in inevitable variability in MAC pricings until they receive a higher number of claims, as stated by the nominator. Through our engagement with MACs, we found that claims for the two Category III CPT codes are reviewed on a case-by-case basis for medical necessity. If the claim is payable, the price will be determined at that time by the MAC. Additionally, these codes were a topic of discussion within the MAC pricing workgroup, and we observed that there was not a significant difference among the MACs in terms of allowances based on the proposed pricing methodologies. However, there is variance in how MACs load pricing for Category III codes. For instance, some MACs publish the price for the service before they receive any claims, while others set the price only after they receive claims that help determine the appropriate pricing. If a MAC does not load a price for a code before receiving any claims, the service can still be paid, but the allowance has not been published.

We continue to hear concerns about these payment inconsistencies for CPT codes 0596T and 0597T. As a result, we recommended that the MACs establish more consistency in pricing, enabling the appropriate inclusion of the Vesiflo system in the code's PE valuation. Therefore, for CY 2025, we encouraged interested parties to provide more accurate and appropriate cost data, along with additional information regarding work RVU, work time, indicators, and utilization estimates for the MACs. This should complement the information provided by the nominator in the CY 2024 final rule (88 FR 78850) and will facilitate the process. To aid in this process, we are adding three new supplies to our direct PE database based on invoices submitted by interested parties: the inFlow Measuring Device at a price of $140 (SD370), the inFlow Valve-Pump Device at a price of $495 (SD371), and the inFlow Activator Kit at a price of $1,250 (SD372). Although we did not propose national pricing for these two Category III codes, we did note for the benefit of the MACs that CPT code 0596T will typically include one of each of these supplies, whereas CPT code 0597T will typically include only one of the supplies (SD371).

We encouraged the MACs to continue to engage with interested parties by providing information on how they price these services. We welcomed additional comments from the broader medical community regarding the usage of this service, particularly concerning its safety and effectiveness, as well as potential factors contributing to its low utilization.

Comment: Commenters supported the establishment of new supply codes (SD370, SD371, and SD372) for the inFlow™ female voiding prosthesis system (the inFlow System), which addresses the needs of women with permanent urinary retention (PUR). According to the commenters, the inFlow System offers a critical alternative to traditional intermittent catheterization, providing significant improvements in both health outcomes and quality of life for women with neurological conditions that limit their ability to self-catheterize. They stated that creating three new supply codes would standardize and improve payment rates by Medicare Administrative Contractors (MACs), thereby reducing access barriers and increasing the utilization of the inFlow system. They emphasized that finalizing appropriate pricing for these device-intensive procedures, as proposed, is essential to ensuring that Medicare beneficiaries have access to this important, life-enhancing technology.

Response: We thank commenters for their overwhelming support for our proposal. After consideration of public comments, we are finalizing creation of three new supply codes in the PE database to facilitate appropriate pricing by the MACs: the inFlow Measuring Device at a price of $140 (SD370), the inFlow Valve-Pump Device at a price of $495 (SD371), and the inFlow Activator Kit at a price of $1,250 (SD372) as proposed.

(34) PE-Only Replacement Code for Heart Failure System

Interested parties have expressed concern about the lack of coding and a billing mechanism when practitioners incur costs replacing identified components of the CardioMEMS™ Heart Failure System used in the physician service described by CPT code 33289 (*Transcatheter implantation of wireless pulmonary artery pressure sensor for long-term hemodynamic monitoring, including deployment and calibration of the sensor, right heart catheterization, selective pulmonary catheterization, radiological supervision and interpretation, and pulmonary artery angiography, when performed*).

The CardioMEMS™ Heart Failure System furnished during this service allows practitioners treating heart failure patients to wirelessly monitor and measure pulmonary artery pressure and heart rate in patients with heart failure and transmit the information to the physician to inform the treatment plan for the patient. The system includes two critical components: first, a miniaturized, wireless monitor, which is implanted into a patient's pulmonary artery, and second, a smart pillow (the CardioMEMS™ Patient Electronics System), which captures and transmits readings via safe radio frequency from the patient's implanted CardioMEMS™ Heart Failure System. Overall, the CardioMEMS™ Heart Failure System enables patients to transmit critical heart failure status information to clinicians regularly, potentially eliminating the need for frequent clinic or hospital visits.

Interested parties have highlighted the critical importance of the device for heart failure patients who require close monitoring of weight and blood pressure to prevent fluid buildup around the heart and have requested that CMS establish coding to describe when practitioners incur costs during clinical scenarios when crucial components of the system require replacement. Given that these components are crucial for system functionality and there is no existing coding framework to address their replacement, we believe that establishing appropriate coding and payment mechanisms can facilitate the provision of these services more effectively in the office and hospital settings. Given provided information, we proposed assigning contractor pricing to this PE-only code for CY 2025. We proposed a new code, HCPCS code G0555 (Provision of replacement patient electronics system (for example, system pillow) for home pulmonary artery pressure monitoring including provision of materials for use in the home and reporting of test results to physician or qualified health care professional). We sought feedback from interested parties on our contractor pricing approach with the aim of establishing national pricing through future rulemaking that can be billed under the OPPS and PFS specifying an ongoing care visit for the CardioMEMS™ Heart Failure System along with the provision of the replacement part. We are specifically looking for information from the broader medical community regarding direct costs from invoices for the replacement component referenced above, utilization estimates, and potential indicators. Additionally, we solicited comments on additional direct PE inputs that we should consider.

Comment: Many commenters disagreed with our proposed new code, HCPCS code G0555 (*Provision of replacement patient electronics system (for example, system pillow) for home pulmonary artery pressure monitoring including provision of materials for use in the home and reporting of test results to physician or qualified health care professional*). Many commenters stated that the proposed HCPCS code G0555 does not align with the current distribution and billing framework because it conflates two distinct functions: replacement of the patient electronics system (PES), often furnished by durable medical equipment (DME) suppliers, and reporting test results to the physician, usually performed by outpatient hospital departments (OPDs) and independent diagnostic testing facilities (IDTFs). Due to these separate functions handled by different parties, some commenters recommended splitting HCPCS code G0555 into two distinct codes—one for PES replacement and another for reporting test results. They agreed that contractor pricing the proposed new code would be appropriate for the replacement PES.

Additionally, commenters raised concerns regarding the removal of the previous monitoring code (G2066) for CardioMEMS monitoring. Some commenters stated that CMS's decision to delete HCPCS code G2066, which was used for reporting the technical component of remote monitoring, has created a billing gap for IDTFs and OPDs. Commenters recommended creating a new code to allow these facilities to report the technical aspects of monitoring; they specifically asked for the establishment of coding that enables IDTFs and OPDs to bill for these services, with contractor pricing as an interim solution.

Response: First, we note that the replacement of the PES does not meet the criteria of DME as outlined in section 1861(n) of the Act. For more information, please refer to the DMEPOS Public Meeting on 6/1/2016, Application #16.019—Request to establish a new Level II HCPCS code to identify the replacement Patient Electronic System at *https://www.cms.gov/Medicare/Coding/MedHCPCSGenInfo/Downloads/2016-06-01-HCPCS-Application-Summary.pdf*. Secondly, we clarify that the last part of the proposed code descriptor (reporting of test results to physician or qualified health care professional) refers to the capability of the equipment, not the act of reporting. In other words, the code is not describing two distinct services; therefore, separate coding is unnecessary. We also believe that establishing additional coding for reporting the technical component of remote monitoring is unnecessary. Following CMS's decision to delete HCPCS code G2066, the services previously reported using HCPCS code G2066 will now be reported using the technical component of CPT codes 93297 and 93298. Our rationale for finalizing these values was discussed extensively in the CY 2024 PFS final rule (88 FR 78913 through 78914).

After considering the public comments, we are finalizing the proposed descriptor with modifications. The final descriptor for HCPCS code G0555 is *Provision of replacement patient electronics system (e.g., system pillow, handheld reader) for home pulmonary artery pressure monitoring.* We believe these revisions will allow flexibility in coding and provide greater access for patients. We are finalizing contractor pricing as proposed.

(35) Portable X-Ray (HCPCS Codes R0070–R0075)

Several Portable X-Ray (PXR) suppliers and trade organizations continue to express longstanding concerns with how payment is established for transportation related to these services (HCPCS codes R0070–R0075). CMS has worked with interested parties over the past several years to understand the costs of these services while taking into consideration the MACs perspective on pricing of these costs. Through recent ongoing discussions with interested parties, we learned that interested parties are concerned with the recognition of costs incurred from PXR services and are wanting more consistency in the pricing

of these services, including the application of an inflation factor.

We acknowledged the interested parties' concerns and clarified that interested parties may best engage with the MACs through appropriate reporting of cost data in the MAC requested format. This information provided by interested parties can help MACs establish payment rates that are more reflective of costs incurred. MACs are then able to consider this cost information and apply an inflation factor to update changes in costs year over year.

However, CMS recognizes that we should maintain consistency in pricing these services that are more indicative of changes in costs that occur yearly. While still preserving MAC discretion, CMS highlights the usage of an ambulance inflation factor (AIF) that is typically used to adjust ambulance services, which include transportation costs. The AIF is updated annually, and we believe MACs may consider using the AIF to price PXR services when establishing payment rates that are more consistent and reflective of costs incurred.

Additionally, interested parties highlighted inconsistency with language found in our manual and program memoranda policies related to transportation costs. Therefore, to remain consistent and transparent in the pricing of PXR services, we proposed to revise language in our Medicare Claims Processing manual (Chapter 13, 90.3 and Chapter 23, 30.5) to reflect any updates to our guidance for these services.

We received public comments on our proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported CMS' proposal to revise language in the Medicare Claims Processing Manual (MPCM) and believe this will help assure that MACs apply appropriate inflation factor and other required updates to PXR services.

Response: We thank commenters for their support of our proposal.

Comment: Commenters also mentioned a few additional policy refinements for PXR services including requiring transparency from MACs regarding the annual update as well as with the PFS ratesetting process for direct and indirect costs, establishing guidelines for a timelier periodic review process, and specifically consolidating two sections of the MCPM related to PXR transportation (Ch. 13, 90.3 and Ch. 23, 30.5) to ensure a single guidance document for both MACs and PXR suppliers.

Response: We thank commenters for these suggestions and may take them into consideration for future rulemaking.

After consideration of the comments received, we are finalizing our proposal to revise language in our Medicare Claims Processing manual (Chapter 13, 90.3 and Chapter 23, 30.5) to reflect updates to our guidance for these services. The Medicare Claims Processing manual is available at *https://www.cms.gov/regulations-and-guidance/guidance/manuals/internet-only-manuals-ioms-items/cms018912.*

(36) Non-Chemotherapy Administration

CMS received inquiries from several external parties with concerns that MACs have developed local coverage determinations (LCDs) and local coverage articles (LCAs) that down code or restrict payment for complex and non-chemotherapeutic drug administration for CPT code series 96401–96549, when used for the administration of several biologic and infusion drugs, including drugs furnished to treat, for example, rheumatology related conditions.

CMS requested information in the CY 2024 PFS proposed rule (88 FR 52837) seeking public feedback regarding the concerns of down coding or denials for the administration of non-chemotherapeutic infusion drugs. We received comments that asked for additional clarification from CMS regarding the payment guidelines for the complex non-chemotherapeutic administration code series and updates to the IOM. Commenters urged CMS to provide additional guidance clarifying the conditions under which these complex infusion drugs should be payable.

In response to the comments received, and in response to continuing inquiries on downcoding and or restrictions on payment for non-chemotherapy complex infusion services, we proposed an updated policy based largely on the IOM Medicare Claims Processing Manual, Chapter 12, section 30.5, to include language currently consistent with CPT code definitions for the complex non-chemotherapy infusion code series stating that the administration of infusion for particular kinds of drugs and biologics can be considered complex and may be appropriately reported using the chemotherapy administration CPT codes 96401–96549. We noted that CPT guidance describes requirements for these non-chemotherapy complex drugs or biologic agents to include the need for staff with advanced practice training and competency, such as, a physician or other qualified health care professional to monitor the patient during these infusions due to the incidence of severe adverse reactions. There are also special considerations for preparation, dosage, or disposal for these infusion drugs. These services do involve serious patient risk which requires frequent consults with a physician or other qualified healthcare professional. Based on these facts and comments, we proposed to update our subregulatory guidance accordingly.

This will also provide complex clinical characteristics for the MACs to consider as criteria when determining payment of claims for these services. The current IOM language does not include the unique characteristics of the administration of these drugs that could provide additional context to the MACs when they are determining appropriate payment. Updating the IOM with the increased detail of these codes would be responsive to the concerns and requests of external parties and will ensure the IOM is consistent with published guidance.

Therefore, we solicited and welcomed comments on our proposal to revise the IOM to better reflect how complex non-chemotherapeutic drug administration infusion services are furnished and billed.

Comment: Commenters were generally very supportive of CMS' proposal to update the IOM with additional detail and considerations of complexity for the administration of complex non-chemotherapeutic drugs. Commenters also stated they were pleased that MACs have retired the LCAs related to this service and that CMS has issued previous instructions to the MACs regarding down coding. A few commenters suggested additional clarifications and revisions beyond the proposed language in the IOM, such as a clarification that stem cell transplant and CAR–T services should not be billed using the chemotherapy administration code series. Another commenter requested that CMS remove ''chemotherapy'' terminology and replace it with ''immunomodulatory'' and that CMS extend additional IOM guidance to subcutaneous injections. One commenter also requested that CMS refer the entire code series to the CPT Editorial Panel for review.

Response: We appreciate commenters support for our proposed revisions to the IOM for these services and we acknowledge commenters additional suggestions to clarify the guidance. Currently, we believe that additions beyond our proposed changes to the IOM and revisions to terms beyond the scope of general coding guidance are not

required. We continue to believe that the proposed increased detail in alignment with current CPT coding definitions will provide clear guidance and considerations when MACs are determining appropriate payment for these services. Additionally, CMS is an active participant in the CPT Editorial Panel review process and encourages interested parties to pursue coding change requests by CPT as necessary.

Comment: Several commenters requested that CMS take additional steps to prevent future down coding of these services. Commenters stated that CMS should establish documentation requirements in the patient medical record to demonstrate that the reported complex drug administration code meets IOM guidance. Commenters also requested that CMS release a Medicare Learning Network (MLN) article to educate MACs and physicians on the finalized guidance. Commenters also urged CMS to prohibit audits and recoupments for these services until the effective date of the finalized IOM revisions.

Response: We thank commenters for their suggested additional steps to prevent future down coding of these services. Currently, we believe that the proposed increased detail and considerations of complexity to the IOM will sufficiently assist MACs with their determination of proper payment for these services. We are encouraged by the positive feedback from commenters regarding the retired LCAs and the previous instructions issued to the MACs via TDL and CR. We will continue to monitor all feedback from external parties and will pursue additional steps to ensure proper payment for these services as necessary.

After consideration of all public comments, we are finalizing revisions to the IOM to update guidance on complex non-chemotherapeutic drug administration as proposed.

(37) Hospital Inpatient or Observation (I/O) Evaluation and Management (E/M) Add-On for Infectious Diseases (HCPCS Code G0545)

Interested parties have continued to engage with CMS and provide recommendations to recognize the increased work associated with diagnosis, management, and treatment of infectious diseases that may not be adequately accounted for in current hospital inpatient or observation E/M codes. Infectious diseases are unique in that they present infection control risks for the patient and close contacts, including healthcare staff, that require attention to safely care for the patient. They present unique challenges in diagnosis in that any previous healthcare interaction could affect the individual resistance patterns of pathogens infecting the individual patient and require close contact with public health agencies since resistance patterns are constantly changing, so a much more extensive medical review is required. Additionally, individual decisions regarding treatment are unique in that use in one patient affects resistance patterns of the entire population, which requires additional expertise to inform antimicrobial selection and management.

We believe that the timing is appropriate for establishing a payment rate for infectious disease physician services since the COVID–19 PHE has ignited a hypervigilance for infectious diseases. Therefore, for CY 2025, we proposed a new HCPCS code to describe intensity and complexity inherent to hospital inpatient or observation care associated with a confirmed or suspected infectious disease performed by a physician with specialized training in infectious diseases. The full descriptor for the hospital I/O E/M visit complexity add-on code is HCPCS code G0545 (*Visit complexity inherent to hospital inpatient or observation care associated with a confirmed or suspected infectious disease by an infectious diseases consultant, including disease transmission risk assessment and mitigation, public health investigation, analysis, and testing, and complex antimicrobial therapy counseling and treatment. (add-on code, list separately in addition to hospital inpatient or observation evaluation and management visit, initial, same day discharge, or subsequent*). We anticipate that HCPCS code G0545 would be reported by physicians with specialized infectious disease training.

We stated in the proposed rule that we do not believe we should limit the scope of codes with which this add-on HCPCS code could be billed based on visit level; or initial, same day discharge, or subsequent hospital inpatient or observation codes. We proposed HCPCS code G0545 as an add-on code (ZZZ global period) separately reportable in addition to CPT codes 99221 (*Initial hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level medical decision making. When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded.*), 99222 (*Initial hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 55 minutes must be met or exceeded.*), 99223 (*Initial hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 75 minutes must be met or exceeded.*), 99231 (*Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.*), 99232 (*Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.*), 99233 (*Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 50 minutes must be met or exceeded.*), 99234 (*Hospital inpatient or observation care, for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.*), 99235 (*Hospital inpatient or observation care, for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 70 minutes must be met or exceeded.*), and 99236 (*Hospital inpatient or observation care, for the evaluation and management of a patient including admission and discharge on the same date, which requires a*

medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 85 minutes must be met or exceeded.). Based on feedback from commenters on the CY 2022 PFS proposed rule comment solicitation regarding infectious diseases (86 FR 65125 through 65126) and feedback from interested parties, HCPCS code G0545 would include the following proposed service elements:

1. Disease Transmission Risk Assessment and Mitigation

- Developing, following, and supervising specialized, individualized infection control protocols for an individual patient based on their diagnosis and risks in order to reduce risk of disease transmission.
- Coordinating with human resources regarding infection prevention and control measures to enable healthcare facility staff to safely care for patient.
- Counseling patients, family members and caregivers regarding infection prevention.
- Managing infection prevention and treatment protocols associated with transitions of care for complex patients.

2. Public Health Investigation, Analysis, and Testing

- In-depth patient chart review that entails going back farther in time and assessing the complete breadth of all health care interactions, with higher-level synthesis for complex diagnoses.
- Communicating with the clinical microbiology lab and directly reviewing specimens.
- Coordinating specialized diagnostic evaluations (for example, identifying and facilitating diagnostic laboratory tests only available at specialized laboratories, the state health department, and/or the Centers for Disease Control & Prevention).
- Coordinating with Federal, State and local public health agencies and laboratories to assist with contact tracing, obtaining specimens for specialized testing, and/or identifying prior testing and treatment for communicable diseases in other jurisdictions.

3. Complex Antimicrobial Therapy Counseling & Treatment

- Counseling patients, family members, and caregivers regarding antimicrobial stewardship and resistance for the patient.
- Engaging in complex medical decision-making associated with antimicrobial prescribing including considerations such as antimicrobial resistance patterns, emergence of new variants/strains, recent antibiotic exposure, interactions/complications from comorbidities including concurrent infections, public health considerations to minimize development of antimicrobial resistance, and emerging and re-emerging infections.

For HCPCS code G0545, we proposed a work RVU of 0.89 based on the work RVU for HCPCS code G2211 (*Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition. (add-on code, list separately in addition to office/outpatient evaluation and management visit, new or established)*), which is 0.33, multiplied by a ratio of the work RVUs for CPT codes 99223 and 99213 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.*), 3.50 and 1.30, respectively. (This ratio is the work RVU of CPT code 99223 divided by the work RVU of CPT code 99213, 3.50 divided by 1.30, which equals 2.69. Multiplying the 0.33 work RVU of HCPCS code G2211 times 2.69 results in our work RVU of 0.89.) We stated in the proposed rule that we believe the relationship between the complexity add-on HCPCS code G2211 and a common base code for the add-on code, CPT code 99213, would strike the correct balance to estimate the time and complexity associated with the proposed new HCPCS code G0545, compared to what we believe would be a common base code for this new add-on code, CPT code 99223. HCPCS code G2211 has a total time of 11 minutes; therefore, we proposed a total time of 30 minutes for HCPCS code G0545 based on the same ratio (11 minutes times the same 2.69 ratio equals 30 minutes). HCPCS code G2211 has no direct PE inputs, and we proposed the same for HCPCS code G0545.

We stated that we believe that the work RVU appropriately falls between the following bracket add-on codes: HCPCS code G0316 (*Prolonged hospital inpatient or observation care evaluation and management service(s) beyond the total time for the primary service (when the primary service has been selected using time on the date of the primary service); each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (list separately in addition to CPT codes 99223, 99233, and 99236 for hospital inpatient or observation care evaluation and management services). (do not report g0316 on the same date of service as other prolonged services for evaluation and management 99358, 99359, 99418, 99415, 99416). (do not report g0316 for any time unit less than 15 minutes)*) with a work RVU of 0.61 and the professional principal care management, chronic care management, and complex chronic care management CPT codes 99425 (*Principal care management services, for a single high-risk disease, with the following required elements: one complex chronic condition expected to last at least 3 months, and that places the patient at significant risk of hospitalization, acute exacerbation/decompensation, functional decline, or death, the condition requires development, monitoring, or revision of disease-specific care plan, the condition requires frequent adjustments in the medication regimen and/or the management of the condition is unusually complex due to comorbidities, ongoing communication and care coordination between relevant practitioners furnishing care; each additional 30 minutes provided personally by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)*), 99437 (*Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 30 minutes by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)*), and 99489 (*Complex chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored, moderate or high complexity medical decision making; each additional 30*

minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)) with work RVUs of 1.00.

To help inform whether our proposed descriptor is appropriate and reflects the typical service, we sought comment on the typical amount of time infectious disease physicians spend on the service elements and the relative intensity compared to similar service elements of other CPT codes. We noted that the valuation of HCPCS code G0545 is meant to capture the visit complexity inherent to hospital inpatient or observation care associated with a confirmed or suspected infectious disease by an infectious diseases consultant that is not accounted for in the appropriate hospital inpatient or observation E/M base code billed by the infectious disease physician.

Interested parties have stated that consultations are a common E/M service performed by infectious disease clinicians, particularly in the inpatient setting, but stated that these services are no longer recognized by Medicare. Interested parties have also stated that this has resulted in a significant reduction in reporting and payment for infectious disease physician services. We noted that we addressed this in the CMS Claims Processing Manual, Chapter 12, section 30.6.9 F, stating that ''Physicians may bill initial hospital care service codes (99221–99223), for services that were reported with CPT consultation codes (99241–99255) prior to January 1, 2010, when the furnished service and documentation meet the minimum key component work and/or medical necessity requirements. Physicians may report a subsequent hospital care CPT code for services that were reported as CPT consultation codes (99241–99255) prior to January 1, 2010, where the medical record appropriately demonstrates that the work and medical necessity requirements are met for reporting a subsequent hospital care code (under the level selected), even though the reported code is for the provider's first E/M service to the inpatient during the hospital stay.'' Accordingly, we sought comment on any potential barriers for infectious disease physicians to use the initial and subsequent day hospital inpatient or observation codes, CPT codes 99221 through 99223 and 99231 through 99233, for consultations if they meet the coding requirements for time and/or medical decision making (MDM). We noted that understanding the barriers to utilizing these codes is important, as these codes would serve as the base codes for the proposed HCPCS code G0545 and would be billed by the infectious disease physician prior to billing HCPCS code G0545.

Finally, we recognized that historically, the CPT Editorial Panel has frequently created CPT codes describing services that we originally established using G codes and adopted them through the CPT Editorial Panel process. We noted that we would consider using any newly available CPT coding to describe services similar to those described here in future rulemaking.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal to create a new HCPCS code to describe intensity and complexity inherent to hospital inpatient or observation care associated with a confirmed or suspected infectious disease. Specifically, commenters supported the code's creation, the proposed work RVU, code descriptor, code structure to be an add-on code to certain I/O E/M codes, and the three proposed service elements of the codes.

Some commenters requested clarification on certain aspects of the code. Specifically, some commenters requested clarification that performing one, or any combination, of the three proposed service elements would be sufficient to bill for the code because it would not be feasible to require all three in a single instance. One commenter asked for clarification regarding the intention to recognize the inherent complexity for all infectious diseases (for example, bacterial infections, MRSA, C. diff, COVID–19) or primarily emerging viral/microbial infections with epidemic potential. The commenter also requested clarification on the exclusion of the I/O E/M discharge CPT codes 99238 (*Hospital inpatient or observation discharge day management; 30 minutes or less on the date of the encounter*) and 99239 (*Hospital inpatient or observation discharge day management; more than 30 minutes on the date of the encounter*), on the specified list of applicable base codes for HCPCS code G0545, and the inclusion of CPT code 99213 (low MDM) in the work RVU analysis. The commenter stated that diagnosing and managing suspected, known, or emerging infectious diseases typically involves high medical decision making, therefore, CPT code 99215 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.*) would be more appropriate for potential work RVU comparisons. Lastly, the commenter requested clarification on the proposed total time of 30 minutes. The commenter asked if the proposed total time of 30 minutes is used to determine the quantity of reportable units of HCPCS code G0545, or if only one unit of HCPCS code G0545 is reportable per encounter.

Some commenters requested clarification that that no additional documentation requirements were being established, similar to HCPCS code G2211, and suggested that the infectious disease specialist's medical record should sufficiently demonstrate inherent complexity.

Response: We appreciate the overwhelming support from commenters regarding all elements of the proposed HCPCS code G0545. Regarding the clarifications requested about the three proposed service elements, we confirm that HCPCS code G0545 is intended to be used for one, or any combination, of the three proposed service elements. We recognize that each service element may not be medically appropriate for every patient with an infectious disease. Furthermore, we are clarifying that HCPCS code G0545 is intended to recognize the inherent complexity for all infectious diseases, and not just emerging infectious diseases with epidemic potential. *Clostridium Difficile* infection, for example, can complicate antibiotic selection and can spread from patient to patient in an inpatient setting without proper infection prevention strategies put in place, requiring several of the code descriptor elements be performed by the treating clinician. As stated in the proposed rule, we continue to believe the relationship between HCPCS code G2211 and a common base code for the add-on code, CPT code 99213, would strike the correct balance to estimate the time and complexity associated with HCPCS code G0545, compared to what we believe would be a common base code for this new add-on code, CPT code 99223. This assumption is supported by 2022 Medicare utilization data for the infectious disease specialty, available on the CMS website under downloads for the CY 2025 PFS final rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html.* If we take the commenter's suggestion and use CPT code 99215 in our analysis to represent the high MDM O/O E/M visit, this would decrease the work RVU for

HCPCS G0545 (that is, the work RVU of CPT code 99223 divided by the work RVU of CPT code 99215, 3.50 divided by 2.80, which equals 1.25. Multiplying the 0.33 work RVU of HCPCS code G2211 times 1.25 would result in a work RVU of 0.41.). We acknowledge that this was likely not the commenter's intention, and that CPT code 99223, used in the proposed work RVU analysis, represents the most common initial I/O E/M visit billed by the infectious disease specialty in 2022 Medicare utilization data, and represents high MDM. Additionally, CPT code 99232 is the most common I/O E/M visit billed by the infectious disease specialty, which represents the subsequent I/O E/M visit with moderate MDM, but using this code in the work RVU analysis would also decrease the work RVU calculation for HCPCS code G0545 (that is, the work RVU of CPT code 99232 divided by the work RVU of CPT code 99213, 1.59 divided by 1.30, which equals 1.22. Multiplying the 0.33 work RVU of HCPCS code G2211 times 1.22 would result in a work RVU of 0.40.). We note that the work RVU analysis for HCPCS code G0545 was not intended to indicate an assumption about the level of medical decision making associated with diagnosing and managing suspected, known, or emerging infectious diseases, and we continue to believe that the comparison of HCPCS code G2211 and CPT code 99213, compared to CPT code 99223 strikes the correct balance to estimate the typical time and complexity associated with HCPCS code G0545, therefore we are finalizing our proposed work RVU of 0.89 for HCPCS code G0545. Additionally, we agree with the commenter that the I/O E/M discharge day management CPT codes are applicable base codes for HCPCS code G0545, as they were inadvertently omitted from the list of applicable base codes in the CY 2025 PFS proposed rule, therefore we are finalizing the inclusion of CPT codes 99238 and 99239 to the list of base codes.

We note that, while we proposed a total time of 30 minutes for HCPCS code G0545, similar to HCPCS code G2211, HCPCS code G0545 is not intended to be a time-based code. The proposed total time adheres to a longstanding practice of establishing times for a new code to represent the anticipated typical time of a service and should not be used to determine reportable units of the code. We acknowledge that I/O E/M visit levels and prolonged service codes are intended to account for additional minutes of time for individual patients, whereas HCPCS code G0545 is intended to account for the visit complexity inherent to hospital inpatient or observation care associated with a confirmed or suspected infectious disease. For time-based reporting of additional incremental time, we refer the commenter to the prolonged hospital I/O E/M code, HCPCS code G0316 (*Prolonged hospital inpatient or observation care evaluation and management service(s) beyond the total time for the primary service (when the primary service has been selected using time on the date of the primary service); each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (list separately in addition to cpt codes 99223, 99233, and 99236 for hospital inpatient or observation care evaluation and management services). (do not report g0316 on the same date of service as other prolonged services for evaluation and management 99358, 99359, 99418, 99415, 99416). (do not report g0316 for any time unit less than 15 minutes)*).

Like HCPCS code G2211, we did not specify any additional medical record documentation requirements for reporting the HCPCS code G0545 add-on code. Our medical reviewers may use the medical record documentation to confirm the medical necessity of the visit and the confirmed or suspected infectious disease as appropriate. We would expect that information included in the medical record or in the claims history for a patient/practitioner combination, such as diagnoses, the practitioner's assessment and medical plan of care, and/or other codes reported could serve as supporting documentation for billing HCPCS code G0545. Practitioners should consult their Medicare Administrative Contractor (MAC) regarding documentation requirements related to the underlying I/O E/M visit.

Comment: Some commenters requested the code to be modified to a stand-alone code rather than an add-on code because the work described by this code may be done with or without the medical necessity of a face-to-face visit. Commenters stated that there are barriers for infectious disease specialists in reporting the inpatient daily care codes that are proposed as base codes for HCPCS code G0545 because the medical decision-making is based on review of significant amounts of data in medical records and can be done without a face-to-face visit with the patient. Therefore, commenters requested that HCPCS code G0545 be a stand-alone code rather than an add-on code to the proposed hospital I/O E/M codes.

Response: We appreciate the commenters' suggestion of modifying HCPCS code G0545 to be a stand-alone code given the possible barriers to reporting the proposed base codes. However, at this time, we are finalizing HCPCS code G0545 as an add-on code as proposed because we did not receive any commenter input on appropriate definition or valuation for the code as a stand-alone code such as a code descriptor, service elements, physician time, work RVU, and what codes would be inappropriate to bill alongside a stand-alone infectious disease code to avoid duplicative payment for these services.

We also note that there are interprofessional consultation codes, CPT codes 99451 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a consultative physician or other qualified health care professional, including a written report to the patient's treating/requesting physician or other qualified health care professional, 5 minutes or more of medical consultative time*), 99452 (*Interprofessional telephone/internet/electronic health record referral service(s) provided by a treating/requesting physician or other qualified health care professional, 30 minutes*), and 99446 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a consultative physician or other qualified health care professional, including a verbal and written report to the patient's treating/requesting physician or other qualified health care professional; 5–10 minutes of medical consultative discussion and review*) through 99449 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a consultative physician or other qualified health care professional, including a verbal and written report to the patient's treating/requesting physician or other qualified health care professional; 31 minutes or more of medical consultative discussion and review*), that could be used to report non-face-to-face consults furnished by infectious disease specialists. These six codes describe assessment and management services conducted through telephone, internet, or electronic health record consultations furnished when a patient's treating physician or other qualified healthcare professional requests the opinion and/or treatment advice of a consulting physician or qualified healthcare professional with specific specialty expertise to assist with the diagnosis

and/or management of the patient's problem without the need for the patient's face-to-face contact with the consulting physician or qualified healthcare professional (83 FR 59489).

Comment: One commenter requested clarification about reporting both HCPCS codes G2211 and G0545 because infectious disease specialists are likely to report their visits with the office/outpatient (O/O) E/M codes, since they are rarely the physician ordering and providing the observation service who will report the hospital I/O E/M codes.

Response: We appreciate the commenter's input regarding the use of the new HCPCS code G0545. However, HCPCS codes G2211 and G0545 have differing base codes and therefore, cannot be reported together. We acknowledge that some commenters raised concerns about barriers to reporting the proposed base codes for HCPCS code G0545, but no other commenters raised that they typically use the O/O E/M codes. We also note that 2022 Medicare utilization data, available on the CMS website under downloads for the CY 2025 PFS final rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html* does not support the assertion that infectious disease specialists are likely to report their visits with the office/outpatient (O/O) E/M codes, therefore, we continue to believe that the proposed base codes for HCPCS code G0545 are appropriate. We are open to feedback from interested parties and may consider additional information for future rulemaking.

Comment: Some commenters requested that we allow a broader scope of qualifying practitioners to be able to bill for HCPCS code G0545 in order to ensure nurses and other qualified practitioners can bill for the expert care they provide in treating infectious diseases.

Response: We appreciate the commenters' suggestion to broaden the scope of practitioners who may bill for HCPCS code G0545. We agree with commenters that it is possible that practitioners other than physicians could provide vital care in treating infectious diseases. Therefore, we are finalizing a modified code descriptor for HCPCS code G0545 that refers to ''an infectious diseases specialist'' to enable all practitioners with specialized training in infectious diseases who can independently bill Medicare for E/M visits to report the HCPCS code G0545 add-on code to the following I/O E/M base codes: CPT codes 99221 through 99223, 99231 through 99233, 99234 through 99235, and 99238 through 99239. The finalized full descriptor for the hospital I/O E/M visit complexity add-on code is HCPCS code G0545 (*Visit complexity inherent to hospital inpatient or observation care associated with a confirmed or suspected infectious disease by an infectious diseases specialist, including disease transmission risk assessment and mitigation, public health investigation, analysis, and testing, and/or complex antimicrobial therapy counseling and treatment. (add-on code, list separately in addition to hospital inpatient or observation evaluation and management visit, initial, same day discharge, subsequent or discharge*). We maintain the expectation that HCPCS code G0545 will be reported by practitioners who have the requisite specialized infectious disease training, including but not limited to physicians, nurse practitioners, physician assistants, and certified nurse specialists.

Comment: A few commenters did not support the creation of HCPCS code G0545, stating that they do not support specialty-specific codes because these codes favor the expertise of one specialty more than others. The commenters stated that CPT codes are not meant to be specialty specific, and this proposal goes against long-standing convention and can cause additional imbalances. Instead, the commenters requested a generalized G code for complex inpatient non-procedural care that all specialties could use, like HCPCS code G2211. Commenters stated that there is no clear reason to solely enhance payment for infectious disease specialists via an add-on code when there are various other specialties that frequently provide vital E/M services in inpatient settings whose professional services are undervalued under the current fee schedule. Commenters stated that this represents a broader issue with undervaluation of E/M services, and that they are willing continue to work with CMS, as well as legislators and other stakeholders, on strengthening physician payment to meet broader workforce needs.

Response: We appreciate the commenters' input regarding specialty-specific codes. We continue to believe that the increased work and unique complexity associated with diagnosis, management, and treatment of infectious diseases are not adequately accounted for in the current hospital I/O E/M codes. We reiterate our belief that infectious diseases are unique in that they present infection control risks for the patient and close contacts, including healthcare staff, that require attention to safely care for the patient, healthcare staff, and other patients in the facility. They present unique challenges in diagnosis in that any previous healthcare interaction could affect the individual resistance patterns of pathogens infecting the individual patient and require close contact with public health agencies since resistance patterns are constantly changing, so a much more extensive medical review is required. Additionally, individual decisions regarding treatment are unique in that use in one patient affects resistance patterns of the entire population, which requires additional expertise to inform antimicrobial selection and management to achieve broader public health goals.

After consideration of public comments, we are finalizing the creation of HCPCS code G0545 as proposed with modifications to the HCPCS code descriptor. We reiterate that we would consider using any newly available CPT coding to describe infectious disease services in future rulemaking.

(38) Preexposure Prophylaxis (PrEP) of Human Immunodeficiency Virus (HIV)

To facilitate prompt beneficiary access to PrEP for CY 2024, we established 3 HCPCS G codes that describe the service of counseling and administration of Human Immunodeficiency Virus (HIV) pre-exposure prophylaxis drugs. Specifically, HCPCS codes G0011 (*Individual counseling for pre-exposure prophylaxis (PrEP) by physician or QHP to prevent human immunodeficiency virus (HIV), includes: HIV risk assessment (initial or continued assessment of risk), HIV risk reduction and medication adherence, 15–30 minutes*) and G0013 (*Individual counseling for pre-exposure prophylaxis (PrEP) by clinical staff to prevent human immunodeficiency virus (HIV), includes: HIV risk assessment (initial or continued assessment of risk), HIV risk reduction and medication adherence*) describe the counseling portion of the service, and G0012 (*Injection of pre-exposure prophylaxis (PrEP) drug for HIV prevention, under skin or into muscle*) describes the injection of the medication.

CMS released a Proposed NCD for Pre-Exposure Prophylaxis (PrEP) for Human Immunodeficiency Virus (HIV) Infection Prevention on July 12, 2023. This proposed NCD announced CMS' intent to cover and pay for those drugs under the section 1861(ddd) additional preventive services authority, and a final NCD was published on September 30, 2024. For CY 2025, we proposed national rates for these HCPCS codes that reflect the relative resource costs associated with the counseling and drug administration portions of the service,

pending finalization of the NCD. For HCPCS code G0011, we proposed a work RVU of 0.45 based off work and direct PE inputs crosswalked from HCPCS code G0445 (*High intensity behavioral counseling to prevent sexually transmitted infection; face-to-face, individual, includes: education, skills training and guidance on how to change sexual behavior; performed semi-annually, 30 minutes*). For HCPCS code G0012, we proposed a work RVU of 0.17 based on the work and direct PE crosswalked from CPT code 96372 (*Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular*), and for HCPCS code G0013 we proposed a work RVU of 0.18 based on the work and direct PE inputs crosswalked from CPT code 99211 (*Office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician or other qualified health care professional*). We appreciate having this opportunity for interested parties to provide feedback on the most accurate way to value these services.

Comment: We received several comments regarding CMS' proposed national payment rates for HCPCS codes G0011, G0012, and G0013. Some commenters agreed with CMS' proposed work RVU and direct PE inputs for this code family while one commenter disagreed with the crosswalk code, CPT code 99211, for HCPCS code G0013. This commenter suggested that CMS crosswalk this code to CPT code 99213 to better account for time and complexity.

Response: We appreciate commenters' support for the proposed national payment rates for this service. We disagree with commenters and continue to believe that CPT code 99211 is the appropriate crosswalk for HCPCS code G0013 because CPT code 99211 describes a counseling service conducted by clinical staff as opposed to a physician or QHP. This aligns with the code descriptor for G0013 (*Individual counseling for pre-exposure prophylaxis (PrEP) by clinical staff to prevent human immunodeficiency virus (HIV), includes: HIV risk assessment (initial or continued assessment of risk), HIV risk reduction and medication adherence*) which also describes the work of clinical staff.

Comment: We received several comments expressing a variety of concerns related to the coverage policy for this service as described in the proposed NCD. Many comments included a request for better inclusion of pharmacists. Some comments would like CMS to partner with pharmacies to allow pharmacists to order HIV PrEP medications, as well as provide the counseling portion of the service. Commenters also asked CMS to clarify that pharmacists are considered clinical staff and/or streamline billing processes to enable pharmacists to bill for PrEP services under their own National Provider Identifier (NPI).

Response: We appreciate and acknowledge commenters' concerns regarding the coverage policy in our proposed NCD. However, concerns related to the coverage policy of HIV PrEP are considered out of scope for our proposal regarding the national payment rates for this service.

After consideration of the public comments, we are finalizing the work RVU and direct PE inputs for HIV PrEP as proposed.

(39) Opfolda

For CY 2024, to facilitate beneficiary access to treatment of late-onset Pompe disease with miglustat in combination with cipaglucosidae alfa-atga, we created a new HCPCS code, G0138, describing the service of administration of cipaglucosidase alfa-atga (Pombiliti), which includes the intravenous administration of cipaglucosidase alfa-atga, the provider or supplier's acquisition cost of miglustat, clinical supervision, and oral administration of miglustat. HCPCS code G0138 (*Intravenous infusion of cipaglucosidase alfaatga, including provider/supplier acquisition and clinical supervision of oral administration of miglustat in preparation of receipt of cipaglucosidase alfa-atga*) was added to the PFS effective April 1, 2024, as a contractor priced service. More information regarding the creation of HCPCS code G0138 can be found at *https://www.cms.gov/files/document/2023-hcpcs-application-summary-quarter-4-2023-drugs-and-biologicals-updated-1/30/2024.pdf*.

For CY 2025, we proposed national pricing for this service that reflects the relative resource costs associated with the infusion administration of Cipaglucosidae alfa-atga and clinical supervision and provision of Miglustat oral with acquisition costs. We proposed a work RVU of 0.21 for HCPCS code G0138 based on a crosswalk from CPT code 96365 (*Intravenous infusion, for therapy, prophylaxis, or diagnosis (specify substance or drug); initial, up to 1 hour*). This includes a crosswalked total time of 9 minutes and an intraservice time of 5 minutes. We also proposed to crosswalk the direct PE inputs from CPT code 96365 for use in valuing HCPCS code G0138. However, we are adding 1 minute of L056A clinical staff time during the preservice portion of the service period to capture the RN/OCN observation of the patient during administration of the Opfolda pill. In addition, to account for the cost of the provision of the self-administered Opfolda as a direct PE input, we are incorporating the wholesale acquisition cost (WAC) data from the most recent available quarter. We proposed a price of $32.50 for the supply input that describes a 65mg capsule of Opfolda (supply code SH111). We sought feedback from interested parties on our proposal of national pricing, as well as our work RVU and direct PE inputs for HCPCS code G0138 to ensure proper payment for this service.

Comment: Regarding the proper payment for this service, one commenter stated that the correct WAC for supply code SH111 (65mg Opfolda pill) is $33.00 per pill and that the typical dosage of SH111 is 3 to 4 pills per patient, which would mean the total acquisition cost would be $132. The commenter also stated that they believe the infusion time for Cipaglucosidae alfa-atga incorporated in G0138 should be 4 to 5 hours instead of 1 hour and that the CPT crosswalk code 96365 does not adequately account for that time. Finally, the commenter requested that CMS incorporate the overhead and clinical staff expenses incurred after the administration of Opfolda and while the patient is observed.

Response: We thank the commenter for providing information to update the national payment for this service. We agree with the commenter that the prescribing information indicates that the typical dosage of Opfolda is 260mg for patients weighing ≥50 kg. We also agree with the commenter that the typical infusion time for Cipaglucosidae alfa-atga is 4 hours. However, we disagree with the commenter and continue to believe that CPT code 96365 is the appropriate crosswalk code for the infusion portion of the service. The overall increase in infusion time can be added to the direct PE equipment input to account for the extra 3 hours. We also believe that the 1 minute of L056A clinical staff time during the preservice portion of the service period adequately captures the RN/OCN observation of the patient during self-administration of the Opfolda pill. After consideration of the public comments, we are increasing the quantity of supply code SH111 in HCPCS code G0138 to 3.5 pills based on an average patient weight at a WAC of $33.00 per pill. We are also increasing the direct PE equipment time for EQ032 IV infusion pump and EF009 medical recliner chair from 60 minutes to 240

minutes. The work RVU and other direct PE inputs will be finalized as proposed.

(40) Payment for Caregiver Training Services

a. Background

In the CY 2017 PFS final rule (81 FR 80330 through 80331), we finalized payment for new CPT code(s) describing administration of a patient-focused health risk assessment instrument as well as administration of a caregiver-focused health risk assessment instrument. In the CY 2024 PFS final rule (88 FR 78914), we finalized the assignment of a payable status for caregiver training services (CTS) for therapy and behavior management/modification services (without the patient present) and finalized the RUC-recommended valuations for these services to better recognize the role that caregivers play in reasonable and necessary care for Medicare beneficiaries. These codes allow treating practitioners to report the training furnished to a caregiver, in tandem with the diagnostic and treatment services furnished directly to the patient, in strategies and specific activities to assist the patient in carrying out the treatment plan.

We finalized in the CY 2024 PFS final rule that payment may be made for CTS when the treating practitioner identifies a need to involve and train one or more caregivers to assist the patient in carrying out a patient-centered treatment plan. We also finalized that because CTS are furnished outside the patient's presence, the treating practitioner must obtain the patient's (or representative's) consent for the caregiver to receive the CTS. Additionally, we finalized that the identified need for CTS and the patient's (or representative's) consent for one or more specific caregivers to receive CTS must be documented in the patient's medical record. These finalized policies apply to current CTS coding and we also proposed for them to apply to the newly proposed CTS coding that follows. We continue to receive questions and requests from interested parties about how we can refine payment for these services.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters requested clarification that caregiver training services (described by CPT codes 97550, 97551, 97552, 96202, and 96203, as well as any caregiver training services HCPCS codes finalized in this year's rule, and any subsequently created caregiver training service codes) may be provided by auxiliary personnel incident to the services of a billing practitioner.

Response: Payment for CTS may be made to physicians, nurse practitioners (NPs), clinical nurse specialists (CNSs), certified nurse-midwives (CNMs), physician assistants (PAs) and clinical psychologists (CPs) under the PFS when they bill for CTS personally performed by them or by other practitioners or auxiliary personnel as an incident to their professional services.

Comment: Commenters requested that we clarify whether practitioners who are limited by statute to performing services for the diagnosis and treatment of mental illness (such as clinical psychologists, clinical social workers, marriage and family therapists, or mental health counselors) can furnish caregiver training services.

Response: Clinical social workers, marriage and family therapists, and mental health counselors can bill Medicare directly for caregiver training services they personally perform for the diagnosis or treatment of mental illness, so long as all other billing requirements are met. However, clinical social workers, marriage and family therapists, and mental health counselors cannot directly bill Medicare for caregiver training services if they were provided by auxiliary personnel, as they are not authorized to supervise, bill, and be paid directly by Medicare for services that are provided by auxiliary personnel incident to their professional services.

Comment: Commenters requested clarification of the minimum amount of time of caregiving training that must be furnished to report the code.

Response: Caregiver training services are treated the same as most other timed services, and the full-time listed in the code descriptor is required.

Comment: Commenters recommended that CMS avoid creating duplicative caregiver training HCPCS codes and instead work with the AMA to consider revisions to CPT coding. Other commenters suggested we work with CPT to create simpler caregiver training codes or re-create current coding to be more inclusive of different types of caregiver training services.

Response: We understand the desire from commenters for simpler coding for caregiver training. However, we also understand the immediate needs of beneficiaries for varying types of caregiver training services that are not currently represented by CPT coding. CMS is available to meet with the CPT Editorial Panel and the AMA to provide input and feedback regarding caregiver training CPT coding for future code creation or editing. Until then, we believe that it is paramount for patients to have appropriate access to these types of services through the creation of HCPCS G codes.

b. Caregiver Assessment

In response to interested parties' requests for assessment of a caregiver's knowledge to be included in caregiver training, we clarified that when reasonable and necessary, assessing the caregiver's skills and knowledge for the purposes of caregiver training services could be included in the service described by CPT code 96161 *(Administration of caregiver-focused health risk assessment instrument (e.g., depression inventory) for the benefit of the patient, with scoring and documentation, per standardized instrument)* to determine if caregiver training services are needed. We also note that CPT code 96161 is currently on the Medicare Telehealth list.

We note that, as specified in the CY 2017 PFS final rule (81 FR 80330), in particular cases, caregiver-focused health risk assessments can be necessary components of services furnished to Medicare beneficiaries. Examples where this service may be reasonable and necessary may include assessment of maternal depression in the active care of infants, assessment of parental mental health as part of evaluating a child's functioning, assessment of caretaker conditions as indicated where atypical parent/child interactions are observed during care, and assessment of caregivers as part of care management for adults whose physical or cognitive status renders them incapable of independent living and dependent on another adult caregiver. Commenters cited that some examples of such individuals might include intellectually disabled adults, seriously disabled military veterans, and adults with significant musculoskeletal or central nervous system impairments (81 FR 80331).

We proposed that because the caregiver-focused health risk assessment may be furnished outside the patient's presence, the treating practitioner must obtain the patient's (or representative's) consent for the caregiver to receive the assessment. We also proposed that the definition of ''caregiver'' specified in the CY 2024 PFS final rule (88 FR 78917) will be the same for caregiver training services and the caregiver-focused health risk assessment.

We sought comment on these proposals and clarifications.

We received public comments on these proposals. The following is a

summary of the comments we received and our responses.

Comment: Some commenters supported our clarifications that CPT code 96161 can be used to determine if caregiver training services are needed. Commenters were also supportive of our proposed consent requirements and proposed adoption of the definition of ''caregiver''.

Response: We thank commenters for their input. We clarify that a caregiver is not required to have a caregiver-focused health risk assessment to participate in caregiver training services.

After consideration of public comments, we are finalizing as proposed.

c. Proposals and New Coding

(A) Proposed Direct Care Caregiver Training Services

i. Coding

We proposed to establish new coding and payment for caregiver training for direct care services and supports. The topics of training could include, but would not be limited to, techniques to prevent decubitus ulcer formation, wound dressing changes, and infection control. Unlike other caregiver training codes that are currently paid under the PFS, the caregiver training codes for direct care services and support focus on specific clinical skills aimed at the caregiver effectuating hands-on treatment, reducing complications, and monitoring the patient. For example, in the direct care CTS codes, a caregiver could be taught how to properly change wound dressings to promote healing and prevent infection. This skill, among other direct care services, would not fall into the categories of CTS codes that currently exist (behavior management/modification or strategies and techniques to facilitate the patient's functional performance in the home or community) but is integral in effectuating the patient's treatment plan. Like other codes describing caregiver training services, these proposed new codes would reflect the training furnished to a caregiver, in tandem with the diagnostic and treatment services furnished directly to the patient, in strategies and specific activities to assist the patient to carry out the treatment plan. We believe that CTS may be reasonable and necessary when they are integral to a patient's overall treatment and furnished after the treatment plan is established. The CTS themselves need to be congruent with the treatment plan and designed to effectuate the desired patient outcomes. We believe this is especially the case in medical treatment scenarios where assistance by the caregiver receiving the CTS is necessary to ensure a successful treatment outcome for the patient—for example, when the patient cannot follow through with the treatment plan for themselves.

We proposed three new HCPCS codes: G0541 (*Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound dressing changes, and infection control) (without the patient present), face-to-face; initial 30 minutes*), G0542 (*Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound dressing changes, and infection control) (without the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service) (Use G0542 in conjunction with G0541)*), and G0543 (*Group caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound dressing changes, and infection control) (without the patient present), face-to-face with multiple sets of caregivers)*).

We continue to believe that CTS may be reasonable and necessary when they are integral to a patient's overall treatment and furnished after the treatment plan is established. The medical or direct care CTS themselves need to be congruent with the treatment plan and designed to effectuate the desired patient outcomes. We believe this is especially the case in medical treatment scenarios where assistance by the caregiver receiving the CTS is necessary to ensure a successful treatment outcome for the patient—for example when the patient cannot follow through with the treatment plan for themselves. Direct care training for caregivers of Medicare beneficiaries should be directly relevant to the person-centered treatment plan for the patient in order for the services to be considered reasonable and necessary under the Medicare program. Each training activity should be clearly identified and documented in the treatment plan. Additionally, this would not be billable for caregiver training that is already being separately billed for patients under home health plan of care, receiving at-home therapy, or receiving DME services for involved medical equipment and supplies.

We sought additional information from commenters about potential service overlaps and potential examples of direct care services to receive caregiver training to inform our final policy. We solicited public comment on each of our proposals for direct care CTS.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were generally supportive of the creation of these codes.

Response: We thank commenters for their support.

Comment: One commenter requested to use the term ''pressure injury'' as opposed to ''decubitus ulcer'' in these code descriptors.

Response: We thank commenters for their input and would like to note that the term ''decubitus ulcer'' is included in the code descriptor only as an example, and caregiver training for the broader term ''pressure injuries'' would be permitted when reasonable and necessary, as CMS uses both terms.

Comment: One commenter requested that we specify that these direct care caregiver training services are ''not billable for patients receiving durable medical equipment (DME) services for medical equipment and supplies,'' although surgical dressings are part of DMEPOS equipment and related supplies. The commenter also requested that we clarify the definition of DME services and how wound dressings are involved in those services.

Response: We seek to avoid potentially duplicative payment for services that are already paid for as part of another Medicare benefit such as the Medicare Part B benefit for durable medical equipment (DME) or the Medicare Part B benefit for surgical dressings. Payment to suppliers of DME items such as drug infusion pumps includes payment for supplies associated with use of the pump, such as wound dressings at the catheter site. DME suppliers are required to train the beneficiary or caregiver on use of supplies necessary for the effective use of the infusion pump, such as the dressings at the catheter site. Likewise, payment to suppliers of dressings covered under the Part B benefit for surgical dressings includes payment related to training the beneficiary or caregiver on how to use the dressings, including how to change them correctly.

However, we would also like to clarify that the goal of paying for the

direct care CTS for beneficiaries with wounds includes training related to all aspects of wound care, such as how to properly change dressings, use of different ointments, turning the patient to prevent pressure. Therefore, we are revising the direct care CTS code descriptors to replace the words ''wound dressing changes'' with ''wound care.'' We are finalizing the direct care CTS code descriptors to read:

- G0541 (*Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face; initial 30 minutes*);
- G0542 (*Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service) (Use G0542 in conjunction with G0541)*); and
- G0543 (*Group caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face with multiple sets of caregivers)*).

Comment: Some commenters requested that we remove the restriction for patients under home health plans of care, receiving at-home therapy, or receiving DME services for unrelated conditions.

Response: We agree with commenters that caregiver training may be appropriate for circumstances where a beneficiary's caregiver needs training, but the patient is under a home health plan of care, receiving at-home therapy, or receiving DME services for unrelated conditions. CTS would not be billable for caregiver training that is already being separately billed for patients under a home health plan of care, receiving at-home therapy, or receiving DME services for involved medical equipment and supplies. We seek to avoid potentially duplicative payment. We would not expect the caregiver population receiving these services on behalf of the patient to also receive CTS on behalf of the patient under another Medicare benefit category or Federal program.

Comment: Some commenters requested that we recognize that RDNs may provide CTS for special diet preparation.

Response: Registered dieticians (RDs) and nutrition professionals may only furnish direct care CTS when they identify a need to involve and train one or more caregivers to assist the patient in carrying out a patient-centered care plan for medical nutrition therapy (MNT) services. Medical nutrition therapy services are defined in section 1861(vv) of the Act as nutritional diagnostic, therapy, and counseling services for the purpose of disease management which are furnished by a RD or nutrition professional pursuant to a physician's referral. Under sections 1861(s)(2)(V) and 1861(vv) of the Act, RDs and nutrition professionals are limited to billing for MNT services they furnish to individuals with diabetes or a renal disease who meet certain specified criteria. This limitation would also apply to direct care CTS. In addition, because CTS are furnished outside the patient's presence, the RD or nutrition professional must obtain the patient's (or representative's) consent for the caregiver to receive the direct care CTS. Like other CTS, the identified need for CTS and the patient's (or representative's) consent for one or more specific caregivers to receive CTS must be documented in the patient's medical record.

Comment: Some commenters requested that these services would be designated as ''sometimes therapy'' services.

Response: We are designating direct care CTS as ''sometimes therapy'' services to facilitate payment for CTS under the PFS for outpatient physical therapy, occupational therapy, and speech-language pathology services when personally furnished by PTs and OTs, including those provided by their supervised assistants as appropriate, as well as the CTS personally furnished by SLPs. This means, as we stated in the CY 2024 PFS final rule (88 FR 78920) for the other CTS codes, that the services described by these codes are always furnished under a therapy plan of care when provided by PTs, OTs, and SLPs; but, in cases where they are appropriately furnished by physicians and NPPs outside a therapy plan of care, that is, where the services are not integral to a therapy plan of care, they can be furnished under a treatment plan by physicians and NPPs.

Comment: Many commenters requested that we add examples, such as caregiver training for home dialysis and rare disease treatments, describing other types of direct care to these code descriptors. Commenters also recommended working with interested parties to develop further examples.

Response: The examples of health conditions for which direct care CTS might be appropriate were not intended to be exhaustive. We acknowledge that there are many circumstances under which direct care CTS may be reasonable and necessary to train a caregiver who assists in carrying out a treatment plan.

After consideration of public comments, we are finalizing the following code descriptors: G0541 (Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face; initial 30 minutes), G0542 (Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service) (Use G0542 in conjunction with G0541)), and G0543 (Group caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face with multiple sets of caregivers)). We are also finalizing that caregiver training may be appropriate for circumstances where a beneficiary's caregiver needs training, but the patient is under a home health plan of care, receiving at-home therapy, or receiving DME services for unrelated conditions. In addition, we are finalizing that G0541, G0542, and G0543 are designated as ''sometimes therapy'' services. All other details for these codes are being finalized as proposed.

ii. Valuation

For G0541, we proposed a direct crosswalk to CPT Code 97550 (*Caregiver training in strategies and techniques to facilitate the patient's functional performance in the home or community (e.g., activities of daily living [ADLs], instrumental ADLs [iADLs], transfers, mobility, communication, swallowing,*

feeding, problem-solving, safety practices) (without the patient present), face to face; initial 30 minutes), with a work RVU of 1.00 as we believe this service reflects the resource costs associated when the billing practitioner performs HCPCS code G0541. CPT code 97550 has an intraservice time of 30 minutes, and the physician work is of similar intensity to our proposed HCPCS code G0541. Therefore, we proposed a work time of 30 minutes intraservice time (40 minutes of total time) for HCPCS code G0541 based on this same crosswalk to CPT 97550. We also proposed to use this crosswalk to establish the direct PE inputs for HCPCS code G0541.

For G0542, we proposed a direct crosswalk to CPT Code 97551 (*Caregiver training in strategies and techniques to facilitate the patient's functional performance in the home or community (e.g., activities of daily living [ADLs], instrumental ADLs [iADLs], transfers, mobility, communication, swallowing, feeding, problem solving, safety practices) (without the patient present), face to face; each additional 15 minutes (List separately in addition to code for primary service)*), with a work RVU of 0.54 as we believe this service reflects the resource costs associated when the billing practitioner performs HCPCS code G0542. CPT code 97551 has an intraservice time of 17 minutes, and the physician work is of similar intensity to our proposed HCPCS code G0542. Therefore, we proposed a work time of 17 minutes for HCPCS code G0542 based on this same crosswalk to CPT 97551. We also proposed to use this crosswalk to establish the direct PE inputs for HCPCS code G0542.

For G0543, we proposed a direct crosswalk to CPT Code 97552 (*Group caregiver training in strategies and techniques to facilitate the patient's functional performance in the home or community (eg, activities of daily living [ADLs], instrumental ADLs [iADLs], transfers, mobility, communication, swallowing, feeding, problem solving, safety practices) (without the patient present), face to face with multiple sets of caregivers*), with a work RVU of 0.23 as we believe this service reflects the resource costs associated when the billing practitioner performs HCPCS code G0543. CPT code 97552 has an intraservice time of 9 minutes, and the physician work is of similar intensity to our proposed HCPCS code G0541. Therefore, we proposed a work time of 9 minutes intraservice time (14 minutes total time) for HCPCS code G0543 based on this same crosswalk to CPT 97552. We also proposed to use this crosswalk to establish the direct PE inputs for HCPCS code G0543.

We sought comment on supplies/equipment that would be typical for the newly created direct care strategies and techniques CTS codes.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters pointed out that the proposed rule inadvertently referred to HCPCS codes GCTD1–3 in this section as GCTM1–3.

Response: We would like to thank commenters for pointing out this inadvertent drafting error. These codes are corrected above with the code descriptors for HCPCS codes G0541–G0543.

After consideration of public comments, we are finalizing the code descriptors for direct care caregiver training services, as described by HCPCS codes G0541–G0543.

Comment: Some commenters supported our valuation for HCPCS codes G0541–G0543. We did not receive comments discussing specific supplies and equipment that would be typical for these codes.

Response: We thank commenters for their input on the valuation of HCPCS codes G0541–G0543.

After consideration of public comments, we are finalizing as proposed.

We believe these services would largely involve contact between the billing practitioner and the caregiver through in-person interactions, which could be conducted via telecommunications, as appropriate. Therefore, we proposed to add these codes to the Medicare Telehealth Services List to accommodate a scenario in which the practitioner completes the caregiver training service via telehealth. Please see section II.D. for more information on Medicare Telehealth Services.

We sought comments on these proposals.

We received public comments on these proposals. Please refer to section II.D. for a summary of the comments we received and our responses.

(B) Individual Behavior Management/Modification Caregiver Training Services

i. Coding

We proposed to establish new coding and payment for caregiver behavior management and modification training that could be furnished to the caregiver(s) of an individual patient. Current CPT coding (CPT 96202 and 96203) allows for ''multiple-family group behavior management/modification training services,'' meaning that this caregiver training service can only be furnished in a group setting with multiple sets of caregivers of multiple beneficiaries (please reference 88 FR 78818 for discussion of CPT 96202 and 96203). We proposed two new HCPCS codes: G0539 (*Caregiver training in behavior management/modification for caregiver(s) of a patient with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face; initial 30 minutes*) and G0540 (*Caregiver training in behavior management/modification for caregiver(s) of a patient with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service) (Use G0540 in conjunction with G0539)*).

We continue to believe that CTS may be reasonable and necessary when they are integral to a patient's overall treatment and furnished after the treatment plan is established. The behavior management/modification CTS themselves need to be congruent with the treatment plan and designed to effectuate the desired patient outcomes. We believe this is especially the case in medical treatment scenarios where assistance by the caregiver receiving the CTS is necessary to ensure a successful treatment outcome for the patient—for example when the patient cannot follow through with the treatment plan for themselves. Behavior management/modification training for caregivers of Medicare beneficiaries should be directly relevant to the person-centered treatment plan for the patient in order for the services to be considered reasonable and necessary under the Medicare program. Each training activity should be clearly identified and documented in the treatment plan. All other policies and procedures surrounding CPT 96202 and 96203 will also apply to these services (88 FR 78914–78920).

We sought comment on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported our proposals to establish HCPCS codes G0539 and G0540. We received some comments requesting the

creation of broader caregiver training codes in the future.

Response: We thank commenters for their input, and we may consider commenters' recommendations for future rulemaking.

After consideration of public comments, we are finalizing HCPCS codes G0539 and G0540 as proposed.

ii. Valuation

For HCPCS code G0539, we proposed a direct crosswalk to CPT Code 97550 (*Caregiver training in strategies and techniques to facilitate the patient's functional performance in the home or community (e.g., activities of daily living [ADLs], instrumental ADLs [iADLs], transfers, mobility, communication, swallowing, feeding, problem solving, safety practices) (without the patient present), face to face; initial 30 minutes*), with a work RVU of 1.00 as we believe this service reflects the resource costs associated when the billing practitioner performs HCPCS code G0539. CPT code 97550 has an intraservice time of 30 minutes, and the physician work is of similar intensity to our proposed HCPCS code G0539. Therefore, we proposed a work time of 30 minutes intraservice time (40 minutes of total time) for HCPCS code G0539 based on this same crosswalk to CPT 97550. We also proposed to use this crosswalk to establish the direct PE inputs for HCPCS code G0539. We sought comment on supplies/equipment that would be typical for the newly created individual behavior management/modification CTS codes.

For HCPCS code G0540, we proposed a direct crosswalk to CPT Code 97551 (*Caregiver training in strategies and techniques to facilitate the patient's functional performance in the home or community (e.g., activities of daily living [ADLs], instrumental ADLs [iADLs], transfers, mobility, communication, swallowing, feeding, problem solving, safety practices) (without the patient present), face to face; each additional 15 minutes (List separately in addition to code for primary service)*), with a work RVU of 0.54 as we believe this service reflects the resource costs associated when the billing practitioner performs HCPCS code G0540. CPT code 97551 has an intraservice time of 17 minutes, and the physician work is of similar intensity to our proposed HCPCS code G0540. Therefore, we proposed a work time of 17 minutes for HCPCS code G0540 based on this same crosswalk to CPT 97551. We also proposed to use this crosswalk to establish the direct PE inputs for HCPCS code G0540.

We sought comment on supplies/equipment that will be typical for the newly created individual behavior management/modification CTS codes.

We believe these services will largely involve contact between the billing practitioner and the caregiver through in-person interactions, which could be conducted via telecommunications as appropriate. Therefore, we proposed to add these codes to the Medicare Telehealth Services List to accommodate a scenario in which the practitioner completes the caregiver training service via telehealth. Please see section II.D. for more information on Medicare Telehealth Services.

We sought comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters supported our valuation for HCPCS codes G0539 and G0540. In addition, a few commenters supported a crosswalk to CPT code 90832 (*Psychotherapy, 30 minutes with patient*), as commenters stated this was a more analogous code. We did not receive comments discussing specific supplies and equipment that would be typical for these codes.

Response: We continue to believe that a crosswalk to CPT codes 97550 and 97551 are most appropriate for valuation of HCPCS codes G0539 and G0540, as these codes match closely in time and intensity. In an effort to maintain relativity within the caregiver training code family, we believe this crosswalk is appropriate.

After consideration of public comments, we are finalizing as proposed.

(C) Patient Consent

In the CY 2024 PFS final rule (88 FR 78916), we finalized a requirement that the treating practitioner must obtain the patient's (or representative's) consent for the caregiver to receive the CTS and that the identified need for CTS and the patient's (or representative's) consent for one or more specific caregivers to receive CTS be documented in the patient's medical record.

We proposed that consent for CTS can be provided verbally by the patient (or representative). This will align consent requirements with other services paid under the PFS that may be furnished without the patient present, such as certain care management services. This proposal will apply to CPT codes 97550, 97551, 97552, 96202, and 96203, as well as any caregiver training services HCPCS codes finalized in this year's rule, and any subsequently created caregiver training service codes. We sought comment on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were supportive of our proposal to allow verbal consent for caregiver training services.

Response: We appreciate commenters' input.

After consideration of public comments, we are finalizing as proposed.

(D) Addition to Telehealth List

Please see section II.D. of this final rule, Payment for Medicare Telehealth Services, for the outline related to proposals to add CTS to the Medicare Telehealth list.

(41) Request for Information for Services Addressing Health-Related Social Needs (Community Health Integration (G0019, G0022), Principal Illness Navigation (G0023, G0024), Principal Illness Navigation-Peer Support (G0140, G0146), and Social Determinants of Health Risk Assessment (G0136))

a. Background

In the CY 2024 PFS final rule (88 FR 78920), we finalized G-codes to reflect new coding and payment for services describing Community Health Integration (CHI), G0019 (Community health integration services performed by certified or trained auxiliary personnel, including a community health worker, under the direction of a physician or other practitioner; 60 minutes per calendar month), and G0022 (Community health integration services, each additional 30 minutes per calendar month), which may include a community health worker (CHW), incident to the professional services and under the general supervision of the billing practitioner. We finalized a new stand-alone G code describing a SDOH Risk Assessment, G0136 (Administration of a standardized, evidence-based Social Determinants of Health Risk Assessment, 5–15 minutes, not more often than every 6 months). SDOH risk assessment refers to a review of the individual's SDOH or identified social risk factors that influence the diagnosis and treatment of medical conditions. We also finalized PIN services, described by HCPCS code G0023 (Principal Illness Navigation services by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a patient navigator or certified peer specialist; 60 minutes per calendar

month) and G0024 (*Principal Illness Navigation services, additional 30 minutes per calendar month*); G0140 (*Principal Illness Navigation—Peer Support by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a certified peer specialist; 60 minutes per calendar month*) and G0146 (*Principal Illness Navigation—Peer Support, additional 30 minutes per calendar month*), to better recognize through coding and payment policies when certified or trained auxiliary personnel under the direction of a billing practitioner, which may include a patient navigator or certified peer support specialist, are involved in the patient's health care navigation as part of the treatment plan for a serious, high-risk disease expected to last at least 3 months, that places the patient at significant risk of hospitalization or nursing home placement, acute exacerbation/decompensation, functional decline, or death.

b. Request for Information on Services Addressing Health-Related Social Needs

For CY 2025 we issued a broad request for information (RFI) on the newly implemented Community Health Integration (CHI) (HPCCS codes G0019, G0022), Principal Illness Navigation (PIN) (HCPCS codes G0023, G0024), Principal Illness Navigation- Peer Support (PIN–PS) (HCPCS codes G0140, G0146), and Social Determinants of Health Risk Assessment (SDOH RA) (HCPCS code G0136) services to engage interested parties on additional policy refinements for CMS to consider in future rulemaking.

We are interested in better addressing the social needs of beneficiaries and requesting information on the codes we created and finalized beginning in CY 2024 to fully encompass what interested parties and commenters believe should be included in the coding and payment we recently established. We sought comment on any related services that may not be described by the current coding that we finalized in the CY 2024 PFS final rule and that are medically reasonable and necessary ''for the diagnosis or treatment of illness or injury'' under section 1862(a)(1)(A) of the Act. We believe we can work within the current coding framework and explore additional opportunities to create codes that describe reasonable and necessary services furnished by billing practitioners and the auxiliary personnel under their general supervision. We are interested in feedback regarding any barriers to furnishing the services addressing health-related social needs, and if the service described by the codes we established are allowing practitioners to better address unmet social needs that interfere with the practitioners' ability to diagnose and treat the patient. This could include barriers specific to certain populations, including rural and tribal communities, residents of the U.S. Territories, individuals with disabilities, individuals with limited English proficiency, or other populations who experience specific unmet social needs.

In response to the CY 2024 PFS proposed rule, we heard from commenters that CSWs often connect individuals with community-based resources to address unmet social needs that affect the diagnosis and treatment of medical problems. CSWs can bill Medicare directly for services they personally perform for the diagnosis or treatment of mental illness but are not authorized by statute to bill for services that are provided by auxiliary personnel incident to their professional services. Since CHI and PIN codes are typically provided by auxiliary personnel supervised by the billing practitioner, CSWs could serve as the auxiliary personnel. CSWs could not directly bill Medicare for CHI and PIN services if they were provided by auxiliary personnel, as they are not authorized to supervise, bill, and be paid directly by Medicare for services that are provided by auxiliary personnel incident to their professional services. We believe the current CHI and PIN coding accurately captures the services CSWs currently provide, including the work involved in connecting beneficiaries with community-based resources for unmet social needs that affect the diagnosis or treatment of medical problems. As we stated previously in the CY 2024 PFS final rule (88 FR 78926), ''the codes do not limit the types of other health care professionals, such as registered nurses and social workers, that can perform CHI services (and PIN services, as we discuss in the next section) incident to the billing practitioner's professional services, so long as they meet the requirements to provide all elements of the service included in the code, consistent with the definition of auxiliary personnel at § 410.26(a)(1).'' We proposed to clarify that when we refer to ''certified or trained auxiliary personnel'' in the following codes: G0019, G0022, G0023, G0024, G0140, G0146, this also includes CSWs.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Commenters overwhelmingly supported of this clarification.

Response: We thank commenters for their input.

We are finalizing our clarification as proposed.

We requested information if there are other types of auxiliary personnel, other certifications, and/or training requirements that are not adequately captured in current coding and payment for these services. We are also interested in hearing more about what types of auxiliary personnel are typically furnishing these services, including the certifications and/or licensure that they have. We are also interested in whether there are nuances or considerations that CMS should understand related to auxiliary personnel and training, certifications or licensure barriers or requirements that are specifically experienced by practitioners serving underserved communities. This could include settings such as community mental health centers, community health clinics including FQHCs and RHCs, tribal health centers, migrant farmworker clinics, or facilities located in and serving rural and geographically isolated communities including the U.S. Territories.

As noted in the CY 2023 PFS final rule (87 FR 69790) and explained in the CY 2023 PFS proposed rule (87 FR 46102), when we refer to community-based organizations, we mean public or private not-for-profit entities that provide specific services to the community or targeted populations in the community to address the health and social needs of those populations. They may include community-action agencies, housing agencies, area agencies on aging, centers for independent living, aging and disability resource centers or other non-profits that apply for grants or contract with healthcare entities to perform social services. They may receive grants from other agencies in the U.S. Department of Health and Human Services, including Federal grants administered by the Administration for Children and Families (ACF), Administration for Community Living (ACL), the Centers for Disease Control and Prevention (CDC), the Substance Abuse and Mental Health Services Administration (SAMHSA), or State-funded grants to provide social services. We stated that, generally, we believe such organizations know the populations and communities they serve and may have the infrastructure or systems in place to assist practitioners to provide CHI and PIN services. We stated that we understood that many community-based organizations (CBOs) provide social services and do other work that is beyond the scope of CHI and PIN

services, but we believed they are well-positioned to develop relationships with practitioners for providing reasonable and necessary CHI and PIN services.

We are interested in hearing more about CBOs and their collaborative relationships with billing practitioners. The new codes for CHI and PIN services recognized CBOs and their role in providing auxiliary personnel under the general supervision of the billing practitioners. We sought comment regarding the extent to which practitioners are contracting with CBOs (including current or planned contracting arrangements) for auxiliary personnel purposes, and if there is anything else CMS should do to clarify services where auxiliary personnel can be employed by the CBO, so long as they are under the general supervision of the billing practitioner. Given that the CHI and PIN services may be provided incident to the billing practitioner's professional services, we are also seeking comment on whether the incident to billing construct is appropriate for CBOs to supplement pre-existing staffing arrangements and the CBO/provider interface. We also sought comment on CBOs' roles, the extent to which practitioners are contracting with CBOs, incident to billing, and auxiliary personnel employed by CBOs under general supervision of practitioners serving and located in rural, tribal and geographically isolated communities, including the U.S. Territories.

We also solicited comments from interested parties across provider types and from practitioners in geographically isolated communities (for example, rural, tribal, and island communities) and otherwise underserved communities about coding Z codes on claims associated with billing for CHI, PIN, and SDOH risk assessment codes. We recognized that when screening for social needs, such needs may be identified and are interested in learning whether practitioners are also capturing unmet social needs on claims using Z codes for social risk factors or in some other way, and any barriers or opportunities to increase coding of Z codes when social risk factors screen positive.

Over the past several years, we have worked to develop payment mechanisms under the PFS to improve the accuracy of valuation and payment for the services furnished by physicians and other health care professionals, especially in the context of evolving models of care and addressing unmet social needs that affect the diagnosis and treatment of medical problems. Given the Agency's broader policy goals of increasing access to care, we are requesting information from interested parties and commenters on anything else that we should consider in the context of these codes and what else we could consider to be included in this newly established code set.

We sought comments on ways to identify specific services and to recognize possible barriers to improved access to these kinds of high-value, potentially underutilized services by Medicare beneficiaries.

We sought public comment to understand more clearly how often evidence-based care for persons with fractures, for example, is not provided and the reasons for this, and how recent or new PFS codes, or their revaluation, might help resolve specific barriers to its provision. The PFS currently includes many codes that pay for various components of care to manage patients with fractures over a course of treatment, such as transitional care management (TCM) and other care management services, evaluation and management visits (including the inherent complexity add-on for office/outpatient visits), principal illness navigation services, community health integration services, and the social determinants of health risk assessment. We referred readers to our recent guidance on these services on the CMS website at *https://www.cms.gov/files/document/health-related-social-needs-faq.pdf.* Medicare also pays for bone mass measurement/density tests (*MLN006559—https://www.cms.gov/medicare/prevention/prevntiongeninfo/medicare-preventive-services/mps-quickreferencechart-1.html#BONE_MASS*, and for outpatient osteoporosis medication under Part D and, in some cases, Part B (*https://www.medicare.gov/coverage/osteoporosis-drugs*). These services can be billed on their own, or in combination, where applicable. We note that in the CY 2020 PFS final rule (84 FR 62685) and CY 2021 PFS final rule (85 FR 84547), CMS indicated that TCM may be billed concurrently with other care management codes when relevant, medically necessary, and not duplicative.

We proposed new coding in other sections of this CY 2025 final rule that might be used to bill for managing fractures under a treatment plan, including the global post-operative add-on code, HCPCS code GPOC1, in section II.L. of this final rule and the advanced primary care management codes in section II.G.2 of this final rule. Interested parties have indicated that orthopedic surgeons, skilled nursing facilities (SNFs), and other practitioners and providers may not be providing comprehensive patient centered fracture management care for quality, payment, or administrative reasons, and that there is inadequate ''hand-off'' when post-discharge fracture care is transferred to practitioners in the community. They indicate a systemic disconnect on which provider and/or specialty is responsible for osteoporosis diagnosis and treatment, and that global surgical periods focus on acute fracture recovery rather than addressing osteoporosis. We are interested in hearing if the global postop add-on code could help resolve these issues.

We received public comments on this RFI. The following is a summary of the comments we received and our responses.

Comment: A few commenters responded to our RFI for fracture-related care. Overall, commenters agreed that care is commonly fragmented in osteoporosis and post-fracture care. Some commenters stated that services like APCM, GPOC1 (G0559), CHI, or PIN do not accurately describe fracture liaison services. Other commenters said that the initiating visits for CHI and PIN may be a barrier to care. Similar to general feedback we received for CHI and PIN, commenters requested that initiating visits be furnished retroactively, meaning that during care transitions, CHI or PIN services could begin, as long as the initiating visit occurs within 30 days of discharge.

Response: We thank commenters for their feedback and may consider these recommendations and requests for future rulemaking. We clarify that for billing PIN services, there are circumstances in which osteoporosis may be considered a serious, high-risk disease expected to last at least 3 months, that places the patient at significant risk of hospitalization or nursing home placement, acute exacerbation/decompensation, functional decline, or death.

Comment: Commenters provided many examples of services and service elements that may not be described in current coding, as well as information about how CBOs are currently working with practitioners to furnish these services.

Response: We thank commenters for providing further information about how CHI, PIN, and SDOH risk assessment services are currently being used and how these services could be improved in the future. We will consider this information for future rulemaking.

TABLE 17: CY 2025 Work RVUs for New, Revised, and Potentially Misvalued Codes

HCPCS	Descriptor	CY 2024 Work RVU	Proposed CY 2025 Work RVU	Final CY 2025 Work RVU	CMS Work Time Refinement
15011	Harvest of skin for skin cell suspension autograft; first 25 sq cm or less	NEW	C	C	Yes
15012	Harvest of skin for skin cell suspension autograft; each additional 25 sq cm or part thereof (List separately in addition to code for primary procedure)	NEW	C	C	Yes
15013	Preparation of skin cell suspension autograft, requiring enzymatic processing, manual mechanical disaggregation of skin cells, and filtration; first 25 sq cm or less of harvested skin	NEW	C	C	Yes
15014	Preparation of skin cell suspension autograft, requiring enzymatic processing, manual mechanical disaggregation of skin cells, and filtration; each additional 25 sq cm of harvested skin or part thereof (List separately in addition to code for primary procedure)	NEW	C	C	Yes
15015	Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, trunk, arms, legs; first 480 sq cm or less	NEW	C	C	Yes
15016	Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, trunk, arms, legs; each additional 480 sq cm or part thereof (List separately in addition to code for primary procedure)	NEW	C	C	Yes
15017	Application of skin cell suspension autograft to wound and donor sites, including application of primary dressing, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 480 sq cm or less	NEW	C	C	Yes

F. Evaluation and Management (E/M) Visits

1. Office/Outpatient (O/O) Evaluation and Management (E/M) Visit Complexity Add-On

In the CY 2024 PFS final rule (88 FR 78970 through 78982), we finalized separate payment for the O/O E/M visit complexity add-on code. The full descriptor for the O/O E/M visit complexity add-on code, HCPCS code G2211, is (*Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition. (Add-on code, list separately in addition to office/outpatient evaluation and management visit, new or established)*).

The O/O E/M visit complexity add-on code ''reflects the time, intensity, and PE resources involved when practitioners furnish the kinds of O/O E/M visit services that enable them to build longitudinal relationships with all patients (that is, not only those patients who have a chronic condition or single high-risk disease) and to address the majority of a patient's health care needs with consistency and continuity over longer periods of time.'' (88 FR 78970 through 78971). We explained in the CY 2024 PFS final rule that it is the relationship between the patient and the practitioner that is the determining factor for when the add-on code should be billed. The add-on code captures the inherent complexity of the visit that is derived from the longitudinal nature of the practitioner and patient relationship. The first part of the code descriptor, the ''continuing focal point for all needed health care services,'' describes a relationship between the patient and the practitioner when the practitioner is the continuing focal point for all health care services that the patient needs. The second part of the add-on code also describes a relationship involving medical services that are part of ongoing care related to a patient's single, serious condition or a complex condition. There is previously unrecognized but important cognitive effort of utilizing the longitudinal relationship in making a diagnosis, developing a treatment plan, and weighing the factors that affect a longitudinal doctor-patient relationship. The practitioner must decide what course of action and choice of words in the visit itself would lead to the best health outcome in the single visit while simultaneously building up an effective, trusting longitudinal relationship with the patient. Weighing these various factors, even for a seemingly simple condition, makes the entire visit inherently complex, which is what this add-on code is intended to capture (88 FR 78973 through 78974).

We responded to concerns raised by commenters about potential duplicative payment and potential misreporting of the code, noting that when procedures or other services are reported on the same day by the same billing practitioner as a significant, separately identifiable O/O E/M visit (the base codes that the visit complexity add-on code can be billed with), we believed that the services involve resources that are sufficiently distinct from the costs associated with furnishing stand-alone O/O E/M visits to warrant a different payment policy (88 FR 78971). We finalized our proposal that the O/O E/M visit complexity add-on code is not payable when the O/O E/M visit is reported with CPT Modifier -25, which denotes a significant, separately identifiable O/O E/M visit by the same physician or other qualified health care professional on the same day as a procedure or other service (88 FR 78974).

Some commenters expressed concern about our proposal to exclude payment for the visit complexity add-on code when the O/O E/M base code is reported with Modifier -25 because some preventive services such as the annual wellness visit (AWV) or a preventive vaccine are often provided on the same day as a separately identifiable O/O E/M visit, appropriately billed with Modifier -25. The commenters were concerned that practitioners might avoid the policy by not providing a preventive service on the same day as another O/O E/M service. We acknowledged that immunizations and AWVs were sometimes furnished on the same day as an O/O E/M visit and that our policy would prevent payment of the add-on code with such office visits billed with Modifier -25 and indicated that we would monitor utilization of the visit complexity add-on code and continue engagement with interested parties as the policy is implemented (88 FR 78975).

We have begun to monitor utilization of HCPCS code G2211 and are continuing to engage with interested parties. We continue to hear from some practitioners that our non-payment of the O/O E/M visit complexity add-on code when the O/O E/M base code is reported on the same day as a preventive immunization or other Medicare preventive service is disruptive to the way such care is usually furnished and contrary to our policy objective for establishing the add-on payment. An early analysis of practitioner claims from the first few months of 2024 shows relatively few Medicare preventive services being billed on the day preceding or following an O/O E/M visit. We cannot conclude from this analysis that our policy to deny payment of the O/O E/M visit complexity add-on code when the O/O E/M base code is reported on the same day as a preventive immunization or other Medicare preventive service is disruptive to the way such care is usually furnished. However, we do agree with practitioners expressing concerns that the current policy is not well-aligned with our policy objective for establishing the add-on payment.

In response to these concerns, we proposed to refine our current policy for services furnished beginning in CY 2025. We proposed to allow payment of the O/O E/M visit complexity add-on code when the O/O E/M base code is reported by the same practitioner on the same day as an AWV, vaccine administration, or any Medicare Part B preventive service furnished in the office or outpatient setting. Allowing payment for the O/O E/M visit complexity add-on code in this scenario as proposed would support our policy aims, which include paying for previously unaccounted resources inherent in the complexity of all longitudinal primary care office visits. In part, the O/O E/M visit complexity add-on code recognizes the inherent costs of building trust in the practitioner-patient relationship. We believe that trust-building in the longitudinal relationship is more significant than ever in making decisions about the administration of immunizations and other Medicare Part B preventive services. We welcomed comments on this proposal.

We received many public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal and encouraged CMS to finalize as proposed. They stated that there are inherent costs of building trust in the practitioner-patient relationship, which is particularly important when making decisions about administering immunizations and other Medicare Part B preventive services, and that these inherent costs are reflected in the valuation of the O/O E/M visit complexity add-on code.

Response: We agree and thank commenters for their support of this proposal.

Comment: A few commenters opposed our proposal and questioned

the need for the O/O E/M visit complexity add-on code based on arguments similar to those made in prior years. Those in opposition stated that our proposed policy would result in unnecessary payments if finalized because the O/O E/M visit complexity add-on code itself is ill defined and the O/O E/M visit code set is appropriately valued.

Response: We refer the commenters to the CY 2024 PFS final rule (88 FR 78972) where we discussed similar concerns regarding duplicative payment when the O/O E/M visit complexity add-on code (HCPCS code G2211) is billed with an O/O E/M visit. We continue to believe that the values we established for the revised O/O E/M CPT codes in the CY 2021 PFS final rule did not fully account for the resource costs associated with primary care and certain types of specialty visits (85 FR 84569). However, those values were finalized in concert with separate payment for HCPCS code G2211 which accounted for the resource costs associated with those types of visits (87 FR 69588).

Comment: A few commenters recommended that CMS allow the O/O E/M visit complexity add-on code (HCPCS code G2211) to be reported alongside other CPT codes, such as those describing other E/M visits furnished to beneficiaries in other settings of care including nursing facilities, assisted living facilities and the patient's home. Commenters explained that home-based primary care practices provide access to primary care services for patients who otherwise would not be able to leave the house to see a primary care practitioner, and include the development of longitudinal, ''high-touch'' relationships with their patients.

Response: We appreciate that practitioners who provide home-based primary care services may furnish E/M visits in an individual's home or residence that contribute to the development of longitudinal relationships with those patients. Commenters focused on how practitioners who furnish E/M visits to patients in homes or residences, nursing facilities, and assisted living facilities develop longitudinal relationships with their patients just as practitioners do in the office or outpatient setting. Whereas the values we established for the revised O/O E/M CPT codes in the CY 2021 PFS final rule were finalized in concert with separate payment for HCPCS code G2211 (85 FR 84569, 87 FR 69588), we finalized work RVUs for the nursing facility E/M visit codes (87 FR 69604 through 69606) and the home or residence services code family (87 FR 69608 and 69609) subsequently in the CY 2023 final rule. Nevertheless, we may consider in future rulemaking whether home or residence evaluation and management services bear unrecognized resource costs and whether HCPCS code G2211 should be applicable to home or residence E/M visits.

Comment: Many commenters recommended that in addition to the AWV, immunizations and preventive services, we finalize that payment for the O/O E/M visit complexity add-on code (HCPCS code G2211) can be made when the following services are reported by the same billing practitioner on the same day as HCPCS code G2211: an echocardiogram or other cardiovascular imaging procedure, occipital nerve block via injection, nebulizer treatment, ambulatory continuous glucose monitoring (CGM), Transitional Care Management (TCM), and spirometry or inhalation device education. These commenters stated that as these services are part of long-term, longitudinal relationships with patients who are often extremely complex and require extensive evaluation, HCPCS code G2211 captures the additional work of treating these patients. Other commenters stated that certain specialists, such as endocrinologists, typically see sicker patients than primary care practitioners and to the extent that other services (beyond O/O E/M visits and preventive services) are furnished to these patients they should also be billable alongside HCPCS code G2211.

Other commenters stated that we should continue to explore the appropriateness of restricting billing of HCPCS code G2211 to O/O E/M visits not billed with the payment modifier -25. These commenters stated that even if the visit is being reported in conjunction with another service, there still may be resource costs associated with longitudinal care that are not reflected in the payment for the O/O E/M visit or the other service.

Other commenters recommended that, rather than refine our billing policies to allow HCPCS code G2211 to be billable alongside O/O E/M visits with modifier -25, that we prohibit concurrent billing with codes in the surgical section of the CPT Codebook (CPT codes 10000–69999), or allow billing of HCPCS code G2211 with O/O E/M visits reported with modifier -25 during a global period if the global period has >0% designated to pre or post operative care.

Many commenters also requested clarification as to whether HCPCS code G0402 (*Initial Preventive Physical Exam (IPPE))* was included as a preventive service billable alongside HCPCS code G2211.

Response: We note that the application of the add-on code is not based on the characteristics of particular patients (even though the rationale for valuing the code is based on recognizing the typical complexity of patient needs), but rather the relationship between the patient and the practitioner (88 FR 78973). In part, HCPCS code G2211 recognizes the inherent costs of building trust in the practitioner-patient relationship that are not reflected in the valuation of the O/O E/M code set. As we discussed in the proposed rule, building trust as part of a longitudinal practitioner-patient relationship may be particularly significant in the context of preventive services, and for this reason, we believe it is appropriate to limit billing of HCPCS code G2211 to preventive services at this time. However, we do acknowledge the points raised by commenters about other similar services and may consider broadening the applicability of HCPCS code G2211 through future rulemaking.

Regarding reporting HCPCS code G2211 alongside O/O E/M visits with modifier -25, we continue to believe as we stated in the CY 2024 PFS final rule, that separately identifiable O/O E/M visits occurring on the same day as minor procedures (such as zero-day global procedures) have resources that are sufficiently distinct from the costs associated with furnishing stand-alone O/O E/M visits to warrant a different payment policy, and as such, we finalized that the O/O E/M visit complexity add-on code, HCPCS code G2211, is not payable when the O/O E/M visit is reported with payment modifier -25 (88 FR 78971). We may consider additional changes to this policy for future rulemaking. We responded to comments that suggested alternative policies and that suggested exemptions for specific codes, including codes that would fall within the range of CPT codes 10000–69999 referenced by one of the commenters on the CY 2025 PFS proposed rule. We believed the alternatives offered by commenters could increase administrative burden with minimal benefit gained and unnecessarily delay reactivation of the complexity add-on code and payment (88 FR 78974–78975). We would need more time to evaluate the potential policy implications and systems changes associated with a prohibition on concurrently billing HCPCS code G2211 with codes in the surgical section of the CPT Codebook (CPT codes 10000–69999) or allow billing of HCPCS code G2211 with O/O E/M visits

reported with modifier -25 during a global period if the global period has >0% designated to pre or post operative care.

We appreciate commenters' recommendations for additional services to be included in the refined policy for the O/O E/M visit complexity add-on code that we proposed to apply for the AWV, vaccine administration, and Part B preventive services furnished in the office or outpatient setting. While we did not propose and are not adding other services to our refined policy for the O/O E/M visit complexity add-on code in this final rule, we are confirming that the IPPE, also known as the ''Welcome to Medicare'' preventive visit is included in our proposed policy because it is a Part B preventive service furnished in the office or outpatient setting.

Comment: Several commenters requested that we provide detailed medical necessity requirements and documentation guidelines related to reporting HCPCS code G2211.

Response: In response to interested party feedback requesting guidance about medical necessity and documentation requirements, we posted frequently asked questions at *https://www.cms.gov/files/document/hcpcs-g2211-faq.pdf*. As we stated in this document, we have not specified any additional medical record documentation requirements for reporting HCPCS code G2211. Our medical reviewers may use the medical record documentation to confirm the medical necessity of the visit and the patient care relationship as appropriate. We would expect that information included in the medical record or in the claims history for a patient/practitioner combination, such as diagnoses, the practitioner's assessment and medical plan of care, and/or other codes reported could serve as supporting documentation for billing HCPCS code G2211. Practitioners should consult their Medicare Administrative Contractor (MAC) regarding documentation requirements related to the underlying O/O E/M visit.

After consideration of public comments, we are finalizing as proposed to allow payment of the O/O E/M visit complexity add-on code (HCPCS code G2211) when the O/O E/M base code (CPT 99202–99205, 99211–99215) is reported by the same practitioner on the same day as an AWV, vaccine administration, or any Medicare Part B preventive service.

G. Enhanced Care Management

1. Background

As described in the CY 2025 Medicare Physician Fee Schedule (PFS) proposed rule, the CMS Center for Medicare and Medicaid Innovation (CMS Innovation Center) tests innovative payment and service delivery models to reduce program expenditures while preserving or enhancing quality of care. CMS Innovation Center models are assessed for their impact on quality of care and expenditures under Medicare, Medicaid, and the Children's Health Insurance Program (CHIP) and the scope and duration of the model test may be expanded through rulemaking if expected to either reduce spending without compromising quality of care or enhance quality of care without increasing spending (section 1115A of the Act). After more than a decade of testing over 50 innovative payment and service delivery models, the CMS Innovation Center has enabled broad transformative changes to service delivery and payment in the Medicare, Medicaid, and CHIP programs which inspire additional transformation throughout the health care delivery system. Participants in CMS Innovation Center models have demonstrated improvements in care delivery and patient experience. The CMS Innovation Center undertook a retrospective review and synthesis of select model evaluations where care delivery changes have been observed, and the review indicated demonstrable evidence of enhanced care delivery in several areas, such as care coordination, team-based care, and leveraging data to risk-stratify patients.[24]

Under the PFS statute at section 1848 of the Act, we establish payment amounts for covered physicians' services, and update our payment policies to address changes, including changes in medical practice. In the CY 2025 PFS proposed rule, we proposed to incorporate key payment and service delivery elements from CMS Innovation Center models tested and evaluated over the prior decade into permanent coding and payment under the PFS (89 FR 61596). Specifically, we proposed to recognize a primary care practice delivery model trend which we will refer to as ''advanced primary care'' and which we propose to define using the 2021 National Academies of Sciences, Engineering, and Medicine (NASEM) report on Implementing High-Quality Care as: ''whole-person, integrated, accessible, and equitable health care by interprofessional teams that are accountable for addressing the majority of an individual's health and wellness needs across settings and through sustained relationships with patients, families, and communities.'' [25] Using this definition, we proposed to recognize the resources involved in furnishing services using an ''advanced primary care'' approach to care under the PFS [26] (89 FR 61596). Under this approach, the delivery of care is supported by a team-based care structure and involves a restructuring of the primary care team, which includes the billing practitioner and the auxiliary personnel under their general supervision, within practices. This restructuring creates several advantages for patients, and provides more broad accessibility and alternative methods for patients to communicate with their care team/practitioner about their care outside of in-person visits (for example, virtual, asynchronous interactions, such as online chat), which can lead to more timely and efficient identification of, and responses to, health care needs (for example, practitioners can route patients to the optimal clinician and setting—to a synchronous visit, an asynchronous chat, or a direct referral to the optimal site of care).[27] Practitioners using an advanced primary care delivery model can more easily collaborate across clinical disciplines through remote interprofessional consultations with specialists as well as standardize condition management into evidence-based clinical workflows, which allow for closed-loop follow-up and more real-time management for

patients with acute or evolving complex issues. Practitioners can then use synchronous interactions to build rapport with patients and families, partner on complex decisions, and personalize their patients' care plans.

Specifically, we proposed to adopt coding and payment policies to recognize advanced primary care management (APCM) services for use by practitioners who are providing services under this specific model of advanced primary care, when the practitioner is the continuing focal point for all needed health care services and responsible for all primary care services for a patient. This new coding and payment makes use of lessons learned from the CMS Innovation Center's testing of a series of advanced primary care models, such as Comprehensive Primary Care (CPC),[28] Comprehensive Primary Care Plus (CPC+),[29] and Primary Care First (PCF)[30] [31] to inform the elements upon which the delivery of APCM services under an advanced primary care delivery model depend. As detailed in this final rule, this coding and payment will incorporate elements of several specific, existing care management and communication technology-based services (CTBS) into a bundle of services, that reflects the essential elements of the delivery of advanced primary care, for payment under the PFS starting in 2025.

In the context of the proposal, we were also interested in feedback on other related policies for our consideration in future rulemaking. To gather information from interested parties to inform potential future proposals, we included an Advanced Primary Care Hybrid Payment Request for Information (RFI) (Advanced Primary Care RFI) in the proposed rule. The Advanced Primary Care RFI sought feedback on whether and how we should consider additional payment policies that reflect our efforts to recognize the delivery of advanced primary care, including bundling of additional individual services, which may currently be furnished together as primary care services but paid separately. This focused approach to seeking feedback on advanced primary care payment policies is an important step in our ongoing efforts to emphasize accountable care and supports our goal of having 100 percent of Traditional Medicare beneficiaries in accountable care relationships by 2030.[32]

In addition to recognizing advanced primary care, this final rule also recognizes physician and practitioner work that draws from evidence generated by the CMS Innovation Center's Million Hearts® model.[33] The Million Hearts® model found that quantitative assessment of patients' atherosclerotic cardiovascular disease (ASCVD) risk and providing high-risk beneficiaries with cardiovascular-focused care management services improved quality of care, including mortality.[34] We proposed to establish coding and PFS payment for these services based in part on the evidence generated by the Million Hearts® model.

2. Advanced Primary Care Management (APCM) Services (HCPCS Codes G0556, G0557, and G0558)

a. Background

We described in the CY 2025 PFS proposed rule that we have been analyzing opportunities to strengthen and invest in primary care in alignment with the goals of the U.S. Department of Health and Human Services (HHS) Initiative to Strengthen Primary Care.[35] Research has demonstrated that greater primary care physician supply is associated with improved population-level mortality and reduced disparities,[36] and also, that establishing a long-term relationship with a primary care provider leads to reduced emergency department (ED) visits,[37] improved care coordination, and increased patient satisfaction.[38] HHS recognizes that effective primary care is essential for improving access to healthcare, for the health and wellbeing of individuals, families, and communities, and for achieving health equity. The first coordinated set of HHS-wide actions to strengthen primary care, as part of the Initiative, is in primary care payment; for example, adjusting payment to ensure it supports delivery of advanced primary care. CMS Innovation Center models, described in section II.G.2.a.(1) in this final rule, reflect the ongoing work within HHS and the unified, comprehensive approach to HHS primary care activities that we are accomplishing through our current statutory authorities and funding.

Over the last decade, we have updated PFS payment policies as appropriate, and we remain committed to improving how Medicare payment recognizes the resources involved in furnishing covered services that encompass aspects of advanced primary care furnished by interprofessional care teams and typically concentrating on the delivery of appropriate preventive care to patients and the management of individuals' chronic conditions as they progress over time. As part of the CY 2014 PFS final rule, we reaffirmed our support of primary care and recognized care management as one of the critical components of primary care that contributes to better health outcomes for individuals and reduced expenditure growth, and explained our prioritization of the development and implementation of several initiatives (such as those discussed in section II.G.2.a.(1) in this final rule) (77 FR 68978). Since then, we have implemented coding and payment for many care management services to better recognize the resources involved in furnishing medically necessary care management activities that generally are performed outside the context of a face-to-face, in-person visit—most often by the billing practitioner's clinical staff on behalf of patients with complex health care needs, including transitional care management in the CY 2013 PFS final rule (77 FR 68979); non-complex and complex chronic care management (CCM) in the CY 2015, 2017, and 2019

PFS final rules (78 FR 74414, 83 FR 58577, and 81 FR 80244); and principal care management (PCM) in the CY 2020 PFS final rule (84 FR 62962). The CCM and PCM code families now include 5 sets of codes which are reported monthly on a timed basis, each set with a base code of 20 to 60 minutes and an add-on code for each additional 30 minutes. The code sets vary by the degree of complexity of patient conditions (that is, non-complex and complex CCM for multiple chronic conditions or PCM for a single high-risk condition), and whether the number of minutes spent by clinical staff or the physician or non-physician practitioner (NPP) is used to meet time thresholds for billing.

Additionally, we have established coding and payment for certain services where a medical professional evaluates a patient's medical information remotely using communication technology. As discussed in the CY 2019 PFS final rule, this set of services is defined by and inherently involves the use of communications technology, and includes certain remote patient monitoring services, virtual check-in services, remote evaluation of pre-recorded patient information, remote interpretations of diagnostic imaging tests, and interprofessional consultations. We recognize that technological advances have changed and continue to change the practitioner-patient care delivery interaction. We have recognized these technology-enabled interactions through separately billable CTBS over the last several years. However, we acknowledge, as we learn more about how advanced primary care services are furnished to patients, that in some clinical care delivery scenarios, practitioners furnishing the type of care highlighted in this discussion may furnish certain aspects of the CTBS services in complement to care management services (for example, by allowing interprofessional care teams to answer patient questions, refer patients to higher levels of care, view and interpret patient images, order needed treatments, and offer reassurance or advice), in an effort to more efficiently manage the quantity and quality of medical information that is necessary to support effective patient-centered treatment plans.

Despite these important steps to pay separately for these care management services, there has been limited uptake of care management services and Medicare still overwhelmingly pays for primary care through traditional office/outpatient (O/O) Evaluation and Management (E/M) visit codes, which describe a broad range of physicians' services but do not fully distinguish and account for the resources associated with primary care and other longitudinal care. As we stated in the CY 2024 PFS final rule, because E/M visit codes are intended to be used very broadly, the complexity of services required to provide this type of care is not fully incorporated as part of the valuation of the work RVUs when the E/M code itself is used as the primary way to report the work of the professional (88 FR 78972). In the CY 2024 PFS final rule, we took steps to better recognize the inherent complexity of visits associated with primary and longitudinal care of patients by finalizing a new add-on code (HCPCS code G2211, *Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition*) for use by practitioners furnishing services as the continuing focal point for all the patient's needed health care services, such as a primary care practitioner (88 FR 78969). When furnishing primary and longitudinal care, practitioners must be attuned to the factors that develop and maintain trusting practitioner-patient relationships that enable effective diagnosis, management, and treatment on an ongoing basis. In finalizing the O/O E/M visit complexity add-on code, we recognized the feedback from interested parties indicating that the care management codes alone may not have mitigated the deficiencies in the ability of existing E/M codes to reflect the time and resources involved in furnishing visits in the context of longitudinal care—of which, advanced primary care is one model. Many commenters responded, as reflected in the CY 2024 PFS final rule, that they did not view the coding and payment currently available under the PFS as capable of recognizing the broad range of elements that define primary care (88 FR 52326). Other commenters responded that they did not believe that the existing E/M service codes alone reflect the work and resources involved in furnishing non-procedural care to Medicare beneficiaries (88 FR 78976).

Over the years, interested parties have focused attention on the ongoing need to improve how practitioners are paid, in and outside of payment bundles, including but not limited to the possibility of E/M codes designed specifically to be billed in conjunction with care management codes and the elimination of multiple disparities between the payment for E/M services in global periods and those furnished individually. Based on feedback from the physician and practitioner community, we understand that advanced primary care encompasses the work of interprofessional teams who are accountable for addressing the majority of an individual's health and wellness needs across settings and through sustained relationships, which necessarily involves time spent by primary care practitioners and their clinical staff outside of individual E/M visits.

As with many services paid under the PFS, we balance making payment that recognizes and supports technological developments in healthcare and the resources involved in evolving medical practice to allow for appropriate and expanded access to innovative technologies and newer services with promoting stability and efficiency in coding and billing rules for practitioners and institutions. We recognize the important role of gathering input and information from the CMS Innovation Center models (described in more detail in section II.G.2.a.(1) in this final rule), comment solicitations, research from other public and private entities, the work of all parties involved in furnishing primary care, and from the public at large. As previously noted, interested parties have given ample feedback over the years to inform our recognition of care management services; for example, as part of the CY 2022 PFS rulemaking, interested parties specifically requested our consideration of a ''30-day global period bundling care management services'' and we responded that we would consider this suggestion for future rulemaking (86 FR 65118). We have continued to incorporate feedback into our rulemaking and strengthen our care management code sets with the goal of better recognizing the elements of advanced primary care as part of a multi-year strategy. Based on this feedback, we proposed to establish a set of codes to better describe advanced primary care management services broadly, to provide more stability in payment and coding for practitioners in the context of continued evolution in advanced primary care, as well as to provide us with a mechanism for continued and intentional improvements to advanced primary care payment.

(1) Key Care Delivery Methods in Select CMS Innovation Center Models

We described in the CY 2025 PFS proposed rule that we have prioritized

the implementation or testing of a series of initiatives designed to improve payment for, and encourage long-term investment in, primary care and care management services. By supporting enhanced care management and coordination, these initiatives contributed to the growing practice of advanced primary care and have also provided valuable lessons learned that we have incorporated into our policies.

Several CMS Innovation Center models address payment for care management services and CTBS. The CPC initiative,[39] the CPC+ model,[40] and the PCF model [41] all included payments for care management services that closely aligned with the care management services included in the PFS. In these initiatives and models, primary care practices received risk-adjusted, per beneficiary per month (PBPM) payments for care management services furnished to Medicare FFS beneficiaries attributed to their practices. These model payments were designed to offer practices a stable, predictable revenue stream that supported required infrastructure and appropriately compensated practices for the enhanced services they would provide. Practices participating in the CPC+ consistently cited these payments as the most useful type of model payment support they received; these stable, prospectively paid payments typically served as the main funding source for compensating care managers, behavioral health providers, and other staff hired to improve care delivery.[42] Because these payments were paid prospectively and could be used to support a range of care management and coordination activities, they provided participants with greater financial stability and flexibility to develop and expand capabilities to meet patients' care needs.[43] Table 23 identifies a number of CMS Innovation Center models and key care delivery methods from each.[44]

TABLE 23: Key Care Delivery Methods from Select CMS Innovation Center Models

Model	Key Care Delivery Methods	Citation
ACO Investment Model (AIM)	AIM provided an opportunity for participants to invest in care transformation activities. Specifically, AIM was an opportunity for independent primary care practices in rural communities to hire population health staff, such as care managers or outreach coordinators. Care managers conducted outreach, scheduling, and patient education. Care managers did this through a variety of mechanisms including phone, in the physician office, and via home visits.	Evaluation of the Accountable Care Organization Investment Model, Final Report, September 2020, available at: https://www.cms.gov/priorities/innovation/data-and-reports/2020/aim-final-annrpt
Comprehensive Primary Care (CPC)	CPC practices provided longitudinal and episodic care management services for patients at high or rapidly increasing risk whom the practices believed were most likely to benefit from intensive support. By 2016, CPC practices risk stratified 95% of their empaneled patients, and provided care management to 20% of those patients. CPC practices also greatly increased their use of dedicated care managers over time. By 2016, 89% of practices reported that, "care managers who were members of the [primary care] practice team systematically provided care management services to high-risk patients" – an increase from 20% in 2012. Beneficiaries attributed to CPC practices had slower growth in hospitalizations and emergency department (ED) visits than those being managed by practices not in the model.	Evaluation of the Comprehensive Primary Care Initiative, Fourth Annual Report, May 2018, available at: *https://downloads.cms.gov/files/cmmi/CPC-initiative-fourth-annual-report.pdfhttps://downloads.cms.gov/files/cmmi/CPC-initiative-fourth-annual-report.pdf* Long-Term Effects of the Comprehensive Primary Care Model on Health Care Spending and Utilization. May 2022. Available at: *https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9130381/.*
Comprehensive Primary Care Plus (CPC+)	CPC+ practices used data and team-based care to proactively identify the needs of their patients and efficiently manage their care. Additionally, by the final year of the model, about 97% of physicians in CPC+ and comparison practices reported the use of scheduled phone, video, or e-visits for at least some of their patients. Finally, CPC+ had small favorable effects on some claims-based, quality-of-care	Evaluation of Comprehensive Primary Care Plus. Final Report, December 2023, available at: *https://www.cms.gov/priorities/innovation/data-and-reports/2023/cpc-plus-fifth-annual-eval-report.*

Model	Key Care Delivery Methods	Citation
	measures of planned care and population health and patient and caregiver engagement.	
Primary Care First (PCF)	All PCF practices provide 24/7 access to a care team practitioner with real-time access to an electronic health record (EHR). Practices also provide risk-stratified care management for all empaneled patients and ensure beneficiaries receive timely follow-up contact from the practice after ED visits and hospitalizations. Practices commonly report expanding their practice care team by hiring additional clinical and non-clinical staff to bolster longitudinal care management services.	Evaluation of the Primary Care First Model, Second Annual Report, February 2024, available at: *https://www.cms.gov/priorities/innovation/data-and-reports/2024/pcf-second-eval-rpt.*

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters overwhelmingly supported the proposed coding and payment policies to recognize APCM services under this specific model of advanced primary care, making use of lessons learned from the CMS Innovation Center's testing of advanced primary care models. Most commenters expressed gratitude that separate payment could be available for services they had already been furnishing, and many commenters appreciated our goal to address the perceived gap in payment for care management and coordination for patients without multiple chronic conditions. Many commenters appreciated the proposed shift away from time-based payment and thanked us for acknowledging that primary care needs often change month to month. Several commenters supported our proposals' emphasis on technology integration and commitment to the evolving healthcare landscape, highlighting the importance of virtual interactions for better patient-centered care. A few commenters were concerned that our proposed APCM coding and payment would duplicate work described by the existing CCM and PCM codes, potentially creating confusion and administrative burden. One commenter suggested we collaborate with the AMA's CPT Editorial Panel on coding or revise existing CCM and PCM codes to reduce burden and simplify requirements.

Many commenters recommended that cost sharing be eliminated for the proposed APCM services, indicating that any amount of cost sharing could be prohibitive to receiving beneficiary consent, ultimately limiting the uptake of and billing for APCM services. A few commenters suggested that APCM services are preventive services that should be exempt from beneficiary cost sharing. Several commenters indicated that cost sharing had limited their ability to bill for other care management services, resulting in their underutilization. A few commenters stressed that it can be difficult to educate beneficiaries on the value of care management services and the associated cost sharing because the patient is not ordinarily present when APCM services are performed. Finally, one commenter believed that the application of cost sharing could exacerbate existing health inequities.

Response: We thank the commenters for their support and feedback. We anticipate that these services will fill a need in primary care and care management, and result in more accurate payment for advanced primary care under the PFS. While we recognize concerns about potential confusion with CCM and PCM, APCM codes are essential for improving payment accuracy and enabling practitioners to spend more time with patients. We look forward to reviewing and considering, including through potential future rulemaking, any recommendations from the AMA's CPT Editorial Panel and RUC if they consider developing CPT codes and recommending valuations for these or similar services.

In response to the comments regarding elimination of beneficiary cost sharing for APCM services, most services covered under Medicare Part B carry cost sharing obligations (deductible and co-payment) unless the statute specifies that they do not apply. As for considering APCM services to be ''preventive services'' to which cost sharing does not apply, we do not see how APCM services would fit within any of the benefit categories for preventive services under the Act at this time. In particular, the Secretary has the authority to add ''additional preventive services'' that, among other things, have been assigned an ''A'' or ''B'' rating by the United States Preventive Services Task Force. But APCM services have not earned such a rating at this time. Since APCM services do not currently meet the criteria for ''additional preventive services,'' we cannot designate them as such under section 1861(s)(2)(BB) of the Act or remove coinsurance obligations on that basis at this time. Further, we do not have other statutory authority that would allow us to remove or waive the applicable cost sharing for APCM services.

b. Proposed HCPCS G-Codes for Advanced Primary Care Management (APCM)

We proposed in the CY 2025 PFS proposed rule to establish coding and make payment under the PFS for a newly defined set of APCM services described and defined by three new

HCPCS G-codes. To recognize the resource costs associated with furnishing APCM services to Medicare beneficiaries, we proposed to establish and pay for three new G-codes that describe a set of care management services and CTBS furnished under a broader application of advanced primary care. This new coding and payment would reflect the recognized effectiveness and growing adoption of the advanced primary care approach to care.[45] It will also encompass a broader range of services and simplify the billing and documentation requirements, as compared to existing care management and CTBS codes, for clinicians who care for their patients using an advanced primary care model. We recognize that there are primary care physicians, practitioners, and practices beyond those that have participated in CMS Innovation Center primary care models (such as those outlined in section II.G.2.a.(1) in this final rule), that may incur resource costs associated with their treatment of patients based on the advanced primary care delivery model. Providing care using an advanced primary care delivery model involves resource costs associated with maintaining certain practice capabilities and continuous readiness and monitoring activities to support a team-based approach to care, where significant resources are used on virtual, asynchronous patient interactions, collaboration across clinical disciplines, and real-time management of patients with acute and complex concerns, that are not fully recognized or paid for by the existing care management codes. We have observed medical practice trends in primary care for several years. We note that in prior rulemaking, for example, in the CY 2013 PFS final rule, we stated, ''we further consider[ed] how advanced primary care practices can fit within a fee-for-service model'' (77 FR 68987), and in the CY 2015 PFS final rule, we stated our commitment ''to supporting advanced primary care, including the recognition of care management as one of the critical components of primary care that contributes to better health for individuals and reduced expenditure growth'' (79 FR 67715). In the CY 2017 PFS final rule, we discussed changes to retain elements of the CCM service that are ''most characteristic of the changes in medical practice toward advanced primary care'' (81 FR 80251). As the delivery of primary care has evolved to embrace advanced primary care more fully, it is prudent to now adopt specific coding and payment policy to better recognize the resources involved in care management under an advanced primary care delivery model.

In the CY 2025 PFS proposed rule, we explained the proposed new codes and their descriptors (89 FR 61596), we proposed to define the elements of the scope of service for APCM that will be required for a practitioner to bill Medicare for the APCM service, and we explained the standards for practices that furnish APCM services to ensure that the physicians and practitioners who bill for these services have the capability to fully furnish advanced primary care, including APCM services (see section II.G.2.c. of this final rule). We proposed to identify specific care management and CTBS services that are a part of advanced primary care delivery and would be bundled into the PFS payment for the APCM services. As such, we identified the services that we proposed will overlap substantially with the new codes and which will not be separately billable with the APCM codes under our proposal (see section II.G.2.d. of this final rule). Finally, we proposed to establish relative values for these codes for purposes of payment under the PFS (see section II.G.2.e. of this final rule).

We proposed the following G-codes and descriptors for APCM services, and as explained in section II.G.2.d. of this final rule, due to the similar scope of APCM and other care management and CTBS services, we proposed to include some of the same language from the CCM and PCM service elements in the APCM code descriptors, as well as emphasized that certain practice capabilities and requirements are inherent in these elements and must be met in order to bill for APCM services:

HCPCS code G0556 (*Advanced primary care management services provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the following elements, as appropriate:*

- *Consent;*

++ *Inform the patient of the availability of the service; that only one practitioner can furnish and be paid for the service during a calendar month; of the right to stop the services at any time (effective at the end of the calendar month); and that cost sharing may apply.*

++ *Document in patient's medical record that consent was obtained.*

- *Initiation during a qualifying visit for new patients or patients not seen within 3 years;*
- *Provide 24/7 access for urgent needs to care team/practitioner, including providing patients/caregivers with a way to contact health care professionals in the practice to discuss urgent needs regardless of the time of day or day of week;*
- *Continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments;*
- *Deliver care in alternative ways to traditional office visits to best meet the patient's needs, such as home visits and/or expanded hours;*
- *Overall comprehensive care management;*

++ *Systematic needs assessment (medical and psychosocial).*

++ *System-based approaches to ensure receipt of preventive services.*

++ *Medication reconciliation, management and oversight of self-management.*

- *Development, implementation, revision, and maintenance of an electronic patient-centered comprehensive care plan;*

++ *Care plan is available timely within and outside the billing practice as appropriate to individuals involved in the beneficiary's care, can be routinely accessed and updated by care team/practitioner, and copy of care plan to patient/caregiver;*

- *Coordination of care transitions between and among health care providers and settings, including referrals to other clinicians and follow-up after an emergency department visit and discharges from hospitals, skilled nursing facilities or other health care facilities as applicable;*

++ *Ensure timely exchange of electronic health information with other practitioners and providers to support continuity of care.*

++ *Ensure timely follow-up communication (direct contact, telephone, electronic) with the patient and/or caregiver after an emergency department visit and discharges from hospitals, skilled nursing facilities, or other health care facilities, within 7 calendar days of discharge, as clinically indicated.*

• *Ongoing communication and coordinating receipt of needed services from practitioners, home- and community-based service providers, community-based social service providers, hospitals, and skilled nursing facilities (or other health care facilities), and document communication regarding the patient's psychosocial strengths and needs, functional deficits, goals, preferences, and desired outcomes, including cultural and linguistic factors, in the patient's medical record;*

• *Enhanced opportunities for the beneficiary and any caregiver to communicate with the care team/practitioner regarding the beneficiary's care through the use of asynchronous non-face-to-face consultation methods other than telephone, such as secure messaging, email, internet, or patient portal, and other communication-technology based services, including remote evaluation of pre-recorded patient information and interprofessional telephone/internet/EHR referral service(s), to maintain ongoing communication with patients, as appropriate;*

++ *Ensure access to patient-initiated digital communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits).*

• *Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate;*

• *Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients;*

• *Be assessed through performance measurement of primary care quality, total cost of care, and meaningful use of Certified EHR Technology).*

HCPCS code G0557 (*Advanced primary care management services for a patient with multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the elements included in G0556, as appropriate*) and HCPCS code G0557 (*Advanced primary care management services for a patient that is a Qualified Medicare Beneficiary with multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the elements included in G0556, as appropriate*).

We proposed that HCPCS codes G0556 through G0558 would describe APCM services furnished per calendar month, following the initial qualifying visit (see section II.G.2.c.(1) for more on the initiating visit). Physicians and NPPs, including nurse practitioners (NPs), physician assistants (PAs), certified nurse midwives (CNMs) and clinical nurse specialists (CNSs), could bill for APCM services. As we describe in more detail in section II.G.2.c., within the code descriptors for HCPCS codes G0556, G0557, and G0558, we proposed to include the elements of the scope of service for APCM as well as the practice capabilities and requirements that are inherent to care delivery by the care team/practitioner who is billing under a practice using an advanced primary care delivery model, and necessary to fully furnish and, therefore, bill for APCM services.

As described in more detail in section II.G.2.e.(1) of this final rule, within the code descriptors for HCPCS codes G0556, G0557, and G0558, we proposed that the practitioner who bills for APCM services intends to be responsible for the patient's primary care and serves as the continuing focal point for all needed health care services. We anticipated that most practitioners furnishing APCM services will be managing all the patient's health care services over the month and have either already been providing ongoing care for the beneficiary or have the intention of being responsible for the patient's primary care and serving as the continuing focal point for all the patient's health care services. We anticipate that these codes will mostly be used by the primary care specialties, such as general medicine, geriatric medicine, family medicine, internal medicine, and pediatrics, but we are also aware that, in some instances, certain specialists function as primary care practitioners—for example, an OB/GYN or a cardiologist. In contrast to situations where the patient's overall, ongoing care is being managed, monitored, and/or observed by a practitioner, there are situations when care is provided by a practitioner who would not serve as ''the continuing focal point for all needed health care services.'' Similarly, there are some time- or condition-limited practitioner-patient relationships that are clearly not indicative of the ongoing care that we anticipate practitioners would be responsible for when furnishing APCM services. As we stated in the CY 2021 PFS proposed rule and CY 2024 PFS final rule in the context of our policies for the O/O E/M visit complexity add-on code (HCPCS code G2211), a practitioner whose ''relationship with the patient is of a discrete, routine, or time-limited nature; such as, but not limited to, a mole removal or referral to a physician for removal of a mole; for treatment of a simple virus, for counseling related to seasonal allergies, initial onset of gastroesophageal reflux disease; treatment for a fracture; and where comorbidities are either not present or not addressed, and/or when the billing practitioner has not taken responsibility for ongoing medical care for that particular patient with consistency and continuity over time, or does not plan to take responsibility for subsequent, ongoing medical care for that particular patient with consistency and continuity over time'' (85 FR 84570 and 84571, 88 FR 78971). For example, a patient who spends one month of the year in another location could require physicians' services in that location if they experience exacerbation of one of their chronic conditions, but the practitioner who treats them would not intend to manage or monitor that patient's overall, ongoing care. Finally, HCPCS code G2211 can also be billed when medical services are ''part of ongoing care related to a patient's single, serious condition or complex condition,'' but this is different from the APCM requirement. A practitioner's management of one or more serious conditions (as is often the case with specialty care), without more, does not mean that the practitioner is also responsible for all primary care services and the focal point for all needed care (the requirement for APCM), and thus would not necessarily mean that the practitioner could bill for APCM.

As is our current policy for other care management services, and consistent with both CPT guidance and Medicare rules for CPT codes 99487, 99489, 99490, we proposed that HCPCS codes G0556, G0557, and G0558 may only be reported once per service period (calendar month) and only by the single practitioner who assumes the care management role with a particular beneficiary for the service period (89 FR 61596). That is, based on a patient's status, a physician or practitioner would identify the patient to receive Level 1, Level 2, or Level 3 APCM services

during a given service period (calendar month), and we would make payment for only one claim for APCM services for that service period. At this time, we do not see the need or value of implementing restrictions or complex operational mechanisms to identify a single physician or NPP who may bill for APCM services for a specific beneficiary. However, we recognize that other initiatives, such as the Medicare Shared Savings Program, have operational mechanisms in place to attribute patients to certain ACOs (§ 425.400). While a similar approach could be used to attribute patients for APCM services, we are reluctant to introduce unnecessary complexity for these services. As we continue to develop our policies in this area, we sought feedback from interested parties on methodologies that could allow for identification of the beneficiary's primary care practitioner. We also sought comment on whether there should be additional requirements to prevent potential care fragmentation or service duplication.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received a few comments regarding the types of practitioners that can furnish and be paid for APCM services. These interested parties thanked us for including advanced practice nurses such as nurse practitioners, certified nurse midwives, and clinical nurse specialists. Several commenters encouraged us to add additional types of health care professionals to those who can furnish APCM, such as registered nurses and pharmacists.

Response: We thank the commenters for their feedback. We appreciate the value of interdisciplinary teams, which can include registered nurses and pharmacists. As discussed later in this rule, APCM services can be furnished by the types of Medicare-enrolled practitioners that are authorized under the statute to furnish and be paid for services performed by auxiliary personnel (which can include registered nurses and pharmacists) incident to their own professional services. We proposed to add APCM services as designated care management services under § 410.26(b)(5), which means that these services can be performed by auxiliary personnel under the general supervision of the billing physician or other practitioner. As defined under § 410.26(a)(3), general supervision means the service is furnished under the physician's (or other practitioner's) overall direction and control, but the physician's (or other practitioner's) presence is not required during the performance of the service, whereas direct supervision in the office setting means the physician (or other supervising practitioner) must be present in the office suite and immediately available to furnish assistance and direction throughout the performance of the service.

Comment: A few commenters asked how to identify the practitioner responsible for the patient's primary care, giving an example of a patient who has a primary care practitioner and a geriatrician. Other commenters supported our proposed definition of primary care practitioner as the individual responsible for the patient's primary care and who serves as the continuing focal point for all needed health care services, with one stating that such a practitioner would understand the history and context of each patient. Another commenter agreed with our proposed approach to identifying the appropriate practitioner for purposes of billing for APCM services, as it is tailored toward those practitioners who provide consistent, longitudinal care rather than those who provide more time-limited, discrete services. We did not receive any comments about patient-practitioner relationships not indicative of a primary care relationship.

Response: We appreciate the commenters' support for our proposed approach to identifying the primary care practitioner responsible for the patient's care. We recognize that a patient may regularly see multiple practitioners, and that more than one of them may be in a specialty that is generally considered to furnish primary care, as in the example provided by the commenter of a patient who sees their primary care practitioner and a geriatrician. While more than one practitioner may have an ongoing relationship with the patient, there ordinarily would be only one of them who serves as the continuing focal point for all needed health care services. We proposed that the patient must be informed as part of the required beneficiary consent before receiving APCM services that only one practitioner can furnish and be paid for these services during a calendar month. We believe that any lack of clarity as to which practitioner serves as the continuing focal point for all care can be resolved through the beneficiary consent process and with clear and comprehensive patient education.

Comment: A few commenters indicated it may be useful to use a beneficiary's attestation of their main health care practitioner on *Medicare.gov* to identify who could bill for APCM services. Additionally, some commenters suggested that we should develop a claims-based attribution method similar to that used by the Shared Savings Program or CMS Innovation Center models to determine the responsible primary care practitioner.

Response: We thank the commenter for this suggestion. We acknowledge that an attribution method that uses historical claims data and/or beneficiary attestations made through *Medicare.gov* could be useful to reduce the administrative burden on practitioners in determining whether they are the appropriate primary care practitioner for purposes of APCM services. Given that these are new services, we believe it would be more appropriate to refrain from implementing additional requirements so that we may consider feedback from interested parties as they gain experience billing for these services. We may consider additional guardrails to prevent the submission of APCM claims from more than one practitioner through possible future rulemaking. Finally, as we discussed in the CY 2021 final rule related to monitoring appropriate use of the E/M visit complexity add-on code (HCPCS code G2211), we believe that information included in the patient's medical record or claims history could serve as supporting documentation to help us determine whether the billing physician or practitioner is the appropriate primary care practitioner for purposes of APCM services (85 FR 84571). We would like to remind commenters that only one practitioner can bill for APCM services per month, which should be discussed when obtaining the patient's consent for these services.

Comment: We received many comments about the specialties of the practitioners we would expect to furnish and bill for APCM services. A few commenters were split on whether specialists should be permitted to bill for the APCM codes, with some commenters recommending that specialists who might tend to serve in the role of primary care practitioner, such as cardiologists, endocrinologists, and pulmonologists should be allowed to bill for APCM services. Other commenters stated that even specialists who have long-term relationships with patients are unlikely to provide advanced primary care services as envisioned in our proposed APCM codes, and expressed concern that allowing them to bill for APCM services could lead to fragmented care.

Response: We understand the commenters' concerns about fragmented care, especially across specialists and primary care practitioners. Our aim in developing proposals to identify the appropriate practitioner to furnish and bill for APCM services was to retain flexibility to allow for the specific circumstances of individual practitioners and beneficiaries. We reiterate as described before that a specialist who manages one or more of a patient's serious conditions is not necessarily the practitioner who is responsible for all of the patient's primary care and the focal point for all needed health care, which is specified in the code descriptors as the basis for a practitioner to furnish and bill for APCM services. In the event that a specialist and a primary care practitioner both intend to be responsible for all primary care services and serve as the focal point of all needed care for the same patient, we note that we proposed to make payment to only one practitioner for APCM services in any single month. Further, we proposed that the patient must be informed of this as part of the required patient consent before receiving APCM services. We believe that the question of which practitioner should furnish and bill for APCM services for a patient can be resolved through clear and comprehensive patient education, as well as communication between practitioners if needed.

Comment: Several commenters agreed with our proposed coding structure of monthly billing for APCM. A few other commenters agreed that a monthly billing cycle strikes a balance between the number of times these services are furnished annually and monthly payment.

Response: We thank commenters for their support. We continue to believe that billing APCM each calendar month is the most appropriate billing cadence.

After consideration of public comments, we are finalizing our proposals without modification to create three G-codes to describe APCM services effective January 1, 2025, which can be billed monthly following the initiating qualifying visit (see section II.G.2.c.(1) for more on the initiating visit) by the physician or practitioner (nurse practitioner, physician assistant, certified nurse midwife, or clinical nurse specialist) who intends to be responsible for the patient's primary care and serve as the continuing focal point for all needed health care services. We are not limiting APCM services to practitioners in specific specialties, but we remain open to feedback about these policies from interested parties.

We anticipate that APCM services would ordinarily be provided by clinical staff incident to the professional services of the billing practitioner in accordance with our regulation at § 410.26. We proposed that APCM services will be considered a ''designated care management service'' under § 410.26(b)(5) and, as such, could be provided by auxiliary personnel under the general supervision of the billing practitioner.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were overwhelmingly supportive of our proposal to include APCM as a designated care management service, including support for our proposal to allow general supervision of auxiliary personnel for these services.

Response: We thank commenters for their support.

After consideration of public comments, we are finalizing our proposal to add APCM services as a ''designated care management service'' under § 410.26(b)(5) and, as such, these services can be provided by auxiliary personnel under the general supervision of the billing practitioner.

Unlike the other coding to describe care management services, we further proposed that the code descriptors for HCPCS codes G0556, G0557, and G0558 would not be time-based (89 FR 61596). Based on feedback from the physician and practitioner community, we understand that ongoing care management and coordination services are standard parts of advanced primary care, even in months when documented clinical staff or billing professional minutes may not reach the required thresholds for billing or the patient's condition does not meet the clinical conditions for care management services under the existing code set. In consideration of the extensive feedback from interested parties, we have learned that practitioners who currently furnish monthly care management services may already be providing APCM services in a variety of clinical circumstances, documenting all necessary aspects of the patient-centered care furnished monthly to the patient without meeting the requirements to bill for care management services, such as satisfying the administrative requirement to count clinical staff minutes to reach specific time-based thresholds. As we stated in the CY 2024 PFS final rule in the context of the O/O E/M visit complexity add-on code (HCPCS code G2211), physicians and practitioners may diagnose and treat a condition in an O/O E/M visit that is not expected to last as long as three months or would not reasonably be expected to result in a risk of hospitalization, and the practitioner's clinical staff may provide significant care management and coordination services relating to that condition. For example, COVID–19 cases are clinical circumstances that generally do not last three months but may require significant acute management, care coordination, and follow-up within a given month, particularly for patients with comorbidities (88 FR 78973). Practitioners may also provide care management and coordination services to a patient whose condition meets the criteria in one or more care management codes, but the documented minutes of service may not reach the minimum time threshold to bill for a care management service. For example, the practitioner might provide care coordination for a month that includes 20 minutes of consulting with the patient's other healthcare providers and modifying medications to address an acute exacerbation of hypertension but will not meet the requirements for billing the PCM service. We also noted that, unlike the current coding to describe certain CTBS services, we proposed that the code descriptors for HCPCS codes G0556, G0557, and G0558 will not include the timeframe restrictions for billing certain CTBS (for example, the restriction for virtual check-in services that there is not a related E/M service provided within the previous 7 days or an E/M service or procedure within the next 24 hours or the soonest available appointment). As addressed in the CY 2019 PFS final rule, we have heard from interested parties that the timeframe restrictions for billing certain CTBS are administratively burdensome (83 FR 59686).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters were overwhelmingly supportive of our proposal to not require the counting of clinical staff minutes spent furnishing APCM services to reach specific time-based thresholds for billing the proposed APCM codes, noting that doing so is both administratively burdensome and often results in practitioners providing services that they are unable to bill and be paid for because they do not reach the required minimum time threshold to bill for a service. One commenter applauded this proposal and asserted that, in time-based billing scenarios, the need to

maintain a certain rate of billable units across the patient population to keep the program financially tenable may directly or indirectly incentivize care managers to prioritize activities that fulfill billing requirements and deprioritize needed activities for patients who may need intervention but have already fulfilled the billing requirements or are unlikely to fulfill the billing requirements. A few commenters expressed concern that removing the time-based thresholds may inadvertently incentivize over-billing of the proposed APCM codes, in which a practitioner bills the APCM codes for beneficiaries whether or not they are performing any of the APCM service elements, such as care coordination.

Response: We agree with the commenters who suggested that practitioners delivering care using an advanced primary care approach are providing ongoing care management and coordination services for their patients. While these activities should be documented in the patient's medical record, we agree that the need to document clinical staff minutes spent providing these services is unnecessarily administratively burdensome in the context of advanced primary care, and that the requirement to meet time-based thresholds is not necessary to bill the APCM codes (HCPCS codes G0556, G0557, and G0558) as we proposed to define them. While we appreciate the concern about over-billing, we believe that practitioners that meet all of the other requirements to bill HCPCS codes G0556, G0557, and G0558, and are documenting the care management and coordination services they are furnishing to patients in the medical record without recording the clinical staff minutes spent on each activity, are providing medically necessary advanced primary care management services. We reiterate that, while only one physician or practitioner may furnish and be paid for APCM services for a patient in a single month, a patient's other health care providers can furnish and bill for other care management services, such as TCM, CCM, PCM, CHI, PIN, and certain CTBS, when medically necessary. Additionally, we recognize that there may be some practitioners who do not furnish care using the advanced primary care model or prefer to bill using other care management codes rather than the new APCM codes. We note that, like all other physicians' services billed under the PFS, each of these services must be medically reasonable and necessary to be paid by Medicare.

Comment: Most commenters were supportive of not including the same time-based restrictions on billing other services that apply for CTBS in the code descriptors for HCPCS codes G0556, G0557, and G0558. Commenters also suggested that it is not always possible to adhere to the current restrictions on billing for certain CTBS services, including for virtual check-in services that there is not a related E/M service provided within the previous 7 days or an E/M service or procedure within the next 24 hours or the soonest available appointment, despite a practitioner's best efforts to do so.

Response: We agree that the time-related billing restrictions that apply for certain CTBS services (for example, virtual check-in services) are not necessary for HCPCS codes G0556, G0557, and G0558. We adopted the limitations on when certain CTBS can be billed with other codes to avoid duplicative payment. For example, in the case of virtual check-in services, which are a brief exchange with a practitioner to determine whether the patient needs to be seen or the problem can be addressed in a different way, payment for a contemporaneous E/M service would already reflect the resources involved in furnishing the virtual check-in service. However, in the case of virtual check-ins provided as part of APCM services, there is no need for such limitations because the APCM codes describe a broad set of advanced primary care services—not all of which will be provided in any particular month.

After consideration of public comments, we are finalizing our proposal without modification to establish APCM codes and descriptors that reflect all elements of service furnished during a month without specifying the amount of time that must be spent furnishing the services during the month; and without including time-related billing restrictions for the elements of the services.

We also proposed that not all elements included in the code descriptors for APCM services must be furnished during any given calendar month for which the service is billed (89 FR 61596). APCM services are largely designed to be person-centered and focused on the individual patient, such that the elements that are provided depend on medical necessity and individual patient need. Therefore, we anticipate that all the APCM scope of service elements (for example, comprehensive care management and care coordination) will be routinely provided, as deemed appropriate for each patient, acknowledging that not all elements may be necessary for every patient during each month (for example, the beneficiary may have no hospital admissions that month, so there is no management of a care transition after hospital discharge). We also anticipate that there may be some months where it may be appropriate for some service elements to be performed more than once for the patient. For example, in one month a patient with heart failure and chronic kidney disease receiving APCM Level 2 services (G0557) may be on a stable medication regimen, receive communication about their care plan, but no virtual check-ins. The next month, the patient may experience a heart failure exacerbation requiring inpatient admission, and then receive as part of their APCM service timely communication and follow-up with new labs ordered, multiple virtual check-ins ensuring that the patient understands their new medications, a phone call to help the patient understand the lab results, and an interprofessional consultation with the patient's cardiologist to help decide if the patient's diuretic dosage should be changed.

However, even if not all elements of the APCM service are furnished each month for which APCM is billed, we proposed that billing practitioners and auxiliary personnel must have the ability to furnish every service element and furnish these elements as is appropriate for any individual patient during any calendar month. As described in more detail in the CY 2025 PFS proposed rule (89 FR 61707), maintaining certain advanced primary care practice capabilities and requirements is inherent in these elements and must be met to fully furnish and bill APCM. For example, using our previous example of the patient with heart failure and chronic kidney disease receiving Level 2 APCM services, if the patient experiences swollen legs, the patient should be able to submit a photo or video to the practitioner via a secure communications system, and the practitioner must be able to interpret and communicate remotely with the patient about those images.

While we proposed that specific minutes spent furnishing APCM services for purposes of billing HCPCS codes G0556–G0558 need not be documented in the patient's medical record, we will expect that any actions or communications that fall within the APCM elements of service will be described in the medical record and, as appropriate, their relationship to the clinical problem(s) they are intended to resolve and the treatment plan, just as

all clinical care is documented in the medical record.

We sought feedback on these service descriptions as part of the CY 2025 PFS proposed rule, on whether there are elements of other care management services that should be removed or altered for purposes of APCM services. We have summarized comments on our proposed service descriptions on section II.G.2.c. for Level 1, Level 2, and Level 3 APCM. Finally, while the service descriptors above are consistent across all three APCM levels because the scope of service elements are consistent across all levels of APCM and the elements that are provided depend on medical necessity and individual patient need, we proposed that the APCM codes will be stratified into three levels based on certain patient characteristics that are broadly indicative of patient complexity and the consequent resource intensity involved in the provision of these services in the context of advanced primary care. We proposed that the new APCM coding schema will be stratified based on APCM services being furnished using the advanced primary care model to patients with one or fewer chronic conditions (''Level 1''); patients with two or more chronic conditions (''Level 2''); and Qualified Medicare Beneficiaries (QMBs)[46] with two or more chronic conditions (''Level 3'') (see Table 24 for the three APCM code levels). This stratification of APCM into three levels allows us to distinguish among different levels of patient complexity and more accurately reflect the resources required to furnish APCM services for certain categories of beneficiaries. We anticipate that a practitioner using the advanced primary care model will bill for APCM services for all or nearly all the patients for whom they intend to assume responsibility for primary care.

Furthermore, we recognized the ways in which this new APCM coding intersects with current care management codes around number of chronic conditions (89 FR 61596). We note that the current care management codes are generally stratified in a similar, though more granular way, by the degree of complexity of care based on the presence of chronic conditions and complexity of medical decision making, who directly performs the service, and the time spent furnishing the service. In establishing separate payment for CCM services in the CY 2014 PFS final rule, we recognized that the resources involved in furnishing comprehensive, coordinated care management services to patients with multiple (two or more) chronic conditions were greater than those included in a typical non-face-to-face care management service, which we continued to consider as bundled into the payment for face-to-face E/M visits (78 FR 43337). In the CY 2017 PFS final rule, based on robust feedback from interested parties indicating that the new CCM codes did not fully capture the service time required to furnish care to beneficiaries with more complex conditions, we finalized new codes for patients with complex care management needs. In the CY 2016 PFS final rule, in considering how to improve the accuracy of our payments for care coordination, particularly for patients requiring more extensive care management, we stated that the care coordination and management for Medicare beneficiaries with multiple chronic conditions, a particularly complicated disease or acute condition, or certain behavioral health conditions often requires extensive discussion, information-sharing, and planning between a primary care physician and a specialist (for example, with a neurologist for a patient with Alzheimer's disease plus other chronic diseases) (80 FR 70919).

TABLE 24: Patient-Centered Risk Stratification for Billing APCM Codes

Level 1 [G0556]	Level 2 [G0557]	Level 3 [G0558]
Patients with one or fewer chronic conditions.	Patients with two or more chronic conditions.	Patients with two or more chronic conditions and who are Qualified Medicare Beneficiaries.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received many public comments on our proposed APCM service code levels, some of which we have summarized in section II.G.2.e(1) where we discuss Level 1, Level 2, and Level 3 APCM services. In general, the majority of commenters appreciated our efforts to stratify the APCM codes based on patient complexity and resource intensity, recognizing the importance of addressing the needs of patients with varying levels of chronic conditions. Furthermore, many commenters were supportive of the proposal not to require all elements of the APCM services to be furnished each month in which APCM is billed, expressing appreciation for our acknowledgment that beneficiaries' needs will vary from month to month.

However, several commenters generally believed the proposed stratification may not fully account for the severity of individual conditions or appropriately account for the resource costs for beneficiaries with multiple complex conditions and recommended various alternatives for stratification. Several commenters suggested that our proposed APCM levels are inappropriately weighted towards uncomplicated, lower-risk patients and were concerned that the proposed stratification does not reflect the additive impact of multiple chronic conditions, or the increased resources associated with furnishing APCM services to higher-risk patients with complex illness. Some of these commenters suggested that there are a significant number of Medicare beneficiaries with more than two chronic conditions and, as the number of chronic condition increases, the types of support and time needed to manage these patients increases. Specifically, several commenters encouraged us to add an additional level to the APCM service codes to account for patients with significant clinical complexity and healthcare needs that do not meet QMB criteria, but who still require intensive resource utilization. A few commenters suggested that six chronic conditions would be an appropriate threshold. Other commenters recommended that a fourth tier be added to the APCM

[46] See 42 CFR 435.123. The proposal includes both individuals in the QMB eligibility group who also have full scope Medicaid coverage (''QMB-plus'') and individuals in the QMB eligibility group who do not have Medicaid eligibility under any other Medicaid coverage group (''QMB-only''). However, this proposal would not include those QMBs who are in the Medicare Part B Immunosuppressive Drug benefit, which provides coverage of immunosuppressive drugs based on eligibility requirements described in § 407.55, because such individuals would not qualify for Medicare coverage of the services described in this rulemaking. See 42 CFR 435.123(c)(2).

service code levels based on the high needs beneficiary criteria from the High Needs track of the ACO REACH Model to account for the resources needed to support patients with complex illness. These commenters suggested that this criterion has been effective at identifying high-cost, high-needs patients and would allow us to incorporate another successful element of value-based care into traditional Medicare payment policy.

Response: We thank all commenters for their careful consideration of the proposed approach to stratify the APCM codes, and we appreciate commenters' suggestions for specific types of beneficiaries who may require intensive care management resource utilization and warrant an additional APCM code level, including beneficiaries with complex illness. We appreciate commenters' suggestion to consider the high needs beneficiary criteria from the High Needs track of the ACO REACH model. The model's eligibility criteria for alignment to a High Needs Population ACO includes beneficiaries with one or more conditions that impair mobility or neurological condition, significant chronic or other serious illness reflected by risk score and unplanned hospital admissions, or signs of frailty (who may also be dually eligible or at risk of becoming dually eligible).[47] We also acknowledge commenters' concerns that patients with two chronic conditions may require additional time and more complex care than a patient with two chronic conditions and QMB status. However, we believe that beneficiaries who are QMBs face unique challenges outside chronic condition management that may impact their care, requiring additional care management resources. We believe that our proposed APCM code stratification recognizes that individual beneficiaries have unique and varying resource needs, and strikes a balance between being overly specific in the creation of many categories, which could increase confusion and administrative burden, and being overly simplistic, which could inadequately differentiate between variations in the resources involved in furnishing APCM services. We believe that our proposal does this in an appropriate way and, as such, are finalizing the code stratification as proposed. However, we continue to welcome feedback to help us consider possible future changes to our policy and will take commenters' suggestions into consideration as we consider the development of proposals for future rulemaking.

Comment: A few commenters recommended that we review the AMA RUC Medical Home Workgroup's valuation recommendations from 2008 where they described services defined in the Medicare Medical Home demonstration project.[48] For context, in 2008, pursuant to the Tax Relief and Health Care Act of 2006 (Pub. L. 109–432), we conducted a three-year demonstration project to evaluate the medical home model of patient care. We drafted a three-tiered system to categorize medical homes based on the capabilities of the physician practices serving in that capacity for purposes of conducting the demonstration project. We asked the RUC for their assistance in creating possible valuations for these three tiers, including costs associated with physician work, direct practice expense, and professional liability insurance. These requirements ranged from entry-level practices to fully integrated, complex health systems, and which took into consideration varying practice-level capabilities, such as electronic prescribing capabilities, documentation of referral histories, and maintenance/service contract for hardware, internet, etc. These commenters suggested that we adopt the RUC's 2008 valuation recommendations as a framework for APCM services and establish APCM levels based on these medical home practice tiers.

Response: We have reviewed the RUC's 2008 recommendations for code descriptors, physician work, direct practice expense inputs, and professional liability insurance crosswalks for each of the three tiers of medical homes and found that the recommended tier system and payment based on practice-level capabilities would not fully capture the policy goals of the proposed APCM coding and payment. The proposed APCM codes were built on a presumed set of practice capabilities that reflect the use of an advanced primary care model of care delivery, which has been increasingly common in medical practice, and valued to more accurately account for the resources involved in furnishing care using an advanced primary care model. While we have never addressed in rulemaking the AMA RUC's findings and recommendations for the medical home practice tiers and associated valuations, we acknowledge that several practice-level capabilities described by the RUC are similar to the proposed APCM service elements, including but not limited to obtaining consent, care planning, acting as the primary focal point of care, and 24/7 access. However, our proposal to adopt coding for APCM was to recognize the shift in medical practice toward care delivery using an advanced primary care model and improve payment for care management services delivered by practitioners who have adopted an advanced primary care approach, which involves a specific set of practice-level capabilities. Stratifying coding for APCM services based on practice-level capabilities would not be helpful to that purpose. And there is other available coding that recognizes the resources involved in care management services furnished by practitioners outside of an advanced primary care model. We are also concerned that stratifying levels of payment for APCM services based on practice-level capabilities, rather than patient-level characteristics, could further exacerbate inequities in health systems, including smaller or rural practices who may furnish care to equally complex patients as compared to larger, more established health systems and clinics.

Finally, we do not believe the valuation proposed in the RUC's recommendation can be appropriately applied to the proposed APCM code levels. The RUC suggested a work RVU per patient per month of 0.35 for Tier 3 in the medical home model, which was intended for ''very sick'' patients. The recommended 0.35 RVU is lower than the highest valuation for APCM. If we had adopted the RUC's recommended RVUs for the three tiers, we would have reduced our proposed values for the APCM codes, which would not have appropriately reflected the resources involved in furnishing these services.

After consideration of public comments, we are finalizing as proposed the APCM service code levels.

(*1*) Level 1 APCM

We proposed the Level 1 APCM code for patients with one or fewer chronic conditions because of the increased import and use of non-face-to-face

[47] For PY2025, CMS expanded these criteria to include beneficiaries that have at least 90 Medicare-covered days of Home Health services utilization or at least 45 Medicare-covered days in a Skilled Nursing Facility within the previous 12 months. The revised eligibility criteria were expected to more effectively identify beneficiaries with complex needs that would benefit from participation in a High Needs Population ACO. More information available at *https://www.cms.gov/priorities/innovation/media/document/aco-reach-rfa* and *https://www.cms.gov/priorities/innovation/innovation-models/reach-py24-model-perf#:~:text=The%20model's%20eligibility%20criteria%20for,admissions%2C%20or%20signs%20of%20frailty*.

[48] *American Medical Association. (n.d.). Medical home model of care: Recommendations (Publication No. 0). AMA. https://www.ama-assn.org/sites/ama-assn.org/files/corp/media-browser/public/rbrvs/medicalhomerecommend_0.pdf*.

interactions in advanced primary care even for patients with relatively fewer health needs, which has increased over time for several observable reasons, including broad evolution in information and communication technology in everyday life, diffusion of practices first adopted for higher-acuity patients, and continuing practices widely adopted during the COVID–19 pandemic that reduce reliance on in-person interactions (89 FR 61596). APCM services for a patient diagnosed with one or fewer chronic conditions will require significantly less time and resources than one with two or more chronic conditions since, in general, there would be fewer ongoing health needs and other health care resources to coordinate, a lower risk of drug interactions, and less complicated physiology. Based on CY 2010 Medicare claims data, the difference in annual expenditures per beneficiary between patients with one or fewer chronic conditions and those with two or three chronic conditions was $3,673.[49] Our current care management coding similarly delineates patient complexity between patients with a single serious chronic condition (PCM codes) and those with two or more serious chronic conditions (CCM codes). We anticipate that practitioners who would furnish APCM services may have already had experience with care management services coding and payment for much of this population. The Level 1 APCM code would also address the current gap in coding and payment for care management services furnished using an advanced primary care model for patients without multiple chronic conditions.

We received many public comments on our proposed APCM service code levels. The following is a summary of the comments we received and our responses.

Comment: Most of the commenters recommended that we adopt additional codes to provide differential payment for more and less complex beneficiaries. Many commenters were concerned that the proposed stratification is heavily weighted towards uncomplicated, lower-risk patients. A few commenters pointed out that some patients with a single, but very serious condition, may require significantly more resources than patients with multiple chronic conditions that are stable or less severe. By focusing solely on the number of chronic conditions, commenters suggested that this stratification could overlook the nuanced differences in resource needs based on condition severity and complexity. Many commenters recommended that we further evaluate and refine the stratification scheme to more accurately reflect the resource intensity required for effective advanced primary care delivery by incorporating additional factors, such as the severity of individual conditions, social risk factors beyond QMB status, and other indicators of medical complexity. Several commenters recommended that we create an add-on code for QMBs that could be reported with any of the APCM levels, including Level 1. These commenters stated that it is likely that there are many beneficiaries with two or fewer chronic conditions that have social risk factors that may impact their care. These commenters provided the example of an otherwise healthy beneficiary who has found themselves newly homeless, leaving them at greater risk for contracting infections and illnesses, which impacts their overall care.

Response: We believe that all beneficiaries, even with a small number of chronic conditions, can benefit from care coordination and access to advanced primary care services. We also recognize that a patient's health conditions may change rapidly, and having established ongoing care can mitigate and reduce negative health outcomes. We appreciate that the number of chronic conditions a beneficiary has may not correlate perfectly to the severity or complexity of illness. However, as noted earlier in this discussion, we are aiming to strike a balance between coding specificity and administrative simplicity to appropriately stratify APCM services based on how chronic medical conditions interact with increased risk associated with social determinants of health (SDOH) factors. We understand that there will always be beneficiaries within a particular APCM code level whose needs for APCM services are greater or less than other beneficiaries. We expect the adoption of coding and payment policies for APCM services to be an iterative process, informed by ongoing feedback from interested parties that we will take into consideration for future rulemaking.

Comment: One commenter stated that the code descriptor for HCPCS code G0556 does not mention the presence of a chronic condition, while the risk stratification for billing the code states ''patients with one or fewer chronic conditions.'' This commenter therefore requested that we include ''patients with one or fewer chronic conditions'' in the code descriptor for enhanced clarity. Another commenter asked us to clarify what constitutes a ''chronic condition'' for purposes of APCM service level selection, and whether we would use an approach similar to CCM in which we do not enumerate an exhaustive list of conditions that qualify for CCM payment, instead defining a qualifying condition as one that is ''expected to last at least 12 months or until the patient's death and or that place them at significant risk of death, acute exacerbation and or decompensation, or functional decline.''

Response: We agreed with the commenters that we should add clarifying language to the code descriptor for Level 1 APCM services. We are finalizing modifications to our proposed code descriptor for Level 1 APCM services to indicate the presence of one or fewer chronic conditions that are ''expected to last at least 12 months or until the patient's death and or that place them at significant risk of death, acute exacerbation and or decompensation, or functional decline.'' We point out to commenters that we had already included this definition of ''chronic condition'' for Level 2 and Level 3 APCM services.

After consideration of public comments, we are finalizing the code descriptor for HCPCS code G0556 as: HCPCS code G0556 (*Advanced primary care management services for a patient with one chronic condition [expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline], or fewer, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the following elements, as appropriate:*

- *Consent*;

++ *Inform the patient of the availability of the service; that only one practitioner can furnish and be paid for the service during a calendar month; of the right to stop the services at any time (effective at the end of the calendar month); and that cost sharing may apply.*

++ *Document in patient's medical record that consent was obtained.*

- *Initiation during a qualifying visit for new patients or patients not seen within 3 years;*
- *Provide 24/7 access for urgent needs to care team/practitioner,*

[49] *Centers for Medicare and Medicaid Services. Chronic Conditions among Medicare Beneficiaries, Chartbook, 2012 Edition. Baltimore, MD. 2012. https://www.cms.gov/research-statistics-data-and-systems/statistics-trends-and-reports/chronic-conditions/downloads/2012chartbook.pdf.*

including providing patients/caregivers with a way to contact health care professionals in the practice to discuss urgent needs regardless of the time of day or day of week;

• *Continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments;*

• *Deliver care in alternative ways to traditional office visits to best meet the patient's needs, such as home visits and/or expanded hours;*

• *Overall comprehensive care management;*

++ Systematic needs assessment (medical and psychosocial).

++ System-based approaches to ensure receipt of preventive services.

++ Medication reconciliation, management and oversight of self-management.

• *Development, implementation, revision, and maintenance of an electronic patient-centered comprehensive care plan with typical care plan elements when clinically relevant;*

++ Care plan is available timely within and outside the billing practice as appropriate to individuals involved in the beneficiary's care, can be routinely accessed and updated by care team/practitioner, and copy of care plan to patient/caregiver;

• *Coordination of care transitions between and among health care providers and settings, including referrals to other clinicians and follow-up after an emergency department visit and discharges from hospitals, skilled nursing facilities or other health care facilities as applicable;*

++ Ensure timely exchange of electronic health information with other practitioners and providers to support continuity of care.

++ Ensure timely follow-up communication (direct contact, telephone, electronic) with the patient and/or caregiver after an emergency department visit and discharges from hospitals, skilled nursing facilities, or other health care facilities, within 7 calendar days of discharge, as clinically indicated.

• *Ongoing communication and coordinating receipt of needed services from practitioners, home- and community-based service providers, community-based social service providers, hospitals, and skilled nursing facilities (or other health care facilities), and document communication regarding the patient's psychosocial strengths and needs, functional deficits, goals, preferences, and desired outcomes, including cultural and linguistic factors, in the patient's medical record;*

• *Enhanced opportunities for the beneficiary and any caregiver to communicate with the care team/practitioner regarding the beneficiary's care through the use of asynchronous non-face-to-face consultation methods other than telephone, such as secure messaging, email, internet, or patient portal, and other communication-technology based services, including remote evaluation of pre-recorded patient information and interprofessional telephone/internet/EHR referral service(s), to maintain ongoing communication with patients, as appropriate;*

++ Ensure access to patient-initiated digital communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits).

• *Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate;*

• *Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients;*

• *Be assessed through performance measurement of primary care quality, total cost of care, and meaningful use of Certified EHR Technology.*).

(*2*) Level 2 APCM

We proposed the Level 2 APCM code for patients with two or more chronic conditions because of the frequency of chronic conditions in the Medicare population. In fact, nearly four in five Medicare beneficiaries have two or more chronic conditions.[50] Furthermore, as noted previously, our current care management coding delineates patient complexity for the CCM codes for patients with two or more serious chronic conditions, and we anticipate that practitioners who will furnish APCM services may have already had experience with care management services coding and payment for much of this population.

For example, someone with chronic kidney disease and heart failure requires regular check-ins, coordination with specialty care, follow-up after hospital admissions for heart failure exacerbations, regular modifications of the care plan, and more. These services are typically described by the existing CCM services. The patient may also typically need to reach out more often to their primary care practitioner with questions or new symptoms via the patient portal. For instance, the person sends a message through the patient portal to ask whether or not they should come into the primary care office after gaining ten pounds in the last week—which could be a sign of increased fluid retention and the need for increased diuretic dosages to avoid pleural edema (an accumulation of fluid in the lungs). The primary care team books the patient for a same-day urgent care appointment to assess for signs of swelling and pleural edema. Again, this on-demand access to their primary care team can help treat the patient's chronic conditions in a patient-centered way and avoid unnecessary complications.

Comment: One commenter recommended that we add a modifier to be reported with the Level 2 APCM code to reflect social complexity and/or additional medical complexity for non-QMB beneficiaries.

Response: We thank commenters for their consideration of the proposed Level 2 APCM service, and we appreciate the commenter's suggestion for potential ways to recognize that non-QMB beneficiaries may also have increased needs associated with social and/or medical complexity and therefore require more resources regardless of their QMB status. However, we believe that our proposed coding approach appropriately balances coding specificity with administrative simplicity. We continue to welcome feedback to help us evaluate the appropriateness of the APCM service levels, coding structure, and our social risk adjustment methodology, and we will consider possible changes to our policy in future rulemaking.

After consideration of public comments, we are finalizing as proposed the code descriptor for HCPCS code G0557:

HCPCS code G0557 (*Advanced primary care management services for a patient with multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the following elements, as appropriate:*

• *Consent*;

++ Inform the patient of the availability of the service; that only one practitioner can furnish and be paid for the service during a calendar month; of

the right to stop the services at any time (effective at the end of the calendar month); and that cost sharing may apply.

++ Document in patient's medical record that consent was obtained.

- *Initiation during a qualifying visit for new patients or patients not seen within 3 years;*
- *Provide 24/7 access for urgent needs to care team/practitioner, including providing patients/caregivers with a way to contact health care professionals in the practice to discuss urgent needs regardless of the time of day or day of week;*
- *Continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments;*
- *Deliver care in alternative ways to traditional office visits to best meet the patient's needs, such as home visits and/or expanded hours;*
- *Overall comprehensive care management;*

++ Systematic needs assessment (medical and psychosocial).

++ System-based approaches to ensure receipt of preventive services.

++ Medication reconciliation, management and oversight of self-management.

- *Development, implementation, revision, and maintenance of an electronic patient-centered comprehensive care plan;*

++ Care plan is available timely within and outside the billing practice as appropriate to individuals involved in the beneficiary's care, can be routinely accessed and updated by care team/practitioner, and copy of care plan to patient/caregiver;

- *Coordination of care transitions between and among health care providers and settings, including referrals to other clinicians and follow-up after an emergency department visit and discharges from hospitals, skilled nursing facilities or other health care facilities as applicable;*

++ Ensure timely exchange of electronic health information with other practitioners and providers to support continuity of care.

++ Ensure timely follow-up communication (direct contact, telephone, electronic) with the patient and/or caregiver after an emergency department visit and discharges from hospitals, skilled nursing facilities, or other health care facilities, within 7 calendar days of discharge, as clinically indicated.

- *Ongoing communication and coordinating receipt of needed services from practitioners, home- and community-based service providers, community-based social service providers, hospitals, and skilled nursing facilities (or other health care facilities), and document communication regarding the patient's psychosocial strengths and needs, functional deficits, goals, preferences, and desired outcomes, including cultural and linguistic factors, in the patient's medical record;*
- *Enhanced opportunities for the beneficiary and any caregiver to communicate with the care team/practitioner regarding the beneficiary's care through the use of asynchronous non-face-to-face consultation methods other than telephone, such as secure messaging, email, internet, or patient portal, and other communication-technology based services, including remote evaluation of pre-recorded patient information and interprofessional telephone/internet/EHR referral service(s), to maintain ongoing communication with patients, as appropriate;*

++ Ensure access to patient-initiated digital communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits).

- *Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate;*
- *Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients;*
- *Be assessed through performance measurement of primary care quality, total cost of care, and meaningful use of Certified EHR Technology.*).

(*3*) Level 3 APCM

We proposed the Level 3 APCM code for patients with QMB status and two or more chronic conditions based on our understanding that people with both multiple chronic conditions and social risk factors generally require more time and resources from primary care practitioners and their teams to ensure that the patient's chronic conditions are managed appropriately and effectively. We proposed to use a patient's QMB status as a method to identify beneficiaries with social risk factors that generally necessitate relatively greater resource requirements to effectively furnish advanced primary care than people without such risk factors. There is significant evidence that such dually eligible beneficiaries, on average, are more medically complex and have higher healthcare needs;[51] for example, dually eligible beneficiaries are more likely to have poor functional status[52] and recent expenditure data found that the difference in Medicare spending on a per person per year basis between dually eligible and non-dually eligible Medicare beneficiaries was $13,198 in CY 2021.[53]

QMBs are the largest eligibility group within the Medicare-Medicaid dually eligible enrollee population, comprising of 66 percent of the 12.8 million individuals per the most recent available data.[54] For the approximately 8.5 million dually eligible beneficiaries who are QMBs, Medicaid covers Medicare's cost sharing requirements. The QMB eligibility group helps to ensure full access to the Medicare benefit for the lowest income enrollees by covering these costs. Individuals can qualify for QMB status if their income is below 100 percent of the Federal Poverty Level ($15,300/year in 2024) and assets are no more than $9,430/$14,130 (one person/married couple in 2024), although States can request our approval to disregard certain income and assets.[55] Beneficiaries apply for this benefit with their State's Medicaid program and must be redetermined eligible at least annually.

There is growing recognition that social risk factors—such as income, education, access to food and housing, and employment status—play a major role in health,[56] such that social risk

factors may affect a person's ability to reach their health goals, as well as the diagnosis and treatment of their medical problems. A report submitted to Congress by the Office of the Assistant Secretary for Planning and Evaluation (ASPE) in response to the Improving Medicare Post-Acute Care Transformation (IMPACT) Act of 2014 (Pub. L. 113–185) found that dual Medicare-Medicaid enrollment as a marker for low income was typically the most powerful predictor of poor outcomes on quality measures among social risk factors examined.[57] Beneficiaries with social risk factors may have worse health outcomes due to a host of factors, including higher levels of medical risk, worse living environments (for example, availability of community services, pollution, safety), greater challenges in adherence to medication regimens and medical recommendations (for example, diet/lifestyle), and/or bias or discrimination. Evidence suggests that many health outcomes are related more to social, environmental, and economic factors (which may be beyond practitioners' control) than to clinical interventions.[58] Dual enrollees, and more specifically, QMBs, are therefore a category of Medicare beneficiaries who are the most socially at-risk of poorer clinical outcomes. As stated in the ASPE report, ''Some of the observed relationship between social risk factors and outcomes may be the result of underlying differences in medical complexity, frailty, disability, and/or functional status. For example, dually-enrolled beneficiaries are more likely to have poor functional status, and therefore, may be more likely to be readmitted after a hospitalization.'' As another example, a patient with diabetes, heart failure, and QMB status may experience food, transportation, or housing insecurity that contributes to difficulty maintaining blood glucose control which can contribute to medical complications including potentially preventable heart failure exacerbations. The primary care practitioner's team may need to check-in regularly to ensure, for example, that the patient gets needed specialty care such as an ophthalmologic examination to avoid the ocular manifestations of diabetes; and consider the availability of transportation vouchers so the patient can attend the ophthalmology appointment. We proposed the Level 3 APCM code to recognize the unique characteristics of QMBs as beneficiaries with social risk factors for whom significantly more resources are involved in comprehensive care management by practitioners that furnish advanced primary care services to them.

Additionally, we note that patients with QMB status are not responsible for the Medicare cost sharing associated with covered Medicare Part A or B services, including for any APCM services. Generally, States cover such cost sharing on behalf of QMBs, although many States use a ''lesser-of'' policy through which States pay less than the full cost sharing amounts.[59] We solicited comments from States on how they would cover cost sharing for the proposed APCM bundle, considering lesser-of policies.

We also sought feedback on the use of QMB status and multiple (two or more) chronic conditions as the basis to bill for APCM Level 3 (G0558), whether QMB status is an appropriate indicator to identify beneficiaries with added social risk, and whether there is an equivalent marker of social deprivation for use in commercial markets that might be a possible alternative identifier.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters appreciated our recognition of social risk as a factor in health outcomes and healthcare delivery and agreed that beneficiaries with higher social risk have higher healthcare needs but were concerned about our proposed use of QMB status as a proxy indicator for patients with added social risk. A few commenters stated that there is currently not a widely adopted or universal approach to social risk adjustment and asserted that research has not shown dual eligibility status to be sufficiently sensitive to capture all at-risk beneficiaries. Multiple commenters encouraged us to broaden the criteria to identify and address social risk for Level 3 and suggested that we use additional data sources, including for example residence in areas with high Area Deprivation Index scores, dual eligibility status, and presence of unmet SDOH needs, to identify social risk.

Several commenters recommended that the requirements for Level 3 APCM include beneficiaries with at least one chronic condition and one unmet SDOH need, regardless of their dual eligibility or QMB status. Another commenter urged us to adjust payments to practitioners caring for patients who experience not only greater medical complexity but also greater social-emotional complexity, asserting that it is critical that risk adjustment criteria account for health-related social needs (HRSNs), including economic stability, education, social and community life, one's neighborhood and access to high-quality health care.

A few commenters were concerned about practitioners' ability to determine a patient's QMB status and were concerned about additional operational burden. These commenters asserted that this will be a significant obstacle to billing G0558 and were concerned that many practices may have to bill G0557 if they cannot confirm a patient's QMB status. Several commenters recommended that we use more readily identifiable criteria, such as dual eligibility status. One commenter stated that we should determine what level of APCM a beneficiary qualifies for to reduce practitioner burden. A few commenters recommended that we make use of existing Z-codes for SDOH (Z55–65) as standard identifiers and make payment to practitioners when they ask their patients about their SDOH to determine their patients' eligibility for APCM Level 3.

Many other commenters supported the use of QMB status as an appropriate indicator to identify beneficiaries with added social risk and called it a ''good first approach'' for us and advanced primary care practices to stratify the risk of Medicare beneficiaries to whom they provide APCM services. One of these commenters suggested that future risk stratification should identify other people in need of more intensive APCM services, such as those with disabilities, those with serious mental and other chronic illnesses, or those with disproportionate use of potentially preventable acute care services. Other commenters encouraged us to review findings of methodologies tested in Innovation Center models, as well as to engage with payers and policymakers to align on a common framework that incorporates a broader understanding of social risk using validated data and methodologies, and then incorporate their learnings into the APCM framework.

[58] World Health Organization. (2018). Health Impact Assessment (HIA): The determinants of health. *http://www.who.int/hia/evidence/doh/en/.*

[59] Under the ''lesser of'' policy, a State caps its payment of Medicare cost sharing at the Medicaid rate for a particular service. For example, if the Medicare rate for a service is $100, of which $20 is beneficiary coinsurance, and the Medicaid rate for the service is $90, the State would only pay $10. If the Medicaid rate is $80 or lower, the State would make no payment.

Response: We thank commenters for their feedback. We reiterate our view that QMB status is a good indicator for patients with higher SDOH needs. As described in the CY 2025 PFS proposed rule (89 FR 61596), we chose QMB status as the method to identify beneficiaries with SDOH factors who may require relatively greater resources from practitioners that furnish advanced primary care services due to the strong evidence associated with dual eligibility for Medicare and Medicaid with poorer outcomes in Medicare Value-Based Purchasing (VBP) programs, in addition to the fact that we have QMB status in our administrative data (in contrast to other SDOH data elements) as well as the lack of cost sharing for QMBs.[60] However, we acknowledge that there may be other ways to identify patients with higher SDOH needs, including for example residence in areas with high Area Deprivation Index scores, dual eligibility status, and presence of unmet SDOH needs, and we intend to consider possible additional or alternative methods through future rulemaking, as appropriate.

We also appreciate the concerns some commenters raised about practitioners' ability to use QMB status to determine patient eligibility for Level 3 APCM services. However, we continue to believe practitioners have access to this information when verifying a patient's Medicare eligibility. Because all Medicare providers and suppliers are prohibited from billing QMBs for Medicare cost sharing, we have established mechanisms in place to help practitioners identify QMB patients. The Medicare 270/271 HIPAA Eligibility Transaction System (HETS) became effective in November 2017. Through HETS, health care providers can determine QMB status for each patient prior to billing. We also include QMB information in the Medicare Remittance Advice (RA) for fee-for-service claims after claims processing. Practitioners should consider asking their third-party eligibility-verification vendors how their products reflect the QMB information in HETS. We also recognize that, in some larger practices or practices that are part of larger health systems, there may be administrative staff or billing departments that have access to this information. For practitioners who furnish services to QMBs, including those who plan to bill for Level 3 APCM services, it would be important to establish internal workflows to ensure proper identification of patients with QMB status. Additional information can be found at *https://www.cms.gov/outreach-and-education/medicare-learning-network-mln/mlnmattersarticles/downloads/se1128.pdf*. Practitioners can also learn a patient's QMB status directly through State Medicaid agencies. While States may use different methods for verification, such as telephonic or electronic systems, the Medicaid eligibility verification systems will confirm whether an individual is covered as a QMB.

While we acknowledge the opportunities raised by several commenters to use additional data sources to identify patients with likely social risk, we believe that our proposal to use QMB status is evidence-based, operationally feasible, and sufficiently sensitive to capture at-risk beneficiaries that require additional resources. As such, are finalizing the use of QMB status as proposed. However, as health services research continues to evolve in identifying social risk, we will continue to explore possible additional or alternative methods to identify patients with social risk and modify coding and payment for APCM services through future rulemaking as appropriate.

Comment: Several commenters recommended that we adopt a higher intensity APCM code for seriously ill/high needs beneficiaries and value this code to account for the higher resource costs involved in delivering advanced primary care to patients with complex illness. These commenters asserted that an additional APCM code level would capture non-QMB patients with significant clinical complexity and healthcare needs who require intensive APCM services and resource utilization.

Response: We appreciate commenters' suggestion for potential ways to recognize that non-QMB beneficiaries who are seriously ill may have increased needs associated with medical complexity and therefore require more resources. As we stated in response to comments on the Level 1 and Level 2 APCM service levels, we believe that our proposed coding approach and the specific recognition of QMBs in one code level appropriately balances coding specificity with administrative simplicity. We will continue to engage with interested parties to assess the appropriate level of code stratification and will address any potential refinements through future rulemaking.

After consideration of public comments, we are finalizing our proposal to define Level 3 APCM services based on QMB status and two or more chronic conditions. We will continue to evaluate the appropriateness of the APCM service levels, coding structure, and recognition of social risk. We are finalizing as proposed the code descriptor for HCPCS code G0558: HCPCS code G0558 *(Advanced primary care management services for a patient that is a Qualified Medicare Beneficiary with multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the following elements, as appropriate:*

- *Consent*;

++ *Inform the patient of the availability of the service; that only one practitioner can furnish and be paid for the service during a calendar month; of the right to stop the services at any time (effective at the end of the calendar month); and that cost sharing may apply.*

++ *Document in patient's medical record that consent was obtained.*

- *Initiation during a qualifying visit for new patients or patients not seen within 3 years;*
- *Provide 24/7 access for urgent needs to care team/practitioner, including providing patients/caregivers with a way to contact health care professionals in the practice to discuss urgent needs regardless of the time of day or day of week;*
- *Continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments;*
- *Deliver care in alternative ways to traditional office visits to best meet the patient's needs, such as home visits and/or expanded hours;*
- *Overall comprehensive care management;*

++ *Systematic needs assessment (medical and psychosocial).*

++ *System-based approaches to ensure receipt of preventive services.*

++ *Medication reconciliation, management and oversight of self-management.*

- *Development, implementation, revision, and maintenance of an electronic patient-centered comprehensive care plan;*

++ *Care plan is available timely within and outside the billing practice as appropriate to individuals involved in the beneficiary's care, can be*

[60] ASPE. Report to Congress: Social Risk Factors and Performance Under Medicare's Value-Based Purchasing Programs. December 2016. *https://aspe.hhs.gov/reports/report-congress-social-risk-factors-performance-under-medicares-value-based-purchasing-programs.*

routinely accessed and updated by care team/practitioner, and copy of care plan to patient/caregiver;

• *Coordination of care transitions between and among health care providers and settings, including referrals to other clinicians and follow-up after an emergency department visit and discharges from hospitals, skilled nursing facilities or other health care facilities as applicable;*

++ Ensure timely exchange of electronic health information with other practitioners and providers to support continuity of care.

++ Ensure timely follow-up communication (direct contact, telephone, electronic) with the patient and/or caregiver after an emergency department visit and discharges from hospitals, skilled nursing facilities, or other health care facilities, within 7 calendar days of discharge, as clinically indicated.

• *Ongoing communication and coordinating receipt of needed services from practitioners, home- and community-based service providers, community-based social service providers, hospitals, and skilled nursing facilities (or other health care facilities), and document communication regarding the patient's psychosocial strengths and needs, functional deficits, goals, preferences, and desired outcomes, including cultural and linguistic factors, in the patient's medical record;*

• *Enhanced opportunities for the beneficiary and any caregiver to communicate with the care team/practitioner regarding the beneficiary's care through the use of asynchronous non-face-to-face consultation methods other than telephone, such as secure messaging, email, internet, or patient portal, and other communication-technology based services, including remote evaluation of pre-recorded patient information and interprofessional telephone/internet/EHR referral service(s), to maintain ongoing communication with patients, as appropriate;*

++ Ensure access to patient-initiated digital communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits).

• *Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate;*

• *Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients;*

• *Be assessed through performance measurement of primary care quality, total cost of care, and meaningful use of Certified EHR Technology.*).

c. APCM Service Elements and Practice-Level Capabilities

All the elements within the scope of APCM services are included in the service descriptors for G0556, G0557, and G0558, listed in Table 26, and described in this section. We proposed in the CY 2025 PFS proposed rule that APCM services will include nearly the same scope of service elements and conditions we established for CCM and PCM services (including elements of 24/7 access and care continuity, care management and care plan, care coordination, management of care transitions, and enhanced communication). This is appropriate because care management is a key component of care delivery using an advanced primary care model. The phrasing in the code descriptors for APCM services generally tracks the code descriptors for CCM and PCM services, except for references to ''time spent'' or ''minutes'' of service.

We sought to ensure that the APCM codes will fully and appropriately capture the care management services and CTBS that are characteristic of the changes in medical practice toward advanced primary care, as demonstrated in select CMS Innovation Center models. As we do for CCM and PCM services, we proposed to require for APCM services that the practitioner provide an initiating visit and obtain beneficiary consent (see section II.G.2.c.(1) and II.G.2.c.(2) of this final rule). As described in more detail in this section, we proposed to incorporate as elements of APCM services ''Management of Care Transitions'' and ''Enhanced Communications Opportunities.'' For the ''Management of Care Transitions'' APCM service element, we proposed to specify timely follow-up during care transitions (see section II.G.2.c.(6) of this final rule). For the ''Enhanced Communications Opportunities'' APCM service element, we proposed to incorporate access to CTBS services, including remote evaluation of pre-recorded patient information and interprofessional telephone/internet/EHR referral service(s), to maintain ongoing communication with the patient, as well as access to patient-initiated digital communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits) (see section II.G.2.c.(8) of this final rule).

We also proposed to specify for APCM services the practice-level characteristics and capabilities that are inherent to, and necessarily present when a practitioner is providing covered services using an advanced primary care delivery model. As described in more detail below, included in the service descriptors for G0556, G0557, and G0558, and listed in Table 26, are practice-level capabilities that reflect care delivery using an advanced primary care model and are focused around 24/7 access and continuity of care (see section II.G.2.c.(3) of this final rule), patient population-level management (see section II.G.2.c.(9) of this final rule), and performance measurement (see section II.G.2.c.(10) of this final rule). These practice capabilities are indicative of, and necessary to, care delivery using an advanced primary care model. Further, APCM services, as we proposed to define them, could not be fully performed in the absence of these practice capabilities; and, in such cases, APCM services should not be billed.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Multiple commenters agreed that the proposed elements and requirements reflect the services consistent with effective APCM and these standards are consistent with current CMS primary care models and demonstration projects. Several commenters supported aspects of the proposal that crossed multiple APCM service elements—for example, commenters expressed appreciation for the reference to caregivers in four of the proposed elements (24/7 access and continuity of care, patient-centered comprehensive care plan, management of care transitions, and enhanced communications opportunities). Some commenters suggested modifications, and several were concerned about the volume and burden of requirements.

Other commenters were concerned that, while most practices may be set up to deliver these services, certain primary care practices may find it challenging to meet some of the proposed service elements. Some commenters raised concerns that the practice-level capabilities will be difficult for small or independent practices (and in some cases, health centers) to meet and requested that that we modify certain practice-level capabilities and APCM levels to account for varying levels of practice infrastructure.

One commenter was particularly concerned about the inability of low resource safety net providers—settings in which lower income individuals and QMBs may receive their primary care, to meet these standards, which could

potentially exacerbate disparities in care and payment for patients at the highest risk. They asserted that without the ability to bill for APCM services, safety net clinics will continue to face underpayment for the important care they provide. The commenters stated that clinics that do not meet the requirements to bill for APCM services, but still deliver substantial care coordination, management, and advanced primary care services to chronically ill beneficiaries with social risk—often with limited resources to expand their capacity—are particularly vulnerable to underpayment. For these reasons, some commenters suggested that implementing tiered practice capability requirements could address the current ''all or nothing'' approach, where there are some practices that invest significant time and resources in infrastructure to provide chronic care management but fall short of the requirements to bill for APCM services, and then are ineligible for payment for their currently uncompensated services.

Response: We appreciate commenters' feedback about the proposed APCM service elements and practice-level requirements which are reflective of the services consistent with care management in advanced primary care. As we do for other care management services, we continue to recognize the involvement of caregivers in health care for some patients.

We also appreciate commenters' suggested modifications to certain service elements and practice-level capabilities, and we acknowledge several commenters' concerns about the volume and burden of requirements. We welcome information on these issues from interested parties and may consider revisions in future rulemaking.

We remain interested in the use of APCM services in settings such as small practices and in rural and underserved areas, and we are committed to identifying ways to increase access to primary care in underserved communications. We also encourage practitioners who may not meet all of the requirements to bill for APCM services to consider whether the care coordination and management services they are delivering would meet the requirements to bill for other care management services such as TCM, CCM, PCM, CHI, PIN, or certain CTBS. We will continue to identify and evaluate ways to encourage providers to make APCM services available to all their patients in order to support care improvement for underserved, high-risk beneficiaries.

We proposed that practitioners participating in the ACO REACH Model, the Making Care Primary model, and the Primary Care First model will satisfy the initiating visit, Patient Population-Level Management, and performance measurement APCM service elements and practice-level capabilities by virtue of their model participation. These CMS Innovation Center models promote advanced primary care delivery consistent with the proposed APCM service elements and practice-level capabilities described in Table 25. The models all utilize attribution methods that review the most recently available two years of Medicare claims to identify whether a model participant is responsible for a Medicare beneficiary's primary care, aligning with the initiating visit requirements for APCM services. Additionally, these three models include risk stratification and quality and cost performance metrics that are aligned or overlap with the ''Value in Primary Care'' Merit-based Incentive Payment System (MIPS) Value Pathway (MVP).[61] Around-the-clock access and continuity of care, Patient Population-Level Management, and performance measurement are indicative of, and necessary to, care delivery using an advanced primary care model. We also considered whether certain practitioners in other types of CMS Innovation Center models also satisfy the service elements and requirements and sought comments on this question.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A number of commenters requested that we deem all ACO or alternative payment model (APM) participants as satisfying all service elements and requirements to bill the APCM codes by nature of their participation in such a program. A few commenters questioned why practitioners in ACOs would need to bill the APCM codes given that the proposed service elements may overlap with ACO functions.

Response: We clarify that practitioners participating in the ACO REACH Model, the Making Care Primary model, and the Primary Care First model would satisfy the proposed initiating visit, patient population-level management, and performance measurement APCM service elements and practice-level capabilities by virtue of meeting requirements of their model participation, and that we are not waiving any of the APCM service elements or requirements for practitioners in these models or the Shared Savings Program.

The one proposed practice-level requirement for APCM services that is slightly different for these model participants and Shared Savings Program participants than for other practitioners is the performance measurement requirement. Because these models and the Shared Savings Program require their participating practitioners to report on quality and cost performance metrics that are aligned or overlap with the Value in Primary Care MVP, we proposed that requiring these practitioners to report the Value in Primary Care MVP for purposes of billing for APCM services would be substantially duplicative. Our proposal would require all other APCM service elements and practice-level capabilities to be met and maintained in order for the model participants to bill for APCM services. We simply noted that, for practitioners participating in the ACO REACH Model, the Making Care Primary model, or the Primary Care First model, many of the APCM service elements and practice-level requirements would be met by meeting model participation requirements. Similarly, practitioners participating in other APMs may, by meeting requirements of their participation in the APM, meet some or all of the APCM service elements and practice-level requirements; however, not all APMs require reporting on quality and cost measures that align or overlap with the Value in Primary Care MVP.

TABLE 25: APCM Service Elements* and Practice-Level Capabilities

Consent • Inform the patient of the availability of APCM services; that only one practitioner can furnish and be paid for these services during a calendar month; of the right to stop services at any time (effective at the end of the calendar month); and that cost sharing may apply* (may be covered by supplemental health coverage) • Document in patient's medical record that consent was obtained
Initiating Visit for New Patients (separately paid) • Initiation during a qualifying visit for new patients • An initiating visit is not needed: (1) if the beneficiary is not a new patient (has been seen by the practitioner or another practitioner in the same practice within the past three years) or (2) if the beneficiary received another care management service (APCM, CCM, or PCM) within the previous year with the practitioner or another practitioner in the same practice.
24/7 Access to Care and Care Continuity • Provide 24/7 access for urgent needs to care team/practitioner, including providing patients/caregivers with a way to contact health care professionals in the practice to discuss urgent needs regardless of the time of day or day of week. In the event of afterhours communication with a beneficiary, whoever is responsive to the patient's concerns must document and communicate their interaction with the beneficiary to the primary care team/practitioner. • Continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments • Deliver care in alternative ways to traditional office visits to best meet the patient's needs, such as home visits and/or expanded hours, as appropriate
Comprehensive Care Management • Overall comprehensive care management may include, as applicable • Systematic needs assessment (medical and psychosocial) • System-based approaches to ensure receipt of preventive services • Medication reconciliation, management and oversight of self-management
Patient-Centered Comprehensive Care Plan • Development, implementation, revision, and maintenance of an electronic patient-centered comprehensive care plan which is available timely within and outside the billing practice as appropriate to individuals involved in the beneficiary's care, can be routinely accessed and updated by care team/practitioner, and copy of care plan to patient/caregiver
Management of Care Transitions (for example, discharges, ED visit follow-up, referrals, as applicable) • Coordination of care transitions between and among health care providers and settings, including transitions involving referrals to other clinicians, follow-up after an emergency department visit, or follow-up after discharges from hospitals, skilled nursing facilities or other health care facilities, as applicable • Ensure timely exchange of electronic health information with other practitioners and providers to support continuity of care. • Ensure timely follow-up communication (direct contact, telephone, electronic) with the patient and/or caregiver after ED visits and discharges from hospitals, skilled nursing facilities, or other health care facilities, within 7 calendar days of discharge, as clinically indicated

Practitioner, Home-, and Community-Based Care Coordination • Ongoing communication and coordinating receipt of needed services from practitioners, home- and community-based service providers, community-based social service providers, hospitals, and skilled nursing facilities (or other health care facilities), as applicable, and document communication regarding the patient's psychosocial strengths and needs, functional deficits, goals, preferences, and desired outcomes, including cultural and linguistic factors in the patient's medical record
Enhanced Communication Opportunities • Enhanced opportunities for the beneficiary and any caregiver to communicate with the care team/practitioner regarding the beneficiary's care through the use of asynchronous non-face-to-face consultation methods other than telephone, such as secure messaging, email, internet, or patient portal, and other communication technology-based services, including remote evaluation of pre-recorded patient information and interprofessional telephone/internet/EHR referral service(s), to maintain ongoing communication with patients, as appropriate • Ensure access to patient-initiated digital communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits)
Patient Population-Level Management • Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate • Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients • A practitioners who is participating in a Shared Savings Program ACO, REACH ACO, Making Care Primary, or Primary Care First satisfies this requirement
Performance Measurement Be assessed on primary care quality, total cost of care, and meaningful use of CEHRT, which can be met in several ways: • For practitioners who are MIPS eligible clinicians, by registering for and reporting the Value in Primary Care MVP** • A practitioner who is part of a TIN participating in a Shared Savings Program ACO satisfies this requirement through the ACO's reporting of the APM Performance Pathway*** • A practitioner who is participating in a REACH ACO, a Making Care Primary, or a Primary Care First practice satisfies this requirement by virtual of meeting requirements under the CMS Innovation Center ACO REACH, Making Primary Care Primary, or Primary Care First models.

* Medicare beneficiaries who are enrolled in the QMB eligibility group do not have any Medicare cost sharing responsibility for copays, deductibles, and coinsurance.

** See discussion in section II.G.2.c.(10) of the CY 2025 PFS proposed rule for a description of the timeline of MIPS reporting, and information for eligible clinicians who are not MIPS eligible or QPs. MIPS eligible clinicians who furnish APCM services in 2025 who intend to report on for the CY performance year/2027 MIPS payment year must register to report the Value in Primary Care MVP as described under § 414.1365(b). For more details, see the 2024 MIPS Quick Start Guide, available at *https://qpp.cms.gov/mips/reporting-options-overview*.

*** See requirement in section III.G. of the CY 2025 PFS final rule for practitioners in Shared Savings Program ACOs to report the APP Plus quality measure set.

We sought comment on whether the proposed service elements and practice-level requirements are appropriately reflective of care management services for advanced primary care, and whether there are elements of APCM services or practice capabilities that should be modified or removed.

We also sought feedback on ways to align the APCM services with other Medicare programs and initiatives, such as the Shared Savings Program, the ACO REACH Model, and advanced primary care models, and the Quality Payment Program, including MIPS and Advanced Alternative Payment Models (Advanced APMs). We sought to create a low burden way for practitioners to furnish APCM services by appropriately recognizing ways in which they may meet APCM billing requirements as part of these programs and initiatives. We noted that under the Quality Payment Program, practitioners who are MIPS eligible clinicians will report measures and activities as specified by us under the four MIPS performance categories: quality, cost, improvement activities, and Promoting Interoperability. To report to MIPS for a performance period (§ 414.1320(i)) for the Promoting Interoperability performance category, a MIPS eligible clinician must use Certified EHR Technology (CEHRT), as defined at paragraph (2) under CEHRT at § 414.1305, report on the objectives and associated measures as specified by us and submit required attestations as specified in § 414.1375(b)(3). Eligible clinicians who participate in Advanced APMs under the Quality Payment Program are required under the terms of those APMs to use CEHRT as specified in § 414.1415(a)(1)(iii); and are paid under the terms of those APMs based on MIPS-comparable quality measures as specified in § 414.1415(b).

As described as part of this final rule, we proposed that a billing practitioner who is part of a Shared Saving Program ACO, or CMS Innovation Center ACO or participating in Making Care Primary or Primary Care First will already satisfy the APCM practice-level requirements for Patient Population-Level Management (see section II.G.2.c.(9) of this final rule), and performance measurement (see section II.G.2.c.(10) of this final rule) by meeting separately applicable participation requirements within the Shared Savings Program and these APMs. As noted previously, we considered whether practitioners in

other types of CMS Innovation Center models might also satisfy certain APCM service elements and practice-level requirements through their participation in the models and sought comments on this question. We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received a few comments recognizing our desire to minimize duplicative reporting and the associated burdens, but no specific suggestions to achieve this goal. Commenters did not directly address the ways in which we may better align with other programs and initiatives. Finally, commenters sought confirmation that practices participating in either a Shared Savings Program ACO or Innovation Center model will satisfy the performance measurement requirements.

Response: We thank commenters for their feedback and the request for clarification. As described in the CY 2025 proposed rule and in this final rule, we considered the burden associated with potentially duplicative reporting requirements. Practitioners in practices participating in a Shared Savings Program ACO or in certain Innovation Center models (ACO REACH, Making Care Primary, Primary Care First) will satisfy the performance measurement element of the APCM services by meeting their respective program and model requirements.

(1) Beneficiary Consent

Consistent with other care management services, we proposed in the CY 2025 PFS proposed rule that the beneficiary's consent to receive APCM services must be documented in the medical record as a condition of payment for APCM services, as not all Medicare beneficiaries for whom APCM services would be medically necessary may want to receive these services. As we do for CCM and PCM services, we proposed to require billing practitioners to inform the beneficiary of the availability of APCM services, and ensure the beneficiary is aware that Medicare cost sharing usually applies (though these costs may be covered through supplemental health coverage). The practitioner should also inform the beneficiary that, by providing APCM services, they intend to assume responsibility for all of the patient's primary care services and serve as the continuing focal point for all needed health care services; and that only one practitioner can furnish and be paid for APCM services during a calendar month, but that their consent to receive APCM services does not limit their option to receive Medicare covered health care services from other practitioners. The practitioner should inform the beneficiary that APCM is an ongoing, monthly service and of their right to stop APCM services at any time (effective at the end of the calendar month), and that they only need to provide consent once to receive APCM services from the practitioner. We proposed that the practitioner would document in the beneficiary's medical record that this information was explained and note whether the beneficiary accepted or declined APCM services. We noted that practitioners can still elect to obtain written consent rather than verbal consent.

Practitioners have informed us that beneficiary cost sharing is a significant barrier to provision of similar care management services, such as CCM services. The patient consent requirement is intended to ensure that patients do not incur unexpected expenses for care that is largely, or in significant part, non-face-to-face in nature. The requirement for patient consent would also help to avoid duplicative practitioner billing, as the patient would understand that the practitioner intends to serve as the focal point for all their care, and that only one practitioner can furnish and be paid for APCM services in any particular month.

We sought feedback on these requirements, including how best to effectively educate both practitioners and beneficiaries on the benefits of APCM, especially as it reflects a new bundle of services that may have previously been separately billed, and whether it would be helpful if we provided a template to facilitate patient consent.

We also sought feedback on whether we should require practitioners to revisit consent for APCM services on an ongoing basis with patients.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters were generally supportive of our proposal to require consent. Many commenters felt that consent is important for beneficiaries so they understand that cost sharing may apply for these services on an ongoing basis. Several commenters requested clarification on the frequency in which consent should be obtained, and some commenters stated it should be obtained no more than once a year. One commenter sought clarification if patients with an existing consent for CCM would require a new consent for APCM. Commenters disagreed on how consent should be obtained, with some requesting written consent to be required, while others requested verbal consent to be allowed, citing administrative burden of obtaining written documents. Another commenter requested that we create a standardized consent form to be used for APCM services. Others criticized consent requirements as an administrative burden and stated that this burden is a substantial barrier to uptake of current CCM and PCM codes.

Response: We thank commenters for their feedback. We appreciate commenters' feedback about the potential operational difficulty of obtaining and documenting consent. However, as discussed in the CY 2014 PFS final rule (78 FR 74424), we continue to believe that consent is important to ensure beneficiaries understand their potential cost sharing responsibilities, especially for non-face-to-face services. We also encourage practitioners and practices to view the consent process as an opportunity to educate the beneficiary about the new coding Medicare has created for APCM services and discuss the service elements and capabilities that make a practice qualified to perform these services. This is also an opportunity to ensure that the beneficiary is not receiving APCM services elsewhere, and as discussed in greater detail later in this final rule, to ensure that the beneficiary acknowledges and understands that this practitioner will serve as the focal point of all primary care services until the beneficiary is no longer receiving this type of care with this practitioner or practice. For these reasons, we do not believe that a patient's previous consent for CCM would be sufficient for purposes of the new APCM services, and a beneficiary transitioning from CCM to APCM would require a new consent.

After consideration of public comments, we are finalizing as proposed that patient consent needs to be obtained at initiation of APCM services and documented in the medical record. Written consent is not necessary; however, practitioners may obtain written consent if they wish. We are also clarifying that the patient consent must be obtained to receive APCM services from the billing practitioner—which would be the practitioner who intends to be responsible for all primary care services and serve as the continuing focal point for all needed health care services. A new consent to receive APCM services is required if there is a change in the practitioner who furnishes and bills for the APCM services, which is in line with consent

requirements for other care management services.

(2) Initiating Visit

Consistent with CCM services (CPT codes 99437, 99439, 99487, and 99489—99491) and PCM services (CPT codes 99424—99427), we proposed in the CY 2025 PFS proposed rule to require an initiating visit for APCM services only for new patients instead of for all beneficiaries receiving APCM services. Consistent with the definition of ''new patient'' as described in the CPT® 2024 Professional Edition Code Book on page 4, we proposed to define a ''new patient'' as a person who did not receive any professional services from the physician or other qualified health care professional or another practitioner in the same group practice within the previous 3 years.[62] The initiating visit furnished in advance of APCM services establishes the beneficiary's relationship with the billing practitioner, ensures the billing practitioner assesses the beneficiary prior to initiating APCM services, facilitates collection of comprehensive health information to inform the care plan, and provides an opportunity to obtain beneficiary consent (although beneficiary consent can be obtained outside of the initiating visit). We proposed that the same services that can serve as the initiating visit for CCM services could serve as the initiating visit for APCM, including a Level 2 through 5 E/M visit, initial preventive physician exam (IPPE), or TCM service, and we proposed that the initiating visit could be provided in person or as a Medicare telehealth service.

We proposed that an initiating visit would not be required for ''established patients'' based on certain circumstances that demonstrate an established patient-practitioner relationship in advance of furnishing APCM services: (1) if the beneficiary is not a new patient (has been seen by the practitioner or another practitioner in the same practice within the past three years) or (2) if the beneficiary received another care management service (including an APCM service, non-complex or complex CCM service (CPT codes 99487, 99489, 99490, 99491, 99439, 99437), or PCM service (CPT codes 99424, 99425, 99426, 99427)) within the previous year with the practitioner or another practitioner in the same practice. For patients with whom the practitioner (or another in the same practice) has an established relationship, there is not necessarily a need for an initiating visit for APCM services; and we would not want to require an initiating visit under circumstances where a visit may not be medically necessary. The policy not to require an initiating visit for beneficiaries who have received any professional service from the physician or other qualified health care professional or another practitioner in the same group practice within the previous 3 years is consistent with CPT's definition of the term ''established patient,'' such that this captures patients who have been seen relatively recently and who have an existing relationship with the practice. In the case of beneficiaries who have received care management services from a practitioner within the practice in the past year, this indicates that the patient is also an ''established patient'' in that the patient has an existing relationship with the practice, and the patient previously has consented to the receipt of care management services, which have overlapping service elements with APCM services.

We noted that these standards would be consistent with applicable Shared Savings Program and CMS Innovation Center patient attribution standards in the ACO REACH Model, Making Care Primary, and Primary Care First. Any beneficiary eligible to be assigned to an ACO because of an established care relationship between the beneficiary and a billing practitioner who will be billing for APCM services under the ACO participant's TIN, including beneficiaries who voluntarily aligned to a practitioner in the ACO, would not be considered a new patient and would not require an initiating visit. Medicare rules governing patient attribution to an ACO on the basis of care provided by an ACO-participating clinician similarly establish where an existing care relationship exists. Similarly, beneficiaries eligible to be assigned to a REACH ACO, or a Making Care Primary or Primary Care First practice because of an established care relationship between the beneficiary and a billing practitioner who will be billing for APCM services under the model participant's TIN, including beneficiaries who voluntarily aligned to a practitioner participating in one of these three models would not be considered a new patient and would not require an initiating visit. While we proposed certain exceptions to the initiating visit requirement for APCM services, we noted that an initiating visit may still be needed even when not required, and the billing practitioner can always furnish and bill for medically necessary visits, including before initiating APCM services.

We sought feedback on these requirements, including whether additional services could serve as the initiating visit and whether a different period of time (for example, patients not seen within one or 2 years) would be more appropriate.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were overwhelmingly in favor of our proposals not to require initiating visits for established patients, and commenters agreed with the definitions proposed for established patients. Commenters were also supportive of our proposal to include Medicare telehealth visits or in-person visits as initiating visits. One commenter suggested that including other specialist visits would expedite patients into APCM. A few other commenters agreed with our inclusion of the IPPE and stated that we should also include the Medicare Annual Wellness Visit (AWV). We did not receive any comments about the proposed inclusion of ACO and CMMI model participants as established patients.

Response: We agree that initiating APCM services expeditiously is important, but we disagree that an initiating visit could be provided by a different practitioner than the practitioner furnishing APCM. APCM coding describes services furnished by the specific practitioner who is serving as the focal point of all health care for a patient, and we continue to believe that the practitioner furnishing the initiating visit should be the practitioner who will be furnishing the APCM services. We thank the commenters for noticing that we did not include the AWV in our proposal. This was an oversight, and we agree that the AWV could serve as an initiating visit, so long as the practitioner furnishing the AWV is a physician or other qualified health professional such as a nurse practitioner, physician assistant, clinical nurse specialist, or certified nurse midwife, as discussed earlier in this final rule, and will be the same practitioner who will furnish the APCM services.

After consideration of public comments, we are finalizing as proposed that an initiating visit is required before a new patient receives APCM services. We are finalizing our definition of a ''new patient'' for this purpose as described in the CPT® 2024 Professional Edition Code Book on page 4, as a person who did not receive any

[62] American Medical Association. CPT Professional 2024. American Medical Association, 2023.

professional services from the physician or other qualified health care professional or another practitioner in the same group practice within the previous 3 years.[63] We are also finalizing that an initiating visit is not required for established patients. We are finalizing our definition of an ''established patient'' as (1) a beneficiary who has been seen by the practitioner or another practitioner in the same practice within the past three years or (2) a beneficiary who has received another care management service (including an APCM service, non-complex or complex CCM service (CPT codes 99487, 99489, 99490, 99491, 99439, 99437), or PCM service (CPT codes 99424, 99425, 99426, 99427)) within the previous year from the practitioner or another practitioner in the same practice. We are also finalizing that beneficiaries who are eligible to be assigned to an ACO because of an established care relationship between the beneficiary and the billing practitioner who will bill for APCM services and beneficiaries assigned to a REACH ACO, or a Making Care Primary or Primary Care First practice because of a similarly established care relationship are considered established patients.

We are finalizing a modification to our proposal to specify that, in addition to the initiating visit services we identified in the proposed rule, the Medicare AWV can serve as an initiating visit, so long as it is furnished by the practitioner who will furnish the APCM services.

(3) 24/7 Access and Continuity of Care

Access and continuity build on the patient-practitioner relationship to ensure patients receive the right care at the right time from the right care team member. We proposed in the CY 2025 PFS proposed rule to include for APCM services the same scope of service elements we established for CCM and PCM services for 24/7 Access and Continuity of Care with some modifications. For 24/7 Access to Care, the scope of the service element we proposed for APCM services would be to provide 24/7 access for urgent needs to the care team/practitioner with real-time access to patient's medical records, including providing patients/caregivers with a way to contact health care professionals in the practice to discuss urgent needs regardless of the time of day or day of week.

As described in the CY 2017 PFS final rule, this accurately reflects the potential role of clinical staff or call-sharing services in addressing after-hours care needs, and that after-hours services typically would and should address any urgent needs and not only those explicitly related to the beneficiary's chronic conditions (79 FR 67722). In advanced primary care models of care, primary care practices should be at the center of that care—providing an effective ''first contact'' for patients, supporting patients in their management of care, and coordinating across different settings of care. Achieving this level of access to primary care requires timeliness and an effective relationship with those in the practice who are providing that care. True access is fully informed by knowledge about the patient and their care, which is only possible through real-time access to the patient's electronic health information. Access to primary care, informed by health information technology (IT), makes the right care at the right time possible, potentially avoiding costly urgent and emergent care. Practices can achieve 24/7 access to care informed by health IT through call coverage by a practitioner with health IT system access. This can be a practitioner from the practice or a covering practitioner who has system access. Many practices and systems use nurse call lines or answering services working with standard protocols to provide the initial point of contact after hours and effectively address common problems. In this situation, an escalation protocol will engage a practitioner with system access when needed for decision making. Other successful practices expand hours, add urgent care services or partner with other practices to provide these services, or contract with existing urgent care providers to manage and coordinate care after regular office hours.

For Continuity of Care, the scope of service element would be to provide continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments. Continuity of care refers to the ability of patients to receive care from practitioners who know them and are known by them. This continuity builds and reinforces a relationship based in trust and shared experience that is highly valued by both practitioners and patients. Practice focus on continuity of care can translate to improved preventive and chronic care, patient and practitioner satisfaction, lower hospital utilization, and lower costs.[64] Depending on the type and setting of care, there are three components of continuity that improve patient outcomes and experience:[65] relational continuity (defined as the ''ongoing therapeutic relationship between a patient (and often their family/caregiver)'' which is foundational in advanced primary care), informational continuity (where practitioners have access to information on patients' past events and personal circumstances to inform current care decisions); and longitudinal continuity (which refers to ongoing patterns of healthcare visits that occur with the same practice over time). A key strategy to optimize continuity is ensuring that all practitioners and/or the care team have access to the same patient information to guide care within health IT, and successful practices start with a review and discussion of the practice-level data developed through measurement of continuity.[66] Practices can develop the capability to measure continuity of care between the patient and the practitioner/care team using health IT, practice management software, or other tracking mechanisms, allowing them to track improvements over time.

As included in the APCM code descriptors, we proposed to specify for the ''24/7 Access to Care'' APCM service element that the practice would maintain the capability to deliver care in alternative ways to traditional office

visits to best meet the patient population's needs, such as e-visits, phone visits, home visits, and/or expanded hours. This standard for alternatives to office visits is similar to several requirements tested in CMS Innovation Center models (such as the CPC+ model's requirement that participating practices regularly offer at least one alternative to traditional office visits [67]) and reflects the understanding that providing alternatives to traditional office visits is an essential element of the delivery of care under an advanced primary care model of care. Moving care out of traditional office visits can reduce demand and open supply for prioritized visits. By changing where and how care is delivered, practices may have increased availability for patients with complex needs who may be better served by more time-intensive visits in the office, at home, or in a nursing home. We did not propose that a practice will need to regularly deliver care in all these alternative ways—for example, a practice may routinely offer e-visits and phone visits, but not regularly furnish home visits, and still demonstrate this primary care practice capability. Another practice might offer extended hours on certain days to help patients who may find it hard to take off work to see their clinician, and this would satisfy this practice requirement.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported our 24/7 access to care requirement for APCM services. One commenter stated that most practices currently have this capability, reflected by the fact that physicians with hospital privileges generally must demonstrate they have continuous coverage for urgent patient needs. Several commenters requested clarification on the 24/7 access to care requirement for APCM services. A few commenters stated that providing 24/7 access to care is very difficult due to physician shortage and burnout, as well as certain practice arrangements that may limit real-time access to the patient's electronic health information—for example, practices that rely on a third party to provide after-hours call coverage. One commenter urged us to support improvements in data-sharing infrastructures, such as health information exchanges, which may help alleviate some of these barriers.

[67] *https://www.cms.gov/priorities/innovation/innovation-models/comprehensive-primary-care-plus.*

Another commenter suggested that we should modify the requirement for 24/7 availability. This commenter stated that depending on the hour of the day, a reasonable amount of time should be allotted to respond to patients, such as overnight when the practitioner should have time to review the patient's charts before speaking to them. If this is not possible, then a previously agreed-upon alternate should be allowed to respond to the patient. Another commenter raised concerns about small and independent practices in under-resourced settings that might not be able to guarantee 24/7 access.

Commenters generally supported our continuity of care requirement for APCM services and acknowledged the alignment of this requirement with our proposal that APCM services are to be billed only by the practitioner who intends to be the focal point for all needed health care for the patient. One commenter was concerned about the lack of a measure of continuity for accountability or evaluation as it relates to the performance measurement requirement for APCM services and recommended that we assess continuity as a measured outcome. This commenter asserted that, with continuity, patient health outcomes are improved across a wide range of chronic disease areas, including diabetes, asthma, cancer, and dementia. Several commenters requested clarification on the alternative visit requirement for APCM services, including one commenter who asked whether the practitioner/care team is required to offer home visits to bill for APCM services.

Response: We emphasize that our intent with this proposal was to ensure that practices have flexibility in how they satisfy the requirements, including how they ensure 24/7 access for urgent patient needs. While we continue to believe that real-time access to patient medical records is best for addressing after-hours care needs, we understand this may not always be feasible, especially for smaller practices that may rely on third parties for after-hours coverage. Furthermore, we would like to reiterate that we did not propose to require that a practice would need to regularly deliver care in all of the alternative ways we mentioned, but instead that the practice would provide care by some alternative means to traditional office visits as appropriate to best meet their patient population's needs, including but not limited to e-visits, phone visits, home visits, and/or expanded in-person patient care hours.

Comment: Several commenters requested clarification on how to document that a practice meets the 24/7 access to care requirement if a patient receiving APCM services does not use after-hours care in a given month, and asked if they would need to document in each patient's medical record that the practice has 24/7 access to care.

Response: We do not expect that the practice level requirements like 24/7 access to care would be documented in each patient's medical records for each month for which APCM services are furnished, but we would expect that if the patient had an interaction with a care team member after hours, this would be documented in the patient's medical record. By billing for APCM services, the practice is attesting that it meets the requirements included in the code descriptor.

After consideration of public comments, we are finalizing the 24/7 access and continuity of care requirement as proposed, but with clarification that 24/7 access for urgent needs means reasonable after-hours care, when necessary, and with a modification that there need not be real-time 24/7 access to the patient's medical record. Instead, we will require that the after-hours responder must document and communicate their interaction with the patient to the primary care team/practitioner, and that interaction must be documented in the patient's medical record. We are modifying the 24/7 access to care requirement because we understand that real-time access to patient medical records may not always be feasible, especially for smaller practices that may rely on third parties for after-hours coverage. We would like to reiterate that real-time access to the patient's medical record is a key component of advanced primary care, and we may revisit this issue in future rulemaking.

(4) Comprehensive Care Management

We proposed in the CY 2025 PFS proposed rule to adopt for APCM services the ''Comprehensive Care Management'' service element we established for CCM and PCM services with some modifications. Rather than ''care management for chronic conditions,'' the APCM service element would be ''overall comprehensive care management'' which, like the element for CCM and PCM services, may include, as applicable, ''systematic assessment of the patient's medical, functional, and psychosocial needs; system-based approaches to ensure timely receipt of all recommended preventive care services; medication reconciliation with review of adherence and potential interactions; and oversight of patient self-management of

medications.'' This care management standard is similar to several requirements tested in CMS Innovation Center models (such as the CPC+ model's requirement that participating practices provide targeted, proactive, relationship-based care management to all patients identified as at increased risk and likely to benefit from intensive care management and provide short-term care management, including medication reconciliation, to patients following hospital admission/discharge/transfer, including observation stays, and, as appropriate, following an ED discharge)[68] and is an essential element of the delivery of care under an advanced primary care model of care. Care management is a resource-intensive process of working with patients, generally outside of face-to-face office visits, to help them understand and manage their health, navigate the health system, and meet their health goals. Practices working with patients who have complex care needs have found care management to be an effective and necessary strategy for mitigating risk and improving health outcomes. Practices have found it valuable to think in terms of two broad types of patients who might benefit from different approaches to care management: patients with some combination of multiple comorbidities, complex treatment regimens, frailty and functional impairment, behavioral and social risks, and serious mental illness who would often benefit from long-term, proactive, and relationship-based longitudinal care management; and patients who are otherwise stable and will benefit from short-term, goal-oriented episodic care management during periods of increased risk like transitions of care; diagnosis of a new, serious illness or injury involving complex treatment regimens; or newly unstable chronic illness.

Successful practices use on-site, non-physician, practice-based, or integrated shared care managers to provide longitudinal care management for the highest risk cohort of patients, with assistance from other practice staff, as needed. Multiple team members may engage in care management, but each patient identified as eligible should have a clinically trained individual in the practice who is accountable for active, ongoing care management that goes beyond office-based clinical diagnosis and treatment.[69] Longitudinal care management is captured in health IT and includes providing proactive care that moves beyond traditional office visits or crisis-driven care (for example, ED care or hospitalization) and is not primarily visit-based. Although office visits are opportunities to define goals, plan patient care, engage in shared decision making, and build a trusting relationship, most care management activities take place by phone, patient portal, email, mail, or home visits (and through visits to skilled nursing facilities or hospitals to support transitional care).

Practices use the concept of episodic care management to identify patients who have acute or urgent needs using ''triggering events'' (for example, hospital discharge, new diagnoses, medical crisis, major life event, decompensation in otherwise controlled chronic condition) for short-term, problem-focused care management services. Episodic care management is generally time-limited and problem focused and most often includes coordination of services and follow-up, patient education and support for self-management, and medication reconciliation.

We sought feedback on these requirements.

Comment: We received a few comments on this proposal, which were overwhelmingly supportive. In particular, several commenters expressed appreciation for our efforts to recognize that practices furnish comprehensive care management by acknowledging the team-based aspect of APCM which may help a patient navigate their complex health conditions.

Response: We thank the commenters for their support and are finalizing the comprehensive care management service element as proposed.

(5) Patient-Centered Comprehensive Care Plan

We proposed in the CY 2025 PFS proposed rule to adopt for APCM services the ''Comprehensive Electronic Care Plan'' service element we established for CCM and PCM services with some modifications. As included in the APCM code descriptors, we proposed to specify that the care plan is ''patient-centered'' which, as for CCM and PCM services, ''is available timely within and outside the billing practice'' as appropriate to individuals involved in the beneficiary's care, can be routinely accessed and updated by care team/practitioner, and ''copy of care plan to patient/caregiver.''

Providing longitudinal care management, which is an essential element of the delivery of care under an advanced primary care model of care, includes the process of personalized care planning. The personalized care planning process helps practices engage and collaborate with patients to ensure that their care aligns with patient preferences, goals, and values.[70] A care plan is a mutually agreed-upon document that outlines the patient's health goals, needs, and self-management activities and is accessible to all team members providing care for the patient. The care plan should be patient-friendly, accessible to the patient, and should limit use of unfamiliar medical jargon and acronyms. The care plan should also be structured and standardized, documented in health IT to enable sharing among patient, caregivers, and care team members. All high-risk patients receiving longitudinal care management should have a personalized care plan developed in a joint, open-ended conversation between the patient and care team. Personalized care planning is a dynamic process; therefore, the care plan document should be updated at when applicable by the care team and patient. In addition, when patients' health status, preferences, goals, and values change, their plans of care should, too.

As described in the CY 2020 final rule, we proposed language to describe the ''typical'' care plan elements which do not comprise a set of strict requirements that must be included in a care plan for purpose of billing but are intended to reflect those that are typically included in a care plan as medically appropriate for a particular beneficiary. The comprehensive care plan for all health issues typically includes, but is not limited to, the following elements: problem list; expected outcome and prognosis; measurable treatment goals; cognitive and functional assessment; symptom management; planned interventions; medical management; environmental evaluation; caregiver assessment; interaction and coordination with outside resources and practitioners and providers; requirements for periodic

review; and when applicable, revision of the care plan (84 FR 62691).

We sought feedback on these requirements.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported our proposed patient-centered comprehensive care plan requirement for APCM services. Several commenters requested clarification on the care plan requirement, including whether existing CCM care plans meet the service requirements and what our expectations are regarding updating the care plan at ''regularly defined intervals.'' One commenter also asked us to clarify whether a member of the care team could initiate the care plan if they sent it to the primary practitioner to edit and approve. One commenter requested that we embed into the care plan the same requirements for cultural and linguistic factors that we proposed in the practitioner, home-, and community-based care coordination requirement for APCM services. Another commenter requested that we create an additional code for updating the care plan (in addition to HCPCS G0506, *Comprehensive assessment and care plan for patients with chronic conditions*), with a limit on billing it three times per year. One commenter encouraged us to work with other agencies, stakeholders, and physicians to establish clear, minimum requirements for EHR vendors that improve the process to create, share, reconcile, and integrate multiple plans of care into a comprehensive care plan. Other commenters agreed that all the required care elements in the plans are necessary elements for care and should be included in any final policy.

Response: We thank the commenters for their feedback. We are clarifying that a member of the care team could draft the care plan, as appropriate, and send to the practitioner for review and approval. We appreciate the recommendation that cultural and linguistic factors be included as a care plan requirement and remind commenters that the typical care plan elements which are based on the those finalized in the CY 2020 PFS final rule (84 FR 62691), are not limited to that list. In the instance it is beneficial to the patient to include cultural and linguistic factors in the care plan, the practitioner should be empowered to add them. We intended that our definition of ''regularly defined intervals'' match similar requirements for other care management services, and thus are clarifying that the care plan should be updated ''when applicable'' to match current requirements for CCM. While it may be preferable, when feasible, to update the care plan on an annual basis or more frequently, if there are relevant clinical changes within that time, we believe that the need and frequency for care plan revision should be considered as medically appropriate for a particular beneficiary. We emphasize that our intent is to ensure that practitioners have flexibility in how they can satisfy the care plan requirement, and we do not wish to impose additional administrative burden.

Comment: Some commenters stated that a ''comprehensive care plan'' is not needed when a practitioner is engaged in Level 1 APCM services for a beneficiary with only one or no chronic conditions, and instead suggested that the care plan requirement would be satisfied if the practitioner maintains an up-to-date problem and medication list for the patient, including the status of preventive services. A few commenters recommended that care plans developed as part of the AWV should satisfy the care plan requirement for APCM services. One commenter was concerned about specific elements of the care plan that might be too subjective—for example, expected outcome and prognosis.

Response: We emphasize that our intent is to ensure that practitioners have flexibility in how they satisfy the care plan requirement, including who drafts the care plan, what elements are included, and as mentioned above, at what frequency they are updated. We are sympathetic to commenters' concerns about this element, especially in terms of current clinical practice and medical necessity for less complex beneficiaries. While we are not requiring a specific format for the care plan and, as described above, we provide a series of typical care plan elements; we would like to emphasize that the need for specific care plan elements should be considered as medically appropriate for a particular beneficiary, which we also believe speaks to the commenters' questions about the care plan for a level 1 beneficiary. We also agree with commenters that care plans developed as part of the AWV by the same practitioner who furnishes APCM services may be used to satisfy this requirement, as appropriate considering the particular patient's clinical circumstances.

After consideration of public comments, we are finalizing the patient-centered comprehensive care plan service element for APCM services as proposed.

(6) Management of Care Transitions

We proposed in the CY 2025 PFS proposed rule to adopt for APCM services the ''Management of Care Transitions'' service element we established for CCM and PCM services with some modifications. Rather than requiring that the practice must facilitate communication of relevant patient information through electronic exchange of continuity of care documents with other health care providers regarding these transitions, we proposed more simply to require the billing practitioner to ''ensure timely exchange of electronic health information'' with other practitioners and providers. As included in the APCM code descriptors, we also proposed to specify for the ''Management of Care Transitions'' APCM service element that the care team/practitioner will follow up with the patient and/or caregiver within 7 days after each ED visit and hospital discharge. This timely follow-up standard is similar to several requirements tested in CMS Innovation Center models (such as the CPC+ model's requirement that participating practices ensure patients with ED visits received a follow-up interaction within one week of discharge [71] and the MCP model's requirement that participating practices implement episodic care management to provide timely follow-ups for high-risk patients post ED visit and hospitalization [72]), and we patterned the timely follow-up element after our policy for TCM services which requires, for example, ''communication (direct contact, telephone, electronic) with the patient and/or caregiver with 2 business days of discharge'' and a ''face-to-face visit within 7 calendar days of discharge.'' Providing timely follow-ups for patients is an essential element of the delivery of care under an advanced primary care model of care, and this will help achieve timely, seamless care across settings especially after discharge from a facility. Key aspects of follow-up after ED visits and hospitalizations include identifying and partnering with target hospitals and EDs where the majority of a practice's patients receive services to achieve timely notification and transfer of information following hospital discharge and ED visits.[73]

Continued

When developing a standardized process for data exchange and timely follow-up, successful practices include the following processes: information and data exchange about patients seen in an ED or admitted to/discharged from a hospital (for example, via HIE, hospital portal, hospital-generated report, EHR, or additional health IT system); definition for ''timely'' follow-up after discharge (for example, no later than within 2 days of discharge from hospital admission or observation stay and within 1 week of discharge from the ED); protocols for when follow-up will be done (for example, before discharge or following a standardized follow-up protocol); process of incorporating into the patient's medical record so the information is available at the time of the follow-up visit or other patient contact; and standardized processes and protocols for data exchange and formalized partnerships to develop an efficient workflow to ensure timely follow-up and facilitate efficient and safe transitions of care.

Practices use a variety of scheduling strategies to prioritize same-day or next-day access for acutely ill patients and to provide timely follow-up for patients experiencing care transitions. Successful practices are those that can strike the right balance between timely access to visits and the offering patients a provider of their choice (Continuity of Care). Establishing standardized protocols and pathways to improve and ensure responsiveness and timely callbacks to patients is an effective way to impact patient–practitioner/care team communication and to ensure a safeguard for addressing emergent and urgent patient phone calls. Successful practices routinely evaluate the degree to which patients' phone calls are answered promptly or returned within a practices' established guidelines (for example, non-urgent, emergent, urgent) and routed to the appropriate practitioner or care team member, incorporating patients' clinical needs and preferences.[74] Such strategies are paramount for practices whose patients may be contacting the practice with care needs that require care team prioritization and urgent reply. We sought feedback on these requirements.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters were concerned about our proposed management of care transitions requirement for APCM services, and particularly the requirement for timely follow-up communication within 7 days of an ED visit or hospital discharge. A few commenters suggested that we should modify the requirement for timely follow-up within 7 days of discharge because this is not always possible. One commenter encouraged us to prioritize strategies designed to improve interoperability to better coordinate care transitions. Another commenter asked us to include pediatric-to-adult care transitions as part of this requirement and they suggested that this type of transition has a 6-month follow-up timeframe.

Response: We appreciate the perspective that interoperability improvements could assist practitioners with managing care transitions, and the feedback on pediatric-to-adult care transitions. We welcome additional information from interested parties on these topics. We emphasize that our intent with this proposal was to ensure that practitioners furnishing APCM services have flexibility within their practices as to how they satisfy the requirement, including how they ensure timely follow-up after their patient's care transition. While we understand that some patients and their caregivers may be difficult to reach, we expect that practices make an active effort to timely follow up with patients post-discharge. We would like to reiterate that we are finalizing that a practice should meet this 7-day follow-up requirement whenever possible.

After consideration of public comments, we are finalizing the management of care transitions service element as proposed, but with clarification that practitioners should make reasonable efforts to provide timely follow-up communication after an ED visit or hospital discharge within 7 days when possible. Consistent with other APCM service elements, we will require that the efforts to reach the patient/caregiver and any interaction must be documented in the patient's medical record. Timely follow-up with patients after care transitions is a key component of advanced primary care which we believe will help achieve timely, seamless care across settings, and we may consider revisions to this policy in future rulemaking.

(7) Practitioner, Home-, and Community-Based Care Coordination

We proposed in the CY 2025 PFS proposed rule to adopt for APCM services the ''Home- and Community-Based Care Coordination'' service element we established for CCM and PCM services with some modifications. As included in the APCM code descriptors, we proposed to specify that the ''ongoing communication and coordinating receipt of needed services'' is not only with home- and community-based service providers, but also with ''practitioners,'' ''community-based social service providers, hospitals, and skilled nursing facilities (or other health care facilities), as applicable.'' We also proposed to add more detail about the communication documented in the patient's medical record in that it would include ''the patient's psychosocial strengths and needs, and functional deficits, goals, preferences, and desired outcomes, including cultural and linguistic factors.''

Coordinated referral management with specialty groups and other community or healthcare organizations ensures referrals are properly managed, coordinated, and communicated. These efforts help practices achieve goals of enhancing the quality of patient care, improving the patient's care experience, and lowering cost, particularly for practices serving high-risk patient populations. Evidence suggests that the development of formal relationships (for example, collaborative care agreements) between the primary care practice and referred groups/organizations that define shared goals and responsibilities, facilitate the coordinated referral management process.[75] The foundation of successful coordinated referral management with specialty groups and other community or healthcare organizations is the development of processes and procedures to ensure high-value referrals, such as collaborative care agreements and electronic consultations (e-Consults). Establishing clear and agreed-upon expectations regarding communication and clinical responsibilities with

specialty practices and other care organizations, through a collaborative care agreement, improves the process. Collaborative care agreements often include the following elements: defining the types of referrals, consultation, and co-management arrangements available; specifying who is accountable for which processes and outcomes for care within the referral, consultation, or co-management arrangement; and specifying what clinical and other information should be provided, how the information is transferred, and timeliness expectations. The electronic e-Consults process is typically conducted through a system-wide EHR or a secure, web-based system by which a practice receives guidance from a specialty provider or other care organization.[76] In this process, a practitioner sends a clinical question and relevant clinical information to the specialist (or other care organization), who responds by providing a clinical opinion and guidance and/or confirms the need for a face-to-face appointment with the patient. This tool and process has the potential to streamline consultations, reduce cost and burden for patients, and improve access to specialty care for high-value referrals. As part of the CY 2019 PFS final rule, we finalized interprofessional consultation services codes, which support payment both to the treating, requesting (primary care) practitioner (CPT code 99452) and the receiving, consultative specialist (CPT codes 99446–99449 and 99451) who engage in e-Consults, and so some practitioners have already become accustomed to providing and billing for these services (83 FR 59687).

Strategies for addressing common health-related social needs (HRSNs) for a practice's high-risk patients include conducting needs assessments at regular intervals, creating a resource inventory for the most pressing needs of the patient population, and establishing relationships with key community organizations. Practices can focus on developing relationships with community-based organizations that support patients' most significant HRSNs. Practices can also seek to find common ground with community and social service organizations, focus on the structure and process of referrals, and develop a bidirectional flow of information. Successful practices work with their patients to ensure there is a shared understanding of the purpose of the referral and aim to understand bottlenecks and barriers to meeting their needs through the process. Many practices identify a care team member to be a community referral resource for their patients. Successful referrals can help practices determine the most useful and available resources in their community. We sought feedback on these requirements.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters were generally supportive of our proposal. Several commenters expressed appreciation for the inclusion of cultural and linguistic factors in the documentation requirements when coordinating with and referring to services outside the primary care clinic. One commenter was concerned that our proposals do not incentivize specialists and other clinicians to coordinate with primary care practitioners, recommending that we consider ways to encourage clinicians to communicate and collaborate with each other. One commenter was concerned that community-based aspect of care coordination may pose challenges for certain primary care practices if it extends beyond the routinely used home health services. For example, lower income and QMB patients may receive their primary care in practices that may not be able to meet these standards, such as low resource safety net practices. The commenters stated that this could potentially exacerbate disparities in care and payment for patients at the highest risk.

Response: We thank the commenters for their support, and we agree with commenters that specialists furnishing consultations in conjunction with primary care practitioners are an essential element of advanced primary care services. We are therefore clarifying in this final rule that the interprofessional consultation codes (CPT codes 99446–99449 and 99451) can be billed concurrently with APCM services. We note again that only one practitioner may furnish APCM services in a month, so the consulting practitioner must not also furnish APCM services to the same beneficiary. See Table 26. We believe that our policy to allow concurrent billing of interprofessional consultation codes and APCM services is responsive to commenters' concerns that our proposals may not incentivize specialists and other clinicians to coordinate with primary care practitioners. We appreciate the comments about safety net practices and their ability to furnish APCM services. As discussed previously in this final rule, we also encourage practitioners in practices that may not meet all of the requirements to bill the APCM codes to consider whether care management codes other than the APCM codes might describe the services they are delivering (for example, CCM, PCM, or certain other CTBS). Also as discussed previously in this final rule, we will continue to identify and evaluate ways to encourage practices and practitioners to make APCM services available to all their patients in order to support care improvement for underserved, high-risk beneficiaries.

After consideration of public comments, we are finalizing the practitioner, home- and community-based care coordination service element as proposed.

(8) Enhanced Communications Opportunities

We proposed in the CY 2025 PFS proposed rule to include for APCM services the element of ''Enhanced Communications Opportunities'' we established for CCM and PCM services with some modifications. Specifically, we proposed to add ''internet and patient portal'' as examples of asynchronous non-face-to-face consultation methods and specify that the practitioner will provide ''other communication technology-based services, including remote evaluation of pre-recorded patient information and interprofessional telephone/internet/EHR referral service(s), to maintain ongoing communication with patients, as appropriate'' as well as specify ''access to patient-initiated digital communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits).'' Providing asynchronous non-face-to-face consultation methods and other CTBS services is an essential element of the delivery of care under an advanced primary care model of care, and this will allow patients to access their usual source of care more conveniently (see section II.G.2.c.(3) of this final rule). There is growing consensus that incorporating telehealth into primary care will allow patients to access their usual source of care more conveniently.[77] Patients using

Continued

telehealth visits have reported high satisfaction, identifying convenience and perceived high quality of care as contributors,[78] such that these may be a good alternative and, in some cases, preferable to in-person communication.[79] Expansion of telehealth to address episodic and chronic conditions has been a significant trend in the evolution of telehealth applications, and there is some evidence that video visits may enable more timely communication of test results than in-person appointments.

As noted in section II.G.2.b. of the CY 2025 PFS proposed rule, we did not propose timeframe restrictions for this proposed element, which includes access to certain CTBS (for example, the restriction for virtual check-in services that there is not a related E/M service provided within the previous 7 days or an E/M service or procedure within the next 24 hours or the soonest available appointment). We sought feedback on these requirements.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the emphasis in our proposal on technology integration and agreed that the bundling of CTBS with APCM services demonstrates our overall commitment to adapting to the evolving healthcare landscape, where virtual and asynchronous interactions are becoming more prevalent. Several commenters agreed with us that the integration of digital health technology into chronic care management would enhance patient engagement, facilitate the delivery of continuous, patient-centered care, and drive efficiencies across the healthcare system. Some commenters asserted that this approach would be particularly beneficial in enhancing care delivery in rural and underserved areas, where access to specialized services may be limited.

Another commenter recommended that we eliminate the requirement to offer digital E/M services and virtual check-ins, since these may not be appropriate for certain specialized populations—for example, some home-bound patients may benefit from consistent face-to-face interventions in the home.

Response: We take this opportunity to clarify that virtual check-ins and digital online assessment and management and E/M visits (or e-visits) are not specific requirements of this service element, but rather, are listed as examples. We agree with commenters that practitioners are in the best position to determine how their patients interact with the practice and therefore are not requiring specific types of encounters, but rather encouraging practices to consider ways to ensure enhanced access to patient-initiated digital communications, including but not limited to virtual check-ins and digital online assessment and management and E/M visits (or e-visits).

Comment: Several commenters requested clarification on the documentation required for this proposed service element and the degree to which the primary care practitioner needs to be personally involved in furnishing CTBS.

Response: With respect to whether the primary care practitioner must be the individual in contact with the patient via any enhanced communication methods, as described earlier in this discussion, many APCM services would ordinarily be provided by clinical staff incident to the professional services of the billing practitioner in accordance with our regulation at § 410.26, and as designated care management services could be provided by auxiliary personnel under the general supervision of the billing practitioner. However, some services, such as virtual check-ins or e-visits, necessarily involve the direct delivery of care by the primary care practitioner. Furthermore, we would not expect that the presence of enhanced communications opportunities and capabilities would be documented in each patient's medical record except to the extent that they are used to furnish APCM services. Rather, if the patient has an interaction with a care team member via an enhanced communication tool or service, we would expect that interaction to be documented in the patient's medical record. By billing for APCM services, the practitioner is attesting that the APCM service meets the requirements specified in the code descriptor.

After consideration of public comments, we are finalizing the enhanced communications opportunities service element as proposed.

(9) Patient Population-Level Management

We proposed in the CY 2025 PFS proposed rule to establish an APCM service element for Patient Population-Level Management that will include practice capabilities for population-based, data-driven approaches to manage preventive and chronic care for their patient population and to plan and implement strategies to improve care and outcomes. We proposed that all practices will use data to develop clear improvement strategies and analytic processes to proactively manage population health, including analyzing patient population data to identify gaps in care and risk-stratifying the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients (such as those at risk for poor health outcomes), and then will offer additional interventions, as appropriate.

These Patient Population-Level Management Standards are similar to several requirements tested in CMS Innovation Center models, including CPC+, which found that model participants used data to identify and resolve gaps in care. We have modeled the Patient Population-Level Management standards on the CPC+ care delivery requirements. In the CPC+ Model, participating practices were required, for example, to ''use a two-step risk stratification process for all empaneled patients, addressing medical need, behavioral diagnoses, and health-related social needs'' and ''define at least one subpopulation of patients with specific complex needs, develop capabilities necessary to better address those needs, and measure and improve the quality of care and utilization of this subpopulation.'' [80] Central to the delivery of advanced primary care is the organization of the practice into care teams that have the data they need to manage their patient populations and that have time allocated to plan and implement practice improvement strategies.[81] Using evidence-based protocols, registries, and the registry functionality of the EHR, reminders and outreach help practices deliver appropriate preventive care and consistent evidence-based management of chronic conditions for the entire patient population.[82] Measurement of clinically relevant data at the practice-

level guides testing and implementing strategies to improve care and outcomes. Patient Population-Level Management capabilities are essential to the delivery of care under an advanced primary care model of care and enable practices to meet the preventive and chronic care needs of their entire patient population. Regular use of data to identify populations or groups of patients with similar needs allows practices and care teams to use streamlined strategies, including setting goals with measurable outcomes, to positively impact their patient populations. Evidence shows that primary care teams supported with real-time, Population-Level clinical outcomes data effectively manage population health and address care gaps which eliminates external costs to close gaps in care.[83] More specifically, risk stratification allows practitioners to identify beneficiaries for longitudinal care management, track beneficiaries with higher levels of need and manage their conditions, and prevent beneficiaries from falling through the cracks, while developing strategies to address those patients who are at increased and rising risk and most likely to benefit from targeted, proactive, relationship-based care management and other strategies essential to APCM.[84] Empanelment, which assigns each active patient to a practitioner and/or care team with consideration of patient and caregiver preferences, allows practices to build responsive care teams to optimize patient care and to address the preventive, chronic, and acute needs of all patients, and provides a way for practices to identify care gaps and proactively reach out to patients who have not been seen or contacted in a while.[85] For example, these elements of advanced primary care management could increase screening rates and ultimately improve care of chronic conditions, such as hypertension and diabetes.

We noted as part of the CY 2025 PFS that this Patient Population-Level Management requirement of the APCM services would be met for practitioners billing for APCM services through a TIN that is participating in an ACO in the Shared Savings Program by virtue of the practitioner's participation in the ACO which must meet eligibility requirements for population management, care coordination and quality improvement, including required processes and patient-centeredness criteria in § 425.112. We note that ACOs in the Shared Savings Program and their practitioners are already engaged in analyzing the patient population for care gaps, risk-stratifying patients to further identify those at risk for poor health outcomes, and identifying patients for whom additional interventions are appropriate. Similarly, the ACO REACH, Making Care Primary, and Primary Care First CMS Innovation Center Models all require their participants to deploy population health strategies to identify and offer interventions to mitigate health risks.[86] Participants in these models and their practitioners are already engaged in population health management as described in Table 25. We sought feedback on these requirements.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: One commenter stated that risk stratification and population management will increase a practice's ability to deliver care in the most efficient way possible. Another commenter stated that population management could help practitioners reach underserved populations. A few commenters indicated that the Patient Population-Level Management and any associated data analysis could be completed by the practice and did not necessarily need to be completed by the practitioner. One commenter suggested that because practices have different infrastructures, they should be allowed flexibility in how to implement this requirement. A few commenters stated that they did not believe patient Population-Level Management should be required to bill APCM, and another commenter indicated it may be resource intensive for small practices. One commenter requested that we develop an attribution method by which we would help practitioners identify patients for which they should conduct population management. Finally, one commenter requested that we require practices to conduct Population-Level management for the pediatric-to-adult referral population.

Response: As we indicated earlier, we agree that Population-Level management can be beneficial for practices, assisting them with addressing gaps in care. While Population-Level management requires the development of a process to analyze data and assess gaps in care, we believe that the standard we have proposed is broad enough to allow practices the flexibility to develop and implement processes in a way that best suits the needs of their practice and their patient population, and in a manner that does not require significant start-up costs. Furthermore, at this time, we do not believe it is necessary to dictate for which patients a practice should conduct specific types of Population-Level management. We did not propose that the Population-Level management needed to be completed by the practitioner billing APCM, and we agree with commenters that it is not necessary to require the practitioner to conduct this work. Finally, we appreciate the feedback that an attribution method may be useful for Population-Level management and we may consider that topic for future rulemaking.

Comment: Several commenters requested clarification on how to document that a practice meets the Patient Population-Level Management requirement.

Response: As previously explained, we would not expect that the practice-level requirements would be documented in each patient's medical record except to the extent they are used in furnishing APCM services to a specific patient, in which case we would expect the service to be documented in the patient's medical record. For example, if a practitioner calls a patient after a hospitalization and reviews medication changes, a record of what transpired during that conversation should be included in that patient's medical record. By billing for APCM services, the practitioner is attesting that the requirements included in the code descriptor have been met.

After consideration of public comments, we are finalizing the ''Patient Population-Level Management'' service element as proposed.

(10) Performance Measurement

We proposed, as part of the CY 2025 PFS, for the APCM services a practice-level requirement for ''Performance Measurement'' of primary care quality, total cost of care, and meaningful use of CEHRT. Performance measurement is a critical element of care management services delivered in the context of advanced primary care, and it forms the basis for practice improvement efforts by enabling practices to identify key measures for improvement activities (for example, cost and utilization data, clinical quality measures, patient experience of care data). Quality measurement improves care delivery, including prevention of heart attacks, increasing vaccination rates, and improving patient safety,[87] and quality measures are also effective tools to ensure that high-quality advanced primary care, including care management, is being delivered. Several performance measurement requirements were tested in CMS Innovation Center models (such as the CPC+ model's requirement that participating practices use data at both the practice- and panel-level to set goals to improve population health management and to continuously improve patients' health, experience, and quality of care, and decrease cost). Using data resources and developing workflows and analytics to guide practice changes can help practices achieve reductions in total utilization and cost of care, and improvements in patient experience and quality of care. Improving upon key outcome measures requires engaged clinical and administrative leadership and a commitment to continuous, data-driven improvement.[88] In the context of the PFS, performance management through quality measurement as a practice-level requirement also ensures integrity to the provision of advanced primary care because it holds billing practitioners accountable to factors that are affected by several service elements of APCM coding. For example, effective patient population-level management can mean the practices close care gaps in diabetes management, and the billing practitioner would perform better on diabetes quality measures that assess for a patient's control of hemoglobin A1c.

We proposed that this practice-level Performance Measurement standard could be met in several ways. For MIPS eligible clinicians, the requirement would be met by registering for and reporting the ''Value in Primary Care'' MVP. A practitioner who is part of a TIN that is participating in a Shared Savings Program ACO or a REACH ACO, or a Primary Care First or Making Care Primary practice would meet these requirements by virtue of meeting requirements under the Shared Savings Program or CMS Innovation Center ACO REACH, Making Primary Care Primary, or Primary Care First models. Because these models require their participating practitioners to report on quality and cost performance metrics that are aligned or overlap with the Value in Primary Care MVP, we proposed that requiring these practitioners to report the Value in Primary Care MVP for purposes of billing for APCM services would be substantially duplicative.

In the CY 2024 PFS final rule (88 FR 80042 through 80047), we finalized ''The Value in Primary Care'' MVP, which focuses on the clinical theme of promoting quality care for patients in order to reduce the risk of diseases, disabilities, and death. This MVP includes certain cost measures, improvement activities, and quality measures for common chronic conditions (for example, hypertension, diabetes, depression).[89] As with all MVPs, the Value in Primary Care MVP also requires meaningfully using CEHRT and reporting the objectives, measures, and attestations specified for the Promoting Interoperability performance category.

The Value in Primary Care MVP contains the Adult Universal Foundation quality measure set, which is consistent with the National Quality Strategy goal of using the Universal Foundation measures across as many programs as is feasible.[90] We proposed in the CY 2025 PFS proposed rule that this MVP is especially well-suited to reflect the delivery of care using the advanced primary care model as it was developed to include quality metrics that reflect clinical actions that are indicative of high-quality primary care. The quality measures include key elements such as cancer screening, immunization, blood pressure management, behavioral health, care coordination, person-centered care, and screening for social drivers of health.

The improvement activities include engaging community resources to address drivers of health, implementing changes in the practice's patient portal to improve communication and patient engagement, reviewing practices in place on targeted patient population needs, and chronic care and preventive care management for empaneled patients, aspects of advanced primary care already discussed in this proposal.

The cost measures include costs for common chronic conditions, such as asthma/chronic obstructive pulmonary disease (COPD), diabetes, depression, and heart failure, as well as the Total Per Capita Cost (TPCC) measure. The TPCC measure is a population-based cost measure which assesses the overall cost of care delivered to a patient with a focus on the primary care they receive from their provider(s) and captures the broader healthcare costs influenced by primary care.[91]

We proposed in the CY 2025 PFS proposed rule that the Value in Primary Care MVP serves to demonstrate performance measurement that is reflective of the care furnished using advanced primary care delivery. To ensure performance measurement consistent with the delivery of advanced primary care services, we proposed as an element of the APCM services that a practitioner who is a MIPS eligible clinician as defined in § 414.1305 can satisfy the performance measurement requirement by registering for and reporting the Value in Primary Care MVP for the performance year in which they bill for APCM services. A MIPS eligible clinician can report to MIPS as an individual, subgroup, group, APM Entity, or in any combination of these four participation options, and can participate in multiple ways to report MVPs.[92]

We discussed in the CY 2025 PFS proposed rule that MIPS eligible clinicians who report the MVP are also required to report the Promoting Interoperability performance category objectives, measures, and required attestations throughout the performance period in which they bill for APCM services,[93] as required under § 414.1375(b) (§ 414.1365(c)(4)(i)) (see section IV. of the CY 2025 PFS proposed

rule for details on reporting the objectives, measures, and required attestations for the MIPS Promoting Interoperability performance category for the CY 2025 performance period/2027 MIPS payment year and see section II.G.c.(10) in this final rule for a summary). The MIPS Promoting Interoperability performance category includes measures such as supporting electronic referral loops by sending health information, supporting electronic referral loops by receiving and reconciling health information, and providing patients with electronic access to their health information, all of which are reflective of important communication and coordination channels between primary care, other specialist practitioners caring for the patient, and the patient themselves. In addition, as set forth in § 414.1375(b)(3), the MIPS Promoting Interoperability performance category requires submission of affirmative attestations: (1) regarding their cooperation in good faith with ONC direct review of their CEHRT; and (2) that they did not knowingly and willfully take action (such as to disable functionality) to limit or restrict the compatibility or interoperability of CEHRT.[94]

We noted as part of the CY 2025 PFS that, for CCM services (CPT codes 99437, 99439, 99487, and 99489—99491) and PCM services (CPT codes 99424—99427), we established a practice-level service element requiring the meaningful use of CEHRT to record certain patient health information in a structured format, provide patients with access to their health information, and exchange all relevant patient health information, including in providing the ''Management of Care Transitions'' element of CCM services. For the APCM services, which are furnished as part of a practitioner's care delivery using the advanced primary care model, we proposed in the CY 2025 PFS proposed rule for practitioners who are MIPS eligible clinicians a practice level requirement to register for and report the MVP, including but not limited to reporting the Promoting Interoperability performance category objectives, measures, and required attestations which focus on meaningful use of CEHRT, for the performance year in which they furnish and bill for APCM services. This would ensure that patients/caregivers and physicians or other qualified practitioners or clinical staff have real-time access to patient's medical information. Meaningful use of CEHRT is a critical element of care management services delivered in the context of advanced primary care.

As we stated in adopting the CEHRT use element for CCM and PCM services, the meaningful use of CEHRT is vital to ensure that practitioners are capable of providing the full scope of services, such as timely care coordination and continuity of care (see our prior discussion of this issue at 79 FR 67723 and 84 FR 62696), and flexibility in how practices can provide the requisite 24/7 access to care, continuity of care, and management of care transitions, can facilitate appropriate access to these services for Medicare beneficiaries. The meaningful use of CEHRT helps ensure that members of the care team have timely access to the patient's most updated health information and offer an integrated view of a patient's clinical history from different points of care, supporting continuing, quality, and integrated healthcare while avoiding duplication of efforts and costs, such as repeated exams.[95] For example, practices can use EHRs to identify high-risk patients with chronic conditions to better coordinate care and can supplement the practice's EHR data with data from external sources (for example, State-level quality organizations) to obtain a more comprehensive view of patients. Practices can also integrate clinical data from EHRs, health plan claims data, and county-level social services data to evaluate population needs, stratify by risk, and assess what programs would be most effective for supporting at-risk patients.[96] Standardized communication methods, enabled by the meaningful use of CEHRT, are a significant part of the advanced primary care delivery model. Health IT systems that include remote access to the care plan or the full EHR after hours, or enable a feedback loop that communicates back to the primary care physician and others involved in the beneficiary's care regarding after-hours care or advice provided, are extremely helpful.[97] They help ensure that the beneficiary receives necessary follow up, particularly if the patient is referred to the ED, and follow up after an ED visit is required under the element of ''Management of Care Transitions.'' Accordingly, the meaningful use of CEHRT or remote access to the care plan is fundamental to providing the APCM service elements of 24/7 Access to Care, Continuity of Care, and Management of Care Transitions under an advanced primary care delivery model. Requiring performance of the MIPS Promoting Interoperability performance category requirements demonstrating the meaningful use of CEHRT is similar to several requirements tested in CMS Innovation Center models (such as the PCF model's requirement that participating practices adopt and maintain CEHRT for electronic clinical quality measure reporting, support data exchange with other providers and health systems, and connect to their regional health information exchange (HIE),[98] and the MCP model's requirement that participating practices use EHR technology that has been certified under the ONC Health IT Certification Program [99]). Furthermore, the Shared Savings Program generally requires ACO participants, providers/suppliers, and professionals (including MIPS eligible clinicians, QPs and Partial QPs participating in the ACO) to demonstrate meaningful use of CEHRT through the reporting of the MIPS Promoting Interoperability performance category measures and requirements annually beginning in Performance Year 2025 (§ 425.507).

We noted as part of the CY 2025 PFS that there are many practitioners who would not be MIPS eligible clinicians for a year because they would have earned Qualifying APM Participant (QP) status based on meeting threshold levels of participation in an Advanced APM. Based on the characteristics of Advanced APMs described in § 414.1415, including the requirement that payment is based on MIPS or MIPS-comparable quality measures, practitioners who have earned QP status are necessarily engaging in performance measurement through the Advanced APMs in which they participate in a way that is consistent with advanced primary care. We also recognize there are other practitioners who are not MIPS eligible clinicians for other reasons,

[94] Note that, under the Quality Payment Program, CMS may reweight the MIPS Promoting Interoperability performance category to zero percent of the MIPS final score, and not require an individual, group, or virtual group to use CEHRT and demonstrate whether they are a meaningful user of CEHRT, by granting a significant hardship exception or other type of exception based on certain circumstances as set forth in 42 CFR 414.1380(c)(2)(i)(C).

such as practitioners who are newly enrolled in Medicare or bill a low volume of Medicare services. We proposed in the CY 2025 PFS proposed rule that these practitioners technically could bill for APCM services if they meet the service and practice level requirements to do so. We note that newly enrolled practitioners are only excluded from MIPS for one year, after which the practitioner would either be a MIPS eligible clinician who would need to report the MVP in order to bill for APCM services or excluded from MIPS on another basis such as QP status. status. In the case of practitioners with low Medicare volume, we anticipate that they would be unlikely to bill for APCM services since the delivery of advanced primary care generally involves time and resources to establish practice-level infrastructure, and the economies of scale usually make this a more likely investment if the infrastructure can be utilized across a larger patient panel.

We also proposed as described in section II.G.c. of this final rule, that the performance measurement element of the APCM services will be satisfied for practitioners billing for APCM services through a TIN that is participating in a Shared Savings Program ACO for a performance year in which they furnish APCM services. ACOs are currently required to report the APP quality measure set on behalf of their practitioners and will be required to report the APP Plus quality measure set in section III.G. of this final rule. Practitioners in ACOs are also already being held accountable for reporting and performance and outcomes on many of the Universal Foundation measures already, which are used in the Value in Primary Care MVP, and the APP Plus quality measure set would fully align the Shared Savings Program's quality performance standard with the Universal Foundation measures upon the complete implementation of the APP Plus measure set.

We proposed in the CY 2025 PFS proposed rule to include the performance measurement requirement as an element of APCM services furnished by practitioners, see section II.G.2.c. of this final rule. MIPS eligible clinicians who intend to report on the Value in Primary Care MVP for the CY 2025 performance period/2027 MIPS payment year must register to report the Value in Primary Care MVP as described under § 414.1365(b). Generally, a MIPS eligible clinician must register for an MVP during between April 1 and November 30 of the applicable CY performance period to report the MVP. MIPS eligible clinicians submit data on measures and activities in the first quarter of the year following (CY 2026) the MIPS performance period. Under this proposal, a MIPS eligible clinician billing for APCM services furnished in 2025 and who satisfies the performance measurement requirement through reporting the Value in Primary Care MVP, would need to register for the MVP between April and November of 2025 and report data between January and March 2026 on measures and activities in the Value in Primary Care MVP relating to services furnished in 2025. A MIPS eligible clinician billing for APCM services furnished in 2026 and who satisfies the performance measurement requirement through reporting the Value in Primary Care MVP, would need to register for the Value in Primary Care MVP between April and November of 2026, and report data between January and March of 2027 on measures and activities in the Value in Primary Care MVP relating to services furnished in 2026, and so on in subsequent years.

As described in section II.G.2.c(9) of this final rule, we sought feedback on ways to align the APCM services with other Medicare programs and initiatives, such as the Shared Savings Program and the Quality Payment Program, including MIPS and Advanced APMs. We sought to create a low burden way for practitioners to furnish APCM services by appropriately recognizing ways in which they may meet APCM billing requirements as part of these programs and initiatives, including other ways that practitioners may be fulfilling these performance measurement requirements.

We sought feedback on whether there are areas of duplication within the APCM service elements and practice capabilities that we should consider addressing.

We also sought comment on how to appropriately align the time period for which the practitioner bills the monthly APCM code with the calendar year reporting period covered by the MVP, and how we would verify and enforce the performance measurement requirement of the APCM service.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received several comments supporting the practice-level performance measurement requirement, and a few commenters appreciated that we were using an existing reporting pathway via the Value in Primary Care MVP for practices to meet the performance measurement requirement. A few commenters requested that we phase the performance measurement requirement over time, while others requested we remove it entirely, indicating it may be a barrier for some entities to utilize the APCM codes. Several commenters suggested that we require the reporting of specific quality or patient experience measures, while several other commenters offered that we should allow the reporting of other, specialty-specific MVPs to fulfill the performance measurement requirement, as specialists may bill for APCM if they are directing the beneficiary's primary care and continue to be the focal point of a beneficiary's primary care.

Response: We chose to propose the Value in Primary Care MVP as the mechanism for meeting the performance measurement requirement both because of the flexibility it offers practitioners in reporting on quality metrics that align with their patient populations and because the measures included in the Value in Primary Care MVP focus on the clinical theme of promoting quality care for patients in order to reduce the risk of diseases, disabilities, and death. While we understand that a specialist may intend to take responsibility for all of a patient's primary care and serve as the continuing focal point for all needed health care services, and meet other requirement to bill for APCM services, as discussed earlier, the specific measures within the Value in Primary Care MVP are best suited to measure the performance in the context of advanced primary care services; and that performance measurement is a key characteristic of advanced primary care that is critical for the improvement of primary care delivery over time. We appreciate the commenters' feedback and may take these points into consideration for possible future rulemaking. At this time, we continue to believe the Value in Primary Care MVP is the best fit for purposes of performance measurement for MIPS eligible clinicians furnishing APCM services. Therefore, it would not be appropriate to specify that the performance measurement requirement could be met by reporting a different MVP.

Comment: A few commenters indicated that it may be difficult or expensive for some practitioners to meet the MIPS Promoting Interoperability performance category requirements, so the electronic data sharing and integration requirements of the Value in Primary Care MVP should be removed or delayed.

Response: Health IT and interoperability, through electronic exchange of health information and having up-to-date information from

multiple clinicians, can have a positive impact on patient care and enhance efficiency and productivity. The same MIPS Promoting Interoperability performance category requirements we are adopting generally apply to those MIPS eligible clinicians who report MVPs as those reporting traditional MIPS. Therefore, MIPS eligible clinicians who want to furnish and bill for APCM services may demonstrate their meaningful use of CEHRT through the MIPS Promoting Interoperability performance category requirements.

We acknowledge that there are several cases in which a MIPS eligible clinician may be excepted from reporting for one or more MIPS performance categories and, thus, not all practitioners billing for APCM services will have to meaningfully use CEHRT and meet requirements for reporting the MIPS Promoting Interoperability performance category. A MIPS eligible clinician may request, that they be excepted from reporting MIPS Promoting Interoperability under the MIPS reweighting policies at § 414.1380(c)(2)(i). If we approve the reweighting/exception, then the MIPS eligible clinician does not need to adopt or meaningfully use CEHRT or report MIPS Promoting Interoperability objectives, measures, or attestations. Similarly, these same exceptions to reporting MIPS Promoting Interoperability have also been made available to ACO participants under 42 CFR 425.507(b).[100]

We also reiterate that there are practitioners who would not be MIPS eligible clinicians for various reasons—for example, they would have earned QP status based on meeting threshold levels of participation in an Advanced APM, they are newly enrolled in Medicare, or they bill a low volume of Medicare services. These practitioners could bill for APCM services if they meet the service elements and practice-level requirements to do so, but we believe it is appropriate for several reasons not to require these practitioners to meet the performance measurement requirement for APCM services through reporting the Value in Primary Care MVP to MIPS. Eligible clinicians excluded from MIPS based on their QP status earned through sufficient participation in an Advanced APM are necessarily engaging in performance measurement through the Advanced APMs in which they participate in a way that is consistent with advanced primary care. As noted previously, Advanced APMs must meet several criteria including payment based on MIPS or MIPS-comparable quality measures, CEHRT use, and assumption of more than a nominal amount of financial risk. Newly enrolled practitioners are excluded from MIPS for only one year, after which the practitioner would need to meet the performance measurement requirement to bill for APCM services. While some newly enrolled practitioners would not report at all during this initial year, we note that many others would furnish APCM services as part of a group practice with other practitioners who deliver advanced primary care. Such a practice would be likely to meet the practice-level requirements with respect to other practitioners in the group who may bill for APCM services. As for eligible clinicians excluded from MIPS based on low Medicare volume, these practitioners are unlikely to furnish advanced primary care or bill the Medicare program for APCM services since the delivery of advanced primary care generally involves routine and ongoing care delivery, and a significant investment of time and resources to establish practice-level infrastructure. Such a practice would be more likely to make the investments necessary to provide advanced primary care if the infrastructure can be utilized across a larger patient panel. We may consider whether to address performance measurement requirements for these practitioners in future rulemaking.

Comment: A few commenters suggested that we should not require practitioners participating in an APM to report the Value in Primary Care MVP. Several commenters requested that participants in other CMS Innovation Center models be able to meet the performance measurement requirement by meeting requirements of their model participation, and not have to report the Value in Primary Care MVP.

Response: While we understand that practitioners participating in many APMs, including other Advanced APMs, are subject to performance measurement requirements under the APM, the measures within the Value in Primary Care MVP are best suited to performance evaluation in the delivery of advanced primary care services. We specifically identified the Shared Savings Program, the ACO REACH model, the Primary Care First model, and the Making Care Primary model, as APMs in which the performance measurement requirements significantly overlap with or are aligned with the Value in Primary Care MVP. We proposed that for practitioners participating in these APMs, the practice-level performance measurement requirement for APCM services can be met by meeting requirements under these APMs. At this time, the performance measurement requirements of other APMs are not sufficiently aligned with the Value in Primary Care MVP.

Comment: Several commenters requested we clarify how APCM services and the performance measurement requirements could be implemented by Medicare Advantage or other payers, and expressed concern that other payers would not use the APCM coding and payment.

Response: We designed the APCM code set, including the practice-level performance measurement requirement, for purposes of payment under FFS Medicare. We recognize that the practitioners and practices that provide care using an advanced primary care delivery model would be likely to care for patients with a broad range of health care coverage. We also recognize that other health care payers sometimes pick up coding adopted for the FFS Medicare program to use for their own purposes. We note that the CPT Editorial Panel often considers establishing CPT codes that either replace or considerably overlap with HCPCS G-codes that CMS establishes. Other payers may consider working with the AMA in this regard. Additionally, we note that the code descriptors for the APCM services do not reflect all of the detailed, Medicare-specific characteristics of the billing and payment policies we are finalizing for APCM services. As such, we anticipate that other payers could adopt and use the APCM HCPCS codes by adapting their own billing and payment policies as needed. We note that the quality measures utilized in the Value in Primary Care MVP can also be utilized by other payers. To the extent that other payers, including Medicare Advantage organizations, Medicaid State plans, or commercial payers, decide to use the APCM codes, we encourage them to adopt requirements that align with ours in the interest of efficiency and burden reduction for practitioners. We also note that multi-payer alignment around performance measurement for APCM services would help focus attention on the Universal Foundation measures that are included in the Primary Care MVP.

After consideration of public comments, we are finalizing the ''Performance Measurement'' requirement as proposed. To satisfy this practice-level requirement, practitioners who are MIPS eligible clinicians must register for and report the Value in Primary Care MVP for the performance

[100] Link to recent guidance is at *https://www.cms.gov/files/document/frequently-asked-questions-shared-savings-program-requirement-report-objectives-and-measures-mips.pdf.*

year in which they bill for APCM services. A practitioner who is part of a TIN that is participating in a Shared Savings Program ACO or a REACH ACO, or in a Primary Care First or Making Care Primary practice would meet these requirements by virtue of meeting requirements under the Shared Savings Program or CMS Innovation Center ACO REACH, Making Primary Care Primary, or Primary Care First models.

We acknowledge that there are many practitioners who are not MIPS eligible clinicians for a year because they earned QP status through sufficient participation in an Advanced APM. These practitioners will meet the performance measurement requirement for APCM services through their involvement in an Advanced APM. We also recognize there are other practitioners who are not MIPS eligible clinicians for other reasons, such as practitioners who are newly enrolled in Medicare or bill a low volume of Medicare services.

We also acknowledge that there are several circumstances under which a MIPS eligible clinician may be excepted from reporting in one or more MIPS performance categories. Thus, some MIPS eligible clinicians could meet the performance measurement requirement for APCM services without demonstrating meaningful use of CEHRT by reporting the MIPS Promoting Interoperability performance category. A MIPS eligible clinician may request (and CMS may approve) that they be excepted from reporting MIPS Promoting Interoperability under the MIPS reweighting policies at 42 CFR 414.1380(c)(2)(i). If we approve the reweighting/exception, then the MIPS eligible clinician does not need to adopt or meaningfully use CEHRT or report MIPS Promoting Interoperability objectives, measures, or attestations. Similarly, these same exclusions/exceptions to reporting MIPS Promoting Interoperability have also been made available to ACO participants under 42 CFR 425.507(b). We note that these exceptions are generally temporary due to extraordinary circumstances, and in general, over the long term, practitioners and practices are expected to report in all MIPS performance categories.

We are clarifying that the practice-level performance measurement element of APCM services does not apply for practitioners who are not MIPS eligible clinicians, for example, because they are newly enrolled or bill a low volume of services under the Medicare. As explained previously, we recognize that these practitioners technically could bill for APCM services if they meet the other service elements and practice-level requirements to do so. We may consider whether to address performance measurement requirements for them in future rulemaking.

We summarize the final service elements and practice-level requirements for the APCM services in Table 25.

d. Duplicative Services and Concurrent Billing Restrictions

We proposed in the CY 2025 PFS proposed rule to identify the services that will overlap substantially with APCM services based on the elements of the scope of service for APCM which we have built into the service descriptors for G0556, G0557, and G0558 (see sections II.G.2.b. and II.G.2.c. of the CY 2025 PFS proposed rule). As such, we proposed that APCM services could not be billed by the same practitioner or another practitioner within the same practice for the same patient concurrent with these other services: CCM, PCM, TCM, interprofessional consultation, remote evaluation of patient videos/images, virtual check-in, and e-visits. Given that we have intentionally designed the elements of APCM services to track closely with the elements of several other care management service and CTBS codes, these services are substantially duplicative of APCM services. Further, these specific services (shown in Table 26) are duplicative with APCM services because there is significant overlap in the patient populations included in the code descriptors for these services and APCM services, such as patients who have chronic conditions, high-risk conditions, or both complex and chronic conditions.

TABLE 26: Care Management and CTBS which are Substantially Duplicative of APCM Services

Service	Description
Care Management Services (12 CPT Codes)	
Chronic Care Management (CCM) (CPT Codes 99487, 99489, 99490, 99491, 99439, 99437)	Management of all care for patients with two or more serious chronic conditions, timed, per month
Principal Care Management (PCM) (CPT Codes 99424, 99425, 99426, 99427)	Management of all care for patients with one serious chronic condition, timed, per month
Transitional Care Management (TCM) (CPT Codes 99495, 99496)	Management of transition from acute care or certain outpatient stays to a community setting, with face-to-face visit (bundled into payment for the code), once per patient within 30 days post-discharge
Communication Technology-Based Services (15 CPT Codes)	
Interprofessional Internet Consultation (IPC) (CPT Codes 99446, 99447, 99448, 99449, 99451, 99452)	Consultations between or among certain kinds of medical practitioners.
Remote Evaluation of Patient Videos/Images (HCPCS code G2250)	Remote evaluation of recorded video and/or images submitted by patient
Virtual Check-In (HCPCS codes G2251, G2252)	Virtual check-in service to decide whether an office visit or other service is needed
Online Digital E/M (e-Visit) (CPT codes 98970, 98971, 98972, 99421, 99422, 99423)	Communication between patient and their provider through an online patient portal

As we have described in the sections earlier, comprehensive care management services are essential to providing advanced primary care in the context of this proposal, and many of the service elements for CCM/PCM/TCM shown in Table 23 are substantially the same as the elements we proposed for APCM services.

Also described earlier, providing CTBS is an essential element of the delivery of care under an advanced primary care model of care. Recognizing this, we designed the APCM service elements to substantially overlap with the elements of the CTBS (for example, interprofessional consultation and e-Visits) shown in Table 26. CTBS are used in delivery of advanced primary care to maintain ongoing communication with patients and enable interprofessional care teams to provide comprehensive support to manage chronic conditions over time, which will allow patients to access their usual source of care more conveniently.[101] Furthermore,

[101] Levine DM, Linder JA. Retail Clinics Shine a Harsh Light on the Failure of Primary Care Access. J Gen Intern Med. 2016;31(3):260–262.; Dorsey ER, Topol EJ. State of Telehealth. N Engl J Med. 2016;375(2): 154–161.; Powell, Rhea E., et al.

Continued

interprofessional consultation can help promote integration of behavioral health and primary care.[102]

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were mixed on many of our proposals. Many commenters did not agree with our proposed concurrent billing restrictions for the codes shown in Table 26 by a practitioner in the same practice as a practitioner who is furnishing APCM services for the patient. Some commenters pointed out that specialists within large hospital systems or multispecialty clinics may fall under the ''same practice'' restriction; these commenters also suggested that beneficiaries receiving APCM services from their primary care practitioner should still be eligible to receive PCM and many of the interprofessional consultation services furnished by specialists if needed to augment a beneficiary's care. One commenter stated that a patient may be receiving APCM services from their primary care practitioner but receiving PCM from their cardiologist who works for the same practice and was concerned the proposed concurrent billing restriction would impede the beneficiary's care. Other commenters expressed similar concerns regarding our inclusion of all of the interprofessional consultation codes, again stating that these codes are most often used by consulting specialists, and expressing concern that limiting these concurrent billing for these codes may have a cooling effect on specialists willing to provide consultations.

Most commenters agreed that CCM and TCM were duplicative with APCM if performed by the same practitioner. A few commenters stated that TCM may be duplicative, but that it depends on the reason for the hospitalization. For example, if a patient is hospitalized for cancer treatment or a surgery, it may be an oncologist or surgeon performing TCM, rather than the primary care practitioner performing APCM.

Response: Our intention in proposing the concurrent billing restrictions for APCM services and the identified codes was to prevent duplicative payment for advanced primary care services by multiple practitioners in the same practice. However, we agree with commenters who recommended that specialists should still be able to furnish the services listed in Table 26 concurrently to patients receiving APCM from another practitioner, when medically reasonable and necessary. We recognize that there are clinical circumstances where a specialist would be the practitioner who furnishes and primarily oversees the care of a beneficiary during one or more months. For example, an oncologist could primarily manage care, including providing TCM services, for a patient who is recently discharged after an admission related to chemotherapy side effects while another practitioner in the same practice could appropriately continue to furnish APCM services for the same patient during the same month. We agree with commenters that the services listed in Table 26 are not necessarily duplicative when billed by another practitioner in the same practice as the practitioner who is billing for APCM services, and accordingly, are finalizing a modified policy. After consideration of public comments, we are not finalizing the concurrent billing restrictions, except with respect to the one practitioner who is furnishing APCM services. The services listed in Table 26 may not be billed for a patient in the same month with APCM services by the same practitioner but may be billed when medically necessary for a patient in the same month by a practitioner other than the practitioner furnishing APCM services (HCPCS G0556, G0557, and G0558). We remain committed to engaging with interested parties on these policies, and we may examine these requirements further in future rulemaking.

We also considered whether other care management services (such as Behavioral Health Integration (BHI)), services addressing HRSNs (Community Health Integration (CHI), Social Determinants of Health Risk Assessment, and Principal Illness Navigation (PIN)), and/or other CTBS (Remote Physiologic Monitoring (RPM) and Remote Therapeutic Monitoring (RTM)) would be duplicative of the APCM services. These services, when appropriate, may complement APCM services rather than substantially overlap or duplicate services, and that these other services are sufficiently different from the APCM services in the nature and extent of the interventions and the qualifications of individuals providing the services, to allow concurrent billing for services when appropriate. While these may be services that a practitioner using the advanced primary care model will be likely to furnish, when appropriate, they are not part of the core, routinely and universally essential elements of the advanced primary care model. Several of these other services (such as BHI, CHI, SDOH Risk Assessment, and PIN) could be supplemental to APCM for patients that have specific identified health care needs.

We sought more information from interested parties through our Advanced Primary Care RFI about whether to consider incorporating additional service elements into the ACPM service elements and valuation for APCM codes; and whether and, if so, how to best incorporate E/M services into future coding (see section II.G.3. of this proposed rule). We note that, for BHI services, there is an established evidence base for approaches to caring for beneficiaries with behavioral health conditions which involve integration in the primary care setting, are typically provided by a primary care team, and include structured care management with regular assessments of clinical status and modification of treatment. BHI is a term that refers broadly to collaborative care that integrates behavioral health services with primary care. BHI is a team-based approach to care that focuses on integrative treatment of patients with medical and mental or behavioral health conditions. For BHI in particular, including CPT codes 99492, 99493, 99494, and 99484 and HCPCS code G0323, we also sought information regarding how evolving changes in practice may warrant reconsideration of payment and coding policies.

We proposed that the care management and CTBS codes that are identified in Table 23 could not be separately billed with the APCM codes for the same beneficiary by the same practitioner, or a different one within the same practice, for the same service period. As explained previously, we are modifying this proposal to apply the concurrent billing restrictions for these codes only to the practitioner who bills for APCM services. We stated that we believed this would prevent duplicative payments for substantially similar services and would also be consistent with how we have paid for potentially overlapping care management services in the past.

As we refine our APCM policies, we note that we did not propose to make changes to the coding and payment policies for the existing care management and CTBS services, other than to prohibit concurrent billing for the same patient during the same month. For CY 2025, those codes will

''Patient perceptions of telehealth primary care video visits.'' The Annals of Family Medicine 15.3 (2017): 225–229.

[102] We are planning a separate proposal on expanding who can bill for IPC, including clinical psychologists, LCSWs, marriage and family therapists (MFTs), and MHCs; see further discussion in section II.I. of this final rule.

still be available for practitioners who do not furnish care using the advanced primary care model or who may find that the existing care management and CTBS codes best describe the services they furnish.

We also sought comment on potential overlap between APCM services and other services, including but not limited to care management and care coordination and other CTBS. If interested parties identify overlaps between APCM and other services, we sought comment on whether the degree of overlap will warrant a policy to restrict the services from being billed concurrently with APCM. We also sought comment on whether any overlap will depend upon whether the same or a different practitioner reports the services.

As we test new CMS Innovation Center models that include payments for the services defined earlier, including CCM, PCM, TCM, interprofessional consultation, remote evaluation of patient videos/images, virtual check-in, and e-visits, or as changes in the advanced primary care model of care or more general changes to Medicare payment policy take place that affect existing CMS Innovation Center models, consistent with existing policy, we will address potential overlaps between payments made to model participants with our payment for APCM, elements of the proposed APCM service, and these duplicative services, and seek to implement appropriate payment policies.

We received public comments on these considerations. The following is a summary of the comments we received and our responses.

Comment: Nearly all commenters were supportive of our proposal to allow concurrent billing of BHI, CHI, PIN, PIN–PS, and the SDOH Risk Assessment with APCM services. Commenters agreed that these services are unique and serve specific needs not otherwise met by the proposed APCM coding. Many commenters discussed the importance of behavioral health (including mental health and substance use disorders) on overall health and urged us to consider including behavioral health in future rulemaking as it relates to advanced primary care citing the growing need for fully integrated physical and behavioral health. These commenters also urged us to examine utilization of APCM services in conjunction with BHI, PIN, and PIN–PS, to inform future work. One commenter requested clarification on whether the Psychiatric Collaborative Care Model (CoCM) codes could be billed in conjunction with APCM.

Response: We agree with commenters that these services are complementary to APCM services, and do not represent duplication of services as long as time and effort involved in furnishing these services are not counted more than once, requirements to bill the other services are met, and the services are medically reasonable and necessary. We also agree with commenters that behavioral health is important in the context of overall health, and we will take comments recommending strategies for further integration into consideration for future rulemaking. We are also clarifying that the BHI codes paid under the PFS (CPT codes 99492, 99493, 99494, and 99484 and HCPCS code G0323), including CoCM, can be billed concurrently with the APCM codes when all applicable requirements for billing both codes are met. As we stated in the CY 2025 proposed rule, for BHI services, there is an established evidence base for approaches to caring for beneficiaries with behavioral health conditions which involve integration in the primary care setting, are typically provided by a primary care team, and include structured care management with regular assessments of clinical status and modification of treatment. BHI is a term that refers broadly to collaborative care that integrates behavioral health services with primary care. BHI is a team-based approach to care that focuses on integrative treatment of patients with medical and mental or behavioral health conditions. We continue to be interested in the use of BHI services as they relate to advanced primary care and welcome input from interested parties, including how evolving changes in practice may warrant reconsideration of payment and coding policies.

Comment: Some commenters expressed that RTM and RPM should not be included within the APCM codes, but rather billed separately as complementary, non-duplicative services. A few commenters stated that RTM and RPM services are not core services that are routinely and universally essential elements of advanced primary care models and should therefore not be included in the definition of APCM. One commenter asserted that these services are not likely to be furnished by the types of practitioners who would also furnish advanced primary care services.

Response: We agree with commenters that RTM and RPM services are complementary to APCM services, and do not represent duplication of services, as long as time and effort involved in furnishing these services are not counted more than once, requirements to bill the other services are met, and the services are medically reasonable and necessary. While we agree with the commenter that these services may not be part of the core, routinely and universally essential elements of the advanced primary care model, we disagree that these services are unlikely to be furnished by a practitioner also furnishing advanced primary care services. We are finalizing our policy that RTM and RPM services can be billed concurrently with APCM services when all applicable requirements for billing both services are met. We continue to be interested in the use of RPM and RTM services as they relate to advanced primary care and welcome input from interested parties.

After consideration of public comments, we are finalizing our proposal to allow concurrent billing for BHI, CHI, PIN, PIN–PS, the SDOH Risk Assessment, RPM, and RTM services in the same month as APCM services. We remain committed to engaging with interested parties on these policies, including whether there is overlap between APCM services and other services and whether to consider incorporating additional service elements into the APCM service elements and valuation for APCM codes, and we may examine these policies further in future rulemaking.

e. Valuation of APCM Services—HCPCS Codes G0556, G0557, and G0558

To improve the accuracy of payment for the kinds of services furnished as part of advanced primary care and reduce the administrative burden associated with current coding and billing rules, we proposed to create three HCPCS codes to use for reporting the APCM service (HCPCS codes G0556, G0557, and G0558) (sections II.G.2.b. and II.G.2.c. of the CY 2025 PFS proposed rule). Although these codes are unique in that they would be created to differentially pay for advanced primary care management, the APCM services incorporate elements of existing services with the understanding that some patients will require more resources and some fewer based on variability in patient complexity and needs (see section II.G.2.b. of the CY 2025 PFS proposed rule). As we ordinarily do, we proposed to base the PFS valuation for APCM codes on the resources involved in furnishing the typical case of the service which may not necessarily reflect the actual resources involved in furnishing every individual service.

We detailed our methods to identify a typical case and set of resources involved in furnishing APCM, and the

valuation of these codes. To value APCM, we compared the service elements described by the APCM codes to the values we have established for the specific care management and CTBS codes on which we modeled the service elements of the APCM codes and which we built into the service descriptors for HCPCS codes G0556, G0557, and G0558 (see Table 23 and sections II.G.2.b. through II.G.2.d. of the CY 2025 PFS proposed rule). As stated above, the elements of APCM services reflect the comprehensive approach to care management involved in care delivery using the advanced primary care model. This is a model of primary care that is being integrated into current medical practice. As such, we stated that it would be appropriate to use the current valuation and uptake of the codes on which we modeled the APCM codes to inform our valuation of APCM services. Using Medicare FFS claims data and evidence from our primary care models, we sought to understand how these different services have been used historically and relate that information to the way we think about the service elements for APCM and the valuation of the three APCM code levels. We know that for Medicare beneficiaries who receive care management services during a year, the non-complex CCM base code is billed on average for five months and with three add-on codes during those five months. We also know that initial information from practitioner interviews conducted as part of our CCM evaluation efforts indicates that practitioners overwhelmingly meet and exceed the 20-minute threshold time for billing the non-complex CCM base code; typically, these practitioners reported spending between 45 minutes and an hour per month on CCM services for each patient, with times ranging between 20 minutes and several hours per month (81 FR 80244). However, this does not account for the care management services that are provided beyond one time-based billing interval and without reaching the next; nor does it account for the resources involved in maintaining certain advanced primary care practice capabilities and continuous readiness and monitoring activities, including patient population monitoring and care needs assessment, to fully furnish and bill APCM services as is medically reasonable and necessary for any individual patient during any calendar month. Finally, this does not account for changes to utilization of APCM that may occur as a result of the billing and documentation requirements for APCM services when compared to the current coding and payment for care management and CTBS services. While our aim is to value APCM services based on refined assumptions that better recognize likely utilization of the new codes and the work required to furnish APCM services, this is challenging without more information. We welcomed comments on ideas for other sources of data that would help us to assess APCM services valuation.

We considered various alternatives for valuing the APCM services and how these may impact the broader health care landscape given that primary care is of such import across the country. We proposed to set baseline APCM code values for this first year based on historical utilization of the care management services we have drawn upon in designing the APCM codes. We noted that utilization of the care management services has been significantly higher than CTBS, and we found that CTBS are not typically billed for a patient in the same month as care management services. It is unclear whether the kinds of services described by the CTBS are not typically provided during these months or whether they are being provided but not separately reported. We will continue to seek information, including from public comments on the proposed rule, to help us identify the best approach to reflecting the proposed CTBS elements incorporated into the APCM monthly bundle, and we remain interested in data that could illuminate differences between what services are furnished and what is being reported separately.

We will continue to consider refinements to the valuation of APCM codes to reflect available information about changes in the volume and mix of care management and communication activities being furnished as part of APCM services in the delivery of advanced primary care.

We received many public comments on our proposed valuation. Following is a summary of comments received and our responses.

Comment: We received many comments in response to our request for other sources of data that would help us assess the valuation for APCM. Commenters expressed concerns with using the RUC as the basis for this information, citing underrepresentation on the RUC for primary care and historical underpayment of primary care services. Many commenters stated the need for empirical data for physician work, time and practice expense requirements for APCM services, with a few commenters discussing the challenge of adequately accounting for the resource costs associated with care management services and the use of team-based care. Many commenters discussed the need for time studies to validate valuation, and others stated there is a need for more research into primary care services that are not currently recognized for payment. One commenter suggested that physician time studies be conducted utilizing time stamp data from EHRs to accurately log how long practitioners spend on documentation. A few of the commenters asked us to conduct these studies, with another commenter asking us and Congress to undertake this work.

Response: We value the work and effort the RUC undertakes to provide us with data and recommendations for valuing services under the PFS, and we also remind commenters that we do not exclusively rely on RUC recommendations and can receive data and recommendations from other outside sources as well. We also agree with commenters that empirical information about how primary care services are provided would be invaluable to assist us in making refinements to payment for APCM services to improve accuracy. We are especially interested in practice-level data that are empirical, routinely updated, able to be audited, and comprehensive. We are also open to receiving partial information, and we note that interested parties can submit information to us through the potentially misvalued codes process that is described in Section II.C. of this final rule. We note that submissions for consideration in our next annual rule cycle should be received by our February 10th deadline. For example, this could include information related to the practice expense involved in furnishing these services, such as the types of clinical staff, disposable supplies, and equipment, as well as the physician or practitioner work involved in furnishing these services. We note that the CY 2025 PFS public use files, which are available on the CMS website under downloads for the CY 2025 PFS final rule at *http://www.cms.gov/Medicare/Medicare-Fee-for-ServicePayment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*, include a sample PE spreadsheet and a sample work spreadsheet.

Additionally, we are open to alternative recommendations for how to price these and other services, and we will consider all options presented to us, with a preference for information with empirical evidence behind it. We welcome interested parties to engage with us on how external data sources could be developed and leveraged.

Comment: Commenters generally suggested that the proposed valuation for APCM services underestimated the time and resources involved in providing the activities required under APCM such as 24/7 access to care, patient population-level management, and performance management. Commenters also stated concern with the increased costs of staff and infrastructure potentially associated with performing APCM. Commenters stated that with the low valuation proposed, practitioners would continue to choose existing care management codes or other PFS services, resulting in low uptake for APCM. Still others were concerned that inadequate payment could discourage provider participation, particularly in underserved areas where the need for comprehensive, team-based care is greatest. These commenters stated that smaller practices in rural areas may lack the potential to benefit from economies of scale to support the infrastructure necessary to meet APCM requirements.

Response: We generally agree with commenters that these services may be undervalued, given the time and resources that are necessary for the provision of advanced primary care, but we also recognize there could be a wide range of potential resource costs, especially during the initial use of the codes. Consequently, we may revisit valuation of these APCM services in future rulemaking. As previously described, if interested parties submit additional data and information upon which to base revised valuation assumptions, that information could form a basis upon which we could refine values for the APCM codes through future rulemaking. We appreciate that the scope and service elements for APCM are more expansive than existing CCM and PCM coding; however, we recognize that some beneficiaries will need more services and some less, and thus, as we ordinarily do, we proposed to value these services based upon the typical service. We agree with commenters that ensuring that these services are available to rural and underserved populations is an important priority. We may consider making refinements to the valuation, billing rules, and documentation requirements through future rulemaking, as necessary.

Comment: Commenters discussed our valuation methodology, urging us to avoid continuing what they view as underinvestment in primary care by valuing APCM services with reference to CCM services. Commenters also stated that CCM is not a correct reference for valuation of APCM services as CCM does not include all the service elements required for APCM. Other commenters recommended we use CMS Innovation Center model per beneficiary per month (PBPM) payments and conduct greater research to determine more appropriate payment rates. Commenters also discussed valuation in the context of concurrent billing restrictions, with some commenters citing the inclusion of CTBS and interprofessional consultation services for which payment rates are in some cases higher than the monthly rate for APCM.

Response: We continue to believe that the most accurate mechanism for determining the appropriate work RVU for this service is to refer to values established for existing CPT codes. We note further that using CCM codes as a reference to value the APCM codes would have the benefit of assuring appropriate relativity with similar services.

Comment: We also received comments that were in favor of our proposed valuations. A few commenters recommended that we finalize as proposed and monitor utilization as the codes are implemented. Another commenter recommended that we finalize as proposed, even if the code descriptors and associated payment rates need to be refined in the future as interested parties gain experience with the new codes and provide feedback.

Response: We agree with commenters that the valuation of these services is likely to be an iterative process, and we may revisit our valuation of these codes in future rulemaking.

(1) APCM Level 1 (HCPCS Code G0556)

For APCM Level 1, we assume the typical case will involve fewer resources than the current care management services based upon the G0556 code descriptor and a broad eligible population that will require limited monthly APCM services; however, it will also involve certain resources inherent to maintaining advanced primary care practice capabilities and continuous readiness and monitoring activities, including patient population monitoring and care needs assessment, to fully furnish and bill APCM. As described in sections II.G.2.b. and II.G.2.c. of the CY 2025 PFS proposed rule, certain elements of the APCM service require resources to maintain continuous readiness and monitoring activities to furnish covered services consistent with the advanced primary care model of care. We concluded that the APCM Level 1 services will be similar in work to that of two billing units of the non-complex code for CCM services (CPT code 99490 (*CCM services provided by clinical staff per calendar month*)) over the course of a year, and therefore based the inputs on CPT code 99490 multiplied by ⅙ (or 2 units over 12 months). Specifically, we propose a work RVU for G0556 of 0.17, which is the work RVU for CPT code 99490 multiplied by ⅙. The resulting PE and MP RVUs are proportionately similar to those for CPT code 99490 and are available in Addendum B (see *https://www.cms.gov/medicare/payment/prospective-payment-systems/hospital-outpatient/addendum-a-b-updates*).[103] Table 27 displays payment amount estimates using the 2024 PFS Conversion Factor.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters expressed concerns that the proposed valuation of G0556 would be inadequate to support the work and necessary infrastructure of this care delivery model. Several commenters pointed out that the proposed work RVU of 0.17 for G0556 is significantly lower than or similar to the work RVUs for the following duplicative component services that cannot be billed during the same period with APCM: CPT code 99426 (*PCM, first 30 minutes*) which has a work RVU of 1.00 and CPT code 99427 (*PCM, each additional 30 minutes*) which has a work RVU of 0.71, and these codes would be appropriate for managing similar patients as G0556. Another commenter stated that HCPCS code G2012 (*Virtual check-in*), which is a type of CTBS that cannot be billed concurrently with APCM is reimbursed at a national rate of $13.81, which is less than the proposed rate for one month of care as described by HCPCS code G0556. Several commenters also asserted that HCPCS code G0556 would result in more billing and administrative costs than would be covered by the proposed $10 payment, leading to decreased uptake. A few commenters also discussed a ''payment gap'' between G0556 and G0557, stating that the difference in both work and practice expense (PE) between the two codes is not as disparate as a $40 change in payment suggests.

Response: We are sensitive to the administrative burden of new coding and payment and sought to reduce administrative burden through the use of bundling elements of existing codes

[103] *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices?DLSort=2&DLEntries=10&DLPage=1&DLSortDir=descending.*

for APCM. We appreciate the commenters' thoughts on the investments required to perform APCM in general, and we understand the commenters' perspectives about the ''payment gap'' between two codes that require the same level of practice capabilities. We look forward to continuing to engage with interested parties as these codes are billed, and we remain open to feedback on how to best value these codes in future rulemaking.

Comment: Commenters had several proposed solutions to increase the valuation of HCPCS code G0556. Several commenters suggested that we increase the work RVU for G0556 to 0.77, equal to that of G0557, to reflect the equivalent physician time required when managing any number of chronic conditions and to better align with existing work RVUs for CCM and PCM. Another commenter suggested we align the valuation of HCPCS code G0556 to the population-based payments made under the Primary Care First (PCF) model. Another commenter agreed that we should use PCM and the PCF model's payments as benchmarks but instead suggested that we increase the work RVU for G0556 to 0.25, equal to three billing units of CPT code 99490 over an annual period, or 60 minutes of physician work in CCM equivalents. This commenter also suggested that the proposed work RVU of 0.17 underestimates the physician work required to establish and maintain these plans of care, even if many service elements are not performed every month. This commenter estimated that the creation of a care plan as described in the service elements would take between 20 and 40 minutes, which they viewed as incompatible with our proposal of estimating 2 units of 99490 or 40 minutes of work time spread over 12 months.

Another commenter argued that the assumption that Level 1 APCM services would be similar in work to that of two billing units of CPT code 99490 over the course of a year is flawed, as it assumes a ''sick care'' model of care delivery rather than one focused on prevention. Several commenters also pointed out that the infrastructure required to furnish all of the practice elements must be in place even if that beneficiary does not need those services that month and that this was especially true for beneficiaries receiving G0556.

Response: We appreciate the alternate methods suggested by commenters, and we are persuaded that the proposed rate for G0556 would not fully capture the relative resource costs involved in providing continuous, ongoing care management through an advanced primary care model of care delivery. We agree with commenters that the methodology suggested of increasing HCPCS code G0556 to the equivalent of three units of 99490 divided over 12 months would better account for the work and PE involved in furnishing APCM services.

After consideration of public comments, we are increasing the valuation of HCPCS code G0556 to reflect the equivalent of three units of 99490 or 60 minutes of work time in CCM equivalents divided over 12 months, or approximately $15 per month. This represents a work RVU of 0.25. We recognize this is a relatively modest increase in valuation for G0556, and we may revisit the valuation of this and other APCM codes in future rulemaking.

(2) APCM Level 2 (HCPCS Code G0557)

For APCM Level 2, which describes APCM services to patients with two or more chronic conditions we assumed the typical, higher intensity work associated with managing a patient with multiple chronic conditions will involve significantly more resources and require more, and more frequent, APCM service elements. We concluded that the APCM Level 2 services will be similar to current utilization assumptions of five billing units of the non-complex CCM code (CPT codes 99490) (*CCM services provided by clinical staff per calendar month*) and three billing units of add-on codes annually, given that, for Medicare beneficiaries who receive these CCM services during a year, the non-complex CCM base code is billed on average for five months and with three add-on codes during those 5 months. Additionally, we proposed to account for continued underutilization of CCM services in this patient population by adding one billing unit of the complex CCM code (CPT code 99490 (*CCM services provided by clinical staff per calendar month*) annually. As we noted in the CY 2020 PFS final rule, ''utilization [of CCM services] has reached approximately 75 percent of the level we initially assumed under the PFS when we began paying for CCM services separately under the PFS; while these are positive results, this evidences that CCM services (especially complex CCM services) continue to be underutilized,'' as discussed in the CY 2020 PFS final rule (81 FR 80244 and 84 FR 62688), considering the number of eligible Medicare beneficiaries. In 2019, approximately 22.6 million FFS beneficiaries were identified as being potentially eligible for CCM (or 63.4 percent of the 35.6 million Medicare FFS beneficiaries); however, the use of CCM services was low among potentially eligible beneficiaries, such that just 4.0 percent of beneficiaries potentially eligible for CCM received any CCM services.[104] Therefore, we based the proposed inputs on CPT code 99490 multiplied by 5/12 (or, five units over 12 months), plus CPT add-on code 99439 (*CCM services each additional 30 minutes by clinical staff directed by a physician or other qualified health care professional, per calendar month*) multiplied by 1/6 (or two units), plus CPT add-on code 99489 (*Complex CCM services each additional 30 minutes by clinical staff directed by a physician or other qualified health care professional, per calendar month*) multiplied by 1/12 (one unit), plus CPT code 99487 (*Complex CCM services provided by clinical staff directed by a physician or other qualified health care professional, per calendar month*) multiplied by 1/12 (one unit). Specifically, we proposed a work RVU for G0557 of 0.77, which is the sum of the work RVU for CPT codes 99490, 99439, 99489, and 99487 multiplied by their respective proportions above. The resulting PE and MP RVUs are proportionately similar and are available in Addendum B (see *https://www.cms.gov/medicare/payment/prospective-payment-systems/hospital-outpatient/addendum-a-b-updates*).[105] Table 27 displays payment amount estimates using the 2024 PFS Conversion Factor.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters appreciated our attempt to account for the underutilization of CCM services in the proposed valuation, but one commenter asserted that those adjustments still only account for the resources associated with CCM and not the increased work or practice expenses incurred with maintaining practice-level advanced primary care capabilities or providing APCM services to more beneficiaries.

[104] *The determination of potential eligibility for CCM was based on presence of two or more Chronic Condition Warehouse (CCW) chronic condition flags, one of which was hypertension, hyperlipidemia, or diabetes. Beneficiaries on Medicare Advantage, with end stage renal disease (ESRD) or using the hospice benefit were excluded. ASPE. Analysis of 2019 Medicare Fee-for-Service (FFS) Claims for Chronic Care Management (CCM) and Transitional Care Management (TCM) Services. [105] *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices?DLSort=2&DLEntries=10&DLPage=1&DLSortDir=descending.*

Like HCPCS code G0556, several commenters pointed out that the proposed work RVU of 0.77 for HCPCS code G0557 is lower than for the following duplicative component services that cannot be billed during the same period with APCM: CPT code 99426 (*PCM, first 30 minutes*) which has a work RVU of 1.00; CPT code 99427 (*PCM, each additional 30 minutes*) which has a work RVU of 0.71; CPT code 99490 (*CCM, clinical staff first 20 minutes*) which has a work RVU of 1.00; and CPT code 99439 (*CCM, clinical staff each additional 20 minutes*) which has a work RVU of 0.70. Commenters assert that the proposed HCPCS code G0557 closely resembles CPT codes 99490 and 99439 for CCM, as all three codes would apply to care management for patients with two or more chronic conditions. One commenter recommended that payment of G0557 be equal to or greater than CPT code 99490. Another commenter asserted that the proposed valuation for G0557 does not account for the extensive work in creating a comprehensive care plan, citing that this was an initial barrier when the care management codes were first introduced and improved somewhat once the guidelines became less prescriptive.

Another commenter was concerned about an inconsistency between the assumptions underlying valuation and those underlying our utilization estimates for the services. The commenter explained that for purposes of estimating utilization, we assumed that beneficiaries who receive APCM services will do so for 12 months each year; however, the valuation methodology assumed beneficiaries receive only a fraction of that—for example, the proposed inputs for G0557 were based on CPT code 99490 multiplied by 5/12, CPT add-on code 99439 multiplied by 1/6, CPT add-on code 99489 multiplied by 1/12, and CPT code 99487 multiplied by 1/12. From their perspective, it seems unreasonable to expect practices to maintain APCM capabilities and provide APCM services for 12 months while setting the value of those capabilities and services at a fraction of that time.

Response: We thank commenters for their feedback. We continue to reiterate that because the APCM codes are a bundle of existing care management and other services, not all of which would be furnished in each month in which the APCM services are billed, and the estimates of utilization of services are divided across the span of 12 months, we believe that our proposed valuation reference is an appropriate approach to estimate the work, time, and intensity of HCPCS code G0557. We also reiterate our assumption that beneficiaries receiving APCM services may not require any services one month and may have increased utilization the next month. We are attempting to reflect the varying care needs of the beneficiary, with an understanding that needs often ebb and flow over a period of months for which APCM services are furnished. As discussed previously, we appreciate that APCM services require different practice capabilities as compared to other care management services and may revisit valuation of all APCM services in future rulemaking.

After consideration of public comments, we are finalizing the valuation of G0557 as proposed. We are finalizing the proposed work RVU of 0.77.

(3) APCM Level 3 (HCPCS Code G0558)

For APCM Level 3 (HCPCS code G0558), which describes APCM services to patients with QMB status and two or more chronic conditions, we proposed to value the service as a relative increase to the valuation of APCM Level 2 based on recent Medicare expenditure data for dually eligible Medicare beneficiaries. In CY 2021, per person per year spending on dually eligible beneficiaries was $24,370 and for non-dually eligible beneficiaries was $11,172. The difference between these two amounts is 218 percent. We have considered the likely resource demands and intensity of the practitioner-patient interaction for this patient population, consistent with our coding and valuation policies that reflect variations in resource cost and patient-centered care delivery policies.[106] By taking into consideration the difference in Medicare spending on a per person per year basis between dually eligible and non-dually eligible Medicare beneficiaries, we can capture the increased resources involved in furnishing APCM services to patients with QMB status and multiple chronic conditions. Therefore, we based the inputs for the APCM Level 3 code on the APCM Level 2 inputs multiplied by 218 percent. Specifically, we proposed a work RVU for G0558 of 1.67, which is the work RVU for G0557 multiplied by 218 percent. The resulting proposed PE and MP RVUs are proportionately similar to those and are available in Addendum B (see *https://www.cms.gov/medicare/payment/prospective-payment-systems/hospital-outpatient/addendum-a-b-updates*).[107] Table 27 displays payment amount estimates using the 2024 PFS Conversion Factor.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most of the comments we received about the valuation of HCPCS code G0558 were in conjunction with comments about expanding or changing our proposed population for HCPCS code G0558 and did not provide specific valuation recommendations. A few commenters thanked us for this proposal and hoped that including QMBs specifically would incentivize practitioners to care for this population. Other commenters stated that CMS Innovation Center models like Primary Care First (PCF) and Comprehensive Primary Care Plus (CPC+) make high complexity payment rates of $200-$250, and these commenters recommended we align G0558 with these values.

Response: We appreciate the reference to various CMS Innovation Center models. We note that each of the models targeted specific patient populations with different approaches and payment methodologies, serving a different but complementary purpose than the coding and payment policies for APCM services. We share the hope of commenters that HCPCS code G0558 will encourage practitioners to furnish APCM services to this population. As discussed previously, we may revisit APCM service valuations in future rulemaking.

After consideration of public comments, we are finalizing the valuation of G0558 as proposed. We are finalizing the proposed work RVU of 1.67.

Table 27 includes the finalized codes, short descriptors, reference codes, work RVUs, and approximate payment rate. For illustration purposes, we multiplied the APCM relative values for work, practice expense (PE), and malpractice (MP), without geographic adjustment, by the CY 2024 conversion factor (CF) ($32.7442) to convert the relative value units (RVUs) into approximate national payment rates.

[106] *https://www.macpac.gov/wp-content/uploads/2024/01/Jan24_MedPAC_MACPAC_DualsData Book-508.pdf.*

[107] *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices?DLSort=2&DLEntries=10&DLPage=1&DLSortDir=descending.*

TABLE 27: Final APCM Bundled Codes and Valuation

Code	Short Descriptor	Reference Codes	CMS Work RVU	Approximate National Non-Facility Rate
G0556	APCM for patients with up to one chronic condition	99490	0.25	$15
G0557	APCM for patients with multiple (two or more) chronic conditions	99490, 99439, 99487, 99489	0.77	$50
G0558	APCM for QMBs enrollees with multiple chronic conditions	Calculated as a relative increase from G0557	1.67	$110

We sought feedback on whether these values appropriately reflect the resource costs involved in furnishing these services, or whether adjustments to the values or additional coding may be needed. We are broadly interested in public comments and input from interested parties on potential refinements in code and service definitions, including how we might refine our utilization assumptions for these codes, and other important information involving coding and payment for APCM services to better reflect the current practice of advanced primary care, including elements of CTBS and care management services. We are interested in developing a better understanding of the resource costs involved in furnishing comprehensive care management as part of advanced primary care to various patient populations, including specifically QMBs.

We intend to engage in further discussions with the public over the next several years to potentially refine our policies for future years, and we expect that having APCM utilization data, once the codes are established, will inform future refinement of the valuations for these codes.

Finally, as described in the Advanced Primary Care RFI that follows, we note that there is potential for the valuation of these codes and future related codes to change and/or scale into larger units if we expand them to incorporate more service elements (see section II.G.3. of the CY 2025 PFS proposed rule). As we receive more information about how these codes are being used and implemented in medical practice, we anticipate that these codes and future related codes will be refined over time. We note that the development of payment and coding policies for these and other kinds of services under the PFS is typically an iterative process that responds to changes in medical practice and may be best refined over several years through annual rulemaking for the PFS, and through the development of CPT codes by the AMA's CPT Editorial Committee.

As described in the next section (see also section XXX of the CY 2025 PFS proposed rule), this new APCM code set can serve as a chassis to incorporate primary care model learnings over time under the PFS and an additional pathway to accountable care for primary care practitioners.

3. Request for Information: Advanced Primary Care Hybrid Payment

a. Background

Recent evidence reviews show that while primary care is the only part of the health system in which investments routinely result in not only improved outcomes but also increased equity,[108] the practice and sustainability of the primary care sector is under significant strain.[109] The NASEM found that many of these challenges relate to a primary care payment system that principally rewards visit volume versus creation and maintenance of longitudinal [110] care relationships over time.[111] We have set a goal of having 100 percent of traditional Medicare beneficiaries and the vast majority of Medicaid beneficiaries in accountable care relationships by 2030. Accountable care occurs when a person-centered care team takes responsibility for improving quality of care, care coordination and health outcomes for a defined group of individuals, to reduce care fragmentation and avoid unnecessary costs for individuals and the health system.[112] Advanced primary care is a core mechanism for achieving this goal. With this goal, we acknowledge the need to increase the capability of primary care clinicians to engage, maintain, and promote longitudinal and accountable relationships with beneficiaries through incentives and flexibilities to manage quality and total cost of care.

Over the past 11 years, the CMS Innovation Center has tested a number of primary care models: CPC, CPC+, Maryland Primary Care Program, PCF, as well as the upcoming MCP and ACO Primary Care Flex. Each of these primary care models has focused on testing what happens when we pay for primary care services with hybrid payments (a mix of fee-for-service and population-based payments), as described earlier. While these models have not met the criteria for expansion to date, the findings suggest advanced primary care may reduce unnecessary utilization and improve diabetes care and cancer screening rates.

In addition to testing new approaches to improve care for beneficiaries by supporting primary care, we have focused on approaches to incorporating these innovations into Medicare programs. For example, lessons learned from the CMS Innovation Center's ACO models may be incorporated into the Shared Savings Program. As such, part of the intent of our proposal to create new APCM payment and coding was that we would have a similar foundation to scale advanced primary care model learnings over time.

Previous Innovation Center primary care model tests have helped us learn lessons to inform our current and future work. For example, participants in primary care models have indicated difficulty investing in and maintaining primary care redesign activities due to a range of challenges. First, additional non-visit-based primary care payments have been generally layered upon base

[108] National Academies of Sciences, Engineering, and Medicine (NASEM); Implementing High-Quality Primary Care (*https://nap.nationalacademies.org/read/25983*).

[110] Longitudinal care management is long-term, proactive, relationship-based care management that augments routine and acute visits with intentional, proactive outreach, especially during times of illness and transitions of care.

[111] NASEM, Implementing High-Quality Primary Care (*https://nap.nationalacademies.org/read/25983*).

[112] *https://www.cms.gov/priorities/innovation/key-concepts/accountable-care-and-accountable-care-organizations.*

payments still predominantly FFS in structure. As such, the incentives and abilities of practices to focus on proactive, population-based non-visit activities may be limited if the funding stream for these activities is limited in scope and duration.[113] [114] (Examples of non-visit-based activities include, but are not limited to: activities to improve care coordination, implement data-driven quality improvement, or enhance targeted care management for beneficiaries identified as high-risk.) Further, model funding for the clinical and administrative staff needed to accomplish advanced primary care coordination and population health functions is contingent on continued participation in these models.[115] Once the models end, practices are left without the funding that they received under the models for the clinical and administrative staff that had supported population health functions under the model. Moreover, because these models involve additional payments tied to performance rather than changes to base primary care payment, practices report that the funding they use to support non-visit activities is sometimes received well after the non-visit services have occurred, leading to further challenges sustaining these efforts fiscally. Solving these challenges is a key goal of future Innovation Center model work.[116]

To strengthen the primary care infrastructure within FFS Medicare, we explored opportunities to create new sustainable pathways to support advanced primary care, equitable access to high-quality primary care, and continued transformation among a wide variety of practices. One potential strategy to increase access to advanced primary care and prepare practitioners in traditional Medicare to engage in more accountable care is through the creation and ongoing refinement of specific billing and coding under the PFS that better recognizes advanced primary care and incorporates the resources involved in furnishing longitudinal care and maintaining relationships with patients over time. In section II.G.2. of the CY 2025 PFS proposed rule, we proposed a set of APCM services that make use of lessons learned from the CMS Innovation Center's primary care models, grouping existing care management and CTBS service elements into a bundle for use starting in CY 2025.

We sought feedback regarding potential further evolution in coding and payment policies to better recognize advanced primary care. Through this Advanced Primary Care RFI, we are committed to collaborating with interested parties to lay the path for a more transparent movement to value-based care. Specifically, we requested input on a broader set of questions related to care delivery and incentive structure alignment and five foundational components:

- Streamlined Value-Based Care Opportunities
- Billing Requirements
- Person-Centered Care
- Health Equity, Clinical, and Social Risk
- Quality Improvement and Accountability

We encouraged input on the questions in this section from diverse voices, including beneficiaries and advocates, community-based organizations, providers, clinicians, researchers, unions, and all other interested parties. We plan to summarize comments received in response to our Advanced Primary Care RFI in a separate publication, which we intend to make available via the Medicare Physician Fee Schedule website (*https://www.cms.gov/medicare/payment/fee-schedules/physician*). Below is a description of the solicitation and questions posed in the RFI.

b. Solicitation of Public Comments

We sought feedback regarding potential changes to coding and payment policies for advanced primary care services to be incorporated in traditional Medicare. For example, in the future, coding for APCM services (in section II.G.2. of the CY 2025 PFS proposed rule) could be revised to include additional service elements, including traditional E/M services. This Advanced Primary Care RFI is designed to solicit feedback on how we can further the goals of reducing administrative burden to refocus time on patient care; better recognizing the relative resources involved in furnishing care; recognizing interdisciplinary, team-based primary care; and supporting primary care sustainability and stability (especially for underserved communities). Whenever possible, respondents are requested to draw their responses from objective, empirical, and actionable evidence and to cite this evidence within their responses. We anticipate potential changes to primary care coding and payment policies, such as use of coding that recognizes groups of services furnished over a fixed time period, that will offer a new opportunity within the PFS for primary care clinicians to move to payment structures that are not fully dependent on billing for each discrete component of overall care and act as a step toward accountability for the cost and quality of patient care. Therefore, we sought feedback on building advanced primary care payment mechanisms that create pathways to recognize how primary care practice has moved away from an encounter-based orientation toward population-based care. This Advanced Primary Care RFI is the first step in ensuring ample opportunity for public input, followed by notice and comment rulemaking in subsequent years.

(1) Streamlined Value-Based Care Opportunities

We sought to create a stepping stone for primary care clinicians, including those new to value-based care, to move away from either encounters or other discrete components of overall care as the dominant method of primary care payment and toward payments in larger units that are better tied to the relative resource costs involved in population-based, longitudinal care. Feedback from interested parties has been helpful when considering how to scale the availability of payments into larger units, and incorporate population-based variability in resources, all while driving toward accountability, and person-centered care. Ultimately, to create more opportunities for beneficiaries to receive high-quality, accountable primary care, we are focused on creating multiple pathways to recognize delivery of integrated care across settings, and engagement in comprehensive, team-based, longitudinal care.

When considering the evolution of a hybrid payment system within the PFS, we sought input on the following questions:

- How can CMS better support primary care clinicians and practices who may be new to population-based and longitudinal care management?
- What are the primary barriers to providing particular strategies or supports needed for pediatric clinicians and practices?
- How can CMS ensure that potential future advanced primary care payment will not induce clinicians to leave

[113] Independent Evaluation of Comprehensive Primary Care Plus (CPC+): Final Report. *https://www.cms.gov/priorities/innovation/data-and-reports/2023/cpc-plus-fifth-annual-eval-report.*

[114] Schurrer J, Timmins L, Gruszczynski M, et al. Evaluation of the Primary Care First Model: Second Annual Report. Mathematica. February 2024. *https://www.cms.gov/priorities/innovation/data-and-reports/2024/pcf-second-eval-rpt.*

[115] CMS defines population health as health behaviors and outcomes of a broad group of individuals, including the distribution of such outcomes affected by the contextual factors within the group.

[116] *https://www.cms.gov/about-cms/what-we-do/cms-strategic-plan.*

effective accountable care relationships and clinician networks that already produce positive results? Additionally, how can CMS support growth over time in existing effective accountable care relationships and clinician networks?

- Should CMS evolve the proposed APCM services into an advanced primary care payment that includes E/M and other relevant services, or maintain a separate code set for APCM?
- If E/M services are bundled together for advanced primary care payments, how can CMS ensure that there is not a disincentive for primary care clinicians to continue to provide E/M visits, or increase accountability to E/M visits as warranted?
- As many codes depend on E/M visits (for example, as the base code for an add-on code, or to initiate specific care management activities), how should CMS consider the downstream impacts of incorporating E/M visits into advanced primary care payments?
- Should CMS consider incorporating other CTBS services into advanced primary care hybrid payments, such as Remote Physiologic Monitoring and/or Remote Therapeutic Monitoring?
- Should CMS consider incorporating other services that involve comprehensive care management and care coordination, such as Behavioral Health Integration, End-Stage Renal Disease Monthly Capitation Payment (ESRD MCP), Assessment/Care Planning for Cognitive Impairment, and/or Advance Care Planning?
- Should CMS consider incorporating other services while the patient is under care of home health agencies or hospices, such as Care Plan Oversight?
- Newly finalized HCPCS codes are eligible for use by other payers, including commercial insurers, State Medicaid agencies, and others. We note that value-based alignment is a key goal of CMS. If the APCM codes are finalized, they would be eligible for use by these other payers as well. To what extent are other payers interested in adopting the APCM codes? Are there any other changes that would be necessary for other payers to adopt the codes?
- CMS has historically used information presented by the Relative Value Scale Update Committee to determine PFS payment rates. Are there other sources of data on the relative value of primary care services that CMS should consider when setting hybrid payment rates?

(2) Billing Requirements

Previous CMS Innovation Center primary care models have provided key lessons learned about how to increase comfort with population-based payments, the importance of reducing the administrative burden of billing, and how to begin addressing gaps in equitable access to population-based payments.[117] Specifically, we have learned through Innovation Center initiatives that retrospective reconciliation or adjustment of payments for services rendered can be especially frustrating for practitioners, as it reduces the predictability and stability of payments.[118]

For these reasons, we sought to understand how advanced primary care hybrid payments can balance program integrity, high-quality care, payment stability, and clinician burden.

We sought input on the following questions:

- How can CMS reduce the potential burden of billing for population-based and longitudinal care services?
- Are there particular types of items or services that should be excluded from the advanced primary care bundle?
- Are there particular services paid under the PFS today that should be included in the advanced primary care bundle?
- Care management activities are currently billed monthly. What episode lengths should CMS consider when thinking about an advanced primary care bundle of services for hybrid payment? Include evidence to support the proposed episode length.
- Should CMS attribute the advanced primary care clinical episode to a single clinician, or consider weighted attribution and payment for multiple entities or clinicians? How could weighted attribution and payment work? What rules or processes should CMS consider to attribute the episode?
- Care management coding and payment have historically required an initiating visit prior to starting monthly billing, to ensure that the services are medically reasonable and necessary and consistent with the plan of care. Are there other ways that CMS could ensure the clinician billing APCM is responsible for the primary care of the Medicare beneficiary?
- Care management coding and payment require beneficiary cost sharing. Has beneficiary cost sharing been a barrier to practitioners providing such services?
- Consistent with the initiating visit requirement in the APCM proposal, should CMS require the billing of specific qualifying services for billing of an advanced primary care bundle that is larger in scale and scope than APCM?
- Are there Health IT functions beyond what is proposed for APCM services that clinicians should be required to have to bill for an advanced primary care bundle? What should CMS consider in the design of the advanced primary care bundle to effectively incorporate Health IT standards and functionality, to support interoperability and the aims of advanced primary care?
- Should CMS limit the types of non-physician clinicians that can bill for an advanced primary care bundle that is larger in scale and scope than APCM? If so, include evidence to support the restriction.
- How should CMS reconcile instances where an advanced primary care bundle is billed, but primary care services are then billed for and provided by separate entities?

(3) Person-Centered Care

Person-centered care integrates individuals' clinical needs across providers and settings, while addressing their social needs.[119] We strive for better, more affordable care and improved health outcomes. Key to this mission are care innovations that empower beneficiaries and clinicians, while reducing the administrative burden of providing episode-based and longitudinal care management. We sought comment on how an advanced primary care code(s) could be structured to both increase efficiency and promote the use of high-value services.

We sought input on the following questions:

- What activities that support the delivery of care that is coordinated across clinicians, support systems, and time should be considered for payment in an advanced primary care bundle that are not currently captured in the PFS?
- How can CMS structure advanced primary care hybrid payments to improve patient experience and outcomes?
- How can CMS structure advanced primary care hybrid payments to ensure appropriate access to telephonic and messaging primary care services?
- What is the best reporting structure to ensure that targeted services are

[117] Independent Evaluation of Comprehensive Primary Care Plus (CPC+): Final Report. *https://www.cms.gov/priorities/innovation/data-and-reports/2023/cpc-plus-fifth-annual-eval-report*; Independent Evaluation of Primary Care First: Second Annual Report. *https://www.cms.gov/priorities/innovation/data-and-reports/2024/pcf-second-eval-rpt.*

delivered without causing undue or excessive documentation?

• How can CMS facilitate coordination between primary care clinicians that bill for advanced primary care bundles and specialists to reduce costs and improve patient outcomes?

(4) Health Equity, Social and Clinical Risk

We define health equity as, ''the attainment of the highest level of health for all people, where everyone has a fair and just opportunity to attain their optimal health regardless of race, ethnicity, disability, sexual orientation, gender identity, socioeconomic status, geography, preferred language, or other factors that affect access to care and health outcomes.'' [120] The CMS Framework for Health Equity lays out how we are working to advance health equity by designing, implementing, and operationalizing policies and programs that support health for all the people served by our programs, eliminating avoidable differences in health outcomes experienced by people who are disadvantaged or underserved, and providing the care and support that our beneficiaries need to thrive.[121] For advanced primary care hybrid payments, this may mean incorporating different types of social and clinical risk into the payment than have typically been considered in traditional E/M or care management codes.

Recent models such as ACO REACH [122] and Making Care Primary [123] have incorporated risk adjustment for social risk factors, such as Part D Low Income Subsidy enrollment status and Area Deprivation Index, to better capture factors relevant to care of the patient. We sought input on how advanced primary care billing and payment policy could be used to reduce health disparities and social risk. Furthermore, we sought to balance a simple payment structure that encourages the uptake of advanced primary care services, while ensuring that the risk adjustment method used to develop the payment rates incentivizes the appropriate coding of patient conditions and needs, including those that have previously been under-documented, such as dementia and patient frailty.[124]

We sought input on the following questions:

• What non-claims-based indicators could be used to improve payment accuracy and reduce health disparities, and how can CMS ensure that they are collected uniformly and documented consistently without unduly increasing administrative burden?

• What risk factors, including clinical or social, should be considered in developing payment for advanced primary care services?

• How can CMS account for apparent changes in risk that are due to changes in coding patterns rather than changes in health status?

• What risk adjustments should be made to proposed payments to account for higher costs of traditionally underserved populations?

• What indicators are used to capture added social risk in commercial insurance? Should CMS consider using these?

• What metrics should be used or monitored to adjust payment to ensure that health disparities are not worsened as an unintended consequence?

• How can CMS ensure that advanced primary care hybrid payment increases access to health care services for patients without a usual source of primary care?

• Are there steps CMS can take to ensure advanced primary care billing and coding is utilized for dually eligible beneficiaries, and by safety net providers?

• Should CMS incorporate Community Health Integration and/or Principal Illness Navigation services and payment into an advanced primary care bundle?

(5) Quality Improvement and Accountability

We are committed to affordable quality health care for all people with Medicare. We seek feedback regarding how we can continue to strengthen beneficiary access to high-quality health services within FFS Medicare. One goal of the CMS Innovation Center Strategy Refresh is to increase the capability of practitioners furnishing advanced primary care to engage in accountable care relationships with beneficiaries through incentives and flexibilities to manage clinical quality, outcomes, patient experience, and total cost of care. As such, part of the intent of evolving and creating over time advanced primary care hybrid payments is that the practitioners who bill for these services are engaged in a relationship where they are responsible for the quality and cost of care for the beneficiary, counting toward the overall 2030 goal of every person with Traditional Medicare being in an accountable care relationship. This Advanced Primary Care RFI seeks input from beneficiaries and their caregivers, primary care and other clinicians, and health plans on how advanced primary care bundles could support that goal.

We sought input on the following questions:

• How can CMS ensure clinicians will remain engaged and accountable for their contributions to managing the beneficiary's care?

• What are key patient-centered measures of quality, outcomes and experience that would help ensure that hybrid payment enhances outcome and experience for patients?

• How could measures of quality, outcomes, and experience guard against and decrement in access or quality?

• As described in the APCM proposal, registration for and reporting of the ''Value in Primary Care'' MVP would be an APCM service element for MIPS eligible clinicians. Since this MVP contains measures focused on both the total cost and quality of care, would its inclusion as an APCM service element be sufficient to count as ''accountable care?'' If not, what other service delivery or quality reporting would be expected in ''accountable care?''

• What should CMS consider so that advanced primary care bundles could be used to promote accountable care across payers, both commercial and Medicaid?

• What quality measures are other payers using to drive improvements in primary care?

• What utilization measures are other payers using to drive improvements in primary care?

• What patient experience measures are other payers using to drive improvements in primary care?

• Should CMS consider flexibilities for smaller practices to bill the advanced primary care bundle? Should CMS consider flexibilities for entities exempt from MIPS to bill the advanced primary care bundle?

• Would clinicians be willing to take on more accountability to further reduce the frequency and/or administrative burden of billing?

• For APCM services, are there other key practice-level elements of the service that should be considered for

advanced primary care practices to bill for advanced primary care?

Most commenters responding to the Advanced Primary Care RFI were generally optimistic about the future of advanced primary care but cautioned that fee-for-service payments are still necessary for certain services. While several commenters expressed concern about administrative burden, many commenters also noted that capacity building investments could provide significant support to providers new to longitudinal care. Furthermore, a few commenters expressed the need for increased payment for primary care and provided recommendations of alternative sources of data for determining hybrid payment rates. Some commenters preferred to restrict APCM billing to ACOs or total cost of care models. Lastly, many commenters supported waiving cost sharing, incorporating patient-reported outcome measures, including health equity factors (social risk adjustments, stratifying quality data) and increasing integration of behavioral health.

We appreciate the support for our efforts to understand how we might build and evolve over time advanced primary care hybrid payments. We will continue to review feedback in response to the Advanced Primary Care Hybrid Payment RFI as it pertains to future rulemaking.

4. Cardiovascular Risk Assessment and Risk Management

a. Background

Cardiovascular disease (CVD) is a leading cause of death, disability, and health care expenditures in the U.S.[125] The burden of CVD is unequal, with black Americans experiencing higher rates of CVD-related morbidity than white Americans.[126] Atherosclerotic CVD [127] is also distinct among leading causes of death for Americans in the proportion of CVD attributable to behavioral causes,[128] making improvement in modifiable CVD risk factors (for example, diet, exercise, smoking cessation) is a key treatment target to reduce the burden of CVD across populations.[129]

The CMS Innovation Center's Million Hearts® Cardiovascular Disease (CVD) Risk Reduction model [130] (hereafter referred to as Million Hearts® model) was launched in 2017 as part of the ongoing HHS Million Hearts® Initiative.[131] The model's goals were to decrease the incidence of first-time heart attacks and strokes among medium and high-risk Medicare beneficiaries over five years and reduce Medicare spending on cardiovascular events. The model was implemented as a randomized design where participant organizations in the intervention group agreed to (1) calculate traditional Medicare beneficiaries' risk of having a heart attack or stroke over 10 years, and (2) provide cardiovascular care management services to high-risk patients (defined as a risk of a cardiovascular event in the next decade of greater than thirty percent). The model also identified medium-risk patients (more than fifteen percent risk of an event in the next decade) in its evaluation. In exchange for doing so, CMS paid participant organizations $10 for each eligible traditional Medicare beneficiary for whom the organizations assessed risk, and in the first year of the model, $10 for each high-risk beneficiary during each month when cardiovascular care management services were provided.[132] In subsequent years of the model (2018 to 2022) participants were expected to reassess cardiovascular risk and were paid based on cardiovascular risk reduction ($0 to $10 per beneficiary per month) for high-risk beneficiaries.

All CMS Innovation Center models are independently evaluated [133] and the evaluation of the Million Hearts® model found the model reduced the rate of death from any cause for medium and high-risk beneficiaries by four percent, as well as reduced the risk of death from a cardiovascular event (that is, heart attack or stroke) by eleven percent.[134] We consider this to be due to increased rates of cardiovascular risk assessment, discussion of cardiovascular risk by participants' clinicians, and the use of appropriate medications to reduce cardiovascular risk (for example, aspirin and statins).[135]

During the Million Hearts® (MH) model (which was tested from 2017–2022), there was a recently-introduced ASCVD risk assessment tool to incorporate demographic (age, sex, race), clinical (blood pressure, cholesterol, history of diabetes), and risk behavior (smoking status, use of anti-hypertensives, use of statins, use of aspirin) established by the American College of Cardiology (ACC),[136] as well as a longitudinal re-assessment tool used within the model.[137] This tool calculated the 10-year risk of a cardiovascular event for beneficiaries ages 40–79. Subsequently, additional ASCVD risk assessment tools have been developed.[138]

Today in clinical practice, ASCVD risk is generally calculated using a tool combining demographic data, personal history (risk behaviors and medical history), and laboratory data (lipid

panel).[139] This information is used to calculate into a 10-year estimate of a patient's ASCVD risk for use in determining treatment advice provided by the treating practitioner. This determination requires both data collection at a visit and laboratory data, which may not be available at an initial visit. This change in clinical practice occurred over time after a series of guidelines from the American Heart Association (AHA) recommended using ASCVD risk in determining treatment decisions for patients without a prior history of CVD.[140] This treatment guideline also includes recommendations for lifestyle modifications for all patients. The CMS Innovation Center Million Hearts® model contributed to this change in clinical practice by demonstrating through a rigorous randomized control trial that the quantitative assessment of 10-year cardiovascular risk improves quality of care, including mortality, compared to prior practice.[141]

In the Million Hearts® model, cardiovascular-focused care management services included an initiating visit where an ASCVD risk assessment is performed, structured recording of patient health information using CEHRT, and a comprehensive care plan focused on cardiovascular risk reduction (including the ABCS focused on in the Million Hearts® model), but did not require 24/7 access to care, management of care transitions, or home and community-based coordination because these services are necessary for the management of complex conditions placing a beneficiary at high risk of death, acute exacerbation/decompensation, or functional decline, and these services are provided to prevent the development of these complex chronic conditions. In the Million Hearts® model, cardiovascular-focused risk management services were provided to beneficiaries at high risk for CVD (more than a thirty percent risk of a cardiovascular event in the next 10 years).

We interpret the findings of the Million Hearts® model to be both reflective of and perhaps augmenting an evolution in clinical practice toward quantitative ASCVD risk assessment. We also do not believe the resources involved in these activities are appropriately reflected in current coding and payment policies. As such, we proposed to establish codes to describe a separately billable cardiovascular disease risk assessment that is furnished in conjunction with an E/M visit and cardiovascular-focused risk management, when reasonable and necessary due to the presence of increased cardiovascular risk factors identified for the individual patient.

b. ASCVD Risk Assessment

We proposed a new stand-alone G-code, HCPCS code G0537 (GCDRA), *Administration of a standardized, evidence-based Atherosclerotic Cardiovascular Disease (ASCVD) Risk Assessment for patients with ASCVD risk factors on the same date as an E/M visit, 5–15 minutes, not more often than every 12 months.* Atherosclerotic Cardiovascular Disease (ASCVD) Risk Assessment refers to a review of the individual's demographic factors, modifiable risk factors for CVD, and risk enhancers for CVD. We proposed this new code to identify and value the work involved in administering an ASCVD risk assessment when medically reasonable and necessary in relation to an E/M visit.

We further proposed that the ASCVD risk assessment must be furnished by the practitioner on the same date they furnish an E/M visit, as the ASCVD risk assessment will be reasonable and necessary when used to inform the patient's diagnosis, and treatment plan established during the visit. ASCVD risk assessment is reasonable and necessary for a patient who has at least one predisposing condition to cardiovascular disease that may put them at increased risk for future ASCVD diagnosis. These conditions could include but are not limited to, obesity, a family history of CVD, a history of high blood pressure, a history of high cholesterol, a history of smoking/alcohol/drug use, pre-diabetes, or diabetes. We further proposed that the ASCVD risk assessment will not be separately billable for patients with a cardiovascular disease diagnosis or those who have history of a heart attack or stroke.

We did not propose any specific tool that will have to be used for the ASCVD risk assessment, although the assessment tool must be standardized and evidence-based. Proposed elements of the ASCVD risk assessment service would include:

- Current (from the last 12 months) laboratory data (lipid panel) for inputs needed for the risk assessment tool.
- Administration of a standardized, evidence-based ASCVD risk assessment tool that has been tested and validated through research, and includes the following domains:

++ The output of the tool must include a 10-year estimate of the patient's ASCVD risk. This output must be documented in the patient's medical record.

++ Demographic factors (such as age, sex).

++ Modifiable risk factors for CVD (such as blood pressure & cholesterol control, smoking status/history, alcohol and other drug use, physical activity and nutrition, obesity).

++ Possible risk enhancers (such as pre-eclampsia, pre-diabetes, family history of CVD).

++ Billing practitioners may choose to assess for additional domains beyond those listed above if the tool used requires additional domains. Examples of tools include but are not limited to, the ACC ASCVD Risk Estimator [142] and the AHA PREVENT tool.[143] CMS expects that the tool that is used would not introduce discriminatory bias, consistent with Section 1557 final rule.

We proposed for HCPCS code G0537 to have a duration of 5–15 minutes for the administration of an ASCVD risk assessment tool, billed no more often than once every 12 months.

We requested comments on these proposals, as well as information pertaining to potential clinician education for these proposed codes.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Overall, commenters were supportive of establishing a payment mechanism for cardiovascular risk assessment and the proposed coding to improve cardiovascular health for beneficiaries. Commenters were generally in support of our proposed required domains of the ASCVD risk assessment tool. We received a few

requests to require other domains, such as coronary calcium score.

Response: We remind commenters that, as stated in the code descriptor for ASCVD risk assessment, ''billing practitioners may choose to assess for additional domains beyond those listed above if the tool used requires additional domains.'' We are also not requiring the use of any specific ASCVD risk assessment tool. After consideration of public comments, we are finalizing the required elements of the ASCVD risk assessment as proposed.

Comment: Commenters pointed out that the PREVENT tool is an AHA tool, not an ACC tool as we stated in the proposed rule.

Response: We thank commenters for pointing out the error, and have accordingly revised the discussion in this final rule.

Comment: Many commenters requested that the ASCVD risk assessment not be required to be furnished on the same date as the associated E/M visit since practitioners may not have the necessary laboratory data on the same date as the E/M visit.

Response: We agree with commenters that there are circumstances where test results may identify the need for an ASCVD risk assessment on a day other than the date of an E/M service, so are not finalizing the requirement that the ASCVD risk assessment must be performed on the same date as the associated E/M visit. We continue to believe that in most cases, HCPCS code G0537 would not be performed in advance of the associated E/M visit. We reiterate that the ASCVD risk assessment code, HCPCS code G0537, when performed in conjunction with an E/M visit is not designed to be a general screening, but rather tied to at least one predisposing condition to cardiovascular disease that may put the patient at increased risk for future ASCVD diagnosis. We are finalizing the code descriptor to align with this change, which will now read: ''*Administration of a standardized, evidence-based Atherosclerotic Cardiovascular Disease (ASCVD) Risk Assessment for patients with ASCVD risk factors, 5–15 minutes, not more often than every 12 months.*''

Comment: Commenters requested that we provide an exclusionary list of predisposing conditions to cardiovascular disease or a list of compounding risk factors that may put patients at increased risk for future ASCVD diagnosis since there may be a wide range of severity and complexity of the beneficiaries' risk factors.

Response: We do not generally provide exclusionary lists of risk factors and/or diagnoses so as not to interfere with the practice of medicine. It is up to the practitioner to determine if the patient's risk factors, such as obesity, a family history of CVD, a history of high blood pressure, a history of high cholesterol, a history of smoking/alcohol/drug use, pre-diabetes, or diabetes, may put the patient at increased risk for future ASCVD diagnosis.

Comment: We received comments requesting clarification on the types of practitioners who can administer the ASCVD risk assessment.

Response: We believe these services would typically involve direct contact between the patient and the billing practitioner or billing practitioner's auxiliary personnel who administers the assessment. Typically, CMS does not specify specific specialty codes for billing services, and in this case, CMS expects this code to be frequently billed both by primary care providers and specialists (that is, cardiologists), but other specialists can furnish these services if all other requirements are met. Because the ASCVD risk assessment must be associated with an E/M visit, the practitioners who can bill for ASCVD risk assessment services are limited to those who can furnish E/M services.

Comment: We received comments requesting changes in the requirement that the ASCVD risk assessment can only be furnished ''not more often than every 12 months'' per beneficiary in cases where a different practitioner may need to furnish the risk assessment to furnish appropriate ASCVD risk management services. For example, if a beneficiary's primary care practitioner conducted the ASCVD risk assessment and they were determined to be at high risk for a future ASCVD diagnosis, the primary care practitioner may feel the need to refer the beneficiary to a cardiologist to finish ASCVD risk management services. If needed, the cardiologist could furnish another ASCVD risk assessment and ASCVD risk management services if they also determined the beneficiary to be at increased risk.

Response: We agree with commenters about this concern. We are finalizing that the ASCVD risk management service can be furnished not more often than once every 12 months per practitioner per beneficiary. We expect that this service is only furnished by practitioners who furnish the bulk of the beneficiary's care, and as this service is for Medicare beneficiaries without a previous diagnosis of coronary artery disease, it may be most frequently billed by primary care, but some beneficiaries may also have a cardiologist for other cardiovascular conditions predisposing to ASCVD. We would like to reemphasize that the ASCVD risk assessment is reasonable and necessary for a patient who has at least one predisposing condition to cardiovascular disease that may put them at increased risk for future ASCVD diagnosis and is not separately billable for patients with a cardiovascular disease diagnosis or those who have history of a heart attack or stroke.

After consideration of public comments, we are finalizing the code descriptor for G0537 ''*Administration of a standardized, evidence-based Atherosclerotic Cardiovascular Disease (ASCVD) Risk Assessment for patients with ASCVD risk factors, 5–15 minutes, not more often than every 12 months per practitioner.*'' We are finalizing all other aspects of G0537 as proposed.

(1) Valuation for ASCVD Risk Assessment G0537

We proposed a direct crosswalk to HCPCS Code G0136 (*Administration of a standardized, evidence-based SDOH assessment, 5–15 minutes, not more often than every 6 months*), with a work RVU of 0.18 as we believe this service reflects the resource costs associated when the billing practitioner performs the service described. HCPCS code G0136 has an intra-service time of 15 minutes, and the physician work is of similar intensity to the proposed HCPCS code G0537. Therefore, we proposed a work time of 15 minutes for HCPCS code G0537 based on this same crosswalk to G0136. We also proposed to use this crosswalk to establish the direct PE inputs for HCPCS code G0537.

We sought comments on these proposals. We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were generally in support of our proposed valuation of ASCVD risk assessment services (G0537). Some commenters suggested that the valuation should be increased, as they stated that the proposed crosswalk HCPCS code G0136 is undervalued.

Response: We believe the crosswalk to G0136 is an appropriate crosswalk because these services are clinically similar standardized risk assessments that take 5–15 minutes. If commenters believe that HCPCS code G0136 is undervalued, we welcome information from interested parties on a more accurate valuation that we may consider for future rulemaking. Individuals and groups may submit codes for review under the potentially misvalued codes

initiative to CMS in one of two ways. Nominations may be submitted to CMS via email or through postal mail. Email submissions should be sent to the CMS emailbox at *MedicarePhysicianFeeSchedule@cms.hhs.gov*, with the phrase ''Potentially Misvalued Codes'' and the referencing CPT code number(s) and/or the CPT descriptor(s) in the subject line. Physical letters for nominations should be sent via the U.S. Postal Service to the Centers for Medicare & Medicaid Services, Mail Stop: C4–01–26, 7500 Security Blvd., Baltimore, Maryland 21244. Envelopes containing the nomination letters must be labeled ''Attention: Division of Practitioner Services, Potentially Misvalued Codes.'' Nominations for consideration in our next annual rule cycle should be received by our February 10th deadline.

After consideration of public comments, we are finalizing the valuation of G0537 as proposed.

c. Atherosclerotic Cardiovascular Disease Risk Management Services (G0538)

Over the past several years, we have worked to develop payment mechanisms under the PFS to improve the accuracy of valuation and payment for the services furnished by physicians and other healthcare professionals, especially in the context of evolving changes in medical practice using evidence-based models of care, such as the Million Hearts® model. We proposed to establish a G-code to describe ASCVD risk management services that incorporate the ''ABCS'' of CVD risk reduction (aspirin, blood pressure management, cholesterol management, and smoking cessation) for beneficiaries at medium or high risk for ASCVD (≤15 percent in the next 10 years) as previously identified through an ASCVD risk assessment. We believe that ASCVD risk management services include continuous care and coordination to reduce or eliminate further elevation of ASCVD risk over time, and potentially prevent the development of future cardiovascular disease diagnoses or first-time heart attacks or strokes.

We proposed new G-code, G0538 (GCDRM), *Atherosclerotic Cardiovascular Disease (ASCVD) risk management services with the following required elements: patient is without a current diagnosis of ASCVD, but is determined to be at medium or high risk for CVD (>15 percent in the next 10 years) as previously determined by the ASCVD risk assessment; ASCVD-Specific care plan established, implemented, revised, or monitored that addresses risk factors and risk enhancers and must incorporate shared decision-making between the practitioner and the patient; clinical staff time directed by physician or other qualified health care professional; per calendar month.* Atherosclerotic Cardiovascular Disease (ASCVD) risk management services refer to the development, implementation, and monitoring of individualized care plans for reducing cardiovascular risk, including shared decision-making and the use of the ABCS of cardiovascular risk reduction, as well as counseling and monitoring to improve diet and exercise. We proposed that the elements of the Atherosclerotic Cardiovascular Disease (ASCVD) risk management service will include:

- ASCVD Specific Risk Management, which may include:

++ Promoting receipt of preventive services (including tobacco cessation counseling, diabetes screening, diabetes self-management training)
++ Medication management (including aspirin or statins to maintain or decrease risk of CVD)
++ Ongoing communication and care coordination via certified electronic health record (EHR) technology
—Synchronous, non-face-to-face communication methods must be offered

- ASCVD-Specific, Individualized, Electronic Care Plan

++ Must address modifiable risk factors and risk enhancers specific to CVD, as applicable, such as:
—blood pressure and cholesterol control
—smoking, alcohol, and other drug use status, history, and cessation
—physical activity and nutrition
—obesity
++ Plan must be established, implemented, and monitored and must incorporate shared decision-making between the practitioner and the patient

Although there is no minimum service time requirement for ASCVD risk management services in a month, each of the elements must be addressed to bill for the service, unless a particular element is not medically indicated or necessary at that time for that specific patient. For example, the element of smoking cessation will not be addressed for a patient who does not use tobacco. Documentation of each service element in the patient's medical record is required.

Comment: Commenters were generally supportive of the proposed elements of the ASCVD risk management service. We received requests to include the use of blood pressure medications in the medication management service element.

Response: We clarify that medication management is not limited to the examples of aspirin and statins that were listed in the proposed rule but could include other medications needed to maintain or decrease risk of CVD.

After consideration of public comments, we are finalizing the service elements for G0538 as proposed.

Physicians and non-physician practitioners (NPPs) who can furnish E/M services could bill for ASCVD risk management services. We anticipate that ASCVD risk management services will ordinarily be provided by clinical staff incident to the professional services of the billing practitioner in accordance with our regulation at § 410.26. We proposed that ASCVD risk management services will be considered a ''designated care management service'' under § 410.26(b)(5) and, as such, could be provided by auxiliary personnel under the general supervision of the billing practitioner.

We proposed that patient consent must be obtained before starting ASCVD risk management services. Like other care management services, ASCVD risk management services will typically be provided by clinical staff outside of face-to-face patient visits. Consent can be written or verbal and must be documented in the medical record. Consent should also include informing the patient about these services, as well as potentially applicable Medicare cost sharing.

We proposed that ASCVD risk management services can be billed no more often than once per calendar month, and that payment is limited to one practitioner per beneficiary per month. Patients must be determined to be at medium or high risk for CVD (>15 percent in the next 10 years) as previously determined by the ASCVD risk assessment and must not have a current diagnosis of cardiovascular disease or have a history of heart attack or stroke.

We sought comments on each of these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received many comments requesting clarification on whether concurrent billing of other services would be allowed with G0538. Some of the examples provided by commenters were care management services, Self-Measured Blood Pressure (SMBP) (99473–99474), G0446

(*Intensive Behavioral Therapy for Cardiovascular Disease*), and Smoking and tobacco use cessation counseling visits (99406–99407).

Response: Concurrent billing with G0538 would be allowed during the same month if time and effort are not counted more than once, requirements to bill both services are met, and the services are medically reasonable and necessary. We would like to remind practitioners that the patient consent requirement for this service includes informing the patient about potentially applicable Medicare cost sharing. When G0538 is billed concurrently with preventive services, like G0446 (Intensive Behavioral Therapy for Cardiovascular Disease), practitioners should be sure to inform the patient that G0538 is not a preventive service, and that cost sharing may apply.

Comment: We received many comments providing us with further information about the current clinical practice metrics for identifying patients at medium to high risk of CVD. Many standardized, evidence-based risk assessment tools use different percentage ranges that may fall outside of the proposed ''>15 percent in the next 10 years.'' Many current tools identify ''intermediate risk'' as 7.5%–19.9% and ''high risk'' as >20%. Commenters also believed that this specific designation may not align with changing clinical recommendations for cardiovascular risk intervention.

Response: The elements of G0538 were designed with the findings from the Million Hearts® model in mind, and so the specific risk percentiles used in the model were included in the proposed rule. We acknowledge that clinical practice evolves over time and the categorization of risk percentiles into categories of risk may also evolve as risk prediction tools and clinical guidelines are refined. We note the most recent 2019 AHA/ACC clinical guidelines for primary prevention of cardiovascular disease establish (distinct from the Million Hearts® model) categories of 'low risk,' 'borderline risk,' 'intermediate risk,' and 'high risk,' and these categories may evolve over time as well. For these reasons, we will remove the risk management threshold percentile from the code description for G0538 services, given that the intent of the Million Hearts® model was to identify patients commonly considered to be at intermediate (or medium) or high risk of ASCVD for G0538 services.

After consideration of public comments, we are finalizing G0538 with the following code descriptor, ''*Atherosclerotic Cardiovascular Disease (ASCVD) risk management services with the following required elements: patient is without a current diagnosis of ASCVD, but is determined to be at intermediate, medium, or high risk for CVD as previously determined by the ASCVD risk assessment; ASCVD-Specific care plan established, implemented, revised, or monitored that addresses risk factors and risk enhancers and must incorporate shared decision-making between the practitioner and the patient; clinical staff time directed by physician or other qualified health care professional; per calendar month.*'' We are finalizing all other policies for G0538 as proposed.

(1) Valuation for ASCVD Risk Management Services (G0538)

We proposed a direct crosswalk to CPT Code 99211 (*Office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician or other qualified health care professional*), with a work RVU of 0.18 as we believe this service reflects the resource costs associated when the billing practitioner performs HCPCS code G0538. CPT code 99211 has a physician intraservice time of 5 minutes, and the physician work is of similar intensity to our proposed HCPCS code G0538. Therefore, we proposed a work time of 5 minutes for HCPCS code G0538 based on this same crosswalk to CPT 99211. We also proposed to use this crosswalk to establish the direct PE inputs for HCPCS code G0538, with modifications to reflect non-face-to-face services. These modifications include eliminating PE inputs used in face-to-face services such as preparing and cleaning the room. We sought comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were generally in support of our proposed valuation of ASCVD risk management services (G0538).

Response: After consideration of public comments, we are finalizing the work RVU of 0.18 and our proposed PE inputs for G0538.

H. Supervision of Outpatient Therapy Services in Private Practices, Certification of Therapy Plans of Care With a Physician or NPP Order, and KX Modifier Thresholds

1. Supervision of Outpatient Therapy Services in Private Practices

In the CY 2024 PFS final rule, we finalized our proposal to allow remote therapeutic monitoring (RTM) services to be furnished by occupational therapy assistants (OTAs) and physical therapy assistants (PTAs) under the general supervision of occupational therapists (OTs) and physical therapists (PTs) in private practice, in an effort to align with the general supervision policy for these services for physicians and other practitioners described in the CY 2023 final rule (88 FR 78990). We also noted that we would consider for possible future rulemaking the commenters' responses to our request for information (RFI) on changing the supervision of therapy assistants in the private practice setting to general supervision for all therapy services (88 FR 78990 through 78992).

In the CY 2024 PFS proposed rule, we reviewed the statutory provisions at sections 1861(p) and 1861(g) (by cross-reference to section 1861(p)) of the Act that describe outpatient physical therapy and occupational therapy services furnished to individuals by physical therapists (PTs) and occupational therapists (OTs) meeting licensing and other standards prescribed by the Secretary if the services meet the necessary conditions for health and safety. These statutory provisions refer separately to outpatient therapy services furnished by a provider of services (such as a rehabilitation agency) and those services furnished in the therapist's office or the individual's home, thus distinguishing therapists who work for an institutional provider of therapy services from therapists who furnish and bill independently for these outpatient therapy services (88 FR 52358 through 52359). In regulations, we have addressed these therapists as physical or occupational therapists in private practice (PTPPs and OTPPs) (63 FR 58868 through 58870). The regulations specific to services furnished by occupational or physical therapists in private practice are found at §§ 410.59(c) and 410.60(c), respectively.

We also summarized a history of related regulatory provisions in the CY 2024 PFS proposed rule. In the CY 2005 PFS final rule with comment period (69 FR 66236, 66351 through 66354), we explained that the personnel requirements that are applicable for Home Health Agencies (HHAs) at 42 CFR part 484 for therapists, therapy assistants and speech-language pathologists (SLPs) apply to all outpatient physical therapy, occupational therapy, and speech-language pathology services. In the CY 2005 PFS final rule, we also added a basic rule at §§ 410.59(a) and 410.60(a), respectively, by cross-referencing the

qualifications for OTs and their OTAs and PTs and their PTAs for all occupational therapy and physical therapy services, respectively, including those who work in private practices, to 42 CFR part 484. Later, in the CY 2008 PFS final rule (72 FR 66328 through 66332), we updated the qualification standards at 42 CFR part 484 for OTs, OTAs, PTs, PTAs, and SLPs.

In the CY 2024 PFS proposed rule, through our RFI on general supervision of OTAs and PTAs by OTPPs and PTPPs, respectively, we solicited public comment, along with supporting data, for our consideration for possible future rulemaking about the following: (a) the questions and concerns we highlighted related to access, patient safety, and utilization; (b) revising §§ 410.59(a)(3)(ii) and (c)(2) and 410.60(a)(3)(ii) and (c)(2) to permit general supervision of OTAs and PTAs by the OTPP and PTPP, respectively, when furnishing therapy services; and (c) any appropriate exceptions to allowing general supervision in the furnishing of therapy services (88 FR 52358 through 52359).

In the CY 2024 PFS final rule, we reviewed the comments we received in response to the proposed rule (please refer to (88 FR 78990 through 78992)). We noted that we would consider these comments for possible future rulemaking—see our review of comments on the RFI in the CY 2024 PFS final rule (88 FR 78992).

Over the past several years and again more recently, we have heard from interested parties that the direct supervision requirements in the private practice setting are problematic for OTPPs and PTPPs who must remain on-site and immediately available when Medicare patients are treated to bill for therapy services furnished by their supervised OTAs and PTAs. As a remedy to this situation, interested parties have requested that we revise our requirement for PTPPs and OTPPs to provide direct supervision of OTAs and PTAs to align with the general supervision policies for OTs and PTs that work in Medicare institutional settings that provide therapy services (for example, rehabilitation agencies, outpatient hospitals, SNFs and comprehensive outpatient rehabilitation facilities (CORFs), etc.), to allow for the general supervision of their therapy assistants. These interested parties tell us that their respective State laws and policies allow general supervision of therapy assistants (most often requiring the OT or PT to be in touch with their therapy assistants via telecommunication) in at least 44 States for PTAs,[144] and all but one State for OTAs.

Some interested parties have reported that allowing for general supervision of OTAs and PTAs by OTPPs and PTPPs, respectively, would allow for patients to have increased access to outpatient therapy services, even with ongoing healthcare workforce shortages. The shortages of OTs [145] and OTAs,[146] PTs,[147] and PTAs,[148] are noted by the United States Bureau of Labor Statistics, which shows thousands of open positions in all of these fields. Interested parties noted that over 22,000 PTs left the workforce in 2021.[149] Additionally, these interested parties noted that workforce shortages have greater impact on private practices in rural and underserved areas where hourly wages are lower, and the OTPPs and PTPPs in these areas tend to have small practices. The interested parties stated that Medicare's direct supervision policy, which requires the PTPP and the PTA to both be present when a Medicare patient is treated, does not allow small practices with one PT and one or two PTAs, for example, to work different or overlapping schedules in order to accommodate all patients' availability by allowing the OTA/PTA to work before or after the OTPP/PTPP normal hours. The interested parties also stated that the direct supervision requirement can unfairly delay care for Medicare patients when, for example, a PTPP or OTPP is out sick, the practice does not have alternative coverage, and appointments for Medicare patients must be canceled.

In light of this input, we believe that the direct supervision requirement for OTPPs and PTPPs of OTAs and PTAs, respectively, may have had an unintended consequence of limiting access to needed therapy services. As noted by interested parties, both the OTPP/PTPP and their respective OTA/PTA must be present in the office to bill and receive Medicare payment for therapy services furnished by OTAs and PTAs. This means, for example, that an OTPP/PTPP cannot bill and receive payment for therapy services furnished to a Medicare patient in their home when furnished by an OTA/PTA, without the presence of the OTPP/PTPP. The direct supervision requirement for OTAs and PTAs in the private practice setting is more stringent than the supervision requirements for OTAs and PTAs in institutional settings. For example, as we noted in the CY 2024 PFS proposed rule, 42 CFR 485.713 specifies that when an OTA or PTA provides services at a location that is off the premises of a clinic, rehabilitation agency, or public health agency, those services are supervised by a qualified occupational or physical therapist who makes an onsite supervisory visit at least once every 30 days. We also cited Table 4 in our Report to Congress, titled ''Standards for Supervision of PTAs and the Effects of Eliminating the Personal PTA Supervision Requirement on the Financial Caps for Medicare Therapy Services,'' [150] in the CY 2024 PFS proposed rule to demonstrate that the minimum level of supervision by PTs and OTs for services performed by PTAs and OTAs working in institutional settings is a general level of supervision, in accordance with various regulations (88 FR 52359). Therefore, we believe that a change from direct to general supervision would allow OTPPs and PTPPs the flexibility to better accommodate patients' availability and act to ensure access to necessary therapy services. A change from direct to general supervision would also allow OTPPs and PTPPs to bill and receive Medicare payment for therapy services furnished by their OTAs and PTAs when they are not in the office or patient's home at the same time.

We also believe that it is important to better align our supervision policies for OTPPs and PTPPs with the majority of state-established supervision levels for therapy assistants providing occupational therapy and physical therapy services. We note that the majority of states allow OTs and PTs to provide general supervision of their

respective OTAs and PTAs when furnishing occupational therapy and physical therapy services. We believe that States are well aware of the health and safety needs for their residents who receive therapy services from OTs and their supervised OTAs, and PTs and their supervised PTAs. Given these beliefs and the input from interested parties, we proposed to revise our regulations at §§ 410.59(a)(3)(ii) and (c)(2) and 410.60(a)(3)(ii) and (c)(2) to allow for general supervision of OTAs and PTAs by OTPPs and PTPPs, when the OTAs and PTAs are furnishing outpatient occupational and physical therapy services, respectively. We expect that this proposal will both increase access to therapy services and more closely align Medicare policy with the majority of State practice acts for occupational therapy and physical therapy. This revised policy will parallel the 44 States that allow general supervision of PTAs and the 49 States that allow general supervision of OTAs (most often described by States as requiring the PT or OT to be in touch via telecommunication). For the States with more restrictive supervision levels, such as direct supervision, Medicare-covered therapy services provided in those States are required to be furnished in compliance with State law. We note that while we proposed to allow for general supervision by OTPPs and PTPPs of their OTAs/PTAs, an OTPP or PTPP will still be required to provide direct supervision to unenrolled OTs and PTs, respectively, in accordance with §§ 410.59(c)(2) and 410.60(c)(2).

We solicited comment on our proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal to change the required level of supervision of PTAs and OTAs in PT and OT private practices from direct to general supervision. Many of these commenters cited potential benefits including increased patient access to therapy services, alignment with State laws and practice acts and reduced administrative burdens. Other commenters appreciated the proposal for general supervision because it would provide greater flexibility in scheduling and resource allocation—allowing PT and OT clinics to address staffing shortages, particularly in rural areas, since the therapists and therapy assistants no longer need to both be onsite to treat Medicare patients. Some commenters supported our proposal because consistent general supervision policies across all Medicare therapy settings will decrease administrative burden and confusion. Many commenters informed us that providers have demonstrated the ability to provide safe and effective care for many years with general supervision of PTAs and OTAs in other Medicare therapy settings and believe these safeguards will protect patients in the private practice setting. A few commenters thanked us for the general supervision proposal, since some of the institutional settings with general supervision, for example, home health agencies (HHAs) and SNFs, include patients with more complex conditions than those in private practice settings where direct supervision is required. One commenter supported our proposal for general supervision as they believe this change could increase employment opportunities for their graduates and allow them to better serve patients in their communities. We heard from several other commenters that suggested this change in supervision could result in Medicare savings—up to an estimated $271 million over 10 years—based on a 2022 report by Dobson DaVanzo & Associates commissioned by therapy organizations.[151] One of these commenters that believes the analysis presents convincing data that general supervision in private practices would create significant savings, even if the supervision change resulted in a modest increase in therapy service, is that some services of the PT would shift to the PTA—resulting in a greater percentage of claims for services furnished by PTAs being paid at 85 percent of what we otherwise make to the therapist under the PFS when those services are furnished in whole or in part by a PTA.

Response: We appreciate the support for our proposed policy from the many commenters.

Comment: One commenter expressed concerns over potential risks to patient safety, quality of care, lost professional development opportunities, lack of consistency in treatment, and legal and ethical issues, recommending the retention of the direct supervision policy.

Response: PTAs and OTAs, who are State-licensed or State-regulated professionals, will continue to be required to comply with their respective State laws, and work under the direction of the PT or OT in private practice, which sufficiently safeguards patients' safety and quality of care. We do not believe that a change to general supervision will affect the consistency in treatment delivery of therapy services under the physical therapy or occupational therapy plan of care; nor will it create gaps in training and development of PTAs and OTAs by their supervising PTs and OTs. Further, we do not agree with the commenter that the change to general supervision where it is permitted under State law will cause a change in the way therapists or therapy assistants fulfill their legal obligations or comply with ethical standards.

After consideration of public comments, we are finalizing as proposed the revisions to §§ 410.59(a)(3)(ii) and (c)(2) and 410.60(a)(3)(ii) and (c)(2) to allow for general supervision of OTAs and PTAs by OTPPs and PTPPs, when the OTAs and PTAs are furnishing outpatient occupational and physical therapy services, respectively.

We believe that this policy will increase access to therapy services and more closely align Medicare policy with the majority of State practice acts for occupational therapy and physical therapy. In States with more restrictive supervision levels, such as direct supervision, Medicare-covered therapy services provided in those States are required to be furnished in compliance with State law.

2. Certification of Therapy Plans of Care With a Physician or NPP Order

Sections 1861(p), (g), and (ll)(2) of the Act define outpatient physical therapy services, outpatient occupational therapy services, and outpatient speech-language pathology services as services provided to an individual outpatient who is under the care of a physician and for whom a plan for the physical therapy, occupational therapy, or speech-language pathology services that are to be furnished has been established by a physician or by a qualified PT, OT, or SLP and is periodically reviewed by a physician. Sections 1835(a)(2)(C) and 1835(a)(2)(D) of the Act require that payment for Medicare therapy services may be made for outpatient physical therapy, occupational therapy, and speech-language pathology services only if a physician certifies (and recertifies, where such services are furnished over a period of time) that: (a) the services are or were required because the patient needs or needed therapy services; (b) a plan for furnishing such services was established by a physician or therapist providing such services, and is periodically reviewed by the physician; and (c) the services are or were furnished while the individual is or was under the care of a physician.

[151] See report at: *https://www.dobsondavanzo.com/index.php?src=directory&view=Publications&submenu=_pubs&category=Cost%20Estimation&srctype=Publications_lister_redesign.*

In accordance with the statute and § 424.24(b), Medicare Part B pays for outpatient physical therapy and speech-language pathology services furnished by providers only if a physician certifies the content specified in § 424.24(c)(1) or (4). We recognize that it may not be clear that § 424.24(c) applies to the occupational therapy services furnished by providers, since occupational therapy services are currently only explicitly mentioned in the recertification requirements at § 424.24(c)(4). We note that there are multiple references to § 424.24(c) in the Medicare Benefit Policy Manual, Pub. 100–02, chapter 15, sections 220.1—Conditions of Coverage and Payment for Outpatient Physical Therapy, Occupational Therapy, or Speech-Language Pathology Services, 220.1.2—Plans of Care for Outpatient Physical Therapy, Occupational Therapy, or Speech-Language Pathology Services, and 220.1.3—Certification and Recertification of Need for Treatment and Therapy Plans of Care, which convey our current policy that all outpatient physical therapy, occupational therapy, and speech-language pathology services are subject to requirements for certification and recertification at § 424.24, whether furnished by providers or by suppliers such as therapists in private practice (TPPs). We note that while section 1835 of the Act explicitly refers to services furnished by providers of services, which would include hospitals and other institutional providers as defined in section 1861(u) of the Act, and clinics, rehabilitation agencies, or public health agencies as further described in section 1835(a) of the Act, we have interpreted the requirements of section 1835(a)(2)(C) and 1835(a)(2)(D) as applying to therapy services furnished by both providers and suppliers, which would include a physician or other practitioner, or an entity other than a provider, that furnishes health care services under Medicare.[152] See Medicare Benefit Policy Manual, Pub. 100–02, chapter 15, sections 220.1, 220.1.2, and 220.1.3 for references to § 424.24. We believe that this interpretation is based on the certification and recertification requirements under section 1835(a) of the Act as a way to effectuate the requirement in sections 1861(p), (g), and (ll)(2) of the Act that the patient is under the care of a physician, and that the plan of treatment/care for the physical therapy, occupational therapy, or speech-language pathology services has been established by a physician or by a qualified PT, OT, or SLP and is periodically reviewed by a physician. Additionally, we thought it was important to establish conforming policies for these therapy services in both the outpatient provider and private practice settings.

Due to the foregoing concerns, we proposed to revise the headings of paragraphs (c) introductory text and (c)(1)(i) to include the term ''occupational therapy'' after physical therapy. We proposed to replace the term speech pathology with the accepted term speech-language pathology in 42 CFR 424.24(c)(1)(i). We also proposed to add the term ''occupational therapist'' to 42 CFR 424.24(c)(3)(ii) between physical therapist and speech-language pathologist.

The regulations at 42 CFR 424.24(c) require that a physician, nurse practitioner (NP), physician assistant (PA), or clinical nurse specialist (CNS) who has knowledge of the case sign the initial certification for the patient's plan of treatment. We reminded readers that plan of treatment is synonymous with the ''plan of care'' mentioned above. This terminology appears in several sections of Pub. 100–02, chapter 15, and both terms may be used interchangeably. In accordance with § 424.24(c)(2), the initial certification must be obtained as soon as possible after the plan is established by a PT, OT, or SLP. In Pub. 100–02, chapter 15, section 220.1.3 for Certification and Recertification of Need for Treatment and Therapy Plans of Care, we specified that the physician or nonphysician practitioner (NPP) must sign the initial plan of care (POC) with a dated signature or verbal order within 30 days from the first day of treatment, including evaluation (or 14 days if a verbal order), in order for the PT, OT, or SLP to be paid for the services. For this reason, the manual also states that the therapist should forward the treatment plan to the physician/NPP as soon as it is established rather than waiting to do so. The manual allows for a delayed certification when the physician or NPP completes certification and includes a reason for the delay, and delayed certifications are accepted without justification up to 30 days after the due date.

The regulations at § 424.24(c)(4) require recertification at least every 90 days, and the plan or other documentation in the patient's medical record must indicate the continuing need for physical therapy, occupational therapy, or speech-language pathology services. The physician, nurse practitioner, clinical nurse specialist, or physician assistant who reviews the plan must recertify the plan by signing the medical record. Pub. 100–02, chapter 15, section 220.1.4.C clarifies that payment and coverage conditions require that the plan of care be reviewed as often as necessary but at least whenever it is certified or recertified, to meet the certification requirements. We explained in the CY 2008 PFS final rule, when changing the plan of care recertification interval from 30 to 90 days, this was done to allow more flexibility to the physician/NPP to order the appropriate amount of therapy for each patient's needs (72 FR 66333). Thus, a physician or non-physician practitioner (NPP) may certify or recertify a plan of care at an interval the physician or NPP determines is appropriate, as long as the amount of time between each recertification does not exceed 90 calendar days. As many episodes of therapy treatment are completed in less than 30 calendar days, we expect that physicians and NPPs will continue to certify plans of care that appropriately estimate the duration of needed therapy treatment for a patient, even if the duration is less than 90 days.

Over the past two years, representatives of several therapy-related organizations have requested that CMS reduce the administrative burden involved with attempting to obtain signed plans of treatment from the physician/NPP. They expressed concern that therapists are held accountable for the action or inaction of physicians/NPPs who may be overwhelmed with paperwork. These interested parties report that therapists make exhaustive efforts to obtain the physician/NPP's signature—some reporting that they contact physician offices (via phone, email, or fax, etc.) more than 30 times. Without the required signature, the therapist will not meet the conditions to be paid for the services they deliver. These interested parties recommend that payment for therapy services should be determined by the medical necessity of the service and whether the therapist has met their statutory and regulatory requirements. Some of these interested parties have noted that Pub. 100–02, chapter 15, section 220.1.1, states that the physician/NPP order provides evidence that the patient is under the care of a physician and that the services are medically necessary. Interested parties told us that while CMS allows treatment to begin before the physician's/NPP's signature is obtained, PTs, OTs, and SLPs in private practice do so at their own risk, knowing that they might not

[152] 42 CFR 400.202.

be paid for the services if the physician's office does not send back the signed plan of treatment. Accordingly, such interested parties have said that care is delayed while awaiting a physician's signature, which could place the beneficiary's health at risk due to the delay in obtaining outpatient therapy services.

While we do not require an order or referral for a Medicare patient to see a PT, OT, or SLP, we have explained that the presence of a signed order from the treating physician satisfies statutory requirements that therapy is/was medically necessary and the patient is/was under the care of a physician (Pub. 100–02, chapter 15, section 220.1.1). However, with this order documented in the medical record, after the therapist evaluates the patient and establishes the plan of treatment, based on the evaluation's findings, the therapist forwards the patient's plan of treatment back to the referring physician/NPP to obtain a dated signature for the same patient with the same diagnosis to meet coverage and payment conditions to satisfy the initial certification requirement—creating an administrative burden for both the physician/NPP and the therapist. Interested parties have reported to us that most patients seeking outpatient therapy services have written orders from their physician, not to be confused with a written plan of treatment. These interested parties have suggested that we amend the regulation at § 424.24(c) to permit the presumption of a physician/NPP signature for purposes of certification and recertification in cases where a signed written order or referral from the patient's physician/NPP is on file and there is written documentation in the patient's medical record to substantiate the method and date (such as a fax, email, etc.) that the therapist forwarded the plan of care to the physician/NPP.

Additionally, interested parties representing all therapy disciplines requested that CMS allot time for plan of treatment changes. Interested parties requested that when a physician/NPP orders the therapy services, the physician/NPP be allotted 10 business days to modify the plan of treatment by contacting the therapist directly after receiving it from the therapist. For patients without a physician/NPP order, interested parties requested that physician/NPPs be given 30 days after receipt of the plan of treatment to modify the treatment plan.

After reviewing our current regulatory requirements and considering the suggestions of interested parties, we believe it would be appropriate to propose to amend the regulation at § 424.24(c) for those cases when a patient has a signed and dated order/referral from a physician/NPP for outpatient therapy services. Since our policy has been to accept the physician or NPP's signature on the plan of treatment to be their certification of the treatment plan's conditions in the content requirements of § 424.24(c)(1)—that the patient needs or needed physical therapy, occupational therapy or speech-language pathology services, the services were furnished while the individual was under the care of a physician, NP, PA, or CNS, and the services were furnished under a plan of treatment that meets the requirements of § 410.61—we proposed that a signed and dated order/referral from a physician/NPP combined with documentation of such order/referral in the patient's medical record along with further evidence in the medical record that the therapy plan of treatment was transmitted/submitted to the ordering/referring physician or NPP is sufficient to demonstrate the physician or NPP's certification of these required conditions. Rather than characterizing this proposal as a ''presumption,'' we are taking the view that when the patient's medical record includes a signed and dated written order or referral indicating the type of therapy needed, CMS (and our contractors) would treat the signature on the order or referral as equivalent to a signature on the plan of treatment. We believe our proposal will be reflective of the intent of the ordering/referring physician/NPP when that order/referral is on file in the patient's medical record. We further believe that this will still be consistent with the initial certification required under section 1835(a) of the Act for providers of therapy services and our current policy for therapy in the private practice setting. When the ordering/referring physician writes the referral for the type of therapy services they determine their patient needs or needed, they also review the treatment plan the therapist established at the time it is forwarded to them, and they verify that the services are or were furnished while the patient is or was under their care. As such, we proposed to carve out an exception to the physician signature requirement at § 424.24(c) by adding a new paragraph (c)(5). The policy will be an exception to the physician signature requirement for purposes of an initial certification in cases where a signed and dated order/referral from a physician, NP, PA, or CNS is on file and the therapist has documented evidence that the plan of treatment has been delivered to the physician, NP, PA, or CNS within 30 days of completion of the initial evaluation. However, at this time, we did not propose and do not intend to establish an exception to the signature requirement for purposes of recertification of the therapy plan of treatment. We believe that physicians and NPPs should still be required to sign a patient's medical record to recertify their therapy treatment plans, in accordance with § 424.24(c)(4), to ensure that a patient does not receive unlimited therapy services without a treatment plan signed and dated by the patient's physician/NPP.

Under our proposal, CMS or its contractors will be able to treat the physician/NPP signature on the order or referral as equivalent to a signature on the plan of treatment for purposes of the initial certification if that physician/NPP has not signed and returned the patient's plan of treatment to the therapist within 30 days of the initial evaluation, but only in cases where the patient's physician/NPP has signed and dated the written order or referral and indicated the type of therapy needed, and that written order or referral is on file in the medical record. This policy will not affect a contractor's ability or authority to determine whether therapy services are reasonable and necessary for a given beneficiary. Lastly, because there is no requirement for a physician/NPP order or referral for patients to obtain outpatient therapy services, we proposed to make clear in § 424.24(c)(5) that the references to an order or referral in § 424.24(c)(5) shall not be construed to require an order or referral for outpatient physical therapy, occupational therapy, or speech-language pathology services. We welcomed comments on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: One commenter supported our technical revisions to § 424.24(c) to specifically include occupational therapy services under the certification requirements and to add the services of an occupational therapist, in addition to physical therapists and speech-language pathologists, as these revisions more clearly identify that the certification requirements outlined in § 424.24(c) apply to the outpatient therapy services furnished by OTs.

Response: We thank the commenter for their support.

Comment: Several commenters expressed support for our proposal to accept a physician's or NPP's signed and dated order as equivalent to a signature on the initial certification of a therapist-established plan of treatment

in cases where the written order or referral from the patient's physician/NPP is on file and the therapist has documented evidence that the treatment plan was transmitted to the physician/NPP within 30 days of the initial evaluation. They stated this change will reduce administrative burden for therapists and physicians/NPPs, as well as encourage more timely and efficient care delivery. Many of these commenters urged us to finalize the proposal so that they would no longer have to waste time and resources tracking down physicians who fail to return signed plans of care and added that the proposed exception to the signature requirement, if finalized, would greatly reduce uncertainty of payment, in addition to reducing administrative burden.

Response: We thank the commenters for their supportive comments.

Comment: A few commenters expressed concerns. One commenter stated that before we make any changes to the certification process, we should consider the roles and contributions of each health care provider involved in the patient's care plan and ensure that the physician is still the head of the care team, while not hindering access to needed therapy.

Response: PTs, OTs, and SLPs are all practitioners of outpatient therapy services and while coverage for outpatient therapy services relies on the patient being under the care of a physician, these practitioners do not require the supervision of physicians or NPPs to furnish Medicare-covered therapy services. However, the plans of care that therapists establish require the signature of the physician, NP, PA, or CNS who has knowledge of the case. As such, the care plan team consists of the physician or NPP and the therapist. This care plan team is the same as the one that currently exists for treatment plans requiring the physician/NPP signature for certification and will remain unchanged once our proposal to amend the certification regulations is finalized.

Comment: Some commenters agreed with our proposal to recognize the signed and dated order for only the initial certification and that the existing signature requirements should be kept for certifications when the patient does not have an order or referral and for all recertifications irrespective of a whether the patient has a referral. Several commenters suggested that the recertification should also be included as part of our proposal, while a few other commenters, perhaps misunderstanding our proposal, stated that they supported our proposal for both the certification and recertification of treatment plans. One commenter asked that we confirm our proposed policy.

Response: We are confirming that our proposed policy as noted in the CY 2025 PFS proposed rule (89 FR 61739) would only apply to the certification in those cases where the patient has an order or referral for physical therapy, occupational therapy, or speech-language pathology services; and, stress that we did not propose, nor did we intend to establish an exception to the signature requirement for purposes of recertification of therapy plans of treatment. In cases when the patient does not have a written order or referral from their physician/NPP, the POC signature requirement for certifications would still apply, as we proposed at § 424.24(c)(5).

Comment: Several commenters asked CMS to make the policy in this proposal clear to our contractors (MACs), that is, the specifics of what we included in the CY 2025 PFS proposed rule (89 FR 61739): ''When the patient's medical record includes a signed and dated written order or referral indicating the type of therapy needed, CMS (and our contractors) would treat the signature on the order or referral as equivalent to a signature on the plan of treatment.'' They additionally asked that we notify our MACs/contractors through a formal program memorandum prior to the policy becoming effective on January 1, 2025, stating that physician signature requirement for the POC certification has been a frequent targeted area for denials and oversight.

Response: The proposed exception to the signature requirement would take effect for dates of service on and after January 1, 2025, based on the date of the therapist's initial evaluation (which begins the episode of care); and we would plan to notify our contractors of the policy changes to the certification process through our usual change management process using the same or similar language suggested by the commenters.

Comment: Several commenters asked us to provide a comprehensive list of all the acceptable ways that the plan of care can be delivered/transmitted to the physician/NPP. Three of these commenters gave examples of the methods of delivery that their members and/or staff have utilized in the past. Their collective list includes the following: electronic health record (EHR) systems (with a time stamp) and electronic signatures, other electronic means, facsimile sheets/logs, paper records and paper logs (for example, physicians providing signatures at the nursing desk in a facility), electronic date stamps, call logs, tracking forms, and those POCs hand delivered to physicians (including to physicians in their offices or during weekly rounds in the facility). Two of these commenters stated that CMS must convey to the MACs that all of these methods of documentation are acceptable. One commenter asked CMS to confirm if facsimile logs or other electronic means could be accepted as evidence that the POC was submitted/transmitted to the referring physician/NPP.

Response: We have not established and are not aware of a comprehensive listing of ''acceptable'' delivery mechanisms. However, since policies relating to POC delivery/transmission to the physician/NPP have been in place for many years, we will direct our contractors to continue to accept the same methods of delivery as they have in the past.

Comment: Several commenters requested that we issue clarifying guidance materials to ensure the ordering/referring physicians and treating therapists are fully aware of the information that must be included in the order or referral.

Response: As we stated in the proposed rule, the order or referral must be written, dated and signed by the ordering or referring physician/NPP and include the type of therapy—physical therapy, occupational therapy, or speech-language pathology—the patient requires. We are clarifying here that we would also expect the order or referral to include information to identify the beneficiary and ordering/referring physician/NPP.

Comment: Two commenters informed us that they believe there is a difference between the terms order and referral—stating that a referral is broadly inclusive of the more specific term ''order'' that might contain specific treatment specifications (for example, duration, frequency) and would be treated functionally the same as a referral broadly specifying the need for therapy services. They pointed out that the Medicare Benefit Policy Manual (MBPM) contains the term ''order'', and it may be confusing if the regulation and MBPM terminology differ. These commenters stated that they would like us to use only one term, ''referral'', ''order'' or ''order/referral'', preferably ''referral'', for this policy and regulation and related MBPM sections for therapy services that they claim will be helpful to PTs who use the MBPM to learn about and understand our policies.

Response: We thank the commenters for their remarks. As we have used the ''order or referral'' and ''order/referral'' terminology throughout this rulemaking

for our proposed exception to the signature requirement policy, we will continue to use it here and in the regulation text at § 424.24(c)(5). We agree that our Medicare Benefit Policy Manual (MBPM), Pub. 100–02, chapter 15, should conform with the regulation and, as such, we will revise the manual in section 220, to reflect that the terms ''order or referral'' can be used interchangeably.

After consideration of public comments, we are finalizing our proposal to amend the certification regulations at 42 CFR 424.24(c) to provide an exception to the physician/NPP signature requirement on the therapist-established treatment plan for purposes of the initial certification in cases where a written order or referral from the patient's physician/NPP is on file and the therapist has documented evidence that the treatment plan was transmitted to the physician/NPP within 30 days of the initial evaluation. We are also finalizing the regulation text at § 424.24(c), as proposed for paragraphs (c), (c)(1)(i), and (c)(3)(ii). We are finalizing the added paragraph (c)(5) with a modification to replace the term ''plan of care'' with ''plan of treatment.'' We recognize that we have used the term ''plan of care'' and ''POC'' in our preamble discussion in the CY 2025 PFS proposed rule and in this final rule, and consider ''plan of care'' and ''plan of treatment'' to have the same meaning. However, we are substituting the term ''plan of treatment'' for ''plan of care'' in the regulation to be consistent with the other uses of plan of treatment found at § 424.24(c). We will be implementing this exception to the signature requirement policy and the clarifications added above via our usual change management process to our contractors.

In addition, we solicited comments to gather more information about the need for a regulation that will address the amount of time for changes to plans of treatment. Our regulations at 42 CFR 410.61(d), which are further clarified in our manual provisions in Pub. 100–02, chapter 15, section 220.1.2.C, currently allow for changes to the treatment plan by the physician/NPP without time restrictions. Interested parties have suggested that we allow physicians/NPPs to have just 10 business days from the date of receipt of a plan of care to modify that plan of care (in the case of a patient with an order for the therapy services).

We received public comments on this comment solicitation. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported having a 10-business day window of opportunity for the physician or NPP to provide modification to the plan of care while some of these commenters stated that 10 business days was a reasonable timeline for the physician/NPP to make changes to the patient's POC. One commenter supporting the 10-business day timeline expressed concern that POC communications about his/her patients to and/or from the smaller therapy provider without a robust EHR system may prove challenging.

Response: We thank the commenters for their comments.

Comment: Several commenters did not support the 10-business day window. One commenter stated that the NPP may not be able to respond within 10 days, and could determine that a modification is necessary after a later review. Another commenter opposed any limitation on the physician's ability to modify the plan of care stating that his/her order/referral in these cases means that they are relinquishing their ability to direct the patient's care, including those occasions when during the episode of care a patient sees the physician with a change in their condition that necessitates a modification. Another commenter voiced concern about establishing restrictive time limits for physicians/NPPs to make POC modifications since none exist currently and they recommend we maintain standing policy until more input is gathered from stakeholders.

Response: We thank the commenters for their comments.

Comment: A few commenters stated that allowing 10 days for a physician to provide modification to the POC was too long. One commenter pointed out that this 10-day window is a disservice to patients since it could postpone healing, pain relief, or receipt of other needed care including increased mobility; and it could complicate scheduling appointments that will accommodate them and their caregivers.

Response: We thank the commenters for their comments.

Comment: Many commenters urged us to clarify that physician/NPP modifications to therapy POCs are only applied on a prospective basis and asked us to guarantee payment for those therapists' services provided prior to a physician/NPP modification to the POC as the patient was under the care of a physician/NPP. They believe that prior to the modification of the POC, the therapy services provided to the patient met Medicare requirements for reimbursement—being both medically necessary and under the care of a physician. The commenters further stated unless we ensured payment for the therapy services furnished prior to the POC being modified by the physician/NPP, therapists would continue to have to decide, just as they do now, whether to risk providing timely care or waiting 10 days before providing therapy services to avoid nonpayment for a modification. We also heard from many therapist commenters who told us they believe the 10-day window both guarantees payment for their services and allows physicians/NPPs the opportunity to provide input to the POC without impeding the provision of timely therapy services. One commenter stated that the time limit was not needed at all if we were to guarantee payment for services prior to physicians/NPPs modification of the POC during the episode of care.

Response: We thank the commenters for their comments.

Comment: One commenter stated their support for the 10-day review policy; however, they also stressed that it is important to preserve existing processes that allow therapists and physicians to work closely together to deliver medically necessary care. Currently, physicians may request changes to POCs at any point throughout the episode of care and the therapist will adjust the POC based on the physician's recommendation. If we finalize the 10-day window review policy, the commenter suggests we view the 10-day review period as an opportunity for establishing the physician's immediate feedback and that it does not preclude their ability to provide future input later in the episode.

Response: We appreciate the commenters' remarks as to the importance of maintaining the ability of the physician/NPP to make changes to a patient's POC outside of the 10-day window, as noted at § 410.61(d), if we were to adopt this 10-day window policy.

Comment: Two commenters requested that we clarify how the physician-modified POC is treated once the therapist has adjusted the POC and sent it back to the referring physician/NPP. They both question whether the modified POC ''presumptively'' meets the signature requirement because the physician input has been incorporated; while one of these commenters also asked if the amended POC requires a physician signature or whether the new POC is subject to the same exception requirement and if the 10-day review period restarts from the date the new

POC was transmitted back to the physician.

Response: The fact that a physician/NPP has modified the POC does not alter the fact that the POC was first established by the therapist at the beginning of the episode of care with an order/referral from that physician/NPP which is maintained in the patient's medical record. If we were to adopt the 10-business day window policy, we would continue to treat the modified plan of care as meeting the exception to the signature requirement, unless the physician/NPP returns the POC with the modifications to the therapist signed, at which point it meets the signature requirement and the exception would not be needed.

Comment: One commenter stated that we should educate the MACs well in advance of the effective date of these new policies and suggested we consider a formal program memorandum to do so. They stated that the MACs have singled out the signature requirement for the POC certification most frequently for denials and oversight, citing examples of the Targeted Probe and Educate program and claims audits. These commenters requested that we ensure that the new finalized policies are understood by our contractors in advance of claims processing for 2025.

Response: Currently, MACs primarily perform prepayment review after claims from therapists or providers are submitted and prior to claims processing. However, the physician/NPP signature itself does not represent medical necessity or ensure payment for the therapy service whether it's on the order/referral or on the POC without an order—in these prepayment review cases, the MACs would look at the therapy services provided to determine their medical necessity. The physician/NPP order/referral would demonstrate the intent for the skilled service, which should then be reflected in the therapist-established plan of care. We will implement these provisions using our usual change management process to provide instructions to contractors and make manual revisions to the applicable sections of the MBPM, chapter 5.

After consideration of public comments, we express appreciation for the feedback from commenters and will take the comments into consideration for possible future rulemaking.

We acknowledge the concerns raised by commenters about payment for any therapy services furnished prior to a physician/NPP modifying a plan of care. We agree with commenters that payment should be made for such therapy services if all applicable payment requirements, including medical necessity, are met. We are clarifying that whenever a physician/NPP amends the therapist-established POC at any point during the patient's episode of care, payment determinations for services provided by the therapist prior to the amendment should be based on the POC that had been timely submitted to the physician/NPP who had written the order/referral, or under a POC without an order/referral submitted to the physician/NPP with knowledge of the case, and considering all other applicable payment requirements, including medical necessity. That said, we remind readers that our final policy, as we noted in the CY 2025 PFS proposed rule (89 FR 61739), will not affect a contractor's ability or authority to determine whether therapy services are reasonable and necessary for a given beneficiary; and, as noted above, the same medical necessity requirements are applied for POCs established with and without orders, with the exception that for those POCs established with an order, the medical reviewers may additionally look for documentation in the patient's medical record of the written order/referral and evidence that the POC was submitted to the physician/NPP within 30 days of the therapist's evaluation. We believe that our finalized policy to permit the physician/NPP written order/referral for therapy services to substitute for the signature on the initial certification of the therapist-established treatment plan, will allow therapists to provide therapy services without any delay and at the same financial risk that he/she would have after receiving, after a period of waiting for, a signed POC from the physician/NPP without an order. This is because, as we noted above, the physician/NPP signature itself—whether on the order/referral or on the POC without an order—does not determine medical necessity or ensure payment for the therapy service. While the therapist has a 30-day timeline to send the POC to the physician/NPP writing the order/referral, sending the POC to the physician/NPP as soon as it is established would allow a MAC conducting medical review on a prepayment basis to be able to see the order on file and evidence that the POC had be sent to the physician/NPP in a timely manner while reviewing all documentation in order to determine the medical necessity of the POC and services provided. Additionally, we reiterate what we stated in the CY 2025 PFS proposed rule (89 FR 61739), and wish to clarify in this final rule, and at § 424.24(c)(5) with a minor amendment, that any reference to an order or referral at § 424.24(c)(5) cannot be construed to require an order or referral for outpatient physical therapy, occupational therapy, or speech-language pathology services. As we noted in the above section, we will implement these provisions using our usual change management process to provide instructions to contractors and make manual revisions to the applicable sections of in the Medicare Benefit Policy Manual, Pub. 100–02, chapter 15, Sections 220 and 230. We are also considering providing education to therapy providers through a separate article should the usual education correlating to the program instruction with manual changes not be available until after the new policy takes effect on January 1, 2025.

Additionally, we solicited comment as to whether there should be a 90 calendar day time limit on the order/referral for outpatient therapy services in cases where the order/referral is intended to be used in relation to the proposed regulatory amendment for the initial certification of the treatment plan at § 424.24(c)(5) discussed previously—that 90-day limit would span from the order/referral date until the initial treatment of the patient, including the evaluation furnished by the PT, OT, or SLP. We also sought feedback about whether this limit, or one of a different duration, should be incorporated into the regulatory provision we proposed previously for § 424.24(c)(5).

We received public comments on this comment solicitation. The following is a summary of the comments we received and our responses.

Comment: Some comments voiced opposition to the 90-day limitation we discussed in the comment solicitation. One commenter stated 90 days was too short and suggested a 6-month limit as more reasonable. Another commenter stated a 90-day limit to physician referrals would pose significant problems for certain patients whose physicians write referrals for therapy at the same time they order surgery, and by the time the patient is able to start therapy the referral could be older than 90 days—taking into consideration time for the surgery to be scheduled followed by a recovery period when needed. This commenter also said that having to implement different workflows for the referrals over 90 days would be difficult to manage. One commenter stated their concerns about the creation of a 90-day limit on orders/referrals that would be used specifically for purposes of the exception to the signature requirement on POC certification as it would create confusion and administrative burden

and may limit patients from receiving timely therapy services. Two commenters stated that workforce distribution has created variable staffing challenges across the country and believes that a backlog of referrals may exist in some states that typically results in therapy being scheduled months in advance—sometimes having to schedule new patients over 90 days after they received the referral. This commenter stated that they believe that a 90-day limit would overcomplicate the ability of these staffing-challenged therapy clinics because they would have the added burden of tracking down physician signatures and could have benefitted from the certification policy without the 90-day order limit. Both commenters suggested that we could reconsider this policy in the future should the agency determine that a significant amount of therapy is initiated beyond 90 days.

Response: We thank the commenters for their comments.

Comment: Several commenters supported the 90-day limit to the order/referral for these therapy services. Two of these commenters stated that a greater than 90-day period between the order/referral and the receipt of therapy might result in changes the patient's condition that could potentially require the referring physician/NPP to reevaluate or reassess the patient's condition in order to provide needed additional direction to the therapist. One of these commenters stated that their support for the exception to the signature requirement policy is contingent upon the adoption of the 90-day time limit on the physician order/referral.

Response: We thank the commenters for their comments.

After consideration of public comments, we appreciate the feedback from commenters and will take the comments into consideration for possible future rulemaking.

We clarify that we did not propose to amend § 424.27 for comprehensive outpatient rehabilitation facilities (CORFs) physical therapy, occupational therapy, and speech-language pathology treatment plans to align with our proposed amendments at § 424.24 because section 1861(cc) of the Act and regulation at 42 CFR 410.105(c) require these treatment plans to be established by a physician.

3. KX Modifier Thresholds

The KX modifier thresholds were established through section 50202 of the Bipartisan Budget Act of 2018 (Pub. L. 115–123, February 9, 2018) (BBA) and were formerly referred to as the therapy cap amounts. These per-beneficiary amounts under section 1833(g) of the Act (as amended by section 4541 of the Balanced Budget Act of 1997) (Pub. L. 105–33, August 5, 1997) are updated each year based on the percentage increase in the Medicare Economic Index (MEI). Specifically, these amounts are calculated by updating the previous year's amount by the percentage increase in the MEI for the upcoming calendar year and rounding to the nearest $10.00. Thus, for CY 2025, we proposed to increase the CY 2024 KX modifier threshold amount by the most recent forecast of the 2017-based MEI. For CY 2025, the proposed MEI increase was estimated to be 3.6 percent and was based on the expected historical percentage increase of the 2017-based MEI. Multiplying the CY 2024 KX modifier threshold amount of $2,330 by the proposed CY 2025 percentage increase in the MEI of 3.6 percent ($2,330 × 1.036) and rounding to the nearest $10.00 resulted in a proposed CY 2025 KX modifier threshold amount of $2,410 for physical therapy and speech-language pathology services combined and $2,410 for occupational therapy services. We also proposed to update the MEI increase for CY 2025 based on historical data through the second quarter of 2024, and we proposed to use such data, if appropriate, to determine the final MEI percentage increase and the CY 2025 KX modifier threshold amounts in the CY 2025 PFS final rule.

Section 1833(g)(7)(B) of the Act describes the targeted medical review (MR) process for services of physical therapy, speech-language pathology, and occupational therapy services. The threshold for targeted MR is $3,000 through CY 2027. Effective beginning with CY 2028, the MR threshold levels will be annually updated by the percentage increase in the MEI, per section 1833(g)(7)(B) of the Act. Consequently, for CY 2025, the MR threshold is $3,000 for physical therapy and speech-language pathology services combined and $3,000 for occupational therapy services. Section 1833(g)(5)(E) of the Act states that CMS shall identify and conduct targeted medical review using factors that may include the following:

(1) The therapy provider has had a high claims denial percentage for therapy services under this part or is less compliant with applicable requirements under this title.

(2) The therapy provider has a billing pattern for therapy services under this part that is aberrant compared to peers or otherwise has questionable billing practices for such services, such as billing medically unlikely units of services in a day.

(3) The therapy provider is newly enrolled under this title or has not previously furnished therapy services under this part.

(4) The services are furnished to treat a type of medical condition.

(5) The therapy provider is part of a group that includes another therapy provider identified using the factors described previously in this section.

We track each beneficiary's incurred expenses for therapy services annually and count them towards the KX modifier and MR thresholds by applying the PFS rate for each service less any applicable multiple procedure payment reduction (MPPR) amount for services of CMS-designated ''always therapy'' services (see the CY 2011 PFS final rule at 75 FR 73236). We also track therapy services furnished by critical access hospitals (CAHs), applying the same PFS-rate accrual process, even though they are not paid for their therapy services under the PFS and may be paid on a cost basis (effective January 1, 2014) (see the CY 2014 PFS final rule at 78 FR 74406 through 74410).

When the beneficiary's incurred expenses for the year for outpatient therapy services exceed one or both of the KX modifier thresholds, therapy suppliers and providers use the KX modifier on claims for subsequent medically necessary services. Using the KX modifier, the therapist and therapy provider attest that the services above the KX modifier thresholds are reasonable and necessary and that documentation of the medical necessity for the services is in the beneficiary's medical record. Claims for outpatient therapy services exceeding the KX modifier thresholds without the KX modifier included are denied.

Comment: Several commenters supported the change in the KX modifier threshold amounts for CY 2025 and urged us to finalize them.

Response: We appreciate the supportive remarks from the commenters.

Comment: One commenter asked us to provide a clarification as to why we grouped physical therapy and speech-language pathology together stating they should each have their own distinct threshold.

Response: Section 1833(g) of the Act defines dollar amounts for the KX modifier thresholds—there is one amount for physical therapy and speech language pathology services combined and a separate amount for occupational therapy services—just as with the incurred expenses for the prior therapy cap amounts. More information about

the KX modifier threshold amounts can be found on the therapy services web page in the article titled *The Implementation of the Bipartisan Budget Act of 2018* that is located at *https://www.cms.gov/medicare/coding-billing/therapy-services*.

We stated in the CY 2025 PFS proposed rule that we would use the MEI update based on historical data through the 2nd quarter of 2024 to determine the final MEI percentage increase and the CY 2025 KX modifier threshold amounts in the CY 2025 PFS final rule. The final CY 2025 MEI is 3.5 percent based on historical data through the second quarter of 2024. Using this percentage increase results in a KX modifier threshold amount of $2,410 for physical therapy and speech-language pathology services combined and $2,410 for occupational therapy services, which we are finalizing for CY 2025.

I. Advancing Access to Behavioral Health Services

1. Safety Planning Interventions and Post-Discharge Telephonic Follow-Up Contacts

a. Background

In the CY 2024 PFS proposed rule, we sought comment on whether there is a need for potential separate coding and payment for interventions initiated or furnished in the emergency department (ED) or other crisis settings for patients with suicidality or at risk of suicide, such as safety planning interventions and/or telephonic post-discharge follow-up contacts after an emergency department visit or crisis encounter, or whether existing payment mechanisms are sufficient to support furnishing such interventions when indicated. Several commenters encouraged CMS to enable wider implementation under Medicare of the Safety Planning Intervention (SPI) and the Post-Discharge Telephonic Follow-up Contacts Intervention (FCI) and expressed that the current payment mechanisms are not sufficient, noting that the lack of adequate payment mechanisms and suitable billing codes for these interventions are barriers that are essential to address. The commenters noted that EDs are not the only care setting where there is need and opportunity to enhance suicide prevention, but that elevated suicide risk is particularly prevalent among ED patients. One commenter noted that a designated code for SPI would make it significantly easier to document that SPI was furnished, including in quality reporting and value-based payment programs.

More than 49,000 people died by suicide in 2022 [153] and death by suicide is growing significantly in older adults, who comprise most of the Medicare population. Among those age 65 and older, the suicide rate increased 4.5% from 2021 to 2022.[154] We recognize data showing that suicide by intentional overdose is a growing concern, particularly among young people, older people, and Black women, although researchers acknowledge the complexities of distinguishing intentional from unintentional death.[155]

b. Safety Planning Interventions (SPI)

Safety planning interventions involve a patient working with a clinician to develop a personalized list of coping and response strategies and sources of support that the person can use in the event of experiencing thoughts of harm to themselves or others. This is not a suicide risk assessment, but rather, an intervention provided to people determined to have elevated risk for suicide. Safety planning interventions have also been used to reduce the risk of overdose. The basic components of a safety plan include the following: (1) recognizing warning signs of an impending suicidal crisis or actions that increase the risk of suicide; (2) employing internal coping strategies; (3) utilizing social contacts and social settings as a means of distraction from suicidal thoughts and/or taking steps to reduce the risk of suicide; (4) utilizing family members, significant others, caregivers, and/or friends to help resolve the crisis; (5) contacting mental health professionals, crisis services, or agencies; and (6) making the environment safe, including restricting access to lethal means, as applicable.[156] One important aspect of making an environment safe could be, for example, addressing a person's access to lethal means, such as firearms, environmental means (including bridges and tall structures), and medications/drugs.

We understand that safety planning is consistent with current practice standards and that many hospitals and clinicians in other settings are already providing some or all of these services to the people who need them, including through the Department of Veterans Affairs (VA).[157] [158] However, in one survey of EDs, only 15.3 percent could confirm routinely implementing safety planning with all of the structured elements mentioned above. Provision of individual safety planning elements ranged from 24.8 percent (n = 492) to 79.2 percent (n = 1710), with 2 of 6 elements being routinely provided more than 50 percent of the time: lists of professionals or agencies to contact in a crisis (1710 [79.2 percent]) and helping patients to recognize warning signs of suicide (1075 [52.2 percent]).[159] Suicide risk among people with substance use disorders who also are at high risk for or may have experienced an intentional overdose is not well recognized.[160]

Therefore, we proposed in the CY 2025 PFS proposed rule to establish separate coding and payment under the PFS describing safety planning interventions. Specifically, we proposed to create an add-on G-code that would be billed along with an E/M visit or psychotherapy when safety planning interventions are personally performed by the billing practitioner in a variety of settings. We recognize that training and expertise are needed to perform these interventions safely and appropriately and sought comment regarding whether clinical staff who meet the definition of auxiliary personnel defined at 42 CFR 410.26(a)(1) or who are employed by a hospital could participate in furnishing this service under the supervision of the billing practitioner in certain settings with the relevant training needed to perform the service as well as what sort of training would be needed.

The proposed G-code is HCPCS code G0560: *Safety planning interventions, including assisting the patient in the identification of the following personalized elements of a safety plan: recognizing warning signs of an impending suicidal crisis; employing internal coping strategies; utilizing social contacts and social settings as a means of distraction from suicidal thoughts; utilizing family members, significant others, caregivers, and/or friends to help resolve the crisis;*

contacting mental health professionals or agencies; and making the environment safe; (List separately in addition to an E/M visit or psychotherapy). We welcomed comments on the proposed elements of the safety planning code.

We proposed to value HCPCS code G0560 based on the valuation for CPT code 90839 (*Psychotherapy for crisis*), which describes 60 minutes, and which we believe describes a similar level of intensity as HCPCS code G0560. For HCPCS code G0560, we assumed a typical time of 20 minutes, resulting in a work RVU of 1.09 (based on one third of the work value currently assigned to CPT code 90839, which is 3.28). We welcomed comments on whether 20 minutes accurately captures the typical amount of time spent with a patient on safety planning interventions, including all six elements enumerated in this section. Additionally, we welcomed comments on whether these interventions typically occur in the context of an encounter, such as an E/M visit or psychotherapy, or whether there may be times when they may be furnished as a standalone service and whether we should consider allowing this code to be billed on its own. We also welcomed comments regarding which clinician types might be most likely to bill such a code on its own.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters recommended that we finalize this code as a standalone code, rather than an add-on code, noting that practitioners need a way to capture time spent performing safety planning interventions beyond the initial 20 minutes. Commenters noted that in settings such as emergency departments, crisis centers, and primary care, SPI will be conducted on its own at times and at other times, SPI will be provided in addition to services such as psychotherapy or E/M services and stated it is essential to establish a billing mechanism that meets the requirements for each of these scenarios. They noted that as currently proposed, there is a risk that additional services that are not required will be conducted to justify billing this code. Other commenters emphasized that the flexibility to bill SPI as a standalone service is essential for providing timely interventions, especially in emergency settings or during critical periods when a full E/M visit or psychotherapy session may not be feasible. These commenters also believe that the proposed typical time of 20 minutes does not accurately capture the typical amount of time spent with a patient to provide evidence-based safety planning interventions, noting that 20 minutes would be the minimum and that 20–45 minutes is typical, while some commenters stated that 45–60 minutes is typical for adults and 90 minutes would be typical for minors or adults who require caregiver assistance. Many commenters recommended that we should allow this code to be billed in units of 20 minutes and allow up to 6 units per encounter. The commenters state that this would accommodate the varying needs of patients, ensuring that those requiring more intensive intervention receive the appropriate level of care.

Response: We thank the commenters for their feedback. We are persuaded by the commenters that there may be times when SPI may need to be furnished as a standalone service, that more time may be needed to complete safety planning interventions and that one 20-minute code may not accurately reflect the resource costs involved in furnishing these services. Therefore, we are finalizing HCPCS code G0560 as a standalone code that can be billed in 20-minute increments.

Comment: Several commenters stated they believe that there is sufficient evidence to support trained clinical staff providing this service under the supervision of the billing practitioner and stated that restricting the service to only allowing the billing practitioner to personally provide the service will severely limit uptake and access for beneficiaries. Several commenters noted that allowing a broader spectrum of staff to provide SPI mirrors the approach used in clinical studies and is consistent with how many existing programs operate. Some commenters stated they agreed that training and practicing within scope is crucial, and also noted that continued training and education is also important and cited that most providers who furnished suicide safety planning desired further training. Other commenters recommended that we require the same staff qualifications that are required for mental health community case management and/or mental health community support under the Medicaid Rehabilitation Option as these positions are frequently used to provide the same services under Medicaid.

Response: We appreciate the feedback from the commenters on this issue. While some commenters emphasized the importance of training, we did not receive specific feedback regarding the nature of the training that would be needed. We also note that for services furnished in hospital settings, services provided by clinical staff would not be separately payable. We are finalizing as proposed that HCPCS code G0560 would need to be personally performed by the billing practitioner for CY 2025, but we will continue to consider this issue for future rulemaking. We also note that the billing practitioner could be any practitioner who is authorized to furnish services for the diagnosis and treatment of mental illness, including Clinical Social Workers, Mental Health Counselors, Marriage and Family Therapists, Clinical Psychologists, as well as physicians and NPPs.

Comment: Some commenters requested that this code be allowed to be billed when furnished via telehealth.

Response: We thank the commenters for this response. Since HCPCS code G0560 is similar to other services already on the Medicare Telehealth list, such as psychotherapy for crisis, we are finalizing adding HCPCS code G0560 to the Medicare Telehealth list. The full list of services being added to the Medicare Telehealth list for CY 2025 can be found Section II.D. of this final rule, Payment for Medicare Telehealth Services Under Section 1834(m) of the Act.

Comment: A few commenters noted that we acknowledged the increasing usage of safety plans related to overdose prevention, but pointed out that the proposed code descriptor reads as if the code is specific to safety planning to prevent an impending suicidal crisis. The commenters suggested that we update the code descriptor to reflect ''recognizing warning signs of an impending suicidal or substance use-related crisis'' and to update the language regarding contacting professionals to read, ''contacting mental health or substance use disorder professionals or agencies.'' Similarly, another commenter also requested that we update the language regarding utilizing social contacts and social settings as a means of distraction from suicidal thoughts to also add the language, ''or risky substance use.'' Other commenters requested that we add an additional step in the language in the code descriptor to include reference to a ''crisis narrative'' in which the patient is asked to describe how they found themselves at a point where they were thinking of suicide and also, for clarity, to add the words ''that are documented in a form.''

Response: We thank the commenters for their feedback and note that we are updating the code descriptor to include ''recognizing warning signs of an impending substance-use related crisis,'' ''contacting mental health or substance use disorder professionals or agencies,''

and adding ''or risky substance use,'' as suggested. In response to the comments requesting that we revise the code descriptor to refer to a crisis narrative and add the words ''that are documented in a form,'' we agree that a crisis narrative would be a typical component of these services and that the safety plan would be documented in a form, however, we do not believe that these items need to be listed in the code descriptor. Additionally, we note that GSPI1 was a placeholder code and the final code number is HCPCS code G0560 (*Safety planning interventions, each 20 minutes personally performed by the billing practitioner, including assisting the patient in the identification of the following personalized elements of a safety plan: recognizing warning signs of an impending suicidal or substance use-related crisis; employing internal coping strategies; utilizing social contacts and social settings as a means of distraction from suicidal thoughts or risky substance use; utilizing family members, significant others, caregivers, and/or friends to help resolve the crisis; contacting mental health or substance use disorder professionals or agencies; and making the environment safe.*

In summary, after consideration of public comments, we are finalizing our proposal to create separate coding and payment for safety planning interventions, with modifications. Specifically, we are finalizing HCPCS code G0560 as a standalone code, rather than an add-on code as proposed. We are also finalizing that HCPCS code G0560 can be billed in units of 20 minutes. We are finalizing as proposed that HCPCS code G0560 would need to be personally performed by the billing practitioner for CY 2025, but we will continue to consider this issue for future rulemaking.

c. Post-Discharge Telephonic Follow-Up Contacts Intervention (FCI)

Some research suggests that patients seen in the ED with deliberate self-harm, intentional overdose, and/or suicidal ideation have been associated with substantially increased risk of suicide and other mortality during the year following their visit to the ED.[161] FCI is a specific protocol of services for individuals with suicide risk involving a series of telephone contacts between a provider and patient in the weeks and sometimes months following discharge from the emergency department and other relevant care settings, that occurs when the person is in the community and is designed to reduce the risk for subsequent adverse outcomes. FCI calls are typically 10–20 minutes in duration and aim to encourage use of the Safety Plan (as needed in a crisis) and updating it to optimize effectiveness, expressing psychosocial support, and helping to facilitate engagement in any indicated follow-up care and services. We note that this service would not be within the scope of Medicare telehealth services and not subject to the restrictions described in Section 1834(m) because these services are specifically structured to be delivered via audio-only phone calls and are not a substitute for an in-person service.

In a recent study led by the Joint Commission, which surveyed a national sample of hospitals to assess the prevalence of SPI and several other recommended suicide prevention services, fewer than half of responding hospitals reported furnishing any post-discharge follow-up contacts. Of these, only 33 percent (16 percent of responding hospitals overall) reported reaching discharged patients ''most of the time.'' Further, among hospitals that furnish follow-up contacts, fewer than half reported covering any of the main aims of FCI, for example, 41 percent review the Safety Plan, 49 percent provide psychosocial support, and 38 percent facilitate outpatient care.[162]

However, some studies have demonstrated that SPI and other services may be able to reduce suicidal behaviors. For example, in the ED–SAFE trial for emergency department (ED) patients identified with elevated suicide risk, the intervention included SPI and up to seven post-discharge follow-up calls with the patient ''focused on identifying suicide risk factors, clarifying values and goals, safety and future planning, facilitating treatment engagement/adherence, and facilitating patient-significant other problem-solving.'' [163] In the SAFE VET study [164] of ED patients identified with elevated suicide risk, the intervention included SPI and at least two follow-up calls with patients ''to monitor suicide risk, review and revise the SPI, and support treatment engagement.'' [165] Each of these studies reported significantly lower suicide behaviors—attempts and/or deaths—among intervention patients compared to the respective control conditions.

In light of this, we proposed in the CY 2025 PFS proposed rule to create a monthly billing code to describe the specific protocols involved in furnishing post-discharge follow-up contacts that are performed in conjunction with a discharge from the emergency department for a crisis encounter, as a bundled service describing four calls in a month, each lasting between 10–20 minutes. The G-code is HCPCS code G0544: *Post discharge telephonic follow-up contacts performed in conjunction with a discharge from the emergency department for behavioral health or other crisis encounter, per calendar month.* We sought comment on whether we should consider finalizing a specified duration that HCPCS code G0544 could be billed) following discharge, for example, allowing this code to be billed for up to two months following discharge or whether a longer duration would be appropriate, the number of calls per month, the billing structure (for example, four calls for each discharged patient), and any other relevant feedback.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

We proposed to price this service based on a direct crosswalk to CPT code 99426 (*Principal care management; first 30 minutes of clinical staff time directed by a physician or other qualified healthcare professional*), which is assigned a work value of 1.00 work RVUs. Since CPT code 99426 describes care management for a single condition, we believe the work will be similar in nature and intensity. We noted that under this proposal, HCPCS code G0544 could be billed regardless of whether HCPCS code G0560 was also furnished and billed for the same patient. We proposed that the billing practitioner will need to meet a threshold of at least one real-time telephone interaction with the patient in order to bill HCPCS code G0544, and that unsuccessful attempts to reach the patient will not qualify as

[165] Stanley B, Brown GK, Brenner LA, Galfalvy HC, Currier GW, Knox KL, Chaudhury SR, Bush AL, Green KL. Comparison of the Safety Planning Intervention With Follow-up vs Usual Care of Suicidal Patients Treated in the Emergency Department. JAMA Psychiatry. 2018 Sep 1;75(9):894–900. doi: 10.1001/jamapsychiatry.2018.1776. PMID: 29998307; PMCID: PMC6142908.

a real-time telephone interaction. We welcomed comments on this threshold to bill HCPCS code G0544, recognizing that while practitioners may attempt to reach the patient, there may be times when the patient cannot be reached. We also proposed that the billing practitioner could not count time or effort more than once for the purposes of billing this code and another service.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters recommended that we unbundle these calls, stating they should be billable per call, allowing up to four calls per month. Commenters stated that unbundling would discourage delaying initiation of these services due to concerns about having enough time in a calendar month to complete a call, especially given the challenges of reaching patients; would incentivize placing multiple calls per month; provide flexibility; and generate data on the number of calls completed, which could be used for future refinement of the code. Commenters also noted that qualifying index visits for billing FCI should include discharge from psychiatric inpatient units/facilities. Several commenters also cited that evidence from the Emergency Department Safety Assessment and Follow-Up Evaluation (ED–SAFE) trial indicates that a longer follow-up period (6 months to a year) significantly enhances the effectiveness of suicide prevention efforts.

Response: We thank the commenters for their feedback. However, we continue to believe that a monthly billing structure would be the most efficient manner in which to bill these services and therefore, we are finalizing HCPCS code G0544 as a monthly bundle, as proposed. Regarding the comments about a longer follow-up period, we acknowledge the evidence cited and are not finalizing a set duration that this could be billed for; rather, we are finalizing that we will allow for this code to be billed and paid for as long as the service is medically reasonable and necessary.

Comment: A commenter suggested that instead of establishing G-codes, CMS could propose extending the use of or revising the existing CPT codes for transitional care management and/or discharge day management services to help patients safely return to their home or community from the ED or other settings.

Response: We appreciate these comments and may consider them for future rulemaking. We are finalizing HCPCS code G0544 as proposed. We also recognize that the CPT Editorial Panel has frequently created CPT codes describing services for which we originally established G-codes and adopted them through the CPT Editorial Panel process. We would consider using any newly available CPT coding to describe services similar to those described here in future rulemaking.

Comment: A few commenters recommended that payment or partial payment be made for earnest attempts to contact the individual, even if the contact is unsuccessful, in order to recognize the effort and time it takes for the provider to attempt to furnish critical follow up.

Response: We thank the commenters for this feedback. However, we are finalizing as proposed that the billing practitioner will need to meet a threshold of at least one real-time telephone interaction with the patient in order to bill HCPCS code G0544, and that unsuccessful attempts to reach the patient will not qualify as a real-time telephone interaction.

Comment: A few commenters suggested that CMS should value HCPCS code G0544 based on a crosswalk to CPT code 99490, Chronic Care Management, first 20 minutes, which is assigned a work RVU of 1.00.

Response: The proposed work RVU for HCPCS code G0544 is 1.00, based on a crosswalk to CPT code 99426 (Principal Care Management). Since CPT code 99426 and 99490 are currently both assigned the same work RVU of 1.00, we are finalizing this valuation as proposed.

Comment: Several commenters suggested that HCPCS code G0544 should be applicable to other settings where an individual is discharged for a crisis encounter and some commenters suggested that CMS should allow this service to be provided in conjunction with a discharge from a hospital, inpatient behavioral health facility, and other inpatient settings.

Response: We thank the commenters for this feedback. We wish to clarify that HCPCS code G0544 can be billed by practitioners in any instance in which the beneficiary has been discharged following a crisis encounter, including discharge from psychiatric inpatient care, or crisis stabilization.

Comment: Some commenters requested clarification regarding whether auxiliary personnel could participate in furnishing the services described by HCPCS code G0544 incident to the services of the billing practitioner.

Response: We thank the commenters for this request. We wish to clarify that the services described by HCPCS code G0544 can be provided by auxiliary personnel incident to the services of the billing practitioner in accordance with the requirements of § 410.26.

Additionally, as we recognized that behavioral health practitioners, training programs, and institutions have worked conscientiously to have risk assessment and safety planning for high-risk patients integrated into their workflows for many years and that discharge instructions and after visit planning may represent one of many final products from the synthesis of all the steps involved in these encounters, we noted that we do not intend to unnecessarily disaggregate aspects of streamlined clinical workflows that providers are successfully using to treat high risk patients. Moreover, we recognized that practitioners may currently be billing for safety planning activities using existing coding, such as E/M visits, psychotherapy, and crisis management codes or potentially for follow-up calls using existing care management services. However, to the extent that this intervention is part of the standard of care, we believe that Medicare payment should accurately reflect the additional resource costs involved in furnishing this service.

Lastly, as applicable Part B cost sharing would apply for HCPCS code G0544, we proposed to require the treating practitioner to obtain verbal (or written) beneficiary consent in advance of furnishing the services described by G0544, which would be documented by the treating practitioner in the medical record, similar to the conditions of payment associated with care management and other non-face-to-face services paid under the PFS. We noted that under this proposal, obtaining advance consent would include: (1) ensuring that the patient is aware that Medicare cost sharing applies to these services; (2) furnishing and receiving the necessary information to enable the patient to receive these services (for example, obtaining the patient's telephone number(s)); and (3) confirming that the patient consents to the contacts.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: One commenter stated that while they agree that consent would be necessary for these services given the financial liability the patient will incur, it may not be possible to obtain consent before performing the services and therefore urged CMS to allow consent to be obtained during the initial phone call. Some commenters suggested

eliminating cost sharing for this service, noting that who require these services are already in an emotionally and mentally vulnerable place and may be reluctant to interact with healthcare providers.

Response: We thank the commenters for this feedback. In response to the comments, we agree that it may not be possible to obtain consent prior to the first phone call, and therefore, we are finalizing to allow consent to be obtained either prior to, or during the initial phone call. Regarding the suggestion to eliminate cost sharing for this service, we note that we do not have statutory authority to waive cost sharing for these services.

Lastly, we note that GFCI1 was a placeholder code. The final code number describing this service is HCPCS code G0544.

2. Digital Mental Health Treatment (DMHT)

We proposed Medicare payment to billing practitioners for digital mental health treatment (DMHT) devices furnished incident to or integral to professional behavioral health services used in conjunction with ongoing behavioral health care treatment under a behavioral health treatment plan of care. We refined the digital cognitive behavioral therapy ''digital CBT'' terminology that we have used previously (88 FR 52262, 52370 through 52371, 88 FR 78818, 79012 and 79013). In this final rule we use the term ''digital mental health treatment (DMHT) device'' to include the term ''digital CBT'' we used in prior rulemaking and in general to refer to software devices cleared, approved, or granted De Novo authorization by the Food and Drug Administration (FDA) that are intended to treat or alleviate a mental health condition, in conjunction with ongoing behavioral health care treatment under a behavioral health treatment plan of care, by generating and delivering a mental health treatment intervention that has a demonstrable positive therapeutic impact on a patient's health. We noted first that the *Diagnostic and Statistical Manual of Mental Disorders–5 (DSM–5)* does not refer to psychiatric disorders but to mental disorders. In this section, following the DSM–5, we used the term behavioral health conditions and mental disorders interchangeably and to mean psychiatric disorders as referenced in FDA regulation, 21 CFR 882.5801. This includes substance use disorders. Second, we noted that FDA guidance refers to computerized behavioral therapy by the acronym CBT. We stated in the proposed rule that we aimed to both provide access to vital behavioral health services and gather further information about the delivery of digital behavioral health therapies, their effectiveness, their adoption by practitioners as complements in the care they furnish, and their use by patients for the treatment of behavioral health conditions. We also noted that we recognized that there are certain statutory limitations on payment for products under the broader category of ''digital health interventions.'' We acknowledged that the field of digital therapeutics is evolving and are open to feedback from the public on this topic, including the CPT Editorial Panel. Additionally, we recognized that historically, the CPT Editorial Panel has frequently created CPT codes describing services that we originally established using G codes and adopted them through the CPT Editorial Panel process. We noted that we would consider using any newly available CPT coding to describe services similar to those described here in future rulemaking.

a. Background

Over the last 5 years the AMA CPT Editorial Panel and CMS have developed coding and separate payment for monitoring physiologic status using software enabled devices that capture and record or transmit data that may be reported to and interpreted by practitioners to manage a patient under a specific treatment plan (83 FR 59452, 59574). Medicare payment has long been available for practitioner provision of monitoring equipment and other kinds of devices provided incident to or integral to the practitioner's professional services. Most recently we have finalized payment for devices which record data related to signs, symptoms, and functions of a therapeutic response (typically for use in association with physical or occupational therapy care) (86 FR 64996, 65114–65116).

However, technologies that rely primarily on software, licensing, and analysis fees, with minimal costs in equipment and hardware may not have been typical and are not well accounted for in our practice expense (PE) methodology. PE resources involved in furnishing services are characterized as either direct or indirect costs. Direct costs of the PE resources involved in furnishing a service are estimated for each HCPCS code and include clinical labor, medical supplies, and medical equipment. Indirect costs include administrative labor, office expenses, and all other expenses. Indirect PE is allocated to each service based on physician work, direct costs, and a specialty-specific indirect percentage. The source of the specialty specific indirect percentage is the Physician Practice Information Survey (PPIS), last administered in 2007 and 2008, prior to the adoption of digital therapy technologies (86 FR 65037). Nevertheless, in past rulemaking, we have recognized that in some cases practitioners do incur resource costs for the purchase and ongoing use of software (86 FR 65038).

In the CY 2023 PFS final rule, we finalized our proposal to accept the RUC recommendation to contractor price CPT code 98978 (*Remote therapeutic monitoring (e.g., therapy adherence, therapy response); device(s) supply with scheduled (e.g., daily) recording(s) and/or programmed alert(s) transmission to monitor cognitive behavior therapy, each 30 days*), a PE-only device code (86 FR 69523, 69646). At the time, specialty societies indicated that the technologies for this service are still evolving, and that as a result, there were no invoices for devices specific to the cognitive behavioral therapy monitoring services described by the code that could be shared. Further, there was no professional work associated with the code.

In the CY 2024 PFS proposed rule, we requested information on digital therapeutics for behavioral health. Among many questions, we asked how practitioners determine which patients might be best served by digital therapeutics and how practitioners monitor the effectiveness of prescribed interventions on an ongoing basis once the intervention has begun. We also asked how the treating clinician was involved in the services received. We asked what scientific and clinical evidence of effectiveness CMS should consider when determining whether digital therapeutics for behavioral health, including care for substance use disorders, depression, sleep disorders and other conditions are reasonable and necessary. We asked whether DMHT devices were used as incident to supplies or independent of a patient visit with a practitioner and if practitioners in such cases issued an order for such devices (88 FR 52262, 52370 through 52371). These factors related to the nature of this treatment compared to other PFS services pose challenges for fitting DMHT services into the existing benefit structure under the PFS.

Setting appropriate pricing under the PFS has also presented challenges. As noted previously, technologies that rely primarily on software, licensing, and analysis fees, with minimal costs in equipment and hardware are not well accounted for in our practice expense

(PE) methodology, even though these items may be appropriately considered practice expenses. Consequently, over the past several years, we have relied on a crosswalk methodology to approximate relative resource costs for these kinds of services relative to other PFS services, or contractor pricing.

Interested parties requested that we adopt coding specifically for DMHT devices, where the digital software device is the actual therapy/intervention (the algorithm software is the DMHT) as opposed to a therapeutic monitoring device that transmits patient data as described by CPT code 98978 for which we finalized contractor pricing in CY 2023. Interested parties have also asked us to set national pricing for the service to supply the DMHT device and education/onboarding that reflects the direct practice expense incurred by practitioners when furnishing DMHT. One of the interested parties submitted invoices to provide data we could use as the basis to set payments for DMHT coding. The interested party submitted four invoices reflecting considerable variation in the cost of the DMHT treatment over 30-day and 90-day periods.

As the field of innovative products including digital therapeutics and computerized behavioral therapy devices for psychiatric or mental disorders develops and expands, the FDA and Substance Abuse and Mental Health Services Administration (SAMHSA) among other agencies such as the Veterans Health Administration (VHA) are also monitoring the development of the field of digital therapeutic devices, including for behavioral health care purposes. For example, VHA is providing digital behavioral health applications as self-help tools, not independent treatment interventions. The FDA has a regulatory framework, discussed in this section, to classify devices and review computerized behavioral therapy devices for psychiatric disorders.

b. Payment for Digital Mental Health Treatment (DMHT) Devices

We recognize that digital therapeutics may offer innovative means to access certain behavioral health care services. The FDA definition of devices encompasses software intended by the manufacturer to be used, alone or in combination, for the specific medical purpose of diagnosis, prevention, monitoring, treatment or alleviation of disease and does not achieve its primary intended action by pharmacological, immunological or metabolic means.[166] SAMHSA has adopted the International Organization for Standardization's definition of DTx as ''health software intended to treat or alleviate a disease, disorder, condition, or injury by generating and delivering a medical intervention that has a demonstrable positive therapeutic impact on a patient's health.'' [167] SAMHSA also notes that ''DTx may be used independently or in concert with medications, devices, or other therapies to optimize patient care and health outcomes.'' Given nationwide behavioral health workforce shortages combined with increasing demand for behavioral health care services, some Medicare beneficiaries may have limited access to these services.[168] This proposal encompasses only part of what may be a spectrum of broadly similar products, most of which might require a new statutory Medicare benefit category. Specifically, we proposed in the CY 2025 PFS proposed rule to pay billing practitioners for DMHT devices furnished incident to or integral to professional behavioral health services used in conjunction with ongoing behavioral health care treatment under a behavioral health treatment plan of care if that device had been cleared by FDA for use under 21 CFR 882.5801. Given that devices are not ''cleared'' by FDA for use under 21 CFR 882.5801, we clarify here that this proposed coding and payment policy would apply to DMHT devices that have been cleared under section 510(k) of the Food, Drug, and Cosmetics Act (FD&C Act) or granted De Novo authorization by FDA and classified under 21 CFR 882.5801, as discussed below. Many digital platforms and applications are marketed as behavioral health and wellness interventions; this proposal does not extend to such platforms and applications in part because other than some DTx, few at this time show evidence demonstrating improved behavioral health outcomes.[169]

We proposed to create three new HCPCS codes for DMHT devices modeled on coding for RTM services. Effective beginning in CY 2025, we proposed that physicians and practitioners who are authorized to furnish services for the diagnosis and treatment of mental illness would be able to bill a new HCPCS code: G0552 (*Supply of digital mental health treatment device and initial education and onboarding, per course of treatment that augments a behavioral therapy plan*) for furnishing a DMHT device. HCPCS code G0552 would be payable only if the DMHT device has been cleared under section 510(k) of the FD&C Act or granted De Novo authorization by FDA and classified under 21 CFR 882.5801 and the billing practitioner is incurring the cost of furnishing the DMHT device to the beneficiary. Furnishing of the DMHT device must be incident to the billing practitioner's professional services in association with ongoing treatment under a plan of care by the billing practitioner. The billing practitioner must diagnose the patient and prescribe or order the DMHT device. The patient could then use the DMHT device at home or perhaps in an office or other outpatient setting, if that is how the device has been classified by FDA for use under 21 CFR 882.5801. The DMHT device furnished must have demonstrated a reasonable assurance of safety and effectiveness. The FDA makes a determination of safety and effectiveness under 21 CFR 860.7. When making this determination, the FDA will consider a variety of factors including users, conditions of use, probable benefit to health weighed against probable injury, and reliability. The regulation at 21 CFR 860.7, states that ''[t]here is reasonable assurance that a device is safe when it can be determined, based upon valid scientific evidence, that the probable benefits to health from use of the device for its intended uses and conditions of use, when accompanied by adequate directions and warnings against unsafe use, outweigh any probable risks.'' HCPCS code G0552 would not be payable in cases where the billing practitioner incurs no cost in acquiring and furnishing the DMHT device, or a patient procures the DMHT device independent of the practitioner. We will continue to monitor how DMHT devices are used as part of overall care.

We sought comment about other parameters that we should consider regarding the services described by HCPCS code G0552:

- Whether payment should be made if the practitioner furnishes a digital device that has not been classified by FDA for a specific use under 21 CFR 882.5801 for mental health treatment, even if the digital device has been classified by the FDA for another specific use under 21 CFR 882.5801;

[166] *https://www.imdrf.org/sites/default/files/docs/imdrf/final/technical/imdrf-tech-131209-samd-key-definitions-140901.pdf.*

[167] *https://store.samhsa.gov/product/advisory-digital-therapeutics-management-and-treatment-behavioral-health/pep23-06-00-001.*

[168] *https://bhw.hrsa.gov/sites/default/files/bureau-health-workforce/data-research/behavioral-health-2013-2025.pdf.*

[169] *https://store.samhsa.gov/product/advisory-digital-therapeutics-management-and-treatment-behavioral-health/pep23-06-00-001.*

• Whether payment should be made for DMHT devices cleared under section 510(k) of the FD&C Act or granted De Novo authorization by FDA and classified not only under 21 CFR 882.5801 but also under other regulations;
• Whether and how payment might be limited if a patient discontinues use of the DMHT device before completing a course of treatment; and
• Whether and how payment might be limited to a set number of DMHT devices per calendar month per patient.

In light of the pricing variability, as discussed previously, we proposed contractor pricing for HCPCS code G0552. We sought comment regarding what national pricing methodology we might consider, including what potential crosswalks would be appropriate.

We also proposed to establish payment for two additional new HCPCS codes. These codes are HCPCS code G0553 (*First 20 minutes of monthly treatment management services directly related to the patient's therapeutic use of the digital mental health treatment (DMHT) device that augments a behavioral therapy plan, physician/other qualified health care professional time reviewing data generated from the DMHT device from patient observations and patient specific inputs in a calendar month and requiring at least one interactive communication with the patient/caregiver during the calendar month*) and HCPCS code G0554 (*Each additional 20 minutes of monthly treatment management services directly related to the patient's therapeutic use of the digital mental health treatment (DMHT) device that augments a behavioral therapy plan, physician/other qualified health care professional time reviewing data generated from the DMHT device from patient observations and patient specific inputs in a calendar month and requiring at least one interactive communication with the patient/caregiver during the calendar month).* Under this proposal, HCPCS code G0552 requires that the billing practitioner who diagnosed the patient and prescribed or ordered the DMHT device or that billing practitioner's clinical staff must monitor the patient's therapeutic response to the DMHT device and adjust the behavioral health therapy plan as needed. HCPCS codes G0553 and G0554 should only be billed when there is ongoing use of the DMHT device and should not be billed in cases where the patient discontinues use of the DMHT device.

For HCPCS code G0553 (first 20 minutes of monthly treatment management services directly related to use of the DMHT device), we proposed valuing the first 20 minutes of treatment management services based on a direct crosswalk to CPT code 98980 (remote therapeutic monitoring first 20 minutes), which is assigned a work RVU of .62. For HCPCS code G0554 (each additional 20 minutes of monthly treatment management services directly related to DMHT device), we proposed to value this code based on a crosswalk to CPT code 98981 (remote therapeutic monitoring each additional 20 minutes), which is assigned a work RVU of .61. We believe that the work and PE described by these crosswalk codes are analogous to the services described in HCPCS codes G0553 and G0554, respectively, because they include similar physician/other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month. We welcomed comments on the proposed RVUs.

We received many public comments on these proposals. Most commenters expressed general support for our proposed coding. Only about a dozen expressed opposition or overall negative sentiment. Several dozen commenters expressed directional support but recommended significant refinements. The following is a summary of the comments we received and our responses.

Comment: Many commenters recommended we broaden our inclusion criteria for which devices would qualify for billing HCPCS code G0552. Some commenters felt that any product that had been classified as software as a medical device by the FDA under Section 201(h)(1) of the FD&C Act should be payable under our policy. Others opined that any remote therapeutic intervention based on medical devices as defined by FDA should be payable under HCPCS code G0552. Others felt that any digital therapeutic device for diagnosis or treatment of a behavioral health condition should be payable under HCPCS code G0552, and that clinicians may review the scientific literature around such devices and find them helpful and appropriate parts of certain behavioral health plans.

Other commenters recommended that we define ''mental health condition'' to explicitly include neurological conditions including dementia that are currently subject to treatment with effective FDA-authorized digital behavioral or psychological interventions. Many commenters advocated that we include medical and neurodevelopmental disorders to adequately cover the range of disorders treated by FDA-authorized products. Others recommended we clarify that all conditions in the DSM–5 are included, including SUD. Others asked that we make payment for evidenced-based psychotherapies for medical conditions that are not generally considered a mental health condition as defined by the DSM–5, for example, irritable bowel syndrome (IBS0, cancer care or obesity treatment. (Whether any of these may be classified as a ''somatic symptom disorder'' in the DSM–5 would be a matter for clinical judgement.)

Many supported payment for digital therapeutic devices specifically when they are furnished incident to a professional health service or ordered by a qualified health professional. Some commenters asked that we clarify which health professionals may report HCPCS code G0552 and asked whether auxiliary personnel such as peer support specialists and community health workers can bill the new codes because education and engagement are critical parts of successful use of digital mental health services.

Others, in response to our question about payment for devices classified by FDA under regulations besides 21 CFR 882.5801, Computerized behavioral therapy device for psychiatric disorders, offered that we should include devices for Gastrointestinal Conditions (21 CFR 876.5960), Attention Deficit Hyperactivity Disorder (21 CFR 882.5803), and Sleep Disturbance for Psychiatric Conditions (21 CFR 882.5705). Others recommended payment for Biofeedback (21 CFR 882.5050) devices.

Several commenters proposed that we adopt the definition provided in the Access to Prescription Digital Therapeutics Act of 2023, S723/HR1458: A product, device, internet application, or other technology that is cleared or approved under section 510(k), 513(f)(2), or 515 of the FD&C Act; has a cleared or approved indication for the prevention, management or treatment of a medical disease, condition or disorder; primarily uses software to achieve its intended result; and is a device that is exempt from section 502(f)(1) of the FD&C Act under 21 CFR 801.109.

On the other hand, some commenters expressed concern that FDA regulatory pathways are inadequate FD&C Act because many devices are authorized without having submitted rigorous studies demonstrating safety or effectiveness. Other commenters wanted to ensure that DMHT devices are safe and beneficial for clinicians and patients. Several commenters

recommended we define digital mental health treatment device independent of FDA regulatory classification pathways. Some commenters recommended that CMS create a registry of all eligible devices as a condition of payment or adopt a model developed by the American Psychiatric Association to evaluate their efficacy.

Other commenters supported our proposal's focus on digital interventions for behavioral health (including mental health and substance use disorders). Other commenters felt we should also include devices that are granted De Novo classification under section 513(f)(2) of the FD&C Act or granted Premarket Approval under section 515 of the FD&C Act. Others felt that DMHT devices do not always provide better health outcomes, and only high-quality, safe, and effective devices should be used. Others supported payment for DMHT devices as long as they are part of a physician-directed care plan. Another commenter supported our limited proposal because they believed DMHT applications are proliferating and their evidence base is minimal. Some referenced various efforts underway to develop an evidence-based evaluation framework for digital therapies. Another encouraged the continued evaluation of these services to ensure their efficacy in patient care. Another suggested CMS issue a broader RFI to gain stakeholder input on a fair and transparent process for evaluating ''Algorithm Based Health Services''. Another opined that CMS should identify opportunities and encourage vendors and billing practitioners to join in efforts to leverage interoperable DMHT data measure quality. Many commenters also recommended that DMHT devices and their technologies ensure or demonstrate data privacy and security. One commenter remarked about our inconsistent language in the proposal using the phrase ''incident to or integral to professional behavioral health services.''

Response: We appreciate all the comments and recommendations offered for our consideration. Commenters expressed wide ranging views about how broadly we should define DMHT devices for payment under HCPCS code G0552. First, we acknowledge the inconsistent use of the term ''incident to or integral to professional behavioral health services.'' We note that ''integral to'' is language reflected in one of the elements of the applicable regulation, 42 CFR 410.26(b)(2). We clarify that we were referencing 42 CFR 410.26 in the language ''incident to or integral to'' used in the proposed rule and that for clarity we are using ''incident to'' by itself in this section regarding DMHT devices furnished incident to professional behavioral health services used in conjunction with ongoing behavioral health treatment under a behavioral health treatment plan of care. Second, as stated above, we wish to clarify that the definition of DMHT device as proposed would include devices cleared under section 510(k) of the FD&C Act or granted De Novo authorization by FDA. In both instances, however, the device would need to be classified under 21 CFR 882.5801 to be payable under this policy.

We agree with commenters who expressed concern with ensuring that DMHT devices are not only safe for patients but also beneficial for patients. The technologies and platforms for digital therapeutics are evolving rapidly. We are at a starting point of Medicare payment for DMHT devices as supplies furnished incident to professional behavioral health services used in conjunction with ongoing behavioral health care treatment under a behavioral health treatment plan of care and anticipate that this will be an iterative process. We are also cognizant that some of the definitions for DMHT devices that commenters proposed, or devices commenters recommended should be payable under HCPCS code G0552, including most Class I devices (exempt from 510(k)) may not be aligned with similar terms used by other agencies and may encompass devices not evaluated or authorized by the FDA. Commenters have noted the work of the American Psychiatric Association, and the Agency for Health Research and Quality (AHRQ), among others. Commenters have suggested CMS leverage its convening power to bring interested parties together to develop frameworks, quality measures, or DMHT device registries. Recommendations for CMS to do so are beyond the scope of the proposed policies in the CY 2025 PFS proposed rule. We do not have the capacity as some commenters have suggested to undertake evaluation of DMHT devices.

While partly in recognition of our inability to evaluate every DMHT device, we proposed to define DMHT device under the proposed codes as devices cleared under section 510(k) of the FD&C Act or granted De Novo authorization by FDA and classified under 21 CFR 882.5801 in an effort to ensure our payment policies for DMHT devices are aligned with devices the FDA classified with special controls requiring clinical data to validate the model of behavioral therapy as implemented by the device. We appreciate commenters concerns for patient privacy and data security. FDA's regulation of medical devices focuses on safety and effectiveness. Although loss of confidential health information is generally not considered to be a direct impact on safety and effectiveness, under Section 524B of the FD&C Act, a person who submits a 510(k), PMA, PDP, De Novo, or HDE for a device that meets the definition of a cyber device is required to submit information to ensure that cyber devices meet the cybersecurity requirements under section 524(b) of the FD&C Act.[170] FDA recommends that manufacturers submit their cybersecurity management plans as part of their premarket submissions so that FDA can assess whether the manufacturer has sufficiently addressed how to maintain the safety and effectiveness of the device after marketing authorization is achieved. Additionally, please note that manufacturers may be obligated to protect the confidentiality, integrity and availability of protected health information (PHI) throughout the product lifecycle in accordance with applicable federal and state laws, including the Health Insurance Portability and Accountability of 1996 (HIPAA).

We are finalizing payment under HCPCS code G0552 for DMHT devices furnished incident to professional behavioral health services used in conjunction with ongoing behavioral health treatment under a behavioral health treatment plan of care. Specifically, we are finalizing that DMHT devices under this payment policy must be cleared under section 510(k) of the FD&C Act or granted De Novo authorization by FDA and in each case must be classified under 21 CFR 882.5801 for mental or behavioral health treatment. While presently use cases for insomnia, substance use disorder, depression and anxiety have been classified by the FDA under 21 CFR 882.5801, future use cases are not necessarily limited to these. Our objective in proposing that DMHT devices be classified under 21 CFR 882.5801 as a condition of payment was to set guardrails within our payment policy for patient safety and benefit. As clarified above, devices granted De Novo authorization by FDA if classified under 21 CFR 882.5801 would fall under the definition of DHMT device. We proposed to limit payment to

[170] Cybersecurity in Medical Devices: Quality System Considerations and Content of Premarket Submissions, Guidance for Industry and Food and Drug Administration Staff, issued September 27, 2023. *https://www.fda.gov/media/119933/download.*

devices classified under 21 CFR 882.5801 which are required to comply with the Class II special controls set forth at 21 CFR 882.5801(b), including clinical data to validate the model of behavioral therapy as implemented by the device.

Furthermore, we are finalizing that a physician or other practitioner who is authorized to diagnose, evaluate, and treat a mental health disorder may prescribe or order a DMHT device as permitted under the device's FDA clearance in accordance with State prescriptive authority and may report HCPCS code G0552. We are clarifying that auxiliary personnel meeting the requirements of 42 CFR 410.26(a)(1) may only provide part of the initial education and onboarding described in HCPCS code G0552, and cannot report HCPCS code G0552, as they do not have the statutory authority to serve as the billing practitioner. Additionally, we are clarifying that we do not define behavioral health services by HCPCS codes or by direct reference to the DSM–5. In the CY 2023 PFS final rule we did not propose to do so and did not do so when we finalized to allow behavioral health services to be furnished under the general supervision of a physician or NPP when these services or supplies are provided by auxiliary personnel incident to the services of a physician or NPP (87 FR 69546). In general, we understand a behavioral health service to be any service furnished for the diagnosis, evaluation, or treatment of a mental health disorder, including substance use disorders (SUD). However, we continue to believe individual practitioners are in the best position to determine whether particular services are behavioral health services. As stated in the CY 2022 PFS final rule (86 FR 65061), SUD services are considered mental health services for the purposes of the expanded definition of ''interactive telecommunications system.'' Moreover, in the CY 2010 PFS final rule (74 FR 61787), we referenced that the outpatient mental health treatment limitation, which was phased out as of 2014, applied to outpatient treatment of a mental, psychoneurotic, or personality disorders, identified under the International Classification of Diseases (ICD) diagnosis code range 290–319.

Comment: Several commenters recommended we refine the code descriptors of HCPCS codes G0552, G0553 and G0554. Some commenters suggested we define the course of treatment to be 30 days and allow HCPCS code G0552 to be billed in subsequent 30-day increments. For this purpose, they recommended that the work RVU for initial education and onboarding be removed from HCPCS code G0552 or that a second subsequent month per course of treatment device code could be created. Other commenters welcomed the inclusion of initial education and onboarding in HCPCS code G0552. While commenters generally supported the two HCPCS codes G0553 and G0554 for treatment management related to a patient's therapeutic use of a DMHT device, several commenters recommended that we acknowledge that many DMHT devices do not collect patient data. Many commenters recommended that we distinguish the treatment management codes from existing RTM codes by revising the descriptors for HCPCS codes G0553 and G0554 to replace the words: ''reviewing data generated from the DMHT device from'' with ''reviewing information related to the use of the DMHT device, including.'' In particular, some commenters who opposed our proposal thought that the RTM family of codes as revised effective January 1, 2024, by the AMA CPT Editorial Panel would overlap with HCPCS code G0552 and create confusion for practitioners.

Response: We thank commenters for their feedback about refining the descriptors for our proposed HCPCS codes G0552, G0553 and G0554. We are finalizing HCPCS code G0552 as proposed. We are finalizing HCPCS code G0553 with these refinements: G0553 (*First 20 minutes of monthly treatment management services directly related to the patient's therapeutic use of the digital mental health treatment (DMHT) device that augments a behavioral therapy plan, physician/other qualified health care professional time reviewing information related to the use of the DMHT device, including patient observations and patient specific inputs in a calendar month and requiring at least one interactive communication with the patient/caregiver during the calendar month*). We are finalizing HCPCS code G0554 with the following refinements: (*Each additional 20 minutes of monthly treatment management services directly related to the patient's therapeutic use of the digital mental health treatment (DMHT) device that augments a behavioral therapy plan, physician/other qualified health care professional time reviewing information related to the use of the DMHT device, including patient observations and patient specific inputs in a calendar month and requiring at least one interactive communication with the patient/caregiver during the calendar month. (List separately in addition to HCPCS code G0553)*). We have noted that DMHT devices vary in the typical course of treatment and acknowledge that persons with mental health and behavioral health conditions may experience circumstances necessitating that their practitioners extend the time. As commenters noted, limiting HCPCS code G0552 to a monthly period would necessitate creating another code to account for a course of treatment beyond a month. As to commenters concerns for potential overlap, we believe that HCPCS code G0552 is specific enough that practitioners could determine when to use RTM coding instead of HCPCS code G0552. We are finalizing refinements to HCPCS codes G0553 and G0554 to clarify that these codes are for treatment management with a DMHT device which is intended as a therapeutic intervention as opposed to RTM devices which, beginning January 1, 2024, will describe devices that may have a digital therapeutic intent as well as be intended to monitor response to a therapeutic intervention not necessarily delivered by an RTM device. HCPCS code G0552 does not describe a device intended to monitor response to therapeutic intervention. We expect that practitioners will report the more specific HCPCS code G0552 when the DMHT device meets conditions of payment we are finalizing. We expect that practitioners will report the more specific HCPCS codes G0553 and G0554 when treatment management services are directly related to a DMHT device described by HCPCS code G0552 meeting these conditions of payment. HCPCS code G0552 would be payable only if:

- The DMHT device has been cleared under section 510(k) of the FD&C Act or granted De Novo authorization by FDA and classified under 21 CFR 882.5801 as described above.
- The billing practitioner is incurring the cost of furnishing the DMHT device to the beneficiary.
- Furnishing of the DMHT device is incident to the billing practitioner's professional services in association with ongoing behavioral health treatment under a plan of care by the billing practitioner.
- The billing practitioner diagnoses the patient with a mental health condition and prescribes or orders the DMHT device.

HCPCS code G0552 shall not be payable in cases where the billing practitioner incurs no cost in acquiring and furnishing the DMHT device, or a patient procures the DMHT device independent of the practitioner. One commenter noted an example of a

DMHT device classified by the FDA under 21 CFR 882.5801, that is prescribed by a practitioner, but the practitioner bears no cost for the device. In that case the commenter is correct that payment is not available to the practitioner. The benefit category for HCPCS code G0552 requires that payment for the DMHT device as a supply incident to a practitioner's professional services be a supply cost that the practitioner has incurred. We are aware this may be a limitation with respect to DMHT devices being payable under HCPCS code G0552.

Comment: In response to questions we raised in the proposed rule, commenters were divided among those concerned principally by greater access to treatment versus guarding against potential waste or misuse, and those concerned principally by patient safety. Some commenters felt that a practitioner and patient should determine whether to use a device ''off-label'' and whether it would be appropriate to use more than one device when the patient had more than one behavioral health condition. While others felt the risks for using a device for a different indication than for which it was authorized by FDA, or using more than one device at a time could pose unknown risks and furthermore that similar efficacy could not be inferred for these use cases. MedPAC suggested we consider giving the Parts A/B Medicare Administrative Contractors (MACs) the discretion to cover use of digital devices for purposes other than what has been approved by the FDA, similar to MACs' ability to cover non- cancer drugs for off-label indications.

Response: We agree with commenters who expressed concerns about unknown risks and that similar efficacy could not be inferred for cases using a device for a different indication than for which it was authorized. We are finalizing that payment may only be made for DHMT devices for mental health treatment in accordance with the use indicated in their FDA classification under 21 CFR 882.5801.

Comment: Commenters generally supported payment for concurrent use of different DMHT devices used in the treatment of different mental health or behavioral health conditions. Some suggested heightened documentation requirements for such cases.

Response: We agree that many individuals with mental health or behavioral health conditions may have more than one co-occurring condition. We are not finalizing any limits in this regard.

Comment: Some commenters noted that practitioners who bore the cost of acquiring the device should not be liable for the cost of the device when a patient discontinued treatment given that patients with mental health conditions often go off treatment and return subsequently. Some commenters felt reduced payment was appropriate in those circumstance and suggested that Modifier-52 could be reported for reduced services.

Response: We agree with commenters who noted many individuals with certain behavioral health conditions are at a higher risk of not adhering to treatment or experiencing events that may necessitate temporary pauses in treatment. For these reasons, we are not finalizing a reduction in payment at this time for discontinued use of the treatment before the full course of treatment has been completed.

Comment: Some commenters urged us to set a national price based on invoices submitted to us or based on crosswalks to PE-only codes and codes with work RVUs for the initial education and onboarding. Some commenters recommended we adopt contractor pricing temporarily until we and our contractors have gained enough experience to adopt national pricing on product specific or product class specific codes. Some commenters noted that one device code was impractical for the range of devices they thought we intended and others recommended including that product classes be defined by treatment length, mechanism of action and hardware requirements. Most commenters supporting the proposal expressed no opinion about the proposed pricing. Some commenters recommended CM work with CMMI on developing a payment model. Finally, MedPAC recommended payment for the device be included in larger payment bundles.

Response: After consideration of public comments, we are finalizing to contractor price HCPCS code G0552, as proposed. We are also finalizing payment for HCPCS codes G0553 and G0554 as proposed. We note that the invoices we received vary considerably. At this time, we do not believe we can appropriately price all the DMHT devices for which we propose to make payment. As we have noted, the technologies and DMHT therapies are evolving rapidly. Given the dynamic nature of the development of these devices and the variation in methods of action for potential technology platforms, we do not have sufficient information needed to establish national pricing for devices under HCPCS code G0552 at this time. However, we continue to welcome information on this and may consider national pricing through future rulemaking.

3. Interprofessional Consultation Billed by Practitioners Authorized by Statute To Treat Behavioral Health Conditions

a. Background

In the CY 2019 PFS final rule (83 FR 59489), we finalized payment for six CPT codes regarding interprofessional consultations (99451, 99452, 99446, 99447, 99448, 99449). The six codes describe assessment and management services conducted through telephone, internet, or electronic health record consultations furnished when a patient's treating physician or other qualified healthcare professional requests the opinion and/or treatment advice of a consulting physician or qualified healthcare professional with specific specialty expertise to assist with the diagnosis and/or management of the patient's condition without the need for the patient's face-to-face contact with the consulting physician or qualified healthcare professional. We established coding and payment for these services to reflect changing healthcare practices, technology, and the shift to treatment of chronic conditions in the Medicare population. In the CY 2019 PFS final rule (83 FR 59491), we established a policy to limit billing of these codes to the types of practitioners who can independently bill Medicare for E/M visits. We did not finalize the expansion of practitioners beyond those who can furnish E/M visits in the CY 2019 PFS final rule due to our belief that interprofessional consultations are primarily for the ongoing evaluation and management of the patient, including collaborative medical decision making among practitioners (83 FR 59491).

In the CY 2024 PFS proposed rule (88 FR 52369), we sought comment on expanding access to behavioral health services, including whether we should consider new coding to allow interprofessional consultation to be billed by practitioners in specialties whose covered services are limited by statute (Clinical psychologists at section 1861(ii) of the Act, Clinical social workers at section 1861(hh) of the Act, Marriage and Family Therapists and Mental Health Counselors at sections 1861(lll)(1) and 1861(lll)(3) of the Act, respectively) to services for the diagnosis and treatment of mental illness (which includes substance use disorders). The CPT codes describing interprofessional consultation (CPT codes 99451, 99452, 99446, 99447, 99448, 99449) are currently limited to being billed by practitioners who can

independently bill Medicare for E/M visits. As such, they cannot be billed by clinical psychologists, clinical social workers, marriage and family therapists, or mental health counselors because these practitioners cannot independently bill Medicare for E/M visits. We proposed new codes that would allow clinical psychologists, clinical social workers, marriage and family therapists, and mental health counselors to bill for interprofessional consultations with other practitioners whose practice is similarly limited, as well as with physicians and practitioners who can bill Medicare for E/M services and would use the current CPT codes to bill for interpersonal consultations. These new codes would facilitate interprofessional consultations between treating/requesting practitioners and consultant practitioners, whether one or both of the practitioners is in a specialty whose practice is limited to the diagnosis and treatment of mental illness. When the treating/requesting practitioner or consultant practitioner is a physician or practitioner authorized to bill Medicare for E/M services, the practitioner will continue to bill using the current CPT codes that describe interprofessional consultation, listed previously in this section. Depending on which practitioner type is billing, and assuming all service requirements of the code descriptors are met, the consulting practitioner could bill the applicable codes, either HCPCS code (G0546–G0551) or CPT code (99451, 99446, 99447, 99448, 99449), determined by the amount of time spent on the consultation and whether a written and verbal consultation is provided or only a written consultation is provided. Similarly, depending on which practitioner type is billing, and assuming all service requirements of the code descriptors are met, the treating/requesting practitioner could bill either HCPCS code G0551 or CPT code 99452 for the time spent on their referral service.

We believe that proposing payment for these interprofessional consultations performed via communications technology such as telephone or internet (including videoconference) is consistent with our ongoing efforts to appropriately recognize and reflect behavioral health care within the PFS. Currently, there is no payment mechanism to recognize the time and effort of performing these services by clinical psychologists, clinical social workers, marriage and family therapists, or mental health counselors. We have also previously received comments from interested parties that by not making separate payment for these services, CMS would not be accurately paying for the work of both the treating and consulting practitioner in a consultative scenario. With the proliferation of team-based approaches to care that are often facilitated by electronic medical record technology, we believe that making separate payment for interprofessional consultations undertaken for the benefit of treating a patient will contribute to payment accuracy under the PFS for behavioral health services.

b. Coding

To further expand access to behavioral health services, we proposed payment for six new G codes: G0546 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a practitioner in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness, including a verbal and written report to the patient's treating/requesting practitioner; 5–10 minutes of medical consultative discussion and review*), G0547 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a practitioner in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness, including a verbal and written report to the patient's treating/requesting practitioner; 11–20 minutes of medical consultative discussion and review*), G0548 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a practitioner in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness, including a verbal and written report to the patient's treating/requesting practitioner; 21–30 minutes of medical consultative discussion and review*), G0549 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a practitioner in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness, including a verbal and written report to the patient's treating/requesting practitioner; 31 or more minutes of medical consultative discussion and review*), G0550 (*Interprofessional telephone/internet/electronic health record assessment and management service provided by a practitioner in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness, including a written report to the patient's treating/requesting practitioner, 5 minutes or more of medical consultative time*), and G0551 (*Interprofessional telephone/internet/electronic health record referral service(s) provided by a treating/requesting practitioner in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness, 30 minutes*). We welcomed comments on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters overwhelmingly supported interprofessional consultations provided by a practitioner in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness. We also received comments requesting that instead of creating new HCPCS coding, we establish an exception to the interprofessional consultation CPT codes. Commenters cited potential confusion for having separate codes for the same service.

Response: In the CY 2019 PFS final rule (83 FR 59491), we established a policy to limit billing of the CPT interprofessional consultation codes to the types of practitioners who can independently bill Medicare for E/M visits since the text of these codes specifies that the practitioners involved in the consultation be physicians or other qualified health care professionals. We continue to believe that the CPT interprofessional consultation codes are most appropriate for physicians or other qualified health care professionals, and HCPCS G0546–G0551 are most appropriate for practitioners in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness.

Comment: Commenters requested clarification on whether the treating/requesting practitioner and the consulting provider must be in the same organization to bill interprofessional consultation codes.

Response: No, the treating/requesting practitioner and the consulting provider do not have to be in the same organization to furnish interprofessional consultation services.

After consideration of public comments, we are finalizing HCPCS G0546–G0551 codes as proposed.

Additionally, since these codes describe services that are furnished by the treating/requesting practitioner and the consultant practitioner without the

involvement of the patient, we proposed to require the treating practitioner to obtain the patient's consent in advance of these services, which would be documented by the treating practitioner in the medical record, similar to the conditions of payment associated with the CPT interprofessional consultation codes and certain other non-face-to-face services paid under the PFS. Obtaining advance patient consent includes ensuring that the patient is aware that Medicare cost sharing applies to these services, including informing the patient that there may be cost sharing for two services (one for the treating/requesting practitioner's service and another for the consultant practitioner's service). We welcomed comments on this proposal.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported obtaining patient consent for these services, as they are usually furnished outside the presence of the patient. Some commenters requested that the requirement for consent not apply when the patient already has a relationship with the billing practitioner.

Response: We continue to believe that consent must be obtained for these services since they are furnished outside the presence of the patient. In addition, we continue to believe that it is important that patients are informed that they may be responsible for the cost sharing of two services.

After consideration of public comments, we are finalizing the consent requirements for HCPCS codes G0546–G0551 as proposed.

c. Valuation

We proposed to value the six proposed new G codes based on crosswalks to the six CPT codes for interprofessional consultations for practitioners who can independently bill Medicare for E/M visits (CPT codes 99451, 99452, 99446, 99447, 99448, 99449). We proposed a work RVU of 0.35 for G0546 based on a crosswalk to CPT code 99446, a work RVU of 0.70 for G0547 based on a crosswalk to CPT code 99447, a work RVU of 1.05 for G0548 based on a crosswalk to CPT code 99448), a work RVU of 1.40 for G0549 based on a crosswalk to CPT code 99449, a work RVU of 0.70 for G0550 based on a crosswalk to CPT code 99451, and a work RVU of 0.70 for G0551 based on a crosswalk to 99452. Since there are no direct PE inputs assigned to the six CPT codes describing interprofessional consultation services on which we are basing the proposed valuation for the new HCPCS codes G0546–G0551, we did not propose any direct PE inputs for these codes. We welcomed comments on this proposal.

Comment: Commenters were supportive of our proposed valuations for HCPCS codes G0546–G0551.

Response: We thank commenters for their support.

After consideration of public comments, we are finalizing HCPCS codes G0546–G0551 as proposed.

4. Comment Solicitation on Payment for Services Furnished in Additional Settings, Including Freestanding SUD Treatment Facilities, Crisis Stabilization Units, Urgent Care Centers, and Certified Community Behavioral Health Clinics (CCBHCs)

In the CY 2024 OPPS final rule (88 FR 81809 through 81858), we finalized payment for Intensive Outpatient Program (IOP) services furnished in hospital outpatient departments (HOPDs), Community Mental Health Centers (CMHCs), Federally Qualified Health Centers (FQHCs), and Rural Health Clinics (RHCs), and Opioid Treatment Programs (OTPs). We noted that Section 4124 of the Consolidated Appropriations Act (CAA), 2023, authorized payment for IOP services in HOPDs, CMHCs, FQHCs, RHCs, and that we additionally used existing statutory authority to propose and finalize payment for IOP services furnished in OTPs. CMS is monitoring utilization and uptake of IOP services in these settings. We have heard from other treatment settings that furnish IOP services that do not fall into the categories of HOPDs, CMHCs, FQHCs, RHCs, or OTPs, such as freestanding SUD facilities, that have an interest in billing Medicare for these services. In light of this, we sought comment on whether IOP services are furnished in other settings in order to determine whether potential coding and payment for IOP services under the PFS would facilitate these services being billed in additional settings.

In particular, we were interested in feedback on the following questions, as well as any other relevant feedback:

- To what extent do freestanding SUD facilities or other entities that furnish IOP services employ practitioner types who can supervise auxiliary personnel and bill Medicare for their services? For example, do they typically employ physicians, clinical psychologists, nurse practitioners, clinical nurse specialists, certified nurse midwives and physician assistants who are eligible to provide general supervision to auxiliary personnel who furnish behavioral health services?
- Would bundled payments under the PFS similar to those finalized in the CY 2024 OPPS final rule (88 FR 81809–81858) better facilitate billing for IOP services in a broader range of settings?
- If CMS outlined how freestanding SUD facilities could bill Medicare under the PFS, would there be an impact in underserved areas?
- To what extent do freestanding SUD facilities see patients with Medicare or who are dually eligible for Medicare and Medicaid?

We received public comments on these questions. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated they believe that freestanding SUD facilities and other entities that furnish IOP services serve an important function in their communities and thus should have a sustainable payment structure because of their vital role in treatment engagement. Several commenters urged CMS to enable payment for freestanding facilities that furnish IOP services, as well as for other levels of care along the continuum of SUD treatment and recovery (including Level 0.5 early intervention and screening, Level 1 outpatient treatment, Level 2.5 high-intensity outpatient treatment (previously partial hospitalization (PHP)), and Level 2.7 medically managed intensive outpatient treatment) to facilitate greater access to and continuity of SUD care. Absent statutory changes, the commenters encouraged CMS to adopt an ''incident to'' billing model for freestanding SUD treatment facilities for all of these levels of care, so long as (1) the reimbursement rate is no lower than the hospital outpatient department rate, (2) an add-on code is developed to appropriately compensate the billing practitioner—especially if they are external to the facility—in a way that does not dilute the rate for the freestanding SUD treatment facility; and (3) the billing practitioner is able to perform their duties via telemedicine so as not to delay or deter access to care where appropriate. One commenter from a provider of SUD services noted that according to their internal data, they had to turn away approximately 3,000 Medicare beneficiaries who called seeking services because they are not an approved setting for Medicare services and urged CMS to expand the Medicare provider type definition to include non-hospital based state licensed freestanding or standalone SUD treatment centers to ensure that participation under Medicare does not

exclude high-quality facilities that are not classified as an OTP, HOPD, CMHS, FQHC, or RHC. One commenter stated that CMS should only expand IOP services to other types of entities if they follow the same rules that apply for the approved entities now in place, including regulatory requirements from State licensing and accreditation bodies that create a layer of accountability. This commenter supported having a physician (or equivalent) guiding and directing all admissions, treatment planning, and discharges for IOP regardless of the type of organization providing the services. AABH also strongly advocates for the use of a multi-disciplinary team to provide the level of care that should be provided and billed as an IOP.

Response: We thank the commenters for the detailed comments received on these topics and note that we may consider this input for potential policy proposals through future rulemaking.

Comment: Some commenters noted that CCBHCs are able to provide services that typically comprise an IOP program, noting that based on the community needs assessment, this may look different across the country as CCBHCs can respond with the level of intensity of care that is responsive and personalized to an individual's need in the community, and ultimately the care provided could rise to a level of care similar to what an IOP program might consist of at a community mental health center (CMHC). However, the commenter urged CMS' caution in pursuing this benefit at CCBHCs, stating that CMHCs appear to face challenges in providing the IOP benefit under Medicare because the Medicare CMHC Conditions of Participation (CoPs) pose challenges and significant administrative burden for provider organizations.

Response: We thank the commenters for the detailed comments received on these topics and note that we may consider this input for potential policy proposals through future rulemaking.

Additionally, we sought comment on entities that offer community-based crisis stabilization, including 24/7 receiving and short-term stabilization centers, that provide immediate access to voluntary and/or involuntary care, without the need for a referral. Regarding such crisis stabilization units, we were interested in feedback on the following questions, as well as any other relevant feedback:

- What kind of services do crisis stabilization units provide? Do crisis stabilization units provide services similar to those described by the psychotherapy for crisis codes (CPT codes 90839 and 90840)?
- Does the definition of crisis stabilization unit vary by State? If so, what are the variations and similarities across States?
- If CMS outlined how crisis stabilization units could bill Medicare under the PFS, would there be an impact in underserved areas?
- To what extent do crisis stabilization units see patients with Medicare or who are dually eligible for Medicare and Medicaid?
- To what extent do crisis stabilization units employ practitioner types who can supervise auxiliary personnel and bill Medicare for their services. For example, do crisis stabilization units typically employ physicians, clinical psychologists, nurse practitioners, clinical nurse specialists, certified nurse midwives and physician assistants who are eligible to provide general to auxiliary personnel who furnish behavioral health services?

We received public comments on these questions. The following is a summary of the comments we received and our responses.

Comment: Commenters stated that innovative approaches such as crisis stabilization units have helped communities improve coordination of emergency psychiatric care, and they can serve as models for other communities to implement and build upon to help alleviate the overall load on the mental health care system and emergency psychiatric boarding. Another commenter stated that payment for mental health and SUD services in these settings would greatly expand access to care in the midst of the ongoing overdose epidemic and mental health crisis, which has been exacerbated by workforce shortages. This commenter noted that especially with the increased access to crisis services through the 988 crisis line and the new mobile crisis psychotherapy code, expanding access to crisis receiving and crisis stabilization services at these settings would ensure that Medicare beneficiaries have access to the full continuum of crisis services and supports they need. One commenter stated that the definition of crisis stabilization, as well as ''sobering care,'' can vary from state to state, and noted that variations can include: acceptance of involuntary admissions, referring parties (law enforcement, EMS, walk-in, etc.), length of stay, environment, staffing levels and qualifications, etc.

Response: We thank the commenters for the detailed comments received on these topics and note that we may consider this input for potential policy proposals through future rulemaking.

Additionally, as a separate example, we have received information from interested parties that there is a similar concern regarding urgent care centers more broadly. These interested parties note that hospital emergency departments are often used by beneficiaries to address non-emergent urgent care needs that could be appropriately served in less acute settings, but where other settings, such as physician offices, urgent care centers or other clinics, are not available or readily accessible. Patients enter EDs to treat common conditions like allergic reactions, lacerations, sprains and fractures, common respiratory illnesses (for example, flu or RSV), and bacterial infections (for example, strep throat, urinary tract infections or foodborne illness). Conditions like these often can be treated in less acute settings. We are interested in system capacity and workforce issues broadly and are interested in hearing more on those issues, including how entities such as urgent care centers can play a role in addressing some of the capacity issues in emergency departments. In particular, we were interested in feedback on the following questions, as well as any other relevant feedback:

- What types of services would alternative settings to EDs need to offer to meet beneficiaries' non-emergent, urgent care needs?
- Does the current ''Urgent Care Facility'' Place of Service code (POS 20) adequately identify and define the scope of services furnished in such settings? Is this place of service code sufficiently distinct from others such as ''Walk-in Retail Health Clinic (POS 17) and ''Office'' (POS 11)? If not, how might these Place of Service code definitions be modified?
- Does the existing code set accurately describe and value services personally performed by professionals and costs incurred by the facility in these settings?
- How might potential strategies to reduce overcrowding and wait times in EDs advance equity in access to health care services?

We received public comments on these questions. The following is a summary of the comments we received and our responses.

Comment: One commenter suggested that CMS create a payment structure in which urgent care centers are differentially compensated. In response to our question about the existing place of service codes, they stated that the current place of service (POS) definitions are inadequately

differentiated, especially if CMS wishes to encourage proliferation of the type of urgent care centers that can provide suitable alternatives to EDs, noting that POS 11 generally refers to physician offices that provide diagnostic and therapeutic care in an office setting, by appointment, typically during regular business hours; POS 17 generally refers to clinics that are attached to retail operations, such as pharmacies, grocery stores or big box stores, and provide low-acuity primary and preventive health care, such as vaccinations; and POS 20 refers to UCCs but does not adequately differentiate between those that offer services more akin to the typical general practitioner's office and those that offer enhanced diagnostic and therapeutic services and extended hours. They suggested that the creation of a new POS code describing ''enhanced'' urgent care centers that offer specific diagnostic and therapeutic services and that operate outside typical business hours could fill this need. In response to our question about the existing code set and valuation, they stated that Medicare's fee-for-service payment systems do not recognize and adequately value services furnished in UCCs and stated that while there is some overlap in the types of professional services furnished in UCCs and physician offices, UCCs that operate for extended hours and that have enhanced diagnostic and therapeutic capabilities incur additional costs to provide these services.

One commenter stated they appreciate the important role that non-emergency facilities, such as urgent care centers, can play treating patients, but emphasized that it is essential to preserve the fundamental right for patients to seek emergency care when they think they are experiencing a medical emergency. They encouraged CMS to consider how best to educate beneficiaries about when they should seek emergency treatment, their right to do so, and when another setting such as an urgent care center may be appropriate to address their health care needs. The commenter stated they believe that physician-led care teams offer the highest quality of care, and every urgent care should seek to have an emergency physician on staff and that in the setting of physician-led teams, urgent care should be capable of caring for the full range of non-life-threatening conditions. Another commenter noted that many urgent care centers and retail clinics do not accept public insurance (*i.e.,* Medicare, Medicaid, CHIP, Tricare) due to low reimbursement rates, stating that this disproportionately impacts the ability for underserved patient populations to access non-ED services for acute, unscheduled care. The commenter stated that improving Medicare and Medicaid reimbursement for urgent care services would advance equity and access for acute care amongst this patient population.

Response: We thank the commenters for the detailed comments received on these topics and note that we may consider this input for potential policy proposals through future rulemaking.

Lastly, we sought comment regarding Certified Community Behavioral Health Clinics (CCBHCs). Specifically, we were interested in feedback on the following questions:

- What kind of services do CCBHCs provide? Do they provide IOP services, services for the treatment of substance use disorders, psychotherapy, behavioral health integration, community health integration, or principal illness navigation services to patients with either Medicare or another payer?
- If CMS outlined how CCBHCs could bill Medicare under the PFS, would there be an impact in underserved areas?
- To what extent do CCBHCs see patients with Medicare or who are dually eligible for Medicare and Medicaid?
- To what extent do CCBHCs employ practitioner types who can supervise auxiliary personnel and bill Medicare for their services? For example, do CCBHCs employ physicians, clinical psychologists, nurse practitioners, clinical nurse specialists, certified nurse midwives and physician assistants who are eligible to provide general supervision to auxiliary personnel who furnish behavioral health services?

We received public comments on these questions. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that they understand that CCBHCs can bill Medicare if they are registered as a different provider type such as an Office or CMHC but noted that Medicare does not cover all required CCBHC services. They also noted that CCBHCs are already certified per federal and state Medicaid criteria and to the extent Medicare were to allow CCBHCs as a Medicare provider, they encouraged alignment of any potential future Medicare CCBHC conditions of payment with existing Medicaid and state certification requirements.

A joint comment letter submitted by several specialty societies and interested parties also described the history of CCBHCs, noting that most recently, the Consolidated Appropriations Act, 2024 (CAA 2024) provided a definition for CCBHCs in Medicaid statute, permanently establishing CCBHCs as an optional Medicaid benefit. They stated that CCBHCs can be implemented and funded through the Section 223 Medicaid Demonstration, CCBHC Expansion Grants administered by SAMHSA, or through independent state programs and noted that states participating in the Demonstration select one of four Medicaid Prospective Payment System (PPS) rate methodologies to establish payment rates for CCBHCs based on the expected cost of delivering care.[171] They stated there are currently nearly 500 CCBHCs across 46 states and territories (offering services in 40 percent of all U.S. counties, covering 62 percent of the nation's population), serving an estimated 3 million people nationwide.[172] A regularly updated list of CCBHCs across the country can be found on National Council for Mental Wellbeing's website.[173]

Response: We thank the commenters for the detailed comments received on these topics and note that we may consider this input for potential policy proposals through future rulemaking.

J. Provisions on Medicare Parts A and B Payment for Dental Services Inextricably Linked to Other Covered Services

1. Medicare Payment for Dental Services

a. Overview

Section 1862(a)(12) of the Act generally precludes payment under Medicare Parts A or B for any expenses incurred for services in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth. (Collectively here, we will refer to ''the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth'' as ''dental services.'') That section of the statute also includes an exception to allow payment to be made for inpatient hospital services in connection with the provision of such dental services if the individual, because of their underlying medical condition and clinical status or because of the severity of the dental procedure, requires hospitalization in connection with the provision of such services. Our regulation at § 411.15(i)

similarly excludes payment for dental services except for inpatient hospital services in connection with dental services when hospitalization is required because of: (1) the individual's underlying medical condition and clinical status; or (2) the severity of the dental procedure.

Fee for service (FFS) Medicare Parts A and B also make payment for certain dental services in circumstances where the services are not considered to be in connection with dental services within the meaning of section 1862(a)(12) of the Act. In the CY 2023 PFS final rule (87 FR 69663 through 69688), we clarified and codified at § 411.15(i)(3) that Medicare payment under Parts A and B could be made when dental services are furnished in either the inpatient or outpatient setting when the dental services are inextricably linked to, and substantially related and integral to the clinical success of, other covered services. We also added several examples of clinical scenarios that are considered to meet that standard under § 411.15(i)(3) and amended that regulation to add more examples in the CY 2024 PFS final rule (88 FR 79022 through 79029).

In the CY 2023 PFS final rule, we also established a process whereby we accept and consider submissions from the public (the ''public submission process'') to assist us to identify additional dental services that are inextricably linked to, and substantially related and integral to the clinical success of, other covered services (87 FR 69663 through 69688). Hereafter in this section we will refer to these services as dental services that are ''inextricably linked to other covered services.''

We also note that the examples provided in our regulation at § 411.15(i)(3)(i) are not exclusive. Medicare administrative contractors (MACs) retain discretion to determine on a claim-by-claim basis whether a patient's circumstances do or do not fit within the terms of the preclusion or exceptions specified in section 1862(a)(12) of the Act and § 411.15(i).

In the CY 2024 PFS final rule, we discussed our plans to issue educational and outreach materials to inform billing and payment for finalized policies for dental services. We reiterated our commitment to review submissions we receive through the public submissions process. We also expressed our intention to continue to engage in discussions with the public on a wide spectrum of issues relating to Medicare payment for dental services that may be inextricably linked to other covered services. We also described our partnership with the Agency for Healthcare Research and Quality (AHRQ) to assist us to review available clinical evidence and consider the relationship between dental services and specific covered medical services and to identify other potential clinical circumstances in which dental services are inextricably linked to other covered services (88 FR 79029).

In the CY 2025 PFS proposed rule (89 FR 61747 through 61765), we: (1) described recent rapid response reports conducted by our partner agency, AHRQ, on the potential connection between sickle cell disease and hemophilia and dental services; (2) summarized submissions we received through the public submission process that we considered for CY 2025 rulemaking; (3) proposed to amend section § 411.15(i)(3)(i) to permit payment for certain dental services that are inextricably linked to other covered services (certain dental services for patients receiving dialysis services to treat end-stage renal disease (ESRD)); (4) requested public comment and information related to other clinical scenarios that may involve dental services that are inextricably linked to other covered services; and (5) are included proposals related to Medicare billing and payment policy for dental services. We also included a request for information regarding oral sleep apnea appliances.

b. Consideration of Dental Services That May Be Inextricably Linked to Other Covered Services

We received several nominations through our public submission process and have partnered with AHRQ to help us consider the evidence supporting the relationship between dental services and other specific covered services. Specifically, AHRQ reviews available clinical evidence regarding this relationship and provides analysis of clinical scenarios where dental services may be inextricably linked to other covered services. To better address the public's immediate dental needs, AHRQ conducted rapid response reports instead of systematic reviews. With these rapid response reports, we can better specify which payments can be made under Medicare Parts A and B for specific dental services that are inextricably linked to other covered services.

Through the public submissions process for consideration in CY 2024 rulemaking, interested parties nominated dental services for individuals living with sickle cell disease (SCD) or hemophilia, urging us to consider adding payment for these services. Acknowledging the importance of dental health to overall well-being of patients with these two types of diseases, in the CY 2024 proposed rule, we summarized information provided by submitters utilizing the public submission process and solicited comment on whether certain dental services are inextricably linked to covered services in the treatment of SCD (88 FR 52374).

In the CY 2024 PFS final rule, we discuss the comments received from commenters suggesting to expand dental service coverage for individuals with SCD. We concluded that the information provided by commenters did not sufficiently demonstrate that dental services are essential to the clinical success of treatments for SCD, including hydroxyurea therapy. Therefore, we did not expand the examples under § 411.15(i)(3)(i) to include additional covered medical services for SCD. Please refer to the CY 2024 PFS final rule (88 FR 79031 through 79032) for more detailed information.

In the CY 2024 PFS proposed rule, we similarly solicited comments on hemophilia regarding whether certain dental services are considered so integral to the primary covered services that the necessary dental interventions are inextricably linked to, and substantially related and integral to clinical success of, the primary covered services for individuals with hemophilia (88 FR 52382). In the CY 2024 PFS final rule, we discuss the comments received from commenters advocating Medicare Part A and Part B payment for dental services for individuals with hemophilia, citing guidelines from Hemophilia Treatment Centers (HTCs), the Centers for Disease Control and Prevention (CDC), and the World Federation of Hemophilia (WFH). While we acknowledged the importance of maintaining oral health to prevent complications such as serious gum bleeding, especially problematic for those with hemophilia, we also reiterated that for the purposes of the PFS payment policy for dental services inextricably linked to covered medical services, our statute and regulations require that specific evidence supports the integral connection between dental services and clinical success in managing hemophilia-related medical services, and, therefore, we did not expand the examples under § 411.15(i)(3)(i) to include additional covered medical services for hemophilia. Please refer to the CY 2024 PFS final rule (88 FR 79032 through 79033) for more detailed information.

In the CY 2025 PFS proposed rule, we noted that while interested parties have suggested the interaction of oral health

care for SCD or hemophilia, further research was necessary to find specific evidence supporting specific medical services for which dental services are inextricably linked to their clinical success. We explained, to gain further understanding of any potential relationship between dental services and specific covered SCD or hemophilia medical services, we again partnered with researchers at AHRQ to review available clinical evidence regarding the relationship between dental services and covered SCD or hemophilia medical services. As a result, AHRQ created two rapid response reports, which summarized recent evidence, aiming to inform CMS policy development related to the possible linkage between dental services and treatment modalities and services for SCD or hemophilia patients (89 FR 61748). For more detailed information about the search strategies and findings, please refer to the two AHRQ rapid response reports available at *https://effectivehealthcare.ahrq.gov/products/sickle-cell-dental/research* and *https://effectivehealthcare.ahrq.gov/products/hemophilia-dental/research*.

In the CY 2025 PFS proposed rule, we gave a detailed discussion and summary of these two rapid response reports provided by AHRQ. We explained that after reviewing AHRQ's rapid response reports both SCD and hemophilia, we found the evidence related to the linkage between dental services and outcomes for covered medical services for both SCD and hemophilia lacking in the current research and literature. Both rapid responses noted a limited number of studies examining the impact of dental care on outcomes for individuals with SCD or hemophilia. Currently, the evidence base does not appear to support that dental services may be inextricably linked to covered services for SCD or hemophilia. Also, the body of evidence evaluating dental services before, during, or after the treatment of SCD and hemophilia lacks primary clinical data and relies on available guidelines and reviews. We stated, however, that the limited information in both the SCD and hemophilia rapid responses did support the need for preventive care and patient education as essential practices for both SCD and hemophilia patients to minimize the likelihood of oral infections, periodontal disease, and major dental procedures. In addition, both rapid response reports recommend collaborative efforts between dentists, hematologists, and specialized clinics as crucial for improved patient care, despite the lack of primary evidence informing the potential effect of dental care on treatment. While both rapid response reports discuss their findings on the importance of a multidisciplinary approach, both rapid response reports also found that the current reviews and guidelines do not address dental care as a standard of care that is inextricably linked to hemophilia or SCD treatment. Instead, their focus was on managing the respective conditions during dental services, not on the inextricable linkage between dental and medical services. Please refer to the CY 2025 PFS proposed rule (89 FR 61748 through 61749) for a more detailed discussion of the two rapid response reports provided by AHRQ for both SCD and hemophilia.

In the CY 2025 PFS proposed rule, we stated that interested parties had asked us to consider the conditions of SCD and hemophilia for the purposes of the Medicare Parts A and B payment policy for dental services that are inextricably linked to other covered services. We then explored the inextricable link between dental and covered services associated with SCD and hemophilia by partnering with AHRQ to generate rapid responses on these topics. However, we did not find the evidence base to support that dental services may be inextricably linked to services for SCD or hemophilia within the meaning of the standard at § 411.15(i)(3). We stated that given the new and evolving therapies and treatments in this space, we will consider conducting additional evaluations as new studies are carried out to examine the impact of dental services on SCD and hemophilia outcomes and will take any future studies into consideration. We noted that we continue to seek clinical evidence demonstrating the integral connection between dental services and other covered services for SCD and hemophilia, and we welcomed any comments or literature regarding these two conditions. We explained that we did not propose to amend § 411.15(i)(3)(i) since we have not identified additional dental services that are inextricably linked to certain services associated with SCD or hemophilia. We stated that we remain open to considering any such services identified by public commenters, and, if sufficient evidence is presented, we may consider adding such services to our regulations in the final rule. In addition, we encouraged interested parties to supply additional submissions for consideration in future PFS rulemaking through the public submission process, which may include relevant medical evidence, peer-reviewed literature, clinical guidelines, or supporting documentation as described in section II.J.1.c. of this final rule (89 FR 61750).

We received 9 public comments on our consideration of dental services that may be inextricably linked to covered services for the treatment of SCD and hemophilia. Commenters included patient advocacy organizations, hospital associations, medical and dental associations representing several different specialties and specialty societies, and dental plan associations. The following is a summary of the comments we received and our responses.

Comment: A few commenters provided information on beneficiaries with SCD. The commenters explained that these individuals represent a particularly vulnerable group since it is an inherited blood disorder primarily affecting individuals of African descent. The commenters stated that beneficiaries with SCD have significant healthcare needs due to the complex nature of their condition. For example, these individuals may experience chronic complications such as pain crises, organ damage, and an increased risk of infections, as well as have comorbidity conditions such as chronic kidney disease, heart failure, and depression, which further complicates their care. The commenters also indicated that these individuals are at risk for oral health complications, including infections that could trigger a sickle cell crisis. The commenters explained that beneficiaries with SCD often experience higher rates of emergency department visits and hospitalizations. This commenter also stated that approximately half of individuals with SCD are enrolled in Medicaid, while 11 percent are enrolled in Medicare, often as dually eligible beneficiaries and that research indicates that SCD patients who are enrolled in both Medicare and Medicaid experience worse survival outcomes compared to those with single coverage.

A few commenters provided information on beneficiaries who have hemophilia. The commenters explained that these individuals also represent a particularly vulnerable group since advancements in medical care have extended their life expectancy and now living longer, they often face multiple comorbidities such as hepatitis C, human immunodeficiency virus, hypertension, and diabetes, which can further complicate their overall health management. The commenters explained that the need for dental management is heightened due to the increased risk of bleeding during and after dental procedures, especially in those with severe hemophilia. One

commenter stated that individuals living with bleeding disorders such as hemophilia are often hesitant to perform normal oral hygiene practices due to the fear of a bleed, which can make these individuals more susceptible to oral diseases and conditions, such as gingivitis, dental caries, and periodontal disease. This commenter also stated that if an individual with a bleeding disorder does require an oral procedure or surgery, it is typical that a large amount of clotting factor would be needed to control the bleeding during such a procedure or surgery. Other commenters stated that while hemophilia is rare, managing severe hemophilia A presents a significant economic burden, with annual treatment costs ranging from approximately $600,000 to over $900,000, depending on the type of prophylactic therapy used.

Some commenters referenced CMS' partnership with AHRQ to conduct response reports on both SCD and hemophilia. One commenter expressed their appreciation for this arrangement but conveyed that they disagreed with CMS' assessment that there is a lack of literature to support coverage of dental services for these conditions. The commenter specifically pointed to the Kawar study from AHRQ's report on SCD which clearly states that ''standard of care for dental management of sickle cell disease patients'' includes ''prevention and early intervention . . . routine dental visits . . . collaboration between healthcare team (including hematologist) and dentist is important''.[174] A different commenter agreed with CMS's assessment that the cited sources in AHRQ's report do not demonstrate that dental services are inextricably linked to covered medical services for SCD and that, based on the available evidence, dental services are not inextricably linked to covered medical services for hemophilia. Another commenter acknowledged that while dental care is essential for managing complications associated with hemophilia, current evidence may not be sufficient to support expanding Medicare coverage beyond the existing provisions since the focus remains on preventing bleeding complications rather than enhancing hemophilia treatment outcomes through dental interventions.

Commenters stated that they recognize that CMS is only able to pay for dental services when the services are inextricably linked to an already covered Medicare service and that, to date, there is not enough evidence to support the need to pay for dental services that are inextricably linked to services for SCD or hemophilia. The commenters then concluded that the broader impact of expanded dental benefits remains an area for further research which they believe reflects the complex relationship between dental health and overall care, suggesting that more exploration is needed without endorsing specific policy changes.

Many commenters supported CMS's commitment to continue seeking clinical evidence regarding circumstances in which dental services are inextricably linked to treatments for SCD and hemophilia. One commenter explained that there are significant racial disparities in the incidence and severity of these health conditions that coverage of dental services would improve. Another commenter appreciated CMS' ongoing commitment to allowing stakeholders to continue presenting evidence that they believe can support policy coverage changes for these critical conditions. However, one commenter thanked CMS for thoroughly reviewing their request to consider coverage for dental services linked to Medicare services for the treatment of SCD. This commenter explained that while they understand that CMS did not believe that the data and other evidence submitted met the threshold, in their members' experience caring for individuals living with SCD, they find that dental health is indeed inextricably linked to their overall health and treatment.

Lastly, we received several recommendations from commenters. Several commenters requested that CMS continue to partner with researchers to monitor the literature related to dental services to obtain additional evidence that may support payment for dental and oral health treatments and ancillary services that improve the affordability, access, and treatments for sickle cell and hemophilia. Another commenter suggested that CMS actively collaborate with organized dentistry and medicine in their scientific review process that goes into coverage determinations.

Response: We thank commenters for their feedback. The information commenters provided did not support a finding that dental services are inextricably linked to a covered medical service for SCD or that the standard of SCD care would be compromised without dental services or that the standard of SCD care would require dental services to be performed in conjunction with treatments for SCD. We also found the same with regard to the information commenters provided for hemophilia.

As we stated in the CY 2024 PFS final rule, in order for us to find that dental services are inextricably linked to, and substantially related and integral to the clinical success of treatments for SCD or hemophilia, we would need clinical evidence to demonstrate that the standard of care would be not to proceed with the other covered services without providing the dental services in conjunction with the treatment for SCD or hemophilia (88 FR 79032 through 79033). As discussed below in section II.J.1.c. of this final rule, to consider whether certain dental services are inextricably linked to the clinical success of other covered services, we need to identify specific covered medical services for which there is medical evidence that certain dental services are so integral to their clinical success that they are inextricably linked to the covered service. Based on the information provided, we have not been able to identify such a specific covered medical service for SCD or hemophilia, and thus we are unable to evaluate whether any medical evidence would support an inextricable linkage to certain dental services.

We thank the commenters for their perspectives and we agree that maintaining good oral health and preventing dental problems is highly important in the prevention of oral diseases that can lead to serious complications for beneficiaries with SCD or hemophilia. However, the information generally provided by commenters did not establish an inextricable link between dental services and a covered medical service. Because the Medicare statute generally prohibits payment for dental services, payment may be made in limited situations such as when the dental services are inextricably linked to, and substantially related and integral to the clinical success of certain other covered services as provided by our regulations at § 411.15(i)(3)(i), or under the exceptions provided by section 1862(a)(12) of the Act and codified at § 411.15(i)(2).

After consideration of public comments, we are not expanding the examples of clinical scenarios under § 411.15(i)(3)(i) to include additional covered medical services for SCD or hemophilia. We remain committed to exploring whether there is an inextricable link between dental services and other covered services associated with SCD and hemophilia.

We plan to continue reviewing the clinical evidence on this topic and

[174] Kawar N., Alrayyes S., Yang B., Aljewari H. Oral health management considerations for patients with sickle cell disease. Dis. Mon. 2018;64(6):296–301. (In eng). DOI: 10.1016/j.disamonth.2017.12.005.

welcome continued engagement from the public.

c. Submissions Received Through Public Submission Process

As we have in the CY 2023 and CY 2024 PFS final rules, we continue to encourage interested parties to engage with us regularly and to submit recommendations through our public submissions process for our consideration of additional clinical scenarios where dental services may be inextricably linked to covered services under § 411.15(i)(3)(i). Through our annual public submissions process, interested parties should provide clinical evidence and other documentation to support their recommendations (87 FR 69685). We are using the PFS annual rulemaking process to discuss public submissions and to consider whether the clinical scenario described in the submissions should be added to § 411.15(i)(3)(i) as an example of a circumstance where payment can be made for dental services inextricably linked to other covered services. Using our annual notice and comment rulemaking process to discuss submitted recommendations allows the public to comment and submit further medical evidence and important feedback to assist us in evaluating whether certain dental services furnished in certain clinical scenarios would meet the standard to permit Medicare payment for the dental services.

Through this process, we review clinical evidence included in submissions and public comments in rulemaking, as well as information and analysis provided by AHRQ in rapid response reports, to assess whether there is an inextricable link between certain dental services and certain covered services. We would find that there is an inextricable link where the standard of care for a service is such that the practitioner would not proceed with the procedure or service without performing the dental service(s), for example, because the covered services would or could be significantly and materially compromised absent the provision of the inextricably-linked dental services, or where dental services are a clinical prerequisite to proceeding with the primary medical procedure and/or treatment. As such, documentation accompanying recommendations should include medical evidence to support that certain dental services are inextricably linked to certain covered services. Specifically, as we specified in the CY 2023 PFS final rule, we request that the medical evidence included in submissions through the public submissions process should:

(1) Provide support that the provision of certain dental services leads to improved healing, improved quality of surgery outcomes, and the reduced likelihood of readmission and/or surgical revisions because an infection has interfered with the integration of the medical implant and/or interfered with the medical implant to the skeletal structure;

(2) Be clinically meaningful and demonstrate that the dental services result in a material difference in terms of the clinical outcomes and success of the procedure such that the dental services are inextricably linked to other covered services; and,

(3) Be compelling to support that certain dental services would result in clinically significant improvements in quality and safety outcomes (for example, fewer revisions, fewer readmissions, more rapid healing, quicker discharge, and quicker rehabilitation for the patient) (87 FR 69686).

This evidence should include at least one of the following:

(1) Relevant peer-reviewed medical literature and research/studies regarding the medical scenarios requiring medically necessary dental care;

(2) Evidence of clinical guidelines or generally accepted standards of care for the suggested clinical scenario;

(3) Other ancillary services that may be integral to the covered services; and/or

(4) Other supporting documentation to justify the inclusion of the proposed medical clinical scenario requiring dental services (87 FR 69686).

Submissions should focus on the inextricably linked relationship between dental services and other services necessary to diagnose and treat the individual's underlying medical condition and clinical status, and whether it would not be clinically advisable to move forward with the other covered services without performing certain dental services. To be considered for purposes of CY 2026 PFS rulemaking, submissions through our public submissions process should be received by February 10, 2025, via email at *MedicarePhysicianFeeSchedule@cms.hhs.gov*. To facilitate processing, interested parties should include the words ''dental recommendations for CY 2026 review'' in the subject line of their email submission. We continue to stress to submitters that recommendations must include at least one of the types of evidence listed earlier. We further note that we may also consider recommendations that are submitted as public comments during the comment period following the annual publication of the PFS proposed rule.

In the CY 2025 PFS proposed rule, we discussed the 13 public submissions received from various organizations and individuals on or before February 10, 2024, with recommendations for additional clinical scenarios for which they believe Medicare payment for dental services would be consistent with the policies we codified at § 411.15(i)(3)(i). The clinical scenarios discussed include hematologic disorders, blood cancers, chronic graft versus host disease, post-treatment for head and neck cancer, autoimmune diseases, renal diseases, and diabetes Several submitters represented dozens or hundreds of other organizations in making these recommendations. We noted one submission was received after the deadline that presented nominations for clinical scenarios addressed by other submitters and a proposal outside the scope of clinical scenarios where dental services may be inextricably linked to covered medical services under § 411.15(i)(3)(i). Please refer to the CY 2025 PFS proposed rule (89 FR 61751 through 61752) for a more detailed discussion of the public submissions received for CY 2025 rulemaking consideration.

2. Additions to Current Policies Permitting Payment for Dental Services Inextricably Linked to Other Covered Services

In the CY 2025 PFS proposed rule, we explained that we have received information and requests from interested parties, including entities submitting information through the public submissions process as well as organizations providing comments in response to prior rulemaking efforts, that an inextricable linkage exists between dental services and dialysis treatment services for individuals diagnosed with end-stage renal disease (ESRD) who are receiving dialysis services, particularly those experiencing comorbidities. Commenters and submitters have stated that dental treatment is inextricably linked and integral, and substantially related to the clinical success and outcomes of covered dialysis medical services (89 FR 61752).

In the CY 2024 PFS final rule, we stated that commenters had provided comments in response to the CY 2024 PFS proposed rule supporting the coverage of annual dental examinations, and treatment as clinically indicated, for individuals with chronic kidney disease and ESRD. The commenters stated that

chronic immunosuppression increases the risk of dental infections leading to potentially deadly complications including BSI, peritoneal dialysis-associated peritonitis, and the exacerbation of chronic cardiovascular conditions. They also stated that when established by patient-specific medical and dental parameters, dental services can be unquestionably integral to the outcome of covered medical procedures. We thanked the commenters for the information they submitted regarding these suggestions; however, at that time, commenters did not provide sufficient evidence to support an inextricable link between certain dental services and certain covered services for chronic kidney disease and ESRD (88 FR 79034).

Subsequent to the issuance of the CY 2024 PFS final rule and as we discuss in section II.J.1.c. of this final rule, we received recommendations through the public submissions process for our consideration in CY 2025 rulemaking. That is, the submitters stated that there is a connection between dental services to identify and address dental or oral infections and covered medical services for individuals receiving dialysis in the treatment of ESRD. In the CY 2025 PFS proposed rule (89 FR 61752 through 61756), as well as in the following paragraphs of this final rule, we discuss the research and recommendations provided by the public through the submission process and our analyses of the studies and research available regarding the connection between dental services and the clinical success of dialysis services for individuals with ESRD.

ESRD is a medical condition in which a patient's kidneys successively experience loss of functionality on a permanent basis, leading to the need for a regular course of long-term dialysis or a kidney transplant to maintain life.[175]

Chronic kidney disease (CKD) is a progressively debilitating disease and is marked by the presence of kidney damage or reduction in the kidneys' filtration rate. CKD is a state of progressive loss of kidney function, in that the disease worsens over time and cannot be reversed, ultimately resulting in the need for renal replacement therapy, generally dialysis or transplantation.[176] The Kidney Disease Improving Global Outcomes (KDIGO) Organization established guidelines that define five stages of CKD using kidney damage markers, including factors that determine proteinuria (level of protein in the urine) and glomerular filtration rate (level of kidney function/filtration) in its KDIGO 2012 Clinical Practice Guideline for the Evaluation and Management of Chronic Kidney Disease.[177] Chronic kidney disease is generally defined as the presence of two factors (glomerular filtration rate [GFR] less than 60 mL/min and albumin greater than 30 mg per gram of creatinine) along with abnormalities of kidney structure or function for greater than three months. Stage 5 of CKD is labeled end-stage renal disease (ESRD) with a GFR of less than 15 mL/min.[178] According to the National Institutes of Health (NIH), more than 500,000 people in the United States live with ESRD.[179]

Per the American Academy of Family Physicians, individuals with ESRD are typically referred to nephrologists for the development of treatment plans. Collectively the various modalities utilized to replicate kidney function are referred to as renal replacement therapy (RRT). Most ESRD patients are treated with dialysis, regardless of whether transplantation ultimately occurs. Generally, kidney transplantation typically yields the best patient outcomes; however, not all patients with ESRD are eligible for or able to undergo transplantation, and some therefore continue dialysis treatment.[180] Standards of medical care for CKD outline the need for monitoring for signs of progression of the disease and early referral to specialists for RRT.[181] Dialysis is generally supplied via two primary modes: hemodialysis or peritoneal dialysis. In hemodialysis, blood is filtered through a dialyzer, outside of the body. A dialyzer is sometimes referred to as an ''artificial kidney.'' [182] To access the circulatory system, several access points may be placed and utilized, including an arteriovenous (AV) fistula, AV graft, and in some cases a central venous catheter.[183] [184] [185] In peritoneal dialysis, a fixed catheter is placed in the abdomen, and dialysis solution is administered into the abdomen. The solution absorbs wastes and excess fluid from the patient's body.[186] [187]

Submissions we received through the public submissions process for consideration in CY 2025 rulemaking provided information regarding the potential linkage between dental services and specific covered medical services associated with ESRD and dialysis including:

- CPT codes 36901–36906: Dialysis circuit procedures;
- CPT codes 90935, 90937, 90940: Hemodialysis procedures;
- CPT code 90961: Physician or other qualified healthcare professional visits for ESRD;
- CPT codes 90989–90999: Other dialysis procedures; and,
- DRG code 872: Hospitalization for septicemia or severe sepsis.

We noted that Medicare provides coverage for individuals with ESRD, regardless of age, when certain requirements are met.[188]

We also noted that dialysis procedures may be utilized for individuals who do not have ESRD in the treatment of acute intoxication or poisoning. For example, in the case of a patient experiencing poisoning, dialysis hemoperfusion may be employed, which passes the blood through a column packed with granules that include a resin that act as absorbents. In this procedure, physicochemical properties of an absorbent are used to remove toxins. Conversely, in hemodialysis utilized in the treatment of ESRD, there is a concentration gradient between the blood and the solvent across the dialysis membrane.[189] We noted that the patient accessing dialysis treatment for the treatment of acute intoxication or poisoning would not present with the same diagnostic profile, treatment needs, nor face the same risks of immunodeficiency and infection as individuals with ESRD as described below.[190]

Continued

Periodontal diseases and dental caries are the main chronic infectious diseases of the oral cavity. Periodontal diseases include a group of chronic inflammatory diseases that affect the periodontal supporting tissues of teeth and encompass destructive and nondestructive diseases. Gingivitis is inflammation of the soft tissue without apical migration of the junctional epithelium. It is a reversible, nondestructive disease that does not involve loss of periodontal tissues. Periodontitis is inflammation of the periodontium that is accompanied by apical migration of the junctional epithelium, leading to destruction of the connective tissue attachment and alveolar bone loss.[191]

Periodontitis serves as a prime example of a disrupted balance between the local microbiome and the host's inflammatory response, a condition known as dysbiosis. Although the inflammatory response is ostensibly triggered to manage the microbial threat, it proves to be ineffective and inadequately regulated in individuals prone to the condition. This leads to the inflammatory destruction of the periodontium, which encompasses the tissues that encase and support the teeth, including the gingiva, periodontal ligament, and alveolar bone. Without appropriate treatment, this disease can progress to tooth loss, adversely affecting chewing, appearance, and overall quality of life.[192]

In 2017, the American Academy of Periodontology (AAP) and the European Federation of Periodontology (EFP) co-presented the 2017 Classification of Periodontal and Peri-Implant Diseases and Conditions. This disease classification framework serves to guide treatment planning for periodontitis and aims to support customized approaches to patient care. The revised classification includes a multi-dimensional staging and grading system for periodontitis classification, a recategorization of various forms of periodontitis, and a classification for peri-implant diseases and conditions.[193]

Individuals with ESRD experience compromised immune systems as the immune system and the kidneys are closely integrated and interdependent. In healthy individuals, the kidneys contribute to immune homeostasis and regulation, while components of the immune system mediate many acute forms of renal disease and play a central role in the progression of chronic kidney disease. A dysregulated immune system can have either direct or indirect renal effects.[194] Moreover, uremia, the buildup of waste products in the blood that occurs as a result of declining or decreasing kidney function, can lead to inflammation and reduction in the immune system's ability to function as evidenced by an increased risk of viral-associated cancers, increased susceptibility to infections, and decreased vaccination responses in patients with ESRD.[195] ESRD is also characterized by diminished endocrine and metabolic functions of the kidney with subsequent retention and accumulation of toxic metabolites.[196] Additionally, the presence of indwelling catheters and grafts utilized for the administration of dialysis, malnutrition, dysregulated inflammation, and acquired immune dysfunction due to uremia contribute to the immune deficiency in ESRD and increase susceptibility to infection.[197] Notably, infection is the second leading cause of death in hemodialysis patients.[198] [199]

Several submitters providing information through the public submissions process stated that comorbidities frequently occur in the ESRD patient population and can cause complications for the patient, potentially jeopardizing the outcomes of the dialysis treatment. For example, submitters stated that comorbid diabetes can result in clinical complications for individuals receiving dialysis services in the treatment of ESRD, stating that periodontitis can worsen blood glucose control in diabetics by increasing levels of inflammatory mediators and may interfere with insulin, resulting in clinical complications. Additionally, periodontitis is associated with oral health-related quality of life in individuals with ESRD. One study evaluated whether periodontitis may be independently associated with oral health-related quality of life (OHRQoL) in individuals with ESRD. Researchers assessed 180 adults with ESRD and evaluated for impacts on various domains, and found that periodontitis exerts an influence on OHRQoL in individuals with ESRD, with a more severe condition impacting different domains.[200] Moreover, a prospective cohort study aimed to determine the association between an index of radiographically assessed oral health, Panoramic Tomographic Index (PTI), and cardiovascular and all-cause mortality, major adverse cardiovascular events (MACEs) and episodes of bacteremia and laboratory measurements during a three-year prospective follow-up in chronic kidney disease (CKD) stage 4–5 patients not on maintenance dialysis at baseline. The study showed that radiographically assessed and indexed dental health is independently associated with all-cause and cardiovascular mortality and MACEs in CKD stage 4–5 patients transitioning to maintenance dialysis and renal transplantation during follow-up (but not with the incidence of bacteremia).[201]

Submitters providing information through the public process also stated that BSI, poor glycemic control, and other complications arising from dental infection can jeopardize the clinical success of medical therapies employed to manage ESRD. Research provided by submitters described that issues and changes in the mouth and oral cavity, such as periodontitis and other consequences of poor oral health, frequently occur in patients with CKD and may contribute to increased morbidity and mortality because of

systemic consequences such as inflammation, infections, protein-energy wasting, and atherosclerotic complications.[202]

Several submitters also stated that addressing oral health issues, including identifying and resolving dental infections through the provision of dental and oral services, can be inextricably linked and integral and related to the clinical success of Medicare covered dialysis services for the treatment of ESRD. The submitters stated that the consequences of poor oral health are worse for ESRD patients than for the general population due to ESRD patient characteristics such as advanced age, higher prevalence of comorbid diabetes, polypharmacy, and impaired immune function, and that medically necessary dental care may improve the clinical success of the dialysis services.

A few submitters supplied a general position paper on the need for dental care and services in the ESRD patient population receiving dialysis services, describing the unique risks for individuals with ESRD and the increased risk of infection from oral sources. Specifically, the position paper states that ''oral diseases represent a potential and preventable cause of poor health outcomes in people with ESRD due to their relation to infection, inflammation, and malnutrition. Oral health represents a potential determinant of health outcomes in patients with end-stage renal diseases (ESRD).'' [203] Several submitters also provided a cohort outcomes study of 675 randomly selected individuals receiving peritoneal dialysis services.[204] The study outcomes described that ''poor oral health was associated with lower educational levels, diabetes, older age, marriage, and worse nutritional indicators (including lower time-averaged serum albumin and phosphate concentrations).'' [205]

The research further isolated that poor oral health is independently associated with an increased risk of peritonitis, an infection of the peritoneum where the peritoneal access graft is placed, and mortality in patients receiving peritoneal dialysis. The authors describe that ''after adjusting for age, sex, comorbidities, serum albumin, shared frailty by study sites, and PD vintage, poor oral health was associated with increased risks of peritonitis (adjusted hazard ratio [HR] = 1.45, 95 percent confidence interval [CI]: 1.06–2.00) and all-cause mortality (adjusted HR = 1.55, 95 percent CI: 1.04–2.32) but not hemodialysis (HD) transfer (adjusted HR = 1.89, 95 percent CI: 0.87–4.10) compared to participants with good oral health.'' Furthermore, the study explained that ''poor oral health status was present in one-fourth of peritoneal dialysis patients and was independently associated with a higher risk of peritonitis and death.'' [206] Moreover, submitters provided information that suggests that patients with ESRD receiving hemodialysis services and receiving preventive oral and dental services experience increased survival while those not receiving dental services were associated with increased mortality. A prospective cohort outcomes study of 4,205 hemodialysis patients assessed the impact of dental health on mortality from 2010 to 2012. The study described that ''in adults treated with hemodialysis, poorer dental health was associated with early death, whereas preventive dental health practices were associated with longer survival.'' [207]

Additionally, in a systematic review supplied by several submitters, studies show that patients on RRT (for example hemodialysis, peritoneal dialysis, and/or transplantation) experience a high prevalence of dental caries, a common chronic infectious disease resulting from tooth-adherent cariogenic bacteria.[208] The observational data presented in the review suggests a link between oral health and mortality in patients on RRT.[209] The review highlighted the need for further research in this area but also stated that improved, multidisciplinary, patient-centered dental care concepts are required to support dental and overall oral health in individuals on RRT.

Several submitters also noted that the Society for Vascular Surgery has stated that transient bacteremia from dental infections can seed hemodialysis access grafts. Among strategies to prevent infection of vascular grafts, recommended preoperative measures include identifying and treating remote site infections, including dental or oral sites of infection.[210] [211] Statements regarding best practices for managing infection control advise that sources of infection, including those within the oral cavity, should be addressed in order to minimize the risk of broader infection in the ESRD patient receiving hemodialysis.[212]

We concluded that the evidence base indicates that evaluation for and treatment of oral infection leads to improved outcomes and reduced risk of mortality for individuals with ESRD receiving covered dialysis services (89 FR 61755).

We noted that in the CY 2023 PFS final rule, we agreed with commenters that there is clinical evidence to support that medically necessary dental care may advance the clinical success of organ transplants and finalized that payment can be made under Medicare Parts A and B for dental services such as dental examinations, including necessary treatment, performed as part of a comprehensive workup prior to organ transplant surgery and medically necessary diagnostic and treatment services immediately necessary to eliminate or eradicate the infection or its source that are provided before transplantation because such services are inextricably linked to, and substantially related and integral to the clinical success of, the organ transplant procedure (87 FR 69676).

Furthermore, we stated that we appreciated commenters' feedback regarding those individuals who are awaiting organ transplantation and the commenters' request that Medicare provide payment for medically necessary dental services prior to transplantation. We described that in a case where an individual is awaiting organ transplantation, we believe that it is appropriate for Medicare to provide payment for, including but not limited to, an oral or dental examination, and

medically necessary diagnosis and treatment for only those services that are considered immediately necessary to eliminate or eradicate the infection or its source prior to the organ transplant (87 FR 69676).

In the CY 2025 PFS proposed rule, we stated, in consideration of research and recommendations provided by the public and our analyses of the studies and research available regarding the connection between dental services and the clinical success of dialysis services for individuals with ESRD, that we believe that dental services to diagnose and treat infection prior to dialysis services in the treatment of ESRD represent a clinically analogous scenario to dental services for which Medicare payment under Parts A and B is currently permitted when furnished in the inpatient or outpatient setting, such as prior to organ transplant. The clinical evidence supports that the medically necessary dental care may similarly advance the clinical success of dialysis services in the treatment of ESRD because an oral or dental infection can present substantial risk to the success and outcomes of these procedures (including the risk of systemic infection, BSI, sepsis, and death) (89 FR 61755 through 61756).

As such, we stated in the proposed rule that we believe that if a patient requiring dialysis services in the treatment of ESRD has an oral infection, the success of those dialysis services could be compromised if the infection is not properly diagnosed and treated prior to the covered medical services. Without an oral or dental examination to identify such an infection and the provision of necessary treatment, such as restorative dental services, to eradicate the infection prior to the dialysis procedure, the patient's ability to complete the dialysis services could be seriously complicated or compromised and the risk of infection would further increase the risk of mortality for the patient (89 FR 61756).

We provided examples of restorative dental services to eradicate infection: extractions (removal of the entire infection, such as pulling of teeth—for example, CDT D7140, D7210), restorations (removal of the infection from tooth/actual structure, such as fillings—for example, CDT D2000–2999), periodontal therapy (removal of the infection that is surrounding the tooth, such as scaling and root planning—for example, CDT D4000–4999, more specifically D4341, D4342, D4335 and D4910), or endodontic therapy (removal of infection from the inside of the tooth and surrounding structures, such as root canal—for example, CDT D3000–3999) (89 FR 61756).

We explained that if such an infection is not treated prior to dialysis services in the treatment of ESRD, then there is an increased likelihood for morbidity and mortality resulting from spreading of the local infection to BSI and sepsis. Likewise, we stated that we believe that infections occurring during the course of dialysis treatment should similarly be addressed and resolved in order to minimize the risk of infection and death for the patient with ESRD receiving dialysis services (89 FR 61756).

We stated that because an oral or dental infection can present substantial risk to the success of dialysis treatment for ESRD, we believe dental services furnished to identify, diagnose, and treat oral or dental infections prior to or contemporaneously with dialysis services in the treatment of ESRD are not in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth, but instead are inextricably linked to, and substantially related and integral to the clinical success of, these other covered medical services. We noted that, in these circumstances, the necessary treatment to eradicate an infection may not be the totality of recommended dental services for a given patient. For example, if an infected tooth is identified in a patient requiring dialysis services in the treatment of ESRD, the necessary treatment would be to eradicate the infection, which could result in the tooth being extracted. Additional dental services, such as a dental implant or crown, may not be considered immediately necessary to eliminate or eradicate the infection or its source prior to surgery. Therefore, such additional services would not be inextricably linked to, and substantially related and integral to, the clinical success of Medicare-covered dialysis services when used in the treatment of ESRD. As such, no Medicare payment would be made for the additional services that are not immediately necessary prior to or contemporaneously with dialysis for ESRD to eliminate or eradicate the infection (89 FR 61756).

In consideration of the concerns discussed above in this section, we proposed to add this clinical scenario to the examples of clinical scenarios under which payment can be made for certain dental services in our regulation at § 411.15(i)(3)(i)(A). Specifically, we proposed to amend the regulation in paragraph A to include dental or oral examination performed as part of a comprehensive workup in either the inpatient or outpatient setting prior to Medicare-covered dialysis services when used in the treatment of ESRD; and medically necessary diagnostic and treatment services to eliminate an oral or dental infection prior to, or contemporaneously with Medicare-covered dialysis services when used in the treatment of ESRD. We sought comments on all aspects of this proposal (89 FR 61756).

a. Consideration of Dental Services That May Be Inextricably Linked to Covered Services for the Treatment of Chronic Kidney Disease

In section II.J.1.b. of this final rule, we discuss that we have partnered with AHRQ to help us consider the relationship between dental services and other specific covered services. Specifically, AHRQ reviews available clinical evidence regarding this relationship and provides analysis of clinical scenarios where dental services may be inextricably linked to other covered services. To better address the public's immediate dental needs, AHRQ conducts rapid response reports instead of systematic reviews. With these rapid response reports, we can better specify which payments can be made under Medicare Parts A and B for certain dental services that are inextricably linked to other covered services.

In the CY 2025 PFS proposed rule (89 FR 61752), we provided an overview of the information we received from the public through the submission process. In that discussion, we summarized the submissions received from interested parties asserting that dental treatments can be integral to the clinical success of covered nephrology-related medical services. We found the evidence submitted through the submission process compelling with respect to dental services furnished to identify, diagnose, and treat oral or dental infections prior to or contemporaneously with dialysis services in the treatment of ESRD, which led to our proposal discussed above.

We acknowledge the importance of dental health to overall well-being of patients with kidney related diseases, such as, CKD. To gain further understanding of potential relationships between dental services and specific covered CKD medical services, we partnered with researchers at AHRQ to review available clinical evidence regarding this topic.

AHRQ created a rapid response report, which was not available at the time of the proposed rule's publication, that summarized recent evidence, aiming to inform CMS policy

development related to the possible linkage between dental services and treatment modalities and services for CKD patients. Specifically, the report reviewed the available clinical evidence on the efficacy of dental services in improving health outcomes for patients with CKD across different treatment modalities and stages of the disease. For more detailed information about the search strategies and findings, please refer to the AHRQ rapid response report available at *https://effectivehealthcare.ahrq.gov/products/treatment-outcomes-chronic-kidney/rapid-research*.

CKD affects around 14 percent of American adults [213] and 850 million people globally,[214] and its prevalence is rising faster than that of other major diseases like diabetes and heart disease.[215] As stated in the AHRQ rapid response report, CKD is a condition characterized by impaired kidney function, which leads to the accumulation of excess fluid and toxic waste. This impairment can result in various health complications, including high blood pressure, heart disease, and stroke. AHRQ stated that assessing kidney function and damage involves the use of several biomarkers, with serum creatinine and other serum indicators employed to estimate the estimated glomerular filtration rate (eGFR). CKD is classified into five stages based on eGFR levels and evidence of kidney damage.[216] According to the rapid response report, stages 1, 2, 3 and 4 have eGFR values of >90, 60–89, 30–59 and 15–29 mL/min/1.73m^2 respectively. CKD stage 4 represents severe kidney damage. CKD stage 5 represents severe kidney damage or failing kidneys and is also termed end-stage renal disease (ESRD), which is defined by eGFR below 15 mL/min/1.73m^2. For individuals in Stage 5, treatment options include dialysis (for example, hemodialysis and peritoneal dialysis) or kidney replacement therapy.

AHRQ's rapid response report highlights that chronic oral diseases (COD), such as dental caries, gingival infection, periodontal disease, and tooth loss,[217] are common in the United States and can significantly impact overall health. Periodontitis, in particular, is a condition that can cause systemic inflammation, which can worsen CKD. According to the rapid response review, the prevalence of periodontitis approaches 100 percent in patients on dialysis in some studies,[218] suggesting that this is a near-ubiquitous comorbidity with severe CKD. A recent study finding identified that dental intervention may reduce total medical treatment for these patients by delaying or preventing disease progression.[219] Additionally, periodontitis may also significantly exacerbate cardiovascular risk and total mortality in patients with CKD at all severity levels.[220]

In their rapid response, the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) flow diagram, used in systematic reviews and meta-analyses to describe the review's findings, revealed that 515 records were initially identified from two large databases, of which 23 relevant articles met the study's eligibility criteria for inclusion. Of these 23 articles, 7 were systematic reviews and/or meta-analyses, 15 were randomized clinical trials, non-controlled clinical trials, or observational studies, and 1 article related to practice guidelines.

Based on the report, no evidence is available regarding the impact of dental services on health outcomes, specifically for individuals with stage 4 CKD alone. However, the report found evidence suggesting improved outcomes for all-cause mortality for hemodialysis patients after nonsurgical periodontal therapy (NSPT), as well as evidence indicating a decreased risk of cardiovascular events with NSPT or endodontic treatment for hemodialysis patients. A single study in their report suggested a decrease in all-cause mortality among ESRD patients undergoing either hemodialysis or peritoneal dialysis. The report also found that there is insufficient evidence suggesting that NSPT leads to lower rates of bacteremia, pneumonia, osteomyelitis, brain abscess, or renal and perinephric abscess outcomes. Additionally, the report found that the evidence regarding the effect of dental services on all-cause mortality in patients undergoing hemodialysis or peritoneal dialysis is inconsistent.

The rapid response report noted several limitations in the evidence base, including varying severities of periodontitis among patient populations and differences in study designs, which affect the overall quality of the findings. Additionally, follow-up periods were generally short, limiting the ability to assess long-term effects. Furthermore, no recent trials or cohort studies have been conducted in the U.S., making it unclear to what extent this evidence is generalizable to the U.S. population.

The findings of the AHRQ rapid responses highlight that this area merits further study by researchers and industry to explore potential connections between dental services and improved outcomes for individuals with CKD. Specifically, the body of evidence evaluating dental services before, during, or after the initiation of dialysis lacks primary clinical data. Additionally, the current literature lacks comprehensive guidance and evidence-based protocols for addressing the diverse oral health needs of CKD patients, including the appropriate frequency and duration of dental services for patients at any stage of CKD.

We received 54 public comments on the proposal to amend the regulation at § 411.15(i)(3)(i)(A) to include dental or oral examination performed as part of a comprehensive workup in either the inpatient or outpatient setting prior to Medicare-covered dialysis services when used in the treatment of ESRD; and medically necessary diagnostic and treatment services to eliminate an oral or dental infection prior to, or contemporaneously with Medicare-covered dialysis services when used in the treatment of ESRD. Commenters included members of Congress, patient advocacy organizations, hospitals and hospital associations, medical and dental associations representing several different specialties and specialty societies, dialysis organizations, dental plan associations, and health insurance companies, among others. The following is a summary of the comments we received and our responses.

Comment: All commenters supported our proposal. Commenters stated they agree with CMS's conclusion that the clinical evidence indicates that

medically necessary dental care may advance the clinical success of dialysis services in the treatment of ESRD because an oral or dental infection can present a substantial risk to the success and outcomes of these procedures. Commenters offered many ways that dental and oral care play a critical role in the success and outcomes of dialysis for individuals living with kidney failure. For example, they explained that dental services furnished to identify, diagnose, and treat oral or dental infections may enhance access to kidney transplants, lessen the risk of morbidity, mortality, and negative cardiovascular events, protect against peritoneal dialysis associated peritonitis, prevent hospitalizations, improve overall health and prognosis of individuals with ESRD, prevent complications including bloodstream infections and poor glycemic control, improve quality of life, and keep patients stable on their current dialysis modality.

Commenters stated that the proposal is a crucial step towards addressing health disparities and enhancing access to transplantation services. They explained that without Medicare coverage, many beneficiaries on dialysis may not have access to dental services, which serves as a serious health equity issue and a real barrier to care and applauded CMS for taking an important step to close a real health equity gap for Americans living with kidney disease. Commenters explained that oral health related infections result in worse prognoses for ESRD patients and perpetuate disparities based on race. The commenters discussed how kidney disease disproportionately affects communities of color and explained that Black people are nearly four times more likely to be affected by kidney disease than white people, and more than one-third of people with ESRD come from neighborhoods that are disproportionately impoverished. These commenters stated that expanding access to these services would address these disparities in communities that have long been underserved by medical and dental care.

One commenter stated that the proposal, if finalized, would improve the health outcomes of pediatric patients who are receiving dialysis. The commenter also offered to work with CMS to explore other policies that would ensure pediatric patients have access to these services. Other commenters shared their support of the proposal and noted that many residents of nursing homes and assisted living residences with ESRD requiring dialysis also have dental diseases that may result in infections and other complications that can impair the effectiveness of the dialysis intervention.

Commenters had different interpretations of the proposal with regard to the population of beneficiaries with ESRD for which Medicare would cover dental services as well as the scope and frequency of such services. Most commenters described the proposal as providing that for individuals with ESRD receiving Medicare-covered dialysis, since these treatments are not a one-time procedure like an organ transplant but instead are ongoing and life-sustaining, the duration of dental services should be the same as for dialysis sessions, because the policy's premise is that they are inextricably linked to the dialysis services. Other descriptions that commenters used included casting the proposed policy as offering comprehensive dental care and an expansion of dental benefits. However, some commenters conveyed their understanding that the oral examinations would be covered only before the onset of dialysis, that is, the time an individual initiates the first dialysis treatment. Some commenters requested clarity on the allowable frequency of dental services.

One commenter restated the proposal as permitting payment for dental exams prior to or contemporaneously with dialysis services, while another commenter described the dental services as reliable which could suggest that they are consistent or planned. A different commenter restated the proposal as permitting payment for periodic dental care and later in their comment referred to regular dental care and how these services can identify and reduce the occurrence of infections.

One commenter restated the proposal as permitting payment for oral evaluations for ESRD patients prior to commencing dialysis, while another commenter described the services as an oral examination performed as part of a comprehensive workup prior to the initiation of Medicare-covered dialysis to treat ESRD. A different commenter stated that a comprehensive workup prior to the initiation of dialysis services does not routinely include a dental and oral examination. The commenter also referenced the Conditions for Coverage for ESRD Facilities (CfCs) at § 494.80, where it states that an ESRD facility's interdisciplinary team conducts an ''individualized and comprehensive assessment'' of the patient's needs, which is then used to develop and implement a comprehensive plan of care. The commenter stated that while the initial assessment might identify a patient's oral health needs, an ESRD facility has no ability or financing with which to incorporate such into the plan of care except perhaps through referral to outside dental services. Likewise, dental issues may surface throughout dialysis treatment, when a patient may relay dental pain or discomfort to a health care provider. The commenter stated that, at that point, too, if a patient and/or health provider realize dental or oral services are needed, the only recourse would be referral.

One commenter stated that it is unclear whether the proposal would permit payment for a dental exam prior to each dialysis session, since dialysis services can be frequent and long-lasting. The commenter stated that ESRD patients often receive dialysis up to three times per week. One commenter requested additional information to understand the proposal. The commenter requested a detailed definition of what constitutes a medically necessary dental or oral examination and asked that we provide the criteria or guidelines that will be used to determine the necessity of such examinations. The commenter also requested clarification on the specific diagnostic and treatment services considered medically necessary, as well as any relevant criteria or thresholds that will determine the necessity for these services.

Commenters expressed appreciation for CMS listening to recommendations provided by the kidney community and evaluating the clinical research that demonstrates the connection between dental services and the clinical success of dialysis services for individuals with ESRD. One commenter stated the proposal aligns with CMS's longstanding policy of covering treatments related to ESRD, including dialysis services and kidney transplant surgeries. The commenter stated that given the critical role of dialysis in managing ESRD and the importance of oral health in these patients, expanding coverage for dental services linked to dialysis is a logical progression. A different commenter stated that they were pleased to see CMS expand access to dental services for individuals with kidney failure seeking transplants in the CY 2023 PFS rule and believe this further expansion to all beneficiaries with ESRD is incredibly positive. The commenter stated that all beneficiaries who require dialysis, including in-center, home peritoneal, and home hemodialysis patients, should have access to dental services. A different commenter was pleased that this year's proposal would be another significant step to ensure another high-risk patient

population can access medically necessary dental services. This commenter stated that they are root canal specialists and witness firsthand the severe consequences of untreated dental infections, which can rapidly spread, exacerbating existing health conditions and potentially become life-threatening.

Several commenters urged CMS to ensure that payment is permitted for dental services not only for patients diagnosed with ESRD (ICD–10 code N18.6) but also for patients diagnosed with stage 5 CKD (ICD–10 code N18.5) who have not yet initiated dialysis, stating that these patients should receive the dental care needed to prevent infections that exacerbate diabetes and kidney disease. These commenters further requested that the policy apply to claims for patients with a diagnosis encompassing one of those conditions, such as Hypertensive Chronic Kidney Disease with stage 5 CKD or ESRD (ICD–10 code I12.0).

Several commenters also urged CMS to reconsider whether certain dental services may be inextricably linked to treatment for stage 4 CKD (ICD–10 code N18.4). They explained that when a patient is at CKD stage 4, they have severe kidney damage, and it is critical to slow the loss of kidney function by managing health problems, such as oral/dental infection, that directly complicate and are complicated by their kidney disease. They further explained that resolving dental infections in patients at that stage can improve eGFR, inflammatory markers, erythrocyte count, and nutrition, as well as reduce the risk of cardiovascular and other serious medical events. They stated that these clinical factors are commonly exacerbated by CKD and negatively impact CKD outcomes, and since dental care can play a substantial role in addressing these factors in patients with stage 4 CKD, it can help to delay or avoid progression to stage 5 and ESRD, and the consequent need for dialysis or kidney transplantation.

One commenter also requested that CMS consider expanding the proposed policy to stage 4 CKD, stating that it is critical that CMS go upstream to address the needs of patients with advanced CKD who may not yet be starting dialysis, but whose eGFR points to a likely start in the near future. The commenter explained that this can be a critical time for a patient—whether in preparation for transplant or transition to dialysis—to address, in collaboration with their nephrologist, dental and/or oral health challenges in a comprehensive manner. Access to necessary oral and dental care is one means of doing so. The commenter asked CMS to clarify that its expansion of dental coverage as related and integral to treatment of kidney disease includes those patients whose course of treatment may not yet have started but is anticipated in the near term. The commenter agreed with our statement in the proposed rule, that the evidence indicates that evaluation for and treatment of oral infections lead to improved outcomes and reduced risk of mortality for individuals with ESRD receiving covered dialysis services and further noted that not only does dental and oral care have the potential to improve kidney care outcomes, but it also has the potential to ultimately generate cost savings.

Response: We agree with commenters that there is evidence to support that dental services are inextricably linked to, and substantially related and integral to the clinical success of dialysis services in the treatment of ESRD. We note that the two leading causes of death in the dialysis patient population are cardiovascular disease and infection. The AHRQ rapid response report identified a high-quality retrospective cohort study comparing 3613 patients who received hemodialysis and intensive periodontal disease treatment to patients on hemodialysis without periodontal disease treatment. The treatment cohort exhibited significantly lower cumulative incidences of cardiovascular disease events and all-cause mortality.[221] The AHRQ rapid response report also identified a high-quality retrospective cohort study that followed 12,454 patients receiving either hemodialysis or peritoneal dialysis over the course of 16 years. From this population, two subgroups were further defined, those that received root canal therapy and those that did not. The results showed that members of the non-root canal therapy group had a significantly higher mortality rate than those of the root canal therapy group. This study suggested that patients on either hemodialysis or peritoneal dialysis who received root canal therapy had a lower risk of death than patients who did not receive root canal therapy. The study also noted infectious diseases had a significant role in mortality among dialysis patients who did not receive root canal therapy.[222]

As earlier stated, we also found submitter information compelling. Specifically, submitters provided a cohort outcomes study of 675 randomly selected individuals receiving peritoneal dialysis services.[223] After adjusting for age, sex, comorbidities, serum albumin, shared frailty by study sites, and peritoneal dialysis vintage, poor oral health was associated with increased risks of peritonitis and all-cause mortality compared to participants with good oral health. While we do note that a specific dental treatment service was not part of this study design, we still find the increased risk of peritonitis in the poor oral health population, which likely would affect the ability to perform and the clinical success of peritoneal dialysis, compelling evidence in support of the assertion that dental services are inextricably linked to, and substantially related, and integral to the clinical success of dialysis services in the treatment of ESRD.

In consideration of the submissions and comments provided by the public and the research conducted by AHRQ, we find that the clinical evidence supports that the medically necessary dental care are inextricably linked to, and substantially related, and integral to the clinical success of dialysis services in the treatment of ESRD because an oral or dental infection can present a substantial risk to the success and outcomes of these procedures (including the risk of systemic infection, BSI, sepsis, and death). Therefore, the dental services are so integral to medically necessary dialysis services in the treatment of ESRD that they are not in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth within the meaning of section 1862(a)(12) of the Act. Rather, such dental services are inextricably linked to the clinical success of the medical service and are substantially related and integral to the covered medical service of dialysis. We note that these medical services include either modality of dialysis that a beneficiary is receiving,

hemodialysis or peritoneal dialysis—and whether or not it is administered in the home or in-center at an ESRD facility. As such, we are finalizing our proposal that Medicare Part A and Part B payment can be made for certain dental services, such as a dental or oral examination performed as part of a comprehensive workup prior to dialysis services in the treatment of ESRD, and medically necessary diagnostic and treatment services to eliminate an oral or dental infection prior to, or contemporaneously with, dialysis services in the treatment of ESRD.

We note that we are finalizing the proposal with modifications, as discussed below, after consideration of public comments to reflect the duration of dialysis services for the treatment of ESRD. The clinical evidence demonstrates that if an infection is not treated prior to, or contemporaneously with dialysis services in the treatment of ESRD, then there is an increased likelihood for morbidity and mortality resulting from spreading of the local infection to BSI and sepsis. Likewise, infections occurring during the course of dialysis treatment should similarly be addressed and resolved in order to minimize the risk of infection and death for the patient with ESRD receiving dialysis services.

Some of the commenters appear to have interpreted the proposal as an expansion of Medicare coverage of dental services. This was not our intention. As we explained in the CY 2023 PFS final rule, under our interpretation of section 1862(a)(12) of the Act, items and services furnished in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting the teeth generally are not covered by Medicare, and no payment may be made for them under either Medicare Part A or Part B, subject to certain exceptions specified in the statute (87 FR 69664). The proposal would not expand Medicare coverage of dental services. Rather, it would add certain dental services that are inextricably linked to Medicare-covered dialysis services used in the treatment of ESRD to the non-exhaustive list of examples of clinical scenarios under § 411.15(i)(3)(i) in which Medicare may pay for certain specified dental services.

With regard to the comments on the population for which Medicare would pay for dental or oral examinations before dialysis, we note payment under Medicare Part A and B may be made for dental services that are inextricably linked to other covered services only for individuals who are entitled to and enrolled in Medicare. To clarify, individuals of any age with ESRD who receive dialysis on a regular basis or a kidney transplant are entitled to Medicare if they file an application and meet certain requirements. Entitlement usually begins after a 3-month waiting period has been served.[224] [225] [226] While the proposal references payment for dental or oral examination performed as part of a comprehensive workup prior to Medicare-covered dialysis services when used in the treatment of ESRD, it does not change the existing terms of Medicare entitlement. We agree with commenters that the proposal would allow for payment for oral evaluations prior to the onset of dialysis, that is, the initial treatment furnished to a patient with ESRD. We also agree with commenters that the proposal would allow for payment for dental services that identify, diagnose, and treat the occurrence of infections for the duration that a beneficiary with ESRD is on dialysis, because dialysis is ongoing and life-sustaining unless a kidney transplant occurs. This means that the duration of the provision of dental services that are inextricably linked to dialysis services for these beneficiaries with ESRD may be ongoing but still would have to be medically reasonable and necessary.

After consideration of these comments, we are finalizing the proposal with a modification to address the duration of the provision of dental services that are inextricably linked to dialysis services for the treatment of ESRD. We are finalizing the addition of new paragraph (F) to the regulation at § 411.15(i)(3)(i) to include dental or oral examination performed as part of a comprehensive workup prior to, or contemporaneously with, Medicare-covered dialysis services when used in the treatment of ESRD; and medically necessary diagnostic and treatment services to eliminate an oral or dental infection prior to, or contemporaneously with, Medicare-covered dialysis services when used in the treatment of ESRD.

With regard to commenters' concerns about how frequently the dental services can be furnished and paid for under Medicare Part A and B and the comment requesting detail on what constitutes dental services that are medically necessary, MACs retain discretion to decide that payment can be made for dental services in accordance with the regulation on a claim-by-claim basis.

With regards to the comments requesting that the policy extend to beneficiaries that are in the earlier stages of CKD, we agree that dental services may improve outcomes for such individuals; however, the clinical evidence available to us does not demonstrate an inextricable link between dental services and other covered medical services that such individuals may receive.

We appreciate the comment referencing the CfCs at § 494.80. We believe that the provisions discussed under this regulation are outside the scope of the proposals for this rule, since they outline the conditions that dialysis facilities must meet to be certified under the Medicare program. We note, as discussed in the CY 2023 PFS final rule (87 FR 69663 through 69688), that we believe the dental services and the other covered services related to the treatment of ESRD would most often be furnished by different professionals and that in order for the dental services to be inextricably linked to the other covered services such that Medicare payment can be made, there must be coordination between these professionals. This coordination should occur between the practitioners furnishing the dental and covered services regardless of whether both individuals are affiliated with or employed by the same entity. This coordination can occur in various forms, such as, but not limited to, a referral or exchange of information between the practitioners furnishing the dental and other covered services. Additionally, any evidence of coordination between the professionals furnishing the primary medical service and dental services should be documented. If there is no evidence to support the exchange of information, or integration, between the professionals furnishing the primary medical service and the dental services, then there would not be an inextricable link between the dental and other covered services within the meaning of our regulation at § 411.15(i)(3)(i). As such, Medicare payment for the dental services would be excluded under section 1862(a)(12) of the Act (though payment for the dental services might be available through supplemental health or dental coverage).

Comment: Commenters urged CMS to be careful not to suggest a preference for tooth extraction as ''the necessary treatment'' for eradicating infections despite our listing of other restorative (and tooth-sparing) services provided in the proposed rule that may be paid for. The commenters explained that doing so could lead MACs to improperly impose an extra burden on health care

[224] Section 226A of the Act.

[225] 42 CFR 406.13.

[226] Pub. 100–01 Medicare General Information, Eligibility and Entitlement Manual, Chapter 2 Hospital Insurance and Supplementary Medical Insurance, Sections 10.4 and 10.4.2.

providers to justify choosing a procedure other than an extraction in a particular instance. The commenters had the same concern with how CMS discusses additional services by using crowns as an example of a service that may not be paid and expressed concern that these types of statements should be approached with ample clinical basis, since the standard of care in certain root canal procedures, among other situations, requires application of a crown to prevent root canal failure, fracture, infection, and other complications in the immediate and longer term. One commenter recognized that implants or crowns may not be immediately necessary on their own to address an acute oral infection but explained that these services become necessary once treatment to extract a tooth is initiated. The commenter expressed the concern that since dialysis for ESRD is a long-term, rather than an acute treatment, the removal of teeth without associated restoration of the mouth and oral structures to function and allow for healthy chewing and eating will have reverberating effects on dialysis treatment outcomes. A different commenter explained that despite the availability of tooth-saving and oral health preservation options such as fluoride applications or restoration of the teeth that are salvageable through root canal treatment or fillings, beneficiaries end up living with fewer natural teeth. They further explained that this partial or complete edentulism impairs their ability to eat healthy food, maintain a social life, and keep an esthetic facial profile and can impair the healing and health maintenance activities that are often necessary to manage the underlying medical condition.

Conversely, one commenter did not believe the proposal properly delineated those dental services that would be deemed inextricably linked to Medicare-covered dialysis treatments for ESRD patients, and, as a result, is concerned with CMS's open-ended proposal to cover many complex dental services which they believe are not warranted. The commenter explained that although CMS mentions several restorative dental services in the preamble of the proposed rule, these are only examples, since a MAC would not be precluded from allowing Medicare payment for other dental services. The commenter also stated that the proposed coverage of endodontics (root canals), which would warrant related restorative treatment, represents a significant expansion, as CMS would only customarily cover an extraction of an infected tooth. In addition, the commenter questioned CMS' logic of covering root canals while excluding implants and crowns as ''not immediately necessary.'' The commenter requested that CMS consider defining infection for this purpose as an acute infection, limit covered dental services to extractions, and provide clarification on the specific dental services that would qualify as restorative dental services to eradicate infection.

Response: In the CY 2025 PFS proposed rule we stated that examples of restorative dental services to eradicate infection could include: extractions (removal of the entire infection, such as pulling of teeth—for example, CDT D7140, D7210), restorations (removal of the infection from tooth/actual structure, such as fillings—for example, CDT D2000–2999), periodontal therapy (removal of the infection that is surrounding the tooth, such as scaling and root planning—for example, CDT D4000–4999, more specifically D4341, D4342, D4335 and D4910), or endodontic therapy (removal of infection from the inside of the tooth and surrounding structures, such as root canal—for example, CDT D3000–3999) (89 FR 61756). Because an oral or dental infection can present substantial risk to the success of dialysis treatment for ESRD, payment under Medicare Part A and B is permitted for only those dental services furnished to identify, diagnose, and treat the infection. We gave the example of dental implants or crowns as additional dental services that might not be considered immediately necessary to eliminate or eradicate the infection or its source because these types of services may have other uses in the dental space.

Comment: One commenter stated that while linking dental services to other services such as a stent for hemodialysis, or a vascular access graft would be a benefit for ESRD patients, receipt of dental services is not a clinical requirement in order to receive dialysis. The commenter said that beneficiaries with ESRD should have access to dental services when necessary, and dental services should not become a requirement that precludes a patient from receiving another important service.

Response: We thank the commenter for their perspective and sharing of clinical insight.

3. Request for Comment on Dental Services Integral to Specific Covered Services To Treat Diabetes

We have received information from interested parties, including submitters providing evidence through the public submissions process as well as commenters on prior proposed rules suggesting that dental services are inextricably linked to treatment services for individuals with diabetes mellitus. As we discussed in the CY 2025 PFS proposed rule (89 FR 61752), several interested parties using the public submissions process have urged us to provide Medicare payment for dental services for individuals diagnosed with diabetes for consideration in CY 2025 rule making. These submissions included information and references supporting oral and dental treatment of advanced periodontitis among individuals with diabetes to improve markers related to management of the diabetes.

Submitters stated that clinical studies demonstrate that dental treatments for oral infections, such as advanced periodontitis and related inflammation, meaningfully advance and improve the treatment of, management of, and outcomes for patients with diabetes. Submitters also stated that conversely, the absence of treatment of chronic dental infections in turn complicates covered medical treatment for the management of diabetes and potentially exacerbates insulin resistance, worsens glycemic control, and other diabetes-related complications, leading to poor outcomes for the individuals with diabetes. Submitters also noted that studies demonstrate cost savings when dental services are employed in the treatment of individuals with diabetes and also serve to advance health equity among vulnerable populations.

Submitters provided information detailing the increased risk of dental caries and periodontal disease in people with diabetes, many of whom lose teeth, which greatly limits nutrition, general well-being, and overall quality of life. Submitted studies demonstrated the bidirectional nature of periodontal disease and diabetes, suggesting that both conditions influence each other and can worsen or conversely improve outcomes.

As described by submitters, numerous basic and clinical studies describe the relationship between oral diseases and inflammation in persons with diabetes, which increases risks for micro- and macrovascular complications including retinopathy, nephropathy, neuropathy, cardiovascular diseases, and stroke. Several submitters stated that there is a documented reduction in hospitalizations in persons with diabetes who receive conservative periodontal treatment. Consequently, submitters stated that periodontal treatment is recommended for patients

with diabetes by the American Diabetes Association Clinical Guidelines and is also promoted by the American Association of Clinical Endocrinologists and others.[227]

Diabetes mellitus is a chronic, metabolic disease characterized by elevated levels of blood glucose (or blood sugar), which, over time, may lead to serious damage to the heart, blood vessels, eyes, kidneys, and nerves. Type 2 diabetes, which usually occurs in adults, causes the body to become resistant to insulin or not to make enough insulin. Type 1 diabetes, previously referred to as juvenile diabetes or insulin-dependent diabetes, is a chronic condition in which the pancreas produces little or no insulin.[228]

A primary goal for diabetes treatment is glycemic control and requires accurate individualization and customization of available treatment options. Interventions to address lipoproteins, blood pressure, weight control, mental health, and lifestyle are important factors that contribute to quality of life and the frequency of diabetes-associated complications.[229] According to recent statistics from the Centers for Disease Control and Prevention, approximately 38 million people in the United States may have diabetes, and the CDC estimates that 1 in 5 of them do not know they have the condition. Approximately 98 million U.S. adults likely have prediabetes, and more than 8 in 10 of them may not know they have prediabetes. Notably, diabetes is the eighth leading cause of death in the United States (and maybe underreported). Type 2 diabetes accounts for approximately 90 to 95 percent of all diagnosed cases of diabetes, while Type 1 diabetes accounts for approximately 5–10 percent. The CDC reports that over the last 20 years, the number of adults diagnosed with diabetes has more than doubled as the overweight and obesity have become more prevalent in the American population.[230] [231]

One key marker for the measurement of glycemic control, a key goal in the treatment of diabetes, in individuals with diabetes is the hemoglobin A1c test. The hemoglobin A1c (also referred to as glycated hemoglobin, glycosylated hemoglobin, HbA1c, or A1c) test is used to evaluate a person's level of glucose control and shows an average of the blood sugar level over the past 90 days and represents a percentage.[232]

Submitters through the public submissions process provided multiple research studies regarding the interaction between dental services and outcomes for medical services to treat diabetes. The Cochrane Library (ISSN 1465–1858) is a collection of databases that contain high-quality, independent evidence to inform healthcare decision-making. The Cochrane Library is owned by Cochrane and published by Wiley.[233] In the Cochrane Review entitled *Treatment of periodontitis for glycemic control in people with diabetes mellitus,* evidence from 30 trials (results from 2,443 participants) showed that periodontitis treatment reduces blood sugar levels (measured by HbA1c) in diabetic patients on average by 0.43 percentage points (for example, from 7.43 to 7 percent; 4.7 mmol/mol) 3 to 4 months after receiving the treatment compared with no active treatment or usual care. A difference of 0.30 percent (3.3 mmol/mol) was seen after 6 months (12 studies), and 0.50 percent (5.4 mmol/mol) at 12 months (one study).[234] All studies in the review used a parallel randomized controlled trials (RCT) design and followed participants for between 3 and 12 months. The studies generally focused on people with type 2 diabetes, save one study that included participants with type 1 or type 2 diabetes. Most studies were mixed in terms of whether metabolic control of participants at baseline was good, fair, or poor and were carried out in secondary care. Researchers compared periodontitis treatment with control, which could be no (or delayed) treatment or usual care (oral hygiene instruction (OHI) or supragingival scaling with or without OHI). The degree and nature of advanced periodontitis were not specifically defined in the context of the studies. Additionally, the studies did not control for other types of interventions deployed in the treatment of diabetes (that is, strategies used to manage glycemic control), so patients may have been receiving other types of treatment during the study periods.

The types of periodontal treatment provided covered a wide range of oral services: subgingival instrumentation, surgical periodontitis treatment—flap surgery or gingivectomy; antimicrobial therapy (encompassing antibacterials and antibiotics), either locally applied (including mouth rinses, gels, or dentifrices) or systemically administered; other drug therapy with a possible benefit of improving the periodontal health of the participant; other novel interventions to manage periodontitis; supragingival scaling (also known as professional mechanical plaque removal (PMPR)); oral hygiene instruction; and/or, education or support sessions to improve self-help or self-awareness of oral hygiene.

In summary, the Cochrane review demonstrated that individuals with diabetes who have periodontitis who receive dental services for the treatment of the periodontitis experience a statistically significant reduction of HbA1c. Again, measurement of HbA1c is a metric for gauging glycemic control which is a primary goal of treatment for all individuals with diabetes. The study suggests that individuals with diabetes who also have a diagnosis of periodontitis who receive treatment to address the periodontitis subsequently experience a reduction in HbA1c. The study authors described the clinical outcomes related to preventive dental care, conservative periodontal treatment, and reduction in HbA1c as statistically and clinically significant. Moreover, the authors of the research stated that ''further trials evaluating no treatment vs usual care are unlikely to change this conclusion.'' [235]

Submitters providing information through the public submissions process suggested that dental services could be inextricably linked to the following specific medical services in the treatment of diabetes:

- CPT 36901–36906: Dialysis circuit procedures.
- CPT 82947: Chemistry procedures, blood glucose testing.

In the CY 2025 PFS proposed rule (89 FR 61758), we discussed how the research provided by submitters suggests that periodontal treatment for an individual with both a diagnosis of diabetes and periodontitis led to improved HbA1c measures.

We stated in the proposed rule that in the case of an individual with diabetes who also has a diagnosis of periodontitis, oral services and treatment to address the periodontitis potentially lead to a reduction in HbA1c, a marker of glycemic control that may be used to determine the effectiveness of interventions for treatment of diabetes. We noted that in the description of the studies submitted, the research seems to indicate that the improvement of glycemic control as evidenced by the HbA1c is due to the provision of treatment for the periodontitis. The dental and oral services may not be integral to other specific medically necessary, covered services, but rather the dental and oral services may serve to influence clinical outcomes directly. The studies compare the impact of the treatment for the periodontitis to the impact of pharmacological interventions.

We recognized that evidence submitted by interested parties demonstrates that an individual with both a diagnosis of diabetes and a diagnosis of periodontitis who in turn receives periodontal treatment services may experience improvements in markers for HbA1c, which is a key target outcome for the patient population with diabetes. However, the interaction between these diagnoses and the potential improvements due to periodontal treatment services does not appear to align with the framework we have established to pay for dental services inextricably linked to covered services; in our framework, the delivery of certain dental services are integral to the successful completion of or outcomes related to the covered services.

We stated that under § 411.15(i)(3), we have specified that payment can be made for certain dental services that are inextricably linked to other services when the specific covered services with which the dental services are inextricably linked are identified. The studies that have been provided to CMS through submissions have not identified any specific covered services for the treatment of diabetes to which dental services are inextricably linked. Rather, the studies indicate that the primary treatment of periodontal disease in patients with diabetes generally leads to better outcomes in the management of the patients' diabetes. While the research makes the case that the dental services are medically necessary for patients with diabetes, medical necessity alone does not permit payment for dental services given the broad statutory prohibition under section 1862(a)(12) on payment for services ''in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth.'' In the case of patients with diabetes, the research does not appear to show that certain dental services are inextricably linked with certain other covered services for the treatment of diabetes, in accordance with our regulation at § 411.15(i)(3) such that the statutory prohibition under section 1862(a)(12) does not apply.

We noted that some of the examples of medical services for diabetes treatment provided by submitters are general in nature and not specific to patients with diabetes who may also have periodontal disease, including CPT codes 99202–99215: Evaluation and Management (E/M) Services that broadly describe outpatient office visits for the diagnosis and medical management of practically any illness, disease, or condition.

Additionally, we noted that submitters providing evidence for our consideration suggested that the services described by codes for diabetes self-management training (for example, G0108: *Diabetes Self-Management Training,* and G0109: *Group Diabetes Self-Management Training*) are services with which dental services may be inextricably linked. However, we were not persuaded by this evidence and do not believe that dental services would be inextricably linked to improved outcomes for services for diabetes self-management training.

In the CY 2025 PFS proposed rule (89 FR 61758 through 61760) we sought comment from the public regarding specific covered services for management of patients with diabetes with which dental services may be inextricably linked. We stated that we did not propose to amend § 411.15(i)(3)(i) since we had not identified additional dental services that are inextricably linked to certain services in the treatment of diabetes. However, we noted that we remain open to considering any such services identified by public commenters, and, if sufficient evidence is presented, we may consider adding such services to our regulations in this final rule.

In the context of payment for dental services for an individual with diabetes, we sought information from the public regarding what the coordination between a medical and dental professional would entail in the scenario where an individual with a diagnosis of diabetes presents with suspected periodontitis. In the CY 2023 PFS final rule, we explained that we would make payment when a doctor of dental medicine or dental surgery (referred to as a dentist) furnishes dental services that are an integral part of the covered primary procedure or service furnished by another physician, or non-physician practitioner, treating the primary medical illness. However, if there is no exchange of information, or integration, between the medical professional (physician or other non-physician practitioner) in regard to the primary medical service and the dentist in regard to the dental services, then there would not be an inextricable link between the dental and covered medical service within the meaning of our regulation at § 411.15(i)(3). Without both integration between the Medicare enrolled medical and dental professional, and the inextricable link between the dental and covered services, Medicare payment for dental services would be prohibited under section 1862(a)(12) because the services are in connection with the care,

treatment, filling, removal, or replacement of teeth or structures directly supporting teeth; though they may be covered by types of supplemental health or dental coverage (87 FR 69687 through 69688).

We asked, in a situation where a medical professional believes that an individual with a diagnosis of diabetes may also have a diagnosis of periodontitis, how are recommendations conveyed between the medical and dental professionals? What coordination, if any, occurs between the medical and dental professionals? We noted that we expect that inextricably linked services related to the treatment of periodontitis in an individual with diabetes would require significant communication between the medical and dental professionals.

We mentioned that we have stated previously that an inextricable linkage may exist between dental services and covered services when the standard of care for the medical service is such that the practitioner would not proceed with the medical procedure or service without performing the dental services, because the covered medical services would or could be significantly and materially compromised, or where dental services are a clinical prerequisite to proceeding with the primary medical procedure and/or treatment (87 FR 69669). While evidence supports that individuals with diabetes and periodontitis who receive periodontal treatment experience improvements in their HbA1c markers, dental services do not appear to serve as a precondition to overall treatment for the diabetes. We sought information from the public on how oral treatment services may be a clinical prerequisite in the treatment protocol for the care of individuals with diabetes.

We noted that there does not appear to be a clear or singular definitional framework for categorizing the state of diabetes, such as ''controlled'' or ''uncontrolled'' diabetes. Research submitted by the public discusses improvements in glycemic control as evidence by HbA1c markers, but does not delineate the characteristics of a patient that would require direct clinical intervention (pharmacological, behavioral, usage of DME such as insulin pumps, etc.) versus a patient that would not require interventions given that their disease state is not within a concerning range requiring direct medical treatment.

Additionally, we noted that in the current literature, there are two types of severity measures that can help categorizing the state of diabetes: the severity of diabetes itself and the severity of periodontal disease among individuals with diabetes. With respect to the severity of diabetes, the American Diabetes Association recommends that most adults with diabetes aim for a HbA1c level below 7.0% (<53 mmol/mol), along with other recommended targets such as blood pressure below 130/80 mmHg and LDL cholesterol below 100 mg/dL.[236] In the current literature, uncontrolled hyperglycemia is typically defined as an HbA1c level above 8.0% (>64 mmol/mol), according to guidelines from various medical organizations, including the ADA, American College of Physicians, Association of Clinical Endocrinologists, and American College of Endocrinology.[237] [238] [239] [240] Based on the literature, this threshold serves as a ''take action'' point in managing diabetes and has been used in previous studies to indicate poor glycemic control. Achieving and maintaining target HbA1c levels is essential for individuals with diabetes (as well as the general population) and is a key goal of treatment. Moreover, we noted that for the purposes of Quality Payment Program (QPP) measures, CMS has issued measures for diabetes (for example, Quality ID #1 (NQF 0059): Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%)).[241] The measure is described as ''Percentage of patients 18–75 years of age with diabetes who had hemoglobin A1c >9.0% during the measurement period.'' Furthermore, measures of HbA1c may fluctuate over time; therefore, a strict threshold could lead to incentives for multiple rounds of testing to aim for the levels established. In general, guidelines exist, but standards vary for defining diabetes states based on multiple severity measures.

In addition, the severity of periodontal disease is not uniformly defined. ICD–10 codes, such as K05.2 for Aggressive Periodontitis and K05.3 for Chronic Periodontitis may be utilized to describe more severe instances of periodontitis (and in this instance when such diagnosis codes are also partnered with diagnoses related to diabetes for a particular individual). Another approach involves using the Armitage criteria for periodontal diagnosis.[242] [243] Severity assessment can be based on the clinical attachment level (CAL), with CAL between 1 mm and 2 mm classified as slight, 3 mm and 4 mm as moderate, and ≥5 mm as severe.[244] Again, some standards exist relative to the staging of periodontitis, but such criteria vary. Additionally, we believe that the current practice of medicine would allow for variation in clinical attributes as well as judgment and discernment by the referring practitioner regarding the clinical status of the individual when determining the need for consultation with other practitioner types, including the dentist. We sought comment on whether clinical standards exist that describe and define the disease state of diabetes that would serve to inform the selection of treatment modalities, including potential referrals to dental professionals with respect to concerns related to oral health. We also sought comment from the public regarding the ways that CMS could ensure that practitioners do not decrease the quality of diabetes treatment in an effort to maintain a beneficiary's potential access to Medicare payment for dental services.

We explained that the evidence supplied by submitters also described periodontitis but without a clear and consistent definitional structure. The 2017 World Workshop on the Classification of Periodontal and Peri-Implant Diseases and Conditions resulted in a new classification of periodontitis characterized by a multidimensional staging and grading system. The staging considers the aspects of severity, complexity, extent,

and distribution while the grading contemplates primary criteria such as progression and grade modifiers, including risk factors such as smoking and diabetes.[245]

For the purposes of our consideration of medical services for the treatment of diabetes for individuals with diabetes who have periodontitis, we sought comment from the public on clinical criteria that will determine eligibility for the effectiveness of periodontal treatment as described in the Cochrane review and other studies. We do not believe that a condition such as gingivitis or early stages of periodontitis will require oral treatment that, in turn, will influence the outcomes for an individual with diabetes. However, we sought information to address the following questions. At what stages and grading will the periodontitis be considered advanced and/or requiring dental and oral treatment intervention? What types of practitioners are able to make determinations regarding the staging of periodontitis? We also sought comment on patient eligibility. What determines patient eligibility for treatment for advanced periodontitis? Are there other criteria for consideration?

Additionally, we sought comment on the duration of potential periodontal treatment. How is the length of treatment determined? If a patient's clinical status improves with respect to the periodontal disease, what factors determine when periodontal treatment comes to an end? What does maintenance treatment entail? What services are provided in the treatment of advanced periodontal disease? What is the service definition? Are services bundled? If yes, what is included in the bundle? When are the services provided and over what period? Is it provided over a calendar month period? A single day? Multiple days? Are services timed? Who provides the services? What specific terminology is involved? Are these services ever provided under supervision? Or ''incident to'' by other clinical staff?

We also sought information on how services for advanced periodontal disease are provided. Where and how are services for treatment of advanced periodontal disease provided? Are there any special rules, such as obtaining advance consent or performance of an initiating visit?

We also sought information regarding coding and billing of periodontal services. What coding is utilized for the treatment services for advanced periodontal disease? What claims format is employed for the submission of claims with related oral and dental services (for example, 837D and/or 837P)?

Additionally, we sought comment from the public regarding the risk of recurrence of periodontal disease for this patient population. What is the level of risk for re-development of advanced periodontitis and likelihood of recurrence?

We also sought information regarding the role of caries in management of diabetes. What is the prevalence of caries in this patient population? What is the impact of caries on management of diabetes?

We also sought information regarding the disease state of the diabetes itself and its interaction with dental services. Does evidence exist to support that certain characteristics related to diabetes management (for example, maintenance of HbA1c) are more closely tied to certain oral interventions' ability to yield clinical improvements?

We reiterated that section 1862(a)(12) of the Act generally precludes payment under Medicare Parts A or B for any expenses incurred for services in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth. Thus, payment is permitted only where the dental services are inextricably linked to covered medical services. We believe that general maintenance and management of oral disease processes clearly falls within the statutory exclusion, and therefore, Medicare would not permit payment for routine dental and oral services.

We noted that many submitters stated that good dental and oral health benefits a patient's overall health in general. Several commenters responding to the CY 2023 PFS proposed rule also expressed that good oral hygiene, along with routine dental services, contributes to better outcomes for patients. We recognized in the CY 2023 PFS final rule in response to those comments that there is a great deal of evidence suggesting that dental health is generally an important component of overall health; however, we are interested in comments on whether certain dental services are considered so integral to the primary covered services that the necessary dental interventions are inextricably linked to, and substantially related and integral to clinical success of, the primary covered services such that they are not subject to the statutory preclusion on Medicare payment for dental services under section 1862(a)(12) of the Act (88 FR 79033).

In summary, we sought comment on whether certain dental services are inextricably linked to certain other covered services for diabetes, supported by clinical evidence as outlined in section II.J.1.c. of this final rule. We also sought comment specifically on whether dental services such as prophylaxis are a standard of care in the management of diabetes. We stated that we are committed to continuing to explore the potential inextricable relationship between dental services and covered medical services utilized in treatment for individuals with diabetes. We thanked submitters for the information they provided through the public submissions process and indicated that may consider revisions to the clinical examples codified in our regulations at § 411.15(i)(3)(i) based upon additional data and information received in response to the proposed rule.

a. Consideration of Dental Services That May Be Inextricably Linked to Covered Services for the Treatment of Diabetes

In section II.J.1.b. of this final rule, we discuss that we have partnered with AHRQ tohelp us consider the relationship between dental services and other specific covered services. In the CY 2025 PFS proposed rule (89 FR 61752), we provided an overview of the information we received from the public through the submission process.

We acknowledge the importance of dental health to overall well-being of patients with diabetes. We believe that further research is necessary to find specific evidence supporting specific medical services for which dental services are inextricably linked to their clinical success. To gain further understanding of any potential relationship between dental services and specific covered diabetes medical services, we partnered with researchers at AHRQ to review available clinical evidence regarding the relationship between dental services and covered diabetes medical services.

AHRQ created a rapid response report, which was not available at the time of the proposed rule's publication, which summarized recent evidence, aiming to inform CMS policy development related to the possible linkage between dental services and treatment modalities and services for diabetes patients. The AHRQ report reviewed the available clinical evidence on the efficacy of dental services in improving health outcomes for patients with diabetes mellitus (type 1 and 2). For more detailed information about the search strategies and findings, please

[245] Tables from Tonetti, Greenwell, Kornman. J Periodontol 2018;89 (Suppl 1): S159–S172. *https://www.perio.org/wp-content/uploads/2019/08/Staging-and-Grading-Periodontitis.pdf.*

refer to the AHRQ rapid response report available at *https://effectivehealthcare.ahrq.gov/products/treatment-outcomes-diabetes/rapid-research*.

According to the response report, diabetes mellitus (DM) characterized by high blood sugar levels (HbA1c >6.5 percent) affects approximately 37 million adults in the United States [246] and 500 million globally.[247] [248] Diabetes is a chronic metabolic disease that can lead to severe health complications, including lower limb amputations, blindness, chronic kidney disease, and cardiovascular diseases. As stated in the report, Type II DM is a highly prevalent metabolic disorder characterized by the loss of ability to adequately control blood glucose levels due to insulin resistance in body tissues and typically emerges in adulthood. On the other hand, Type I DM (formerly commonly known as juvenile diabetes), where an autoimmune response results in the destruction of insulin-secreting β cells in the pancreas, requires life-long insulin therapy.

Notably, chronic oral diseases (COD) including dental caries, gingival infection, periodontal disease, and tooth loss are significantly more common and more severe in diabetic patients.[249] As stated in the rapid response report, emerging evidence shows a complex relationship between diabetes and oral health (see Figure 1 in the AHRQ report). Increasing COD severity results in greater systemic inflammation, reducing glycemic control [250] and worsening diabetes outcomes. Conversely, poorly controlled diabetes can lead to increased severity of oral diseases such as periodontitis,[251] creating a cycle that negatively impacts overall health. The report also highlights a growing body of data indicating that oral inflammation affects general diseases.[252] According to the findings, diabetes patients with severe COD can have a significantly increased risk of all-cause mortality, underscoring the impact of oral health on cardiovascular, immune, and renal function.

The relationship between oral health treatment and diabetes management has been investigated in several studies; however, the exact correlation between oral health management and diabetes (both Type 1 and Type 2) has not been comprehensively addressed. Thus, the rapid response report conducted literature searches using large databases. As presented in the PRISMA diagram, the search identified 601 studies, of which 27 met the inclusion and exclusion criteria for the current review. Of these 27 articles, 16 were randomized clinical trials or non-randomized controlled observational studies, 6 were systematic reviews or meta-analyses, 3 were reviews of reviews, and 2 were practice guidelines.

The report found that there is consistent evidence that non-surgical periodontal therapy (NSPT) can improve glycemic control in diabetic patients, as measured by HbA1c. In the report, a subgroup analysis that divided patients into different baseline HbA1c groups suggested that dental care treatments may lead to greater improvement in glycemic control for patients with higher baseline HbA1c levels. Additionally, three primary studies show a statistically significant reduction in inflammatory markers, such as C-reactive protein and TNF-alpha, with the use of NSPT. Based on the report, guidelines reflected the available literature, demonstrating the effectiveness of NSPT in improving glycemic control in people with diabetes. There is also concordance in these guidelines regarding the need for an integrated care approach that includes dental health as part of comprehensive diabetes management.

The report also provided a few equivocal findings. The report found insufficient evidence to determine whether periodontal treatment sustains glycemic improvement or reduces inflammatory status for periods longer than 6 months. Outcomes related to mortality, hospitalizations, cardiovascular events, and quality of life (QoL) have been variable across studies. Additionally, a significant reduction in HbA1c levels in patients with type 2 DM after dental prophylaxis alone has not been consistently demonstrated. Furthermore, no significant changes in non-diabetes-specific metrics, such as inflammation and lipid markers, have been observed following non-periodontal dental services.

The report highlights three major limitations in the evidence: a lack of comprehensive reporting on important factors such as insulin resistance and additional inflammatory mediators beyond C-reactive protein (CRP); a limited follow-up duration of most interventional studies, typically capped at six months; and the generalizability of the current evidence to the U.S. population is unknown.

The findings of the AHRQ rapid response reports underscore that this area warrants further investigation by researchers and industry to explore potential connections between dental services and improved outcomes for individuals with diabetes. Specifically, future research can focus on identifying which subgroups of diabetic patients, and with what degree of periodontal disease, are most likely to experience significant improvements in glycemic control through concurrent treatment of their periodontal disease. Additionally, research is needed to determine whether recurring periodontal treatments, or a combination of periodontal and non-periodontal dental services, are necessary to sustain glycemic improvements and/or reductions in inflammatory status for periods longer than six months. Such studies could provide valuable insights for policymakers when assessing whether there is an inextricable link between certain dental and covered services for patients with diabetes.

We received 23 public comments responding to the request for information on whether certain dental services are inextricably linked to certain other covered services for diabetes. The following is a summary of the comments we received and our responses.

Comment: Commenters provided information and references supporting oral and dental treatment of periodontal disease among individuals with diabetes to improve markers related to management of the diabetes (mainly,

glycemic control). Some commenters urged us to continue to review findings, work within our authority and with stakeholders to support policies for individuals with diabetes to receive appropriate dental care while others recommended that we continue a judicious approach in consideration of expanding the policy for Medicare payment for dental services. One commenter stated that an act of Congress is required to further expand coverage to manage life-long chronic conditions because there are no specific medical services that can be used to qualify payment for dental services under the policy's framework. Commenters expressed concern about the broad application of the policy, and some suggested that CMS assess the similar standards of care found within the Veterans Health Administration and within Medicare Advantage.

Response: We thank commenters for their thoughtful feedback on the requests for information and note that we will take these comments into consideration for the future. The information provided to CMS through public comment did not identify any specific covered services for the treatment of diabetes to which dental services are inextricably linked. Rather, the information indicates that the primary treatment of periodontal disease in patients with diabetes generally leads to better outcomes in the management of the patients' diabetes, which is consistent with information provided through the public submission process. We continue to believe that while the research makes the case that the dental services are medically necessary for patients with diabetes, medical necessity alone does not permit payment for dental services given the broad statutory prohibition under section 1862(a)(12) of payment for services ''in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth.''

While the AHRQ rapid response report and the public comments we received provided more information regarding the standard of care and severity levels of diabetes along with severity levels of periodontitis and certain dental services that may improve clinical outcomes, this information lacks evidence that supports an inextricable link between dental services and certain other covered services for the treatment of diabetes. We will continue to engage with interested parties on this topic and are interested in information that could assist us in identifying specific covered medical services that the dental services are inextricably linked to. We believe that the list of services identified by submitters provided above in section II.J.3 of this final rule may be a good starting point in considering how to apply the inextricably linked standard to chronic disease management. Are there codes that describe specific services that align to patients with these conditions or needs (for example, an uncontrolled diabetic that has periodontitis)? Are there physicians' services that dental services would be inextricably linked to for beneficiaries with these needs?

4. Request for Comment on Dental Services Integral to Specific Covered Services To Treat Systemic Autoimmune Disease Requiring Immunosuppressive Therapies

We have received information from interested parties, including submitters providing evidence through the public submissions process as well as commenters on prior proposed rules suggesting that certain dental services are inextricably linked to immunosuppressive therapies for individuals with autoimmune disorders.

According to the NIH's National Institute of Environmental Health Sciences, a healthy immune system is able to defend the body against disease and infection. However, if the immune system malfunctions, it may mistakenly attack healthy cells, tissues, and organs. This scenario is called autoimmune disease, and these attacks can affect any part of the body, weaken bodily function, and in some cases become life-threatening.[253] There are over 100 autoimmune diseases, including Type 1 diabetes, multiple sclerosis, lupus, rheumatoid arthritis, and inflammatory bowel disease. There are also other autoimmune diseases that are rare and difficult to diagnose. In some cases, patients may suffer for years before receiving a proper diagnosis, and most of these diseases have no cure. Additionally, some autoimmune diseases require lifelong treatment for system management.[254]

Autoimmune diseases are continuously affecting more people. Estimates indicate that as many as 50 million people in the U.S. have an autoimmune disease, making it the third most prevalent disease category, surpassed only by cancer and cardiac disease. Generally speaking, a person's genes, in combination with infections and other environmental exposures, likely play a significant role in disease development, though in some instances, the pathology may be unknown. Additionally, nearly 80 percent of people with a chronic autoimmune condition are women.[255] Symptoms of autoimmune diseases can include: fatigue, pain, dermatologic manifestations, weight loss or gain, insomnia, fever, and a myriad of other symptoms.[256]

Many treatment modalities are employed in the management of autoimmune diseases. Treatments could include use of oral medications, including steroids, anti-inflammatory medications, as well as infusion immunotherapy. Some autoimmune conditions may present in a localized fashion, such as Sjogren's, and many of the independent organ inflammations require immunosuppressive therapies, and may progress to a more systemic involvement. Conversely, some systemic autoimmune diseases, like sarcoidosis, may not require immunosuppression in mild cases.

Submissions through the public submissions process urged us to provide that payment can be made for dental services for individuals with autoimmune diseases receiving immunosuppressive therapy. In submissions, several interested parties have asserted that immunosuppressive therapies utilized in the treatment of autoimmune disease have similar immunosuppressive effects as those of toxic chemotherapy utilized in the treatment of cancer and that these treatments are analogous to the clinical examples finalized in CY 2024 PFS rulemaking for dental services inextricably linked to covered medical services in the treatment of cancer.

Submitters stated that oral and dental treatment is also often integral to the successful care and management of beneficiaries with autoimmune diseases who are initiating or undergoing immunosuppressive or immunomodulator therapy because the absence of medically necessary oral and dental treatment can pose serious complications to those beneficiaries and the covered medical services they receive. Submitters state that, for example, dental infections can spread quickly when host immunity is compromised by immunosuppressing or immunomodulating drugs utilized in treatment. As such, submitters note that the American College of Physicians has described that the implications of dental disease in patients who are undergoing immunosuppressive therapy extend

[253] *https://www.niehs.nih.gov/health/topics/conditions/autoimmune.*

[254] Ibid.

[255] Ibid.

[256] *https://www.womenshealth.gov/a-z-topics/autoimmune-diseases.*

beyond their oral disease, with potentially life-threatening complications if the dental problems are not treated. For these reasons, submitters state that the covered services upon which immunocompromised patients depend (for example, immunosuppressive therapy) should not proceed until a dental or oral exam is performed to address the oral complications and/or clear the patient of an oral or dental infection.

Submitters provided information regarding specific covered services that they believe could be associated with treatments for immunosuppressive therapy for the treatment of autoimmune disease and that may increase infection risk, such as:

- CPT codes 99212–99215: Evaluation and Management (E/M) Services.
- CPT codes 96365–96368: Infusion services.

Submitters also provided coding information related to drug therapies, such as CPT codes for immunosuppressant drugs, including:

- J0129: Abatacept (Orencia) for Rheumatoid Arthritis.
- J0135: Adalimumad (Humira) for Crohn's, Ulcerative Colitis, Rheumatoid Arthritis.
- J0490: Belimumab (Benlysta) for systemic lupus erythematosus (SLE), Lupus Nephritis, and Sjögren's.
- J0491: Anifrolumab-fnia (Saphnelo) for systemic lupus erythematosus (SLE).
- J1303: Ravulizumab-cwvz (Ultomiris) for Generalized Myasthenia Gravis.
- J1438: Etanercept (Enbrel) for Rheumatoid Arthritis, Ankylosing Spondylitis.
- J1595: Glatiramer (Copaxone) for Multiple Sclerosis.
- J1602: Golimumab (Simponi) for Rheumatoid Arthritis, UC, Ankylosing Spondylitis.
- J1745: Infliximab (Remicade) for Crohn's, Ulcerative Colitis, Rheumatoid Arthritis.
- J2250: Upadacitinib (Rinvoq) for Rheumatoid Arthritis, Ulcerative Colitis, Crohn's.
- J2323: Natalizumab (Tysabri) for Multiple Sclerosis.
- J2350: Ocrelizumab (Ocrevus) for Multiple Sclerosis.
- J3262: Tocilizumab (Actemra) for Scleroderma-associated lung fibrosis.
- J3357: Ustekinumab (Stelara) for Crohn's, Ulcerative Colitis, Psoriatic Arthritis.
- J3380: Vedolizumab (Entyvio) for Crohn's, Ulcerative Colitis.
- J3590: Secukinumab (Cosentyx) for Plaque Psoriasis.
- J7500: Azathioprine (Imuran) for Lupus, Crohn's, Sjögren's.
- J7517: Mycophenolate (Cellcept) for Lupus, Sjögren's.
- J9070: Cyclophosphamide (Cytoxan) for Sjögren's, Vasculitis.
- J9250: Methotrexate for Sjögren's, Rheumatoid Arthritis (unresponsive to other treatment).
- J9302: Ofatumumab (Kesimpta) for Multiple Sclerosis.
- J9312: Rituximab (Rituxan) for Rheumatoid Arthritis, Sjögren's.
- J9332: Efgartigimod (Vyvgart) for Myasthenia Gravis.

Submitters also provided coding information for potential medical services for medical treatment for pulmonary diseases when aspiration of dental pathogens risk or cause the initiation and/or recurrence of complications, such as:

- CPT codes 99212–99215: Evaluation and Management (E/M) Services.
- CPT code 99291: Critical Care Services.
- DRG code 177: Hospitalization for respiratory infections and inflammation.
- DRG code 190: COPD with complications.

Submitters also provided coding regarding medical treatment for dentally sourced dissecting maxillofacial space infections:

- CPT 41000: Intraoral incision and drainage of abscess.
- CPT 87181: Antibiotic susceptibility study.
- CPT 96365: Infusion of antibiotic.
- CPT codes 99281–99285: Emergency department services.
- CPT codes 99291–99292: Critical care services.
- DRG code 135: Sinus procedures with CC/MCC.
- DRG code 141: Major head and neck procedures with CC.
- DRG code 872: Hospitalization for septicemia or severe sepsis.

Submitters providing information through the public submissions process stated that if dental or oral infections are left undetected or untreated in the population of individuals undergoing immunosuppressive therapy for autoimmune disease, serious complications may occur and negatively impact the course and outcome of the covered medical procedures, which submitters state is analogous to previously finalized policies for dental services inextricably linked to covered cancer treatment for the patient. Several submitters pointed out that we stated in the CY 2024 PFS final rule that proceeding without a dental or oral exam of the mouth prior to chemotherapy could lead to systemic infection or sepsis, among other complications, and that similar outcomes can follow for those receiving immunosuppressive therapy to treat autoimmune diseases.

The submitters noted that in the CY 2024 PFS final rule, we described that AHRQ identified evidence to support that dental evaluation/treatment prior to cancer treatment led to decreased incidence and/or less severity of serious oral infections and complications like oral mucositis and encouraged CMS to explore this connection to confirm that dental evaluations and treatment prior to immunosuppressive therapy would lead to decreased incidence of serious oral infections in a similar fashion. The submitters also stated that they believe it is critical that beneficiaries with an autoimmune disease that requires immunosuppressive therapy have access to necessary dental services, as proper dental care for this population can reduce the incidence of serious infection and improve overall patient outcomes for the covered service.

In the CY 2025 PFS proposed rule (89 FR 61762), we stated that we appreciate the evidence and information provided by submitters and agree that we should continue to research whether there is a connection between dental and oral evaluations and treatment prior to immunosuppressive therapy and outcomes for said therapies, including the potential decreased incidence of serious oral infections.

However, we sought comment on whether the level of immunosuppression utilized in the treatment of autoimmune diseases is analogous to the immunosuppression levels employed in the treatment of cancer. We believe that the level of immunosuppression for systemic autoimmune disease has different characteristics versus therapies utilized in chemotherapy for the treatment of cancer. For example, the usage of monoclonal antibodies in the treatment of autoimmune disease may not render the same level of immunosuppression and subsequent susceptibility to infection as chemotherapy used in the treatment of cancer.

We also sought information on the connection between immunosuppressive therapy in the treatment of autoimmune disease and the likelihood of systemic infection and sepsis. Specifically, we sought information regarding the likelihood of dental and oral sources as the locus of the seeding of infection in this patient population. Additionally, we sought information regarding standards of care or clinical guidelines that recommend that a dental infection be addressed

before proceeding with the immunosuppressive treatment or the administration of drugs or whether oral antibiotics would be prescribed to resolve the infection and that the therapy would advance without direct dental or oral services to address the infection.

We also sought information regarding whether there is differential impact between drugs that are administered in an office setting or similar versus those medications that are taken in an oral fashion.

We thanked submitters for the information they provided through the public submissions process. We explained that we believe that additional information is necessary to consider whether there is an inextricable link between dental services and covered services to treat systemic autoimmune disease requiring immunosuppressive therapies and sought comment from the public. We indicated that we remain open to considering any such services identified by public commenters, and if sufficient evidence is presented, we may consider adding such services to § 411.15(i)(3) in this final rule.

a. Consideration of Dental Services That May Be Inextricably Linked to Covered Services for the Treatment of Systemic Autoimmune Disease Requiring Immunosuppressive Therapies

In section II.J.1.b. of this final rule, we discuss that we have partnered with AHRQ to help us consider the relationship between dental services and other specific covered services. In the CY 2025 PFS proposed rule (89 FR 61752), we provided an overview of the information we received from the public through the submission process.

We acknowledge the importance of dental health to overall well-being of patients with autoimmune disease. We believe that further research is necessary to find specific evidence supporting specific medical services for which dental services are inextricably linked to their clinical success. To gain further understanding of any potential relationship between dental services and specific covered autoimmune disease medical services, we again partnered with researchers at AHRQ to review available clinical evidence regarding the relationship between dental services and covered autoimmune disease medical services.

AHRQ created a rapid response report, which was not available at the time of the proposed rule's publication, which summarized recent evidence, aiming to inform CMS policy development related to the possible linkage between dental services and treatment modalities and services for patients with autoimmune conditions. The AHRQ report reviewed the available clinical evidence on the efficacy of dental services in improving health outcomes for patients with autoimmune (AI) diseases treated with biologics and other immunosuppressants. For more detailed information about the search strategies and findings, please refer to the AHRQ rapid response report available at *https://effectivehealthcare.ahrq.gov/products/autoimmune-disease/rapid-research*.

As stated in the AHRQ rapid response report, AI, such as systemic lupus erythematosus (SLE), rheumatoid arthritis (RA), and limited cutaneous systemic sclerosis (lcSSc), affect over 50 million people in the United States,[257] with oral symptoms often serving as early indicators of AI disease.[258] Patients with autoimmune conditions frequently experience poor oral health (for example, increased plaque index, gum disease, and edentulism) compared to healthy individuals.[259] [260] [261] [262] Additionally, as chronic autoimmune and inflammatory diseases are correlated with an elevated risk of periodontitis, patients with both periodontitis and lcSSc exhibited greater arterial stiffness and disease activity compared to healthy individuals with periodontitis,[263] a gum disease that damages local tissue and can promote systemic inflammation.[264] The rapid response underscores a bidirectional relationship for autoimmune diseases, including SLE, where the dysregulated immune system exacerbates oral inflammation and dysbiosis of the oral microbiota. In turn, oral infections contribute to systemic inflammation and the progression of SLE.[265] For more details on the causal model depicting the relationship between rheumatoid arthritis and oral disease, please refer to Figure 1 in the AHRQ report.

Given a bidirectional relationship between oral health and autoimmune disease, the Centers for Disease Control and Prevention (CDC) emphasizes the importance of daily oral hygiene and professional dental care, which reduce rates of tooth decay and oral inflammation.[266] Maintaining good oral health and reducing overall plaque may be especially beneficial to AI patients with dysregulated inflammatory responses.

According to the report, there are various therapies available for treating RA and other autoimmune diseases. One key group of treatments, disease-modifying anti-rheumatic drugs (DMARDs), has been used effectively for multiple autoimmune conditions. DMARDs are divided into two main types: conventional small molecule drugs like methotrexate, and biologics, which are more targeted therapies. Both types work by suppressing the immune system but through different mechanisms. Conventional DMARDs inhibit inflammatory pathways broadly, while biologics are more selective, targeting specific immune components such as cytokines or B-cells.

As stated in the AHRQ rapid response report, an electronic database search conducted in Medline and Embase yielded 127 records, of which 38 articles were assessed for eligibility. Of the 38 full-text articles retrieved and reviewed for eligibility, 25 articles were excluded. In total, 13 unique publications—

including 10 primary studies and 3 systematic reviews with meta-analyses—were included, extracted, and synthesized in this rapid response review.

The evidence reviewed on the impact of dental services on autoimmune disease outcomes primarily focused on patients with RA receiving non-surgical periodontal treatment (NSPT). There is limited evidence for other autoimmune diseases and no studies assessing the effect of other dental services. Additionally, all studies examined NSPT during autoimmune treatments, with no evidence available on the impact of NSPT prior to immunosuppressive therapy. The report found that the evidence generally supports the effectiveness of NSPT in reducing disease activity scores for RA and psoriasis, with follow-up times ranging from 6 weeks to 6 months. Additionally, there is moderate evidence that C-reactive protein (CRP) and erythrocyte sedimentation rate (ESR) levels decrease post-NSPT in patients with RA and SLE.

The report also provided a few equivocal findings. There is a lack of evidence regarding dental services other than NSPT. Findings on the reduction of the number of tender or swollen joints in RA patients after NSPT are inconsistent. Additionally, there is inconsistent evidence showing that NSPT had no significant effect on quality of life (QoL) measures for RA and psoriasis. The report found insufficient evidence of any effect of NSPT on disease activity in SLE. Also, there has been no reported impact of NSPT on adverse effects related to therapies for autoimmune conditions. A guidance article on RA published by the American Dental Association included recommendations for oral health management,[267] and of the 30 clinical practice guidelines on autoimmune diseases, only one—focused on Sjogren's syndrome—provided recommendations for dental care.

The report found that there are several limitations to the current body of evidence. Most studies had short follow-up periods (typically 3 months or less), preventing a full assessment of NSPT's long-term effects on autoimmune disease outcomes. The report also highlighted high variability across studies, making it difficult to draw definitive conclusions about the benefits of periodontal therapy. Additionally, most research focuses on rheumatoid arthritis, leaving gaps in understanding of other autoimmune conditions and dental services beyond non-surgical periodontal treatment. Finally, the generalizability to diverse populations, particularly in the U.S., remains uncertain.

Based on this report, several future research areas can be identified. More studies could focus on examining the impact of dental services on autoimmune conditions beyond RA. Additionally, researchers could evaluate whether improvements in disease activity scores are appropriate metrics for clinical improvement in RA, especially when these scores do not appear to correlate with improvements in clinical joint inflammation. Furthermore, it may be necessary to subdivide DMARDs, used to treat RA and other autoimmune diseases, into categories such as corticosteroids, biologics, and antimetabolites to better assess their specific impacts on treatment outcomes.

We received 22 public comments in response to the request for information on whether certain dental services are inextricably linked to certain other covered services for individuals with autoimmune disorders requiring immunosuppressive therapies. The following is a summary of the comments we received and our responses.

Comment: Commenters provided information on the value of dental services, both prior to and during, for beneficiaries undergoing immunosuppressive therapy due to their compromised immune system. Commenters stated that immunosuppressive therapies, used to treat conditions such as autoimmune diseases and certain cancers, often exacerbate oral health problems. Commenters stated that the level of immunosuppression for systemic autoimmune disease has different characteristics versus therapies used in chemotherapy in the treatment of cancer. Commenters stated the variability in therapies, severity levels of dental disease, and severity levels of compromised immunity but urged CMS to recognize that the risk of immunosuppression is real, as is the associated risk for infection-related complications. Some commenters urged us to continue to review findings, work within our authority and with stakeholders to support policies for individuals with autoimmune disease who are undergoing immunosuppressive therapy to receive appropriate dental care while others recommended that we continue a judicious approach in consideration of expanding the policy for Medicare payment for dental services. Some commenters suggested that CMS assess the similar standards of care for immunocompromised individuals found within the Veterans Health Administration.

Response: We thank commenters for their thoughtful feedback on the requests for information and note that we will take these comments into consideration for the future. We agree with commenters that people who are immunocompromised due to receiving immunosuppressive therapies may be prone to serious infection. We also believe that information provided by commenters further supports the idea that, broadly, dental health is an important component of good overall health. However, we reiterate that dental services in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting the teeth are statutorily excluded from payment under Medicare Parts A and B unless a specific exception applies.

We agree with commenters that comparing autoimmune diseases and cancer as related to immunosuppression is difficult due to several factors such as the location of cancer and the modality of treatment. We also agree that in order to make a meaningful comparison, it would be necessary to identify the specific autoimmune disease and immunosuppressive therapy, or both.

While the AHRQ rapid response report and the public comments we received provided more information regarding certain autoimmune diseases and therapies and certain dental services that may improve clinical outcomes, this information lacks evidence to help us determine whether there is an inextricable link between dental services and covered services for treating autoimmune disease. Specifically, we believe that we need more clinical evidence to help us identify whether there are clinical scenarios where dental services are inextricably linked with specific clinical outcomes of a medical service for people with immunosuppression.

We will continue to engage with interested parties on this topic and are interested in information that could assist us in identifying specific clinical scenarios and the covered medical services that the dental services are inextricably linked to. Similarly, with what we stated for diabetes, we believe that the list of services identified by submitters provided above in section II.J.4 of this final rule may be a good starting point in considering how to apply the inextricably linked standard to chronic disease management. In

[267] De Rossi, S.S.; Ciarrocca, K.N. Autoimmune and Connective Tissue Diseases. In The ADA Practical Guide to Patients with Medical Conditions; John Wiley & Sons, Ltd, 2015; pp 201–229. *https://doi.org/10.1002/9781119121039.ch10.*

addition, we are interested in information on specific autoimmune diseases, level of severity, and the extent to which there is a linkage of an autoimmune disease to dental infection. Are there metrics available to indicate the depth and breadth of immunosuppression? If so, what could be the level of immunosuppression that creates susceptibility to infection? How do the different therapies impact immunosuppression levels and health outcomes? Are there specific immunosuppressive therapies that pose higher risks to patients? Does the duration of use for a particular immunosuppressant play a role and if so how? What are the clinical scenarios where an immunosuppressive must be stopped because they are placing the individual's health and continued treatment at risk?

5. Implementation of Payment for Dental Services Inextricably Linked to Other Specific Covered Services

In the CY 2024 PFS final rule (88 FR 79035 through 79039), we solicited comments on whether we should provide additional guidance that would aid in processing claims for dental services that are inextricably linked to a Medicare-covered medical service. Some commenters suggested the usage of a modifier on the dental claim format that would better identify when dental services are inextricably linked to specific covered medical services. As we continue to consider improvements to our payment policies and have gained experience around the provision of dental services inextricably linked to covered medical services, we have explored tools and resources that may help to facilitate the implementation and coordination of dental services that are currently covered under Medicare, including the possible usage of modifiers and diagnosis codes. The usage of modifiers on a dental claim would seek to identify the dental service as a service the billing practitioner identifies as inextricably linked to a specific covered medical service and for which there was an exchange of information, or integration, between the medical and dental professional (physician, including a dentist, or other non-physician practitioner) as specified in the CY 2023 PFS final rule (87 FR 69663 through 69688). We have explained that if there is no exchange of information, or integration, between the medical professional (physician or other non-physician practitioner) regarding the primary medical service and the practitioner furnishing the dental services, then there would not be an inextricable link between the dental and covered medical service within the meaning of our regulation at § 411.15(i)(3). Furthermore, integration between medical and dental professionals can occur when these professionals coordinate care. This level of coordination can occur in various forms such as, but not limited to, a referral or exchange of information between the medical professional (physician or non-physician practitioner) and the dentist. This coordination should occur between a dentist and another medical professional (physician or other non-physician practitioner) regardless of whether both individuals are affiliated with or employed by the same entity.

In the CY 2025 PFS proposed rule, we explained that the KX modifier is currently submitted on a Medicare Part B claim to indicate that the service or item is medically necessary, and that the healthcare provider has included appropriate documentation in the medical record to support or justify the medical necessity of the service or item. We stated that we believe that usage of the KX modifier in the context of claims for dental services inextricably linked to covered services would be appropriate and support claims processing and program integrity efforts.

We further explained that based on comments received and summarized in the CY 2024 PFS final rule (88 FR 79037), interested parties requested that we provide more guidance on how a practitioner submitting claims for dental services can attest that the dental and medical services are inextricably linked, and that the criteria have been met to support payment. We believe that the use of the KX modifier would allow practitioners to signal that the dental services meet the criteria to support payment. We also noted that the use of the KX modifier may improve the MACs' ability to ascertain the volume of claims that are being submitted for dental services inextricably linked to covered services.

Therefore, we proposed that, effective January 1, 2025, the KX modifier will be required for claims submission for dental services inextricably linked to covered medical services on both the dental claim format 837D and the professional claim format 837P. We proposed that practitioners who bill for dental services for which they seek payment in accordance with § 411.15(i)(3) must include the KX modifier on the 837D or 837P claim to indicate that they believe that the dental service meets the established payment criteria; that the practitioner has included appropriate documentation in the medical record to support or justify the medical necessity of the service or item and that demonstrates the inextricable linkage to covered medical services; and that coordination of care between the medical and dental practitioners has occurred.

We discussed how practitioners now have the option to utilize the KX modifier as proposed, for services with dates of service in CY 2024 as a way to help with this transition to potentially requiring use of the KX modifier for claims submission beginning in 2025. We stated that this optional usage in CY 2024 will not be mandatory and will serve to support both clinician and MAC claims processing activities. We noted our intent to provide additional instruction and education through subregulatory guidance regarding this voluntary phase of the usage of the KX modifier on claims submitted for dental services inextricably linked to covered medical services. We sought comment on all aspects of this proposal. (89 FR 61762 through 61763)

In the CY 2025 PFS proposed rule, we also discussed that while the KX modifier indicates that the services are medically necessary, the GY modifier (along with three other HCPCS denial modifiers) serves to indicate that a service is not covered because it is outside of the scope of Medicare coverage authorized by the statute. We reiterated that denial modifiers should be used when physicians, practitioners, or suppliers want to indicate that the item or service is statutorily non-covered.

We explained that the use of the GY modifier could support MAC efforts to adjudicate claims and remove from the claims processing pipeline those claims that do not require further processing. We sought comment on whether we should recommend the usage of the GY modifier on the 837D or 837P dental claim format in instances where a Medicare claim denial is sought for purposes of submission to third party payers or when the service does not fit within a Medicare benefit category and is statutorily excluded from coverage.

Additionally, we stated that in general, the Act and our regulations mandate the submission of diagnostic coding (for example, ICD–10 codes) on Medicare claims. Section 1842(p)(1) of the Act states that ''each request for payment, or bill submitted, for an item or service furnished by a physician or practitioner specified in subsection (b)(18)(C) for which payment may be made under this part shall include the appropriate diagnosis code (or codes) as established by the Secretary for such item or service.'' Under this section, each bill or request for payment for

physicians' services under Medicare Part B must include the appropriate diagnostic code ''as established by the Secretary'' for each item or service for which the Medicare beneficiary received treatment. We noted that in the March 4, 1994 final rule entitled *Medicare Program; Diagnosis Codes on Physician Bills,* we codified that each bill or request for payment for a service furnished by a physician under Medicare Part B must include appropriate diagnostic coding for the diagnosis or the symptoms of the illness or injury for which the Medicare beneficiary received care and revised our regulations at § 424.32, *Basic requirements for all claims,* to state specifically that a claim for physician services must include appropriate diagnostic coding using diagnostic information (59 FR 10290).

We noted that in the CY 2023 PFS final rule, we stated that dentists are included in the statutory definition of physician at section 1861(r)(2) of the Act and would generally be considered and treated as a physician for purposes of enrollment, compliance, and other administrative programs (87 FR 69673). Therefore, dentists, who are physicians for the purposes of the Medicare program, are required to submit diagnosis codes on claims for physician services as described in the statute and regulations. Furthermore, we noted that diagnosis code information is currently required on the submission of the professional claim form 837P; professional claims lacking such information are returned to the healthcare provider and are not processed.

We also noted that in the CY 2023 PFS final rule (87 FR 69679 through 69680), we acknowledged the need to address and clarify certain operational issues related to Medicare payment for dental services inextricably linked to covered services and noted that we were working to address these issues, including claims processing questions raised by the commenters. We stated that we anticipated resolving many of the additional operational issues raised by commenters potentially as soon as CY 2024, including efforts to adopt the dental claim form (837D). Similarly, in the CY 2024 PFS final rule (88 FR 79036), we stated that we continue to work to address issues raised by commenters, such as questions related to claims processing and efforts to accommodate the dental claim form within our claims processing systems, effective 2024. The efforts related to adopting the dental claim form are ongoing, and as efforts advance to address the implementation and functionality of claims processing systems for the dental claim form, we intend to provide appropriate guidance and education to interested parties. (89 FR 61763)

In the CY 2025 PFS proposed rule, we explained that we anticipate that our systems will be able to process claims submitted using the dental claim form 837D (OMB Control No. 0938–1471) by January 1, 2025. We stated that consistent with the statutory and regulatory requirements discussed above, we intend to require a diagnosis code to be included on claims submitted for physicians' services for dental services inextricably linked to covered medical services on both the 837P and 837D formats, beginning on January 1, 2025. However, given the complexities related to the operational launch of and transition to the 837D dental claims format, we also considered further delaying the requirement to include a diagnosis code on the 837D form. For example, interested parties have indicated that in current dental practice, claims processing systems may not require the submission of a diagnosis code on claims for dental services, and therefore, dental practices may need time to adjust to this requirement for the 837D form. We also stated that we believe that it may be appropriate to delay this requirement for a limited time to support clinicians and billing entities as they seek to change their workflows and transition to using the 837D form. We sought comment on our intention to require the inclusion of a diagnosis code on the 837D form beginning on January 1, 2025. We were particularly interested in any operational challenges that interested parties may face in attempting to comply, as well as other considerations that we should take into account with regard to the timing of this requirement. (89 FR 61763)

We received 25 public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters supported the proposal to require the KX modifier for claims submission of dental services inextricably linked to covered medical services on both the dental claim format 837D and the professional claim format 837P. One commenter stated they support the use of the KX modifier to indicate that a dental service is inextricably linked to a covered medical service and that there has been integration between the medical and dental providers. The commenter stated that a patient's provider is well positioned to determine that a KX modifier should or should not be added.

Overall, commenters responded favorably to our comment solicitation on whether we should recommend the usage of the GY modifier on the 837D or 837P dental claim format in instances where a Medicare claim denial is sought for purposes of submission to third party payers or when the service does not fit within a Medicare benefit category and is statutorily excluded from coverage. Most commenters supporting the proposed use of the KX modifier also supported usage of the GY modifier in this context. These commenters indicated that the KX and GY modifiers would streamline and improve claim submission and generally help to establish a more clear, transparent standard to help ensure coordination between the dental and clinical professional and agree that it will help to demonstrate when dental services are inextricably linked to Medicare covered services. One commenter supported the use of both modifiers, stating that this will ensure claims are accurately categorized and processed more efficiently for both CMS and providers.

One commenter expressed concern about the overuse of the GY modifier and explained that using the same modifier for different scenarios may create confusion procedurally for providers and their teams because it may be unclear on how to proceed with payment. The commenter recommended that CMS consider the use of two or more unique modifiers—one for coordination of benefits issues or third-party responsibility, another when the service is statutorily excluded from coverage (the dental procedure), and one in which the service may not be statutorily excluded but does not meet the conditions for payment. Commenters requested clarification around the specific instances when a claim must be submitted with the GY modifier, for example, whether a dental claim must be submitted with the GY modifier to coordinate dental benefits with a State's Medicaid program, even in cases in which the Medicaid provider knows a dual-eligible patient will be ineligible for dental benefits under the medically necessary payment rules.

Two commenters did not support the use of the KX or the GY modifiers. The commenters stated that the dental industry and dental software are not ready for the requirement of modifiers within the current architecture supporting the industry's operational aspects. In addition, the commenters stated that the modifiers would entail significant costs for new programs and training to dental offices and carriers alike and would add complexity

without a therapeutic benefit. Further, the commenters stated that they do not believe that the use of the GY modifier would be beneficial but did not give an explanation.

Many commenters supported our intent to require a diagnosis code on claims submitted for physicians' services for dental services inextricably linked to covered medical services on both the 837P and 837D formats, beginning on January 1, 2025. Commenters recognized that the inclusion of these codes is intended to improve the accuracy and coordination of care between medical and dental providers, particularly for services that are intrinsically linked to medical procedures.

Overall, the comments received on the use of modifiers and the inclusion of a diagnosis code on claims requested that CMS allow delay of their implementation. Commenters were concerned that time is needed to resolve potential claims processing issues. Regarding the KX and GY modifiers, commenters stated that there is currently no place on dental claim forms to accommodate them. They were particularly concerned with the readiness of healthcare IT infrastructure, stating that there has been minimal testing among software developers, electronic dental record companies, and claims clearinghouses to verify that CDT codes with these modifiers can be processed accurately. They also stated that the ADA 2024 Paper Claim Form cannot accommodate modifiers at the procedure level.

Commenters appreciated our engagement with them to learn more about the challenges associated with including ICD–10 codes in Medicare dental claim submissions. One commenter explained that using diagnosis codes may create operational difficulties for dental providers since dental practices, especially small dental practices, do not typically have access to patient medical records to include ICD–10 codes on the 837D. A different commenter explained that the dental community does not have a widespread adoption of reporting diagnosis codes and as a result, a delay is necessary to ensure providers can adjust to these new requirements, including updating their practice management systems and training staff on the correct use of ICD–10 codes.

Given these concerns about the potential challenges associated with implementing the reporting of the two modifiers and a diagnosis code, commenters suggested several options for a delay such as, until mid-2025, January 1, 2026, and January 1, 2027. We note that with each suggestion for the duration of a delay, commenters did not provide information that would distinguish a need for one timeframe from another. Commenters explained a delay would allow sufficient time for comprehensive testing, reporting, and educational materials for providers, vendors, and payors. During this transitional period, some commenters recommended CMS allow MACs to adjudicate claims without modifiers, with an approved claim report advising providers that modifiers will be required starting January 1, 2026. Commenters indicated this approach would help alleviate any confusion for providers and ensure the continuation of quality patient care for these new coding requirements. Meanwhile, one commenter strongly urged CMS not to delay the requirement of a diagnosis code, stating that a diagnosis code is critically necessary to understand whether a dental service is covered under Medicare.

Response: We thank commenters for their support of our proposal to require the usage of the KX modifier on the dental claim format 837D and the professional claim format 837P to identify dental services inextricably linked to covered medical services; our intent to require the reporting of a diagnosis code on the 837P and 837D forms for physicians' services for dental services inextricably linked to covered medical services; and our recommendation on the use of the GY modifier on the 837P and 837D forms. We agree with commenters that these claim payment mechanisms would streamline and improve claim submission and generally help to establish a more clear, transparent standard to help ensure coordination between the dental and clinical professional and agree that it will help to identify when dental services may be inextricably linked to other Medicare covered services. We appreciate commenters' concerns regarding the challenges they may encounter in implementing these new aspects of claims submission and found the need for additional time compelling. Therefore, we are finalizing a delay of implementing the requirement for reporting the KX modifier on the professional, dental, and institutional (as discussed in the following comment and response) claim forms to identify dental services inextricably linked to covered medical services. We are also finalizing a delay of implementing the requirement for reporting a diagnosis code on the dental claim form for physicians' services for dental services inextricably linked to covered medical services. That is, both of these billing requirements will be effective July 1, 2025. We agree with commenters that suggested a mid-2025 effective date and believe that this timeframe would allow sufficient time for comprehensive testing, reporting, and educational materials for healthcare providers, vendors, and payors. We are also finalizing that the GY modifier may be used on the professional, dental, and institutional (as discussed in the following comment and response) claim forms in instances where a Medicare claim denial is sought for purposes of submission to third party payers or when the dental service does not fit within a Medicare benefit category and is statutorily excluded from coverage.

Comment: Commenters stated that the scope of the proposed billing policies only included the dental claim format 837D and the professional claim format 837P. These commenters requested CMS to clarify if reporting the KX and GY modifiers would apply to the institutional claim format 837I. Commenters explained that this clarification is needed because of the discussion in section III.B.8 of the CY 2025 PFS proposed rule (89 FR 61805 through 61806) wherein CMS establishes that the modifier KX billing requirement applies to rural health clinics (RHC) and federally qualified health center (FQHC) claims, which are submitted using the 837I claim format. This commenter also stated that the 837I claim format is used by Method II critical access hospitals (CAHs) to submit professional charges.

Response: We agree with commenters that the discussion in the CY 2025 PFS proposed rule only referenced the dental claim format 837D and the professional claim format 837P and that we need to be clear regarding whether these proposed billing policies are applicable to the institutional claim format 837I. In the CY 2023 PFS final rule (87 FR 69663 through 69688), we clarified and codified at § 411.15(i)(3)(i) that Medicare payment under Parts A and B could be made when dental services are furnished in either the inpatient or outpatient setting when the dental services are inextricably linked to, and substantially related and integral to the clinical success of, other covered services. We recognize that when dental services are furnished in either the inpatient or outpatient setting, depending on the provider or supplier, they may be billed using the 837I, 837P, or the 837D claim forms. As the commenter stated, FQHC services are paid under Medicare Part B and are billed to Medicare on the 837I claim

form. Therefore, we are finalizing that in addition to the 837D and 837P claim forms, the KX modifier will be required for claims submission for dental services inextricably linked to covered medical services on the institutional claim format 837I. We are also finalizing that the GY modifier may be used on the institutional claim format 837I in instances where a Medicare claim denial is sought for purposes of submission to third party payers or when the dental service does not fit within a Medicare benefit category and is statutorily excluded from coverage. Regarding the requirement to report a diagnosis code, we note that this is already a requirement for the institutional claim format. Please see section III.B.8. of this final rule for the policy discussion of dental services inextricably linked to other covered services when furnished in an RHC or FQHC.

Comment: Several commenters provided feedback regarding operational issues for our dental policies. Many commenters supported CMS adoption of the dental claim format and stated this is a great step to streamline communication between providers and payors alike. A few commenters emphasized there is currently no standard to define what qualifies as an exchange of information or care coordination between a physician and dentist. Commenters mentioned this lack of clarity creates a lot of challenges and recommended CMS establish clear guidance to the MACs to avoid any inconsistences or ambiguity. One commenter requested that CMS ensure that MACs are duly evaluating claims and not automatically denying payment on the basis that they do not squarely match up with a listed clinical example in the regulation. This commenter also asked that CMS issue guidance directing MACs to carefully evaluate—and not simply pass on—claims in which there is indication that a patient needed dental clearance in order to qualify for a Medicare-covered procedure or treatment. A different commenter suggested adopting the ''ADA Medicare Referral Form'' as a standard template to verify coordination of care.

Response: We thank commenters for their suggestions and for raising concerns regarding the MACs' evaluation of claims. CMS continues to provide guidance to the MACs on processing claims for dental services and encourages interested parties to share similar feedback with the MACs to better streamline communication between health care providers and MACs.

Comment: Additionally, the majority of commenters urged CMS to educate providers on billing practices and how dental policies applies to different programs. For example, commenters wanted more information on how dually eligible beneficiaries are affected and a few commenters recommended CMS update the Medicare Managed Care Manual to discuss how it interacts with any supplemental dental coverage. Also, a few commenters offered suggestions on how best to educate providers on billing practices such as through the usage of MLNs, NCDs, as well as establishing a list of services of relevant conditions for which dental care is inextricably linked for providers to utilize. By doing so, commenters highlighted this will encourage more dental providers to enroll in Medicare, including those dental providers that are already contracted with Medicaid.

Response: We thank commenters for their suggestions and will continue to seek ways to better educate healthcare providers on our dental policies related to billing practices and supplemental dental coverage. We would like to highlight that many common questions posed by the commenters regarding billing, claims, or inextricably linked-covered services can be found on our website at: *https://www.cms.gov/medicare/coverage/dental.*

In the CY 2023 PFS final rule, we stated that we believed that MACs are appropriately situated to establish contractor prices for dental services inextricably linked to covered services until we have additional pricing data that could enable national pricing (87 FR 69680). Therefore, as we acknowledged in the CY 2025 PFS proposed rule, dental services inextricably linked to covered services are currently contractor priced. However, we stated in the proposed rule that we have received feedback from the MACs regarding pricing information for dental services inextricably linked to covered services, and the MACs have requested information that would support their efforts to assign payment amounts for such dental services. We stated that the MACs retain broad flexibility with respect to assigning payment amounts to claims for dental services inextricably linked to covered services; however, we seek to facilitate the sharing of available pricing information with the MACs for these purposes. Thus, in the CY 2025 PFS proposed rule, we sought comment from the public on potential sources of payment information for the pricing of dental services inextricably linked to covered services. We noted, for example, that publicly available data (such as Fair Health cost data) are available for purchase; however, we understand that this information may not directly inform payment amounts in a manner useful for the payment of Medicare claims for dental services. We noted that according to Fair Health's website, cost estimate information is based on claims for medical and dental services paid for by private insurance plans, including the country's largest insurers.[268] We also noted that we are aware of other fee schedules, such as those used by State governments for State employees, or discount fee schedules, such as discount dental programs (for example, *https://www.dentalbenefitprogram.com/groupfees.php?id=NEV.*) We aimed to support the ongoing efforts by the MACs to price these services and sought any information from the public that may serve to support and inform the MAC development of payment amounts for dental services inextricably linked to covered services. (89 FR 61763 through 61764)

We received 7 public comments on this comment solicitation. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated the best source of data available for pricing dental services is by utilizing national benchmark prices, such as those in the FAIR Health database, to help support and inform interim contractor pricing for dental claim reimbursement. A few commenters also mentioned CMS should require MACs to update payment rates annually using the Medicare Economic Index. Additionally, one commenter suggested CMS should establish national rates for CDT codes in the PFS RVU files to ensure consistent reimbursement of these services.

Response: We thank commenters for these suggestions and will take them into consideration in our future development of payment policies for dental services.

We remind readers once again that, to be considered for purposes of the CY 2026 PFS rulemaking, submissions through our public process for recommending additional clinical scenarios where dental services may be inextricably linked to covered services under § 411.15(i)(3)(i) should be received by February 10, 2025, via email at *MedicarePhysicianFeeSchedule@cms.hhs.gov.* Interested parties should include the words ''dental recommendations for CY 2026 review'' in the subject line of their email

[268] *https://www.fairhealthconsumer.org/#answer2*; Accessed May 22, 2024.

submission to facilitate processing. We continue to stress to submitters that recommendations must include at least one of the types of evidence listed in section II.J.1.c. of this final rule when submitting documentation to support the inextricable link between specified dental services and other covered services. We further note that we may also consider recommendations that are submitted as public comments during the comment period following the publication of the PFS proposed rule.

6. Miscellaneous Comments

We also received the following miscellaneous comments concerning our proposals.

Comment: We received many comments generally supporting the ongoing public submission process and our use of the annual rulemaking process to evaluate whether evidence submitted by interested parties meets the standard to permit Medicare payment for dental services. Commenters supported what they described as CMS's efforts to ensure that the ''medically necessary'' standard keeps up with growing clinical evidence and evolving standards of care.

One commenter stated that our rigorous review process for determining whether dental services are inextricably linked to other covered services is essential to ensuring that Medicare beneficiaries receive comprehensive care that addresses both their medical and dental needs. The commenter suggested a collaboration with us and offered their scientific and clinical insights.

One commenter requested that we allow payment for dental services when a beneficiary is pregnant. The commenter explained patients should be routinely counseled about the maintenance of good oral health habits throughout their lives as well as the safety and importance of oral health care during pregnancy.

One commenter requested that we consider payment for dental services following organ and stem cell transplants due to the development of oral chronic graft versus host disease, which damages mucosa and salivary glands and causes sclerotic changes in the oral cavity. The commenter also requested that we consider payment for dental services for a period of time following treatment for head and neck cancer and other cancer types, including blood cancers, as well as following antiresorptive therapy for non-cancer conditions, such as osteoporosis.

One commenter recommended that we clarify the regulatory language to provide that dental and oral care extends to medically necessary diagnostic and treatment services to ensure that the patient is in acceptable oral health prior to any surgical procedure. The commenter stated that dental services and interventions to remove plaque and biofilm from the teeth and gums prior to surgery aid in the prevention of infection.

One commenter requested that we permit payment for dental services for beneficiaries with intellectual and/or developmental disabilities (IDD). The commenter stated that beneficiaries with IDD experience higher rates of complications of poorer oral health such as aspiration pneumonia, cardiovascular disease, diabetes, respiratory disease and stroke,[269] therefore, improving dental coverage for people with IDD will provide better overall health outcomes for these individuals and substantial savings in Medicare spending by preventing and reducing complications that arise from poor oral health. Further, the commenter stated while the importance of improving access and payment for dental services for people with IDD is robustly clear, they understand the need to gain further understanding of any potential relationship between dental services and specific covered medical services for patients with IDD. They suggested that we partner with AHRQ to conduct a rapid response report focused on people with IDD.

One commenter suggested that we explore ways to integrate dentists in the coordination of care for cancer and other illnesses and stated that The National Cancer Institute recommends that dental professionals be considered part of the cancer care team in individuals undergoing cancer treatment and that people see their dentist 4 weeks prior to initiating cancer treatment (if possible) to allow for healing if any dental work is required.

Response: We thank commenters for their support and suggestions. Regarding the specific clinical scenarios identified by these commenters, we did not find that the information they provided indicated an inextricable link between dental services and a covered medical service such that dental services would not be in connection with the care, treatment, filling, removal, or replacement of the teeth or structures supporting the teeth. As we have previously stated, because the Medicare statute generally prohibits payment for dental services, payment may be made in limited situations such as when the dental services are inextricably linked to, and substantially related and integral to the clinical success of certain other covered services as provided by our regulations at § 411.15(i)(3), or under the exceptions provided by section 1862(a)(12) of the Act and codified at § 411.15(i)(2).

7. Request for Information: Services Associated With Furnishing Oral Appliances Used for the Treatment of Obstructive Sleep Apnea

In the CY 2025 PFS proposed rule (89 FR 61764 through 61765) we included a Request for Information (RFI) to help us determine if oral appliances used to treat obstructive sleep apnea can withstand repeated use (furnished as rental equipment for use by successive patients) and thus could be classified as durable medical equipment (DME). We also requested information regarding the types of services furnished by a dentist or other practitioner related to oral sleep apnea appliances. Specifically, we sought information regarding details that may inform or support a future proposal regarding a code assignment for services related to oral sleep apnea appliances under the Medicare physician fee schedule.

We received 400 comments in response to this RFI. We received comments responding to some or all of the RFI questions from approximately 209 stakeholders, with an additional 191 comments that indirectly addressed the RFI questions. While we are not responding to the comments here, we thank the commenters for their detailed and thoughtful input and will consider these comments for future rulemaking.

K. Payment for Skin Substitutes

In the CY 2023 PFS proposed rule (87 FR 46027 through 46029), we outlined several objectives related to refining skin substitute policies under Medicare, including: (1) ensuring a consistent payment approach for skin substitute products across the physician office and hospital outpatient department settings; (2) ensuring that appropriate HCPCS codes describe skin substitute products; (3) using a uniform benefit category across products within the physician office setting, regardless of whether the product is synthetic or comprised of human or animal-based material, to incorporate more consistent payment methodologies; and (4) maintaining clarity for interested parties on CMS skin substitutes policies and procedures. When considering potential changes to policies involving skin substitutes, we noted that we believe it would be appropriate to take a phased

[269] Wilson NJ, Lin Z, Villarosa A, George A. Oral health status and reported oral health problems in people with intellectual disability: a literature review. J Intellect Develop Disabil. 2019:44(3):292–304.

approach over multiple rulemaking cycles to examine how we could appropriately incorporate skin substitutes as supplies under the PFS ratesetting methodology. After receiving feedback from commenters requesting more information on how CMS intends to achieve a consistent payment approach for skin substitute products, we did not finalize any policies in the CY 2023 PFS final rule.

In alignment with our objectives, in the CY 2024 PFS final rule, we solicited comments on different approaches CMS could use to identify appropriate practice expense (PE) direct costs for skin substitute products, such as reviewing various sources for price information, including performing market research, reviewing invoices submitted by interested parties, or cost information on Medicare claims. Discussing these approaches in the CY 2024 PFS final rule provided interested parties with more details about payment mechanisms CMS is considering under our PFS ratesetting methodology.

The CY 2024 PFS proposed rule did not contain a specific proposal for changing how skin substitute products are paid under the PFS; however, we continue to pursue our objectives for refining skin substitute payment policies under Medicare, as mentioned above. More specifically, we continue examining ways to treat skin substitute products as incident-to supplies under the PFS ratesetting methodology. Additionally, we believe continuing this dialogue with interested parties on payment for skin substitute products will help inform potential policy changes for future rulemaking.

We recognize that skin substitute products may vary in composition, size, and applicability and will continue to consider these distinct characteristics in proposing a consistent payment approach and policy. We also note an increase in HCPCS Level II coding request applications for newly developed skin substitute products and are considering broadly all of our relevant payment policies. Such policies, for example, include the discarded drug refund policy and the Part B drug inflation rebate policy and how these policies may align with the usage and payment for skin substitute products. In the CY 2024 PFS final rule (88 FR 79060 through 79061), we finalized that billing and payment codes that describe products currently referred to as skin substitutes are not counted for identifying refundable drugs for calendar quarters during 2023 and 2024. While we continue to consider making changes to the Medicare Part B payment policies for such products, similar to last year, for CY 2025, we proposed that billing and payment codes that describe products currently referred to as skin substitutes will not be counted for purposes of identifying refundable drugs for calendar quarters in 2025. We plan to revisit discarded drug refund obligations for skin substitutes in future rulemaking. In section III.I. of this final rule, CMS is finalizing codification of existing policy by including products currently referred to as skin substitutes on the list of product categories that are not considered Part B rebatable drugs in § 427.101(b)(5).

CMS did not make any proposals for payment for skin substitute products for CY 2025; however, we did receive public comments on our intention to move forward with a future proposal to achieve a consistent payment mechanism for all skin substitute products. The following is a summary of comments received and our responses.

Comment: Several commenters raised similar objections to paying for all skin substitute products as supplies, including: (1) commenters suggested skin substitute products should not be treated as supplies since they are affixed into the wound; (2) commenters stated that assessing the costs of skin substitute products within the PE RVU methodology is challenging due to the variability in usage of these products (size, intended use, composition); and (3) commenters suggested bundling payment for skin substitute products would significantly reduce payment for providers, which they state would negatively affect innovation and access to care for Medicare beneficiaries.

Response: We thank commenters for their feedback as we continue to work through ways in which to achieve consistent payment for skin substitute products under the PFS. We refer readers to a similar discussion in the CY 2024 PFS final rule (88 FR 78987 through 78990) where CMS discussed numerous factors we could consider in establishing a consistent payment approach. As also mentioned in the CY 2024 PFS final rule (88 FR 78989), our goal is to achieve a consistent payment approach for skin substitute products that does not negatively impact beneficiary access.

Comment: Many commenters also mentioned alternative options to achieving consistent payment for all skin substitute products under the PFS, such as applying the ASP+6% payment methodology to all skin substitute products and enforcing ASP reporting for skin substitute products. Another commenter recommended an alternative option of applying a maximum fee-for-service price of $150 per cm squared that would be applicable to all skin substitute product, for both Q and A codes. Additionally, one commenter recommended that CMS replace application CPT codes 15271–15278 with newer, temporary codes to describe the more complex wound procedures and offer revisions to the sizing increments.

Response: We thank these commenters for their suggestions and may consider these alternative policies for future rulemaking.

Comment: Several commenters applauded CMS for delaying a proposal for payment of skin substitute products and appreciated our efforts to continue to engage with interested parties. These same commenters also acknowledged the urgency to finalize a proposal to change the way skin substitute products are treated and paid for under the PFS.

Response: We thank these commenters for their feedback and reiterate CMS' commitment to achieving a consistent payment mechanism for all skin substitute products under the PFS. CMS also acknowledges the desire for a proposal on this issue and intends to bridge the gap in variation of pricing for these products through establishing a consistent framework for payment of skin substitutes under the PFS in future rulemaking.

Comment: One commenter recommended reverting to the pre-2014 policy where each skin substitute with its own HCPCS code was paid separately to ensure consistency, given the ASP reporting requirements that became effective on January 1, 2022. The commenter recommended against bundling skin substitute products under the PFS, emphasizing the need for specific PE RVUs and careful consideration of the diverse uses and types of skin substitutes. The commenter also recommended that all skin substitute manufacturers be required to report ASP data, consistent with the approach of treating skin substitutes as drugs and biologicals.

Response: We thank the commenter for their feedback. As discussed in the CY 2024 PFS final rule (88 FR 78987 through 78990), we are working to develop a consistent payment approach for skin substitute products that maintains beneficiary access by evaluating various payment policy aspects, including the diverse uses and types of skin substitutes, in alignment with our goals of consistency and fairness.

Additionally, we acknowledge the recommendation for requiring all skin substitute manufacturers to report ASP data and the concerns regarding bundling under the PFS. These

considerations will be factored into our ongoing efforts as we continue to develop future payment policies for skin substitutes and may consider these suggestions for future rulemaking.

Comment: One commenter urged CMS to acknowledge that skin substitutes should not be classified as refundable drugs under the discarded drug refund program, as this exclusion is mandated by law, irrespective of the year. The commenter highlighted that skin substitutes do not fall within the definition of ''single source drug or biological'' as outlined in section 1847A(c)(6)(D). This is because they are neither approved by the FDA as a biological under section 351 of the Public Health Service Act nor produced or distributed under an FDA-approved new drug application.

Response: We thank the commenter for the feedback and are continuing to consider this issue. As noted, we are finalizing our proposal to continue our policy that billing and payment codes that describe products currently referred to as skin substitutes will not be counted for purposes of identifying refundable drugs for calendar quarters in 2025.

Comment: We received one comment requesting that CMS acknowledge skin substitutes as exempt from the discarded drug refund program in all future years.

Response: We are not establishing skin substitutes as exempt from the discarded drug refund policy for all future years, as we plan to revisit the refund obligations for skin substitutes in future rulemaking. However, while we continue to consider making changes to the Medicare Part B payment policies for such products, we are finalizing that billing and payment codes that describe products currently referred to as skin substitutes will not be counted for purposes of identifying refundable drugs for calendar quarters in 2025.

L. Strategies for Improving Global Surgery Payment Accuracy

1. Background

Currently, there are approximately 4,100 physicians' services that are coded and valued under the PFS as global surgical packages (herein ''global packages''). Global packages are single codes that are valued to include a specific surgical procedure and all related services provided during a specified period of days (0-day, 10-day, or 90-day global packages) by a physician (or another practitioner in the same group practice). The PFS Look-up Tool provides information on each procedure code, including the global surgery indicator. This tool is available at *https://www.cms.gov/medicare/physician-fee-schedule/search/overview.*

The global packages include:

- The surgical procedure itself, including day-of pre-service activities and day-of recovery care;
- Related post-operative evaluation and management (E/M) visits and discharge services provided during specified post-operative periods (10-day or 90-day periods for most minor and major procedures, respectively; 0-day global packages do not include post-operative visits);
- Related pre-operative visits on the day of the procedure (for services with 10-day and 90-day periods) and pre-operative visits on the day prior to the procedure (for major procedures with 90-day periods only);
- Services provided during the post-operative period (for services with 10-day and 90-day periods) related to the procedure (for example, treatment of complications, pain management).

Any medical care that requires a return to the operating room during the global period is paid separately and starts a new global period. Like other services paid under the PFS, post-operative visits that are part of the global packages can vary by level and site of service. Global packages are valued using our annual PFS rulemaking process.

As we described and discussed beginning in the CY 2015 PFS final rule (79 FR 67582 through 67591), both CMS and other interested parties have concerns with the accuracy of global package valuation and payment under the PFS. Foremost, we have longstanding concerns regarding whether the number and level of post-operative visits assumed to occur within global packages are consistent with the number and kind of post-operative services actually being furnished. Findings from multiple OIG reports suggest that practitioners perform fewer post-operative visits than are expected and accounted for in the valuation of the global packages. We also described concerns that global packages as currently defined and valued may cause potential distortions in valuation among other PFS services. Furthermore, we noted that the structure of the current packages assumes a single model of care delivery (a single practitioner or other practitioners in the same group practice furnishing the surgical procedure and all associated care) and does not directly address scenarios where the surgical procedure and follow-up care are provided by different practitioners or in different group practices.

Taking these findings and concerns into account, we finalized a policy to transition all 10-day and 90-day global packages to 0-day global packages, which would allow any post-operative visits furnished after the day of the procedure to be billed separately as standalone visits by any practitioner who furnishes them. However, in 2015, through amendments made by section 523 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA; Pub. L. 114–10, enacted April 16, 2015), we were prohibited under section 1848(c)(8)(A) of the Act from implementing this finalized policy. Further, under section 1848(c)(8)(B), we were required to collect data beginning in 2017 on the number and level of post-operative visits typically provided to patients during 10-day and 90-day global periods and to use this newly collected data and other data beginning in 2019 to improve the accuracy of global package valuation.

In response to these requirements, over the past 9 years, we have:

- Initiated research contracts and implemented a data-collection process to analyze data to understand the extent to which post-operative visits are furnished to patients and improve the accuracy of payment rates for the global surgical packages. This research contract was funded by CMS (HHSM–500–2014–00036I) and carried out within the Payment, Cost, and Coverage Program in RAND Health Care (''RAND'').
- Released three RAND reports (located at *https://www.cms.gov/medicare/payment/fee-schedules/physician/global-surgery-data-collection*) on the number of post-operative visits furnished during post-operative periods, with the most recent published finding that only 4 percent of expected post-operative visits in 10-day global packages and 38 percent of expected post-operative visits following 90-day global packages were furnished to patients.
- Fielded and released a RAND report on a survey of selected global packages, collecting information related to the level and complexity of medical visits furnished during post-operative periods which found post-operative visits following common procedures were of similar length and intensity as corresponding separately billed E/M visits.
- Released two RAND reports on potential approaches for revaluing the global packages based on these findings.
- Internally, we analyzed the prevalence of transfer of care modifiers (-54 for surgical care only; -55 for post-operative management only; and -56 for

pre-operative management only) applied to global packages.

More recently, in the CY 2023 PFS proposed and final rules, we reviewed the prior work and conversations around the accuracy of global package valuations and solicited comments from the public on (1) suggested strategies for revaluing these services, (2) information on how changes to healthcare delivery and payment may be impacting the relevance or accuracy of global package payments, and (3) possible impact of changes to global packages on health care access for beneficiaries (see 87 FR 69432 through 69437). In response to the comment solicitation in the CY 2023 PFS proposed rule, some commenters generally disagreed with our findings that the post-operative visits in the global packages are not performed as frequently as assumed in our valuation of global surgical packages. However, opposition from commenters was based on anecdotal assertions rather than alternative data. Many of these commenters' specific points restated earlier comments submitted in response to our request for feedback in the CY 2020 PFS proposed rule on claims-based reporting of post-operative visits, survey findings on the level of visits, and potential revaluation approaches. Some commenters supported eliminating 10-day global package periods and requested that the AMA RUC review these services. However, these commenters also acknowledged that the AMA RUC review process could take years. In addition to the comments we received in response to the CY 2023 PFS proposed rule, we have received feedback over several years from many interested parties regarding the findings from claims-based reporting of post-operative visits and considered revaluation methodologies presented in our prior reports.

Overall, we have continued exploring ways to improve the accuracy of valuation and payment for global packages to ensure appropriate payments to the practitioners providing pre-operative, surgery, and post-operative care to Medicare beneficiaries while considering feedback from interested parties. In addition, commenters have not proposed specific alternative strategies to revalue global surgical packages beyond what CMS has previously proposed.

Separately, we continue to review approaches to better describe physicians' services in the context of the evolving care delivery landscape and to allow practitioners to furnish patient-centered care. Our review work includes considering care delivery models discussed with interested parties (and developed though our CMS Innovation Center work), reviewing our policies and billing requirements, identifying care elements that could serve as the building blocks for describing newer, impactful services, and seeking opportunities to reduce administrative burdens for practitioners while ensuring accurate payment. Through this lens, we have also recently reviewed our billing requirements and payment policies for the global packages, concurrent with continued analysis of the Medicare claims data.

While ongoing, our review highlights opportunities for us to clarify or revise longstanding policy and billing instructions for global packages, using data and experience gathered over the last several years, consistent with our overall objectives to pay more accurately for services and to right-size the valuation of PFS services based on how practitioners currently furnish these services. In this final rule, we discuss proposals (1) to revise our transfer of care policy for global packages to address instances where one practitioner furnishes the surgical procedure and another practitioner furnishes related post-operative E/M visits during the global period, and (2) to develop a new add-on code that would account for resources involved in post-operative care provided by a practitioner who did not furnish the surgical procedure. In the proposed rule, we stated that we believe that clarifying the scope of global surgical packages, addressing the use of transfer of care modifiers, and documenting the time and resources involved when practitioners who do not furnish the surgical procedure provide post-operative care, are essential steps in aligning payment with the way in which surgical procedures are currently furnished as evidenced in our data, and would make meaningful progress toward more accurate payment for these services in particular and improve relative valuation for PFS services overall.

2. Clarifying the Scope of Global Surgical Packages

We have valued global packages to include the surgical procedure and services furnished during the specified global period related to the surgical procedure when furnished by the practitioner who performs the surgery (hereafter in this section, the proceduralist) or by another practitioner in the same group practice as the proceduralist.

Under current Medicare payment policy, certain services furnished during the global period by the proceduralist or by another practitioner in the same group practice may be separately billed with an appropriate modifier:

- Initial decision for surgery: E/M service billed with modifier -57 (Decision for Surgery).
- E/M services unrelated to the procedure: billed with modifier -24 (Unrelated E/M Service During a Global Period).
- Other services unrelated to the procedure (including underlying condition treatment, diagnostic tests, distinct procedures) not including care for complications/returns to the operating room: no modifier required.
- Failure of a less extensive procedure requiring a more extensive procedure: no modifier required.
- Organ transplant immunosuppressive therapy: no modifier required.
- Critical care services unrelated to surgery: billed with modifier -FT if in the post-operative period.

Under our current policy, the scope of the global package extends to services furnished by the entire group practice of the proceduralist, including services furnished by practitioners in the group practice who are a different specialty from the proceduralist. In other words, the PFS payment for post-operative visits and other services furnished during the global period that are related to the surgical procedure and provided by the proceduralist or a practitioner in the same group practice as the proceduralist is bundled into the global package, and those services are not separately billable. If the proceduralist or a practitioner in the same group practice as the proceduralist wants to bill during the global period for a service furnished to the surgical patient, but unrelated to the global package, the correct modifier must be used to indicate that the service is not related to the global package. Without a modifier to indicate otherwise, during the global period for a global package, all E/M services furnished to the patient by the proceduralist or another practitioner in the same group practice as the proceduralist are presumed to be related to, and included in the payment for, the global package. Modifiers for separate payment (such as modifier -24) are required when services unrelated to the global package are billed by the proceduralist or a practitioner in the same group practice as the proceduralist during the global period.

In general, except where a formal transfer of care modifier applies, a practitioner other than the proceduralist or a practitioner in the same group practice as the proceduralist can bill separately for an E/M visit for services

they furnish during the global period for a global package, including post-operative E/M visits related to the procedure. We established formal transfer of care modifiers to apply in cases where the work, time, and resources involved in furnishing services included in the global packages are split between the proceduralist (or another practitioner in the same group practice) and other practitioners providing related post-operative visits during the global period. Under our current transfer of care policy, transfer of care modifiers must be reported when a formal transfer of care arrangement is documented by both the proceduralist and a practitioner (or group practice) providing the related post-operative visits. Based on our analysis of Medicare fee-for-service claims data, these formal transfer of care modifiers are rarely used and, when they are, it is often with respect to certain ophthalmologic procedures (for example, cataract surgery).

3. Strategies To Address Global Package Valuation

We recognize that we are precluded under section 1848(c)(8)(A) of the Act from revisiting the policy we established in the CY 2015 PFS final rule to revalue all 10-day and 90-day global packages to 0-day global packages (79 FR 67582 through 67591). Further, we note that transitioning all global packages to 0-day global periods could take several years and require substantial CMS resources (see CY 2014 PFS final rule (77 FR 44737 through 44738) for previous discussion). We have also considered revaluing 10-day and 90-day global packages to reflect the observed number of post-operative visits furnished to patients based on data we have collected over nearly a decade and note that this approach would be quicker to implement, assuming there would be straightforward ways to revalue the services with the data. However, interested parties have continued to express uncertainty about the validity of claims-based counts of post-operative visits. This uncertainty stems in part from CMS not having complete information surrounding the use of the transfer of care modifiers since they are not currently routinely used. The same interested parties also object conceptually to revaluing the 10-day and 90-day global packages using the ''building block'' framework, where each component of a service, including bundled post-operative visits, contributes to total valuation to align valuation with the number of post-operative visits typically provided to patients. Some interested parties have expressed larger concerns about the redistributive impacts across the PFS among specialties if we were to implement and revalue all global packages.

We acknowledge the practical challenges involved in revaluing 10-day and 90-day global packages, whether they remain as 10-day and 90-day periods with fewer post-operative visits or are transitioned to 0-day global packages, and continue to carefully consider how to best improve global package valuation given access to administrative claims data and other inputs that help us understand the scope of services provided to patients within global packages. Ultimately, we want to ensure payments to practitioners and the relative values assigned to global surgical packages are accurate and, to the extent possible, driven by real-world objective and updatable information regarding the relative resources involved in furnishing the services.

For CY 2025, we focused on different aspects of our policy objectives for global packages and proposed policies (as discussed in greater detail later in this section), which are not mutually exclusive, to obtain information and allow for more accurate payment to reflect time and resources spent on post-operative care associated with the current global packages. We will continue to assess and monitor for potential future opportunities to improve our payment approach for the global packages more broadly.

Additionally, in developing our proposed policies to pay more accurately for the global packages, we also considered whether, when, or how our policies may be affected when services are provided by the proceduralist, versus another practitioner who did not perform the procedure but is providing follow up care. We also recognized that there may be multiple practitioners in the same or different specialties in the same group practice and considered how our policies should apply to practitioners in a range of specialties within the same group practice. We sought comment on these considerations in the context of our proposed policies and welcomed feedback that may further inform our valuation of global surgical services and payment policy for global packages. Additionally, as we continue to better understand what services are being furnished in the global period, by whom, and how the global surgical packages are valued and billed, we sought comment on how remote monitoring and other types of new technologies represent new resource costs and/or produce efficiencies and effectiveness of post-operative care. This information could be useful both for purposes of valuation for surgical and post-operative care, as well as for policies regarding when specific PFS codes should be reported during global periods for global packages.

We sought public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were generally supportive of our ongoing efforts to pay more accurately for global surgical services. Some commenters stated that finalizing these policies is an essential step in aligning payment with how surgical procedures are currently furnished and that these proposed policies would make meaningful progress toward more accurate payment for these services and improve relative valuation for PFS services overall.

Many commenters requested that CMS update the values of the global surgical packages to reflect the revalued E/M visits with the full increase of work and physician time for the inpatient hospital and observation care visits (CPT codes 99231–99233, 99238, and 99239), and office visits (CPT codes 99202–99215) for each CPT code with a global period of 10 days and 90 days, in addition to updating the practice expense inputs. Several commenters suggested referring the 90-day global packages to the RUC for revaluation.

A few commenters objected to the policy of global surgical packages entirely, or provided suggestions on how they could be revalued by CMS, for example, by shifting 10-day and 90-day global periods to 0-day global periods or aligning work RVUs with the amount of post-operative care typically provided to patients. Commenters also expressed concerns about unbundling post-operative visits from the global packages and the effect this could have on beneficiary cost-sharing and stated that the financial burden may cause patients to not seek follow up care.

We received some specific feedback from commenters in response to our solicitation for comments specific to the provision of RPM and RTM during the global period. These commenters supported allowing separate billing and payment for RPM and RTM during the global period by the physician who performed the procedure. Commenters expressed that there is a shift to value-based care and these services do not replace an alternate form of care, rather they enhance care with additional capabilities that improve patient outcomes and ultimately lower Medicare costs. Other commenters

stated that good patient care should not be impeded by coding or billing restrictions. One commenter cautioned that the current coding and billing restrictions related to Medicare global payments for surgical services prevent the providers of these services from using remote monitoring technology.

Another commenter suggested that CMS provide clarification related to post-operative visits that are furnished via telehealth or telecommunications and stated that follow up care can be done remotely and alleviates travel burden.

Response: We appreciate the recommendation to consider a broader revaluation of global surgical packages as a critical next step to improving the accuracy of global surgical valuation and payment. As we note above, we consider improving the accuracy of global surgical package valuation and payment as a crucial, ongoing process. We view our proposals for the CY 2025 PFS rulemaking cycle as steps in this direction.

While not directly related to our proposals, in public comments on the CY 2025 PFS proposed rule, many commenters stated that CMS should increase the valuation of the global surgical packages based on the previously revalued E/M visits. We have discussed these concerns in previous rules and consider this topic out of scope with respect to our proposals. We refer the commenters to our most recent discussion in the CY 2020 PFS final rule (84 FR 62858).

We understand commenters' concerns about unbundling post-operative visits from the global packages and the effect this could have on beneficiary cost-sharing and potential financial burden that may cause patients to not seek follow up care. While we do not have the authority under section 1848 of the Act to waive beneficiary cost-sharing for services furnished under the PFS, we understand the potential for financial implications and will take this into consideration in our process for improving global payment accuracy in possible future rulemaking.

We appreciate the commenters' support and insight describing the use of RPM and RTM in the post-operative global period and may consider these comments for future rulemaking. CMS considers improving the accuracy of global surgical package valuation and payment as a crucial, ongoing process. With regard to the provision of follow up visits via Medicare telehealth, we wish to clarify that when a separately billable E/M visit is furnished via Medicare telehealth during the global period, that visit is subject to the requirements of section 1834(m) and should be reported with the applicable Medicare telehealth place of service codes. For global surgeries, the applicable place of service (POS) code would be the one associated with where the procedure is performed.

4. Expand Applicability of Transfer of Care Modifiers

We created transfer of care payment modifiers at the inception of the PFS. Under our current policy, these modifiers are required to be appended to the relevant global package code when billing for services that are within the scope of the global package (within the global period and related to the surgical procedure) only when the proceduralist and one or more other practitioners who are not in the same group practice as the proceduralist formally document their agreement to provide distinct portions of the global package.

The following transfer of care modifiers describe the different portions of the global surgical package that could be provided by different practitioners:

- Modifier-54 Surgical Care Only: this modifier is appended to the relevant global package code to indicate that the proceduralist performed only the surgical procedure portion of the global package.
- Modifier-55 Post-operative Management Only: this modifier is appended to the relevant global package code to indicate that the practitioner performed only the post-operative management portion of the global package.
- Modifier-56 Pre-operative Management Only: this modifier is appended to the relevant global package code to indicate that the practitioner performed only the pre-operative portion of the global package.

For each of these modifiers, the payment for the global package is adjusted based on the applicable percentage noted in the PFS Relative Value files *https://www.cms.gov/medicare/payment/fee-schedules/physician/pfs-relative-value-files.*

As previously noted, we currently require the transfer of care modifiers (-56 for pre-operative care, -54 for procedures, and -55 for post-operative care) to be appended in cases where there is a formal documented transfer of care agreement, that is, ''in the form of a letter or an annotation in the discharge summary, hospital record, or Ambulatory Surgical Center (ASC) record'' (CMS Manual System, Pub 100–04 Medicare Claims Processing, Transmittal 11287). In our recent analyses of 2022 Medicare claims data, we identified that these modifiers were rarely used other than for certain ophthalmology global packages. We found over 99 percent of claim lines for 90-day surgical procedures billed with modifier -54 were ophthalmology services (primarily cataract-related procedures). We also identified a difference in the number of claim lines annually for a given 90-day global package with modifier -54 and with modifier -55. In other words, there are sometimes more claim lines billed with modifier -54 than there are corresponding lines with modifier -55 and vice versa during a year. We note that modifier -56 (pre-operative management only) is only very rarely used in practice. These recent observations suggest (1) the overwhelming concentration of reported transfer of care modifiers is in ophthalmology procedures, and (2) a potential mismatch in billing for formal transfer of care cases between proceduralists and other practitioners providing post-operative care.

While we recognize the benefits to continuity of care when the proceduralist also provides pre-operative and follow-up care for the procedure, we also recognize that it is not always feasible, or even perhaps typical practice for the same practitioner to furnish all portions of the global package; for example, in instances when the practitioner furnishing the procedure does not schedule a post-operative visit(s) on the day of the procedure or plans for the patient to follow up with their primary care provider, or when the practitioner performing the surgery arranges alternative follow-up care because it would be difficult for the beneficiary to travel to return for follow-up care. Because our current policies require use of the transfer of care modifiers only where there is a formal documented agreement between practitioners to provide specific portions of the global package, we believe there are many practical and potentially common circumstances under which the transfer of care modifiers would not be required or used.

Beginning for services furnished in 2025, we proposed to broaden the applicability of the transfer of care modifiers for the 90-day global packages. We proposed to require the use of the appropriate transfer of care modifier (modifier -54, -55, or -56) for all 90-day global surgical packages in any case when a practitioner plans to furnish only a portion of a global package (including but not limited to when there is a formal, documented transfer of care as under current policy,

or an informal, non-documented but expected, transfer of care). Practitioners billing for a global package procedure code with modifier -54 and other practitioners in the same group practice as that practitioner would still be able to bill during the global period for any separately identifiable E/M services they furnish to the patient that are unrelated to the global package procedure. To do so, the practitioner would append modifier -24 to the claim line for the E/M service.

We stated in the proposed rule that this proposed policy, which would be a first step toward improved valuation and payment would provide us with more accurate information on the resources involved in furnishing components of global surgical packages. This proposal would prevent duplicative Medicare payment for post-operative care because the global surgical package payment would be adjusted based on the appended modifier, and payment for post-operative care would not be made both as part of a global surgical package and through separately billed E/M visits. We also stated that we anticipate that the proposed policy would provide us with insight into changes in standards of practice and post-operative patient care for services that are not billed with transfer of care modifiers pursuant to our current policy (that is, services other than certain ophthalmology procedures).

We acknowledge the potential challenge associated with anticipating whether other practitioners (or their group practices) will furnish post-operative care and, accordingly, appending the appropriate modifier when billing global package services.

We are interested in understanding and sought comment on the circumstances under which practitioners in separate group practices furnish different portions of the care included in global packages, and what that means for reporting the transfer of care modifiers. While we made proposals related to the 90-day global periods beginning for services furnished in 2025, we also sought comment on whether we should consider proposing these changes for the 10-day global packages in future rulemaking.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters supported our proposal regarding the use of transfer of care modifiers. Several commenters stated that broadening the cases where transfer of care modifiers must be reported is an important step in improving the accuracy of payment for global surgical services. One commenter stated that broader use of transfer of care modifiers provides an important opportunity for CMS to emphasize the expectation that billing practitioners accurately indicate when a portion of care is shared with another provider to inform CMS on how the post-operative care is being furnished and to avoid inaccurate or fraudulent billing. Other commenters said this clarification of the transfer of care modifiers will align with CMS's objective of reducing administrative burden and ensuring accurate payments. Another commenter stated that CMS should collaborate with HHS leadership and the Office of the Inspector General to assess the use of the transfer of care modifiers and the impact of this policy change to ensure it has the intended effect on reducing duplicative Medicare payment for post-operative care.

Some commenters expressed concerns regarding our proposed policy and intent for expanding the scope for transfer of care modifier reporting, while others requested clarification regarding how CMS plans to identify an informal transfer of care.

Commenters also expressed concern regarding the oversight and monitoring of modifier use through several aspects; namely the Recovery Audit Contractor (RAC), Medicare Administrative Contractors (MACs), and in consideration of the False Claims Act. Commenters stated that the modifiers were not well defined and are unnecessary, and thus their use would give rise to more frequent auditing and therefore not decrease costs overall. Commenters stated that the modifiers would require significant monitoring for accuracy and processes for appeal when inaccuracies are recognized, and their use would require extensive work and likely be ineffective.

Response: We appreciate the commenters' support for our proposal to broaden the required use of the transfer of care modifiers. We agree that our proposal is a first step in an iterative process towards improving the accuracy of global surgical service valuation and payment.

We acknowledge the concerns raised by commenters regarding the applicability of the transfer of care modifiers. We are finalizing the requirement that in instances when a practitioner only intends to perform the procedure and does not intend to provide the post-operative care, that the appropriate modifier (modifier-54) be applied.

We appreciate commenters' concerns surrounding potential increased risk for audit and general oversight of these modifiers. We will continue to monitor these concerns by monitoring claims data and may address them in future rulemaking if needed. Additionally, we will continue to engage with interested parties for education and feedback as needed.

Comment: Some commenters expressed concerns with the proposal to require that transfer of care modifiers be reported for both formal (per our current policy) and other transfers of care. Commenters suggested that CMS should maintain current policy and only require transfer of care modifiers for formal transfers of care, while others stated that these transfers do not occur often. Several commenters asked CMS to clarify between formal and other transfers of care, what it means when the transfer of care is 'expected', and what steps the practitioner furnishing the follow up care would need to take to ''accept'' transfer of care from the proceduralist. One commenter stated they were unclear on the application of the transfer of care modifiers when the transfer occurs in an emergent situation or in instances where practitioners may not have the tools to provide the post-operative care appropriately.

Some commenters stated concerns regarding administrative burden associated with modifier use while others stated that the responsibility for the patient's post-operative care rests primarily with the operating surgeon and transferring may compromise care. Some commenters broadly criticized our rationale for expanding the application of the transfer of care modifiers, stating that in modern medical practice it is common for a surgeon to direct a patient's overall post-operative care while the patient also sees other practitioners, for example, a primary care practitioner. Commenters expressed concerns about the assignment of liability to either the surgeon or the practitioner assuming post-operative care under the proposed transfer of care modifier expansion and stated that CMS needs to clarify which clinician would assume liability for post-operative care.

Response: We acknowledge that the commenter expressed uncertainty surrounding the application of the transfer of care modifiers in an emergent situation or in instances where practitioners may not have the tools to provide the post-operative care appropriately. As we stated previously, we acknowledge the potential challenge associated with anticipating whether other practitioners will furnish portions of the global package and, accordingly, appending the appropriate modifier

when billing global package services. We are finalizing that in instances when a practitioner only intends to perform the procedure and does not intend to provide the post-operative care, that the appropriate modifier (modifier–54) be applied. We note that when practitioners intend to bill a significant service that is medically reasonable and necessary separately outside a global package, standard Medicare billing rules continue to apply.

Comment: One commenter stated that if the surgeon did not report modifier -54, the claim from a different physician or practice during the 90-day global period is denied as ''bundled'' unless it is an unrelated E/M service. Should the post-operative visit be correctly billed with modifier-55, they stated that allowing the physicians to communicate directly about surgical package component billing is a reasonable and far better solution than our proposed policy.

Commenters expressed confusion about how modifier-55 should be appropriately used and documented under our proposal, as well as concern about the need for extensive education for operating and non-operating practitioners to ensure appropriate use. Many commenters further questioned the applicability of the transfer of care modifiers to services that may be subject to the multiple procedure payment reduction (MPPR) and identified by modifier-51. Commenters asked CMS to only apply payment adjustments to the primary procedure when multiple procedures are performed and billed on the same day and not to adjust payment on the second and subsequent services reported with modifier-51. Commenters stated that the MPPR already reduces payment for the second and subsequent service(s) and therefore, a reduction for the service to which a transfer of care modifier applies would be redundant.

Several commenters stated that this proposal would add administrative burden and layers of complexity and also stated that the data received from the modifier usage could be misinterpreted or not actionable and possibly skewed with a high number of modifier-55. Commenters also expressed concerns about potential inaccuracies in claims data when utilization of procedure codes are reported by both the performing surgical specialty and the non-proceduralist managing the post-operative care. One commenter stated utilization may remain low due to a lack of clinician education. One commenter did not object to the use of the transfer of care modifiers but questioned how much the utilization of the modifiers would change based on the proposal. They stated that surgeons and hospitalists, for example, would not be discussing and adjudicating which party should get credit for which clinical services and urged CMS to continue to evaluate the gaps that exist between the goals of global periods and the results they achieve, and ensure that clinicians are accurately and appropriately credited for the services they provide. One commenter asked that we clarify how our proposed policy would affect the use of modifier-24 (Unrelated E/M Service During a Global Period) for services provided during the post-operative period.

Another commenter suggested that CMS should also take into consideration that even when an in-person post-operative visit does not take place, significant time is still spent on phone calls from the patient/caregiver and discussions with the patient's primary and referring health care providers and stated that the time spent should count towards the cumulative global period or be separately reimbursed.

Several commenters recommended CMS delay implementation of the transfer of care modifier proposal until CY 2026. Commenters suggested that CMS implement the proposed transfer of care modifier changes in the CY 2025 PFS final rule for tracking purposes only and delay payment changes associated with these modifiers until CY 2026. Commenters stated a delay until CY 2026 would allow CMS more time to refine the policy so it does not create inadvertent burden for all clinicians involved in the billing of these modifiers and would allow for time to adjust to new workflows.

Response: We appreciate and acknowledge these comments related to the implementation of the transfer of care modifiers proposal. However, broadly, we emphasize the need to balance any potential administrative burden on practitioners and billers with accurate valuation and payment for global surgical services. Without separate billing by the practitioners furnishing procedures and post-operative visits, when appropriate, Medicare may be making duplicative payment for some of the services included in global surgical package valuations (for example, by making an unmodified global surgery payment to the proceduralist in addition to separate payment for follow-up E/M services to other practitioners). Ultimately, the solution to both global surgical package valuation and practitioner burden may be to update the valuations to reflect the number of post-operative visits typically provided by the proceduralist or by another practitioner in the same group practice. Then, services outside the scope of global surgical packages (for example, those furnished by a practitioner who is not in the same group practice as the proceduralist) could be separately billed without the need to refer to the initial global surgical procedure.

We clarify the purpose of our proposal and emphasize that our main focus was on scenarios where the proceduralist does not anticipate seeing the patient for any follow-up visits. In those instances, under our proposal, the proceduralist would append the transfer of care modifier, modifier-54. We acknowledge the concerns from commenters regarding the lack of clarity around the actions a practitioner may have to take to accept the transfer of the patient's care; however, this was not intended to be the primary focus of our proposed policy. For the reasons we discussed in the proposed rule, we believe the transfer of care modifier-54 is important to append even if the proceduralist does not formally transfer the patient's care, and we are finalizing our policy as proposed with regard to modifier-54.

With regard to commenters' concerns about the liability of the surgeon performing the procedure or practitioner assuming post-operative care, our proposal was not intended to affect the scope of services that a physician or other practitioner would otherwise furnish. Rather, we believe that the proposed policy would serve as a mechanism to reflect practice patterns that are already occurring. As we stated previously, we view this as a first step in ensuring global surgical package payment accuracy, and we are putting other tools in place (such as the add-on code, as discussed later) to appropriately account for time and resources and recognize practice patterns that are already occurring.

We acknowledge the substantial confusion from commenters regarding the applicability of the other transfer of care modifiers, particularly modifier-55. After consideration of the comments received, we are not finalizing any changes to our current policy with regard to the use of modifier-55 or modifier-56. Because our policy for CY 2025 remains unchanged for formal transfers of care, we do not expect the practitioner 'receiving' the patient through an informal transfer of care to use modifier-55. Practitioners other than the proceduralist and, if applicable, those outside the proceduralist's group practice, can continue to separately bill for post-operative services without the need to report a modifier.

We thank the commenters for their suggestions regarding the MPPR modifier (modifier-51). Modifier-51 is the most commonly applied modifier under the PFS, and it typically reduces the payment of a second (and any subsequent) procedure if conducted on the same patient on the same day, most often with the most expensive procedure getting paid in full and additional procedures having their payment cut in half. It is a very common modifier for surgical services of all types, and we continue to believe that modifier-51 should continue to apply and payment for any subsequent surgeries should be reduced regardless of whether the proceduralist performed only the surgery and not the pre- or post-operative visits or performed the entire global surgery package.

Comment: One commenter suggested CMS consult with ophthalmologists about how they have integrated the transfer of care modifiers into their clinical practice to see if there is guidance that could be developed to apply across specialties based on their practice of using these modifiers more frequently than other physicians.

Response: We appreciate the commenter's suggestion.

After consideration of the public comments, we are finalizing the proposal to broaden the applicability of transfer of care modifier-54 for 90-day global packages as proposed. Beginning with services furnished in CY 2025, modifier-54 is required for all 90-day global surgical packages in any case when a practitioner plans to furnish only the surgical procedure portion of the global package (including both formal and other transfers of care). We are not finalizing any changes regarding the use of modifier-55 and modifier-56 for CY 2025. Modifiers-55 and -56 will continue to be billed exclusively in cases where there is a documented formal transfer of care.

We will continue to assess the full range of modifiers for future consideration.

5. Payment for Global Packages

In the proposed rule, we stated that under our current policy for global packages where the transfer of care modifiers are used (required only where there is a formal transfer of care arrangement), the total combined PFS payment made for the global package during the global period does not exceed the total global surgical package payment established for the procedure when billed without any transfer of care modifier. In general, we continue to believe this is the appropriate result when more than one practitioner furnishes portions of a global package. Under our proposal (which we are finalizing, as discussed previously), we would require that practitioners performing the surgical procedure but not intending to furnish the post-operative portions of a 90-day global service would appropriately append modifier-54, which would adjust the portion of the payment received to reflect that the proceduralist did not provide post-operative care.

More specifically, as noted in the discussion earlier, the transfer of care modifiers correspond to three distinct portions of the global package (pre-operative services, the surgical procedure itself, and post-operative care). We have assigned a proportion of the global package payment to each portion of the service based on longstanding assumptions. We stated in the proposed rule that under our current policy, the payment for the entire global package is made to the billing practitioner unless a transfer of care modifier is included on the claim. Payment is only adjusted if a transfer of care modifier is included on the claim. We requested comments, as we further develop our payment policies for global packages, on how best to determine the appropriate payment proportions for the three portions of the global package, which impact payment to the different practitioners who may furnish different portions of the global surgical service.

We noted in the proposed rule that we are continuing to consider approaches to establishing the payment allocations for portions of the global package when the transfer of care modifiers are used, and anticipate revising the allocations through future rulemaking. We sought comment on potential approaches to revise these payment allocations and how they could be established to better reflect current medical practice and conventions for post-operative follow-up care. We sought to identify a procedure-specific, data-driven method for assigning shares to portions of the global package payment to more appropriately reflect the resources involved in each portion. We stated in the proposed rule that we would appreciate and carefully consider recommendations from interested parties, including the AMA RUC, on what those allocation percentages should be, based on how the global package codes are valued and any other relevant information. We also stated in the proposed rule that CMS could use data collected over nearly a decade on the observed number of post-operative visits furnished to patients as the basis for calculating new data-driven payment allocations.

We received public comments in response to our comment solicitations. The following is a summary of the comments we received and our responses.

Comment: A few commenters stated that the current component percentages published in the PFS were developed using magnitude estimation and cross-specialty scaling. These commenters stated they did not believe that any reverse engineering of work and time can be performed to develop a better percentage of pre-, intra- and post-operative work than what is currently published in the PFS.

Response: We appreciate the information received on the origins of allocation percentages. However, we note the development of the component percentages occurred three decades ago and that both PFS global surgical procedures and relative valuations have since changed.

We also note that a series of analytic reports from RAND have found (located at *https://www.cms.gov/medicare/payment/fee-schedules/physician/global-surgery-data-collection*) that fewer post-operative visits are provided to patients compared to the number of visits reflected in the valuation of global packages, with variation across procedure services in the share of visits assumed to occur during global periods (as noted in the Physician Time File) versus the number of visits actually furnished. Both the RAND reports (located at *https://www.cms.gov/medicare/payment/fee-schedules/physician/global-surgery-data-collection*) and, in prior PFS rules, CY 2015 PFS final rule (79 FR 67582 through 67591), and CY 2023 PFS final rule (see 87 FR 69432 through 69437), CMS, note data from claims-based reporting of post-operative visits could be used to exclude post-operative visit RVUs from total global package valuation on a code-by-code level.

If our allocation of the global package payment based on the presence of transfer of care modifiers were to undervalue the surgical procedure portion or the post-operative care portion of the global package, we are concerned that we could unintentionally introduce incentives that influence current medical practice for transfers of care. This points to RAND's prior recommendation that we revalue global packages to reflect the actual number of post-operative visits provided to patients. After revaluation, separating the procedure and post-operative payments would reflect observed data and mitigate any possible inappropriate incentives in place for practitioners to initiate transfers of care

and support use of transfer of care modifiers as medically appropriate. This approach has the advantage of anchoring the valuation of separate modifier-54 and -55 components using real-world information on post-operative visits reported to CMS rather than on historical assumptions or current survey data reflecting estimates of the typical number and level of visits.

In our internal review of the percentages assigned for the pre-operative, surgical care, and post-operative portions of the global package, we found that there are a small number of codes that do not have any assigned percentages in our files even though these codes are identified as global packages. HCPCS codes 77750 (Infusion or instillation of radioelement solution (includes 3-month follow-up care)), HCPCS code 77761 (*Intracavitary radiation source applic simple*), HCPCS code 77762 (*Intracavitary radiation source applic intermed*), and HCPCS code 77763 (*Intracavitary radiation source applic complex*) do not have assigned percentages in our RVU files. It is our understanding, however, that the MACs have local edits in place to ensure appropriate payment for these services when billed with the transfer of care modifiers. We sought comment on whether we should consider, first, whether these codes are appropriately categorized as 90-day global package codes. If these are appropriately considered to be 90-day global package codes, we sought comment on what the assigned percentages should be for the pre-operative, surgical care, and post-operative portions of the service.

We did not receive public comments in response to this comment solicitation.

6. Post-Operative Care Services Add-on Code

We recognize the importance of continuity in surgical and post-operative care. However, we recognize that there are instances where post-operative care is not furnished by the proceduralist or another practitioner in the same group practice, or even by a practitioner who is in the same specialty as the proceduralist, despite there being no formal transfer of care. We also recognize that there is an extra level of complexity involved when a practitioner sees a patient post-operatively after a surgical procedure performed by another practitioner in those circumstances. The practitioner providing the post-operative care may not be involved in creating the surgical plan and may not have access to the operative notes to know how the surgery went or be abreast of any particular considerations related to the procedure that may factor in medical care decisions for the post-operative care. As such, we recognize that there are comparatively more resource costs incurred when a practitioner who did not furnish the surgical procedure in a global package provides the follow-up care. We proposed to address these scenarios, which can occur in a few different ways, by establishing a new add-on code that would account for resources involved in post-operative care for a global package provided by a practitioner who did not furnish the surgical procedure and does not have the benefit of a formal transfer of care. However, we noted in the proposed rule that when a patient is seen by practitioners in the same group practice or specialty as the surgeon, the same resources are not incurred during follow-up and therefore, the add-on code should not be billed by another practitioner in the same group practice as the practitioner who performed the surgical procedure, or in the same specialty as the practitioner who performed the surgical procedure. In the case of a practitioner providing follow up care who is of a different specialty and not within the same group practice as the proceduralist, researching the procedure to determine expected post-operative course and potential complications may be needed, which would warrant using the add-on code. We also acknowledged that sometimes the proceduralist does not schedule the patient to follow up with them post-operatively and directs the patient to follow up with other practitioners as needed, such as with the patient's primary care provider. The patient may independently choose to follow up with their primary care provider or another practitioner based on other considerations such as convenience of the practice location or ease of scheduling. We stated that we understand and acknowledge that the patient can choose to see another practitioner without the knowledge of the practitioner who performed the procedure.

To more appropriately reflect the time and resources involved in these kinds of visits, we proposed to make payment using a new add-on code to be billed with an office/outpatient E/M visit for post-operative follow-up care during the global period of a global package to capture additional resources associated with practitioners who were not involved in furnishing the surgical procedure. This follow-up care may include, but is not limited to, obtaining and reviewing the surgical notes and surgical history, monitoring for signs and symptoms of infection, taking into account any considerations from the surgical procedure that may affect the medical care, and monitoring for any potential post-operative complications that may arise. It is often difficult in these circumstances for the practitioner who did not perform the surgical procedure to know how the wound looked after the procedure, and so it is more challenging to recognize possible changes that may have occurred since the time of the procedure (when this is something the operating surgeon would have been able to know). This new code would be billed by the practitioner who furnishes the post-operative office/outpatient E/M visits when that practitioner is not the proceduralist and is not in the same specialty or group practice as the proceduralist. Documentation in the medical record must justify use of the add-on code and that the E/M visit was, as clinically understood by the reporting practitioner, related to a post-operative visit furnished during the 90-day post-operative period. As noted earlier, we proposed and are finalizing an expansion of our current policy for reporting the transfer of care modifiers-54 and -55 as a first step toward improving payment accuracy for the global packages to promote improved valuation and payment for these services. Instituting an add-on code to capture the time and intensity of post-operative work absent a formal transfer of care would be an essential step in recognizing how the services are currently furnished and make meaningful progress toward 'right-sizing' the structure of the global packages.

Given the history of the global packages since data collection began, as specified in section 1848(c)(8) of the Act, and in consideration of our policies for post-operative care and our proposal requiring the use of the transfer of care modifiers in a broader set of circumstances, we stated in the proposed rule that we believe that the timing is appropriate to establish an add-on code and payment for post-operative care provided in the office/outpatient setting by a practitioner other than the proceduralist (or another practitioner in the same specialty) to account for the additional time, intensity, and resources that are involved in post-operative care. We proposed a new HCPCS code, G0559, to capture the additional time and resources spent in providing follow up post-operative care by a practitioner who did not perform the surgical

procedure and who has not been involved in a formal transfer of care agreement.

We proposed the following code and descriptor for the add-on code:

G0559 (Post-operative follow-up visit complexity inherent to evaluation and management services addressing surgical procedure(s), provided by a physician or qualified health care professional who is not the practitioner who performed the procedure (or in the same group practice), and is of a different specialty than the practitioner who performed the procedure, within the 90-day global period of the procedure(s), once per 90-day global period, when there has not been a formal transfer of care and requires the following required elements, when possible and applicable:

- Reading available surgical note to understand the relative success of the procedure, the anatomy that was affected, and potential complications that could have arisen due to the unique circumstances of the patient's operation.
- Research the procedure to determine expected post-operative course and potential complications (in the case of doing a post-op for a procedure outside the specialty).
- Evaluate and physically examine the patient to determine whether the post-operative course is progressing appropriately.
- Communicate with the practitioner who performed the procedure if any questions or concerns arise. (List separately in addition to office/outpatient evaluation and management visit, new or established)).

We proposed that HCPCS code G0559 would be reported by a physician or other practitioner who did not perform the surgical procedure for a global package and provides related post-operative visits during the global period despite the absence of a formal transfer of care. We proposed that the add-on code (HCPCS code G0559) would only be reported with an office or other outpatient E/M visit for the evaluation and management of a new or established patient. We would expect the documentation in the medical record to indicate the relevant surgical procedure, to the extent the billing practitioner can readily identify it, in order to aid in our understanding of the post-operative care being furnished and when there is no transfer of care modifier appended on the claim.

We proposed that this code could be billed only once during the 90-day global period for the global package because we believe the practitioner will only have additional resource costs upon the first visit following the procedure. We proposed to assign a ZZZ global period payment indicator for HCPCS code G0559, as this allows the add-on code to be billed during the post-operative time frame that applies to payment for each surgical procedure and, under our proposed policy, this code would be reportable with an E/M visit. The ZZZ global period payment indicator would identify this code as a service that is related to another service paid under the PFS and is always included in the global period of the other service.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported CMS's proposal to establish a new add-on code to capture the time and resources spent by a practitioner who is assuming post-operative care for a patient. Some of these commenters stated that the add-on code would support patient flexibility to seek follow up care from practices other than those that performed the surgery, such as when patients have had to travel long distances for their surgery. Several commenters stated that the policy would help address inadequate payment for post-operative care delivered by clinicians and primary care physicians. Another commenter stated that the add-on code would improve access to post-operative care. One commenter supported the introduction of an add-on code, but was concerned about the impact it would have on overall PFS budget neutrality.

Response: We appreciate commenters' support of the proposed new add-on code. We agree our proposals in the CY 2025 PFS proposed rule would result in more accurate payment by helping to ensure that practitioners of other specialties, who do not have a formal transfer of care agreement with the surgeon, providing post-operative care are paid for the time and work involved in furnishing post-operative care. We also agree with commenters that patients' ability to choose their practitioner for post-operative follow up care would be positively impacted thus improving patients' access to care. We continue to believe that it is important to accurately value the relative resource costs involved in furnishing services that pertain to a procedure that are not explicitly described in the E/M code set.

Comment: Several commenters voiced strong general opposition to the add-on code viewing our rationale as ignoring the expertise, training and continuity necessary to perform appropriate follow-up care for some procedures and skeptical that non-specialists could adequately learn the necessary information to provide appropriate follow-up care within minutes. Other commenters suggested that the proposed time was not sufficient to learn and address everything surrounding the post-operative visits including complications. Some commenters supported the add-on code although some stated that the proposed code descriptor was ambiguous, poorly defined, and requested clarification regarding when it could be billed and that it should not be limited to the office/outpatient E/M visits. Some commenters stated that the current E/M visit codes are sufficient to account for additional time and resources and that the revised E/M guidelines is robust and designed to capture the varying intensity of services while also reducing administrative reporting burdens. Commenters requested clarification as to which specialty can bill the new add-on code for post-operative work, whether multiple practitioners are able to bill, and, if so, how payment would be impacted. Commenters questioned whether patient consent is required, whether coordination between the surgeon and the non-surgeon practitioner billing G0559 is required, and some commenters questioned the regulatory oversight of the code being billed. Other commenters questioned whether use of HCPCS code G0559 would result in reliable data on the number of visits furnished by the operating surgeon or if it would confirm the care was related to the surgery.

A few commenters pointed to CPT code 99024 and how it is currently available to report unpaid post-operative visits that are normally included in the surgical package and this could provide data that CMS can consider.

Response: We appreciate commenters' concerns regarding the proposed add-on HCPCS code G0559 and lack of clarity surrounding when and by whom it can be billed. Under our proposal, HCPCS code G0559 would be reported by a physician or other practitioner who did not perform the surgical procedure within a global package but provided a related post-operative visit during the global period despite the absence of a formal transfer of care agreement. We understand that there may be instances where there is no formal coordination (*i.e.,* to require billing of the transfer of care modifier -55) or no coordination at all between the proceduralist and the practitioner who provides post-operative care and expect that HCPCS code G0559 would be used in those instances. We are finalizing HCPCS code G0559 with modification such that

it may be billed by a practitioner of the same specialty as the proceduralist who is not in the same group practice as the proceduralist. We recognize that in some clinical scenarios, it is possible that post-operative care would be furnished only by a particular specialty. We believe it is plausible for a patient to follow up with another practitioner in the same specialty as the proceduralist in cases where a patient may travel for the procedure or in instances where a patient may opt to follow up with another practitioner of their choosing. Additionally, there may be instances when a surgeon may refer a patient to another practitioner specifically for post-operative care and they may be of the same specialty as the proceduralist. We continue to believe that when a patient is seen by practitioners in the same group practice regardless of their specialty, the same resources are not incurred during post-operative care as compared to when a patient is seen by a practitioner who is not in the same group practice. For this reason, the add-on code should not be billed by another practitioner in the same group practice as the practitioner who performed the surgical procedure. In cases where the practitioner furnishing the post-operative care is of the same specialty as the surgeon but not within the same group practice, they would be able to bill for HCPCS code G0559 given the time and resources that could be incurred by a practitioner who is providing post-operative care when they themselves did not perform the actual procedure.

As discussed above regarding the expanded policy for reporting transfer of care modifier -54, the new G-code, HCPCS code G0559, is a mechanism to account for practice patterns that are already happening where practitioners are spending time and resources with patients who are seen for a post-operative visit and to ensure those practice patterns are accurately reflected in coding and payment policy.

We expect the add-on code will be reported with an office or other outpatient E/M visit for the evaluation and management of a new or established patient. We understand commenters' concerns surrounding not knowing which global surgical package was billed and how one may not know whether there was a transfer of care modifier appended on the claim. Practitioners can bill the G-code when applicable, regardless of whether the proceduralist billed for the procedure with or without transfer of care modifier -54. We specifically proposed the G-code to capture the work involved when a practitioner may not know the surgical history. We expect that this code would be billed only once per practitioner during the 90-day global period for the global package because we expect the patient to typically see one practitioner, either a specialist or their primary care physician for post-operative care.

We appreciate the commenters pointing to CPT code 99024 and its applicability during the global surgical period. We note that CPT code 99024 is billed by the proceduralist, or another practitioner in the same group, to indicate that a post-operative visit was performed during the global period and that CPT code 99024 is not separately payable. We clarify that CPT code 99024 should not be reported by practitioners in a different group practice than the proceduralist when billing for post-operative care.

Regarding concerns surrounding program integrity and audit, as with implementation of any new billing code, we will be monitoring its use going forward, not just for data and other purposes, but also for program integrity reasons.

After consideration of public comments, we are finalizing the proposed code descriptor with modification, as follows:

- G0559 (*Post-operative follow-up visit complexity inherent to evaluation and management services addressing surgical procedure(s), provided by a physician or qualified health care professional who is not the practitioner who performed the procedure (or in the same group practice) and is of the same or of a different specialty than the practitioner who performed the procedure, within the 90-day global period of the procedure(s), once per 90-day global period, when there has not been a formal transfer of care and requires the following required elements, when possible and applicable:*

++ Reading available surgical note to understand the relative success of the procedure, the anatomy that was affected, and potential complications that could have arisen due to the unique circumstances of the patient's operation.

++ Research the procedure to determine expected post-operative course and potential complications (in the case of doing a post-op for a procedure outside the specialty).

++ Evaluate and physically examine the patient to determine whether the post-operative course is progressing appropriately.

++ Communicate with the practitioner who performed the procedure if any questions or concerns arise. (List separately in addition to office/outpatient evaluation and management visit, new or established)).

7. Valuation for G0559 Add-On Code

We noted in the proposed rule that the proposed valuation of HCPCS code G0559 is meant to capture the additional resource costs, including for visit complexity inherent to office/outpatient care associated with a post-operative visit that is not accounted for in the appropriate office/outpatient E/M base code billed by the physician or practitioner. Therefore, we stated that we believe that CPT code 90785 (Interactive complexity (List separately in addition to the code for primary procedure)) serves as an appropriate reference for the purposes of valuing HCPCS code G0559. CPT code 90785 was created to capture additional work that occurs during diagnostic psychiatric evaluation, psychotherapy, psychotherapy performed with an E/M service and group psychotherapy sessions, and the service refers to specific communication factors that complicate the delivery of a psychiatric/psychotherapy procedure. However, we also stated that we believe there may be relatively less work involved for G0559 when compared to the work of CPT code 90785, considering the amount of time needed to gather the operative history and conduct the elements discussed above. Therefore, we proposed a work RVU of 0.16, which represents approximately half of the assigned work for minutes of CPT code 90785. Additionally, we proposed a work time of 5.5 minutes (or half of the 11 minutes established for CPT code 90785), personally performed by the billing practitioner including the elements discussed above during the post-operative E/M visit furnished during the global period, that is, no later than 90-days following a 90-day global code, respectively. CPT code 90785 has no direct PE inputs, and we proposed the same for HCPCS code G0559.

To help inform whether our proposed valuation reflects the typical service, we sought comment on the typical time and intensity physicians and practitioners spend over and above a separately billed E/M visit when providing post-operative care to a patient when they did not perform the surgical procedure, gathering the surgical history as well as the pre-operative, intra-operative, and post-operative, and on the proposed service elements and the relative intensity compared to similar service elements of other CPT codes. For the individual practitioner, not having an intimate knowledge of the procedure itself and not having a before/after comparison to look at for the wound can all complicate their E/M visit. The proposed work RVUs are intended to

account for the additional relative resource costs in time and intensity in addition to those involved in the E/M visit.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters were generally supportive of the proposed valuation of HCPCS code G0559.

Response: We thank the commenters for their support.

Comment: Several commenters stated that the proposed work RVU and work time for HCPCS code G0559 was not sufficient to accurately reflect assessment of certain post-operative patients. One commenter stated the complexity of post-operative work for patients in some settings, such as tertiary care centers, may often exceed the ''typical'' post-operative work in other settings. One commenter stated the shift to value-based care in the last decade has led to evolution in how many surgical procedures are managed, which requires a new comprehensive consideration.

One commenter acknowledged that other specialists should be involved when a patient has relevant complications and the current procedural RVUs are not valued to include management of such complications, stating that current valuations only include routine post-operative care. One commenter had concerns about whether CPT code 90785, primarily used in diagnostic psychiatric evaluation, is the appropriate reference for post-operative E/M care from a clinician that did not perform the index surgery.

Response: We thank the commenters for sharing their concerns surrounding the valuation of the add-on code. While CMS agrees some providers (such as tertiary care centers) may provide more post-operative care within global periods than typical compared to other settings, we note that the proposed add-on code, HCPCS code G0559, can only be valued to reflect the typical work time and resources for this service. We believe that the proposed work RVU and work time accurately capture the initial time and resources spent by a practitioner when they see the patient for a post-operative visit.

Finally, we recognize that historically, the CPT Editorial Panel has frequently created CPT codes describing services for which we originally established G-codes and adopted them through the CPT Editorial Panel process. We note that we would consider using any newly available CPT coding to describe services similar to those described here in future rulemaking.

For discussion of our expected utilization assumptions for this service, see the outline in the Regulatory Impact Analysis section of this final rule.

After consideration of public comments, we are finalizing valuation for HCPCS code G0559 as proposed.

III. Other Provisions of the Proposed Rule

A. Drugs and Biological Products Paid Under Medicare Part B

1. Requiring Manufacturers of Certain Single-Dose Container or Single-Use Package Drugs to Provide Refunds with Respect to Discarded Amounts (§§ 414.902 and 414.940)

a. Background

Section 90004 of the Infrastructure Investment and Jobs Act (Pub. L. 117–58, November 15, 2021) (hereinafter referred to as ''the Infrastructure Act'') amended section 1847A of the Act to redesignate subsection (h) as subsection (i) and insert a new subsection (h), which requires manufacturers to provide a refund to CMS for certain discarded amounts from a refundable single-dose container or single-use package drug (hereinafter referred to as ''refundable drug'') for calendar quarters beginning January 1, 2023.

In the CY 2023 PFS final rule (87 FR 69710 through 69734), we finalized many policies to implement this provision. First, we finalized the requirement that billing providers and suppliers report the JW modifier for all separately payable drugs and biologicals (hereinafter referred to as ''drugs'') with discarded drug amounts from single use vials or single use packages payable under Part B, beginning January 1, 2023 (87 FR 69719). We also finalized the requirement that billing providers and suppliers report the JZ modifier for all such drugs with no discarded amounts beginning no later than July 1, 2023, and we stated that we would begin claims edits for both the JW and JZ modifiers beginning October 1, 2023 (87 FR 69718 through 69719). After the issuance of the CY 2023 PFS final rule, CMS published a JW Modifier and JZ Modifier Policy Frequently Asked Questions (FAQ) document [270] to provide further guidance on the correct use of these modifiers.

Second, we adopted a definition of ''refundable single-dose container or single-use package drug'' at § 414.902, which also specifies exclusions from this definition (87 FR 69724). These three exclusions are: radiopharmaceutical or imaging agents, certain drugs requiring filtration, and drugs approved by FDA on or after November 15, 2021 for which payment has been made under Part B for fewer than 18 months.

Third, regarding reports to manufacturers, we specified that we would send reports (including information described in section 1847A(h)(1) of the Act) for each calendar quarter, on an annual basis, to each manufacturer of a refundable drug (87 FR 69726).

Fourth, we finalized how the refund amount will be calculated, which is specified in regulation at § 414.940 (87 FR 69731). We stated we would issue a preliminary report based on available claims data from the first two quarters of CY 2023 to provide manufacturers information regarding discarded amounts of refundable drugs prior to the initial refund report (87 FR 69725). In these reports, which were sent in December of 2023, we included preliminary information on estimated discarded amounts of refundable drugs for each labeler code based on available claims data from the first 2 quarters of CY 2023 for any refundable drug for which discarded units were billed using the JW modifier. More information about discarded drugs, including the discarded drug refund and the JW and JZ modifier policy, can be found at *https://www.cms.gov/medicare/payment/part-b-drugs/discarded-drugs*.

Fifth, we addressed drugs with unique circumstances for which we can, through notice-and-comment rulemaking, increase the applicable percentage otherwise applicable for determining the refund. Section 1847A(h)(3)(B)(ii) of the Act provides that, in the case of a refundable drug that has unique circumstances involving similar loss of product as that described in section 1847A(h)(8)(B)(ii) of the Act, the Secretary may increase the applicable percentage otherwise applicable as determined appropriate by the Secretary. We adopted an increased applicable percentage of 35 percent for drugs reconstituted with a hydrogel and with variable dosing based on patient-specific characteristics (87 FR 69731). Lastly, we adopted a dispute resolution process through which manufacturers can challenge refund calculations, and we established enforcement provisions, including manufacturer audits, provider audits, and civil money penalties required by statute (87 FR 69732 through 69734).

In the CY 2024 PFS final rule (88 FR 79047 through 79064), we finalized the

[270] *https://www.cms.gov/medicare/medicare-fee-for-service-payment/hospitaloutpatientpps/downloads/jw-modifier-faqs.pdf.*

date of the initial refund report to manufacturers, the date for subsequent reports, method of calculating refunds for discarded amounts in lagged claims data, method of calculating refunds when there are multiple manufacturers for a refundable drug, increased applicable percentages for certain drugs with unique circumstances, and a future application process by which manufacturers may apply for an increased applicable percentage for a drug, which would precede proposals to increase applicable percentages in rulemaking.

We also finalized that drugs separately payable under Part B from single-dose containers that are furnished by a supplier who is not administering the drug are required to be billed with the JZ modifier, since we believe it is unreasonable to collect discarded drug data from beneficiaries. We were concerned that claim rejections may occur in the absence of a claims modifier to designate that a drug was dispensed, but not administered, by the billing supplier.

b. Application for increased applicable percentage

Section 1847A(h)(3)(B)(ii) of the Act permits the Secretary to increase the applicable percentage for a refundable drug that has unique circumstances through notice and comment rulemaking. In the CY 2024 PFS final rule (88 FR 79057 through 79060), we finalized an application process (CMS–10835, OMB 0938–1435) by which manufacturers could apply for an increased applicable percentage for a drug and may request that we consider an individual drug to have unique circumstances for which an increased applicable percentage is appropriate. We explained that manufacturers could benefit from a formal process through which they can provide information, including that which may not be publicly available, in order to request an increase in their refundable drug's applicable percentage and provide justification for why the drug has unique circumstances for which such an increase is appropriate, including in the case of a drug with an applicable percentage that has already been increased by virtue of its unique circumstances. We finalized the application deadline of February 1 of each year, adopted a deadline of August 1 for the FDA-approval of the drug and the deadline for notifying and submitting the FDA-approved label to CMS of September 1 of the year before the year in which the increased applicable percentages would apply. We codified this process in regulation at § 414.940(e). The application process requires the applicant to provide a written request comprising FDA-approved labeling for the drug; justification for the consideration of an increased applicable percentage based on such unique circumstances; and justification for the requested increase in the applicable percentage.

We received one application for increased applicable percentage for CY 2025 from the manufacturer of Leukine® (sargramostim). Leukine® is a leukocyte growth factor that is primarily used in hematological malignancies to increase white blood cell counts. The applicant submitted the information required under § 414.940(e)(1), including its justification for consideration for increased applicable percentage, and justification for the requested applicable percentage of 72 percent. The applicant did not submit FDA-approved labeling for the drug for the adjuvant uses described in the application (further described below in this paragraph) due to ongoing cancer vaccine adjuvant trials. The applicant states that there are several manufacturers in late-stage (Phase II and Phase III) development using Leukine® as a vaccine adjuvant in oncology indications, specifically in stimulating the immune response of dendritic cells when used alongside these vaccines. Cancer treatment vaccines are different from the vaccines that work against viruses (for example, influenza). Cancer treatment vaccines try to get the immune system to mount an attack against cancer cells in the body. Instead of preventing disease, they are meant to get the immune system to attack a disease that already exists.[271] The applicant stated that it has no ownership stake in the development of these cancer treatment vaccines and does not possess control or influence over the design and execution of the clinical trials. The estimated completion dates for Phase III clinical trials vary, with the earliest expected in March 2025 [272] and the latest in March 2029.[273] The adjuvant use of Leukine® in predetermined dosage is distinct from its six FDA-approved indications, all of which have dosages that are based on body weight or body surface area (BSA). The adjuvant use dosages of Leukine® in clinical trials are generally much smaller than dosages for indications in the FDA-approved labeling. The smallest dose of Leukine® used for vaccine adjuvant purposes of which the applicant is aware (that is, 70 mcg) would lead to as much as 72 percent of the drug being discarded from a single-dose 250 mcg lyophilized vial, which is the only size available commercially. The applicant suggested that if use of these small doses were to become more common for an approved indication, the percentage of discarded units could increase the discarded drug refund amount that could be owed by the applicant, even though the applicant lacks control or knowledge of the potential variability of the discarded amounts that may occur if Leukine® were used for such purposes. If another manufacturer were to seek FDA approval for adjuvant use of sargramostim, the available single-dose 250-mcg vial presentation of Leukine® would likely not be optimized for the small doses being studied in these trials.

As part of CMS's review of the application, we analyzed existing claims data from the first quarter of 2023 through the first quarter of 2024 and found the percentage of units discarded for the Healthcare Common Procedure Coding System (HCPCS) code for Leukine® (J2820) ranged from 1.2 percent to 3.8 percent, which is below the applicable percentage of 10 percent. Since we did not yet know the impact of a new adjuvant indication with a type of immunotherapy commonly referred to as cancer vaccines [274] on the current percentage of units discarded, we did not propose an increased applicable percentage. Because it was not yet known whether sargramostim would be approved for additional indications and dosages, as indicated in the information provided by the applicant, and the available data did not provide enough information for CMS to determine whether Leukine® had unique circumstances that would prompt an increase in the applicable percentage, we did not propose an increase in the applicable percentage for the drug in the CY 2025 PFS proposed rule, and stated the applicant may reapply in a future application cycle when more information becomes available.

The following is a summary of the comments we received and our responses.

Comment: We received one comment related to the single application we received for an increased applicable percentage beginning in CY 2025. The manufacturer of Leukine® agreed with our rationale, noting that we lacked sufficient information to determine whether Leukine® has unique circumstances that would prompt an

[271] *https://www.cancer.org/cancer/managing-cancer/treatment-types/immunotherapy/cancer-vaccines.html.*

[272] *https://clinicaltrials.gov/study/NCT04229979.*

[273] *https://clinicaltrials.gov/study/NCT05100641.*

[274] *https://www.cancerresearch.org/treatment-types/cancer-vaccines.*

increase in the applicable percentage. The commenter indicated they will reapply in a future application cycle when more information becomes available.

Response: We appreciate the commenter's feedback and agreement with why we did not propose an increased applicable percentage at this time for this product. Taking into account the commenter's support for our assessment of the application for increased applicable percentage application beginning in CY 2025 for Leukine®, we are finalizing that we will not increase the applicable percentage for the drug at this time. As discussed above in this section, the application, including reapplication, for an increased applicable percentage is due by February 1 of the calendar year prior preceding the year in which the increased applicable percentage would apply, as described at § 414.940(e).

We received several comments related to categories and products that commenters believe we should consider for increased applicable percentages for unique circumstances, as well as a general comment concerning the finalized applicable percentage for orphan drugs.

Comment: We received comments recommending increases in the applicable percentages in the following scenarios:

(1) an increased applicable percentage above 10 percent when treating pediatric indications with products packaged for adult dosing. The commenter did not suggest a specific applicable percentage increase and stated that some discarded amounts of drug is unavoidable with pediatric patients, as their dosing is typically based on adult requirements;

(2) a 100 percent applicable percentage for all products with vial fill volumes smaller than 1 mL. The commenter stated that the small amount of drug remaining in vials after intravitreal injections is not ''wastage'' and should not be subject to the refund requirement;

(3) a 100 percent or the highest possible applicable percentage for all cell and gene therapies, without requiring manufacturers to submit applications justifying the exemption. The commenter noted that the unique characteristics of these therapies necessitate tailored approaches to drug availability and administration, requiring upfront preparation and sufficient drug supply. They also emphasized the importance of having the personalized medication available to avoid delays and potential complications, particularly in outpatient settings;

(4) a unique circumstances category to exempt orphan drugs with a single indication from drug refund liability; and

(5) a unique circumstances category to increase the applicable percentage for drugs that treat multiple indications across diverse patient types and characteristics (for example, weight-based dosing and dose titration).

Response: As we discussed in prior rulemaking, we continue to believe it would be inappropriate for any product to have an applicable percentage of 100 percent, as stated in the CY 2024 PFS final rule (88 FR 79053), or to expand the list of exclusions described in section 1847A(h)(8)(B) of the Act by proposing an increased applicable percentage of 100 percent to drugs not excluded in such section. Such an applicable percentage would, in effect, exclude drugs from the refund liability altogether, creating a significant loophole that undermines the goal of minimizing discarded amounts. This could jeopardize the integrity of our policy framework. We also recognize that there may be other drug products with unique circumstances, and that an increased applicable percentage for these products would have to be determined through future notice and comment rulemaking, as required by section 1847A(h)(3)(b)(ii) of the Act. In the CY 2023 PFS (88 FR 79060), we finalized the application process for increased applicable percentages, including the application deadline of February 1 of the calendar year preceding the year in which the increased applicable percentage would apply. We direct commenters to § 414.940(e) for further details and urge commenters seeking increased applicable percentages to utilize this request process for CY 2026 and subsequent years.

Comment: We received a comment in support of the increased applicable percentage of 26 percent for certain orphan drugs, which we finalized last year in the CY 2024 PFS final rule.

Response: We thank the commenter for its support.

After reviewing all comments, we are not finalizing any changes to the applicable percentage for any drug, including those used in pediatrics, ophthalmology, cell and gene therapies, or drugs with multiple indications.

c. Clarifications for the definition of refundable single-dose container or single-use package drug

(1) Exclusions for drugs for which payment has been made under Part B for fewer than 18 months

Section 1847A(h)(8)(B)(iii) of the Act excludes from the definition of refundable drug a drug approved or licensed by FDA on or after November 15, 2021, and for which payment has been made under Part B for fewer than 18 months. This is codified in the definition of refundable single-dose container or single-use package drug in § 414.902. In the CY 2023 PFS final rule (87 FR 69720 through 69731), we finalized that the 18-month period begins on the first day of the calendar quarter following the date of first sale as reported to CMS for the first National Drug Code (NDC) assigned to the HCPCS code. We expected that the first date of sale would approximate the date of payment of the first Part B claim, and we finalized that we would use the first date of sale because it is more operationally feasible than identifying the date when the first Part B claim was paid for a new drug. We did not receive any opposing comments to this approach when the policy was proposed (87 FR 69719 through 69724). Since then, however, we found one instance where the date of first sale for a drug, as reported to CMS, did not adequately approximate the first date for which payment was made under Part B.

As such, we proposed that, while we would continue to use the first date of sale reported to CMS for most refundable drugs, we would use the date on which the drug is first paid under Part B if the date of first sale as reported to CMS does not adequately approximate the first date of payment under Part B due to an applicable National Coverage Determination (NCD). Under the proposed exception, the first date for which the drug was actually paid under Part B (not the date of first sale) would be used to determine the beginning of the 18-month exclusion period.

As an example, we described in the case of Leqembi® (lecanemab-irmb), a drug targeting cerebral amyloid-beta plaques in Alzheimer's disease to receive FDA approval, the first date of sale reported to CMS via the Average Sales Price (ASP) portal was in January 2023, as it was marketed and sold under accelerated approval granted on January 6, 2023. However, because Leqembi® was subject to the NCD for Monoclonal Antibodies Directed Against Amyloid for the Treatment of Alzheimer's Disease under coverage with evidence

development (CED),[275] and because Leqembi® was initially marketed and sold under accelerated approval, Leqembi® coverage under Part B required the product to be furnished in a randomized controlled trial (RCT) conducted under an investigational new drug (IND) application.[276] In public comments on the CY 2024 proposed rule, the manufacturer of Leqembi® explained that Leqembi®'s Phase III confirmatory trial was already fully enrolled and complete prior to FDA granting accelerated approval, and as such, there was no RCT in which to enroll Medicare beneficiaries. Leqembi® received traditional approval on July 6, 2023. The first Part B payments for Leqembi® did not occur until after traditional FDA approval of the drug on July 6, 2023, and Medicare paid for the drug beginning that month in CED studies using a registry.[277] Under policies finalized in the CY 2023 PFS final rule, the 18-month exclusion period for Leqembi® would begin on April 1, 2023, which marks the first day of the calendar quarter after the drug's first date of sale as reported to CMS in January 2023. Based on this example, we believed that, in this situation, our current policy of using the date of first sale as reported in ASP data does not adequately approximate the beginning of the 18-month period for which payment has been made for the drug under Part B.

As stated in the CY 2025 PFS proposed rule (89 FR 61768), we proposed that the 18-month exclusion for Leqembi® would be October 1, 2023, through March 31, 2025 (that is, 6 full calendar quarters following the date that the drug was first paid under Medicare Part B).

Therefore, to maintain operational feasibility of this provision and better align the policy with statutory language when the date of first sale reported to CMS does not adequately approximate the date of first payment under Medicare Part B, we proposed to amend the exclusions in the definition of refundable single-dose container or single-use package drug at § 414.902. We noted that we also proposed to revise the structure of the definition of *Refundable single-dose container or single-use package drug* and as part of that restructuring, we proposed that exclusions would be defined at paragraph (2) of the definition. Moreover, we proposed to add a fourth exclusion to paragraph (2) to address drugs for which the date of first sale does not adequately approximate the first date of payment under Part B due to an applicable NCD. We stated that we anticipate that instances of inadequately approximating the date of first payment under Medicare Part B based on the date of first sale due to an applicable NCD will be rare, as coverage of a drug under Part B is not often restricted by an NCD.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal regarding the 18-month exclusion period, which uses the date a drug is first paid under Part B when the date of first sale reported to CMS does not adequately approximate the first date of payment under Part B due to an applicable NCD. Three commenters recommended creating a new unique circumstance category to extend the exclusionary period up to 36 months for manufacturers actively conducting post-marketing product formulation optimization efforts. They stated that an additional 18 months would accommodate the typical development, testing, and production of new drug delivery systems or vial sizes.

Response: We appreciate the support from the commenters regarding the clarification of the 18-month exclusion period. Section 1847A(h)(8)(B)(iii) of the Act excludes from the definition of refundable single-dose container or single-use package drug those drugs or biologicals approved by FDA on or after November 15, 2021 for which payment has been made under Part B for fewer than 18 months. The 18-month period is therefore prescribed in the statutory text, and as such, we do not have flexibility to extend it to 36 months to accommodate post-marketing product formulation optimization efforts.

Comment: One commenter requested that CMS notify manufacturers when the first Part B payments are made as this would allow manufacturers to be aware of the starting point for any potential 18-month exclusion period.

Response: Although drugs described in section 1847A(h)(8)(B)(iii) of the Act are excluded from the definition of refundable single-dose container or single-use package drugs, we agree that providing information regarding discarded amounts from such drugs would be beneficial to the manufacturers during the 18-month exclusion period. In the CY 2023 PFS final rule (87 FR 69726), we finalized that an annual refund report would provide information on the total number of units of the billing and payment code of drugs meeting this exclusion (and not meeting any other exclusion in section 1847A(h)(8)(B) of the Act) that were discarded during the 18-month exclusion period. We reiterate that, in most cases, the first date of sale indicated in the annual refund report would approximate the date of payment for the first Part B claim (87 FR 69719 through 69724). However, for refundable drugs where the date of first sale does not approximate the first date of payment under Part B, the annual refund report will include them after the first Part B claim for those drugs is paid.

Comment: One commenter recommended the use of consistent language, noting that the regulatory text describing the standard 18-month exclusion period uses the term ''has been marketed (as reported to CMS),'' while the proposed new paragraph for drugs subject to an NCD uses ''date of first sale.''

Response: We thank the commenter for the feedback. We agree with the commenter that the regulation text should use consistent terminology. Therefore, we are finalizing a modification to the regulatory text at § 414.902 describing the 18-month exclusion for drugs subject to an NCD from ''date of first sale as reported to CMS'' to ''date the drug was first marketed (as reported to CMS)'' to use consistent terminology throughout the definition of refundable drug.

After considering public comments, we are finalizing that we will amend the exclusions in the definition of refundable single-dose container or single-use package drug at § 414.902 as proposed.

(2) Clarification for identifying single-dose containers

In the CY 2023 PFS final rule (87 FR 69719), we finalized that the definition of refundable drug would apply to drugs paid under Medicare Part B (that is, under any payment methodology) that are described in FDA-approved labeling as being supplied in a ''single-dose'' container or ''single-use'' package. This definition also includes drugs described in FDA-approved labeling as a part of a ''kit'' that is intended for a single dose or single use. We also finalized that for a drug to meet the definition of refundable drug, all NDCs assigned to the drug's billing and payment code must be single-dose containers, as described in each product's labeling.

During our analysis in identifying refundable drugs for the preliminary

[275] Section 200.3 of the Medicare National Coverage Determinations Manual.

[276] *https://www.cms.gov/medicare/coverage/coverage-evidence-development/monoclonal-antibodies-directed-against-amyloid-treatment-alzheimers-disease-ad.*

[277] *https://www.cms.gov/newsroom/press-releases/statement-broader-medicare-coverage-leqembi-available-following-fda-traditional-approval.*

reports (which are based on available JW modifier data from the first and second quarters of 2023), we learned that some product labeling [278] did not specify the package type terms (for example, whether the product was supplied in a single-dose or single-use package or a multiple-dose preparation). This might occur in drugs that were approved prior to October 2018 when FDA issued guidance [279] regarding the selection of the appropriate package terms to address bacterial and viral infections among patients resulting from improper use of single-dose containers such as vials, ampules, and prefilled syringes. The guidance defines a single-dose container as a container of a sterile medication for parenteral administration (injection or infusion) that is not required to meet the antimicrobial effectiveness testing requirements. The guidance further states a single-dose container is designed for use with a single patient as a single injection/infusion and, when space permits, the label should include the correct package type term and appropriate discard statements. Discard statements include instruction for discarding or, if appropriate, storage guidance for drugs remaining after preparation. The guidance defines a multiple-dose container as a container of sterile medication for parenteral administration that has met antimicrobial effectiveness testing requirements or is excluded from such testing requirements. In addition, the guidance defines the term ''single-patient-use'' container, which describes a package that contains multiple doses of an injectable medical product that is intended to be used in a single patient.

Some drugs approved prior to the release of this guidance (that is, those prior to October 2018) and certain orphan drugs did not include the package type terms and explicit discard statements. Examples of drugs without the package type terms and discard statements included certain manufacturers of digoxin injection (approved in 1954), oxytocin injection (approved in 1980), diphenhydramine hydrochloride injection (approved in 1982), phenobarbital sodium injection (orphan drug without FDA approval). Several of these drugs were available in small containers with only a few mL of labeled drug in the containers.

Based on these reasons, we proposed to include injectable drugs with a labeled volume of 2 mL or less and that lack the package type terms and explicit discard statements in their product labeling to be single-dose containers in the definition of refundable single-dose container or single-use package drugs. We identified 2 mL as a threshold for this proposal for several reasons. For intramuscular administration, the maximum volume administered at one time for diphenhydramine hydrochloride and digoxin is less than or equal to 2 mL. We also noted that for adults, the maximum volume [280] for intramuscular administration is typically limited to 3 mL. For drugs administered intravenously and supplied in containers containing 2 mL or less, like digoxin and phenobarbital sodium, dosages are calculated based on body weight, potentially leading to discarded amounts. We believe that preparation of these drugs would likely be used for a single dose based on the range of dose sizes for these drugs and the amount of drug in the container. In other words, it is unlikely that more than one dose could be prepared from the amount of drug in the container.

Another category of drugs approved before 2018 that lack discard statements is drugs contained in ampules (also spelled as ampoules or ampuls, hereinafter referred to as ''ampules''). The term ampule is an airtight vial made of glass, plastic, metal, or any combination of these materials.[281] Examples of drugs currently contained in ampules include epinephrine injection (approved in 1939), lidocaine hydrochloride injection (1948), dicyclomine hydrochloride injection (1950), digoxin injection (1954), chlorpromazine hydrochloride injection (1957), fentanyl citrate injection (1968), promethazine hydrochloride injection (1973), alprostadil injection (1981), nalbuphine hydrochloride injection (1993), and tacrolimus injection (1994). Drugs contained in ampules are accessed by breaking the concaved part (''the neck''), and the content should be passed through a sterile filter to remove any residual glass particles.[282]

Therefore, we also proposed to amend the definition of refundable single-dose container or single-use package drug to include drugs contained in ampules and for which there is no discard statement. We proposed to classify drugs supplied in ampules to be drugs in single-dose containers for purposes of this discarded drug policy because this approach will be consistent with the description of single-dose container in the October 2018 FDA guidance. We noted that some drugs contained in ampules may be excluded from the definition of refundable drug under section 1847A(h)(8)(B)(ii) of the Act because dosage and administration instructions included in the product labeling require filtration during the drug preparation process, prior to dilution and administration, and require that any unused portion of such drug after the filtration process be discarded after the completion of such filtration process. This exclusion will still be applicable for ampules that can demonstrate that they meet that exclusion. However, this is not the case for the product labeling of all drugs contained in ampules.

In summary, we proposed to amend the definition of *Refundable single-dose container or single-use package drug* at § 414.902 by including ''single-patient-use container'' as a package type term and adding three types of products that may be considered refundable single-dose container or single-use package drugs under paragraph (1). These are:

(1) Product furnished from a single-dose container or single-use package based on FDA-approved labeling or product information.

(2) Product furnished from an ampule for which product labeling does not have a discard statement or language indicating the package type term, like ''single-dose container,'' ''single-use package,'' ''multiple-dose container,'' or ''single-patient-use container''.

(3) Product furnished from a container with a total labeled volume 2 mL or less for which product labeling does not have language indicating the package type term, like ''single-dose container,'' ''single-use package,'' ''multiple-dose container,'' or ''single-patient-use container''. As noted above, we also proposed to revise the organization of this definition in the regulatory text.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received many comments expressing general support for our proposals to include injectable drugs with a labeled volume of 2 mL or less that lack package type terms and explicit discard statements in their product labeling, as well as drugs contained in ampules without discard statements, in the definition of refundable single-dose container or single-use package drugs.

[278] ''Product labeling'' in this document means the container label, carton labeling, or prescribing information.

Response: We thank the commenters for their support.

Comment: One commenter stated that ''many'' drugs with a labeled volume of 2 mL or less do not specify whether they are single-dose container or single-use package. The commenter added that these drugs often require administrative equipment from different suppliers, which contribute to the discarding of a portion of the drug during administration. The commenter expressed concern that the proposal may incentivize manufacturers to produce formulations requiring in-office dilution to avoid potential rebate [sic] for discarded amounts.

Response: We disagree with the commenter's claim that there are ''many'' drugs with a labeled volume of less than 2 mL that lack package type terms and explicit discard statements in their labeling. The commenter did not specifically name ''many'' drugs but cited one study utilizing botulinum exotoxin A (that is, botulinum toxin type A). All four commercially available botulinum toxin type A products mentioned in the study cited by the commenter are supplied in single-dose vials and instruct users to discard any unused remaining solution.[283] Additionally, these four products require dilution without filtration to achieve the various final concentrations, which range from 1.25 units per 0.1 mL to 50 units per 0.1 mL.

While we acknowledge that additional administrative equipment may be required to achieve a final product volume of less than 2 mL, this dilution process does not exempt these products from discarded drug refund requirements. We reiterate that drugs or biologicals that require filtration prior to dilution and administration are exempt from discarded drug refund requirements, as described in section 1847A(h)(8)(B)(ii) of the Act. Furthermore, we have not seen evidence that the equipment used during drug preparation results in discarded amounts exceeding 10 percent.

Comment: One commenter raised concern about the proposed change to classify injectable drugs with a label of 2 mL or less as single-dose containers, noting that this would impose an administrative burden to retinal care specialists who commonly administer such drugs.

Response: We disagree with the commenter regarding the administrative burden on retinal care specialists who frequently administer drugs with a labeled volume of 2 mL or less. We note that the clarification we are making in this final rule as to injectable drugs with a labeled volume of 2 mL or less as single-dose containers applies only to those without package type terms or explicit discard statements in their product labeling. While many ophthalmic drugs have a labeled volume of 2 mL or less, many of these ophthalmic drugs include package type terms and explicit discard statements in their labeling; therefore, this proposal does not apply to them.

Comment: A few commenters requested CMS publish NDC codes for drugs identified as meeting the definitions of single-dose containers or single-use packages, as well as multiple-dose containers, on at least a quarterly basis. They noted that regular publication of NDC codes would help providers in verifying and reporting discarded amounts accurately.

Response: Drugs and biologicals payable under Medicare Part B are billed using billing and payment codes (that is, HCPCS codes) rather than the NDC of each individual product. CMS has published a non-exhaustive list of specific billing and payment codes assigned exclusively to single-dose containers or single-use packages on the Discarded Drug Refund website,[22] having manually identified each code. An analysis to definitively identify an exhaustive list of all NDCs that would be accurate in real time is not operationally feasible at this time. Because new drugs, including therapeutically equivalent drugs and those with new formulations are continuously introduced, we intend to update this list periodically as they become available and as is feasible.

Comment: One commenter objected to the proposal to include injectable drugs with a labeled volume of 2 mL or less, which lack package type terms and explicit discard statements, in the definition of refundable single-dose containers or single-use package drugs. The commenter argued that the 2 mL threshold is arbitrary and would result in the misclassification of numerous drugs. The commenter recommended a comprehensive review of a broader range of injectable drugs, in consultation with physicians who administer these drugs, to determine if 2 mL is an appropriate threshold.

Response: We disagree with the commenter that the 2 mL threshold is arbitrary. According to FAQs [284] published by the Joint Commission in response to the question, ''What are the Joint Commission's expectations for managing multi-dose vials of sterile, injectable medication?'', multiple-dose vials are labeled as such by the manufacturer and typically contain an antimicrobial preservative to help prevent the growth of bacteria. If a multiple dose vial has been opened or accessed (for example, needle-punctured), the vial should be dated with the last date that the product should be used (expiration date) and discarded within 28 days unless the manufacturer specifies a different (shorter or longer) date for that opened vial. An exception to this guidance on the presence of preservative applies to certain vaccines and allergenic product described in 21 CFR 610.15(a).[285] In contrast, single-dose or single-use vials are labeled as such by the manufacturer and typically lack an antimicrobial preservative. As a result, once the necessary amount is withdrawn, any remaining contents in the single-dose or single-use vials must be discarded.

When a drug lacks explicit package terms or discard statement, we proposed to treat it as a single-dose container. If a drug does not contain a preservative or include labeling about stability and sterility after being opened, it is reasonable to infer that it is not intended to be used as a multiple-dose container. In the absence of such critical information, treating the product as single-dose container minimizes the risk of contamination from multiple entries, which could compromise patient safety. This conservative approach aligns with the principle of *first, do no harm,*[286] ensuring that safety is prioritized in the face of uncertainty.

Initially, we considered injectable drugs that lacked the package type terms and explicit discard statements, regardless of their labeled volume, to be packaged in single-dose containers. However, given that many of these drugs have a labeled volume of 2 mL or less and typically yield no more than one dose from the container, we intentionally proposed to narrow the scope of our policy to only drugs with a labeled volume of 2 mL or less. We proposed this narrowing in an effort to mitigate any unintended consequences from this policy change. We note that this clarification would apply to very few drugs, most likely those approved by the FDA before 2018, as most drugs approved since the publication of FDA

guidance include package type terms and discard statements.

Comment: One commenter inquired how refunds will be calculated when a drug subject to the discarded drug refund policy no longer meets the definition of refundable drug mid-way through a quarter. Specifically, the commenter asked on which date CMS would consider a single source drug to become a multiple source drug, thereby no longer meeting the definition of refundable drug.

Response: CMS internally evaluates drugs each quarter to determine whether each is a single-source drug or biological (as defined in section 1847A(c)(6)(D) of the Act) or multiple source drug (as defined in section 1847A(c)(6)(C) of the Act). That is, for a given calendar quarter, a drug cannot be considered both a single source drug and a multiple source drug. When a drug that is rated as therapeutically equivalent in FDA's Orange Book [287] to a previously single source drug is newly marketed and sold, and partial quarter data is reported to CMS for the therapeutically equivalent product in a quarter, then that data is included in the calculation of the volume-weighted ASP-based payment limit for the quarter. The therapeutically equivalent product is crosswalked to the same billing and payment code as the previously single source drug. Therefore, both drugs become multiple source drugs for that entire quarter. It follows that, if a refundable drug becomes multiple source drug mid-way through a quarter, it would be a multiple source drug for the entire quarter and would not meet the definition of refundable drug for the quarter, provided that both the original product (likely the reference listed drug) and one or more therapeutically equivalent products are marketed and sold in the same quarter.

For example, if a therapeutically equivalent product to a single source drug is first marketed and sold in May 2024, the original product (that is, the single source drug) would be reclassified as a multiple source drug starting in the second quarter of 2024. Even though the therapeutically equivalent product was introduced mid-way through the quarter, both drugs would be treated as multiple source drugs for the entire second quarter. As a result, starting in the second quarter of 2024 and continuing thereafter, the original drug would no longer be classified as a single source drug or meet the definition of a refundable single-dose container or single-use package drug. This change exempts the drug from the discarded drug refund policy for that quarter and beyond.

In contrast, if all therapeutically equivalent products are no longer sold or marketed and only the reference listed drug remains, which was previously classified as a multiple source drug, the reference listed drug would be reclassified as a single source drug. However, if the reference listed drug is no longer sold or marketed and only one therapeutically equivalent product remains, the therapeutically equivalent product would continue to be classified as a multiple source drug because it was approved by the FDA under an *abbreviated* new drug application (ANDA). According to section 1847A(c)(6)(D)(ii) of the Act, a single source drug is defined as a drug approved by the FDA under a new drug application.

After consideration of public comments, we are finalizing the amendment of the definition of *Refundable single-dose container or single-use package drug* at § 414.902 as proposed.

(3) Skin substitutes

As discussed in the CY 2023 PFS final rule (87 FR 69650 through 69655), CMS aims to create a consistent coding and payment approach for the suite of products currently referred to as skin substitutes. In the CY 2024 PFS final rule (88 FR 79060 through 79061), we finalized that billing and payment codes that describe products currently referred to as skin substitutes were not counted for purposes of identifying refundable drugs for calendar quarters during 2023 and 2024.

While we continue to consider changes to the Medicare Part B payment policies for these products, we are finalizing, similar to last year, that billing and payment codes that describe products currently referred to as skin substitutes will not be counted for the purposes of identifying refundable drugs for calendar quarters in 2025. A more detailed discussion of potential future billing approaches for skin substitute products, including comments and responses, is provided in section II.K of this final rule.

d. Discarded amounts

Effective January 1, 2017, providers and suppliers were required to report the JW modifier on all claims that bill for drugs separately payable under Medicare Part B with unused and discarded amounts (that is, discarded amounts) from single-dose containers or single-use packages. In the CY 2023 PFS, we finalized the requirement to use the JW modifier for single-dose container drugs that are separately payable under Part B, and we finalized the use of the JW modifier (or any successor modifier that includes the same data) to identify discarded billing units of a billing and payment code for the purpose of calculating the refund amount as described in section 1847A(h)(3) of the Act. In that final rule, to align with the JW modifier policy, we also finalized the requirement that, beginning July 1, 2023, the JZ modifier is required when there are no discarded amounts of a single-dose container drug for which the JW modifier would be required if there were discarded amounts.

In the CY 2023 PFS final rule (87 FR 69723), we discussed the applicability of the JW and JZ modifiers to drugs that are not administered by the billing supplier, including drugs furnished through a covered item of DME that may be administered by the beneficiary. In such cases, we stated that the reporting requirement does not apply to drugs that are self-administered by a patient or caregiver in the patient's home. In the JW Modifier and JZ Modifier Policy FAQ document [288] released on January 5, 2023, we reiterated that suppliers who dispense but do not actually administer a separately payable drug are not expected to report the JW or JZ modifier.

Then, in the CY 2024 PFS final rule (88 FR 79062), we finalized a change to this policy, such that drugs separately payable under Part B from single-dose containers that are furnished by a supplier who is not administering the drug be billed with the JZ modifier. This meant that the JW modifier would not be used on these claims. As we stated in that rule, in the absence of a claims modifier to designate that a drug was dispensed, but not administered, by the billing supplier (as finalized in the CY 2023 PFS), we were concerned that claims rejections may occur. Therefore, this change in policy required the JZ modifier on all such claims to ensure claims rejections did not occur unnecessarily. On October 16, 2023, we updated the JW Modifier and JZ Modifier Policy FAQ document to include the requirement of the JZ modifier by the supplier. However, after this policy was finalized, interested parties have requested further clarification on how to appropriately bill for discarded amounts from single-dose containers when there are amounts

[287] *https://www.fda.gov/drugs/drug-approvals-and-databases/approved-drug-products-therapeutic-equivalence-evaluations-orange-book.*

[288] *https://www.cms.gov/medicare/medicare-fee-for-service-payment/hospitaloutpatientpps/downloads/jw-modifier-faqs.pdf.*

discarded during preparation by the billing supplier who is not administering the drug. To provide additional clarity, we proposed to require the JW modifier if a billing supplier is not administering a drug, but there are amounts discarded during the preparation process before supplying the drug to the patient. Such a supplier would report the JZ modifier if no amounts were discarded during the preparation process before supplying the drug to the patient.

We believe this proposal is appropriate because drug preparation occurs before supplying a drug to the beneficiary and the billing supplier can determine the discarded amount at the site of drug preparation. These discarded units should be billed using the JW modifier in the same way as a drug that is administered incident-to physician service. In addition, suppliers and other interested parties have expressed that suppliers are accustomed to using the JW modifier in this context already. Therefore, we proposed to require the JW modifier if a billing supplier is not administering a drug, but there are amounts discarded during the preparation process before supplying the drug to the patient. For example, if a billing supplier prepares a dose from a single-dose vial labeled as containing a total of 50 billing units such that 45 billing units of the drug are used in the prepared dose and 5 billing units are discarded during preparation, and then the drug is supplied to the patient (but not administered by the supplier), the claim should be submitted on two lines: 45 units (without a modifier) and 5 units with the JW modifier. We reiterate that suppliers who dispense a drug, but do not actually administer the drug, are not expected to monitor or bill for discarded amounts that are discarded after the drug is supplied because they are not at the site of administration to measure discarded amounts. For example, if the patient who was supplied the above dose with 45 billing units subsequently only receives 35 of those billing units, the above billing supplier would not be expected to account for the 10 subsequently discarded billing units on the claim. We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Four commenters expressed general support for the proposal to require the JW modifier for reporting discarded amounts during drug preparation by a billing supplier.

Response: We thank the commenters for their support.

Comment: One commenter requested clarification on the definitions of ''supplier'' and ''provider'' as they relate to the JW modifier to prevent ambiguity about who this proposed policy applies to.

Response: In § 400.202,[289] ''supplier'' is defined as a physician, or other practitioner, or an entity other than a provider that furnishes health care services under Medicare. In contrast, ''provider'' is defined in § 400.202 as a hospital, critical access hospital (CAH), skilled nursing facility, comprehensive outpatient rehabilitation facility, home health agency, hospice, or a clinic, rehabilitation agency, or public health agency that furnishes outpatient physical therapy or speech pathology services, all of which must have an agreement to participate in Medicare. The definition of ''provider'' also includes community mental health centers with a similar agreement to provide partial hospitalization services. For the purposes of the JW and JZ modifier requirements, a billing supplier or billing provider who prepares but does not administer the drug would be subject to the JW and JZ modifier requirements.

We received several comments regarding the JW and JZ modifier requirements more generally. The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed concern about the administrative burden associated with the use of modifiers. One commenter, without providing further details, stated that the use of any modifiers for billing drugs creates an administrative burden. Another commenter specified that the burden stems from the added complexity involved in preparing and administering chemotherapy drugs. Specifically, one commenter noted that drugs used for cancer treatments are disproportionately subject to discarded drug refund requirements, citing 2020 CMS drug pricing dashboard data that showed 22 of the 39 drugs with over 10 percent discarded amount were cancer drugs. The commenters suggested CMS conduct outreach to impacted providers for modifier training and collect data to evaluate whether the JW modifier imposes an excessive burden on suppliers.

Response: We thank the commenters for their feedback. For a complete discussion on potential burden as to JW and JZ modifiers, we refer readers to our discussion in the CY 2023 PFS final rule (87 FR 69711 through 69720), in which we codified the JW modifier policy that had been in place since 2017.

In that rule, we explained that the most practicable method for improving our data quality for amounts of discarded drug is by requiring providers filing claims for drugs from single-dose containers to report either a JW modifier when there are discarded amounts, or JZ modifier when no amount is discarded. We continue to believe providers are the only party that can obtain complete and accurate information on used and discarded amounts of variably dosed drugs. We acknowledge that, in some situations, it may be difficult to quantify discarded quantities of drugs and associate the specific amount with a single beneficiary, but we believe that, in most situations, there are no practical impediments that would prevent billing providers or other staff, such as nurses or pharmacists, from incorporating the measurement of discarded amounts into the process of preparing and administering the drug.

Further, we stated in the CY 2024 PFS final rule (88 FR 79062) that we believe that in most cases the JW and JZ modifier requirements impose no new burdens on providers beyond the requirement of measuring and reporting discarded amounts by use of the JW modifier that predates the enactment of the discarded drug refund policy under section 1847A(h) of the Act. Providers and suppliers who have been complying with the JW modifier requirement effective January 1, 2017 have already been assessing and documenting what is needed for the JZ modifier, and the new requirement of reporting the JZ modifier is minimal and justifiable for the purposes of obtaining more complete discarded amount data.

According to the HHS Assistant Secretary for Planning and Evaluation (ASPE),[290] biologicals contributed to 89 percent of the growth in Part B drug spending from 2008 to 2021. The report also highlighted that 12 of the 20 top drugs and biologicals by expenditure carried oncology indication(s). As the utilization and expenditure of drugs and biologicals continue to rise, the implementation of the discarded drug refund policy will help reduce waste and control spending within the Medicare Part B program.

As noted in the 2024 PFS final rule (88 FR 79059), most drugs in single-dose containers are manufactured in package sizes efficient enough to keep discarded amounts below 10 percent. We believe that drugs with more than 10 percent

[289] *https://www.ecfr.gov/current/title-42/section-400.202.*

[290] *https://aspe.hhs.gov/sites/default/files/documents/fb7f647e32d57ce4672320b61a0a1443/aspe-medicare-part-b-drug-pricing.pdf.*

discarded amounts could reflect an inefficiency related to vial sizes and high utilization. Since JZ and JW modifiers apply equally to all drugs packaged in single-dose containers, CMS does not target any particular subset of drugs, including therapeutic classes. A high discarded amount is likely due to mismatch between vial sizes and patient needs, leading to excess drug being discarded after each use.

CMS has created Discarded Drug Refund website [22] for additional information, and following the publication of this final rule, the Medicare Claims Processing Manual will be updated with the finalized policies regarding the JW and JZ modifiers. These updates will be accompanied by other CMS communications, such as an MLN Matters® article, directed to the provider community.

Comment: One commenter expressed concern about the administrative burden on ophthalmic practices due to the drug modifier requirement, particularly for intravitreal drug injections. The commenter requested a 100 percent increase in the applicable percentage to exempt ophthalmic drugs with labeled volume of less than 1mL.

Response: As discussed in the previous response, we stated in the CY 2023 PFS final rule (87 FR 69711 through 69720) that the burden of the JW and JZ modifier requirements is not a recent occurrence, as the JW modifier policy has been in place since 2017 and was codified in the CY 2023 final rule without change. Providers should currently be reporting the JW modifier on their claims, as well as documenting the discarded amounts in the beneficiary's medical records. We further explained that the most practicable method for improving our data quality for amounts of discarded drug is by requiring providers filing claims for drugs from single-dose containers to report either a JW modifier when there are discarded amounts, or JZ modifier when no amount is discarded. We also stated (87 FR 69724) that increasing the applicable percentage to 100 percent does not relieve the burden complying with the JW and JZ modifier requirements.

Section 1847A(h) of the Act establishes that CMS provide information on the total number of units of the billing and payment code, if any, that were discarded during a quarter, as determined by the JW modifier (or any such successor modifier that includes such data). Section 1847A(h)(8)(B) of the Act delineates three exclusions from the definition of refundable drug, one of which includes a specific class of drugs—radiopharmaceuticals and imaging agents—and does not include ophthalmic drugs. CMS has compiled a list of drugs with an increased applicable percentage, emphasizing that many injectable ophthalmic drugs are already included in this category on the Discarded Drug Refund website.[291]

Comment: One commenter noted the use of the JW modifier might lead to unintended consequences with Medicare's Medically Unlikely Edits (MUEs), potentially resulting in unnecessary claim denials. MUEs set the maximum number of units of a drug or service that can be reported on a claim. The current MUE policy includes both administered and discarded units in this calculation. The commenter explained that the MUE limit for Tecvayli® (teclistamab-cqyv, HCPCS code J9380) is 480 billing units, which could lead to claims denials if two vials of Tecvayli®, each containing 153 mg (that is, 306 billing units per vial), are used. The commenter recommended that the MUE policy be amended to exclude discarded units identified by the JW modifier from the unit of service calculations to prevent these unnecessary denials.

Response: The MUE files [292] for both facility outpatient hospital services and practitioner services, effective July 1, 2024, listed the MUE limit for Tecvayli® as 480 units, as the commenter noted. However, we clarify that effective October 1, 2024, the limit in the MUE file is 612 units to accommodate claims for two vials.

After consideration of public comments, we are finalizing the proposal that the JW modifier is required when a billing supplier is not administering a drug but discards drug amounts during the preparation process before supplying it to the patient. We are finalizing that JZ modifier is required if no drug amounts are discarded during preparation.

We received a few general comments about the discarded drug refund provisions. Below is a summary of comments and our responses.

Comment: One commenter cited *Loper Bright Enterprises* v. *Raimondo,* stating that ''courts [must] use every tool at their disposal to determine the best reading of the statute.'' [293] The commenter argued that CMS failed to adopt the ''best reading'' of the statutory requirement for the discarded drug refund, contending that its interpretation unfairly penalizes manufacturers with ''refundable drugs'' available on the market when the regulations took effect, despite regulatory decisions being made in compliance with laws prior to the enactment of section 90004 of the Infrastructure Act.

Response: As stated in the CY 2023 PFS final rule (87 FR 69713), we do not have discretion on whether to implement the Infrastructure Act, which was signed into law on November 15, 2021. As these policies affect refunds that will be paid in the future after the promulgation of the rule, there are no retroactive effects on payments that have already been made.

Specifically, manufacturers were informed that drugs in vial sizes specified in FDA labeling, with discarded amounts exceeding the 10 percent applicable percentage, would trigger the refund policy beginning on January 1, 2023, such that no retroactive penalties are imposed. While some vial sizes optimized for manufacturing prior to the Infrastructure Act may no longer be considered efficient due to resulting discarded amounts, our policy reflects the standards set by Congress. Therefore, we maintain that our interpretation of the statutory requirement for the discarded drug refund is appropriate and does not unfairly penalize manufacturers.

Comment: One commenter expressed the requirement in the CY 2024 PFS final rule raises due process concern, stating that ''the requirement attaches new legal consequences to events completed prior to enactment of the law, and this retroactive effect of the law is in conflict with the well-established due process principle of fair notice.''

Response: We disagree with the view that implementation violated the principle of fair notice. As these policies affect refunds that will be paid in the future after the promulgation of the rule, we disagree that our proposed implementation of section 1847A(h) of the Act violates the due process principle of fair notice. There are no retroactive effects on payments that have already been made. Additionally, we have finalized the requirement to provide ample notice that the refund amounts specified in the initial refund report must be paid no later than February 28, 2025. This includes provisions for the application process related to increased applicable percentages and dispute resolution. Furthermore, we have made every effort to keep interested parties informed

[293] *Loper Bright Enters. v. Raimondo, No. 22–1219, 2024 WL 3208360, at *16 (2024).*

about the new requirements by providing as much advance notice as possible, including information on the decision to revisit the process and timeline for manufacturers' provisions of refunds (87 FR 69727) to align with the Medicare Prescription Drug Inflation Rebate Program.

The rule aligns with fair notice standards by clearly setting forth explicit criteria, timelines, and thresholds, allowing manufacturers to adjust their practices accordingly. While we recognize that adjusting vial sizes may require time and resources, the regulation applies prospectively and is intended to promote efficiency and minimize drug waste in a fair and transparent manner.

Comment: One commenter recommended evaluating whether CMS's proposals regarding the 18-month exclusion period, the clarification for identifying single-dose containers, and use of JW and JZ modifiers when a billing supplier is not administering a drug effectively reduce wastage and inappropriate overpayment for unused medication. The commenter recommended that CMS conduct this evaluation by measuring payment timeliness, administrative burden, and product adjustments by provider.

Response: We recognize the importance of assessing whether these measures effectively reduce wastage and prevent inappropriate payment for unused medications. We began applying claims edits for both the JW and JZ modifiers on October 1, 2023 (87 FR 69718 through 69719). As we monitor reporting information for refundable drugs with multiple manufacturers, we plan to analyze the following: (1) the frequency of claims with JW versus JZ modifiers, which will help identify drugs with non-optimized package sizes and prescribing patterns by providers; (2) trends in refund amount, which may reveal insights, such as decreasing refund amounts suggesting lower drug utilization or optimized package sizes, while increasing refund amounts may indicate higher drug utilization or new indications requiring different dosing; (3) the frequency of disputes and the timeliness of their resolution, which may highlight issues that we cannot directly measure, such as administrative burden. We also regularly update the list of specific billing and payment codes that we identified as being assigned exclusively to single-dose containers. We believe that analyzing the variability in the percentage of discarded drugs from quarter to quarter can inform future policy development.

2. Payment Limit Calculation When Manufacturers Report Negative or Zero Average Sales Price (ASP) Data (§ 414.904)

a. Background

Drugs payable under Medicare Part B fall into three general categories: those furnished incident to a physician's service (hereinafter referred to as ''incident to'') (section 1861(s)(2) of the Act), those furnished via a covered item of durable medical equipment (DME) (section 1861(s)(6) of the Act), and other drugs for which coverage is specified by statute (for example, certain vaccines described in sections 1861(s)(10)(A) and (B) of the Act). Payment limits for most drugs separately payable under Medicare Part B are determined using the methodology in section 1847A of the Act, and in many cases, payment is based on the average sales price (ASP) plus a statutorily mandated 6 percent add-on. If CMS determines a payment limit for a drug, it is published in the ASP pricing file or Not Otherwise Classified (NOC) pricing file,[294] which are both updated quarterly.

We generally calculate the payment limits for drugs payable under Part B on a quarterly basis using the manufacturer's ASP (as defined in § 414.902). Manufacturers are required to report ASP to CMS under sections 1847A(f)(2) and 1927(b)(3) of the Act. Manufacturers are instructed to calculate ASP in accordance with section 1847A(c) of the Act and § 414.804(a).

For each NDC, in most cases, the manufacturer's ASP is a positive dollar value, along with a positive number of units sold (hereinafter referred to as ''positive manufacturer's ASP data''). However, sometimes the reported data is not positive manufacturer's ASP data. Specifically, a manufacturer could report that an NDC has a negative or zero-dollar value for the manufacturer's ASP with a positive, negative, or zero number of units sold, or a positive dollar value for the manufacturer's ASP with a negative or zero number of units sold (each of these scenarios is hereinafter referred to as ''negative or zero manufacturer's ASP data''). Such negative or zero manufacturer's ASP data could occur because of lagged discounts, units returned to the manufacturer, drug shortages, discontinuation of a drug, or other reasons that are not known to CMS. Negative or zero manufacturer's ASP data can occur when a manufacturer calculates its ASP in accordance with section 1847A of the Act.

First, section 1847A(c)(3) of the Act requires that the manufacturer's calculation of its ASP for an NDC must include volume discounts, prompt pay discounts, cash discounts, free goods that are contingent on any purchase requirement, chargebacks, and rebates (other than rebates under the Medicaid drug rebate program or the Medicare Prescription Drug Inflation Rebate Program) (hereinafter referred to as ''price concessions''). Second, section 1847A(c)(5)(A) of the Act requires each manufacturer to apply a methodology based on a 12-month rolling average for the manufacturer to estimate costs attributable to price concessions if there is a lag in the reporting of the information on rebates and chargebacks under section 1847A(c)(3) of the Act. These provisions may result in the inclusion of large price concessions from a quarter or quarters with a higher sales price prior to price concessions in the ASP calculation for a subsequent quarter with a much lower sales price, which can result in negative dollar value ASP. The same situation could happen in a quarter if more units were returned to the manufacturer than are sold, which can result in a negative dollar value ASP as well as a negative number of units sold. The requirement to use a rolling average for lagged price concessions is codified at § 414.804(a)(3), which states that, to the extent data on price concessions are available on a lagged basis, the manufacturer must estimate its ASP in accordance with the described methodology in that paragraph. In certain instances, as stated above, lagged price concessions can lead to negative or zero manufacturer's ASP data.

In 2022, the U.S. Department of Health and Human Services Office of Inspector General (OIG) issued a report assessing potential inaccuracies in manufacturer reporting of ASP and noted that manufacturers believe additional guidance may be needed to reduce distortions and inconsistencies in the calculation of payment limits.[295] The report found that several manufacturers would like additional guidance regarding reporting of negative ASP data and how CMS uses negative ASP data in payment limit calculations. CMS concurred with the OIG's recommendation to actively review current guidance and determine whether additional guidance would

[294] *https://www.cms.gov/medicare/payment/part-b-drugs/asp-pricing-files.*

[295] OEI–BL–21–00330. *https://oig.hhs.gov/oei/reports/OEI-BL-21-00330.asp.*

ensure more accurate and consistent ASP calculations.

Accordingly, we reviewed our current guidance and determined that it is appropriate for us to provide additional guidance regarding how CMS will handle payment for drugs separately payable under Part B when the manufacturer's ASP for at least one NDC within the billing and payment code (that is, HCPCS code) of the drug is negative or zero. Currently, when all NDCs assigned to a HCPCS code have negative or zero manufacturer's ASP data, CMS establishes the payment limit in other ways. As appropriate given the data available for a drug, we will either calculate a payment limit for a billing and payment code based on other applicable and available pricing data or not include a payment limit for the billing and payment code on the ASP pricing file. When a payment limit for a drug separately payable under Part B is not included in the ASP pricing file, the payment limit is based on either the published Wholesale Acquisition Cost (WAC) or invoice pricing, as described in section 20.1.3, Chapter 17 of the Medicare Claims Processing Manual.[296]

We previously contemplated how to set a payment limit in certain situations in which ASP data is ''not available'' for multiple source drugs. In the CY 2011 PFS final rule (75 FR 73461 through 73465), we addressed situations in which ASP data for some, but not all, NDCs in a multiple source drug billing and payment code are not available for the calculation of an ASP payment limit (for example, if a manufacturer's entire submission of data was not received or manufacturer's ASP data for specific NDCs was not reported).[297] In that rule, we finalized a process, consistent with authority in section 1847A(c)(5)(B) of the Act, to update payment limits based on the manufacturer's ASP reported for the most recent quarter for which data are available. We specified that if manufacturer's ASP data is not available for some but not all NDCs in a multiple source drug billing and payment code prior to the publication deadline for quarterly payment limits and such unavailability of manufacturer's ASP data significantly changes the quarterly payment limit for the billing and payment code when compared to the prior quarter's payment limit, CMS will calculate the payment limit by carrying over the most recently available manufacturer's ASP from a previous quarter for an NDC, adjusted by the weighted average of the change in the manufacturer's ASPs for the NDCs that were reported for both the most recently available previous quarter and the current quarter, and codified this policy in § 414.904(i).[298] In that final rule, we explained that such circumstances are limited to when a manufacturer's data for a multiple source drug product with sales during a quarter is missing, and efforts to obtain manufacturer reported ASP data before Medicare ASP payment limits publication deadlines have not been successful. We continue to believe that this process, which we apply in cases ASP data is ''not available'' for some but not all NDCs associated with a multiple source billing and payment code, is appropriate.

b. Approach to Payment Limit Calculations When Manufacturer's ASP Data is not Available

As described in the previous section, we determined that it is appropriate for CMS to provide additional guidance regarding how we will handle payment for drugs separately payable under Part B when the reported manufacturer's ASP for at least one NDC within the billing and payment code (that is, HCPCS code) of the drug is negative or zero (that is, has negative or zero manufacturer's ASP data). As detailed below, we proposed to consider ASP data to be not ''available'' for the purposes of calculating a payment limit in circumstances in which negative or zero manufacturer's ASP data is reported, consistent with section 1847A(c)(5)(B) of the Act. We also proposed how CMS would calculate a payment limit in these circumstances, consistent with section 1847A(c)(5)(B) of the Act.

Our existing policy, before the regulatory changes finalized in this final rule as discussed below, did not address how payment limits are calculated for several situations in which a drug separately payable under Part B does not have available ASP data. The set of situations in which this might occur include circumstances in which either some or all NDCs for a billing and payment code have a negative or zero manufacturer's ASP data; in which negative or zero manufacturer's ASP data is reported for a drug which has been discontinued; and vary further depending on whether a drug is multiple source or single source (both as defined in § 414.902). In each of these circumstances, there are various other pricing data available that we believe can appropriately be used to calculate a payment limit.

Therefore, we proposed, consistent with section 1847A(c)(5)(B) of the Act, a methodology for calculating payment limits in certain circumstances based on manufacturer's ASP for the most recent quarter for which data are available. Specifically, we proposed to specify that positive manufacturer's ASP data are considered ''available'' and that negative or zero manufacturer's ASP data are considered ''not available'' for purpose of CMS calculating a payment limit under the statute. We believe it is appropriate to consider negative or zero manufacturer's ASP data to be not available because if used to calculate a payment limit, this data can result in a negative or zero payment limit, which would require CMS to collect payment from providers and suppliers for a drug, rather than make payment for a drug. Negative or zero payment limits for a drug are not reasonable because Medicare does not expect to collect payment from providers and suppliers for their provision of separately payable drugs. Therefore, we proposed to specify the methodology we will use for calculating the payment limit in such circumstances to ensure reasonable payment amounts based on the best available data for separately payable drugs. In the following sections, we proposed how payment limits would be determined using available ASP data for each scenario.

We received comments regarding this proposal. The following is a summary of the comments we received and our responses.

Comment: One commenter expressed support for our proposal to consider positive manufacturer's ASP data ''available'' and to consider negative or zero manufacturer's ASP data ''not available'' for the purpose of calculating payment limits under the section 1847A of the Act. The commenter stated they believe this would provide predictability for manufacturers and mutual accountability between CMS and manufacturers when ASP data isn't available. Another commenter shared their support for using available pricing data as a basis for payment limits when manufacturers report negative or zero manufacturer's ASP data. The commenter stated that they support a pricing metric that accounts for price concessions, citing program cost savings, and oppose those that do not account for price concessions, such as WAC and average wholesale price (AWP).

Response: We thank the commenter for their support. We generally agree

[296] *https://www.cms.gov/%E2%80%8BRegulations-and-Guidance/%E2%80%8BGuidance/%E2%80%8BManuals/%E2%80%8BDownloads/%E2%80%8Bclm104c17.pdf.*

[297] *https://www.govinfo.gov/content/pkg/FR-2010-11-29/pdf/2010-27969.pdf.*

[298] *https://www.ecfr.gov/current/title-42/part-414/section-414.904#p-414.904(i).*

with the commenter that a pricing metric that accounts for price concessions is preferable as the basis of payment limits when manufacturer's ASP data from the most recent quarter is unavailable; in general, we also believe use of the most recent positive ASP data available for a billing and payment code for a drug is most consistent with the payment limit calculations described in section 1847A(b) and (c) of the Act, including section 1847A(c)(5)(B) of the Act.

After consideration of public comments, we are finalizing our policy as proposed that for the purposes of calculating a payment limit for Part B drugs, we will consider positive manufacturer's ASP data ''available'' and negative or zero manufacturer's ASP data ''not available.''

c. Single and Multiple Source Drugs When Negative or Zero Manufacturer's ASP Data is Reported for some, but not all NDCs

In the case that a drug separately payable under Part B has negative or zero manufacturer's ASP data reported for some, but not all, NDCs associated with a billing and payment code for that drug, we proposed to calculate a payment limit using only NDCs with positive manufacturer's ASP data (and omitting NDCs with negative or zero manufacturer's ASP data) for that drug and proposed to codify this at § 414.904(i). We proposed this policy to apply to both single source drugs and biologicals, including biosimilar biological products (defined at § 414.902) (hereinafter referred to as a ''biosimilars'') and multiple source drugs. We believed this was appropriate because it would result in payment limits based on the most recent positive manufacturer's ASP data reported by manufacturers with NDCs associated with a billing and payment code.

However, we noted that, as discussed in section III.A.2.a of this final rule, CMS already has a policy in place for multiple source drugs for which the absence of ASP data would result in a significant change (that is, a 10 percent or greater change) in the ASP payment limit compared to the payment limit of the previous quarter, as finalized in the CY 2011 PFS final rule (75 FR 73461 through 73465). In that discussion (75 FR 73462), we noted several examples of situations in which data is not available to be included in the calculation of a payment limit, such as when a manufacturer's entire submission was not received or when the manufacturer's ASP data for specific NDCs has not been reported. We did not intend for our proposed policy to override that existing policy; rather, we intend for the proposed policy described above to address circumstances not addressed in that rulemaking (that is, we intend to address circumstances of single source drugs when negative or zero manufacturer's ASP data is reported for some, but not all NDCs, and of multiple source drugs when negative or zero manufacturer's ASP data is reported for some, but not all NDCs and the absence of such data from the calculation of the payment limit does not result in a significant change in the payment limit compared to the payment limit of the previous quarter) and thus fill a policy gap. In addition, the circumstances we provided as examples in which ASP data is not available in the CY 2011 PFS final rule continue to be circumstances we consider manufacturer's ASP data not available under current § 414.904(i) (which we proposed to move within § 414.904(i) to fit within the structure of the proposed new set of payment limit methodologies); but, as noted in section III.A.2.b of the rule, we are expanding what we consider to be not available to include circumstances in which negative or zero manufacturer's ASP data is reported.

We received several public comments on the proposed payment limit calculation for single and multiple source drugs when negative or zero manufacturer's ASP data is reported for some, but not all NDCs. The following is a summary of the comments we received and our responses.

Comment: One commenter expressed support for the proposal for calculation of the payment limit for drugs when negative or zero manufacturer's ASP data is reported for some, but not all NDCs, specifically as it would apply to biosimilars.

Response: We thank the commenter for their support.

Comment: One commenter opposed the approach of using available positive ASP data when some but not all NDCs are reported with positive ASP data for single source drugs and biologicals, including biosimilars. The commenter recommended an alternative approach that calculates the volume-weighted ASP for a drug in this circumstance using the most recent positive manufacturer's ASP for each NDC in the billing and payment code, while using the current quarter's reported units sold for each NDC. The commenter suggested this would result in a payment limit that more accurately reflects market conditions than simply relying on only the NDCs that have positive ASP data in a given quarter, as we proposed in this section.

Response: We thank the commenter for their thoughtful response. Subsection 1847A(c)(5)(B) of the Act directs the Secretary to update quarterly a drug's ASP payment limit using manufacturer's ASP data from the most recent calendar quarter for which such data are available. We believe our proposal for single source drugs and biologicals is consistent with subsection (c)(5)(B) of section 1847A of the Act, which directs the Secretary to use available ASP data from a singular quarter, that being the most recent one with positive manufacturer's ASP data for a given drug.

Further, we believe the proposed policy would base payment limits on data most closely related to the current market conditions because it would rely on the most recently available data required to be reported under section 1847A(c) of the Act from a full calendar quarter associated with a billing and payment code. We disagree with the commenter that calculating the payment limit for a drug using positive manufacturer's ASP data from multiple quarters would result in a payment limit that is more reflective of current market conditions because more time would have passed since the sales reflected in the additional quarters for which inclusion is sought by the commenters. The manufacturer's positive ASP data in a given quarter represent the full set of most recently available data for the statutory calculation of an ASP-based payment limit, as discussed in section III.A.2.a of this final rule; the data set is not made more complete or accurate by the inclusion of older data.

Comment: Two commenters recommended that in lieu of our proposal for calculating a payment limit for a drug with negative or zero manufacturer's ASP data reported for some, but not all, associated NDCs, the ASP payment limit should be calculated using a volume-weighted average of available positive manufacturer's ASP data from the previous four quarters for which data are available. The commenters recommended this approach to smooth payment limit fluctuations caused by changes in the market. One commenter described this recommendation as consistent with the policy we finalized in the CY 2011 PFS final rule (75 FR 73461 through 73465), described above.

Response: We thank the commenters for their feedback. As noted above, section 1847A(c)(5)(B) of the Act directs the Secretary to update quarterly a drug's ASP payment limit using manufacturer's ASP data from the most recent single calendar quarter for which such data are available, rather than

several quarters. For this reason, we believe using a single quarter of data, as proposed, is most appropriate.

We disagree with the commenters who described carrying over four quarters of ASP data as consistent with the existing carryover policy finalized in the CY 2011 PFS final rule. Under this policy, in circumstances in which the unavailability of manufacturer's ASP data for an NDC causes a significant change in the ASP payment limit when compared to that of the previous quarter, CMS carries over only a single previous quarter's available ASP data for the NDC. In addition, as the commenter suggested a need for smoothing, we note that a smoothing function is already incorporated in the calculation of ASP payment limits by section 1847A(c)(5)(A) of the Act and codified at § 414.804(a)(3), which requires manufacturers to factor a 12-month rolling average to estimate the costs attributable to rebates and chargebacks. We disagree with the commenters that an additional smoothing function using older data would lead to payment limits more representative of current market prices.

After consideration of these comments, and for the reasons stated above and in the proposed rule, we are finalizing as proposed the calculation of the payment limit for a drug separately payable under Part B with negative or zero manufacturer's ASP data reported for some, but not all, NDCs associated with a billing and payment code for that drug at § 414.904(i). We will calculate the payment limit for such a drug using only NDCs with positive manufacturer's ASP data (and omitting NDCs with negative or zero manufacturer's ASP data). This policy applies to single source drugs and biologicals, including biosimilars, and multiple source drugs.

d. Multiple Source Drugs With Only Negative or Zero Manufacturer's ASP Data

In the case of a multiple source drug (as defined in § 414.902) separately payable under Part B that has negative or zero manufacturer's ASP data reported for all NDCs associated with a billing and payment code for that drug (and at least one NDC for the drug is actively being marketed (that is, not discontinued)), we proposed to carry over all positive manufacturer's ASP data from the most recently available previous quarter with positive manufacturer's ASP data for at least one NDC until at least one NDC for the drug has positive manufacturer's ASP data for a quarter. Specifically, we proposed to calculate the payment limit for the applicable quarter using data from the most recent calendar quarter for which ASP data are available, that is, for which there is positive manufacturer's ASP data. We believe this is appropriate because, similar to the methodology described in section III.A.2.c of this rule, it would result in payment limits based on the most recent positive manufacturer's ASP data reported by manufacturers with NDCs associated with a billing and payment code. Similarly, we believe the most recently available positive manufacturer's ASP data from NDCs associated with a billing and payment code are more likely to be reflective of providers' acquisition costs for drugs associated with that billing and payment code in a given quarter than other pricing data, and unlikely to result in challenges to access for these drugs for providers and beneficiaries.

We note that because section 1847A of the Act provides for payment limit calculations that differ between single-source drugs (as defined in section 1847A(c)(6)(D) of the Act and § 414.902) and multiple source drugs (as defined in section 1847A(c)(6)(C) of the Act and § 414.902), we proposed different ways to determine payment limits for each, in cases in which only negative or zero manufacturer's ASP data is reported, to reflect these differences. Specifically, the payment limit for single source drugs is described in section 1847A(b)(4) of the Act; for multiple source drugs, the payment limit is described in section 1847A(b)(3) of the Act. The payment limit for single source drugs is determined using the lesser of ASP or WAC; but WAC is not used for multiple source drugs whose ASP exceeds WAC. Nonetheless, our proposals for the calculation of the payment limit for single source and multiple source drugs with only negative or zero manufacturer's ASP data are consistent in that, where ASP is used, we proposed to use the most recently available positive manufacturer's ASP data from at least one NDC for the drug. We believe using similar input data in our calculation of the payment limit is consistent with our goal to ensure reasonable payment amounts based on the best available data for separately payable drugs.

We proposed to amend § 414.904(i) to include the above proposal regarding how CMS would calculate the payment limit in circumstances in which only negative or zero manufacturer's ASP data is reported for a multiple source drug.

We received two comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Both commenters recommended that for multiple source drugs with only negative or zero manufacturer's ASP data, CMS calculate the ASP payment limit using a volume-weighted average of available positive manufacturer's ASP data from the previous four quarters for which data are available.

Response: We thank the commenters for their feedback. Our proposed approach to use a single calendar quarter of data is most consistent with the Secretary's requirement under section 1847A(c)(5)(B) of the Act because the statute directs that Secretary to update quarterly a drug's ASP payment limit using manufacturer's ASP data from the most recent single calendar quarter for which such data are available, rather than several quarters. For this reason, we believe using a single quarter of data is most appropriate. We also note a smoothing function for lagged price concessions is already incorporated into the ASP payment limit calculation by section 1847A(c)(5)(A) of the Act. We disagree with the commenters that an additional smoothing function using older data would lead to payment limits more representative of current market prices. We refer readers to the response to the same approach recommended for single and multiple source drugs when zero or negative manufacturer's ASP data are reported for some, but not all NDCs in section III.A.2.c of this rule.

After consideration of these comments, and for the reasons stated above and in the proposed rule, we are finalizing as proposed the methodology for calculating the payment limit for a multiple source drug separately payable under Part B that has negative or zero manufacturer's ASP data reported for all NDCs associated with a billing and payment code for that drug at § 414.904(i). We will calculate the payment limit for such a drug using all positive manufacturer's ASP data from the most recently available previous quarter for which ASP data are available for at least one NDC.

e. Single Source Drugs With Only Negative or Zero Manufacturer's ASP Data, Excluding Biosimilar Biological Products

In the case of a single source drug, excluding biosimilars (both as defined in § 414.902), separately payable under Part B that has negative or zero manufacturer's ASP data reported for all NDCs associated with a billing and payment code for that drug (and at least one NDC for the drug is actively being marketed (that is, not discontinued)), we proposed to set the payment limit for

the given quarter for the single source drug at the lesser of the following until at least one NDC for the drug has positive manufacturer's ASP data for a quarter:

- 106 percent of the volume-weighted average of the most recently available positive manufacturer's ASP data from a previous quarter in which at least one NDC for the drug has positive manufacturer's ASP data for a quarter. If the payment limit from the quarter with the most recently available positive manufacturer's ASP data was based on 106 percent of the WAC because of the application of § 414.904(d)(1), that payment limit would be carried over; or
- 106 percent of the WAC for the given quarter. If there is more than one WAC per billing unit for the drug, the payment limit would be set using the lowest WAC per billing unit.

We proposed to only use the lesser of the positive manufacturer's ASP or WAC data from that previous quarter or the WAC data from the given quarter until positive manufacturer's ASP data are available for a future quarter. We proposed that once positive manufacturer's ASP data for a drug is available again in a future quarter, we would have data available to input into the routinely used methodologies described in section 1847A(b) of the Act and § 414.904.

As discussed above, we continue to believe it is appropriate to apply different policies for determining payment limits for single and multiple source drugs when negative or zero manufacturer's ASP data is reported because of statutory differences in the payment limit calculations.

We received several public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: One commenter supported our proposal for single source drugs, excluding biosimilars, when all NDCs have negative ASP data.

Response: We thank the commenter for their support.

Comment: One commenter recommended that for single source drugs with only negative or zero manufacturer's ASP data, excluding biosimilars, CMS set the payment limit by calculating the volume-weighted ASP for a drug in this circumstance using the most recent positive manufacturer's ASP for each NDC in the billing and payment code, while using the current quarter's reported units sold for each NDC.

Response: We thank the commenter for their feedback. Our proposed approach is most consistent with section 1847A(c)(5)(B) of the Act, which directs the Secretary to update quarterly a drug's ASP payment limit using manufacturer's ASP data from the most recent calendar quarter for which such data are available. In addition, we believe the proposed policy would base payment limits on data most closely related to the current market conditions because it would rely on the most recently available data required to be reported under section 1847A(c) of the Act from a full calendar quarter associated with a billing and payment code. We disagree with the commenter that calculating the payment limit for a drug using positive manufacturer's ASP data from multiple quarters would result in a payment limit that is more reflective of current market conditions because more time has passed since the sales reflected in the additional quarters for which inclusion is sought by the commenter. We refer readers to the response to the same approach recommended for single and multiple source drugs when zero or negative manufacturer's ASP data are reported for some, but not all NDCs in section III.A.2.c of this rule.

Comment: Two commenters recommended that for single source drugs with only negative or zero manufacturer's ASP data, excluding biosimilars, CMS calculate the ASP payment limit using a volume-weighted average of available positive manufacturer's ASP data from the previous four quarters for which data are available.

Response: We thank the commenters for their feedback. Our proposed approach to use a single calendar quarter of data is most consistent with the Secretary's requirement under section 1847A(c)(5)(B) of the Act because the statute directs that Secretary to update quarterly a drug's ASP payment limit using manufacturer's ASP data from the most recent single calendar quarter for which such data are available, rather than several quarters. For this reason, we believe using a single quarter of data is most appropriate. We also note a smoothing function for lagged price concessions is already incorporated into the ASP payment limit calculation by section 1847A(c)(5)(A) of the Act. We refer readers to the response to the same approach recommended for single and multiple source drugs when zero or negative manufacturer's ASP data are reported for some, but not all NDCs in section III.A.2.c of this rule.

After consideration of the comments we received, and for the reasons stated above and in the proposed rule, we are finalizing as proposed the methodology for calculating the payment limit for a single source drug, excluding biosimilars, separately payable under Part B that has negative or zero manufacturer's ASP data reported for all NDCs associated with a billing and payment code for that drug at § 414.904(i). We will set the payment limit for such a drug at the lesser of 106 percent of the volume-weighted average of the most recently available positive manufacturer's ASP data from a previous quarter in which at least one NDC for the drug has positive manufacturer's ASP data for a quarter and 106 percent of the WAC for the given quarter. In the former case, if the payment limit from the quarter with the most recently available positive manufacturer's ASP data was based on 106 percent of the WAC because of the application of § 414.904(d)(1), that payment limit will be carried over. In the latter case, if there is more than one WAC per billing unit for the drug, the payment limit would be set using the lowest WAC per billing unit.

f. Biosimilars With Only Negative or Zero Manufacturer's ASP Data

In circumstances in which negative or zero manufacturer's ASP data is reported for all NDCs for a biosimilar for a given quarter (and at least one NDC for the biosimilar is actively being marketed (that is, not discontinued)), and positive manufacturer's ASP data are available for another biosimilar(s) with the same reference biological product (hereinafter referred to as a ''reference product'') for the given quarter, we proposed to set the payment limit for the given quarter equal to the sum of the following until at least one NDC for the particular biosimilar for which negative or zero manufacturer's ASP data is reported for all NDCs has positive manufacturer's ASP data for a quarter:

- The volume-weighted average of the positive manufacturer's ASP data from all other biosimilars with the same reference product, and
- 6 percent (or 8 percent for qualifying biosimilar biologicals as defined in § 414.902, as appropriate) of the amount determined under section 1847A(b)(4) of the Act for the reference biological product (as defined in § 414.902) for the given quarter.

We believe this proposal was appropriate because section 351(i)(2) of the Public Health Service Act defines the terms biosimilar and biosimilarity to mean that a biosimilar is highly similar to its reference product, notwithstanding minor differences in clinically inactive components, and that there are no clinically meaningful differences between the biosimilar and the reference product in terms of the

safety, purity, and potency of the product. In addition, biosimilars with the same reference product likely compete in the marketplace since they all rely on FDA's previous determination of safety, purity, and potency for the reference product for approval. For these reasons, we believe that when a biosimilar has only negative or zero manufacturer's ASP data, the volume-weighted average of positive manufacturer's ASP data of biosimilars with the same reference product would be an appropriate payment limit for a biosimilar that, under this proposal, would be considered to have ASP data that is not available. As such, we proposed to calculate the payment limit for a biosimilar with only negative or zero manufacturer's ASP data based on the positive manufacturer's ASP data of other biosimilars with the same reference product.

We noted that in the CY 2016 PFS final rule (80 FR 71096 through 71101), we finalized that we would group all biosimilars with a common reference product in a single billing and payment code with a single payment rate, in a manner similar to how we price multiple source or generic drugs because of the significant similarities between each biosimilar and its reference product. In the CY 2018 PFS final rule (82 FR 53182 through 53187), we changed the initial policy and finalized separate coding and payment for biosimilars. In that final rule, we stated that that there is a program need for assigning Part B biosimilars into separate billing and payment codes; specifically, that this policy change addressed concerns about the public interest in a stronger marketplace, access to these drugs in the United States marketplace, and provider and patient choice and competition. Our proposal for biosimilars with negative or zero manufacturer's ASP data reported for all NDCs is consistent with the CY 2018 PFS rulemaking, as it would not result in grouping biosimilars with a shared reference product in a single billing and payment code. Rather, it would allow CMS to calculate an operationally reasonable payment limit using positive manufacturer's ASP data for products that are biosimilar to a shared reference product in limited instances.

This proposal would also provide payment limit stability that could help avoid potential access issues for providers and beneficiaries that could otherwise occur if we were to calculate a payment limit for a drug with negative or zero manufacturer's ASP data that is far below the provider's cost for acquiring the drug. If a biosimilar's ASP falls below zero only after several quarters of declining but still positive manufacturer's ASP data, the most recent positive manufacturer's ASP data from a previous quarter for a drug may be significantly lower than the volume-weighted average of the biosimilars with the same reference product as the biosimilar with negative ASP data. In such a case, the payment limit based on the ASPs of competitor biosimilars would be higher than if we were constrained to use ASP data only from the biosimilar that has most recently reported negative or zero manufacturer's ASP data. We noted that under the methodology proposed in section III.A.2.c of this rule, in circumstances in which some, but not all NDCs of a single or multiple source drug are negative or zero, we would similarly calculate the payment limit using only NDCs with positive manufacturer's ASP data from the given quarter and omitting those that had declined to zero or a negative value in ASP or sales. Likewise, we believe that such an approach would likely result in a payment limit reflective of providers' acquisition costs of biosimilars and be helpful in avoiding access issues for providers and beneficiaries.

In circumstances in which negative or zero manufacturer's ASP data is reported for all NDCs for a biosimilar for a given quarter and either no other biosimilars have been approved for the same reference product or no other biosimilars with the same reference product report positive manufacturer's ASP data for the given quarter, we proposed that we would set the payment limit for the given quarter equal to the sum of the following until at least one NDC for the biosimilar has positive manufacturer's ASP data for a quarter:

- The volume-weighted average of the most recently available positive manufacturer's ASP data from a previous quarter, and
- 6 percent (or 8 percent for qualifying biosimilar biologicals, as appropriate) of the amount determined under section 1847A(b)(4) of the Act for the reference product (as defined in § 414.902) for the given quarter.

In situations in which CMS would use the volume-weighted average of the most recently available positive manufacturer's ASP data from a previous quarter, we proposed we would only use positive manufacturer's ASP data from that previous quarter until positive manufacturer's ASP data are available for a future quarter. This proposed methodology is similar to the proposed methodology for multiple source drugs and single source drugs that are not biosimilars when manufacturers report negative or zero manufacturer's ASP for all NDCs.

In addition to the payment approaches we proposed for biosimilars with only negative or zero manufacturer's ASP data, we considered two alternatives for which we solicited public comment. Under the first alternative, the volume-weighted ASP calculation would include the ASP data and billing units sold of its reference product for a given quarter along with those of the other biosimilars that reference the same reference product in the volume-weighted average calculation. We believe including the reference product's data in the blended calculation for a biosimilar's payment limit in the limited circumstance described could be appropriate in determining an operationally reasonable payment limit because the FDA approval for the biosimilar relies in part on FDA's previous determination of safety, purity, and potency for the reference product, and the biosimilar is necessarily approved for at least one condition of use that has been previously approved for its reference product, as required under the 351(k) approval pathway;[299] therefore, the case that the two are comparable is at least as strong as that for any two biosimilars with the same reference product. If it is preferable, as we proposed, to base the payment limit on the available positive manufacturer's ASP data submitted by manufacturers of market competitor biosimilars (in this context, biosimilars that reference the same reference product), then including the ASP data and billing units sold of the reference product would also increase the likelihood that positive data in such a group is available, particularly in the case that a reference product only has one biosimilar. Under this alternative, the payment limit would be set equal to the sum of the volume-weighted average of the positive manufacturer's ASP data from all other biosimilars with the same reference product and the reference product plus 6 or 8 percent, as appropriate, of the amount determined under section 1847A(b)(4) of the Act for the reference product for the given quarter. We solicited public comments about whether including ASP data from the reference product in a variant of the proposed calculation would produce a more appropriate payment limit for a biosimilar with only negative or zero manufacturer's ASP data.

Under the second alternative, we would calculate payment limits for all

[299] *Section 351(k)(2)(A)(i)(III) of the Public Health Service Act (42 U.S.C. 262).*

biosimilars with only negative or zero manufacturer's ASP data in the manner described above for biosimilars when either no other biosimilars have been approved for the same reference product or no other biosimilars with the same reference product report positive manufacturer's ASP data for the given quarter. That is, under this alternative we would not consider the manufacturer's ASP data of other biosimilars with the same reference product; rather, we would base the payment limit of the biosimilar on the volume-weighted average of the its own most recently available positive manufacturer's ASP data from a previous quarter and either 6 or 8 percent, as appropriate, of the amount determined under section 1847A(b)(4) of the Act for the reference biological product for the given quarter. We solicited comments from interested parties about whether, and if so, why, it is preferable for the payment limit to be calculated only using manufacturer's ASP data from the biosimilar that reports negative or zero manufacturer's ASP data in a given quarter.

We received many public comments on our proposed payment limit calculations for biosimilars with only negative or zero manufacturer's ASP data and alternatives considered in this section. The following is a summary of the comments we received and our responses.

Comment: Regarding our proposal to calculate the payment limit for a biosimilar with all negative or zero manufacturer's ASP data for a given quarter when positive manufacturer's ASP data are available for another biosimilar(s) with the same reference product for the given quarter, multiple commenters opposed the proposed use of ASP data from drugs with other billing and payment codes to calculate a payment limit. Commenters stated that they believe this may create competitive asymmetries between biosimilars and reference products.

Two commenters stated that they believe treating payment for biosimilars in a manner similar to that of multiple source drugs, even in the limited circumstances described in the proposal, would distort the ASP-based payment system as a whole for biosimilars. Multiple commenters argued the biosimilar proposal would undermine profitability in the biosimilar marketplace and result in less participation by manufacturers and fewer treatment options for patients.

Several commenters opposed the proposal on the grounds that they believe it would undermine the policy we established in the CY 2018 PFS final rule (82 FR 53182 through 53187) to allocate separate billing and payment codes for each biosimilar product and urged that we extend that policy to circumstances in which no manufacturer ASP data is available in a given quarter. Commenters stated that the interests we articulated in the CY 2018 rulemaking, namely, to advance patient access, improve marketplace dynamics, and long-term program savings, continue to be served by the assignment of unique payment limits for each biosimilar and would be undercut by either the proposed methodology for biosimilars with all negative or zero manufacturer's ASP data when positive manufacturer's ASP data are available for another biosimilar(s) with the same reference product or the first alternative. Two commenters stated that they believe payment limits for single source drugs and biosimilars reporting zero or negative manufacturer's ASP data must reflect the unique market dynamics that an individual product faces and be based on the product's own sales data. One commenter stated that they believe we should avoid implicating interchangeability where it hasn't been established.

In general, commenters who opposed the proposal favored the second alternative. Several commenters explained their support for the second alternative due to its consistency with the requirement in section 1847A(b)(8) of the Act that a biosimilar's payment limits be based on its own ASP data when ASP data is available. Commenters also expressed approval of its consistency with other drug pricing methodologies that employ a carryover approach when manufacturer data is negative or zero.

Response: We appreciate the commenters' thoughtful responses to our proposal and alternatives and recognize the variety of different policy preferences expressed in the comments. In response to feedback expressed by the majority of interested parties, we are finalizing the second alternative policy as described in the proposed rule (89 FR 61774). That is, we will set the payment limit for a biosimilar for which negative or zero ASP data are reported for all NDCs equal to the sum of the following until at least one NDC for the biosimilar has positive manufacturer's ASP data for a quarter:

- The volume-weighted average of the most recently available positive manufacturer's ASP data from a previous quarter, and
- 6 percent (or 8 percent for qualifying biosimilar biologicals, as appropriate) of the amount determined under section 1847A(b)(4) of the Act for the reference biological product (as defined in § 414.902) for the given quarter.

We will not consider the manufacturer's ASP data of other biosimilars with the same reference product.

After considering the comments, we are persuaded by feedback provided by interested parties that the second alternative also supports our stated goal in the proposed rule: to codify a clear payment methodology for situations in which manufacturer ASP data is zero or negative, while accurately and fairly paying for these drugs and biosimilars. While we continue to believe our proposal would be suitable to achieve these program objectives and is consistent with the other calculations we are finalizing in sections III.A.d and e of this final rule, the second alternative also offers the advantages of methodologic simplicity and has broad support from interested parties.

However, we continue to believe that there are advantages to our original proposed policy relative to the alternative method that we are finalizing. As stated in the proposed rule, we believe the proposed policy is consistent with policies finalized in the CY 2018 PFS rulemaking, as the proposal would allow CMS to calculate an operationally reasonable payment limit using positive manufacturer's ASP data for highly similar products in limited instances, but also not group biosimilars with a shared reference product in a single billing and payment code.

We also disagree with commenters that our original proposed policy would cause general disruptions in the biosimilar market, provide competitive advantages to certain products relative to a reference biological product, or lead to the withdrawal of treatment options for patients, given the very narrow range of circumstances in which it would have applied. Furthermore, both the proposal and the second alternative would result in positive payment limits increased by the use of alternative data when price concessions for the given quarter would otherwise reduce the manufacturer's ASP to or below zero and neither would affect the payment limits of competitor products. The argument that one calculation would undermine the market or introduces harmful competitive asymmetries solely due to the source of the data and the other would not is unpersuasive.

Our priority, however, is to establish a transparent and predictable payment approach and avoid unnecessary inconsistency in the overall payment policy structure. Therefore, we are

finalizing the second alternative as described in the proposed rule, meaning we are finalizing that we will calculate payment limits for all biosimilars for which negative or zero manufacturer's ASP data is reported for all NDCs regardless of whether other biosimilars have been approved for the same reference product or whether other biosimilars with the same reference product report positive manufacturer's ASP data for the given quarter, as set forth in the language we are finalizing at § 414.904(i)(3)(ii), by setting the payment limit equal to the sum of the following until at least one NDC for the biosimilar has positive manufacturer's ASP data for a quarter:

- The volume-weighted average of the most recently available positive manufacturer's ASP data from a previous quarter, and
- 6 percent (or 8 percent for qualifying biosimilar biologicals, as appropriate) of the amount determined under section 1847A(b)(4) of the Act for the reference biological product (as defined in § 414.902) for the given quarter.

Comment: One commenter opposed the proposal and recommended that for biosimilars with only negative or zero manufacturer's ASP data, CMS set the payment limit by calculating the volume-weighted ASP using the most recent positive manufacturer's ASP for each NDC in the billing and payment code, while using the current quarter's reported units sold for each NDC. The commenter noted that if we do not incorporate this recommendation into our final policy, they would support the second alternative.

Response: We thank the commenter for their feedback. The approach we are finalizing, basing the payment limit of the biosimilar on the volume-weighted average of the its own most recently available positive manufacturer's ASP data from a previous quarter and an add-on payment amount determined under section 1847A(b)(4) of the Act for the reference biological product, is most consistent with section 1847A(c)(5)(B) of the Act, which directs the Secretary to update quarterly a drug's ASP payment limit using manufacturer's ASP data from the most recent calendar quarter for which such data are available. In addition, we believe the policy we are finalizing will base payment limits on data most closely related to the current market conditions because it would rely on the most recently available data required to be reported under section 1847A(c) of the Act from a full calendar quarter associated with a billing and payment code. We disagree with the commenter that calculating the payment limit for a drug using positive manufacturer's ASP data from multiple quarters would result in a payment limit that is more reflective of current market conditions because more time has passed since the sales reflected in the additional quarters for which inclusion is sought by the commenter. We refer readers to the response to the same approach recommended for single and multiple source drugs when zero or negative manufacturer's ASP data are reported for some, but not all NDCs in section III.A.2.c of this rule.

Comment: Two commenters expressed support for the second alternative discussed in the proposed rule, but requested that it be modified by calculating the first component of the payment limit with the volume-weighted average of the positive ASP data from the previous four quarters for which positive data are available for the biosimilar, rather than only the most recent calendar quarter for which data are available.

Response: We thank the commenters for their feedback. The calculation we are finalizing for biosimilars for which negative or zero ASP data is reported for all NDCs, using a single calendar quarter of data, is most consistent with the Secretary's requirement under section 1847A(c)(5)(B) of the Act because the statute directs that Secretary to update quarterly a drug's ASP payment limit using manufacturer's ASP data from the most recent single calendar quarter for which such data are available, rather than several quarters. For this reason, we believe using a single quarter of data is most appropriate. We also note a smoothing function for lagged price concessions is already incorporated into the ASP payment limit calculation by section 1847A(c)(5)(A) of the Act. We refer readers to the response to the same approach recommended for single and multiple source drugs when zero or negative manufacturer's ASP data are reported for some, but not all NDCs in section III.A.2.c of this rule.

Comment: Several commenters stated that they believe CMS does not have the statutory authority to set payments limit for biosimilars for which ASP data is not available using pricing data associated with other biosimilar products. Some of those commenters stated that they believe section 1847A(b)(8) of the Act, which provides the methodology for calculating the payment limit of biosimilars when manufacturer's ASP data is available, requires the calculation of ASP-based payment for biosimilars to be particular to each biosimilar product even when ASP data is not available for a given quarter and prohibits the proposed blending of manufacturer ASP data. Two commenters stated that they believe section 1847A(b)(8)(A) of the Act similarly prohibits basing a payment limit on a reference product's ASP data, and therefore they believe the first alternative is similarly impermissible.

One commenter stated its view that the Social Security Act does not expressly provide for how CMS should calculate payment amounts for separately payable Part B drugs when manufacturers report negative or zero ASP data, but urged CMS to apply a policy in these circumstances that adheres as closely as possible to the statutory payment limit requirements that apply when ASP data is available. The commenter stated that the main proposal and the first alternative considered are inconsistent with statutory requirements when positive manufacturer's ASP data is available, which require payment limit calculations, other than the add-on payment, to be specific to each biosimilar.

Response: We disagree with commenters regarding our statutory authority to implement the proposed policy (which we note we are not finalizing).. The methodology described in section 1847A(b)(8)(A) of the Act applies to circumstances in which manufacturer's ASP data is available for the calculation of a biosimilar's payment limit for a given quarter, which is not the circumstance we are addressing in this policy.

We agree with the commenter who expressed the view that the section provides no statutory methodology for the calculation of a drug's payment limit when manufacturers report negative or zero ASP data. We also agree with the commenter that the proposal for calculating the payment limit for a biosimilar for which negative or zero ASP data are reported for all NDCs is dissimilar from the methodology provided in statute for circumstances when positive manufacturer's ASP data is available. While such inconsistency does not preclude the from establishing a payment limit calculation for circumstances not described in section 1847A of the Act, the calculation are finalizing earlier in this section aligns more closely with the methodology described in section 1847A(b)(8)(A) of the Act and other calculations finalized in this final rule for payment limits for drugs for which negative or zero ASP data are reported for all NDCs.

Comment: One commenter noted that our proposal and the second alternative do not address situations in which price

concessions significantly reduce the ASP-based payment limit but the payment limit is still positive, and urged that we pursue either a legislative proposal to exclude certain rebates from payment limit calculations, discussed further below in section III.A.2.h of this rule, or the first alternative considered. The commenter stated that the first alternative would provide the greatest assurance that the payment limit for a biosimilar does not fall below provider acquisition costs and recommended finalizing that methodology.

Response: We appreciate the commenter's response. However, circumstances in which price concessions significantly reduce the ASP payment limit but the limit is still positive are outside the scope of the proposed rule. We appreciate the commenter's support for the first alternative, but for the reasons discussed above, we are finalizing the second alternative. We note that section 1847A(c)(3) of the Act expressly requires that in calculating the manufacturer's ASP, such price shall be calculated net of discounts as described in that paragraph.

Comment: One commenter, while generally supporting the proposal and the first alternative, expressed concern that in biosimilar markets with few participants, the proposal and first alternative would provide manufacturers a perverse incentive to employ aggressive rebate strategies or otherwise manipulate pricing data in order that competitor products' ASP data be used as the basis for a more favorable payment limit.

Response: We thank the commenter for their feedback. As we are finalizing neither the proposal nor the first alternative, we are not considering refinements to these approaches that may stem any pricing data manipulation resulting from these approaches.

Comment: Two commenters recommended that in lieu of our proposal, we propose measures that address the underlying causes of negative or zero ASP data or biosimilar market dynamics that may cause manufacturers to exit the market.

Response: We thank the commenters for their feedback and note that we may consider this input for potential policy proposals through future rulemaking.

g. Discontinued Drugs

Generally, for single source drugs and multiple source drugs for which negative or zero manufacturer's ASP data is reported for all NDCs and for which all relevant applications (for example, new drug applications (NDAs), biologics license applications (BLAs), or abbreviated new drug applications (ANDAs)) have a marketing status of ''discontinued'' on the FDA website,[300] [301] we proposed that the drug be priced by MACs consistent with section 20.1.3 in Chapter 17 of the Medicare Claims Processing Manual for developing payment limits for covered drugs when CMS does not supply the payment allowance limit on the ASP drug pricing file.[302]

Once a drug is discontinued, as indicated by the marketing status on the FDA website (either at *Drugs@FDA* [303] for drugs or the Purple Book [304] for biologicals), the manufacturer might not have sales to calculate an ASP and, therefore, the manufacturer often reports zero sales for the drug or a negative number for its calculated ASP or number of sales. However, even if a drug has a marketing status of discontinued on the FDA website, there may theoretically be available product that could be billed by the provider until the expiration date of the last lot sold for the drug. Relatedly, we have observed that very few claims are paid for drugs following their discontinuation. For these reasons, setting a payment limit for drugs with a marketing status of discontinued on the FDA website is not expected to be practically useful for claims processing and is not a prudent use of CMS resources.

We did not receive any public comments on our proposal to have single source drugs and multiple source drugs for which negative or zero manufacturer's ASP data is reported for all NDCs and all NDCs have a marketing status of ''discontinued'' priced by the MACs consistent with section 20.1.3 in Chapter 17 of the Medicare Claims Processing Manual and are finalizing it as proposed.

h. General Comments

Comment: One commenter expressed general support for the proposed changes under each of the circumstances, and expressed the view that these changes, if finalized, will simplify the process of establishing a payment limit when a drug is under circumstances that would otherwise make doing so difficult. Another commenter expressed support for the principle of using positive ASP data from the most recent quarter with at least one NDC with positive ASP to calculate a drug's payment limit when the manufacturer reports negative or zero ASP data. One commenter expressed general support of the use of ASP as the basis of payment whenever possible and appropriate, and added that ASP is the most transparent, predictable, and consistent pricing metric available.

Response: We thank the commenters for their support.

Comment: One commenter requested clarification on several technical aspects regarding when manufacturers report negative or zero ASP, including: whether negative values are to be noted by putting a number in parentheses or by including an initial minus sign; and how ''false positive'' ASPs (that is, ASPs calculated with negative values for both total sales and total units sold) are to be reported.

Response: We thank the commenter for their request. Manufacturers should report negative values with a minus sign. In instances of false positives, manufacturers should report zero for the drug's ASP and provide clarification in their reasonable assumptions. We will update the Medicare Part B ASP Module Submitter User Guide and ASP Quarterly Publication Process Frequently Asked Questions documents to reflect these instructions.

Comment: A couple commenters supported the proposed policies, but expressed concern that they do not go far enough to address the challenges posed by drugs for which the provider acquisition costs exceed their payment limits. Several commenters urged CMS to work with Congress to modify the payment limit calculations described in section 1847A of the Act to ensure payment limits are greater than acquisition costs. Specifically, commenters requested legislative proposals including an add-on payment for drugs based on 8 percent of acquisition costs and the exclusion of certain price concessions from the payment limit calculation, such as rebates paid to pharmacy benefit managers (PBMs). One commenter requested that CMS clarify that PBMs, group purchasing organizations (GPOs), and payers are not purchasers referenced in section 1847A(c) of the Act and that sales to such entities are excluded from ASP payment limit calculations.

Response: We thank the commenters for their feedback on the gaps between provider acquisition costs and payment

limits. As the commenters noted, in previous rules (that is, the Manufacturer Submission of Manufacturer's ASP Data for Medicare Part B Drugs and Biologicals interim final rule with comment (69 FR 17936) and the Manufacturer Submission of Manufacturer's ASP Data for Medicare Part B Drugs and Biologicals final rule (69 FR 55763 through 55765) on what price concessions described in section 1847A(c)(3) of the Act must be included in manufacturer's ASP calculations, we did not distinguish between whether the recipient of the concession is a purchaser or not. Further information is available in the ASP Quarterly Publication Process Frequently Asked Questions document,[305] which specifies that manufacturers must report each drug's sales volume including the manufacturer's sales to all purchasers in the United States and ASP reflecting all price concessions as specified in 42 CFR 414.804(a)(2) and (a)(3). We note, however, that both the legislative proposals and the recommended interpretation of a purchaser as it relates to manufacturer ASP calculations under section 1847A(c) of the Act are out of scope for this final rule.

i. Summary

We are finalizing amendments to § 414.904(i) to reflect CMS's approach to setting a payment limit in circumstances in which negative or zero manufacturer's ASP data is reported by a manufacturer for a drug, beginning with the payment limits included in the January 2025 ASP Drug Pricing file. Specifically, we are finalizing our proposal to codify that in cases where negative or zero manufacturer's ASP data is reported for some, but not all, NDCs of a multiple source drug, we will calculate the payment limit using the positive manufacturer's ASP data reported for the drug, except for the existing carryover policy for multiple source drugs that we will apply when unavailable data results in a significant change in the ASP payment limit. We are finalizing our proposal to move this carryover policy for multiple source drugs within § 414.904(i) to fit within the structure of the proposed new set of payment limit methodologies. We also finalizing our proposal to codify that in the case of a multiple source drug for which negative or zero manufacturer's ASP data is reported for all NDCs, we will set the payment limit using the most recently available positive manufacturer's ASP data from a previous quarter until at least one NDC for the drug has positive manufacturer's ASP data for a quarter.

We are finalizing our proposal to codify that in cases where negative or zero manufacturer's ASP data is reported for some, but not all, NDCs of a single source drug that is not a biosimilar, we will calculate the payment limit using the positive manufacturer's ASP data reported for the drug. We finalizing our proposal to codify that for single source drugs that are not biosimilars with all negative or zero manufacturer's ASP data for a given quarter, the payment limit will be, until at least one NDC for the drug has positive manufacturer's ASP data for a quarter, the lesser of 106 percent of the volume-weighted average of the most recently available positive manufacturer's ASP data for at least one NDC from a previous quarter and 106 percent of the WAC, and we will use 106 percent of the lowest WAC per billing unit if there is more than one WAC per billing unit available.

We are also finalizing our proposal to codify that in cases where negative or zero manufacturer's ASP data is reported for some, but not all, NDCs of a biosimilar, we will calculate the payment limit using the positive manufacturer's ASP data reported for the biosimilar. Lastly, we are finalizing a modification to our proposal to codify a methodology for calculating payment limits when the manufacturer reports negative or zero manufacturer's ASP for all NDCs for a biosimilar for a given quarter. We are adopting the approach proposed for circumstances when no other biosimilars have been approved for the same reference product or no other biosimilars with the same reference product report positive manufacturer's ASP data for the given quarter for all circumstances, regardless of whether positive ASP data is reported for other biosimilars that reference the same reference product. In other words, we are finalizing for all biosimilars with all negative or zero manufacturer's ASP data that we will set the payment limit equal to the sum of the volume-weighted average of the most recently available positive manufacturer's ASP data from a previous quarter plus 6 percent (or 8 percent for a qualifying biosimilar biological) of the amount determined under section 1847A(b)(4) of the Act for the reference biological product for the given quarter.

3. Payment of Radiopharmaceuticals in the Physician Office

Section 303(c) of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173, enacted December 8, 2003) revised the payment methodology for most Medicare-covered Part B drugs by adding section 1847A to the Act, which established a new ASP drug payment methodology for separately payable Medicare Part B drugs, beginning January 1, 2005. Specifically, section 303(h) of the MMA states, ''Nothing in the amendments made by this section [303 of the MMA] shall be construed as changing the payment methodology under [Medicare] Part B . . . for radiopharmaceuticals, including the use by carriers of invoice pricing methodology.''

In accordance with the law, radiopharmaceuticals are not required to be paid using payment methodology under section 1847A of the Act, as currently described in the Medicare Claims Processing Manual (MCPM) Chapter 17, section 20.1.3. The manual instructs MACs to determine payment limits for radiopharmaceuticals based on the methodology in place as of November 2003, before the passage of the MMA, in the case of radiopharmaceuticals furnished in settings other than the hospital outpatient department. Currently, payment can vary by MAC. For example, payment can be based on 95 percent of Average Wholesale Price (AWP), invoices, or other reasonable payment methods/data made available when the product is contractor priced.[306] [307] [308] [309] [310] [311]

We have heard from MACs and other interested parties that there is confusion about which exact methodologies are available to MACs for pricing of radiopharmaceuticals in the physician office setting, as different MACs had different methodologies in place as of

November 2003. MACs are uncertain whether they can use *any* of these payment policies that were in place, or only the policy that was in place for their jurisdiction as of November 2003.

Accordingly, while we evaluate our broader policies in this space for future rulemaking, we proposed to clarify that *any* payment methodology that was being used by *any* MAC prior to the enactment of the MMA can continue to be used by any MAC, including the use of invoice pricing. That is, we proposed to clarify that any methodology that was in place to set pricing of radiopharmaceuticals in the physician office setting prior to November 2003 can be used by any MAC, regardless of whether that specific MAC used the methodology prior to November 2003.

Thus, we proposed to codify in regulations at § 414.904(e)(6) that, for radiopharmaceuticals furnished in a setting other than the hospital outpatient department, MACs shall determine payment limits for radiopharmaceuticals based on any methodology used to determine payment limits for radiopharmaceuticals in place on or prior to November 2003. Such methodology may include, but is not limited to, the use of invoice-based pricing. We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received many comments expressing general support for the proposal to clarify that any MAC may use any radiopharmaceutical payment methodology available on or prior to November 2003. One commenter expressed strong support for separate Medicare payment for radiopharmaceuticals.

Response: We thank the commenters for their support.

Comment: Several commenters recommended various approaches to improve transparency around how MACs make payment for radiopharmaceuticals, including for CMS to closely monitor and evaluate how MACs make payment for radiopharmaceuticals and to direct MACs to publish the prices of these radiopharmaceuticals and publicly state the specific payment methodology that they use. Specifically, one commenter recommended CMS require that MACs routinely update (for example, quarterly or semiannually) their invoice and AWP reference files to accurately set payment limits for these therapies. In addition, the commenter requested that CMS publish AWP and WAC pricing information for therapeutic radiopharmaceuticals in the quarterly ASP pricing file on the CMS website. Another commenter encouraged CMS to work with MACs to ensure that appropriate metrics such as WAC, invoice pricing, and ASP are used as the basis to establish payment rates.

Response: We appreciate the many commenters for their feedback. In accordance with our clarification, *any* payment methodology that was being used by *any* MAC prior to the enactment of the MMA can continue to be used by any MAC, including the use of invoice pricing. MACs update their own pricing files, and therefore, we suggest that the commenters share their concerns with the MACs. We note that CMS was able to find public pricing file information for some MACs.[312] [313] We appreciate the other commenters' feedback and may address our broader policies regarding payment of radiopharmaceuticals in the physician office in future rulemaking.

Comment: A few commenters urged CMS to direct MACs to utilize a single payment methodology across all the MACs, and the commenters suggested that they believe uniform payment would alleviate confusion for MACs. They also stated that payment variation across MACs results in difficulty obtaining the payment rate prior to submitting a claim. Other commenters raised concern that there is significant variation in coverage of radiopharmaceuticals across jurisdictions, resulting in some providers not offering certain radiopharmaceuticals. One commenter recommended implementing invoice-based pricing, asserting that that payment methodology would result in savings for Medicare. Another commenter recommended standardizing a single rate across MACs of AWP minus 5%, which they claim would ensure acquisition and administration costs are covered to support access to this treatment in the community-based setting.

Response: We appreciate the commenters feedback. We may consider these comments on the broader policies regarding payment of radiopharmaceuticals in the physician office if addressed in future rulemaking.

Comment: A few commenters recommended CMS issue educational materials on radiopharmaceutical payment as well as to reach out to contractors, providers, and other stakeholders to educate them on this issue. One commenter requested CMS engage with interested parties early in any process that could potentially impact longstanding Medicare payment policies for radiopharmaceuticals.

Response: We appreciate the feedback from commenters. CMS plans to update the Medicare Claims Processing Manual to reflect the finalized policies for payment of radiopharmaceuticals in the physician office. In addition, we welcome engagement on other ways to educate interested parties on our current payment policies, as well as possible payment policies CMS could consider.

Comment: We received one comment that recommends MACs disclose how payment rates will be determined, and for this method to be open for public comment. The commenter also requested MACs work with providers if the resulting payment is below the cost of the radiopharmaceutical.

Response: We appreciate the commenter's feedback. This recommendation as to the way MACs determine appropriate payment rates is outside the scope of this proposal. This proposal clarifies that MACs may use any payment methodology that was being used on or prior to November 2003.

After consideration of public comments, we are finalizing as proposed a revision to § 414.904(e)(6). For radiopharmaceuticals furnished in a setting other than the hospital outpatient department, MACs shall determine payment limits for radiopharmaceuticals based on any methodology used to determine payment limits for radiopharmaceuticals in place on or prior to November 2003. Such methodology may include, but is not limited to, the use of invoice-based pricing.

4. Immunosuppressive Therapy (§§ 410.30 and 414.1001)

a. Background

Medicare Part B coverage of drugs used in immunosuppressive therapy was established by section 9335(c) of the Omnibus Budget Reconciliation Act of 1986 (Pub. L. 99–509) (OBRA '86). OBRA '86 added subparagraph (J) to section 1861(s)(2) of the Act to provide Medicare Part B coverage for immunosuppressive drugs, furnished to an individual who receives an organ transplant for which Medicare payment is made, for a period not to exceed 1 year after the transplant procedure. Coverage of these drugs under Medicare Part B began January 1, 1987. Section

[312] Radiopharmaceutical Fee Schedule, Noridian Healthcare Solutions. *https://med.noridianmedicare.com/web/jfb/fees-news/fee-schedules/radiopharmaceutical-fees.*

[313] Fee Schedule Lookup Details, National Government Services. *https://www.ngsmedicare.com/web/ngs/fee-schedule-lookup-details?lob=93617&state=97256&rgion=93623&selectedArticleId=4920515.*

4075 of the Omnibus Budget Reconciliation Act of 1987 (Pub. L. 100–203) (OBRA '87) revised section 1861(s)(2)(J) of the Act so that the scope of coverage was expanded from coverage of ''immunosuppressive drugs'' to coverage of ''prescription drugs used in immunosuppressive therapy.'' For the purposes of this proposed rule, we refer to this benefit as the immunosuppressive drug benefit.

In the February 16, 1995 Medicare Coverage of Prescription Drugs Used in Immunosuppressive Therapy final rule (60 FR 8951 through 8955),[314] we codified policies related to the scope of drugs for which payment may be made under this benefit. We finalized that payment may be made for prescription drugs used in immunosuppressive therapy that have been approved for marketing by the U.S. Food and Drug Administration (FDA) and meet one of the following conditions:

(1) The approved labeling includes the indication for preventing or treating the rejection of a transplanted organ or tissue.

(2) The approved labeling includes the indication for use in conjunction with immunosuppressive drugs to prevent or treat rejection of a transplanted organ or tissue.

(3) Have been determined by a Part B carrier, in processing a Medicare claim, to be reasonable and necessary for the specific purpose of preventing or treating the rejection of a patient's transplanted organ or tissue, or for use in conjunction with immunosuppressive drugs for the purpose of preventing or treating the rejection of a patient's transplanted organ or tissue. (In making these determinations, the carriers may consider factors such as authoritative drug compendia, current medical literature, recognized standards of medical practice, and professional medical publications.)

We also finalized the period of coverage eligibility for a transplant patient.[315] Lastly, we established the policy that drugs are covered under this provision irrespective of whether they can be self-administered. We codified these policies at § 410.31 (later redesignated as § 410.30).

We note that we do not maintain a list of drugs covered under this benefit; rather, MACs are expected to maintain a list of these drugs, as stated in section 80.3, Chapter 17 of the *Medicare Claims Processing Manual.* MACs are expected to keep informed of FDA approvals of immunosuppressive drugs and update guidance as applicable.

While the eligibility timeframe has been extended and eligibility has been expanded since the immunosuppressive drug benefit under Medicare Part B was revised by OBRA '87, the scope of drugs payable under this benefit has not changed. Some examples of how the benefit has been extended and expanded include: section 13565 of the Omnibus Reconciliation Act of 1993 (OBRA '93) (Pub. L. 103–66), amended section 1861(s)(2)(J) of the Act to extend the duration of coverage for the immunosuppressive drug benefit to 36 months from the hospital discharge date following a covered transplant procedure for drugs furnished after CY 1997; section 113 of the Medicare, Medicaid and SCHIP Benefits Improvement and Protection Act of 2000 (Pub. L. 106–554) (BIPA) revised section 1861(s)(2)(J) of the Act to eliminate the time limits for coverage of prescription drugs used in immunosuppressive therapy under the Medicare program; and most recently, section 402 of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260) amended section 226A(b)(2) to allow certain individuals whose Medicare entitlement based on ESRD would otherwise end 36 months after a kidney transplant to continue enrollment under Medicare Part B only for the coverage of immunosuppressive drugs described in section 1861(s)(2)(J) of the Act.

After reviewing our longstanding policies for the immunosuppressive drug benefit and engaging with interested parties about current practices and challenges, we proposed policies aimed to reduce barriers faced by beneficiaries receiving immunosuppressive drugs under this benefit, as described below.

b. Compounded Immunosuppressive Drugs With Oral or Enteral Routes of Administration

As discussed in the previous section, the immunosuppressive drug benefit currently includes immunosuppressive therapies that have been approved for marketing by the FDA (and meet other regulatory requirements at § 410.30). Interested parties have expressed concern that compounded formulations of immunosuppressive drugs (for example, a liquid formulation of an immunosuppressive drug not commercially available from a manufacturer but prepared by a pharmacist) are not included in the immunosuppressive therapy benefit because these formulations are not approved by the FDA (that is, FDA does not review these drugs to evaluate their safety, effectiveness, or quality before they reach patients [316]), which is a regulatory requirement under the current benefit. These interested parties communicated that compounded formulations are frequently used in the treatment of transplant recipients who cannot swallow oral capsules or tablets due to age or oral-motor dysfunction. Some examples of drugs compounded for preventing or treating the rejection of a transplanted organ or tissue include, but are not limited to, azathioprine,[317] cyclophosphamide,[318] and tacrolimus.[319]

We recognize certain patient groups, such as those with dysphagia, those with enteral feeding tubes (for example, a nasogastric feeding tube or a percutaneous endoscopic gastrostomy (PEG) tube), and many pediatric patients [320] [321] covered under Medicare rely on compounded immunosuppressive drugs for maintenance therapy and believe that

[314] *https://www.govinfo.gov/content/pkg/FR-1995-02-16/pdf/95-3835.pdf.*

[315] Since the establishment of the benefit by the enactment of OBRA '86, the period of coverage for a transplant patient under section 1861(s)(2)(J) of the Social Security Act has been subsequently amended by section 202 of the Medicare Catastrophic Coverage Act of 1988 (Pub. L. 100–360), the Medicare Catastrophic Coverage Repeal Act of 1989 (Pub. L. 101–234), section 13565 of the Omnibus Reconciliation Act of 1993 (OBRA '93) (Pub. L. 103–66), section 160 of the Social Security Act Amendments of 1994 (Pub. L. 103–432), section 113 of the Medicare, Medicaid and SCHIP Benefits Improvement and Protection Act of 2000 (Pub. L. 106–554) (BIPA 2000). The last of these statutory changes eliminates the time limits for coverage of prescription drugs used in immunosuppressive therapy under the Medicare program, effective with immunosuppressive drugs furnished on or after December 21, 2000.

[321] Lentine, K, Smith, JM, Lyden, GR, Miller, JM, Dolan, TG, Bradbrook, K, Larkin, L, Temple, K, Handarova, DK, Weiss, S, Israni, AK, Snyder, JJ (2024). OPTN/SRTR 2022 Annual Data Report: Kidney. *American Journal of Transplantation,* 24(2), S19–S118. *https://doi.org/10.1016/j.ajt.2024.01.012.*

their inclusion in the immunosuppressive drug benefit will help to ensure that each beneficiary is able to access the most clinically appropriate formulation of an immunosuppressive drug.[322] [323] [324] Nonadherence to lifelong maintenance immunosuppressive therapy contributes to unfavorable post-transplant outcomes, with obstacles to accessing medication being a prominent risk factor for such nonadherence.[325] Therefore, in the CY 2025 PFS proposed rule, we proposed revisions at § 410.30 to include orally and enterally administered compounded formulations with active ingredients derived only from FDA-approved drugs where approved labeling includes an indication for preventing or treating the rejection of a transplanted organ or tissue, or for use in conjunction with immunosuppressive drugs to prevent or treat rejection of a transplanted organ or tissue, or have been determined by a MAC, in processing a Medicare claim, to be reasonable and necessary for this specific purpose as outlined in the immunosuppressive drug benefit. As we intend this proposal to enhance access and address adherence concerns for patients who are not able to swallow capsules or tablets and we do not believe there are access concerns with other types of formulations, we proposed to limit the included compounded formulations to those products with oral and enteral routes of administration (for example, oral suspensions or solutions).

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for the proposal to include orally and enterally administered compounded formulations for immunosuppressive drugs covered under the Part B immunosuppressive therapy benefit. Several commenters reiterated that compounded medications may be the only treatment option available for certain patient populations in need of immunosuppressive therapy, such as those with dysphagia, those with enteral feeding tubes, and children who are transplant recipients. These commenters stated that the proposed policy would ensure these patient groups have access to appropriate care.

Response: We thank the comments for their support.

Comment: One commenter requested clarification on whether the proposed revision to the immunosuppressive therapy benefit includes compounds prepared with the same active ingredients contained in the FDA-approved drug or whether the FDA-approved drug must itself be compounded. The commenter also asked whether all active ingredients in the FDA-approved drug must be included in the compounded formulation administered to the beneficiary to be included in the benefit, or whether a subset of active ingredients from the FDA-approved drug may be included in the compounded formulation.

Response: We thank the commenter for the questions. We clarify that for a compounded formulation to be included in the immunosuppressive therapy benefit, it must be compounded from an FDA-approved drug for which the approved labeling includes an indication for preventing or treating the rejection of a transplanted organ or tissue, or for use in conjunction with immunosuppressive drugs to prevent or treat rejection of a transplanted organ or tissue, or has been determined by a MAC, in processing a Medicare claim, to be reasonable and necessary for this specific purpose as outlined in the immunosuppressive drug benefit. A bulk drug substance [326] (in other words, an active pharmaceutical ingredient for compounding) can be a component of an FDA-approved drug product. However, since the bulk drug substance itself does not meet one of those definitions, compounded immunosuppressives made from a bulk drug substance are not included in the benefit. Accordingly, a compounded formulation that meets one of the three proposed definitions must be compounded from the FDA-approved drug.

Comment: One commenter disapproved of the proposal and requested it be limited to coverage of compounded drugs that are in an FDA-designated shortage. The commenter cited patient safety, efficacy, and quality concerns, as compounded drugs are not reviewed by the FDA. The commenter also expressed concern that including compounded drugs in the immunosuppressive therapy benefit could lead to medication cost increases due to supply constraints.

The commenter also raised billing concerns, including that dosage adjustments in compounded formulations make billing monitoring more challenging and the use of Not Otherwise Classified (NOC) billing and payment codes adds to the complexity of making correct payments.

Response: We thank the commenter for their feedback. Because of the limited scope of this proposal to the coverage of compounded immunosuppressives from FDA-approved drugs, we believe the safety, efficacy, and quality concerns relative to the commercial formulations to be minimal. The aim of the proposal is to allow coverage under Part B for certain liquid compounded immunosuppressives that may not be available as an FDA-approved product so that individuals who require such formulations can receive the most clinically appropriate therapy. To minimize safety concerns, we limited these compounded versions to orally and enterally administered versions and did not permit compounded versions with other routes of administration that may have more safety considerations (for example, intravenously administered drugs).

To the commenter's concern about access and cost increases, we estimate the patient population of these compounded immunosuppressive drugs is currently no more than 2,000 patients a year.[327] We do not believe a patient population of this size will have a significant impact on compounding pharmacy resources or the costs of compounded drugs.

We acknowledge the commenter's concern regarding the billing for compounded immunosuppressive drugs with a NOC billing and payment code. In order to ensure correct payments in processing claims under the revised benefit, MACs could require providers and suppliers who bill for compounded immunosuppressive drugs to include information necessary (for example, the name of the drug, NDC, total dosage, and the method of administration) in the narrative field, or Item 19 of claim form CMS–1500 or electronic claim

equivalent and/or request additional documentation.

After consideration of public comments, we are finalizing as proposed to include orally and enterally administered compounded formulations with active ingredients derived only from FDA-approved drugs where approved labeling includes an indication for preventing or treating the rejection of a transplanted organ or tissue, or for use in conjunction with immunosuppressive drugs to prevent or treat rejection of a transplanted organ or tissue, or have been determined by a MAC, in processing a Medicare claim, to be reasonable and necessary for this specific purpose as outlined in the immunosuppressive drug benefit at § 410.30(a).

c. Immunosuppressive Refill Policy and Supplying Fee

Section 303(e)(2) of the MMA added section 1842(o)(6) of the Act which requires the Secretary to pay a supplying fee (less applicable deductible and coinsurance) to pharmacies for certain Medicare Part B drugs and biologicals, as determined appropriate by the Secretary, including for immunosuppressive drugs described in section 1861(s)(2)(J) of the Act.

In the CY 2005 PFS, we established a supplying fee of $50 for the initial oral immunosuppressive prescription supplied in the first month after a transplant (69 FR 66312 through 66313). In the CY 2006 PFS, we established a supplying fee of $16 for all subsequent prescriptions after the initial prescription supplied during a 30-day period (70 FR 70233 through 70236).

Following the CY 2006 rulemaking, we issued program instruction [328] to the MACs that prohibits payment for refills of immunosuppressive drug prescriptions in most circumstances and limits payment for prescriptions to 30-day supplies. We stated in Chapter 17 of the Medicare Claims Processing Manual that contractors should limit payment for prescriptions to those of 30-day supplies, except in special circumstances, because dosage frequently diminishes over time; it is not uncommon for the provider to change the prescription from one drug to another; and coinsurance liability on unused drugs could be a financial burden to the beneficiary.

We have heard from interested parties that both the 30-day limit on supplies and prohibition on payment for refills no longer align with current practice for treating patients on maintenance immunosuppression regimens who are prescribed a stable dosage for months or years and receive refillable supplies for several months' use at a time. Frequent dosage adjustments for some immunosuppressive drugs that require therapeutic drug monitoring and dose titration based on blood concentrations, such as tacrolimus, tend to occur more often in newly transplanted recipients, and less frequently once patients are on stable regimens.[329] Other immunosuppressive drugs, such as mycophenolate mofetil, do not require routine therapeutic drug monitoring and have fixed recommended dosages per labeling where patients may be maintained on stable dosages for several months unless patients experience complications.[330] Transplant recipients must take immunosuppressive drugs on a lifelong basis to prevent rejection, maintain allograft function, and, for some transplanted organs, prevent death. Most patients are eventually prescribed stable maintenance immunosuppressive drug dosages post-transplant for extended periods of time. For example, liver transplant guidelines recommend review of the immunosuppressive drug regimen at least every 6 months.[331] For transplant beneficiaries, we believe that the limitation on payment to a maximum 30-day supply of immunosuppressive therapy by our program instruction is an unnecessary burden that poses a greater risk to adherence than does the potential for a sudden change in dosage needs. There is considerable concern among providers and advocates that interrupted access to immunosuppressive drugs caused by running out of or having insufficient medication supply can decrease medication adherence, increase risk of organ transplant rejection, and ultimately decrease the rate of survival of transplant recipients.[332] [333] We agree with interested parties that it would be beneficial to patients to reduce barriers that complicate access to immunosuppressive medication and reasonable for CMS to make programmatic changes consistent with this objective.

Accordingly, we proposed two changes regarding supplying fees and refills for immunosuppressive drugs. First, we proposed to allow payment of a supplying fee for a prescription of a supply of up to 90 days. To reflect this proposal, we proposed to revise § 414.1001 to allow payment of a supplying fee to a pharmacy for first prescriptions and for prescriptions following the first prescription for greater than a 30-day supply. We proposed additional modifications at § 414.1001 to combine paragraphs (a) (for supplying fees) and (b) (for supplying fees following a transplant). Accordingly, we also proposed to remove paragraph (b) and redesignate paragraphs (c) and (d) as paragraphs (b) and (c), respectively. We stated that further study the supplying fee amounts for immunosuppressive drugs is needed and did not propose to make any changes to the supplying fee amounts at this time (meaning the current 30-day supplying fees would apply to any amount of days' supply). The dispensing and supplying fees under Part B (§ 414.1001) have been shown to be higher than dispensing fees paid in the commercial market.[334] So, until additional study is done regarding input costs for dispensing drugs billed to Medicare Part B and subsequent notice-and-comment rulemaking can be done, if appropriate, in response to such information, we aim to continue the current fee amounts regardless of the days' supply dispensed. Second, we proposed to allow payment of refills for these immunosuppressive drugs. Under this proposal, the prescribing healthcare provider may adjust the days' supply up to 90 days and allow refills for an immunosuppressive drug based on the individual circumstance of the beneficiary in accordance with applicable State laws.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Two commenters expressed support for both allowing a supplying fee for a prescription of a supply for up to 90 days, rather than 30 days as is the case under current regulation, and to allow refills for an immunosuppressive drug. One commenter affirmed the proposal would reduce barriers to treatment and in so doing reduce the occurrence of organ rejection.

Response: We thank the commenters for their support.

After consideration of public comments, we are finalizing as proposed to allow payment of a supplying fee for a prescription of a supply of up to 90 days and to allow refills for an immunosuppressive drug based on the individual circumstance of the beneficiary in accordance with applicable State laws.

d. General Comments

Comment: Several commenters requested we clarify that patients who receive stem cell transplants have access to the immunosuppressive therapy benefit.

Response: Our regulations at § 410.30(b) specify the immunosuppressive therapy is available to individuals who received an organ or tissue transplant for which Medicare payment is made, provided the individual is eligible to receive Medicare Part B benefits. Stem cells are taken from various tissues throughout the body, such as blood and bone marrow.[335] [336] [337] Therefore, stem cells are included in the meaning of a ''tissue,'' as it is used in § 410.30(b), and individuals who receive a stem cell transplant are eligible for the immunosuppressive therapy benefit, so long as they also otherwise meet the eligibility requirements. We also note that both DME MACs recognize recipients of stem cell transplants as eligible for the immunosuppressive therapy benefit.[338]

e. Out of Scope Comments

Comment: We received comments on topics that were outside the scope of the proposed rule. Those topics included: (1) coverage for all other compounded drugs that are part of treatment plans for pediatric Medicare beneficiaries and (2) a request that we work with compounding pharmacy interested parties if we consider changes to immunosuppressive supplying fee amounts in the future.

Response: We implemented section 1861(s)(2)(J) of the Act, which provides coverage for health services including prescription drugs used in immunosuppressive therapy furnished to an individual who receives an organ transplant for which Medicare payment is made, in the Immunosuppressive Therapy final rule (60 FR 8951 through 8955). As we finalized in section III.A.4.b, § 410.30(a) describes drugs that have approved labeling with indications for preventing or treating the rejection of a transplanted organ or tissue or for use in conjunction with immunosuppressive drugs to prevent or treat rejection of a transplanted organ or tissue; drugs that have been approved for marketing by FDA and determined by a MAC to be reasonable and necessary for the specific purpose of preventing or treating the rejection of a patient's transplanted organ or tissue, or for use in conjunction with immunosuppressive drugs for the purpose of preventing or treating the rejection of a patient's transplanted organ or tissue; and drugs that are a compounded formulation with active ingredients derived only from either of the first two groups of covered drugs. Drugs with indications for other conditions not described in § 410.30(a), such as mineral deficiencies or hypertension, would not be covered under the immunosuppressive therapy benefit.

Regarding changes to supplying fee amounts, we noted in the CY 2025 PFS proposed rule that further study for input costs for dispensing drugs billed to Medicare Part B is needed and could propose, if appropriate, changes to fee amounts in future notice-and-comment rulemaking. As the comment we received was about the amount of the supplying fee, it is outside the scope of this rulemaking. However, we welcome engagement with interested parties regarding supplying fees for immunosuppressives.

As such, while these comments are out of scope for this final rule because they do not relate to the specific proposals included in the proposed rule, we appreciate the feedback and may consider these recommendations for future rulemaking.

5. Blood Clotting Factors (§ 410.63)

a. Background

Hemophilia is a genetic bleeding disorder resulting in a deficiency of coagulation Factor VIII (hemophilia A) or coagulation Factor IX (hemophilia B) due to mutations in the respective clotting factor genes.[339] [340] Prophylactic use of clotting factors has been proven to improve quality of life by preventing joint bleeds but requires maintenance therapy, usually throughout the life of the patient. Preventing joint damage early is crucial because the initial damage will progress, irrespective of whether further bleeds occur in the affected joints.[341] Currently, clotting factor treatments include: plasma-derived products, which are virally inactivated and made from human donor plasma; recombinant products, such as recombinant Factors VIIa, VIII, IX, X, XIII, which are created using genetically engineered cells and recombinant technology; and a monoclonal antibody product that binds to specific receptor sites of missing clotting factor, which is needed for effective hemostasis.[342] [343] Individuals with hemophilia generally self-infuse clotting factor at home, often learning to do so in childhood.[344] [345] [346]

Section 2324 of the Deficit Reduction Act of 1984 (Pub. L. 98–369) added subparagraph (I) to section 1861(s)(2) of the Act to provide Medicare Part B coverage of blood clotting factor treatments for hemophilia patients who are competent to use such factors to control bleeding without medical supervision (that is, self-administered), and items related to the administration of such factors; this is codified at § 410.63(b). As set forth in section 1842(o)(1)(C) of the Act, payment for clotting factor product is the amount provided for under section 1847A of the Act.

In January of 2003, the Comptroller General of the United States published a report entitled ''Payment for Blood Clotting Factor Exceeds Providers Acquisition Cost'' [347] (hereinafter referred to the January 2003 report). Among other things, the January 2003 report found that ''providers incur additional costs associated with delivering clotting factor that are not separately reimbursed by Medicare.'' Specifically, the January 2003 report cited delivery costs generated in inventory management, specialized refrigerated storage, shipping, and the provision of ancillary supplies such as needles, syringes, and tourniquets to patients that were not accounted for by Medicare payment for the clotting factor product alone.

After the release of the January 2003 report, section 303(e)(1) of the MMA amended section 1842(o) of the Act by adding a new paragraph (5), requiring the Secretary to establish a furnishing fee for the items and services associated with the furnishing of blood clotting factor. Specifically, section 1842(o)(5) of the Act requires that for clotting factors furnished on or after January 1, 2005, the Secretary shall provide for a separate payment to the entity which furnishes blood clotting factors for items and services related to the furnishing of such factors in an amount that the Secretary determines to be appropriate. Accordingly, the clotting factor furnishing fee was codified at § 410.63(c), which states that the furnishing fee is added on a per unit basis to the clotting factor.

In 2005, CMS established a furnishing fee of $0.14 per unit of clotting factor. The clotting factor furnishing fee is increased by the percentage increase in the Consumer Price Index (CPI) for Medical Care for the 12-month period ending with June of the previous year, as required by section 1842(o)(5)(C) of the Act, and updated annually in chapter 17, section 80.4.1 of the Medicare Claims Processing Manual. For 2024, the clotting factor furnishing fee is $0.250 per unit. Chapter 17 of the Medicare Claims Processing Manual, section 80.4.1 indicates that ''CMS includes this clotting factor furnishing fee in the nationally published payment limit for clotting factor billing codes'' along with the pricing file, which denotes which HCPCS codes have the furnishing fee added. The payment limit in the pricing file includes the payment limit for the clotting factor product (under methodology in section 1847A of the Act) plus furnishing fee.

As was the case at the time the clotting factor furnishing fee regulations were originally finalized, we continue to believe the products eligible for payment of the clotting factor furnishing fee and those eligible for payment as clotting factor products are the same subset of products: that is, self-administered clotting factor products, as described above. Similar to section 1861(s)(2)(I) of the Act, section 1842(o)(5) of the Act specifically contemplates that clotting factors are self-administered. In particular, section 1842(o)(5)(A)(ii) of the Act specifies that the furnishing fee can take into account ''ancillary supplies and patient training for the self-administration of such factors.'' As stated in the CY 2005 PFS final rule, the furnishing fee accounts for the costs associated with supplying the clotting factor, including patient training necessary for self-administration of such factors (69 FR 47523; 69 FR 66311). Thus, the clotting factor furnishing fee, as implemented, pays for services and supplies in connection with the patient's self-administration of the product.

We note that section 1842(o)(5)(A) of the Act directed the Secretary to ''review[. . .] the January 2003 report'' when establishing the separate payment for entities which furnish blood clotting factors to the patient. The January 2003 report refers to self-administration of clotting factor and the benefits beneficiaries receive from home-use of the product throughout the report. For example, the January 2003 report states, ''Individuals with hemophilia generally self-infuse clotting factor. Clotting factor can be infused on demand, when a bleeding episode occurs, or for prevention, known as prophylactic use. By self-infusing, individuals can avoid waiting for care at a medical facility.''

Most notably, for purposes of understanding the Medicare clotting factor payment inadequacy that was addressed by Congress by adding the furnishing fee, the January 2003 report states ''[t]he method of delivery of clotting factor has implications for Medicare payment. Most outpatient drugs covered by Medicare are administered in a physician's office. When a beneficiary visits a physician in order to receive a drug, the physician receives one payment from Medicare for the drug and another payment through the physician fee schedule for administering the drug. Clotting factor, however, is generally not administered in a physician's office.'' That is, the January 2003 report highlighted that Medicare payment for clotting factor, in particular, was inadequate because there are costs associated with supplying the clotting factor, but because it is self-administered, the furnishing of clotting factor was generally not eligible for the administration fee. Generally, the January 2003 report noted that payment for supplying other outpatient drugs covered by Medicare Part B were adequate because they are eligible for the administration fee. Again, as stated above, Congress addressed this issue by creating the furnishing fee for these self-administered clotting factor products in the MMA.

More recently, gene therapies have been FDA-approved for the treatment of hemophilia. These gene therapies introduce a functional gene to the patient, which provides the genetic information needed for the patient to produce the missing or nonfunctional protein. A viral vector in the gene therapies, engineered with adeno-associate virus, delivers the functional copy of the clotting factor gene into the patient's liver cells. The viral vector then releases the functional gene which integrates into the cell's DNA and starts producing the missing clotting factor protein (that is, Factor VIII or Factor IX) to restore normal clotting function.

In the case of hemophilia A or B, the gene therapy introduces the functional gene that enables the patient to produce Factor VIII or Factor IX, respectively, on their own. Unlike clotting factors, which promptly restore balance in the coagulation cascade at the point of deficiency or bridge activated Factor IX and Factor X to restore the function of missing activated Factor VIII,[348] allowing for stable blood clot formation and hemostasis, the gene therapies do not directly integrate into the coagulation cascade.[349] [350] In the coagulation cascade, clotting factors become activated in response to damaged tissues or exposure to collagen at the injury site. This activation initiates the conversion of prothrombin to thrombin. Thrombin then converts fibrinogen into fibrin strands, forming the blood clot. Clotting factors restore normal clotting function by replacing deficient factors through repeated, dose-adjustable infusions or injections. In contrast, a single administration of gene therapies maintains a consistent and adequate level of clotting factors over the long term by enabling the self-

[350] Schenone M., Furie B.C., Furie B. The blood coagulation cascade. *Curr Opin Hematol.* 2004 Jul;11(4):272–7.

production of the clotting factor proteins—an indirect method that relies on the patient's cells to increase clotting factor levels. However, as the self-production of clotting factor proteins takes time, the sustained outcomes of gene therapies may take several weeks to fully manifest. Interested parties have asked if CMS considers these gene therapies to be clotting factors for which the clotting factor furnishing fee would be paid.

Gene therapies for hemophilia are administered via a one-time, single-dose intravenous infusion in a setting where personnel and equipment are immediately available to treat infusion-related reactions. They are not typically administered by the patient in his or her home, and close monitoring is required for at least three hours after the end of the infusion.[351] While these gene therapy products may have a similar goal to clotting factor products, in that both products are designed to improve outcomes for patients with hemophilia, gene therapy products prompt the body to make clotting factors, but are not clotting factors themselves. Given that the administration would occur incident to a physician service (that is, the product is not self-administered), the differing mechanism of action from replacing deficient factors (that is, triggering the body to make clotting factors rather than infusing clotting factors into the body), and the requirement of close monitoring by a healthcare professional post-infusion, these gene therapies do not have the characteristics described in the January 2003 report that is referenced in section 1842(o)(5) of the Act, which the Secretary relied on in drafting § 410.63(c). Therefore, they do not constitute ''clotting factors'' for purposes of Medicare payment.

Accordingly, gene therapies for hemophilia are eligible for payment as drugs or biologicals under Part B as part of (or incident to) a physician's service. The ''incident to'' coverage is limited to drugs that are not usually self-administered and the physician generally must incur a cost for the drug and must bill for it. Furnishing entities will bill for its administration, and the administration fees will reflect the resources necessary to furnish the drug. For example, certain CPT codes for administering drugs include preparation of the dose and patient monitoring. Specifically, CPT codes 96401–96549 (chemotherapy administration and nonchemotherapy injections and infusions) include clinical labor activities such as clinical staff preparation of chemotherapy agent(s) as well as evaluation and management services.[352]

For the reasons explained above, we do not believe gene therapies for hemophilia meet the definition of a clotting factor for purposes of Medicare payment, but even if they did, they still would not be eligible for the furnishing fee because the costs associated with furnishing these gene therapies would already be reflected in applicable administration codes paid under the Physician Fee Schedule. In accordance with § 410.63(c)(1), a clotting factor furnishing fee is not payable when the costs associated with furnishing a clotting factor are paid through another payment system. In this case, the payment system is the payment system established under the Physician Fee Schedule. Furnishing fees for drugs that are physician administered would result in physicians being paid twice for incidental costs of administering the drug because the furnishing fee is intended to compensate for supplies like needles, syringes, and tourniquets as well as storage costs, and so is the Part B payment for administering the drug. We do not believe this double payment is appropriate, nor do we believe this is what Congress intended in directing CMS to establish a clotting factor furnishing fee.

Accordingly, we proposed to update § 410.63(b) to clarify existing CMS policy that blood clotting factors must be self-administered to be considered clotting factors for which the furnishing fee applies. Additionally, we proposed to clarify at § 410.63(c) that the furnishing fee is only available to entities that furnish blood clotting factors, unless the costs associated with furnishing the clotting factor are paid though another payment system, including the Physician Fee Schedule. That is, we proposed to clarify through revisions to § 410.63 that clotting factors (as specified in section 1861(s)(2)(I) of the Act) and those eligible to receive the clotting factor furnishing fee (as specified in section 1842(o)(5) of the Act) are the same subset of products.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Four commenters expressed general support of our proposal to clarify that only self-administered blood clotting factors be eligible for furnishing fees. One of these commenters agreed with our proposal that cell and gene therapies used to treat hemophilia are not clotting factors.

Response: We thank the commenters for their support.

Comment: Two commenters disagree with our interpretation of section 1861(s)(2)(I) of the Act. One commenter stated that section 1861(s)(2)(I) of the Act addresses only coverage of self-administered clotting factors under Medicare Part B but does not dictate which products are eligible to receive a furnishing fee. Another commenter stated that our interpretation of section 1861(s)(2)(I) of the Act is incorrect because they state the phrase ''without medical or other supervision'' describes a capability of certain patients, not a limitation on the definition of clotting factors themselves. Further, one of the commenters stated that if Congress had intended to limit clotting factors to self-administered products in section 1861(s)(2)(I) of the Act, they could have used explicit language to that effect, as they did in section 1861(s)(2)(A) of the Act.

Response: Section 1861(s)(2)(I) of the Act provides Medicare Part B coverage of blood clotting factors for hemophilia patients who are competent to use such factors to control bleeding without medical or other supervision (that is, self-administered), and items related to the administration of such factors; this is codified at § 410.63(b). Treatments for hemophilia that are not self-administered but rather administered in a setting where personnel and equipment are immediately available do not fit the description of coverage set forth in section 1861(s)(2)(I).

Commenters compared the language used in the Social Security Act for clotting factor and coverage of ''medical and other health services.'' Specifically, they noted section 1861(s)(2)(A) of the Act, which provides for Medicare Part B coverage of ''services and supplies (including drugs and biologicals which are not usually self-administered by the patient) furnished as an incident to a physician's professional service.'' Commenters stated that because the same exact words were not used to describe the limits of these two different subsets of coverage, that is, medical and other health services and clotting factor, then Congress could not have meant the same thing. We disagree. The two different statutory provisions function differently within the statute and refer to coverage of different items that are distinct from one another. It is not necessary for Congress to use the same language in different parts of the statute to describe coverage of different items

[351] Carvalho M., Sepodes B., Martins AP., Patient access to gene therapy medicinal products: a comprehensive review BMJ Innovations 2021;7:123–134.

[352] Section 30.5, Chapter 12 of the Medicare Claims Processing Manual.

and services. Here, context, and the words themselves, show that the two different phrases have the same meaning.

Comment: Three commenters disagree with our interpretation that section 1842(o)(5) of the Act requires a clotting factor be self-administered in order to be eligible for the furnishing fee, citing what the commenters stated was Congress's choice to reference self-administration in section 1842(o)(5)(A)(ii) of the Act, and not in section 1842(o)(5)(A)(i) of the Act or elsewhere in the paragraph. The commenters state that this shows that the furnishing fee is not limited to self-administered clotting factors. The commenters stated that they believe this provision merely establishes the furnishing fee payment for clotting factor products and they believe nothing in this provision prohibits a clotting factor product that is not self-administered from being eligible for the furnishing fee. One of these commenters stated that they believe our interpretation limiting section 1842(o)(5) of the Act to self-administered clotting factors is unlawful. Another commenter argued that neither the statute's legislative history nor the January 2003 report included in the statute demonstrate Congressional intent to require that blood clotting factors be self-administered to receive the furnishing fee.

Response: The products eligible for payment of the clotting factor furnishing fee and those eligible for payment as clotting factor products are the same subset of products: that is, self-administered clotting factor products. Section 1842(o)(5) of the Act provides for the payment of a furnishing fee to an entity that furnishes clotting factors. Like section 1861(s)(2)(I) of the Act, section 1842(o)(5) specifically contemplates that clotting factors are self-administered. In particular, section 1842(o)(5)(A)(ii) of the Act, which was amended after the release of the January 2003 report, specifies that the furnishing fee can take into account ''ancillary supplies and patient training for the self-administration of such factors.'' CMS set the clotting factor furnishing fee through rulemaking, taking into account the costs associated with supplying the clotting factor, including patient training necessary for self-administration of such factors (see 69 FR 47523; 69 FR 66311). Thus, the clotting factor furnishing fee, as implemented, pays for services in connection with the patient's self-administration of the product.

Such a payment for furnishing of a product would be inappropriate for a product that cannot be self-administered and requires significant medical supervision. Rather, physician-administered clotting factors are eligible to receive a separate administration fee under Part B as part of (or incident to) a physician's service.

Comment: Two commenters opposed CMS's clarification that the furnishing fee is only available to entities that furnish blood clotting factors, unless the costs associated with furnishing the clotting factor are paid though another payment system, including the PFS. One commenter argued that the PFS is not another payment system, and that the administration fees providers will bill for does not negate the need for the costs the furnishing fee covers for physician-administered gene therapies for hemophilia. The commenter claims that providing both fees would not result in duplicate payment.

Response: In accordance with § 410.63(c)(1), a clotting factor furnishing fee is not payable when the costs associated with furnishing a clotting factor are paid through another payment system. In this case, the payment system is the payment system established under the PFS. Furnishing fees for drugs that are physician administered would result in physicians being paid twice for incidental costs of administering the drug because the furnishing fee is intended to compensate for supplies like needles, syringes, and tourniquets as well as storage costs, and Part B payment is meant to capture the costs associated with administering the drug. We do not believe this double payment would be appropriate.

Comment: One commenter argued that the January 2003 report defines blood clotting factor in a way that includes gene therapies.

Response: Because gene therapies did not exist at the time when the statute and January 2003 report were written, they could not have contemplated such a therapy at that time. Furthermore, gene therapies treating hemophilia are not clotting factors themselves and do not interact directly with the coagulation cascade; rather, they are genetic treatments that enable the body to produce its own clotting factors. Because gene therapies are not themselves clotting factors, they are not eligible for the clotting factor furnishing fee.

Comment: One commenter urged CMS to clarify that there is an exception to the eligibility of the furnishing fee for when a patient needs a blood clotting factor for hemophilia and surgery while in the hospital, contending that absent the recommendation, there could be a significant impact on hospitals due to lack of payment.

Response: Effective January 1, 2005, a furnishing fee of $0.14 per unit of clotting factor is paid to entities that furnish blood clotting factors unless the costs associated with furnishing the clotting factor are paid through another payment system, for example, hospitals that furnish clotting factor to patients during a Part A covered inpatient hospital stay. This is codified at 42 CFR 410.63(c)(1).

Comment: We received comments on topics that were outside the scope of the proposed rule. Those topics included establishing payment for providers for educating patients on cell and gene therapies and engaging with stakeholders to gather input on potential impacts of classification decisions and to consider developing a framework that can accommodate the evolving landscape of hemophilia treatments without requiring frequent regulatory updates.

Response: While these comments are out of scope for this final rule because they do not relate to the specific proposals included in the proposed rule, we appreciate the feedback and may consider these recommendations for future rulemaking.

After consideration of public comments, we are finalizing as proposed to update § 410.63(b) to clarify existing CMS policy that blood clotting factors must be self-administered. In response to comments, we are also clarifying in § 410.63(b) that therapies that enable the body to produce clotting factor and do not directly integrate into the coagulation cascade are not themselves clotting factors for which the furnishing fee applies. Additionally, we are finalizing the proposed clarification at § 410.63(c) that the furnishing fee is only available to entities that furnish blood clotting factors, unless the costs associated with furnishing the clotting factor are paid though another payment system, including the PFS.

B. Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs)

1. Background on RHC and FQHC Payment Methodologies

As provided in 42 CFR part 405, subpart X, of our regulations, RHC and FQHC visits generally are defined as face-to-face encounters between a patient and one or more RHC or FQHC practitioners during which one or more RHC or FQHC qualifying services are

furnished. RHC and FQHC practitioners are physicians, NPs, PAs, CNMs, clinical psychologists (CPs), licensed marriage and family therapists, mental health counselors, and clinical social workers, and under certain conditions, a registered nurse or licensed practical nurse furnishing care to a homebound RHC or FQHC patient in an area verified as having shortage of home health agencies. Transitional Care Management (TCM) services can also be paid by Medicare as an RHC or FQHC visit. In addition, Diabetes Self-Management Training (DSMT) or Medical Nutrition Therapy (MNT) sessions furnished by a certified DSMT or MNT program may also be considered FQHC visits for Medicare payment purposes. Only medically necessary medical, mental health, or qualified preventive health services that require the skill level of an RHC or FQHC practitioner are RHC or FQHC billable visits. Services furnished by auxiliary personnel (for example, nurses, medical assistants, or other clinical personnel acting under the supervision of the RHC or FQHC practitioner) are considered incident to the visit and are included in the per-visit payment.

RHCs generally are paid an all-inclusive rate (AIR) for all medically necessary medical and mental health services and qualified preventive health services furnished on the same day (with some exceptions). The AIR is subject to a payment limit, meaning that an RHC will not receive any payment beyond the specified limit amount per visit. As of April 1, 2021, all RHCs are subject to statutory upper payment limits determined in accordance with section 1833(f) of the Act, as amended by section 130 of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260).

FQHCs were paid under the same AIR methodology until October 1, 2014. Beginning on that date, in accordance with section 1834(o) of the Act (as added by section 10501(i)(3) of the Patient Protection and Affordable Care Act (Pub. L. 111–148)), FQHCs began to transition to the FQHC PPS system, in which they are paid based on the lesser of the FQHC PPS rate or their actual charges. The FQHC PPS rate is adjusted for geographic differences in the cost of services by the FQHC PPS geographic adjustment factor (GAF). The rate is increased by 34 percent when an FQHC furnishes care to a patient that is new to the FQHC, or to a beneficiary receiving an initial preventive physical examination (IPPE) or has an annual wellness visit (AWV).

Both the RHC AIR and FQHC PPS payment rates were initially designed to reflect the cost of all services and supplies that an RHC or FQHC furnishes to a patient in a single day. These nearly all-inclusive rates are not adjusted at the individual level for the complexity of individual patient health care needs, the length of an individual visit, or the number or type of practitioners involved in the patient's care. Instead for RHCs, all costs for the facility over the course of the year are aggregated and an AIR is derived from these aggregate expenditures. The FQHC PPS base rate is updated annually by the percentage increase in the FQHC market basket reduced by a productivity adjustment. For CY 2025, we proposed to rebase and revise the FQHC market basket to reflect a 2022 base year; see section III.B.7 of this final rule.

2. General Care Management Services in RHCs and FQHCs

a. Background

We have been engaged in a multi-year examination of coordinated and collaborative care services in professional settings, and as a result established codes and separate payment in the PFS to independently recognize and pay for these important services. The care coordination included in services, such as office visits, does not always adequately describe the non-face-to-face care management work involved in primary care and similar care relationships. Payment for office visits may not reflect all the services and resources required to furnish comprehensive, coordinated care management for certain categories of beneficiaries, such as those who are returning to a community setting following discharge from a hospital or skilled nursing facility (SNF) stay.

Before we get into the detailed background of our RHC and FQHC payment policies for care coordination services, we want to acknowledge that we have used several terms to describe these services and are providing clarification. We use the terms ''care coordination'' services interchangeably with the term ''care management'' services in preamble and manual guidance to describe the type of work discussed above. We began to use the term ''general care management'' when we established the HCPCS code G0511 for CY 2018. Use of ''general care management'' is meant to describe certain non-face-to-face care management work involved in primary care that we have identified as appropriate for separate payment as discussed in the following paragraphs.

As we discussed in the CY 2016 PFS final rule (80 FR 71081 through 71088), to address the concern that the non-face-to-face care management work involved in furnishing comprehensive, coordinated care management for certain categories of beneficiaries is not adequately paid for as part of an office visit, beginning on January 1, 2015, practitioners billing under the PFS are paid separately for chronic care management (CCM) services when CCM service requirements are met. We explained that RHCs and FQHCs cannot bill under the PFS for RHC or FQHC services and individual practitioners working at RHCs and FQHCs cannot bill under the PFS for RHC or FQHC services while working at the RHC or FQHC. Although many RHCs and FQHCs pay for coordination of services within their own facilities and may sometimes help to coordinate services outside their facilities, the type of structured care management services that are now payable under the PFS for patients with multiple chronic conditions, particularly for those who are transitioning from a hospital or SNF back into their communities, are generally not included in the RHC or FQHC payment because in general, although a few of the services required for CCM payment may be provided by some RHCs and FQHCs on occasion, the systematic provision of care management, the level and intensity of care coordination, and the interoperability of care plans with external providers is not typically found in RHCs or FQHCs Therefore, separate payment was established in the CY 2016 PFS final rule (80 FR 71080 through 71088) for RHCs and FQHCs that furnish CCM services. We believe the non-face-to-face time required to coordinate care is not captured in the RHC AIR or the FQHC PPS payment, particularly for the rural and/or low-income populations served by RHCs and FQHCs. Allowing separate payment for CCM services in RHCs and FQHCs is intended to reflect the additional resources necessary for the unique components of CCM services.

In the CY 2018 PFS final rule (82 FR 53169 through 53180), we finalized revisions to the payment methodology for CCM services furnished by RHCs and FQHCs and established requirements for general behavioral health integration (BHI) and psychiatric collaborative care management (CoCM) services furnished in RHCs and FQHCs, beginning on January 1, 2018. We also initiated the use of HCPCS codes G0511 and G0512. HCPCS code G0511 is a general care management code for use by RHCs or FQHCs when at least 20 minutes of qualified CCM or general

BHI services are furnished to a patient in a calendar month. HCPCS code G0512 is for psychiatric CoCM and can be billed by RHCs or FQHCs when at least 60 minutes of qualified psychiatric CoCM services are furnished to a patient in a calendar month.

For CY 2018 the payment amount for HCPCS code G0511 was set at the average of the 3 national non-facility PFS payment rates for the CCM and general BHI codes and updated annually based on the PFS amounts. That is, for CY 2018 the 3 codes that comprised HCPCS code G0511 were CPT code 99490 (*20 minutes or more of CCM services*), CPT code 99487 (*60 minutes or more of complex CCM services*), and CPT code 99484 (*20 minutes or more of BHI services*).

In the CY 2019 PFS final rule (83 FR 59683), we explained that another CCM code was introduced for practitioners billing under the PFS, CPT code 99491, which would correspond to 30 minutes or more of CCM furnished by a physician or other qualified health care professional and is similar to CPT codes 99490 and 99487. Therefore, for RHCs and FQHCs, we added CPT code 99491 as a general care management service and included it in the calculation of HCPCS code G0511. Starting on January 1, 2019, RHCs and FQHCs were paid for HCPCS code G0511 based on the average of the national non-facility PFS payment rates for CPT codes 99490, 99487, 99484, and 99491 (83 FR 59687).

In the CY 2021 PFS final rule (85 FR 84697 through 84699), we explained that the requirements described by the codes for principal care management (PCM) services were similar to the requirements for the services described by HCPCS code G0511; therefore, we added HCPCS codes G2064 and G2065 to HCPCS code G0511 as general care management services for RHCs and FQHCs. Consequently, effective January 1, 2021, RHCs and FQHCs are paid when a minimum of 30 minutes of qualifying PCM services are furnished during a calendar month. The payment rate for HCPCS code G0511 for CY 2021 was the average of the national non-facility PFS payment rate for the RHC and FQHC care management and general behavioral health codes (CPT codes 99490, 99487, 99484, and 99491), and PCM codes (HCPCS codes G2064 and G2065). We noted that in the CY 2022 PFS final rule (86 FR 65118), HCPCS codes G2064 and G2065 were replaced by CPT codes 99424 and 99435. Therefore, for CY 2022 the payment rate for HCPCS code G0511 was the average of the national non-facility PFS payment rate for CPT codes 99490, 99487, 99484, 99491, 99424, and 99425).

In the CY 2023 PFS final rule (87 FR 69735 through 69737), we included chronic pain management (CPM) services described by HCPCS code G3002 in the general care management HCPCS code G0511 when at least 30 minutes of qualifying non-face-to-face CPM services are furnished during a calendar month. We explained since HCPCS code G3002 is valued using a crosswalk to the PCM CPT code 99424, which is currently one of the CPT codes that comprise HCPCS code G0511, there was no change made to the average used to calculate the HCPCS code G0511 payment rate to reflect CPM services.

Most recently, in the CY 2024 PFS final rule (88 FR 79071 through 79073) we included the CPT codes that are associated with the suite of services that comprise remote physiologic monitoring (RPM) and remote therapeutic monitoring (RTM) in the general care management HCPCS code G0511 when these services are furnished by RHCs and FQHCs. In addition, we included community heath integration (CHI), principal illness navigation (PIN), and PIN—peer support services in HCPCS code G0511 when these services are furnished by RHCs and FQHCs (88 FR 79073 through 79081). We noted that for each of these newly included services that they must be medically reasonable and necessary, meet all requirements, and not be duplicative of services paid to RHCs and FQHCs under the general care management code for an episode of care in a given calendar month. We also clarified RHCs and FQHCs may bill HCPCS code G0511 multiple times in a calendar month, as long as all of the requirements are met and resource costs are not counted more than once (88 FR 79075).

Additional information on care management requirements is available on the CMS Care Management web page and on the CMS RHC and FQHC web pages.[353] [354] [355]

b. Regulatory Update (§ 405.2464(c))

During our development of the proposals discussed in sections III.B.2.c. and III.B.2.d. of this final rule, we determined that the language located in § 405.2464(c) could use additional information to streamline and provide clarity on our payment policy for care coordination services. For example, using consistent terms, effective dates, and the description of the basis of payment. Therefore, we proposed technical changes to § 405.2464(c) to accurately reflect the iterations of our payment policy for care coordination services as detailed in this background section.

We received a few comments on the proposed technical changes to § 405.2464(c) to accurately reflect the iterations of our payment policy for care coordination services. The following is a summary of the comments we received and our responses.

Comment: One commenter stated they were encouraged to learn that CMS proposed revisions to § 405.2464(c). The commenter stated that the average health care inflation rate has increased 3.5 percent per year over the past 4 years and that it appeared that actuarial analysis underlying the changes made last year were based on historical utilization and reimbursement, not provider expenses to provide these services. The commenter further stated that expansion of population health management requires a sustainable and viable reimbursement schema. Another commenter, who supported the proposed technical changes to § 405.2464(c), stated that this change represented a significant improvement in how care management services are billed and reimbursed and that it aligned with broader goals to enhance flexibility and accuracy in reimbursement, ensuring fair compensation for the full spectrum of care management services.

Response: We thank commenters for their support of the proposed technical changes to § 405.2464(c) to accurately reflect the iterations of our payment policy for care coordination services.

After consideration of public comments, we will finalize our proposed technical changes to § 405.2464(c) to accurately reflect the iterations of our payment policy for care coordination services.

c. Payment Policy for General Care Management Services

As discussed previously, in the last few years of PFS payment rules we have expanded the scope of care management services billable using HCPCS code G0511. Prior to CY 2024, HCPCS code G0511 was based on the national average non-facility PFS payment rate for each base code identified as billable general care management services. That is, we added each payment rate divided by the total number of codes to arrive at the payment amount for HCPCS code G0511. This payment amount was a flat

[353] *https://www.cms.gov/medicare/payment/fee-schedules/physician/care-management.*

[354] *https://www.cms.gov/center/provider-type/rural-health-clinics-center.*

[355] *https://www.cms.gov/medicare/payment/prospective-payment-systems/federally-qualified-health-centers-fqhc-center.*

rate that was not subsequently adjusted for locality.

In the CY 2024 PFS final rule (88 FR 79076 through 79079), we explained continuing to calculate the value of HCPCS code G0511 using an approach based on an average may no longer be appropriate payment for those services since we are simply dividing by the number of codes that comprise HCPCS code G0511. As that number of services with lower payment rates increases, the payment rate per service decreases. We noted that while the policy may address providing a payment for furnishing non-face-to-face services, the magnitude of the value may not appropriately account for the costs. Therefore, we finalized a revised methodology for the calculation of HCPCS code G0511 by looking at the actual utilization of the services. We used a weighted average of the services that comprise HCPCS code G0511. For the utilization data of the services, we used the most recently available utilization data from the services paid under the PFS in the physician office setting. We explained that the physician office setting may provide an appropriate proxy for utilization of these services in the absence of actual data because this setting most closely aligns with the types of services furnished in RHCs and FQHCs since they typically furnish primary care.

To ensure we accounted for payments accurately, we explained that we looked at PFS utilization of the base code for the service and any applicable add-on codes used in the same month as well as any base codes reported alone in a month for all of the services comprising general care management (that is, the array of services that made up HCPCS code G0511). We believed we needed to account for the payment associated with the base code along with an applicable add-on code in our calculation as this demonstrates a complete encounter. Then to arrive at the payment rate for HCPCS code G0511 for CY 2024, we took the weighted average of the base code and add-on code pairs, in addition to the individual base codes for all of the services that comprise HCPCS code G0511 by using the CY 2021 PFS utilization.

We determined that this approach was a more accurate representation of the payment since it is consistent with practitioners billing under the PFS, and it accounts for the additional time spent in care coordination.

Subsequent to the issuance of the CY 2024 PFS final rule, interested parties have requested that CMS give them the ability to bill Medicare for each of the care management services that comprise HCPCS code G0511 when they are furnished in RHCs and FQHCs. RHCs, FQHCs, and associations supporting access to health care for rural populations have expressed concerns regarding the transparency of the services being billed with HCPCS code G0511. We noted, in the CY 2024 PFS final rule we stated that HCPCS code G0511 could be billed multiple times in a calendar month for each care management code that comprised HCPCS code G0511 as long as all requirements were met, there was no overlapping of resource time and services were furnished in accordance with CPT coding guidelines and conventions. However, providing this guidance triggered questions on how CMS tracks which general care management service is being furnished if the bundled code is reported so they would know when it was appropriate to bill multiple care management services on a single claim. RHCs and FQHCs have also requested the ability to bill the add-on codes that describe additional minutes spent on furnishing care management services and often ask for guidance on how to account for additional time spent.

We have also heard from interested parties that RHCs and FQHCs would not find it burdensome to report the actual HCPCS code that describes the care management service furnished, which was the main concern we had when we implemented HCPCS code G0511 (82 FR 53172). We understand that RHCs and FQHCs have become more sophisticated with billing and therefore reporting multiple codes has become less burdensome than in CY 2018 when we implemented G0511. In addition, we have heard that RHCs and FQHCs are interested in having more exposure and recognition in playing their part in the delivery of quality primary care and believe that this could be achieved with data that shows their utilization of services which could also be used in future payment refinements.

Due to these concerns, we reevaluated our payment policy for care management services. We agree with interested parties that it is important to identify the actual services being furnished and understand the utilization of these services, especially given our strong interest in their volume and their contribution to initiatives on health equity and social needs of services in the care coordination space. Therefore, we proposed to require RHCs and FQHCs to bill the individual codes that make up the general care management HCPCS code, G0511. The current list of base and add-on codes that make-up G0511 are listed in Table 28, titled ''General Care Management HCPCS Codes and Descriptors.'' Under this proposal, HCPCS code G0511 would no longer be payable when billed by RHCs and FQHCs. We noted that the payment amounts for some services that make up G0511 are less than the payment amount for G0511 and if an RHC or FQHC mostly furnishes these services, they could see a potential decline in payment. We also proposed to allow RHCs and FQHCs to bill the add-on codes for additional time spent once the minimum threshold of time was met to account for a complete encounter. This could potentially offset any decrease in payments. Payment for these services would be the national non-facility PFS payment rate when the individual code is on an RHC or FQHC claim, either alone or with other payable services and the payment rates are updated annually based on the PFS amounts for these codes. We believe that these proposals promote transparency in billing and payment and allowing RHCs and FQHCs to bill the individual care management codes would take into account the complexity of the service and the time spent furnishing the service.

TABLE 28: General Care Management HCPCS Codes and Descriptors

HCPCS code	Short Descriptors	Long Descriptors
99091	Collj & interpj data ea 30 d	Collection and interpretation of physiologic data (e.g. Blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days
99424	Prin care mgmt phys 1st 30	Principal care management services, for a single high-risk disease, with the following required elements: one complex chronic condition expected to last at least 3 months, and that places the patient at significant risk of hospitalization, acute exacerbation/ decompensation, functional decline, or death, the condition requires development, monitoring, or revision of disease-specific care plan, the condition requires frequent adjustments in the medication regimen, and/or the management of the condition is unusually complex due to comorbidities, ongoing communication and care coordination between relevant practitioners furnishing care; first 30 minutes provided personally by a physician or other qualified health care professional, per calendar month
99425	Prin care mgmt phys ea addl 30	Principal care management services, for a single high-risk disease, with the following required elements: one complex chronic condition expected to last at least 3 months, and that places the patient at significant risk of hospitalization, acute exacerbation/ decompensation, functional decline, or death, the condition requires development, monitoring, or revision of disease-specific care plan, the condition requires frequent adjustments in the medication regimen and/or the management of the condition is unusually complex due to comorbidities, ongoing communication and care coordination between relevant practitioners furnishing care; each additional 30 minutes provided personally by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)
99426	Prin care mgmt staff 1st 30	Principal care management services, for a single high-risk disease, with the following required elements: one complex chronic condition expected to last at least 3 months, and that places the patient at significant risk of hospitalization, acute exacerbation/ decompensation, functional decline, or death, the condition requires development, monitoring, or revision of disease-specific care plan, the condition requires frequent adjustments in the medication regimen and/or the management of the condition is unusually complex due to comorbidities, ongoing communication and care coordination between relevant practitioners furnishing care; first 30 minutes of clinical staff time directed by physician or other qualified health care professional, per calendar month
99427	Prin care mgmt staff ea addl 30	Principal care management services, for a single high-risk disease, with the following required elements: one complex chronic condition expected to last at least 3 months, and that places the patient at significant risk of hospitalization, acute exacerbation/ decompensation, functional decline, or death, the condition requires development, monitoring, or revision of disease-specific care plan, the condition requires frequent

HCPCS code	Short Descriptors	Long Descriptors
		adjustments in the medication regimen and/or the management of the condition is unusually complex due to comorbidities, ongoing communication and care coordination between relevant practitioners furnishing care; each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional per calendar month (List separately in addition to code for primary procedure)
99437	Chrnc care mgmt phys ea addl 30	Chronic care management services, provided personally by a physician or other qualified health care professional, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline, comprehensive care plan established, implemented, revised or monitored; each additional 30 minutes by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)
99439	Chrnc care mgmt staf ea addl 20	Chronic care management services, each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month
99453	Rem mntr physiol param setup	Remote monitoring of physiologic parameter(s) (e.g. Weight, blood pressure, pulse oximetry, respiratory flow rate) initial set-up and patient education on use of equipment
99454	Rem mntr physiol param dev	Remote monitoring of physiologic parameter(s) (e.g. Weight, blood pressure, pulse oximetry, respiratory flow rate) initial device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days
99457	Rem physiol mntr 1st 20 min	Remote physiologic monitoring treatment services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes
99458	Rem physiol mntr ea addl 20	Remote physiologic monitoring treatment services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; each additional 20 minutes (list separately in addition to code for primary procedure)
99474	Self-meas bp 2 readg bid 30d	Self-measured blood pressure using a device validated for clinical accuracy; separate self-measurements of two readings one minute apart, twice daily over a 30-day period (minimum of 12 readings), collection of data reported by the patient and/or caregiver to the physician or other qualified health care professional, with report of average systolic and diastolic pressures and subsequent communication of a treatment plan to the patient
99484	Care mgmt svc bhvl hlth cond	Care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional time, per calendar month, with the following required element: initial assessment or follow-up monitoring, including using applicable validated rating scales, behavioral health care planning about behavioral or psychiatric health problems, including revision for patients not progressing or whose status changes, facilitating and coordinating treatment such as psychotherapy,

HCPCS code	Short Descriptors	Long Descriptors
		pharmacotherapy, counseling, or psychiatric consultation, continuity of care with an appointed member of the care team
99487	Cplx chrnc care 1st 60 min	Complex chronic care management services, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, establishment or substantial revision of comprehensive care plan, moderate or high complexity medical decision making; first 60 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month
99489	Cplx chrnc care ea addl 30	Complex chronic care management services, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, establishment or significant revision of comprehensive care plan, moderate or high complexity medical decision making; each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)
99490	Chrnc care mgmt staff 1st 20	Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month
99491	Chrnc care mgmt phys 1st 30	Chronic care management services, provided personally by a physician or other qualified healthcare professional, at least 30 minutes of physician or other qualified healthcare professional time, per calendar month, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored
98975	Rem ther mntr 1st setup&edu	Remote therapeutic monitoring (e.g. therapy adherence, therapy response); initial set-up and patient education on use of equipment
98976	Rem ther mntr dev sply resp	Remote therapeutic monitoring (e.g. therapy adherence, therapy response); device(s) supply with scheduled (e.g. daily) recording(s) and/or programmed alert(s) transmission to monitor respiratory system, each 30 days
98977	Rem ther mntr dv sply mscskl	Remote therapeutic monitoring (e.g. therapy adherence, therapy response); device(s) supply with scheduled (e.g. daily) recording(s) and/or programmed alert(s) transmission to monitor musculoskeletal system, each 30 days

HCPCS code	Short Descriptors	Long Descriptors
98980	Rem ther mntr 1st 20 min	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient or caregiver during the calendar month; first 20 minutes
98981	Rem ther mntr ea addl 20 min	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient or caregiver during the calendar month; each additional 20 minutes (list separately in addition to code for primary procedure)
G0140	Nav srv peer sup 60 min pr m	Principal Illness Navigation – Peer Support by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a certified peer specialist; 60 minutes per calendar month, in the following: • Person-centered assessment, performed to better understand the individual context of the serious, high-risk condition ++ Conducting a person-centered assessment to understand the patient's life story, strengths, needs, goals, preferences, and desired outcomes, including understanding cultural and linguistic factors. ++ Facilitating patient-driven goal setting and establishing an action plan. ++ Providing tailored support as needed to accomplish the person-centered goals in the practitioner's treatment plan. • Identifying or referring patient (and caregiver or family, if applicable) to appropriate supportive services. • Practitioner, Home, and Community-Based Care Communication ++ Assist the patient in communicating with their practitioners, home-, and community-based service providers, hospitals, and skilled nursing facilities (or other health care facilities) regarding the patient's psychosocial strengths and needs, goals, preferences, and desired outcomes, including cultural and linguistic factors. ++ Facilitating access to community-based social services (e.g., housing, utilities, transportation, food assistance) as needed to address SDOH need(s). • Health education-Helping the patient contextualize health education provided by the patient's treatment team with the patient's individual needs, goals, preferences, and SDOH need(s), and educating the patient (and caregiver if applicable) on how to best participate in medical decision-making. • Building patient self-advocacy skills, so that the patient can interact with members of the health care team and related community-based services (as needed), in ways that are more likely to promote personalized and effective treatment of their condition. • Developing and proposing strategies to help meet person-centered treatment goals and supporting the patient in using chosen strategies to reach person-centered treatment goals.

HCPCS code	Short Descriptors	Long Descriptors
		++ Periodic administration of SDOH survey tools and monitoring of related SDOH, that is not separately billed. PIN services may address newly discovered SDOH if the practitioner determines they are significantly impacting the practitioner's ability to diagnose or treat the high-risk condition(s). • Facilitating and providing social and emotional support to help the patient cope with the condition, SDOH need(s), and adjust daily routines to better meet person-centered diagnosis and treatment goals. Leverage knowledge of the serious, high-risk condition and/or lived experience when applicable to provide support, mentorship, or inspiration to meet treatment goals.
G0146	Nav srv peer sup addl 30 pr m	Principal Illness Navigation—Peer Support, additional 30 minutes per calendar month (List separately in addition to G0140)
G3002	Chronic pain mgmt 30 mins	Chronic pain management and treatment, monthly bundle including, diagnosis; assessment and monitoring; administration of a validated pain rating scale or tool; the development, implementation, revision, and maintenance of a person-centered care plan that includes strengths, goals, clinical needs, and desired outcomes; overall treatment management; facilitation and coordination of any necessary behavioral health treatment; medication management; pain and health literacy counseling; any necessary chronic pain related crisis care; and ongoing communication and care coordination between relevant practitioners furnishing care, e.g. physical therapy and occupational therapy, and community-based care, as appropriate. Required initial face-to- face visit at least 30 minutes provided by a physician or other qualified health professional; first 30 minutes personally provided by physician or other qualified health care professional, per calendar month. (when using G3002, 30 minutes must be met or exceeded)
G3003	Chronic pain mgmt addl 15m	Each additional 15 minutes of chronic pain management and treatment by a physician or other qualified health care professional, per calenda month. (List separately in addition to G3002. When using G3003, 15 minutes mut be met or exceeded).
G0323	Care manage beh svs 20mins	Care management services for behavioral health conditions, at least 20 minutes of clinical psychologist or clinical social worker time, per calendar month, with the following required elements: initial assessment or follow-up monitoring, including the use of applicable validated rating scales; behavioral health care planning in relation to behavioral/psychiatric health problems, including revision for patients who are not progressing or whose status changes; facilitating and coordinating treatment such as psychotherapy, coordination with an/or referral to physicians and practitioners who are authorized by Medicare law to prescribe medications and furnish E/M services counseling and/or psychiatric consultation; and continuity of care with a designated member of the care team)

		• Health education—Helping the patient contextualize health education provided by the patient's treatment team with the patient's individual needs, goals, preferences, and SDOH need(s), and educating the patient (and caregiver if applicable) on how to best participate in medical decision-making. • Building patient self-advocacy skills, so that the patient can interact with members of the health care team and related community-based services (as needed), in ways that are more likely to promote personalized and effective treatment of their condition. • Health care access/health system navigation. ++ Helping the patient access healthcare, including identifying appropriate practitioners or providers for clinical care, and helping secure appointments with them. ++ Providing the patient with information/resources to consider participation in clinical trials or clinical research as applicable. • Facilitating behavioral change as necessary for meeting diagnosis and treatment goals, including promoting patient motivation to participate in care and reach person-centered diagnosis or treatment goals. • Facilitating behavioral change as necessary for meeting diagnosis and treatment goals, including promoting patient motivation to participate in care and reach person-centered diagnosis or treatment goals. • Leverage knowledge of the serious, high-risk condition and/or lived experience when applicable to provide support, mentorship, or inspiration to meet treatment goals.
G0024	Pin srv addl 30 min pr m	Principal Illness Navigation services, additional 30 minutes per calendar month (List separately in addition to G0023).

We proposed revisions at § 405.2464(c) to reflect the proposed payment method for care management services furnished in RHCs and FQHCs beginning January 1, 2025.

We received several comments on our proposal to permit RHCs and FQHCs to report and bill under the individual codes that make up the general care management HCPCS code G0511.

The following is a summary of the comments we received and our responses.

Comment: Many commenters were very supportive of our proposal to unbundle HCPCS G0511 and require RHCs and FQHCs to report and bill for the actual codes that make up the general care management HCPCS code G0511. One commenter stated that they appreciated CMS' proposed steps to harmonize access to payment for asynchronous remote monitoring across the Medicare system.

Response: We thank the commenters for their support.

Comment: Although many commenters support our proposal to unbundle HCPCS G0511 and require RHCs and FQHCs to bill the individual codes that make up the general care management HCPCS code G0511, many commenters had additional requests/recommendations. A few commenters urged CMS to establish adequate reimbursement rates to ensure health centers continued financial viability and stated that although this proposal makes a lot of sense, the financial implications of a reduced payment for some of the services could jeopardize sustainability. These commenters implored CMS to ensure payment rates accurately reflect the cost of providing these services as CMS calculates the reimbursement rates for all these different general care management services. These commenters requested that CMS ensure sufficient reimbursement for all services previously under the HCPCS code G0511 to promote financial stability for health centers. Another commenter stated that CMS must ensure reimbursement rates are sufficient to enable providers to adopt high-value applications of software-based technologies. This commenter also recommended that CMS, alongside with ensuring adequate reimbursement, work with medical specialty societies to define high-value remote patient monitoring applications and develop clinical guidelines to help providers deliver evidence-based care. One commenter requested that CMS reconsider the approach of encouraging other codes to be utilized to offset the potential decline in reimbursement from HCPCS code G0511 to CPT code 99490 (*chronic care management services*). The commenter explained that for example, an FQHC in the Southeastern U.S. that was billing 1,000 CCM patients using HCPCS code G0511 would likely need to bill the additional 20-minute code (99439) for at least 500 patients each month to make up the difference in net reimbursement after factoring in

the cost of care. The commenter further explained that while this is certainly possible, many CCM patients do not need or want an additional 20 minutes of care, especially when factoring in the potential for an additional cost share each month. The commenter shared concerns that FQHCs will suffer from this change by both (i) not being able to successfully replace the lost reimbursement through CPT code 99439 (or other additional codes) and (ii) seeing a decline in CCM participation from patients opting out of the program due to additional cost sharing. The commenter requests that CMS consider maintaining the G0511 reimbursement rate for 99490 in 2025.

Finally, other commenters had specific requests related to RPM/RTM services. Some commenters stated that reimbursement rates for Remote Patient Monitoring (RPM) have been flagged to potentially generate lower reimbursement rates, which could result in health centers, especially smaller health centers with limited budgets, struggling to provide this crucial service to their patients.

Response: We noted above and in the proposed rule that the payment amounts for some services that make up G0511 are less than the payment amount for HCPCS code G0511 and if an RHC or FQHC mostly furnishes these services, they could see a potential decline in payment. We also proposed to allow RHCs and FQHCs to bill the add-on codes for additional time spent once the minimum threshold of time was met to account for a complete encounter. Payment for these services would be the national non-facility PFS payment rate when the individual code is on an RHC or FQHC claim, either alone or with other payable services and the payment rates are updated annually based on the PFS amounts for these codes. These payment rates reflect the cost of services provided and are in line with services in other comparable settings.

Comment: In addition to supporting our proposal to unbundle HCPCS code G0511, a few commenters requested that CMS waive co-insurance for these services. One commenter supported the elimination of co-insurance for care management programs, stating that removing coinsurance will eliminate a significant obstacle for patients requiring ongoing care management, especially those with chronic conditions needing frequent monitoring and intervention. The commenter stated that eliminating coinsurance will increase access to necessary care management services, encourage more consistent patient engagement with their care plans, and potentially reduce overall healthcare costs by preventing complications, decreasing hospital admissions, and ensuring timely and appropriate care. Another commenter urged CMS to waive the 20 percent copay as we have with AWV's to accelerate the adoption by physicians and participation by patients or at the very least allow the physicians to make the decision if they wish to waive the 20 percent copay for those who do not have the ability to pay. This commenter further urged CMS to allow RHC's to be able to conduct an AWV the same day as an office visit as they noted they believe it is often difficult either logistically or financially for many in the rural healthcare setting to make 2 trips, and as a result they do not believe as many patients whose only access to healthcare that is being served by a RHC are benefiting from AWV's.

Response: As we stated in the CY 2018 PFS final rule (82 FR 53178), we are aware that the copayment and/or deductible in RHCs and the copayment in FQHCs can be a barrier for some beneficiaries, but we do not have the statutory authority to waive these charges. Because these services are typically furnished non-face-to-face, and therefore, are not visible to the patient, it is important that adequate information is given to patients during the consent process on cost-sharing responsibilities and the benefits of care management services. RHCs and FQHCs should also provide information on the availability of assistance to qualified patients in meeting their cost-sharing obligations, or any other programs to provide financial assistance, if applicable. We note that Part B coinsurance would apply for the unbundled codes that make up the list of codes included in HCPCS code G0511, as mandated for Part B services by section 1833(a)(1) of the Act. Regarding the comment about AWVs, we thank the commenter for this feedback, but note that it is out of the scope of this final rule.

Comment: Many other commenters who supported the proposal requested that CMS implement a transition period for at least one year to allow time for providers to either continue to bill under HCPCS code G0511 or under individual codes proposed for CY 2025 to ensure continued access to care and ease the transition for providers. Other commenters suggested that a transition period would also help to ensure that a patient beginning treatment in 2024 does not lose access to that treatment in 2025 as reimbursement models change. Other commenters stated that the transition period would help providers begin to prepare for the proposed changes since the addition of the new codes to G0511 in the past years complicated billing for these providers. A few commenters stated that the transition period will allow the greatest access to care management services for patients and simplify compliance for providers that are still new to billing these services. Other commenters' transition requests were specific to RPM/RTM services. These commenters noted they believe that the shift in RHC and FQHC reimbursement for RPM would lead to patients being cut off from care. They also requested that CMS create, at a minimum, a one-year transition period for patients and providers who have only just begun offering and receiving RPM services at RHCs and FQHCs because of the harmful impact of this change on RPM access.

Response: We understand why some commenters might want a transition. We would expect those individual RHCs/FQHCs that have the capability to bill the individual HCPCS codes that make up HCPCS code G0511 to do so. However, we recognize that some RHCs/FQHCs may need more time to implement systems changes needed to incorporate the change for billing purposes. These changes should be on a facility basis and not on a patient-by-patient or claim-by-claim basis. To this end, we were persuaded by the commenters' requests and are allowing 6 months RHCs and FQHCs to come into compliance. We are allowing facilities at least until July 1, 2025, to enable them to be able to update their billing mechanisms. During this period during which RHCs and FQHCs bring themselves into compliance, RHCs and FQHCs shall continue reporting G0511. However, RHCs and FQHCs that have the infrastructure in place to report the individual HCPCS codes that describe the individual services may do so. We want to clarify that at the facility level when billing Medicare, RHCs and FQHCs should report these services with G0511 or the individual codes, but not both.

Comment: A few commenters who were also supportive of our proposal also requested that CMS provide additional resources and support to help FQHCs transition to the new billing method and meet the increased documentation requirements when billing for individual general care management codes previously included in HCPCS code G0511, including providing the following resources: updated cost reporting instructions to help FQHCs understand the specific requirements for each service code and ensure accurate documentation;

comprehensive training guides, such as FAQs, to educate FQHC staff on the detailed documentation requirements, time tracking, and compliance with each service code; access to technical assistance; and support to help FQHCs implement new billing systems and processes effectively. Another commenter recommended that CMS provide clear guidelines for documentation and billing purposes for when FQHCs can bill, for how much time, and how many times per month. Additionally, the commenter encouraged CMS to issue guidance for understanding what is not allowed to be billed concurrently.

Response: We encourage interested parties to review the guidance on all of the various care coordination services on our website.[356] We will provide subregulatory guidance updates and educational resources, including updates to the RHC and FQHC Medicare Benefit Policy Manual, CMS MLN publications, and various web pages including the RHC and FQHC web pages and CMS' Care Management web page.

Comment: One commenter urged CMS to implement a policy to allow FQHCs/RHCs to bill for Community Health Integration (CHI), Principal Illness Navigation (PIN) and Principal Illness Navigation Peer Support (PIC–PS) CHI/PIN/PIN–PS, using the same set of HCPCS billing codes available to traditional providers with no cap or limit on the volume of services rendered to a beneficiary per calendar month. This commenter stated that the requirement that only one provider bill for CHI/PIN/PIN–PS at a time, while simultaneously requiring FQHCs/RHCs to bill for a range of care management services under the same code, places FQHCs/RHCs at considerable risk of having their claims denied as being for duplicate services. The commenter identified barriers to adopting CHI/PIN/PIN–PS including: the risk of a claim denial because another provider is rendering a different service coded under the same HCPCS code (G0511), and the lack of clarity regarding the volume of CHI/PIN/PIN–PS that can be provided to a beneficiary during a calendar month.

Response: As proposed in the CY 2025 proposed rule (89 FR 61596, 61782), we would like to reiterate that we proposed to unbundle the codes that make up HCPCS G0511, including CHI/PIN/PIN–PS, and require RHCs and FQHCs to bill the individual codes that make up the general care management codes HCPCS code G0511. The current billing policies and requirements for the care coordination codes remain applicable. In addition, regarding the comment about the requirement that only one provider bill for CHI/PIN/PIN–PS, we would also like to reiterate that as we stated in the CY 2024 PFS final rule (88 FR 78923), we finalized a policy of only allowing one provider to bill CHI.

Comment: We received several comments from the RHC and FQHC community requesting CMS modify other bundled codes or provide separate unbundled payments for additional services. Many commenters suggested that CMS make changes to HCPCS code G0512. Some of those suggested changes included: allow FQHCs/RHCs to utilize the 99 set of HCPCS codes (99492, 99493, and 99494) in addition to the CPT Time Rule, unbundle HCPCS code G0512 to support the adoption of CoCM, and to reconsider the ongoing use of HCPCS code G0512 for Collaborative Care management services in RHCs and FQHCs and instead harmonize and unify the coding for Collaborative Care using the dedicated CPT codes. Other commenters also requested that CMS allow additional codes to be added to the list of HCPCS code G0511 that we proposed to unbundle. One commenter commended CMS's proposal to allow clinicians in RHCs and FQHCs to bill individual care management codes but urged CMS to include CPT code 99483, Cognitive Assessment and Care Planning Services, among the eligible codes. Other commenters advocated for payment parity for all care management services in RHC and FQHC settings and supported the elimination of HCPCS G0511 and adopt the full complement of Fee-for-Service (FFS) codes including any new care management code in the future such as Atherosclerotic Cardiovascular Disease (ASCVD). Another commenter stated that they would support RHCs being eligible for reimbursement under the HCPCS code G2211 code, as primary care clinicians in other settings are. This commenter noted they believe this would help both CMS and RHCs fully account for the additional time, intensity, and practice expense inherent to longitudinal care that HCPCS code G2211 was designed to capture.

Another commenter requested guidance to understand how these care management codes should be billed, as more FQHCs enter value-based care through the Medicare Shared Shavings Program, Making Care Primary (MCP) Model, or other CMMI models.

Response: We thank you for your support and appreciate your feedback regarding unbundling of HCPCS code G0512 and the addition of other services such as Cognitive Assessment and Care Planning Services, and Atherosclerotic Cardiovascular Disease (ASCVD) risk assessment service, and HCPCS code G2211 services. Regarding HCPCS code G0512, we did not propose to unbundle those services in the same way as HCPCS code G0511; however, we can evaluate further and contemplate for future rulemaking. Since cognitive assessment and care planning and the ASCVD risk assessment services happen in face-to-face visits with a provider, they would be included in the RHC AIR and the FQHC PPS and not be paid separately. Regarding HCPCS code G2211, RHCs and FQHCs in most cases are not paid according to complexity of the patient. Except for the services paid outside of the all-inclusive rates, we pay an encounter rate. HCPCS code G2211 is bundled into the RHC AIR and the FQHC PPS and not paid separately. Since we did not make any proposals regarding these services, these comments are out of scope. However, we will consider your feedback for future rulemaking. Finally, the CMS programs (MSSP or CMMI models) that currently use HCPCS code G0511 are aware of the changes we are making and will evaluate their programs accordingly.

After consideration of public comments, we are finalizing our proposal as proposed with a modification to permit RHCs and FQHCs 6-months to come into compliance, to enable those RHCs/FQHCs to be able to update their billing systems. We will also finalize the technical corrections at § 405.2464(c) to reflect the proposed payment method for care management services furnished in RHCs and FQHCs beginning January 1, 2025.

d. New Codes for Advanced Primary Care Management (APCM) Services

As discussed in section II.G of this final rule, HHS and CMS have been analyzing opportunities to strengthen and invest in primary care in alignment with the goals of the HHS Initiative to Strengthen Primary Care.[357] Research has demonstrated that greater primary care physician supply is associated with improved population-level mortality and reduced disparities,[358] and also that

[356] Care Management | CMS (*https://www.cms.gov/medicare/payment/fee-schedules/physician/care-management*).

[357] U.S. Department of Health and Human Services. (2023). Primary Care: Our First Line of Defense. *https://www.hhs.gov/sites/default/files/primary-care-issue-brief.pdf*.

[358] Basu S, Berkowitz SA, Phillips RL, Bitton A, Landon BE, Phillips RS. Association of Primary Care Physician Supply With Population Mortality in the United States, 2005–2015. *JAMA Intern Med*.

establishing a long-term relationship with a primary care provider leads to reduced emergency department (ED) visits,[359] improved care coordination, and increased patient satisfaction.[360] HHS recognizes that effective primary care is essential for improving access to healthcare, for the health and wellbeing of individuals, families, and communities, and for achieving health equity. The first coordinated set of HHS-wide actions to strengthen primary care, as part of the Initiative, is in primary care payment; for example, adjusting payment to ensure it supports delivery of advanced primary care. CMS Innovation Center models, described in section II.G.2.a.(1) of this final rule, reflect the ongoing work within HHS and the unified, comprehensive approach to HHS primary care activities that we are accomplishing through our current statutory authorities and funding.

In recent years, we have implemented significant changes aimed at better capturing the resources required for care management services, including chronic care management (CCM), principal care management (PCM), and transitional care management (TCM) and more recently, community health integration (CHI), principal illness navigation (PIN) and PIN-peer support services. For RHCs and FQHCs, we have established payment for these suites of care coordination services outside of the RHC AIR and FQHC PPS.

In section II.G.2.b. of this final rule, we proposed to establish coding and make payment under the PFS for a newly defined set of APCM services described and defined by three new HCPCS G-codes. This new coding would reflect the recognized effectiveness and growing adoption of the advanced primary care approach to care. It would also encompass a broader range of services and simplify the billing and documentation requirements, as compared to existing care management codes. The proposed coding for APCM incorporates elements of several existing care management services into a bundle that we have already considered to be care coordination services paid separately to RHCs and FQHCs using HCPCS code G0511 (for example, CCM and PCM). In addition, the coding for APCM incorporates elements of communication technology-based services (CTBS) into a bundle that we have already considered to be virtual communications paid separately to RHCs and FQHCs using HCPCS code G0071. For example, remote evaluation of patient videos/images, virtual check-in, and e-visits. Therefore, to allow RHCs and FQHCs the ability to simplify the billing and documentation requirements associated with furnishing APCM services we proposed to allow RHCs and FQHCs to bill for these services and receive separate payment. Consistent with section II.G.2.b. of this final rule, the APCM code sets vary by the degree of complexity of patient conditions (that is, non-complex and complex CCM for multiple chronic conditions or PCM for a single high-risk condition), and whether the number of minutes spent by clinical staff or the physician or non-physician practitioner (NPP) is used to meet time thresholds for billing. In the CY 2025 proposed rule, we proposed to adopt the three new APCM codes GPCM1, GPCM2, and GPCM3 and the finalized HCPCS codes are as follows: G0556, G0557 and G0558, respectively. For further discussion on the proposed HCPCS codes G0556, G0557, and G0558, please see section II.G.2.b. of this final rule.

As we have established previously, care coordination services are RHC/FQHC services and as such, we proposed to align once again with the PFS and adopt the new codes for APCM services. Additionally, allowing separate payment for APCM services in RHCs and FQHCs is intended to reflect the additional time and resources necessary for the unique components of care coordination services.

Further, in alignment with our proposal earlier in this section to require RHCs and FQHCs to utilize the same coding as when billing under the PFS and no longer use HCPCS code G0511, which described many care coordination services, we proposed to require RHCs and FQHCs when furnishing APCM to use the more specific coding, that is, the three HCPCS G-codes described above. We would pay for these services in addition to the RHC AIR or FQHC PPS because we consider these services as non-face-to-face services and similar to other care management services such as chronic care management, principal care management, and remote physiological monitoring, where these services are not captured in the RHC AIR or FQHC PPS payment. Similarly, we proposed that payment for these services would be paid at the PFS non-facility rate.

It is important to note that if RHCs and FQHCs report these new codes, they are per calendar month bundles. If the RHC/FQHC decides to bill for APCM then they would not bill for certain other individual services. For further discussion on duplicative services and concurrent billing restrictions with regard to APCM policies, we refer readers to section II.G.2.d. of this final rule.

We received several comments on our proposal to require RHCs and FQHCs when furnishing APCM services to use the three newly created HCPCS G-codes created for the PFS and paid at the PFS non-facility rate.

The following is a summary of the comments we received and our responses.

Comment: A few commenters fully supported our proposal to establish coding and making payment under the PFS for the three new HCPCS G-codes for APCM services. One commenter stated that these codes will also provide payment for services that are often already provided but for which they are often not compensated and urged CMS to support all care integration efforts. One commenter stated that RHCs and FQHCs are critical sources of primary care for low-income beneficiaries, including those with intellectual and developmental disabilities (IDD) who are dually eligible and/or often turned away by private medical practices. Another commenter stated that these new codes will likely give RHC providers flexibility in choosing the most appropriate care management option for their patients and the clinic's capacity—whether they elect to perform and bill for individual care management services, or the consolidated codes based on complexity of patient conditions. The commenter appreciated the clarity regarding which care management services can be billed simultaneously with APCM codes versus those that are considered duplicative.

Response: We thank the commenters for their support of our proposal to require RHCs and FQHCs when furnishing APCM services to use the three newly created HCPCS G-codes created for the PFS and paid at the PFS non-facility rate. We agree that adopting these three new HCPCS G-codes will give RHCs and FQHCs providers the flexibility to choose the most

2019;179(4):506–514. doi:10.1001/jamainternmed.2018.7624. *https://jamanetwork.com/journals/jamainternalmedicine/fullarticle/2724393.*

appropriate care management option for their patients and the clinic's capacity.

Comment: Although a few commenters fully supported our proposal to adopt the three new HCPCS G-codes for APCM services, other commenters were generally supportive and had additional requests/recommendations. Many commenters recommended that CMS allow a coinsurance waiver for FQHC and RHC patients who consent to using APCM services. These commenters stated many health center patients are financially vulnerable and that while health centers can place this co-insurance obligation on the sliding fee scale, patients have historically been wary of monthly payment requirements for general care management services. The commenters stated that waiving co-insurance costs of APCM for FQHC patients alleviates potential financial barriers to care and will help maintain patient enrollment in receiving these vital services. Some commenters expressed their concern about the burden a monthly cost-sharing responsibility will have on health center patients and recommended CMS allow a co-insurance waiver for FQHC patients who consent to using APCM services to help alleviate patient cost burdens, while another commenter urged CMS to examine any existing authority to permit health centers to waive co-pays to alleviate cost burdens to patients, whether it is done by working with OIG, incorporating flexibilities from demonstration models, or working with Congress. One commenter urged CMS to waive the applicable co-pay for APCM services furnished in RHCs/FQHCs or at the very least allow physicians to make the decision if they wish to waive the 20 percent copay for those who do not have the ability to pay.

Response: We thank commenters for their support and feedback. Regarding commenters' requests for waiving coinsurance costs, we note that we do not have any statutory authority that would allow us to waive the applicable coinsurance for APCM services. For more detail, please refer to section II.G2.2.

Comment: One commenter, who supports our proposal to adopt the three new APCM HCPCS G-codes, requests further clarification. The commenter does not recommend that these bundled payments include CHI and PIN services as the payment would be inadequate and the CHI and PIN provide different but complementary services. The commenter stated that if care management code G0511 is eliminated, FQHCs would need to be allowed to bill CHI and PIN separately and distinctly in addition to the APCM codes. The commenter requests clarification and guidance on the time constraints for FQHCs and billing for APCM services versus general care management services, which they stated could burden an FQHC's ability to bill these codes.

Another commenter stated that CMS is proposing to mandate both RHCs and FQHCs to bill individual codes that make up the general care management HCPCS code G0511 using three new G-codes, GPCM1, GPCM2, and GPCM3. The commenter stated that to offset decreases in payment for services that make up G0511, CMS proposes to include these add-on codes for additional time spent when the minimum threshold of time is met to adjust for a complete encounter. The commenter further stated that CMS believes that this will promote transparency in billing and payment, and it will also account for the complexity of the service and the time for each service. The commenter stated that while they appreciated the steps CMS is taking to improve primary care, these care management codes will only further create administrative burdens for practices and confusion for patients, as mentioned previously and that the introduction of three new G-codes will cause the conversion factor to decrease and reduce reimbursement. The commenter urged CMS to delay implementation and involve stakeholders in this conversation. One commenter requested that APCM bundle codes exclude CHI and PIN services.

Response: We note that CHI and PIN may be billed concurrently with APCM. We think that these services are unique and serve specific needs not otherwise met by the proposed APCM coding and believe that these services are additive to APCM services, and do not represent duplication of services, as long as time and effort are not counted more than once, requirements to bill the other services are met, and the services are medically reasonable and necessary. In response to the comment about the use of the three new APCM codes and G0511, we again reiterate that general care management services that make up HCPCS G0511 include chronic care management (CCM), principal care management (PCM), chronic pain management (CPM), general behavioral health integration (BHI), remote physiologic Monitoring (RPM), remote therapeutic monitoring (RTM), community health integration (CHI), principal illness navigation (PIN), and principal illness navigation-peer support (PIN–PS). As stated in the CY 2025 PFS proposed rule (88 FR 61782), we proposed to require RHCs and FQHCs to bill the individual codes that make up the general care management HCPCS code, G0511. The APCM codes are not included in the list of codes that make up HCPCS G0511. Therefore, we will not be delaying the implementation of adopting the APCM codes. If RHCs and FQHCs provide APCM, they should report the APCM codes.

Comment: One commenter requested that CMS develop additional resources/technical assistance, beyond cost reporting instructions, to help health centers understand how to take up this new APCM bundled payment option.

Response: We thank the commenter for their feedback. We will issue sub-regulatory guidance to help health centers understand how to take up the APCM bundled payments via updating multiple resources including the RHC and FQHC Medicare Benefit Policy Manual, MLN publications and the RHC and FQHC web pages.

Comment: Some commenters requested that CMS monitor and evaluate the use of APCM services at RHCs and FQHCs to help reveal any potential barriers to uptake. These commenters state that they would appreciate CMS' diligence in monitoring RHCSs and FQHCs usage to inform whether future tweaks to APCM services would make them more accessible in rural settings.

Response: We thank the comments for this recommendation and will take this into consideration as we evaluate APCM.

After consideration of public comments, we are finalizing our proposal to require RHCs and FQHCs when furnishing APCM services to use the three newly created HCPCS G-codes created for the PFS paid at the PFS non-facility rate effective January 1, 2025, as proposed.

e. Request for Information—Aligning With Services Paid Under the PFS

As we discuss in section III.B.2.a. of this final rule, over the last several years we have been increasing our focus on care coordination. These services have evolved to focus on preventing and managing chronic disease, improving a beneficiary's transition from the hospital to the community setting, or on integrative treatment of patients with behavioral health conditions. We have acknowledged that the care coordination included in services such as office visits does not always describe adequately the non-face-to-face care management work involved and may not reflect all the services and resources required to furnish comprehensive, coordinated care management for

certain categories of beneficiaries. Therefore, under the PFS we have proposed new services over the years that practitioners billing under the PFS can be paid separately under the PFS. We have noted previously that RHCs and FQHCs cannot bill under the PFS for RHC or FQHC services and individual practitioners working at RHCs and FQHCs cannot bill under the PFS for RHC or FQHC services while working at the RHC or FQHC. Therefore, we have proposed payment policies for RHCs and FQHCs that complement the new services for care coordination under the PFS to align the RHC and FQHC resource cost for those services with payment.

The increase in frequency of this complementary rulemaking has triggered us to consider operational efficiencies internally that we believe could result in more transparency and clarity for interested parties. Since RHCs and FQHCs are generally paid under encounter-based payment systems, we have not systematically analyzed all services paid under the PFS (nor do we analyze all new services proposed) to determine if they are included as a part of the visit versus are eligible for additional payment. Another reason that we do not analyze every code is because frequently codes created under the PFS for billing practitioners are to more appropriately account for resources paid under the PFS. Codes for these purposes are not applicable for RHCs and FQHCs since they are not paid under the PFS.

Generally, for PFS services that are a part of the office visit, there is no separate payment under the RHC AIR or FQHC PPS payment methodologies. On the contrary, care coordination services where the focus is on care management, coordination, or certain activities needed to manage chronic illnesses or adapt to new models of care, we have allowed separate payment for RHCs and FQHCs.

We solicited comment on how we can improve the transparency and predictability regarding which HCPCS codes are considered care coordination services. Our goal is to classify care coordination services on the PFS in a way that makes it automated in the downstream effect on RHCs and FQHCs. We stated that we believe establishing a streamlined policy regarding which services are separately paid for RHCs and FQHCs versus included as part of the visit is more transparent. In addition, a policy where codes are communicated and updated through subregulatory guidance may be more efficient.

We received a few comments in response to our request for information about how we can improve transparency and predictability regarding which HCPCS codes are considered care coordination services.

Comment: One commenter expressed their appreciation for our seeking comment on improving transparency and predictability regarding which codes are considered care coordination services but noted that CMS also did not propose to allow RHCs to bill for six new G codes associated with interprofessional behavioral health consultations. The commenter noted they believe there is a significant opportunity for this to be utilized in Rural Health Clinics (RHCs) as many of these providers integrate other specialty providers in their provision of comprehensive care. The commenter urged CMS to provide RHCs with the same opportunities to bill for these types of services that do not meet the traditional definition of a face-to-face encounter, in recognition of the broader set of services provided in the primary care setting. Another commenter suggested that that any services which are partially paid for under the PFS and partially paid under RHC or FQHC payment rates be considered care coordination and therefore should be reimbursed under one payment system. This commenter also urged CMS to choose one payment system and use it throughout Medicare and stated that having only one system for payment will lower overhead costs, and therefore, will save administrative time and money. The commenter also stated that practitioners are well aware that there are different payment systems and sometimes will be reimbursed in different ways, but that when there is a question as to which system is used, it results in wasted time trying to figure out which is the proper system, and then, if the wrong system is billed, there could be additional time spent trying to fix the mistakes that were made. Another commenter noted CMS could establish a clear classification system on the PFS and that this system should automatically translate the impact of these codes to RHCs and FQHCs. The commenter stated that by distinguishing services that are separately payable from those included in visit payments, CMS could provide greater clarity. The commenter agreed that a policy where codes are communicated and updated through subregulatory guidance may be more efficient.

Response: We recognize that there are varying perspectives on how we can improve transparency and predictability regarding which HCPCS codes are considered care coordination services. We appreciate the depth of consideration different interested parties have offered in their comments as we continue to evaluate.

Comment: Another commenter, who appreciated the opportunity to opine on our request for information expressed serious concerns regarding billing practices by RHCs who utilize providers to furnish services in non-rural areas, particularly in skilled nursing facilities (SNFs). The commenter stated that the Balanced Budget Act of 1997(BBA) required CMS to finalize location requirements to decertify non-rural RHCs, which CMS initially proposed in 2003 and 2008 but explained the 2003 rule was past the statutory deadline and the 2008 rule was never finalized. This commenter expressed concern that, in the absence of location requirements, some RHCs have exploited this gap by continuing to operate in areas that are no longer rural or underserved, including in non-rural skilled nursing facilities (SNFs). The commenter urged CMS to examine and report on the billing practices of RHCs operating outside rural areas to understand the cost of reimbursing for RHC services, particularly SNF stays, that are billed in non-underserved or rural locations. The commenter stated that addressing these issues would benefit both the Medicare program by decreasing costs from paying higher RHC rates in urban locations and allow non-RHCs to compete when providing SNF services. The commenter further recommended that CMS consider regulatory changes that would limit RHCs from adding providers that primarily serve patients in non-rural settings.

Response: We thank the commenter for this important feedback.

3. Services Using Telecommunications Technology

a. Background

Section 3704 of the Coronavirus Aid, Relief, and Economic Security Act (the CARES Act) (Pub. L. 116–136, March 27, 2020) directed the Secretary to establish payment for RHC and FQHC services that are provided as Medicare telehealth services by RHCs and FQHCs serving as a distant site (that is, where the practitioner is located) during the PHE for COVID–19. Separately, section 3703 of the CARES Act expanded CMS' emergency waiver authority to allow for a waiver of any of the statutory telehealth payment requirements under section 1834(m) of the Act for telehealth services furnished during the PHE. Specifically, section 1834(m)(8)(B) of the Act, as added by section 3704 of the CARES Act, requires that the Secretary develop and implement payment

methods for FQHCs and RHCs that serve as a distant site during the PHE for the COVID–19 pandemic. The payment methodology outlined in the CARES Act requires that rates shall be based on rates that are similar to the national average payment rates for comparable telehealth services under the Medicare PFS. We established payment rates for these services furnished by RHCs and FQHCs based on the average PFS payment amount for all Medicare telehealth services, weighted by volume.

In the CY 2022 PFS final rule with comment period (86 FR 65211), we revised the regulatory requirement that an RHC or FQHC mental health visit must be a face-to-face (that is, in-person) encounter between an RHC or FQHC patient and an RHC or FQHC practitioner. We revised the regulations under § 405.2463 to state that an RHC or FQHC mental health visit can also include encounters furnished through interactive, real-time, audio/video telecommunications technology or audio-only interactions in cases where beneficiaries are not capable of, or do not consent to, the use of devices that permit a two-way, audio/video interaction for the purposes of diagnosis, evaluation or treatment of a mental health disorder. We noted that these changes aligned with similar changes for Medicare telehealth services for behavioral health paid under the PFS. We also noted that this change allows RHCs and FQHCs to report and be paid for mental health visits furnished via real-time, telecommunication technology in the same way they currently do when these services are furnished in-person.

In addition, we revised the regulation under § 405.2463 to state that there must be an in-person mental health service furnished within 6 months prior to the furnishing of the telecommunications service and that an in-person mental health service (without the use of telecommunications technology) must be provided at least every 12 months while the beneficiary is receiving services furnished via telecommunications technology for diagnosis, evaluation, or treatment of mental health disorders, unless, for a particular 12-month period, the physician or practitioner and patient agree that the risks and burdens outweigh the benefits associated with furnishing the in-person item or service, and the practitioner documents the reasons for this decision in the patient's medical record (86 FR 65210 and 65211).

As discussed in the CY 2023 PFS final rule (87 FR 69738), the Consolidated Appropriations Act, 2022 (CAA, 2022) (Pub. L. 117–103, March 15, 2022) included the extension of several Medicare telehealth flexibilities established during the PHE for COVID–19 for a limited 151-day period beginning on the first day after the end of the PHE. Specifically, Division P, Title III, section 304 of the CAA, 2022, delayed the in-person requirements for Medicare telehealth services for behavioral health and for mental health visits furnished by RHCs and FQHCs via telecommunications technology until the 152nd day after the end of the PHE for COVID–19. Therefore, in the CY 2023 PFS final rule (87 FR 69737), we revised the regulations under §§ 405.2463 and 405.2469 again to reflect these provisions.

In the CY 2024 PFS final rule (88 FR 79065), we discussed that the CAA, 2023 (Pub. L. 117–328, December 29, 2022) further extended the Medicare telehealth flexibilities for a period beginning on the first day after the end of the PHE for COVID–19 and ending on December 31, 2024, if the PHE ends prior to that date. Specifically related to RHCs and FQHCs, section 4113(c) of the CAA, 2023 amended section 1834(m)(8) of the Act to extend payment for RHC and FQHC services provided as Medicare telehealth services for the period beginning on the first day after the end of the COVID–19 PHE and ending on December 31, 2024, if the PHE ends prior to that date. We noted that payment continued to be made under the methodology established for Medicare telehealth services furnished by FQHCs and RHCs during the PHE, which is based on payment rates that are similar to the national average payment rates for comparable telehealth services under the PFS.

We explained that section 4113(d) of the CAA, 2023 continues to delay the in-person requirements for Medicare telehealth services for behavioral health and for mental health visits furnished by RHCs and FQHCs via telecommunications technology. That is, for RHCs and FQHCs, in-person visits will not be required until January 1, 2025, or, if later, the first day after the end of the PHE for COVID–19. Therefore, we stated that we will continue to apply the delay of the in-person requirements under Medicare for mental health services furnished by RHCs and FQHCs via telecommunications technology. We noted that the PHE for COVID–19 under section 319 of the Public Health Service Act ended on May 11, 2023.[361] Therefore, we revised the regulations under §§ 405.2463 and 405.2469 again to reflect these provisions (88 FR 79066 through 79067).

[361] *https://www.hhs.gov/coronavirus/covid-19-public-health-emergency/index.html.*

b. Direct Supervision Via Use of Two-Way Audio/Video Communications Technology

Under Medicare Part B, certain types of services are required to be furnished under specific minimum levels of supervision by a physician or practitioner. See section II.D.2.a. of this final rule for the discussion regarding direct supervision for services provided using telecommunications technologies under the PFS.

In the CY 2024 PFS final rule (88 FR 79067), we explained that extending this definition of direct supervision for RHCs and FQHCs under our regulations at §§ 405.2413, 405.2415, 405.2448, and 405.2452 through December 31, 2024, would align the timeframe of this policy with many of the previously discussed PHE-related telehealth policies that were extended under provisions of the CAA, 2023. In addition, we were concerned about an abrupt transition to the pre-PHE policy of requiring the physical presence of the supervising practitioner beginning after December 31, 2024, given that RHCs and FQHCs have established new patterns of practice during the PHE for COVID–19. We also believed that RHCs and FQHCs would need time to reorganize their practices established during the PHE to reimplement the pre-PHE approach to direct supervision without the use of audio/video technology. Similar to services furnished in physician office setting, RHC and FQHC services and supplies furnished incident to physician's services are limited to situations in which there is direct physician supervision of the person performing the service, except for certain care coordination services which may be furnished under general supervision. For CY 2024, we continued to define ''immediate availability'' as including real-time audio and visual interactive telecommunications through December 31, 2024, and solicited comment on whether we should consider extending the definition of ''direct supervision'' to permit virtual presence beyond December 31, 2024.

(1) Proposal for CY 2025

In the CY 2024 PFS proposed rule, we solicited comment on potential patient safety or quality concerns when direct supervision occurs virtually in RHCs and FQHCs; for instance, if certain types of services are more or less likely to present patient safety concerns, or if this flexibility would be more appropriate when certain types of auxiliary

personnel are performing the supervised service. We were also interested in potential program integrity concerns such as overutilization or fraud and abuse that interested parties may have in regard to this policy.

Comments provided were overall supportive of our proposal to continue to define ''immediate availability'' to include availability through virtual means, stating that it will benefit healthcare providers while greatly enhancing patient access to quality care, particularly in underserved areas. Commenters also noted that direct supervision has become increasingly challenging and the option to provide virtual direct supervision has enhanced the quality and provision of healthcare services beneficiaries have received in medically underserved, rural communities.

We note that in section II.D.2.a. of this final rule, there is a proposal to permanently adopt a definition of direct supervision that allows ''immediate availability'' of the supervising practitioner using audio/video real-time communications technology (excluding audio-only), but only for the following subset of incident-to services described under § 410.26, (1) services furnished incident to a physician or other practitioner's service when provided by auxiliary personnel employed by the billing practitioner and working under their direct supervision, and for which the underlying HCPCS code has been assigned a Professional Component/Technical Component indicator of '5'; and (2) services described by CPT code 99211 (*Office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of* a physician or *other qualified health care* professional). In addition, under the PFS we proposed for all other services required to be furnished under the direct supervision of the supervising physician or other practitioner, to continue to define ''immediate availability'' to include real-time audio and visual interactive telecommunications technology only through December 31, 2025.

After evaluating the information gathered through the comment solicitation, we believe that we should maintain the current flexibility in RHCs and FQHCs as it continues to support access and preserve workforce capacity. We believe that there is value in allowing RHC and FQHC services to be furnished under direct supervision where virtual presence meets the definition of ''immediately available'' as status quo, so that we may further evaluate the services along with the analysis occurring for the remaining services that we are contemplating under the PFS. We noted that there may be nuances in the RHC and FQHC settings since generally payment is at the AIR or PPS rate and not at the individual service code level to carve out services limited/obvious services from other services. We could seek to establish a final policy in RHCs and FQHCs once a final policy is determined under the PFS, to avoid confusion since they are taking an incremental approach at the code level for CY 2025.

Therefore, we proposed to maintain the virtual presence flexibility on a temporary basis, that is, the presence of the physician (or other practitioner) would include virtual presence through audio/video real-time communications technology (excluding audio-only) through December 31, 2025.

Comment: Commenters supported this proposal. A commenter stated that requiring the supervising practitioner to be physically present would delay care in many instances.

Response: After consideration of public comments, we are finalizing as proposed to maintain the virtual presence flexibility on a temporary basis, that is, the presence of the physician (or other practitioner) would include virtual presence through audio/video real-time communications technology (excluding audio-only) through December 31, 2025.

c. Services Furnished Through Telecommunications Technology

As discussed above, section 3704 of the CARES Act directed the Secretary to establish payment for RHC and FQHC services provided as Medicare telehealth services by RHCs and FQHCs serving as a distant site (that is, where the practitioner is located) during the PHE for COVID–19. Separately, section 3703 of the CARES Act expanded CMS' emergency waiver authority to allow for a waiver of any of the statutory telehealth payment requirements under section 1834(m) of the Act for telehealth services furnished during the PHE. Specifically, section 1834(m)(8)(B) of the Act, as added by section 3704 of the CARES Act, required that the Secretary develop and implement payment methods for FQHCs and RHCs that serve as a distant site during the PHE for COVID–19. The payment methodology outlined in the CARES Act requires that rates shall be based on rates that are similar to the national average payment rates for comparable telehealth services under the Medicare PFS. Therefore, we established payment rates for these services furnished by RHCs and FQHCs based on the average PFS payment amount for all Medicare telehealth services, weighted by volume. RHCs and FQHCs bill for these telehealth services using HCPCS code G2025.

In the CY 2022 PFS final rule with comment period (86 FR 65211), we revised the regulatory requirement that an RHC or FQHC mental health visit must be a face-to-face (that is, in person) encounter between an RHC or FQHC patient and an RHC or FQHC practitioner. We revised the regulations under § 405.2463 to state that an RHC or FQHC mental health visit can also include encounters furnished through interactive, real-time, audio/video telecommunications technology or audio-only interactions in cases where beneficiaries are not capable of, or do not consent to, the use of devices that permit a two-way, audio/video interaction for the purposes of diagnosis, evaluation or treatment of a mental health disorder. We noted that these changes aligned with similar changes for Medicare telehealth services for behavioral health paid under the PFS. We also noted that this change allows RHCs and FQHCs to report and be paid for mental health visits furnished via real-time, telecommunication technology in the same way they currently do when these services are furnished in-person.

The temporary authority under section 1834(m)(8) of the Act was extended by statute through the end of CY 2024, meaning that under current law and absent additional changes in regulation, RHCs and FQHCs could not continue to be paid under Medicare Part B for RHC and FQHC services (other than mental health visits) furnished as Medicare telehealth services after December 31, 2024.

(1) Payment for Medical Visits Furnished Via Telecommunications Technology

Widespread use of telecommunications technology to furnish services during the PHE has illustrated interest within the medical community and among Medicare beneficiaries in furnishing and receiving care through the use of technology beyond the PHE. During the PHE, RHCs and FQHCs, much like other health care providers, have had to change how they furnish care in order to meet the needs of their patients. RHCs and FQHCs heavily utilized the temporary authority to be paid for their services when provided as Medicare telehealth services during the PHE. Eliminating flexibilities under which RHC and FQHC services have been furnished to beneficiaries via telecommunications technology for over 4 years and

resuming payment solely for in-person, face-to-face medical visits after December 31, 2024, would cause disruptions in access to services from RHC and FQHC practitioners. This would be particularly problematic for the underserved populations that these settings furnish services to since it could fragment care. We believe that we need to preserve the flexibilities under which RHC and FQHC services have been furnished to beneficiaries via telecommunications technology temporarily and to do so through an approach that these settings are familiar with in order to mitigate burden. Technologies used in this space and the quality of care associated with them continue to evolve. We believe that it would be prudent to allow time to engage with interested parties while we consider how to incorporate services furnished through telecommunications technology on a more permanent basis.

For these reasons, we proposed, on a temporary basis, to allow payment for non-behavioral health visits (hereafter referred to in this discussion as ''medical visit services'') furnished via telecommunications technology. We proposed to facilitate payments using an approach that closely aligns with the mechanism we have used during the PHE and subsequent extensions that end on December 31, 2024. That is, RHCs and FQHCs would continue to bill for RHC and FQHC medical visit services furnished using telecommunications technology, including services furnished using audio-only communications technology, by reporting HCPCS code G2025 on the claim. Since the costs associated with medical visit services furnished via telecommunications technology are not included in the calculations for the RHC AIR methodology and FQHC PPS, we believed that we needed to propose a proxy that would represent such resources used when furnishing these services. Therefore, we proposed to continue to calculate the payment amount for these services billed using HCPCS code G2025 based on the average amount for all Medicare telehealth services paid under the PFS, weighted by volume for those services reported under the PFS. We believe that continuing to use this weighted average is appropriate during this interim period while we contemplate permanent policies for these services since there is a wide range of payment rates for the Medicare telehealth services paid under the PFS. We believe that RHCs and FQHCs generally furnish services that are similar to and at a frequency the same as physicians and other practitioners paid under the PFS. While we do not have actual cost information, we believe that this weighted average is an appropriate proxy since it addresses certain resource costs experienced by professionals and would mitigate any potential over or under payments. Costs associated with these services would continue to not be used in determining payments under the RHC AIR methodology or the FQHC PPS.

We believe that the proposed approach would preserve the telecommunication technology flexibility under which RHC and FQHC services have been furnished for over 4 years and would not impact access to care for Medicare beneficiaries who currently benefit from these services while CMS contemplates next steps. We solicited comment on whether there may be other payment methodologies that may be a proxy for costs associated with medical visit services furnished via telecommunications technology and why those payment methodologies may be more appropriate than the rate based on a weighted average of the Medicare telehealth services paid under the PFS.

We proposed to amend § 405.2464 by adding new paragraph (g) to reflect our proposed payment policy for medical visit services furnished in RHCs and FQHCs via telecommunications technology for CY 2025.

(2) Alternative Considered for Payment of Medical Visits Furnished Via Telecommunications Technology

We considered reevaluating the regulations regarding face-to-face visit requirements for encounters between a beneficiary and an RHC or FQHC practitioner in light of contemporary medical practices. That is, we considered proposing a revision to the regulatory requirement that an RHC or FQHC medical visit must be a face-to-face (that is, in-person) encounter between a beneficiary and an RHC or FQHC practitioner to also include encounters furnished through interactive, real-time, audio and video telecommunications technology. This would result in payment for services furnished via telecommunication technology to be made under the RHC AIR methodology and under the FQHC PPS, similar to how we revised the regulations for RHC and FQHC mental health visits. We believe interested parties may prefer the per visit payment that aligns with the RHC AIR or FQHC PPS. However, we did not propose this alternative because we determined that it would have unintended consequences, especially in cases where the RHC AIR or FQHC PPS per-visit rates would be significantly higher than the PFS rate that would apply if other entities furnished the same service to the same beneficiary in the same location.

We believe that temporarily continuing to pay for RHC and FQHC medical visit services furnished via telecommunication technologies in the same manner as we have done over the past several years would preserve the flexibility for RHCs and FQHCs to continue access to care, mitigate administrative burden, and mitigate potential program integrity concerns. However, we solicited comment on the alternative proposal we considered. That is, revising the definition of a medical visit to include interactive, real-time, audio/video telecommunications technology which would result in a uniform per-visit payment under the RHC AIR methodology or FQHC PPS.

Comment: Commenters supported our proposal to pay for medical visit services furnished by RHCs and FQHCs via telecommunications technology for CY 2025, stating that it will benefit these healthcare providers while greatly enhancing patient access to quality care, particularly in underserved areas.

Response: We appreciate the support of the commenters.

Comment: Many commenters expressed a preference for our alternative considered, whereby we would change the definition of a visit to include interactive, real-time, audio/video telecommunication technology, resulting in a uniform per-visit payment under the RHC AIR methodology or FQHC PPS for medical visit services. Commenters stated that this approach would ensure that RHCs and FQHCs receive consistent and timely reimbursement for providing these services via telecommunications technology. One commenter asked CMS to elaborate on what we described as potential unintended consequences of adopting this approach, stating that there has been no widespread fraud, abuse, or other unintended consequence resulting from the changed definition of a mental health visit, so there is no logical reasoning on which to base the belief that changing the definition of a medical visit would have those negative results. According to this commenter, offering lower reimbursement to safety net providers through a crude special payment rule because it is just a continuation of current policy is not reducing administrative burden; rather it continues to limit safety net providers' ability to invest in these important technologies. The commenter stated that if there are program integrity concerns, CMS has the ability to monitor utilization of services delivered

using telecommunications technology through a simple modifier code, and address issues if they arise; however, they asserted that simply continuing the disparate policy is not an appropriate guardrail and continues to have the potential to limit access to care.

Response: We recognize that under the current statute, RHCs and FQHCs will no longer provide their services as a distant site for Medicare telehealth services after the end of CY 2024. While further legislative extensions of Medicare telehealth flexibilities adopted during the PHE for COVID–19 are possible, we proposed an approach that would allow us to continue making payment for RHC and FQHC medical visit services provided via telecommunications technology as we have for several years during and after the PHE for COVID–19 while we consider the implications of incorporating payment for these services into the RHC AIR and FQHC PPS in the future.

We note that before the PHE for COVID–19, we tended to presume that nearly all Medicare services that involve interaction between a practitioner and a patient are to be delivered in person in a face-to-face encounter except, as in section 1834(m) of the Act, where the statute specifically addressed payment for service delivery via interactive telecommunications technology. As the use of telecommunications technology in health care delivery has become more sophisticated and prevalent, our views have been evolving. For example, in the context of opioid use disorder (OUD) treatment services by an Opioid Treatment Program (OTP), we explained that the requirements of section 1834(m) of the Act do not apply to these services because they are not furnished by a physician or other practitioner, but instead are furnished by the OTP; and no physician or practitioner can be paid separately for these services because payment is made through the bundled payment to the OTP (84 FR 62658, 62645). In light of our experience with the proliferation of telecommunications technology-based services during the PHE for COVID–19, we have recognized that we could take a similar approach with RHC and FQHC services, as evidenced by the changes we made to our regulations in the CY 2022 PFS final rule for RHC and FQHC mental health visits provided via telecommunications technology, as well as our proposal in the CY 2025 PFS proposed rule for RHC and FQHC medical visit services.

We believe our proposed approach allows us to ensure immediate access to care for beneficiaries currently relying on RHCs and FQHCs while we continue to monitor and analyze information made available to us in order to develop, propose, and finalize more permanent policy in future rulemaking, particularly given the potential for congressional action. We are therefore finalizing as proposed to continue to pay through CY 2025 for these services furnished by RHCs and FQHCs via telecommunications technology as they have been during and after the PHE through the end of CY 2024; however, we will continue to evaluate and may consider this issue again in future rulemaking.

After consideration of public comments, we are finalizing as proposed to continue to make payment through CY 2025 for RHC and FQHC medical visit services furnished via telecommunications technology using the payment amount based on the average amount for all Medicare telehealth services paid under the PFS, weighted by volume.

d. In-Person Visit Requirements for Remote Mental Health Services Furnished by RHC and FQHCs

Section 123 of the CAA, 2021 amended section 1834(m)(7) of the Act to require that a beneficiary must receive an in person, non-telehealth service from the physician or practitioner 6 months prior to initiation of the telehealth mental health services and direct the Secretary to establish an appropriate frequency for provision of subsequent periodic in person, non-telehealth services. As amended by section 4113(d)(1) of CAA, 2023 (Pub. L. 117–328), this requirement applies to all mental health services provided beginning on January 1, 2025.

In the CY 2022 PFS final rule with comment (86 FR 65210), we revised the regulation under § 405.2463 to apply this provision to RHCs and FQHCs, to state that there must be an in-person mental health service furnished within 6 months prior to the furnishing of the telecommunications service and that an in-person mental health service (without the use of telecommunications technology) must be provided at least every 12 months while the beneficiary is receiving services furnished via telecommunications technology for diagnosis, evaluation, or treatment of mental health disorders, unless, for a particular 12-month period, the physician or practitioner and patient agree that the risks and burdens outweigh the benefits associated with furnishing the in-person item or service, and the practitioner documents the reasons for this decision in the patient's medical record.

As discussed in the CY 2023 PFS final rule (87 FR 69738), the CAA, 2022 included the extension of a number of Medicare telehealth flexibilities established during the PHE for COVID–19 for a limited 151-day period beginning on the first day after the end of the PHE. Division P, Title III, section 304 of the CAA, 2022, delayed the in-person requirements under Medicare for mental health services furnished through telehealth under the PFS and for mental health visits furnished by RHCs and FQHCs via telecommunications technology until the 152nd day after the end of the PHE for COVID–19.

The CAA, 2023 (Pub. L. 117–328, December 29, 2022) extended the Medicare telehealth flexibilities enacted in the CAA, 2022 for a period beginning on the first day after the end of the PHE for COVID–19 and ending on December 31, 2024, if the PHE ended prior to that date. While the CAA, 2021 only applied to the PFS, we implemented similar policies for RHCs, FQHCs, and hospital outpatient departments. As noted above, the in-person visit requirements are currently set to take effect for services furnished on or after January 1, 2025.

However, given concerns from interested parties on the impact of enforcing these requirements after multiple years of delay, we proposed an additional extension. We proposed to continue to delay the in-person visit requirement for mental health services furnished via communication technology by RHCs and FQHCs to beneficiaries in their homes until January 1, 2026.

Comment: Commenters supported our proposal to continue to delay the in-person visit requirement for these services, stating that this requirement is unnecessary and a barrier to care. Commenters also requested that we permanently remove this requirement.

Response: After consideration of public comments, we are finalizing our proposal to continue to delay the in-person visit requirement for mental health services furnished via communication technology by RHCs and FQHCs to beneficiaries in their homes until January 1, 2026. We may consider an additional extension in future rulemaking.

4. Intensive Outpatient Program Services (IOP)

a. Background

As we discussed in the CY 2024 OPPS final rule (88 FR 81838) section 4124 of Division FF of the CAA, 2023 established Medicare coverage for intensive outpatient program (IOP)

services furnished by a hospital to its outpatients, or by a community mental health center (CMHC), a FQHC or a RHC, as a distinct and organized intensive ambulatory treatment service offering less than 24-hour daily care in a location other than an individual's home or inpatient or residential setting, effective January 1, 2024.

IOP is a distinct and organized outpatient program of psychiatric services provided for individuals who have an acute mental illness, which includes, but is not limited to conditions such as depression, schizophrenia, and substance use disorders. We noted an IOP is thought to be less intensive than a partial hospitalization program (PHP).

This new provision mandated several areas of policy to implement an IOP program, including scope of benefits and services, certification and plan of care requirements, and special payment rules for IOP services in RHCs and FQHCs, all of which are discussed in the CY2024 OPPS final rule (88 FR 81838 through 81845). We made corresponding regulation changes for IOP services at §§ 405.2400, 405.2401, 405.2410, 405.2411, 405.2446, 405.2462, 405.2463, 405.2464, 405.2468, and 405.2469.

b. Update to Special Payment Rules for Intensive Outpatient Services

As we discussed in the CY 2024 OPPS final rule (88 FR 81841), section 4124(c) of the CAA, 2023 further amended section 1834(o) of the Act and section 1834(y) of the Act, to provide special payment rules for both FQHCs and RHCs, respectively, for furnishing IOP services. Section 4124(c)(1) of the CAA, 2023 amended section 1834(o) of the Act to add a new paragraph (5)(A) to require that payment for IOP services furnished by FQHCs be equal to the amount that would have been paid under Medicare for IOP services had they been covered outpatient department services furnished by a hospital. In addition, section 4124(c)(2) of the CAA, 2023 amended section 1834(y) of the Act to add a new paragraph (3)(A) to require that payment for IOP services furnished by RHCs be equal to the amount that would have been paid under Medicare for IOP services had they been covered outpatient department services furnished by a hospital.

In the CY 2024 OPPS final rule (88 FR 81841), we provided a detailed discussion of the final CY 2024 payment rate methodology for IOP. CMS finalized two payment rates, a 3- and a 4- or more services per day, for IOP services for hospitals and CMHCs. However, for RHCs and FQHCs we established a 3-service per day payment rate. We stated that we believed it was appropriate to establish the payment rate where the utilization is typically structured to be days with 3 or fewer services and solicited comment on whether the hospital-based IOP payment rate for 4-service days would be appropriate for RHCs and FQHCs. Although we previously stated that we would review the data and consider a 4 or more services per day for future rulemaking, we considered it further. We believed that we should provide parity for IOP services across the various settings with site neutral payments while continuing to monitor access to these services. Therefore, we proposed to provide payment for 4 or more services per day in an RHC/FQHC setting. Additionally, as required in section 4124(c)(2) of the CAA, 2023 we proposed to align with the 4 or more-services per day payment rate for hospital outpatient departments. As we stated with the 3-services per day, the 4 or more services per day payment rates would also be updated annually.

We received several comments on our proposal to provide payment for 4 or more IOP services per day in an RHC/FQHC setting and align such payment with the 4 or more-services per day payment rate for hospital outpatient departments, which would be updated annually.

The following is a summary of the comments we received and our responses.

Comment: Many commenters were very supportive of our proposal to establish payment for 4 or more services per day in an RHC/FQHC setting and align such payment with the 4 or more services per day payment rate for hospital outpatient departments, which will be updated annually. One commenter stated that they supported and appreciated CMS' proposal to align payment rates with those of hospitals and community mental health centers, which the commenter believes will promote fairness and consistency in reimbursement for IOP services, regardless of the setting. A few commenters stated that this will provide parity and site-neutral payments for IOP services across different settings. Some commenters stated that they are hopeful that adding the 4 or more services per day will encourage rural uptake.

Response: We agree with supporters that adding the 4 or more services per day payment for IOP service will promote fairness and consistency in reimbursement for IOP services and also believe that the additional payment will provide parity and site-neutral payments for IOP services.

Comment: Although commenters on a whole support our proposal to establish a 4-service day payment for IOP services, a few also noted some concerns. One commenter noted that payment and recruiting staff are barriers to establishing IOP programs. Another commenter stated that the payment rate is not adequate for RHCs associated with a critical access hospital, but also hoped that allowing a 4-service day payment rate will encourage more uptake for IOP services.

Response: Regarding concerns about the payment rate, we believe that establishing a 4 or more-service day payment will provide parity for IOP services across the various settings, with site neutral payments. As discussed in the CY 2024 OPPS final rule, 88 FR 81844, we finalized implementation of the special payment rules for IOP services furnished in RHCs and FQHCs. We explained that the payment rate determined for IOP for 3 services per day for hospital-based IOPs is the payment rate for IOP services furnished in RHCs. In other words, payment for IOP services furnished in RHCs would be based on the hospital-based rates and not the RHC AIR. We also explained that for IOP services furnished in FQHCs, the payment is based on the lesser of a FQHC's actual charges or the IOP determined rate. That is, payment for IOP services furnished in FQHCs would be based on the hospital-based rate and not the FQHC PPS. In the CY 2025 PFS proposed rule, we proposed to provide payment for 4 or more services per day in an RHC/FQHC setting, which is also based on the hospital-based payment rate for IOP services and not the RHC AIR or the FQHC PPS. The estimated for 4 or more IOP services is $413.50.

After consideration of public comments, we are finalizing our proposal to establish a payment for 4 or more services per day in an RHC/FQHC setting and as required in section 4124(c)(2) of the CAA, 2023, aligning that payment with the 4 or more-services per day payment rate for hospital outpatient departments. These payment rates will be updated annually.

c. Technical Correction (§§ 405.2410 and 405.2462)

In the CY 2024 Hospital Outpatient Prospective Payment (OPPS) and Ambulatory Surgical Center (ASC) Payment Systems final rule with comment (88 FR 81844) we finalized revisions to §§ 405.2410, 405.2462, and 405.2464 in the regulations to reflect the payment amount for IOP services and

how the Medicare Part B deductible and coinsurance are applied in RHC's and FQHC's. For RHCs, the beneficiary is responsible for the Medicare Part B deductible and coinsurance amounts at an amount not to exceed 20 percent of the clinic's reasonable charges for IOP services. For FQHC's, the beneficiary is responsible for a coinsurance amount of 20 percent of the lesser of the FQHC's actual charge for the service or the IOP rate. We revised the regulatory requirements at § 405.2410, ''Application of Part B deductible and coinsurance'' and § 405.2462(j), ''Payment for RHC and FQHC Services'' to reflect how the Medicare Part B deductible and coinsurance are applied to IOP services.

During a recent review of our regulations at §§ 405.2410(c) and 405.2462(j), we noticed that both sections had errors. That is, § 405.2410(c) does not reflect the correct policy that is applicable for beneficiary coinsurance when they receive IOP services in RHCs and FQHCs. With regard to the error at § 405.2462(j), we inadvertently left language specific to RHCs in the introductory text when it should have been its own paragraph. Therefore, we proposed revisions to § 405.2410 to reflect the correct policy applicable for beneficiary coinsurance as described above in the previous paragraph. We also proposed revisions to § 405.2462(j) to accommodate the new paragraph (j)(1).

The following is a summary of the comments we received and our responses.

Comment: Many commenters were very supportive of our proposal to revise § 405.2410(c) to correct policy applicable for beneficiary coinsurance. These commenters expressed their appreciation of the clarification. Commenters stated that this correction means that FQHC beneficiaries do not have to meet a deductible before Medicare begins to cover their services. They further stated that simplifying this structure ensures that health center patients can receive necessary behavioral health services without the barrier of high upfront costs, making it easier for them to seek timely care. Additionally, they stated that this change enhances affordability and predictability of the coinsurance amount and provides financial relief and certainty for beneficiaries, thereby further promoting health equity and access to essential services. We did not receive any comments related to § 405.4662(j).

Response: We thank commenters for their support of our proposal to revise § 405.2410(c) to reflect the correct policy applicable for beneficiary coinsurance.

As we did not receive public comments on our proposed revisions to § 405.2462(j) to accommodate the new paragraph (j)(1). Therefore, we are finalizing as proposed.

After consideration of public comments, we are finalizing our proposal to revise § 405.2410 to reflect the correct policy applicable for beneficiary coinsurance and to revise § 405.2462(j) to accommodate the new paragraph (j)(1).

5. Payment for Preventive Vaccine Costs in RHCs and FQHCs

a. Background

Section 1833(a)(3)(A) of the Act specifies that services described in section 1861(s)(10)(A)—pneumococcal, influenza and COVID–19 vaccines and their administration—are exempt from the RHC and FQHC payment limit of 80 percent of reasonable costs. Therefore, payment for pneumococcal, influenza and COVID–19 vaccines and their administration in RHCs and FQHCs is governed by the statute at section 1833(a)(1)(B) of the Act, which requires payment at 100 percent of reasonable cost. For RHCs, this means we don't include costs associated with these vaccines and their administration in determining the AIR; and that such vaccines and administration are not subject to the payment limit. For FQHCs, these costs are not included under the FQHC PPS. Please see section III.H.2.c. of this final rule for more information on hepatitis B vaccines and their administration in RHCs and FQHCs.

In the April 3, 1996 FQHC final rule (61 FR 14657), we codified at § 405.2466(b)(1)(iv) that, for RHCs and FQHCs, payment for pneumococcal and influenza vaccines and their administration is 100 percent of Medicare reasonable cost, which is paid as part of the annual reconciliation through the cost report. In the CY 2022 PFS final rule (86 FR 65207), we made conforming changes in that section to include the COVID–19 vaccine and its administration.

b. Revisions to Current Policy

In the May 2, 2014 RHC/FQHC PPS final rule (79 FR 25449), we addressed commenters' recommendations that CMS apply a consistent approach to payment for Part B vaccines. One commenter specifically recommended that CMS allow RHCs and FQHCs to bill for Part B vaccines at the time of service, either with or without an encounter for a visit. The commenter stated that those bills could be paid using national Part B rates, to be followed by an annual reconciliation on the cost report between the payments and the reasonable costs of the vaccines and their administration. This commenter wished to reduce the time between vaccine administration and payment, and to enable the documentation on individual patient claims that these vaccines were furnished. Commenters generally asserted that streamlining Part B vaccine payment would help ensure broad vaccine access for Medicare beneficiaries.

In response to these comments, we responded that we did not believe that any changes in our billing policies were necessary. We stated that RHCs and FQHCs are accustomed to reporting and receiving payment for the reasonable costs of Part B vaccines and their administration through the annual cost report, and we believed that an annual reconciliation between vaccine payments and reasonable costs would create an additional administrative burden for FQHCs and MACs. We also noted that as of January 1, 2011, FQHCs have been required to report pneumococcal and influenza vaccines and their administration on a patient claim with the appropriate HCPCS and revenue codes when furnished during a billable visit. Please note that this is not a requirement for RHCs.

In the CY 2022 PFS final rule (86 FR 65207), in which we made conforming regulatory changes at § 405.2466(b)(1)(iv) to include the COVID–19 vaccine, we received several comments regarding the timing of vaccine payments for RHCs and FQHCs. These comments echoed the sentiments expressed by the commenters on the same topic in the 2014 final rule mentioned above, and while they were out of the scope of our proposals for CY 2022, we will elaborate on them here. These commenters expressed appreciation for measures taken by CMS in April 2021 to make lump-sum payments for COVID–19 vaccine administration available to RHCs and FQHCs in advance of cost report settlement, but commenters emphasized that those payments were only a temporary solution. Commenters suggested CMS to update the RHC and FQHC cost report to ensure adequate, permanent reimbursement for COVID–19 vaccines. Commenters added that RHCs and FQHCs have experienced challenges with burdensome reporting requirements and data collection, as well as slow distribution of payments from MACs. Another commenter stated that RHCs and FQHCs should not have to wait until settlement of cost report to

be reimbursed for other preventive vaccines, and that delayed payment may hinder them from immunizing Medicare beneficiaries.

While we did not respond directly to those comments in the CY 2022 PFS final rule, as they were out of scope of the policies that were finalized at the time, we did make clarifications regarding payment for preventive vaccines and their administration in the RHC and FQHC Frequently Asked Questions (FAQs) that accompanied the publication of the CY 2022 PFS final rule.[362] In those FAQs, we clarified that the conforming change made to § 405.2466(b)(1)(iv) to reflect coverage and payment for COVID–19 vaccines in RHCs and FQHCs did not reflect any other payment policy changes regarding payment for Part B vaccines and administration in those settings. We reiterated that RHCs and FQHCs are paid 100 percent of reasonable cost through their cost report for Part B vaccines and their administration. Since there is a gap in time from when costs are incurred in RHCs and FQHCs for furnishing vaccines and when payment is received, the Medicare Administrative Contractors (MACs) could provide early payments in the form of lump sum payments to RHCs and FQHCs in March of 2021 to facilitate COVID–19 vaccinations. RHCs and FQHCs can request additional lump sum payments from their MAC at any time.

Since the publication of the CY 2022 PFS final rule, we have given additional consideration to the comments discussed above. During and since the COVID–19 PHE, we have especially promoted efforts aimed at facilitating increased access to vaccinations for both Medicare enrollees and all Americans. Vaccination promotion efforts also dovetail with CMS' overarching strategic priorities of expanding health care access and advancing health equity. For CY 2025, we have identified the issue of vaccination in RHCs and FQHCs as an area where payment policy can be updated to improve access to preventive vaccines for Medicare enrollees.

In the CY 2025 PFS proposed rule (89 FR 61794), we proposed to allow RHCs and FQHCs to bill for the administration of Part B preventive vaccines at the time of service. Based on the policy changes found in sections III.M. and III.H.2.c. of this final rule, this revision in policy will include all four Part B preventive vaccines: pneumococcal, influenza, hepatitis B, and COVID–19 vaccines. These claims would initially be paid like other Part B vaccine and vaccine administration claims, whose payments are discussed at section III.H.1. of this final rule: vaccine products will be paid at 95 percent of their Average Wholesale Price (AWP), and vaccine administration will be paid according to the National Fee Schedule for Medicare Part B Vaccine Administration. The fee schedule's locality-adjusted payment rate files for CY 2024 can be found on the CMS Vaccine Pricing website *at https://www.cms.gov/medicare/payment/all-fee-service-providers/medicare-part-b-drug-average-sales-price/vaccine-pricing.* Payment rate files for influenza, pneumococcal and hepatitis B vaccine administration can be found under the ''Seasonal Flu Vaccine'' tab, and payment rate files for COVID–19 vaccines can be found under the ''COVID–19 Vaccines & Monoclonal Antibodies'' tab. The CY 2025 payment rates for Part B vaccine administration HCPCS codes G0008, G0009, G0010 and 90480, with the annual update applied for CY 2025, will be made available at the time of publication of the CY 2025 PFS final rule, and Tables XX and XX in section III.H.1.f. of this final rule provide the CY 2025 payment rates for those amounts.

We also clarified that RHC or FQHC providers are eligible to bill HCPCS code M0201 for an in-home additional payment for Part B preventive vaccine administration, provided that a home visit meets all the requirements of both part 405, subpart X, for RHCs and FQHCs services provided in the home, and § 410.152(h)(3)(iii) for the in-home additional payment for Part B preventive vaccine administration. More information regarding the in-home additional payment can be found at section III.H.1.d of this final rule, and payment rates for M0201 can be found together with Part B vaccine administration payment rates mentioned above.

We emphasized that the statute at section 1833(a)(1)(B) of the Act requires that RHCs and FQHCs be paid at 100 percent of reasonable cost for Part B COVID–19 vaccines and their administration. Therefore, payments for these services received at the time they are furnished in RHCs and FQHCs will need to be annually reconciled with the facilities' actual vaccine and vaccine administration costs, including any in-home additional costs, on their cost reports. Due to the operational systems changes needed to facilitate payment through claims, we proposed that RHCs and FQHCs begin billing for preventive vaccines and their administration at the time of service, for dates of service beginning on or after July 1, 2025. This would allow ample time for CMS to release cost reporting instructions and subregulatory guidance with additional billing instructions for RHCs and FQHCs to bill Medicare Part B for preventive vaccines and their administration at the time of service.

We believed that the proposal addressed the comments and requests of stakeholders who have suggested this payment approach over the last several years. We noted that this payment approach was mentioned in the Senate Appropriations Committee's ''Explanatory Statement For Departments Of Labor, Health And Human Services, And Education, And Related Agencies Appropriations Bill, 2021.'' [363] That report referenced a December 2019 white paper by the National Association of Community Health Centers, which noted that ''FQHCs can face significant delays in reimbursement for influenza and pneumococcal vaccines.'' [364] The Committee thus encouraged CMS to promote the ability of FQHCs to bill Part B directly for vaccinations at the time of service, with reconciliation of payments at the time of cost report settlement.

We solicited comment on these proposals. We mentioned that we would especially appreciate comments on the benefits of payments for vaccine costs billed at the time of service, weighed against the potential additional burdens of annual reconciliation of vaccine claims payments against actual vaccine costs.

We received several public comments on the above proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters overwhelmingly supported our proposals to allow RHCs and FQHCs to bill for the administration of Part B preventive vaccines at the time of service. Commenters explained that health centers like RHCs and FQHCs serve as community hubs where patients can receive vaccinations, but that those facilities often operate on financially thin margins. They stated that timelier vaccine payments will allow RHCs and FQHCs to proactively stock and administer some vaccines and will also allow health centers to stock vaccines in other sites around the health center besides their pharmacy, which

[362] RHCs CY 2022 PFS final rule Fact Sheet: *https://www.cms.gov/files/document/rhcs-pfs-faqs.pdf*; FQHCs CY 2022 PFS Final Rule Fact Sheet: *https://www.cms.gov/files/document/fqhcs-pfs-faqs.pdf.*

[363] *https://www.appropriations.senate.gov/imo/media/doc/LHHSRept.pdf.*

[364] *https://www.nachc.org/wp-content/uploads/2023/10/adult-imm-fqhc-white-paper-11-01-2019.pdf.*

will facilitate RHC and FQHC investment in developing robust vaccination programs for their patients. Other commenters appreciated that our proposal will generally alleviate cash flow issues for rural providers.

Other commenters expressed that they appreciate that this proposal streamlines the payment of Part B vaccine claims across more health care settings, which will help minimize administrative burden and paperwork, increase the time physicians can spend with patients, simplify the vaccine billing process and reduce wait times for reimbursement. Some commenters specifically expressed support for our clarification that RHC or FQHC providers can bill for an in-home additional payment for Part B vaccine administration for eligible home visits. Another commenter stated that a policy allowing RHCs and FQHCs to bill for the administration of Part B preventive vaccines at the time of service outweighs any potential burden of annual reconciliation processes. One commenter appreciated that the proposal would be effective for dates of service on or after July 1, 2025, and they concurred with CMS that the additional time would give facilities more time to make necessary operational changes.

Response: We thank commenters for partnering with CMS in our efforts to improve health access and equity, especially for those vulnerable populations that are served by RHCs and FQHCs. We agree that finalizing this proposal will assist RHCs and FQHCs in their operations and specifically in administering preventive vaccines to their patients. We look forward to continuing our work with all our partners to continue facilitating increased access to vaccinations for both Medicare enrollees and all Americans.

Comment: Some commenters asked for additional clarifications regarding our proposed policies. Several commenters recommended that CMS keep in mind that, when releasing cost reporting instructions on the process of billing for Part B vaccines at the time of service, those payments must be reconciled to the FQHCs' reasonable costs during the Cost Reporting process. Another commenter encouraged CMS to issue and implement reporting instructions, subregulatory guidance, and operational system changes as expeditiously as possible to facilitate payment of these claims.

Response: Both in the CY 2025 PFS proposed rule (89 FR 61794) and in our text above, we emphasized that the statute at section 183B(a)(1)(b) of the Act requires that RHCs and FQHCs be paid at 100 percent of reasonable cost for Part B vaccines and their administration, and therefore payments for Part B preventive vaccines and their administration that are received at the time they are furnished in RHCs and FQHCs will need to be annually reconciled with the facilities' actual vaccine and vaccine administration costs, including any in-home additional costs, on their cost reports. In the same paragraphs, we also expressly state our intent to release cost reporting instructions and subregulatory guidance before the July 1, 2025 proposed effective date of this policy, which would contain additional billing instructions for RHCs and FQHCs to bill Medicare Part B for preventive vaccines and their administration at the time of service.

Comment: A number of commenters requested updates and changes to cost reporting instructions and settlement methodology for vaccine costs in RHCs and FQHCs. They stated that the current cost reporting structure averages the costs of all vaccines administered in a facility, include those vaccines that are not recommended for the Medicare population, and thus the averaged cost as reported that does not accurately represent the true expense of RHCs' and FQHCs' vaccine acquisition costs. Commenters mentioned that some RHCs and FQHCs must pay Medicare back after receiving payments based on these cost reporting calculations. The commenters explained that some vaccines recommended for the Medicare population by the CDC's Advisory Committee on Immunization Practices (ACIP) may have a higher cost due to their higher antigen content or adjuvant, as compared to lower doses of the vaccines that are suited for other populations.[365] One commenter stated that our proposal will not fix this underlying issue with RHC and FQHC vaccine costs. These commenters suggested that we change cost reporting instructions to have RHCs and FQHCs only submit costs for those vaccines administered to Medicare enrollees.

Response: We thank commenters for their feedback on these aspects of RHC and FQHC vaccine cost and payment. Based on the policies finalized in both this section and in section III.H. of the proposed rule, several RHC/FQHC cost report updates will be needed for CY 2025, including changes to address hepatitis B vaccine costs. We plan to take these comments into consideration as we make those cost report updates.

Comment: One commenter objected to our proposal. This commenter directly addressed our request for comment on the benefits of payments for vaccine costs billed at the time of service, weighed against the potential additional burdens of annual reconciliation of vaccine claims payments against actual vaccine costs. The commenter stated that the proposal imposes an additional burden of tracking the initial vaccines payments, and then submitting vaccine costs again on the annual cost report in order to ensure reimbursement at 100 percent of reasonable costs. The commenter views the proposal as requiring additional work, but not providing additional reimbursement.

Response: We thank this commenter for their feedback. We acknowledge that there is additional work involved for RHCs and FQHCs to both track payments received from vaccine administration claims, and also reconcile vaccine costs on their cost report. However, based on the overwhelming support received from a significant majority of other commenters on this proposal, several of whom say this policy will ultimately reduce burdens for providers, we are finalizing this policy as proposed.

Comment: We received several comments that were out of the scope of our proposal. One commenter requested that we expand this proposal to combination vaccines that include a component that is covered and paid as a Part B preventive vaccine. Several commenters requested that CMS pay for an ''immunization-only visit'' with nurses and/or pharmacists outside of the FQHC PPS. Commenters stated that this would help improve immunization rates among underserved individuals who seek care at FQHCs. Commenters also asked that CMS permit RHCs and FQHCs to bill for vaccine counseling. Another commenter requested that CMS holistically review its policy on how FQHCs and RHCs can bill for vaccines across programs, including Medicare Part D and Medicaid, and that CMS to provide additional clarity on how FQHCs and RHCs can bill for Medicare Part D covered vaccines. One commenter suggested that CMS expand this proposal to all CDC recommended vaccines.

Response: We thank commenters for their feedback. These comments are outside of the scope of our proposals that are to be finalized here. We plan to take these comments into consideration for further evaluation.

We would like to include a clarification about Part D vaccinations in RHCs and FQHCs. While RHCs and FQHCs cannot currently bill Medicare directly for vaccines and vaccine administration outside of the

[365] *https://www.cdc.gov/mmwr/volumes/71/wr/mm7104a1.htm?s_cid=mm7104a1_w.*

pneumococcal, influenza and COVID–19 vaccines, Medicare does cover and pay RHCs and FQHCs for other vaccines and their administration, as part of the FQHC PPS rate and the RHC AIR. Please see the discussions on 79 FR 25449 of the 2014 RHC/FQHC PPS final rule regarding vaccine coverage and payment in RHCs and FQHCs, which elaborate on this point. Please also note that, based on our finalized policies at section III.H.2.c. of this final rule, effective January 1, 2025, Hepatitis B vaccines and their administration will be paid at reasonable cost in RHCs and FQHCs, and they will no longer be included in the RHC AIR or FQHC PPS rate. Please see that section for more information.

After consideration of public comments, we are finalizing these policies as proposed. Effective for dates of service on or after July 1, 2025, RHCs and FQHCs can bill for all four Part B preventive vaccines and their administration at the time of service. RHCs and FQHCs can bill HCPCS code M0201 for an in-home additional payment for Part B preventive vaccine administration, provided that a home visit meets all the requirements of both part 405, subpart X, for RHCs and FQHCs services provided in the home, and § 410.152(h)(3)(iii) for the in-home additional payment for Part B preventive vaccine administration. Payments for these services received at the time they are furnished in RHCs and FQHCs will need to be annually reconciled with the facilities' actual vaccine and vaccine administration costs, including any in-home additional costs, on their cost reports. We plan to release additional guidance implementing these policies in advance of the effective date of July 1, 2025.

6. Productivity Standards

a. Background

Productivity standards for RHCs were first established on March 1, 1978 (43 FR 8260) and updated on December 1, 1982 (47 FR 54163 through 54165), to help determine the average cost per patient for Medicare reimbursement in RHCs. These productivity screening guidelines were intended to identify situations where costs would not be allowed without acceptable justification by the clinic and limits on the amount of payment (57 FR 24967). Physicians, nurse practitioners (NPs), physician assistants (PAs), and certified nurse midwives (CNMs) are held to a minimum number of visits per full time employee (FTE), as discussed in section 80.4, chapter 13 of the Medicare Benefit Policy Manual. The productivity standards policy requires 4,200 visits per full-time equivalent (FTE) physician and 2,100 visits per FTE non-physician practitioner (for example, nurse practitioner, physician assistant, or certified nurse midwife). Physician and non-physician practitioner productivity may be combined and if so, the number of visits per full-time equivalent team is 6,300. If actual visits are less than the productivity standards, the average cost per visit will be computed based on the productivity standards rather than actual visits, which would result in the cost per visit to be lower than if actual visits were used. In other words, if the current productivity standards are not met, the results would be a reduction in the cost per visit, which could negatively impact the RHC AIR and reduce payments. There are exceptions to the productivity standards that can be made based on individual circumstances that is at the discretion of the MAC. We note that these standards of 4,200 visits per FTE physician and 2,100 visit per FTE nonphysician practitioner and 6,300 visits per combined FTE have not been updated since 1982. We also note similar requirements to contain costs in this way were not required in FQHCs or other settings paid on reasonable cost.

Interested parties have requested that CMS re-evaluate or remove the productivity standards policy for RHCs because they believe that the environment today is very different than when the RHC benefit began and that the ''visit per FTE'' is too high for practitioners to meet and results in reducing the AIR. They also shared that the productivity standards matter even less now since the implementation of the CAA, 2021 established payment limits for all RHCs.

During the PHE for COVID–19, we issued a combination of emergency authority waivers, regulations, enforcement discretion, and subregulatory guidance to ensure and expand access to care and to give health care providers the flexibilities needed to help keep people safe. RHCs expressed concerns about how the productivity standards may impact them during the PHE. For example, many RHCs had trouble meeting the productivity standards due to a change in the way they staffed their clinics and billed for RHC services with increased telecommunications services. RHCs claimed that they were negatively impacted even more so than other health care settings because of these requirements. We have long standing guidance in the Medicare Benefit Policy Manual, chapter 13, section 80.4 that describes the MAC's role in providing flexibility to grant productivity exceptions to RHCs who experienced disruptions in staffing and services to minimize the burden on RHCs. During the PHE we reminded RHCs of the exception process in FAQs,[366] and provided instructions to MACs to proactively reach out to RHCs reminding them of the exception process and to proactively grant exceptions as necessary.

Section 130 of the CAA, 2021 restructured the payment limits for RHCs beginning April 1, 2021. That is, independent RHCs, provider-based RHCs in a hospital with 50 or more beds, and RHCs enrolled under Medicare on or after January 1, 2021, will receive a prescribed national statutory payment limit per visit increase over an 8-year period for each year from 2021 through 2028. This provision also established payment limits for provider-based RHCs in a hospital with less than 50 beds. See the CY 2022 PFS final rule (86 FR 65199 through 65202) for more detailed discussion.

Since the CAA, 2021 restructured the payment limits for RHCs, and in some cases established payment limits for RHCs beginning April 1, 2021, we believe that applying productivity standards may no longer be necessary. In the CY 2025 PFS NPRM, we stated that the productivity standards are outdated and redundant with the CAA, 2021 provisions and therefore, we proposed to remove productivity standards requirements.

We received several comments on our proposal to remove the productivity standard for RHCs.

Comment: All commenters are very supportive of our proposal to remove the productivity standard for RHCs. A few commenters stated that the productivity standards are outdated and redundant given the payment limits established in the CAA, 2021 provisions. Another commenter stated that reduced burdens and costs coupled with increased access to care can only serve to improve the services provided by these facilities as long as appropriate patient care standards and requirements continue to be met. Another commenter stated that they supported our proposal to remove the productivity standard because in practice, these productivity standards direct RHCs to lean heavily toward advanced practice provider (APP) coverage, due to the lower productivity threshold. This commenter further stated that in other cases, RHCs are attached to hospitals, which necessitates more physician coverage to

[366] *https://www.cms.gov/files/document/03092020-covid-19-faqs-508.pdf.*

support the hospital services and in the end, this arbitrarily impacts RHC primary care clinic reimbursement. The commenter believes that penalizing RHCs for an arbitrary rule that forces providers to offer less services, is counterintuitive to the basic reasoning RHCs exist. Another commenter stated that the productivity standards make it difficult for physicians practicing at RHCs to provide the services their patients need because if they spend too much time treating more complex patients and do not reach the productivity standard as a result, then payment rates could be significantly reduced. The commenter further stated that they believe removing the productivity standard would empower physician-led care teams in RHCs to deliver more flexible, patient centered care that can better meet their patients' needs.

One commenter stated that this change will require a cost report and calculation change and suggested that this change be effective for cost reporting periods ending after December 31, 2024. The commenter further stated that for RHCs that do not meet the guidelines for cost reporting periods that have not been final-settled (that is, without a Notice of Program Reimbursement) as of the publication date of the final rule, MACs should be instructed to apply a waiver during final settlement that would eliminate any application of the guidelines.

Response: We agree that the productivity standard is outdated and that removing the productivity standard will eliminate redundancy given the payment limits established by the CAA, 2021. Regarding the comment suggesting that the change be effective for cost reporting periods ending after December 31, 2024, we agree. However, we do not agree with instructing MACs to apply a waiver during final settlement that would eliminate any application of the guidelines as we are striving to have all RHC fiscal year ends for this change be handled consistently.

After consideration of public comments, we are finalizing our proposal to remove the productivity standard for RHCs as proposed with a clarification on timing; effective with cost reporting periods ending after December 31, 2024.

7. Rebasing of the FQHC Market Basket

a. Background

Section 10501(i)(3)(A) of the Affordable Care Act added section 1834(o) of the Act to establish a payment system for the costs of FQHC services under Medicare Part B based on prospectively set rates. In the Prospective Payment System (PPS) for FQHC final rule published in the May 2, 2014 **Federal Register** (79 FR 25436), we implemented a methodology and payment rates for the FQHC PPS. Beginning on October 1, 2014, FQHCs began to transition to the FQHC PPS based on their cost reporting periods, and as of January 1, 2016, all FQHCs have been paid under the FQHC PPS.

Section 1834(o)(2)(B)(ii) of the Act requires that the payment for the first year after the implementation year be increased by the percentage increase in the Medicare Economic Index (MEI). Therefore, in CY 2016, the FQHC PPS base payment rate was increased by the MEI. The MEI at that time was based on 2006 data from the American Medical Association (AMA) for self-employed physicians and was used in the PFS sustainable growth rate (SGR) formula to determine the conversion factor for physician service payments. (See the CY 2014 PFS final rule (78 FR 74264) for a complete discussion of the 2006-based MEI.) Section 1834(o)(2)(B)(ii) of the Act also requires that beginning in CY 2017, the FQHC PPS base payment rate will be increased by the percentage increase in a market basket of FQHC goods and services, or if such an index is not available, by the percentage increase in the MEI.

Beginning with CY 2017, FQHC PPS payments were updated using a 2013-based market basket reflecting the operating and capital cost structures for freestanding FQHC facilities (hereafter referred to as the FQHC market basket). A complete discussion of the 2013-based FQHC market basket can be found in the CY 2017 PFS final rule (81 FR 80393 through 80403). In the CY 2021 PFS final rule (85 FR 84699 through 84710), we rebased and revised the FQHC market basket to reflect a 2017 base year.

For the CY 2025 PFS proposed rule, we proposed to rebase and revise the 2017-based FQHC market basket to reflect a 2022 base year, which would maintain our historical frequency of rebasing the market basket every 4 years. The proposed 2022-based FQHC market basket is primarily based on Medicare cost report data for FQHCs for 2022, which are for cost reporting periods beginning on and after October 1, 2021, and prior to October 1, 2022. We proposed to use data from cost reports beginning in FY 2022 because these data are the latest available complete set of Medicare cost report data for purposes of calculating cost weights for the FQHC market basket at the time of rulemaking.

In the following discussion, we provide an overview of the proposed FQHC market basket, describe the methodologies for developing the 2022-based FQHC market basket, and provide information on the proposed price proxies. We then present the CY 2025 FQHC market basket update based on the 2022-based FQHC market basket.

b. Overview of the 2022-Based FQHC Market Basket

Similar to the 2017-based FQHC market basket, the proposed 2022-based FQHC market basket is a fixed-weight, Laspeyres-type price index. A Laspeyres price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix (that is, intensity) of goods and services purchased over time are not measured. The index itself is constructed using three steps. First, a base period is selected (we proposed to use 2022 as the base period) and total base period expenditures are estimated for a set of mutually exclusive and exhaustive expenditure categories, with the proportion of total costs that each category represents being calculated. These proportions are called cost weights. Second, each cost category is matched to an appropriate price or wage variable, referred to as a ''price proxy.'' In almost every instance, these price proxies are derived from publicly available statistical series that are published on a consistent schedule (preferably at least on a quarterly basis). Finally, the cost weight for each cost category is multiplied by the level of its respective price proxy. The sum of these products (that is, the cost weights multiplied by their price index levels) for all cost categories yields the composite index level of the market basket in a given period. Repeating this step for other periods produces a series of market basket index levels over time. Dividing an index level for a given period by an index level for an earlier period produces a rate of growth in the input price index over that timeframe. As previously noted, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to furnish FQHC services. The effects on total expenditures resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. For example, a FQHC hiring more nurse practitioners to accommodate the needs of patients would increase the volume of goods and services purchased by the FQHC but would not be factored into

the price change measured by a fixed-weight FQHC market basket. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect recent changes in the mix of goods and services that FQHCs purchase (FQHC inputs) to furnish care between base periods.

c. Development of the 2022-Based FQHC Market Basket Cost Categories and Weights

We solicited public comments on our proposed methodology, discussed in this section of this rulemaking, for deriving the proposed 2022-based FQHC market basket.

We did not receive public comments on this methodology, and therefore, we are finalizing as proposed.

(1) Use of Medicare Cost Report Data

The major types of costs underlying the proposed 2022-based FQHC market basket are derived from the Medicare cost reports (CMS Form 224–14, OMB Control Number 0938–1298) for freestanding FQHCs. Specifically, we use the Medicare cost reports for eleven specific costs: FQHC Practitioner Wages and Salaries, FQHC Practitioner Employee Benefits, FQHC Practitioner Contract Labor, Clinical Staff Wages and Salaries, Clinical Staff Employee Benefits, Clinical Staff Contract Labor, Non-Health Staff Compensation, Medical Supplies, Pharmaceuticals, Fixed Assets, and Movable Equipment. A residual category is then estimated and reflects all remaining costs not captured in the 11 types of costs identified previously (such as non-medical supplies and utilities).

The resulting proposed 2022-based FQHC market basket cost weights reflect Medicare allowable costs. We proposed to define Medicare allowable costs centers for freestanding FQHC facilities as the expenses reported on: Worksheet A, lines 1 through 7, lines 9 through 12, lines 23 through 36, and line 66. For the proposed 2022-based FQHC market basket, we proposed to include data from the cost center from Worksheet A, line 66 (Telehealth) as effective for CY 2022 since CMS finalized a proposal to revise the current regulatory language for RHC or FQHC mental health visits to include visits furnished using interactive, real-time telecommunications technology and for RHCs and FQHCs to report and be paid for mental health visits furnished via real-time, telecommunication technology in the same way they currently do when these services are furnished in-person (86 FR 65208 through 62511). As done with the 2017-based FQHC market basket, we proposed to continue to exclude Professional Liability Insurance (PLI) costs from the total Medicare allowable costs because FQHCs that receive section 330 grant funds also are eligible to apply for medical malpractice coverage under Federally Supported Health Centers Assistance Act (FSHCAA) of 1992 (Pub. L. 102–501) and FSHCAA of 1995 (Pub. L. 104–73 amending section 224 of the Public Health Service Act).

Later in this section, we explain in more detail how the costs for each of the 11 categories are derived. Prior to estimating any costs, we apply three basic edits. First, we only include the last submitted cost report so there is no double counting of a FQHC provider. Second, we exclude providers that have less than half a year of reported cost data; this edit excludes 175 FQHC providers for 2022. Finally, we remove any providers that did not report net direct patient care expenses on the FQHC cost report Worksheet A, line 37, column 7; this edit excludes 717 FQHC cost reports, or about 29 percent of FQHC providers. If a provider does not have reported costs, then we are unable to use that provider's costs to calculate cost weights. We encourage providers to report net direct patient care expenses when reporting the data. After the three edits, there are 1,713 remaining FQHC providers in the 2022 data set that we use to estimate cost expenditures for, or roughly two-thirds of the total FQHCs in the original Medicare cost report data set.

(a) FQHC Practitioner Wages and Salaries Costs

A FQHC practitioner is defined as one of the following occupations: physicians; nurse practitioners (NPs); physician assistants (PAs); certified-nurse midwife (CNMs); clinical psychologist (CPs); and clinical social workers (CSWs). We proposed to calculate FQHC Practitioner Wages and Salaries Costs using three steps. First, we proposed to calculate FQHC Practitioner Compensation Costs as equal to the net expenses (that is, costs after reclassifications and adjustments) as reported on Worksheet A, column 7, lines 23, 25, 26, 29, 30, and 31. These lines represent the total net costs (after reclassifications and adjustments) for physicians, PAs, NPs, CNMs, CPs, and CSWs.

Second, we proposed to further divide the FQHC Practitioner Compensation Costs for these occupations into wages and salaries, employee benefits, and contract labor costs based on the ratios of practitioner wages and salaries, practitioner employee benefits, and practitioner contract labor costs to the sum of these three groups of costs. We do this by applying the ratios of practitioner wages and salaries, practitioner employee benefits, and practitioner contract labor to the net expense FQHC Practitioner Compensation Costs, and the determination of these ratios is described below. We proposed to derive the practitioner wages and salaries costs as the sum of direct care wages and salaries reported on Worksheet A, column 1, lines 23, 25, 26, 29, 30, and 31. These lines represent the wages and salaries costs for physicians, PAs, NPs, CNMs, CPs, and CSWs. We proposed to derive the practitioner employee benefits costs for these occupations as the sum of costs reported on Worksheet S–3, part II, column 2, lines 2, 3, 4, 7, 8, and 9. These lines represent the employee benefits costs for physicians, PAs, NPs, CNMs, CPs, and CSWs. We proposed to derive the practitioner contract labor costs for these occupations as the costs reported on Worksheet S–3, part II, column 1, lines 2, 3, 4, 7, 8, and 9. These lines represent the contract labor costs for physicians, PAs, NPs, CNMs, CPs, and CSWs. This was the same method used to calculate the ratios to split the FQHC Practitioner Compensation Costs as was done for the 2017-based FQHC market basket. Approximately 56 percent of FQHCs that reported direct patient care wages and salaries costs also reported employee benefits costs data and approximately 99 percent of FQHCs that reported direct patient care wages and salaries costs also reported contract labor cost data on Worksheet S–3, part II for 2022. This is higher reporting than the percent of FQHCs reporting the same data compared to the 2017-based FQHC market basket, which had a 45 percent and 66 percent reporting incidence for the 2017 cost report data. We are encouraged by this improvement in the data and continue to encourage all providers to report these data on the Medicare cost report.

The final step in the process to derive the FQHC Practitioner Wages and Salaries costs is to apply the ratio of practitioner wages and salaries to the sum of practitioner wages and salaries costs, practitioner employee benefits costs, and practitioner contract labor costs times the FQHC Practitioner Compensation costs (representing the net expenses for each occupation as reported on Worksheet A column 7) as described above. This calculation is

done for each occupation individually (physicians, PAs, NPs, CNMs, CPs, and CSWs). The resulting proposed FQHC Practitioner Wages and Salaries costs are equal to the sum of each occupation's wages and salary costs. This is the same methodology that was used for the 2017-based FQHC market basket.

As stated in the CY 2022 PFS final rule (86 FR 65209), effective for CY 2022 FQHC mental health visits furnished using interactive, real-time telecommunications technology are paid for at the same rate as other FQHC visits when these services are furnished in-person; therefore, we proposed to include telehealth wages and salaries costs in the FQHC Practitioner Wages and Salaries cost category. We proposed to derive telehealth wages and salaries by multiplying the net telehealth costs (as reported on Worksheet A, column 7, line 66) times the ratio of telehealth wages and salaries (as reported on Worksheet A, column 1, line 66) to the sum of telehealth costs (the sum of Worksheet A, column 1 and 2, line 66).

(b) FQHC Practitioner Employee Benefits Costs

To calculate FQHC Practitioner Employee Benefits costs, we proposed to use a similar methodology as used to calculate the FQHC Practitioner Wages and Salaries costs. We proposed to apply the ratio of practitioner employee benefits as described above to the FQHC Practitioner Compensation costs (representing the net expenses for each occupation as reported on Worksheet A column 7) as defined in the section III.B.7.(c)(1)(a) of this final rule. This calculation is done for each occupation individually (physicians, PAs, NPs, CNMs, CPs, and CSWs). The FQHC Practitioner Employee Benefits costs are equal to the sum of each occupation's employee benefits costs. This is the same methodology that was used for the 2017-based FQHC market basket. As stated previously, effective for CY 2022, telehealth services are covered under the FQHC PPS; therefore, we proposed to also include in the FQHC Practitioner Employee Benefits the telehealth employee benefits. We proposed to estimate telehealth employee benefits by multiplying telehealth wages and salaries (as described in section III.B.7.(c)(1)(a)) of this final rule times the ratio of total direct patient care facility benefits (Worksheet S–3 part II, column 2, line 1) to total facility direct patient care salaries (the sum of Worksheet A, columns 1 and 2, lines 23 and 25 through 36), which is estimated to be 21 percent on average. This ratio is referred to as the overall employee benefit share and represents the ratio of employee benefits to wages and salaries for all patient care costs reported by FQHCs.

(c) FQHC Practitioner Contract Labor Costs

To calculate FQHC Practitioner Contract Labor Costs, we proposed to use a similar methodology as used to calculate FQHC Practitioner Wages and Salaries and FQHC Practitioner Employee Benefit Costs. We proposed to multiply the ratio of practitioner contract labor, as described above, by the FQHC Practitioner Compensation costs (representing the net expenses for each occupation as reported on Worksheet A column 7) as defined in section III.B.7.(c)(1)(a) of this final rule. This calculation is done for each occupation individually (physicians, PAs, NPs, CNMs, CPs, and CSWs). The FQHC Practitioner Contract Labor costs are equal to the sum of each occupation's contract labor costs plus all net expenses reported for Physicians Services Under Agreement from Worksheet A, column 7, line 24. This is the same methodology used for the 2017-based FQHC market basket.

(d) Clinical Staff Wages and Salaries Costs

We proposed to calculate Clinical Staff Wages and Salaries Costs using three steps. First, we proposed to define Clinical Staff Compensation costs as the sum of net expenses (that is, costs after reclassifications and adjustments) as reported on Worksheet A, column 7, lines 27, 28, 32, 33, 34, 35, and 36. Clinical Staff Compensation includes any health-related clinical staff who do not fall under the definition of a FQHC Practitioner. These lines represent the net expenses for visiting registered nurses (RNs), visiting licensed practical nurses (LPNs), laboratory technicians, registered dietician/Certified DSMT/MNT educators, physical therapists (PTs), occupational therapists (OTs), and other allied health personnel.

Second, we proposed to further divide the Clinical Staff Compensation costs for these occupations into wages and salaries, employee benefits, and contract labor costs based on the ratio of clinical staff wages and salaries, clinical staff employee benefits, and clinical staff contract labor costs to the sum of these three groups of costs. We do this by applying the ratio of clinical staff wages and salaries, clinical staff employee benefits, and clinical staff contract labor to the net expense Clinical Staff Compensation costs, and the determination of these ratios is described later in this section. We proposed to derive clinical staff wages and salaries costs as the sum of direct care cost salaries as reported on Worksheet A, column 1, lines 27, 28, 32, 33, 34, 35, and 36. These lines represent the wages and salaries costs for visiting RNs, visiting LPNs, laboratory technicians, registered dietician/Certified DSMT/MNT educators, PTs, OTs, and other allied health personnel. We proposed to derive the clinical staff employee benefits costs for these occupations as the sum of costs reported on Worksheet S–3, part II, column 2, lines 5, 6, 10, 11, 12, 13, and 14. These lines represent the employee benefits costs for visiting RNs, visiting LPNs, laboratory technicians, registered dietician/Certified DSMT/MNT educators, PTs, OTs, and other allied health personnel. Similarly, we proposed to calculate clinical staff contract labor costs for these occupations as the costs reported on Worksheet S–3, part II, column 1, lines 5, 6, 10, 11, 12, 13, and 14. These lines represent the contract labor costs for visiting RNs, visiting LPNs, laboratory technicians, registered dietician/Certified DSMT/MNT educators, PTs, OTs, and other allied health personnel. This was the same method used to calculate the ratios to split the Clinical Staff Compensation net expenses as was done for the 2017-based FQHC market basket.

The final step in the process to derive the Clinical Staff Wages and Salaries costs is to apply the ratio of clinical staff wages and salaries calculated in the prior step to the Clinical Staff Compensation costs (representing the net expenses for each occupation as reported on Worksheet A column 7) as described above. This calculation is done for each occupation individually (visiting RNs, visiting LPNs, laboratory technicians, registered dietician/Certified DSMT/MNT educators, PTs, OTs, and other allied health personnel). The Clinical Staff Wages and Salaries costs is equal to the sum of each occupation's wages and salary costs. This is the same methodology that was used for the 2017-based FQHC market basket.

(e) Clinical Staff Employee Benefits Costs

To calculate Clinical Staff Employee Benefit costs, we proposed to use a similar methodology as used to calculate the Clinical Staff Wages and Salaries costs. We proposed to multiply the ratio of clinical staff employee benefits, as described above by the Clinical Staff Compensation costs (representing the net expenses for each occupation as reported on Worksheet A

column 7) as defined in the section III.B.7.(c)(1)(d) of this final rule. This calculation is done for each occupation individually (visiting RNs, visiting LPNs, laboratory technicians, registered dietician/Certified DSMT/MNT educators, PTs, OTs, and other allied health personnel). The Clinical Staff Employee Benefits costs are equal to the sum of each occupation's Employee Benefits costs. This is the same methodology that was used for the 2017-based FQHC market basket.

(f) Clinical Staff Contract Labor Costs

To calculate Clinical Staff Contract Labor costs, we proposed to use a similar methodology as used to calculate Clinical Staff Wages and Salaries Costs and Clinical Staff Benefit Costs. We proposed to multiply the ratio of clinical staff contract labor costs, as described above, by the Clinical Staff Compensation costs (representing the net expenses for each occupation as reported on Worksheet A column 7) as defined in the section III.B.7.(c)(1)(d) of this final rule. This calculation is done for each occupation individually (visiting RNs, visiting LPNs, laboratory technicians, registered dietician/ Certified DSMT/MNT educators, PTs, OTs, and other allied health personnel). The Clinical Staff Contract Labor costs are equal to the sum of each occupation's contract labor costs. This is the same methodology that was used for the 2017-based FQHC market basket.

(g) Non-Health Staff Compensation Costs

We proposed to define Non-Health Staff Compensation costs using net expenses (that is, costs after reclassifications and adjustments) as the estimated share of compensation costs from Worksheet A, column 7 for lines 3, 4, 5, 6, 7, 9, 10, 11, and 12. These lines represent the net expenses for the employee benefits department, administrative & general services, plant operations & maintenance, janitorial, medical records, pharmacy, medical supplies, transportation, and other general services. Since the net expenses for the General Service Cost centers include both compensation and other costs, we estimate the share of net expenses for each general service cost center that reflects compensation costs. First, we estimate a share of non-health staff wages and salaries costs for each general service cost center as reported on Worksheet A, column 1 for lines 3, 4, 5, 6, 7, 9, 10, 11, and 12 divided by Worksheet A, column 1 and 2 for lines 3, 4, 5, 6, 7, 9, 10, 11, and 12. Then, we multiply the Non-Health Staff net expenses (that is, costs after reclassifications and adjustments) by the non-health staff wages and salaries share to derive estimated Non-Health Staff Wages and Salaries costs for each general service cost center (lines 3–7 and lines 9–12). Second, we estimate Non-Health Staff Employee Benefit costs by multiplying the Non-Health Staff Wages and Salaries costs (step one) by the overall employee benefit share as described in section III.B.7.(c)(1)(b) of this final rule, or 21 percent. Finally, we sum the derived Non-Health Staff Wages and Salaries costs and the derived Non-Health Staff Employee Benefits costs for each general service cost center (lines 3–7 and lines 9–12) to calculate Non-Health Staff Compensation costs. This is the same methodology used for the 2017-based FQHC market basket.

(h) Pharmaceutical Costs

We proposed to calculate Pharmaceutical costs as the non-compensation costs for the Pharmacy cost center. We define this as Worksheet A, column 7, line 9 less derived pharmacy compensation costs. Derived pharmacy compensation costs are included in the Non-health Staff Compensation costs described in section III.B.7.(c)(1)(g) of this final rule. We note that the only pharmaceutical costs eligible for inclusion in the FQHC PPS market basket are those reported on line 9 of Worksheet A. These pharmaceutical costs would include only the costs of routine drugs (both prescription and over the counter), pharmacy supplies, and pharmacy services, provided incident to an FQHC visit. Other types of drugs and pharmacy supplies costs not included in this category are those reported on line 67 (drugs charged to patients), line 77 (retail pharmacy), line 48 (pneumococcal vaccine), and line 49 (influenza vaccine, COVID–19, and monoclonal antibody products for treatment of COVID–19), as these costs are reimbursed to FQHC providers outside of the FQHC PPS payment. The derived pharmacy compensation costs are equal to the sum of the estimated pharmacy wages and salaries and pharmacy employee benefits costs. This is the same methodology used for the 2017-based FQHC market basket.

(i) Medical Supplies Costs

We proposed to calculate Medical Supplies costs as the non-compensation costs for the Medical Supplies costs center. We define this as Worksheet A, column 7, line 10 less derived medical supplies compensation costs. Derived medical supplies compensation costs are included in the Non-health Staff Compensation costs described in section III.B.7.(c)(1)(g) of this final rule. The derived medical supplies compensation costs are equal to the sum of the estimated medical supplies wages and salaries and medical supplies benefits costs. This is the same methodology used for the 2017-based FQHC market basket.

(j) Fixed Assets Costs

We proposed to define Fixed Asset costs to be equal to costs reported on Worksheet A, line 1, column 7 of the Medicare cost report. This is the same methodology used for the 2017-based FQHC market basket.

(k) Movable Equipment Costs

We proposed to define Movable Equipment costs to be equal to the capital costs as reported on Worksheet A, line 2, column 7. This is the same methodology used for the 2017-based FQHC market basket.

(2) Major Cost Category Computation

After we derive costs for the major cost categories for each provider using the Medicare cost report data as previously described, we proposed to trim the data for outliers. For each of the 11 major cost categories, we proposed to divide the calculated costs for the category by total Medicare allowable costs calculated for the provider to obtain cost weights for the universe of FQHC providers after basic trims described in section III.B.7.(c) of this final rule. For the proposed 2022-based FQHC market basket, total Medicare allowable costs are equal to total net expenses (after reclassifications and adjustments) reported on: Worksheet A, column 7, for lines 1 through 7, lines 9 through 12; lines 23 through 36, and line 66. This is the same method used to derive total Medicare allowable costs for the 2017-based FQHC market basket with the only difference being that we now include the net expenses for line 66, telehealth because as previously described, effective for CY 2022 CMS finalized the policy for mental health visits furnished using interactive, real-time telecommunications technology to be paid in the same way they currently do when these services are furnished in-person (86 FR 65208 through 62511).

For the FQHC Practitioner Wages and Salaries, FQHC Practitioner Employee Benefits, FQHC Practitioner Contract Labor, Clinical Staff Wages and Salaries, Clinical Staff Employee Benefits, Clinical Staff Contract Labor, Non-Health Staff Compensation, Pharmaceuticals, Medical Supplies, Fixed Assets, and Movable Equipment cost weights, after excluding cost weights that are less than or equal to zero, we proposed to then remove those

providers whose derived cost weights fall in the top and bottom 5 percent of provider-specific derived cost weights to ensure the exclusion of outliers. A 5 percent trim is the standard trim applied to the mean cost weights in most CMS market baskets and is consistent with the trimming used in the 2017-based FQHC market basket. After the outliers have been excluded, we sum the costs for each category across all remaining providers. We proposed to then divide this by the sum of total Medicare allowable costs across all remaining providers to obtain a cost weight for the proposed 2022-based FQHC market basket for the given category. This trimming process is done for each cost weight separately.

Finally, we proposed to calculate the residual ''All Other'' cost weight that reflects all remaining costs that are not captured in the 11 major cost categories listed. Table 29 provides the resulting cost weights for these major cost categories derived from the Medicare cost reports.

Table 29 displays the proposed 2022-based FQHC market basket cost weights compared to the 2017-based FQHC market basket cost weights.

TABLE 29: Major Cost Categories as Derived from Medicare Cost Reports

Major Cost Categories	2022-Based FQHC Cost Report Weights (Percent)	2017-Based FQHC Cost Report Weights (Percent)
FQHC Practitioner Compensation	24.8	28.4
FQHC Practitioner Wages and Salaries	17.1	19.4
FQHC Practitioner Employee Benefits	3.6	4.5
FQHC Practitioner Contract Labor	4.1	4.6
Clinical Staff Compensation	15.3	16.8
Clinical Staff Wages and Salaries	11.8	12.9
Clinical Staff Employee Benefits	2.8	3.1
Clinical Staff Contract Labor	0.6	0.9
Non-Health Staff Compensation	28.4	27.2
Pharmaceuticals	3.2	2.4
Medical Supplies	2.4	2.2
Fixed Assets	5.0	4.4
Movable Equipment	2.2	2.0
All Other (Residual)	18.7	16.5

Note: Totals may not sum to 100.0 due to rounding

As we did for the 2017-based FQHC market basket, we proposed to allocate the Contract Labor cost weight to the Wages and Salaries and Employee Benefits cost weights based on their relative proportions under the assumption that contract labor costs comprise both wages and salaries and employee benefits for both FQHC Practitioners and Clinical Staff. The contract labor allocation proportion for Wages and Salaries is equal to the Wages and Salaries cost weight as a percent of the sum of the Wages and Salaries cost weight and the Employee Benefits cost weight. This percentage based on the proposed 2022-based FQHC cost weights is 82.5 percent for FQHC practitioners and 80.8 percent for clinical staff. Therefore, we proposed to allocate 82.5 percent of the FQHC Practitioner Contract Labor cost weight to the FQHC Practitioner Wages and Salaries cost weight and 17.5 percent to the FQHC Practitioner Employee Benefits cost weight. Similarly, we proposed to allocate 80.8 percent of the Clinical Staff Contract Labor cost weight to the Clinical Staff Wages and Salaries cost weight and 19.2 percent to the Clinical Staff Employee Benefits cost weight. Table 30 shows the FQHC Practitioner and Clinical Staff Wages and Salaries and Employee Benefits proposed 2022-based cost weights after the contract labor cost weight has been allocated. Table 30 also includes the comparison of the weights to the 2017-based cost weights for the same categories.

TABLE 30: Wages and Salaries and Employee Benefits Cost Weights After Contract Labor Allocation

Major Cost Categories	2022-Based FQHC Practitioner	2022-Based Clinical Staff	2017-Based FQHC Practitioner	2017-Based Clinical Staff
Compensation	**24.8**	**15.3**	**28.4**	**16.8**
Wages and Salaries	20.5	12.4	23.1	13.6
Employee Benefits	4.3	2.9	5.4	3.3

*Totals may not sum due to rounding

(3) Derivation of the Detailed Operating Cost Weights

To further divide the ''All Other'' residual cost weight estimated from the 2022 Medicare cost report data into more detailed cost categories, we proposed to use the 2017 Benchmark Input-Output (I–O) ''Use Tables/Before Redefinitions/Purchaser Value'' for NAICS 621100, Offices of Physicians, published by the Bureau of Economic Analysis (BEA). We noted that the BEA benchmark I–O data is used to further disaggregate residual costs in other CMS market baskets. Therefore, we noted that we believe the data from this industry are the most technically appropriate for disaggregation of the residual net expenses since both physician offices and FQHCs provide similar types of care. These data are publicly available at *https://www.bea.gov/industry/input-output-accounts-data.* For the 2017-based FQHC market basket, we used the 2012 Benchmark Input-Output (I–O) ''Use Tables/Before Redefinitions/ Purchaser Value'' for NAICS 621100, Offices of Physicians, published by the BEA.

The BEA Benchmark I–O data are scheduled for publication every 5 years with the most recent data available for 2017. The 2017 Benchmark I–O data are derived from the 2017 Economic Census and are the building blocks for BEA's economic accounts. Therefore, they represent the most comprehensive and complete set of data on the economic processes or mechanisms by which output is produced and distributed.[367] BEA also produces Annual I–O estimates. However, while based on a similar methodology, these estimates reflect less comprehensive and less detailed data sources and are subject to revision when benchmark data become available. Instead of using the less detailed Annual I–O data, we proposed to inflate the 2017 Benchmark I–O data forward to 2022 by applying the annual price changes from the respective price proxies to the appropriate market basket cost categories that are obtained from the 2017 Benchmark I–O data. We repeat this practice for each year. We then calculate the cost shares that each cost category represents of the 2017 data inflated to 2022. These resulting 2022 cost shares were applied to the ''All Other'' residual cost weight to obtain the detailed cost weights for the proposed 2022-based FQHC market basket. For example, the cost for Medical Equipment represents 7.8 percent of the sum of the ''All Other'' 2017 Benchmark I–O Offices of Physicians Expenditures inflated to 2022. Therefore, the proposed Medical Equipment cost weight represents 7.8 percent of the proposed 2022-based FQHC market basket's ''All Other'' cost category (18.7 percent), yielding a Medical Equipment cost weight of 1.5 percent in the proposed 2022-based FQHC market basket (0.078×18.7 percent = 1.5 percent).

Using this methodology, we proposed to derive six detailed FQHC market basket cost category weights from the proposed 2022-based FQHC market basket residual cost weight (18.7 percent). These categories are: (1) Utilities; (2) Medical Equipment; (3) Miscellaneous Products; (4) Professional, Scientific, and Technical Services; (5) Administrative and Facilities Support Services; and (6) All Other Services.

(4) 2022-Based FQHC Market Basket Cost Categories and Weights

Table 31 shows the cost categories and cost weights for the proposed 2022-based FQHC market basket compared to the 2017-based FQHC market basket. The Total Compensation cost weight of 68.5 percent (sum of FQHC Practitioner Compensation, Clinical Staff Compensation, and Non-health Staff Compensation) calculated from the Medicare cost reports for the proposed 2022-based FQHC market basket is 4.1 percentage points lower than the total compensation cost weight for the 2017-based FQHC market basket (72.6 percent). The decrease in the compensation cost weight between the 2017-based and the proposed 2022-based market basket is stemming from the decreasing FQHC Practitioner and Clinical Staff Compensation cost weights. The proposed 2022-based cost weights for FQHC Practitioner and Clinical Staff Compensation are 5.3 percentage points lower compared to the 2017-based FQHC market basket, while the Non-Health Staff Compensation cost weight is 1.2 percentage points higher. Analysis of the cost report data shows that the decline in the health-related compensation cost weights is stemming from a change in the mix of health-related workers from higher-paid to lower-paid occupations. Specifically, there has been a shift in full time equivalents (FTEs) from physicians to nurse practitioners and a shift from registered and licensed practical nurses to other allied health personnel. Additionally, the proposed 2022-based Pharmaceuticals cost weight, Non-Health Staff Compensation costs weight, and the Capital cost weight, are each roughly 1 percentage point higher than the cost weight in the 2017-based FQHC market basket.

We noted that our analysis of the Medicare cost report data over time shows the general trends in these cost weights (particularly for the Total Compensation and Pharmaceuticals cost weights) began after 2017 with about half of the cost weight changes occurring between 2017 and 2019. Consistent with our historical frequency of rebasing the other CMS market baskets, we believe it is important to rebase the FQHC market basket every four to five years to reflect the more recent data and changing cost structure.

[367] *http://www.bea.gov/papers/pdf/IOmanual_092906.pdf.*

TABLE 31: 2022-Based FQHC Market Basket Cost Weights Compared to 2017-Based FQHC Market Basket Cost Weights

Cost Category	2022-based FQHC Market Basket Cost Weight	2017-based FQHC Market Basket Cost Weight
Total	**100.0**	**100.0**
Compensation	**68.5**	**72.6**
FQHC Practitioner Compensation	**24.8**	**28.5**
FQHC Practitioner Wages and Salaries	20.5	23.1
FQHC Practitioner Employee Benefits	4.3	5.4
Clinical Staff Compensation	**15.3**	**16.9**
Clinical Staff Wages and Salaries	12.4	13.6
Clinical Staff Employee Benefits	2.9	3.3
Non-Health Staff Compensation	**28.4**	**27.2**
All Other Products	**9.8**	**8.5**
Pharmaceuticals	3.2	2.4
Utilities	0.5	0.6
Medical Equipment	1.5	1.2
Medical Supplies	2.4	2.2
Miscellaneous Products	2.3	2.2
All Other Services	**14.5**	**12.6**
Professional, Scientific, and Technical Services	8.6	6.4
Administrative and Facilities Support Services	1.5	1.7
All Other Services	4.4	4.5
Capital-Related Costs	**7.2**	**6.4**
Fixed Assets	5.0	4.4
Movable Equipment	2.2	2.0

Note: Totals may not sum due to rounding.

d. Selection of Price Proxies

After developing the cost weights for the proposed 2022-based FQHC market basket, we selected the most appropriate wage and price proxies currently available to represent the rate of price change for each expenditure category. For most of the cost categories, we rely on using the price proxies based on U.S. Bureau of Labor Statistics (BLS) data, as they produce indexes that best meet the criteria of reliability, timeliness, availability, and relevance, and group them into one of the following BLS categories:

- *Employment Cost Indexes.* Employment Cost Indexes (ECIs) measure the rate of change in employment wage rates and employer costs for employee benefits per hour worked. These indexes are fixed-weight indexes and strictly measure the change in wage rates and employee benefits per hour. ECIs are superior to Average Hourly Earnings (AHE) as price proxies for input price indexes because they are not affected by shifts in occupation or industry mix, and because they measure pure price change and are available by both occupational group and by industry. The industry ECIs are based on the North American Industry Classification System (NAICS) and the occupational ECIs are based on the Standard Occupational Classification System (SOC).
- *Producer Price Indexes.* Producer Price Indexes (PPIs) measure the average change over time in the selling prices received by domestic producers for their output. The prices included in the PPI are from the first commercial transaction for many products and some services (*https://www.bls.gov/ppi/*).
- *Consumer Price Indexes.* Consumer Price Indexes (CPIs) measure the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services (*https://www.bls.gov/cpi/*). CPIs are only used when the purchases are similar to those of retail consumers rather than purchases at the producer level, or if no appropriate PPIs are available.

We evaluate the price proxies using the criteria of reliability, timeliness, availability, and relevance:

- *Reliability.* Reliability indicates that the index is based on valid statistical methods and has low sampling variability. Widely accepted statistical methods ensure that the data were collected and aggregated in a way that can be replicated. Low sampling variability is desirable because it indicates that the sample reflects the typical members of the population. (Sampling variability is variation that occurs by chance because only a sample was surveyed rather than the entire population.)
- *Timeliness.* Timeliness implies that the proxy is published regularly, preferably at least once a quarter. The market baskets are updated quarterly, and therefore, it is important for the underlying price proxies to be up-to-date, reflecting the most recent data available. We believe that using proxies that are published regularly (at least quarterly, whenever possible) helps to ensure that we are using the most recent data available to update the market basket. We strive to use publications that are disseminated frequently, because we believe that this is an

optimal way to stay abreast of the most current data available.

- *Availability.* Availability means that the proxy is publicly available. We prefer that our proxies are publicly available because this will help ensure that our market basket updates are as transparent to the public as possible. In addition, this enables the public to be able to obtain the price proxy data on a regular basis.
- *Relevance.* Relevance means that the proxy is applicable and representative of the cost category weight to which it is applied.

The CPIs, PPIs, and ECIs that we have selected to use in the proposed 2022-based FQHC market basket meet these criteria. Therefore, we believe that they continue to be the best measures of price changes for the cost categories to which they would be applied.

Table 32 lists all price proxies we proposed to use in the proposed 2022-based FQHC market basket. Below is a detailed explanation of the price proxies we proposed for each cost category.

(1) Price Proxies for the 2022-Based FQHC Market Basket

(a) FQHC Practitioner Wages and Salaries

We proposed to use the ECI for Wages and Salaries for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to measure price growth of this category. There is no specific ECI for physicians or FQHC Practitioners, and therefore, we proposed to use an index that is based on professionals that receive advanced training similar to those performing at the FQHC Practitioner level of care. This index is consistent with the price proxy used to measure wages and salaries inflation pressure for physicians own time in the Medicare Economic Index (MEI) and is based on the MEI technical panel recommendation from 2012 for more details see the CY 2014 PFS final rule (78 FR 74266 through 74271). Additionally, this is the same price proxy used for the FQHC Practitioner Wages and Salaries cost category in the 2017-based FQHC market basket (85 FR 84708).

(b) FQHC Practitioner Employee Benefits

We proposed to use the ECI for Total Benefits for Private Industry Workers in Professional and Related to measure price growth of this category. This ECI is calculated using the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU1016220000000I) and the relative importance of wages and salaries within total compensation. This is the same price proxy used for the FQHC Practitioner Employee Benefits cost category in the 2017-based FQHC market basket (85 FR 84708).

(c) Clinical Staff Wages and Salaries

We proposed to use the ECI for Wages and Salaries for all Civilian Workers in Health Care and Social Assistance (BLS series code CIU1026200000000I) to measure the price growth of this cost category. This cost category consists of wage and salary costs for Nurses, Laboratory Technicians, and all other healthcare staff not included in the FQHC Practitioner compensation categories. Based on the clinical staff composition of these workers, we believe that the ECI for health-related workers is an appropriate proxy to measure wage and salary price pressures for these workers. This is the same price proxy used for the Clinical Staff Wages and Salaries cost category in the 2017-based FQHC market basket (85 FR 84708).

(d) Clinical Staff Employee Benefits

We proposed to use the ECI for Total Benefits for all Civilian Workers in Health Care and Social Assistance to measure price growth of this category. This ECI is calculated using the ECI for Total Compensation for all Civilian Workers in Health Care and Social Assistance (BLS series code CIU1016220000000I) and the relative importance of wages and salaries within total compensation. This is the same price proxy used for the Clinical Staff Employee Benefits cost category in the 2017-based FQHC market basket (85 FR 84708).

(e) Non-Health Staff Compensation

We proposed to use the ECI for Total Compensation for Private Industry Workers in Office and Administrative Support (BLS series code CIU2010000220000I) to measure the price growth of this cost category. The Non-health Staff Compensation cost weight is predominately attributable to administrative, and facility type occupations, as reported in the data from the Medicare cost reports. This is the same price proxy used for the Non-Health Staff Compensation cost category in the 2017-based FQHC market basket (85 FR 84708).

(f) Pharmaceuticals

We proposed to use the PPI Commodities for Pharmaceuticals for Human Use, Prescription (BLS series code WPUSI07003) to measure the price growth of this cost category. This price proxy is used to measure prices of Pharmaceuticals in other CMS market baskets, such as the 2018-based Inpatient Prospective Payment System market basket and is the same price proxy used for the Pharmaceuticals cost category in the 2017-based FQHC market basket (85 FR 84708).

(g) Utilities

We proposed to use the CPI for Fuel and Utilities (BLS series code CUUR0000SAH2) to measure the price growth of this cost category. This is the same price proxy used for the Utilities cost category in the 2017-based FQHC market basket (85 FR 84708).

(h) Medical Equipment

We proposed to use the PPI Commodities for Surgical and Medical Instruments (BLS series code WPU1562) as the price proxy for this category. This is the same price proxy used for the Medical Equipment cost category in the 2017-based FQHC market basket (85 FR 84708).

(i) Medical Supplies

We proposed to use a 50/50 blended index that comprises the PPI Commodities for Medical and Surgical Appliances and Supplies (BLS series code WPU156301) and the CPI–U for Medical Equipment and Supplies (BLS series code CUUR0000SEMG). The 50/50 blend is used in all market baskets where we do not have an accurate split available. We noted that we believe FQHCs purchase the types of supplies contained within these proxies, including such items as bandages, dressings, catheters, intravenous equipment, syringes, and other general disposable medical supplies, via wholesale purchase, as well as at the retail level. Consequently, we proposed to combine the two aforementioned indexes to reflect those modes of purchase. This is the same price proxy used for the Medical Supplies cost category in the 2017-based FQHC market basket (85 FR 84708 through 84709).

(j) Miscellaneous Products

We proposed to use the CPI for All Items Less Food and Energy (BLS series code CUUR0000SA0L1E) to measure the price growth of this cost category. We believe that using the CPI for All Items Less Food and Energy is appropriate as it reflects a general level of inflation. This is the same price proxy used for the Miscellaneous cost category in the 2017-based FQHC market basket (85 FR 84709).

(k) Professional, Scientific, and Technical Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Professional, Scientific, and Technical Services (BLS series code CIU2015400000000I) to measure the price growth of this cost category. This is the same price proxy used for the Professional, Scientific, and Technical Services cost category in the 2017-based FQHC market basket (85 FR 84709).

(l) Administrative and Facilities Support Services

We proposed to use the ECI Total Compensation for Private Industry Workers in Office and Administrative Support (BLS series code CIU2010000220000I) to measure the price growth of this cost category. This is the same price proxy used for the Administrative and Facilities Support Services cost category in the 2017-based FQHC market basket (85 FR 84709).

(m) All Other Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Service Occupations (BLS series code CIU2010000300000I) to measure the price growth of this cost category. This is the same price proxy used for the All Other Services cost category in the 2017-based FQHC market basket (85 FR 84709).

(n) Fixed Assets

We proposed to use the PPI Industry for Lessors of Nonresidential Buildings (BLS series code PCU531120531120) to measure the price growth of this cost category (81 FR 80398). We believe this continues to be the most appropriate price proxy since fixed asset costs in FQHCs should reflect inflation for the rental and purchase of business office space. This is the same price proxy used for the Fixed Assets cost category in the 2017-based FQHC market basket (85 FR 84709).

(o) Movable Equipment

We proposed to continue to use the PPI Commodities for Machinery and Equipment (BLS series code WPU11) to measure the price growth of this cost category as this cost category represents nonmedical movable equipment. This is the same price proxy used for the Movable Equipment cost category in the 2017-based FQHC market basket (85 FR 84709).

(2) Summary of Price Proxies of the 2022-Based FQHC Market Basket

Table 32 shows the cost categories and associated price proxies for the proposed 2022-based FQHC market basket.

TABLE 32: Cost Categories and Price Proxies for the 2022-based FQHC Market Basket

Cost Description	Price Proxies
FQHC Practitioner Wages and Salaries	ECI for Wages and Salaries for Private Industry Workers in Professional and Related
FQHC Practitioner Employee Benefits	ECI for Total Benefits for Private Industry Workers in Professional and Related
Clinical Staff Wages and Salaries	ECI for Wages and Salaries for All Civilian Workers in Health Care and Social Assistance
Clinical Staff Employee Benefits	ECI for Total Benefits for All Civilian Workers in Health Care and Social Assistance
Non-Health Staff Compensation	ECI for Total Compensation for Private Industry Workers in Office and Administrative Support
Pharmaceuticals	PPI Special Index for Pharmaceuticals for Human Use, Prescription
Utilities	CPI-U for Fuels and Utilities
Medical Equipment	PPI Commodity Index for Surgical and Medical Instruments
Medical Supplies	Composite: PPI Commodity Index for Medical and Surgical Appliances and Supplies (50%) and CPI for Medical Equipment and Supplies (50%)
Miscellaneous Products	CPI-U for All Items Less Food and Energy
Professional, Scientific, and Technical Services	ECI for Total compensation for Private industry workers in Professional, Scientific, and Technical Services
Administrative and Facilities Support Services	ECI for Total Compensation for Private Industry Workers in Office and Administrative Support
All Other Services	ECI for Total Compensation for Private Industry Workers in Service Occupations
Fixed Assets	PPI Industry Index for Lessors of Nonresidential Buildings
Movable Equipment	PPI Commodity Index for Machinery and Equipment

We solicited comments on our proposal to rebase and revise the FQHC market basket to reflect a 2022 base year.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported our proposal to rebase and revise the FQHC market basket from a 2017 base year to a 2022 base year and supported the proposed market basket methodology and results. The commenters stated they appreciated CMS recognizing the financial challenges and using the 2022 cost report data to support the FQHC market basket. These commenters also stated their support that the proposed 2022-based market basket uses a fixed-weight, Laspeyres-type price index, which they stated will provide a reliable measure of price changes over time, and that this method coupled with the use of other reliable data sources ensures that the

market basket accurately reflects the cost trends that FQHCs experience. Finally, several commenters also stated their support for the proposal to include the costs related to telehealth services in the 2022-based FQHC market basket, as it reflects the critical regulatory changes and the expansion of telehealth services that took place in 2022.

Response: We appreciate the commenters' support for the proposed rebasing of the FQHC market basket to reflect a 2022 base year that accounts for changes in the mix of goods and services purchased in providing FQHC services as well as the general methodological approach of using Medicare cost report data, a Laspeyres-type index formula, and the use of publicly available price proxies when available and appropriate.

After consideration of public comments, we are finalizing the methodology for deriving the 2022-based FQHC market basket as proposed without modification effective with the CY 2025 FQHC PPS update.

e. CY 2025 Productivity-Adjusted Market Basket Update for FQHCs

For CY 2025 (that is, January 1, 2025, through December 31, 2025), we proposed to use an estimate of the proposed 2022-based FQHC market basket to update payments to FQHCs based on the best available data. Consistent with CMS practice, we proposed to use the update based on the most recent historical data available at the time of publication of the final rule. For example, the final CY 2025 FQHC update is based on the four-quarter moving-average percent change of the 2022-based FQHC market basket through the second quarter of 2024 (based on the final rule's statutory publication schedule). At the time of the proposed rule, we did not have the second quarter of 2024 historical data, and therefore, we proposed to use the most recent projection available at the time. Consistent with CMS practice, we estimate the market basket update for the FQHC PPS based on the most recent forecast from IHS Global, Inc. (IGI). IGI is a nationally recognized economic and financial forecasting firm with which CMS contracts to forecast the components of the market baskets and total factor productivity (TFP).

Based on IGI's third quarter 2024 forecast with historical data through the second quarter of 2024, the final 2022-based FQHC market basket increase factor for CY 2025 is 4.0 percent. For comparison, the 2017-based FQHC market basket percentage increase is 4.1 percent for CY 2025 based on IGI's third quarter 2024 forecast (with historical data through the second quarter of 2024). The difference between the CY 2025 percentage increase using the 2017-based FQHC market basket and the 2022-based FQHC market basket is due to the lower wages and salaries cost weight for FQHC Provider Wages and Salaries and Clinical Staff Wages and Salaries.

Section 1834(o)(2)(B)(ii) of the Act describes the methods for determining updates to FQHC PPS payment. We have included a productivity adjustment to the FQHC PPS annual payment update since implementation of the FQHC PPS (81 FR 80393) and we proposed to continue to include a productivity adjustment to the proposed 2022-based FQHC market basket. We proposed to use the most recent estimate of the 10-year moving average of changes in annual private nonfarm business (economy-wide) total factor productivity (TFP), which is the same measure of TFP applied to other CMS market basket updates including the MEI. The U.S. Department of Labor's Bureau of Labor Statistics (BLS) publishes the official measures of productivity for the U.S. economy. We note that previously the productivity estimates published by BLS was referred to as multifactor productivity. Beginning with the November 18, 2021, release of productivity data, BLS replaced the term ''multifactor productivity'' (MFP) with ''TFP.'' Please see *https://www.bls.gov/productivity/data.htm* for the BLS historical published TFP data. For the final FQHC market basket update, we proposed to use the most recent historical estimate of annual TFP as published by the BLS. Generally, the most recent historical TFP estimate is lagged two years from the payment year.

Therefore, we proposed to use the 10-year moving average percent change in annual private nonfarm business TFP through 2023 as published by BLS in the CY 2025 FQHC market basket update. We note that TFP is derived by subtracting the contribution of labor and capital input growth from output growth. Since at the time of development of the proposed rule the measure of TFP for 2023 had not yet been published by BLS, we proposed to use IGI's first quarter 2024 forecast of TFP. A complete description of IGI's TFP projection methodology is available on the CMS website at *https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information.*

Using IGI's first quarter 2024 forecast, the productivity adjustment for CY 2025 (the 10-year moving average of TFP for the period ending CY 2023) was projected to be 0.5 percent. Therefore, the proposed CY 2025 productivity-adjusted FQHC market basket update was 3.5 percent, based on IGI's first quarter 2024 forecast. This reflected a 4.0 percent increase in the 2022-based FQHC market basket reduced by a 0.5 percentage point productivity adjustment. Finally, we proposed that the CY 2025 market basket update and the productivity adjustment would be updated to reflect the most recent historical data available for the final rule.

For this final rule, as proposed, we are using the latest historical data for TFP as published by the BLS to determine the productivity adjustment. The 10-year moving average percent change in TFP for the period ending CY 2023 as published by BLS is 0.6 percent. Based on the latest historical data through the second quarter of 2024, the final 2022-based FQHC market basket percentage increase is 4.0 percent. Therefore, the final CY 2025 productivity-adjusted FQHC market basket update is 3.4 percent (4.0 percent FQHC market basket percentage increase reduced by a 0.6 percentage point productivity adjustment).

8. Clarification for Dental Services Furnished in FQHCs

a. Payment for Dental Services Furnished in FQHCs

Section 1862(a)(12) of the Act generally precludes payment under Medicare Parts A or B for any expenses incurred for services in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth. (Collectively here, we will refer to ''the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth'' as ''dental services.'') That section of the statute also includes an exception to allow payment to be made for inpatient hospital services in connection with the provision of such dental services if the individual, because of their underlying medical condition and clinical status or because of the severity of the dental procedure, requires hospitalization in connection with the provision of such services. Our regulation at 42 CFR 411.15(i) similarly excludes payment for dental services except for inpatient hospital services in connection with dental services when hospitalization is required because of: (1) the individual's underlying medical condition and clinical status; or (2) the severity of the dental procedure.

Fee for service (FFS) Medicare Parts A and B also make payment for certain dental services in circumstances where the services are not considered to be in connection with dental services within the meaning of section 1862(a)(12) of the Act. In the CY 2023 PFS final rule (87 FR 69663 through 69688), we clarified and codified at § 411.15(i)(3) that Medicare payment under Parts A and B could be made when dental services are furnished in either the inpatient or outpatient setting when the dental services are inextricably linked to, and substantially related and integral to the clinical success of, other covered services. We also added several examples of clinical scenarios that are considered to meet that standard under § 411.15(i)(3) and amended that regulation to add more examples in the CY 2024 PFS final rule (88 FR 79022 through 79029).

In the CY 2024 PFS final rule (88 FR 79038), we received comments requesting we provide payment for inextricably linked dental services in the FQHC setting. Commenters stated that it is critical that CMS consider FQHCs' unique Medicare payment structure and that CMS ensure that policy changes for FQHCs are analogous to any changes made under the PFS. Commenters noted that many FQHCs provide dental services on-site, and health center patients could benefit from the payment policies for dental services inextricably linked to other covered services and suggested that the FQHC billing codes should be edited in tandem. Commenters further noted that ''physicians' services'' component of the Medicare FQHC benefit includes services furnished by dentists. Several commenters urged that the list of billable dental visit codes modified in the proposed rule be added to the list of codes that may be billed in the FQHC setting and requested that any expansion in codes recognized under the PFS for dental-related services also be applied to FQHCs. We acknowledged the commenters concerns and noted our intention to modify operational procedures in the FQHC setting to reflect the expansion of this PFS policy, including updates to billable code lists.

In the CY 2025 PFS proposed rule, we agreed that RHC and FQHC Medicare beneficiaries could benefit from the payment policies established under the PFS for dental services that are inextricably linked to specific medical services. Dentists are defined as physicians in Medicare statute (42 CFR 491.2). Services furnished by physicians are billable visits in RHCs and FQHCs and they could bill for a face-to-face, medically necessary visit furnished by a dentist within their scope of practice. Therefore, we clarified that dental services exactly as described in section II.J and furnished in an RHC or FQHC are RHC and FQHC visits and as such can be paid under the RHC AIR methodology or FQHC PPS.

We would apply and operationalize the dental policies finalized in the CY 2023 and 2024 PFS final rules as applicable also to RHCs and FQHCs and update the FQHC qualifying visit list as appropriate. Consistent with the discussion in section II.J of this final rule, if an RHC or FQHC practitioner believes the dental services for which they submit Medicare claims are inextricably linked to a covered service, a modifier may be reported on an RHC or FQHC claim for payment purposes. The KX modifier would be reported on an RHC or FQHC claim to indicate that the service is medically necessary, and that the provider has included appropriate documentation in the medical record to support or justify the medical necessity of the service or item. We believe that usage of the KX modifier in the context of claims for dental services inextricably linked to covered services to indicate that the clinician attests that the service is medically necessary, and that the provider has included appropriate documentation is appropriate and will support claims processing and program integrity efforts.

In addition, the GY modifier may be reported on a Medicare claim to indicate that a service is not covered because it is outside of the scope of Medicare coverage authorized by the statute. Denial modifiers should be used when physicians, practitioners, or suppliers want to indicate that the item or service is statutorily non-covered. Use of the GY modifier could support MAC efforts to adjudicate claims and remove from the claims processing pipeline those claims that do not require further processing.

We intend to provide additional instruction and education through subregulatory guidance regarding the usage of the KX and GY modifiers on claims submitted for dental services inextricably linked to covered medical services.

We clarified that when RHCs and FQHCs furnish dental services that align with the policies and operational requirements in the physician setting, we would consider those services to be a qualifying visit and the RHC would be paid at the RHC AIR methodology and the FQHC would be paid under the FQHC PPS.

b. Medical and Dental Visits Furnished on the Same Day

If an RHC or FQHC patient has a medically-necessary face-to-face visit with an RHC or FQHC practitioner, and is then seen by another RHC or FQHC practitioner, including a specialist, for further evaluation of the same condition on the same day, or is then seen by another RHC or FQHC practitioner, including a specialist, for evaluation of a different condition on the same day, the multiple encounters would constitute a single RHC or FQHC visit and be payable as one visit regardless of the length or complexity of the visit, whether the second visit is a scheduled or unscheduled appointment, or whether the first visit is related or unrelated to the subsequent visit.

If the RHC or FQHC patient suffers an illness or injury that requires additional diagnosis or treatment on the same day subsequent to the first visit, or has a medical and a mental health visit on the same day, or an RHC patient has an initial preventive physical exam (IPPE) and a separate medical and/or mental health visit on the same day, then the RHC or FQHC would be paid separately for each visit.

We solicited comment on whether the multiple visits policy should apply to patients who have an encounter with an RHC or FQHC practitioner and a dentist on the same day or should a subsequent encounter with a dentist be considered an exception to this policy and be paid as a separate billable visit. We are interested in understanding when these situations could occur.

We received several public comments on this proposal. The following is a summary of the comments we received.

Comment: Commenters were very supportive of the clarification provided for dental services furnished in RHCs and FQHCs, that is RHCs and FQHCs would align with the PFS and adopt the policies and operational requirements proposed for dental services that are inextricably linked to, and substantially related and integral to the clinical success of, other covered services, and would be paid as a qualifying visit. Commenters stated expanding Medicare coverage of dental services furnished in RHCs and FQHCs would alleviate financial burden, make providing dental services more sustainable, ensure equitable access to care, and improve care coordination.

Response: We thank commenters for their support of the clarification.

Comment: One commenter encouraged CMS to clarify how this payment clarification will be implemented for RHCs and FQHCs and

partner with RHCs and FQHCs to implement the policy.

Response: If an RHC or FQHC practitioner believes the dental services for which they submit Medicare claims are inextricably linked to a covered service, a modifier may be reported on an RHC or FQHC claim for payment purposes. The KX modifier would be reported on an RHC or FQHC claim to indicate that the service is medically necessary, and that the provider has included appropriate documentation in the medical record to support or justify the medical necessity of the service or item, and the dental service would be paid at the RHC AIR methodology or the FQHC PPS. We intend to provide additional instructions and education on the policy and billing requirements for dental services in subregulatory guidance.

Comment: All of the commenters who responded to the comment solicitation believed that the exception to the multiple visit policy should apply to dental visits; that is, RHCs and FQHCs could bill for both a medical visit and a dental visit for a patient on the same day. Commenters noted applying the exception to dental services furnished in RHCs and FQHCs would align with the current exception for a medical visit and a behavioral health visit, and or IOP visit, enhance access to care, and minimize patient burden by reducing travel time, childcare, mobility issues and other logistical challenges. Commenters also noted that same day billing for medical and dental visits ensures accurate reimbursement, reflecting the actual time and resources invested in each patient encounter. One commenter expressed concerns that that if we constrained medical and dental visits to be payable as a single visit, regardless of the length or complexity, this may incentivize clinics to schedule patients for medical and dental visits on separate days and to ensure that integration is realized in the provision of patient care, FQHCs and RHCs should be incentivized to schedule medical and dental visits on the same day.

Response: We appreciate the commenters feedback on the multiple visits policy. We agree with the commenters recommendation and will clarify in subregulatory guidance that RHCs and FQHCs can bill separately for dental services that are inextricably linked to other covered Medicare services on the same day a medical visit is furnished by an RHC or FQHC practitioner. We believe this clarification has the potential to increase access to dental services that are inextricably linked to other covered medical services in underserved areas and that this would help to demonstrate the value of dental services, especially in areas where the need for dental services is high and utilization is low.

After consideration of public comments, we are finalizing as proposed our clarification that when RHCs and FQHCs furnish dental services that align with the policies and operational requirements in the physician setting, we would consider these services to be a qualifying visit, and they would be paid at the RHC AIR methodology or the FQHC PPS. We will issue additional instructions and education through subregulatory guidance on the policy and billing requirements for these services. We are also clarifying in subregulatory guidance that RHCs and FQHCs can bill separately for dental services that are inextricably linked to other covered services on the same day a medical visit is furnished by an RHC or FQHC practitioner.

9. ''Grandfathered'' Technical Refinement

a. Background

We have conducted a review of our regulations and guidance to determine where preferred terms may be used. We found several sections in part 405, subpart X, that use the term ''grandfathered.'' For example, in § 405.2462(f)(1) a ''grandfathered tribal FQHC'' is a FQHC that is operated by a tribe or tribal organization under the Indian Self-Determination and Education Assistance Act (ISDEAA); was billing as if it were provider-based to an IHS hospital on or before April 7, 2000, and is not currently operating as a provider-based department of an IHS hospital.

b. Technical Refinement

We believe language in communication products should reflect and speak to the needs of people in the audience of focus. In an effort to represent an ongoing shift to non-stigmatizing language, we proposed to make a technical change to remove the term ''grandfathered'' from the regulation text in §§ 405.2462, 405.2463, 405.2464, and 405.2469 and replace it with ''historically excepted'' to describe a level of protection provided to certain tribal FQHCs that predates applicable restrictions.

We received two public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Commenters were supportive of the technical change that would remove the term ''grandfathered'' from applicable regulation texts and replace it with ''historically excepted.''

Response: We thank commenters for their support.

After consideration of public comments, we are finalizing our proposal to make a technical change to remove the term ''grandfathered'' from the regulation text in §§ 405.2462, 405.2463, 405.2464, and 405.2469 and replace it with ''historically excepted'' to describe a level of protection provided to certain tribal FQHCs that predates applicable restrictions.

C. Rural Health Clinic (RHC) and Federally Qualified Health Center (FQHC) Conditions for Certification and Conditions for Coverage (CfCs)

1. Background and Statutory Authority

The Rural Health Clinic Services Act of 1977 (Pub. L. 95–210 enacted December 13, 1977) amended the Act by enacting section 1861(aa) of the Act to extend Medicare and Medicaid entitlement and payment for outpatient services and emergency care services furnished at a rural health clinic (RHC) by physicians and certain other practitioners, and for services and supplies incidental to their services. Other practitioners include nurse practitioners and physician assistants, and subsequent legislation extended the definition of covered RHC services to include the services of clinical psychologists, clinical social workers, certified nurse midwives, marriage and family therapists, and mental health counselors.

We have broad statutory authority to establish health and safety standards for most Medicare and Medicaid participating provider and supplier types. Section 1861(aa) of the Act authorizes the Secretary to establish the requirements that an RHC and Federally Qualified Health Center (FQHC) must meet to participate in the Medicare Program. As required by subparagraph (iv) of the flush material set out after section 1861(aa)(2)(K) of the Act, Medicare certified RHCs must not be a rehabilitation agency or a facility which is primarily for the care or treatment of mental diseases. These statutory requirements are codified in the regulations at 42 CFR part 491 in the Conditions for Conditions for Certification and Conditions for Coverage (CfCs). RHCs and FQHCs must meet these requirements to receive Medicare payment for services. These regulations are intended to protect the health and safety of patients receiving care from these facilities. We note that there are approximately 5,462 Medicare-

certified RHCs and 11,853 Medicare participating FQHCs.

2. Summary of the RHC and FQHC CfCs Proposed Provisions, Public Comments, and Responses to Comments

In accordance with section 1861(aa) of the Act, § 491.9, *Provision of services,* establishes the basic requirements for services RHCs and FQHCs must provide in accordance with applicable Federal, State, and local laws. This CfC also outlines patient care policies, including the development of written policies and the establishment of guidelines for medical management, record-keeping, and drug administration. Additionally, this section specifies the diagnostic, therapeutic, laboratory, and emergency services that RHCs and FQHCs must offer, as well as the necessary agreements or arrangements with other healthcare providers to furnish additional services not available onsite.

Based on feedback from interested parties, including RHC providers and rural health associations, we identified a discrepancy between our guidance and the statute, and regulations. Specifically, interested parties questioned the language in the State Operations Manual *Appendix G—Guidance for Surveyors: Rural Health Clinics (RHCs)* as it relates to § 491.9(a)(2). The guidance states that ''RHCs may not be primarily engaged in specialized services.'' [368] The guidance goes on to state that, in this context, ''primarily engaged'' is determined by considering the total hours of an RHC's operation and whether a majority, that is, more than 50 percent, of those hours involve the provision of RHC services. Section 1861(aa)(2)(A) of the Act references an RHC being primarily engaged in ''furnishing to outpatients'' physician services and services furnished by a physician assistant or a nurse practitioner, clinical psychologist or by a clinical social worker, as cross-referenced by sections 1861(aa)(1)(A) and (B) of the Act. This is codified in the CfCs at § 491.9(a)(2), requiring RHCs and FQHCs to be primarily engaged in ''providing outpatient health services.'' Historically we have enforced the standard that RHCs be primarily engaged in providing primary care services based on the policy included in the interpretive guidance.

[368] Centers for Medicare & Medicaid Services. (2020, February 21). State Operations Manual Appendix G—Guidance for Surveyors: Rural Health Clinics (RHCs) (pp. 63–64). *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/downloads/som107ap_g_rhc.pdf.*

a. Basic Requirements (§ 491.9(a))

At § 491.9(a)(2)(i), we proposed to explicitly require RHCs and FQHCs to provide primary care services. Under the proposal, RHCs and FQHCs would continue to be required to provide primary care services to their patient populations, but CMS would no longer determine or enforce the standard of RHCs ''being primarily engaged in furnishing primary care services'' and would no longer consider the total hours of an RHC's operation and whether a majority, that is, more than 50 percent, of those hours involve the provision of primary care services through the survey process. We note that under the authority of section 1865 of the Act, CMS determines compliance with the regulations using surveys conducted by a State survey agency, surveys conducted by accreditation organizations that have deeming authority for Medicare providers and suppliers, and self-attestation. CMS requires RHCs participating in Medicare to demonstrate and maintain compliance with the provisions included in 42 CFR part 491.

We proposed this policy because we believe it provides RHCs with greater flexibility in the services, including specialty services, that they provide by no longer placing parameters on the amount of primary care services they provide.

We received public comments on these proposals. The following is a summary of the comments we received and our responses. Commenters included individuals from the RHC community (including RHCs), rural health associations, professional associations, State mental health associations, and health systems.

Comment: Many commenters expressed their support for the proposal, particularly the flexibility in tailoring services to meet the unique needs of their patient populations and addressing shortages in access to specialty services in rural areas to reduce health disparities and improve health outcomes. Other commenters noted this proposal not only promotes more equitable access to medical services but also aligns better with the intent of the statute, decreases the burden for RHCs, and preserves access to primary care services. Some commenters shared their support for this proposed provision and our consideration of the mobility barriers individuals in rural areas face, noting the importance of having access to services near one's home and that this proposal may minimize unnecessary travel time one may face when accessing specialized services. Additionally, we received multiple comments stressing the importance of RHCs continuing to provide primary care services. However, one commenter recommended that CMS not consider internal medicine, pediatric medicine, and OB/GYN services to be outpatient specialty services and to define ''primary care services'' in alignment with 42 CFR part 5 Appendix A paragraph (B)(3)(a). Two commenters supported this proposal, noting that the proposal would remove the limitation on the total amount of behavioral health services RHCs can provide.

Response: We appreciate the many comments noting support for this proposal and the feedback regarding the positive impacts on access to care that the proposal will support. While primary care services continue to be a critical aspect in addressing health disparities, we recognize that we also need to provide alternative rural points of access to specialty outpatient services, because more traditional points of access, such as hospitals in rural communities, may not be available. Many communities rely solely on RHCs to provide medical services, and this provision aims to reduce barriers to accessing high-quality, comprehensive care.

We appreciate the commenter's suggestion to use the criteria for determining whether there is a shortage of primary care practitioners, set out at 42 CFR part 5, Appendix A, paragraph (B)(3)(a), as a proxy for the amount of primary care services offered. This provision counts the number of M.D.s and D.O.s practicing in the categories of general or family practice, general internal medicine, pediatrics, and obstetrics and gynecology to determine areas having shortages of primary medical care professionals (under section 332(a)(1)(A) of the Public Health Services Act). However, we disagree with the suggestion. The Health Resources and Services Administration (HRSA) is responsible for determining whether a location is in a designated shortage area. As noted in the proposed rule (89 FR 61807), we use the phrase ''the entry point into the health care system'' in the RHC and FQHC CfCs at § 491.9(c)(1) to determine the services considered to be ''primary care.'' This standard is consistent with the language used in the Rural Emergency Hospital Conditions of Participation (CoPs) at § 485.524(a) ''*Additional outpatient medical and health services*'' and follows the Critical Access Hospital CoPs at § 485.635(b)(1)(i) ''*Provision of services.*'' Furthermore, the American Academy of Family Physicians (AAFP) defines primary care practice as follows:

''A primary care practice serves as the patient's entry point into the health care system and as the continuing focal point for all needed health care services.'' [369] However, we do agree with the commenter that RHCs may offer internal medicine, pediatric medicine, and OB/GYN care and that the services that are considered primary care services (with the latter considered primary care services for women's health). We note that one goal of the revised language is to clarify that RHCs can and should provide services that focus on specific areas of medicine from specialists with advanced training and expertise in specific areas of medicine, and CMS will no longer determine if RHCs are ''primarily engaged'' in providing these services.

Lastly, we note that this provision allows RHCs to provide behavioral health services similar to other services for diabetes, cardiovascular disease, and other common conditions. The new regulatory requirement that RHCs must provide primary care services does not remove the statutory requirement that RHCs cannot be a rehabilitation agency or a facility primarily for the care and treatment of mental diseases. We have not codified this statutory language in this final rule (see discussion below). Therefore, RHCs can provide services that focus on the needs of the community (including behavioral health services) as long as they also meet the primary care needs of their community.

Comment: One commenter shared that this policy could facilitate additional rural specialized medical residency rotations, noting Congress' recent approval of 1,200 additional medical residency spots and the Biden-Harris Administration's commitment to expanding medical residency in rural areas. Another commenter noted this proposal could promote more coordinated, patient-centered care across specialties and ease concerns among physicians practicing within their scope. Several commenters noted that certain medical professionals such as pediatricians, geriatricians, allergists, obstetricians, rheumatologists, dermatologists, and endocrinologists are in high demand in rural areas, but patients have difficulty accessing certain professionals. One commenter stated this proposal will aid RHCs in forming partnerships with specialists to promote appropriate access to specialty medications and complex specialty care that may be beyond the scope of practice for many providers currently working in RHCs. The commenters also noted that having access to these specialists will also improve access to care to treat chronic conditions like diabetes and obesity.

Response: Improving the health of rural communities is a top priority for the Biden-Harris Administration and CMS remains steadfast in our commitment to supporting access to care and ensure high quality and safe care. As highlighted by the commenter, efforts have been made to enhance the rural health workforce through specialized medical residency rotations, which RHCs can leverage more effectively with the flexibilities offered through this provision.

Comment: Several commenters expressed concern that the revised language may unintentionally limit access to care in underserved areas. Specifically, the commenters noted that many FQHCs provide services that primarily consist of behavioral health services. Commenters note that FQHCs provide a broad range of services and often serve patients who may not have access to other healthcare settings. They noted that behavioral health services FQHCs provide is in response to community needs. Furthermore, these commenters shared that health centers provide care to over 2.7 million patients with mental health care needs and 300,000 patients with substance use disorders.[370] Further, in 2021 health centers employed over 17,000 full-time behavioral health staff.[371]

Response: After consideration of the public comments and further consultation with HRSA regarding the potential for unintended consequences impacting FQHCs, we agree with commenters who stated that applying this provision to FQHCs may negatively impact patient health and safety. To participate in the Medicare program, FQHCs must be designated under HRSA's Health Center Program either as Health Center Program award recipients or as ''look-alikes.'' As part of this program, HRSA provides oversight to ensure that FQHCs and look-alike FQHCs provide services to meet the full spectrum of healthcare needs in the communities they serve, including primary care services. Section 330 of the Public Health Service Act, 42 U.S.C. 254b, authorizes the Health Center Program. Under this authority, health centers provide required primary health services and additional health services necessary for the adequate support of primary health services to a population that is medically underserved or to a special medically underserved population by providing such services for all residents of the area served by the center. HRSA reviews compliance to ensure health centers provide primary care services during the initial application process and once an organization is a health center through organizational site visits that occur once every 3 years. We believe that withdrawing this proposal for FQHCs would not negatively impact patient care because there are safeguards in place to ensure that a standard of primary care services is provided in health centers. Conversely, under the authority of section 1865 of the Act, CMS is responsible for determining if a Medicare-certified RHC demonstrates and maintains compliance with the provisions included in 42 CFR part 491. Given that HRSA provides oversight over FQHCs and CMS oversees RHCs, there are differences in how they assess compliance with the requirements. As a result, RHCs do not have the same safeguards in place. To preserve access to primary care services in communities served by RHCs, it is essential that each RHC provide some level of primary care services.

Therefore, focusing this provision on RHCs and withdrawing the proposal as it would apply to FQHCs avoids the potential for limiting access to care while ensuring that RHCs and FQHCs provide a standard of primary care services.

Final Rule Action: After consideration of public comments, we are finalizing this requirement as proposed for RHCs with a technical change to finalize at § 491.9(a)(3) and with a modification to withdraw the proposal with respect to FQHCs. This revision will avoid the potential for limiting access to care while ensuring that RHCs and FQHCs provide a standard of primary care services.

This revision will maintain access to primary health and behavioral health services furnished by FQHCs and remove the potential for unintended consequences this provision may impose on FQHCs.

b. Mental Diseases (§ 491.9(a)(2)(ii))

To further clarify the requirements and the intent of the RHC program, we proposed at § 491.9(a)(2)(ii) to codify the statutory requirement in subparagraph (iv) of the flush material set out after

[369] *Primary care.* AAFP. (2019, December 12). *https://www.aafp.org/about/policies/all/primary-care.html.*

[370] National Association of Community Health Centers. (2024). *Community Health Centers: Providers, Partners and Employers of Choice. https://www.nachc.org/wp-content/uploads/2024/07/2024-2022-UDS-DATA-Community-Health-Center-Chartbook.pdf.*

[371] National Association of Community Health Centers. (2023). *Community Health Center Chartbook. https://www.nachc.org/wp-content/uploads/2023/04/Community-Health-Center-Chartbook-July-2023-2021UDS.pdf.*

section 1861(aa)(2)(K) of the Act that RHCs cannot be a rehabilitation agency or a facility primarily for the care and treatment of mental diseases. While this requirement is included at § 491.2, *Definitions—Rural health clinic or clinic,* including this requirement the *Provision of services* CfC at § 491.9(a)(2)(ii) as a separate standard more clearly cites the requirement and allows for a clearer evaluation of compliance with the specific requirement.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters supported the goal of our proposal to eliminate confusion regarding the types of services RHCs and FQHCs can provide by codifying the statutory requirement that RHCs cannot be a rehabilitation agency or a facility primarily for the care and treatment of mental diseases. Other commenters appreciated the discussion of the term ''mental disease'' and recognition that the term is outdated and can perpetuate stigma, noting that using language that includes both mental health and substance use disorders is important and consistent with terms used across fields of practice. A couple of commenters supported codifying this requirement as it protects primary care services in rural areas, and one commenter stated that this proposal would ensure appropriate payment for services furnished in an RHC.

Conversely, many commenters opposed codifying this requirement noting that its explicit addition to the CfCs could further amplify confusion amongst providers by seemingly imposing additional restrictions on the types of services RHCs can furnish, preventing them from meeting the needs of the communities they serve. Commenters indicated that the proposal may disincentivize RHCs from delivering behavioral health services, inadvertently creating obstacles to accessing behavioral health services. To prevent unintended consequences and protect access to essential services, many commenters recommended that CMS instead define facilities that are primarily for the care and treatment of mental diseases, such as certified community behavioral health clinics (CCBHCs), community mental health centers (CMHCs), standalone opioid treatment programs (OTPs), psychiatric residential treatment facilities (PRTFs), or facilities that only provide intensive outpatient services. These commenters indicated that defining ''mental diseases'' and not basing it on the facility type would have the potential to limit access to behavioral health services provided in RHCs. If CMS did not accept this recommendation, one commenter recommended CMS use ''behavioral health conditions'' in the CfCs, and another commenter recommended including both ''mental health conditions'' and ''substance use disorders'' in the regulation text, similar to the regulations CMS has adopted for intensive outpatient (IOP) therapy. Furthermore, commenters provided suggestions on how CMS should survey for compliance with this provision. Some commenters believe that if RHCs provide primary care services, there should be no restrictions on the services they provide, urging the advancement of integrated behavioral health services in a primary care setting. These commenters believe RHCs can serve as an access point for behavioral health services and that rural health providers must be flexible to meet the unique needs of the patient population, as opposed to requiring that a percentage of services are of a specific type. Lastly, a few commenters expressed concerns that CMS imposed this requirement on FQHCs, noting that we do not have the statutory authority to do so.

Response: We appreciate the overall feedback received from commenters on this proposal. We understand the various concerns raised by commenters regarding the unintended consequences that this proposal may impose on RHCs, such as impacting access to outpatient services, in particular behavioral health services. We expect RHCs to offer a range of primary health care services to ensure that patients receive the necessary care at the earliest possible point of contact. Our intention in codifying the statutory requirement was not to further restrict the current state of the health care environment or discourage the provision of RHC specialty services or behavioral health services. An RHC may offer such specialty services and behavioral health services to its patients in addition to the primary care services it already provides in accordance with the statute.

As noted previously, while primary care services continue to be a critical aspect in addressing health disparities, we recognize that we also need to provide alternative rural points of access to specialty outpatient services. We recognize that many communities rely solely on RHCs to provide medical services, and our goal in proposing this provision was to provide clarity and reduce barriers to accessing high-quality, comprehensive care, rather than imply that RHCs should restrict or limit the existing services they provide. We are withdrawing this proposal after considering public comments. This decision aligns with the HHS strategic goal to protect and strengthen equitable access to health care,[372] We believe finalizing the standard at § 491.9(a)(3), requiring RHCs to provide primary care services (discussed in the previous section), will support our goal of clarifying the services that RHCs may provide and safeguard access to primary care services while avoiding unintended consequences that may create barriers to accessing care.

We appreciate the commenter's suggestion to include mental health conditions and substance use disorders in the regulation text; however, the IOP therapy provisions the commenter referred to are payment policy and not health and safety standards, such as those set forth in the CfCs. The CfCs set forth the minimum health and safety standards that facilities must comply with to participate in the Medicare and Medicaid programs, and do not impact the amount of payment for services.

We thank the commenters who recommended that we define ''a facility that is primarily for the care and treatment of mental diseases'' as a facility type that primarily provides behavioral health services. As we noted, we have decided to withdraw the proposal, and therefore, this recommendation no longer applies.

Final Rule Action: After consideration of public comments, we are withdrawing this proposal.

c. Laboratory (§ 491.9(c)(2))

We proposed to remove hemoglobin and hematocrit (H&H) (§ 491.9(c)(2)(ii)) from the listed laboratory services that RHCs must perform directly. Interested parties have expressed concerns with the existing laboratory requirements, citing the financial and physical burdens associated with maintaining laboratory tests equipment, as they are ordered infrequently. RHC providers have reported that the H&H laboratory test, in particular, is overly burdensome. RHCs report that when they order laboratory tests that the RHC cannot provide, such as a complete blood count (CBC), their patients are often sent to the nearest hospital that would have a full-service laboratory available to perform the test. In this example, a CBC contains an H&H, so there would be no need for the RHC to perform the H&H if the patient is getting a CBC completed

[372] Assistant Secretary for Planning and Evaluation. U.S. Department of Health and Human Services. (2022). Strategic Goal 1: Protect and Strengthen Equitable Access to High Quality and Affordable Healthcare. *https://www.hhs.gov/about/strategic-plan/2022-2026/goal-1/index.html.*

elsewhere. As a result, some RHCs located near hospitals or full-service laboratories may not be utilizing their laboratory equipment and supplies, or they may be utilizing them on a limited basis.

At § 491.9(c)(2)(vi), we proposed to revise the language to ''collection of patient specimens for transmittal to a certified laboratory for culturing.'' We proposed this revision in response to feedback from rural interested parties that this requirement does not reflect current clinical laboratory standards of practice and laboratory techniques for RHCs. Typically, RHCs are not performing primary culturing prior to sending specimens to a certified laboratory. Instead, RHCs collect specimens using appropriate collection and storage techniques and send them to a certified laboratory without initial culturing. Therefore, we proposed to update the language in this standard such that the laboratory services RHCs will be required to provide include the ''collection of patient specimens for transmittal to a certified laboratory for culturing.''

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: All commenters supported the proposed changes to remove the hemoglobin and hematocrit (H&H) requirement, as well as the proposed language update to the ''primary culturing'' requirement. Various organizations and entities expressed their support for the proposed change to remove H&H from the CfCs, emphasizing the outdated nature of the requirement, as these tests are usually ordered as part of a larger panel and are frequently referred to offsite laboratories. Commenters noted that removing this requirement would reduce compliance costs and unnecessary equipment and supplies, thereby improving efficiency and patient care.

Response: We thank the commenters for their responses and believe it is important that the requirements reflect current clinical laboratory standards of practice and laboratory techniques.

Comment: One commenter noted that the removal of H&H from the list of required lab services would impact access to this laboratory test. The commenter referenced the preamble in which we explained that RHCs can still choose to maintain the equipment and supplies to provide H&H testing on-site to meet the needs of their patients, and because of this, the larger RHC community is not concerned with this provision impacting access to this test. Furthermore, in the proposed rule, we solicited comments on how removing H&H from the CfCs would impact access to this test. Additionally, we requested comments on data, evidence, and experience related to laboratory services in RHCs, as well as alternative lab services RHCs should provide to meet the needs of their communities. One commenter, in response to this request, cited that according to their data, 82 percent of RHCs indicated that the lab requirement for the ''examination of stool specimens for occult blood'' was no longer frequently ordered or considered the best clinical practice. Therefore, it was no longer necessary to be included in the required labs that RHCs must provide.

Response: There are a few types of fecal occult blood tests (FOBT) used for screening for blood in the stool prior to performing a colonoscopy for colon cancer detection. FOBTs are less invasive than receiving a colonoscopy and can be performed in the office or at home. The national guidelines, including those of the US Preventive Services Task Force (USPSTF) and American Cancer Society, explicitly specify that colorectal cancer (CRC) screening using FOBT should be done at home.[373] [374] However, FOBTs only detect blood in stool, and a colonoscopy would need to be done to find the source of the bleeding if the test result is positive, though FOBTs are limited by false-positive results.[375] [376] Based on the current national standards, we are revising the proposal to remove the examination of stool specimens for occult blood from the list of required labs for RHCs.

We would like to reiterate that § 491.9(d)(1)(iii) requires RHCs to provide prompt access to a Medicare or Medicaid participating provider or supplier that can furnish an H&H laboratory test and any additional and specialized diagnostic and laboratory services the RHC is not equipped to perform. Additionally, this proposal does not prevent RHCs from providing tests not listed in § 491.9. An RHC is free to provide tests consistent with its CLIA certification and can choose a higher level CLIA certification than the certificate of waiver if it wishes to provide tests of higher complexity and comply with all CLIA requirements.

Final Rule Action: After consideration of public comments, we are finalizing this provision with modification by also removing the current requirement that RHCs directly provide ''examination of stool specimens for occult blood.''

d. Comments Outside the Scope of This Rulemaking

Comment: One commenter acknowledged the steps CMS has taken to extend telehealth flexibilities for RHCs and FQHCs but recommends that CMS utilize digital health technologies in every way possible to efficiently improve health outcomes and avoid unnecessary in-person requirements.

Another commenter urged CMS to make permanent the flexibilities issued during the COVID–19 Public Health Emergency related to medical supervision of nurse practitioners in rural and underserved communities. They emphasized the importance of these flexibilities for RHCs and FQHCs located in areas where workforce shortages persist, and this change aligns with statutory requirements for non-physician directed clinics.

Another commenter recommended that the statutory definition of a ''rural health clinic'' include marriage and family therapists and mental health counselors.

Response: We appreciate these comments; however, they are outside the scope of this rule. CMS does not have the authority to change the statute as this is done through an act of Congress.

D. Clinical Laboratory Fee Schedule: Revised Data Reporting Period and Phase-In of Payment Reductions

1. Background on the Clinical Laboratory Fee Schedule

Prior to January 1, 2018, Medicare paid for clinical diagnostic laboratory tests (CDLTs) on the Clinical Laboratory

Fee Schedule (CLFS) under section 1833(a), (b), and (h) of the Act. Under the previous payment system, CDLTs were paid based on the lesser of: (1) the amount billed; (2) the local fee schedule amount established by the Medicare Administrative Contractor (MAC); or (3) a national limitation amount (NLA), which is a percentage of the median of all the local fee schedule amounts (or 100 percent of the median for new tests furnished on or after January 1, 2001). In practice, most tests were paid at the NLA. Under the previous payment system, the CLFS amounts were updated for inflation based on the percentage change in the Consumer Price Index for All Urban Consumers (CPI–U) and reduced by a productivity adjustment and other statutory adjustments but were not otherwise updated or changed. Coinsurance and deductibles generally do not apply to CDLTs paid under the CLFS.

Section 1834A of the Act, as established by section 216(a) of the Protecting Access to Medicare Act of 2014 (PAMA), required significant changes to how Medicare pays for CDLTs under the CLFS. A final rule entitled ''Medicare Clinical Diagnostic Laboratory Tests Payment System'' (CLFS final rule), which appeared in the **Federal Register** on June 23, 2016 (81 FR 41036), implemented section 1834A of the Act at 42 CFR part 414, subpart G.

Under the CLFS final rule, ''reporting entities'' must report to CMS during a ''data reporting period'' ''applicable information'' collected during a ''data collection period'' for their component ''applicable laboratories.'' The first data collection period occurred from January 1, 2016, through June 30, 2016. The first data reporting period occurred from January 1, 2017, through March 31, 2017. On March 30, 2017, we announced a 60-day period of enforcement discretion for the application of the Secretary's potential assessment of civil monetary penalties for failure to report applicable information with respect to the initial data reporting period.[377]

In the CY 2018 PFS proposed rule (82 FR 34089 through 34090), we solicited public comments from applicable laboratories and reporting entities to better understand the applicable laboratories' experiences with data reporting, data collection, and other compliance requirements for the first data collection and reporting periods. We discussed these comments in the CY 2018 PFS final rule (82 FR 53181 through 53182) and stated that we would consider the comments for potential future rulemaking or guidance.

As part of the CY 2019 Medicare PFS rulemaking, we finalized two changes to the definition of ''applicable laboratory'' at § 414.502 (see 83 FR 59667 through 59681, 60074; 83 FR 35849 through 35850, 35855 through 35862). First, we excluded Medicare Advantage plan payments under Part C from the denominator of the Medicare revenues threshold calculation to broaden the types of laboratories qualifying as an applicable laboratory. Second, consistent with our goal of obtaining a broader representation of laboratories that could potentially qualify as an applicable laboratory and report data, we also amended the definition of applicable laboratory to include hospital outreach laboratories that bill Medicare Part B using the CMS–1450 14x Type of Bill.

2. Payment Requirements for Clinical Diagnostic Laboratory Tests

In general, under section 1834A of the Act, the payment amount for each CDLT on the CLFS furnished beginning January 1, 2018, is based on the applicable information collected during the data collection period and reported to CMS during the data reporting period and is equal to the weighted median of the private payor rates for the test. The weighted median is calculated by arraying the distribution of all private payor rates, weighted by the volume for each payor and each laboratory. The payment amounts established under the CLFS are not subject to any other adjustment, such as geographic, budget neutrality, or annual update, as required by section 1834A(b)(4)(B) of the Act. Additionally, section 1834A(b)(3) of the Act, implemented at § 414.507(d), provides for a phase-in of payment reductions, limiting the amounts the CLFS rates for each CDLT (that is not a new advanced diagnostic laboratory test (ADLT) or new CDLT) can be reduced as compared to the payment rates for the preceding year. Under the original provisions enacted by section 216(a) of PAMA, for the first 3 years after implementation (CY 2018 through CY 2020), the reduction could not be more than 10 percent per year. For the next 3 years after implementation (CY 2021 through CY 2023), section 216(a) of PAMA stated that the reduction could not be more than 15 percent per year. Under sections 1834A(a)(1) and (b) of the Act, as enacted by PAMA, for CDLTs that are not ADLTs, the data collection period, data reporting period, and payment rate update were to occur every 3 years. As such, the second data collection period for CDLTs that are not ADLTs occurred from January 1, 2019, through June 30, 2019, and the next data reporting period was originally scheduled to take place from January 1, 2020, through March 31, 2020, with the next update to the Medicare payment rates for those tests based on that reported applicable information scheduled to take effect on January 1, 2021.

Section 216(a) of PAMA established a new subcategory of CDLTs known as ADLTs, with separate reporting and payment requirements under section 1834A of the Act. The definition of an ADLT is set forth in section 1834A(d)(5) of the Act and implemented at § 414.502. Generally, under section 1834A(d) of the Act, the Medicare payment rate for a new ADLT is equal to its actual list charge during an initial period of 3 calendar quarters. After the new ADLT initial period, ADLTs are paid using the same methodology based on the weighted median of private payor rates as other CDLTs. However, under section 1834A(d)(3) of the Act, updates to the Medicare payment rates for ADLTs occur annually instead of every 3 years.

Additional information on the private payor rate-based CLFS is detailed in the CLFS final rule, which implemented section 1834A of the Act as required by PAMA (81 FR 41036 through 41101), and this information is also available on the CMS website.[378]

3. Previous Statutory Revisions to the Data Reporting Period and Phase-In of Payment Reductions

Beginning in 2019, Congress passed a series of legislation to modify the statutory requirements for the data reporting period and phase-in of payment reductions under the CLFS. First, section 105(a)(1) of the Further Consolidated Appropriations Act, 2020 (FCAA) (Pub. L. 116–94, December 20, 2019) amended the data reporting requirements in section 1834A(a) of the Act to delay the next data reporting period for CDLTs that are not ADLTs by 1 year so that data reporting would be required during the period of January 1, 2021, through March 31, 2021, instead of January 1, 2020, through March 30, 2020. The 3-year data reporting cycle for CDLTs that are not ADLTs would resume after that data reporting period. Section 105(a)(1) of the FCAA also specified that the data collection period that applied to the data reporting period

[377] *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/ClinicalLabFeeSched/Downloads/2017-March-Announcement.pdf.*

[378] *https://www.cms.gov/medicare/payment/fee-schedules/clinical-laboratory-fee-schedule-clfs/pama-educational-resources.*

of January 1, 2021, through March 30, 2021, would be the period of January 1, 2019, through June 30, 2019, which was the same data collection period that would have applied absent the amendments. In addition, section 105(a)(2) of the FCAA amended section 1834A(b)(3) of the Act regarding the phase-in of payment reductions to provide that payments may not be reduced by more than 10 percent as compared to the amount established for the preceding year through CY 2020, and for CYs 2021 through 2023, payment may not be reduced by more than 15 percent as compared to the amount established for the preceding year. These statutory changes were consistent with our regulations implementing the private payor rate-based CLFS at § 414.507(d) (81 FR 41036).

Subsequently, section 3718 of the Coronavirus Aid, Relief, and Economic Security Act, 2020 (CARES Act) (Pub. L. 116–136, March 27, 2020) further amended the data reporting requirements for CDLTs that are not ADLTs and the phase-in of payment reductions under the CLFS. Specifically, section 3718(a) of the CARES Act amended section 1834A(a)(1)(B) of the Act to delay the next data reporting period for CDLTs that are not ADLTs by one additional year, to require data reporting during the period of January 1, 2022, through March 31, 2022. The CARES Act did not modify the data collection period that applied to the next data reporting period for these tests. Thus, under section 1834A(a)(4)(B) of the Act, as amended by section 105(a)(1) of the FCAA, the next data reporting period for CDLTs that are not ADLTs would have been based on the data collection period of January 1, 2019, through June 30, 2019.

Section 3718(b) of the CARES Act further amended the provisions in section 1834A(b)(3) of the Act regarding the phase-in of payment reductions under the CLFS. First, it extended the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2024 instead of CY 2023. It further amended section 1834A(b)(3)(B)(ii) of the Act to specify that the applicable percent for CY 2021 is 0 percent, meaning that the payment amount determined for a CDLT for CY 2021 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2020. Section 3718(b) of the CARES Act further amended section 1834A(b)(3)(B)(iii) of the Act to state that the applicable percent of 15 percent would apply for CYs 2022 through 2024, instead of CYs 2021 through 2023. In the CY 2021 PFS rulemaking (85 FR 50210 through 50211; 85 FR 84693 through 84694), in accordance with section 105(a) of the FCAA and section 3718 of the CARES Act, we proposed and finalized conforming changes to the data reporting and payment requirements at 42 CFR part 414, subpart G.

Section 4 of the Protecting Medicare and American Farmers from Sequester Cuts Act (PMAFSCA) (Pub. L. 117–71, December 10, 2021) made additional revisions to the CLFS requirements for the next data reporting period for CDLTs that are not ADLTs and to the phase-in of payment reductions under section 1834A of the Act. Specifically, section 4(b) of PMAFSCA amended the data reporting requirements in section 1834A(a) of the Act to delay the next data reporting period for CDLTs that are not ADLTs by 1 year, so that data reporting would be required during the period of January 1, 2023, through March 31, 2023. The 3-year data reporting cycle for CDLTs that are not ADLTs would resume after that data reporting period. As amended by section 4 of PMAFSCA, section 1834A(a)(1)(B) of the Act provided that in the case of reporting with respect to CDLTs that are not ADLTs, the Secretary shall revise the reporting period under subparagraph (A) such that—(i) no reporting is required during the period beginning January 1, 2020, and ending December 31, 2022; (ii) reporting is required during the period beginning January 1, 2023, and ending March 31, 2023; and (iii) reporting is required every 3 years after the period described in clause (ii).

Section 4 of PMAFSCA did not modify the data collection period that applies to the next data reporting period for these tests. Thus, under section 1834A(a)(4)(B) of the Act, as amended by section 105(a)(1) of the FCAA, the next data reporting period for CDLTs that are not ADLTs (January 1, 2023, through March 31, 2023) would continue to be based on the data collection period of January 1, 2019, through June 30, 2019, as defined in § 414.502.

Section 4 of PMAFSCA further amended the provisions in section 1834A(b)(3) of the Act regarding the phase-in of payment reductions under the CLFS. First, it extended the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2025. It further amended section 1834A(b)(3)(B)(ii) of the Act to specify that the applicable percent for each of CY 2021 and 2022 is 0 percent, meaning that the payment amount determined for a CDLT for CY 2021 and 2022 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2020. Section 4(a) of PMAFSCA further amended section 1834A(b)(3)(B)(iii) of the Act to state that the applicable percent of 15 percent would apply for CYs 2023 through 2025, instead of CYs 2022 through 2024. In the CY 2023 PFS rulemaking (87 FR 46068 through 46070; 87 FR 69741 through 69744, 70225), in accordance with section 4 of PMAFSCA, we proposed and finalized conforming changes to the data reporting and payment requirements at 42 CFR part 414, subpart G.

Section 4114 of the Consolidated Appropriations Act, 2023 (CAA, 2023) (Pub. L. 117–328, December 29, 2022) made further revisions to the CLFS requirements for the next data reporting period for CDLTs that are not ADLTs and to the phase-in of payment reductions under section 1834A of the Act. Specifically, section 4114(b) of the CAA, 2023 amended the data reporting requirements in section 1834A(a)(1)(B) of the Act to delay the next data reporting period for CDLTs that are not ADLTs by 1 year, so that data reporting would be required during the period of January 1, 2024, through March 31, 2024, instead of the data reporting period of January 1, 2023, through March 31, 2023. The 3-year data reporting cycle for CDLTs that are not ADLTs would resume after that data reporting period. As amended by section 4114(b) of the CAA, 2023, section 1834A(a)(1)(B) of the Act now provides that in the case of reporting with respect to CDLTs that are not ADLTs, the Secretary shall revise the reporting period under subparagraph (A) such that—(i) no reporting is required during the period beginning January 1, 2020, and ending December 31, 2023; (ii) reporting is required during the period beginning January 1, 2024, and ending March 31, 2024; and (iii) reporting is required every 3 years after the period described in clause (ii).

Section 4114 of the CAA, 2023 did not modify the data collection period that applies to the next data reporting period for CDLTs. Thus, under section 1834A(a)(4)(B) of the Act, the next data reporting period for CDLTs that are not ADLTs (January 1, 2024, through March 31, 2024) would continue to be based on the data collection period of January 1, 2019, through June 30, 2019, as reflected in the definitions of data collection period and data reporting period at § 414.502.

Section 4114(a) of the CAA, 2023 further amended the provisions in

section 1834A(b)(3) of the Act regarding the phase-in of payment reductions under the CLFS. First, it extended the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2026. It further amended section 1834A(b)(3)(B)(ii) of the Act to specify that the applicable percent for CY 2023 is 0 percent, meaning that the payment amount determined for a CDLT for CY 2023 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2022. Section 4114(a) of the CAA, 2023 further amended section 1834A(b)(3)(B)(iii) of the Act to state that the applicable percent of 15 percent will apply for CYs 2024 through 2026, instead of CYs 2023 through 2025. In the CY 2024 PFS rulemaking (88 FR 79083 through 79087; 88 FR 79531), in accordance with section 4114 of the CAA, 2023, we proposed and finalized conforming changes to the data reporting and payment requirements at 42 CFR part 414, subpart G.

4. Additional Statutory Revisions to the Data Reporting Period and Phase-In of Payment Reductions

On November 17, 2023, section 502 of the Further Continuing Appropriations and Other Extensions Act, 2024 (Pub. L. 118–22) (FCAOEA, 2024) was passed and delayed data reporting requirements for CDLTs that are not ADLTs, and it also delayed the phase-in of payment reductions under the CLFS from private payor rate implementation under section 1834A of the Act. Specifically, section 502(b) of the FCAOEA, 2024 amended the data reporting requirements in section 1834A(a)(1)(B) of the Act to delay the next data reporting period for CDLTs that are not ADLTs by 1 year, so that data reporting would be required during the period of January 1, 2025, through March 31, 2025, instead of the data reporting period of January 1, 2024, through March 31, 2024. The 3-year data reporting cycle for CDLTs that are not ADLTs would resume after that data reporting period. As amended by section 502(b) of the FCAOEA, 2024, section 1834A(a)(1)(B) of the Act provided that in the case of reporting with respect to CDLTs that are not ADLTs, the Secretary shall revise the reporting period under subparagraph (A) such that—(i) no reporting is required during the period beginning January 1, 2020, and ending December 31, 2024; (ii) reporting is required during the period beginning January 1, 2025, and ending March 31, 2025; and (iii) reporting is required every 3 years after the period described in clause (ii).

Section 502 of the FCAOEA, 2024 did not modify the data collection period that applies to the next data reporting period for these tests. Thus, under section 1834A(a)(4)(B) of the Act, the next data reporting period for CDLTs that are not ADLTs (January 1, 2025, through March 31, 2025) would continue to be based on the data collection period of January 1, 2019, through June 30, 2019, as reflected in the definitions of data collection period and data reporting period at § 414.502.

Section 502(a) of the FCAOEA, 2024 further amended the provisions in section 1834A(b)(3) of the Act regarding the phase-in of payment reductions under the CLFS. First, it extended the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2027. It further amended section 1834A(b)(3)(B)(ii) of the Act to specify that the applicable percent for CY 2024 is 0 percent, meaning that the payment amount determined for a CDLT for CY 2024 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2023. Section 502(a) of the FCAOEA, 2024 further amended section 1834A(b)(3)(B)(iii) of the Act to state that the applicable percent of 15 percent will apply for CYs 2025 through 2027.

As a result of the statutory revisions under the FCAA, CARES Act, PMAFSCA, the CAA, 2023, and the FCAOEA, 2024, there have only been two data collection periods for CDLTs that are not ADLTs to date. The first data collection period for these tests occurred from January 1, 2016, through June 30, 2016, and the second occurred from January 1, 2019, through June 30, 2019. Thus far, there has been only one data reporting period for these tests, which took place from January 1, 2017, through March 31, 2017. We have established CLFS payment rates for these tests using the methodology established in PAMA only one time, effective January 1, 2018, based on the applicable information collected by applicable laboratories during the 2016 data collection period and reported to CMS during the 2017 data reporting period.

Additionally, we have applied the phase-in of payment reductions for the first 3 years of PAMA implementation, CY 2018 through CY 2020, whereby reduction of payment rates could not be more than 10 percent per year as compared to the amount established the prior year. However, the phase-in of payment reductions set forth in PAMA for years 4 through 6 after PAMA implementation, whereby payment cannot exceed 15 percent per year as compared to the amount established the prior year, has not yet occurred.

5. Proposed Conforming Regulatory Changes

In accordance with section 502 of the FCAOEA, 2024, we proposed to make conforming changes to the data reporting and payment requirements at 42 CFR part 414, subpart G. Specifically, we proposed to revise the definitions of both the ''data collection period'' and ''data reporting period'' at § 414.502 to specify that for the data reporting period of January 1, 2025, through March 31, 2025, the data collection period is January 1, 2019, through June 30, 2019. We also proposed to revise § 414.504(a)(1) to indicate that initially, data reporting begins January 1, 2017, and is required every 3 years beginning January 2025. In addition, we proposed to make conforming changes to our requirements for the phase-in of payment reductions to reflect the amendments in section 502(a) of the FCAOEA, 2024. Specifically, we proposed to revise § 414.507(d) to indicate that for CY 2024, payment may not be reduced by more than 0.0 percent as compared to the amount established for CY 2023, and for CYs 2025 through 2027, payment may not be reduced by more than 15 percent as compared to the amount established for the preceding year.

We noted that the CYs 2024 and 2025 CLFS payment rates for CDLTs that are not ADLTs are based on applicable information collected in the data collection period of January 1, 2016, through June 30, 2016. We also stated that under current law, the CLFS payment rates for CY 2026 through CY 2028 would be based on applicable information collected during the data collection period of January 1, 2019, through June 30, 2019, and reported to CMS during the data reporting period of January 1, 2025, through March 31, 2025.

We received a few public comments on our proposals to conform the regulatory text at 42 CFR part 414, subpart G to FCAOEA, 2024. However, the Continuing Appropriations and Extensions Act, 2025 (CAEA, 2025) (Pub. L. 118–83) was passed on September 26, 2024, after the publication of the proposed rule and close of the comment period. Section 221 of that law delayed data reporting requirements for CDLTs that are not ADLTs as well as the phase-in of payment reductions under the CLFS from private payor rate implementation

under section 1834A of the Act. Specifically, as amended by section 221(b), section 1834A(1)(B) of the Act now provides that, in the case of reporting with respect to CDLTs that are not ADLTs, the Secretary shall revise the reporting period under subparagraph (A) such that: (i) no reporting is required during the period beginning January 1, 2020, and ending December 31, 2025; (ii) reporting is required during the period beginning January 1, 2026, and ending March 31, 2026; and (iii) reporting is required every 3 years after the period described in subparagraph (ii). Essentially, data reporting will now be required during the period of January 1, 2026, through March 31, 2026, instead of January 1, 2025, through March 31, 2025. The 3-year data reporting cycle for CDLTs that are not ADLTs will resume after that data reporting period.

Section 221 of the CAEA, 2025 does not modify the data collection period that applies to the next data reporting period for these tests. Thus, under section 1834A(a)(4)(B) of the Act, the next data reporting period for CDLTs that are not ADLTs (January 1, 2026, through March 31, 2026) will continue to be based on the data collection period of January 1, 2019, through June 30, 2019.

Section 221(a) of the CAEA, 2025 further amends provisions in section 1834A(b)(3) of the Act pertaining to the phase-in of payment reductions under the CLFS. First, it extends the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2028. It further amends section 1834A(b)(3)(B)(ii) of the Act to specify that the applicable percent for CY 2025 is 0 percent, meaning that the payment amount determined for a CDLT for CY 2025 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2024. Finally, section 221(a) further amends section 1834A(b)(3)(B)(iii) of the Act to specify that the applicable percent of 15 percent will apply for CYs 2026 through 2028.

The following is a summary of the comments we received and our responses.

Comment: Commenters agreed with the proposed conforming regulatory changes pursuant to the FCAOEA, 2024 and understood that this action is necessary.

Response: We appreciate the commenters' support for these regulatory changes that reflect the statutory revisions required by section 502 of the FCAOEA, 2024. As noted above, section 221 of the CAEA, 2025 was passed on September 26, 2024. We believe it is necessary to reflect conforming regulatory text changes pursuant to section 221 of the CAEA, 2025 rather than those we included in the proposed rule that would have conformed to section 502 of the FCAOEA, 2024. Section 221 of the CAEA, 2025 is prescriptive, leaving us no room for interpretation and, as such, is self-implementing. We direct readers to the end of this section for a description of the conforming regulation text changes to 42 CFR part 414, subpart G.

Comment: One commenter expressed concerns over the data collection period (January 1, 2019, through June 30, 2019) that would be utilized for the data reporting period specified in the FCAOEA, 2024 (January 1, 2025, through March 31, 2025). The commenter noted that private payer rates from CY 2019 are severely outdated as the information will be more than 5 years old by the time it is collected and analyzed by CMS. The commenter also expressed concern that the reported data will include codes that are no longer valid and will be missing data on codes that have been created since 2019.

Response: We note that section 502 of the FCAOEA, 2024 and the more recent amendments in section 221 of the CAEA, 2025 did not modify the data collection period at section 1834A(a)(4)(B) of the Act that applies to the next data reporting period for CDLTs that are not ADLTs. Therefore, the next data reporting period for CDLTs that are not ADLTs (January 1, 2026, through March 31, 2026) will continue to be based on the data collection period of January 1, 2019, through June 30, 2019, as defined in § 414.502. Because this requirement is statutorily prescribed, we are unable to modify the data collection period. We acknowledge the commenter's concern regarding missing data on laboratory HCPCS codes that have been created since 2019 and note that on average over 100 new codes are created each year.

Comment: One commenter suggested that CMS should conduct aggressive outreach to hospital outreach laboratories and other applicable laboratories that need information and assistance to meet their obligation to report applicable information to CMS, per section 1834A(a)(1)(A) of the Act, and also recommended we send a letter to each independent laboratory and physician office laboratory that qualified as an ''applicable laboratory'' in the 2016 data collection period but that failed to submit applicable information during the 2017 data reporting period, reminding each of its obligation to determine whether it meets the definition now and, if so, to report applicable information in the next data reporting period, or be subject civil monetary penalties. This commenter also stated that CMS should use its authority to impose a civil monetary penalty of up to $10,000 per day on an applicable laboratory for each failure to report or each misrepresentation or omission of applicable information and state publicly our intention to audit applicable laboratories and to impose penalties, when warranted, in order to signal to all applicable laboratories that reporting is not voluntary—it is mandatory.

Response: We appreciate the commenter's recommendations related to outreach for data reporting. Obtaining applicable information from applicable laboratories as required by section 1834A of the Act is necessary to enable us to establish payment rates for CDLTs, and outreach and education activities for applicable laboratories play an important role in achieving this objective. Accordingly, we regularly update the CMS website and have leveraged different media platforms to disseminate various educational materials and other resources to prepare applicable laboratories for data reporting and inform them of changes to reporting requirements. For example, we have released a video [379] on how to determine if a laboratory is an applicable laboratory. We have also conducted two direct mailings to independent and hospital laboratories. Overall, CMS shares the commenter's interest in ensuring all applicable laboratories have the educational resources needed to report accurate and complete data to inform payment rates under the CLFS, and we may consider the submitted recommendations for upcoming data reporting periods.

Additionally, regarding the comments on CMPs, we note that section 1834A(a)(9)(A) of the Act authorizes the Secretary to apply a CMP in cases where the Secretary determines that an applicable laboratory has failed to report or made a misrepresentation or omission in reporting applicable information under section 1834A(a) of the Act for a CDLT. In these cases, the Secretary may apply a CMP in an amount of up to $10,000 per day for each failure to report or each such misrepresentation or omission. We codified this provision in our regulations at § 414.504(e). As we previously stated in the CLFS final rule,

[379] *https://youtu.be/c3eiPYeRA_U.*

which implemented section 216(a) of PAMA (81 FR 41069), in situations where our review reveals that the data submitted is incomplete or incorrect, we will assess whether a CMP should be applied, and if so, determine the appropriate amount based on the specific circumstances.

Comment: One commenter conveyed concerns over the phase-in of payment reductions to CLFS payment amounts that would be required to resume in CY 2025. Specifically, the commenter was concerned about access to care and quality of care issues for nursing home patients resulting from payment cuts to some clinical laboratory services of up to 15 percent per year. The commenter explained that patients in nursing facilities typically have a complex array of post-acute and chronic conditions that frequently require clinical laboratory services to identify new conditions or to monitor the beneficiary's reaction to specific care interventions. According to the commenter, the majority of clinical laboratory services for nursing facility residents are furnished by outside laboratories that drive to the facility and obtain the needed specimen bedside, or the resident must face the costs and disruptions to their daily life and sometimes interrupted rehabilitation care in order to be transported to a hospital or clinical laboratory to obtain needed laboratory services. The commenter expressed concern that access to these services may be disrupted, or the beneficiary might be required to travel further to obtain clinical laboratory services if nearby laboratories close or consolidate due to significantly reduced reimbursement. Another commenter strongly encouraged CMS to work with Congress to find a better solution to setting laboratory rates. The commenter asserted that the current process of collecting data from laboratories is administratively burdensome, and setting CLFS rates based on the median private payor rates (which the commenter believes are most likely rates from large national laboratories that are able to accept low rates in exchange for large volumes of laboratory tests) results in financial harm to small, independent laboratories. Another commenter called for payment for laboratory tests to be sufficient to cover the costs associated with providing these necessary tests to patients and as such, opposed federal mandates that require private-sector reporting of CDLT data.

Response: We appreciate hearing from commenters on these issues and their concerns related to the phase-in of payments reductions, laboratory payment rates and reporting burden under the CLFS. Nevertheless, we note that the phase-in of payment reductions, applicable information reporting, and subsequent determination of payment rates are required under section 1834A of the Act, and any changes would require Congressional action.

In consideration of these public comments, and subsequent amendments made in section 221 of the CAEA, 2025 that amended the requirements we proposed to reflect in regulation per section 502 of the FCAOEA, 2024, we are finalizing the self-implementing conforming changes to the data reporting and phase-in of payment reductions at 42 CFR part 414, subpart G in accordance with section 221 of the CAEA, 2025. Specifically, we are revising the definitions of both the ''data collection period'' and ''data reporting period'' at § 414.502 to specify that for the data reporting period of January 1, 2026, through March 31, 2026, the data collection period is January 1, 2019, through June 30, 2019. We are also finalizing revisions to § 414.504(a)(1) to indicate that initially, data reporting begins January 1, 2017, and is required every 3 years beginning January 1, 2026. Finally, related to the requirements for the phase-in of payment reductions we are revising § 414.507(d) to indicate that for CY 2024 and CY 2025, payment may not be reduced by more than 0.0 percent as compared to the amount established for CY 2023 and 2024 respectively, and for CYs 2026 through 2028, payment may not be reduced by more than 15 percent as compared to the amount established for the preceding year.

We note that the CYs 2025 and 2026 CLFS payment rates for CDLTs that are not ADLTs are based on applicable information collected in the data collection period of January 1, 2016, through June 30, 2016. Under current law, the CLFS payment rates for CY 2027 through CY 2029 will be based on applicable information collected during the data collection period of January 1, 2019, through June 30, 2019, and reported to CMS during the data reporting period of January 1, 2026, through March 31, 2026.

E. Medicare Diabetes Prevention Program (MDPP)

The Centers for Medicare & Medicaid Services' (CMS) Medicare Diabetes Prevention Program Expanded Model (hereafter, ''MDPP'' or ''MDPP expanded model'') is an evidence-based behavioral intervention that aims to prevent or delay the onset of type 2 diabetes for eligible Medicare beneficiaries diagnosed with prediabetes. MDPP is an expansion in duration and scope of the Diabetes Prevention Program (DPP) model test, which was initially tested by CMS through a Round One Health Care Innovation Award (2012–2016).[380] MDPP was established in 2017 as an ''additional preventive service,'' [381] covered by Medicare and not subject to beneficiary cost-sharing, in addition to being available once per lifetime to eligible beneficiaries. To facilitate delivery of MDPP in a non-clinical community setting (to align with the certified DPP model tested by The CMS Innovation Center), CMS created a new MDPP supplier type through rulemaking in the CY 2017 PFS final rule (81 FR 80471), in addition to requiring organizations that wish to participate in MDPP to enroll in Medicare separately, even if they are already enrolled in Medicare for other purposes.

MDPP is a non-pharmacological behavioral intervention consisting of up to 22 intensive sessions furnished over 12 months by a trained Coach who provides training on topics that include long-term dietary change, increased physical activity, and behavior change strategies for weight control and diabetes risk reduction. MDPP sessions must be one hour in length and adhere to a Centers for Disease Control and Prevention (CDC) approved National Diabetes Prevention Recognition Program (National DPP) curriculum.[382] The primary goal of the MDPP expanded model is to help Medicare beneficiaries reduce their risk for developing type 2 diabetes by achieving at least 5 percent weight loss from the first core session (81 FR 80465).

Eligible organizations seeking to furnish MDPP began enrolling in Medicare as MDPP suppliers on January 1, 2018, and began furnishing MDPP on April 1, 2018. As of May 13, 2024, there were 301 approved MDPP suppliers.[383] The most recent MDPP evaluation report, reflected that between April 2018 and December 31, 2021, 4,848 Medicare beneficiaries participated in MDPP, including 2,325 FFS

[380] The Health Care Innovation Awards funds awards to organizations that implemented the most compelling new ideas to deliver better health, improved care, and lower costs to people enrolled in Medicare, Medicaid and Children's Health Insurance Program (CHIP), particularly those with the highest health care needs. The CMS Innovation Center announced the first batch of awardees for the Health Care Innovation Awards on May 8, 2012, and the second (final) batch on June 15, 2012. For more, see *https://www.cms.gov/priorities/innovation/innovation-models/health-care-innovation-awards.*

[383] Medicare Provider Enrollment, Chain, and Ownership System (PECOS). Unpublished data.

beneficiaries and 2,523 MA beneficiaries.[384] Through the Diabetes Prevention Recognition Program (DPRP), CDC administers a national quality assurance program recognizing eligible organizations that furnish the National DPP through its evidence based DPRP Standards,[385] which are updated every 3 years. The CDC established the DPRP in 2012 and possesses significant experience assessing the quality of program delivery by organizations throughout the United States, applying a comprehensive set of national quality standards. For further information on the DPP model test,[386] the CDC's National DPP,[387] and DPRP Standards,[388] please refer to the CY 2017 (81 FR 80471) and CY 2018 PFS (82 FR 52976) final rules and related websites.

The Public Health Emergency (PHE) for COVID–19 prompted changes to allow virtual delivery of the MDPP, among other changes (85 FR 84830 through 84841). Changes to MDPP in the CY 2024 PFS final rule (88 FR 78818) included a simplified payment structure to allow for fee-for-service (FFS) payments for beneficiary attendance while retaining the performance-based payments for diabetes risk reduction (that is, weight loss). Beginning January 1, 2024, payments are made to an MDPP supplier if an MDPP beneficiary attends any core session in the first 6 months or core maintenance session in the second 6 months, allowing payment for up to 22 sessions in a 12-month timeframe. The CY 2024 PFS final rule also extended certain PHE flexibilities, including the option to deliver some or all MDPP sessions via distance learning and for beneficiaries to virtually self-report weight for MDPP distance learning sessions, until December 31, 2027 (88 FR 79241).

CDC released the 2024 DPRP Standards [389] to replace the 2021 DPRP Standards in June 2024. To align MDPP with the 2024 CDC DPRP Standards, we proposed conforming changes to align with CDC delivery modes. These changes are expected to reduce administrative burden, ensure compliance with existing MDPP regulations, and streamline data reporting for MDPP suppliers. In this final rule, we also proposed an additional option for self-reporting weight in an MDPP distance learning session, removing the MDPP bridge payment, and making minor edits to align current rule language pertaining to MDPP with previous rulemaking.

1. Changes to § 410.79 by Amending Paragraphs (b) and (d)(1)

We established MDPP as an expanded model in 2018 based on a Health Care Innovation Award (HCIA) to the National Young Men's Christian Association (YMCA) of the USA (Y–USA), who tested the CDC's National DPP in the Medicare population through their network of YMCAs in multiple U.S. markets (DPP model test).[390] The DPP model test successfully met statutory criteria for model expansion,[391] demonstrating 5 percent weight loss from their starting weight by participants (a key metric of the program's success) along with statistically significant reductions in Medicare spending, emergency department (ED) visits, and inpatient stays.[392] The MDPP expanded model was implemented through the rulemaking process in two phases, in the CY 2017 PFS (81 FR 80459 through 80483) and CY 2018 PFS final rules (82 FR 53234 through 53339).

MDPP went into effect in 2018, with supplier enrollment starting January 1, 2018, and beneficiary enrollment starting April 1, 2018 (82 FR 53237). After nearly 6 years of implementation, through the CY 2024 PFS final rule, we finalized updates to MDPP based on lessons learned since the expanded model's launch, including updates to definitions and the core services period and extended the flexibilities allowed under the PHE for COVID–19 for a period of 4 years (88 FR 79241).

This year we proposed to make conforming changes to § 410.79(b), *Conditions of Coverage,* to align with the 2024 CDC DPRP Standards.[393] In the CY 2018 PFS final rule, we stated our intention to align MDPP with CDC DPRP Standards whenever possible (82 FR 53245). Several commenters encouraged CMS to consider adopting the same definitions for MDPP as CDC uses for the National DPP, including distance learning, online, and combination modalities to better align MDPP and the National DPP. Commenters indicated that the addition of definitions that are consistent with the CDC's definitions will reduce confusion about MDPP (88 FR 79247). To increase this alignment, we worked closely with CDC to update the National DPP and MDPP for CY 2024 final rule (88 FR 79240 through 79256), as well as the 2024 DPRP Standards.[394] We agree in aligning terminology where applicable.

The CY 2024 PFS final rule introduced and defined ''distance learning'' and ''combination delivery'' for MDPP and provided a definition for ''online delivery'' (88 FR 79243). The 2024 CDC DPRP Standards include the following delivery modes with definitions: ''in-person,'' ''distance learning (live),'' ''in-person with a distance learning component,'' ''online (non-live),'' and ''combination with an online component.'' [395] These delivery modes also serve as organization codes for CDC DPRP recognition. Through this final rule, we proposed to amend § 410.79(b) to add a new term for MDPP, ''in-person with a distance learning component,'' defined as ''MDPP sessions that are delivered in person by trained Coaches where participants have the option of attending sessions via MDPP distance learning. These sessions must be furnished in a manner

consistent with DPRP Standards for in-person and distance learning sessions.'' The following examples of an acceptable delivery model for the ''in-person with a distance learning component'' delivery mode are provided in the 2024 CDC DPRP Standards: a combination of in-person and distance learning during the core (first 6 months) and core maintenance (second 6 months) phases; some participants within a cohort using the in-person delivery mode and some participants using the distance learning delivery mode; or participants choosing from session to session which mode (in-person or distance learning) they wish to use.[396]

To further align with 2024 CDC DPRP Standards, we also proposed to add a new term at § 410.79(b), ''combination with an online component,'' defined as ''sessions that are delivered as a combination of online (non-live) with in-person or distance learning. These sessions must be furnished in a manner consistent with the DPRP Standards for the modality being used.'' Furthermore, we proposed to remove the ''combination delivery'' term from § 410.79(b), which was added in the CY 2024 PFS final rule (88 FR 79241) and is defined as ''MDPP sessions that are delivered by trained Coaches and are furnished in a manner consistent with the DPRP Standards for distance learning and in-person sessions for each individual participant.'' We believe that the MDPP ''combination delivery'' term and definition are no longer needed with the addition of ''in-person with a distance learning component,'' which includes any combination of in-person and distance learning sessions.

Lastly, we proposed to modify the current term and definition for ''online delivery'' at § 410.79(b), also added by the CY 2024 PFS final rule (88 FR 79241), to align with the 2024 CDC DPRP Standards.[397] First, we proposed to update the term from ''online delivery'' to ''online'' to align with both the MDPP ''distance learning'' term and CDC DPRP ''online (non-live)'' term. We proposed to revise the definition for the MDPP ''online'' delivery mode to provide that sessions that are delivered one hundred percent (100%) through the internet via phone, tablet, or laptop in an asynchronous (non-live) classroom where participants are experiencing the content on their own time without a live (including non-artificial intelligence (AI) Coach teaching the content. These sessions must be furnished in a manner consistent with the DPRP Standards for online sessions. Live Coach interaction must be offered to each participant during weeks when the participant has engaged with content. Emails and text messages can count toward the requirement for live Coach interaction if there is bi-directional communication between the Coach and participant. Chat bots and AI forums do not count as live Coach interaction. This modified definition adds the term ''non-live'' and further clarifies that Chat bots and AI forums do not constitute live interaction.

In summary, we are revising the ''online'' definition and adding the ''combination with an online component'' term and definition to help align terminology between MDPP and DPRP and prevent confusion about acceptable CDC delivery modes for MDPP. We are confirming that only MDPP ''in-person,'' ''distance learning,'' and ''in-person with a distance learning component'' delivery modes, can be used during the extension of the flexibilities allowed under the PHE for COVID–19, as finalized in the CY 2024 PFS final rule (88 FR 79241), not ''online'' nor ''combination with an online component'' delivery modes.

Furthermore, in the CY 2021 PFS final rule, we established that virtual sessions performed under flexibilities finalized in that rule could only be performed by MDPP suppliers who offered in-person services (85 FR 84830). For the MDPP Extended flexibilities period, we finalized in the CY 2024 PFS final rule to limit virtual delivery to the CDC DPRP definition of ''distance learning'' (88 FR 79243). We stated that the MDPP Extended flexibilities do not include online delivery (or asynchronous virtual), as defined in the CDC DPRP Standards through the ''online'' modality, including virtual make-up sessions (88 FR 79244). A make-up session in MDPP was described in CY 2018 PFS final rule (82 FR 53241) and at § 410.79(a) as ''a core session or a core maintenance session furnished to an MDPP beneficiary when the MDPP beneficiary misses a regularly scheduled core session or core maintenance session.'' The 2024 CDC DPRP Standards allow for National DPP make-up sessions to be furnished using any delivery mode, including online.[398] In alignment with the CY 2024 final rule, we are proposing to amend § 410.79(d)(1) to clarify that MDPP make-up sessions can only be furnished using the modalities permitted by the CY 2024 final rule for MDPP sessions: distance learning and in-person delivery (88 FR 79243 through 79246). Specifically, we proposed to add the following: ''MDPP make-up sessions may only use in-person or distance learning delivery.''

We proposed to amend § 410.79(b) and (d)(1) and solicited comment on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were generally supportive of the proposed policy, with support received for aligning conditions of coverage with the 2024 CDC DPRP Standards definitions. Commenters universally supported aligning conditions of coverage with the 2024 CDC DPRP Standards definitions (*e.g.,* distance learning, online delivery, and in-person with a distance learning component). Many commenters stated that these terms will allow suppliers to streamline data reporting to the CDC's Diabetes Prevention Recognition Program (DPRP). Some commenters provided recommendations to allow virtual-only providers to offer MDPP asynchronously. Some commenters also suggested that CMS remove the once in a lifetime use of MDPP.

Response: We have responded to previous public comments requesting that CMS allow asynchronous delivery of MDPP and virtual-only providers to offer MDPP in previous rules (85 FR 84472, 84831). The MDPP expanded model was certified as an in-person program and allowing for virtual-only delivery is outside of the model's certification. Virtual-only providers include those that deliver the National DPP services solely by distance learning or online delivery. Although ''telehealth'' is included in CDC's definition of distance learning, CMS stated in the CY 2017 PFS final rule (82 FR 52976, 53235) that MDPP services delivered via a telecommunications system or other remote technologies do not qualify as telehealth services. Additionally, we have stated that through utilizing distance learning, participants may still interact with their

Coach and other participants in their cohort in real-time, allowing for relationship building and peer support, unlike online delivery which is delivered asynchronously (88 FR 79244). CMS is currently allowing an exception to the once per lifetime requirement for MDPP beneficiaries to restart their MDPP program if their services were interrupted by the PHE for COVID–19 (85 FR 19230, 19283). After consideration of public comments regarding the proposed changes to amend § 410.79(b) and (d)(1), we are finalizing as proposed and will continue to monitor use of this flexibility to approximate the demand for beneficiaries to restart their program for other reasons.

2. Changes to § 410.79(e)(3)(iii)

As part of MDPP's Emergency Policy finalized in the CY 2021 PFS final rule, we allowed for virtual weight collection (88 FR 79249). We summarized our policies for alternatives to the requirement for in-person weight collection at *Alternatives to the requirement for in-person weight measurement* (§ 410.79(e)(3)(iii)), which permit an MDPP supplier to obtain weight measurements for MDPP beneficiaries for the baseline weight and any weight loss-based performance achievement goals in the following manner: (1) via digital technology, such as scales that transmit weights securely via wireless or cellular transmission; or (2) via self-reported weight measurements from the at-home digital scale of the MDPP beneficiary (88 FR 79243). We stated that self-reported weights must be obtained during live, synchronous online video technology, such as video chatting or video conferencing, wherein the MDPP Coach observes the beneficiary weighing themselves and views the weight indicated on the at-home digital scale. Alternatively, the MDPP beneficiary may self-report their weight by submitting to the MDPP supplier a date-stamped photo or video recording of the beneficiary's weight, with the beneficiary visible in their home. The photo or video must clearly document the weight of the MDPP beneficiary as it appears on the digital scale on the date associated with the billable MDPP session. This flexibility has allowed suppliers to bill for MDPP beneficiaries achieving weight loss performance goals.

Overall, commenters on the proposed MDPP Extended flexibilities in the CY 2024 PFS rule were very supportive of CMS continuing to allow virtual weight collection (88 FR 79240 through 79256). However, we received several comments regarding barriers suppliers experienced relating to virtual weight collection during the PHE for COVID–19. For example, several commenters recommended that CMS no longer require date-stamped photos to document the self-reported beneficiary weights (88 FR 79249). The commenters also reported that many of their beneficiaries are unable to take a picture while standing on their home scales due to risk of injury and physical health limitations. Commenters stated that this risk has prevented organizations from submitting claims accurately, since they have several participants who live alone and attend sessions via distance learning (88 FR 79249). We acknowledged in our responses to these comments that some MDPP beneficiaries may lack the technology or capacity to provide a date-stamped photograph to document their body weight measurements. We stated that in situations in which beneficiaries may be unable to self-report their weight according to the MDPP conditions of coverage, suppliers may want to consider collecting weight measurements from the MDPP beneficiary in person.

We have continued to hear from MDPP suppliers and interested parties that the requirement to submit a photo with both the beneficiary's weight on the scale and the beneficiary visible is not physically possible. This problem has become even more relevant in CY 2024 as suppliers continue to expand distance learning to help reach beneficiaries in rural and underserved areas, sometimes across state lines. We previously responded that for situations in which beneficiaries may be unable to self-report their weight according to the MDPP conditions of coverage, suppliers may want to consider collecting weight measurements from the MDPP beneficiary in person (88 FR 79249). However, this may not be a practical option for beneficiaries who have chosen distance learning based on not living within driving distance from an MDPP supplier location. Therefore, we proposed revising § 410.79(e)(3)(iii)(C) to provide that self-reported weights must be obtained during live, synchronous online video technology, such as video chatting or video conferencing, wherein the MDPP Coach observes the beneficiary weighing themselves and views the weight indicated on the at-home digital scale, or the MDPP supplier receives 2 (two) date-stamped photos or a video recording of the beneficiary's weight, with the beneficiary visible on the scale, submitted by the MDPP beneficiary to the MDPP supplier. Photo or video must clearly document the weight of the MDPP beneficiary as it appears on their digital scale on the date associated with the billable MDPP session. If choosing to submit 2 photos, one photo must show the beneficiary's weight on the digital scale, the second photo must show the beneficiary visible in their home, and both photos must be date-stamped. Similar to options in paragraphs (e)(3)(iii)(A) and (B) in § 410.79, this revised option in paragraph (e)(30(iii)(C) is only available for MDPP beneficiaries reporting their weight for an MDPP distance learning session. We are continuing to require the date-stamp on both photos to ensure program integrity in the virtual setting. We proposed to amend § 410.79(e)(3)(iii).

We solicited comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Similar to comments from previous rules (FR 88 79249, 88 FR 78818), commenters expressed concern about the burden of requiring a date-stamped photo of weight on the lifestyle coaches, suppliers, and beneficiaries due to technology difficulties and/or inexperience, risk of injury, and HIPAA compliance for photo storage. Some commenters suggested further guidance on what constitutes a date-stamped photo, suggesting that CMS allow for metadata to count toward the requirement, and that CMS further align with CDC 2024 DPRP Standards to allow for weight self-attestation in which participants may self-report weight without photo or video evidence. While many commenters supported the new option to *allow* 2 photos instead of just 1 to self-report weight in an MDPP distance learning session, some commenters misinterpreted the proposed regulatory language, commenting that CMS was *requiring* 2 photos instead of 1, thus doubling the amount of photo collection.

Response: After consideration of public comments, we are revising the regulation text in the final rule to reflect that beneficiaries can choose to submit one or two (2) photos for self-reporting weight for an MDPP distance learning session. If a beneficiary is able to capture both themself and their weight on the digital scale in one photo, then they can choose to submit only one photo, or they can choose to submit two photos (one showing their weight on the scale and one showing them visible in their home), if this is more convenient. Our intention was to add flexibility in

self-reporting of weight for MDPP distance learning sessions, not to limit it. The new regulation text we are finalizing through the CY 2025 PFS specifies ''(C) Self-reported weight measurements from the at-home digital scale of the MDPP beneficiary. Self-reported weights must be obtained during live, synchronous online video technology, such as video chatting or video conferencing, wherein the MDPP Coach observes the beneficiary weighing themselves and views the weight indicated on the at-home digital scale, or the MDPP supplier receives one or 2 (two) date-stamped photo(s) or a video recording of the beneficiary's weight, with the beneficiary visible on the scale, submitted by the MDPP beneficiary to the MDPP supplier. Photo or video must clearly document the weight of the MDPP beneficiary as it appears on their digital scale on the date associated with the billable MDPP session. If choosing to submit one photo, this photo must show the beneficiary's weight on the scale with the beneficiary visible in their home. If choosing to submit 2 photos, one photo must show the beneficiary's weight on the digital scale, and a second photo must show the beneficiary visible in their home. All photos must be date-stamped.''

Additionally, regarding the comments requesting that photo metadata be used for the required date-stamp for self-reporting weight during an MDPP distance learning session, at this time we are not further defining what constitutes a date stamp for the purpose of MDPP videos and photos under this regulation. CMS relies on MDPP suppliers to ensure a reasonable and reliable indication of the date connected to a picture or video. A physical date on the photo or video would satisfy this requirement, however, CMS also recognizes that in some cases a technological solution may meet these criteria.

Regarding the National DPP self-attestation of weight, self-reporting of weight was added to MDPP as a flexibility during the PHE (85 FR 19230, 19283). The submission of video or photos remains necessary to ensure program integrity in MDPP. We acknowledge that some MDPP beneficiaries may lack the technology or capacity to provide a date-stamped photograph to document their body weight measurements. In situations in which beneficiaries may be unable to self-report their weight according to the MDPP conditions of coverage, suppliers may consider collecting weight measurements from the MDPP beneficiary in-person.

Lastly, we finalized in the CY 2021 PFS final rule that the flexibilities under § 410.79(e)(3)(iii) and (iv) would only apply only to MDPP suppliers that have and maintain CDC DPRP ''in-person'' recognition (85 FR 84830 and 84831). In the CY 2024 PFS final rule, we extended flexibilities allowed during the PHE for COVID–19 or 4 years, or through December 31, 2027 (88 FR 79241). We also confirmed that that the Extended flexibilities would continue to only apply to MDPP suppliers that have and maintain CDC DPRP ''in-person'' recognition, and that virtual only suppliers were not permitted to furnish the Set of MDPP services because MDPP beneficiaries may elect to return to in-person services, and MDPP suppliers need to be able to accommodate their request (88 FR 79248).

To reduce confusion as MDPP suppliers transition to the new CDC DPRP recognition for ''in-person with a distance learning component,'' we are clarifying that MDPP suppliers can have and maintain either CDC's ''in-person'' or the new ''in-person with a distance learning component'' CDC DPRP code. The 2024 CDC DPRP Standards, implemented in June 2024, introduced and defined the new ''in-person with a distance learning component'' modality and associated code.[399] This new modality and code for recognition include a combination of in-person and distance learning delivery, which are both modalities currently permitted until December 31, 2027 (88 FR 79241). The new MDPP term and definition for ''in person with a distance learning component'' that we are proposing to align with the 2024 CDC DPRP Standards will replace the current MDPP ''combination delivery'' term, which we proposed to remove in this rulemaking. Aligning terminology for delivery of MDPP that involves a combination of in-person and distance learning delivery with the 2024 CDC DPRP Standards would reduce administrative burden to MDPP suppliers and allow them to streamline CDC DPRP data submission (that is, they will not have to submit data for two CDC organization codes). MDPP suppliers will not be required to switch to this new code if they already have an in-person code; it is only being made available for their convenience.

[399] Centers for Disease Control and Prevention Diabetes Prevention Recognition Program. Standards and Operating Procedures. Requirements for CDC Recognition. June 2024. *https://nationaldppcsc.cdc.gov/s/article/DPRP-Standards-and-Operating-Procedures.*

3. Changes to § 414.84(a), (c), (d), and (e)

We further proposed to amend § 414.84(a), (d), and (e) to remove the MDPP bridge payment. This payment is no longer necessary in MDPP's CY 2024 FFS payment structure for attendance and could introduce the potential for fraud, waste, or abuse.

The CY 2017 PFS final rule confirmed that a beneficiary may change MDPP suppliers at any time (81 FR 80470). The MDPP bridge payment was introduced in the CY 2018 PFS final rule at § 414.84(a) and is defined as follows: ''Bridge payment means a one-time payment to an MDPP supplier for furnishing its first MDPP session to an MDPP beneficiary who has previously received one or more MDPP services from a different MDPP supplier'' (81 FR 80470). The CY 2018 PFS final rule specified that an MDPP supplier that had previously been paid either a bridge payment or a performance payment for an MDPP beneficiary was not eligible to be paid a bridge payment for that beneficiary, along with other conditions. An MDPP supplier may only receive one bridge payment per MDPP beneficiary, however, there is no limit on how many MDPP suppliers can receive a bridge payment for the same beneficiary (82 FR 53361).

The CY 2018 PFS final rule also noted that the MDPP bridge payment was intended to be similar (that is, the same amount) to the payment for the first core session furnished by the previous supplier and would be received only if the subsequent supplier did not furnish the first core session to the MDPP beneficiary (82 FR 53361). In the performance-based payment structure, the bridge payment was intended to prevent scenarios where subsequent MDPP suppliers would receive no payment for sessions furnished to MDPP beneficiaries who changed suppliers during the MDPP services period in the absence of the bridge payment. We stated that the bridge payment was not intended to be a performance payment; rather, it would account for the financial risk a subsequent MDPP supplier took on by furnishing services to a beneficiary changing MDPP suppliers during the MDPP services period (82 FR 53293). However, such risk is not applicable in an FFS payment structure.

Along with the performance payments for weight loss, the MDPP bridge payment was retained in the CY 2024 Fee Schedule for MDPP (88 FR 79252). Currently, a subsequent MDPP supplier can receive both an attendance payment and a bridge payment for the first session attended by an MDPP beneficiary who switches suppliers. For

example, in CY 2024, if a beneficiary changed suppliers on MDPP session 8, the subsequent supplier could receive both the attendance payment for session 8 ($25) and the bridge payment ($25). The bridge payment for this beneficiary could only be received by this supplier once, but if the beneficiary changed suppliers again (for example, on session 17), the new (second) subsequent supplier could also receive the bridge payment in addition to the payment for session 17 ($25). This could continue as many times as the beneficiary changed suppliers until they have the maximum of 22 sessions paid, across all suppliers, with no maximum on the total number of bridge payments. In the CY 2018 PFS final rule, we noted some program integrity risk that organizations could coordinate to bill multiple bridge payments that would ultimately increase total MDPP payments to separately enrolled MDPP suppliers to serve the financial interests of the umbrella organization. This scenario could occur if MDPP suppliers systematically encouraged beneficiaries to change suppliers for the purpose of being paid the bridge payment (82 FR 53294). Due to these reasons, we propose to amend § 414.84(a), (d), and (e) to remove reference to, and requirements of the MDPP bridge payment. Per our Regulatory Impact Analysis, we expect removal of the MDPP bridge payment to be budget neutral for the Medicare program. We solicited comment on these proposals, and the comments are addressed below.

Additionally, at § 414.84(c), facilitate Medicare Administrative Contractors (MACs) in processing claims for same day make-up sessions in MDPP, we proposed to require MDPP suppliers to append an existing claim modifier to any claim for G9886 or G9887 that indicates a make-up session that was held on the same day as a regularly scheduled MDPP session. The CY 2018 PFS final rule permits an MDPP beneficiary to have one make-up session on the same day as a regularly scheduled session and for a beneficiary to have one make-up session per week (82 FR 53360), consistent with CDC DPRP Standards.[400] In the CY 2024 PFS final rule, we stated that we wanted to encourage suppliers to schedule make-up sessions on days other than the same day of a regularly scheduled session to avoid claims being rejected or denied under the new CY 2024 FFS payment schedule and to allow beneficiaries to receive the benefit as intended by having access to the full 12 months MDPP service period to build the skills needed to reduce their risk for diabetes (88 FR 79250).

However, since then, we have heard from MDPP suppliers that same day make-up sessions are an essential flexibility that assist an MDPP beneficiary in staying on track with the curriculum and their cohort after an MDPP beneficiary needs to miss a regularly scheduled session. To help prevent potential claim rejections for duplicate services, we proposed to require MDPP suppliers to append a modifier to the applicable G-code for the second session held on the same day as a regularly scheduled MDPP session. Specifically, we proposed to add § 414.84(c)(4), which states that ''Current Procedural Terminology (CPT) Modifier 79 (repeat services by same physician) must be appended to any claim for G9886 or G9887 to identify an MDPP make-up session that was held on the same day as a regularly scheduled MDPP session.'' We believe this new requirement would contribute minimal additional complexity to the payment structure while creating a flexibility that would have value for the program, particularly for beneficiaries in the core phase of MDPP who may not have transportation to 2 in-person sessions in one week or have the flexibility to make time on more than one day per week for a distance learning session. Additionally, we believe the existing limitation on one make-up session per week would be sufficient to ensure program benefit because whether the make-up session is held on the same day or the next day would likely have minimal impact on program duration and intensity. To clarify, we proposed that the CPT Modifier 79 would only need to be appended to the HCPCS code (G9886 or G9887) that identifies the session that included content from a previously held session that serves as a makeup session for the session the MDPP beneficiary missed, which was held on the same day as a regularly scheduled MDPP session. This modifier would not need to be included on claims for make-up sessions held on different days than regularly scheduled MDPP sessions.

Lastly, with the removal of § 414.84(d), we proposed to amend the current § 414.84(e) to be the new § 414.84(d). We also removed from the new § 414.84(d) the reference to updating the MDPP bridge payment, as the bridge payment has been proposed to be removed from this CY 2025 Physician Fee Schedule rulemaking.

We solicited comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were all supportive of the proposed policies to remove the MDPP bridge payment and to allow Medicare Administrative Contractors (MACs) to process claims for an MDPP make-up session held on the same day as a regularly scheduled session. Many commenters noted these changes will reduce administrative burden, allow suppliers to streamline data reporting, and increase beneficiary flexibilities. Specifically, many commenters stated that same-day makeup sessions will allow MDPP suppliers to streamline data reporting to the CDC and alleviate participant burden by accommodating beneficiaries without access to transportation for multiple program classes within one week.

Response: After consideration of public comments, we are finalizing the changes to the provision to remove the MDPP bridge payment as proposed. To allow MACs to process claims for MDPP make-up sessions held on the same day as a regularly scheduled session, we are finalizing with a technical correction to change CPT modifier 79 to CPT modifier 76. We proposed to add § 414.84(c)(4), which states that ''Current Procedural Terminology (CPT) Modifier 79 (repeat services by same physician) must be appended to any claim for G9886 or G9887 to identify an MDPP make-up session that was held on the same day as a regularly scheduled MDPP session.'' Upon further review of modifier 79 and the associated description, we are making a technical correction to finalize in § 414.84(c)(4) that Modifier 76 (repeat services by same physician) to be appended to any claim for G9886 or G9887 to identify an MDPP make-up session that was held on the same day as a regularly scheduled MDPP session.

4. Aligning Language With Previous Rulemaking in §§ 410.79, 424.205, and 414.84

We proposed minor edits throughout §§ 410.79, 424.205, and 414.84 to update outdated references and align with previous rulemaking pertaining to MDPP terminology, payment structure, and requirements. This includes updating references to the performance-based payments for attendance and ongoing maintenance sessions, which were both removed from the 2024 MDPP Fee Schedule by the CY 2024 PFS final rule (88 FR 79252), as well as including

[400] Centers for Disease Control and Prevention Diabetes Prevention Recognition Program. Standards and Operating Procedures. Requirements for CDC Recognition. June 2024. *https://nationaldppcsc.cdc.gov/s/article/DPRP-Standards-and-Operating-Procedures.*

the clarification that suppliers can offer MDPP sessions via distance learning, a flexibility extended by the CY 2024 PFS final rule (88 FR 79241), where applicable.

At § 410.79(b), we proposed to update the definition for the ''Set of MDPP services'' to remove the reference to ''ongoing maintenance'' sessions. All references to and requirements for the MDPP ''ongoing maintenance'' phase were removed by the CY 2024 PFS finale rule (88 FR 79256). We are revising this definition to read: ''Set of MDPP services means the series of MDPP sessions, composed of core sessions and core maintenance sessions, and subject to paragraph (c)(3) of this section offered over the course of the MDPP services period.''

We also proposed § 410.79(e)(3)(iv)(F)(*3*) to state that no more than 12 virtual sessions offered monthly during the ongoing maintenance session intervals, months 13 through 24 for beneficiaries enrolled before January 1, 2022.

This proposed revision adds the date that the CY 2022 PFS final rule was effective, which is the date when no more MDPP beneficiaries could enroll in ongoing maintenance sessions (86 FR 65317).

At § 410.79(e)(3)(v)(F)(*2*), we proposed to remove the reference to weight measurement at an ongoing maintenance session, so the paragraph provides that for an MDPP beneficiary who began receiving the Set of MDPP services on or after January 1, 2021, has suspended services during an applicable 1135 waiver event, the MDPP supplier must use the baseline weight recorded at the beneficiary's first core session.

At § 424.205(c)(10), we proposed revision to specify in-person and distance learning delivery for MDPP core and core maintenance sessions, to provide that, except as allowed under § 424.205(d)(8), the MDPP supplier must offer an MDPP beneficiary no fewer than all of the following:

- 16 in-person or distance learning core sessions no more frequently than weekly for the first 6 months of the MDPP services period, which begins on the date of attendance at the first such core session.
- 1 in-person or distance learning core maintenance session each month during months 7 through 12 (6 months total) of the MDPP services period.

At § 424.205(f)(1)(ii), we propose to remove reference to the HICN, as Medicare is now using Medicare Beneficiary Identifiers (MBIs),[401] to state: Basic beneficiary information for each MDPP beneficiary in attendance, including but not limited to beneficiary name, MBI, and age.

At § 424.205(f)(2)(i), we proposed to replace ''whether a core session, a core maintenance session, an in-person make-up session, or a virtual make-up session'' with the two currently permitted types of sessions (that is, in-person and distance learning), to state: Documentation of the type of session (in-person or distance learning).

At § 424.205(f)(5), we proposed to remove the references to the MDPP performance-based payments for attendance in paragraphs (f)(5)(i) and (ii) because these payments were removed in the CY 2024 Fee Schedule for MDPP (88 FR 79252). In their place, we are adding references to the performance payment for the required minimum 5 percent weight loss (82 FR 53289). We also proposed to correct the references to § 414.84(b), and also to remove the reference to the ongoing maintenance sessions from § 424.205(f)(5)(iv).

At § 414.84(b)(1), we proposed to clarify that the performance payment for the required minimum weight loss is made for 5 percent weight loss, as reflected in the CY 2024 Fee Schedule (88 FR 79252), and can be made for a distance learning, as well as an in-person MDPP session, as allowed by the PHE for COVID–19 flexibilities (85 FR 84830 through 84841) and their extension (88 FR 79241). Performance Goal 1 provides that it achieves the required minimum 5-percent weight loss. We make a performance payment to an MDPP supplier for an MDPP beneficiary who achieves the required minimum weight loss as measured in-person or during a distance learning session during a core session or core maintenance session furnished by that supplier.

Similarly, we proposed to revise § 414.84(b)(2) for 9 percent weight loss. Performance Goal 2 provides that it achieves 9-percent weight loss. We make a performance payment to an MDPP supplier for an MDPP beneficiary who achieves at least a 9-percent weight loss as measured in-person or in a distance learning session during a core session or core maintenance session furnished by that supplier.

We solicited comments on these proposals.

We did not receive public comments on these provisions, and therefore, we are finalizing as proposed.

F. Modifications Related to Medicare Coverage for Opioid Use Disorder (OUD) Treatment Services Furnished by Opioid Treatment Programs (OTPs)

1. Background

Section 2005 of the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment (SUPPORT) for Patients and Communities Act (SUPPORT Act) (Pub. L. 115–271, October 24, 2018) established a new Medicare Part B benefit for OUD treatment services furnished by OTPs during an episode of care beginning on or after January 1, 2020. In the CY 2020 PFS final rule (84 FR 62630 through 62677 and 84 FR 62919 through 62926), we implemented Medicare coverage and provider enrollment requirements and established a methodology for determining the bundled payments for episodes of care for the treatment of OUD furnished by OTPs. We also established in the CY 2020 PFS final rule new codes and finalized bundled payments for weekly episodes of care that include methadone, oral buprenorphine, implantable buprenorphine, injectable buprenorphine or naltrexone, and non-drug episodes of care, as well as add-on codes for intake and periodic assessments, take-home dosages for methadone and oral buprenorphine, and additional counseling.

Since the CY 2020 PFS final rule, we have made several refinements and expansions to services covered under the Medicare OTP benefit. Specifically, we adopted new add-on codes for take home supplies of nasal naloxone and injectable naloxone (85 FR 84683 through 84692) in the CY 2021 PFS final rule, and a new add-on code and payment for a higher dose of nasal naloxone (86 FR 65340 and 65341) in the CY 2022 PFS final rule. We have also finalized various telecommunications flexibilities, including: to allow OTPs to furnish individual and group therapy and substance use counseling via two-way interactive audio-video telecommunications (84 FR 62630 through 62677 and 84 FR 62919 through 62926) in the CY 2020 PFS final rule, and via audio-only telephone calls when audio-video telecommunications are not available to the beneficiary (86 FR 65342) in the CY 2022 PFS final rule; to allow the OTP intake add-on code to be furnished via two-way interactive audio-video telecommunications when billed for the initiation of treatment with buprenorphine, and via audio-only telecommunications when audio-video telecommunications are not available to

[401] *https://www.cms.gov/training-education/partner-outreach-resources/new-medicare-card/medical-beneficiary-identifiers-mbis.*

the beneficiary, to the extent that these technologies are authorized by the Drug Enforcement Administration (DEA) and the Substance Abuse and Mental Health Services Administration (SAMHSA) at the time the service is furnished (87 FR 69775 through 69777) in the CY 2024 final rule; and to allow periodic assessments to be furnished via two-way interactive audio-video telecommunications as clinically appropriate (85 FR 84690) in the CY 2021 final rule. OTPs may furnish these aforementioned services via telecommunications systems provided all other applicable requirements are met. Additionally, for the purposes of the geographic adjustment, we have clarified, in the CY 2023 final rule, that services furnished via OTP mobile units will be treated as if the services were furnished in the physical location of the OTP for purposes of determining payments to OTPs under the Medicare OTP bundled payment codes and/or add-on codes, as long as services are medically reasonable and necessary and comply with SAMHSA and DEA guidance (87 FR 69768 through 69777). Lastly, we have made a few changes to various pricing methodologies under the OTP benefit in the 2023 PFS final rule, including: revising our methodology for pricing the drug component of the methadone weekly bundle and the add-on code for take-home supplies of methadone by using the Producer Price Index (PPI) for Pharmaceuticals for Human Use (Prescription) to better reflect the changes in methadone costs for OTPs over time (87 FR 69768 through 69777); and modifying the payment rate for individual therapy in the non-drug component of the bundled payment to base the payment rate on the rate for longer therapy sessions that better account for the greater severity of needs for patients with an OUD (87 FR 69768 through 69777).

More recently, for CY 2024, we made further modifications and expansions to covered services for the treatment of OUD by OTPs. In the CY 2024 PFS final rule (88 FR 79089 through 79093), we finalized an extension to allow periodic assessments to be furnished audio-only through the end of CY 2024 when video is not available to the extent that use of audio-only communications technology is permitted under the applicable SAMHSA and DEA requirements at the time the service is furnished, and all other applicable requirements are met. In the CY 2024 PFS final rule, we noted that extending these flexibilities another year would allow CMS time to further consider this issue, including whether periodic assessments should continue to be furnished using audio-only communication technology following the end of CY 2024. Lastly, in the CY 2024 Outpatient Prospective Payment System (OPPS) final rule (88 FR 81845 through 81858), we finalized an add-on code for intensive outpatient program (IOP) services furnished by OTPs for the treatment of OUD and added a new paragraph (ix) in the definition of ''Opioid disorder treatment service'' at § 410.67(b) to describe such services. We stated that Medicare would pay for IOP services provided by OTPs if each service is medically reasonable and necessary and not duplicative of any service paid for under any bundled payments billed for an episode of care in a given week, and other applicable requirements are met. We believe that payment for IOP services will improve continuity of care between different treatment settings and levels of care, and further promote health equity for Medicare beneficiaries that may face barriers to accessing treatment, such as racial/ethnic minorities and/or beneficiaries aged 65 or older. We continue to monitor utilization of OUD treatment services furnished by OTPs to ensure that Medicare beneficiaries have appropriate access to care. For CY 2025, we proposed several modifications to the policies governing Medicare coverage and payment for OUD treatment services furnished by OTPs.

2. Telecommunication Flexibilities for Periodic Assessments and Initiation of Treatment With Methadone

We have finalized several flexibilities for OTPs regarding the use of telecommunications, both during the Public Health Emergency (PHE) for the Coronavirus Disease 2019 (COVID–19) and outside of the PHE. In the CY 2020 PFS final rule, we finalized a policy allowing OTPs to furnish substance use counseling and individual and group therapy via two-way interactive audio-video communication technology. In the interim final rule with comment period (IFC) entitled ''Medicare and Medicaid Programs: Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency,'' which appeared in the April 6, 2020 **Federal Register** (85 FR 19258), we revised paragraphs (iii) and (iv) in the definition of *opioid use disorder treatment service* at § 410.67(b) on an interim final basis to allow the therapy and counseling portions of the weekly bundles, as well as the add-on code for additional counseling or therapy, to be furnished using audio-only telephone calls rather than via two-way interactive audio-video communication technology during the PHE for the COVID–19 if beneficiaries do not have access to two-way audio-video communications technology, provided all other applicable requirements are met. In the CY 2022 PFS final rule (86 FR 65341 through 65343), we finalized that after the conclusion of the PHE for COVID–19, OTPs are permitted to furnish substance use counseling and individual and group therapy via audio-only telephone calls when audio and video communication technology is not available to the beneficiary. As we explained in the CY 2022 PFS final rule (86 FR 65342), we interpret the requirement that audio/video technology is ''not available to the beneficiary'' to include circumstances in which the beneficiary is not capable of or has not consented to the use of devices that permit a two-way, audio/video interaction because in each of these instances audio/video communication technology is not able to be used in furnishing services to the beneficiary. In the CY 2023 PFS final rule (87 FR 69775 through 69777), we further extended telecommunication flexibilities for the initiation of treatment with buprenorphine outside of the PHE for COVID–19 in paragraph (vi) in the definition of *opioid use disorder treatment service* at § 410.67(b). Specifically, we allowed the OTP intake add-on code to be furnished via two-way, audio-video communications technology when billed for the initiation of treatment with buprenorphine, to the extent that the use of audio-video telecommunications technology to initiate treatment with buprenorphine is authorized by DEA and SAMHSA at the time the service is furnished. We also permitted the use of audio-only communication technology to initiate treatment with buprenorphine in cases where audio-video technology is not available to the beneficiary, provided all other applicable requirements are met.

a. Allowing Periodic Assessments To Be Furnished Via Audio-Only Telecommunications on a Permanent Basis

In recent years, we have finalized several telecommunication flexibilities for periodic assessments furnished by OTPs. In the IFC entitled ''Medicare and Medicaid Programs, Basic Health Program, and Exchanges; Additional Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency and Delay of Certain Reporting Requirements for the Skilled Nursing Facility Quality Reporting Program,'' which appeared in the May 8, 2020 **Federal Register** (85 FR 27558), we revised paragraph (vii) in the definition of ''Opioid use disorder treatment

service'' at § 410.67(b) on an interim final basis to allow periodic assessments to be furnished during the PHE for COVID–19 via two-way interactive audio-video telecommunication technology and, in cases where beneficiaries do not have access to two-way audio-video communication technology, to permit the periodic assessments to be furnished using audio-only telephone calls rather than via two-way interactive audio-video communication technology, provided all other applicable requirements are met. In the CY 2021 PFS final rule (85 FR 84690), we finalized our proposal to revise paragraph (vii) in the definition of ''Opioid use disorder treatment service'' at § 410.67(b) to provide that periodic assessments (HCPCS code G2077) must be furnished during a face-to-face encounter, which includes services furnished via two-way interactive audio-video communication technology, as clinically appropriate, provided all other applicable requirements are met, on a permanent basis.

Furthermore, in the CY 2023 PFS proposed rule (87 FR 46093), we sought comment on whether we should allow periodic assessments to continue to be furnished using audio-only communication technology following the end of the PHE for COVID–19 for patients who are receiving treatment via buprenorphine, and if this flexibility should also continue to apply to patients receiving methadone or naltrexone. In response, several commenters advocated for CMS to continue to allow periodic assessments to be furnished audio-only when video is not available after the end of the PHE. Commenters highlighted that allowing audio-only flexibilities would further promote health equity for individuals who are economically disadvantaged, live in rural areas, are members of racial and ethnic minorities, lack access to reliable broadband or internet access, or do not possess devices with video capability. Commenters also indicated that periodic assessments are no less complex than intake/initial assessments, and thus are equally appropriate for audio-video and audio-only care, and that permitting audio-only flexibilities would allow an opportunity for both the provider and patient to jointly determine that the patient would individually benefit from telehealth services. After considering these comments, we determined that it would be appropriate to allow periodic assessments to be furnished audio-only when video is not available through the end of CY 2023, to the extent that it is authorized by SAMHSA and DEA at the time the service is furnished and, in a manner consistent with all applicable requirements. We stated our belief that this modification would allow continued beneficiary access to these services for the duration of CY 2023 in the event the PHE terminated before the end of 2023 and that it would also grant additional time for CMS to further consider telecommunication flexibilities associated with periodic assessments.

Moreover, section 4113 of Division FF, Title IV, Subtitle A of the Consolidated Appropriations Act, 2023 (CAA, 2023) (Pub. L. 117–328, December 29, 2022) extended the telehealth flexibilities enacted in the Consolidated Appropriations Act, 2022 (CAA, 2022) (Pub. L. 117–103, March 15, 2022). Specifically, it amended sections 1834(m), 1834(o), and 1834(y) of the Act to delay the requirement for an in-person visit prior to furnishing certain mental health services via telecommunications technology by physicians and other practitioners, Rural Health Clinics (RHCs), and Federally Qualified Health Centers (FQHCs) until dates of service on or after January 1, 2025, if the PHE for COVID–19 had ended prior to that date. Additionally, it extended the flexibilities that were available during the PHE that allowed for certain Medicare telehealth services defined in section 1834(m)(4)(F)(i) of the Act to be furnished via an audio-only telecommunications system through December 31, 2024, if the PHE for COVID–19 had ended prior to that date. The PHE for COVID–19, which was declared under section 319 of the Public Health Service Act, expired at the end of the day on May 11, 2023, so the aforementioned flexibilities were extended through the end of CY 2024.

To better align coverage for periodic assessments furnished by OTPs with the telehealth flexibilities described in section 4113 of the CAA, 2023 for other settings under Medicare, in the CY 2024 PFS final rule (88 FR 79089 through 79093; 79528), we finalized extending the audio-only flexibilities for periodic assessments furnished by OTPs through the end of CY 2024 in paragraph (vii) in the definition of Opioid use disorder treatment service at § 410.67(b). We finalized to allow periodic assessments to be furnished audio-only when video is not available to the extent that use of audio-only communications technology is permitted under the applicable SAMHSA and DEA requirements at the time the service is furnished, and all other applicable requirements are met. In submitted comments supporting the proposal, commenters reiterated evidence showing that audio-only telehealth encounters are more prominent among individuals who are older, Black, Hispanic, American Indian/Alaska Native, Spanish-speaking, living in areas with low broadband access, low-income, and with public insurance, suggesting that the proposal would have positive health equity implications for these populations.[402] Several other commenters raised that audio-only flexibilities are important since many underserved populations may experience challenges in partaking in video-based telehealth services, due to not possessing the needed technological proficiencies to operate video-based services, not having a caregiver able to assist them with appointments, feeling discomfort with the use of video, and because of the cost of high-speed internet and data required for video technologies. Several other commenters shared evidence that audio-only visits produce many of the same benefits as video-based visits,[403] and that patients often report that audio-only visits left them feeling supported and with greater privacy, provided increased access to behavioral health professionals, and helped reduce transportation barriers.[404] Lastly, a large number of commenters requested that CMS make the extension for audio-only periodic assessments permanent beyond CY 2024. Commenters stated that extending this policy permanently would retain a beneficiary's right to decide with their provider how best to receive their care

and would curtail existing barriers that Medicare beneficiaries with an OUD may face in accessing care. In response to these comments that requested indefinitely extending these audio-only flexibilities for periodic assessments, CMS stated that extending these flexibilities for one additional year at the time would allow the agency time to further examine the issue, including to understand if a permanent extension would be appropriate for patients who are receiving treatment via buprenorphine, methadone, and/or naltrexone at OTPs, and whether proper safeguards are in place so these services can be delivered in a way that would not diminish safety or quality of care for Medicare beneficiaries with an OUD.

We continue to monitor the services provided under the OTP benefit to ensure flexibilities for OUD treatment services are consistent with flexibilities authorized in other settings under Medicare, as medically reasonable and necessary for the diagnosis and treatment of OUD. In the CY 2022 PFS final rule, we revised the regulatory definition of ''interactive telecommunications system'' at § 410.78(a)(3) for Medicare Telehealth services paid under the PFS beyond the termination of the PHE for COVID–19 to allow for inclusion of audio-only services under certain circumstances. Specifically, we redefined ''interactive telecommunications system'' to include audio-only communications technology when used for telehealth services for the diagnosis, evaluation, or treatment of mental health disorders furnished to a patient in their home. We also finalized to limit payment for audio-only services to services furnished by a physician or practitioner that has the technical capability at the time of the service to use two-way audio-video telecommunications, but where the patient is not capable of, or does not consent to, the use video technology for the service, and the patient is located at their home at the time of service. Lastly, we clarified that SUD services are considered mental health services for purposes of the expanded definition of ''interactive telecommunications system'' to include audio-only services under § 410.78(a)(3). In short, these flexibilities and policy clarifications that permit audio-only telecommunication flexibilities for the treatment of a SUD, which can include an OUD, already exist under other payment systems in Medicare.

Therefore, to better align coverage for periodic assessments furnished by OTPs with other telehealth services furnished under the PFS for the diagnosis, evaluation, or treatment of a mental health disorder including SUDs, and in response to many supportive comments received in response to the CY 2024 PFS proposed rule that advocated for allowing OTPs to furnish periodic assessments via audio-only telecommunications on a permanent basis, in the CY 2025 PFS proposed rule we proposed to allow OTPs to furnish periodic assessments using audio-only communications technology when video is not available on a permanent basis beginning January 1, 2025. Under this proposal, we would allow periodic assessments to be furnished via audio-only when video is not available to the extent that use of audio-only communications technology is permitted under the applicable SAMHSA and DEA requirements at the time the service is furnished, and all other applicable requirements are met.

We believe permanently extending this flexibility would meaningfully promote access to care for the Medicare population, as supported by our analysis of claims data showing the proportion of telephonic audio-only visits increases with the age of the patient, with 17-percent of visits delivered via audio-only interaction for patients 41–60 years of age, 30-percent for patients 61 to 80 years of age, and 47 percent of visits for patients over 81 years of age.[405] Evidence further reveals that Medicare beneficiaries who are older than 65 years old, racial/ethnic minorities, dual-enrollees in Medicare and Medicaid, or living in rural areas, or who experience low broadband access, low-income, and/or for whom English in not their primary language, are more likely to be offered and use audio-only telemedicine services than audio-video services.[406] Other evidence also suggests that while Tribal populations, including American Indian and Alaska Natives, have the highest rates of OUD prevalence among Medicare beneficiaries, one-third of these populations do not have adequate access to high-speed broadband and continue to rely on audio-only visits.[407] Telemedicine flexibilities have been shown to be feasible and effective for rural patients with an OUD with data supporting that telemedicine flexibilities have helped improve treatment retention in OUD treatment, especially for rural patients who are older and covered by Medicare.[408] Lastly, these audio-only flexibilities would be meaningful for OTPs and their patients because telehealth services have become widely used among SUD treatment facilities as regular service offerings. During the COVID–19 pandemic, SUD treatment facilities increased telemedicine offerings by 143 percent, and as of 2021, almost 60 percent of SUD treatment facilities offer telehealth.[409] Now, telephone-based (that is, audio-only) therapy provided by SUD programs has been found to be one of the most common modes of telehealth for treatment of OUD.[410] Given the prevalence of audio-only modalities of care for the treatment of OUD, permanently extending this flexibility could help prevent disruptions to care in OTP settings that may regularly provide periodic assessments via audio-only telehealth to Medicare beneficiaries. For these reasons, we believe a permanent extension would be appropriate for patients who are receiving buprenorphine, methadone, and/or naltrexone at OTPs, and that proper safeguards are in place so these services can be delivered in a way that would not diminish safety or quality of care for Medicare beneficiaries with an OUD.

Accordingly, we proposed to revise paragraph (vii) of the definition of ''Opioid treatment services'' at § 410.67(b) of the regulations to remove the references to the ''Public Health Emergency, as defined in § 400.200 of this chapter'' and ''through the end of CY 2024,'' in order to reflect that this flexibility would be implemented on a permanent basis. We would continue to state that ''in cases where a beneficiary does not have access to two-way audio-video communications technology, periodic assessments can be furnished using audio-only telephone calls if all other applicable requirements are met.'' We solicited comments on this proposal to permanently extend this audio-only flexibility for periodic assessments. We received many public comments on our proposal to allow OTPs to furnish periodic assessments using audio-only communications technology when video is not available on a permanent basis beginning January 1, 2025. These public comments and our responses to these comments are addressed in the section below.

Comment: We received many comments in support of this proposal. Commenters stated that making this flexibility permanent would significantly expand access to care, especially for patients living in rural regions, racial or ethnic minorities, tribal populations, individuals for whom English is a secondary language, older Medicare beneficiaries, and dual enrollees in Medicare and Medicaid. Commenters also shared that audio-only telecommunication is often the most accessible form of communication for patients with limited access to high-speed broadband internet service, those with lower incomes, individuals with unstable housing, and individuals who lack access to necessary video equipment or do not possess the skills to effectively operate video equipment. Commenters affirmed that beneficiary access to OUD treatment during the COVID–19 PHE increased due to telecommunication flexibilities, especially in remote and underserved communities, demonstrating the need to permanently extend the policy. A few commenters further noted that patients have grown accustomed to accessing services via audio-only telecommunications, and thus, discontinuing the flexibility could disrupt treatment, negatively affect treatment outcomes, and lead to withdrawal symptoms and recurrent opioid use. Other commenters agreed with CMS that audio-only services could be delivered by OTPs in a manner that would not diminish safety or quality of care. Commenters also mentioned that this flexibility would expand options for the modality in which to receive treatment and further promote provider and patient collaborative decision-making to ensure the patient's needs are met. Lastly, one commenter noted that if OTPs are concerned about issues that may arise during a patient's periodic assessment, then they could ask the patient to be seen in person.

Response: We appreciate commenters' overwhelming support of our proposal to permanently allow OTPs to furnish periodic assessments using audio-only telecommunications beginning January 1, 2025. We agree that finalizing this flexibility on a permanent basis will significantly expand access to care, improve patient outcomes while maintaining quality and safety of care, and allow a modality of treatment to be selected to sufficiently meet the needs of the patient.

Comment: One commenter recommended that CMS create a modifier that OTPs may append to claims when OTPs furnish audio-only periodic assessments, since it would allow CMS to track the use of audio-only telecommunications and better evaluate patient outcomes associated with the flexibility.

Response: We thank the commenter for this suggestion. We note that CMS did create modifiers for OTPs to append to claims when billing for OUD treatment services that were furnished via telecommunications technology. Specifically, after the conclusion of the COVID–19 PHE, which ended on May 11, 2023, CMS stated in section 30.5 of Chapter 39 of the Medicare Claims Processing Manual that we expect ''OTPs to add Modifier 93 (Synchronous telemedicine service rendered via telephone or other real-time interactive audio-only telecommunications system) to the claim for counseling and therapy provided via audio-only telecommunications using HCPCS code G2080, as well as for intake activities and periodic assessments furnished using audio-only communication technology.'' We also stated that we expect OTPs to ''add Modifier 95 (Synchronous Telemedicine Service Rendered via Real-Time Interactive Audio and Video Telecommunications System) to the claim for counseling and therapy provided via audio-video telecommunications using HCPCS code G2080, as well as for intake activities and periodic assessments furnished using audio and video communication technology.'' Thus, OTPs should append Modifier 93 to claims for OUD treatment services furnished via telecommunications, including for audio-only periodic assessments.

Comment: One commenter urged CMS to not restrict audio-only flexibilities for periodic assessments to specific circumstances, such as when video technology is unavailable to the patient and provider or when the patient does not consent to the use of video technology. The commenter further stated that restricting audio-only flexibilities to cases where only patients lack access to video-based technologies (and not also providers), overlooks scenarios where providers might also face limitations (for example, in emergency situations). The commenter said that it is essential to allow both providers and patients the flexibility to determine the most appropriate modality for their care, without imposing restrictive conditions. Therefore, the commenter requested that CMS delete the language, ''in cases where a beneficiary does not have access to two-way audio video communications'' within paragraph (vii) in the definition of Opioid use disorder treatment service at § 410.67(b) in order to be more inclusive of providers and to not impose restrictions on when audio-only communication technologies are permissible.

Response: We appreciate the commenters' feedback. We understand that there could be limited circumstances where a provider is unable to access audio-video communications technology. However, we believe that allowing audio-only communications technology in situations where a patient does not have access to two-way audio-video communications technology is critical to safeguarding the medical needs of the patient and ensuring that an appropriate modality of care is selected for the patient's condition and circumstance. We do not believe it would be appropriate if audio-only periodic assessments are performed on the basis that the provider does not have access to audio-video communications technology if the audio-only modality of care does not benefit the patient or the treatment of their condition. We believe that OTPs should possess the technical capability at the time the service is furnished to use an interactive telecommunications system (that is, with audio-only and audio-video capabilities) to ensure telecommunication services are a comparable and appropriate substitute for services that would ordinarily be provided in person. CMS continues to maintain that allowing audio-only periodic assessments in cases where a beneficiary does not have access to two-

way audio-video communications achieves the balance of ensuring beneficiaries still have access to care while still maintaining proper safeguards so services can be delivered in a way that would not diminish the safety or quality of care for Medicare beneficiaries with an OUD.

Comment: A few commenters encouraged CMS to work with other federal partners to align and clarify telemedicine regulations for OUD treatment policies. Some commenters also raised the importance of the DEA revising their regulations to clarify post-pandemic rules on telemedicine flexibilities for the prescription of controlled medications (for example, medications for opioid use disorder) ahead of the flexibilities expiring at the end of the year, in order to prevent disruptions in care.[411]

Response: CMS shares the commenters' interest in ensuring the consistency of policies that span across HHS and other agencies. We continue to work with other agencies on these matters, including SAMHSA and the DEA, to ensure high-quality care is accessible to program beneficiaries and that OTPs receive adequate communication and program guidance on various policies across agencies.

After consideration of public comments, we are finalizing our proposal to permanently allow OTPs to furnish periodic assessments via audio-only telecommunications beginning January 1, 2025, so long as all applicable requirements are met, and the use of these technologies are permitted under the applicable SAMHSA and DEA requirements at the time the services are furnished. We are revising paragraph (vii) of the definition of ''Opioid use disorder treatment service'' at § 410.67(b) of the regulations to remove the references to the ''Public Health Emergency, as defined in § 400.200 of this chapter'' and ''through the end of CY 2024,'' in order to reflect that this flexibility will be implemented on a permanent basis. We will continue to state that ''in cases where a beneficiary does not have access to two-way audio-video communications technology, periodic assessments can be furnished using audio-only telephone calls if all other applicable requirements are met.''

b. Use of Audio-Visual Telecommunications for Initiation of Treatment With Methadone

Prior to the PHE for COVID–19, the Ryan Haight Online Pharmacy Consumer Protection Act of 2008 (Pub. L. 110–425) amended the Controlled Substances Act and instructed the DEA to issue regulations that required healthcare providers to conduct an in-person examination in the presence of a practitioner prior to prescribing controlled substances (for example, methadone, buprenorphine, etc.) to patients, with certain exceptions. These statutory provisions prevented the distribution and dispensing of controlled substances by means of the internet without at least one in-person medical evaluation before writing a prescription. Similarly, SAMHSA regulations under 42 CFR 8.12(f)(2) have historically required a complete physical evaluation before a patient begins treatment at an OTP. However, after the declaration of the PHE for COVID–19, the DEA and SAMHSA jointly issued flexibilities for prescribing of controlled substances via telehealth to ensure patient therapies would remain accessible. Consequently, OTPs were exempted from the requirement to perform an in-person physical evaluation for any patient who would be treated by the OTP with buprenorphine if a program physician, primary care physician, or an authorized healthcare professional under the supervision of a program physician, determines that an adequate evaluation of the patient can be accomplished via telehealth through an audio-video or audio-only evaluation.[412] At the time, this exemption applied exclusively to patients with an OUD being treated at an OTP with buprenorphine, and it did not apply to new patients initiating treatment with methadone. This meant that new OTP patients starting treatment with methadone would need to still receive an in-person physical evaluation prior to the OTP prescribing methadone. Accordingly, in the CY 2023 PFS final rule (87 FR 69775 through 69777), we revised the regulation in paragraph (vi) of the definition of ''Opioid use disorder treatment services'' at § 410.67(b) to allow the OTP intake add-on code to be furnished via two-way audio-video communications technology when billed for the initiation of treatment with buprenorphine, to the extent that the use of audio-video telecommunications technology to initiate treatment with buprenorphine is authorized by DEA and SAMHSA at the time the service is furnished. CMS also permitted the use of audio-only communication technology to initiate treatment with buprenorphine in cases where audio-video technology is not available to the beneficiary in the CY 2023 PFS final rule (87 FR 69775 through 69777). We stated that section 1834(m)(7) of the Act allows telehealth services for the treatment of a diagnosed SUD or co-occurring mental health disorder to be furnished to individuals at any telehealth originating site, including in a patient's home, and that some codes describing new patient office/outpatient visits are already under the Medicare Telehealth list (CPT codes 99202 through 99205). Therefore, we believed that these changes for the initiation of treatment with buprenorphine via audio-only or audio-video telecommunications would also be consistent with existing flexibilities under the PFS. Consistent with SAMHSA and DEA requirements at the time of CY 2023 PFS rulemaking, we also noted that this exemption applied exclusively to OTP patients treated with buprenorphine and did not apply to new patients treated with methadone. Notably, SAMHSA recently finalized and codified this flexibility at § 8.12(f)(2)(v)(B),[413] so that OTPs may use audio-visual or audio-only platforms when evaluating patients who are being admitted for treatment at the OTP with schedule III medications (such as buprenorphine) on a permanent basis.

Furthermore, in their recent final rule published in the **Federal Register** in February of 2024 (89 FR 7528), SAMHSA made updates to full examination requirements for initiation of treatment with methadone at § 8.12(f)(2)(v)(A). Specifically, SAMHSA made revisions to allow for audio-visual telehealth initiation for any new patient who will be treated by the OTP with methadone if a practitioner or primary care provider determines that an adequate evaluation of the patient can be accomplished via an audio-visual telehealth platform. When audio-visual technologies are not available or their use is not feasible for a patient, it is acceptable to use audio-only devices, but only when the patient is in the presence of a licensed practitioner who is registered to prescribe (including dispense) controlled medications. In finalizing this new flexibility, SAMHSA reasoned that ''evidence underlying the initiation of buprenorphine using

[413] 89 FR 7528, February 2, 2024 (*https://www.federalregister.gov/documents/2024/02/02/2024-01693/medications-for-the-treatment-of-opioid-use-disorder*).

telehealth also is applicable to the treatment of OUD with methadone, and warrants expanding access to methadone therapy by applying some of the buprenorphine in-person examination flexibilities to treatment with methadone in OTPs (89 FR 7533).'' [414] SAMHSA also noted that video-based telehealth was overwhelmingly supported by commenters for medical intake, periodic medical assessments, and methadone or buprenorphine initiation by OTP practitioners. SAMHSA did not extend the flexibility to allow the use of audio-only telehealth platforms in assessing new patients who will be treated by the OTP with methadone due to safety considerations, as they stated ''methadone, in comparison to buprenorphine, holds a higher risk profile for sedation in patients presenting with mild somnolence which may be easier to identify through an audio-visual telehealth platform (89 FR 7533).'' [415] However, SAMHSA did finalize specific exceptions that would facilitate audio-only initiation of methadone via telehealth. Pursuant to § 8.12(f)(2)(v)(A), when audio-visual technologies are not available or their use is not feasible for a patient, it is acceptable to use audio-only devices, but only when the patient is in the presence of a licensed practitioner who is registered to prescribe (including dispense) controlled medications (89 FR 7539). The licensed practitioner would need to be present in the same room as the patient and be available to conduct the visual component of the examination, which would be required to satisfy the requirement for telehealth initiation of treatment with methadone which is through an audio-visual examination. These new flexibilities to allow new patients to initiate treatment with methadone via audio-visual telehealth is significant, as the majority of patients who are being treated at an OTP receive methadone.[416] Methadone is used to treat those with a confirmed diagnosis of OUD, and is a synthetic opioid agonist that eliminates withdrawal symptoms and relieves drug cravings by acting on opioid receptors in the brain.[417] Methadone has been associated with reducing the risk of drug overdose, opioid-related acute care, all-cause mortality, and opioid-related mortality.[418] It has also been shown to retain patients in treatment, reduce consequences of injection drug use such as HIV/Hepatitis C transmission, and contribute to quality of life improvements for patients.[419] However, many barriers currently exist for patients seeking to receive methadone treatment. Currently, only SAMHSA-certified OTPs can dispense and administer methadone for the treatment of OUD as provided under section 303(g)(1) of the Controlled Substances Act (21 U.S.C. 823(g)(1)) and 42 CFR part 8. This often means that daily travel might be necessary if it is determined that the risks of giving take-home doses outweigh the benefits, unless patients are eligible to receive take-home doses after meeting certain conditions. Most adults in methadone treatment report at least one barrier to accessing treatment, including lack of reliable transportation, distance from home to treatment, and work schedule conflicts.[420] Frequent travel to an OTP also disproportionately impacts rural residents who already face lower odds of finding an OTP in their area, and therefore, must spend nearly 2–5 times the amount of average drive time to access the closest OTP compared to their urban counterparts.[421] Research has also shown that the number of missed doses of methadone increases for residents living longer distances from an OTP. Additionally, people living with disabilities are less likely to receive MOUDs, and some data also shows that many SUD treatment programs are not physically accessible for these populations.[422] The existence of these physical barriers to accessing methadone and treatment at OTP facilities, especially among historically underserved populations, warrants additional considerations to the extent that telehealth flexibilities can mitigate these barriers to accessing care, as long as these flexibilities are medically appropriate and reasonable for the diagnosis and treatment of OUD.

To be consistent with SAMHSA's reforms to telehealth flexibilities for initiation of treatment with methadone at § 8.12(f)(2)(B)(v), past conforming regulations under the Medicare OTP benefit to allow telecommunication flexibilities for initiation of treatment with buprenorphine, and to contribute towards efforts to reduce barriers in accessing care for Medicare beneficiaries seeking treatment with methadone, we proposed to make similar telecommunication flexibilities under the Medicare OTP benefit in the

CY 2025 PFS proposed rule. Specifically, we proposed to allow the OTP intake add-on code (HCPCS code G2076) to be furnished via two-way audio-video communications technology when billed for the initiation of treatment with methadone, to the extent that the use of audio-video telecommunications technology to initiate treatment with methadone is authorized by DEA and SAMHSA at the time the service is furnished. We noted that under this proposal, the initiation of treatment with methadone using telecommunications technology would be considered an intake activity for purposes of paragraph (vi) of the definition of ''Opioid use disorder treatment services'' at § 410.67(b) only to the extent that the use of such telecommunications technology is permitted under the applicable DEA and SAMHSA regulations and guidance at the time the services are furnished. However, we did not propose to extend the flexibility to allow the use of audio-only telecommunications for intake activities described in paragraph (vi) of the definition of ''Opioid use disorder treatment services'' at § 410.67(b) for initiation of treatment with methadone, as these flexibilities are not currently permitted by SAMHSA and the DEA. We recognized that methadone is characterized as a schedule II controlled substance, which means that it still has higher potential for misuse with potential physical dependence.[423] Unlike buprenorphine that is a schedule III controlled substance, methadone is a full agonist and does not have a ''ceiling effect,'' which provides more protective overdose factors when taking additional doses of the drug.[424] Thus, use of audio-visual telecommunications for initiation of treatment with methadone would balance potential safety concerns associated with methadone, such as its higher potential for misuse and risk for sedation in patients presenting with mild somnolence which may be easier to identify via a audio-visual telehealth platform, while still allowing patients the flexibility of initiating treatment via (audio-visual) telehealth at an OTP. However, CMS continues to defer to SAMHSA guidance on the use of audio-only telecommunications for initiation of treatment with methadone pursuant to § 8.12(f)(2)(v)(A), which allows a specific exception to allow for the use of audio-only devices when the patient is in the presence of a licensed practitioner who is registered to prescribe (including dispense) controlled medications, and when audio-visual technologies are not available or their use is not feasible for a patient (89 FR 7539). Accordingly, we proposed to allow the intake add-on code to be billed for audio-only telecommunications for initiation of treatment with methadone if these specific exceptions are met, consistent with SAMHSA guidance at § 8.12(f)(2)(v)(A).

We believed that this proposal would meaningfully improve access to care, promote positive health outcomes, and advance health equity among Medicare beneficiaries. Data indicate that expanded use of telehealth and flexibilities for the provision of MOUD during the COVID–19 pandemic was associated with improved care retention and a reduction in medically treated overdoses among Medicare beneficiaries.[425] Similarly, telehealth initiation for buprenorphine to treat OUD was associated with improved treatment retention in a subset of U.S States.[426] Other research has not found significant differences in clinical severity and complexity markers (for example, OUD-related emergency department visits) between patients receiving telemedicine inductions into treatment versus in-person examinations,[427] suggesting that quality of care can be maintained through initiation of treatments via telehealth. Thus, many of these benefits associated with telehealth flexibilities for initiating treatment with other MOUDs can be potentially replicated by allowing initiation of treatment with methadone via audio-visual telecommunications. Additionally, we believed this proposal would meaningfully impact health equity. Individuals from Black, American Indian and Alaska Native, and Hispanic populations are significantly less likely to initiate treatment for a SUD, as well as individuals from economically disadvantaged communities.[428] Despite these disparities, during the COVID–19 pandemic, the odds of initiating treatment for a SUD increased for most age, race, ethnicity, and socioeconomic status subgroups, which may have been explained by increases in treatment initiation occurring through telehealth.[429] Thus, promoting flexibilities for telecommunication modalities of treatment initiation in regards to methadone may provide additional options for accessing treatment, especially for populations who often experience barriers in beginning treatment. Lastly, we believed this proposal was in alignment with the HHS Overdose Prevention Strategy, which aims to broaden access to evidence-based care that increases willingness to engage and remain in treatment.[430] Similarly, we believed this proposal would further the goals of the National Drug Control Strategy, which strives to expand policies that improve SUD treatment engagement by lowering various barriers to enter and participate in treatment, such as through telemedicine treatment initiation.[431]

Accordingly, we proposed to revise the regulations for intake activities at paragraph (vi) within the definition of ''Opioid use disorder treatment service'' at § 410.67(b). We proposed to add a new paragraph (vi)(A) within the description of intake activities to separately list flexibilities for intake activities furnished via communications technology, and we proposed to add and reserve a new paragraph (vi)(B). We proposed to move the language related to the existing flexibilities for the initiation of treatment with buprenorphine to paragraph (vi)(A)(*1*). Additionally, in the definition of ''Opioid use disorder treatment service''

at § 410.67(b), we proposed to codify telecommunications flexibilities for initiation of treatment with methadone at paragraph (vi)(A)(*2*). Specifically, we proposed that services to initiate treatment with methadone may be furnished via two-way interactive audio-video communication technology, as clinically appropriate, and in compliance with all applicable requirements, if an OTP determines that an adequate evaluation of the patient can be accomplished through audio-video communication technology. We received public comments on our proposal to allow the OTP intake add-on code (HCPCS code G2076) to be furnished via two-way audio-video communications technology when billed for the initiation of treatment with methadone if the OTP determines that an adequate evaluation of the patient can be accomplished via an audio-visual telehealth platform.

The following is a summary of the comments we received and our responses.

Comment: We received many comments in strong support of this proposal. Commenters expressed that providing the flexibility to initiate methadone treatment via audio-video telecommunications would improve access to care, advance health equity, and encourage positive health outcomes. Commenters shared that many individuals face geographic or social challenges to engaging in OUD treatment, and others may have an immediate need for treatment with methadone but face barriers to initiating treatment due to the need to coordinate transportation, childcare, work schedules, or other complicating factors. Commenters further added that this flexibility would assist in reducing barriers to care since it would limit the need for patients to travel to and from appointments when initiating treatment with methadone, which is a difficulty faced by many individuals from rural communities and other underserved populations. A few commenters noted that this telecommunications flexibility is needed, as OTPs are one of the few settings where beneficiaries can receive this medication. Multiple commenters agreed with CMS on the necessity of requiring audio-video telecommunications when initiating treatment with methadone. Specifically, commenters concurred that methadone is distinct from buprenorphine, given both its risk for sedation and complex pharmacokinetics. For these reasons, commenters stated that utilizing audio-visual telecommunications for methadone treatment initiation would address potential safety concerns by allowing the OTP to monitor the patients via audio-video telecommunications technology, while still increasing access to care and maintaining care quality.

Response: We thank commenters for their support of this proposal.

Comment: One commenter stated that while they believe extending the COVID–19 PHE telecommunications flexibilities is important as they are approaching expiration, they do not believe that controlled substances should be prescribed without an initial in-person visit.

Response: We agree that there could be limited instances where it may not be appropriate for an OTP to initiate treatment with methadone via audio-visual communication technology for a particular patient without an in-person visit. However, as we stated in the proposed rule, existing evidence has demonstrated that initiating OUD treatment via audio-visual communications technology can be done in a manner that maintains quality of care and safety for patients. For example, some research has not found significant differences in clinical outcomes (for example, OUD-related emergency department visits or severity of an OUD) between patients receiving telemedicine inductions into treatment versus in-person examinations, suggesting that telemedicine inductions to OUD treatment can serve as an appropriate substitute for in-person visits in many cases.[432] Furthermore, we believe limiting the use of audio-video telecommunication technology to instances where an OTP determines that an adequate evaluation of the patient can be accomplished via an audio-video platform requires the OTP to evaluate on an individual basis if audio-video communication technology is an appropriate modality for initiating methadone treatment. We note that our proposal to allow OTPs to initiate methadone treatment via audio-video communication technology was meant to be a flexibility and not a requirement, meaning that we intended OTPs could still choose to see the patient in person instead. Lastly, CMS defers to program requirements established by SAMHSA and the DEA concerning when these communication technology services can be furnished before they can be billed for under the Medicare OTP benefit, including program requirements relating to initiation of MOUD through various forms of telecommunications and in-person visit requirements.

Comment: A few commenters, including some representing tribal populations, requested that CMS consider extending flexibilities to allow initiation of treatment with methadone via audio-only telecommunications. One commenter asked the agency to evaluate the evidence and appropriateness of enabling audio-only treatment initiation of methadone, including by partnering with external research organizations to assess this topic, improve parity in flexibilities for buprenorphine and methadone, and reduce stigma around methadone. This same commenter suggested that CMS should consider in the interim, implementing waivers for individual cases where an audio-only telecommunications evaluation of the patient is the only means that a patient can access services, or where there is an insufficient supply of OTP providers in the area to prescribe or dispense methadone.

Response: We appreciate the feedback shared by commenters. We agree that it is important to continue to monitor and evaluate the evidence of the appropriateness of various telecommunication flexibilities furnished in the OTP setting. In proposing to allow initiation of treatment with methadone utilizing audio-video telecommunications if an OTP determines that an adequate evaluation of the patient can be accomplished via an audio-video platform, we considered the existing evidence based on safety and quality of these assessments conducted via telecommunications platforms, including potentially via audio-only telecommunications. As we stated in the proposed rule (89 FR 61822), methadone is characterized as a schedule II-controlled substance, which means that it has higher potential for misuse with potential physical dependence, thus there are potential safety concerns associated with conducting these type of assessments through audio-only platforms.[433] Additionally, CMS believes it is important to ensure telecommunication flexibilities allowed in OTP settings are consistent with existing guidance by SAMHSA and the DEA to ensure the health and safety of Medicare beneficiaries. As we stated in the discussion above, SAMHSA allows a specific exception to the use of audio-only initiation of treatment with

[432] Barsky, B.A., Busch, A.B., Patel, S.Y., Mehrotra, A., & Huskamp, H.A. (2022). ''Use of telemedicine for buprenorphine inductions in patients with commercial insurance or Medicare advantage.'' JAMA Network Open, 5(1), e2142531. *https://doi.org/10.1001/jamanetworkopen.2021.42531.*

[433] *4https://www.dea.gov/drug-information/drug-scheduling.*

methadone pursuant to § 8.12(f)(2)(v)(A), which allows for the use of audio-only devices when the patient is in the presence of a licensed practitioner who is registered to prescribe (including dispense) controlled medications, and when audio-visual technologies are not available or their use is not feasible for a patient (89 FR 7539). If these specific exceptions are met, CMS will allow the intake add-on code to be billed for audio-only telecommunications for initiation of treatment with methadone consistent with SAMHSA requirements at § 8.12(f)(2)(v)(A). CMS believes in the importance of expanding access to services under the OTP benefit and will continue to collaborate with Federal partners to continually monitor these various telecommunication flexibilities and propose updates in future rulemaking as appropriate.

After consideration of public comments, we are finalizing our proposal to allow the OTP intake add-on code (HCPCS code G2076) to be furnished via two-way audio-video communications technology when billed for the initiation of treatment with methadone, to the extent that the use of audio-video telecommunications technology to initiate treatment with methadone is authorized by DEA and SAMHSA at the time the service is furnished, and if the OTP determines that an adequate evaluation of the patient can be accomplished via audio-video communication technology. We are finalizing our revisions to intake activities within the definition of ''opioid use disorder treatment service'' at § 410.67(b) by adding new paragraphs (vi)(A) and (vi)(B) within the description of intake activities at paragraph (vi). We are moving the language related to the existing flexibilities for the initiation of treatment with buprenorphine to paragraph (vi)(A)(1) to separately list flexibilities for intake activities furnished via communications technology. In the definition of ''opioid use disorder treatment service'' at § 410.67(b), we are codifying telecommunications flexibilities for initiation of treatment with methadone at paragraph (vi)(A)(2). Specifically, we are codifying that services to initiate treatment with methadone may be furnished via two-way interactive audio-video communication technology, as clinically appropriate, and in compliance with all applicable requirements, if an OTP determines that an adequate evaluation of the patient can be accomplished through audio-video communication technology. We are reserving new paragraph (vi)(B).

3. Reforms to 42 CFR Part 8

In the CY 2020 PFS final rule, we implemented payment and coverage for opioid use disorder treatment services, including services such as substance use counseling by a professional to the extent authorized under State law to furnish such services, individual and group therapy with a physician, psychologist (or other mental health professional to the extent authorized under State law), and other items and services that the Secretary determines are appropriate (but in no event to include meals or transportation), as authorized by section 1861 of the Act (84 FR 62630 through 62677 and 84 FR 62919 through 62926). Consequently, we included these services within the definition of OUD treatment services at § 410.67(b) and incorporated payment for these services as part of the non-drug component at § 410.67(d)(2)(ii). We also created an add-on code described by HCPCS code G2080 to reflect an additional 30 minutes of counseling or individual or group therapy provided in a week. We further finalized additional adjustments to the bundled payment for an episode of care, such as intake activities and periodic assessments. At the time, we noted that both initial and periodic assessments are required under SAMHSA regulations, and that they were integral services for the establishment and maintenance of OUD treatment for a beneficiary at an OTP (84 FR 62634). We codified definitions of these services within the definition of *OUD treatment services* at § 410.67(b); at paragraph (vi), we stated that intake activities include initial medical examination services required under § 8.12(f)(2), and initial assessment services required under § 8.12(f)(4); at paragraph (vii) we stated that periodic assessment services include those required under § 8.12(f)(4). Services under § 8.12(f) are required services as part of Federal opioid treatment standards for OTPs, as regulated by SAMHSA. Accordingly, we created HCPCS code G2076 [*Intake activities, including initial medical examination that is a complete, fully documented physical evaluation and initial assessment conducted by a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician or qualified personnel that includes preparation of a treatment plan that includes the patient's short-term goals and the tasks the patient must perform to complete the short-term goals; the patient's requirements for education, vocational rehabilitation, and employment; and the medical, psycho-social, economic, legal, or other supportive services that a patient needs, conducted by qualified personnel (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure*], and code G2077 [*Periodic assessment; assessing periodically by qualified personnel to determine the most appropriate combination of services and treatment (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure*] in order to have a mechanism to make payment under Medicare to OTPs for these required services. In the CY 2021 and CY 2022 PFS final rules (85 FR 84682 through 84690; 86 FR 65338 through 65341), we also established payment for take-home supplies of naloxone and overdose education furnished in conjunction with providing an opioid antagonist medication.

Additionally, in the CY 2020 PFS final rule, we codified requirements specified in the section 1861(jjj)(2) of the Act for OTPs. Specifically, we defined an ''opioid treatment program'' at § 410.67(b) as an entity that is an OTP as defined in § 8.2 (or any successor regulation) that meets the applicable requirements for an OTP. For an OTP to participate and receive payment under the Medicare program, the OTP must be enrolled in Medicare under section 1866(j) of the Act, have in effect a certification by SAMHSA for such a program, and be accredited by an accrediting body approved by SAMHSA. Lastly, an OTP must meet additional conditions as the Secretary may find necessary to ensure the health and safety of individuals being furnished services under such program and the effective and efficient furnishing of such services.

Recently, SAMHSA issued a new final rule (89 FR 7528), which made significant reforms to 42 CFR part 8, governing requirements for OTPs in providing medications for the treatment of OUD and many other services. The rule provides significant refinements, as 42 CFR part 8 was originally published over 21 years ago, by reflecting new paradigms of care for OUD that have become increasingly patient-centered and evidence-based. The regulatory reforms for opioid treatment standards reflect an understanding that OUD is a chronic disease that necessitates respective patient-centered care, and to be successful, treatment interventions should be individualized and include harm reduction and recovery support

services, among other services.[434] Consequently, SAMHSA redefined comprehensive treatment at § 8.2 to specify that comprehensive treatment at OTPs includes ''the continued use of MOUD provided in conjunction with an individualized range of appropriate harm reduction, medical, behavioral health, and recovery support services.'' At the same time, SAMHSA constructed a new definition of harm reduction services at § 8.2 to specify that harm reduction ''refers to practical and legal evidence-based strategies, including: overdose education; testing and intervention for infectious diseases, including counseling and risk mitigation activities forming part of a comprehensive, integrated approach to address human immunodeficiency virus (HIV), viral hepatitis, sexually transmitted infections, and bacterial and fungal infections; distribution of opioid overdose reversal medications; linkage to other public health services; and connecting those who have expressed interest in additional support to peer services.'' Harm reduction approaches are especially important to reduce certain health and safety issues associated with drug use through care that is intended to be free of stigma and centered on the needs of people who use drugs. Decades of research have shown that harm reduction strategies provide significant benefits in preventing drug overdose deaths and transmission of infectious diseases among those who use drugs, educate individuals and community members about reducing the negative consequences associated with drug use, and link individuals to SUD treatment and other recovery resources.[435] Harm reduction is also a crucial component of the HHS Overdose Prevention Strategy, which aims to promote evidence-based harm reduction services, including those that are integrated within healthcare delivery, and to expand sustainable funding strategies for harm reduction services.[436] Besides defining harm reduction, SAMHSA also finalized a new definition for ''recovery support services'' at § 8.2, which includes definitions for ''recovery,'' and ''recovery support services.'' Specifically, ''recovery'' is defined as ''the process of change through which people improve their health and wellness, live self-directed lives, and strive to reach their full potential.'' ''Recovery support services'' ''can include, but are not limited to, community-based recovery housing, peer recovery support services, social support, linkage to and coordination among allied service providers and a full range of human services that facilitate recovery and wellness contributing to an improved quality of life. The services extend the continuum of care by strengthening and complementing substance use disorder (SUD) treatment interventions in different settings and stages.'' Recovery support services are a vital part SUD treatment, as they take into account the relapsing and chronic nature of SUD, and emphasize the need for continuous care to keep individuals engaged in treatment, especially along different stages of recovery.[437] Recovery support services are also a component of the HHS Overdose Prevention Strategy, which recognizes that treatment alone may not be enough to support long-term recovery, and that enabling access to quality integrated and coordinated recovery support services is important to prevent drug overdoses.[438]

Furthermore, SAMHSA made updates to existing definitions that include some of the services currently covered under the Medicare OTP benefit. For example, a psychoeducational service element was added to the definition of counseling services at § 8.12(f)(5), so that both counseling and psychoeducational services would also include harm reduction education and recovery-oriented counseling. New guidelines on counseling related to preventing exposure to and transmission of various infectious diseases were also added. As part of these services, at § 8.12(f)(5)(iii), OTPs also must continue to provide directly, or through referral to adequate and reasonably accessible community resources, vocational training, education, and employment services for patients who request such services or for whom these needs have been identified and mutually agreed-upon as beneficial by the patient and program staff. Notably, SAMHSA also made updates to their descriptions of initial and periodic assessment activities at § 8.12(f)(4), which initially informed the definitions of intake activities and periodic assessments in the definition of ''OUD treatment services'' at § 410.67(b) and the creation of codes describing these services (HCPCS codes G2076 and G2077) when CMS first implemented the Medicare OTP benefit in the CY 2020 PFS final rule. When introducing these changes in their proposed rule in December 2022 (87 FR 77330), SAMHSA noted that ''changes to the initial and periodic medical services sections are intended to promote key issues for OTP medical practitioners and the OTP multi-disciplinary team to address with a patient as part of treatment. This includes areas that may increase the risk of a patient leaving care prematurely, such as unmet mental health or other disability, medical and oral health needs, the need for culturally supportive care that addresses race, ethnicity, sexual orientation, religion or gender identity, and social determinants of health, such as housing and transportation, that may pose barriers to treatment engagement, or harm reduction and recovery support service needs.'' SAMHSA's new changes to the definition of initial assessments now include more patient-centered language to ensure that care provided is consistent with the patient's needs and self-identified goals for treatment and recovery, while promoting shared decision making between the OTP practitioner and patient to create individualized care plans. SAMHSA's revisions to initial assessments reflect the need for care plans to include the patient's goals and mutually agreed-upon actions for the patient to meet those goals, and new references are added for harm reduction interventions and recovery support services to be included as components of care plans if a patient needs and wishes to pursue these services. For example, patient-centered care plans developed during initial assessments may reflect a ''patient's goals and mutually agreed-upon actions for the patient to meet those goals, including harm reduction interventions; the patient's needs and goals in the areas of education, vocational training, and employment; and the medical and psychiatric, psychosocial, economic, legal, housing, and other recovery support services that a patient needs and wishes to pursue (89 FR 7558).'' Lastly, regarding periodic assessment services at § 8.12(f)(4)(ii), SAMHSA requires that these examinations should occur not less than one time each year and be conducted by an OTP practitioner. The periodic physical examination should include review of MOUD dosing,

treatment response, other SUD treatment needs, responses and patient-identified goals, and other relevant physical and psychiatric treatment needs and goals. The periodic physical examination should be documented in the patient's clinical record.

As a whole, SAMHSA'S regulatory changes largely reflect significant changes in evidence-based practice and towards patient-centered care in the treatment of OUD that have occurred in the past couple of decades, including considerations of the need to address unmet health related social needs (HRSN) that impose barriers on a patient's ability to initiate, engage, and remain in treatment, including in areas of education, employment, and housing as well as in harm reduction strategies that decrease the negative consequences associated with a patient's use or abuse of opioids, and recovery support services that address the chronic nature of OUD and the need for supports across the full continuum of care.

In addition to these reforms to opioid treatment standards at 42 CFR part 8 codified by SAMHSA, there have been recent activities under the Medicare in the PFS, and through other CMS programs, that have addressed the social determinants of health (SDOH), which often affect the diagnosis and treatment of a patient's medical problem. Healthy People 2030, which is a 10-year HHS initiative to identify public health priorities that help individuals, organizations, and communities across the U.S improve health and well-being,[439] defines the SDOH, as the ''conditions in the environments where people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks.'' [440] SDOH include many domains that largely impact health, including economic stability, education, healthcare, the neighborhood and built environment, and social and community context. Some studies have estimated that SDOH can affect as much as 50 percent of the variation in health outcomes compared to clinical care impacting only 20 percent.[441] For example, individuals with a higher income have been found to exhibit lower mortality, higher life expectancy, and slower declines in physical mobility; individuals who lack insurance are less likely to obtain necessary medical care and prescription medications; and, food insecurity is associated with higher rates of birth defects, cognitive problems, hospitalization rates, asthma, and behavioral health problems.[442] Moreover, SDOH act as structural and contextual factors that shape the conditions impacting health, and their unequal distribution impacts the development of HRSNs at the individual level, which refer to an individual's needs that might include housing, healthy foods, transportation, financial assistance, etc. An inability to address these HRSNs put individuals at a higher risk for exacerbating health conditions, and it is a major driver of health inequities.[443] Health equity is the attainment of the highest level of health for all people, where everyone has a fair and just opportunity to attain their optimal health regardless of race, ethnicity, disability, sexual orientation, gender identity, socioeconomic status, geography, preferred language, or other factors that affect access to care and health outcomes, which is complicated by SDOH such as poverty, unequal access to healthcare, lack of education or employment, stigma, and discrimination.[444] Therefore, in light of decades of research showing that these upstream factors drive health outcomes, and evidence suggesting interventions in healthcare settings that address social needs can improve the treatment of an individual's condition, CMS recently finalized coding and payment for SDOH risk assessments in the CY 2024 PFS final rule (88 FR 78932). HCPCS code G0136 describes SDOH risk assessments (*Administration of a standardized, evidence-based Social Determinants of Health Risk Assessment, 5–15 minutes, not more often than every 6 months*) that may be billed when practitioners spend time and resources assessing HRSNs that interfere with the practitioner's ability to diagnose or treat the patient. These assessments, which may also be provided during a behavioral health visit, are often administered as part of an assessment of patient histories, risk, and in informing medical decision-making around the care and treatment of the disease or illness. They are often accomplished through the use of a standardized evidence-based tool that include the domains of food insecurity, housing insecurity, transportation needs, and utility difficulties. Besides establishing standalone payment for SDOH risk assessments, in the CY 2024 PFS final rule, CMS also created coding and payment for community health integration (CHI) (HCPCS codes G0019 & G0022) and principal illness navigation services (PIN) (HCPCS codes G0023, G0024, G0140, and G0146). Both CHI and PIN services include: performing a person-centered assessment to better understand the patient's life story, coordinating care coordination between different providers and care settings, contextualizing health education, building patient self-advocacy skills, assisting the patient with health system navigation, facilitating behavioral change, providing social and emotional support, and facilitating access to community-based social services (for example, housing, utilities, transportation, food assistance) to address unmet SDOH needs. The services described by the CHI codes address unmet SDOH needs that affect the diagnosis and treatment of the patient's medical problems. PIN services focus on Medicare beneficiaries diagnosed with high-risk conditions (for example, dementia, HIV/AIDS, and cancer) in order to identify and connect them with appropriate clinical and support resources.

Moreover, many of these aforementioned services, including harm reduction interventions, recovery support services, addressing HRSN, and facilitating access to community-based social services to address these needs, ordinarily occur in OTP settings. In 2022, approximately 92 percent of OTP facilities offered various recovery support services, including peer support (59.6 percent), assistance locating housing for clients (75.0 percent), employment counseling (49.5 percent),

and assistance helping patients obtain social services (81.2 percent). The majority of OTPs also offered various types of harm reduction services, including testing for various types of infectious diseases (>55 percent), health education (>77 percent), and naloxone and overdose education (92.3 percent). Many OTPs also conduct community outreach services to those in need of OUD treatment (76.1 percent) and case management services (87.8 percent).[445] Additionally, as part of initial and periodic assessment services at § 8.12(f)(4), OTPs must designate in the care plan a patient's needs and goals in the areas of harm reduction interventions, education, vocational training, and employment, along with the medical and psychiatric, psychosocial, economic, legal, housing, and other recovery support services that a patient needs and wishes to pursue, which all reflect consideration to various HRSN. The new definitions of harm reduction and recovery support services at § 8.2 are also inclusive of activities that involve linkage to and coordination with providers that address a full range of human and public health services to facilitate recovery and wellness for a SUD. Lastly, in the CY 2020 PFS final rule we responded to public comments pertaining to the above-mentioned activities. Specifically, several commenters stated that OTPs often provide case management and/or care management services and requested that CMS consider reimbursing for these services either as part of the standard bundle or as an adjustment to the bundled payment, as applicable. A few commenters stated that OTPs serve as a fixed point of responsibility in the provision of whole person-centered care and improving health outcomes through collaborative arrangements with health care providers outside of the OTP and that the goal of care management is to reduce health care costs, specifically preventable hospital admissions, readmissions, and avoidable emergency room visits. The commenters also stated in the CY 2020 final rule that OTP staff also help patients with accessing food benefits, housing, and employment searches, which are critical components for sustained recovery, as part of the goal of complete case management (84 FR 62648). At the time, CMS stated that we would consider making payment for these types of care management activities in future rulemaking, including activities whereby OTPs collaborate with providers outside the OTPs to help patients access social services. We believed it was appropriate to work with OTPs to better understand how these services are furnished in an OTP setting, as well as to continue to look at data on specific items and services that may fit within the scope of OUD treatment services.

a. Payment for Social Determinants of Health Risk Assessments

The recent refinements to initial assessments under § 8.12(f)(4)(i) likely necessitate additional resource costs for OTPs to comply with the opioid treatment standards for assessing various SDOHs (for example, education, vocational training, employment, economic, legal, housing, etc.) that impact a patient's HRSNs, and to identify a patient's goals for harm reduction interventions and needs for recovery support services as they relate to the treatment of an OUD. We recognize that the paradigm for OUD treatment and care has evolved rapidly since the implementation of the Medicare OTP benefit in CY 2020, and that providers have increasingly incorporated interventions to address HRSNs that increase the risk of a patient leaving OUD treatment prematurely or that pose barriers to treatment engagement. We additionally acknowledge that coding already exists under the PFS that accounts for the resources involved in conducting these types of assessments. For these reasons, in the CY 2025 PFS proposed rule we proposed to establish payment for SDOH risk assessments as part of intake activities within OUD treatment services, as long as these assessments are medically reasonable and necessary for the diagnosis or treatment of an OUD, and OTPs have a reason to believe unmet HRSNs or the need for harm reduction intervention or recovery support services identified during such an assessment could interfere with the OTP's ability to diagnose or treat the patient's OUD. As previously stated, the SDOH include broad structural and contextual domains that may impact health (for example, economic stability, education, healthcare, neighborhood and built environment, and social and community context) and the development of HRSNs at the individual-level (for example, housing and utilities assistance, transportation assistance, financial assistance, healthy foods, personal safety, employment, recovery support and harm reduction services). We understand that there are multiple standardized, evidence-based SDOH risk-assessment tools utilized across the healthcare system that are structured to assess a patient across various SDOH domains.[446] If an OTP furnishes SDOH risk assessments as part of initial assessments under § 8.12(f)(4)(i), we would expect that the assessment tools used would allow the OTP to identify more specific individual-level HRSNs as part of the care plan, including giving consideration to potential harm reduction and recovery support services needs.

Specifically, we proposed to update the payment rate for intake activities described by HCPCS code G2076 by adding in the value of the non-facility rate for SDOH risk assessments described by HCPCS code (G0136). We believe HCPCS code G0136 may serve as a reasonable proxy to reflect the value and resources required for the type of assessment service activities that OTPs are required to provide according to SAMHSA requirements under § 8.12(f)(4)(i), including an assessment to identify a patient's unmet HRSNs or the need for harm reduction intervention and recovery support services that are critical to the treatment of an OUD. We understand that OTPs have been involved in collaborative agreements with organizations who address HRSNs and offer various recovery support services (84 FR 62648), and we believe that for OTPs to appropriately identify these types of organizations that target a specific need, identifying these HRSNs as part of SDOH risk assessments is likely needed prior to engaging in activities to coordinate service delivery. However, we solicited comment on whether these types of SDOH assessments ordinarily complement the type of community coordination activities that OTPs perform.

Establishing payment to account for SDOH risk assessments as part of intake activities under the OTP benefit is important, as unmet HRSNs identified as part of such assessments significantly impact outcomes for OUD treatment. Evidence shows that healthcare providers who screen for SDOH in their settings have found that patients who screen positive for a HRSN were significantly more likely to have a history of substance use or mental illness compared to patients who did not have an HRSN.[447] For example, one

[445] Table SU17b: Substance use treatment facilities, by services provided and facility type: Number and column percent, 2022: *https://www.samhsa.gov/data/sites/default/files/reports/rpt42714/NSUMHSS-Annual-Detailed-Tables-22.pdf*.

[447] Chukmaitov, A., Dahman, B., Garland, S.L., Dow, A., Parsons, P.L., Harris, K.A., & Sheppard, Continued

review found that between 50 to 90 percent of patients in publicly funded OTPs were unemployed, and that older adults identified to have misused opioids were 22-percent less likely to be employed.[448] Patients with an OUD are also more likely to have a lower educational attainment, encounter financial hardship, and housing instability.[449] Even more, food insecurity has been indicated to be a strong predictor of prescription opioid misuse and abuse.[450] The SDOH and their contribution to unmet HRSNs have also heavily impacted the rates of drug overdoses. For example, one study examined 28 different SDOH measures that collectively explained 89-percent of the variance in drug-overdose mortality across States.[451] Housing insecurity, in particular, negatively affects the population with an OUD, as this risk factor has been increasing over time among those seeking treatment with an OUD.[452] One analysis conducted by the State of Massachusetts has revealed alarming evidence that the risk of death from an opioid overdose is 30-times higher for those who have experienced homelessness.[453] Lower median household income and unemployment have also been associated with an increase in opioid death rates.[454] Moreover, unmet HRSNs have also hampered access to treatment among Medicare beneficiaries with a SUD, as evidence has shown that among Medicare beneficiaries with an SUD who were not receiving treatment, one-third reported financial barriers and one-fifth reported logistical barriers such as lack of access to transportation as rationales for not receiving treatment.[455] Lastly, many of these SDOH factors have impaired treatment retention and completion rates. Those with lower levels of educational attainment and who are unemployed are less likely to complete SUD treatment, and individuals who are experiencing homelessness are significantly less likely to remain in treatment.[456] Therefore, screening for the SDOH and identifying these unmet HRSNs as part of intake assessments may help OTPs link patients with an identified social need to appropriate resources that can impact the diagnosis of an OUD or address barriers to treating an OUD.

As previously stated, we proposed to update the adjustment to the bundled payment for an episode of care for intake activities (G2076) by adding in the value of the non-facility rate for SDOH risk assessments (G0136: *Administration of a standardized, evidence-based Social Determinants of Health Risk Assessment, 5–15 minutes, not more often than every 6 months*), which is currently assigned a non-facility rate of $18.66 under the PFS. At the time of ratesetting during the CY 2025 PFS proposed rule, the CY 2024 payment rate for the intake add-on code (G0276) was $201.73 and adding the value of a crosswalk to the CY 2024 non-facility rate of $18.66 resulted in a payment rate of approximately $220.39. We stated that we believed that incorporating the value of G0136 into the intake activities adjustment would be the most appropriate, as we believe assessment activities related to SDOH are more likely to occur during intake assessments when a new patient is admitted to an OTP. SAMHSA treatment guidelines recommend that during initial screenings, OTPs should identify barriers and medical and psychosocial risk-factors that may hinder a patient's ability to meet treatment requirements, including co-occurring health conditions, and vocational, legal, financial, transportation, and family concerns.[457] We noted that intake activities (G2076) should only be billed for new patients (that is, patients starting treatment at the OTP), and since SDOH risk assessments would be bundled into the code describing intake activities, this billing requirement would similarly apply. However, we solicited comment on the frequency with which these SDOH risk assessments occur, and whether it would be more appropriate if these assessments occur when OTPs furnish periodic assessments described by HCPCS code G2077.

When OTPs bill the intake add-on code (G2076), we did not propose to require that OTPs performed SDOH risk assessments in a specific manner, but rather that OTPs continued to perform initial assessment services consistent with SAMHSA certification requirements at § 8.12(f)(4)(i) that already largely reflect these type of SDOH risk assessment activities; and, that OTPs abided by other applicable requirements under the Medicare OTP benefit at § 410.67, including those listed in the definition of intake activities at paragraph (vi) within the definition of ''OUD treatment service'' at § 410.67(b). This also means that for the purposes of Medicare payment, if SDOH risk assessments are furnished, they must be related to the diagnosis or treatment of OUD, and any HRSNs identified through SDOH risk assessments performed should be documented in the patient's medical

record to indicate how assessing and addressing the HRSN relates to the treatment and diagnosis of an OUD. We reiterate that our proposal to incorporate the value of HCPCS code G0136 into the OTP intake add-on code (G2076) is meant to serve as a reasonable proxy to reflect the value and resources of the type of initial assessment service activities that OTPs are required to provide under SAMHSA requirements, which now include more specific updates to a patient's care plan with considerations of a patient's goals related to harm reduction interventions, needs for recovery support services, and other HRSNs. However, if OTPs utilize SDOH risk assessments during intake activities, CMS did not propose to require OTPs to utilize a specific type of SDOH risk assessment tool, consistent with similar existing requirements under the PFS for these services. If OTPs do furnish these assessment services, CMS encourages OTPs to adopt evidence-based, validated tools that are already available (such as the CMS Accountable Health Communities tool, the Protocol for Responding to and Assessing Patients Assets, Risks and Experiences (PRAPARE), and instruments identified for Medicare Advantage Special Needs Population Health Risk Assessment);[458] that include the domains of food insecurity, housing insecurity, transportation needs, and utility difficulties, and that can be furnished in a manner appropriate for the patient's educational, developmental, and health literacy level, and that are culturally and linguistically appropriate. We understand that there is not a national consensus around one specific tool, and OTPs should choose the tool that fits their needs and allows them to appropriately detect unmet HRSNs, as well as other needs for harm reduction interventions and recovery support services that are integral to the treatment of an OUD.

Lastly, in light of these proposed changes, we proposed to revise the current descriptor for the intake add-on code for consistency with revisions to § 8.12(f)(4)(i) and to reflect furnishing an SDOH risk assessment: G2076 (*Intake activities, including initial medical examination that is a complete, fully documented physical evaluation and initial assessment conducted by a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician or qualified personnel that includes preparation of a care plan, which may be informed by administration of a standardized, evidence-based Social Determinants of Health Risk Assessment to identify unmet health-related social needs, and that includes the patient's goals and mutually agreed-upon actions for the patient to meet those goals, including harm reduction interventions; the patient's needs and goals in the areas of education, vocational training, and employment; and the medical and psychiatric, psychosocial, economic, legal, housing, and other recovery support services that a patient needs and wishes to pursue, conducted by qualified personnel (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to each primary code*).

We received many public comments from a variety of interested parties on this proposal to establish payment for SDOH risk assessments as part of intake activities within OUD treatment services to support activities at an OTP that identify a patient's unmet HRSNs or the need and interest for harm reduction interventions and recovery support services that are critical to the treatment of an OUD. The following is a summary of the comments we received and our responses.

Comment: We received many comments that supported our proposal to establish payment for intake activities to account for SDOH risk assessments that allow an OTP to identify unmet HRSNs that could interfere with the OTP's ability to diagnose or treat the patient's OUD. Commenters agreed that recent regulatory reforms to OUD treatment finalized by SAMHSA necessitate additional resources for OTPs to implement the new changes. Commenters stated that improving the valuation of intake activities by accounting for SDOH risk assessments would align with new paradigms of whole-person-centered care for OUD treatment. Commenters noted that the proposed update would help OTPs address key issues during intake activities that increase the risk of a patient leaving OUD treatment prematurely or that pose barriers to treatment engagement and allow an OTP to identify appropriate harm reduction interventions, recovery support service needs, or other supports to address unmet HRSNs. Commenters also noted that some accrediting organizations require HRSNs to be assessed as part of a patient's initial assessment, and that establishing payment for intake activities to account for these assessments may further incentivize these assessments as a standard practice at OTP intakes. One commenter agreed with CMS' proposal not to require a specific SDOH risk assessment screening tool if an OTP conducts these assessments during intake activities, but rather to provide OTPs the discretion to select the most appropriate and evidence-based, validated tool.

Furthermore, commenters believe that these proposed updates would help promote health equity while improving the quality of treatment provided at OTPs. Commenters shared that beneficiaries with an OUD may experience greater disparities in accessing safe housing, transportation, education, and job training, and are more likely to have limited financial resources, difficulty accessing medical care, underemployment, and underinsurance. Thus, interventions designed to address these needs could reduce barriers to seeking care, improving health outcomes, and increasing the likelihood of treatment success.

Response: We appreciate these comments that validate the need to update intake activities to account for SDOH risk assessments to promote new paradigms of care for OUD treatment, as well as to allow OTPs to effectively address key issues that increase the risk of a patient prematurely leaving OUD treatment or that create barriers to engaging in OUD treatment.

Comment: One commenter encouraged CMS to make SDOH risk assessments optional as part of intake activities for both the OTP and beneficiary. The commenter reasoned that there may be some circumstances that prevent OTPs from being able to administer an SDOH risk assessment during intake activities, such as a patient being under the influence or unable to answer questions.

Response: We agree with the commenter that there could be circumstances that impact OTPs being able to effectively assess the patient and perform an SDOH risk assessment. However, OTPs must perform initial assessment services consistent with SAMHSA certification requirements at § 8.12(f)(4)(i) that already largely reflect these types of SDOH risk assessment activities. In the proposed rule, we did not propose to require that OTPs perform SDOH risk assessments in a specific manner. (89 FR 61828) We understand that there are various types of validated SDOH risk assessment tools available that OTPs may use to conduct these assessments, and OTPs are best suited to evaluate when and how to appropriately conduct these assessments after considering clinical

[458] *https://innovation.cms.gov/files/worksheets/ahcm-screeningtool.pdf; https://www.nachc.org/research-and-data/prapare/;* CMS–10825.

and situational circumstances of the patient.

Comment: One commenter mentioned that the code descriptor for the current SDOH risk assessment code (G0136) is based on assessments between 5–15 minutes that are not more often than every 6 months (G0136: *Administration of a standardized, evidence-based Social Determinants of Health Risk Assessment, 5–15 minutes, not more often than every 6 months*). This commenter requested that we confirm the frequency for which this type of SDOH risk assessment could be billed in OTP settings, including whether it is permissible to bill for intake activities each time these SDOH risk assessments are furnished.

Response: We appreciate this question. Intake activities (HCPCS code G2076) may only be billed for new patients (that is, patients starting treatment at the OTP), and since SDOH risk assessments would be bundled into the code describing intake activities, this billing requirement would similarly apply. Thus, an OTP is not permitted to bill multiple intake activities via HCPCS code G2076 for existing patients.

Comment: One commenter stated that they did not believe CMS' proposed revision to the code descriptor for intake activities was appropriate, that is, HCPCS code G2076 (*Intake activities, including initial medical examination that is a complete, fully documented physical evaluation and initial assessment conducted by a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician or qualified personnel that includes preparation of a care plan, which may be informed by administration of a standardized, evidence-based Social Determinants of Health Risk Assessment to identify unmet health-related social needs, and that includes the patient's goals and mutually agreed-upon actions for the patient to meet those goals, including harm reduction interventions; the patient's needs and goals in the areas of education, vocational training, and employment; and the medical and psychiatric, psychosocial, economic, legal, housing, and other recovery support services that a patient needs and wishes to pursue, conducted by qualified personnel (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to code for primary procedure*). The commenter highlighted that the language in the descriptor referring to initial medical examination and initial assessments specifies that these services are conducted by ''a program physician or a primary care physician, or an authorized healthcare professional under the supervision of a program physician or qualified personnel.'' The commenter added that this specific language has been removed in SAMHSA's regulations at § 8.12(f)(2)(i) after the recent final rule, so the current code descriptor language is not in alignment with new regulatory requirements. Instead, the commenter requested that CMS update the code descriptor with current regulatory language that utilizes an ''appropriately licensed practitioner.''

Response: We appreciate the comment raising this important discrepancy. We agree that it is important for the code descriptor language to reflect current regulatory requirements for OTPs under 42 CFR part 8. Accordingly, we are finalizing a revision to the code descriptor of HCPCS code G2076 to be more inclusive to other types of professionals who may conduct these assessments in an OTP setting, as follows: (*Intake activities, including initial medical examination that is conducted by an appropriately licensed practitioner and preparation of a care plan, which may be informed by administration of a standardized, evidence-based Social Determinants of Health Risk Assessment to identify unmet health-related social needs, and that includes the patient's goals and mutually agreed-upon actions for the patient to meet those goals, including harm reduction interventions; the patient's needs and goals in the areas of education, vocational training, and employment; and the medical and psychiatric, psychosocial, economic, legal, housing, and other recovery support services that a patient needs and wishes to pursue, conducted by an appropriately licensed/credentialed personnel (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to each primary code*).

Comment: A few commenters requested that CMS clarify the types of healthcare professionals who may receive payment for furnishing SDOH risk assessments during intake activities at OTPs. For example, commenters noted that clinical social workers, counselors, and nurses are often involved in assessment processes for identifying SDOH needs.

Response: In the CY 2025 PFS proposed rule, we did not propose to limit the types of professionals that can provide these aforementioned services. If OTPs furnish SDOH risk assessments during intake activities, they must continue to furnish these services consistent with SAMHSA certification requirements at § 8.12(f)(4)(i), which currently reflect that these initial assessment services may be furnished by ''appropriately licensed/credentialed personnel.''

Comment: One commenter requested that CMS clarify if SDOH risk assessment services can be billed in connection with discharge in OTP programs.

Response: There is no current coding under the Medicare OTP benefit that describes discharge planning or services, and we did not propose to include payment for SDOH risk assessments in connection with these types of services. We appreciate the commenter's question and may consider this topic for future rulemaking.

Comment: One commenter asked CMS to clarify whether these payment updates will have an impact on budget neutrality and urged CMS to not subject these payment updates to budget neutrality limitations to avoid potential financial impacts on the broader healthcare system.

Response: Although CMS typically includes proposals for modifications related to Medicare coverage for OUD treatment services furnished by OTPs within annual PFS rules, we note that the Medicare OTP benefit is wholly separate from services paid under the PFS and physician services, and for which payment is made under section 1848 of the Act, and is not subject to budget neutrality rules or limitations.

Comment: One commenter requested that the agency avoid payment conditions that require services to be medically reasonable and necessary prior to billing under the Medicare program, and to instead defer to the judgment of healthcare professionals.

Response: In general, the Medicare statute at section 1862(a)(1)(A) prohibits payment for items and services under Part A and Part B that are not reasonable and necessary for the diagnosis or treatment of an illness or injury or to improve the functioning of a malformed body member. Although Congress has made some exceptions for some services, Congress has not made an exception for OUD treatment services. Thus, while we appreciate the commenter's suggestion, we are not adopting it. OUD treatment services furnished under the OTP benefit must be medically reasonable and necessary for the treatment of an OUD in order to be paid under Medicare Part B.

Comment: Multiple commenters stated that establishing payment for SDOH risk assessments should not just be limited to intake activities. Commenters highlighted several concerns, including: there may be

circumstances preventing OTPs from administering SDOH screenings at intake; patients may not be willing to answer sensitive SDOH questions at the time of intake since it takes time for patients to establish trust with their providers before sharing any treatment barriers they may face; intake activities in OTP settings involve a mix of multiple assessments and medical evaluations that are time-intensive, so additional assessments furnished may require multiple treatment sessions to complete; and the recovery process for patients with an OUD is rarely linear, and patients with an OUD often face changes in their SDOHs throughout treatment, including in economic circumstances, housing, and employment, which require the OTP to continuously reassess unmet HRSNs and update care plans. In raising these concerns, commenters recommended that CMS modify the frequency for which SDOH risk assessments could be billed. One commenter requested that CMS create separate coding to allow billing for additional SDOH reassessments if needed. Other commenters specifically asked that CMS also add the value of the SDOH risk assessment code (HCPCS code G0136) to the existing periodic assessments code (HCPCS code G2077) under the Medicare OTP benefit.

Response: We thank the commenters for these comments. CMS understands that OUD is a chronic condition, and that recovery is an ongoing, long-term process that may necessitate various supports across different stages of the continuum of care. While we proposed that OTPs would account for SDOH risk assessments as part of intake activities, we specifically sought comments on the frequency with which SDOH risk assessments occur and whether it would be more appropriate if those assessments occurred when OTPs furnish periodic assessments described by HCPCS code G2077 (89 FR 61827 through 61828). At the time of drafting the proposed rule, CMS did not have enough information to understand the extent to which SDOH risk assessments are performed following intake activities. However, we recognized that patients with an OUD are at a higher risk for having unmet HRSNs, including housing instability, financial hardship, food insecurity, unemployment, and lack of access to transportation.[459] In response to the proposed rule, commenters affirmed that these unmet HRSNs often require OTPs to continuously reassess a patient's unmet HRSNs and the needs for various harm reduction interventions and peer recovery supports throughout the duration of treatment in order to reduce potential barriers that may limit the likelihood of a patient's treatment success. Additionally, in the proposed rule, CMS did not initially consider various circumstances that may prevent an OTP from being able to perform SDOH risk assessments at intake, which commenters highlighted. These various circumstances include a patient not being able to answer sensitive SDOH questions at the beginning of treatment due to a lack of trust with their provider, or an OTP not being able to assess a patient who is under the influence. CMS was also made aware by commenters that these types of assessments take additional time and, in some cases, cannot be completed in full at the time of intake. Thus, we are persuaded by commenters that multiple SDOH risk assessments may be needed to address unmet HRSNs that impact OUD treatment outcomes when a patient is being treated at an OTP, so these types of assessments should not be limited to only intake activities that are payable under the Medicare OTP benefit for new patients. Therefore, we believe it is appropriate to finalize payment for SDOH risk assessments during periodic assessments in addition to intake activities. We note that when SAMHSA introduced changes to 42 CFR part 8, they intended also for changes to periodic assessments to promote key issues for OTPs to address with a patient as part of treatment, including ''areas that may increase the risk of a patient leaving care prematurely, such as unmet mental health or other disability, medical and oral health needs, the need for culturally supportive care that addresses race, ethnicity, sexual orientation, religion or gender identity, and social determinants of health, such as housing and transportation, that may pose barriers to treatment engagement, or harm reduction and recovery support service needs.'' (87 FR 77341) SAMHSA requires that periodic assessment services at § 8.12(f)(4)(ii) ''should occur not less than one time each year and be conducted by an OTP practitioner. The periodic physical examination should include a review of MOUD dosing, treatment response, other substance use disorder treatment needs, responses and patient-identified goals, and other relevant physical and psychiatric treatment needs and goals.'' CMS understands that periodic assessments often build upon and adjust the care plan initially developed during intake activities, which may reflect various SDOH, harm reduction, and recovery support service needs. Therefore, consistent with the feedback shared by commenters, we believe it is appropriate to also update payment for periodic assessments (HCPCS code G2077) by adding in the value of the non-facility rate for SDOH risk assessments described by HCPCS code (G0136). We believe that this update will reflect additional activities undertaken by OTPs to continuously reassess unmet HRSNs or the need for harm reduction interventions and recovery support services throughout various lengths of treatment and that are critical to the treatment of an OUD. Accordingly, we are also finalizing a revision to the code descriptor for periodic assessments to reflect furnishing an SDOH risk assessment and to reflect current regulatory requirements for periodic assessments furnished by OTPs under § 8.12(f)(4)(ii): G2076 (*Periodic assessment; assessing periodically by an OTP practitioner and includes a review of MOUD dosing, treatment response, other substance use disorder treatment needs, responses and patient-identified goals, and other relevant physical and psychiatric treatment needs and goals; assessment may be informed by administration of a standardized, evidence-based Social Determinants of Health Risk Assessment to identify unmet health-related social needs, or the need and interest for harm reduction interventions and recovery support services (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to each primary code*). By adding the valuation of SDOH risk assessments into the code for periodic assessments, we are clarifying that this does not require OTPs to perform SDOH risk assessments during periodic assessments or in a specific manner or duration. Rather, as with intake activities, this valuation is similarly intended to serve as a proxy to reflect the additional effort needed by OTPs in line with new SAMHSA reforms. We continue to expect that OTPs perform periodic assessments consistent with SAMHSA certification requirements at § 8.12(f)(4)(ii).

After consideration of public comments, we are finalizing our proposal to update the payment rate for intake activities (HCPCS code G2076) by adding in the value of the non-facility rate for SDOH risk assessments (G0136). We are also updating the payment rate for periodic assessments (HCPCS code G2077) by adding in the value of the

[459] *https://doi.org/10.1016/j.pmedr.2022.101935; https://doi.org/10.1080/19371918.2021.1939831; https://doi.org/10.1016/j.japh.2023.02.016; https://doi.org/10.1016/j.ssmph.2021.100768.*

non-facility rate for SDOH risk assessments (G0136). We believe these updates are needed to reflect the value and resources of initial and periodic assessment activities required by OTPs to identify a patient's unmet HRSNs or the need for harm reduction intervention and recovery support services while remaining consistent with SAMHSA requirements at § 8.12(f)(4). The current CY 2024 non-facility rate for G0136 is $18.97, and this amount will be added to the current CY 2024 payment rates for the intake add-on code ($201.73) and periodic assessments add-on code ($123.96) for approximate final payment rates of $220.70 (HCPCS code G2076) and $142.93 (HCPCS code G2077), respectively, and updated by the MEI and GAF. The final CY 2025 OTP payment rates will be posted on the CMS website after publication of this final rule.[460] We reiterate that intake activities, periodic assessments, and SDOH risk assessments conducted during intake and periodic assessments must continue to relate to the diagnosis or treatment of an OUD and be consistent with SAMHSA requirements under § 8.12(f)(4). In addition, we expect that any unmet HRSNs identified through SDOH risk assessments performed should be documented in the patient's medical record to indicate how assessing and addressing the HRSN relates to the treatment and diagnosis of an OUD.

b. Request for Information on Payment for Coordinated Care and Referrals to Community-Based Organizations That Address Unmet Health-Related Social Needs, Provide Harm Reduction Services, and/or Provide Recovery Support Services

In the discussion above, we noted that SAMHSA's recent reforms to 42 CFR part 8 finalized new definitions for harm reduction and recovery support services, which are included as components of the type of services that OTPs may provide. Some examples of harm reduction strategies include overdose education, distribution of opioid overdose reversal medications, and linkage to other public health services. Recovery support services can include, but are not limited to, community-based recovery housing, social support, and linkage to and coordination among allied service providers and a full range of human services that facilitate recovery and wellness. Under the Medicare OTP benefit, we have already established payment for some of these services, including take-home supplies of opioid antagonist medications for emergency treatment of known or suspected opioid overdose (for example, naloxone), overdose education furnished in conjunction with opioid antagonist medications, and social support via group therapy. However, we do not currently have specific coding for activities that OTPs may conduct to coordinate care and make referrals or ''link'' to community-based organizations (CBOs) that help facilitate a patient's needs and goals related to harm reduction and recovery support services, as well as to address unmet HRSNs. We understand that a referral is an important aspect of following up on unmet HRSNs identified during an initial assessment service and/or SDOH risk assessment so that a patient can be connected to resources or services that may help address their unmet HRSN that interferes with treatment of their OUD. Additionally, we have received previous comments that OTPs often have collaborative agreements with providers outside of the OTP. For these reasons, we solicited comment to understand how OTPs are currently coordinating care and making referrals to CBOs that address unmet HRSNs, provide harm reduction services, and/or provide recovery support services.

Some evidence has indicated that providers who coordinate care with CBOs to address HRSNs (for example, housing, transportation, care management, etc.) can positively influence health outcomes,[461] and that SUD treatment facilities establishing relationships with community-based peer support services, educational and employment agencies, housing agencies, and other organizations have been able to better support a patient's engagement in SUD treatment.[462] Additionally, harm reduction organizations, including syringe service programs, function as important facilitators of entry to treatment, as individuals who partake in these programs are five times more likely to enter treatment, more likely to remain engaged in treatment, and more likely to reduce their injection drug use.[463] Additionally, recovery support services, such as those linking individuals in SUD treatment who are also experiencing homelessness with supportive or transitional housing, have resulted in improved uptake of behavioral health visits;[464] and, recovery support services facilitated by peers who have recovered from a SUD have been shown to reduce relapse rates, improve treatment retention, enhance the provider and patient relationship, and boost overall treatment experience.[465] Therefore, there is evidence to suggest that linkage to these types of community-based resources may contribute to improved outcomes related to OUD treatment; however, we solicited comment on additional evidence that demonstrates how this type of services would directly help OTPs address the diagnosis or treatment of an OUD. CMS would also be interested in additional evidence describing how these community-based resources and coordination of these services with MOUD provided by OTPs would impact access to treatment for Medicare beneficiaries who may face barriers in accessing treatment, such as those who are residents of rural areas, racial/ethnic minorities, living with a disability, dual-enrollees in Medicare and Medicaid, and low-income, or other populations who may face barriers in accessing treatment. Additionally, we sought information on the types of entities, service providers, and organizations that OTPs may interact with on a regular basis to address a patient's unmet HRSNs and needs or goals related to harm reduction and recovery support services. For example, we sought to understand if these entities would typically include housing or transportation agencies, local support groups, syringe service programs, non-profits that provide financial assistance, etc. We sought information on the types

of collaborative arrangements that OTPs typically have with these CBOs, including how frequently (for example, weekly, monthly, annually, etc.) OTPs coordinate care or make referrals to these CBOs for patients with an OUD, the types of circumstances that warrant an OTP interacting with these CBOs, and the workflows originating from the initial SDOH assessment to identify these HRSNs to a beneficiary successfully receiving referred services. We also expressed interest in learning to what extent some of these programs are already integrated into OTP settings.

Moreover, we stated we were also interested in learning when these coordinated activities and/or referrals occur in the process of furnishing care to a beneficiary. For example, a component of SAMHSA's new revised standards for MOUD treatment under counseling and psychoeducational services at § 8.12(f)(5)(iii) suggests that OTPs must provide directly, or through referral to adequate and reasonably accessible community resources, vocational training, education, and employment services for patients who request such services or for whom these needs have been identified and mutually agreed upon as beneficial by the patient and program staff. Thus, we solicited comment on whether these coordination and referral services typically occur during SUD counseling session services, or if they may occur during initial or periodic assessments, therapy sessions, or as part of other services. We also expressed interest in understanding if, when billing for intake activities (G2076), periodic assessments (G2077), additional therapy/counseling (G2080), and/or the non-drug component code (G2074) under the Medicare OTP benefit, OTPs are already accounting for these coordinated care and referral services as part of those codes.

We also stated that we are interested in additional information related to payment for these types of coordinated care or referral services. Specifically, we solicited comment on the resource costs that OTPs must expend to coordinate or make referrals to community-based services that address HRSNs, harm reduction, or recovery support needs. We mentioned that we were also interested in learning whether there is existing coding that properly describes these types of coordinated care or referral services, or whether there are elements to these types of services that are unique to OTPs and require new coding. We solicited comment on if any of the following codes below may describe the type of coordinated care or referral activities that OTPs may provide, or if there are other codes that more precisely match the type of coordinated care or referral activities at OTPs: community health integration (G0019 & G0022), principal illness navigation (G0023, G0024, G0140, G0146), chronic care management (99437, 99439, 99490, 99491), complex chronic care management (99487, 99489), principal care management (99424, 99425, 99426, 99427), or other codes, including any other relevant codes used by other payers.

Lastly, we sought information on whether OTPs already receive funding for these types of coordinated care or referral services from other public or private sources, and if additional payment would be duplicative or unnecessary. We mentioned we were interested in learning, for example, if OTPs already receive State or Federal grants for these types of activities (for example, the SAMHSA Harm Reduction Grant Program, Rural Communities Opioid Response Program, State Opioid Response Grants, Building Communities of Recovery, Substance Use Prevention, Treatment, and Recovery Services Block Grant, etc.).[466] Additionally, we stated that we would like to understand if OTPs already receive payment from States who might already cover these services under State Medicaid programs, including through section 1115 waiver demonstrations and delivery system reform incentive payments, State plan amendments, managed care contracts, or other service benefits and payment arrangements,[467] and if new coding under the Medicare OTP benefit may unintentionally supplant coverage for dually eligible beneficiaries. We solicited comment by the public on these questions and issues to better understand activities that OTPs conduct to coordinate care and make referrals to CBOs that address unmet health-related social needs, provide harm reduction services, and/or provide recovery support services.

We received many public comments on this request for information to understand how OTPs are currently coordinating care and making referrals to CBOs that address unmet HRSNs, provide harm reduction services, and/or provide recovery support services. The section below includes a summary of the comments we received related to this topic and our responses.

Comment: Commenters submitted an abundance of information on coordinated care and referral services within OTP settings, including the types of service provider entities in the community OTPs interact with, examples of operational processes in OTP settings related to these activities, the types of referral services OTPs refer patients to, potential resource costs associated with rendering coordinated care and referral services, current public and private funding mechanisms for these activities, and existing coding that may appropriately describe these activities in OTP settings.

Commenters shared that providing services and supports to address unmet HRSNs, harm reduction intervention needs and/or recovery support services needs are vital elements of treatment and recovery, and that these integral activities should be meaningfully incorporated into the Medicare OTP benefit. One commenter encouraged CMS to work with other HHS agencies, community organizations, and patients with an OUD to implement more payment and coverage policies, consistent with the HHS Overdose Prevention Strategy, SAMHSA's Harm Reduction Framework, and the National Drug Control Strategy.[468]

Commenters described the various types of entities OTPs typically coordinate with or provide referrals to such as local recovery community organizations, State and residential programs, recovery houses, certified community behavioral health centers (CCBHCs), food pantries and distribution programs, job training programs, community support specialists, and peer recovery support specialists. Commenters mentioned that OTPs often have memorandums of understanding with these types of service providers. For example, a few commenters noted that Missouri requires OTPs to hire or coordinate with community support specialists who function as system navigators, care coordinators, or case managers to ensure patients receive services they are referred to. Additional commenters communicated that by licensing regulations, Massachusetts requires OTPs to maintain qualified service

organization agreements with a wide variety of healthcare and social service providers, and to outline referral pathways in these agreements to ensure SDOH needs identified by the OTP can be addressed by the appropriate community-based organization. One commenter stated that for over 8 years, OTPs in South Carolina have leveraged a Screening, Brief Intervention, and Referral to Treatment (SBIRT) online system where community-based referrals are regularly tracked and monitored. A few commenters added that beginning July 1, 2024, CCBHCs are required to partner with OTPs in their service areas, and often these healthcare organizations help facilitate access to supportive housing programs for patients. Many commenters also shared that in some cases, OTPs may refer patients who both are receiving treatment with methadone and require higher levels of care to recovery centers, which may offer additional supports including if a patient has additional SUD diagnoses. Some commenters also raised that peer recovery specialists often interact with OTPs and assist patients on their treatment journeys by providing peer support, connecting the patient with resources in the community, or helping the patient navigate various care options.

Commenters furthered shared when coordination and referral services occur in OTP settings. Specifically, OTPs routinely perform coordination of care and referral and linkage services, and these activities could occur when an unmet HRSN is identified during an initial assessment, individual counseling session, case management visit, or medical examination. Commenters shared the types of frequent services that OTPs refer patients to: overdose prevention education, legal assistance, housing, nutrition, primary care, vocational, education, employment, and services to address or treat co-occurring HIV, viral hepatitis, and STIs.

Furthermore, regarding payment and funding for these coordinated care and referral services, commenters mentioned that many OTPs don't necessarily have all the resources to implement these services to their full extent due to lack of infrastructure and relevant information technologies, administrative burden, and the availability of community resources. Commenters stated that some OTPs have used grant funds or opioid settlement money to fund these types of activities, but that these funding sources are not as stable as direct payment for OUD treatment services under the Medicare program. Other commenters noted that some underserved communities may not have easy access to private (for example, private health insurers, charitable foundations, etc.) or public funding sources (for example, State or Federal grants, State Medicaid programs, etc.) to fill this gap in payment for coordinated care and referral services. A few commenters also stated that although some State Medicaid programs may offer coverage for case management services, in most cases OTPs are not reimbursed for these types of coordination or referral services they furnish to Medicare beneficiaries. Commenters further added that if OTPs received payment through Medicare, they would have the capacity to expand the breadth of these services and hire additional full-time staff. Many commenters specified the types of coding that would be appropriate to characterize coordinated care or referral activities in OTP settings, including community health integration (CHI) services (HCPCS codes G0019 and G0022) and/or Principal Illness Navigation (PIN) services (HCPCS codes G0023, G0024, G0140, and G0146). A few commenters encouraged CMS to focus on payment for case management services or peer recovery support services.

Response: We appreciate information submitted by commenters, which offered an abundance of detail as to how coordinated care and referral services are provided in OTP settings. We are persuaded by commenters that these types of services have been integrated into OTP settings for a long period of time, are critical to the treatment of an OUD and a patient's recovery and warrant additional payment under the Medicare OTP benefit. As we stated in the proposed rule (89 FR 61826), we recognize that OTPs often directly provide, or provide referrals to, services related to harm reduction interventions, recovery support services, addressing HRSNs, and facilitate access to community-based social services. For example, data collected by SAMHSA in 2022 indicated approximately 92 percent of OTP facilities offered various recovery support services, including peer support (59.6 percent), assistance locating housing for clients (75.0 percent), employment counseling (49.5 percent), and assistance helping patients obtain social services (81.2 percent).[469] Public comments in response to the implementing final rule (CY 2020 PFS final rule) stated OTPs often provide various coordinated care services, possess collaborative arrangements with healthcare providers outside of the OTP, and help patients with accessing food benefits, housing, and employment searches, which are critical components for sustained recovery (84 FR 62648). Altogether, CMS believes that we now have enough information to establish coding and payment for coordinated care and referral activities as well as for patient navigational and peer recovery support services in this final rule. We believe establishing payment for these services will further efforts to enhance access to MOUD treatment and recovery services among Medicare beneficiaries with an OUD, and align services covered under the Medicare OTP benefit with current paradigms of whole-person centered care for MOUD treatment. We also believe expansion of these services is important to ensure consistency across the Medicare program in the types of benefits that are accessible to Medicare beneficiaries in different care settings and allow OTPs to receive additional payment to implement new SAMHSA reforms to MOUD treatment.

Based on the comments received, we believe that community health integration services (CHI), principal illness navigation services (PIN), and principal illness navigation services—peer support (PIN–PS) are consistent with services ordinarily provided in OTP settings to coordinate care or referrals to community-based organizations, in addition to navigational or peer recovery support services. CHI services, described by HCPCS G-codes G0019 and G0022, focus on providing tailored support to help address unmet HRSNs that significantly limit a provider's ability to diagnose or treat the patient. Some of these services include: coordinating receipt of needed services from health care providers, health care facilities, and community-based service providers; coordination of care transitions between and among other health care providers and settings; following up with a patient after an emergency department visit or discharge from a health care facility; and facilitating access to community-based social services to address unmet HRSN (for example, housing, utilities, transportation, food assistance) to address the SDOH need(s). We are finalizing creation of a new code for coordinated care and/or referral services (G0534) that is based on a crosswalk to the CY 2024 PFS non-facility rate of the community health integration base HCPCS code G0019 (*Community health integration services performed by*

[469] Table SU17b: Substance use treatment facilities, by services provided and facility type: Number and column percent, 2022: *https://www.samhsa.gov/data/sites/default/files/reports/rpt42714/NSUMHSS-Annual-Detailed-Tables-22.pdf.*

certified or trained auxiliary personnel, including a community health worker, under the direction of a physician or other practitioner; 60 minutes per calendar month, in the following activities to address social determinants of health (SDOH) need(s) that significantly limit the ability to diagnose or treat problem(s) addressed in an initiating visit), but divided by two to represent each additional 30 minutes of services furnished (CY 2024 PFS non-facility rate of G0019 = $80.56 and divided by two = $40.28). We believe that basing HCPCS code G0534 on each additional 30 minutes of services furnished would allow for a smaller unit of billing (30 minutes versus 60 minutes per calendar month for HCPCS code G0019), which would lower the time threshold needed to bill for coordinated care and/or referral services as CMS learns how often these services are furnished in OTP settings. Additionally, basing HCPCS code G0534 on each additional 30 minutes of services for coordinated care and/or referral activities may allow these services to be more easily billed alongside the weekly bundled payments for an episode of care due to the smaller time increments. It may further reduce administrative burden through billing simplification via one HCPCS G-code, rather than creating two separate codes for coordinated care and referral activities based on the two CHI codes under the PFS for 60 minutes per calendar month (G0019) and each additional 30 minutes thereafter (G0022). Moreover, we expect OTPs to furnish services coded with G0534 (*Coordinated care and/or referral services, such as to adequate and accessible community resources to address unmet health-related social needs, including harm reduction interventions and recovery support services a patient needs and wishes to pursue, which significantly limit the ability to diagnose or treat an opioid use disorder; each additional 30 minutes of services (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to each primary code*) when an OTP coordinates care or provides referral or linkage services to adequate and accessible community resources or community-based organizations that address a patient's identified unmet HRSN, or need and interest for harm reduction interventions and recovery support services, which may limit the ability of an OTP to diagnose or treat a patient's OUD. These community-based organizations may include, but are not limited to, harm reduction organizations, peer support organizations, housing agencies, job training programs, recovery centers, food assistance or distribution programs, residential programs, and educational services. Accordingly, we are finalizing a revision to the definition of an opioid use disorder treatment service at § 410.67(b) by adding paragraph (x) to account for these type of ''coordinated care and/or referral services, provided by an OTP to link a beneficiary with community resources to address unmet health-related social needs or the need and interest for harm reduction interventions and recovery support services that significantly limit the ability to diagnose or treat a patient's opioid use disorder.'' We are also revising § 410.67(d)(4)(i) by adding paragraph (G) to specify that for the ''coordinated care and/or referral services described in paragraph (x) of the definition of OUD treatment service at § 410.67(b), an adjustment will be made when each additional 30 minutes of these services are furnished,'' to the bundled payment.

Moreover, PIN services, described by HCPCS G-codes G0023 and G0024, and PIN–PS services, described by G0140 and G0146, are similar to CHI, but do not necessarily require a patient to have an unmet HRSN before services are furnished. PIN and PIN–PS are more focused on helping patients with a serious high-risk condition (for example, substance use disorder) navigate the health care system and guiding them through their course of care. PIN–PS services are slightly distinct from PIN services in that these services are often facilitated by peer support specialists who directly assist patients in helping to navigate various health system and social sector interactions, whereas navigators may serve as a more direct point of contact on behalf of the patient. We are finalizing the creation of a new code for patient navigational services (HCPCS code G0535) that is based on a crosswalk to the CY 2024 PFS non-facility rate of the principal illness navigation base HCPCS code G0023 (*Principal illness navigation services by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a patient navigator; 60 minutes per calendar month, in the following activities*), but divided by two to represent each additional 30 minutes of services furnished (CY 2024 PFS non-facility rate of HCPCS code G0023 = $80.56 and divided by two = $40.28). We are basing HCPCS code G0535 on each additional 30 minutes of services for similar reasons to why we are finalizing each additional 30 minutes of service for HCPCS code G0534, that is, administrative simplification for providers, to lower the billing threshold, to more easily be billed alongside the weekly bundled payment for an episode of care, and to be consistent with the payment approach for HCPCS code G0534.) We expect OTPs to bill for HCPCS code G0535 (*Patient navigational services, provided directly or by referral; including helping the patient to navigate health systems and identify care providers and supportive services, to build patient self-advocacy and communication skills with care providers, and to promote patient-driven action plans and goals; each additional 30 minutes of services (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to each primary code*) when an OTP provides directly or by referral to patient navigational services that help the patient with an OUD navigate multiple settings of care, including by identifying care providers or recovery supportive services, communicating with other health care or social service providers and securing appointments for patients, building patient self-advocacy and communication skills, and facilitating patient-driven goal-setting and action plans for MOUD treatment and recovery. We believe patient navigational services may be best suited for situations in which the navigator may serve as a more direct point of contact for the patient. Additionally, we are finalizing the creation of a new code for peer recovery support services (HCPCS code G0536) that is based on a crosswalk to the CY 2024 PFS non-facility rate of the principal illness navigation—peer support base code HCPCS code G0140 (*Principal illness navigation—peer support by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a certified peer specialist; 60 minutes per calendar month, in the following activities*) but divided by two to represent each additional 30 minutes of services furnished (CY 2024 PFS non-facility rate of HCPCS code G0140 = $80.56 and divided by two = $40.28). We are basing HCPCS code G0536 on each additional 30 minutes of services for similar reasons to why we are finalizing each additional 30 minutes of service for G0534 and G0535, that is, administrative simplification for providers, to lower the billing threshold, to more easily be billed alongside the weekly bundled payment for an episode of care, and to be consistent with the

payment approach for HCPCS codes G0534 and G0535. We expect OTPs to bill for HCPCS code G0536 (*Peer recovery support services, provided directly or by referral; including leveraging knowledge of condition or lived experience to provide support, mentorship, or inspiration to meet OUD treatment and recovery goals; conducting a person-centered interview to understand the patient's life story, strengths, needs, goals, preferences, and desired outcomes; developing and proposing strategies to help meet person-centered treatment goals; assisting the patient in locating or navigating recovery support services; each additional 30 minutes of services (provision of the services by a Medicare-enrolled Opioid Treatment Program); List separately in addition to each primary code)* when individuals either with knowledge of an OUD, or with lived experience of an OUD, provide support, coaching, mentorship, or inspiration to patients with an OUD to meet various MOUD treatment and recovery goals. Peer recovery support specialists may help: Medicare beneficiaries with an OUD to stay engaged in treatment at an OTP; connect patients with other peer support networks or recovery services in the community; conduct interviews of the patient to understand their background, needs, and goals, and then propose or strategize means for accomplishing such treatment and recovery goals; and more. Accordingly, we are finalizing a revision to the definition of opioid use disorder treatment service at § 410.67(b) by adding paragraph (xi) to account for ''patient navigational services and/or peer recovery support services, when provided directly by an OTP or through referral, in order to assist patients with an OUD in navigating the health system and accessing supportive services, and/or to provide support in meeting patient-driven OUD treatment and recovery goals.'' We are also adding new paragraph (H) to § 410.67(d)(4)(i) to specify that we are making an adjustment to the bundled payment for patient navigational services and/or peer recovery support services when each additional 30 minutes of these services are furnished.

Furthermore, we are revising § 410.67(d)(4)(ii) and (iii) to update the adjustment to the bundled payment for coordinated care and/or referral services (G0534), and patient navigational services (G0535) and/or peer recovery support services (G0536) by the GAF and MEI, respectively, consistent with other adjustments to the bundled payment.

Moreover, we encourage OTPs to engage in discussions with patients regarding coordinated care and/or referral services, patient navigational services, and/or peer recovery support services prior to furnishing and billing for these services under the Medicare OTP benefit. We believe these discussions are important to ensure patients are aware of and agree with these services being furnished, to provide information to patients regarding these services and their benefits, and so that these services are furnished in a manner that is patient-centered and consistent with a patient's OUD treatment and recovery goals. We expect OTPs to document in the patient's medical record how coordinated care and/or referral services, patient navigational services, and/or peer recovery support services relate to the treatment and diagnosis of an OUD. Like other services provided under the Medicare OTP benefit, we are not limiting the types of professionals that can provide these services to those professionals who are able to bill Medicare directly. However, professionals who render these services (coordinated care/referral services, patient navigational services, and peer recovery support services) within or external to OTP settings must be authorized under State law, including by licensure, certification, and/or training, for these services prior to furnishing them to Medicare beneficiaries. We further note that only OTPs may continue to bill directly for OUD treatment services furnished via the bundled payment and adjustments to the bundled payment, including these new codes (HCPCS codes G0534, G0535, and G0536). Additionally, all services provided to Medicare beneficiaries under the OTP benefit must be medically reasonable and necessary and related to the treatment of an OUD. We similarly expect for coordinated care and/or referral services, patient navigational services, and/or peer recovery support services to be medically reasonable and necessary and related to the treatment of an OUD. Thus, OTPs should document in the patient's care plan how these services relate to the diagnosis or treatment of an OUD prior to billing Medicare for these services. At this time, we are not finalizing limitations to how frequently these services may be furnished, so as to not hinder access as we gather more information on how these services will be utilized under the OTP benefit. We understand that the number of minutes needed for these services may vary greatly depending on the needs and condition of the patient with an OUD. Given the addition of these new codes under the Medicare OTP benefit, CMS remains open to feedback from the public on the implementation and utilization of these codes; therefore, we will continue to consider additional refinements as needed via future rulemaking to ensure Medicare beneficiaries have appropriate access to these services to meet MOUD treatment and recovery needs.

4. Payment for New FDA-Approved Opioid Agonist and Antagonist Medications

Section 1861(jjj)(1)(A) of the Act establishes Medicare payment for opioid agonist and antagonist treatment medications (including oral, injected, or implanted versions) that are approved by the Food and Drug Administration under section 505 of the Federal Food, Drug, and Cosmetic Act (FFDCA) for use in the treatment of OUD and as part of OUD treatment services under the OTP benefit. Additionally, section 1834(w)(2) of the Act granted CMS the authority to establish multiple bundled payments in stating that the Secretary may implement this subsection through one or more bundles based on the type of medication provided (such as buprenorphine, methadone, naltrexone, or a new innovative drug), the frequency of services, the scope of services furnished, characteristics of the individuals furnished such services, or other factors as the Secretary determine appropriate. In the CY 2020 PFS final rule, we finalized basing the OTP bundled payments, in part, on the type of medication used for treatment that reflect those drugs currently approved by the FDA under section 505 of the FFDCA for use in treatment of OUD. Accordingly, at § 410.67(d)(1) we specified that CMS would establish categories of bundled payments for OTPs for an episode of care, including categories for each type of opioid agonist and antagonist treatment medication, a category for medications not otherwise specified, and a category for episodes of care in which no medication is provided. At § 410.67(d)(2) we finalized that the bundled payment amounts for an episode of care would be based on both a drug and non-drug component, and we codified the payment methodology for determining these components. At § 410.67(d)(4), we described various adjustments that could be made to the bundled payment. Since the implementation of the Medicare OTP benefit on January 1, 2020, we have established bundled payments and/or add-on codes for the following

medications: methadone (HCPCS codes G2067 & G2078), oral buprenorphine (HCPCS codes G2068 & G2079), injectable buprenorphine (HCPCS code G2069), buprenorphine implants (HCPCS codes G2070 through G2072), naltrexone (HCPCS code G2073), nasal naloxone (HCPCS codes G2215 & G1028), injectable naloxone (HCPCS code G2216), and medication not otherwise specified (HCPCS code G2075) (for new FDA-approved opioid agonist or antagonist medications for OUD treatment that is not specified in one of our existing codes). In the CY 2025 PFS proposed rule, we proposed new payment for injectable buprenorphine and nalmefene hydrochloride products furnished by OTPs.

a. Coding and Payment for a New Nalmefene Hydrochloride Product

In May of 2023, the FDA approved the first nalmefene hydrochloride (nalmefene) nasal spray (under the brand name Opvee®), which is indicated for the emergency treatment of known or suspected opioid overdose induced by natural or synthetic opioids. This is the first FDA approval of a nasal spray for nalmefene hydrochloride for health care and community use, and it is intended for immediate administration as emergency therapy in settings where opioids may be present. Nalmefene acts as an opioid receptor antagonist and when administered quickly, it can reverse the effects of an opioid overdose including respiratory depression, sedation, and low blood pressure.[470] Newly approved Opvee® delivers 2.7 milligrams (mg) of nalmefene in a single spray into the nasal cavity. After the first dose is administered, if the patient does not respond, or responds and there is a recurrence of respiratory depression, additional doses of the Opvee® nasal spray may be administered with an additional spray every 2 to 5 minutes until emergency medical assistance arrives.[471] Compared to naloxone which has a half-life of approximately 2 hours and also rapidly reverses the effects of an opioid overdose, nalmefene has a half-life of 11 hours which means that it remains in the body much longer than other overdose reversal drugs.[472] The rise of dangerous synthetic opioids, such as fentanyl and its analogs (for example, carfentanil, acetylfentanyl, furanylfentanyl) have made it increasingly important to increase the types of opioid overdose reversal agents available to respond to the possibility of an opioid overdose.

In the CY 2021 PFS final rule (85 FR 84683 through 84692), we adopted new add-on codes for take-home supplies of nasal naloxone (HCPCS code G2215) and injectable naloxone (HCPCS code G2216). Additionally, we used our discretionary authority in section 1861(jjj)(1)(F) of the Act (which generally authorizes us to include as an OTP treatment service other items and services we determine are appropriate) to extend the definition of OUD treatment services to include short-acting opioid antagonist medications for the emergency treatment of known or suspected opioid overdose, such as naloxone, and overdose education furnished in conjunction with opioid antagonist medication. We also established an adjustment at § 410.67(d)(4)(i)(E) to the weekly bundled payments when the OTP furnishes take-home supplies of these medications. This adjustment includes both a drug component and a non-drug component for overdose education. The payment methodology for the drug component of the adjustment was finalized at § 410.67(d)(2)(i) and is updated annually using the most recent data available at the time of ratesetting. The amount of the non-drug component of the adjustment, which includes overdose education, is based on the CY 2020 Medicare payment rate for CPT code 96161 (*Administration of caregiver focused health risk assessment instrument (e.g., depression inventory) for the benefit of the patient, with scoring and documentation, per standardized instrument*). We also finalized that any payment to an OTP for naloxone would be duplicative if a claim for the same medication is separately paid under Medicare Part B or Part D for the same beneficiary on the same date of service, and that we would recoup any duplicative payment made to an OTP for naloxone.

Furthermore, in the CY 2022 PFS final rule (86 FR 65340 and 65341), we established a new add-on code and payment for a higher dose of nasal naloxone (G0128). We also finalized that the adjustment includes take-home supplies of opioid antagonist medications in the list of items for which the non-drug component will be geographically adjusted using the Geographic Adjustment Factor (GAF) and the payment amount will be updated annually by the growth in the Medicare Economic Index (MEI). Lastly, we revised our regulations at § 410.67(d)(5) to state explicitly that payments for medications that are delivered, administered or dispensed to a beneficiary as part of an adjustment to the bundled payment are considered a duplicative payment if a claim for delivery, administration or dispensing of the same medication(s) for the same beneficiary on the same date of service was also separately paid under Medicare Part B or Part D. We clarified that this revision would apply not only to duplicative payments for take-home supplies of naloxone, but also to duplicative payments for additional take-home supplies of other medications that are made under § 410.67(d)(4)(i)(D).

In light of a novel nalmefene product, Opvee®, receiving FDA approval as an opioid antagonist medication for the emergency treatment of known or suspected opioid overdose, we proposed to make payment for this new drug under the Medicare OTP benefit in the CY 2025 PFS proposed rule. Expanding access to overdose reversal medications, such as nalmefene, is a critical component to confronting the opioid crisis. The number of drug overdose deaths involving prescription opioids was nearly 330 percent higher in 2022 than in 1999; however, deaths involving prescription opioids has decreased in recent years. From May 2023 through April 2024, there were approximately 75,000 predicted opioid overdose deaths in the US, and nearly 92 percent of opioid-involved deaths involved synthetic opioids other than methadone (mainly illegally-made fentanyl and fentanyl analogs such as acetylfentanyl, furanylfentanyl, and carfentanil).[473]

These increasing rates of drug overdose deaths over the past few decades have also been seen among the Medicare-eligible population with adults aged 65 and over experiencing the largest percentage increase (28 percent) in drug overdose deaths rates between 2020 and 2021,[474] and the rate of drug overdose deaths involving synthetic opioids among this age group increased by over 53 percent in only one year (between 2019 and 2020).[475] Over 50,000 Medicare Part D beneficiaries were estimated to have experienced an opioid overdose in 2021, and the number of these beneficiaries receiving

[470] *https://www.fda.gov/news-events/press-announcements/fda-approves-prescription-nasal-spray-reverse-opioid-overdose.*

[475] *https://blogs.cdc.gov/nchs/2023/06/30/7408/.*

naloxone has grown.[476] Not only has the opioid crisis impacted the Medicare-eligible population, but health disparities in drug overdose deaths have persisted. Non-Hispanic Black men aged 65 and over have experienced drug overdose death rates that are more than four times higher than Hispanics and non-Hispanic whites.[477] In addition, death rates from drug overdoses among people aged 65 and over have increased at faster rates for men than women.[478] Expanding access to overdose reversal medications is important, including for populations at a greater risk for drug overdose, as overdose reversal medications have been regarded as an evidence-based strategy to help individuals quickly respond to an overdose to reduce drug overdose deaths, and increase survival rates.[479] Lastly, we believe this proposal to pay for nalmefene nasal spray under the OTP benefit would further the objectives of the HHS Overdose Prevention Strategy and the National Drug Control Strategy, which both aim to widen availability and access to opioid overdose reversal treatments.[480]

Section 1861(jjj)(1)(A) of the Act recognizes opioid agonist and antagonist treatment medications (including oral, injected, or implanted versions) that are approved by the FDA under section 505 of the FFDCA for the use in treatment of OUD, but nalmefene is not on the list of drugs for the treatment of OUD.[481] When CMS first finalized payment for nasal and injectable naloxone under the OTP benefit in the CY 2021 PFS final rule (85 FR 84682 through 84689 and 85026 through 85027), we used our discretionary authority under section 1861(jjj)(1)(F) of the Act to finalize and extend the definition of OUD treatment services to include short acting opioid antagonist medications (for example, naloxone) that are approved by the FDA under section 505 of the FFDCA for the emergency treatment of known or suspected opioid overdose. Since nalmefene nasal spray was approved by the FDA under section 505(b)(1) authority,[482] and is an opioid antagonist and on the list of overdose reversal drugs approved by the FDA,[483] we believe nalmefene is consistent with our definition of OUD treatment service at § 410.67(d), which describes opioid antagonist medications that are approved by the FDA under section 505 of the FFDCA for the emergency treatment of known or suspected opioid overdose at paragraph (viii). Therefore, we believe it was appropriate to propose new payment for nalmefene as it would align with existing authority under § 410.67(b) that recognizes opioid antagonist medications which treat known or suspected opioid overdose as an OUD treatment service.

We proposed to create a new adjustment to the bundled payment for nalmefene hydrochloride nasal spray described by GOTP1 *[Take-home supply of nasal nalmefene hydrochloride; one carton of two, 2.7 mg per 0.1 mL nasal sprays (provision of the services by a Medicare-enrolled Opioid Treatment Program); (List separately in addition to each primary code)].* We proposed to price this new add-on code based on the established methodology under the OTP benefit for determining the adjustment for take-home supplies of opioid antagonist medications at § 410.67(d)(4)(i)(E). This adjustment would include both a drug component and a non-drug component. The amount of the drug component would be determined using the methodology for pricing the drug component of an episode of care at § 410.67(d)(2)(i), which tends to use average sales price (ASP) data when available (with certain exceptions). Accordingly, consistent with the approach used to price the drug component for nasal naloxone (HCPCS code G2215 & G1028), we proposed to apply the ASP payment methodology set forth in section 1847A of the Act to determine the payment for the new naloxone hydrochloride nasal spray product, except that payment amounts would not include any add-on percentages if either ASP or wholesale acquisition cost (WAC) is used. As stated in the CY 2021 PFS final rule (85 FR 84685), we continue to believe that using ASP provides a transparent and public benchmark for manufacturers' actual pricing as it reflects the manufacturers' actual sales prices to all purchasers (with limited exceptions as noted in section 1847A(c)(2) of the Act) and is the only pricing methodology that includes off-invoice rebates and discounts as described in section 1847A(c)(3) of the Act. Therefore, we believe ASP to be the most market-based approach to set drug prices, including for the new nalmefene nasal spray. As we stated in the CY 2020 PFS final rule, we also continue to believe that limiting the payment amount to 100-percent of the volume-weighted ASP for a HCPCS code will incentivize the use of the most clinically appropriate drug for a given patient (84 FR 62651 through 62656). We understand that many OTPs purchase medications directly from manufacturers, thereby limiting the markup from distribution channels.

Furthermore, as stated in the CY 2020 PFS final rule (84 FR 62650), we usually use the typical maintenance dose to calculate the drug component for the OTP benefit. As part of determining a payment rate for the proposed bundles for OUD treatment services, a dosage of the applicable medication is often selected to calculate the costs of the drug component of the bundle. According to the prescribing information for Opvee®, each unit-dose nasal spray device delivers 2.7 mg of nalmefene in 0.1 mL.[484] Each unit-dose device contains a single dose of nalmefene and cannot be reused. Each carton contains two unit-dose nasal spray devices to allow for an additional repeat dose if needed. Thus, we proposed to price the drug component of the code for nalmefene nasal spray based on an assumption of a typical dosage for this new product to be a carton containing two 2.7-mg nasal sprays. We would, therefore, multiply the payment amount of 100-percent of the ASP for each unit-dose nasal spray containing 2.7 mg of nalmefene by two to reflect a carton of two nasal spray devices. We sought comment on whether this amount (a carton of two 2.7-mg nasal sprays) reflects the typical maintenance dosage for this drug when administered. The ASP+0 for Opvee® for sales in the fourth quarter of 2023 is $92.033, which reflects a carton of two 2.7-mg nasal sprays and would be used to price the drug component of GOTP1.

Additionally, consistent with the methodology established in § 410.67(d)(4)(i)(E), we proposed to include a non-drug component for GOTP1 that would include payment for overdose education. Overdose education is an important component of overdose prevention and includes educating patients and caregivers on how to recognize respiratory depression, the signs and symptoms of a possible opioid overdose, how to administer overdose reversal medications, and the importance of calling 911 or getting emergency medical help right away,

even after the overdose reversal medication is administered.[485] Additionally, overdose education paired with distribution of overdose reversal medications has been found to be effective in improving knowledge about opioid overdose, improving attitudes toward using overdose reversal medications, training individuals to safely and effectively manage overdoses, and reducing opioid-related mortality.[486] For these reasons, we proposed to include a non-drug component to GOTP1 based on the CY 2020 Medicare payment rate for CPT code 96161 *(Administration of caregiver-focused health risk assessment instrument (e.g., depression inventory) for the benefit of the patient, with scoring and documentation, per standardized instrument)* and updated to reflect the MEI updates that have been applied since that time. This is consistent with the payment methodology for naloxone and the language in § 410.67(d)(4)(i)(E). In addition, the language at § 410.67(d)(4)(ii) currently states that the non-drug component of the adjustments for take-home supplies of opioid antagonist medications will be geographically adjusted using the geographic adjustment factor described in § 414.26. Separately, § 410.67(d)(4)(iii) states that the non-drug component of the adjustments for take-home supplies of opioid antagonist medications will be updated annually using the Medicare Economic Index described in § 405.504. Since we proposed to establish payment for nasal nalmefene through an adjustment to the bundled payment, and since the drug is also considered an opioid antagonist medication, we also proposed to update the non-drug component for the adjustment of GOTP1 annually based on the GAF and MEI.

Furthermore, consistent with our established criteria for opioid antagonist medications at § 410.67(d)(4)(i)(E), we also proposed to limit payment for nasal nalmefene to one add-on code (GOTP1) every 30 days. However, we believe that access to the drug should not be limited when it is medically reasonable and necessary as part of the treatment for OUD and known or suspected opioid overdose. Therefore, similar to flexibilities established for frequency limits for naloxone, we proposed to allow exceptions to this limit in the case where the beneficiary overdoses and uses the initial supply of nalmefene dispensed by the OTP to the extent that it is medically reasonable and necessary to furnish additional nalmefene. We noted that section 1862(a)(1)(A) of the Act requires that for payment to be made for most Part A and Part B services furnished to Medicare beneficiaries, those services must be reasonable and necessary for the diagnosis or treatment of illness or injury or to improve the malfunctioning of a malformed body member. If an additional supply of nasal nalmefene is needed within 30 days of the original supply being provided, we proposed that OTPs must document in the medical record the reason for the exception. Moreover, section 1834(w)(1) of the Act, added by section 2005(c) of the SUPPORT Act, requires the Secretary to ensure, as determined appropriate by the Secretary, that no duplicative payments are made under Medicare Part B or Part D for items and services furnished by an OTP. Similar to naloxone, we recognized that nalmefene may also be appropriately available to beneficiaries through other Medicare benefits, including under Medicare Part D. At § 410.67(d)(5), we define duplicative payment to involve circumstances when medications are delivered, administered or dispensed to a beneficiary are paid as part of the OTP bundled payment, and where the delivery, administration or dispensing of the same medication (that is, same drug, dosage and formulation) is also separately paid under Medicare Part B or Part D for the same beneficiary on the same date of service. Consistent with § 410.67(d)(5), we proposed that CMS recoup duplicative payments made to an OTP for nalmefene. We expect that if the OTP provides reasonable and necessary medications for an OUD as part of an episode of care, the OTP will take measures to ensure that there is no claim for payment for these drugs other than as part of the OTP bundled payments. Thus, nalmefene billed by an OTP as an add-on to the bundled payment should not be reported to or paid under a Medicare Part D plan.

We solicited comments related to this proposal to establish an adjustment to the bundled payment for nasal nalmefene (Opvee®) *GOTP1* [*Take-home supply of nasal nalmefene hydrochloride; one carton of two, 2.7 mg per 0.1 mL nasal sprays (provision of the services by a Medicare-enrolled Opioid Treatment Program); (List separately in addition to each primary code)*], as well as comments related to applicable requirements and criteria for billing this code. We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal to establish payment for nasal nalmefene. Commenters expressed that this policy would expand access to a new innovative treatment for reducing the risk of harm and death from opioid overdoses, and that the high potency of drugs in the nation's drug supply necessitates multiple doses of effective medications, like nalmefene, to treat patients. One commenter shared evidence from a computer-based simulated model study conducted by the drug manufacturer of Opvee®, where nalmefene nasal spray was found to predict a substantially greater reduction in the incidence of cardiac arrest compared to nasal naloxone following a synthetic opioid overdose.[487] A few commenters stated that they supported both the proposed coding and payment methodology for the add-on code of take-home supplies of nalmefene nasal spray, as it would be consistent with pricing provisions in section 1847A of the Act and CMS's method for pricing similar opioid antagonist medications under the Medicare OTP benefit.

Response: We thank commenters for their support of this proposal.

Comment: One commenter provided information on the typical dose of nalmefene hydrochloride: one spray by intranasal administration, and in the event a patient relapses into respiratory depression, an additional dose would be given of a new nasal spray.
