spread risk factor was a type A non-modellable risk factor.

³⁹⁴ For example, for an investment grade corporate bond, the banking organization would be

IMCC and subject to the more conservative treatment within the SES calculation.

First, the proposal would require the data used in the expected shortfall models to calculate the IMCC to capture both the systematic risk and idiosyncratic risk, as applicable, of a risk factor, so that the IMCC appropriately reflects the potential losses arising from the risk factor.

Second, the proposal would require the data used to calculate the expected shortfall-based measure to reflect the volatility and correlation of risk factors of model-eligible positions. Different data sources can provide dramatically different volatility and correlation estimates for asset prices. When selecting the data sources to be used in calculating the IMCC, a banking organization should assess the quality and relevance of the data to ensure it would be appropriately representative of real prices, not understate price volatility, and accurately reflect the correlation of asset prices, rates across yield curves, and volatilities within volatility surfaces.

Third, the proposal would generally require that the data used to calculate the expected shortfall-based measure reflect prices observed or quoted in the market. For any data not derived from real prices, the banking organization must be able to demonstrate that such data are reasonably representative of real prices. A banking organization should periodically reconcile the price data used to calibrate its expected shortfall models for the IMCC with that used by its financial reporting³⁹⁵ and internal risk management models, to confirm the validity of the price data used to calculate the IMCC.

Fourth, the proposal would require a banking organization to update the data at a sufficient frequency to accurately reflect the performance of the risk factor, at a minimum on a weekly basis. While generally banking organizations should strive to update the data inputs as frequently as possible, the proposal would only require banking organizations to update the data on a weekly basis, as requiring large data sets to be updated more frequently may pose significant operational challenges.³⁹⁶ The proposal would also require a banking organization that uses

regressions to estimate risk factor parameters to re-estimate the parameters on a regular basis. In addition, the agencies would expect a banking organization to calibrate its expected shortfall models to current market prices at a sufficient frequency to accurately reflect the performance of the risk factor, ideally no less frequently than the calibration of financial reporting models. The proposal would also require a banking organization to have clear policies and procedures for updating the sources of data used as well as for backfilling and gap-filling missing data.

Fifth, in determining the liquidity horizon-adjusted expected shortfall-based measure within IMCC, a banking organization that uses a reduced set of risk factors to calculate the expected shortfall-based measure³⁹⁷ would be required to use data that are reflective of market prices observed or quoted in the twelve-month historical stress period used by the expected shortfall model.³⁹⁸ Under the proposal, banking organizations should source the data directly from the historical stress period, whenever possible. There may be cases where the characteristics of positions currently being traded in the market differ from those traded during the historical stress period used by the expected shortfall model. The proposal would require a banking organization to empirically justify any instance where the market prices used for the historical stress period in the expected shortfall calculation differ from the market prices actually observed for that period. For model-eligible positions that did not exist during the historical stress period, the proposal would require banking organizations to demonstrate that the prices used match changes in the prices or spreads of similar instruments traded during that period.

Sixth, the proposal would allow the data for risk factors to include proxies if the banking organization is able to

demonstrate the appropriateness of such proxies to the satisfaction of the primary Federal supervisor. At a minimum, a banking organization would be required to have sufficient evidence demonstrating the appropriateness of the proxies, such as an appropriate track record for their representation of model-eligible positions. Additionally, any proxies used would be required to (1) exhibit sufficiently similar characteristics to the transactions they represent in terms of volatility level and correlations, and (2) be appropriate for the region, credit spread cohort, quality, and type of instrument they are intended to represent.

Even if a risk factor satisfies each of the six proposed data quality requirements, a banking organization's primary Federal supervisor may determine the data inputs to be unsuitable for use in calculating the IMCC (for example, where the data inputs reflect variation that is less than the bid-ask spread for a product). Any risk factor that does not satisfy the proposed data quality requirements would be a type B non-modellable risk factor, which the banking organization would be required to exclude from the IMCC calculation and include in the more conservative SES calculation.

Question 146: The agencies request comment on the appropriateness of the proposed data quality requirements for risk factors. What, if any, challenges might the proposed requirements pose for banking organizations? What, if any, additional requirements should the agencies consider to help ensure the data used to calculate the IMCC appropriately capture the potential losses arising from modellable and type A non-modellable risk factors?

Question 147: The agencies request comment on the appropriateness of requiring banking organizations to re-estimate parameters in line with the frequency specified in their policies and procedures. What, if any, challenges might this pose for banking organizations?

ii. Quantitative Test

For risk factors that pass the qualitative test, the banking organization would then need to determine whether there are a sufficient number of real prices in the prior twelve months (quantitative test) for the risk factor to qualify as a modellable risk factor. The quantitative test would require a banking organization to establish buckets for each relevant risk factor or set of risk factors, and assign real prices to the relevant bucket(s). If the number of real prices allocated to the bucket equals or exceeds the

³⁹⁵ As described in section V.A.6.d. of this **SUPPLEMENTARY INFORMATION**, the term "financial reporting models" used throughout this section is intended to refer to the models a banking organization uses to report actual profits and losses for financial reporting purposes.

³⁹⁶ For example, a banking organization that relies on a third-party provider may not be able to receive updated data on a real time or daily basis.

³⁹⁷ As discussed in section V.A.8.b.i. of this **SUPPLEMENTARY INFORMATION**, a banking organization may elect to either use (1) the full set of risk factors employed by its internal risk management models and directly calculate the daily expected shortfall measure under the selected twelve-month historical stress period or (2) an appropriate subset of risk factors to estimate the potential losses that would be incurred throughout the selected stress period, which would require the banking organization to estimate a daily expected shortfall measure for both the current and stress period.

³⁹⁸ As described in more detail in section V.A.8.b.iii. of this **SUPPLEMENTARY INFORMATION**, for purposes of calculating the IMCC daily expected shortfall measures, the proposal would require a banking organization to use the twelve-month historical stress period in which its model-eligible positions on model-eligible trading desks would experience the largest loss.

minimum number required under the proposal, the risk factor would qualify as a modellable risk factor.

I. Real Price

To perform the quantitative test, the proposal would first require a banking organization to map real prices observed over the prior twelve months to each of the risk factors that affect the value of the model-eligible positions. For example, as the price of a typical corporate bond fluctuates primarily due to changes in interest rates and issuer credit spreads, a banking organization could map the price of a corporate bond to a credit spread risk factor and an interest rate risk factor. The proposal would define a real price as (1) a price at which the banking organization has executed a transaction, (2) a price provided by an exchange, a qualifying central counterparty, a sovereign entity, a specified supranational entity, or a multilateral development bank, (3) a verifiable price for an actual transaction between third parties transacting at arm's length or obtained from a bona fide competitive bid or offer made by the banking organization itself or another party transacting at arm's length, subject to certain conditions discussed below.

The agencies recognize that a banking organization may need to obtain pricing information from third parties to demonstrate the market liquidity of the underlying risk factors, and this may pose unique challenges for validation and other model risk management activities. Therefore, the proposed definition of a real price would generally limit recognition of prices obtained from third-party providers to only those for which (1) the transaction, bid, or offer has been processed through a third-party provider, or (2) the third-party provider agrees to provide evidence of the transaction, bid, or offer to the banking organization upon request.³⁹⁹

In certain cases, obtaining information on the prices of individual transactions from third parties may raise legal concerns for a banking organization, a third-party provider, or both.⁴⁰⁰

³⁹⁹ The additional requirements for prices or other information obtained from third parties to qualify as a real price would not apply to prices (1) obtained from an exchange or a qualifying central counterparty, or (2) provided by an exchange, a qualifying central counterparty, a sovereign entity, a specified supranational entity or a multilateral development bank. As such entities are subject to extensive regulation and oversight (including requirements regarding maintaining accurate data), the proposed requirements are unnecessary to assess the validity of the prices or other information obtained from such third-parties.

⁴⁰⁰ Banking organizations must ensure that exchanges of price information among competitors

Therefore, the proposal would allow a banking organization to consider information obtained from a third party on the number of corresponding real prices observed and the dates at which they have been observed in determining whether a risk factor satisfies the quantitative test, if the banking organization is able to appropriately map this information to the risk factors relevant to the model-eligible positions. For a banking organization to be able to use such information for determining the model eligibility of a risk factor, the proposal would require that either the third-party provider's internal audit function or another external party audit the validity of the third-party provider's pricing information. Additionally, the proposal would require that the results and reports of the audit either be made public or available upon request to the banking organization.⁴⁰¹

The additional requirements described above for prices or other information obtained from third parties to qualify as a real price for purposes of the quantitative test would allow banking organizations to appropriately demonstrate the market liquidity of a risk factor, while also ensuring there is sufficient documentation for the banking organization and the primary Federal supervisor to assess the validity of the prices or other information obtained from a third party.

Question 148: What, if any, other information should the agencies consider in defining a real price that would better demonstrate the market liquidity for risk factors, such as valuations of individual derivative contracts for the purpose of exchanging variation margin? What, if any, conditions or limitations should the agencies consider applying to help ensure the validity of such information, such as only allowing information related to individual derivative transactions to qualify as a real price and not information provided on a pooled basis or subject to a loss threshold or minimum transfer requirement for exchanging variation margins?

or with third parties are not likely to include acts or omissions that could result in a violation of antitrust laws, including the Sherman Act, 15 U.S.C. 1 *et seq.*, and the Federal Trade Commission Act, 15 U.S.C. 41 *et seq.*

⁴⁰¹ If the audit on the third-party provider is not satisfactory to a banking organization's primary Federal supervisor (for example, the auditor does not meet the independence or expertise standards of U.S. securities exchanges), the supervisor may determine that data from the third-party provider may not be used for purposes of the quantitative test.

II. Bucketing Approach

Under the proposal, a banking organization would be required to (1) establish buckets for each relevant risk factor or set of risk factors, and (2) assign real prices to each relevant bucket to determine whether each bucket has the minimum number of real price observations to satisfy the quantitative test. A banking organization could choose to apply either its own bucketing approach or the standard bucketing approach. As the choice of approach is at the risk factor level, the proposal would allow a banking organization to adopt its own bucketing approach for some risk factors and the standard bucketing approach for others. The number of buckets should be driven by the banking organization's trading strategies. For example, a banking organization with a complex portfolio across many points on the yield curve could elect to define more granular buckets for interest rate risk, such as separate 3-month and 6-month buckets, than those prescribed under the standard bucketing approach, which puts all maturities of less than 9 months in one bucket. Conversely, a banking organization with less complex products could elect to use the less granular standard bucketing approach.

Table 1 to § __.214 of the proposal provides the proposed buckets a banking organization would be required to use to group real prices under the standard bucketing approach. The proposal would define the buckets under the standard bucketing approach based on the type of risk factor, the maturity of the instruments used for the real prices, and the probability that an option has value (is "in the money") at the maturity of the instrument.⁴⁰² The proposed buckets are intended to balance between the granularity of the risk factors allocated to each standardized bucket and the compliance burden of tracking and mapping the allocation of real prices to more granular buckets, especially as market conditions change. Too frequent re-allocation of real prices may lead to artificial and unwarranted regulatory capital requirement volatility.

When using its own bucketing approach, a banking organization would be able to define more granular buckets than those prescribed under the standard bucketing approach. While the

⁴⁰² Whether an option has value (is "in the money") at the maturity of the instrument depends on the relationship between the strike price of the option and the market price for the underlying instrument (the spot price). A call option has value at maturity if the strike price is below the spot price. A put option has value at maturity if the strike price is above the spot price.

use of more granular buckets could facilitate a model-eligible trading desk's ability to pass the proposed PLA test, it would also render the quantitative test more challenging as the banking organization would need to source a sufficient number of real prices for each additional bucket. Therefore, the proposal would provide a banking organization the flexibility to define its own bucketing structures and would place an additional operational burden on the banking organization to demonstrate the appropriateness of using a more granular bucketing structure.

As positions mature, a banking organization could continue to allocate real prices identified within the prior twelve months to the bucket that the banking organization initially used to reflect the maturity of such positions. Alternatively, the banking organization could re-allocate the real prices for maturing positions to the adjacent (shorter) maturity bucket. To avoid overstating the market liquidity of a risk factor, the proposal would allow the banking organization to count a real price observation only once, either in the initial bucket or the adjacent bucket to which it was re-allocated, but not in both.

To enable banking organizations' expected shortfall models to capture market-wide movements for a given economy, region, or sector, the proposal would allow, but not require, a banking organization to decompose risks associated with credit or equity indices into systematic risk factors⁴⁰³ within its expected shortfall models.⁴⁰⁴ The proposal would allow a banking organization, where possible, to consider real prices of market indices (for example, CDX.NA.IG and S&P 500 Index) and instruments of individual issuers as representative for a systematic risk factor as long as they share the same attributes (for example, economy, region, sector, and rating) as the systematic risk factor. The proposed treatment would allow banking organizations to align the treatment of real prices for market indices with those for single-name positions and, thus, provide greater hedging recognition.

⁴⁰³ The proposal would define systematic risk factors as categories of risk factors that present systematic risk, such as economy, region, and sector. Systematic risk would be defined as the risk of loss that could arise from changes in risk factors that represent broad market movements and that are not specific to an issue or issuer.

⁴⁰⁴ As banking organizations may not always be able to model each constituent of the index, the proposal would not require banking organizations to always decompose credit spread and equity risk factors.

To determine whether each bucket has the minimum number of real prices required to satisfy the quantitative test, the proposal would require a banking organization to allocate each real price to any bucket for which the price is representative of the risk factor(s) within the bucket and to count all real prices mapped to a bucket. As real price may often be used to infer values for multiple risk factors, requiring banking organizations to assign real prices to all of the buckets for which it is representative would more accurately capture the market liquidity for the relevant risk factors.

Question 149: What, if any, modifications to the proposed bucketing structure should the agencies consider to better reflect the risk factors used to price certain classes of products. What would be the benefits or drawbacks of such alternatives compared to the proposed bucketing structure?

III. Minimum Number of Real Price Observations

For a risk factor to pass the quantitative test, the proposal would require a banking organization on a quarterly basis to identify a minimum number of real prices for the bucket corresponding to the relevant risk factor(s). Specifically, the proposal would require the banking organization to identify in the previous twelve-month period at least 24 real prices for the most liquid risk factors (those with a liquidity horizon of 20 days or less, as described in section V.A.8.b.ii. of this **SUPPLEMENTARY INFORMATION**) and at least 16 real prices for all other risk factors.

The proposed criteria are intended to help ensure real prices capture products that exhibit a minimum level of trading activity throughout the year. Aligning the minimum number of real prices required to pass the quantitative test with the liquidity horizon assigned to the risk factor in the IMCC calculation is intended to enhance the risk sensitivity of the models-based non-default capital requirement. The longer liquidity horizons assigned to less liquid risk factors within the IMCC calculation should appropriately capture the illiquidity of such risk factors. As such, the proposal would require a banking organization to identify fewer real prices for less liquid risk factors to pass the quantitative test and qualify as modellable risk factors.

For risk factors associated with new issuances, the proposal would allow a banking organization to consider the observation period for purposes of the quantitative test to begin on the issuance date and pro-rate the minimum

number of real prices required to pass the quantitative test until twelve months after the issuance date. For example, for a bond that was issued six months prior, the proposal would require at least 8 real prices for the bucket relating to for the issuer credit spread risk, prorated from the 16 real price annual requirement.

For any model-eligible position, the banking organization could not count more than one real price in any single day and would be required to count the real price for all of the buckets for which it is representative. The agencies recognize that the banking organization may use a combination of internal and external data for the quantitative test. When a banking organization relies on external data, the real prices may be provided with a time lag. Therefore, the proposal would allow the banking organization to use a different time period for purposes of the quantitative test than that used to calibrate the expected shortfall model, if such difference is not greater than one month. Together, these requirements are intended to help ensure that real prices capture more accurately the market liquidity for the relevant risk factors and prevent outdated prices from being used as model inputs.⁴⁰⁵

If a bucket contains a sufficient number of real prices to pass the quantitative test, the risk factor(s) within that bucket would qualify as a modellable risk factor. Risk factors that pass both the quantitative and qualitative tests would be deemed modellable and included in the IMCC, but not the SES.

Question 150: What, if any, restrictions on the minimum observation period for new issuances should the agencies consider and why?

Question 151: What, if any, operational challenges could the proposed quantitative test pose? What, if any, changes should the agencies consider making to the quantitative test, such as excluding risk factors from the quarterly real price observation requirement if the banking organization can demonstrate the substantial market depth and liquidity of such risk factors over time? What criteria (such as exchange listing criteria for the New York Stock Exchange) should the agencies consider to appropriately differentiate between risk factors with liquid and deep markets that should be

⁴⁰⁵ For example, if several transactions occur on day one, followed by a long period for which there are no real price observations, the proposal would prevent a banking organization from using the outdated day-one prices to estimate the fair value of its current model-eligible positions on model-eligible trading desks.

subject to the qualitative test only once versus those that should be subject on a quarterly basis, and why?

Question 152: The agencies seek comment on the framework of identifying a minimum number of real prices for the bucket corresponding to the relevant risk factor(s) in order to pass the quantitative test. Specifically, the agencies seek comment on adjusting the real price observations based on liquidity horizons for risk factor category. For example, for investment grade corporate positions (the credit spread risk category) with a liquidity horizon of 40 days, a banking organization would be required to have at least 8 real price observations for the risk factor in the last 12 months to be able to pass the quantitative test. What would the advantages and disadvantages of this approach and why?

b. Internally Modelled Capital Calculation (IMCC)

The IMCC is intended to capture the estimated losses for model-eligible positions arising from changes in modellable and type A non-modellable risk factors over a twelve-month historical period of substantial market stress. As described in this section, the IMCC would begin with the calculation of a daily expected shortfall-based measure over a twelve-month historical stress period on both an entity-wide level for each risk class and on an entity-wide level across risk classes for all model-eligible positions, each of which then would be adjusted using risk-factor specific liquidity horizons.⁴⁰⁶

While the proposal would allow a banking organization's expected shortfall models to use any generally accepted modelling approach (for example, variance-covariance models, historical simulations,⁴⁰⁷ or Monte Carlo simulations) to calculate the expected shortfall-based measure, the proposal would require the models to satisfy the proposed backtesting and PLA testing requirements on an ongoing basis to help ensure that the models are functioning effectively over

time as conditions and model applications change.⁴⁰⁸

Additionally, the proposal would require a banking organization's expected shortfall models to appropriately capture the risks associated with options, including non-linear price characteristics, within each of the risk classes, as well as correlation and relevant basis risks, such as basis risks between credit default swaps and bonds. For options, at a minimum, the proposal would require a banking organization's expected shortfall models to have a set of risk factors that capture the volatilities of the underlying rates and prices and model the volatility surface across both strike price and maturity, which are necessary inputs for appropriately valuing the options.

i. Expected Shortfall-Based Measure

To reflect the potential losses arising from the risk factors throughout an appropriately severe, historical twelve-month period of stress (as described in section V.A.8.b.iii. of this **SUPPLEMENTARY INFORMATION**), the proposal would require a banking organization to use one or more expected shortfall models to calculate on each business day an expected shortfall-based measure using a one-tail, 97.5th percentile confidence interval at the entity-wide level for each risk class and across all risk classes for all model-eligible positions.⁴⁰⁹

To calculate the daily expected shortfall-based measure, a banking organization would apply a base liquidity horizon of 10 days (the shortest liquidity horizon applicable to any risk factor category) to either the full set of risk factors for its model-eligible positions or an appropriate subset of risk factors throughout the twelve-month historical stress period (base expected shortfall). Requiring a banking organization to directly estimate the potential change in value of each of its model-eligible positions arising from the full set of risk factors throughout the twelve-month historical stress period may pose significant operational challenges. For example, a banking organization may not be able to source sufficient data for all risk factors during the identified twelve-month historical stress period. Thus, the proposal would allow a banking

organization to use either the full set of risk factors employed by the expected shortfall models (direct approach) or an appropriate subset (indirect approach) to estimate the losses that would be incurred throughout the twelve-month historical stress period.⁴¹⁰

Under the direct approach, the banking organization would directly calculate the daily expected shortfall measure at the entity-wide level for each risk class and across all risk classes for all model-eligible positions throughout the twelve-month historical stress period and then apply the liquidity horizon adjustments discussed in the following section.

Under the indirect approach, a banking organization would use a reduced set of risk factors in IMCC to estimate the losses that would be incurred throughout the twelve-month historical stress period for the full set of risk factors. The proposal would require a banking organization using the indirect approach to calculate three separate daily expected shortfall measures at the entity-wide level for each risk class and at the entity-wide level across risk classes: one using a reduced set of risk factors for the twelve-month historical stress period, one using the same reduced set of risk factors for the current period, and one using the full set of risk factors for the current period. Similar to the direct approach, the proposal would require the banking organization to apply the liquidity horizon adjustments discussed in the following section to each of the three expected shortfall measures to approximate the entity-wide liquidity horizon-adjusted expected shortfall-based measures for the full set of risk factors in stress.

Specifically, the proposal would require banking organizations that use the indirect approach to multiply the liquidity horizon-adjusted expected shortfall-based measure for the

⁴⁰⁶ As discussed in section V.A.8.b.i. of this **SUPPLEMENTARY INFORMATION**, if a banking organization elects to use a subset of modellable risk factors to estimate the potential losses that would be incurred throughout the selected stress period, the proposal would require the banking organization to estimate a daily expected shortfall measure for the current period as well as the historical stress period.

⁴⁰⁷ The proposal would allow a banking organization to use filtered historical simulation, as the approach generally reflects current volatility and would maintain equal weighting of the observations by rescaling all of the observations.

⁴⁰⁸ See sections V.A.8.e. and V.A.8.f. of this **SUPPLEMENTARY INFORMATION** for further discussion on the proposed desk-level PLA testing and backtesting requirements, respectively.

⁴⁰⁹ The proposal would also require banking organizations to calculate a daily expected shortfall-based measure at the trading desk level for the purposes of backtesting to calculate the PLA add-on. See section V.A.8.f. of this **SUPPLEMENTARY INFORMATION** for further discussion.

⁴¹⁰ In calculating the IMCC, a banking organization could use other data than that used to demonstrate the market liquidity of a risk factor for purposes of the quantitative test, provided that such data satisfy the qualitative test. Alternative sources may provide updated data more frequently than would otherwise be available from those used to obtain real prices. For example, banking organizations may be able to obtain updated data more frequently from internal systems than from third-party providers. Additionally, in certain cases, a banking organization may not be able to use the real prices to calculate the IMCC. For example, a banking organization may receive data from a third-party provider on the dates and number of real prices, as described in section V.A.8.a.ii.I. of this **SUPPLEMENTARY INFORMATION**. While such data demonstrates the liquidity of a risk factor for purposes of the quantitative test, without the transaction prices, such real prices would not provide any value to calibrate potential losses for a particular risk factor.

historical stress period based on the reduced set of risk factors ($ES_{R,S}$) by the ratio of the liquidity horizon-adjusted expected shortfall-based measure in the current period based on the full set of risk factors ($ES_{F,C}$) to the liquidity horizon-adjusted expected shortfall-based measure using the reduced set of risk factors based on the most recent twelve-month period ($ES_{R,C}$), as provided according to the following formula under § _____.215(b)(6)(ii)(B) of the proposed rule:

$$ES = ES_{R,S} \cdot \max \left(1, \frac{ES_{F,C}}{ES_{R,C}} \right)$$

The proposal would floor this ratio at one to prevent a reduction in capital requirements due to using the reduced set of risk factors.

Additionally, the proposal would require the entity-wide liquidity horizon-adjusted expected shortfall-based measure for the current period based on the reduced set of risk factors ($ES_{R,C}$) to explain at least 75 percent of

the variability of the losses estimated by the liquidity horizon-adjusted expected shortfall-based measure in the current period for the full set of risk factors ($ES_{F,C}$) over the preceding 60 business days. Under the proposal, compliance with the 75 percent variation requirement would be determined based on an out-of-sample R^2 measure, as defined according to the following formula under § _____.215(b)(5)(ii)(C) of the proposed rule:

$$1 - \frac{\sum_{h=t-60}^{t-1} (ES_{F,C,h} - ES_{R,C,h})^2}{\sum_{h=t-60}^{t-1} (ES_{F,C,h} - \text{Mean}(ES_{F,C}))^2}$$

Where:

$ES_{F,C,h}$ is the liquidity horizon-adjusted ES-based measure based on the most recent 12-month observation period (the current ES-based measure) using the full set of risk factors calculated at date h , which ranges from one day prior to date t to 60 days prior to date t ;

$ES_{R,C,h}$ is the current liquidity horizon-adjusted ES-based measure using the reduced set of risk factors calculated at date h , which ranges from one day prior to date t to 60 days prior to date t ; and

$\text{Mean}(ES_{F,C})$ is the mean of $ES_{F,C}$ over the previous 60 business days.

This formula is intended to help ensure that the potential losses estimated under the indirect approach appropriately reflect those that would be produced by the full set of modellable risk factors, if the historical

stress were to occur in the current period.

Furthermore, to help ensure the accuracy of this comparison, the proposal would require a banking organization that uses the indirect approach to update the reduced set of risk factors whenever it updates its twelve-month historical stress period, as described in section V.A.8.b.iii. of this

SUPPLEMENTARY INFORMATION. The proposal would also require the reduced set of risk factors used to calculate the liquidity horizon-adjusted expected shortfall-based measure for the twelve-month historical stress period in IMCC to have a sufficiently long history of observations that satisfies criteria five within the qualitative risk factor eligibility test, as described in section V.A.8.a.i. of this **SUPPLEMENTARY**

INFORMATION. In this manner, the proposal would hold the inputs used for the indirect approach to the same data quality standards requirements as those for inputs used in the direct approach.

Question 153: The agencies request comment on the appropriateness of requiring the election of either the direct or the indirect approach to be made at the entity-wide level for all risk factors of model-eligible positions on model-eligible trading desks. What, if any, alternatives should the agencies consider that would enable banking organizations' expected shortfall models to more accurately measure potential losses under the selected stress period, such as allowing banking organizations to make this election at the level of the trading desk, risk class, or risk factor?

ii. Liquidity Horizon Adjustments
To capture appropriately the potential losses from the longer periods of time needed to reduce the exposure to certain

risk factors (for example, by selling assets or entering into hedges), a banking organization would assign each risk factor in IMCC to a proposed

minimum liquidity horizons, as specified in Table 2 to § _____.215 of the proposed rule.

BILLING CODE 4810-33- 6210-01- 6714-01-P

Table 2 to § _____.215. Liquidity horizon, *n* (number of days), by risk factor category

Risk factor category	<i>n</i>	Risk factor category	<i>n</i>

⁴¹¹ Any currency pair formed by the following list of currencies: USD, EUR, JPY, GBP, AUD, CAD, CHF, MXN, CNY, NZD, HKD, SGD, TRY, KRW, SEK, ZAR, INR, NOK, BRL, and any additional currencies specified by the primary Federal supervisor.

BILLING CODE 4810-33- 6210-01- 6714-01-C

The proposed liquidity horizons (10, 20, 40, 60, and 120 days) would vary across risk factors, with longer horizons assigned to those that would require longer periods of time to sell or hedge. For each model-eligible trading desk, the proposal would generally require banking organizations to assign the same minimum liquidity horizon to each risk factor within the same risk categories as specified in Table 2 to § _____.215 for all model-eligible positions, with two exceptions.

For instruments with a maturity shorter than the respective liquidity horizon assigned to the risk factor, the proposal would require banking organizations to use the next longer liquidity horizon compared to the maturity of the model-eligible position. For example, if an investment grade corporate bond matures in nineteen days, the proposal would require a banking organization to assign the associated credit spread risk factor a liquidity horizon of twenty days rather than the proposed forty-day liquidity horizon.

To map liquidity horizons for multi-underlying instruments, such as credit and equity indices, the proposal would require a banking organization to take a weighted average of the liquidity horizons of risk factors corresponding to the underlying constituents and the respective weighting of each within the index and use the shortest liquidity horizon that is equal to or longer than the weighted average.⁴¹² Furthermore, the proposal would require a banking organization to apply a consistent liquidity horizon to both the inflation risk factors and interest rate risk factors for a given currency, as specified in Table 2 to § _____.215 of the proposal.

The proposal would also specify the applicable liquidity horizon for non-securitization positions issued by GSEs, as such instruments are unique to the United States. Consistent with the current capital rule, the proposal would assign a longer forty-day liquidity horizon to debt instruments issued by the GSEs, as such instruments are not as liquid or readily marketable as U.S. Treasury securities and other exposures directly and unconditionally backed by the full faith and credit of the United

States (such as mortgage-backed securities issued by Ginnie Mae). Additionally, as multilateral development banks and specified supranational entities have similar liquidity risk profiles as sovereign exposures, the proposal would require banking organizations to apply the liquidity horizons applicable to sovereigns to multilateral development banks and specified supranational entities. Together, the proposed treatment is intended to promote consistency and comparability in regulatory capital requirements across banking organizations and to help ensure appropriate capitalization of such positions under the proposed market risk framework.

To encourage sound risk management and enable banking organizations and the agencies to appropriately evaluate the conceptual soundness of the expected shortfall models used to calculate the IMCC, the proposal would require a banking organization to have in place internal risk management systems and processes for performing risk factor mappings consistently over time. Additionally, the proposal would require a banking organization to map each of its risk factors to one of the risk factor categories and the corresponding liquidity horizon in a consistent manner on a quarterly basis to help ensure that the selected historical stress period continues to appropriately reflect potential losses for the risk factors of model-eligible positions over time.⁴¹³

To conservatively recognize empirical correlations across risk classes, the proposal would require a banking organization to calculate the liquidity horizon-adjusted expected shortfall-based measure both at the entity-wide level for each risk class and at the entity-wide level across risk classes for all model-eligible positions. To calculate the entity-wide liquidity horizon-adjusted expected shortfall-based measure for each risk class, the banking organization would (1) calculate the ten-day base expected shortfall measure for each risk factor

category as specified in Table 2 to § _____.215 of the proposal, (2) scale up the ten-day base expected shortfall measure using the longer proposed liquidity horizons for each risk factor category within the same risk class. When scaling up the ten-day base expected shortfall measure for the risk factor category(s) assigned a liquidity horizon of more than ten-days within the same risk class, the banking organization would hold all other risk factors, including those within the same risk class but assigned a shorter liquidity horizon, constant to appropriately reflect the incremental losses attributable to the specific risk factor categories within the same risk class over the longer proposed liquidity horizon. In this manner, the proposal would require a banking organization to calculate separately the liquidity horizon-adjusted expected shortfall-based measure for risk factors within the same risk class at each proposed liquidity horizon consecutively, starting with the shortest (ten days). Specifically, for each risk factor category within the same risk class, a banking organization would first compute the potential loss over the zero to ten-day period,⁴¹⁴ then the potential loss over the subsequent ten- to twenty-day period—assuming that its exposure to risk factors within the ten-day liquidity horizon has been eliminated—and continue this calculation for each of the proposed liquidity horizons, as described in Table 1 to § _____.215 of the proposed rule. A banking organization would then aggregate the losses for each period to determine the total liquidity horizon-adjusted expected shortfall-based measure for the risk class.

The liquidity horizon-adjusted expected shortfall-based measure for each risk class would reflect both the losses under the expected shortfall-based measure and the incremental losses at each proposed liquidity horizon, according to the following formula, as provided under § _____.215(b)(3) of the proposed rule:

⁴¹² A weighted average would be based on the market value of the instruments with the same liquidity horizon.

⁴¹³ As described in section V.A.8.b.iii. of this **SUPPLEMENTARY INFORMATION**, the proposal would require banking organizations to calculate the entity-wide expected shortfall-based measures for each risk class and across risk classes using the twelve-month historical stress period in which either the full or reduced set of risk factors would incur the largest loss.

⁴¹⁴ When computing losses over the zero to ten-day period, the proposal would require a banking organization to floor the time period for extinguishing its exposure to a risk factor exposure at ten days. For example, if an instrument would mature in two days, the banking organization must still calculate the potential losses assuming a ten-day liquidity horizon.

$$ES = \sqrt{(ES_T(P))^2 + \sum_{j \geq 2} \left(ES_T(P, j) \sqrt{\frac{(LH_j - LH_{j-1})}{T}} \right)^2}$$

Where:

ES is the liquidity horizon-adjusted expected shortfall-based measure;

T is the length of the base liquidity horizon, 10 days;

$ES_T(P)$ is ES at base liquidity horizon T of a portfolio with market risk covered positions P ;

$ES_T(P, j)$ is the ES at base liquidity horizon T of a portfolio with market risk covered positions P for all risk factors whose liquidity horizon is at least as long as the liquidity horizon corresponding to the index value, j , LH_j , as specified in Table 1 to § _____.215 of the proposed rule;

LH_j is the liquidity horizon corresponding to the index value, j , specified in Table 1 to § _____.215 of the proposed rule.

To calculate the liquidity horizon-adjusted expected shortfall-based measure at the entity-wide level across risk classes for all model-eligible positions, a banking organization would scale up the ten-day expected shortfall-based measure for all risk factors assigned either the same or a longer liquidity horizon, without distinguishing between risk classes. Otherwise, the process to calculate the entity-wide liquidity horizon-adjusted expected shortfall-based measure would be the same as the risk-class level calculation.

For example, assume that a banking organization would be required to calculate the liquidity horizon-adjusted expected shortfall-based measure for a single, USD denominated, investment grade corporate bond, whose price is driven by two risk factors, interest rate risk and credit spread risk. Under the proposal, the banking organization would calculate the expected shortfall-based measure for both interest rate risk and credit risk factors using the ten-day liquidity horizon, as expressed by $ES_T(P)$ in the above formula. According to Table 2 to § _____.215 in the proposed rule, the liquidity horizon for interest rate risk denominated in USD is ten days and the liquidity horizon for credit spread risk of investment grade issuers is forty days. Therefore, the banking organization would not extend the liquidity horizon for interest rate risk factor but would for the credit spread risk factor. To determine the liquidity horizon-adjusted expected shortfall-based measure for the credit spread risk factor, the banking organization would (1) scale the credit spread risk factor by the square root of the incremental increase in time (one for liquidity

horizon from ten to twenty days and the square root of two for liquidity horizon from twenty to forty days),⁴¹⁵ (2) add the resulting liquidity horizon adjustment for credit spread risk factor, as expressed by the second term in the above formula and repeated below, to the base ten-day liquidity horizon squared, and (3) calculate the square root of the sum of (1) and (2):

$$\sum_{j \geq 2} \left(ES_T(P, j) \sqrt{\frac{(LH_j - LH_{j-1})}{T}} \right)^2$$

As described above, the proposal would require the banking organization to perform this calculation for all model-eligible positions at the entity-wide level across risk classes and separately at the entity-wide level for each risk class, such as interest rate risk and credit spread risk. The proposal would require the banking organization to use the results of these calculations as inputs into the overall models-based non-default capital requirement, described in more detail below in section V.A.8.b.iv. of this

SUPPLEMENTARY INFORMATION.

Question 154: What, if any, risk factors exist that would not be captured by the proposal for which the agencies should consider designating a specific liquidity horizon and why?

Question 155: The agencies request comment on the appropriateness of assigning a liquidity horizon for multi-underlying instruments based on the weighted average of the liquidity horizons for the risk factors corresponding to the underlying constituents and the respective weighting of each within the index. What, if any, alternative methodologies should the agencies consider, such as assigning the liquidity horizon for credit and equity indices based on the longest liquidity horizon applicable to the risk factors corresponding to the underlying constituents? What would be the

⁴¹⁵ The incremental increase in time is represented by the difference in the liquidity horizons, $LH_j - LH_{j-1}$. In the example, the incremental increase in time for the liquidity horizon of twenty days and forty days would be twenty days (forty days minus twenty days). The incremental increase in time is divided by the base horizon of ten days. Thus, the time scaling factor for credit spread risk is the square root of two.

benefits and drawbacks of such alternatives compared to the proposal? Commenters are encouraged to provide data to support their responses.

Question 156: The agencies request comment on the appropriateness of requiring banking organizations to use the next-longer liquidity horizon for instruments with a maturity shorter than the respective liquidity horizon assigned to the risk factor. What, if any, operational challenges might this pose for banking organizations? How could such concerns be mitigated while still ensuring consistency and comparability in regulatory capital requirements across banking organizations?

iii. Stress Period

To appropriately account for potential losses in stress, the proposal would require a banking organization to calculate the entity-wide expected shortfall-based measures for each risk class and across risk classes described in section V.A.8.b.i. of this **SUPPLEMENTARY INFORMATION** using the twelve-month historical stress period during which its model-eligible positions would experience the largest loss according to the banking organizations' policies and procedures approved by its primary Federal supervisor. To identify the appropriate stress period, the proposal would require a banking organization to consider all twelve-month periods spanning back to at least 2007 and, depending on whether the banking organization elected to employ the direct or indirect approach, select the period in which either the full or reduced set of risk factors would incur the largest loss.⁴¹⁶ The proposal would require a banking organization to equally weight observations within each twelve-month historical stress period when selecting the appropriate stress period.

To help ensure that the twelve-month historical stress period continues to appropriately reflect potential losses for the risk factors of model-eligible positions over time, the proposal would require a banking organization to review and update the twelve-month historical

⁴¹⁶ Under the proposal, a banking organization that has elected to use the direct approach would select the relevant stress period using the full set of modelable risk factors, while that using the indirect approach would use the reduced set of risk factors to select the stress period.

stress period on at least a quarterly basis, if appropriate, or whenever there are material changes in the risk factors of model-eligible positions.

Question 157: The agencies seek comment on the appropriateness of requiring banking organizations to use the same reduced set of risk factors to both identify the appropriate twelve-month historical stress period and calculate the IMCCs. To what extent does the proposed approach provide banking organizations sufficient flexibility to appropriately capture the risk factors that may be present in some, but not all stress periods? What, if any, alternative approaches should the agencies consider that would better serve to capture such risk factors relative to the proposal?

Question 158: The agencies are considering options to define the largest loss when identifying the appropriate twelve-month historical stress period. For example, what are the advantages and disadvantages of defining the largest loss based on amounts banking organizations use for financial reporting, and why? What are the advantages and disadvantages of requiring firms to have policies and procedures approved by a banking organization's primary Federal supervisor to identify the twelve-month historical stress period during based on the largest loss, and why?

iv. Total Internal Models Capital Calculations (IMCC)

The proposal would require banking organizations to use the liquidity

horizon-adjusted expected shortfall-based measures calculated throughout the twelve-month historical stress period at the entity-wide level for each risk class ($IMCC(C_i)$) and at the entity-wide level across risk classes ($IMCC(C)$) to calculate the IMCC for model-eligible positions. To constrain the empirical correlations and provide an appropriate balance between perfect diversification and no diversification across risk classes, the IMCC would equal half of the entity-wide liquidity horizon-adjusted expected shortfall-based measure across all risk classes plus half of the sum of the liquidity horizon-adjusted expected shortfall measures for each risk class, according to the following formula, as provided under § _____.215(c)(4) of the proposed rule:

$$IMCC = \omega(IMCC(C)) + (1 - \omega) \left(\sum_i IMCC(C_i) \right)$$

Where:

ω equals 0.5;

i is the index of risk classes, which are the following: interest rate risk, credit spread risk, equity risk, commodity risk and foreign exchange risk.

$IMCC(C)$ equals the aggregate liquidity horizon-adjusted ES-based measure across all risk classes; and

(iv) $IMCC(C_i)$ equals the partial liquidity horizon-adjusted ES-based measure for each risk class (i).

c. Stressed Expected Shortfall (SES) for Non-Modellable Risk Factors

Under the proposal, the SES for non-modellable risk factors would be similar to the IMCC for modellable and type A non-modellable risk factors, except that, relative to the IMCC, the SES calculation would provide significantly less recognition for hedging and portfolio diversification for type B non-modellable risk factors and significantly more for type A non-modellable risk factors.

Under the proposal, a banking organization would have to calculate the liquidity horizon-adjusted expected shortfall-based measure for non-modellable risk factors using the same general process as proposed for

modellable and type A non-modellable risk factors in IMCC, with three key differences. First, the proposal would require a banking organization to separately carry out such calculation for each non-modellable risk factor, rather than at the risk class level. Second, the proposal would require a banking organization to apply a minimum liquidity horizon adjustment of at least twenty days, rather than ten days. Third, the proposal would require a banking organization to identify a common twelve-month historical stress period for all non-modellable risk factors within the same risk class, which is calibrated to be at least as conservative as the twelve-month historical stress period used within IMCC. To reduce operational burden, the proposal would allow banking organizations to apply the same twelve-month historical stress period used to calculate IMCC for purposes of the common twelve-month historical stress period used for each risk class within the SES calculation. If a banking organization is not able to determine a stress scenario capital requirement for a risk factor, the proposal would require the banking organization to set the SES

capital requirement equal to the maximum possible loss for that risk factor.

Alternatively, with approval from its primary Federal supervisor, a banking organization may use an alternative approach to design the stress scenario for each risk class of non-modellable risk factors.

In recognition of the data limitations of non-modellable risk factors, the proposal would allow a banking organization that receives approval to use an alternative approach to use proxies in determining the common twelve-month historical stress period for each risk class of non-modellable risk factors, as long as such proxies satisfy the data quality requirements of the qualitative test.⁴¹⁷

To calculate the SES for non-modellable risk factors, the proposal would require a banking organization to separate non-modellable risk factors into type A and type B non-modellable risk factors. A banking organization would calculate the SES for both types of non-modellable risk factors, according to the following formula as provided under § _____.215(d)(2) of the proposed rule:

⁴¹⁷ See section V.A.8.a.i. of this **SUPPLEMENTARY INFORMATION** for a description of the data quality requirements in the qualitative test.

$$SES = \sqrt{\left(\sum_{k=1}^K SES_{NM,k}^2\right) + \left((1 - \rho_b) \sum_{j=1}^J SES_{NM,j}^2 + \rho_b \left(\sum_{j=1}^J SES_{NM,j}\right)^2\right)}$$

Where:

- (i) $SES_{NM,k}$ is the stress scenario capital measure for the type A non-modellable risk factor k ;
- (ii) K is the number of type A non-modellable risk factors;
- (iii) ρ_b is 0.36;
- (iv) $SES_{NM,j}$ is the stress scenario capital measure for the type B non-modellable risk factor j ; and
- (v) J is the number of type B non-modellable risk factors.

For type B non-modellable risk factors, the second term would allow for a limited and appropriate diversification benefit that depends on the level of ρ parameter. The first term would provide type A non-modellable risk factors a greater diversification benefit by allowing such non-modellable risk factors to be aggregated with zero correlation because they passed the qualitative test.

Given the limited data available for type B non-modellable risk factors from which to estimate correlations between such factors throughout the twelve-month historical stress period, the proposed conservative capital treatment

of type B non-modellable risk factors would address the potential risk of lower quality inputs being used in calculating market risk capital requirements for such factors (for example, the risk that the limited data set overstates the diversification benefits and, therefore, understates the magnitude of potential losses of type B non-modellable risk factors).

Type A non-modellable risk factors would already be captured within the IMCC, which limits the model-estimated diversification benefit across risk classes. Thus, the IMCC would capture most of the risk arising from type A non-modellable risk factors. Yet, unlike modellable risk factors, type A non-modellable risk factors can pose higher model risk and elevated liquidity risk due to infrequent price observations. To appropriately capture such additional risks that may not be fully captured by IMCC, type A non-modellable risk factors would also be included in the SES calculation.⁴¹⁸

Question 159: The agencies seek comment on the proposed rho parameter (ρ_b) for type B non-

modellable risk factors. What are the advantages and disadvantages of the proposed rho parameter (ρ_b)? What are the advantages and disadvantages of reducing the rho parameter (ρ_b) to a lower value (such as 0.0625 or 0.16), and why? Please provide any data and rationale that would be useful to consider for this purpose.

Question 160: What are the advantages and disadvantages of the proposed calculation of the stressed expected shortfall capital requirement for non-modellable risk factors? Alternatively, what are the advantages and disadvantages of requiring a banking organization to separate non-modellable risk factors into those with idiosyncratic credit spread risk, those with idiosyncratic equity risk, and those with systematic risk, according to the following formula, and why? Specifically, what are the advantages and disadvantages of the following alternative formula for calculating the stressed expected shortfall capital requirement for non-modellable risk factors:

$$SES = \sqrt{\sum_{i=1}^I ISES_{NM,i}^2} + \sqrt{\sum_{j=1}^J ISES_{NM,j}^2} + \sqrt{\left(\rho \sum_{k=1}^K SES_{NM,k}\right)^2 + (1 - \rho^2) \sum_{k=1}^K SES_{NM,k}^2}$$

Where:

- $ISES_{NM,i}$ is the stress scenario capital measure for non-modellable idiosyncratic credit spread risk, i , aggregated with zero correlation, and where I is a non-modellable idiosyncratic credit spread risk factor;
- $ISES_{NM,j}$ is the stress scenario capital measure for non-modellable idiosyncratic equity risk, j , aggregated with zero correlation, and where J is a non-modellable idiosyncratic equity risk factor;
- $SES_{NM,k}$ is the stress scenario capital measure for the remaining non-modellable systematic risk factors, k , and where K is the remaining non-modellable risk factors in a model-eligible trading desk; and

ρ is equal to 0.6.

If the agencies were to consider this alternative approach, what further

adjustments should they also consider (such as using a different correlation parameter, ρ , between 0 and 1.0)? Please provide any data and rationale, including data from a wide range of stressed market conditions, that would be useful for evaluating this alternative.

d. Aggregate Trading Portfolio Backtesting Capital Multiplier

Under the current capital rule, each quarter, a banking organization must compare each of its most recent 250 business days of entity-wide trading losses (excluding fees, commissions, reserves, net interest income, and intraday trading) with the corresponding daily VaR-based measure calibrated to a one-day holding period and at a one-tail, 99.0 percent

confidence level. Depending on the number of exceptions in the entity-wide backtesting results, a banking organization must apply a multiplication factor, which can range from 3 to 4, to a banking organization's VaR-based and stressed VaR-based capital requirements for market risk.

The proposal generally would retain the backtesting requirements in the current capital rule, with two modifications. First, the proposal would require backtesting of the VaR-based measures against both the actual and the hypothetical profits and losses produced by the financial reporting

⁴¹⁸ Unlike type B non-modellable risk factors, type A non-modellable risk factors would receive

full diversification (zero correlation) with other

type A non-modellable risk factors in the SES calculation.

models.⁴¹⁹ Specifically, for the most recent 250 business days,⁴²⁰ a banking organization would be required to separately compare each business day's aggregate actual profit and loss for transactions on model-eligible trading desks and aggregate hypothetical profit and loss for transactions on model-eligible trading desks with the corresponding aggregate VaR-based measures for that business day calibrated to a one-day holding period at a one-tail, 99.0 percent confidence level for transactions on all model-eligible trading desks.⁴²¹ Second, the proposal generally would require a banking organization to apply a lower capital multiplier (m_c), that could range from a factor of 1.5 to 2, to the 60-day average estimated capital required for modifiable and type A non-modifiable risk factors, based on the number of exceptions in the entity-wide backtesting results.⁴²²

$$IMA_{G,A} = \max((IMCC_t - 1 + SES_{t-1}), ((m_c \times IMCC_{average}) + SES_{average})) + PLA \text{ add on}$$

The proposed backtesting requirements would measure the conservatism of the forecasting assumptions and the valuation methods used in the internal models by

⁴¹⁹ The proposal would define hypothetical profit and loss as the change in the value of the market risk covered positions that would have occurred due to changes in the market data at end of current day if the end-of-previous-day market risk covered positions remained unchanged. Valuation adjustments that are updated daily would have to be included, unless the banking organization receives approval from its primary Federal supervisor to exclude them. Valuation adjustments for which separate regulatory capital requirements have been otherwise specified, commissions, fees, reserves, net interest income, intraday trading, and time effects would have to be excluded. See § __.202 of the proposed rule.

⁴²⁰ In its first year of backtesting, a banking organization would count the number of exceptions that have occurred since it began backtesting.

⁴²¹ As described in section V.A.6.d.i. of this **SUPPLEMENTARY INFORMATION**, the proposal would allow, subject to approval by the primary Federal supervisor, a banking organization, for a model-eligible trading desk that holds a limited amount of model-ineligible positions pursuant to its trading or hedging strategy, to include such positions for the purposes of the aggregate trading portfolio backtesting requirement as well as for the desk-level PLA and backtesting requirements.

⁴²² The mechanics of the backtesting requirements for the aggregate trading portfolio backtesting multiplier would be the same as those at the trading desk level. Consistent with the trading desk level backtesting requirements, the proposal would allow banking organizations to disregard backtesting exceptions related to official holidays and, in certain instances, those related to non-modifiable risk factors, model-ineligible positions and technical issues. See section V.A.8.f. of this **SUPPLEMENTARY INFORMATION** for a detailed description of the mechanics of the proposed trading desk-level backtesting requirements, including circumstances in which a banking organization may disregard a backtesting exemption.

comparing the daily VaR-based measure against the actual and hypothetical profits and losses produced by the financial reporting models. Such comparisons are a critical part of a banking organization's ongoing risk management, as they improve a banking organization's ability to make prompt adjustments to the pricing models that impact the expected shortfall calculation used for determining risk-based capital requirements to address factors such as changing market conditions and model deficiencies. A high number of exceptions could indicate modeling issues (for example, insufficiently conservative risk factor shocks) and warrant increased capital requirements.

The backtesting requirements and associated multiplication factor provide appropriate incentives for banking organizations to regularly update the internal models used for calculating expected shortfall-based measure in determining regulatory capital requirements.

Question 161: The agencies request comment on the appropriateness of the proposed calculation for the aggregate trading portfolio backtesting capital multiplier. What, if any, changes should the agencies consider that would appropriately measure the robustness of a banking organization's internal models used in calculating the expected shortfall-based measure but impose less operational burden relative to the proposal?

e. PLA Test and Add-On

Under the proposal, use of the models-based non-default capital requirement for a model-eligible trading desk fundamentally would depend on the accuracy of the potential future profits or losses estimated by the banking organization's internal risk management models relative to those produced by its financial reporting models. The proposed profit and loss attribution test metric⁴²³ would help ensure that the theoretical changes in a model-eligible trading desk's revenue produced by the internal risk management models are sufficiently close to the hypothetical changes produced by valuation methods used by the financial reporting models in the banking organization's end-of-day valuation process and adequately capture the risk factors used in such models. Thus, the proposed PLA test metric would measure the materiality of

the simplifications of the internal risk management models used by a model-eligible trading desk relative to the financial reporting models and remove the eligibility of any trading desk for which such simplifications are deemed material from using the models-based non-default capital requirement to calculate its regulatory capital requirement for market risk.

The proposed models-based non-default capital requirement would include an additional capital requirement (the PLA add-on) for model-eligible trading desks for which the desk-level PLA test metric demonstrates deficiencies in the ability of the valuation methods used by the banking organization's internal risk management models to appropriately capture the market risk of the model-eligible positions but does not disqualify the eligibility of the models. The PLA add-on would help ensure that banking organizations with model-eligible trading desks with non-disqualifying model deficiencies are subject to more conservative capital requirements relative to banking organizations with model-eligible trading desks without such deficiencies.⁴²⁴ Additionally, the PLA add-on would provide appropriate incentives for banking organizations with model-eligible trading desks with model deficiencies to address the potential gaps in data and model deficiencies.

The agencies recognize the potential difficulties for banking organizations in implementing the proposed desk-level PLA test metric. To improve the ability of banking organizations to use more risk-sensitive modeled approaches for non-default capital requirement, where appropriate, the proposal would provide a three-year transition period during which there would be no automatic consequences for PLA test results. During this period, a banking organization would be required to submit quarterly PLA test results to its primary Federal supervisor. The test results would not have any automatic regulatory consequences during the transition period. This extended transition period for implementation of the PLA test would allow banking organizations to gain experience with the test and provide time to improve their systems and processes and address potential gaps in data and model

⁴²⁴ As described in section V.A.6.d.iv. of this **SUPPLEMENTARY INFORMATION**, a model-eligible trading desk that passes the PLA test metric could still be subject to the PLA add-on if the primary Federal supervisor determines that the trading desk no longer complies with all applicable requirements.

⁴²³ The proposed PLA test metric refers to the Kolmogorov-Smirnov metric which assesses the similarity of the distributions of the risk-theoretical profit and loss and the hypothetical profit and loss.

performance. Furthermore, the delayed implementation would allow more time to develop and refine the valuation methods used in the expected shortfall models without the potential cliff effects that could arise when one or more model-eligible trading desks having PLA test results in the amber or red zone. The delayed transition of PLA test automatic consequences would also provide the agencies an additional opportunity to monitor the effectiveness of the PLA test metric and identify the root causes leading to poor testing performances while allowing banking organizations to gain experience with the tests and improve their systems and models.

Question 162: The agencies seek comment on the proposed three-year transition period for the PLA test. What are the benefits and drawbacks of delaying for three years the automatic consequences of having PLA test results in the amber or red zones? To what extent does the proposed time period facilitate banking organizations' ability to gain experience with the tests and address any potential gaps in data and model performance? Please provide any rationale that would be useful to consider for this purpose.

i. PLA Test

To measure the materiality of the simplifications (for example, missing risk factors and differences in the way positions are valued) within the expected shortfall models used by each model-eligible trading desk, the PLA test would require a banking organization, for each model-eligible trading desk, to compare the daily profit and loss values produced by its internal risk management models (risk-theoretical profit and loss)⁴²⁵ against the hypothetical profit and loss produced by the financial reporting models.

I. Data Input Requirements

For the sole purpose of the PLA test, the proposal would permit a banking organization to align the risk factor input data used in the valuations calculated by the internal risk management models with that used in the financial reporting models, if the banking organization demonstrates that such an alignment would be

appropriate. If the input data for a given risk factor that is common to both the financial reporting models and the internal risk management models differs due to data acquisition complications (specifically, different market data sources, time fixing of market data sources, or transformations of market data into input data suitable for the risk factors of the underlying valuation engines), a banking organization may adjust the input data used by the financial reporting models into a format that can be used by the internal risk management models. When transforming the input data of the financial reporting models into a format that can be applied to the risk factors used in internal risk management models, the banking organization would be required to demonstrate that no differences in the risk factors or in the valuation models have been omitted. The proposal would require a banking organization to assess the effect of these input data alignments on both the valuations produced by the internal risk management models and the PLA test when designing or changing the input data alignment process, or at the request of the primary Federal supervisor. Additionally, the proposal would require a banking organization to treat time effects⁴²⁶ in a consistent manner in the hypothetical profit and loss and the risk-theoretical profit and loss.⁴²⁷ The proposed flexibility would allow the results of the PLA test metric to more accurately assess the consistency of the risk-theoretical and hypothetical profit and loss for a particular model-eligible trading desk, by focusing on differences due to the pricing function and risk factor coverage rather than those arising from use of different data inputs.

Furthermore, the proposal would allow, subject to approval by the primary Federal supervisor, a banking organization, for a model-eligible trading desk that holds a limited amount of model-ineligible positions pursuant to its trading or hedging strategy,⁴²⁸ to include such positions for the purposes of the PLA tests. Allowing such positions to be included would

enable model-ineligible positions held as hedges to be recognized with the underlying positions they are intended to hedge and thus minimize the potential for the PLA test to incorrectly identify model deficiencies for model-eligible trading desks due solely to the bi-furcation of such hedges. For model-eligible trading desks with approval of the primary Federal supervisor to incorporate model-ineligible positions in their PLA test metric, the proposal would require the banking organization to calculate the market risk capital requirements for such positions using the more conservative capital treatment under the standardized non-default capital requirement or the fallback capital requirement, as described in sections V.A.7. and V.A.3.d. of this **SUPPLEMENTARY INFORMATION**, respectively.

II. PLA Test Metric

For the PLA test, the banking organization would be required to compare, for each model-eligible trading desk, the risk-theoretical profit and loss and the hypothetical profit and loss for the most recent 250 business days using the Kolmogorov-Smirnov metric.

To calculate the Kolmogorov-Smirnov metric, the banking organization, for each model-eligible trading desk, would identify the number of daily observations over the most recent 250 business days where the risk-theoretical profit and loss or separately the hypothetical profit and loss is less than or equal to the specified value. To appropriately weight the probability of each daily observation,⁴²⁹ the proposal would define the empirical cumulative distribution function as the number of daily observations multiplied by 0.004 (1/250). Under the proposal, the Kolmogorov-Smirnov metric would be the largest absolute difference observed between these two empirical cumulative distributions of profit and loss at any value, which could be expressed as:

$$KS = \max(\text{abs}(D_{HPL} - D_{RTPL}))$$

where D_{HPL} is the empirical cumulative distribution of hypothetical profit and loss produced by the financial reporting models and D_{RTPL} the empirical cumulative distribution of risk-theoretical profit and loss produced by the internal risk management models.

As a testing metric, the Kolmogorov-Smirnov metric is intended to support good risk management by requiring

⁴²⁵ The proposal would define risk-theoretical profit and loss as the daily trading desk-level profit and loss on the end-of-previous-day market risk covered positions generated by the banking organization's internal risk management models. The risk-theoretical profit and loss would have to take into account all risk factors and positions, including non-modellable risk factors and model-ineligible positions, in the banking organization's internal risk management models.

⁴²⁶ Time effects can include various elements such as the sensitivity to time, or theta effect, and carry or costs of funding.

⁴²⁷ In particular, when time effects are excluded from the hypothetical profit and loss, they must also be excluded from the risk-theoretical profit and loss. A banking organization that excludes time effects must do so consistently for purposes of backtesting and the PLA test.

⁴²⁸ Model-ineligible positions include equity positions in an investment fund where the banking organization is not able to identify the underlying positions held by an investment fund on a quarterly basis, securitization positions, and correlation trading positions.

⁴²⁹ For example, if the internal risk management model generates the same value for the model-eligible trading desk's portfolio on two separate days, the proposal would require the banking organization to assign a larger probability by requiring each daily observation to be weighted at 0.004.

banking organizations to assess the similarity of the distribution of the daily portfolio values for a model-eligible trading desk generated by the internal risk management models and the financial reporting models. The closeness of the distributions would indicate how accurately the internal risk management models capture the range of losses experienced by the model-eligible trading desk across different market conditions with closer distributions indicating greater accuracy with respect to pricing and risk factor coverage. Applying this process over a given period would provide information about the accuracy of the internal risk management model's ability to appropriately reflect the shape of the whole distribution of values for the model-eligible trading desk's portfolio compared to the distribution of values generated by the financial reporting models, including information on the size and number of valuation differences.

Based on the PLA test results for the Kolmogorov-Smirnov metric, a banking organization would be required to allocate each model-eligible trading desk to a PLA test zone as set out in Table 1 to § _____.213 of the proposed rule. Additionally, under the proposal, the primary Federal supervisor could require a banking organization to assign a different PLA test zone to a model-eligible trading desk than that based on PLA test metric of the model-eligible trading desk.⁴³⁰

Question 163: What, if any, modifications should the agencies

consider with respect to the PLA test? Commenters are encouraged to provide specific details on the mechanics, empirical support, capital implications, and rationale for any suggested modifications.

Question 164: The agencies seek comment on the appropriateness of allowing banking organizations to align the risk input data between the internal risk management models and the financial reporting models. What other instances, if any, should the agencies consider to ensure accurate and consistent assessment of the profit and losses produced by the internal risk management models with those produced by the financial reporting models for a particular model-eligible trading desk?

Question 165: The agencies request comment on the benefits and drawbacks of allowing banking organizations, with regulatory approval, to include non-modellable risk factors for purposes of the PLA tests. Should non-modellable risk factors be excluded from the PLA tests? Why or why not? What, if any, further conditions should the agencies consider including to appropriately limit the inclusion of non-modellable risk factors for purposes of the PLA tests? Commenters are encouraged to provide data to support their responses.

ii. Calculation of the PLA Add-On

Under the proposal, a banking organization would consider model-eligible trading desks in the green zone or amber zone as passing the PLA test for model eligibility purposes. If a

banking organization has one or more model-eligible trading desks within the amber zone, the proposal would require the banking organization to reflect the PLA add-on in the models-based non-default risk capital requirement, as described above in section V.A.8. of this **SUPPLEMENTARY INFORMATION**.⁴³¹ Under the proposal, a banking organization would calculate the PLA add-on as the greater of zero and the aggregate capital benefit to the banking organization from the models-based non-default capital requirement (the difference between the capital requirements for all model-eligible trading desks⁴³² in the green or amber zone under the standardized non-default capital requirement ($SA_{G,A}$) and those under the models-based non-default capital requirement ($(IMCC_{t-1} + SES_{t-1})$, $((m_c \times IMCC_{average}) + SES_{average})$), multiplied by a multiplication factor of k , as defined according to the following formula under § _____.213(c)(4) of the proposed rule:

$$PLA \text{ add-on} = k \times \max((SA_{G,A} - \max((IMCC_{t-1} + SES_{t-1}), ((m_c \times IMCC_{average}) + SES_{average}))), 0)$$

Under the proposal, the value of k would equal half of the ratio of the sum of the standardized non-default capital requirement for each model-eligible trading desk within the amber zone and those for each of the model-eligible trading desks within either the green or amber zone as defined according to the following formula under § _____.213(c)(4)(i) of the proposed rule:

$$k = 0.5 \times \frac{\sum_{i \in A} SA_i}{\sum_{i \in G,A} SA_i}$$

Thus, the value of k would gradually increase from 0 to 0.5 as the number of model-eligible trading desks within the amber zone increases, which is intended to mitigate the potential cliff effect of significantly increasing market risk capital requirements as a model-eligible trading desk transitions from using the

models-based non-default capital requirement to the standardized non-default capital requirement.

iii. Application of the PLA Add-On

After the three-year transition period, if, in the most recent 250 business day period, a trading desk that the primary

Federal supervisory previously approved to use the models-based non-default capital requirement produces results in the PLA test red zone, the proposal would require the banking organization to use the standardized non-default capital requirement and calculate market risk capital

⁴³⁰ As discussed in more detail in section V.A.6.d.iv. of this **SUPPLEMENTARY INFORMATION**, if, after the three-year transition period, the primary Federal supervisor subjects a model-eligible trading desk to the PLA add-on as part of the initial approval or for on-going model eligibility, the model-eligible trading desk would remain subject to the PLA add-on until either the model-eligible trading desk (1) provides at least 250 business days of backtesting and PLA test results that pass the trading-desk level backtesting requirements and produce PLA metric in the green zone, or (2) receives approval from the primary Federal supervisor that the PLA add-on no longer applies.

⁴³¹ As described in section V.A.1.b. of this **SUPPLEMENTARY INFORMATION**, the proposal would provide a three-year transition period during which there would be no automatic consequences for PLA test results. While banking organizations would be required to report PLA test results during the transition period, the PLA add-on would not apply until after the expiration of the three-year transition period.

⁴³² In calculating the PLA add-on, the proposal would require a banking organization to exclude any model-ineligible positions held by a model-eligible desk, as such positions must be subject to

either the standardized non-default capital requirement or the fallback capital requirement.

⁴³³ As discussed in section V.A.6.d.i. of this **SUPPLEMENTARY INFORMATION**, model-eligible trading desks that hold limited amounts of model-ineligible positions must calculate regulatory capital requirements for such positions under the standardized non-default capital requirement or fallback capital requirement, as applicable. With regulatory approval, a banking organization may include such positions within its internal models for the purposes of the desk-level PLA and backtesting requirements as well as the aggregate trading portfolio backtesting requirement.

requirements for the positions held by the trading desk together with all other trading desks subject to the standardized non-default capital requirement.⁴³³ The proposal would not permit the banking organization to use the models-based non-default capital requirement to calculate market risk capital requirements for the trading desk until the trading desk (i) produces PLA test results in either the green or amber zone and passes specific trading desk level backtesting requirements over the most recent 250 business days, or (ii) receives approval from the primary Federal supervisor.⁴³⁴

f. Backtesting Requirements for Model-Eligible Trading Desks

Under the proposal, a banking organization may treat a trading desk that conducts and successfully passes both backtesting and the PLA test at the trading desk level on an ongoing quarterly basis as a model-eligible trading desk.⁴³⁵ For determining the model eligibility of a trading desk, the proposal would require the banking organization to perform backtesting at the trading desk level. For the purpose of desk-level backtesting, for each trading desk, a banking organization would be required to compare each of its most recent 250 business days' actual profit and loss and hypothetical profit and loss produced by the financial reporting models with the corresponding daily VaR-based measure calculated by the banking organization's internal models. The proposal would require the banking organization, for each trading desk, to calibrate the VaR-based measure to a one-day holding period and at both the 97.5th percentile and the 99.0th percentile one-tail confidence levels. Time effects must be treated in a consistent manner in the hypothetical profit and loss metric used for purposes the backtesting and PLA tests.

Under the proposal, a backtesting exception would occur when the daily actual profit and loss or the daily hypothetical profit and loss produced by the financial reporting model for the trading desk exceeds the corresponding daily VaR-based measure. A banking organization must count separately the

number of backtesting exceptions that occurred in the most recent 250 business days for actual profit and loss at each confidence level and those that occurred for hypothetical profit and loss at each confidence level. A trading desk would become model-ineligible if, in the most recent 250 business day period, the desk experiences any of the following: (1) 12 or more exceptions for actual profit and loss at the 99.0th percentile; (2) 12 or more exceptions for hypothetical profit and loss at the 99.0th percentile; (3) 30 or more exceptions for actual profit and loss at the 97.5th percentile; or (4) 30 or more exceptions for hypothetical profit and loss at the 97.5th percentile. In the event that either the daily actual or hypothetical profit and loss is unavailable or impossible to compute, the proposal would require the banking organization to treat such an occurrence as a backtesting exception for the actual profit and loss or hypothetical profit and loss, respectively. If the VaR-based measure for a particular business day is unavailable or impossible to compute, an exception for actual and hypothetical profit and loss is deemed to have occurred. No exception is deemed to have occurred if the unavailability or the impossibility is related to an official holiday; in such cases the banking organization may disregard the backtesting exception. In addition, with approval of the primary Federal supervisor, the banking organization may disregard the backtesting exception if the banking organization could demonstrate that the backtesting exception is due to technical issues that are unrelated to the banking organization's financial reporting or internal models; or to one or more model-ineligible positions; or if the banking organization could demonstrate that a backtesting exception relates to one or more non-modellable risk factors or to one more model-ineligible positions and the portion of the stressed expected shortfall or standardized non-default capital requirement attributed to these non-modellable risk factors or model-ineligible positions, respectively, for that business day exceeds the difference between the banking organization's VaR-based measure and the actual or hypothetical loss for that business day.⁴³⁶

⁴³⁶ It is not sufficient to compare the size of backtesting exceptions to standalone SES for individual non-modellable risk factors or standalone standardized non-default capital requirements for model-ineligible positions because the sum of standalone capital requirements for individual non-modellable risk factors or model-ineligible positions would almost always be smaller than the relevant aggregate capital requirement.

If in the most recent 250 business day period a trading desk experiences either 12 or more backtesting exceptions at the 99.0th percentile, or 30 or more backtesting exceptions at the 97.5th percentile, the proposal would require the banking organization to use the standardized non-default capital requirement to determine the market risk capital requirements for the market risk covered positions held by the trading desk. If a model-eligible trading desk is approved with less than 250 business days of trading desk level backtesting and PLA test results, the proposal would require a banking organization to use all backtesting data for the model-eligible trading desk and to prorate the number of allowable exceptions by the number of business days for which backtesting data are available for the model-eligible trading desk.⁴³⁷ The proposal would allow the banking organization to return to using the models-based non-default capital requirement to calculate market risk capital requirements for the trading desk if the banking organization (1) remediates the internal model deficiencies such that the trading desk successfully passes trading desk-level backtesting and reports PLA test metric in the green or amber zone or (2) receives approval of the primary Federal supervisor.⁴³⁸

Question 166: Should non-modellable risk factors be excluded from the proposed backtesting requirements? Why or why not? What, if any, further

Instead, the size of backtesting exceptions needs to be compared to the portion of the aggregate SES or standardized non-default capital requirement that can be attributed to those non-modellable risk factors or model-ineligible positions, accounting for recognition of diversification within each formula. For example, one approach for determining the portion of the aggregate SES attributable to a particular non-modellable risk factor is to multiply the risk factor's standalone SES by its marginal contribution to the aggregate SES (*i.e.*, for non-modellable risk factor *i*, attribute $(aSES/aSES_{mm,i}) \cdot SES_{mm,i}$), which is a valid method for apportioning the aggregate SES because the SES formula is homogenous of degree one.

⁴³⁷ To receive approval as a model-eligible desk during the three-year transition period, the proposal would require the banking organization to provide backtesting results for the trading desk and demonstrate to the satisfaction of the primary Federal supervisor that the expected shortfall models would be able to satisfy the backtesting requirements on an on-going basis. See section V.A.6.d.iv.I. of this SUPPLEMENTARY INFORMATION for the criteria for a trading desk to receive approval as a model-eligible trading desk.

⁴³⁸ Under the proposal, there would be no automatic consequences for the PLA test results during the three-year transition period. Accordingly, during the transition period, a banking organization's model-eligible trading desk would only be required to successfully pass quarterly trading desk-level backtesting requirements to return to using the models-based non-default capital requirement.

⁴³⁴ During the three-year transition period, a banking organization may use the models-based non-default capital requirement to calculate market risk capital requirements for the trading desk once the desk produces satisfactory desk-level backtesting results for the most recent 250 business days.

⁴³⁵ During the three-year transition period, a banking organization may treat a trading desk that conducts and successfully passes backtesting at the trading desk level on an ongoing quarterly basis as a model-eligible trading desk.

conditions should the agencies consider including to limit appropriately the inclusion of non-modellable risk factors for purposes of the backtesting requirements? Commenters are encouraged to provide data to support their responses.

Question 167: The agencies invite comment on what, if any, challenges requiring banking organizations to directly calculate the internally modelled capital requirement for modellable risk factors using a 10-day liquidity horizon for the purposes of the daily expected shortfall-based measure for modellable risk factors could pose and a 1-day VaR for the purposes of backtesting could pose. What, if any, alternative methodologies should the agencies consider?

Question 168: The agencies invite comment on whether notional desks that are model-eligible desks and primarily hold foreign exchange and commodity positions to hedge banking book exposures should be excluded from PLA testing and backtesting requirements. What would be the potential benefits and drawbacks of providing such an exclusion for these specific desk types? Would alternative treatment or modified requirements for these desks be more appropriate and if so, why?

9. Default Risk Capital Requirement

The default risk capital requirement is intended to capture the incremental loss if the issuer of an equity or credit position were to immediately default (the additional losses from jump-to-default risk), which are not captured by the credit spread or equity shocks under the sensitivities-based method or the models-based non-default capital requirement. Thus, the proposed default risk capital requirement would apply only to non-securitization debt or equity positions (except for U.S. sovereigns, specified supranational entities, and multilateral development banks), securitization positions non-CTP, and correlation trading positions. To recognize offsetting of long and short positions across model-eligible and model-ineligible desks, the proposal would allow a banking organizations that has one or more model-eligible trading desks to perform a single calculation of the default risk capital requirement across model-eligible and model-ineligible trading desks.

Under the proposal, a banking organization would be required to separately calculate the default risk capital requirement for each of the three default risk categories (three position types that could incur default risk) using the following five steps.

First, for each of the three default risk categories, the banking organization would be required to group instruments with similar risk characteristics throughout an economic cycle into the defined default buckets as described in more detail below.

Second, to estimate the position-level losses from an immediate issuer default, the banking organization would be required to calculate the gross default exposure separately for each default risk position. Additionally, the banking organization would be required to determine the long and short direction of the gross default exposure based on whether it would experience a loss (long) or gain (short) in the event of a default.

Third, to estimate the portfolio-level losses of a trading desk from an immediate issuer default, the banking organization would be required to calculate the net default exposure for each obligor by offsetting the gross long and short default exposures to the same obligor, where permitted.

Fourth, to estimate and recognize hedging benefit between net long and net short position of different issuers within the same default bucket, the banking organization would be required to calculate the hedge benefit ratio and apply the prescribed risk weights⁴³⁹ to the net default exposures within the same default bucket for the class of instruments.⁴⁴⁰ In general, the proposed buckets and associated risk weights closely follow those in the Basel standards, which are calibrated to reflect a through-the-cycle probability of default. The hedge benefit ratio is calculated based on the aggregate net long default positions and the aggregate net short default positions. It is intended to recognize the partial hedging of net long and net short default

⁴³⁹ The proposal would require a banking organization that applies a hypothetical portfolio approach to apply the highest risk weight that is applicable under the investment limits of an equity position in an investment fund that may invest in primarily high-yield or distressed names under the fund's mandate by first applying the highest risk weight that is applicable under the fund's investment limits to defaulted instruments, followed by sub-speculative grade, then speculative grade, then investment grade securities. A banking organization may not recognize any offsetting or diversification benefit when calculating the average risk weight of the fund. See § _____.205(e)(3)(ii) of the proposed rule.

⁴⁴⁰ Specifically, a banking organization would first calculate the hedge benefit ratio (the total net long jump-to-default risk positions (numerator) divided by the sum of the total net long jump-to-default risk positions and the sum of the absolute value of the total net short positions (denominator), and then calculate the risk-weighted exposure for each risk bucket by multiplying the aggregate total net jump-to-default exposure by the risk weight prescribed for the applicable risk bucket.

positions in distinct obligors due to systematic risk. The bucket-level default risk capital requirement would equal (1) the sum of the risk-weighted net long default positions minus (2) the product of the hedge benefit ratio and the sum of the risk-weighted absolute value of the net short default positions. For non-securitization debt and equity positions and securitization positions non-CTP, the results of this calculation would be floored at zero.

Fifth, to calculate the default risk capital requirement for each default risk category, the banking organization would sum the bucket-level capital requirements (except for correlation trading positions). The aggregation for correlation trading positions is not the simple sum but is the sum of the risk-bucket level capital requirements for the net long default exposures plus half of the sum of the risk-weighted exposures for the net short default exposures as further described in section V.A.9.c.iii. of this **SUPPLEMENTARY INFORMATION**. For conservatism, the proposal would require a banking organization to calculate the total default risk capital requirement as the sum of each of the default risk category level capital requirements without recognizing any diversification benefits across different types of default risk categories.

a. Non-Securitization Debt or Equity Positions

i. Gross Default Exposure

Under the proposal, the default risk capital requirement for non-securitization debt or equity positions would generally follow the calculation steps described above. To calculate the gross default exposure for each non-securitization debt or equity position, the proposal would require a banking organization to multiply the notional amount (face value) of the instrument and the prescribed loss given default (LGD) rate⁴⁴¹ to determine the total potential loss of principal at default and then add the cumulative profits (losses) already realized on the position to avoid double-counting realized losses, with one exception.⁴⁴² The proposed calculation methodology is intended to appropriately quantify the gross default risk for most securities, including those that are less common.

For the purpose of calculating the gross default exposure for each non-securitization debt or equity position, the proposal would require banking

⁴⁴¹ The loss rate from default is one minus the recovery rate.

⁴⁴² As losses are recorded as a negative value, effectively they would be subtracted from the overall exposure amount.

organizations to use the following LGD rates, which are generally consistent with those in the Basel standards: 100 percent for equity and non-senior debt instruments, and defaulted positions,⁴⁴³ 75 percent for senior debt instruments, unless a lower LGD is assigned, 75 percent for GSE debt issued but not guaranteed by the GSEs, 50 percent for U.S. PSEs,⁴⁴⁴ 25 percent for GSE debt guaranteed by the GSEs, 25 percent for covered bonds, and zero percent for instruments whose value is not linked to the recovery rate of the issuer.⁴⁴⁵ GSE debt issued and guaranteed by the GSEs is secured generally by residential properties that satisfy the specific underwriting standards of the GSEs (for example, loan-to-value ratios of less than 80 percent), and include a guarantee on the repayment of principal by the GSE. As these characteristics are economically similar to the requirements for covered bonds, the proposal would extend the LGD rate applied to covered bonds to GSE debt issued and guaranteed by the GSEs to appropriately capture the expected losses of such positions in the event of default. As GSE debt instruments issued but not guaranteed by the GSEs are similarly secured by high-quality residential mortgages, the proposal would allow banking organizations to treat such exposures as senior debt (subject to a 75 percent LGD rate) rather than apply the higher proposed risk weight for equity and non-senior debt

instruments. For debt positions in U.S. PSEs, the proposal would allow a banking organization to apply an LGD rate aligned with the average loss given default for such entities, rather than applying the higher LGD rate for senior debt. For credit derivatives, a banking organization would be required to use the LGD rate of the reference exposure.

For consistency across banking organizations, the proposal specifies that a banking organization would be required to reflect the notional amount⁴⁴⁶ of a non-securitization debt or equity position that gives rise to a long gross default exposure as a positive value and the corresponding loss as a negative value, and those that produce a short exposure as a negative value and the corresponding gain as a positive value. If the contractual or legal terms of a derivative contract allow for the unwinding of the instrument, with no exposure to default risk, the gross default exposure would equal zero.

Question 169: The agencies request comment on whether the proposed formula for calculating gross default exposure appropriately captures the gross default risk for all types of non-securitization debt and equity instruments. What, if any, positions exist for which the formula cannot be applied? What is the nature of such difficulties and how could such concerns be mitigated? In particular, the agencies seek comment on whether the proposed formula appropriately captures the gross default risk of convertible instruments.

Question 170: The agencies request comment on the appropriateness of the proposed LGD rates for non-securitization debt or equity positions. What, if any, changes should the agencies consider making to the categories to appropriately differentiate the LGD rates for various instruments or for instruments with different seniority (for example, senior versus non-senior)?

ii. Net Default Exposure

To calculate the net default exposure for non-securitization debt or equity positions, the proposal would permit a banking organization to recognize either full or partial offsetting of the gross default exposures for long and short positions if both reference the same obligor and the short positions have the same or lower seniority as the long

positions.⁴⁴⁷ To appropriately reflect the net default risk, the proposed calculation would not allow a banking organization to recognize any offsetting of the gross default exposure for market risk covered positions where the obligor is not identified, such as equity positions in an investment fund, index instruments, and multi-underlying options for which a banking organization elects to calculate a single risk factor sensitivity (not to apply the look-through approach).

As the GSEs can default independently of one another, the agencies are clarifying that banking organizations should treat Federal National Mortgage Association (Fannie Mae), Federal Home Loan Mortgage Corporation (Freddie Mac), the Federal Agricultural Mortgage Corporation (Farmer Mac) and a Federal Home Loan Bank as separate obligors. As the single security initiative led by Fannie Mae and Freddie Mac has homogenized the mortgage pool and security characteristics for Uniform Mortgage-Backed Securities (UMBS), the proposal would allow the banking organization to fully offset UMBS that are issued by two different obligors.

Full offsetting would be permitted for short and long market risk covered positions with maturities greater than one year or positions with perfectly matching maturities provided other criteria are met such as if both long and short positions reference the same obligor and the short positions have the same or lower seniority as the long positions. To determine the offsetting treatment for market risk covered positions with maturities of one year or less, a banking organization would be required to scale the gross default exposure by the fraction of a year corresponding to the maturity of the instrument, subject to a three-month floor. In the case where long and short gross default exposures both have maturities of one year or less, scaling would apply to both the long and short gross default exposure. By allowing only partial offsetting, the proposed scaling approach is intended to appropriately reflect the risk posed by maturity mismatch between exposures and their hedges within the one-year capital horizon. For example, under the proposal, the gross default exposure for an instrument with a six-month

⁴⁴³ The proposal would allow a banking organization to treat a distressed position as a defaulted position for the purpose of calculating market risk capital requirements. Furthermore, to prevent situations when the default capital requirement would increase the capital requirements for defaulted positions beyond the maximum potential loss, a banking organization would be able to calculate the gross default exposure for defaulted positions by multiplying the current market value and the prescribed LGD rate.

⁴⁴⁴ The proposed LGD rate for U.S. PSEs is consistent with the debt-size weighted average LGD rate using Moody's municipal bonds data between 1970 and 2022. The debt-size weighted average LGD rate is derived as one minus the ultimate recovery rate, which is based on the recovery value creditors actually received at the resolution of the default relative to what the creditors should have contractually received inclusive of any accrued interest. For issuers with a range of estimated recovery rates, the proposed LGD rate is consistent with both the worst LGD and the mid-point LGD, for municipal bonds over this period. The data used in the analysis is from Moody's data on U.S. municipal bond defaults and recoveries 1970–2022 published by Moody's Investors Service Data Report. See Moody's Investors Service Data Report, U.S. Municipal Bond Defaults and Recoveries, 1970–2022 (July 19, 2023).

⁴⁴⁵ For example, in the case of a call option on a bond, the notional amount to be used in the jump-to-default calculation would be zero given that in the event of default the call option would not be exercised (the default would extinguish the call option's value, with the loss captured through the reduced fair value of the position).

⁴⁴⁶ For all non-securitization debt or equity positions, the notional amount would equal the amount of the non-securitization debt or equity position relative to which the loss of principal is calculated. For a call option on a non-securitization position, the notional amount to be used in the gross default exposure calculation would be zero.

⁴⁴⁷ For a market risk covered position that has an eligible guarantee, to determine if the exposure is to the underlying obligor or an exposure to the eligible guarantor, the credit risk mitigation requirements set out in the § _____.36 of the current capital rule and § _____.120 of the proposed rule would apply. See 12 CFR 3.36 (OCC); 12 CFR 217.36 (Board); 12 CFR 324.36 (FDIC).

maturity would be weighted by one-half, whereas that for a one-week repurchase agreement would be prescribed a three-month maturity and weighted by one-fourth.

The proposal would permit a banking organization to assign a maturity of either three months or one year to cash equity positions that do not have a stated maturity. For derivative transactions, the proposal would require a banking organization to use the maturity of the derivative contract, rather than that of the underlying, to determine the applicable scaling factor. To prevent broken hedges for equity and derivative positions, the proposal would allow banking organizations to assign the same maturity to a cash equity position as the maturity of the derivative contract it hedges (permit full offsetting). Similarly, the proposal would allow a banking organization to align the maturity of an instrument with that of a derivative contract for which that instrument could be delivered to satisfy the derivative contract, and thus permit full offsetting between the instrument and the derivative. For example, a banking organization may assign the maturity of a derivative contract in the to-be-announced (TBA) market that is hedging a security interest in a pool of mortgages to that security interest provided that the delivery of the security interest would satisfy the delivery terms of the TBA derivative contract.

The net default exposure to an issuer would be the sum of the maturity-weighted default exposures to the issuer.

Question 171: The agencies request comment on the appropriateness of allowing banking organizations to net the gross default exposures of derivative contracts and the underlying positions that are deliverable to satisfy the derivative contract. What, if any, additional criteria should the agencies consider to further clarify the netting of gross default exposures and why? What, if any, positions should the agencies consider allowing to net that would not exhibit default risk? What would be the advantages and disadvantages of allowing a banking organization to offset short dated futures with longer-dated derivatives when the underlying exposures match, and why?

iii. Buckets and Corresponding Risk Weights

Table 1 to § _____.210 of the proposed rule provides the proposed default buckets and corresponding risk weights for non-securitization debt or equity positions, which reflect counterparty type and credit quality, respectively.

Under the proposal, the buckets and applicable risk weights would distinguish between the type of obligor based on whether the exposure is to a non-U.S. sovereign, a public sector entity or GSE, or a corporate and include a single bucket for defaulted positions.

To capture the credit quality of the obligor, the proposal would define the default buckets in a manner that is generally consistent with those provided in the Basel standards but uses alternative criteria. The default buckets for non-securitization positions in the Basel standards are defined based on the applicable credit ratings of the reference entity. As discussed previously in section V.A.7.a.iii.II. of this **SUPPLEMENTARY INFORMATION**, the proposed approach does not rely on external credit ratings but allows for a level of granularity in the default buckets (and corresponding risk weights) applicable to non-securitization positions that is generally consistent with the Basel standards. Specifically, the proposal would define the default buckets and corresponding risk weights for non-securitization positions based on the definition for investment grade in the agencies' existing capital rule and the proposed definitions of speculative grade and sub-speculative grade.⁴⁴⁸

⁴⁴⁸ The agencies propose to modify the Basel standards' ratings-based risk weights, as in previous rules, to instead use grade-based risk weights, calculated as a weighted average of the ratings-based risk weights. The weighting scheme for this calculation would be derived from the notional amount of bond issuances in each grade category from 2007 through 2019. For this analysis, the agencies used the Mergent Fixed Income Securities Database to identify bond notional issuance amounts for the period from January 1, 2007 through December 31, 2019. See LSEG Mergent, <https://wrds-www.wharton.upenn.edu/pages/about/data-vendors/lseg-mergent/>. This look back period (from January 1, 2007 to December 31, 2019) was selected to: (i) capture issuance activity across varying market conditions, including pre-crisis, crisis, and initial recovery phases; (ii) ensure sufficient data availability, reliability, and through the cycle stability. The methodology employed by the agencies proceeded in two distinct analytical stages. First, the original Basel III standardized approach risk weights based on external credit ratings, as set forth in the Basel Committee on Banking Supervision's finalized standards published in December 2017 and revised in 2019, were adjusted by the proportionate share of bond issuances in each corresponding Basel rating category during the look back period (January 1, 2007–December 31, 2019). This adjustment reflects the actual distribution of market issuance activity across rating grades and serves to calibrate the risk weights to observed market behavior rather than theoretical rating-based classifications. Second, following this proportionate adjustment, the ratings-based risk weights were collapsed and consolidated to form three simplified creditworthiness categories: (a) "Investment Grade," (b) "Non-Investment Grade," and (c) "Sub-Investment Grade." This categorical consolidation was applied uniformly across three principal

Question 172: The agencies solicit comment on the appropriateness of the proposed risk weights and granularity in Table 1 to § _____.210. What, if any, alternative approaches should the agencies consider for assigning risk weights that would be consistent with the prohibition on the use of credit ratings? Commenters are encouraged to provide specific details on the mechanics of and rationale for any suggested methodology.

b. Securitization Positions Non-CTP

For securitization positions non-CTP, the process to calculate the default risk capital requirement would be identical to that for non-securitization positions, except for the gross default exposure calculation, the offsetting of long and short exposures in the net default exposure calculation, and the proposed buckets and corresponding risk weights.

i. Gross Default Exposure

Under the proposal, the gross default exposure for a securitization position non-CTP equals the position's market value. As the proposed bucket-level risk weights described in section V.A.7.a.iii.II. of this **SUPPLEMENTARY INFORMATION** would already reflect the LGD rates for such positions, a banking organization would not apply an LGD rate to calculate the gross default exposure.

ii. Net Default Exposure

First, the proposal would allow offsetting between securitization exposures with the same underlying asset pool and belonging to the same tranche. No offsetting would be permitted between securitization exposures with different underlying asset pools, even where the attachment and detachment points are the same.

Second, the proposal would permit a banking organization to offset the gross default exposure of a securitization position non-CTP with one or more non-securitization positions by decomposing the exposure of non-tranched index

exposure types: corporate exposures, public sector entity (PSE) exposures, and sovereign exposures. The agencies determined that this two-stage methodology—consisting of proportionate adjustment followed by categorical consolidation—achieves an appropriate balance among the following regulatory objectives: (i) alignment with the fundamental risk-sensitivity principles underlying the Basel framework; (ii) consistency with Section 939A of the Dodd-Frank Wall Street Reform and Consumer Protection Act (codified at 15 U.S.C. 78o–7 note); (iii) operational simplicity and administrability for banking organizations of varying sizes and complexity; (iv) consistency with observed market issuance patterns during the relevant look back period (January 1, 2007–December 31, 2019); and (v) stability of risk weights across credit cycles.

instruments and replicating the exposures that make up the entire capital structure of the securitized position. Additionally, a banking organization would be required to exclude non-securitization positions that are recognized as offsetting the gross default exposure of a securitization position non-CTP from the calculation of the default risk capital requirement for non-securitization debt and equity positions.

Third, the proposal would allow a banking organization to offset the gross default exposure of a securitization position non-CTP through decomposition if a collection of short securitization positions non-CTP replicates a collection of long securitization positions non-CTP. For example, if a banking organization holds a long position in the securitization, and a short position in a mezzanine tranche that attaches at 3 percent and detaches at 10 percent, the proposal would permit the banking organization to decompose the securitization into three tranches and offset the gross default exposures for the common portion of the securitization (3–10 percent). In this case, the net default exposure would reflect the long positions in the 0–3 percent tranche and in the 10–100 percent tranche.

Question 173: The agencies seek comment on the proposed netting and decomposition criteria for calculating the net default exposure for securitization positions non-CTP. What, if any, alternative non-model-based methodologies should the agencies consider that would conservatively recognize some hedging benefits but still capture the basis risk between non-identical positions?

iii. Buckets and Corresponding Risk Weights

To promote consistency and comparability in risk-based capital requirements across banking organizations, the proposal would define the bucket structure that a banking organization would be required to use to group securitization positions non-CTP. Specifically, the proposal would require a banking organization to classify securitization positions non-CTP as corporate positions or based on the asset class and the region of the underlying assets, following market convention.⁴⁴⁹ Under the proposal, a

banking organization would assign each position to one bucket, and those with underlying exposures in the same asset class and region to the same bucket. Additionally, the proposal would require a banking organization to assign any position that is not a corporate position and that it cannot assign to a specific asset class or region to one of the “other” buckets.⁴⁵⁰

For consistency in the capital requirements for securitizations under either the standardized approach or the expanded risk-based approach, as applicable, and to recognize credit subordination,⁴⁵¹ the proposed risk weights for securitization positions non-CTP are based on the proposed risk weights calculated for securitization exposures under either the proposed standardized approach or expanded risk-based approach of the capital rule.

To calculate the default risk capital requirement for securitization positions non-CTP, a banking organization would sum the bucket-level capital requirements, except that a banking organization could cap the default risk capital requirement for an individual cash securitization position non-CTP at its fair value. For cash positions, the maximum loss on the exposure would not exceed the fair value of the position even if each of the underlying assets of the securitization were to immediately default. Furthermore, the proposed treatment would align with the maximum potential capital requirement for securitizations under either the standardized approach or the expanded risk-based approach, as applicable, of the capital rule.⁴⁵²

Question 174: The agencies request comment on the proposed buckets. What are the potential benefits and drawbacks of aligning the default bucketing structure with the proposed delta buckets for securitization positions non-CTP in the sensitivities-based method? Commenters are encouraged to

commercial mortgage-backed securities, collateralized loan obligations, collateralized debt obligations squared, small and medium enterprises, student loans, other retail, and other wholesale. See § _____.210(c)(3)(B) of the proposed rule.

⁴⁵⁰ Under the proposal, the other buckets would include other retail and other wholesale (for asset class) and other (for region). See § _____.210(c)(3)(B) of the proposed rule.

⁴⁵¹ For example, consistent with the existing SSFA, the proposed SEC-SA would use the risk weights applicable to the underlying exposures within the general credit risk framework to calculate the risk weight for the securitization exposure. The SEC-SA calculates the risk weight for a securitization exposure based on characteristics of the tranche, such as the attachment and detachment points and quality of the underlying collateral.

⁴⁵² See § _____.44(a) of the current capital rule and § _____.132(a)(3) of the proposed rule.

provide information regarding any associated burden, complexity, and capital impact of such an alignment.

c. Correlation Trading Positions

The process to calculate the default risk capital requirement for correlation trading positions would be the same as that for non-securitization debt and equity positions, except for the metrics used to measure gross default exposure, the offsetting of long and short exposures in the net default exposure calculation, the buckets, and the aggregation of the bucket level exposures across buckets.

i. Gross Default Exposure

Under the proposal, the gross default exposure for a correlation trading position equals the position's market value. To calculate the gross default exposure for correlation trading positions that are nth-to-default positions, the proposal would require a banking organization to treat such positions as tranches and to calculate the attachment point as (N–1) divided by the total number of single names in the underlying basket or pool and the detachment point as N divided by the total number of single names in the underlying basket or pool. The proposed calculation is intended to appropriately reflect the credit subordination of such positions.

ii. Net Default Exposure

Similar to securitization positions non-CTP, to increase risk sensitivity and permit greater offsetting of substantially similar exposures, the proposal would permit banking organizations to offset gross long and short default exposures in specific cases.

First, the proposal would allow a banking organization to offset the gross default exposure of correlation trading positions that are otherwise identical except for maturity, including index tranches of the same series. This means the offsetting positions would need to have the same underlying index family of the same series, and the same attachment and detachment points.

Second, the proposal would allow a banking organization to offset the gross default exposure of long and short exposures of tranches that are perfect replications of non-tranched correlation trading positions. For example, the proposal would allow a banking organization to offset the gross default exposure of a long position in the CDX.NA.IG.24 index with short positions that together comprise the entire index position (for example, three distinct tranches that attach and detach

⁴⁴⁹ The proposal would define the asset class buckets along two dimensions: asset class and region. The region risk buckets would include Asia, Europe, North America, and other. The asset class risk buckets would include asset-backed commercial paper, auto loans/leases, residential mortgage-backed securities, credit cards,

at 0–3 percent, 3–10 percent, and 10–100 percent, respectively).

Third, the proposal would allow a banking organization to offset the gross default exposure of indices and single-name constituents in the indices through decomposition when the long and the short gross default exposures are otherwise equivalent except for a residual component. Under the proposal, a banking organization would account for the residual exposure in the calculation of the net default exposure. In such cases, the proposal would require that the decomposition into single-name equivalent exposures account for the effect of marginal defaults of the single names in the tranching correlation trading position. Such decomposition generally would be permissible for correlation trading positions (for example, vanilla CDOs, index tranches or bespoke indices), but would be prohibited for exotic securitizations (for example, CDO squared).

Fourth, the proposal would allow a banking organization to offset the gross default exposure of different series (non-tranched) of the same index through decomposition when the long and the short gross default exposures are otherwise equivalent except for a residual component. Under the proposal, a banking organization would account for the residual exposure in the calculation of the net default exposure. For example, assume that a banking organization holds a long position in a CDS index that references 125 underlying credits and a short position in the next series of the index that also references 125 credits. The two indices share the same 123 reference credits, such that there are two unique credits in each index. Under the proposal, a banking organization could offset the 123 names through decomposition, in which case the net default exposure would reflect only the two unique single-name credits for the long index position and the two unique single-name credits for the short index position. Similarly, a banking organization could offset the long exposure in 125 credits by selling short an index that contains 123 of those same credits. In this case, only the two residual names would be reflected in the net default exposure.

Fifth, the proposal would allow a banking organization to offset different tranches of the same index and series through replication and decomposition and calculate a net default exposure on the unique component only, if the residual component has the attachment and detachment point nested with the original tranche or the combination of

tranches. In such cases, the banking organization would be required to account for the residual component of the unhedged tranche within the default risk capital requirement. For example, assume that a banking organization holds long positions in two tranches, one that attaches at 5 percent and detaches at 10 percent and another that attaches at 10 percent and detaches at 15 percent. To hedge this position, the banking organization holds a short position in a tranche on the same index that attaches at 5 percent and detaches at 20 percent. In this case, the banking organization's net default exposure would only be for the residual portion of the tranche that attaches at 15 percent and detaches at 20 percent.

iii. Buckets and Corresponding Risk Weights

For correlation trading positions, the proposal would define buckets by index, each index would comprise its own bucket.⁴⁵³ Under the proposal, a bespoke correlation trading position would be assigned to its own unique bucket, unless it is substantially similar to an index instrument, in which case the bespoke position would be assigned to the bucket corresponding to the index. For a non-securitization position that hedges a correlation trading position, a banking organization would be required to assign such position and the correlation trading position to the same bucket.

For consistency in the proposed capital requirements for securitizations under either the standardized approach or the expanded risk-based approach of the capital rule and to recognize credit subordination,⁴⁵⁴ the proposed risk weights corresponding to the proposed buckets for correlation trading positions are based on the proposed treatment under either the standardized approach or the expanded risk-based approach of the capital rule.⁴⁵⁵ For non-tranched hedges of correlation trading positions or decomposed single-name exposures, the proposal would allow a banking

organization to apply the same risk weights and loss given default rates as for non-securitization debt or equity positions, provided that such hedges or decomposed single-name exposures are excluded from the default risk capital requirement for non-securitization debt or equity positions.

The agencies recognize that the granularity of the proposed bucket structure could result in several individual buckets containing only net short exposures and thus overstate the offsetting benefits of non-identical exposures if the total default risk capital requirement for correlation trading positions was calculated as a sum of the bucket-level capital requirements. To appropriately limit the benefit of buckets with short default exposures offsetting those with long exposures, the total default risk capital requirement for correlation trading positions would be calculated as the sum of the risk-bucket level capital requirements for the net long default exposures plus half of the sum of the risk-weighted exposures for the net short default exposures.

10. Treatment of Certain Market Risk Covered Positions

To promote consistency and comparability in the risk-based capital requirements across banking organizations and to help ensure appropriate capitalization of positions subject to the proposed market risk framework, the proposal would clarify the treatment of certain market risk covered positions under the standardized and models-based measures for market risk.

a. Net Short Risk Positions

The proposal would require a banking organization to calculate on a quarterly basis its exposure arising from any net short credit or equity position.⁴⁵⁶ A banking organization would be required to include any net short risk position of at least \$20 million, adjusted to reflect CPI-W, in its total market risk capital requirement for the entire quarter, under both the standardized measure for market risk and the models-based measure for market risk, as applicable.

The proposed quarterly approach is intended to reduce operational burden of requiring a banking organization to capture temporary or small differences arising from fluctuations in the value of positions subject to the credit risk framework. Further, the proposed quarterly calculation requirement should help ensure that banking

⁴⁵³ A non-exhaustive list of indices include: the CDX North America IG, iTraxx Europe IG, CDX HY, iTraxx XO, LCDX (loan index), iTraxx LevX (loan index), Asia Corp, Latin America Corp, Other Regions Corp, Major Sovereign (G7 and Western Europe) and Other Sovereign.

⁴⁵⁴ For example, consistent with the existing SSFA, the proposed SEC-SA would use the risk weights applicable to the underlying exposures within the general credit risk framework to calculate the risk weight for the securitization exposure. The SEC-SA calculates the risk weight for a securitization exposure based on characteristics of the tranche, such as the attachment and detachment points and quality of the underlying collateral.

⁴⁵⁵ See § _____.42 of the current capital rule and § _____.132 of the proposed rule.

⁴⁵⁶ See section V.A.4.b. of this SUPPLEMENTARY INFORMATION for a more detailed discussion on net short risk positions.

organizations are appropriately managing and monitoring net short risk positions arising from exposures subject to the standardized approach or the expanded risk-based approach of the capital rule at intervals of sufficient frequency to prevent the formation of non-negligible net short risk positions.

As proposed it may be difficult for a banking organization to apply the standardized non-default capital requirement or models-based non-default capital requirement to net short risk positions given that the composition of any particular net short position could contain a different combination of various underlying instruments. Therefore, if unable to calculate a risk factor sensitivity for a net short risk position, the proposal would require the banking organization to calculate market risk capital requirements using the fallback capital requirement as described in section V.A.3.d. of this **SUPPLEMENTARY INFORMATION**.

b. Securitization Positions and Defaulted and Distressed Market Risk Covered Positions

The proposal would require a banking organization to calculate market risk capital requirements for securitization positions using the standardized non-default capital requirement or the fallback capital requirement, as applicable. The proposed treatment would address regulatory arbitrage concerns as well as deficiencies in the modelling of securitization positions that became more evident during the course of the financial crisis that began in mid-2007.⁴⁵⁷

The proposal would require a banking organization to include defaulted market risk covered positions in the default risk capital requirement. The proposal would allow a banking organization to extend the treatment of defaulted market risk covered positions to distressed market positions. Such positions are not required to be included in the standardized non-default capital requirement or in the models-based non-default capital requirement. Generally, distressed and

defaulted positions trade based on recovery, which is not driven by or reflective of the credit spread of the issuer. Therefore, in addition to being operationally difficult, requiring a banking organization to calculate the sensitivity of such positions to changes in credit spreads may not be appropriate for the purposes of quantifying the risk posed by such positions. Additionally, subjecting defaulted and distressed positions to capital requirements under the standardized or models-based non-default capital requirement would increase the capital requirements for such positions beyond the maximum potential loss of such holdings, as the default risk capital requirement already assigns a 100 percent risk weight and 100 percent LGD to such exposures. If a banking organization is unable to calculate the default risk capital requirement for such positions, the proposal would require the banking organization to calculate market risk capital requirements using the fallback capital requirement.⁴⁵⁸

As the amount of regulatory capital required under the fallback capital requirement would equal the absolute fair value of the position, the proposal would cap the overall market risk capital requirement for defaulted, distressed, and securitization positions at the maximum loss of the position. By capping the regulatory capital requirement for such positions at the total potential loss that a banking organization could incur from holding such positions, the proposal would align the risk-based requirements under the standardized and models-based non-default capital requirements, as applicable, with those under the fallback capital requirement.

c. Hybrid Instruments

i. Standardized Non-Default Capital Requirement

Hybrid instruments are instruments that have characteristics in common with both debt and equity instruments, including traditional convertible bonds. As hybrid instruments primarily react to changes in interest rates, issuer credit spreads, and equity prices, the proposal would require a banking organization to assign risk sensitivities for these instruments into the interest rate risk class, credit spread risk class for non-

securitization positions, and equity risk class, as applicable, when calculating the delta, curvature, and vega capital requirements under the sensitivities-based method.

ii. Default Risk Capital Requirement

For the default risk capital requirement, the proposal would require a banking organization to decompose a hybrid instrument into a non-securitization position and an equity position and calculate the default risk capital requirement for each position respectively. For example, a convertible bond can be decomposed into a vanilla bond and an equity call option. The notional amount to be used in the calculation of the default risk capital requirement for the vanilla bond is the notional amount of the convertible bond. The notional amount to be used in the calculation of the default risk capital requirement for the call option is zero (because, in the event of default, the call option will not be exercised). In this case, a default of an issuer of the convertible bond would extinguish the call option's value and this loss would be captured through the profit and loss component of the gross default exposure amount calculation. The default risk capital requirement for the convertible bond would be the sum of the default risk capital of the vanilla bond and the default risk capital requirement for the equity option.

d. Index Instruments and Multi-Underlying Options

i. Standardized Non-Default Capital Requirement

When calculating the delta and curvature capital requirements under the sensitivities-based method for index instruments and multi-underlying options, the proposal would allow a banking organization to apply the look-through approach or the single sensitivity approach.

The look-through approach would require a banking organization to identify the underlying positions of the index instrument or multi-underlying option and calculate market risk capital requirements as if the banking organization directly held the underlying exposures. Under the proposal, a banking organization would be required to apply the look-through approach consistently through time and for all positions that reference the same index. The proposed look-through approach would align the treatment of such instruments with that of single-name positions and thus provide greater hedging recognition by allowing such instruments to net with single-name

⁴⁵⁷ As discussed further in section V.A.6.d.i. of this **SUPPLEMENTARY INFORMATION**, model-eligible trading desk would be allowed to hold insignificant amounts of model-ineligible positions, including securitization positions. For model-eligible trading desks that hold insignificant amounts of such positions, the proposal would require a banking organization to exclude any model-ineligible positions held by the model-eligible trading desk from (1) the aggregate trading portfolio backtesting; and (2) the relevant desk-level backtesting and profit and loss attribution metric, unless the banking organization receives approval from its primary Federal supervisor to include such positions.

⁴⁵⁸ As described in more detail in section V.A.3.d. of this **SUPPLEMENTARY INFORMATION**, the fallback capital requirement would apply in instances where a banking organization is unable to calculate market risk capital requirements for one or more of its market risk covered positions under either the standardized non-default capital requirement, the models-based non-default capital requirement, if eligible, or the default risk capital requirement.

positions issued by the same company. Specifically, a banking organization would be able to net risk factor sensitivities of such positions of the index instrument or multi-underlying option and other single-name positions without restriction when calculating delta and curvature capital requirements under the sensitivities-based method.

The single sensitivity approach would require a banking organization to calculate a single sensitivity to the index and then assign the index instrument or multi-underlying option to a relevant bucket to calculate the delta and curvature capital requirements. To assign the sensitivity of the index to the relevant sector or index bucket, the proposal includes a waterfall approach as a simple and risk-sensitive method to appropriately reflect the risk of such positions based on the risk and diversification of the underlying assets. For indices where at least 75 percent of the notional value of the underlying constituents relate to the same sector (sector-specific indices), taking into account the weightings of the index, the sensitivity would be assigned to the corresponding sector bucket; otherwise, the proposal would require a banking organization to assign the sensitivity to an appropriate index bucket. For equity indices that are not sector specific, the proposal would require a banking organization to assign the sensitivity to the large market cap and liquid market economy (non-sector specific) equity indices bucket if least 75 percent of the market value of the index constituents met both the large market cap and liquid market economy criteria, and to the other equity indices (non-sector specific) bucket otherwise. For credit indices that are not sector specific, the sensitivity would be assigned to the investment grade indices bucket if the credit quality of at least 75 percent of the notional value of the underlying constituents is investment grade, and to the speculative grade and sub-speculative grade indices bucket otherwise.⁴⁵⁹ To the extent a credit or an equity index spans multiple risk classes, the proposal would require the banking organization to allocate the index proportionately to the relevant risk classes following the above methodology. For credit indices the proposal would allow a banking organization to use delta sensitivity for equity risk of the index adjusted by the index's effective duration as a proxy to

calculate delta sensitivity for interest rate risk and credit spread risk for non-securitizations in the sensitivities-based method. This approach would help ensure a more risk sensitive treatment of credit indices when the look-through approach is not possible or practical. Furthermore, a banking organization would need to assign credit spread risk and interest rate risk delta sensitivities to the closest tenors using interpolation. The delta sensitivity for interest rate risk should be assigned based on currency. To calculate the vega capital requirement for options on credit indices under the single sensitivity approach, the proposal would require a banking organization to follow the steps outlined in section V.A.7.a.ii.I. of this **SUPPLEMENTARY INFORMATION** and use the same buckets as applied in the delta capital calculation. When calculating curvature for options on credit indices, the proposal would allow a banking organization to use a single shock measured as the delta risk weight multiplied by the index's effective duration.

When calculating vega capital requirements for index instruments and multi-underlying options (including index options), the proposal would permit, but not require, a banking organization to apply the look-through approach and calculate the vega capital requirements based on the implied volatility of options on the underlying constituents. Alternatively, under the proposal, a banking organization could calculate the vega capital requirement for multi-underlying options based on the implied volatility of the option, which typically is the method used by banking organizations' financial reporting models for multi-underlying options. For indices, the proposal would require a banking organization to calculate vega capital requirements with respect to the implied volatility based on the same sector specific bucket or index bucket used to calculate the delta capital requirement and the curvature capital requirement, or an appropriate sector specific or index bucket otherwise.

ii. Models-Based Non-Default Capital Requirement

When calculating the models-based non-default capital requirement for indices and multi-underlying options the proposal would allow, but not require, a banking organization to calculate the market risk capital requirement for such positions held by a model-eligible desk by applying the look-through approach or the hypothetical portfolio approach based on the most recent quarterly disclosure

of the index's historical holdings of underlying positions. In addition, a banking organization may use any other modelling approach to calculate the models-based non-default capital requirement after receiving a prior approval from its primary Federal supervisor.

iii. Default Risk Capital Requirement

The default risk of credit and equity indices as well as multi-underlying options that are non-securitization debt or equity positions is primarily a function of the idiosyncratic default risk of the underlying constituents. Accordingly, to capture appropriately the default risk of such positions, the proposal would allow a banking organization to apply the look-through approach when calculating the default risk capital requirement for indices and multi-underlying options that are non-securitization debt or equity positions. When decomposing multi-underlying exposures or indices, a banking organization would be required to set the gross default exposure assigned to a single name, referenced by the instrument, equal to the difference between the value of the instrument assuming only the single name defaults and the value of the instrument assuming none of the single names referenced by the instrument default. By aligning the treatment of positions in credit and equity indices with that of single-name positions, the proposal would provide greater hedging recognition as the banking organization would be able to offset the gross default exposure of long and short positions in indices with that of single-name positions included in the index.

Alternatively, as the underlying constituents of credit and equity indices and multi-underlying options could react differently to the same market or economic event, the proposal would also allow a banking organization to treat such positions as a single position for purposes of calculating the default risk capital requirement, provided the index or multi-underlying option substantially meets the criteria for the applicable bucket. Also, the proposal would allow a banking organization to treat the index or multi-underlying option as a single sub-speculative exposure. For example, a banking organization may choose to apply a single sub-speculative exposure approach when it would be operationally challenging for a banking organization to apply the look-through approach or perform the analysis to identify an appropriate bucket for a single exposure.

⁴⁵⁹ See section V.A.7.a.iii. of this **SUPPLEMENTARY INFORMATION** for a more detailed description on the assignment of delta sensitivities to the prescribed buckets under the proposed sensitivities-based method.

Question 175: The agencies seek comment on the proposed threshold of 75 percent for assigning a credit or equity index to the corresponding sector or the investment grade indices bucket. What would be the benefits and drawbacks of the proposed threshold? What, if any, alternative thresholds should the agencies consider that would more appropriately measure the majority of constituents in listed and well-diversified credit and equity indices?

Question 176: The agencies seek comment on the calculation of vega capital requirement for credit indices for which a banking organization chooses to apply a single sensitivity approach. To mitigate any operational burden that could arise from using the single sensitivity approach in order to calculate the vega capital requirement, what would be the advantages and disadvantages of allowing a banking organization to calculate the vega capital requirement according to the backstop fund method? Please specify how a banking organization would perform such calculation.

e. Equity Positions in an Investment Fund

i. Standardized Non-Default Capital Requirement

For equity positions in an investment fund or portions of such positions for which the banking organization is able to use the look-through approach to calculate a market risk capital requirement for its proportional ownership share of each exposure held by the investment fund, the proposal would allow a banking organization to apply the look-through approach under the standardized measure for market risk. If a banking organization is able to use the look-through approach to calculate market risk capital requirements for only a portion of the underlying positions in the fund, the proposal would require a banking organization to treat the equity position in the investment fund as two separate market risk covered positions: one as a market risk covered position for which the banking organization is able to apply the look-through approach and the rest as a market risk covered position for which the banking organization is not able to apply the look-through approach. In this circumstance, each position would represent the proportional amount of original position corresponding to the portion of the investment fund that the banking organization is able to use the look-through approach or not able to use the look-through approach, respectively.

Alternatively, a banking organization could elect not to apply the look-through approach for such positions and, instead, apply the single sensitivity approach if the investment fund meets the criteria to be assigned to the relevant bucket as described in further detail in section V.A.10.d.i. of this

SUPPLEMENTARY INFORMATION. For equity or debt positions in publicly traded real estate investment trusts, the proposal would allow a banking organization to treat such exposures as a single exposure and apply the risk weight applicable to exposures allocated to the financial sector bucket when calculating the delta, vega, and curvature capital requirements under the sensitivities-based method.⁴⁶⁰ While equity positions in publicly traded real estate investment trusts are traded on the market, the underlying assets of such trusts generally are not. Thus, a banking organization will generally not be able to calculate the risk factor sensitivity for each of the underlying assets of the real estate investment trust and perform a full look through. Allowing a banking organization to treat equity positions in real estate investment trusts as a single position would help ensure that market risk capital requirements appropriately capture a banking organization's market risk exposure arising from such positions in a manner that minimizes compliance burden and enhances risk-capture. As each of the proposed alternative approaches would reflect a conservative capital requirement, the agencies consider that the proposed alternatives would help ensure a banking organization maintains sufficient capital against potential losses arising from equity positions in an investment fund for which the banking organization is unable to identify the underlying positions held by the fund.

Additionally, for equity positions in an investment fund or portions of such positions where a banking organization is not able to apply the look-through approach, the proposal would allow the banking organization to either apply the tracked index method, the hypothetical portfolio approach or the backstop fund method, as applicable. A banking organization could apply the tracked index method if the investment fund closely tracks an index benchmark or

the investment fund's mandate or prospectus requires that it tracks an index with tracking performance published quarterly. Generally, the agencies would consider an equity position in an investment fund to closely track the index if the returns of the investment fund (ignoring fees and commissions) over the prior year differs from those of the index by only a small percentage. For an equity position in an investment fund that closely tracks an index benchmark or if its mandate or prospectus requires that it tracks an index and publishes its tracking performance on a quarterly basis, the proposal would allow a banking organization to treat the equity position in the investment fund as if it was the tracked index in calculating the delta, vega, and curvature capital requirements, given the high correlation of the equity position with that of the index.⁴⁶¹ Further, for equity positions in an investment fund that holds an index, the proposal would allow a banking organization to calculate the delta, vega, and curvature capital requirements for the underlying index position using the treatment for indices⁴⁶² and apply the look-through approach or the single sensitivity approach to the other underlying exposures of the investment fund.

Under the proposed hypothetical portfolio approach, the banking organization would need to assume that the investment fund invests to the maximum extent permitted under its mandate in those exposures with the highest applicable risk weight and continues to make investments in the order of the exposure type with the next highest applicable risk weight until the maximum total investment level is reached. If more than one risk weight can be applied to a given exposure, the proposal would require the banking organization to use the maximum applicable risk weight in calculating the sensitivities-based method requirement. Alternatively, the banking organization may assume that the investment fund invests based on the most recent quarterly disclosure of the fund's historical holdings of underlying positions. The proposal would require a banking organization to weigh the constituents of the investment fund based on the hypothetical portfolio.

⁴⁶⁰ Under the proposal, such exposures would receive the 55 percent or 50 percent risk weight applicable to equity risk factors allocated to buckets 4 or 8, respectively, in Table 8 to § _____.209 of the proposed rule. Similarly, such exposures would receive the five percent or 12 percent risk weight applicable to counterparty credit spread risk for non-securitization risk factors allocated to buckets 3 and 11, respectively, in Table 3 to § _____.209 of the proposed rule.

⁴⁶¹ In this situation, the banking organization would apply the treatment for index instruments described in section V.A.10.d.i. of this **SUPPLEMENTARY INFORMATION.**

⁴⁶² In this situation, the banking organization would apply the treatment for index instruments described in section V.A.10.d.i. of this **SUPPLEMENTARY INFORMATION.**

To address any potential operational burden that can arise from the above discussed approaches for equity positions in an investment fund, the proposal would permit a banking organization to use an effective risk weight calculated by third parties in the calculation of market risk capital requirements for the look-through approach,⁴⁶³ hypothetical portfolio approach, and tracked index method. Under this approach, the fund's exposure would be assigned to one or more appropriate buckets without the requirement to look-through the fund, and with diversification allowed with other exposures.

Alternatively, the proposal's backstop fund method would allow a banking organization to allocate equity positions in an investment fund to the applicable other sector bucket.⁴⁶⁴ This approach would be a simple conservative measure in situations when, due to computational or operational challenges, a banking organization is unable to apply other allowed approaches to calculate the standardized non-default capital requirement. In situations when the mandate of the investment fund allows investments in positions subject to the residual risk add-on, such as positions with exposures to exotic risks or residual risks, the banking organization would need to calculate residual risk add on requirement for the equity position in the investment fund assuming that the investment fund has invested in such exposures to the maximum extent permitted under its mandate.

ii. Models-Based Non-Default Capital Requirement

The proposal would only allow a banking organization to use the models-based non-default capital requirement for equity positions in an investment fund for which the banking organization is able to identify the underlying positions held by the fund on a quarterly basis.⁴⁶⁵ Otherwise, these

positions would be calculated using the standardized non-default capital requirement or the fallback capital requirement. Under the proposal, a banking organization would be required to calculate the market risk capital requirement for such positions held by a model-eligible desk by applying the look-through approach or the hypothetical portfolio approach based on the most recent quarterly disclosure of the investment fund's historical holdings of underlying positions. In addition, a banking organization also may use any other modelling approach to calculate the models-based non-default capital requirement after receiving a prior approval from its primary Federal supervisor.

Question 177: What would be the advantages and disadvantages of allowing banking organizations to decompose equity positions in investment funds into the underlying holdings of the fund or based on the hypothetical portfolio, for purposes of calculating capital requirements under the models-based non-default capital requirement? Please provide specific details on the mechanics, capital implications and rationale for any suggested methodology, in particular the extent to which the proposed backtesting and PLA requirements would help ensure appropriate risk capture for positions in which the banking organization is only able to perform a look-through on a quarterly basis.

iii. Default Risk Capital Requirement

Similar to index instruments and multi-underlying options that are non-securitization debt or equity positions, the default risk of equity positions in an investment fund is primarily a function of the idiosyncratic default risk of the underlying constituents. Accordingly, to capture appropriately the default risk of such positions, the proposal would allow a banking organization to apply the look-through approach when calculating the default risk capital requirement for equity positions in an investment fund that are non-securitization debt or equity positions. Alternatively, for positions in an investment fund that closely tracks an index benchmark or for which a banking organization can identify the main investment strategy specified in the fund's mandate or prospectus, a banking

such exposures held by the investment fund. For portions of equity positions in an investment fund for which the banking organization is unable to use the look-through approach, the banking organization would use one of the approaches discussed in section V.A.10.e.i. of this

SUPPLEMENTARY INFORMATION.

organization would be allowed to treat an exposure to the fund as a single-name exposure assigned to an appropriate default bucket for non-securitization debt and equity positions.⁴⁶⁶ In situations when a banking organization is unable to use either the look-through approach or apply the single exposure treatment to calculate the default risk capital requirement for such positions due to some potential operational limitations, the proposal would allow a banking organization to treat a fund as a single-name sub-speculative exposure with the highest risk weight applicable to the fund (for example, 50 percent risk weight as specified in Table 1 to § _____.210 of the proposed rule).

For equity positions in an investment fund for which the banking organization applies the hypothetical portfolio approach under the standardized non-default capital requirement described above, the proposal would require a banking organization to apply the same hypothetical portfolio approach for purposes of calculating the default risk capital requirement for such positions.

For equity positions in an investment fund for which the banking organization applies the backstop fund method under the standardized non-default capital requirement, the proposal would allow a banking organization to use either the hypothetical portfolio approach for purposes of calculating the default risk capital requirement for such positions or treat the fund as a single sub-speculative exposure. The proposed treatment would help ensure the risk-based requirements appropriately capture the default risk of such positions in a manner that is consistent across banking organizations and minimizes operational burden.

Question 178: The agencies seek comment on whether a banking organization's ability under the proposal to treat an equity position in an investment fund as an index position when the investment fund closely tracks an index benchmark provides sufficient specificity to help ensure consistent application across banking organizations. To what extent would a specific quantitative measure more appropriately capture the types of positions that should be treated as index positions? What, if any, alternatives should the agencies consider (such as specifying an absolute value of one percent) to better capture the types of positions whose risks would

⁴⁶⁶ See Table 1 to § _____.210 of the proposed rule provides the proposed default risk buckets and corresponding risk weights for the non-securitization debt and equity risk positions.

⁴⁶³ If a banking organization relies on a third party to calculate the effective risk weight, the banking organization should be able to have understanding of how the third party calculates the risk weight and be able to verify that the calculation was conducted in a manner consistent with the requirements of the capital rule.

⁴⁶⁴ Table 8 to § _____.209 of the proposed rule provides the proposed delta risk buckets and corresponding risk weights for positions within the equity risk class.

⁴⁶⁵ The proposal would allow a banking organization to use the models-based non-default capital requirement for portions of equity positions in an investment fund for which the banking organization is able to use the look-through approach to calculate a market risk capital requirement for its proportional ownership share of

more appropriately be captured by the proposed market risk capital requirements for index positions and why? Commenters are encouraged to provide specific details on the mechanics, capital implications, and rationale for any suggested methodology.

Question 179: The agencies seek comment on requiring banking organizations to calculate the default risk capital requirement for equity positions in investment funds, if, based on its mandate, the fund would invest in the types of exposures that would be subject to the residual risk add-on to the maximum extent permitted under the mandate. What, if any, alternatives—such as allowing banking organizations to use the historical risk characteristics of the fund—should the agencies consider to better capture the residual risks of such positions? Commenters are encouraged to provide specific details on the mechanics, capital implications and rationale for any suggested methodology.

f. Treatment of Term Repo-Style Transactions

The current capital rule permits a banking organization to calculate a market risk capital requirement for securities subject to repurchase and lending agreements with an original maturity of more than one business day (term repo-style transactions), regardless of whether such transactions meet the short-term trading intent criterion of the definition of a market risk covered position.⁴⁶⁷ Under the current capital rule, this optionality is only available for term repo-style transactions for which the banking organization separately calculates risk-based requirements for counterparty credit risk using the collateral haircut approach under the standardized approach or the advanced approaches of the capital rule.⁴⁶⁸ The standardized approach and the advanced approaches of the capital rule permit a banking

organization to recognize the credit risk mitigation benefits of non-financial collateral under the collateral haircut approach for these term repo-style transactions.

The proposal would retain the treatment of term repo-style transactions in the current capital rule. The proposal similarly would permit a banking organization to include term repo-style transactions in market risk covered positions, where the transactions are marked to market and provided that it includes all of such term repo-style transactions in market risk covered positions consistently over time. In such cases, the proposal would permit a banking organization to include term repo-style transactions in the sensitivities-based method or models-based non-default capital requirement if held by a model-eligible trading desk. For purposes of calculating market risk capital requirements under the sensitivities-based method or the models-based non-default capital requirement, the proposal would require a banking organization to capture the risk factor sensitivities of the cash leg to general interest rate risk. The proposal would also require a banking organization to separately calculate the default risk capital requirement to capture losses on the underlying reference exposure in the event of issuer default as described in section V.A.9.a. of this **SUPPLEMENTARY INFORMATION** and the risk-based capital requirements for counterparty credit risk using the collateral haircut approach as described in section IV.A.4.a. of this **SUPPLEMENTARY INFORMATION**.

Question 180: The proposal would retain the current capital rule's treatment of repurchase and lending agreements with an original maturity of more than one business day (term repo-style transactions). What are the advantages and disadvantages of allowing a banking organization to treat repurchase agreements with no specified maturity date (open repurchase transactions) or those which maturity date automatically renews until canceled by a participating party (evergreen repurchase transactions), and why? To what extent open and evergreen repurchase transactions have different risk profiles from term repo-style transactions?

11. Reporting and Disclosure Requirements

The reporting and public disclosures required under the proposal are intended to strike a balance between the information necessary for ensuring that a banking organization is conforming to the requirements of the proposed market

risk rule, the public policy benefits that result from transparency of information, and a banking organization's compliance burden. The proposal does not change the requirements under the current capital rule regarding public disclosure policy and attestation, the frequency of required disclosures, the location of disclosures, or the treatment of proprietary and confidential information except that each of these aspects of the proposal is discussed not only in regard to a banking organization's public disclosures, but also in regard to its reporting (public regulatory reports and, as applicable, confidential supervisory reports).

a. Scope

The quantitative and qualitative disclosures required by this section would not apply to a banking organization that is a consolidated subsidiary of a bank holding company, savings and loan holding company, or a depository institution that is subject to these requirements, or of a non-U.S. banking organization subject to comparable public disclosure requirements in its home jurisdiction.

The information contained within both public regulatory reports and, as applicable, confidential supervisory reports described in the proposal would be necessary for the primary Federal supervisor to assess whether a banking organization has adequately implemented the proposed market risk capital framework. Therefore, under the proposal, any banking organization that is subject to the proposed market risk capital requirements must provide public regulatory reports in the manner and form prescribed by its primary Federal supervisor, including any additional information and reports that the primary Federal supervisor may require. Any such banking organization that also uses the models-based measure for calculating market risk capital requirements must provide confidential supervisory reports as discussed below to its primary Federal supervisor in a manner and form prescribed by that supervisor.

b. Quantitative and Qualitative Disclosures

The current capital rule requires a banking organization subject to the market risk capital framework to disclose information related to the composition of portfolios of covered positions as well as the internal models used to calculate the market risk of covered positions. The proposal would eliminate the existing quantitative disclosures related to the calculations of VaR and incremental and

⁴⁶⁷ While such transactions are similar to trading activities, not all such transactions meet the short-term trading intent criterion of the definition of covered position. For example, certain repo-style transactions operate in economic substance as secured loans and do not, in normal practice, represent trading positions.

⁴⁶⁸ Under the market risk capital framework in the current capital rule, a banking organization that uses the simple VaR approach for purposes of calculating counterparty credit risk capital requirements may also include term repo-style transactions within the VaR-based measure for market risk. As noted in section IV.A.1. of this **SUPPLEMENTARY INFORMATION**, the proposal would eliminate the simple VaR approach for calculating risk-based requirements for counterparty credit risk—and thus this optionality would only apply in the context of the collateral haircut approach.

comprehensive risk capital requirements, which would no longer be necessary for calculating risk-based capital requirements for market risk under the proposal. The proposal would, however, retain the existing quantitative disclosures related to the aggregate amount of on-balance sheet and off-balance sheet securitization positions by exposure type, as well as the aggregate amount of correlation trading positions. Together, these disclosures would promote transparency regarding a banking organization's securitizations, which have historically been sources of uncertainty for regulators and market participants during periods of financial stress. Finally, the proposal would add a quantitative disclosure requiring a banking organization that uses the models-based measure for market risk to disclose a comparison of VaR-based estimates to actual gains or losses for each material portfolio of market risk covered positions with an analysis of important outliers. In addition to the requirement to disclose a general description of a banking organization's internal capital adequacy assessment methodology, a banking organization that uses the models-based measure for market risk would also be required to include such assessment for categories of non-modellable risk factors.⁴⁶⁹

The proposal would also retain the existing qualitative disclosures for material portfolios but with certain revisions to reflect the changes to the market risk framework under the proposal. Specifically, the requirement that a banking organization disclose characteristics of internal models would be revised to also require that the banking organization disclose information related to the models used to calculate expected shortfall (ES), the frequency with which data is updated, and a description of the calculation based on current and stress observations. The existing requirement that a banking organization disclose its internal capital adequacy assessment, including a description of the methodologies used to achieve a capital adequacy assessment consistent with the soundness standard, would be subsumed into the quarterly quantitative disclosure requirements described above. Qualitative disclosures

that typically do not change each quarter may be disclosed annually, provided any significant changes are disclosed in the interim.

The proposal would add new qualitative disclosures related to a banking organization's processes and policies for managing market risk. Specifically, the proposed qualitative disclosures include (i) a description of the structure and organization of the market risk management system, including a description of the market risk governance structure established to implement the strategies and processes described below; (ii) a description of the policies and processes for determining whether a position is designated as a market risk covered position and the risk management policies for monitoring market risk covered positions; (iii) a description of the scope and nature of risk reporting and/or measurement systems and the strategies and processes implemented by the banking organization to identify, measure, monitor, and control the banking organization's market risks, including policies for hedging; and (iv) a description of the trading desk structure and the types of market risk covered positions included on the trading desks or in trading desk categories, including a description of the model-eligible trading desks for which a banking organization calculates the models-based non-default risk capital requirement and any changes in the scope of model-ineligible trading desks and the market risk covered positions on those desks. Together, the additional disclosure requirements in the proposal would increase transparency, encourage sound risk management practices, and assist the regulatory review process of a banking organization subject to the proposed market risk framework by providing clear information on the policies and procedures that each banking organization has adopted to manage and mitigate potential losses arising from market fluctuations.

c. Public Reports

In addition to the public disclosure requirements, the proposal would require that a banking organization provide a quarterly public regulatory report of its measure for market risk. This public report, the form of which would be specified by the agencies, would contain information that the agencies deem necessary for assessing the manner in which a banking organization has implemented the proposed market risk rule. This, in turn, would help ensure the safety and soundness of the financial system by facilitating the identification of

problems at a banking organization and ensuring that a banking organization has implemented any corrective actions imposed by the agencies.

d. Confidential Supervisory Reports

Under the proposal, a banking organization using the models-based measure to calculate market risk capital requirements would be required to submit, via confidential regulatory reporting in the manner and form prescribed by the primary Federal supervisor, data pertaining to its backtesting and PLA testing.

To reflect the proposed changes to the market risk framework, the proposal would require a banking organization to submit backtesting information for model-eligible trading desks at both the aggregate level and for each trading desk, as well as PLA testing information for each model-eligible trading desk, on a quarterly basis. This information would cover the previous 500 business days, or all business days if 500 business days are not available, and would have to be reported with no more than a 20-day lag. At the aggregate level, the data would include the daily VaR-based measures calibrated to the 99.0th percentile; the daily ES-based measure calibrated at the 97.5th percentile; the actual profit and loss; the hypothetical profit and loss; and the p-value of the profit or loss for each day. At the trading desk level, the data would include the daily VaR-based measure for the trading desk calibrated at both the 97.5th and 99.0th percentile; the daily ES-based measure calibrated at the 97.5th percentile; the actual profit and loss; the hypothetical profit and loss; the risk-theoretical profit and loss; and the p-values of the profit or loss for each day.

The information in the proposed report would enable the primary Federal supervisor to identify changes to the risk profiles of reporting banking organizations as well as to monitor the risk inherent in the broader banking system. Specifically, the collection of backtesting and PLA data included in the proposed reports would enable the primary Federal supervisor to determine the validity of a banking organization's internal models, and whether these models accurately account for the risk associated with exposure to price movements, changes in market structure, or market events that affect specific assets. If the primary Federal supervisor finds these models to be flawed, the banking organization must then use the standardized non-default capital requirement for calculating its market risk capital requirements, thereby preventing divergence between a banking organization's risk profile and

⁴⁶⁹ The agencies would expect a banking organization to have sound internal capital assessment processes which would include, but not be limited to, identification of capital adequacy goals with respect to risks, taking into account the strategic focus and business plan of the banking organization, risk identification, measurement, and documentation, as well as a process of internal controls, reviews, and audits.

its capital position. In addition, the proposed report would be a valuable tool for a banking organization subject to the market risk capital requirements under the proposal to verify that the proposed market risk framework has been appropriately implemented.

12. Technical Amendments

The proposal would streamline the definitions related to securitizations in the market risk capital framework with those in the standardized approach or the expanded risk-based approach of the capital rule. Specifically, the proposal would eliminate the definition of “securitization” from the market risk capital framework and revise the definitions of “securitization position” and “resecuritization position” to refer to the terms “securitization exposure” and “resecuritization exposure,” which are defined in § _____.2 of the capital rule.⁴⁷⁰ These modifications would not change the scope of positions that would be considered securitization positions and resecuritization positions under the market risk capital framework. Rather, the proposed revisions would clarify that the same types of positions are captured under the market risk capital framework as under the standardized approach and the proposed expanded risk-based approach, which currently use substantially similar, but separate definitions.

B. Credit Valuation Adjustment Risk

1. Background

In general, OTC derivative contracts are bilateral agreements either to make or receive payments or to buy or sell an underlying asset on a certain date, or dates, in the future. The value of an OTC derivative contract, and thus a party’s exposure to its counterparty, changes over the life of the contract

based on movements in the value of the reference rates, assets, commodity prices, or indices underlying the contract. In addition to the exposure to changes in the market value of OTC derivative contracts, there is also credit risk associated with such contracts. Specifically, if a counterparty to an OTC derivative contract, or a portfolio of such contracts subject to a qualifying master netting agreement or a qualifying cross-product master netting agreement,⁴⁷¹ defaults prior to the contract’s expiration, the non-defaulting party will experience a loss if the market value of the contract, or of the portfolio of contracts under a qualifying master netting agreement, is positive at the time of default. The risk of such a loss, known as counterparty credit risk, exists even if the current market value of the contract, or the portfolio under a qualifying master netting agreement, is negative because the future market value may become positive if market conditions change. Under the current capital rule, a banking organization determines risk-based capital requirements for counterparty credit risk using the credit risk framework, with exposure amounts determined via either SA–CCR, the current exposure methodology, or the internal models methodology, as applicable.⁴⁷²

The valuation change of OTC derivative contracts resulting from the risk of the counterparty’s defaulting prior to the expiration of the contracts, known as the credit valuation adjustment (CVA), depends on (1) counterparty credit spreads, which reflect the creditworthiness of the counterparty perceived by the market; and (2) credit exposure generated by CVA risk covered positions⁴⁷³ that the market would expect at various future points in time. Thus, CVA risk has two components: a counterparty credit spread component (CVA increases as a result of the deterioration in the

creditworthiness of a counterparty perceived by the market) and an exposure component (CVA increases as a result of an increase in the expected future exposure).

The proposal would revise the criteria for determining whether a banking organization is subject to CVA risk capital requirements. Under the proposal, a Category I or Category II depository institution holding company and its depository institution subsidiaries that are subject to the market risk framework, as well as any banking organization with significant OTC derivatives that is subject to the market risk framework, would be required to reflect in risk-weighted assets the potential losses on OTC derivative contracts resulting from increases in CVA for all OTC derivative contract counterparties, subject to certain exceptions.⁴⁷⁴

The proposal would provide two measures for calculating CVA risk capital requirements: (1) the basic measure for CVA risk that includes the basic CVA approach (BA–CVA) capital requirement, which recognizes only the credit spread component of CVA risk and is similar to the current capital rule’s simple CVA approach, and (2) a standardized measure for CVA risk that includes a new standardized CVA approach (SA–CVA) capital requirement and the BA–CVA capital requirement. The SA–CVA would account for both credit spread and exposure components of CVA risk and would allow a banking organization to recognize hedges for the exposure component of CVA risk. Under the proposal, only banking organizations that use SA–CCR for counterparty credit risk would be eligible to use the standardized measure to calculate its CVA risk capital requirements.⁴⁷⁵ Additionally, the proposal would require the banking organization to receive a prior approval from the primary Federal supervisor to calculate the CVA risk capital requirements under the SA–CVA approach.

2. Scope of Application

The proposed capital requirements for CVA risk would apply to a Category I or

⁴⁷⁰ Section 2 of the capital rule defines a securitization exposure as an on- or off-balance sheet credit exposure (including credit-enhancing representations and warranties) that arises from a traditional or synthetic securitization (including a resecuritization), or an exposure that directly or indirectly references a securitization exposure. The agencies’ capital rule defines a traditional securitization, in part, as a transaction in which all or a portion of the credit risk of one or more underlying exposures is transferred to one or more third parties (other than through the use of credit derivatives or guarantees), where the credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority. The definition includes certain other conditions, such as requiring all or substantially all of the underlying exposures to be financial exposures. See 12 CFR 3.2 s.v. securitization exposure, traditional securitization (OCC); 12 CFR 217.2 s.v. securitization exposure, traditional securitization (Board); 12 CFR 324.2 s.v. securitization exposure, traditional securitization (FDIC).

⁴⁷¹ “Qualifying master netting agreement” is defined in § _____.2 of the current capital rule. In order to recognize an agreement as a qualifying master netting agreement, a banking organization must meet the operational requirements in § _____.3(d) of the current capital rule. See 12 CFR 3.2, and 3.3(d) (OCC); 12 CFR 217.2 and 217.3(d) (Board); 12 CFR 324.2, and 324.3(d) (FDIC). In general, a qualifying master netting agreement means a netting agreement that permits a banking organization to accelerate, terminate, close-out on a net basis and promptly liquidate or set off collateral upon default of the counterparty. The proposal would retain this definition, except as discussed in section IX of this **SUPPLEMENTARY INFORMATION**, whereby the proposal would modify the definition in the Board’s and OCC’s rule to address a prior error.

⁴⁷² See §§ _____.34 and _____.132 of the current capital rule.

⁴⁷³ CVA risk covered positions are described in section V.B.3.a. of this **SUPPLEMENTARY INFORMATION**.

⁴⁷⁴ The proposal would allow a banking organization to exclude certain OTC derivative contracts recognized as a credit risk mitigant and that receive substitution treatment under § _____.36 of the current capital rule or § _____.120 of the proposed rule from the portfolio of OTC derivative contracts that are subject to the CVA risk capital requirements (under both BA–CVA and SA–CVA).

⁴⁷⁵ The proposal would require banking organizations that use the current exposure methodology to calculate exposure amounts for counterparty credit risk to use the BA–CVA measure to calculate CVA risk capital requirements.

Category II depository institution holding company, a subsidiary depository institution of a Category I or II banking organization that is subject to the proposed market risk capital requirements, and to any banking organization subject to the proposed market risk capital requirements that has average aggregate OTC derivatives gross notional amounts of \$1 trillion or more, adjusted to reflect CPI-W, over the prior four quarters. Under the proposal, these banking organizations would be required to calculate a risk-weighted asset amount for the CVA risk arising from their portfolio of OTC derivative transactions that would be subject to the CVA risk capital requirement, as described in the following section of this **SUPPLEMENTARY INFORMATION**.

Consistent with the current capital rule, the proposed scope would apply CVA risk capital requirements to the largest and complex banking organizations that, due to their significant trading activity, operational scale, and domestic and global presence, are subject to more stringent capital requirements. As Category I or II banking organizations are generally subject to rules based on the standards published by the Basel Committee, the proposed scope would help promote competitive equity among U.S. banking organizations and their foreign peers and competitors, and reduce opportunities for regulatory arbitrage across jurisdictions. At the same time, the proposal would apply CVA risk capital requirements to subsidiary depository institutions of Category I or II banking organizations only if the subsidiary is subject to market risk capital requirements. The proposed criterion is intended to tailor the proposed CVA risk capital requirements to only those subsidiary depository institutions with significant trading activity and increased exposure to CVA risk, and thus reduce operational burden for those with less exposure to CVA risk.

In addition to applying CVA risk capital requirements to the largest banking organizations, the proposed rule would introduce activity-based thresholds. The proposed CVA risk capital requirement would apply to a banking organization that is subject to the proposed market risk capital requirements and that has average aggregate OTC derivatives gross notional amounts of \$1 trillion or more, adjusted to reflect CPI-W,⁴⁷⁶ over the prior four

consecutive quarters. Due to their substantial derivative portfolios, these banking organizations have meaningful exposure to losses resulting from changes to their credit valuation adjustment accounting reserve.

Under the proposal, the primary Federal supervisor of a banking organization that does not meet the proposed scoping criteria for CVA risk capital requirements could require the banking organization to apply the risk-based capital requirements for CVA risk if the supervisor deems it necessary or appropriate because of the level of CVA risk of the banking organization's portfolio of OTC derivative contracts or to otherwise ensure safe and sound banking practices. The primary Federal supervisor could also exclude from application of the proposed CVA risk capital requirements a banking organization that meets the scoping criteria if the supervisor determines that (1) the exclusion is appropriate based on the level of CVA risk of the banking organization's CVA risk covered positions, and (2) such an exclusion would be consistent with safe and sound banking practices. While the agencies consider that the proposed scoping criteria for application of CVA risk capital requirements would reasonably identify a banking organization with significant CVA risk given the current risk profile of a banking organization, there may be unique instances where a banking organization either should or should not be required to reflect CVA risk in its risk-based capital requirements. As such, the proposal would allow the primary Federal supervisor to exercise its authority to address such instances on a case-by-case basis.

Question 181: The agencies seek comment on the appropriateness of the proposed scope of application of CVA risk capital requirements. What, if any, alternative thresholds should the agencies consider and why?

Question 182: What are the advantages or disadvantages of using an average aggregate OTC derivatives gross notional amount of \$1 trillion or more for the scope of application threshold, and why?

3. CVA Risk Covered Positions and CVA Hedges

1. Definition of CVA Risk Covered Position

The proposal would define a CVA risk covered position as a derivative contract that is not a client-facing derivative transaction or cleared transaction. In

addition, the proposal would allow a banking organization to choose to exclude an eligible credit derivative for which the banking organization recognizes credit risk mitigation benefits from the calculation of its CVA risk capital requirement.⁴⁷⁷ This approach would align the scope of the CVA framework with the scope of instruments that present CVA risk. The proposal would also allow a banking organization to exclude certain OTC derivative contracts that are credit risk mitigants from the CVA risk covered positions in order not to create a disincentive to hedge against credit default risk in the standardized approach or the expanded risk-based approach of the capital rule, as applicable. For example, a CDS on a loan borrower that is recognized as a credit risk mitigant and receives substitution treatment under § _____.¹²⁰ of the proposed rule would not be included in the portfolio of OTC derivative contracts that are subject to the CVA risk capital requirements.

A banking organization generally does not calculate accounting CVA for cleared transactions, client-facing derivative transactions, or for securities financing transactions (SFTs) for financial reporting purposes. Consistent with industry practice and to align the scope of the CVA framework with the scope of instruments that present CVA risk, the proposed definition of CVA risk covered position would not include a cleared transaction, a client-facing derivative transaction, or an SFT. Therefore, the CVA risk-based capital requirements would not apply to such positions under the proposal.

The proposal would exclude cleared derivative transactions from the CVA risk-based capital requirements because the primary risk of a banking organization facing a CCP lies in the risk that a CCP participant, not the CCP itself, defaults.⁴⁷⁸ Clearing members of

⁴⁷⁷ A cleared transaction includes an exposure resulting from a transaction that a CCP has accepted. For purposes of the CVA risk capital requirement, a banking organization that is not a clearing member may treat its exposure as directly facing the CCP (that is, the banking organization would have no exposure to the clearing member) and may exclude that cleared transaction from CVA risk covered positions. Additionally, when a clearing member banking organization is either (1) acting as a financial intermediary and entering into an offsetting transaction with a QCCP or (2) providing a guarantee on the performance of its client to a QCCP, the banking organization may exclude the client-facing derivative transaction from CVA risk covered positions. See the definitions of cleared transaction and client-facing derivative transaction in 12 CFR 3.2 (OCC), 12 CFR 217.2 (Board), 12 CFR 324.2 (FDIC).

⁴⁷⁸ A CCP could only default if a sufficient number of members default at the same time and

⁴⁷⁶ See section II.E. of this **SUPPLEMENTARY INFORMATION** for a more detailed discussion on

indexing nominal thresholds in the proposal going forward to reflect CPI-W.

the CCP would be responsible for covering losses of a defaulted clearing member's portfolio with the CCP; clearing member banking organizations are subject to a capital requirement for such risk in § _____.116 of the proposal or § _____.35 of the current capital rule, as applicable.

In addition, in light of the systemic risk-reducing benefits of derivatives clearing and to minimize potential unintended consequences for client clearing activities, the proposal would also exclude from CVA risk capital requirements client-facing derivative transactions which generally present low CVA risk.⁴⁷⁹ Client-facing derivative transactions generally are highly collateralized transactions subject to netting, daily or intraday margin requirements, immediate close-out, and significant regulatory oversight, thus resulting in small expected exposure amounts for clearing members to their clients. While this expected exposure does result in CVA in the economic sense, it is usually immaterial and banking organizations do not include it in the CVA they calculate for accounting purposes. Given these considerations, subjecting such transactions to the CVA risk capital requirements would be incommensurate with the risk of such transactions.

2. Recognition of CVA Hedges

The proposal would set forth general requirements for the recognition of CVA hedges, as well as specific requirements under BA-CVA and SA-CVA. The proposal would allow a banking organization to include certain CVA hedges as risk-reducing elements in risk-weighted asset calculations for CVA risk (eligible CVA hedges). The proposal would define a CVA hedge as a transaction the banking organization enters into with a counterparty that is a third party (external CVA hedge) or an internal trading desk (internal CVA hedge),⁴⁸⁰ as described in section V.B.3.b. of this **SUPPLEMENTARY**

the remaining clearing members of this CCP are unable to contribute sufficient funds to make the counterparties to the defaulting members whole.

⁴⁷⁹ See 88 FR 64028, at 64150 n. 428 (Sept. 18, 2023). See also 12 CFR 3.2 (definitions of cleared transaction and client-facing derivative transaction) (OCC); 12 CFR 217.2 (definitions of cleared transaction and client-facing derivative transaction) (Board); 12 CFR 324.2 (definitions of cleared transaction and client-facing derivative transaction) (FDIC).

⁴⁸⁰ Both BA-CVA and SA-CVA would recognize internal CVA hedges that satisfy eligibility requirements of the specific approach and require that a banking organization have a CVA risk management function to manage internal CVA risk transfers as described in section V.A.5.c. of this **SUPPLEMENTARY INFORMATION**.

INFORMATION, and manages for the purpose of mitigating CVA risk.

An internal CVA hedge is an internal derivative transaction that is usually executed between a CVA risk management function, such as a CVA desk (or a functional equivalent thereof), and a trading desk of the banking organization. Every such internal CVA hedge has two offsetting positions: the position of the CVA risk management function (the CVA segment) and the position of the trading desk (the trading desk segment). In addition to its ability to reduce CVA risk, a CVA hedge may also contribute to CVA risk arising from the counterparty of the hedge, in which case the CVA hedge could also be a CVA risk covered position. Whether a CVA hedge is a CVA risk covered position has no impact on its qualification as an eligible CVA hedge. Specifically, a non-CVA risk covered position could be an eligible CVA hedge if it meets the proposed eligibility criteria as described below. For example, a banking organization could hedge its CVA risk using a cleared transaction; in such cases, the CVA hedge would effectively reduce the CVA risk of the banking organization, though the transaction itself would not be a CVA risk covered position. The proposed treatment of CVA hedges intends to provide better alignment between the economic risks posed by such transactions and the risk-based capital requirement for CVA risk. In this manner, the proposal would provide incentives for a banking organization to manage CVA risk prudently.

As described below, the proposal would include two approaches for calculating CVA capital requirements: the basic approach or BA-CVA⁴⁸¹ and the standardized approach or SA-CVA.⁴⁸² The BA-CVA is simpler, but less risk sensitive, than the SA-CVA. For this reason, these two approaches have different eligibility requirements for recognizing the risk-mitigating benefits of CVA hedges.

Under the BA-CVA, the proposal would allow a banking organization to recognize in the CVA risk capital calculation the risk-mitigating benefit of hedges of the counterparty credit spread component of CVA risk, where the only instruments that could be recognized as eligible hedges are the following instruments: index CDS, single-name

⁴⁸¹ The basic approach for calculating CVA capital requirements (BA-CVA) is discussed below in section V.B.5.a. of this **SUPPLEMENTARY INFORMATION**.

⁴⁸² The standardized approach for calculating CVA capital requirements (SA-CVA) is discussed below in section V.B.5.b. of this **SUPPLEMENTARY INFORMATION**.

CDS, and single-name contingent CDS. The proposal would expand the set of instruments recognized as eligible CVA hedges relative to the simple CVA approach within the current capital rule to include a single-name credit instrument that references an affiliate of the counterparty or that references an entity that belongs to the same sector and region⁴⁸³ as the counterparty (together, eligible indirect single-name CVA hedges). Although a banking organization generally can hedge the credit spread risk of a counterparty whose credit risk is actively traded (that is, liquid counterparties) by using credit instruments that directly reference that counterparty, instruments referencing illiquid counterparties are thinly traded, if at all. For illiquid counterparties, a banking organization may use credit instruments that reference a sufficiently liquid entity whose credit spread is highly correlated with the credit spread of the illiquid counterparty such as counterparties that belong to the same sector and region. For this reason, the BA-CVA would allow a banking organization to recognize the risk-mitigating benefit of eligible indirect single-name CVA hedges, but, given the potentially significant basis risk between the counterparty and the hedge reference name, the BA-CVA would require a banking organization to use a non-perfect correlation parameter between the counterparty credit spread and the hedge reference name credit spread in order to constrain the risk-mitigating benefit of such indirect but eligible CVA hedges.⁴⁸⁴ The restrictions on hedging instruments as stated above apply to both external and internal hedging transactions. Additionally, for a banking organization to recognize an internal CVA hedging transaction as an eligible CVA hedge under the BA-CVA, the transaction would have to satisfy the requirements of an eligible internal risk transfer of CVA risk, as described in section V.A.5.c. of this **SUPPLEMENTARY INFORMATION**.

Under the SA-CVA, hedges of the counterparty credit spread component of CVA risk would be recognized without the BA-CVA restriction on eligible instrument types described above. Furthermore, the SA-CVA would recognize as eligible CVA hedges

⁴⁸³ Under the proposal, for BA-CVA purposes, a region would refer to a country or territorial entity.

⁴⁸⁴ The aggregation formula in the BA-CVA calculation would introduce new regulatory correlation parameters that quantify the relationship between the credit spreads of the counterparty and of the entity referenced by the hedge, thus restricting hedging benefits. See section V.B.5.a. of this **SUPPLEMENTARY INFORMATION** for a more detailed description of the BA-CVA calculation.

instruments that are used to hedge the exposure component of CVA risk. The SA-CVA would also recognize both external and internal CVA hedging transactions as eligible CVA hedges. Similar to the BA-CVA, a banking organization would be able to recognize an internal CVA hedging transaction as an eligible CVA hedge under the SA-CVA if the transaction satisfies the requirements of an eligible internal risk transfer of CVA risk, as described in section V.A.5.c. of this **SUPPLEMENTARY INFORMATION**.

Under both the BA-CVA and SA-CVA, the proposal would not allow a banking organization to recognize a fraction of an actual transaction as an eligible CVA hedge. Instead, a banking organization would only be permitted to recognize whole transactions as eligible CVA hedges. For example, if a banking organization for internal risk management purposes uses an interest rate swap to hedge interest rate risk for both CVA and margin valuation adjustment, the banking organization would either have to recognize the entire swap when calculating its risk-based capital requirements for CVA risk or exclude the entire swap. The proposed treatment intends to prevent a banking organization from choosing a fraction of a hedging transaction to minimize its capital requirement.

Finally, under both the BA-CVA and SA-CVA, the proposal would not allow a banking organization to recognize the risk mitigating benefits of CVA hedges that are securitization positions or correlation trading positions when calculating risk-based capital requirements for CVA risk. As reliably pricing such instruments is difficult, the agencies are concerned with the ability of a banking organization to measure reliably the price sensitivity of such positions to the proposed risk factors under the SA-CVA. The BA-CVA, as a very simplistic approach, is even less suitable than the SA-CVA for adequately capturing the risk of such instruments.

Question 183: The agencies seek comments on the proposed interpretation of region for the purposes of BA-CVA. To what extent would limiting a region to a country or a territorial entity pose challenges for hedge recognition under BA-CVA? What, if any, other criteria or interpretations should the agencies consider and why?

4. General Risk Management Requirements

The proposal would require a banking organization to satisfy certain general risk management requirements related

to the identification and management of CVA risk covered positions and eligible CVA hedges and also to comply with additional operational requirements as described in section V.B.4.c. of this **SUPPLEMENTARY INFORMATION**.

a. Identification and Management of CVA Risk Covered Positions and CVA Hedges

Identification of CVA risk covered positions and CVA hedges is the prerequisite of prudent CVA risk management. The proposal would therefore require a banking organization subject to the proposed CVA framework to identify all CVA risk covered positions and all transactions that hedge or are intended to hedge CVA risk. For transactions that hedge or are intended to hedge CVA risk, the proposal would require the banking organization to identify which are eligible CVA hedges and which are ineligible CVA hedges.⁴⁸⁵ A banking organization that received approval from its primary Federal supervisor to use the standardized measure for CVA risk would be required to identify all eligible CVA hedges for the purposes of calculating the BA-CVA and all eligible CVA hedges for the purpose of calculating the SA-CVA. Furthermore, a banking organization that hedges its CVA risk must have a clearly defined hedging policy for CVA risk that is reviewed and approved by senior management at least annually. The hedging policy would be required to quantify the level of CVA risk that the banking organization is willing to accept and detail the instruments, techniques, and strategies that the banking organization would use to hedge CVA risk.

b. Documentation

The proposal would also require a banking organization to have policies and procedures for determining its CVA risk capital requirement and to document adequately all material aspects of its management and identification of CVA risk covered positions and eligible CVA hedges, and its control, oversight, and review processes. Such general documentation requirements are intended to facilitate regulatory review and a banking organization's internal risk management and oversight processes.

⁴⁸⁵ The proposal would exclude ineligible CVA hedges from both market risk and CVA risk capital requirements. Accordingly, this proposed requirement is intended to support appropriate risk measurement and monitoring of CVA risk and help ensure that a banking organization appropriately reflects the respective hedges in the calculation of risk-based capital requirements for CVA risk.

The proposed requirements are intended to appropriately support the active risk management and monitoring of CVA risk under the proposed framework.

c. Additional Risk Management Requirements for Use of the Standardized Measure for CVA Risk

In addition to the general risk management requirements, a banking organization that has received approval from its primary Federal supervisor to use the standardized measure for CVA risk would be required to comply with additional operational requirements on documentation, initial approval and ongoing performance of regulatory CVA models as described below.

i. Documentation

The proposal would require a banking organization using the SA-CVA to adequately document policies and procedures of the CVA desk, or similar dedicated function, and the independent risk control unit. Furthermore, the banking organization would be required to document the internal auditing process; the internal policies, controls, and procedures concerning the banking organization's CVA calculations for financial reporting purposes; the initial and ongoing validation of models used to calculate regulatory CVA (including exposure models); and the banking organization's process to assess the performance of models used for calculating regulatory CVA (including exposure models) and implement remedies to mitigate model deficiencies. The agencies expect that a banking organization would document any adjustments, if applicable, made to the CVA models to satisfy the operational requirements described in section V.B.4.c. of this **SUPPLEMENTARY INFORMATION** under SA-CVA. These enhanced documentation requirements are designed to help ensure that exposure models under the SA-CVA appropriately capture the CVA risk of CVA risk covered positions and that a banking organization has effective and sound risk management and oversight processes.

ii. Initial Approval

To receive approval from its primary Federal supervisor to use the SA-CVA for any of its CVA risk covered positions, a banking organization must be capable of calculating, on at least a monthly basis, regulatory CVA (as described in section V.B.5.b.i. of this **SUPPLEMENTARY INFORMATION**), as well as the sensitivities of regulatory CVA to counterparty credit spreads and market risk factors. Due to the computational

intensity associated with calculating regulatory CVA and its sensitivities, the proposal would permit a banking organization to choose to recognize in its risk-based capital requirement certain netting sets of CVA risk covered positions under BA-CVA and other netting sets under SA-CVA.

Furthermore, the prior approval from the primary Federal supervisor could specify which CVA risk covered positions must be included in the calculation of the BA-CVA, and which could be included in the calculation of the SA-CVA. If a banking organization were to use both SA-CVA and BA-CVA for the calculations of risk-based capital requirements for CVA risk, the proposal would require the banking organization to assign each CVA hedge that the banking organization intends to recognize in these calculations to one of the two approaches (SA-CVA or BA-CVA). This assignment would have to satisfy the eligibility requirements of the SA-CVA or the BA-CVA. For example, a single-name CDS hedging the counterparty credit spread component of CVA risk could be assigned to either the SA-CVA or the BA-CVA, while an interest rate swap hedging the interest rate component of CVA risk could only be assigned to the SA-CVA. With this proposed requirement, the agencies intend to support appropriate risk measurement and monitoring of CVA risk and help ensure that a banking organization appropriately reflects the respective hedges in the calculation of risk-based capital requirements for CVA risk.

To better align regulatory CVA with accounting CVA and to help ensure that CVA capital requirements more accurately reflect CVA risk, the proposal would require a banking organization to use CVA models that it uses for financial reporting purposes (accounting CVA models) to calculate regulatory CVA under the SA-CVA, adjusted, if necessary, to satisfy the additional requirements as described in section V.B.5.b. of this **SUPPLEMENTARY INFORMATION**.

Furthermore, to support active management of CVA risk, the proposal would require a banking organization that intends to use the SA-CVA to have a CVA desk, or similar dedicated function, responsible for risk management and hedging of CVA risk consistent with the banking organization's CVA risk management and hedging policies and procedures. The agencies view a designated CVA desk or designated function as the best mechanism to support the active management of CVA risk.

The primary Federal supervisor may rescind its approval of the use of the standardized measure for CVA risk in whole or in part, if it determines that the banking organization's models no longer comply with all applicable requirements or fails to reflect accurately the CVA risk. If the primary Federal supervisor determines that a banking organization's implementation of the SA-CVA risk no longer complies with proposed requirements or fails to accurately reflect CVA risk, the primary Federal supervisor could specify one or more types of CVA risk covered positions or eligible CVA hedges must be included in the BA-CVA or prescribe an alternative capital requirement.

iii. Ongoing Eligibility

For a banking organization approved to use the standardized measure for CVA risk, the proposal would require the exposure models used in the calculation of regulatory CVA to be part of a CVA risk management framework that includes the identification, management, measurement, approval, and internal reporting of CVA risk.

I. Control and Oversight

A banking organization that receives prior approval from its primary Federal supervisor to use the standardized measure for CVA risk would be required to maintain an independent risk control unit that is responsible for the effective initial and ongoing validation of the models used for calculating regulatory CVA (including exposure models), reports directly to senior management, and is independent of the banking organization's trading desks and CVA desk, or similar dedicated function, as well as the business unit that evaluates counterparties and sets limits.

Senior management of the banking organization would be required to have oversight of the CVA risk control process. In addition, the banking organization would be required to have a regular independent audit review of the overall CVA risk management process, including both the activities of the CVA desk (or similar dedicated function) and of the independent risk control unit. The agencies intend that, together, the independent risk control unit and internal audit would provide appropriate review and credible challenge of the effectiveness of CVA risk management function.

II. Exposure Model Eligibility

The proposal would introduce requirements for a banking organization that calculates the CVA risk-based capital requirements under SA-CVA to further strengthen its CVA risk

management processes and promote effective CVA risk management pertaining specifically to CVA exposure models. Such requirements would guide the banking organization's internal CVA risk control unit and audit functions in providing appropriate review and challenge of CVA risk management. In particular, the proposal would require the banking organization to (1) include exposure models for the regulatory CVA calculation in its CVA risk management framework and (2) define criteria on which to assess the exposure models and their inputs and have a written policy in place describing the process for assessing the performance of exposure models and for remedying unacceptable performance.

To help ensure that the CVA capital requirements are commensurate with CVA risk, the proposal would require a banking organization to have the exposure models used in regulatory CVA calculation be part of its ongoing CVA risk management framework, including identification, measurement, management, approval, and internal reporting of CVA risk. Such requirements would subject the regulatory CVA exposure models to ongoing effective measurement and management.

Specifically, the proposal would require a banking organization to document the process for initial and ongoing validation of its models used for calculating regulatory CVA, including exposure models, with sufficient detail to enable a third party to understand the model's operations, limitations, and key assumptions. A banking organization would be required to validate, no less than annually, its CVA models including exposure models, and to account for other circumstances, such as a sudden change in market behavior, under which additional validation would need to be conducted more frequently. In addition, a banking organization would be required to sufficiently document how the validation is conducted with respect to data flows and portfolios, what analyses are used, and how representative counterparty portfolios are constructed. As part of the independent model validation, a banking organization would be required to test the pricing models used to calculate exposure for given paths of market risk factors against appropriate independent benchmarks for a wide range of market states as part of the initial and ongoing model validation process. The proposal would require the pricing models for CVA risk covered positions that are options to account for

the non-linearity of option value with respect to market risk factors.

Additionally, a banking organization would be required to obtain current and historical market data that are either independent of the line of business or validated independently of the line of business, to be used as an input for an exposure model, as well as comply with applicable financial reporting standards. The proposal would require well-developed data integrity processes to handle the data of erroneous and anomalous observations, and that data be input into exposure models in a timely and complete fashion and be maintained in a secure database that is subject to formal periodic audits. Where data used in the exposure model are proxies for actual market data, the proposal would require a banking organization to set internal policies to identify suitable proxies and be able to demonstrate, empirically on an ongoing basis, that the proxy data are a conservative representation of the underlying risk under adverse market conditions.

To accurately calculate simulated paths of a discounted future exposure required for regulatory CVA calculations as discussed below, a banking organization's exposure models would need to capture and accurately reflect transaction-specific information (for example, terms and specifications). A banking organization would be required to verify that transactions are assigned to the appropriate netting set within the model. The terms and specifications would need to reside in a secure database subject to at least annual formal audit. The transmission of the transaction terms and specifications data to the exposure model would also be subject to internal audit. The proposal would require a banking organization to establish formal reconciliation processes between the internal model and source data systems to verify on an ongoing basis that transaction terms and specifications are being reflected correctly or at least conservatively.

5. Measure for CVA Risk

To calculate the risk-based capital requirement for CVA risk, the proposal would provide a basic measure for CVA risk and a standardized measure for CVA risk. Under the proposal, the basic measure for CVA risk would include risk-based capital requirements for all CVA risk covered positions and eligible CVA hedges calculated using the BA-CVA, and any other additional capital requirement for CVA risk established by a banking organization's primary Federal supervisor if the primary

Federal supervisor determines that the capital requirement for CVA risk as calculated under the BA-CVA is not commensurate with the CVA risk of the banking organization's CVA risk covered positions. The standardized measure for CVA risk would include risk-based capital requirements calculated under (1) the SA-CVA for all standardized CVA risk covered positions⁴⁸⁶ and standardized CVA hedges, (2) the BA-CVA for all basic CVA risk covered positions⁴⁸⁷ and basic CVA hedges, and (3) any additional capital requirement for CVA risk established by a banking organization's primary Federal supervisor if the primary Federal supervisor determines that the capital requirement for CVA risk as calculated under the SA-CVA and BA-CVA is not commensurate with the CVA risk of the banking organization's CVA risk covered positions. The primary Federal supervisor may require the banking organization to maintain an overall amount of capital that differs from the amount otherwise required under the proposal, if the primary Federal supervisor determines that the banking organization's CVA risk capital requirements under the rule are not commensurate with the risk of the banking organization's CVA risk covered positions, a specific CVA risk covered position, or portfolios of such positions, as applicable.

Banking organizations that use the current exposure methodology for counterparty credit risk would be required to use the basic measure for CVA risk. A banking organization that uses SA-CCR for counterparty credit risk would only be able to use the standardized measure for CVA risk if it has received prior approval from the primary Federal supervisor. A banking organization that has received prior approval from its primary Federal supervisor to use the standardized measure for CVA risk would be required to include all CVA risk covered positions that are outside of the approval scope of the SA-CVA in the BA-CVA. Furthermore, a banking organization could choose to exclude any number of in-scope netting sets

⁴⁸⁶ The proposal would define standardized CVA risk covered positions as all CVA risk covered positions that are not basic CVA risk covered positions; these terms are used in the standardized measure for CVA risk.

⁴⁸⁷ The proposal would define basic CVA risk covered positions as CVA risk covered positions that must be included in the BA-CVA because: (i) the banking organization does not have supervisory approval to use the SA-CVA for these CVA risk covered positions; or (ii) the banking organization chooses to exclude the netting sets with these CVA risk covered positions from the SA-CVA.

from SA-CVA calculations and recognize them instead in the BA-CVA. Given that the calculation of CVA sensitivities to market risk factors in the SA-CVA is computationally intensive for large netting sets, the proposal would allow a banking organization to restrict application of the SA-CVA only to netting sets with the most material CVA risk. A banking organization may also bifurcate CVA risk covered positions of a single netting set between SA-CVA and BA-CVA. Thus, for a banking organization that has received prior approval from its primary Federal supervisor to use the standardized measure for CVA risk, the CVA capital requirement generally would equal the SA-CVA capital requirement for its CVA risk covered positions and eligible CVA hedges recognized under SA-CVA (these CVA risk covered positions and eligible CVA hedges are referred to as "standardized" in the proposal), plus the BA-CVA capital requirement for its CVA risk covered positions and eligible CVA hedges recognized under BA-CVA (these CVA risk covered positions and eligible CVA hedges are referred to as "basic" in the proposal), if applicable.

After calculating the CVA capital requirement using either the basic measure for CVA risk or the standardized measure for CVA risk, a banking organization's total capital requirements for CVA risk would equal the CVA capital requirement multiplied by 12.5. Additionally, the primary Federal supervisor could require the banking organization to maintain an amount of regulatory capital that differs from the amounts required under the basic measure for CVA risk or the standardized measure for CVA risk.

a. Basic Approach for CVA Risk

Similar to the simple CVA approach in the current capital rule, the capital requirement for CVA risk under the BA-CVA would be calculated according to a formula, described below, that approximates CVA expected shortfall, which replaces value-at-risk in the simple CVA approach, assuming fixed expected exposure profiles and based on a set of simplifying assumptions. The assumptions provide that: (1) all credit spreads have a flat term structure; (2) all credit spreads at the time horizon have a lognormal distribution; (3) each single name credit spread is driven by the combination of a single systematic risk factor and an idiosyncratic risk factor; (4) the correlation between any single name credit spread and the systematic risk factor is 0.5, and (5) the single systematic risk factor drives all credit indices without any idiosyncratic risk component.

The BA-CVA would improve upon the simple CVA approach in the current capital rule by: (1) providing limited recognition for the risk-mitigating benefit of eligible single-name credit instruments that do not reference a counterparty directly; (2) putting a restriction on hedge effectiveness; (3) relying on risk weights derived from the SA-CVA; and (4) introducing a new method of calculating risk weights for credit indices.

Under the proposal, the risk-based capital requirement under the BA-CVA would be calculated according to the following formula, as provided under § _____.222(a) of the proposed rule:

$$K_{basic} = 0.65 \cdot (\beta \cdot K_{unhedged} + (1 - \beta) \cdot K_{hedged})$$

Where:

K_{basic} is the risk-based capital requirement under the BA-CVA;

$K_{unhedged}$ is the risk-based capital requirement for CVA positions before recognizing the

risk mitigating effect of eligible CVA hedges; K_{hedged} is the risk-based capital requirement after recognizing such hedges; and β is a regulatory parameter set to 0.25.

The formula sets the capital requirement under the BA-CVA equal to the weighted average of $K_{unhedged}$ and K_{hedged} scaled by a factor of 0.65 in order to ensure that the simpler and less risk-sensitive BA-CVA method is calibrated appropriately relative to the SA-CVA. Applying the weighted average in the BA-CVA capital requirement formula is a conservative measure that implicitly recognizes the presence of the expected exposure component of CVA risk by reducing the effectiveness of eligible CVA hedges to 75 percent (preventing a banking organization's eligible CVA hedges from fully offsetting the CVA risk of its CVA risk covered positions).⁴⁸⁸ Thus, even if a banking organization perfectly hedges the

counterparty credit spread component of CVA risk, the BA-CVA capital requirement would be equal to $0.65 \cdot (0.25 \cdot K_{unhedged})$. For a banking organization that does not hedge CVA risk, eliminating the recognition of eligible CVA hedges would result in $K_{hedged} = K_{unhedged}$, so that the BA-CVA calculation would become:

$$K_{basic} = 0.65 \cdot (K_{unhedged})$$

i. Calculation of $K_{unhedged}$

Under BA-CVA, the proposal would first require a banking organization to calculate the risk-based capital requirements for CVA risk covered positions without recognizing the risk mitigating effect of eligible CVA hedges, $K_{unhedged}$, for each counterparty on a stand-alone basis ($SCVA_c$) and then aggregate the respective standalone counterparty capital requirements across counterparties, as expressed by the following formula:

$$K_{unhedged} = \sqrt{\left(\rho \cdot \sum_c SCVA_c\right)^2 + \left((1 - \rho^2) \cdot \sum_c SCVA_c^2\right)}$$

The first term under the square root in the formula ($(\rho \cdot \sum_c SCVA_c)^2$) aggregates the systematic components of CVA risk, while the second term under the square root in the formula ($((1 - \rho^2) \cdot \sum_c SCVA_c^2)$) aggregates the idiosyncratic components of CVA risk. The purpose of the $K_{unhedged}$ formula is intended to reflect the potential losses arising from unhedged CVA risk.

I. Regulatory Correlation Parameter

One of the basic assumptions underlying the BA-CVA is that a single risk factor drives systematic credit spread risk. This assumption is important because it simplifies the credit spread correlation structure. The proposed regulatory correlation parameter ρ of 0.5 approximates the correlation between the credit spread of a counterparty and the systematic risk

factor. The square of the regulatory correlation parameter (0.25) approximates the correlation between credit spreads of any two counterparties. The proposed value of the regulatory correlation parameter is generally consistent with historically observed correlations between credit spreads and would appropriately recognize the diversification of CVA risk by ensuring that a banking organization's exposure would be less than the sum of the CVA risks for each counterparty.

II. Standalone CVA Capital Requirement for Each Counterparty ($SCVA_c$)

$SCVA_c$ represents the capital requirement a banking organization would be subject to under the BA-CVA if a single counterparty were the only counterparty with which the banking

organization has CVA risk covered positions (that is ignoring the existence of the other counterparties), and there are no eligible CVA hedges to consider. For purposes of calculating $SCVA_c$, the proposal first would require a banking organization to calculate for each netting set the product of the effective maturity M_{NS} , the exposure at default amount EAD_{NS} , and the regulatory discount factor DF_{NS} , and sum the resulting products across all netting sets with the same counterparty. The banking organization would multiply the resulting quantity for each counterparty by the supervisory risk weight of the counterparty RW_c from Table 1 to § _____.222 and divide by alpha (α), discussed below, as expressed by the following formula:⁴⁸⁹

$$SCVA_c = \frac{1}{\alpha} \cdot RW_c \cdot \sum_{NS} (M_{NS} \cdot EAD_{NS} \cdot DF_{NS})$$

The proposal would set the exposure at default amount, EAD_{NS} , for the

netting set, NS , equal to the exposure amount calculated by the banking

organization for the same netting set for counterparty credit risk capital

⁴⁸⁸ Suppose, for example, that a banking organization perfectly offsets the counterparty credit spread component of CVA risk, so that $K_{hedged} = 0$. Allowing the banking organization to set the

BA-CVA to zero in this case would not be prudent because there is also the exposure component of CVA risk, which is not explicitly captured by the BA-CVA.

⁴⁸⁹ The above formula for $SCVA_c$ is a simplified representation of how the expected shortfall of the counterparty credit spread component of CVA risk of a single counterparty can be calculated.

requirements according to § ____ . 34 of the current rule or § ____ . 113 of the proposal,⁴⁹⁰ which captures the potential losses in the event of the counterparty's default. The effective maturity of the netting set, M_{NS} , would equal the weighted-average remaining maturity, measured in whole or fractional years, of the individual CVA risk covered positions in the netting set, NS , with the weight of each individual position set equal to the ratio of the notional amount of the position to the aggregate notional amount of all CVA risk covered positions in the netting set.⁴⁹¹ As the proposal would define the effective maturity of a netting set as an average of the actual CVA risk covered position maturities, the regulatory discount factor, DF_{NS} , would scale down the potential losses projected over the effective maturity of the netting set to their net present value, using a 5 percent interest rate. The proposed interest rate would be a reasonable

discount factor and generally consistent with historical long-term interest rates. The proposal would define components of the SCVA_c calculation at a netting set level, thus clarifying the use of counterparty-level exposure at default and effective maturity calculated in the same way as the banking organization calculates it for minimum capital requirements for counterparty credit risk.

A. Supervisory Risk Weights (RW_c)

Table 1 to § ____ .222 of the proposed rule provides the proposed supervisory risk weights for each counterparty, RW_c , which reflect the potential variability of credit spreads based on a combination of the sector and credit quality of the counterparty or of the eligible hedge reference entity. With the exception of sovereign exposures, specified supranational entities, and MDBs, each sector would have two risk weights, one for counterparties that are investment grade, as defined in the current rule,⁴⁹²

and one for counterparties that are speculative grade or sub-speculative grade, each as defined in the proposal.⁴⁹³ Sovereign exposures, specified supranational entities, and MDBs would have separate risk weights for counterparties that are speculative grade and counterparties that are sub-speculative grade. The proposed supervisory risk weights match the risk weights set out in the SA-CVA for counterparty credit spread risk class.

The proposal would provide counterparty sectors generally similar to those contained in the Basel standards and a treatment for certain U.S.-specific counterparties (for example, GSEs and public sector entities). Specifically, the proposal would group GSEs and public sector entities (PSEs) with government-backed non-financials, education and public administration to appropriately reflect the potential variability in the credit spreads of such counterparties, as shown in Table 1 to § ____ .222 below.

Table 1 to § ____ .222 Supervisory Risk Weights, RW_c

Sector of counterparty	Credit quality of counterparty		
	Investment grade	Speculative grade / sub-speculative grade	
Sovereign exposures, MDBs, and specified supranational entities	0.5%	3.0%	7.0%
PSEs, ⁴⁹⁴ government-backed non-financials, GSEs, education, and public administration	1.0%	4.0%	
Financials including government-backed financials	5.0%	12.0%	
Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	3.0%	7.0%	
Consumer goods and services, transportation and storage, administrative and support service activities	3.0%	8.5%	
Technology and telecommunications	2.0%	5.5%	
Health care, utilities, professional and technical activities	1.5%	5.0%	
Other sector	5.0%	12.0%	

Counterparty credit spread risk for financial entities is a large component of CVA-related capital requirements and the financial sector bucket comprises a broad category of financial entities including financial institutions as defined in the capital rule,⁴⁹⁵ mutual funds, pension funds, registered

investment companies, hedge funds, and other financial entities. Although regulated financial entities have many similar characteristics to other financial entities, such as hedge funds and private equity funds, they also differ in ways that may significantly affect CVA risk. For example, regulated financial

entities typically differ from other financial entities in capital structure, scope and risk of activities, regulatory frameworks, and are also subject to robust disclosure requirements, regulatory oversight, or supervision. Therefore, regulated financial entities may present a different risk profile for

⁴⁹⁰ Under the proposal, banking organizations that would be subject to the proposed expanded risk-based approach or that have elected to use SA-CCR to calculate counterparty credit risk exposure amounts would be required to use the *Exposure Amount* for the single product netting set or the *Exposure Amount_{derivatives}* for cross-product netting set calculated under SA-CCR for purposes of EAD_{NS} within the proposed BA-CVA approach. See § ____ .34 of the current rule or § ____ .113 through § ____ .114 of the proposed rule, as applicable. All other banking organizations would be required to

use the exposure amount produced by the current exposure methodology for purposes of EAD_{NS} within the proposed BA-CVA approach.

⁴⁹¹ For a netting set consisting of a single transaction (for example, a derivative contract that is not subject to a qualifying master netting agreement, the effective maturity would equal the remaining contractual maturity of the derivative contract.

⁴⁹² See the definition of Investment Grade in the capital rule. 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁴⁹³ See the definitions of Speculative Grade and Sub-Speculative Grade in § ____ .2 of the proposed rule.

⁴⁹⁴ Under § ____ .2 of the current capital rule, *public sector entity (PSE)* means a state, local authority, or other governmental subdivision below the sovereign level.

⁴⁹⁵ See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

purposes of CVA risk compared to other financial entities and the agencies are seeking comments on a potential modification to the proposed supervisory risk weights that would introduce separate supervisory risk weights for counterparty credit spread risk within the financial sector bucket to reflect potential differences in risk profiles between regulated financial entities and other financial entities. The agencies seek feedback on the appropriateness of assigning lower supervisory risk weights (such as a range between 3 and 5 percent for investment grade and a range between 8.5 and 12 percent for speculative or sub-speculative) to certain regulated financial entities to better differentiate risk profiles of the various types of entities within the financial sector bucket.⁴⁹⁶ The agencies seek feedback on whether these additional supervisory risk weights would enhance the risk-sensitivity of the CVA risk capital requirement by better capturing differences in the risk profiles of the various entities within the financials sector bucket.

Question 184: The agencies seek comments on the appropriateness of the proposed risk weights of Table 1 to § _____.222 for financials, including government-backed financials. What, if any, alternative risk weights should the agencies consider? What are the advantages and disadvantages of subjecting regulated financial entities (such as banks, insurance companies, broker-dealers, pension funds, and registered investment companies or their foreign equivalents) to lower risk weights? Please provide specific details and supporting evidence on the alternative risk weights.

Question 185: The agencies seek comments on the appropriateness of

treating the counterparty credit risks of public-sector entities and the GSEs in the same way as those of government-backed non-financials, education, and public administration entities. What, if any, alternatives should the agencies consider to more appropriately capture the counterparty credit risk for such entities?

Question 186: The agencies seek comments on the appropriateness of applying a 0.65 calibration factor in the formula setting the capital requirement under the BA-CVA to ensure that CVA risk capital requirements appropriately reflect CVA risk. What other level of calibration should the agencies consider and why? If IMM were retained as a method to calculate the capital requirements for counterparty credit risk, what if any adjustments to the multiplier should the agencies consider to reflect the generally reduced capital requirements for banking organizations that use IMM for purposes of calculating the BA-CVA?

B. Alpha Factor (α)

As previously discussed, when calculating a standalone CVA counterparty-level capital requirement, the proposal would require a banking organization to use the exposure amount that it uses in the counterparty credit risk framework. The exposure amount determined in the counterparty credit risk framework under SA-CCR would be the sum of replacement cost and potential future exposure multiplied by a multiplication factor (the alpha factor) to capture certain risks (for example, wrong-way risk⁴⁹⁷ and risks resulting from non-perfect granularity).⁴⁹⁸ CVA calculations are based on expected exposure, which in SA-CCR is proxied by the sum of replacement cost and potential future exposure. Accordingly,

the proposal would remove the effect of this multiplication factor from the risk-based capital requirement for CVA risk by dividing the exposure at default amount used in the $SCVA_c$ formula by the alpha factor. Specifically, the proposal would require such banking organization to use the same alpha factor in calculating the risk-based capital required under the BA-CVA as required in exposure amount calculations under SA-CCR by setting the alpha factor at 1.4 for derivative contracts with counterparties that are not commercial end-users and at 1 for derivative contracts with counterparties that are commercial end-users.

Unlike SA-CCR, the exposure amount determined in the counterparty credit risk framework under the current exposure methodology does not reflect a multiplication factor. Accordingly, the proposal would set the alpha factor equal to 1 for banking organizations that use the current exposure methodology to calculate exposure amount in the counterparty credit risk framework.

Question 187: The agencies seek comment on using the counterparty credit risk framework to calculate the exposure amount for the standalone CVA counterparty-level capital requirement. Does the CVA capital requirement pose particular issues in the case of nonfinancial counterparties? If so, what modifications should the agencies consider to mitigate such issues?

ii. Calculation of K_{hedged}

The second component of the BA-CVA calculation, K_{hedged} , represents the risk-based capital requirements for CVA risk after recognizing the risk mitigation benefits of eligible CVA hedges, as expressed by the following formula:

$$K_{hedged} = \sqrt{\left(\rho \cdot \sum_c (SCVA_c - SNH_c) - IH\right)^2 + (1 - \rho^2) \cdot \sum_c (SCVA_c - SNH_c)^2 + \sum_c HMA_c}$$

⁴⁹⁶ For example, banks, insurance companies, broker-dealers, pension funds, and investment companies registered with the SEC under the 1940 Act or foreign equivalents thereof (registered investment companies).

⁴⁹⁷ Wrong-way risk reflects the situation where exposure is positively correlated with the

counterparty's probability of default—that is, the exposure amount of the derivative contract increases as the counterparty's probability of default increases.

⁴⁹⁸ See 85 FR 4362 (Jan. 24, 2020). Under SA-CCR, the alpha factor generally is set at 1.4. However, for a derivative contract with a

commercial end-user counterparty, the alpha factor is removed from the exposure amount formula. This is equivalent to applying an alpha factor of 1 to these contracts.

In general, the calculation of K_{hedged} follows that of $K_{unhedged}$, but introduces new terms to reflect the risk-mitigating effect of eligible CVA hedges.⁴⁹⁹ The first term, $((\rho \cdot \Sigma_c(SCVA_c - SNH_c) - IH)^2)$, recognizes the risk mitigating effect of single-name hedges (SNH_c) and index hedges (IH) on the systematic component of a banking organization's aggregate CVA risk. The second term, $((1 - \rho^2) \cdot \Sigma_c(SCVA_c - SNH_c)^2)$, recognizes the risk mitigating effect of single-name hedges on the aggregate idiosyncratic component of aggregate CVA risk. The third term, $\Sigma_c HMA_c$, aggregates the components of indirect single-name hedges that are not aligned with

counterparty credit spreads and is designed to limit the regulatory capital reduction a banking organization may realize from indirect hedges given that such hedges will not fully offset movements in a counterparty's credit spread (that is, indirect hedges cannot reduce K_{hedged} to zero).

I. Single-Name Hedges of Credit Spread Risk (SNH_c)

Under the proposal, to calculate the capital reduction for a single-name hedging instrument, a banking organization would multiply the supervisory prescribed correlation (r_{hc}) between the credit spread of the counterparty and the hedging

instrument, the supervisory risk weight of the reference name of the hedging instrument (RW_h), the remaining maturity of the hedging instrument in years (M_h^{SN}), the notional amount of the hedging instrument (B_h^{SN})⁵⁰⁰ and the supervisory discount factor (DF_h^{SN}). The offsetting benefit of all single-name hedges of credit spread risk on the CVA risk of each counterparty (SNH_c) would equal the simple sum of the capital reduction for each eligible CVA hedge that a banking organization uses to hedge the counterparty credit spread component of CVA risk of a given counterparty as expressed by the following formula:

$$SNH_c = \sum_{h \in c} (r_{hc} \cdot RW_h \cdot M_h^{SN} \cdot B_h^{SN} \cdot DF_h^{SN})$$

Risk weights (RW_h) would be based on a combination of the sector and the credit quality of the reference name of the hedging instrument as prescribed in

Table 1 to § _____.222 included above. Parameter r_{hc} is the regulatory value of the correlation between the credit spread of the counterparty and the

credit spread of the reference name of an eligible single-name hedge as prescribed in Table 2 to § _____.222 below.

Table 2 to § _____.222—Correlations Between Credit Spread of Counterparty, c , and a Single-Name Hedge, h

Single-name hedge, h , of counterparty, c	Value of r_{hc}
References counterparty, c , directly	100%
References an affiliate of counterparty, c	80%
References an entity that belongs to the same sector and region as the counterparty, c	50%

II. Hedge Mismatch Adjustment for Indirect Single-Name Hedges (HMA_c)

Under the proposal, the portion of the indirect hedges that are not recognized

in SNH_c due to the imperfect regulatory prescribed correlation would be reflected in the hedge mismatch

adjustment, HMA_c , as expressed by the following formula:

$$HMA_c = \sum_{h \in c} ((1 - r_{hc}^2) \cdot (RW_h \cdot M_h^{SN} \cdot B_h^{SN} \cdot DF_h^{SN})^2)$$

While the summation would cover all single-name hedges assigned to counterparty c , only indirect hedges for which correlation with the counterparty spread is non-perfect (that is, the regulatory prescribed correlation (r_{hc}) is less than one) would contribute to HMA_c .

III. Index Hedges of Credit Spread Risk (IH)

Under the proposal, the total amount by which index hedges of credit spread risk reduce the systematic component of the aggregate CVA risk across all counterparties, IH , would equal the simple sum of the capital reduction

amounts for eligible CVA hedges that are index hedges, which would be calculated for each such hedge as the product of the supervisory risk weight (RW_i), the remaining maturity in years (M_i^{ind}), notional amount (B_i^{ind}), and the supervisory discount factor (DF_i^{ind}), as expressed by the following formula:

⁴⁹⁹ The standalone CVA capital, $SCVA_c$, and regulatory correlation parameter, ρ , are defined in exactly the same way as in the formula for CVA risk

covered positions $K_{unhedged}$. See section V.B.5.a.i. of this **SUPPLEMENTARY INFORMATION**.

⁵⁰⁰ Under the proposal, the notional amount for single-name contingent CDS would be determined by the current market value of the reference portfolio or instrument.

$$IH = \sum_i (RW_i \cdot M_i^{ind} \cdot B_i^{ind} \cdot DF_i^{ind})$$

Each term in the summation in the formula for IH above is a simplified representation of how the expected shortfall for the market value of a given index hedge can be calculated. Because of the BA-CVA's underlying assumption that each credit index is driven by the same systematic factor without any idiosyncratic risk component, the expected shortfall of each individual index hedge would be aggregated via simple summation across all such hedges, and the result of this aggregation (IH) would appear only in the systematic risk component in the formula for K_{hedged} above.

To determine the appropriate supervisory risk weight (RW_i) for each index hedge, the proposal would require a banking organization to adjust the supervisory risk weights in Table 1 to § _____.222. Specifically, for index hedges where all the underlying constituents belong to the same sector and are of the same credit quality, a banking organization would assign the index hedge to the corresponding bucket used for single-name positions and multiply the supervisory risk weight by 0.7. For index hedges where the underlying constituents span multiple sectors or are not of the same credit quality, the banking organization would calculate the notional-weighted average of the risk weights assigned to each underlying constituent in the index based on the risk weights provided in Table 1 to § _____.222 and multiply the result by 0.7. Multiplication by a factor of 0.7 is intended to recognize diversification of idiosyncratic risk of individual index constituents.

b. Standardized Approach for CVA Risk

The SA-CVA is an adaptation of the sensitivities-based method used in the standardized measure for market risk as described in section V.A.7.a. of this **SUPPLEMENTARY INFORMATION**. The inputs to the SA-CVA calculations are sensitivities of the aggregate regulatory CVA (discussed in the following subsection) and of the market value of all eligible CVA hedges under SA-CVA (discussed below in this section) to delta and vega risk factors specified in the proposal. In general, the proposed SA-CVA would closely follow the sensitivities-based method for market risk with some exceptions. Broadly, the SA-CVA calculation would reflect capital requirements for only delta and vega (but not curvature), apply slightly

different steps in the calculation of the risk-weighted net sensitivity, use less granular risk factors and buckets, and include a capital multiplier to account for model risk.

There are other specific differences between the SA-CVA and the sensitivities-based method for market risk. Unlike the market risk of trading instruments, CVA risk always depends on two types of risk factors: the term structure of credit spreads of the counterparty and a set of market risk factors that drives the expected exposure of the banking organization to the counterparty. For this reason, the SA-CVA would have six distinct risk classes for the CVA delta capital requirement: counterparty credit spread and the five risk classes for exposure-related market risk factors which are the interest rate, foreign exchange, reference credit spread, equity, and commodity risk classes. Regulatory CVA is approximately linear in counterparty credit spreads and does not depend on their volatilities. Accordingly, calculation of the CVA vega capital requirement would not be required in the counterparty credit spread risk class. Expected exposure, on the other hand, is always sensitive to volatilities of market risk factors that drive market values of CVA risk covered positions. Because of this, a banking organization would be required to calculate the CVA vega capital requirements for the five exposure-related risk classes regardless of the presence of options in CVA risk covered positions.

Regulatory CVA would require simulating future exposure that depends on multiple market risk factors over long time horizons. Calculation of each CVA sensitivity to an exposure-related market risk factor would involve a separate regulatory CVA calculation, which could limit the number of CVA sensitivities to market risk factors that a banking organization could realistically calculate. Accordingly, the agencies would reduce the granularity of both delta and vega risk factors in the five exposure-related risk classes in the SA-CVA compared to the sensitivities-based method for market risk. Curvature calculations would not be required. For the five exposure-related risk classes, the SA-CVA would use the same buckets, regulatory risk weight calibrations, and correlation parameters as are used in the sensitivities-based method for market risk, with necessary

adjustments for the SA-CVA's reduced granularity of market risk factors.

In contrast to market risk factors that drive exposure, CVA sensitivities to counterparty credit spreads can be calculated based on a single regulatory CVA calculation. In the counterparty credit spread risk class, the SA-CVA would use the same granularity of risk factors as are used in the sensitivities-based method for market risk. Vega and curvature calculations would not be required in the counterparty credit spread risk class because regulatory CVA would be approximately linear with respect to counterparty credit spreads. For counterparty credit spreads, the SA-CVA would adjust buckets and correlations based on the role that counterparty credit spreads play in CVA calculations.

i. Regulatory CVA

Under the proposal, the aggregate regulatory CVA would equal the simple sum of counterparty-level regulatory CVAs. Counterparty-level regulatory CVA is intended to reflect an estimate of the market expectation of future loss that a banking organization would incur on its portfolio of derivatives with a counterparty in the event of the counterparty's default, assuming that the banking organization survives until the maturity of the longest instrument in the portfolio. For consistency in the calculation of risk-based capital across banking organizations, the proposal would require a banking organization to apply a positive sign to non-zero losses, so that regulatory CVA is always a positive quantity. The proposal would require a banking organization to base the calculation of regulatory CVA for each counterparty on at least three sets of inputs: the term structure of market-implied probability of default (market-implied PD) of the counterparty, the market-consensus expected loss-given-default (ELGD), and the simulated paths of discounted future exposure. In addition to the three specified inputs, the proposal would also allow a banking organization to use models that incorporate additional inputs for purposes of calculating regulatory CVA.

I. Term Structure of Market-Implied PD

The proposal would require a banking organization to use credit spreads observed in the markets, if available, to estimate the term structure of the market-implied PD based on market expectations of the likelihood that the

counterparty will default by a certain point in the future. Relative to historical default probabilities, market-implied PDs are typically substantially higher as they reflect the premium that investors demand for accepting default risk.

As many counterparties' credit is not actively traded, the proposal would allow a banking organization to use proxies to estimate the term structure of market-implied PD. For these illiquid counterparties, a banking organization would be required to estimate proxy credit spreads from credit spreads observed in the market for the counterparty's liquid peers, determined using, at a minimum, credit quality, industry, and region. Alternatively, the proposal would permit a banking organization to map an illiquid counterparty to a single liquid reference name if the banking organization demonstrates to its primary Federal supervisor the appropriateness of such mapping.⁵⁰¹ In addition, for illiquid counterparties for which there are no available credit spreads of liquid peers, the proposal would permit a banking organization to use an estimate of credit risk to proxy the credit spread of an illiquid counterparty (for example, to use a more fundamental analysis of credit risk based on balance sheet information or other approaches). While historical default probabilities may form part of this analysis, the resulting spread would have to relate to credit markets as well. This requirement would help ensure that the estimated term structure of market-implied PD reflects the market risk premium for counterparty credit risk.

II. Market-Consensus ELGD

In general, the proposal would require a banking organization to use the market-consensus ELGD value that is used to calculate the market-implied PDs from the counterparty's credit spreads. The fraction of exposure that a banking organization would lose in the event of a counterparty default (that is, loss given default) depends on the seniority of the derivative contracts that the banking organization has with the counterparty at the time of default. Most CDS contracts, which are used to calculate the market-implied PD, allow for delivery of senior unsecured bonds and thus have the same seniority as senior unsecured bonds in bankruptcy. By generally requiring a banking organization to use the same market-

consensus ELGD as the one used in calculations of the market-implied PD from the credit spreads, the proposal would require a banking organization to generally assume that derivative contracts' seniority is the same as the seniority of senior unsecured bonds. If a banking organization's derivative contracts with the counterparty are more or less senior to senior unsecured bonds, the proposal would allow a banking organization to adjust the market-consensus ELGD to appropriately reflect the lower or higher losses arising from such exposures. However, the proposal would not allow a banking organization to use collateral provided by the counterparty as the justification for changing the market-consensus ELGD as the banking organization would already have considered collateral in determining its exposure to the counterparty.

III. Simulated Paths of Discounted Future Exposure

To align regulatory CVA with industry practices, the regulatory CVA calculation in the SA-CVA would generally be based on the exposure models that a banking organization uses to calculate CVA for purposes of financial reporting. Specifically, a banking organization would obtain the simulated paths of discounted future exposure by using the exposure models the banking organization uses for calculating CVA for financial reporting, adjusted, if needed, to meet the requirements imposed for the regulatory CVA calculation, as described below. The proposal would require that these exposure models be subject to the same model calibration processes (with the exception of the margin period of risk, which would have to meet the regulatory floors), and use the same market and transaction data as the exposure models that the banking organization uses for calculating CVA for financial reporting purposes.

To produce the simulated paths of discounted future exposure, a banking organization would price all standardized CVA risk covered positions with the counterparty along simulated paths of relevant market risk factors and discount the prices to today using risk-free interest rates along the path. The banking organization would be required to simulate all market risk factors material to the transactions as stochastic processes for an appropriate number of paths defined on an appropriate set of future time points extending to the maturity of the longest transaction. The proposal would require drifts of risk factors to be consistent with a risk-neutral probability measure

and would not permit historical calibration of drifts. The banking organization would be required to calibrate volatilities and correlations of market risk factors to current market data whenever sufficient data exist in a given market, although the proposal would permit a banking organization to use historical calibrations of volatilities and correlations if sufficient current market data are not available. A banking organization's assumed distributions for modelled risk factors would be required to account for the possible non-normality of the distribution of exposures, including the existence of leptokurtosis (that is, "fat tails"), where appropriate. The banking organization would be required to use the same netting recognition as in its CVA calculations for financial reporting. Where a transaction has a significant level of dependence between exposure and the counterparty's credit quality, the banking organization would be required to take this dependence into account.

The proposal would permit a banking organization to recognize financial collateral as a risk mitigant for margined counterparties if the financial collateral would be included in the net independent collateral amount or variation margin amount and the collateral management requirements in SA-CCR are satisfied.

The proposal would require that (1) simulated paths of discounted future exposure capture the effects of margining collateral that is recognized as a risk mitigant along each exposure path; and (2) the exposure model appropriately captures all the relevant contractual features such as the nature of the margin agreement (that is, unilateral versus bilateral), the frequency of margin calls, the type of collateral, thresholds, independent amounts, initial margins, and minimum transfer amounts.⁵⁰² To determine collateral available to a banking organization at a given exposure measurement time, the proposal would require a banking organization's exposure model to assume that the counterparty will not post or return any collateral within a certain time period immediately prior to that time, known as the margin period of risk (MPoR). The proposal specifies a minimum length of time for the MPoR. For all CVA risk covered positions, the minimum MPoR is equal to 9 + N business days, or 10 business days for margin agreements

⁵⁰¹ For example, a banking organization may be permitted to use the credit spread curve of the home country as a proxy for that of a municipality in the home country (that is, setting the municipality credit spread equal to the sovereign credit spread plus a premium).

⁵⁰² Minimum transfer amount means the smallest amount of variation margin that may be transferred between counterparties to a netting set pursuant to the variation margin agreement.

with daily or intra-daily exchange of margin.

ii. Calculation of the SA-CVA Approach

Conceptually, the proposed SA-CVA approach is similar to the proposed sensitivities-based method under the market risk framework, as described in section V.A.7.a. of this **SUPPLEMENTARY INFORMATION**, in that a banking organization would estimate the changes in regulatory CVA arising from CVA risk covered positions and, if applicable, eligible CVA hedges resulting from applying standardized shocks to the relevant risk factors. As in the case of the proposed sensitivities-based method, to help ensure consistency in the application of risk-based capital requirements across banking organizations, the proposal would establish the applicable risk factors, the method to calculate the sensitivity of regulatory CVA and CVA hedges to each of the prescribed risk factors, the shock applied to each risk factor, and the process for aggregating the net weighted sensitivities within each risk class and across risk classes to arrive at the total CVA risk-based capital requirement for the portfolio under the SA-CVA. First, under the proposal, a banking organization would identify one or more of the specified risk classes that, in addition to counterparty credit spread risk class, would be applicable to its CVA risk covered positions and its CVA hedges. Based on standard industry classifications, the proposed exposure-related risk classes represent the common, yet distinct market variables that impact the value of CVA risk covered positions and CVA hedges. The proposed sensitivity calculations for delta and vega risk factors would estimate how much the aggregate regulatory CVA arising from CVA risk covered positions and separately the market value of all standardized CVA hedges would change as a result of a small change in a given risk factor, while all other relevant risk factors remain constant. For the sensitivity calculation, a banking organization would be able to use either the standard risk factor shifts or smaller values of risk factor changes, if such smaller values are consistent with those used by the banking organization for internal risk management.

Second, for each delta (and, separately, vega) risk factor, the banking organization would multiply the measured sensitivity of the aggregate CVA arising from CVA risk covered positions to that risk factor and, separately, that of the market value of the aggregate eligible CVA hedges to that risk factor by the standardized risk

weight proposed for that risk factor. A banking organization would then subtract the resulting weighted sensitivity for the eligible CVA hedges from the weighted sensitivity for the aggregate CVA arising from the CVA risk covered positions to obtain the net weighted sensitivity to a given risk factor. The agencies intend the proposed risk weights to capture the amount that a risk factor would be expected to move during the liquidity horizon of the risk factor in stress conditions and generally would be consistent with the risk weights in the proposed sensitivities-based method for market risk outlined in section V.A.7.a.iii. of the **SUPPLEMENTARY INFORMATION**.

Third, to aggregate CVA risk contributions of individual risk factors, the proposal would provide aggregation formulas for calculating the total delta and vega capital requirements for the entire CVA portfolio. Within each risk class, the proposal would group similar risk factors into buckets. Similar to the sensitivities-based method for market risk, a banking organization would aggregate the net risk-weighted sensitivities for delta (and, separately, for vega) risk factors first within each bucket and then across buckets within each risk class using the prescribed aggregation formulas to produce the respective delta and vega risk-based capital requirements. The agencies' intention is that the aggregation formulas limit offsetting and diversification benefits via the prescribed correlation parameters. Under the proposal, the correlation parameters specified for each risk factor pair would limit the risk-mitigating benefit of hedges and diversification, given that the hedge relationship between the underlying position and the hedge as well as the relationship between different types of positions could decrease or become less effective in a time of stress.

Fourth, a banking organization would aggregate the resulting delta and vega risk-class-level capital requirements as the simple sum across risk classes with no recognition of any diversification benefits because in stress, diversification across different risk classes may become less effective.

Finally, the overall risk-based capital requirement for CVA risk would be the simple sum of the separately calculated delta and vega capital requirements without recognition of any diversification benefits as these measures are intended to capture different types of risk and because in stress, diversification may become less effective.

I. Delta and Vega

To appropriately capture linear CVA risks, the proposal would require a banking organization to separately calculate the risk-based capital requirements for delta and vega using the above steps. As the sensitivity to vega risk is always material for CVA (as discussed further below), the proposal would require a banking organization to always measure the sensitivity of regulatory CVA to vega risk factors, regardless of whether the CVA risk covered positions include positions with optionality. When a banking organization calculates the sensitivity of regulatory CVA to a vega risk factor, it would apply the appropriate volatility shift to both types of volatilities that appear in exposure models: volatilities used for generating risk factor paths and volatilities used for pricing options.

II. Risk Classes

Under the proposal, a banking organization would be required to identify all of the relevant risk factors for which it would calculate sensitivities for delta risk and vega risk. Based on the identified risk factors, a banking organization would be required to identify the corresponding buckets within relevant risk classes. The CVA of a single counterparty can be represented as the product of counterparty credit spread and expected exposure for various future time points, aggregated across these time points. Because of this structure, counterparty credit spread risk naturally presents itself as a separate delta risk class that is always present in CVA risk regardless of the type of CVA risk covered positions in the portfolio.⁵⁰³ The risk classes specified for delta and vega risk factors related to expected exposure under SA-CVA are generally consistent with those under the sensitivities-based method for market risk and include interest rate, foreign exchange, credit spread, equity, and commodity.

For credit spread risk, the proposal would specify two distinct risk classes that may share the same risk factors but would need to be treated separately: (i) counterparty credit spread risk; and (ii) reference credit spread risk. Reference credit spread risk would be defined as the risk of loss that could arise from changes in the underlying credit spread risk factors that drive the exposure component of CVA risk. For example, a banking organization could have a portfolio of derivatives with Firm X as

⁵⁰³ This is a fundamental distinction between CVA risk and market risk, which, in the latter case, is entirely determined by market risk covered positions.

a counterparty and, at the same time, have a CDS referencing credit of Firm X in a portfolio of derivatives with Firm Y. In such cases, under the SA-CVA, the same credit spreads of Firm X would be treated as distinct risk factors in two sets of sensitivity calculations: one within the counterparty credit spread risk class calculations, and the other within the reference credit spread risk class calculations. To incorporate credit spread hedges of CVA risk properly, each such hedge would be designated as either a counterparty credit spread hedge or a reference credit spread hedge and included only in one calculation according to the designation.

Each risk class used for delta would also apply to vega, except for counterparty credit spread risk. The regulatory CVA is approximately linear in counterparty credit spreads and does not depend on their volatilities. Accordingly, calculation of the CVA vega capital requirement would not be required in the counterparty credit spread risk class. On the other hand, expected exposure is always sensitive to volatilities of market risk factors that drive market values of CVA risk covered positions.⁵⁰⁴ Accordingly, for each of the five exposure-related risk classes, a banking organization would be required to compute vega risk factor sensitivities of the aggregate regulatory CVA, in addition to delta risk factor sensitivities, regardless of whether the portfolio includes options.

III. Risk Factors

Under the proposal, a banking organization would be required to identify all of the relevant risk factors for which it would calculate sensitivities for delta risk and vega risk. The proposed risk factors differ for each risk class to appropriately reflect the specific market risk variables relevant for each risk class.

To measure the impact of a small change in each of the risk factors on the aggregate regulatory CVA and the market value of eligible CVA hedges, the proposal would specify the sensitivity calculations that a banking organization may use to calculate the CVA sensitivity to small changes in each of the specified delta or vega risk factors, as

applicable.⁵⁰⁵ Specifically, for the equity, commodity, and foreign exchange delta risk factors, the sensitivity would equal the change in the aggregate regulatory CVA arising from CVA risk covered positions and separately the market value of all eligible CVA hedges due to a one percentage point increase in the delta risk factor divided by one percentage point. For the interest rate, counterparty credit spread, and reference credit spread delta risk factors, the sensitivity would equal the change in the aggregate regulatory CVA arising from CVA risk covered positions and separately the market value of all eligible CVA hedges due to a one basis point increase in the risk factor divided by one basis point. The sensitivity to a vega risk factor would equal the change in the aggregate regulatory CVA arising from CVA risk covered positions and separately the market value of all eligible CVA hedges due to a one percentage point increase in the volatility risk factor divided by one percentage point. When a banking organization calculates the sensitivity of regulatory CVA arising from CVA risk covered positions and separately of the market value of all eligible CVA hedges to a vega risk factor, the banking organization would apply the shift to the relevant volatility used for generating risk factor simulation paths for regulatory CVA calculations. If there are options in the portfolio with the counterparty, the shift would also be applied to the relevant volatility used to price options along the simulation paths.

In cases where a CVA risk covered position or an eligible CVA hedge references an index, the proposal would require a banking organization to calculate the sensitivities of the aggregate regulatory CVA arising from the CVA risk covered positions or the market value of the eligible CVA hedges to all risk factors upon which the value of the index depends. The sensitivity of the aggregate regulatory CVA or the market value of the eligible CVA hedges to a risk factor would be calculated by applying the shift of the risk factor to all index constituents that depend on this risk factor and recalculating the aggregate regulatory CVA or the market value of the eligible CVA hedges.

⁵⁰⁵ As previously noted, for the sensitivity calculation, a banking organization would be able to use either the standard risk factor shifts or smaller values of risk factor changes, if such smaller values are consistent with those used by the banking organization for internal risk management (for example, using infinitesimal values of risk factor shifts in combination with algorithmic differentiation techniques).

For the risk classes of counterparty credit spread risk, reference credit spread risk, and equity risk, the SA-CVA would allow a banking organization to introduce a set of additional risk factors that directly correspond to credit and equity indices.⁵⁰⁶ For a CVA risk covered position or an eligible CVA hedge whose underlying is an index, its contribution to sensitivities to the index constituents would be replaced with its contribution to a single sensitivity to the underlying index, provided that (1) for an index where at least 75 percent of notional value for credit indices or market value for equity indices of the index's constituents on a weighted basis are mapped to the same sector, the entire index would have to be mapped to that sector and treated as a single-name sensitivity in that bucket, and (2) in all other cases, the sensitivity would have to be mapped to the applicable index bucket. The proposal would provide this option because some popular credit and equity indices involve a large number of constituents⁵⁰⁷ and calculating sensitivities to each constituent may be impractical for such indices.

C. Counterparty Credit Spread Risk

The proposal would define the counterparty credit spread delta risk factors as the absolute shifts of credit spreads of individual entities (counterparties and reference names for counterparty credit spread hedges) and indices (under the optional treatment of indices) for the following tenors: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

In addition to single-name CVA counterparty credit spread hedges, banking organizations use index hedges to hedge the systematic component of counterparty credit spread risk. If an eligible CVA counterparty credit spread risk hedge references a credit index, a banking organization would be required to calculate delta sensitivities of the market value of all eligible CVA hedges of counterparty credit spread risk to the credit spread of each constituent entity included in the index. In these calculations, a banking organization would be required to shift the credit spread of each of the underlying constituents of the index while holding the credit spreads of all others constant.

⁵⁰⁶ If a banking organization chooses to introduce such additional risk factors, the banking organization would be required to calculate CVA sensitivities to the index risk factors in addition to sensitivities to the non-index risk factors.

⁵⁰⁷ For example, the credit index CDX has 125 constituents and the equity index S&P 500 has 500 constituents.

⁵⁰⁴ CVA expected exposure profile can be characterized as today's price of a call option on the portfolio market value at that time point (or on the increment of the portfolio market value over the MPoR for a margined portfolio). Since the price of an option depends both on the price and volatility of the underlying asset, both delta and vega risk factor sensitivities materially contribute to expected exposure variability, even when the portfolio of CVA risk covered positions with a counterparty does not include options.

The SA-CVA would offer an alternative, optional approach that introduces additional index risk factors for indices. Specifically, for each index referenced by eligible CVA counterparty credit spread risk hedges, delta risk factors would be absolute shifts of the index for the following tenor points: 0.5 years, 1 year, 3 years, 5 years, and 10 years. Under this optional approach, when a banking organization calculates sensitivities to single-name credit spread risk factors, the indices would remain unchanged. For each distinct credit index referenced by an eligible CVA counterparty credit spread risk hedge, the banking organization would perform a separate delta sensitivity calculation where the entire credit index is shifted. The index sensitivity calculations would only affect eligible CVA hedges of counterparty credit spread risk that reference the indices. This alternative is designed to reduce the complexity of constituent-by-constituent calculations, as many popular credit indices have more than a hundred constituents.

D. Risk Factors for Exposure-Related Risk Classes

As noted above, given the computational intensity of calculating the sensitivity of CVA to market risk factors and the less material impact of such risk factors on the volatility of CVA, the proposal would define the delta and vega risk factors for all five market risk classes (interest rate risk, foreign exchange risk, reference credit spread risk, equity risk, and commodity risk) in a much less granular way than under the sensitivity-based method for market risk.

1. Interest Rate Risk

For both delta and vega risk factors in the interest rate risk class, the proposal would define individual buckets by currency, which would consist of interest rate risk factors and inflation rate risk factors. For specified currencies (USD, EUR, GBP, AUD, CAD, SEK, or JPY), the delta interest rate risk factors would be defined as the simultaneous absolute change in all risk-free yields in a given currency at each specified tenor point (1 year, 2 years, 5 years, 10 years, and 30 years) and the absolute change in the inflation rate of a given currency. For all other currencies, the delta risk factors for interest rate risk would be defined along two dimensions: the simultaneous parallel shift in all risk-free yields in a given currency and the absolute change in the inflation rate of a given currency.

As the specified currencies are intended to capture the set of liquid

currencies that would likely dominate a banking organization's portfolios, the proposal would require a banking organization to identify and apply more granular delta risk factors for such exposures relative to those for all other currencies. Of the ten tenors used under the sensitivities-based method in market risk, the proposed five tenors are intended to capture the most commonly used tenors based on the liquidity in interest rate OTC derivative markets.

For all currencies, the interest rate vega risk factors for each currency would be defined along two dimensions: the simultaneous relative change of all interest rate volatilities for a given currency and the simultaneous relative change of all inflation rate volatilities for a given currency. For vega risk factors, the proposal would reduce the granularity in the tenor dimension in the same manner for all currencies given the computational intensity of calculating the vega risk sensitivity and the less material impact of such risk factors on the volatility of CVA.

2. Foreign Exchange Risk

The proposal would specify delta and vega buckets for foreign exchange risk as individual foreign currencies. For each foreign exchange bucket, the proposal would define one delta risk factor and one vega risk factor. Specifically, the proposal would define (1) the foreign exchange delta risk factor as the relative change in the foreign exchange spot rate⁵⁰⁸ between a given foreign currency and the reporting currency (or base currency); and (2) the foreign exchange vega risk factor as the simultaneous, relative change of all volatilities for an exchange rate between a banking organization's reporting currency (or base currency) and another given currency. For transactions that reference an exchange rate between a pair of non-reporting currencies, the sensitivities to the foreign exchange spot rates between the bank's reporting currency and each of the referenced non-reporting currencies must be measured.

3. Reference Credit Spread Risk

The proposal would define buckets for the delta and vega risk factors by sector and credit quality which is consistent with the definitions of buckets for non-securitization credit spread risk that are used in the proposed sensitivities-based method for market risk. The proposal would define

⁵⁰⁸ Under the proposal, the foreign exchange spot rate would be defined for purposes of CVA risk as the current market price of one unit of another currency expressed in the units of the banking organization's reporting (or base) currency.

one reference credit spread risk factor per delta or vega bucket under the SA-CVA. Specifically, the proposal would define (1) the delta risk factor as the simultaneous absolute shift of all credit spreads of all tenors for all reference entities in the bucket; and (2) the vega risk factor as the simultaneous relative shift of the volatilities of all credit spreads of all tenors for all reference entities in the bucket. In addition, similar to the counterparty credit spread risk as described above in section V.B.5.b.ii.III.A. of this **SUPPLEMENTARY INFORMATION**, the SA-CVA would offer an alternative, optional approach that introduces additional index risk factors for qualified indices and allows a banking organization to calculate delta and vega sensitivities of aggregate regulatory CVA and eligible CVA hedges with respect to the qualified indices instead of each constituent of the indices.

4. Equity Risk

The proposal would set the buckets for delta and vega risk factors generally matching the buckets for equity risk in the proposed sensitivities-based method for market risk. The proposal would define one equity risk factor per delta or vega bucket to reduce the complexity of calculating CVA sensitivities to equity risk factors. The proposal would define (1) the delta risk factor as the simultaneous relative change of all equity spot prices for all entities in the bucket and (2) the vega risk factor as the simultaneous relative change of all equity price volatilities for all entities in the bucket. In addition, similarly to the counterparty credit spread risk and reference credit spread risk as described in sections V.B.5.b.ii.III.A. and V.B.5.b.ii.III.B.3. of this **SUPPLEMENTARY INFORMATION**, the SA-CVA would offer an alternative, optional approach that introduces additional index risk factors for qualified indices and allows a banking organization to calculate delta and vega sensitivities of aggregate regulatory CVA and eligible CVA hedges with respect to the qualified indices instead of each constituent of the indices.

5. Commodity Risk

The proposal would set the buckets for delta and vega risk factors matching the buckets for commodity risk in the proposed sensitivities-based method for market risk. The proposal would define one commodity risk factor per delta or vega bucket under the SA-CVA. Specifically, the proposal would define (1) the delta risk factor as the simultaneous relative shift of all commodity spot prices for all

commodities in the bucket and (2) the vega risk factor as the simultaneous relative shift of all commodity price volatilities for all commodities in the bucket.

IV. Buckets, Risk Weights, and Correlations

As noted above, there are six risk classes for delta risk factors in the SA-CVA: the counterparty credit spread risk class and the five risk classes for market risk factors that drive expected exposure (interest rate, foreign exchange, reference credit spread, equity, and commodity). In addition, there are five exposure-related risk classes for vega risk factors. The granularity of risk factors in the counterparty credit spread risk class matches the one in the non-securitization credit spread risk class in the sensitivities-based method for market risk, while the granularity of both delta and vega risk factors in the exposure-related risk classes is greatly reduced.

A. Exposure-Related Risk Classes

The exposure component of regulatory CVA of a portfolio of CVA risk covered positions is affected by delta and vega market risk factors in a similar way as a portfolio of options on future market values (or their increments). Therefore, there is no compelling reason for the exposure-related risk classes in the SA-CVA to deviate from the bucket structure, risk weights, and correlations used in the corresponding risk classes in the sensitivities-based method for market risk, except for accommodating the reduced granularity of exposure-related risk factors in the SA-CVA. Accordingly, for both delta and vega risk factors in the exposure-related risk classes, the SA-CVA would use the bucket structure that matches the bucket structure of the corresponding risk classes in the sensitivities-based method for market risk. Furthermore, the proposal would set the values of all cross-bucket correlations, γ_{bc} , used for aggregation of bucket-level capital requirements across buckets within each exposure-related risk class equal to the corresponding values used in the sensitivities-based method for market risk.

For the foreign exchange, reference credit spread, equity, and commodity risk classes, the SA-CVA would assign one delta (and, separately, one vega) risk factor per bucket. Therefore, in contrast to the sensitivities-based method for market risk, the SA-CVA does not need to provide intra-bucket correlations, ρ_{kl} , for these risk classes. Furthermore, because the sensitivities-based method

for market risk provides no more than one risk weight per bucket for the corresponding risk classes (foreign exchange, non-securitization credit spread, equity, and commodity), the SA-CVA would generally match the values of these risk weights for both delta and vega risk factors.⁵⁰⁹

For the interest rate risk class, similar to the market risk, the SA-CVA would have two groups of buckets/currencies: the “specified” currencies (USD, EUR, GBP, AUD, CAD, SEK, and JPY) and the other currencies. However, while in the sensitivities-based method for market risk the two groups only differ in the values of the risk weights (the risk weights can be divided by $\sqrt{2}$ when applied to the specified currencies), in the SA-CVA they would differ both in the value of risk weights and in the level of granularity for delta risk factors. As mentioned above, the SA-CVA would specify delta risk factors for the specified currencies as the absolute changes of the inflation rate and of the risk-free yields for the following five tenors: 1 year, 2 years, 5 years, 10 years, and 30 years. Risk weights for these risk factors would be set approximately equal to the risk weights for the inflation rate and for the corresponding tenors of risk-free yields in the sensitivities-based method for market risk divided by $\sqrt{2}$. The intra-bucket correlations, ρ_{kl} , for the specified currencies in the SA-CVA would approximately match the ones between the corresponding tenors and the inflation rate in the sensitivities-based method for market risk. For each of the non-specified currencies, the SA-CVA would provide two delta risk factors per bucket/currency: the absolute change of the inflation rate and the parallel shift of the entire risk-free yield curve for a given currency. The risk weights for these risk factors would approximately match the ones for the inflation rate and for the 1-year risk free yield in the sensitivities-based method for market risk. The intra-bucket correlation between the two risk factors for the non-specified currencies would be set equal to the value of the correlation between the inflation rate and any tenor of the risk-free yield specified in the sensitivities-based method for market risk. As stated above, the SA-CVA would specify two vega risk factors for the interest rate risk class for each bucket/currency: a simultaneous

relative change of all inflation rate volatilities and a simultaneous relative change of all interest rate volatilities for a given currency. The SA-CVA would set the vega risk weights for both risk factors equal to the single value of the vega risk weight used for all interest rate vega risk factors in the sensitivities-based method for market risk. The SA-CVA would set the only intra-bucket interest rate vega correlation equal to the value of the SA-CVA intra-bucket interest rate delta correlation for the non-specified currencies.

Question 188: The agencies seek comment on the appropriateness of the proposed buckets, risk weights, and correlations for the exposure-related risk classes. What, if any, alternative bucketing structures, risk weights, or correlations should the agencies consider and why?

B. Counterparty Credit Spread Risk Class

Fundamentally, counterparty credit spreads are no different from reference credit spreads and, therefore, should follow the same dynamics. While the common dynamics might suggest using the same set of buckets for counterparty credit spread risk class and the reference credit spread risk class, the proposal would modify bucket definitions and structure for the counterparty credit spread risk class based on different counterparty types and the different roles counterparty credit spreads play in CVA risk management.

The counterparty credit spread component of CVA risk is usually substantially greater than the exposure component, and, therefore, is the primary focus of CVA risk management by banking organizations. To promote prudent risk management by improving recognition of certain hedges of the counterparty credit spread component of CVA risk and to better align the calibration of the CVA risk capital framework with the underlying economic risk, the agencies propose, for the application in the counterparty credit spread risk class, to modify the bucket structure that is used for the non-securitization credit spread risk class in the sensitivities-based method for market risk, as described below. These modifications would not generally affect the risk weights (Table 3 to § _____.225) in the counterparty credit spread risk class that would generally follow the corresponding risk weights in the sensitivities-based method for market risk.

Banking organizations often use single-name credit instruments to hedge the counterparty credit spread

⁵⁰⁹ The only exception would be foreign exchange delta risk: the sensitivities-based method for market risk would use two values for the delta risk weight (depending on the currencies), while the SA-CVA would use a single delta risk weight (set approximately equal to the lower of the two) regardless of the currency.

component of CVA risk of individual counterparties with large CVA and use index credit instruments to hedge the systematic part of the counterparty credit spread component of the aggregate (across counterparties) CVA risk. In the non-securitization credit spread risk class in the sensitivities-based method for market risk, (1) investment grade entities and (2) speculative and sub-speculative grade entities from the same sector generally form two separate buckets based on credit quality. This, however, could undermine the efficiency of hedges of the counterparty credit spread component of CVA risk. In order to prevent this, the proposal would merge the investment grade bucket and speculative and sub-speculative grade bucket of each sector into a single bucket.

Furthermore, banking organizations often use single-name sovereign CDS as indirect single-name counterparty credit spread hedges of CVA risk of illiquid counterparties such as GSEs and local governments. However, in the non-securitization credit spread risk class in the sensitivities-based method for market risk, such entities would belong to the PSE, government-backed non-financials, GSE debt, education, and public administration sector, which form a bucket separate from sovereign exposures, specified supranational entities, and MDBs. Thus, following the non-securitization credit spread bucket structure of the sensitivities-based method for market risk would result in a situation where the counterparty and the reference entity of the hedge reside in different buckets, thus substantially reducing the effectiveness of the hedge. In order to prevent a such scenario, the proposal would merge the sovereign exposures, specified supranational entities, and MDBs sector and the PSE, government-backed non-financials, GSE debt, education, and public administration sector into a single bucket. To preserve hedging efficiency, the proposal would move government-backed financials from the “financials” bucket to the combined bucket that includes sovereign exposures.

The agencies propose to set the cross-bucket correlations, γ_{bc} , equal to the corresponding correlations that would be applicable under the assumption of the same credit quality in the non-securitization credit spread risk class as in the sensitivities-based method for market risk. The agencies propose to

change both the structure and the values of the intra-bucket correlations used in the sensitivities-based method to better recognize indirect single-name hedges where the reference name is in the same bucket as the counterparty. Similar to the non-securitization credit spread risk class in the sensitivities-based method for market risk, the intra-bucket correlations, ρ_{kl} , proposed for the counterparty credit spread risk class would be equal to the product of three correlation parameters. Two of the SA-CVA parameters—for tenor difference and name difference—are the same as in the sensitivities-based method if risk factors are identical but have higher values for non-identical risk factors for better hedge recognition. The third SA-CVA parameter—for credit quality difference—would replace the basis correlation parameter of the sensitivities-based method. This parameter would equal 100 percent if the credit quality of the two names is the same (treating speculative and sub-speculative grade as one credit quality category) and 80 percent otherwise. The basis correlation parameter is not needed in the SA-CVA because the SA-CVA does not make a distinction between different credit curves referencing the same entity. On the other hand, reference entities of the same sector, but different credit quality would be in different buckets under the sensitivities-based method, so the sensitivities-based method does not need the credit quality difference correlation parameter.

To promote prudent risk management by improving recognition of cross-sector index hedges of the counterparty credit spread component of CVA risk, the agencies are proposing to increase the inter-bucket correlation between bucket 8 (the index bucket) and buckets 1 through 6 from 45 to 70 percent. While the sensitivities-based method applies a correlation value of 45 percent for cross-sector indices within the non-securitization credit spread risk class, this would not appropriately reflect counterparty credit spread risk within the CVA risk framework. Counterparty credit spread risk class has a very specific structure for purposes of the CVA risk, where firms would offset the aggregate CVA amount, which is essentially a weighted sum of individual counterparty credit spreads with positive weights, with a cross-bucket index hedge, which represents its own bucket. Thus, for purposes of the CVA

risk capital requirement, the correlation parameter between a specific single-name bucket and the index bucket should reflect the actual correlation between the bucket-level CVA and a cross-bucket index. Because the bucket-level CVA is a weighted sum of the individual counterparty credit spreads within the bucket, it has a substantial amount of idiosyncratic credit spread risk diversified away and can be, therefore, viewed as a single-bucket index. Thus, the correlation between the bucket-level CVA and the cross-bucket index is comparable to the correlation between a single-bucket index and a cross-bucket index. The agencies consider that this correlation is substantially higher than 45 percent and are proposing to increase it to 70 percent. This increase would improve recognition of cross-bucket index hedges of counterparty credit spread component of CVA risk in SA-CCR.

Question 189: The agencies seek comments on the appropriateness of the proposed risk weights of Table 3 to § _____.225 for financials, including government-backed financials. What, if any, alternative risk weights should the agencies consider? Should regulated financial institutions (such banks, insurance companies, broker dealers, pension funds, registered investment companies, and their foreign equivalents) be subject to lower risk weights? Please provide specific details and supporting evidence on the alternative risk weights.

Question 190: To what extent are the proposed buckets, risk weights, and correlations for counterparty credit spread risk class appropriate? What, if any, alternative bucketing structures, risk weights, or correlations should the agencies consider and why?

V. Intra- and Inter-Bucket Aggregation

Consistent with the sensitivities-based method for market risk, the proposal would require a banking organization first to separately aggregate the risk-weighted net sensitivities for CVA delta and CVA vega within their respective buckets and then across buckets within each risk class using the prescribed aggregation formulas to produce respective delta and vega risk capital requirements for CVA risk.

First, for each bucket b , a banking organization would aggregate all net weighted sensitivities for all risk factors within this bucket according to the following formula:

$$K_b = \sqrt{\left(\sum_{k \in b} WS_k^2 + \sum_{k \in b} \sum_{l \in b, l \neq k} \rho_{kl} \cdot WS_k \cdot WS_l \right) + R \cdot \sum_{k \in b} (WS_k^{Hdg})^2}$$

where WS_k is the net weighted sensitivity to risk factor k , WS_k^{Hdg} is the weighted sensitivity of the market value of all standardized CVA hedges to risk factor k , ρ_{kl} is the regulatory correlation parameter between risk factors k and l within bucket b , and R is the hedging disallowance parameter set at 0.01.

While this formula is similar to the intra-bucket aggregation formula in the

sensitivities-based method for market risk, it differs by the presence of an additional term under the square root, proportional to the hedging disallowance parameter R . The purpose of this term is to prevent extremely small levels of K_b when most of the risk factors k are perfectly hedged. For the case of perfect hedging ($WS_k = 0$ for all

k), the term provides a floor equal to 10 percent of weighted sensitivities of the standardized CVA hedges, aggregated as idiosyncratic risks.

Second, a banking organization would aggregate bucket-level capital requirements across buckets within the same risk class according to the following formula:

$$K = m_{CVA} \cdot \sqrt{\sum_b K_b^2 + \sum_b \sum_{c \neq b} \gamma_{bc} \cdot S_b \cdot S_c}$$

where γ_{bc} is the regulatory correlation parameter between bucket b and bucket c ; S_b is the sum of the net weighted sensitivities WS_k over all risk factors k

in bucket b , floored by $-K_b$ and capped by K_b ; and S_c is the sum of the net weighted sensitivities WS_k over all risk factors k in bucket c , floored by $-K_c$

and capped by K_c as given by the following formulas:⁵¹⁰

$$S_c = \max \left(\min \left(\sum_{k \in c} WS_k, K_c \right), -K_c \right)$$

$$S_b = \max \left(\min \left(\sum_{k \in b} WS_k, K_b \right), -K_b \right)$$

This aggregation formula differs from the one used in the sensitivities-based method for market risk. In order to compensate for a higher level of model risk in the calculation of sensitivities for the aggregate regulatory CVA arising from the CVA risk covered positions relative to that for market risk covered positions, the proposed inter-bucket aggregation formula includes a multiplication factor (m_{CVA}) with a default value equal to one but would allow the primary Federal supervisor to increase the multiplier and scale up risk-based capital required for each risk class (K), if the supervisor determines that the banking organization's CVA model risk warrants such an increase.⁵¹¹ The primary Federal supervisor would notify the banking organization in writing that a different value must be used.

Finally, as with the sensitivities-based method for market risk, the overall risk-

based capital requirement for CVA risk would be the simple sum of the separately calculated risk-class level delta and vega capital requirements across risk classes without any recognition of any diversification benefits given that delta and vega are intended to separately capture different risks.

Question 191: To what extent are the proposed intra- and inter-bucket aggregation methodologies appropriate? What, if any, alternative methodologies should the agencies consider and why?

Question 192: What, if any, alternative methods should the agencies consider for recognizing diversification across risk classes in the calculation of the SA-CVA, and why?

Question 193: To what extent is the default value of one for the multiplier appropriate or should the agencies consider a higher or lower default value for the multiplier and why?

6. Reporting and Disclosure Requirements

Table 1 to § _____.217, "General Qualitative Disclosure Requirements Related to CVA" is a new disclosure table that would require a banking organization to disclose certain information pertaining to CVA risk, including its risk management objectives and policies for CVA risk and information related to a GSIB's CVA risk management framework, including processes implemented to identify, measure, monitor, and control CVA risks and effectiveness of CVA hedges. Table 2 to § _____.217, "Qualitative Disclosures for Banks Using the SA-CVA" is a new disclosure table that would require a banking organization that has approval to use the standardized CVA approach (SA-CVA) to make disclosures related to the banking organization's risk management framework, including a description of

⁵¹⁰ Note that this definition of S_b differs from the one used in the sensitivities-based method for market risk, where the floor and the cap apply only

when the quantity under the square root in the aggregation formula is negative.

⁵¹¹ For example, the SA-CVA calculation does not fully account for the dependence between the

banking organization's exposure to a counterparty and the counterparty's credit quality.

the banking organization's risk management framework, a description of how senior management is involved in the CVA risk management framework, and an overview of the governance of the CVA risk management framework such as documentation, independent risk control unit, independent review, and independence of data acquisition from lines of business.

VI. Disclosure Requirements

A. Proposed Disclosure Requirements

Meaningful public disclosures of a banking organization's activities and the features of its risk profile, including risk appetite, work in tandem with the regulatory and supervisory frameworks by helping to support robust market discipline. In this way, meaningful public disclosures help to support the safety and soundness of banking organizations and the financial system more broadly.

The proposal would revise certain existing qualitative disclosure requirements and introduce new and enhanced qualitative disclosure requirements related to the proposed revisions described in this **SUPPLEMENTARY INFORMATION**. The proposal would also remove most of the existing required quantitative disclosures, which would instead be included in regulatory reporting forms. Therefore, the agencies anticipate separately proposing revisions to the Consolidated Reports of Condition and Income, the Regulatory Capital Reporting for Institutions Subject to the Advanced Capital Adequacy Framework (FFIEC 101), and the Market Risk Regulatory Report for Institutions Subject to the Market Risk Capital Rule (FFIEC 102). The Board similarly anticipates proposing corresponding revisions to the Consolidated Financial Statements for Holding Companies (FR Y-9C), the Capital Assessments and Stress Testing (FR Y-14A and FR Y-14Q), and the Systemic Risk Report (FR Y-15) to reflect the changes to the capital rule that would be required under this proposal. The proposal would also remove disclosures related to internal ratings-based systems and internal models that are not required by the proposal.

Under the current capital rule, Category I and II banking organizations generally are subject to enhanced public disclosure in comparison to other banking organizations. Under the proposal, the enhanced public disclosure requirements would generally apply to any Category I and II banking organizations and any banking

organization that opts into the expanded risk-based approach. Consistent with the current capital rule, the proposed enhanced public disclosure requirements would be required of the top tier banking organization within a consolidated organization and not other entities within the consolidated organization. Disclosure table 4 would only apply to Category I and II banking organizations. These enhanced disclosure requirements would promote transparency for market participants.

The proposal would not change the current capital rule's requirements regarding public disclosure policy and attestation, the frequency of required disclosures, the location of disclosures, or the treatment of proprietary information.

B. Specific Public Disclosure Requirements

The proposed changes to disclosure requirements pertaining to the risk-based capital framework are described below.⁵¹² Disclosure tables 1,⁵¹³ 2,⁵¹⁴ 3,⁵¹⁵ 4,⁵¹⁶ 11⁵¹⁷ (table 9 to § _____.162 in the proposal), and 12⁵¹⁸ (table 10 to § _____.162 in the proposal) in § _____. 173 of the current capital rule would be retained without material modification, although some of the table numbers would change.

The proposal would retain the requirement that Category I and II banking organizations disclose their risk management objectives as they relate to specific risk areas (e.g., credit risk). The proposal would revise the risk areas to which these disclosure requirements apply to help ensure consistency with the broader proposal. In addition, the proposal would require a Category I or II banking organization to describe its risk management objectives as they relate to the organization overall. The required disclosures would include information regarding how each Category I and II banking organization's business model determines and interacts with the overall risk profile; how this risk profile aligns with the

parameters of the risk tolerance approved by its board of directors; the banking organization's risk governance structure; channels to communicate, define, and enforce the risk culture within the banking organization; scope and features of risk measurement systems; risk information reporting; qualitative information on stress testing; and the strategies and processes to manage, hedge, and mitigate risks. These disclosures are intended to allow market participants to evaluate the adequacy of Category I and II banking organizations' approaches to risk management.

Table 5 to § _____.162, "Credit Risk: General Disclosures," would include the disclosures a banking organization is required to make under the current capital rule regarding its approach to general credit risk.⁵¹⁹ In addition, the proposal would require Category I and II banking organizations to disclose certain additional information regarding its risk management policies and objectives for credit risk. Specifically, the proposal would require Category I and II banking organizations to enhance their existing disclosures by describing how their business model translates into the components of the banking organization's credit risk profile and how it defines credit risk management policy and sets credit limits. Additionally, Category I and II banking organizations would be required to disclose the organizational structure of their credit risk management and control function as well as interactions with other functions. Category I and II banking organizations would also be required to disclose information on their policies related to reporting of credit risk exposure and the credit risk management function that are provided to the banking organization's leadership.

Table 6 to § _____.162, "General Disclosure for Counterparty Credit Risk-Related Exposures," would include the disclosures Category I and II banking organizations are required to make under the current capital rule regarding their approach to managing counterparty credit risk.⁵²⁰ The proposal would also include new disclosure requirements regarding Category I and II banking organizations' methodology for assigning economic capital for counterparty credit risk exposures as well as their policies

⁵¹² The table numbers refer to the table numbers included in the proposed rule.

⁵¹³ See Table 1 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Scope of Application.

⁵¹⁴ See Table 2 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Capital Structure.

⁵¹⁵ See Table 3 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Capital Adequacy.

⁵¹⁶ See Table 4 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Capital Conservation and Countercyclical Capital Buffers.

⁵¹⁷ See Table 11 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Equities Not Subject to Subpart F of This Part.

⁵¹⁸ See Table 12 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Interest Rate Risk for Non-Trading Activities.

⁵¹⁹ See Table 5 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Credit Risk—General Disclosures.

⁵²⁰ See Table 7 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—General Disclosure for Counterparty Credit Risk of OTC Derivative Contracts, Repo-Style Transactions, and Eligible Margin Loans.

regarding wrong-way risk exposures. Additionally, the proposal would further require Category I and II banking organizations to disclose their risk management objectives and policies related to counterparty credit risk, including the method used to assign the operating limits defined in terms of internal capital for counterparty credit risk exposures and for CCP exposures, policies relating to guarantees and other risk mitigants and assessments concerning counterparty credit risk (including exposures to CCPs), and the increase in the amount of collateral that the banking organization would be required to provide in the event of a credit rating downgrade.

Table 7 to § _____.162, “Credit Risk Mitigation,” would include the disclosures Category I and II banking organizations are required to make under the current rule regarding their approach to credit risk mitigation.⁵²¹ In addition, the proposal would specify that Category I and II banking organizations must provide a meaningful breakdown of their credit derivative providers, including a breakdown by rating class or by type of counterparty (e.g., banking organizations, other financial institutions, and non-financial institutions). These disclosures would apply to eligible credit risk mitigants under the proposal,⁵²² although a banking organization would be encouraged to also disclose information about other mitigants. The credit risk mitigation disclosures in Table 7 to § _____.162 of the proposal would not apply to synthetic securitization exposures, which would be included in Table 8 to § _____.162 as part of the banking organization’s disclosures related to securitization exposures.

Table 8 to § _____.162, “Securitization,” would include the disclosures Category I and II bank holding companies are required to make under the current capital rule regarding their approach to securitization.⁵²³ In addition to the existing qualitative disclosures related to securitization, the proposal would require disclosure of whether the banking organization provides implicit support to a

securitization and the risk-based capital impact of such support.

Table 11 to § _____.162, “Additional Disclosure Related to the Credit Quality of Assets,” is a new disclosure table that would require Category I and II banking organizations to provide further information on the scope of “past due” exposures used for accounting purposes, including the differences, if any, between the banking organization’s scope of exposures treated as past due for accounting purposes and those treated as past due for regulatory capital purposes.

Table 12 to § _____.162, “General Qualitative Information on a Banking Organization’s Operational Risk Framework,” is a new disclosure table that would require a Category I and II banking organizations to disclose information regarding its operational risk management processes, including its policies, frameworks, and guidelines for operational risk management; the structure and organization of its operational risk management and control function; the systems and data used to calculate the operational risk capital requirement; the scope and context of its reporting framework on operational risk to executive management and to the board of directors; and the risk mitigation and risk transfer used in the management of operational risk.

Table 13 to § _____.162, “Main Features of Regulatory Capital Instruments and of Other TLAC-Eligible Instruments,” is a new disclosure table that would require Category I banking organizations to disclose information regarding the terms and features of its regulatory capital instruments and other instruments eligible for TLAC.⁵²⁴ In addition, the proposal would require a Category I bank holding company to describe the main features of its regulatory capital instruments and provide disclosures of the full terms and conditions of all instruments included in regulatory capital. Category I bank holding companies would also be required to describe the main features of their covered debt positions and provide disclosures of the full terms and conditions of all covered debt positions.

Question 194: The agencies invite comment on the utility of the proposed public disclosure requirements. What additional considerations, if any, should the agencies consider with regard to the

scope and granularity of the proposal’s disclosure requirements? What are the advantages and disadvantages of the proposed disclosure requirements?

VII. Estimated Impact on Capital Requirements

The proposal would revise the calculation of risk-weighted assets for Category I and II banking organizations and other banking organizations choosing to adopt the expanded risk-based approach, as well as the calculation of market risk and CVA risk requirements for a small number of other banking organizations. These changes would in turn affect these banking organizations’ risk-based capital requirements. The impact on required capital would depend on banking organizations’ risk exposures as well as the other capital requirements to which they are subject.

The remainder of this section provides estimates of the impact of the proposal on risk-weighted assets and capital requirements, with particular focus on Category I and II banking organizations. Section VII.A provides the impact of this proposal relative to the current capital requirements, inclusive of applicable buffer requirements and reflecting recently finalized changes to the enhanced supplementary leverage ratio standards (recent eSLR changes).⁵²⁵ To provide a broader perspective of recent capital reforms, section VII.B provides cumulative impact estimates of both recent and concurrent capital-related proposals that would affect these banking organizations. The set of proposals considered jointly includes the recent eSLR changes, the Board’s GSIB surcharge proposal, and proposed changes to the Board’s supervisory stress test.⁵²⁶ Section VII.C attributes the impact across several broad areas of banking activity. Section VII.D describes the data and estimation methodology used in this section. Discussion of the economic impact of these changes to capital requirements is provided in section VIII.

A. Standalone Effect of Proposed Capital Rule Changes

Table VII.1 below presents the estimated impact of the proposal on aggregate capital requirements for Category I and II banking organizations. While banking organizations’ minimum regulatory capital ratios and capital

⁵²¹ See Table 8 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Credit Risk Mitigation.

⁵²² See section IV.A.5. of this SUPPLEMENTARY INFORMATION for a more detailed discussion on the types of credit risk mitigants that a banking organization would be allowed to recognize for purposes of calculating risk-based capital requirements.

⁵²³ See Table 9 to § 3.173 (OCC); § 217.173 (Board); § 324.173 (FDIC)—Securitization.

⁵²⁴ For purposes of Table 13, unique identifiers associated with regulatory capital instruments and other instruments eligible for TLAC may include Committee on Uniform Security Identification Procedures number, Bloomberg identifier for private placement, International Securities Identification Number, or others.

⁵²⁵ See 90 FR 55248 (Dec. 1, 2025).

⁵²⁶ See Federal Reserve Board Requests Comment on Proposals to Enhance the Transparency and Public Accountability of its Annual Stress Test (Oct. 24, 2025), <https://www.federalreserve.gov/newsevents/pressreleases/bcreg20251024a.htm>.

buffer requirements have distinct, complementary purposes, the estimates in this proposal represent requirements inclusive of GSIB surcharge and stress

capital buffer requirements, as described below, in order to present impact as a single quantity. In addition, the standalone impact estimates of the

proposal on tier 1 capital requirements reflect the recent eSLR changes. The methodology behind the estimates is described in section VII.D.

Table VII.1: Estimate of the Proposal’s Impact on Aggregate Capital Requirements of Category I and II Banking Organizations (%)

	Common Equity Tier 1	Tier 1
Bank Holding Companies	+1.4%	+1.6%
Depository Institution Subsidiaries	-4.8%	-2.3%

The agencies estimate that the proposal would increase aggregate common equity tier 1 capital requirements for Category I and II bank holding companies by about 1.4 percent relative to current requirements and would increase their aggregate tier 1 capital requirements by about 1.6 percent. Across Category I and II depository institution subsidiaries, the proposal is estimated to decrease aggregate common equity tier 1 and tier 1 capital requirements by about 4.8 and 2.3 percent, respectively. The proposal would increase aggregate capital requirements for holding companies but decrease them for depository institutions because the proposal has a different impact on their aggregate risk-weighted assets, detailed below. Specifically, market risk-weighted assets, which generally increase under the proposal, and operational risk-weighted assets are relatively concentrated at the holding company level. The decrease in tier 1 capital requirements for depository institutions is limited by binding leverage requirements for several banks.

The capital impact estimates are based on balance sheets as of 2025 Q2 and GSIB surcharges that would be applicable in early 2026 under the current rule.⁵²⁷ The estimates represent a simple average of the impact calculated using the stress capital buffer requirement from the 2024 stress test and the impact using the stress capital buffer requirement from the 2025 stress test. While the specific stress test and level of the resulting stress capital buffer requirement has little effect on the

percentage impact of this proposal,⁵²⁸ it can materially change the impact of other capital changes considered cumulatively with the proposal. The analysis therefore considers an average across two years to mitigate effects of a specific year on the impact estimates.

As detailed in section VII.D.5, the methodology behind these estimates abstracts from bucketing and rounding effects that are present in the capital rule and that would primarily add noise to estimates. In addition, capital requirements include amounts of assets that are subject to threshold-based capital deductions so that deducted and risk-weighted portions of such exposures are treated comparably. The cumulative effect of these methodological choices is small in aggregate.⁵²⁹

As described in section VII.D.1, the estimated changes in risk-weighted assets are extrapolated from the Federal Reserve’s Basel III Endgame Special Data Collection. This data collection details exposures as of Q2 2023 under the agencies’ 2023 Basel III proposal. Adjustments, as described in section VII.D.1.c, are applied to these data to reflect the current proposal, and the resulting estimates are then extrapolated to data as of Q2 2025. This extrapolation

procedure, also described in section VII.D.2, accounts for changes in the composition of exposures across different areas of risk, but does not reflect changes in impact associated with changes in the composition of exposures within each of these areas. For example, the extrapolated estimates reflect changes in impact due to a different growth rate of residential real estate lending and trading activities, but would not reflect changes in impact due to a shift in the LTV ratios of the real estate exposures or the composition of the risk within market risk covered positions. Thus, there may be a tradeoff whereby estimates with as of dates closer to Q2 2023 may more accurately reflect capital impact at that point in time than later estimates, but later estimates may still be more informative of impact going forward given that they account for how banking activity has shifted at a high level. Regardless, when using risk exposures and banking activity as of intermediate calendar quarters between Q2 2023 and Q2 2025, the estimated aggregate impact on common equity tier 1 capital requirements varies between an increase of 0.6 percent and an increase of 1.4 percent. Thus, changes in the broad composition of large banking organizations’ balance sheets and activity over the past few years, as measured, have not materially affected the estimated impact of this proposal on capital requirements.

Importantly, all of these impact estimates are made ex-ante—before banking activity and risk exposures have adjusted to any changes in incentives that may result from the proposal.⁵³⁰ As the proposal goes into

⁵²⁷ These GSIB surcharges are based on the firm-specific minimum of GSIB scores from year-end 2023 and 2024 derived from FR Y–15 Systemic Risk Report data.

⁵²⁸ For example, the increase in aggregate common equity tier 1 capital requirements is 1.5 and 1.3 percent when using stress capital buffer requirements from 2024 and 2025, respectively. However, the capital impact of the enhanced supplementary leverage ratio proposal on aggregate tier 1 capital requirements of Category I and II bank holding companies would have been a decrease of 0.4 percent and 4.2 percent using 2024 and 2025 stress capital buffer requirements respectively.

⁵²⁹ If using bucketed GSIB surcharges and rounded stress capital buffer requirements, and excluding threshold deductions from requirements, the estimated change in the aggregate common equity tier 1 capital requirements of Category I and II banking organizations would be an increase of about 0.9 percent.

⁵³⁰ Arguably, to the extent that some aspects of the proposal’s impact might have been anticipated in advance, some of the impact of its effect on

effect, banking organizations might increase activities that would receive relative reductions in requirements or decrease activities that would receive relative increases in requirements, which could result in a lower ex-post level of capital requirements.

While all impact estimates in this proposal reflect aggregates across banking organizations, the impact on individual banking organizations would vary. Across the nine Category I and II bank holding companies, the standard deviation of the percentage impact on common equity tier 1 capital requirements is estimated at about 8.7 percent. In general, firm-specific impact is well explained by variation in exposure to risk categories or engagement in business activities that face different impacts under the proposal.

While this proposal would change both the numerator and denominator of risk-based capital ratios,⁵³¹ the impact operates primarily through the denominator, risk-weighted assets. To simplify discussion of the impact of the proposal on requirements at a more granular level, the analysis focuses on changes to risk-weighted assets.

Table VII.2 provides risk-weighted assets for Category I and II bank holding companies aggregated by risk category across the current standardized approach, the advanced approaches,⁵³² and the proposed expanded risk-based approach. Under the proposal, the aggregate risk-weighted assets for such Category I and II banking organizations would increase by about 1.9 percent compared to the current standardized approach (which produces the binding risk-based capital requirements for

nearly all of the banking organizations). Market risk-weighted assets increase by approximately 20 percent under the proposal. However, as discussed in section VII.C, the cumulative effect on the requirements applicable to trading activities of this and related capital proposals is more moderate. Meanwhile, combined risk-weighted assets for credit, operational, and CVA risks are roughly equal to general credit risk-weighted assets under the current standardized approach. For the depository institution subsidiaries of these organizations, risk-weighted assets would decrease by 3.0 percent relative to the standardized approach on aggregate, consistent with the relatively smaller amount of trading activity at the level of the depository institution.

Table VII.2: Category I and II Banking Organization Risk-weighted Assets Under the Proposal
by Risk Category (\$ billion)

	Current		Expanded risk-based approach
	Standardized approach	Advanced approaches	
Bank Holding Companies			
Credit risk	7,235	4,890	6,165
Operational risk		1,745	927
CVA		280	207
Market risk	453	453	546
Total ⁵³³	7,673	7,362	7,820
Depository Institution Subsidiaries ⁵³⁴			
Credit risk	6,173	4,015	5,168
Operational risk		1,252	637
CVA		202	132
Market risk	256	257	309
Total	6,413	5,718	6,220

incentives may already be reflected in banking organizations' risk exposures and activity.

⁵³¹ The impact on the numerator includes the removal of capital deductions for above-threshold mortgage servicing assets. While no Category I or II banking organizations currently have any such deductions, the removal of the deduction treatment may have a significant effect on these banking organizations' incentives to originate and service

mortgages, as discussed in section VIII.D.2. In addition, impact estimates account for changes to required capital ratios due to how changes in risk-weighted assets affected the stress capital buffer requirement and the short-term wholesale funding score in the current GSIB surcharge rule. Also, the proposal affects capital requirements by removing the advanced approaches requirements, which

occasionally are larger than standardized requirements for some banking organizations.

⁵³² For purposes of sections VII and VIII, the term "advanced approaches" refers to a banking organization's total risk-weighted asset amount based on the sum of its risk-weighted assets calculated for credit, CVA, and operational risks plus, if applicable, risk-weighted assets for market risk, minus certain deductions.

1. Impact on Other Banking Organizations^{533 534}

In addition to the revisions to the capital requirements of Category I and II banking organizations, the proposal would introduce certain changes to the capital requirements of non-Category I or II banking organizations. Specifically, the proposed market risk capital requirements would apply to banking organizations with significant trading activity, while no longer applying to a small number that would not meet the proposed applicability thresholds. In addition, some of the banking organizations that would remain subject to market risk capital requirements and have substantial exposure to OTC derivatives would become subject to capital requirements for CVA risk. For these non-Category I and II banking organizations that would remain subject to market risk capital requirements, the proposed market risk and CVA requirements would increase common equity tier 1 capital requirements by 0.9 percent.⁵³⁵

Furthermore, other banking organizations would have the option to apply the expanded risk-based approach. The agencies estimate that three Category III or IV holding companies would see a reduction in capital requirements in the range of three to seven percent if they were to choose to apply the expanded risk-based approach instead of the concurrently proposed revised standardized approach. In addition, the agencies estimate that about a third of banking organizations below Category IV would see reductions in capital requirements of between five and ten percent if they were to apply the expanded risk-based approach, although only a small number might see a reduction in capital requirements greater than ten percent. However, various features of the expanded risk-based approach that are appropriate for larger and more complex banking organizations, such as the requirements to adopt SA-CCR and

reflect most elements of accumulated other comprehensive income in regulatory capital, may make the framework unappealing to many smaller banking organizations. Section VIII.F.2 considers further how other banking organizations' may respond to the optional application of this rule.

Lastly, while banking organizations that remain below the Category I and II applicability thresholds would retain this optionality, those that subsequently become Category I or II banking organizations would become subject to the proposal's requirements. The different treatment of business activities under the proposal may affect the incentives of smaller banking organizations that plan to elect to use the expanded risk-based approach.

B. Cumulative Effect of Proposed Capital Rule Changes

Other recently finalized or proposed revisions that relate to the regulatory capital framework could also materially affect the capital requirements of Category I and II banking organizations. These include (1) the recent eSLR changes, (2) the concurrent GSIB surcharge proposal, and (3) the Board's proposed stress test changes for the Board's supervisory stress test,⁵³⁶ which would inform the Board's determination of a bank holding company's stress capital buffer requirement.⁵³⁷ This section estimates the impact of this Stress Test Transparency Proposal jointly with these other capital reforms. Specifically, the stress testing

component of the cumulative analysis here incorporates the data published in the Stress Test Transparency Proposal, which projected impacts to stress capital buffer requirement determinations as if the proposed model changes and proposed revisions to the global market shock scenario design had been implemented in the 2024 and 2025 stress tests, independent of other factors that affect the determination of a banking organization's stress capital buffer requirement.⁵³⁸ In addition, this section provides some historical context for the overall cumulative impact of these proposals on capital requirements.

In addition to capital requirements, the proposal's adjustments to risk-weighted assets would also affect the Board's total loss absorbing capacity (TLAC) and long-term debt requirements for U.S. GSIBs. The estimated impact of this proposal on TLAC and long-term debt requirements is described in the economic analysis section contained in the Board's separate notice of proposed rulemaking for the GSIB surcharge proposal.

I. Cumulative Impact of Recent Proposals on Capital Requirements

Table VII.3 provides estimates of the combined impact of these revisions on Category I and II bank holding companies' aggregate common equity tier 1 and tier 1 capital requirements. The rightmost column in the table presents aggregate leverage requirements for these bank holding companies as a share of aggregate tier 1 capital risk-based requirements.⁵³⁹

⁵³⁶ The "proposed stress test changes" refer to the proposed model changes and revisions to the global market shock component announced in connection with the Board's proposal to enhance the transparency and public accountability of the Board's supervisory stress test. See Board, Enhanced Transparency and Public Accountability of the Supervisory Stress Test Models and Scenarios; Modifications to the Capital Planning and Stress Capital Buffer Requirement Rule, Enhanced Prudential Standards Rule, and Regulation LL, 90 FR 51856 (Nov. 18, 2025) (the "Stress Test Transparency Proposal").

⁵³⁷ This analysis excludes consideration of the proposal to reduce the volatility of the stress capital buffer requirement, which would not have any standalone impact on the determination of a bank holding company's stress capital buffer requirement. Instead, the proposal would reduce the volatility of the stress capital buffer requirement by averaging the maximum common equity tier 1 capital declines projected in each of the Board's prior two annual supervisory stress tests to inform a bank holding company's stress capital buffer requirement. See Board, Modifications to the Capital Plan Rule and Stress Capital Buffer Requirement, 90 FR 16843 (Apr. 22, 2025).

⁵³³ Data in the "Total" rows of the table also reflect deductions from risk-weighted assets for excess allowances for credit losses and allocated transfer risk reserves.

⁵³⁴ Includes all depository institution subsidiaries of Category I and II bank holding companies.

⁵³⁵ The aggregate impact is small as the additional CVA requirements are significantly offset by estimated reductions in market risk-weighted assets for smaller banking organizations under the proposal.

⁵³⁸ The estimated capital impact described in this cumulative analysis with respect to the proposed stress test changes announced in the Stress Test Transparency Proposal incorporates the underlying data published by the Board in the Stress Test Transparency Proposal, without changes to the underlying data. That proposal included illustrative analysis that considered the potential effects of the proposed stress test model and scenario changes, independent of other factors and components that inform the Board's stress capital buffer determinations for specific bank holding companies, within the 2024 and 2025 supervisory stress tests. As stated in the Stress Test Transparency Proposal, in aggregate, the proposed stress test model and scenario changes are not expected to materially change capital requirements for bank holding companies subject to the supervisory stress test, across various stress scenarios and jump-off conditions at the start of the test.

⁵³⁹ As with the estimates reported earlier, the estimates in section VII.B reflect the GSIB surcharge that would be applicable in early 2026.

Table VII.3: Cumulative Impact of Proposals on Capital Requirements of Category I and II

Bank Holding Companies		Cumulative % Change in Requirements		Aggregate Leverage /
		Common Equity Tier 1	Tier 1	Risk-Based Requirement
Current Rule	Pre-Nov 2025 Rules	-	-	99.0%
	+ Recent eSLR changes	-	-2.3%	76.8%
Proposals	+ This proposal	+1.4%	-0.7%	75.8%
	+ GSIB surcharge proposal	-2.4%	-3.9%	79.4%
	+ Proposed stress test changes	-4.8%	-6.0%	81.1%

The combined impact of this proposal and the GSIB surcharge proposal on GSIBs' aggregate common equity tier 1 capital requirements would be a decrease of 2.4 percent. When combined with the proposed stress test changes, the decrease would be 4.8 percent, based on the average impact across 2024 and 2025 stress tests. The aggregate combined capital impact of the proposals is close to the sum of their standalone impact, as there are limited interactions between them.

Turning to tier 1 capital, the recent eSLR changes are projected to reduce requirements for Category I and II bank holding companies by about 2.3 percent. When combined with this proposal, the GSIB surcharge proposal, and the stress testing changes, the reduction in aggregate tier 1 capital requirements is projected to be 6.0 percent. The estimated cumulative reduction of tier 1 capital requirements is only about 1.2 percentage points larger than for common equity tier 1 capital requirements (6.0 percent decrease versus 4.8 percent decrease) despite the 2.3 percent reduction due to recent eSLR changes because tier 1 leverage requirements would become binding for two of the bank holding companies.

The final column of Table VII.3 shows how binding the leverage and risk-based tier 1 capital requirements are by reporting the ratio of the aggregate leverage to risk-based requirements.⁵⁴⁰ Before the recent eSLR changes, aggregate leverage and risk-based tier 1 capital requirements were almost equal for Category I and II bank holding

companies. With the recent eSLR changes, aggregate risk-based requirements would remain significantly higher than leverage requirements after accounting for the cumulative effects of the proposed changes to risk-based requirements, preserving the role of leverage as a backstop capital requirement.

Also, while these estimates reflect an average across requirements under 2024 and 2025 stress tests, the specific stress test significantly affects the impact of certain of these changes in particular. The potential impact of the proposed stress test changes are conditional on the specific stress scenario used. In addition, the level of the stress capital buffer requirement affects the relative level of risk-based and leverage capital requirements, and thus the effect of the recent eSLR changes.

While these proposals would result in a reduction relative to current capital requirements, requirements would still remain higher than they would be absent certain increases in capital requirements in recent years. To illustrate this, Figure VII.1 below plots common equity tier 1 capital requirements for Category I and II bank holding companies under two scenarios.⁵⁴¹ The black curve provides requirements under the then-current rules. The gray curve provides a counterfactual where past increases in capital requirements that do not clearly respond to increasing banking system risks have been neutralized. First, the counterfactual assumes that method 2 coefficients are indexed such that they grow at the same rate as method 1 scores

beginning in Q4 2019. This date is chosen as the lack of indexation in method 2 becomes particularly apparent as GSIBs' balance sheets expand rapidly in response to monetary and fiscal policy actions taken in the global COVID-19 pandemic. In addition, the counterfactual replaces the stress capital buffer requirement, which came into effect in late 2020, with an estimate of what capital requirements would have been under the previous stress testing framework.⁵⁴² The counterfactual also neutralizes the aggregate impact on risk-weighted assets of the introduction of the standardized approach for counterparty credit,⁵⁴³ and reduces requirements by the estimated amount

⁵⁴² Specifically, the counterfactual subtracts planned cumulative common stock dividends and net share repurchases from holding companies' stress CET1 capital over the whole 9-quarter stress period, then recalculates the maximum decline in the CET1 ratio, and sets a stress requirement equal to 4.5% plus this maximum decline of standardized risk-weighted assets. Overall CET1 capital requirements under the counterfactual equal the greater of this stress requirement or the greater of standardized and advances approaches risk-weighted assets multiplied by 7.0% plus the GSIB surcharge. The counterfactual does not account for changes in assumed stress balance sheet growth that were part of the stress capital buffer rule, but does account for the counterfactual's changes to risk-weighted assets (for SA-CCR) and allowances (for CECL). See Federal Reserve Board approves rule to simplify its capital rules for large banks, preserving the strong capital requirements already in place (Mar. 4, 2020), <https://www.federalreserve.gov/newsevents/pressreleases/bcreg20200304a.htm>.

⁵⁴³ Based on values reported in eight of the nine banking organizations' SEC 10-Q/K filings following SA-CCR adoption (Q2 2020 for Bank of America, Q4 2021 for Goldman Sachs and Morgan Stanley, and Q1 2022 for all others), in aggregate, at adoption, SA-CCR increased risk-weighted assets associated with derivatives exposures by about 15.8 percent. Consequently, in every quarter following SA-CCR adoption, each banking organizations' risk-weighted assets for derivative exposures under the counterfactual is scaled by 1.158.

⁵⁴⁰ Prior to this proposal, the denominator of this ratio is measured using the greater of advanced approaches and standardized approach requirements.

⁵⁴¹ This plot is constructed using rounded stress capital buffer requirements and threshold deductions are not included in requirements.

of the impact of the current expected credit losses (CECL) accounting standard on common equity tier 1 capital.⁵⁴⁴ The gap between the two curves grows in early 2020 due to CECL, in late 2020 due to the stress capital buffer requirement, in 2022 due to SA-CCR, and gradually widens over time

due to the impact of this balance sheet growth on method 2 scores. The gap is especially large in 2023 due to the impact of the stress capital buffer requirement under the 2022 stress test. The blue diamond on the plot represents requirements in Q2 2025 after the estimated cumulative reduction

in requirements of 4.8 percent under the several recently proposed revisions.⁵⁴⁵ In comparison, aggregate common equity tier 1 capital requirements are lower under the counterfactual.

Figure VII.1

2. Cumulative Impact of Recent Proposals on Common Equity Tier 1 Capital Requirements by Risk Type

The analysis now turns to the cumulative impact at the more granular level, focusing on the specific types of risk measured under the proposal: credit, operational, market, and CVA. The cumulative impact on capital requirements for each risk type can differ markedly from what is implied by the proposal's standalone impact on risk-weighted assets.

As an example, capital requirements for trading activity are affected not only by risk-weighted assets for market risk but also by the overall required capital ratio, which is affected by a banking

organization's stress capital buffer requirement. As a result, capital requirements for trading activities are also informed by the revenues and losses such activities generate in the Board's supervisory stress test, independent of other factors, which depend on the scenarios and models used to project outcomes.

As the minimum capital requirements is a fixed percentage point amount regardless of the composition of the banking organization's risks, it can be mapped straightforwardly to risk types based on the risks' share of risk-weighted assets. However, both the GSIB surcharge and stress capital buffer requirement reflect a banking organization's composition of risks, and

thus attributing these requirements to risk types is conceptually more complex. Given that the GSIB surcharge proposal has a relatively limited impact on the composition of risks reflected by GSIB scores, this analysis makes the simplifying assignment of GSIB surcharge requirements to risks in proportion to their share of risk-weighted assets as well.

As discussed in the Stress Test Transparency proposal, the proposed stress test changes, independent of other factors, could affect the composition of risks reflected in the modeled losses.⁵⁴⁶ Therefore, a more detailed approach to attributing the stress capital buffer requirement is undertaken in this analysis. The approach first considers

⁵⁴⁴ The impact of additional allowances under CECL in each quarter after adoption is estimated as equal to the capital impact at adoption (January 1, 2020), multiplied by the ratio of the current balance of allowances for loans and lease losses divided by the sum of the balance of such allowances on December 31, 2019, plus the impact of CECL on allowances at adoption. Data are from the FR Y-9C, with reference codes (MDRM) as follows: capital impact at adoption (BHCKJJ26), allowance impact at

adoption (BHCKJJ28), and allowances for loans and lease losses (BHCT3123).

⁵⁴⁵ The dollar amount of common equity tier 1 requirements in this plot do not correspond with dollar requirements elsewhere in this proposal, primarily because the analysis elsewhere uses an average impact across 2024 and 2025 stress capital buffer requirements and GSIB surcharges applicable in 2026.

⁵⁴⁶ In aggregate, the stress test model and scenario changes are not expected to materially change

capital requirements for bank holding companies subject to the supervisory stress test, across various stress scenarios and jump-off conditions at the start of the test. However, notwithstanding the limited overall effect on stressed CET1 capital ratios, there may be significant variation across the different loss drivers. For example, the proposed changes could result in less severe credit, market, and operational loss estimates. See 90 *Federal Register* 51856, 51874–51877 (Nov. 18, 2025).

whether the bank holding company's stress capital buffer requirement has been consistently bound by the 2.5 percent floor. For holding companies with stress capital buffer requirements consistently set at 2.5 percent, the requirement is effectively independent of the stress losses each risk type might generate, and so the 2.5 percent buffer is attributed to risks in proportion to each risk's share of risk-weighted assets. For other holding companies, however, the hypothetical losses generated by risks are reasonably likely to affect the stress capital buffer requirement. For these remaining banking organizations, each modelled driver of the maximum decline in the common equity tier 1 capital ratio under the stress scenario is mapped to risks. Similarly, proposed stress test changes are mapped to risks.

Some of this mapping is relatively straightforward, such as mapping losses associated with provisions to credit risk, trading losses to market risk, counterparty losses to credit risk, and operational losses to operational risk. Revenue sources or other losses are mapped using blunt assumptions. Specifically, interest expenses and offsetting account fees are attributed across market and credit risk in proportion to the holding company's trading versus non-trading assets.

Compensation and general noninterest expenses are attributed across risks in proportion to their estimated business-as-usual net revenues. Potential changes in capital requirements due to reconciliation of differences in accounting, tax and regulatory treatments are then allocated proportionally across each risk's contributions to the common equity tier 1 capital decline under the stress capital buffer, which is informed by the Board's stress test results. Finally, potential declines in the common equity tier 1 capital ratio associated with planned distributions are attributed across risks in proportion to their share of risk-weighted assets. Further details of this attribution process are in section VII.D.

Table VII.4 below presents estimates of how common equity tier 1 capital requirements are cumulatively affected by the proposed revisions to capital requirements and the proposed stress test changes. The first two columns provide requirements under the current advanced and standardized approaches. While the standardized approach does not include measures of operational or CVA risk-weighted assets, requirements for these risks in the standardized approach column result from their contribution to the stress capital buffer requirement. The "binding"

requirement is determined by which requirement is commonly binding for that bank holding company. Specifically, for all but two bank holding companies, the standardized approach requirement has been binding over at least the past five years, so their binding requirements are set equal to the standardized approach. For the other two bank holding companies, where the advanced approaches have occasionally been binding, the binding requirement reflects an average of the standardized and advanced approaches capital requirements.⁵⁴⁷ The requirements under the combined proposals column represents risk-weighted assets measured under this proposal, GSIB surcharges computed under the corresponding GSIB surcharge proposal, and stress capital buffer requirements recalculated when applying the proposed revisions to the stress test, independent of other factors, to historical 2024 and 2025 stress testing scenarios.

⁵⁴⁷ For these two bank holding companies, the share of requirements attributed to each risk stripe under standardized and advanced approaches is averaged, and then multiplied by the maximum of standardized and advanced approaches requirements.

Table VII.4: Common Equity Tier 1 Capital Requirements of Category I and II Bank Holding

Companies By Risk - Current Rule and Combined Proposal (\$bn)

	Current Rules			Combined Proposals	Change vs. Binding ⁵⁴⁸
	Advanced Approaches	Standardized Approach	Binding		
Credit	507	690	680	612	-10.0%
Operational	180	102	113	130	14.9%
Market	47	50	49	42	-5.8%
CVA	29	16	17	34	96.0%
<u>Total</u>	764	858	860	818	-4.8%

Note: This table shows banking activity common equity tier 1 capital requirements for Category I and II bank holding companies under the current standardized and advanced approaches and the proposal, inclusive of the GSIB surcharge proposal and proposed stress test changes. Estimated requirements are constructed separately for 2024 and 2025 stress tests, and the reported numbers reflect the average across these two estimates. Estimates are based on an as of date of June 30, 2025. Source: Special data collection, FR Y-9C, FR Y-14, stress testing output, and agency calculations as described in section VII.D.⁵⁴⁹

In aggregate, common equity tier 1 capital requirements would decrease modestly—by about 5 percent—with notable differences across risk types. The binding requirement is projected to decline from \$860 billion under current rules to \$818 billion under the combined proposals.

Credit risk capital requirements would decline by about 10.0 percent under the combined proposals. This decline occurs because the Basel III

proposal would generally reduce risk weights for credit exposures, and the proposed stress test changes are not projected to meaningfully modify the capital requirements applicable to credit risk. Therefore, the combined proposals' effects on credit risk capital requirements are more directly aligned with the changes in credit risk-weighted assets implied by the expanded risk-based approach.

Operational risk capital requirements would increase because the Basel III proposal includes operational risk-weighted assets in the expanded risk-based approach. However, the proposed stress test changes would meaningfully reduce the operational risk requirements embedded in the stress capital buffer requirement in this analysis. Taking both the Basel III and the proposed stress test changes together, the requirement for operational risk would increase by about 14.9 percent. Still, operational risk requirements would be substantially lower than those that currently result from banking

organizations' internal models under the advanced approaches.

Cumulative market risk capital requirements are projected to decline by approximately 5.8 percent.⁵⁵⁰ The increase in market risk-weighted assets as a result of the Basel III proposal would be more than offset by the proposed changes to the global market shock component of the Board's stress test. The changes to the global market shock component would better align the liquidity horizons used to calibrate risk-factor shocks.

Finally, CVA capital requirements would increase substantially because CVA risk-weighted assets would be included in the single risk-based capital requirement applicable to Category I and II banking organizations. The binding common equity tier 1 capital requirement for CVA risk would rise about 96 percent increase. Still, CVA risk would continue to represent a small

⁵⁴⁸ The changes reported reflect the simple average of the percentage change calculated separately using 2024 and 2025 stress tests, and thus differ from the change computed from the dollar amounts in the columns to the left.

⁵⁴⁹ Statistics used in agency calculations are from the special data collection, FR Y-9C, and FR Y-14 forms as of June 30, 2025. See FFIEC 031 Form Statistics. For Form Y-14M, see Board of Governors of the Federal Reserve System, Reporting Forms: FR Y-14M (Capital Assessments and Stress Testing) (version June 2025) ("Form FR Y-14M"), https://www.federalreserve.gov/apps/reportingforms/Report/Index/FR_Y-14M. For FR Y-14Q, see Board of Governors of the Federal Reserve System, Reporting Forms: FR Y-14Q (Capital Assessments and Stress Testing) (version June 2025) ("Form FR Y-14Q"), https://www.federalreserve.gov/apps/reportingforms/Report/Index/FR_Y-14Q.

⁵⁵⁰ The reduction would be larger when considering the proposed changes, independent of other factors, as implemented for the 2024 stress test than under the 2025 stress test.

share of total risk-based capital requirements compared with credit and operational risk. Also, the share of capital requirements for CVA risk would remain similar to its share under the advanced approaches.

C. Impact by Banking Activities

To assess how the proposal may affect the incentives for Category I and II banking organizations to engage in different lines of business, this section analyzes the proposal's estimated impact on the risk-weighted assets associated with different banking activities. The section then turns to an analysis of the cumulative impact of the recent and concurrent capital-related proposals considered in the previous section, on the common equity tier 1 capital requirements of these banking activities.

1. Impact on Risk-Weighted Assets by Banking Activity

A single banking activity can be associated with several categories of risk-weighted assets under the expanded risk-based approach. For example, mortgage intermediation can generate credit risk-weighted assets associated with mortgages, mortgage-backed securities, and mortgage servicing assets. In addition, the interest income on the mortgages, fee income on mortgage originations or servicing, and gains on mortgage sales or securitizations would increase risk-weighted assets for operational risk through their inclusion in the business indicator. Thus, all sources of risk-weighted assets need to be considered to understand how the proposal may affect overall capital requirements—and thereby the funding costs—associated with an activity. Conversely, a single category of risk-weighted assets does not generally represent a single type of banking activity. For example, credit risk-weighted assets could represent a loan to a household to buy a car, a line of credit to a nonbank financial company, debt securities primarily held to preserve the banking organization's liquidity, or an exposure to a corporate counterparty on a derivative contract.

To assess the impact of the proposal on different banking activities, risk-weighted assets were decomposed into three areas intended to be broadly representative of banking organizations' high-level functions: traditional lending, credit facilitation, and trading-related activity. The remaining bank exposures and activities represent banking services, such as wealth management and corporate treasury, as well as fixed assets that could not be neatly slotted into the three primary activity areas.

The largest category of banking activity is what is described here as traditional lending, which primarily serves to fund the economic activity of households and non-financial businesses. In this analysis, traditional lending includes exposures to loans, debt securities (including securitizations), and undrawn commitments. Traditional lending is further subdivided into residential mortgage lending, other retail lending, and corporate lending. Residential mortgage lending includes loans, residential mortgage-backed securities and mortgage securitization and servicing activity. Other retail lending captures all other forms of credit extension to households, such as credit cards, auto loans, installment loans, and student loans. In addition, loans to small businesses below \$1 million are included in retail lending. Corporate lending consists of larger loans to non-financial sector businesses and includes both commercial and industrial loans as well as commercial real estate loans. Small business lending would fall under a mix of retail and corporate lending, based primarily on whether the amount borrowed exceeds \$1 million.⁵⁵¹

Large banking organizations also engage in credit facilitation beyond the direct lending activity discussed above. This activity includes providing financing to other financial sector entities. It also includes investing in Treasury securities and central bank reserves, which enable the banking organization to meet liquidity needs while engaging in less liquid traditional lending activity. It further includes products, such as guarantees or letters of credit, that facilitate business transactions by offering assurances.

In addition to providing credit, large banking organizations serve an important intermediary role through a range of activities associated with trading. Certain core trading activities generate market risk-weighted assets due to their exposure to gains and losses based on market prices or factors. Such activities include maintaining an inventory of financial instruments when a banking organization acts as a

principal to the transactions. Additionally, market risk-weighted assets can result from exposures that arise as part of banking organizations' provision of derivatives or other financial products. Derivatives and other activities that facilitate clients' trading positions, such as securities financing transactions, also generate counterparty credit risk, and derivatives also generate CVA risk.

The remaining risk-weighted assets are associated with "other banking services" or are "fixed or other assets." Other banking services include wealth management and custody, advisory, insurance, and cash management services. These services would generate operational risk-weighted assets through the associated fee income, net of fee expenses, under the proposal. Fixed or other assets include owned real estate, investment in unconsolidated subsidiaries, and deferred tax assets, as well as any residual uncategorized balance sheet assets.

While the attribution of risk-weighted assets for credit, market, and CVA risks across these activities is relatively straightforward, operational risk-weighted assets must be split across several activities that generate income. While certain activities may have a disproportionate effect on a banking organizations' GSIB scores, GSIB surcharge requirements are assigned in proportion to each activity's attributed risk-weighted assets to avoid further complexity. Details of the methodology are covered in section VII.D.

Table VII.5 provides risk-weighted assets aggregated by banking activity across the current standardized approach and under the proposal. In most cases, capital requirements under the standardized approach exceed those under the advanced approaches, so this analysis is simplified by considering only the standardized approach here. Table VII.6 further below provides the breakdown of risk-weighted assets of each banking activity under the proposal across the several risk categories.

Despite the explicit measure of operational risk when compared to the current standardized approach, the proposal would generally reduce the risk-weighted assets associated with traditional lending activity. Risk-weighted assets would decrease by 10 percent for residential real estate due to a roughly 21 percent reduction in credit risk-weighted assets on residential mortgages, which is only partly offset by operational risk-weighted assets. Similarly, risk-weighted assets decrease by a significant 18 percent for corporate lending. Risk-weighted assets increase

⁵⁵¹ While the banking activities of large banking organizations are less concentrated in small business lending, they remain significant providers of small business credit. As of Q2 2025, category I and II banking organizations account for about 18 percent of small business loans below \$1 million, and 33 percent of small business loans below \$100,000. Source: FFIEC Call Report, Line Item "Loans to Small Businesses and Small Farms." This may not capture all small business lending, as the line item only covers exposures of \$1 million or less and extensions of credit to small businesses may fall into other categories, such as real estate exposures, for purposes of the FFIEC Call Report.

by 9 percent for retail lending due to a smaller 9 percent decrease in credit risk-weighted assets related to the risk-weighting of unconditionally cancelable commitments and comparatively larger operational risk requirements associated with the higher interest margins on most retail lending. Risk-weighted assets associated with credit facilitation would decrease by about 10 percent.

Risk-weighted assets associated with trading-related activity would increase by 31 percent. While more than half of these risk-weighted assets come from counterparty credit risk on derivatives and securities financing transactions, the increase is driven by increases in market risk-weighted assets and operational risk associated with the

significant revenue generated by trading-related activity.

While the share of Category I and II banking organizations' risk-weighted assets resulting from trading-related activities would increase, traditional lending activity would still account for the largest share of their risk-weighted assets under the proposal. Specifically, traditional lending activity would account for 44 percent of risk-weighted assets of Category I and II banking organizations under the proposal, a decrease from 50 percent under the current standardized approach. In contrast, the percentage of Category I and II banking organizations' total risk-weighted assets arising from trading-related activities would increase from 23 percent under the standardized

approach to 29 percent under the proposal.

Other banking services, which consist primarily of investment management, merchant banking, advisory services and corporate treasury, generate operational risk-weighted assets under the proposal due to their income. Income associated with these banking activities accounts for about 27 percent of Category I and II banking organizations' noninterest income. Consequently, while this analysis does not assign assets to such activities that would generate risk-weighted assets under the standardized approach, they would account for approximately 1.8 percent of risk-weighted assets under the proposal.

Table VII.5: Banking Activity Risk-Weighted Assets Under the Current Standardized Approach and the Proposal

	Standardized Approach (\$bn)	Expanded Risk-Based Approach (\$bn)	Change vs. Standardized
Traditional Lending	3,863	3,488	-9.7%
Corporate	1,964	1,604	-18.3%

2. Cumulative Impact of Recent Proposals on Common Equity Tier 1 Capital Requirements by Banking Activity

The final analysis in this section attributes common equity tier 1 capital requirements to business activities. Due to the challenges of attributing many sources of stress loss to a specific banking activity, this analysis assigns the stress capital buffer requirements associated with each risk type in proportion to each activities' share of the risk type within the proposal's risk-weighted assets calculation. For example, if corporate lending accounts for 15 percent of credit risk-weighted assets at a bank, 15 percent of the portion of the banks' stress capital

buffer requirement attributed to credit risk would be further attributed to corporate lending.

Table VII.7 presents the cumulative impact of the proposals and proposed stress test changes on requirements by banking activity. The cumulative impact on requirements for traditional lending and credit facilitation roughly track the risk-weighted asset changes. However, the 9 percent increase in common equity tier 1 capital requirements for trading-related activities is significantly smaller than the 31 percent risk-weighted asset impact. This difference is primarily driven by the proposed stress test changes, which would significantly reduce projected market risk losses (particularly in the 2024

stress test) and projected operational losses (which are attributed in significant part to trading-related activity) in this analysis. At the same time, the increase in requirements for trading-related activities is significantly larger than the 6 percent decrease in requirements for market risk,⁵⁵⁵ which falls within the broader category of trading-related activities. This follows, as trading-related activities include significant operational risk and CVA requirements, which increase relative to current rules, notwithstanding the proposed stress test changes.

Further discussion of the economic implications of this proposal in combination with other recent capital rulemakings is found in section VIII.

⁵⁵³ Includes risk-weighted asset deductions—allocated proportionally to pre-deduction risk-weighted assets.

D. Data and Estimation Methodology

This section describes the data and methodology used to estimate the impact of this proposal on banking organizations' risk-weighted assets and capital requirements. Section VII.D.1 describes the "special data collection" used as a starting point for the risk-weighted asset impact estimates for holding companies, and the adjustments made to these data to reflect the current proposal. Section VII.D.2 describes how these estimates of risk-weighted assets are extrapolated to more recent time periods and depository institution subsidiaries. Section VII.D.3 describes

how risk-weighted assets are attributed across banking activities under the current standardized approach as well as under the proposal. Section VII.D.4 describes how impacts on capital requirements are constructed from the estimated total risk-weighted assets. Section VII.D.5 describes how stress capital buffer capital requirements, as informed by the Board's supervisory stress test, are attributed to risk types within the cumulative capital impact analysis.

Question 195: The agencies request comment on all aspects of the impact analysis in this proposal, including the estimation of risk-weighted assets and capital requirements, the attribution of risk-weighted assets to banking activities and the attribution of stress capital buffer requirements to risk categories. What changes or alternative methodologies, if any, should the agencies consider, and why? What additional analysis or data should the agencies consider, and why? Commenters are encouraged to provide any additional data that would be relevant.

1. Estimation of Risk-Weighted Assets Under the Proposed Expanded Risk-Based Approach

a. Special Data Collection

In late 2023, the Board collected data on risk-weighted assets from 32 large bank holding companies based on the specific requirements contained in a July 27, 2023, capital proposal.⁵⁵⁷ The data in this voluntary collection reflected respondents' exposures as of June 30, 2023.⁵⁵⁸ The differences between the current proposal and the proposal on which the special data collection was intended to inform are broad and material. However, the definitions of risk exposures under the current proposal is still significantly better aligned with the special data collection than alternative sources, making the special data collection the

⁵⁵⁶ Statistics used in agency calculations are from the special data collection, FR Y-9C, and FR Y-14 forms as of June 30, 2025. See FFIEC 031 Form Statistics. For Form Y-14M, see Board of Governors of the Federal Reserve System, Reporting Forms: FR Y-14M (Capital Assessments and Stress Testing) (version June 2025) ("Form FR Y-14M"), https://www.federalreserve.gov/apps/reportingforms/Report/Index/FR_Y-14M. For FR Y-14Q, see Board of Governors of the Federal Reserve System, Reporting Forms: FR Y-14Q (Capital Assessments and Stress Testing) (version June 2025) ("Form FR Y-14Q"), https://www.federalreserve.gov/apps/reportingforms/Report/Index/FR_Y-14Q.

⁵⁵⁷ See <https://www.federalreserve.gov/newsevents/pressreleases/bcreg20231020b.htm>.

⁵⁵⁸ One banking organization submitted data as of the third quarter of 2023, instead of as of June 30, 2023. The data provided by this banking organization was not used for the analysis described in this proposal. This banking organization would not be subject to the current proposal.

most suitable starting point for much of the impact analysis.⁵⁵⁹

The special data collection includes data from all nine Category I and II bank holding companies, as well as most of the additional bank holding companies that are expected to be subject to the proposed market risk capital requirements, and these data were substantially complete.⁵⁶⁰ In addition, the special data collection includes estimates of market risk and CVA covering most of the additional bank holding companies that would be subject to market risk and CVA. However, the collection did require some limited imputation of data points to address inconsistencies, as discussed below in section VII.D.1.ii. In addition, significant adjustments were made to reflect differences between the current proposal and the 2023 proposal. These adjustments, detailed below in section VII.D.1.iii, were informed by a combination of FR Y–14 data and industry comment letters received in response to the 2023 proposal. For comparison with the current capital rule, the analysis also relied on regulatory financial reports (FFIEC Call Reports, FR Y–9C, FR Y–15, FFIEC 101, and FFIEC 102), supplemented with data on stress capital buffer requirements.⁵⁶¹

⁵⁵⁹ The Board is releasing an aggregated form of the special data collection in order to preserve the confidentiality of the responses provided by individual banking organizations while also providing additional information to the public. The aggregated form of the special data collection will be available on the Board's website, see: <https://www.federalreserve.gov/supervisionreg/basel/basel-default.htm>.

⁵⁶⁰ Specifically, banking holding companies with complete market risk estimates in the special data collection represent over 96 percent of the Q2 2025 trading assets plus liabilities of all bank holding companies expected to be subject to market risk capital requirements.

⁵⁶¹ Reporting forms issued by the Federal Financial Institutions Examination Council (FFIEC) are available at www.ffiec.gov and reporting forms issued by the Federal Reserve Board are available at www.federalreserve.gov. The "Call Report" collectively refers to the data from the FFIEC 031, 041, and 051 forms. Specifically, see FFIEC 031 Form Statistics and FFIEC 041 Form Statistics. For FFIEC 051 ("FFIEC 051 Form Statistics"), see FFIEC, Reporting Forms, Consolidated Reports of Condition and Income for a Bank with Domestic Offices Only and Total Assets Less than \$5 Billion: FFIEC 051 (version June 2023). Bulk data download available at: <https://cdr.ffiec.gov/public/PWS/DownloadBulkData.aspx>. Certain financial reports filed by banking organizations, including portions of the FFIEC 101 and FFIEC 102 reports, as well as FR Y–14 reports, are not available publicly because they contain confidential supervisory information and are confidential business information of the reporting banking organizations. Where the agencies relied on confidential information collected through these reports for estimates in this SUPPLEMENTAL INFORMATION, the agencies have described in detail what confidential data were used and how they were used.

A few important caveats remain for impact estimates included in this section. Although the agencies and participating banking organizations have corrected known erroneous data submissions through extensive dialogue and resubmissions from reporting banking organizations, some data quality issues could remain. In addition, the adjustments detailed in section VII.D.1.iii in many cases are only approximations and may not account for all material differences between the current proposal and the 2023 proposal upon which the special data collection was based. Also, the impact estimates do not reflect potential longer-term changes in banking organizations' behavior or changes in market conditions that may occur after implementation of the proposal. Section VIII includes discussion of the economic implications of the capital impact of the proposal on different banking activities and under different economic conditions.

b. Data Imputations

The imputations fall into two categories: recalculations and proxies. Recalculations are applied to adjust certain firm-wide totals based on subcomponent data where a banking organization did not report such total values or because inconsistencies were identified in a banking organization's calculations based on its subcomponent data. Proxies are extrapolations of missing data from one banking organization based on submissions of similar banking organizations. Proxies were only applied in cases where subcomponent data that could enable a recalculation were also not provided.

There are three areas that required recalculations:

(1) *CVA risk-weighted assets*, where one GSIB submitted data using an incorrect formula that was included in an early version of the data submission instruction, before the Board issued an update to correct the error in submission instructions. In this case, the Board used the correct formula to recalculate CVA risk-weighted assets.

(2) *Operational risk-weighted assets*, where some banking organizations' total operational risk-weighted assets were calculated in a manner inconsistent with the formula published in the proposal. In these cases, the agencies recalculated total operational risk-weighted assets from their subcomponents by applying the formula in the proposal, which had a material effect for one GSIB.

(3) *Internal models approach market risk-weighted assets*, where some banking organizations provided internal

models approach values for one or more trading desks but did not follow the formula for calculating the entity-wide market risk capital requirement using these values. In these cases, the agencies assumed that these trading desks are model-eligible and applied the proposed formula to recalculate market risk weighted assets, which caps the banking organization's entity-wide internal models-based market risk-weighted assets.⁵⁶²

These recalculations carry through to firm-wide calculations. For example, the agencies recalculated total risk-weighted assets to reflect recalculated operational or market risk-weighted assets where appropriate.

Proxies were applied where a banking organization's submission for market risk-weighted assets was missing or equal to zero, and the banking organization's regulatory reports suggested that it would likely be subject to market risk under the proposal. For these few holding companies, market risk-weighted assets under the proposal were proxied by market risk-weighted assets under the current rule, multiplied by (one plus) the median percentage change in market risk-weighted assets under the proposal across peer holding companies in the data collection. These peer groups were constructed as (i) Category I and II holding companies, (ii) Category III and IV domestic holding companies, and (iii) Category III and IV foreign holding companies. As with recalculated values, the proxied value was carried through to the calculation of total risk-weighted assets.

c. Data Adjustments To Reflect Current Proposal

The special data collection measures risk-weighted assets under the 2023 proposal, necessitating adjustments to reflect the impact of this proposal. Where possible, the special data collection is used to estimate these adjustments to risk-weighted assets. However, in some cases, a sufficiently accurate estimate requires additional regulatory data or industry estimates. The discussion below details how the estimates used in this proposal were constructed.⁵⁶³

The current proposal would apply the Basel III risk weights for residential real estate exposures, removing 20

⁵⁶² Estimates of the impact of the proposal cap the banking organization's entity-wide internal models-based market risk capital requirement at the capital requirement under the standardized approach.

⁵⁶³ The estimated risk-weighted assets do not include adjustments for details of the current proposal not reflected in the 2023 special data collection where the impact is both expected to be immaterial and difficult to reliably estimate.

percentage points from the set of risk weights proposed in 2023. To reflect this, risk-weighted assets were adjusted by an amount equal to 20 percent of the estimated residential real estate exposure in the special data collection. In calculating real estate exposure, on-balance sheet residential real estate exposures are taken as those reported as regulatory residential real estate under risk weights that correspond to such exposures under the 2023 proposal.⁵⁶⁴ Because there is no specific item for off-balance sheet residential real estate exposures in the special data collection, these are estimated as the amount of home equity loan commitments in the FR Y–9C under the assumption that these are all unconditionally cancelable exposures with a 10 percent credit conversion factor under the proposal.⁵⁶⁵

Similarly, the current proposal would reduce retail risk weights by 10 percentage points relative to the 2023 proposal. The impact of this modification is calculated similarly to the residential real estate modification, with the applicable on- and off-balance sheet retail exposure estimated using special data collection exposures reported under 55, 85, or 110 percent risk weights in the items corresponding to retail and unconditionally cancelable commitments, respectively.

The scope of applicability of the 65 percent risk weight for investment grade corporate exposures has expanded significantly relative to the 2023 proposal. Data from the special data collection are used to estimate the impact of this change. Specifically, for each banking organization, memo items M.6 and M.10 are used as estimates of the amount of additional investment grade corporate exposure to which the 65 percent risk weight would apply.⁵⁶⁶ Across Category I and II banking organizations, an estimated 53 percent of balance sheet corporate exposure and 60 percent of off-balance sheet corporate exposure is classified as investment-

grade and risk-weighted at 65 percent under the proposal, including the exposure already risk-weighted at 65 percent under the 2023 proposal. The bank-specific difference between this amount and the amount of corporate exposure risk-weighted at 65 percent under the 2023 proposal is multiplied by the negative 35-percentage-point change in risk weight to obtain the estimated adjustment to risk-weighted assets.

The treatment of equity exposures in the banking book differs significantly under this proposal versus the special data collection. As this proposal retains the current treatment of banking book equity exposures, their risk-weighted assets under the current simple risk-weight method are used as the starting point for their estimated risk-weighted assets under the proposal.⁵⁶⁷ However, a downward adjustment is applied to this amount to account for publicly traded equity exposures that are scoped into market risk under this proposal. This adjustment was estimated using memo item 2 of the “Equity exposures” template of the special data collection. For the few banking organizations that did not provide data for this memo item, the share of equity exposure migrating to the trading book is imputed as the aggregate share of such exposure across the special data collection banking organizations that did provide these data.⁵⁶⁸ In calculating risk-weighted assets, it is assumed that the migrating equity exposures would have otherwise received the 100 percent risk weight applicable to “non-significant” equity exposures.

Risk-weighted assets in the special data collection are also adjusted to reflect removal of the minimum haircut floor. As the special data collection does not provide the calculation of a standalone impact of the minimum haircut floor in the 2023 proposal on risk-weighted assets, the impact of removing the haircut floor is estimated by calculating the difference between the current standardized approach and the expanded risk-based approach for exposures that would fail the minimum haircut floor requirement.⁵⁶⁹

The adjustments to operational risk-weighted assets in the special data collection are constructed in two stages.

First, risk-weighted assets for operational risk are recalculated using an internal loss multiplier equal to one for all banking organizations. Risk-weighted assets for operational risk are then recomputed using the business indicator as defined in the proposal, replacing the financial and services components with a noninterest component that also downscales net income from investment management, investment services, and treasury services.⁵⁷⁰ This noninterest component is computed primarily from the special data collection “Operational risk” sheet as the three-year average of the absolute value of net noninterest income before operational losses (Part 2, sum of 2.a, 2.c, 3.a and 3.b, plus Part 1, item 1, minus the sum of 2.b and 2.d), accounting for a scaling of net noninterest income associated with investment management, and investment and treasury services, plus the three-year average operational losses (Part 1, item 1). To account for the scaling of net noninterest income from historically lower operational risk activities, the three-year average absolute value of net noninterest income is scaled by a factor that accounts for the scaling of net income associated with investment management and investment and treasury services in the proposal.⁵⁷¹ Due to data limitations, this factor is based on these activities share of total, not net, noninterest income.

The agencies used information from the special data collection to recalculate market risk-weighted assets under the proposal.⁵⁷² The main changes from the 2023 proposal were to: (1) recognize full diversification for certain non-modellable risk factors, (2) recognize diversification between positions modeled under the standardized approach and the internal models

⁵⁶⁴ Special data collection item 6.e under 40, 45, 50, 60, 70, or 90 percent risk weights and item 6.f under 50, 55, 65, 80, 95, and 125 percent risk weights.

⁵⁶⁵ FR Y–9C, Schedule HC–L, item 1.a.

⁵⁶⁶ One banking organization’s entry on memo item 10 is divided by 1000 due to a likely unit error. In addition, in each of memo items 6 and 10, there is one entry that is likely incorrect (*i.e.* zero or amounts exceeding total corporate exposure risk-weighted at 100 percent), and treated as missing. The missing values for the (on/off-balance sheet) investment-grade corporate exposures risk weighted at 100 percent are imputed by multiplying (on/off-balance sheet) corporate exposures risk-weighted at 100 percent (item 8) by the aggregate investment grade share of (on/off-balance sheet) corporate exposures, based on those banking organizations in the special data collection where the investment grade 100 percent risk weighted memo item is reported.

⁵⁶⁷ Specifically, risk-weighted assets are taken as the amount reported in Schedule B of the FFIEC 101, item 23, column G.

⁵⁶⁸ The estimate of the aggregate share of equity exposures migrating out of the equity framework is 3.79 percent.

⁵⁶⁹ Specifically, this difference is the sum of items 1 through 4 and 11 through 14 of column M minus the sum of those same items in column K within the “transacts fail haircut flrs” sheet of the special data collection.

⁵⁷⁰ The proposal would not downscale all treasury services (as defined in the FR Y–14Q report), but rather only certain treasury services (see Section IV.D.1 of this Supplemental Information). However, data on the relevant subset of treasury services is not available to the agencies. This discrepancy implies that the aggregate impact of the proposal would be slightly smaller than estimated. If none of treasury services income were subject to the scaling factor, the impact of the proposal on aggregate common equity tier 1 capital requirements would only be about 0.3 percent higher.

⁵⁷¹ Specifically, the scaling factor equals one minus the ratio of 70 percent of three-year average of the sum of investment management, investment services, and treasury services noninterest income divided by three-year average total noninterest income. Investment management, investment services, treasury services, and total noninterest income are items 19, 20, 21, and 26 of FR Y–14Q Schedule G.

⁵⁷² Due to nonlinearities in market risk formulas, firm-level data are required to construct these estimates.

approach, (3) use a single default risk calculation for all trading desks rather than separate default risk calculations for modeled and non-modeled desks, (4) cap the amount of capital required under the internal models approach at the amount required by the standardized approach for market risk in certain circumstances, (5) remove the Spearman Correlation profit and loss attribution test for internally modelled desks, and (6) clarify netting for Uniform Mortgage-Backed Securities.⁵⁷³ In addition to the changes noted above, the estimated impact of the proposal includes an estimated impact on risk-weighted assets from a reduction in the scope of application of the market risk framework of the capital rule. Due to limited data on which to base the corresponding impact estimate for scope, it is assumed that the credit risk-weighted assets of these currently market risk-weighted exposures would equal the current market risk-weighted assets of these exposures.⁵⁷⁴

Most market risk impact estimates are obtained by applying formulas in the regulation. To calculate the impact of removing the Spearman Correlation test, the agencies assume a 20 percentage point increase in the share of modeled capital requirements and also assume that shifting positions from the standardized approach to internal models reduces capital requirements by 50 percent.⁵⁷⁵

Additionally, due to data limitations, to reflect the impacts of clarifying netting for Uniform Mortgage-Backed Securities, an estimate from the joint comment letter from the International Swaps and Derivatives Association and Securities Industry and Financial Markets Association was used. This letter estimates an approximately nine percent reduction in capital requirements for market risk positions capitalized under the standardized approach across eight GSIBs.⁵⁷⁶ These

impact estimates apply the nine percent reduction in standardized approach capital requirements across all banking organizations.

Due to data limitations, to reflect the exemption of client-facing derivative transactions from CVA risk, an estimate from the joint comment letter from the International Swaps and Derivatives Association and Securities Industry and Financial Markets Association was used. This letter estimates that such a change would reduce proposed CVA risk-weighted assets relative to the 2023 proposal by about 9 percent in aggregate.⁵⁷⁷ This 9 percent impact was applied to each bank's CVA risk-weighted assets.

Lastly, to reflect a change in the securitization p-factor under the proposal, the agencies use estimates of securitization risk-weighted assets under a p-factor of 0.5 (memo item 1 in the "Securitization exposures" sheet of the data collection). This estimate was completed by all holding companies that would be subject to this proposal.

2. Extrapolation of Estimates to Other Time Periods and Banking Organizations

As it has been more than two years since the as of date of the special data collection (June 30, 2023), the analysis in this proposal adjusts risk-weighted assets to reflect more current balance sheets. The adjustment approach in this proposal is intended to capture not only general growth, but also the potential effect of broad shifts in the composition of banking organizations' balance sheets since 2023. Specifically, the analysis in this proposal decomposes risk-weighted assets into eleven exposure segments, and then establishes an index for each segment and banking organization; a measure which is assumed to change over time in proportion to the exposures' risk-weighted assets under the proposal. The risk-weighted assets for each segment under the proposal, as of Q2 2025, are then estimated as the segment's risk-weighted assets under the special data collection, adjusted for differences between the 2023 and

current proposal as described above, and then multiplied by one plus the cumulative growth in the segment's index over the period Q2 2023 through Q2 2025. Total risk-weighted assets under the proposal as of Q2 2025 are then taken by summing across the segments.⁵⁷⁸

The analysis in this proposal takes a similar approach when estimating risk-weighted assets for the depository institution subsidiaries of holding companies present in the special data collection. Specifically, the index for each segment is measured at both the depository institution and holding company levels, and the share of risk-weighted assets at the depository institution subsidiary is estimated to be the same as the share of the corresponding index at the depository institution subsidiary.

The eleven exposure segments and their corresponding indices, are described below. Given their function, the indices must exist over time at both the holding company and depository institution levels. Furthermore, the selected indices should bear a close conceptual relationship with the risk-weighted assets associated with the exposure. This improves the reliability of the estimates by ensuring that drivers of changes in the index should generally be reflected in changes to risk-weighted assets under the proposal. In most cases, the chosen index is the risk-weighted assets of the exposure segment under the standardized approach.

The eleven exposure segments include operational risk, market risk, CVA, and eight areas of credit risk exposure. The eight segments within credit risk are: residential real estate,⁵⁷⁹ retail,⁵⁸⁰ securitization, banking book

⁵⁷³ The analysis assumes that banking organizations receive supervisory approval to cap the amount of capital required under the internal models approach at the amount of capital required for all trading desks under the standardized approach. For more information on this process, see section V.A.3.b.

⁵⁷⁴ This conservative assumption results in the small increase in risk-weighted assets noted in section VII.A.1, as the proposed market risk rule would otherwise result in an overall decrease in market risk-weighted assets for these banking organizations.

⁵⁷⁵ The 50 percent impact is derived from an analysis of the ratio of modelled capital requirements compared to standardized approach capital requirements for the same portfolio using information from the special data collection.

⁵⁷⁶ The nine percent figure is imputed from the comment letter. Page 23 includes a figure indicating a \$70.3 billion reduction in risk-weighted assets

from the "GSE" change on a base of \$801.7 billion in risk-weighted assets under the standardized approach. \$70.3 billion is approximately nine percent of \$801.7 billion. See Comment Letter from International Swaps and Derivatives Association and the Securities Industry and Financial Markets Association, (Jan. 16, 2024), https://www.federalreserve.gov/SECRS/2024/February/20240220/R-1813/R-1813_011724_156753_496678267479_1.pdf.

⁵⁷⁷ Comment Letter from International Swaps and Derivatives Association and the Securities Industry and Financial Markets Association, at 103 & n. 269, 160 (Jan. 16, 2024), https://www.federalreserve.gov/SECRS/2024/February/20240220/R-1813/R-1813_011724_156753_496678267479_1.pdf.

⁵⁷⁸ In addition, total risk-weighted assets reflect a small adjustment for an estimate of risk-weighted asset deductions as of Q2 2025—actual deductions for allocated transfer risk reserve (FR Y-9C HC-R Part II, item 30), plus an adjusted deduction for excess AACL. This adjusted excess AACL deduction is estimated as zero for holding companies reporting no excess AACL deduction in Q2 2025 (FR Y-9C HC-R Part II, item 29), and for other holding companies it is equal to this reported amount plus 1.25 percent of the difference in the credit risk-weighted assets of non-equity exposures between the proposal and the current standardized approach.

⁵⁷⁹ Includes all risk-weighted assets reported in items 6.a, e, and f of the special data collection "General credit risk exposures" sheet, plus 10 percent of the exposure amount reported in item 1.a of FR Y-9C HC-L (i.e. home equity line of credit risk-weighted assets when assuming a 100 percent credit risk weight and a 10 percent CCF under the proposal).

⁵⁸⁰ Includes all risk-weighted assets reported in item 7, plus risk-weighted assets of exposures risk-weighted at 55, 85 or 110 percent in item 12 of the special data collection "General credit risk exposures" sheet.

equity, SFTs,⁵⁸¹ derivatives,⁵⁸² all other balance sheet exposures,⁵⁸³ and all other off-balance sheet exposures.⁵⁸⁴ For nine of the eleven exposure segments, the chosen index represents risk-weighted assets for the exposure segment under the standardized approach, or a close approximation thereof.⁵⁸⁵ Standardized risk-weighted assets should change similarly to risk-weighted assets under this proposal as long as there are not large changes within the exposure segment associated with the additional risk-drivers incorporated within the proposal. For example, risk-weighted assets for residential real estate should grow similarly as long as the loan-to-value composition of the portfolio does not shift significantly.

Neither operational risk or CVA risk are part of current standardized risk-weighted assets, so a different approach to indexing is required. CVA risk-weighted assets measured under the advanced approaches is used as the index for CVA.⁵⁸⁶ Lastly, for operational risk, the agencies index the business indicator to an approximation developed from regulatory report data items. This approximation equals three-year average absolute modified revenue, where modified revenue has two parts. The first part is the minimum of net interest income and 2.25 percent of

interest earning assets.⁵⁸⁷ The second part is modified net noninterest income, defined as noninterest income plus realized gains or losses on securities, minus 70 percent of investment management noninterest income and other noninterest expenses.⁵⁸⁸ Operational risk weighted-assets are extracted by applying the operational risk formula to the estimated Q2 2025 business indicator, which in turn equals the business indicator measured from the special collection data, indexed by growth in this approximate indicator.

3. Attribution of Risk-Weighted Assets to Banking Activities

This section provides the methodology used to attribute all risk-weighted assets under the standardized and proposed expanded risk-based approach, to the banking activities that most likely generated them. The sample includes the bank holding companies that participated in the special data collection, including all that would be subject to this proposal. The attribution of banking activity applied in this section is chosen to distinguish the several functions that large banking organizations serve in the U.S. economy. Banks may decide to expand or contract the business units that perform each of these functions based on the required capital, among other factors. These categories of banking activity are chosen to be broad enough to allow for a mapping of risk exposures between the FR Y–9C, which collects standardized risk-weighted assets, and the special data collection.

Section VII.D.3.a applies this exercise to expanded total risk-weighted assets, as reported in the special data collection and modified to reflect the proposal. Section VII.D.3.b describes how the agencies estimate the attribution of risk-weighted assets under the standardized approach to these same banking activities. The total risk-weighted assets attributed align with amounts reported within the sections VII.C and VIII.

a. Attribution of Expanded Total Risk-Weighted Assets

When estimating risk-weighted assets by banking activity, the agencies

attribute all risk-weighted assets reported in the special data collection under the expanded risk-based approach as well as all adjustments (described above in section VII.D.1.c) to these figures that were made to reflect the current proposal.

Most risk-weighted asset items in the special data collection are attributed entirely to a specific banking activity. These comparatively simple attributions are described below.

Traditional lending includes all credit risk-weighted assets associated with exposures to GSEs, residential and commercial real estate, and retail exposures, as well as all securitizations.⁵⁸⁹ Risk-weighted assets for equity exposures not subject to the market risk framework are also attributed to traditional lending as, like loans, these are typically illiquid long-term funding arrangements.⁵⁹⁰ Within these traditional lending exposures, securitization risk-weighted assets are split evenly across the residential real estate, retail, and corporate lending categories due to data limitations. In aggregate, securitizations account for less than 3 percent of risk-weighted assets under the proposal. Exposures to GSEs and residential real estate, including statutory multifamily and “other real estate exposures,” are attributed to residential real estate lending, and all other exposures except for “retail” are attributed to corporate lending.

Credit facilitation includes credit risk-weighted exposures to sovereigns, supranational entities, public-sector enterprises, and banks.⁵⁹¹ This banking activity also includes credit risk-weighted assets associated with letters of credit, guarantees, contingent items, and forward agreements.⁵⁹²

Trading-related activities include all market risk-weighted assets, as well as credit risk-weighted assets associated with derivatives, repo-style transactions, and exposures to unsettled transactions.⁵⁹³ In addition, CVA risk

⁵⁸¹ Includes all risk-weighted assets reported in items 18, 20 and 21 of the special data collection “General credit risk exposures” sheet, plus risk-weighted assets reported in items 1 through 4 and 11 through 14 of the “Transacts fail min hairct flrs” sheet.

⁵⁸² Includes all risk-weighted assets reported in items 24 and 25 of the special data collection “General credit risk exposures” sheet.

⁵⁸³ Defined as all risk-weighted assets reported in part 1 of “General credit risk exposures” in the special data collection, less those amounts already included within residential real estate or retail.

⁵⁸⁴ Defined as all risk-weighted assets reported in part 2 of “General credit risk exposures” in the special data collection, less those amounts already included within residential real estate, retail, SFT or derivatives.

⁵⁸⁵ For these nine exposure segments, the standardized approach-based index is defined by items in regulatory reports as follows. Unless indicated otherwise, amounts represent risk-weighted assets associated with the indicated items from the FR Y–9C, HC–R Part II, with corresponding values from FFIEC Call reports used for depository institution subsidiaries. Market risk—item 27. Residential real estate—items 4.a and 5.a, amounts in columns H, I and S. Retail—HC–C items 6.a through d (all amounts assumed risk-weighted at 100 percent). Securitization—items 9 and 10. Banking book equity—FFIEC 101, Schedule B, item 23. SFTs—item 16. Derivatives—items 20 and 21. All other off-balance sheet items—items 12 through 15, 17, and 18. All other balance sheet items—item 28, minus the amounts for the other eight standardized risk-weighted asset exposure segments.

⁵⁸⁶ Specifically, items 31.a and b of FFIEC 101 Schedule B.

⁵⁸⁷ Net interest income is FR Y–9C Schedule HI item 5.m and interest earning assets are approximated as the sum of Schedule HC items 1.b, 3, 4.a, and 4.b, Schedule HC–B item 8 (cols A and D), and Schedule HC–D item 12. Corresponding items from FFIEC Call reports are used for the depository institution subsidiaries.

⁵⁸⁸ Specific FR Y–9C data used are in Schedule HI—item 5.m (noninterest income), item 6 (gains on securities sales), item 7.d (other noninterest expense). Investment management noninterest income is taken as item TPPNRS68 from the FR Y–14.A.

⁵⁸⁹ These exposures correspond to items 3, 6 and 7 of “general credit risk exposures” plus item 1.c of “overview” of the special data collection template.

⁵⁹⁰ These exposures correspond to item 2 of part 1 of the “overview” sheet of the special data collection template, modified to reflect the current treatment of banking book equity exposures.

⁵⁹¹ Within the special data collection template, these correspond to items 1, 2, 4 and 5 of “general credit risk exposures.”

⁵⁹² Within the special data collection template, these correspond to items 14 through 17, 19, 22 and 23 of “general credit risk exposures.”

⁵⁹³ Within the special data collection template, market risk-weighted assets correspond to item 4 in part 1 of “overview” and the credit risk items correspond to item 1.b of overview and items 18,

and default fund contributions accompany the derivative exposures.⁵⁹⁴

Fixed or other assets include credit risk-weighted assets associated with insurance and other exposures, except for mortgage servicing assets which are included in residential real estate lending.⁵⁹⁵ This segment also incorporates exposures that were deducted from common equity tier 1 capital under the 2023 proposal, and therefore not present in risk-weighted assets, but risk-weighted at 250 percent under this proposal.⁵⁹⁶

The remaining risk-weighted assets under the proposal are split across several banking activities. These include credit risk associated with commitments and corporate exposures, as well as operational risk and deductions from risk-weighted assets for excess allowances or allocated transfer risk reserves.

Credit risk-weighted assets associated with corporate exposures are attributed to either traditional lending or credit facilitation based on whether the borrower is a financial firm.⁵⁹⁷ This is determined from the proportion of such exposures to non-financial firms based on the FR Y–14Q Schedule H.1 data.⁵⁹⁸ The adjustment to risk-weighted assets that is made to account for the broader applicability of the 65 percent investment grade corporate risk weight under the proposal, as compared to the 2023 proposal, is similarly split across traditional lending and credit facilitation based on the proportion of non-public investment grade corporate exposures that are indicated as

exposures to highly regulated industries in the special data collection.

Commitments could represent exposures to counterparties that are corporate, retail, banks, or sovereigns.⁵⁹⁹ The likely type of counterparty is indicated by the risk weight assigned to the commitment exposure. Therefore, within each risk weight, commitments are allocated to banking activities based on the activity's share of balance sheet exposure assigned that risk weight.⁶⁰⁰

Under the proposal, the operational risk-weighted assets of each banking organization are attributed to banking activities based on their contribution to the banking organization's business indicator. The business indicator is comprised of an interest, lease, and dividend component and a noninterest component. Operational risk-weighted assets are attributed to these two components in proportion to their share of the business indicator. The operational risk-weighted assets attributed to each of these components are further attributed to the banking activities as discussed below.

The interest, lease, and dividend component is proportional to the banking organization's net interest income until it hits a cap equal to 2.25 percent of average interest-earning assets. Thus, each banking activity's share of the net interest component equals either the activity's share of net interest income if the banking organization is below the cap or the activity's share of interest-earning assets if the banking organization is above the cap. As many banking organizations are currently near the cap, the agencies first estimate for each banking organization the probability that it will be subject to the cap in the long run. This estimate is equal to the fraction of the previous ten years (2015 through 2025) in which the banking organization had a net interest margin exceeding 2.25 percent.⁶⁰¹ Then, a weight equal to the probability of having net interest margin above the cap is applied to the segment's share of interest-earning assets, while a weight equal to the probability of having net interest margin below the cap is applied to the segment's share of net interest income. To calculate each segment's share of net interest income and interest-earning assets, the agencies rely

on data from the FR Y–14Q Schedule G and special data collection.⁶⁰²

While the noninterest income component includes historical operational losses, these are excluded from the attribution of the component across business segments.⁶⁰³ Furthermore, due to data limitations and the difficulty of allocating noninterest expenses, the agencies use each segment's share of noninterest income as a proxy for its share of net noninterest income. Noninterest income is taken from the FR Y–14Q Schedule G. Traditional lending is associated with noninterest income from retail and small business banking and corporate lending (items 14 and 15). Credit facilitation accounts for noninterest income associated with syndicated lending (item 16D). Trading-related activities are associated with noninterest income from equity and debt capital markets activities as well as sales and trading and investment services (items 16B, 16C, 18 and 20). The other banking services segment's noninterest income includes investment banking advisory, merchant banking, investment management, investment services, insurance services, and other small income sources (items 16A, 17, 19, and 21 through 25).

Each banking activity's share of both the interest, lease, and dividend component and noninterest income component is floored at zero, and scaled so that the sum of shares across banking activities for each component is equal to one. To calculate the operational risk-weighted assets for each banking activity, these component shares are multiplied by the operational risk-weighted assets associated with that component, and the contributions of the two components are added together.

As a final step, deductions from risk-weighted assets associated with excess allowances and allocated transfer risk reserve are attributed to business segments for each banking organization

20, 21, 24, 25 and 27 of "general credit risk exposures."

⁵⁹⁴ In the special data collection, default fund contributions are item 26 of "general credit risk exposures" and CVA risk-weighted assets are item 5 on part 1 of the "overview" sheet.

⁵⁹⁵ Within the special data collection template, these correspond to items 9 and 10 of "general credit risk exposures."

⁵⁹⁶ These exposures are mostly deferred tax assets, and thus would be reported as other assets on the balance sheet if not deducted.

⁵⁹⁷ The small amount of corporate exposures not reported under either a 65 percent or 100 percent risk weight in the special data collection (item 8) are attributed to lending and credit facilitation. The small amount of corporate risk-weighted assets not reported under a specific risk weight are attributed to banking activities pro rata with all other corporate exposures across the entire sample.

⁵⁹⁸ Specifically, starting from all drawn exposure in the H.1 (commercial and industrial loan data) that are reported in items 1.e.1, 3, 4, 9.a, 9.b.2 and 10.b of the FR Y–9C and have known NAICS codes, the fraction to borrowers in NAICS starting 52 or 53 is attributed to credit facilitation with the remainder to corporate lending. The average share across other banking organizations is used where NAICS are not reported for the banking organization.

⁵⁹⁹ Commitments represent items 12 and 13 in the "general credit risk exposures" sheet of the special data collection template.

⁶⁰⁰ Balance sheet exposures are those reported in Part 1 of "general credit risk exposures" in the special data collection.

⁶⁰¹ The average probability of having a net interest margin over 2.25 percent equals about 61 percent for the four GSIB universal bank holding companies and is zero for the other five Category I and II bank holding companies.

⁶⁰² Net interest income in the FR Y–14Q Schedule G is attributed to segments as follows: traditional lending—retail and small business banking (except deposits) and commercial lending (items 1 and 2, except 1E); trading—sales and trading and investment services (items 5 and 7); credit facilitation—investment banking (item 3); other banking services—merchant banking, investment management, insurance services, and other immaterial segments (items 4, 6, and 9 through 11). Net interest income associated with deposits and corporate treasury is excluded from the calculation. Interest-bearing assets are estimated as those reported in special data collection items 1 through 8, which are attributed to business activities as discussed earlier in this section.

⁶⁰³ This approach is equivalent to an assumption that operational losses are distributed across business segments in the same proportion as net noninterest income.

in proportion to those segments' risk-weighted assets.⁶⁰⁴

b. Attribution of Risk-Weighted Assets Under the Standardized Approach

In this second part of the analysis, the agencies construct an estimate of standardized risk-weighted assets for the same banking activities. For credit risk exposures on the balance sheet, the agencies extrapolate from the special data collection. Adjustments to risk-weighted assets are applied to ensure that total standardized risk-weighted assets equal those in the FR Y–9C. For other exposures, the agencies take standardized risk-weighted asset amounts directly from the FR Y–9C.

The FR Y–9C does not disaggregate balance sheet exposures sufficiently to allow for the direct calculation of risk-weighted assets by banking activity. Therefore, the agencies risk-weight the balance sheet exposure amounts from the special data collection using assumed standardized risk weights, discussed below. These assumed risk weights apply in place of the risk weights under the proposal wherever the risk weight in the special data collection does not exist under the standardized approach. In addition, the assumed standardized risk weights are applied in place of the 150 percent risk weight for all special data collection items where a 150 percent risk weight (1) might be applicable to non-defaulted exposures under the 2023 proposal and (2) would be applicable only to defaulted exposures under the standardized approach.⁶⁰⁵

For assumed risk weights, the agencies use the most commonly applicable standardized risk weight for the special data collection item. This assumed risk weight is zero percent for sovereign and supranational exposures (items 1 and 2); 20 percent for GSEs, public sector entities, U.S. depository institutions, and self-liquidating trade-related items (items 3, 4.a, 4.c, and 5); 50 percent for statutory multifamily mortgages, pre-sold construction loans, and residential real estate (items 6.a., b, e, and f); 150 percent for high-volatility commercial real estate (item 6.c); and 100 percent for all other balance sheet exposures. In addition, the assumed risk weight for equity exposures not subject to the market risk framework is 100

percent, as almost all such exposures fall under the non-significant equity exposure threshold in the standardized approach. Because the assumed risk weights are slightly different from the actual average risk weight, the resulting estimates of standardized risk-weighted assets using assumed risk weights are scaled so that the total balance sheet risk-weighted assets align with the comparable amounts in the FR Y–9C for each banking organization.⁶⁰⁶

For the remaining off-balance sheet and counterparty credit risk exposures, as well as securitizations and market risk, standardized risk-weighted assets corresponding to items or small sets of items in the special data collection can be taken directly from the FR Y–9C Schedule HC–R Part 2. Traditional lending includes securitization exposures and retained recourse on small business obligations (items 9, 10, and 15). Trading-related activities include all market risk-weighted assets, as well as credit risk-weighted assets associated with repo-style transactions, derivatives, central counterparty default fund contributions, and exposures to unsettled transactions (items 8.b, 16, 20 through 22, and 27). The credit facilitation segment includes letters of credit and other off-balance sheet liabilities (items 12 through 14 and 17).

Commitments (items 18 and 19) are present in multiple banking segments. Consistent with the attribution of commitment risk-weighted assets under the proposal discussed above, in each risk weight, commitment exposures are attributed to banking activities pro rata based on the activity's share of balance sheet exposures assigned to that risk weight.⁶⁰⁷ This distribution of balance sheet exposures across special data collection items is also used to estimate an average assumed standardized risk weight for the commitment. As a final step, the estimated risk-weighted assets for commitments summed across banking segments are scaled to match the risk-weighted asset amount reported in the FR Y–9C. This scaling addresses not only potential errors in the assumed standardized risk weights, but also the change in credit conversion factors under the proposal.⁶⁰⁸

⁶⁰⁶ Specifically, the agencies match the sum of standardized risk-weighted assets associated with items 1 through 8.a in FR Y–9C HC–R Part 2. On average, the initial estimates of standardized risk-weighted assets using assumed risk weights are scaled down by about 2 percent.

⁶⁰⁷ Risk-weighted assets associated with unconditionally cancelable commitments are zero under the standardized approach.

⁶⁰⁸ The calculation implicitly assumes that the percentage change in commitments' average credit conversion factors is the same across business segments within each banking organization.

At this stage, by construction, the standardized risk-weighted asset amounts match with those reported in the FR Y–9C prior to application of any deduction for excess allowances or allocated transfer risk reserve. As was done throughout other estimates in section VII, the agencies allocate these risk-weighted asset deductions across banking segments in proportion to their pre-deduction total risk-weighted assets.

4. Estimation of Capital Requirements

The capital requirements computed in this proposal include both common equity tier 1 and tier 1 risk-based requirements under the standardized and advanced approaches as well as tier 1 leverage and supplemental leverage ratio requirements. Dollar amounts of requirements are calculated by multiplying the applicable requirement ratio by the relevant risk-weighted asset or exposure measure. In addition, in order to capture changes to the definition of capital, the requirements calculated in this proposal include the estimated amount of changes in capital deductions, plus the current amount of threshold deductions for deferred tax assets, mortgage servicing assets, or investments.⁶⁰⁹ Previous sections discuss the how risk-weighted assets are computed under the proposal, and the analysis assumes no changes to leverage exposure measures under all proposals under consideration. Therefore, the remainder of this section discusses how the buffer requirements are calculated.⁶¹⁰

The risk-based capital ratio requirements used within the estimates throughout this proposal include all applicable minimum capital ratio and buffer requirements, including the stress capital buffer requirement and GSIB surcharge. The estimated stress capital buffer requirement and GSIB surcharge are adjusted to reflect the mechanical effect of risk-weighted asset changes under this proposal. In addition, the GSIB surcharges and stress capital buffer estimates, as described below, are linearized to avoid discontinuities in requirements that could result in the short-run from small changes in risk-weighted assets or GSIB scores when using bucketed GSIB surcharges or rounded stress capital buffer requirements.

⁶⁰⁹ As of Q2 2025, only one of the bank holding companies that would be subject to this proposal had any threshold capital deductions, and none had deductions for mortgage servicing assets. Therefore, this adjustment has limited impact.

⁶¹⁰ The calculation of method 1 GSIB surcharge, using the approach described below, is applicable to estimating the enhanced supplementary leverage ratio requirement under the recently finalized rule.

⁶⁰⁴ Allowance and transfer risk reserve deductions amount to only about 0.3 percent of risk-weighted assets in aggregate, so their attribution does not materially affect conclusions.

⁶⁰⁵ Specifically, the assumed risk weight is applied to exposures to the U.S. government, supranational entities, GSEs, U.S. public sector entities, U.S. depository institutions, ADC (not high-volatility commercial real estate) and other real estate loans, and corporate exposures.

Under the capital plan rules, the stress capital buffer requirement is generally calculated as (1) the difference between a banking organization's starting and minimum projected common equity tier 1 capital under the severely adverse scenario in the Board's supervisory stress test plus (2) the sum of the dollar amount of the banking organization's planned common stock dividend for each of the fourth through seventh quarters of the capital planning horizon as a percentage of risk-weighted assets.⁶¹¹ Therefore, stress capital buffer requirements, expressed as a ratio, would differ under the proposal due to the proposal's impact on risk-weighted assets. To adjust the stress capital buffer requirement to reflect the proposal, the Board assumed that the estimated percentage difference in risk-weighted assets between the expanded risk-based approach and the standardized approach would have applied at the date at which the stress capital buffer requirement was calculated. Specifically, the estimates in this proposal adjust the actual stress capital buffer requirements by (i) removing the 2.5 percent floor and rounding, (ii) multiplying by the ratio of risk-weighted assets under the standardized approach relative to risk-weighted assets under the expanded risk-based approach in this proposal, and then (iii) reapplying the 2.5 percent floor on the requirement. For comparability, stress capital buffer requirements under current rules in this proposal also removes the effect of rounding.⁶¹² Therefore, for bank holding companies whose stress capital buffer requirements exceed 2.5 percent under both the standardized and expanded risk-based approach, the change in risk-weighted assets under the proposal has no effect on the stress capital buffer requirement when expressed in dollar terms. However, for bank holding companies whose stress capital buffer requirement would equal the 2.5 percent floor under both the standardized approach and the proposed expanded-risk based approach, the dollar amount of the stress capital buffer requirement would change proportionally to any changes in risk-weighted assets.

Under the current rule, risk-weighted assets are an input in method 2 of the GSIB surcharge calculation.⁶¹³ In particular, the short-term wholesale funding score's contribution to a GSIB's

method 2 score is calculated by dividing the average of a banking organization's weighted short-term wholesale funding amount by its average risk-weighted assets and multiplying that amount by a fixed factor of 350.⁶¹⁴ Hence, increases (or decreases) in a banking organization's risk-weighted assets would decrease (or increase) its method 2 score, thereby partially offsetting in GSIB surcharge requirements the proposal's effect on capital requirements. The standalone impact analysis in section VII.A adjusts the short-term wholesale funding score used in the GSIB surcharge calculation with the proposal's estimated impact on risk-weighted assets and recalculates GSIBs' method 2 scores and capital surcharges using the adjusted short-term wholesale funding indicator.⁶¹⁵ The GSIB score for each year is then taken as the minimum of the method 1 and 2 score, which is then converted into a surcharge using the following linearization which approximates the surcharge step function: $\text{surcharge} = 0.01 + 0.00005 \times \max[0, \text{score} - 180]$. The same linearization is applied to scores calculated under the GSIB surcharge proposal, noting that scores under the GSIB surcharge proposal are independent of risk-weighted assets. In this proposal, analyses use the linearized version of the surcharge applicable in 2026, which reflects the minimum of the surcharge based on year-end 2023 and year-end 2024 score data.

5. Attribution of Stress Capital Buffer Requirement to Risk Categories

Analysis of the cumulative impact of the several changes to large banking organizations' capital requirements at the risk or business activity level, as described in sections VII.B and VII.C, necessitates a mapping from the components of stress capital buffer requirements to the risks that they reflect. This section describes the method used to attribute stress capital buffer requirements to the four risk types (credit, market, operational, and CVA) measured under this proposal.

The stress capital buffer requirement represents the maximum decline in each bank holding company's common equity tier 1 capital ratio, plus four quarters of planned common stock dividends, also expressed as a

percentage of risk-weighted assets.⁶¹⁶ Thus, the quarter in the stress scenario with the minimum capital ratio is first identified, and the drivers of the cumulative change in capital through that quarter are attributed to risks. In estimates reflecting changes to the stress test, the impact (on minimum capital ratio) of several proposed changes is also attributed to risks. Lastly, the common stock dividends are attributed. Details of the attribution are covered below. Note that the analysis attributing capital requirements to banking activities, as described in section VII.C, does not require an explicit attribution of stress capital buffer requirements to banking activities. Instead, as discussed in section VII.C, this attribution is extrapolated from the combination of the attribution of risk-weighted assets by risk type to banking activities (discussed above in section VII.D.3) and the attribution of stress capital buffer requirements to risk types discussed here.

First, the drivers of the stress capital decline that can be entirely attributed to a specific risk type are attributed. All credit loss provisions are attributed to credit risk,⁶¹⁷ along with losses on loans held at fair value and private equity, gains or losses on asset-liability hedges, changes in capital due to "accumulated other comprehensive income" (AOCI), and expenses associated with other real estate owned. Losses from the largest counterparty default in the stress test are also attributed to credit risk. Reducing the credit-attributed losses, interest income on all assets except trading assets are attributed to credit risk. When changes to the stress test are considered, those changes associated with credit losses (including counterparty credit), assets under fair value option, securities losses, and net interest margin models are attributed to credit risk. Losses (or gains) attributed to market risk include those on public equity securities, and both mark-to-market and intraday trading. Trading revenue and interest income on trading assets are also attributed to market risk. When considered, the impact of changes associated with the global market shock component of the severely adverse scenario are attributed to market risk. Counterparty losses associated with credit valuation adjustments, net of hedges, are attributed to CVA. Lastly, modeled operational losses are attributed to operational risk. These

⁶¹¹ See 12 CFR 225.8(f)(2) and 12 CFR 238.170(f)(2).

⁶¹² Under the current capital plan, stress capital buffer requirements are rounded to the nearest 0.1 percent.

⁶¹³ See 12 CFR part 217, subpart H.

⁶¹⁴ See 12 CFR 217.406 (calculation of the short-term wholesale funding score).

⁶¹⁵ The cumulative impact analysis in section VII.B and VII.C does not require this adjustment as under the GSIB proposal, the method 2 score would be unaffected by changes in risk-weighted assets.

⁶¹⁶ Before application of the 2.5 percent floor on the requirement.

⁶¹⁷ The adjustment credit for allowances held at the start of the stress test is also attributed to credit risk.

losses change under proposed changes to the stress test.

Second, all interest expenses, net of income from account fees and services charges are attributed across credit and market risk in proportion to the trading book share of total assets. The implicit assumption here is that the funding composition of a dollar of trading and non-trading assets is the same.

Third, estimated changes in capital with drivers that are not neatly associated with the specific types of measured are attributed across credit, market, and CVA risk categories in proportion to their share of risk-weighted assets. These drivers consist primarily of noninterest income associated with fiduciary and investment banking services, but also include other noninterest income, servicing fees, changes in goodwill, and income due to minority interests. Under the proposed stress test changes, changes in losses associated with the proposed use of a discount path approach are also attributed in proportion to risk-weighted asset shares.

Fourth, the major operating expense categories that cut across banking activities are attributed across the risks in proportion to each risk's share of an estimate of the "business as usual" income associated with the risk. The operating expenses attributed in this step include those associated with employee compensation, fixed assets and all other non-interest expenses other than operational losses and expenses associated with other real estate owned. When considering requirements incorporating proposed stress test changes, the operating expenses attributed here reflects the proposed use of efficiency ratio-based expense projections. The estimate of "business as usual" income associated with each risk type equals that risk type's share of net interest income plus non-interest income, where these items are attributed to risks as described above.

Fifth, accounting and regulatory capital-related adjustments that are driven by losses in general are applied across risks in proportion to their stress losses as attributed thus far. These adjustments include those associated with deferred tax assets, taxes and associated valuation allowance adjustment, and any (generally de minimus) changes in common equity tier 1 threshold deduction amounts.

Lastly, as the stress capital buffer requirement associated with common and preferred stock dividends is independent of the risks the bank holding company undertakes or the gains and losses realized in the stress

test, it functions similarly to a requirement that is a fixed percentage of risk-weighted assets. Therefore, the dividend portion of the stress capital buffer requirement is attributed to risks in proportion to their share of risk-weighted assets under whichever framework (standardized or expanded risk-based) is being applied in the given estimate.

At this point in the process, the impact of the 2.5 percent floor on the stress capital buffer requirement is considered. Since the introduction of the stress capital buffer in 2020, three of the nine bank holding companies subject to this proposal have consistently had pre-floor stress capital buffer requirements below 2.5 percent. For these bank holding companies, the stress capital buffer requirement is independent of the specific drivers of the stress test loss, and is effectively proportional to risk-weighted assets. Therefore, the stress capital buffer requirement for these three bank holding companies is attributed proportionally to risk-weighted assets. For the other bank holding companies, the stress capital buffer requirements is routinely in excess of 2.5 percent, so the requirement is attributed as described above. However, in those instances where the pre-floor requirement for these bank holding companies is below 2.5 percent, the additional requirement associated with the 2.5 percent floor is attributed across risk types in proportion to their associated risk-weighted assets.

VII. Economic Analysis

This section evaluates the projected economic effect of the proposal by analyzing its key costs and benefits. When applicable, the analysis considers the effects of the GSIB surcharge proposal, the standardized approach proposal, and the proposed changes to the supervisory stress testing models and scenarios.

Section VIII.A presents an overview of the baseline of the economic analysis by examining the current state of banking organizations and the economy absent the combined proposals. It provides context for subsequent analyses on changes in risk-weighted assets, capital requirements, revenue sources, assets, and the relative importance of bank and nonbank financial intermediation.

Section VIII.B compares the anticipated risk-weighted asset effects of the proposal with three reasonable alternative implementations of the Basel standards. Changes in risk-weighted assets under the proposal would be within the range of impact of the

alternatives while providing a substantial degree of risk-sensitivity.

Section VIII.C discusses the macroeconomic effects of changes in capital requirements. Based on the agencies' analysis, the decrease in capital requirements stemming from the proposal combined with the GSIB surcharge proposal and the standardized approach proposal would maintain levels of banking organization capital that are reasonable to achieve a safe and sound banking system based on the academic literature. Using a variety of methods, this literature provides a wide range of optimal capital requirements that balance the benefits of safety and soundness against the costs of reduced banking organization lending from higher requirements. This section also acknowledges certain limitations in applying this literature to analyze the proposed regulatory changes.⁶¹⁸

The proposal aims to enhance the measurement of credit, operational, and market risk to more accurately capture the underlying risks of covered banking organizations' activities. Improved risk measurement helps avoid unintended inefficiencies and potential misallocation of resources from capital regulation. Given the effects of regulatory capital requirements on the real economy, the proposal may improve economic efficiency. Moreover, reducing complexity in the regulatory framework enhances transparency of capital requirements and supports market discipline, with potential safety and soundness benefits.

Section VIII.D presents information on the potential effects of the proposal on banking organization lending, such as credit card, residential mortgage, and business lending.⁶¹⁹ Lending is a key business for banking organizations and an essential method for intermediating between savers and borrowers. The section analyzes a range of lending products that facilitate consumption and investment throughout the economy. The proposal's changes to risk sensitivity, operational risk, and treatment of off-balance sheet exposures would be the primary drivers of changes in capital requirements, potentially encouraging banking organizations to

⁶¹⁸ The literature on optimal capital levels has limitations in its applicability to the proposed changes, as it typically assumes fixed risk weights and focuses primarily on loan portfolios rather than trading activities. This is particularly relevant given the important role of capital markets in the U.S. economy.

⁶¹⁹ While this analysis primarily relies on data for the largest banks, the findings are also likely applicable to any smaller banks that choose to adopt the expanded risk-based approach, as the expected changes in risk weighted assets for lending portfolios would be similar.

shift lending toward activities with projected reductions in risk weights.

Residential mortgage lending would incorporate LTV-based risk weights to enhance risk sensitivity. At the same time, lower risk weights would likely lead to a modest increase in mortgage lending by the banking organizations. Risk-weighted assets for corporate lending is projected to decrease due to more favorable treatment of investment-grade borrowers and lower standardized credit conversion factors for conditional equity and credit commitments with more than one year to maturity, which together outweigh new operational risk requirements and higher credit conversion factors for off-balance sheet exposures with less than one year to maturity. Credit card portfolios would experience mixed effects by borrower repayment behavior and utilization rates. Depending on whether the new risk-weight on unutilized balances and the operational risk add-ons outweigh lower risk-weights on utilized balances, risk-weighted assets on credit card exposures under the proposal could be higher or lower than the current standardized approach.

Section VIII.E assesses the projected effects of the proposal on trading activities of banking organizations and the potential impact on their customers and on markets. The agencies expect the proposal would help preserve the availability of intermediation and market functioning during economic downturns by determining capital requirements based on losses from historical stress periods, which exhibits less cyclical than the current approach. Also, trading products that are less liquid or more difficult to model would require more market risk capital. This may increase the cost of intermediation of some products but would also better align capital requirements with risk.

Trading activity involves market risk, counterparty credit risk, CVA risk, and operational risk. This proposal makes major revisions to the market risk framework which would affect incentives for banking organizations' hedging strategies and risk modelling methods. In addition, risk-weighted assets related to trading activity would increase from the inclusion of CVA and operational risk-weighted assets, which are not part of the current standardized approach that generally determines capital requirements today. The majority of capital requirements for trading activity today comes from counterparty credit risk-weighted assets, and this would remain true under the proposal.

Taken together with the proposed changes to the GSIB surcharge and supervisory stress test models, and the recent revision of the eSLR, the cumulative effect on capital requirements related to trading activity is expected to be about a 9 percent increase for Category I and II banking organizations. Increases in risk-weighted assets from changes in the market risk framework and inclusion of CVA and operational risk are expected to be materially offset by the proposed changes to the global market shock in supervisory stress tests. Non-Category I and II banking organizations will see generally a small impact to their trading activity given the relatively smaller change in their market risk and CVA.

Section VIII.F considers the potential effects of the proposal on competition between financial institutions. The proposed changes to capital requirements for large U.S. banking organizations are expected to have implications for competition both domestically and internationally. By aligning U.S. capital requirements more closely with international standards, the proposal may enhance Category I and II banking organizations' ability to compete globally without compromising their comparatively strong capital positions. The revised risk weights, and increased certainty in capital requirements from moving to a single set of risk-based requirements, are anticipated to support more consistent lending and market-making activities throughout economic cycles.

The proposal incorporates measures that maintain competitive balance while acknowledging the business model differences between large and small institutions. Notably, the proposal would allow banking organizations of any size to adopt the new risk-weight framework. This proposal preserves higher overall capital requirements for Category I and II banking organizations which, along with the parallel proposal to revise the U.S. standardized approach, would mitigate concerns about an unlevel playing field. Moreover, reducing complexity in the regulatory framework enhances transparency of capital requirements and supports market discipline, with potential safety and soundness benefits.

The proposal would likely, in aggregate, encourage the migration of certain activities, particularly traditional lending, back towards banking organizations while effects on trading activities would be more mixed. Lower risk weights for most mortgages and the removal of the mortgage servicing assets threshold capital deduction could encourage covered banking

organizations to maintain or expand these activities relative to nonbank financial intermediaries, directly and via correspondent lending relationships with independent mortgage banks and smaller depository institutions. More broadly, enhanced competition in key lending markets could reduce the premiums that lenders can charge above their costs, providing greater economic benefits to consumers. For Category I and II banking organizations, heterogeneous effects on different products within the proposed market risk framework could incentivize liquidity provision for those products to either shift toward or away from nonbank financial intermediaries, with increases in risk weights being offset by both reductions in the GSIB surcharge proposal and the proposed revision to stress test scenarios.

A. Overview of the Baseline

This section discusses the current state of Category I and II banking organizations and the economy absent the proposal (the baseline) to help understand the potential effects of the proposal. To help contextualize the broader macroeconomic effects of the proposal, a discussion of the total banking system is also included.

Sections VIII.A.1 and VIII.A.2 provide context for the changes in capital requirements under the proposal by exploring the cross-section and time series of bank capital. Sections VIII.A.3 and VIII.A.4 help to contextualize results presented in sections VIII.D and VIII.E that discuss the potential effects on lending, trading, and other business activities by breaking down the principal revenue sources and assets of covered banking organizations. Finally, sections VIII.A.5 and VIII.A.6 document the relative dependency of the economy on bank and nonbank sources of financial intermediation. These sections support later analyses in section VIII.D regarding the potential macroeconomic and financial intermediation effects of the proposal on the U.S. economy.

1. Capital Ratios of Category I and II Banking Organizations—Cross Section

Banking organizations generally maintain capital ratios above regulatory capital requirements, including any applicable buffer requirements. The excess above such requirements—often called “management buffers”—varies across banking organizations and would likely continue to vary under the proposal as such buffers reflect firm-specific considerations. Table VIII.1 shows the average required and actual common equity tier 1 capital levels for Category I and II banking organizations.

Table VIII.1: Minimum-Plus-Buffer Required and Actual Common Equity Tier 1 Capital Levels for Banking Organizations Subject to Category I or II Capital Standards

Standardized Approach Requirement	Advanced Approaches Requirement	Actual CET1 Capital
\$858 Billion	\$764 Billion	\$1,008 Billion

Note: This table shows aggregate required and actual common equity tier 1 capital levels as of June 30, 2025, for the top-tier holding companies of Category I and II banking organizations. For this purpose, capital requirements include applicable buffer requirements, including, as applicable, the GSIB surcharge requirement and, under the standardized approach only, the stress capital buffer requirement. Required capital ratios were calculated using the methodology described in section VII.D. Source: FR Y-9C and FFIEC 101.⁶²⁰

Note: This table shows aggregate required and actual common equity tier 1 capital levels as of June 30, 2025, for the top-tier holding companies of Category I and II banking organizations. Required capital ratios were calculated using the methodology described in section VII.D. Source: FR Y–9C and FFIEC 101.⁶²⁰

Capital Ratios of Banking Organizations—Time Series

Observing banking organizations’ capital ratios over time helps provide another perspective on the capital in the U.S. banking system.⁶²¹ In this case, the agencies consider the entire banking system to provide context for considering the potential effects of the proposal from a broader macroeconomic perspective. Figure VIII.1 shows that the aggregate common equity tier 1 capital ratios of the U.S. banking system have increased slowly from around 12

percent in the middle of the last decade to a bit above 13 percent now. Currently, the U.S. banking system, not counting credit unions, maintains over \$2.2 trillion in common equity tier 1 capital to help support approximately \$31 trillion in assets (\$17 trillion in risk-weighted assets). The proposal is expected to generally maintain the overall stability of capital in the U.S. banking system.

Figure VIII.1: Aggregate U.S. Banking System Common Equity Tier 1 Capital Ratio (Percent)

⁶²⁰ Statistics are calculated from the FR Y–9C and FFIEC 101, as of June 30, 2025 (collectively, “June 2025 Form Statistics”).

⁶²¹ The analysis presented in section VIII.A.2 was conducted using data from all top-level depository institution holding companies that file the FR Y–9C, except for community banking organizations

that have opted into the community bank leverage ratio framework and therefore do not report risk-based capital ratios. Credit unions are not included in the analysis.

Note: This figure shows aggregate common equity tier 1 capital as a percentage of aggregate risk-weighted assets from March 31, 2001, to September 30, 2025. Source: Federal Reserve

Bank of New York.⁶²²

3. Portfolio Characteristics of Category I and II Banking Organizations—By Revenue

Capital requirements affect banking organizations' choice of business model and hence the composition of their revenue. Interest income, primarily accrued from loans and fixed-income securities, is a key source of banking organization revenue. Across Category I and II banking organizations, interest income constitutes nearly 69 percent of total gross income.⁶²³ The remaining approximately 31 percent of total gross income is earned from noninterest sources, such as fees and commissions. These and other figures included in this section are based on Y–9C data.

A significant share of interest income (39 percent) comes from domestic loan portfolios, which generally include residential mortgages; commercial mortgages; other loans to businesses;

and consumer loans such as credit cards, student loans, and auto loans. Another 27 percent comes from interest on securities held for investment and trading assets. The remainder of interest income comes from foreign loans (6 percent) and other interest earning activities (29 percent) including federal funds sold, interest on balances due from other depository institutions, and lease financing receivables.

Roughly 36 percent of noninterest income is earned from trading activities. Securities-related activities account for nearly 35 percent of gross noninterest income. This category includes fees and commissions from activities such as securities brokerage, investment banking, and advisory activities.

While these are the broad patterns of aggregate income, there is substantial variation across Category I and II banking organizations. The largest universal banking organizations offer a wide array of services, whereas other banking organizations are more specialized.

Therefore, while aggregate statistics provide an overview of covered banking organizations subject to the proposal, each banking organization differs in its revenue streams. Hence, the potential effects of the proposal are likely to vary

depending on each banking organization's business model, although the overall effect is likely to reinforce the role of banks in traditional banking activities. Moreover, the proposed rule could also create feedback effects that alter these metrics as banking organizations adjust their business activities to optimize their risk-weighted assets.

4. Portfolio Characteristics of Category I and II Banking Organizations—By Broad Asset Class

This section presents the composition of the aggregate assets of Category I and II banking organizations. The largest asset category on the balance sheet of these banking organizations is loans and leases (31 percent), which are the traditional lending business of banking organizations. Another major category is securities (19 percent), which includes both held-to-maturity and available-for-sale debt securities, as well as equity securities not held for trading.⁶²⁴ Debt

⁶²² Data from Quarterly Trends for Consolidated U.S. Banking Organizations https://www.newyorkfed.org/research/banking_research/quarterly_trends.html (Downloaded on 1/15/26).

⁶²³ Estimates are based on data from the FR Y–9C filings of banking organizations subject to Category I or II capital standards as of June 30, 2025. Interest Income share is calculated as Total Interest Income (BHCK4107) divided by the sum of Total Interest Income and Total Noninterest Income (BHCK4079).

⁶²⁴ Estimates are based on data from schedule RC of the FR Y–9C filings on June 30, 2025. Loans and leases consist of Loans and Leases Held for Sale (BHCK5369) and Loans and Leases Held for Investment (BHCKB528). Securities held for investment includes Held to Maturity (BHCKJ34)

securities holdings include primarily government and corporate bonds, and mortgage-backed securities. The trading assets category (19 percent), which includes securities that are in banking organizations' trading portfolios as well as derivatives and other financial instruments, is also a major asset category. Trading securities are generally substantial for banking organizations engaged heavily in investment banking activities, a group that includes six of the nine Category I and II bank holding companies.

As with the presentation of the sources of aggregate income, these aggregate statistics mask heterogeneity across Category I and II banking organizations. The heterogeneity in their asset compositions exposes these banking organizations to different combinations of credit, market, and operational risk. Therefore, the effects of the proposal would vary based on individual banking organizations' business models.

Balance sheet data provide an incomplete picture of risk because they do not account for off-balance sheet exposures, including contingent liabilities like loan commitments and letters of credit. Banking organizations subject to Category I or II capital standards have close to \$6 trillion in total undrawn loan commitments, including consumer credit card lines, lines of credit extended to non-financial corporates as well as nonbank financial entities, commitments to fund commercial real estate and other construction loans, securities underwriting commitments, and other

commitments.⁶²⁵ This total is about a third of the size of these banking organizations' on-balance sheet assets of \$16.8 trillion. The proposal would apply different risk weights and credit conversion factors for certain off-balance sheet exposures, relative to the standardized approach.

5. Dependency of the U.S. Economy on the Banking System

As shown in Figure VIII.2 below, U.S. businesses and households receive a larger share of financing from nonbank entities relative to other advanced economies due to the depth and breadth of U.S. financial markets. The difference in bank dependence is partially due to the United States having a more market-oriented financial system that provides more opportunities for various forms of equity financing as well as for nonbanks to participate in credit markets compared with the more bank-oriented financial systems of Europe and Japan. This difference may affect how the implementation of the Basel standards would impact the U.S. economy when compared to the impact on the economies of Europe and Japan. To better understand these differences, the agencies analyzed trends in total bank credit in the United States as a share of gross domestic product (GDP) and compared these trends with those of the United Kingdom, Japan, and the Euro Area using data from the Bank for International Settlements (BIS).⁶²⁶

⁶²⁵ The undrawn loan commitments calculation includes the sum of items BHCKJ455, BHCKJ456, BHCK3816, BHCK6550, BHCK3817, BHCKJ457, BHCKJ458, and BHCKJ459 from schedule HC–L. To provide a sense of the relative importance of off-balance sheet exposures, the agencies use data from Schedule HC–L of FR Y–9C reports as of June 30, 2025.

⁶²⁶ Bank of International Settlements (BIS), BIS Data Portal, Credit to the Non-Financial Sector (data

In other advanced economies, particularly in Europe and Japan, banks are the primary source of credit for the non-financial sector. As shown in Figure VIII.2, the share of credit to the non-financial sector coming from banks is significantly higher in these jurisdictions than in the United States. Moreover, the share of banking sector credit in the United States has remained relatively constant over the past decade.⁶²⁷ Because a smaller share of private sector credit originates from the banking system in the United States, the proposal, which directly affects only covered banking organizations, is likely to have more modest macroeconomic effects than a similar regulation in a more bank-dependent economy.

However, looking at the potential direct effects alone may underestimate the impact of the proposal. Covered banking organizations facilitate significant provision of credit to households and nonbank financial institutions through their role in financial markets (these effects are described in section VIII.D).

Figure VIII.2: Credit From the Banking Sector to the Private Non-Financial Sector as a Share of GDP

⁶²⁷ Over time, the share of bank credit in the United Kingdom and the European Union has declined some, converging partway towards the United States' level.

and Available for Sale Securities (BHCK1773). Trading assets is BHCK3545.

Note: This figure shows credit from the banking sector to the private non-financial sector as a share of GDP between December 31, 2011 and June 30, 2025. Source: BIS.⁶²⁸

6. Nonbank Financial Intermediaries
U.S. nonbank financial entity (nonbank) assets are currently three times larger than bank assets (Figure

VIII.3). This is the result of a longstanding trend; since 1985, nonbank assets have grown much faster than bank assets.

Figure VIII.3: Total Assets of Banks and Nonbanks

⁶²⁸ BIS Data: Credit (2025).

Note: This figure shows the total assets of banks and nonbanks in billions of U.S. dollars between December 31, 1979, and June 30, 2025 in the United States. Source: Flow of Funds, and agency calculations.⁶²⁹ Nonbanks include the following Flow of Fund sectors: asset-backed securities, broker/dealers, closed-end funds, exchange-traded funds, finance companies, money market funds, mortgage real estate investment trusts, mutual funds, other financial businesses, insurance companies (PC insurance), and pension funds. Banks include the following Flow of Funds sectors: Banks and Holding Companies.

The growth in total assets discussed above is often cited to gauge the shift in financial activity between traditional banks and nonbanks. However, this analysis omits other linkages, such as

credit lines provided by banking organizations to nonbanks,⁶³⁰ and can also overestimate activity by nonbanks.⁶³¹

The amount of credit that banks and nonbanks provide to the non-financial private sector is another way to measure the migration of activity out of the traditional banking sector. Figure VIII.4 shows that the share of credit to the non-financial private sector provided by banking organizations has been between 30 and 35 percent since the early 2000s. This share has persisted through regulatory changes and economic

⁶²⁹ Statistics used in agency calculations are from the Board of Governors of the Federal Reserve System, Z.1 Financial Accounts of the United States (from Dec. 31, 1979, to June. 30, 2025), <https://www.federalreserve.gov/releases/z1/>. The bank data consists of the sum of series FL702000095.Q and FL734194005.Q. The nonbank data consists of series FL792000095.Q less the sum of series FL702000095.Q and FL734194005.Q.

events, including the U.S. implementation of Basel II and Basel III reforms, the 2007–09 financial crisis, and the COVID–19 pandemic. The faster growth in nonbank assets (Figure VIII.3) and (Figure VIII.4) noting the increased role of nonbanks in the investment activity of U.S. households and small and medium enterprises. For example, a substantial share of mortgage origination is now primarily undertaken by nonbanks.⁶³²

Figure VIII.4 also shows a sharp decline in bank credit to the non-financial private sector in the 1980s from the higher levels of the 1970s. This decline was likely driven by a combination of regulation and financial sector innovation that reshaped the U.S. financial system.⁶³³ One of these

developments was the introduction of formal leverage requirements in bank supervision and regulation in 1981.⁶³⁴ Other important changes also contributed to this decline. In the 1980s, the financial landscape began to shift significantly, marked by the expanded activities of government-sponsored enterprises (GSEs) and U.S. agencies, including Fannie Mae, Freddie Mac, and Ginnie Mae. During this period, certain housing GSEs rapidly expanded their role in the mortgage market by securitizing a substantial share of residential loans. Previously, the bulk of loans had generally been held on the balance sheets of banking organizations.⁶³⁵ This expansion of

regulation/summer-2023/rise-nonbank-mortgage-lending.

securitization allowed nonbanks to intermediate a larger share of mortgage lending, a trend that accelerated with the creation of real estate mortgage investment conduits in the late 1980s.⁶³⁶ As a result, the share of credit provided by banking organizations to the non-financial private sector began to decline sharply. This rise in GSE activity and the broader growth of securitization markets played a pivotal role in the long-term shift of credit provision away from banking organizations.⁶³⁷ As described in the sections below, by adjusting the capital framework, the proposal may support lessening of this decline in the share of credit to the non-financial private sector provided by banking organizations.

Note: This figure shows the share of credit provided by banking organizations to the private non-financial sector between 1945 and 2025. Vertical lines represent the issuance date of the U.S. final rules for the introduction of formal capital requirements, including implementation of leverage ratio requirements in 1981 and the different Basel accords. Source: BIS, *Credit to the Non-Financial Sector*, “United States - Credit from All Sectors to Private Non-Financial Sector at Market Value, U.S. Dollar, Adjusted for Breaks.”⁶³⁸

The nonbank sector is diverse, comprising investment funds, insurance providers, pensions, specialty finance companies (such as mortgage lenders and private credit funds), and market infrastructure providers, among other types of institutions. Nonbanks that are funded by less stable sources of funding or are highly leveraged and nonbanks’ funding access interlinkages with wholesale capital markets, institutional investors, and banking institutions can pose financial stability concerns. For example, as seen during the 2007–09 financial crisis, the suspension of redemptions by one money market mutual fund can cause contagion as

investors are incentivized to withdraw from other funds.⁶³⁹ In addition, during the market dislocations in the early days of the COVID–19 pandemic, principal trading firms, facing volatile and uncertain markets, may have pulled back from providing liquidity to U.S. Treasury markets, thus contributing to the overall stressed market conditions.⁶⁴⁰ Moreover, the uneven regulatory oversight of nonbanks, relative to banks, may increase their

vulnerability to runs, liquidity stresses, and other systemic shocks, with potential financial stability consequences.⁶⁴¹ Any potential shifts in activity from the nonbank sector to the banking sector stemming from this proposal may help alleviate such vulnerabilities.

The presence of nonbanks alongside, and in competition with, traditional banks can also promote access to credit for households and businesses and improve the secondary market liquidity for this credit. Nonbanks, with business models, funding structures, and use of technology that differ from traditional banks, can help to diversify the financial landscape, foster innovation, and enhance the overall efficiency of

financial services.⁶⁴² These tradeoffs are discussed further when analyzing the potential competitive effects of the proposal in section VIII.F.

B. Reasonable Alternatives

This section compares the estimated consequences of the proposal on banking organization risk-weighted assets with three reasonable alternatives to implement the Basel standards in the United States and achieve the objectives of the proposal. These alternatives, along with the proposal, represent different approaches intended to promote robust levels of capital, risk sensitivity, and a simplified capital framework. Similar to the current capital rule, Alternative 1 would subject Category I and II banking organizations to two sets of risk-based capital ratio requirements: one set based on the proposed revisions to the standardized approach, the other set based on the proposed expanded risk-based approach (subsequently referred to as the dual calculation implementation). Alternative 2 would replace the current capital framework with a version of the Basel standards that does not contain any of the U.S.-specific adjustments in the proposal that account for factors such as the specific characteristics of U.S. markets, practices of U.S. banking organizations, or U.S. statutory mandates and policy objectives and, in contrast to the proposal, would assume use of models-based approaches for credit risk (subsequently referred to as the BCBS models-based implementation). Alternative 3 would also not contain the U.S.-specific adjustments outlined in the proposal and would only allow use of standardized, non-modelled approaches within the Basel standards without any U.S.-specific adjustments (subsequently referred to as the BCBS standardized implementation). Both Alternatives 2 and 3 would entail a single calculation and rely on data from the quantitative impact studies conducted by the Basel Committee on Banking Supervision.⁶⁴³ This section discusses each alternative

in turn, then presents a quantitative comparison of their effects on the risk-weighted assets of Category I banking organizations.

1. Alternative 1: Dual Calculation Implementation

Category I and II banking organizations are currently required to calculate two sets of risk-based capital ratio requirements: one set based on the standardized approach (which also applies generally to other banking organizations), the other set based on the advanced approaches. The binding requirement for purposes of complying with minimum risk-based capital requirements is the lower of each ratio calculated under the two approaches.⁶⁴⁴ Under the proposal, Category I and II banking organizations would be subject to requirements based on the expanded risk-based approach and revised market risk framework. The standardized approach would no longer apply to these banking organizations and the advanced approaches would be eliminated. Thus, such banking organizations would no longer be required to calculate two sets of risk-based capital ratios.

In contrast, Alternative 1's dual calculation implementation assumes that Category I and II banking organizations would be required to calculate ratios under both the standardized approach (inclusive of proposed amendments in the companion proposal to modify the standardized approach) and the expanded risk-based approach. In the context of comparing the proposal with the reasonable alternatives, which focuses on comparisons of risk-weighted assets, the approach under the dual calculation implementation that yields the higher amount of risk-weighted assets would be considered the binding approach.

The retention of the standardized approach requirements alongside the expanded risk-based approach for banking organizations using the latter approach could be justified by the goal of improving comparability in capital resulting from the proposals. As discussed in section I.B and II.C, the proposal introduces consistent, comparable, and robust capital requirements, without requiring two parallel sets of requirements like in Alternative 1.

2. Alternative 2: BCBS Models-Based Implementation

In the design of this proposal, the agencies made certain adjustments to the Basel standards to address factors such as specific characteristics of U.S. markets, practices of U.S. banking organizations, and U.S. policy objectives. The BCBS models-based implementation would not include these U.S.-specific adjustments and would assume the use of internal models for credit risk and market risk, similar to implementation of the Basel standards in other jurisdictions. The scope of application for mandatory use would remain Category I and II banking organizations, consistent with the proposal and the current advanced approaches framework.

Empirically, under the BCBS models-based implementation, modelled risk-weighted assets would generally be higher than the Basel standardized approach output floor.⁶⁴⁵ However, the Basel output floor, which limits the benefits banking organizations can derive from using internal models to calculate minimum capital requirements, would be binding for a few Category I or II banking organizations.

The key methodological difference in the treatment of credit risk under the BCBS models-based implementation is that it continues the use of the internal ratings-based approach for credit risk, albeit in a constrained way.⁶⁴⁶ In contrast, the proposal does not allow the use of internal models to determine risk-weighted assets for credit portfolios. This generally causes a lower requirement, under Alternative 2, for low-default non-sovereign exposures.

The proposal's market risk capital requirements include several important differences relative to the BCBS models-based framework. For example, the proposal would recognize market risk diversification between modelled and unmodelled positions. The proposal would also change the internal models approach to streamline testing requirements and modify the treatment of non-modelled risk factors. Additionally, risk weights and correlation parameters for some risk buckets in the standardized approach to

⁶⁴² Stijn Claessens & Laura E. Kodres, "The Regulatory Responses to the Global Financial Crisis: Some Uncomfortable Questions," *International Monetary Fund*, Working Paper No. 2014/046 (March 2014) ("Claessens and Kodres (2014)"), <https://www.imf.org/external/pubs/ft/wp/2014/wp1446.pdf>.

⁶⁴³ See, e.g., Basel Committee on Banking Supervision (2010, 2025). Basel Committee on Banking Supervision. "Results of the Comprehensive Quantitative Impact Study." Bank for International Settlements, December 2010. <https://www.bis.org/publ/bcbis186.pdf>.

Basel Committee on Banking Supervision. "Basel III Monitoring Report." Bank for International Settlements, October 2025. <https://www.bis.org/bcbis/publ/d599.pdf>.

⁶⁴⁴ The lower of the two ratios is the stricter of the two requirements.

⁶⁴⁵ The Basel standards include a floor to risk-weighted assets, which corresponds to 72.5 percent of risk-weighted assets calculated only using standardized approaches.

⁶⁴⁶ With credit risk, the BCBS Basel III internal rating-based approaches remove the estimation of loss given default for lower default portfolios (large corporates, sovereigns, banks). In addition, the output floor constrains the degree to which those models can reduce the contribution of risk weighted assets to risk-weighted assets.

market risk would be calibrated for U.S.-specific markets. The proposal also includes a simplified partial look-through approach for calculating fund exposures based on an appropriate index that is less conservative than the Basel standard.

The proposal's credit valuation adjustment (CVA) risk requirements are similar to those under the BCBS models-based implementation. One important difference is that client-facing exposures, in connection with client-cleared derivative transactions, are excluded from CVA risk capital requirements under the proposal. Another important difference is that the proposal introduces a separate counterparty credit spread risk weight category for certain lower-risk financial institutions.

The proposal also differs in certain key respects from the operational risk Basel standard and, therefore, from Alternative 2.⁶⁴⁷ Under the Basel standards, the business indicator is composed of three components: (1) the interest, lease, and dividend component; (2) the services component;

and (3) the financial component. The proposal retains the interest, lease, and dividend component. However, the services and financial components are replaced with a single noninterest component, in part to allow for netting of applicable income and expenses.⁶⁴⁸ In addition, the proposal would scale the income and expenses of the investment management business line in the business indicator calculation while the Basel standard does not scale any business line.

3. Alternative 3: BCBS Standardized Implementation

The BCBS standardized implementation under Alternative 3 modifies Alternative 2 in two respects. First, Alternative 3 only contemplates the use of standardized approaches for credit and market risk as outlined in the Basel standards. Thus, Alternative 3 would remove the option to use models to determine market risk capital

⁶⁴⁸ In particular, the BCBS models-based implementation (1) calculates the services component on a gross basis, (2) does not allow netting across banking book and trading book activities in the financial component, and (3) does not allow netting across activities captured in the services component and those captured in the financial component.

requirements compared to the proposal. Requiring the use of the market risk standardized approach generally results in higher, less risk-sensitive capital requirements. Second, because alternative 3 reflects only the use of standardized approaches, it does not include the 72.5 percent output floor.

4. Quantitative Estimates and Discussion

For each of the three alternatives, the agencies estimate aggregate risk-weighted assets under the alternatives and contrast them with the estimated levels under the proposal. The results for Category I banking organizations appear in Table VIII.2.⁶⁴⁹

TABLE VIII.2: Aggregate GSIB Risk-Weighted Assets under the Reasonable Alternatives (\$ billion)

⁶⁴⁹ While Category II banking organizations are also subject to the proposal, there is insufficient Basel quantitative impact study data to calculate the impact for such banking organizations under Alternative 2 and Alternative 3. Category II banking organizations are part of the impact figures in section VII. In addition, Table VIII.2 does not reflect RWA deductions. Therefore, the aggregate figures for risk-weighted assets under the proposal, in Table VIII.2, are slightly different from those reported in Tables VII.2 and VII.5 in sections VII.A and VII.C.1, respectively.

⁶⁴⁷ The proposal is consistent with the approach in the Basel standards of setting the internal loss multiplier equal to 1.

Table VIII.2: Aggregate GSIB Risk-Weighted Assets under the Reasonable Alternatives (\$ billion)

			Dual Calculation*	BCBS Models- based*	BCBS Standardized
	Current Standardized	Proposal	Alternative 1	Alternative 2	Alternative 3
Credit risk	7,144	6,095	6,120	5,044	6,971
Operational risk		920	904	1,169	1,207
CVA		207	207	226	233
Market risk	453	545	545	866	997
Total	7,597	7,768	7,776	7,305	9,408
Change from Current Standardized		2.2%	2.4%	-3.9%	23.8%

*This table shows the RWA component of the most binding component of the requirement.

Totals are the sum of most binding requirement. Estimates as of Q2 2025.

Under the dual calculation implementation, aggregate risk-weighted assets would be slightly higher than risk-weighted assets under the proposal, and about 2 percent above current levels under the standardized approach, which most commonly is the more binding of the current risk-based capital requirements. The dual calculation requirements are only slightly higher than under the proposal, as only one of the smaller banking organizations subject to the proposal would have higher risk-weighted assets under the standardized approach proposal.

The BCBS models-based implementation would modestly reduce aggregate risk-weighted assets by about 4 percent, relative to the current standardized approach. Most Category I banking organizations would have lower risk-weighted assets under Alternative 2 than under the proposal.

The BCBS standardized approach would substantially increase aggregate risk-weighted assets by 24 percent, relative to current standardized approach. All Category I bank holding companies have higher risk-weighted

assets under Alternative 3 than under the proposal or the other alternatives.

Despite variations in their estimated effects on total risk-weighted assets, the proposal and alternatives maintain similar relative contributions across risk stripes. Table VIII.2 illustrates this composition, with credit risk contributing the majority at 70–80 percent of the total, operational risk accounting for 12–16 percent, market risk representing 7–12 percent, and CVA comprising the smallest portion at 3 percent. Risk-weighted assets are directly changed by the proposal, and these alternatives do not necessarily imply equivalent changes to capital requirements. Typically, capital requirements move in the same direction as changes in risk-weighted assets. But changes in capital requirements would likely be smaller in percentage terms primarily because the capital amount required by the stress capital buffer framework would be unaffected by changes in risk-weighted assets for holding companies for which the 2.5 percent capital conservation buffer requirement floor does not bind. In addition, changes in risk-weighted

assets may not translate into proportional changes in tier 1 capital requirements if leverage requirements, rather than risk-based capital requirements, were binding for a given banking organization.

C. Macroeconomic Effects and the Analysis of the Proposal With Respect to Estimates of Optimal Capital Levels

This section situates the proposal within the context of the academic literature and policy analysis on the optimal capital levels of the banking system. The proposal would change risk weights to more closely align with the risks of covered banking organizations. These changes in risk weights imply that the amount of required capital would change for these banking organizations, potentially resulting in a change to U.S. banking system capital requirements. The economic effect of these changes can be evaluated in light of the findings of the optimal capital research.

As noted, the proposal would mandatorily apply to Category I and II banking organizations and banking organizations with significant trading

activity. These banking organizations hold about half of the assets of the U.S. banking system. In addition, the standardized approach proposal would revise capital requirements for non-Category I and II banking organizations that are subject to the risk-based framework. As such, the analysis considers the literature on the optimal level of capital for all banking organizations.⁶⁵⁰

As shown earlier in Figure II.1, the aggregate U.S. banking system has more than \$2.2 trillion of common equity tier 1 capital, equaling 13.4 percent of risk-weighted assets (as of June 30, 2025).

1. Impact of the Proposals

The agencies examined the impact of the proposals on capital requirements for the U.S. banking system. This analysis includes the proposed revisions to the calculation of risk-weighted assets and the proposed amendments to the GSIB surcharge framework under the Board's GSIB surcharge proposal. It also includes the proposed revisions to the risk-weights in the U.S. standardized approach. When applicable, it also notes the impact of the recent proposal to modify the Board's stress tests.

Based on the estimates reported in section VII.C.2, the revisions to the risk-weight framework and the GSIB surcharge would result in a decrease to common equity tier 1 capital minimum plus buffer requirements for Category I and II bank holding companies of \$42.1 billion (inclusive of changes to stress capital buffer and GSIB surcharge requirements). The estimated capital decrease is based on balance sheets and exposures as of June 30, 2025. The actual impact may be higher or lower depending on the future behavior of Category I and II banking organizations.

Capital requirements for Category III and IV bank holding companies would change due to revisions to risk-weighted assets for these banking organizations that engage in significant trading activity, as well as the accompanying proposal to revise the standardized approach. In conjunction with the proposed stress test changes, these proposals are expected to lower common equity tier 1 requirements of such bank holding companies by \$19.5 billion. Turning to bank holding companies with assets below \$100 billion, the proposals under consideration would lower their common equity tier 1 requirements by \$26.2 billion. Altogether, these proposals would lower the common

equity tier 1 requirements in the U.S. banking system by about \$87.7 billion. Excluding the effects of the stress test proposal, the three proposals under consideration would lower common equity tier 1 requirements by about \$58.3 billion.

Using the total amount of common equity tier 1 capital in the U.S. banking system of \$2.22 trillion as a denominator and assuming affected banking organizations would decrease their capital dollar-for-dollar with the decrease in capital requirements—in effect maintaining the same dollar amount of capital over requirements as they currently do—the proposals altogether would lower aggregate capital in the U.S. banking system by 4.0 percent.⁶⁵¹ When this percentage decrease is applied to the current common equity tier 1 capital ratio of the U.S. banking system of 13.4 percent, the combined proposals are estimated to decrease the common equity tier 1 capital ratio of the U.S. banking system to an amount that is equivalent to about 12.9 percent when measured relative to risk-weighted assets under the current rule.⁶⁵²

To situate the proposals' effect on the quantity of capital in the U.S. banking system in the literature on the optimal level of capital, the agencies discuss the historical evolution of this literature as well as more recent advances.

2. Development of the Literature on the Optimal Level of Capital in the Banking System

The Basel Committee's long-term economic impact assessment of capital requirements (BCBS 2010 study) represented an important milestone in the development of the literature on the optimal capital level in the banking system.⁶⁵³ This study was carried out in the aftermath of the 2007–09 financial crisis and supported the increase in capital requirements that was part of the initial phase of the Basel III reforms.⁶⁵⁴

⁶⁵¹ The corresponding decrease in capital requirements from the three proposals under consideration—the Basel III proposal, the standardized approach proposal and the G–SIB surcharge proposal—yields an estimated decrease of 2.6 percent. The lower estimates arises due to excluding the effects of the proposed changes to the stress tests.

⁶⁵² The projected common equity tier 1 capital ratio of 12.9 percent is obtained via $13.4 \text{ percent} \times (1 - 0.040)$.

⁶⁵³ See generally Basel Committee, "An Assessment of the Long-Term Economic Impact of Stronger Capital and Liquidity Requirements" (Aug. 2010), <https://www.bis.org/publ/bcbs173.pdf> ("BCBS 2010 study").

⁶⁵⁴ See, e.g., Basel Committee, "Basel III: A Global Regulatory Framework for More Resilient Banks and Banking Systems" (June 2011), <https://www.bis.org/publ/bcbs189.htm>.

It helped spur a number of related studies by academics and staff at regulatory agencies across the world.

The BCBS 2010 study developed a framework in which the benefits of higher capital stem from a reduced probability of a financial crisis.⁶⁵⁵ These benefits can be quantified by estimating the degree to which higher bank capital reduces the probability of a crisis and multiplying this reduction in probability by the expected economic output loss caused by a crisis. The cost of higher capital requirements stems from the increased cost of funding for banks, which can lead to higher interest rates on lending and thus lower economic activity, depending on market structure, competition, and other factors. The trade-off between these benefits and costs yields the optimal level of capital in the banking system. That said, significant uncertainties and limitations remain on how to measure these benefits and costs, and different approaches used in various studies yield different estimates of the optimal level of capital. Moreover, as discussed subsequently in section VIII.C.3, the literature has since developed additional frameworks.

The BCBS 2010 study applies this framework using several macroeconomic models to capture a range of possible costs and benefits, resulting in a range of possible values for the optimal level of capital in the banking system. The study concludes that the optimal capital requirement, measured as tangible common equity capital to risk-weighted assets, is in the range of 10–14 percent,⁶⁵⁶ which encompasses the projected new level of the common equity tier 1 capital ratio of the U.S. banking system, under the proposals, of about 13 percent, as described in section VII.B. The fact that the projected capital level falls within the range of optimal values suggests that the overall proposals are consistent with the analysis of the BCBS 2010 study.

Other studies provide additional perspective. For example, Fender and Lewrick (2016) argue that after accounting for differences in measurement of capital and risk-weighted assets over time,⁶⁵⁷ the BCBS 2010 study implies a lower optimal level for the common equity tier 1 capital ratio of around 8–11 percent. Miles, Yang, and Marcheggiano (2013)

⁶⁵⁵ See BCBS 2010 study.

⁶⁵⁶ See BCBS 2010 study.

⁶⁵⁷ See Ingo Fender & Ulf Lewrick, Monetary and Economic Department, BIS, *Adding it All Up: The Macroeconomic Impact of Basel III and Outstanding Reform Issues* (BIS, Working Paper No. 591, Nov. 2016) ("Fender and Lewrick (2016)"), <https://www.bis.org/publ/work591.pdf>.

⁶⁵⁰ This reflects the fact that the literature on optimal capital level focuses on the banking sector of an economy, not just the large banks.

apply a similar framework to data on global banks and find that the optimal capital level is higher, in the range of 16–20 percent.⁶⁵⁸ This result stems partly from their finding that increased capital would have a smaller adverse effect on interest rates, and thus economic activity, than the BCBS 2010 study estimates.

Conversely, Brooke et al. (2015) apply a similar framework and find that, after accounting for the benefits from improvements in the resolution framework, one would obtain a lower optimal capital level than in the BCBS 2010 study.⁶⁵⁹ This study has played a key role in informing the Bank of England's views on the optimal level of capital in the UK banking system.⁶⁶⁰ Their analysis suggests that the optimal capital level for tier 1 capital (rather than common equity tier 1 capital) ranges from 10–14 percent.⁶⁶¹ In comparison, the projected tier 1 capital in the U.S. banking system from the combined proposals would be about 14 percent, suggesting that the proposals could result in capital levels within the optimal range.

Firestone et al. (2019) apply the framework of the BCBS 2010 study to the U.S. banking system and find that the optimal capital level for tier 1 capital ranges from 13–26 percent.⁶⁶² In this case, the projected capital in the U.S. banking system would fall in the low end of the range. The wide range stems in part from uncertainty regarding the economic costs of financial crises, as the benefits of higher capital levels increase with the severity of the

financial crises that are averted by the increased capital.

Soederhuizen et al. (2023) build on this framework and study the optimal capital level in the Euro area.⁶⁶³ They use a more advanced model for the costs of increased bank capital levels and obtain an optimal level of common equity tier 1 capital relative to risk-weighted assets of 16–31 percent, higher than the level currently maintained by the U.S. banking system. Soederhuizen et al. (2023) also find that the optimal capital level differs across Euro member states. This heterogeneity, along with the range of optimal capital estimates in the papers in this section, underlines the uncertainty in the estimated optimal capital levels.

Jorda et al. (2021) challenge the underlying premise of the literature that follows from BCBS (2010) that higher capital levels reduce the probability of a financial crisis.⁶⁶⁴ Instead, they find that higher capital levels reduce the severity of a crisis by promoting a faster economic recovery but have no impact on the probability of a financial crisis. Accounting for their findings could result in different estimates of optimal capital levels than what is obtained in the studies discussed above.⁶⁶⁵

Admati and Hellwig (2024) provide another perspective on the level of optimal capital in the banking system and argue that it ought to be much higher than current capital levels.⁶⁶⁶ Their argument hinges on the ability of nonbanks to provide a substitute for bank credit, thus ameliorating the cost of higher capital requirements on bank lending. That said, such substitution of financial services away from banks towards nonbanks may pose other concerns, as discussed in section VIII.F.3.

3. General Equilibrium Models of Optimal Capital Levels

One limitation of the above studies is that the models they employ do not account for the optimizing behavior of

agents, a key theoretical underpinning of modern economics. As discussed below, recent developments in modeling of optimal capital levels have turned towards embedding optimizing behavior of agents, including households, non-financial businesses, and banks. Notably, the cost-benefit tradeoff examined in these models can differ from the tradeoff in the literature based on the BCBS 2010 study discussed above.⁶⁶⁷

Begenau (2020) reflects a new approach in this literature.⁶⁶⁸ In particular, this study argues that higher capital requirements can spur lending by reducing the incentives of banks to take on deposits, which results in a lower cost of deposits and potentially a lower overall cost of funding. In this model, households value the liquidity services provided by deposits, and higher capital requirements can lead to lower provision of those services. This study finds that the optimal capital requirement equals 12.4 percent of risky assets, close to the projected capital levels in the U.S. banking system.

Begenau and Landvoigt (2022) study optimal capital ratios in a setting with banks and unregulated nonbanks.⁶⁶⁹ In this setup, they find that higher capital requirements shift activity to the unregulated sector. However, the authors argue that such a shift can be optimal as it moves activity away from a banking sector that is supported by government guarantees. This study reports an optimal leverage ratio capital requirement of 16 percent, higher than the projected capital in the U.S. banking system.

Elenev et al. (2021) embed financial crises into an equilibrium macroeconomic model of households, non-financial businesses, and banks.⁶⁷⁰ In this model, higher capital requirements result in a smaller

⁶⁵⁸ See David Miles, Jing Yand, & Gilberto Marcheggiano, "Optimal Bank Capital," 123 *The Economic Journal* 1, 29 Table 10 (Mar. 2013) ("Miles, Yang and Marcheggiano (2013)"), <https://academic.oup.com/ej/article/123/567/1/5080596>.

⁶⁵⁹ See Martin Brooke, Oliver Bush, Robert Edwards, Jas Ellis, Bill Francis, Rashmi Harimohan, Katharine Neiss, and Caspar Siegart, *Bank of England, Measuring the Macroeconomic Costs and Benefits of Higher UK Bank Capital Requirements* (Bank of England, Financial Stability Paper No. 35, Dec. 2015) ("Brooke et al. (2015)"), <https://www.bankofengland.co.uk/-/media/boe/files/financial-stability-paper/2015/measuring-the-macroeconomic-costs-and-benefits-of.pdf>.

⁶⁶⁰ See Bank of England, "Financial Stability in Focus: The FPC's assessment of bank capital requirements", <https://www.bankofengland.co.uk/financial-stability-in-focus/2025/jsif-the-fpcs-assessment-of-bank-capital-requirements>.

⁶⁶¹ Tier 1 capital includes a broader set of instruments than common equity tier 1 capital. Thus, a banking organization will typically have a higher tier 1 capital ratio than a common equity tier 1 capital ratio.

⁶⁶² See Simon Firestone, Amy Lorenc, & Ben Ranish, "An Empirical Economic Assessment of the Costs and Benefits of Bank Capital in the United States," 101 *Federal Reserve Bank of St. Louis Review* 203, 203–30 (2019) ("Firestone et al. (2019)"), <https://doi.org/10.20955/r.101.203-30>.

⁶⁶³ See Beau Soederhuizen, Gerrit Hugo van Heuvelen, Rob Luginbuhl, & Bert van Stiphout-Kramer, Netherlands Bureau for Economic Policy Analysis (CPB), "Optimal Capital Ratios for Banks in the Euro Area," 69 *Journal of Financial Stability*, Art. No. 101164 (Dec. 2023) ("Soederhuizen et al. (2023)"), <https://doi.org/10.1016/j.jfs.2023.101164>.

⁶⁶⁴ See Oscar Jorda, Björn Richter, Moritz Schularick, and Alan Taylor, "Bank Capital Redux: Solvency, Liquidity, and Crisis," 88 *The Review of Economic Studies* 260, 260–268 (2021) ("Jorda et al. (2021)"), <https://doi.org/10.1093/restud/rdaa040>.

⁶⁶⁵ The analytical framework in Jorda et al. (2021) does not yield an estimate of the optimal level of bank capital. See Jorda et al. (2021).

⁶⁶⁶ See Anat Admati and Martin Hellwig, *The Bankers' New Clothes: What's Wrong with Banking and What to Do About It* (2024) ("Admati and Hellwig (2024)").

⁶⁶⁷ These models tend to be more complex than those based on the BCBS 2010 study, and their results are obtained via matching elements of the data to those implied by the model. As such, this literature tends to avoid framing findings in terms of a range and instead discusses robustness of the findings to modeling assumptions.

⁶⁶⁸ See Juliane Begenau, "Capital Requirements, Risk Choice, and Liquidity Provision in a Business-Cycle Model," 136 *Journal of Financial Economics* 355, 355–378 (May 2020) ("Begenau (2020)"), <https://doi.org/10.1016/j.jfineco.2019.10.004>.

⁶⁶⁹ Juliane Begenau and Tim Landvoigt, "Financial Regulation in a Quantitative Model of the Modern Banking System," 89 *The Review of Economic Studies* 1748, 1748–1784 (July 2022) ("Begenau and Landvoigt (2022)"), <https://doi.org/10.1093/restud/rdab088>.

⁶⁷⁰ Vadim Elenev, Tim Landvoigt & Stijn Van Nieuwerburgh, "A Macroeconomic Model With Financially Constrained Producers and Intermediaries," 89 *Econometrica* 1361, 1361–1418 (May 2021) ("Elenev et al. (2021)"), <https://doi.org/10.3982/ECTA16438>.

financial sector and thus a smaller economy. The calibrated model implies that welfare is maximized at a capital requirement of 6 percent of risky assets, well below current and projected requirements.

Begenau et al. (2025) examine bank capital requirements in the context of delayed accounting for loan-loss recognition.⁶⁷¹ In their model, optimal capital requirements are lower than current values. This decrease in optimal capital requirements arises in conjunction with an expedited loan loss recognition relative to current practices, which makes the banking system safer by ensuring timely accounting for non-performing loans.

Davyduik (2017) uses an equilibrium model to study how capital requirements vary over the business cycle and finds that a countercyclical capital requirement increases welfare.⁶⁷² According to the calibration in this model, the optimal level of the capital requirement fluctuates around 6 percent over the business cycle.

The agencies find that the decrease in the capital required in the U.S. banking system under the combined proposals would result in a level of banking organization capital that is reasonable, as informed by the literature based on the BCBS 2010 study, as well as the more recent studies based on the optimizing behavior of agents. Collectively, the studies surveyed indicate uncertainty about the true level of optimal capital requirements, providing a range of estimates that are roughly equivalent to between 5 and 31 percent of risk-weighted assets.⁶⁷³ Four of these 13 studies find optimal capital requirements substantially below the projected level of capital in the U.S. banking system under the proposal. Four studies find the projected capital levels approximately optimal and five of the studies would recommend higher levels of capital. Notably, more recent studies tend towards the lower end of the above range for optimal capital requirements, indicating the continuing evolution of this literature. However, there are certain limitations to applying

this literature to the proposal, as detailed in the following section.

In the event that the Board chooses to adopt the GSIB surcharge proposal or the agencies choose to adopt the proposals under consideration on separate timelines, the effect on the overall level of required capital in the banking system would be smaller than if the three proposals were adopted together. As such, viewed through the lens of the literature on optimal capital, the impact of each individual proposal would also remain within the optimal range and thus achieve a reasonable level of capital in the banking system.

4. Limitations of Applying the Academic Studies on Optimal Capital Levels To Evaluating the Proposals

The proposals would establish risk weights applicable to banking activities that align more closely with the risks of these activities, relative to the current standardized approach, and improve transparency and consistency of requirements relative to the advanced approaches framework. Part of the changes in the proposed capital requirements stem from these differences in risk weights.⁶⁷⁴ The literature on optimal capital levels, however, takes the assignment of risk weights as given and examines the optimal level of capital given equilibrium levels of safe and risky assets. As such, this literature may be less suitable for analyzing a change in capital requirements resulting from changes in risk weights, as opposed to a direct change in the required capital for a certain quantity of risky assets.

A related measurement challenge stems from the broad range of loss-absorbing instruments that banking organizations use to meet the different capital requirements. While there are a few exceptions, such as Brooke et al. (2015), many of the studies do not distinguish between these different capital instruments.⁶⁷⁵ This makes it challenging to determine which capital ratio is most applicable to mapping the results of a given study to the U.S. banking system.

As noted in section VII.C.1, the proposal would increase total risk-weighted assets applicable to trading-related activities by 31 percent while reducing total risk-weighted assets relating to lending by about 10 percent.⁶⁷⁶ The optimal capital level

literature, including the studies based on optimizing macroeconomic agents, primarily focuses on capitalizing for the risks posed by banks' loan portfolios. The literature neither considers the risk associated with trading activity nor the potential macroeconomic effect of changes in the provision of trading activity. This reduces the applicability of the optimal capital levels literature to the proposal, given the prominent role that capital markets play in the financing of economic activity in the United States.⁶⁷⁷

One additional limitation is that the optimal level of capital can differ across jurisdictions. For example, Stavrekeva (2020) finds that jurisdictions with a higher fiscal capacity may have a lower optimal capital level as the fiscal authorities may be better positioned to absorb shocks by bailing out the financial system.⁶⁷⁸ However, the agencies note that one function of the regulatory capital framework is to reduce the probability of a crisis and the need for extraordinary government support in the event of stress. Conversely, a small open economy may wish to have a higher capital level to reduce the likelihood of banking stress that subsequently triggers a sovereign debt crisis.⁶⁷⁹ Differences in the degree to which an economy uses a bank-based system of finance versus a market-based system may also affect the optimal level of capital in the banking system.

5. Differences Across U.S. Households

The literature on the optimal capital level typically considers macroeconomic benefits and costs through the lens of an economic agent that represents the household sector.⁶⁸⁰ As such, these models typically look past heterogeneity across U.S. households. However, the economic situation of different households may influence their costs and benefits from banking organization capital requirements.

impact of this increase in trading related risk-weighted activities.

⁶⁷⁷ See supra Figure VIII.4—Share of Credit to Non-Financial Private Sector Provided by Banks.

⁶⁷⁸ See Vania Stavrekeva, "Optimal Bank Regulation and Fiscal Capacity," 87 *The Review of Economic Studies* 1034, 1034–89 (Mar. 2020) ("Stavrekeva (2020)"), <https://doi.org/10.1093/restud/rdz012>.

⁶⁷⁹ Alter and Beyer (2014) provides an empirical analysis of spillovers between banks and sovereign debt. See Adrian Alter and Andreas Beyer, "The Dynamics of Spillover Effects During the European Sovereign Debt Turmoil," 42 *Journal of Banking & Finance* 134, 134–153 (May 2024) ("Alter and Beyer (2014)"), <https://doi.org/10.1016/j.jbankfin.2014.01.030>.

⁶⁸⁰ Such models are typically referred to as "representative agent" models.

⁶⁷⁴ Capital requirements for large banking organizations would also change due to the companion proposal to reform the G–SIB surcharge.

⁶⁷⁵ See Brooke et al. (2015).

⁶⁷⁶ As discussed subsequently in section VIII.E, the changes to the GMS in the stress testing proposal would significantly offset the capital

Commenters on previous capital proposals have raised concerns that certain increased risk weights may increase costs and impede access to credit for members of disadvantaged communities. Economic theories link net worth to the cost of external finance.⁶⁸¹ Specifically, members of disadvantaged communities would likely have lower net worth and thus be more adversely affected by an increased cost of borrowing. For example, Fairlie et al. (2022) find that borrowers from certain disadvantaged communities face higher interest rates and exhibit more reluctance to seek bank debt.⁶⁸² The reduction in capital requirements stemming from the proposals may encourage banking organizations to introduce new banking products and expand the availability of products to more customers, facilitating financial inclusion.

Conversely, members of disadvantaged communities may be at higher risk of suffering losses during financial stress. For example, Bayer et al. (2016) find that members of such communities had higher rates of delinquency and default on their mortgage debt during the 2007–09 financial crisis.⁶⁸³ In addition, Contreras et al. (2023) show that bank failures can increase income inequality.⁶⁸⁴

Question 196: What alternative approaches, if any, should the agencies consider for assessing the macroeconomic benefits and costs of the changes in the level of required capital that would result from the proposals, and why?

⁶⁸¹ See Ben S. Bernanke and Mark Gertler, “Inside the Black Box: The Credit Channel of Monetary Policy Transmission” 9 *Journal of Economic Perspectives* 27, 27–48 (Fall 1995) (“Bernanke and Gertler (1995)”), <https://www.aeaweb.org/articles?id=10.1257/jep.9.4.27>; Ben S. 6. Benefits From Improved Risks Measurement

The proposal’s changes to the measurement of credit risk, market risk, and operational risk aim to improve how regulatory capital ratios capture the underlying economic riskiness of covered banking organizations’ balance sheets and activities. Improving the measurement of key policy inputs and reducing complexity in the regulatory framework contributes to enhancing and consistency while avoiding potential deadweight losses in the banking sector associated with miscalibrated capital requirements.

While capital requirements figure prominently in banking organizations’ intermediation decisions, pinning down their optimal level to foster economic activity and to increase welfare is challenging. Deposit insurance is viewed in the literature as one of the rationales for the existence of capital requirements.⁶⁸⁵ The use of capital requirements to mitigate moral hazard induced by government guarantees and contribute to financial stability depends on appropriate calibration to avoid excessive risk-taking behavior by banking organizations.⁶⁸⁶ By improving the measurement of risks that banking organizations are subject to, the proposal contributes to avoiding potential deadweight losses resulting from the deviation of capital requirements from their socially optimal level.

Given the far-reaching effects of banking policies on the real economy,⁶⁸⁷ the proposal aims to reduce the unintended consequences of capital regulation by improving the measurement of risks to which covered banking organizations are exposed. For

instance, migration of certain lending activity from depository institutions to nonbanks, as described in section VIII.A.6, may be mitigated by improving risk measurement inside of the banking sector.

Reducing complexity in the regulatory framework enhances transparency of capital requirements and supports market discipline. As financial innovation made the banking system more complex, financial regulation has been strengthened to preserve the safety and soundness of the banking sector.⁶⁸⁸ Increased regulatory burden and complexity stemming from this more restrictive environment may have contributed to the increase in noninterest expenses faced by covered banking organizations through higher compliance costs.⁶⁸⁹ Overly complex banking regulation could also contribute to systemic risk by incentivizing regulatory arbitrage and encouraging migration of activities toward nonbanks.⁶⁹⁰ By making the regulatory framework simpler, the proposal aims to reduce compliance burdens while preserving the financial stability benefits of banking regulation.

7. Microprudential Consequences of the Proposals

As discussed in section VII.B.1, the proposed revisions to the calculation of risk-weighted assets and the G–SIB surcharge are projected to reduce the capital requirements of Category I and II banking organizations by about 2.7%. This projected change is primarily from the GSIB surcharge proposal, while the proposed changes to the calculation of risk-weighted assets leaves capital requirements approximately unchanged. When combined with the effects of the proposed changes to stress test model

and scenarios, common equity tier 1 requirements for Category I and II banking organizations are projected to decline by a moderate 5.1%. Furthermore, the proposed changes to risk weights are expected to lower common equity tier 1 requirements for Category I and II depository institutions by about 5.3%.

These lower capital requirements could moderately reduce these banking organizations' ability to withstand financial stress, marginally increasing their risk of failure. Specifically, reducing capital requirements could increase the size and likelihood of losses, thereby shifting losses from shareholders to creditors and the Deposit Insurance Fund in the event that the FDIC is required to resolve the insured depository institution. Category I and II depository institutions remain subject to heightened supervisory and regulatory standards. Additionally, the parent GSIBs remain subject to resolution planning requirements, designed to facilitate rapid and orderly resolution under the U.S. Bankruptcy Code. The resolution plans of GSIBs envision a single-point-of entry strategy, under which parent GSIBs would enter resolution while material subsidiaries, including insured depository institutions, continue to operate on a going-concern basis and therefore would not enter FDIC receivership requiring the use of Deposit Insurance Fund resources. Finally, as the tier 1 leverage ratio is included in the pricing methodology for large banks, assessments paid by Category I and II depository institutions may increase if tier 1 capital declines as a result of the proposal, partially offsetting any additional losses to the Fund that might occur. While the combined proposals maintain a strong level of capital in the regulatory framework and the proposed changes are expected to support financial intermediation by covering banking organizations, these microprudential effects are a potential cost of the combined proposals.

D. Effects on Lending (Including Credit Cards, Residential Mortgages, and Business Lending)

Lending is a cornerstone of banking and an essential source of financing to households and businesses through which banking organizations fulfill their fundamental economic role of intermediating between savers and borrowers. For Category I and II banking organizations, lending encompasses a diverse range of products including consumer loans such as credit cards, auto loans, student loans, and personal loans; commercial loans to corporations,

small businesses, and financial institutions; as well as residential mortgages, exposures to GSEs, and commercial real estate loans. Lending supports economic growth by enabling capital formation, business expansion, and household wealth-building through homeownership and other forms of credit access. Given the importance of lending to the broader economy, this section analyzes the potential economic effects of the proposal on lending by Category I and II banking organizations.

The agencies provided the overall impact of the proposal on lending activity and the marginal effects of other proposals in section VII.C. In this section, the agencies examine specific lending segments—including credit cards, residential mortgages, and corporate loans to provide additional insights on the costs and benefits of the proposal for these segments.

1. Credit Cards

As explained in section IV.A.3.b, the proposal's impact on credit card exposures varies by borrower repayment history and credit line utilization. The current standardized approach applies a 100 percent risk weight to the drawn, on-balance sheet portion of all credit card exposures, while generally a zero percent credit conversion factor (CCF) would apply to the undrawn portion of the exposure. The proposal differs in three ways (see sections IV.A.2.d and IV.A.3). First, risk weights would vary by the obligor's repayment history: 45 percent for transactor exposures and 75 percent for non-transactor exposures (revolvers). Second, a 10 percent CCF would apply to the unutilized portion of all credit lines that are unconditionally cancelable commitments. Third, operational risk capital requirements would reflect interest-earning assets, net interest income, fee income, and fee expenses associated with credit cards.⁶⁹¹

The proposal's differential treatment of credit cards that are retail exposures reflects a more risk-sensitive approach compared with the current standardized approach's uniform 100 percent risk weight:

⁶⁹¹ As discussed in detail in section VII.D, operational risk capital requirements would result from interest-earning assets, net interest income, fee income, and fee expenses associated with credit cards. Based on the figures presented in Table VII.6 of section VII.D, the agencies estimate that operational risk capital requirements for credit card exposures, which are a subset of retail lending, would be equivalent to approximately 20 percentage points when expressed as an add-on to credit risk weights. This estimate reflects the ratio of operational risk RWAs to credit risk RWAs for retail exposures (\$172 billion/\$840 billion).

Non-transactor exposures: The proposal's impact depends on utilization rates. Accounts with lower utilization would generally face higher capital requirements because applying a 10 percent credit conversion factor to the large unused portion of the credit line, combined with operational risk-weighted assets, more than offsets the benefit of the reduced credit risk weight. Accounts with higher utilization may face lower capital requirements, as the reduced credit risk weight (75 percent compared with the current 100 percent) applied to the large drawn portion more than offsets the capitalization of the small unused portion, although operational-risk add-ons would partially offset this reduction.

Transactor exposures: Similarly, the proposal's impact varies significantly by utilization rates. Transactor exposures with lower utilization could still face higher capital requirements despite the reduced credit risk weight (45 percent compared with the current 100 percent), primarily because capitalizing their substantial unused commitments dominates the calculation. Accounts with higher utilization would benefit from lower capital requirements, as the substantially reduced credit risk weight more than offsets the capitalization of unused commitments and operational-risk add-ons.

The proposal would align capital requirements more closely with the underlying credit risk across borrower types and usage patterns. This risk-sensitive framework would provide incentives for banking organizations to differentiate among credit card exposures based on repayment behavior, enhancing the risk-responsiveness of regulatory capital requirements for retail exposures.

2. Residential Mortgages

The proposal includes several provisions that may impact mortgage lending activities, such as traditional originate-to-hold lending, originate-to-distribute lending, investing in mortgage-backed securities, funding nonbank mortgage lenders and servicers, and servicing of loans both held in portfolio and in mortgage-backed security pools. In this section, the agencies analyze how the proposal could affect mortgage activities.

The proposal would enhance risk sensitivity in the treatment of residential mortgage loans, whether originated by the banking organization or purchased from another lender. Under the current standardized approach, a prudently underwritten first lien residential mortgage on a property that is either owner-occupied or rented

generally receives a 50 percent risk weight; other mortgages receive a 100 percent risk weight. The proposal would assign risk weights to the former category (generally regulatory residential real estate exposures under the proposal) based on the LTV ratio of the mortgage, among other factors.⁶⁹²

To better understand which types of borrowers are more reliant on mortgages with high LTV ratios, the agencies conducted an analysis of Home Mortgage Disclosure Act (HMDA) data collected by the Federal Financial Institutions Examination Council (FFIEC) and the Consumer Financial Protection Bureau.⁶⁹³ The institutions reporting these data include the universe of depository and non-depository mortgage lenders that extend more than a minimal number of loans in any metro area. The data are at the applicant level, and the analysis focuses on originated first-lien purchase mortgages. The data include information about both the institutions that originated the loans and whether a loan was sold or securitized.⁶⁹⁴

⁶⁹² The proposal would also assign risk weights for residential mortgage exposures based on whether the residential real estate loan is dependent on cash flows from the property for repayment of the loan. For purposes of this analysis, the agencies have restricted the sample to primary residence loans (HMDA occupancy field = 1), excluding any investment properties from the sample.

⁶⁹³ Data represent the most comprehensive available source of loan-level information on U.S. mortgage market activity. Originally enacted by Congress in 1975 and implemented through Regulation C, HMDA requires many financial institutions to maintain, report, and publicly disclose detailed mortgage lending information. The dataset serves three primary purposes: (1) assessing whether lenders adequately serve their communities' housing needs, (2) providing public officials with data-driven insights for policy decisions, and (3) identifying potentially discriminatory lending patterns. To protect applicant and borrower privacy, the publicly available data are modified before release. See Consumer Financial Protection Bureau & FFIEC, "Home Mortgage Disclosure Act: HMDA Data Publication" (downloaded on October 1, 2025; most recent available loan data sets from Jan. to Oct. 2023) ("HMDA Data (2023)"), <https://ffiec.cfpb.gov/data-publication/2023>.

⁶⁹⁴ The data also include information on loan size, origination LTV ratio, borrower income and

The results of this analysis are presented below in Table VIII.4. The discussion of results to follow focuses mainly on Panel A. Panel B of Table VIII.4 reproduces the analysis using loan dollar volumes as opposed to loan counts, with broadly consistent results. The first column presents the total number of loans originated. The second column shows average LTV ratios at origination by borrower or loan type. Columns three through five present origination market shares by Category I and II banking organizations, other banking organizations (including credit unions solely for this purpose), and nonbank lenders, respectively. Column six shows the share of mortgages held in portfolio, meaning whole loans funded long-term on the balance sheet, by Category I and II banking organizations.⁶⁹⁵ The last column

race/ethnicity, and the income and racial composition of the borrower's neighborhood. While a version of the data is public, the analysis utilized a confidential version to better identify which loans were sold. See Consumer Financial Protection Bureau & FFIEC, "Home Mortgage Disclosure Act: Public HMDA—LAR Data Fields" (accessed on October 1, 2025), <https://ffiec.cfpb.gov/documentation/publications/loan-level-datasets/lar-data-fields>.

⁶⁹⁵ The agencies estimated borrower characteristics for loans purchased by Category I and II banking organizations from loan origination records. This was necessary as records of loan purchases by covered banking organizations from other lenders typically do not include borrower demographic data. This allows a breakdown of the share of whole loans held longer term on covered banking organization balance sheets in the second to last column. To estimate demographic data for purchased loans, the agencies sorted both originated and purchased loans into 96 bins based on three characteristics: loan-to-value ratio (LTV), census tract median income relative to the loan's MSA or MD median income, and the percentile of a loan's property value relative to other loans in the same MSA or MD. Specifically, loans were categorized using six LTV tranches (0 to 50 percent, greater than 50 to 60 percent, greater than 60 to 80 percent, greater than 80 to 90 percent, greater than 90 to 100 percent, and greater than 100 to 120 percent); four MSA-based income tranches (census tract income less than 0.5 times MSA/MD median income, 0.5 to less than 0.8 times, 0.8 to less than 1.2 times, and 1.2 times or greater); and four MSA-based home price tranches based on property value percentiles within each MSA or MD (0 to 25th percentile, greater than 25th to 50th percentile, greater than 50th to 75th percentile, and greater

applies the proposal's LTV-based risk weights to all originated loans extended to each borrower or loan type, as though they were all held on these banking organizations' balance sheets.⁶⁹⁶ These reflect credit risk-weighted assets only. The rows break down results by borrower income and loan type. Below, the agencies make comparisons incorporating implied operational risk-weighted assets.

The rows of the table break out the results by different borrower and loan types. Rows two and three divide mortgages into those taken by low-to-moderate income (LMI) and higher income borrowers. Rows four and five divide mortgages by loan size, specifically into jumbo (that is, those above the loan size limits set by the GSEs for their loan purchases and securitizations) and non-jumbo. Rows six and seven segment conventional loans from non-conventional, where the latter are loans available only to specific borrowers as specified by various sponsor agencies.⁶⁹⁷ These mortgages are frequently extended with ultra-low down payments and securitized into Ginnie Mae mortgage-backed securities.⁶⁹⁸

than 75th percentile). For originated loans in each bin, the agencies calculated the share that ended up funded as portfolio loans of Category I and II banking organizations. This share was then applied as the probability that purchased loans in the same bin would be funded as portfolio loans by these banking organizations. Additionally, all loans in the sample—both originated and purchased—were limited to first-lien, home-purchase loans for one-unit, owner-occupied, one- to four-family housing (excluding manufactured homes), and excluded open-end lines of credit and reverse mortgages.

⁶⁹⁶ This approach implicitly assumes that changes in risk weights affect all issuance, regardless of whether a particular loan will be held on balance sheet.

⁶⁹⁷ The sponsor agencies are predominantly the Federal Housing Administration, Department of Veterans Affairs, and the United States Department of Agriculture.

⁶⁹⁸ See Government National Mortgage Association (Ginnie Mae), "Programs and Products," https://www.ginniemae.gov/about_us/what_we_do/Pages/programs_products.aspx (accessed [1/6/2026]).

to October 2023. Source: HMDA Data Publication from Jan. to Oct. 2023 as collected by the

Consumer Financial Protection Bureau and FFIEC.⁶⁹⁹

Although Category I and II banking organizations extend a large number of mortgages, their market share is low both in absolute terms and particularly in comparison to their overall footprint in the banking sector. From Table VIII.4 Panel A, Category I and II banking organizations originate only 4 percent of mortgages and fund only 3 percent of mortgages as portfolio loans (as seen in row one of columns three and six), compared to the 30 percent for the other banking organizations (column four). As seen in row four in Panel A (or 7 percent relative to 31 percent by dollars of loan volume in Panel B), Category I and II banking organizations originate and fund a much larger share of jumbo loans. Comparing column two of rows two and three indicates that higher- and

lower-income borrowers obtain mortgages with similar LTV ratios on average.

The last column of Table VIII.4 shows the average credit risk weight that would apply to each segment of loans under the expanded risk-based approach. For example, in Panel A, the 42 percent average risk weight in row two of column seven for low-to-moderate income borrowers is calculated based on the distribution of LTV ratios for all mortgages extended to low-to-moderate income borrowers in the data, whether they were originated by Category I and II banking organizations, other banking organizations, or nonbanks.

To characterize the total impact of the proposal, the agencies also convert the operational risk-weighted assets attributable to these loans into an effective additional risk weight. More specifically, as described in section VII.D, the agencies estimate operational

risk-weighted assets based on exposures' contribution to each component of the operational risk business indicator. These estimated operational risk-weighted assets are then divided by the total balance sheet exposures in the residential mortgage market to determine the effective additional risk weight. This methodology yields an implied interest income operational risk weight add-on of around 4 percent on average across Category I and II banking organizations.⁷⁰⁰

In line with the decline in aggregate risk-weighted assets for residential mortgages under the proposal, estimated

⁶⁹⁹ See HMDA Data Publication, <https://ffiec.cfpb.gov/data-publication>. HMDA data are published with a significant delay. The data used in the analysis are the most recent data available at the time of this analysis.

⁷⁰⁰ As noted above for credit cards, the operational risk weight add-on does vary across Category I and II banking organizations and over time for the same organization depending on whether recent net interest margins are above or below the 2.25 percent ceiling. When below, the effective operational risk weight depends on the net interest margin of the particular activity, which for mortgages is relatively moderate.

effective risk weights, inclusive of operational risk, would be stable or falling for almost all types of mortgage borrowers relative to the 50 percent risk weight in the current standardized approach. For instance, for low-to-moderate income borrowers (second row), the total equivalent risk weight under the proposal would be 46 percent (42 percent from credit risk and 4 percent from operational risk). Therefore, effective risk weights would be lower than the 50 percent risk weight applicable under the current standardized approach for most types of borrowers. Jumbo loans would see the largest reduction, with average risk weights more than 10 percentage points lower than the current standardized approach. Non-conventional loans would see an increase in average risk weights. However, because these loans are for the most part not originated by Category I and II banking organizations, this change would have limited practical impact.

In addition to lowering average risk weights at origination for portfolio mortgages, the expanded risk-based approach would also include additional risk sensitivity relative to the current standardized approach as the LTV-based tables allow further decreases in risk weights over time as mortgages are paid down. That is, the proposal better accounts for amortization through reduced risk weights as mortgages migrate to lower LTV ratio buckets over time. These amortization provisions would support mortgage lending, particularly under the originate-to-hold model.

The agencies supervise banking organizations' mortgage underwriting in accordance with the Interagency Guidelines for Real Estate Lending.⁷⁰¹ These guidelines assist banking organizations in formulating and maintaining a real estate lending policy that satisfies supervisory expectations and is appropriate to the banking organization. For mortgages with an LTV ratio at or above 90 percent at origination, the guidelines recommend that banking organizations require appropriate credit enhancements, including private mortgage insurance or readily marketable collateral. Under both the current standardized approach and the proposed expanded risk-based approach, mortgages that do not meet the standards in the guidelines receive a 100 percent risk weight, while

prudently underwritten mortgages receive lower risk weights, which would vary by LTV ratio under the proposal. Therefore, the proposal would not lower risk weights for higher-risk mortgages.

Many banking organizations that would be subject to the expanded risk-based approach extend mortgages under an originate-to-distribute business model. The introduction of operational risk-weighted assets for these activities under the proposal could lead these banking organizations to reduce this activity if, for example, such requirements lead to higher funding costs and these banking organizations are unable to raise mortgage margins to compensate in what is a competitive market. In the originate-to-distribute business model, the banking organization underwrites a loan following the standards of the GSEs, Ginnie Mae sponsor agencies, or private label mortgage-backed securities issuers and sells the mortgage to a securitizer, holding it on balance sheet for a short period, often only a matter of weeks. Profits in this business line are largely attributable to the prices offered by mortgage-backed security investors, origination fees, and the valuation of the servicing rights generated by the origination and sale of the mortgage. Under the proposal, this noninterest income would generate operational risk-weighted assets. Fuster et al. (2013) develop a methodology to measure average originator profits and use it to produce a monthly series. Over the past 10 years, the measure has averaged 2.75 percent of originate-to-distribute loan volumes.⁷⁰² Although a lack of granular data on noninterest expenses prevents a precise quantification, the agencies expect residential real estate lending activities to generate about \$100 billion in aggregate operational risk-weighted assets at Category I and II banking organizations, with about \$26 billion of that attributable to noninterest income.⁷⁰³

Lax underwriting standards in the pre-financial crisis period resulted in

the GSEs requiring originating banking organizations to repurchase large quantities of non-performing mortgages.⁷⁰⁴ The risks posed to banking organizations by so-called putback requests, along with legal actions, including for potential fair lending violations, are risks of the originate-to-distribute business model. Even though these mortgages are only briefly held on balance sheet, they entail ongoing risk of operational losses throughout their term. Because risk weights on portfolio mortgages under the proposal would tend to be lower than under the current standardized approach while income from mortgage securitization activities would now generate an operational risk requirement, Category I and II banking organizations may tilt their mortgage exposures somewhat towards portfolio lending and away from originate-to-distribute lending, depending on the strength of this incentive.⁷⁰⁵

Banking organizations are significant funders of nonbank mortgage lenders via warehouse lines of credit.⁷⁰⁶ The impact of the proposal on warehouse lending depends on several factors, including the application of the securitization framework to the exposures. On the one hand, this lending could be affected by proposed changes to the risk weights for certain corporate borrowers and credit conversion factors for off-balance sheet commitments.⁷⁰⁷ To that end, the proposal's effects on warehouse lending could vary depending on the creditworthiness of the nonbank

⁷⁰⁴ See Laurie S. Goodman and Jun Zhu, "Reps and Warrants: Lessons from the GSEs Experience," 24 *Journal of Fixed Income* 29, 29–41 (June 2014) ("Goodman and Zhu (2014)"), <https://www.pm-research.com/content/iiifxinc/24/1/29>.

⁷⁰⁵ See section VII.D for a description of how operational risk-weighted assets are attributed across banking activities. Noninterest income associated with mortgage securitization activity is within items 14E through N of FR Y14Q Schedule G.

⁷⁰⁶ See Erica Xuewei Jiang, "Financing competitors: Shadow banks' funding and mortgage market competition," *The Review of Financial Studies* 36, no. 10 (2023): 3861–3905, <https://doi.org/10.1093/rfs/hhad031>.

⁷⁰⁷ The expanded risk-based approach would apply lower risk weights, relative to the current standardized approach, for investment grade corporate counterparties (65 percent vs. 100 percent). It would also apply a different treatment to commitments, where the standardized approach applies a 20 percent credit conversion factor to commitments with an original maturity of one year or less that are not unconditionally cancellable by the banking organization and a 50 percent credit conversion factor to commitments with an original maturity of more than one year that are not unconditionally cancellable by the banking organization. The expanded risk-based approach would apply a uniform 40 percent credit conversion factor to these exposures regardless of their maturity.

⁷⁰¹ See Interagency Guidelines for Real Estate Lending, 12 CFR part 34 subpart D app. A (OCC); Interagency Guidelines for Real Estate Lending Policies, 12 CFR part 208 app. C (Board); Interagency Guidelines for Real Estate Lending Policies, 12 CFR part 365 subpart A app. A (FDIC).

⁷⁰² See Andreas Fuster, Laurie Goodman, David Lucca, Laurel Madar, Linsey Molloy, & Paul Willen, "The Rising Gap Between Primary and Secondary Mortgage Rates," 19 *Federal Reserve Bank of New York Economic Policy Review* 17, 17–39 (Dec. 2013) ("Fuster et al. (2013)"), https://www.newyorkfed.org/research/epr/2013/execsum_fust.html. The Fuster et al. (2013) methodology remains valid under Basel III as it measures originator margins using observable market prices rather than regulatory models. The authors explicitly tested the framework's robustness to Basel III capital treatment changes (see Fuster et al. 2013, section 4.1, pp. 31–32).

⁷⁰³ See sections VII.C and VII.D for further discussion and detail on the attribution of risk-weighted assets by banking activity and for detail on the methodology, respectively.

borrowers and the structure of the lending arrangements. If warehouse lending counterparties qualify as investment-grade borrowers, they would receive more favorable risk weights under the proposal compared to non-investment-grade counterparties.

On the other hand, both under the current framework and the proposal, mortgage warehouse lending can be treated as a securitization exposure rather than a corporate exposure when the structure meets the relevant criteria—typically based on the level of overcollateralization and the use of special-purpose entities. Further, the proposed securitization framework would generally require less capital under the credit risk framework and so the proposal would likely continue to incentivize extension of credit by banking organization to mortgage warehouse lenders using such structures.

In a lender's decision to make a mortgage loan, the profitability from a mortgage servicing asset, which is generated when a mortgage is securitized, is part of the economic consideration. With performing loans, mortgage servicers collect borrowers' monthly payments and handle escrow for property tax and insurance payments. For non-performing loans, servicers must both work with borrowers to potentially amend payment plans and continue making tax and insurance payments and, in some cases, continue forwarding expected loan payments to mortgage-backed securities investors that, in the event of foreclosure, may not be recouped for some time.

Under the current standardized approach, Category I and II banking organizations must deduct MSAs from CET1 capital when they exceed 10 percent of CET1 capital individually or 15 percent in aggregate with other threshold items, with any non-deducted portions receiving a 250 percent risk weight. The proposal would eliminate this deduction requirement, instead applying a 250 percent risk weight to all MSAs.

The removal of capital deductions for mortgage servicing rights would incentivize Category I and II banking organizations to expand mortgage servicing activity. Eliminating the deduction requirement would significantly reduce the regulatory disincentives for maintaining such assets, which may contribute to a more active secondary market for mortgage servicing rights as banking organizations face fewer capital constraints when holding these assets.

While maintaining the 250 percent risk weight acknowledges MSAs' inherent risk due to interest rate sensitivity and complexity, the proposed treatment could alter capital allocation decisions. This would create opportunities for deployment of capital that would otherwise be restricted under the current framework; the agencies would continue monitoring MSA concentration and market value volatility during periods of economic stress.⁷⁰⁸

Taken together, the proposal would enhance risk sensitivity in residential mortgage lending by implementing more granular risk weights based on loan characteristics like LTV ratios and credit quality. The proposal is also expected to have a positive impact on the availability of mortgage credit relative to the current standardized approach. In part, the limited expected impact comes from Category I and II banking organizations originating fewer than 10 percent of residential mortgages and holding less than that as portfolio loans. The proposal would decrease funding costs for most portfolio lending operations undertaken by Category I and II banking organizations, by increasing risk sensitivity of capital requirements for mortgages compared to the current standardized approach. Category I and II banking organizations may consider these shifts in incentives among other factors when deciding their future participation in these activities.

3. Corporate Loans

The current standardized approach requires banking organizations to assign a 100 percent risk weight to all corporate loan exposures. Off-balance-sheet exposures, substantially consisting of unutilized portions of credit lines, are subject to requirements through credit conversion factors.

The application of credit conversion factors under the current standardized approach varies based on the nature and duration of the commitment. For commitments that are not unconditionally cancelable, the credit conversion factor depends on the original maturity: those with an original maturity of one year or less are assigned a 20 percent credit conversion factor, while those exceeding one year receive a 50 percent credit conversion factor. Commitments that are unconditionally cancellable receive a zero percent credit conversion factor.

The proposed expanded risk-based approach would enhance risk sensitivity

by allowing banking organizations to assign lower risk weights (65 percent versus current 100 percent) to loans to investment-grade corporate borrowers based on internal ratings. Further, the proposal would apply a 10 percent credit conversion factor to unconditionally cancellable commitments, and apply a flat 40 percent credit conversion factor to commitments that are not unconditionally cancellable regardless of maturity. As mentioned above, the proposal would also introduce operational risk-weighted assets attributed to the interest and fee income associated with loans and credit lines.

Applying differentiated risk weights to investment-grade and non-investment-grade exposures increases the risk sensitivity of the framework by distinguishing between varying exposure risks. Banking organizations can leverage their existing risk management frameworks through internal ratings systems for determining investment-grade status. This more granular risk assessment approach could better align capital with actual risk exposures.

Since differentiation would be based on individual organizations' internal credit risk models, there could be variability in requirements for similar risks. The proposal addresses this by setting expectations for investment-grade determinations when applying the 65 percent risk weight. Robust supervisory oversight would help ensure appropriate application of investment-grade criteria and prevent banking organizations from using this framework to grant lower risk weights to riskier loans.

The internal ratings systems used for determining investment-grade status undergo ongoing refinement and validation, helping ensure appropriate capital levels through different economic conditions. The agencies estimate a meaningful reduction in capital requirements for affected institutions, based on applying a 35 percentage point reduced risk weight to applicable investment-grade exposures.

As described in section VII.D.1.c, based on data from the special data collection, an estimated 53 percent of balance-sheet corporate exposure and 60 percent of off-balance-sheet corporate exposure is classified as investment-grade and would be risk-weighted at 65 percent under the proposal for Category I and II banking organizations. This expanded scope would likely result in a more efficient allocation of capital, with the potential for banks to pass some capital relief to borrowers in the form of reduced borrowing costs or

⁷⁰⁸ See the 2016 agencies report available at: <https://www.federalreserve.gov/publications/other-reports/files/effect-capital-rules-mortgage-servicing-assets-201606.pdf>.

increased credit availability for investment-grade corporations. The more targeted approach to risk weighting may encourage lending to financially sound corporations, supporting productive economic activity while still maintaining appropriate capital buffers against potential losses.

The proposed changes to credit conversion factors present a mixed impact on capital requirements for individual loans. The implementation of a flat 40 percent credit conversion factor for commitments that are not unconditionally cancellable would decrease capital requirements for longer-term commitments (previously at 50 percent) while increasing requirements for shorter-term commitments (previously at 20 percent). This change would likely encourage banks to provide more long-term credit compared with the current framework, potentially benefiting businesses seeking stable, longer-term financing arrangements. The standardization could also simplify regulatory compliance while providing incentives for longer-duration lending that may better match the funding needs of many corporate borrowers. The introduction of a 10 percent credit conversion factor for unconditionally cancellable commitments would increase capital requirements for these exposures, which currently receive a 0 percent factor. While this change better recognizes the inherent risk in such commitments, it could also lead to adjusted pricing or terms for certain credit products, particularly revolving credit facilities.

In sum, the proposed expanded risk-based approach represents an enhancement to the current standardized approach by improving risk sensitivity through differentiated treatment of corporate exposures based on creditworthiness. It also streamlines the approach to off-balance-sheet exposures and incorporates operational risk requirements. The agencies' analysis suggests that Category I and II banking organizations would experience a decrease in their overall capital requirements for these exposures, potentially leading to increased lending activity. The proposal also creates incentives for longer-term lending by equalizing credit conversion factors across maturity bands. These changes, implemented within the existing supervisory framework, aim to create a more risk-sensitive capital regime that supports economic activity.

E. Effects on Trading

This part of the economic analysis studies the potential effects of the

proposal on the trading businesses of banking organizations and the resulting potential effects on end users and markets. On a standalone basis, this proposal would raise the capital required for trading. Taken together with the proposals to change to the GSIB surcharge and supervisory stress test models, the combined impact is estimated to be a 9.2 percent increase in common equity tier 1 capital for Category I and II banking organizations (see table VII.7) and a small impact on non-Category I and II banking organizations (see discussion in section VII.A.1).

Trading activity exposes banking organizations to market risk, counterparty credit risk, CVA risk, and operational risk. This proposal makes changes to how each of these risks are capitalized. There are major revisions to the market risk framework which would affect incentives for banking organizations' hedging strategies and risk modelling methods. Proposed changes to the credit risk framework would somewhat reduce counterparty credit risk-weighted assets. CVA and operational risk-weighted assets would be required for many banking organizations, whereas these are currently not part of the standardized approach that generally determines capital requirements today.

The proposal would have different impacts on banking organizations depending on their size. Category I and II banking organizations are key participants in the capital markets and conduct the majority of trading among banking organizations. These banking organizations have diversified trading businesses, which can provide substantial diversification benefits even in stress periods. The proposed market risk framework intentionally limits the recognition of diversification across risk classes and adds a layer of conservatism for non-modellable risk factors. Due primarily to these two features, this proposal would increase market risk-weighted assets for Category I and II banking organizations by 20 percent (see table VII.2 in section VII.A). However, the cumulative effect inclusive of the GSIB surcharge proposal and stress test changes is projected to be a 5.8 percent decrease in the common equity tier 1 capital requirements associated with market risk (see table VII.4 in section VII.B.2). The reduction is largely due to changes to the global market shock that would reduce the liquidity horizons used to calibrate risk-factor shocks and offset the increase in market risk-weighted assets. This change to the global market shock would be expected

to increase banking organizations' incentives to participate in trading.

This proposal also makes significant changes to the frameworks for CVA and operational risk-weighted assets. These are currently explicitly included in the advanced approaches calculation, but not in the standardized approaches calculation which is most often the binding constraint. Under the proposal, all Category I and II banking organizations would be required to include them. The CVA and operational risk-weighted assets associated with trading activity can be seen in table VII.6. The impact due to their inclusion is significantly larger than the proposed changes in market risk-weighted assets. Overall risk-weighted assets for trading-related activities of Category I and II banking organizations would rise 30.9 percent (see table VII.5). Despite this significant increase in risk-weighted assets, when considering the other proposals, in particular the proposed changes to the global market shock, the combined impact on capital requirements would be a moderate 9.2 percent.

In contrast, this proposal will have a smaller impact on non-Category I and II banking organizations. Some of these have significant trading activity and must calculate market risk-weighted assets. The proposed changes to the market risk framework would result in a 39 percent decrease in market risk-weighted assets for non-Category I and II banking organizations.⁷⁰⁹ This decrease is likely attributable to increased recognition of credit and equity hedges in the proposal relative to the current standardized specific risk charge, which is highly conservative and typically used by relatively smaller banking organizations. However, a few non-Category I and II banking organizations also have substantial exposure to over-the-counter derivatives, and under the proposal they would begin to include CVA risk-weighted assets. Not every banking organization would be subject to both requirements, but in the aggregate they offset each other. Finally, some non-Category I and II banking organizations might elect to use the expanded risk-based approach, in which case they would be required to also calculate operational risk-weighted assets for trading activity.

Under the proposal, total risk-weighted assets related to trading activity by non-Category I and II

⁷⁰⁹ These impacts of changes to market and CVA risk-weighted assets for non-Category I and II banking organizations are not stated separately in section VII.A.1, but are calculated using the same underlying bank-specific impacts and methodology.

banking organizations would increase by 0.9 percent (see discussion in section VII.A.1). The proposed change to the GSIB surcharge does not affect these banking organizations. The impact of the proposed revisions to the supervisory stress is expected to be small since most non-Category I and II banking organizations are not subject to the global market shock.

The post-implementation change in trading-related capital requirements could be lower than these estimates as banking organizations could optimize requirements under the proposal, including by changing their trading activities and modeling approaches.

The agencies expect the proposal would increase the resilience of banking organizations by better aligning capital requirements with risk in several ways. Replacing the Value at Risk (VaR)-based measure of market risk with an expected shortfall-based measure better reflects the tail risk of extreme events, especially for portfolios with non-normal return distributions. Replacing the current uniform 10-day liquidity horizon with varying horizons would better account for market illiquidity during stress periods and the risk that difficult-to-trade positions may lose more value as they remain on balance sheets longer. The more conservative recognition of diversification within the proposed framework would aim to capture the risk that historical correlations between risk factors may not hold in stress periods. The inclusion of equities within the default risk capital requirement would account for the possibility of the value of an equity falling to zero.

Finally, the proposed framework would better address model risk relative to the current framework. The proposal would hold the internal models used by banking organizations to a higher standard by introducing new tests of model performance while explicitly recognizing that some risk factors are not modellable. In addition, the proposal's introduction of a standardized approach would offer a conservative alternative for banking organizations that choose not to use internal models and serves as a fallback method when internal models perform poorly.

The agencies expect that capital requirements under the proposed framework would be substantially less procyclical, which would help to preserve the availability of intermediation during periods of financial stress. The current market risk framework is more procyclical because current period VaR is a substantial component of capital requirements and

it generally rises during market stress, increasing market risk capital requirements and the cost of intermediation. The proposed market risk framework is calibrated based on historic stressed market conditions and, therefore, will tend to increase less under new stressed conditions, resulting in a less procyclical capital requirements.⁷¹⁰

The following sections focus on how capital requirements are likely to change on average across different trading activities, and how changes in capital requirements for trading activities would generally affect banking organizations, end users, and markets.

1. Changes in Capital Requirements Across Different Trading Activities

Because banking organizations engage in a broad range of trading activities, this section takes a high-level view of how general categories of trading activities would be affected under the proposal. The agencies expect substantial heterogeneity in the capital impacts across both banking organizations and trading activities. Different products and portfolios receive different treatments, which could lead to capital requirements rising for some banking organizations and falling for others depending on their trading portfolios. Capital impacts would also depend on banking organizations' use of models, both under the current framework and the proposal.

Broadly, the agencies expect that capital requirements would be relatively higher for products that are exposed to risk factors that are less liquid, lack transaction data, or have complex payoff structures. Highly liquid and simple products would likely receive relatively lower capital requirements. Portfolios that are diversified across risk classes would receive less recognition of diversification compared to the current framework, which does not limit recognition of diversification between risk classes. Cross-asset-class hedges would also receive less recognition, likely leading to increases in risk-weighted assets for trading strategies that make substantial use of them.

⁷¹⁰ While the structure of the proposed framework avoids direct procyclicality, some components might indirectly contribute a degree of procyclicality for banking organizations using the models-based method. Stressed market conditions could cause these banking organizations to fail backtests or the profit and loss attribution test, which could potentially increase the banking organization's backtesting multiplier or force some modeled desks to revert to the standardized approach (or add a surcharge). Such market conditions might also increase the number of non-modellable risk factors.

a. Illiquid Risk Factors

Products with illiquid risk factors would be particularly affected by the proposal's introduction of variable liquidity horizons. Under the current framework, banking organizations estimate their risk over a 10-day horizon, based on the assumption that they can trade or hedge the exposure within that time period (liquidity horizon). The proposal would introduce liquidity horizons that vary across risk factors and assign longer liquidity horizons to less liquid risk factors to better reflect the time needed to sell or hedge the exposure to such risk factors. These liquidity horizons are explicitly in the models-based measure and are implicitly used to calibrate risk weights in the standardized approach. Highly liquid risk factors, such as linear U.S. dollar interest rate risk exposure, would maintain a 10-day liquidity horizon, while less liquid risk factors, such as those reflecting volatility exposures, would have higher liquidity horizons that could reach a maximum of 120 days.

The most liquid risk factors, with 10-day liquidity horizons, are generally interest rates for major currencies, foreign exchange rates for major currency pairs, and large cap equities. Products whose valuations are primarily affected by these risk factors would likely see limited impact from the proposed liquidity horizon revisions.⁷¹¹ The least liquid risk factors are implied volatilities, credit spreads, and many commodity prices. Thus, products whose valuations depend heavily on these risk factors, for example volatility swaps, would likely see larger capital requirement increases.

b. Market Data Availability

Risk factors lacking sufficient reliable data on transaction prices would likely see an increase in capital requirements for banking organizations using the models-based approach due to the non-modellable risk factor framework.

Within the models-based approach, a risk factor is modellable if it passes a qualitative test of data quality and a quantitative test of whether there is sufficient data from traded prices. If a risk factor passes the qualitative test, but fails the quantitative test, it is a Type A non-modellable risk factor. Otherwise, the risk factor is a Type B non-modellable risk factor.

Non-modellable risk factors are capitalized by first computing standalone losses and then aggregating them based on a formula that imposes

⁷¹¹ Examples include vanilla interest rate and foreign exchange swaps as well as cash equities.

assumptions about the correlations of those risk factors. Type A non-modellable risk factors are included in the internal model capital charge, but are assumed to have zero correlation in the stressed expected shortfall to capture their inherently higher risks associated with model risk and illiquidity. Type B non-modellable risk factors are only included in the stressed expected shortfall, but are assumed to have a higher correlation of 0.36 with other Type B non-modellable risk factors. In most cases, non-modellable risk factors are expected to contribute to higher capital requirements.

The non-modellable risk factor framework would have the largest impact on asset markets for which there is limited trade data, whether due to market illiquidity or limited access to transaction details. The agencies expect that highly liquid products with easily-available data, such as large cap stocks, would not be materially affected. Less liquid products, such as certain fixed income products, would likely see a bigger impact. Products whose values are sensitive to illiquid parts of curves or surfaces, such as implied volatilities that are far away from current implied volatility, would also likely be more affected.

c. Specific Risk

The agencies expect that products with substantial exposures to specific risk would have reduced capital requirements, but only for banking organizations that currently use the standardized approach for calculating specific risk capital charges. Such organizations tend to be smaller. Specific risk accounts for risks that are not covered by systematic market factors, such as idiosyncratic equity or credit spread risk. The standardized approach for capturing specific risk in the current framework makes highly conservative assumptions that are not included in the proposed framework. In particular, the current standardized approach only recognizes the netting of idiosyncratic risk from the same issuer if the offsetting positions are in identical instruments. The proposal would recognize offsetting of risks to the same issuer across different issuances based on a correlation parameter that takes into account the issuer name, tenor differences, and curve basis risk. This change in the treatment of specific risk is likely one of the major reasons why non-Category I and II banking organizations that remain subject to market risk are projected to see market

risk-weighted assets decrease by 35 percent.⁷¹²

d. Operational Risk

Trading strategies with higher profits would likely see an increase in their capital requirements due to operational risk capital requirements. The noninterest component of operational risk capital requirements would depend on a formula that includes the absolute value of a measure that combines trading profits with profits from other sources. Typically, higher trading profits would increase operational risk capital requirements.

e. Risk Class Diversification

The reduced recognition of diversification across risk classes under the proposal would likely raise capital requirements for portfolios containing exposures to risk factors from multiple risk classes. Currently, the market risk framework does not restrict recognition of diversification across risk classes, which means that the current market risk capital requirement reflects that banking organization's estimated diversification benefit based on the empirical correlation it uses for different risk classes. The proposal would entirely eliminate recognition of diversification across risk classes in the standardized non-default capital requirement and reduce the diversification benefit in the models-based non-default capital requirement.⁷¹³ Reducing the recognition of diversification across risk classes would likely raise risk-weighted assets, which has been noted by Viegas de Carvalho, et al. (2024) for a representative portfolio under the models-based non-default capital requirement.⁷¹⁴ While the models-based

⁷¹² However, the proposed inclusion of CVA risk-weighted assets for banking organizations with over \$1 trillion in OTC derivatives will offset the reduction in market risk-weighted assets for many of the non-Category I and II banking organizations. As noted above, the impacts of changes to market and CVA risk-weighted assets for non-Category I and II banking organizations are not stated separately in section VII.A.1, but are calculated using the same underlying bank-specific impacts and methodology based on the special collection.

⁷¹³ Specifically, in the standardized non-default capital requirement, the sensitivities-based method capital requirements are simply added across risk classes, which implicitly assumes that losses across risk classes are perfectly correlated. In the models-based non-default capital requirement, the internally modelled capital calculation places a weight of 50 percent on a measure that assumes losses are perfectly correlated and 50 percent on a measure that is based on their empirical relationships.

⁷¹⁴ See Viegas de Carvalho, Paulo, et al. "The Impact of the Fundamental Review of the Trading Book: Evaluation on a Stylized Portfolio." *Journal of Risk*, 23 Jan. 2024, <https://doi.org/10.21314/jor.2023.014>.

non-default capital requirement would recognize greater diversification across risk classes than the standardized non-default capital requirement, both approaches would reduce recognition of diversification compared to the current market risk framework. This more conservative treatment of cross-risk-class diversification addresses the possibility that correlations between risk classes change between stress periods; one prominent example is how the correlation between nominal bonds and equities has changed signs over time.⁷¹⁵

f. Other Effects

There are many other changes within the proposal that would affect the market risk capital requirements for particular products. The residual risk add-on within the standardized non-default capital requirement would increase capital requirements associated with exotic positions and those with residual risk not captured by the sensitivities-based method.⁷¹⁶ The inclusion of equities in the default risk capital requirement might raise requirements associated with equities to capture risks associated with companies rapidly failing, although other changes, such as revisions to the treatment of specific risk, may counteract that increase. Within the models-based non-default capital requirement, the switch from VaR, which measures loss at a specific percentile, to expected shortfall, which measures expected loss beyond a specific percentile, would likely raise capital requirements for products with greater tail risk.

Changes to the standardized approach to counterparty credit risk would recognize diversification between derivative transactions and non-cleared repo-style transactions within a netting set when calculating exposure at default. These changes would reduce capital requirements associated with combining both types of transactions within a single netting set, such as engaging in Treasury repo and Treasury futures transactions with the same counterparty. There is limited empirical evidence on the magnitude of the change in capital requirements to expect with respect to these changes.

2. Impact on Banking Organizations

This section considers how changes in capital requirements for trading

⁷¹⁵ For empirical evidence on bond-stock comovements, see Campbell, John, et al. *Bond-Stock Comovements*. Working paper. 1 Oct. 2025. Accessible at www.nber.org/papers/w34323.

⁷¹⁶ Examples of exotic positions include those referencing longevity risk, weather, or natural disasters.

activities could affect the behavior of covered banking organizations. Because the proposal would better capture certain risks, the agencies expect that covered banking organizations would become more resilient. Banking organizations would also likely reduce the quantity of intermediation and raise fees for trading activities with increased capital requirements, and similarly increase the quantity and reduce the cost for trading activities with reduced capital requirements, although the magnitudes are uncertain. The agencies also expect that banking organizations would likely adjust their trading strategies to reduce capital requirement impacts, such as by hedging more risks or holding fewer positions. The agencies also expect that the reduced procyclicality of the proposed market risk capital requirements would lead to more stable provision of financial intermediation during market stress periods as compared to the current framework.

a. Supply of Intermediation Services

Increased capital requirements may lead banking organizations to reduce the scale of their trading activities or increase their fees, commissions, or bid-ask spreads—the costs they charge to their customers for intermediation services—although the magnitudes of any potential impact are difficult to estimate. Changes in the volume of trading and to its cost are intimately connected, as suggested by a standard supply-demand framework.

The intersection of supply and demand establishes the equilibrium price and quantity of intermediation for a particular type of trading. An increase in capital requirements would shift the supply curve upward, which would increase the cost of intermediation and reduce the quantity. A decrease in capital requirements would similarly reduce the cost of intermediation and increase the quantity. The magnitudes of quantity versus price changes would depend on the elasticities of supply and demand (that is, how responsive the quantity of intermediation is to changes in its price). There is limited empirical evidence on the magnitude of the impact of capital requirements on trading activity and it is difficult to obtain such an estimate.

Another consideration is that banking organizations are not the only companies engaging in these trading activities. To the extent that higher costs only apply to banking organizations, intermediation activity may flow outside the banking system. This effect on markets will be considered in section VIII.E.3.

b. Trading and Hedging Strategies

Another possible effect of the proposal is that banking organizations may switch to trading or modeling strategies that result in lower capital requirements. Some possible approaches include (1) changing hedging strategies, (2) changing the number of positions held directly, (3) improving their models or gathering additional data, and (4) increasing central clearing.

First, banking organizations may adjust hedging strategies in response to the proposed requirements. These adjustments could take many forms. For example, if a banking organization were leaving an exposure unhedged in the current framework and its standalone capital requirements would rise under the proposed framework, then the banking organization might use hedges to reduce the capital impact. To the extent that the proposed framework is more risk sensitive, banking organizations would have greater incentives to hedge economically meaningful risk exposures. Evidence from Lu and Wallen (2024) indicates that large dealer banking organizations are already hedging most market risk, suggesting that the scope for additional hedging may be limited.⁷¹⁷

Second, banking organizations may change how many positions they hold directly. For example, one approach to market making is to buy and sell products as needed by customers and to hold a product inventory plus any trade imbalances. Another approach is to directly match buyers and sellers together, which does not require the banking organization to hold any position. If capital requirements associated with holding inventory were to rise, a banking organization might start directly matching buyers and sellers more frequently or decide to limit the size of its inventory. Conversely, if capital requirements were to fall, a banking organization might increase the size of its inventory. Bessembinder et al. (2018) document how bank-affiliated dealers were less likely to hold customer order imbalances on their own balance sheets following the 2008 financial crisis relative to other dealers.⁷¹⁸ The evidence is consistent with post-crisis capital regulations affecting trading

inventories, although it is difficult to disentangle other effects.

Third, banking organizations using the models-based approach might respond to the proposed capital framework by gathering additional data to reduce the impacts of non-modellable risk factors. Gathering additional data could help a non-modellable risk factor to become modellable, which would generally reduce capital requirements. However, there are indications that there is reluctance among banking organizations to share data and that purchasing the data from vendors can be expensive, although greater adoption of internal models by banking organizations could mitigate these problems.⁷¹⁹

Fourth, banking organizations may centrally clear more of their derivatives. Such exposures are exempt from the CVA framework due to their substantially reduced risk profiles. Evidence from Canada, which has already implemented its version of the new market risk standards, indicates an increase in derivatives clearing.⁷²⁰ Increased clearing would have the benefit of reducing counterparty-related risks.

c. Stability

Banking organizations would likely provide more stable intermediation during market stress due to the reduced procyclicality of the proposed market risk framework. The inclusion of current period VaR within the current framework means that capital requirements are more likely to increase sharply during market stress, which can lead banking organizations to reduce their intermediation activity.⁷²¹ The proposed framework would instead rely on estimates of losses during past stressed conditions, which would reduce the likelihood of spikes in capital requirements. The agencies expect this change to lead to more stable

provision of intermediation during market stress.

d. Impacts on End Users

The proposal would likely change the cost of financial intermediation for end users, with effects that differ by the type of trading activity. Trading activities with increased capital requirements may become less profitable for banking organizations unless they can increase revenue by charging higher fees and commissions on transactions or by widening bid-ask spreads. Banking organizations often focus on return on equity as an essential measure of profitability.⁷²² Return on equity for trading is likely to decrease if risk-weighted assets increase, and the proposal is expected to increase overall risk-weighted assets for trading activities for Category I and II banking organizations, unless they adjust their portfolios, which would require changes in either trading or hedging strategies.

Some banking organizations may exit some markets or reduce the variety of their offerings if they cannot maintain an acceptable return on equity. It is widely accepted that banking organizations attempt to shift resources from activities with low capital efficiency towards activities with higher capital efficiency. However, Ding and Sickles (2018) document that return on equity for banking organizations has fluctuated significantly over time.⁷²³ Moreover, a survey conducted by Federal Reserve supervision staff of Category I banking organizations showed significant dispersion in the capital efficiency of different trading activities. This was true when comparing similar business lines at different banking organizations and when comparing different business lines within the same banking organization. The observation that less capital efficient business lines continue to operate suggests that banking organizations may not entirely abandon low capital efficiency trading activity.

The trading businesses of banking organizations serve a wide variety of clients, including commercial end users, institutional investors such as pension funds and insurance companies, governments, other banking

organizations, and nonbank financial organizations such as hedge funds. Banking organizations also serve households indirectly through securitization of loans and by supporting mutual funds and retail brokerages. Each type of trading customer has different intermediation needs. For example, commercial end users may be interested in accessing capital markets, and in hedging the foreign exchange or commodity price risk arising from their business and hedging interest rate risk on their debt. Any change in the cost or availability of these services may have a significant effect on the real economy.

The benefit to society from enabling hedging by commercial end users is difficult to ascertain, so the proposal's impacts from changing hedging behavior are difficult to estimate. Classic finance theory dating back to Modigliani and Miller holds that risk management does not increase firm value because it is irrelevant to a firm's shareholders who can themselves hedge by holding a diversified portfolio.⁷²⁴ Regardless, commercial firms themselves have a strong demand for hedging instruments. A number of theories have been proposed to explain this behavior. For example, Froot, Scharfstein and Stein (1993) suggest firms that manage risk reduce the chance of not being able to take advantage of growth opportunities.⁷²⁵ There is some empirical evidence that risk management increases firm value. Allayannis and Weston (2015) find that, among nonfinancial firms that are exposed to exchange rate risk from their foreign operations, the use of derivatives to hedge foreign currency risk increases firm value by 4 percent.⁷²⁶

The impact of the proposal on end users would differ depending on the type of customer relationships end users have with banking organizations of different sizes. The largest banking organizations offer a broad variety of intermediation services, including some that require sophisticated risk management. Category I and II banking organizations generally have well-hedged and diversified portfolios, but also have the capacity to warehouse the

risks that arise from their intermediation and are difficult to hedge. Mixon and Onur (2020) document how commodities swaps dealers, many of which are banking organizations,⁷²⁷ offer their customers bespoke contracts which they then hedge with standard, liquid instruments, leaving the dealer holding residual basis risk.⁷²⁸ Category I and II banking organizations tend to optimize their trading and hedging strategies and their risk management, including the models used to calculate required capital, to maximize return on capital while not exceeding their appetite for risk. Category I and II banking organizations serve the entire gamut of investment banking clients and are also market makers, generally in multiple markets.

In contrast, smaller banking organizations (those not in Categories I and II) are more likely to focus on a few lines of trading business. Customers may be commercial end users with whom the banking organization already has a lending relationship and provides other commercial banking services. For such banking organizations, trading strategy focuses on client facilitation. As a result, non-category I or II banking organizations are less likely to rely on sophisticated risk management and more likely to offer services for which the risks are straightforward to hedge. This also suggests that these banking organizations have generally invested less in risk models, and may intentionally compensate for this by erring on the side of conservatism when calculating required capital.

The introduction of a standardized approach for market risk capital requirements is likely to expand the intermediation services offered by non-Category I or II banking organizations for two reasons. First, the proposed standardized approach for market risk would reduce the regulatory compliance and operational costs of offering new products. The current rule requires banking organizations to receive regulatory approval for the models used in market risk capital calculations prior to trading a new product. This approval process takes time and involves overhead in ensuring that the risk models comply with the rule. Banking organizations that use the proposal's standardized approach would avoid this delay and overhead of regulatory pre-approval and may reduce other costs

⁷²² Pennacchi and Santos (2018) document banks' emphasis on return on equity and explore banks' motivation in preferring this metric.

⁷²³ See Ding, Dong, and Robin C. Sickles. "Frontier Efficiency, Capital Structure, and Portfolio Risk: An Empirical Analysis of U.S. Banks." *BRQ Business Research Quarterly*, vol. 21, no. 4, Oct. 2018, pp. 262–277. Ding and Sickles (2018) also find that banking organizations with lower operating costs also hold higher capital buffers above their minimums and take on more risk.

⁷²⁴ See Modigliani, Franco, and Merton H. Miller. "The Cost of Capital, Corporation Finance and the Theory of Investment." *The American Economic Review*, vol. 48, no. 3, June 1958, pp. 261–297.

associated with modelling risk.⁷²⁹ This may eliminate a current disincentive for accommodating customer requests for particular trading products that a banking organization does not already trade.

Second, the new standardized approach is likely to result in lower capital requirements for some types of trading activity of smaller banking organizations. The current rule requires internal models for general market risk but applies a standardized add-on unless a banking organization receives supervisory approval for their risk model's treatment of specific risk.⁷³⁰ Modelling specific risk is complex, and supervisors have set a high bar for model approval. As a result, while Category I and II banking organizations often have approved specific risk models, many other banking organizations with significant trading activity do not. The current standardized specific risk add-on is conservative. Moreover, it does not recognize any hedging benefit from offsetting credit exposures to the same obligor unless there is an exact match on the reference obligation.⁷³¹ This treatment encourages banking organizations that do not have specific risk approval to focus on agency and riskless principal trading, making back-to-back trades with customers offset by trades with other banking organizations. This allows banking organizations to facilitate access to capital markets for their relationship clients, but it constrains their market offerings to liquid, readily tradable products.

The proposal's standardized approach does not have separate treatments for general and specific risk. Both the sensitivities-based method and the

default risk capital requirement would apply risk weights to net exposures at the issuer level. For a banking organization currently applying the specific risk add-on, this recognition of netting at the issuer level rather than the issuance level may result in significantly lower risk-weighted assets for portfolios with risk that is economically small but not perfectly offset. Moreover, both the proposed sensitivities-based method and the default risk capital requirement would recognize some hedge benefit across exposures to different issuers in the same bucket, and the proposed sensitivities-based method would recognize some diversification between buckets.

Lower market risk-weighted assets, and the option to reduce operational and regulatory overhead by choosing the standardized approach for market risk, will likely increase the capital efficiency of non-Category I or II banking organizations, particularly for trading businesses in which the banking organization retains some specific risk. Examples include market making in less liquid corporate bonds and more bespoke customer facilitation. This may reduce a barrier to entry into new markets for some banking organizations. As such, customers of non-Category I or II banking organizations may find more choice of trading products for hedging credit spread risk and equity price risk.

An expected benefit of the proposal is that it would likely reduce costs and increase availability of intermediation during times of financial stress, relative to the current rule. This is for two reasons. First, distressed banking organizations may be unable or unwilling to undertake trading activity that adds risk. The proposal is intended to make banking organizations less likely to become distressed by more accurately reflecting their exposure to losses during extreme stress in their market risk capital requirement. Second, if the capital requirement for a given trading activity fluctuates over time, then banking organizations may be less willing to provide intermediation at times when the capital requirement is high or may charge more for intermediation to maintain an acceptable return on capital. Capital requirements under the proposal are based on through-the-cycle risk measures and should be less procyclical than the current rule, as capital requirements would not increase as much during financial downturns. With less cyclical fluctuation in capital requirements, the costs to end users should also fluctuate less.

3. Impacts on Markets

To understand how the proposal could affect market liquidity, it is informative to understand how markets reacted to the higher capital requirements that were implemented after the 2008 financial crisis.

Literature exploring the impact of post-2008 capital requirements on the corporate bond market generally shows limited impacts on bid-ask spreads, but also that customers waited longer before making transactions. The papers also indicate that dealers reduced their inventory imbalances and charged higher prices for providing immediate liquidity. Broadly, there is evidence that the cost of immediate liquidity rose in the corporate bond market and that bank-affiliated dealers reduced their willingness to bear inventory imbalances, although it is difficult to isolate how much is due to higher capital requirements compared to other factors.^{732 733}

⁷³² Dick-Nielsen and Rossi (2018) show that the cost of immediate trades, reflected by index trackers that must trade quickly after a bond falls out of an index, has risen more than twofold and Bao, et al. (2018) show greater costs from trading following bond rating downgrades. Furthermore, Bessembinder (2018) and Dick-Nielsen and Rossi (2018) provide evidence that bank-affiliated dealers reduced the extent of inventory imbalances that they accommodated. In more recent times, Anderson, et al. (2023) and Kargar, et al. (2021) show that dealers did not substantially change their net positions in corporate bonds during the COVID-related market turmoil around March 2020. See Trebbi, Francesco, and Kairong Xiao. Continued

⁷²⁹ Note that it is expected that banking organizations will continue to use internal models for their risk management, regardless of whether those models are used to calculate market risk capital requirements. See § _____.203 (c)(4) of the proposal, which requires daily monitoring of risk-management measurements including VaR. However, if banking organizations' internal risk management models are not the same as those used to calculate capital requirements, then banking organizations may invest fewer resources in their internal risk management models, which could mean reducing data quality, computational capacity, or quality of model risk management. For example, the generation of historical risk factor scenarios required for stressed-VaR can be particularly costly for products that a banking organization did not trade or products that did not exist during a banking organization's stress-VaR window.

⁷³⁰ Specific risk is the risk that is not attributable to broad market movements and includes event risk, default risk, and idiosyncratic risk.

⁷³¹ However, the current rule avoids double counting of the specific risk add-on for an exposure and its credit derivative hedge that does not meet the "same obligation" criterion but in which all or substantially all of the price risk has been hedged.

Wu (2024) specifically considers the impact of post-crisis capital regulations, which in the case of market risk are informally known as Basel 2.5.⁷³⁴ The paper argues that the size of the liquidity premium embedded within corporate bonds increased after the 2008 financial crisis.⁷³⁵ Wu (2024) shows that immediately after the release of the Basel 2.5 NPR in June 2012, there was an abrupt increase in the liquidity premium for more volatile bonds, which would likely receive higher capital requirements under Basel 2.5, compared to less volatile bonds. The paper estimates an approximately 0.3 percentage point difference in yield spreads between the most and least volatile bonds, controlling for other characteristics.

Extrapolating from evidence in the corporate bond market to potential broader impacts, higher capital requirements on certain products would likely incentivize banking organizations to hold smaller inventories and accommodate fewer imbalances, although magnitudes are unclear. There would likely be a reduction in banking organizations providing immediate liquidity (*i.e.*, entering into a trade with a customer immediately rather than waiting), although the magnitude would likely vary across markets. More illiquid products, such as corporate bonds, would likely see larger effects. Additionally, because market risk capital requirements are typically based on end-of-day inventories, accommodating intraday imbalances for more liquid products would likely not be as costly. Similarly, lower capital requirements on other products would likely incentivize banking organizations to accommodate more imbalances and provide greater immediate liquidity to their customers.

cost of immediacy for corporate bonds.” The Review of Financial Studies 32.1 (2019): 1–41; Bao, Jack, Maureen O’Hara, and Xing Alex Zhou. “The Volcker Rule and corporate bond market making in times of stress.” *Journal of*

⁷³³ Several papers, including Trebbi and Xiao (2017) and Bessembinder (2018), have documented that standard measures of market liquidity, such as bid-ask spreads, did not change substantially following the financial crisis or even improved relative to before. However, some literature argues that customers have shifted away from demanding immediate liquidity from dealers, which is more expensive, to instead being willing to wait longer before transacting, which is cheaper. In that case, it would be possible for average transaction costs to fall, even if the cost of immediate liquidity would have risen.

⁷³⁴ See Wu, Botao. “Increasing corporate bond liquidity premium and post-crisis regulations.” NYU Stern School of Business Working Paper (2020).

⁷³⁵ The liquidity premium is the component of a corporate bond’s yield that compensates investors for difficulty in transacting in that bond.

Another consideration is the migration of activity to nonbanks. Bessembinder (2018) provides evidence that nonbank-affiliated dealers expanded their intermediation in the corporate bond market as bank-affiliated dealers pulled back.⁷³⁶ This evidence suggests that nonbank-affiliated dealers might step in to mitigate reduced liquidity provision of bank-affiliated dealers in other markets as well.

There are both benefits and drawbacks to nonbanks potentially increasing intermediation if banking organizations pull back. One clear benefit is that nonbanks could mitigate any potential reductions in market liquidity. Also, given that nonbanks do not benefit from deposit insurance, a shift toward nonbanks might reduce costs to the government. One drawback is that nonbanks may take on excessive leverage or risk, in part due to lack of prudential regulation comparable to bank regulation. If important nonbank intermediaries were to fail during extreme stress, there could be substantial negative effects on financial stability and market liquidity, which could impose costs on the government and the economy.

Some aspects of the proposal could also have impacts on markets beyond the effects of a change in the average level of capital requirements.

First, the reduced procyclicality of capital requirements for banking organizations may encourage relatively more market liquidity during periods of stress. Both the proposed standardized and models-based approaches are substantially less sensitive to changes in current market conditions and are calibrated instead to historical periods of stress, in contrast to the current market risk framework that includes VaR based on current market data.

Second, the decrease in capital requirements for non-Category I and II banking organizations could potentially reduce their trading costs, which may encourage market making to be relatively less concentrated among the largest banking organizations. One of the key channels would be the removal of the standardized approach for specific risk, which tends to have a

⁷³⁶ Bessembinder (2018) show that only bank-affiliated dealers reduced the inventory imbalances they would accommodate, while the nonbank-affiliated dealers took on greater imbalances, although not enough to offset changes by the bank-affiliated dealers. However, it is difficult to disentangle the impacts of capital regulation from those of other regulations. Bao, et. al (2018) find limited difference in the inventory imbalances held by dealers passing the CCAR stress test compared to those not passing, they interpret as evidence of capital requirements not being a likely driver.

larger impact on smaller banking organizations.

Third, there may be greater use of central clearing for certain derivatives. As central clearing becomes more common, there could possibly be spillover effects whereby other market participants not directly affected by the proposal choose to centrally clear as well, which could potentially enhance the efficiency and stability of markets.

Fourth, if banking organizations hedge more in aggregate due to the proposed capital framework, some nonbank counterparties would likely have to take on that risk instead. While there is uncertainty over exactly how risk is distributed throughout the U.S. financial system, it is possible that entities such as pension funds, insurance companies, or investment funds would step in to purchase more of that risk from banking organizations. These could create new opportunities for such trading counterparties, but also potential avenues for financial instability outside the banking system.

To summarize, there would likely be heterogeneous effects on markets, depending on whether capital requirements would rise or fall for products in a given market under the proposal. The markets where the proposal would result in a larger increase in banking organization capital requirements would likely see banking organizations accommodating smaller inventory imbalances. Average transaction costs would not necessarily rise, but the cost of conducting immediate trades would likely rise. Nonbanks would likely step in to provide more intermediation, although growing reliance on nonbanks for market intermediation raises its own potential concerns. Similarly, the areas in which the proposal would result in a decrease in banking organization capital requirements would likely see larger inventory imbalances, lower costs of immediate trades, and a greater share of activity conducted by banking organizations. Various features of the proposal could also have other impacts on markets, such as reducing the procyclicality of intermediation and encouraging relatively more trading activity by smaller banking organizations.

F. Effect on Competitiveness

The proposed changes to risk-based capital requirements of the largest U.S. banking organizations could potentially affect competition of those banking organizations with international peers, smaller banking organizations in the United States, and nonbank financial entities. This section highlights the

anticipated potential effects expected to be the most economically important for the United States.

An overall moderate lowering of required capital for Category I and II banking organizations, moving closer in line with the requirements for internationally active foreign banks, could somewhat increase U.S. banking organizations' ability to compete for business internationally. Lower risk weights relative to the current standardized approach in certain lending areas could advantage covered banking organizations in attracting domestic customers, though other changes, like ending capital deduction for excess mortgage servicing assets, could also help them support smaller banking organizations through correspondence lending relationships, growing aggregate lending. At the same time, the concurrent standardized approach proposal and the option available to smaller banking organizations to use the expanded risk-based approach under this proposal would help ensure continued robust competition between domestic banking organizations. The proposal may induce some lower-risk traditional lending activities to flow back into the banking sector in a way that would enhance competition and financial stability in the United States. Finally, the analysis discusses how key lending areas could see improved pricing and service quality as increased competition reduces applicable interest rates, and how regulatory barriers to entry into the largest bank tiers would be reduced through a shift to lower, less complex, and more certain capital requirements.

1. On Internationally Active Banks

Benefits of the Basel framework include the promotion of global financial stability by strengthening the resilience of the global banking system and preventing a regulatory race-to-the-bottom for internationally active banks. International banking integration can increase competition, boosting productivity and growth, with particular importance for international trade and global liquidity management.⁷³⁷ The agencies project the combined impact of this proposal and the GSIB surcharge proposal to yield lower required capital levels on average and for most individual banking organizations subject to the rules. As detailed further below, internationally active banks from other jurisdictions are generally bound

by capital requirements based on a calculation of risk-weighted assets which rely heavily on internally modelled risk weights. While Category I and II banking organizations currently also compute risk weights for their exposures based on internal models, most of these organizations are bound by the U.S. standardized approach in most quarters, which generally sets higher, fixed risk weights to compensate for the reduced risk sensitivity of the approach.⁷³⁸ In practice, this means internationally active foreign banks are applying lower risk weights and have lower minimum capital requirements than their U.S. counterparts.⁷³⁹

The proposed expanded risk-based approach risk weights are generally calibrated at a lower level than the current standardized approach, and are more granular to enhance risk sensitivity, reducing incentives to disengage from relatively lower risk lending activities. While important, lower capital requirements are not the sole determinant of long-run profitability, as illustrated by return on equity at U.S. GSIBs following the 2007–09 global financial crisis which averaged around 5 to 6 percentage points higher than their counterparts in the Euro Area.⁷⁴⁰ That said, the lower requirements that proposed revisions to the GSIB surcharge would deliver, and that would remain within the generally accepted optimal level of capital, as discussed in section VIII.C, should promote the global competitiveness of internationally active U.S. banking organizations.

The BIS collects anonymized data on large, internationally active banks in Basel member jurisdictions. These data are analyzed and compiled in a semi-annual monitoring report that describes the average asset holdings and concomitant risk weight density, risk-weighted assets divided by exposure amounts, by exposure category. These reveal that the effective average risk weights used by foreign banks subject to the Basel standards as implemented in other jurisdictions are materially lower

than the risk weights that Category I and II banking organizations currently apply across several exposure categories. For example, for internationally active banks in all Basel jurisdictions at the end of 2024, average risk weight density for corporate exposures was around 56 percent and for retail exposures around 29 percent.⁷⁴¹ Category I and II banking organizations, when bound by the current standardized approach as is typically the case, apply 100 percent risk weights to both types of exposures. While the proposed risk weights in those exposure types would still exceed global averages, the downward calibrations would bring them much closer in line, reducing anti-competitive disparities with global competitors while still maintaining the comparatively stronger levels of capital at Category I and II banking organizations that have resulted in greater resilience relative to their global peers.

Increased competition in international banking can lower individual and systemic risk. Faia et al. (2021) develops a model of global banking competition that predicts cross-border expansion of banks into retail activities like lending and deposit-taking can actually lower individual risk taking and systemic risk through a competition driven compression of loan-deposit spreads. They find empirical evidence that supports this prediction using data from 2005 to 2014 on the foreign expansion, profit margins, and market and accounting risk metrics of 15 European G–SIBs headquartered in eight different countries.⁷⁴²

This proposal would obviate the need for U.S. banking organizations to internally model credit and operational risk for regulatory capital calculations, which could yield more certainty in capital requirements, which could support investment, lending, and trading activities through the economic cycle. As noted above, Category I and II banking organizations, in recent years, have been predominantly bound by standardized or leverage capital requirements. During the height of the shock from the COVID–19 pandemic beginning in early 2020, a number of these banking organizations became unexpectedly bound by rising modelled

capital requirements as expected defaults rose. Behn, Haselmann, and Wachtel (2016) exploit an upward shock to modelled capital requirements at German banks following the failure of Lehman Brothers in 2008 to show how unexpected swings in capital requirements can lead to a procyclical drag on lending.⁷⁴³ The proposed removal of modelling for credit and operational risk, and proposed changes to the modelling of market risk capital requirements, would reduce uncertainty in future capital requirements, particularly during times of stress, allowing Category I and II banking organizations to continue lending and market making during such periods.⁷⁴⁴

2. On Smaller Banks

As mentioned previously, Category I and II banking organizations are currently predominantly bound by the standardized approach that also applies to smaller banking organizations, while also being subject to additional buffer requirements. While these proposals are projected to lower aggregate capital requirements at Category I and II banking organizations, these requirements would still exceed those applied to smaller banking organizations. Further, Category I and II banking organizations would continue to have more stringent requirements relative to Category III and IV banking organizations, reflecting the former group's greater size, complexity, and systemic risk. On an exposure-by-exposure basis, the proposed revised capital requirements would sometimes be lower than those in the standardized approach, even inclusive of associated operational risk requirements. A number of factors help though to mitigate any concern that the proposal would create competitive inequity overall between Category I and II banking organizations and smaller banks. These include the companion standardized approach proposal, the proposed option for any banking organization to adopt the expanded risk-based approach as discussed in section II.A, the proposed operational risk requirements included in the expanded risk-based approach, and the differing nature of large and small banking organization business models. Smaller lenders could also benefit from potential

enhanced interest from the largest banking organizations in correspondent lending relationships, given the proposed reduction in risk weights in some lending areas under the expanded risk-based approach.

The proposal would address potential concerns around competitive imbalances by allowing banking organizations of any size to elect to use the expanded risk-based approach.

Broader concerns about impacts of the proposal on the competition between large and small banking organizations are diminished more generally by the differences in their typical business models. For one, Category I and II banking organizations tend to have significant trading operations, an area where smaller banking organizations do not participate. Second, smaller banking organizations tend to rely more heavily on relationship lending models that entail the cultivation of qualitative information about their customers' credit-worthiness and monitoring via geographic proximity. The largest banking organizations tend to engage in more transactional lending that relies heavily on data collection and verification for underwriting and that is backed by tangible collateral.⁷⁴⁵

Aspects of the proposal, as discussed in sections III and IV.A, may also indirectly support smaller banking organizations by increasing the attractiveness of correspondent lending models and other forms of loan participation agreements.⁷⁴⁶ Smaller lenders can cultivate customers via their superior local knowledge while turning to larger banking organizations for funding and for their facility with securitization markets.⁷⁴⁷ This could allow larger banking organizations to essentially downstream the reduced risk weights under the expanded risk-based approach in areas like real estate, retail, and corporate lending to the smaller banking organizations originating the loans. The proposed removal of the

mortgage servicing assets deduction treatment could also make mortgage lending relationships under these types of models more attractive, particularly for Ginnie Mae securitizations where lenders must pool together multiple loans themselves.

3. On Nonbank Financial Intermediaries

The proposal would likely drive expansion in bank lending that could partially reverse the ongoing migration of activity to the nonbank financial sector in a manner that could support financial stability. Heightened capital requirements have been identified as one factor in nonbanks' increased share of financial market activity. The proposal reduces requirements in certain areas, particularly for traditional lending activities such as mortgages and corporate loans, in a way that would support bank competitiveness relative to nonbanks. Given the greater willingness and capacity for lending that banks demonstrate during periods of stress, this could generate stability benefits.

The migration of activities from banking organizations to nonbanks has been a longstanding trend for the financial system. It can have heterogeneous effects on financial stability. Certain nonbanks operate with very low leverage and are well-positioned to manage large economic downturns.⁷⁴⁸ However, many nonbanks rely on fragile, confidence-sensitive sources of funding, partly from banking organizations, making them vulnerable during times of stress. Moreover, more resilient banking organizations are better positioned to lend in the face of economic downturns, in part compensating for the potential reduction in lending from more vulnerable nonbanks. Thus, the impact of migration on financial stability and lending over the business cycle is influenced by numerous factors, including the specific characteristics of the nonbanks that assume these activities and their interdependencies with banks.

a. Effects of Capital Regulations on Migration of Activity to Nonbanks

Capital regulation has been linked to the migration of activity to nonbanks, though the effects through the entire economic cycle are less certain. On the one hand, tighter regulations, including stricter capital requirements, might induce banking organizations to reduce

their lending, creating opportunities for nonbanks to fill the gap. For example, Buchak et al. (2018) found that more stringent capital requirements and tighter regulations pushed mortgage origination to nonbanks, which expanded their mortgage origination market share.⁷⁴⁹ On the other hand, well-capitalized banking organizations are better positioned to extend credit, especially during times of economic stress.⁷⁵⁰ Buchak et al. (2018) note that resilient banking organizations, supported by robust regulatory frameworks, can act as stabilizing forces during crises where banking organizations with strong capital buffers can provide essential liquidity, supporting investment and economic recovery.⁷⁵¹

The differential effects of the proposal across business activities, as well as differences across nonbanks, may contribute to reversing the migration of some activities toward banking organizations. For example, the proposed lower risk weights for most mortgages may encourage banking organizations to hold more of these loans in their portfolios, while the proposed removal of the MSA deduction treatment may lead them to expand their originate-to-distribute lending operations. Conversely, the proposed increase in risk-weighted assets for market risk, as well as an increase in some credit conversion factors and operational risk-weighted assets attributed to the interest and fee income associated with credit lines, may incentivize some liquidity provision in financial markets to shift towards nonbanks.

b. Impact of Migration of Activity to Nonbanks on Financial Stability

The proposal's contribution to slowing or partially reversing the migration of financial activities toward nonbanks would have implications for financial stability. While some nonbanks are less leveraged than banking organizations, making them better positioned to absorb losses, they often rely on less stable sources of

funding compared to banks.⁷⁵² Besides, not all nonbank financial entities are equally prone to runs. Private equity funds manage long-term capital through funding structures that permit less frequent redemption and corporate bond mutual funds operate with little or no leverage. Some studies, though, argue that their fragile funding structures still make them vulnerable.⁷⁵³ Disorderly withdrawals have forced the closure of corporate bond mutual funds at Credit Suisse and Third Avenue Management,⁷⁵⁴ and it is common for private equity funds to face withdrawals when lock-up periods expire.⁷⁵⁵

In aggregate, by encouraging the migration of certain activities back towards banking organizations, the proposal is expected to support financial stability. Nonbanks are typically less regulated and are not subject to the same comprehensive federal prudential regulation and supervision as banking organizations. Gorton and Metrick (2012) argue that the lack of regulatory oversight makes nonbanks more vulnerable to runs and liquidity crises.⁷⁵⁶ Some of these risks are discussed further in the Federal Reserve Board's Financial Stability Report of April 2025.⁷⁵⁷ Nonbanks do

(2015)"), <https://www.reuters.com/article/business/hidden-in-plain-sight-big-risks-at-failed-third-avenue-fund-were-clear-to-some-idUSKBN0U627V>.

⁷⁵⁵ As another example of U.S. government support of nonbanks in a period of stress, during the COVID-19 pandemic, the Federal Reserve established the Primary Market Corporate Credit Facility and the Secondary Market Corporate Credit Facility to alleviate stress in the corporate bond market. Before that, the Federal Reserve established several financial crisis era facilities including the Money Market Investor Funding Facility, the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility, Commercial Paper Funding Facility, and the Term Asset-Backed Securities Loan Facility.

⁷⁵⁶ Gorton and Metrick (2012).

not have access to the same protections as banking organizations through deposit insurance or other central bank facilities. Finally, nonbanks may amplify shocks during times of stress by reducing lending to a larger extent compared to banking organizations.⁷⁵⁸

4. On Consumer Welfare and Barriers to Entry

The proposal would generally lower risk weights, particularly for safer portfolios, while also enhancing the risk sensitivity of capital requirements. Doing so would likely encourage more lending, thereby heightening competition, with end users seeing the benefits in improved pricing and increased consumer surplus. While certain financial markets, like large corporate lending, are already quite competitive, others persist with pricing that includes significant markups above marginal cost.⁷⁵⁹ For example, in the mortgage space, Bhutta, Fuster, and Hizmo (2024) combine rate lock and loan offer data and find that borrowers with similar credit profiles see significant dispersion in the prices they pay for loans, which they link to lender market power. Importantly, they demonstrate through lender income and expense data and borrower surveys that more expensive loans are indicative of higher markups rather than better service.⁷⁶⁰

In addition to promoting activity at current Category I and II banking organizations, the proposals could also encourage growth in the number of banking organizations in these categories. More Category I and II banking organizations, rather than just a few that continually get bigger, could constitute a safer and more competitive financial landscape.

Besides dampening lending in general, overly complex, or uncertain, capital requirements can introduce barriers to entry that enshrine incumbents, reducing overall competition and incentivizing banking organizations that may pose systemic risk to bunch below the regulatory thresholds at which they would be

⁷⁵¹ Buchak et al. (2018).

formally recognized as such. While other jurisdictions have seen some churn in which institutions are systemically important enough to be deemed GSIBs, the eight U.S. bank holding companies identified as GSIBs by the Financial Stability Board in 2012 remain the only U.S. GSIBs today, and no additional Category II banking organizations have emerged following the creation of the current tier definitions.⁷⁶¹ The proposed rules, through a potential reduction in the overall level of required capital, removal of complexity and burden from the requirement to simultaneously internally model credit and operational risk, and increased certainty from a single set of risk-based requirements, should lessen the extent to which becoming a Category I or II banking organization may be seen as undesirable. While somewhat paradoxical, the growth and consolidation of some large regional banks into Category I or II banking organizations could actually provide more competition in the lending and trading markets that can only be contended by banking organizations of the largest scale.

Larger banking organizations can also reduce risk in some dimensions and temper local economic shocks through greater depositor base diversification.⁷⁶² Indicatively, Caglio, Dlugosz, and Rezende (2025) found, using confidential data on bank balance sheets, that during the period of heightened stress following the regional banking organizations failures of March 2023, GSIBs saw notable upticks in uninsured deposit flows, even relative to other large non-GSIB banks.⁷⁶³ That highlights the benefits to financial market stability of promoting the

emergence of competitors to the current Category I and II banking organizations. Importantly, should the proposed rule changes in these proposals lead more Category I or II banking organizations to emerge, they would become subject to key provisions around capital, augmented liquidity, detailed resolution planning, and enhanced supervisory oversight to formally allay concerns over whether such institutions were too big to fail.

Question 197: What, if any, alternative approaches should the agencies consider for assessing the proposal's effect on competitiveness, and why?

G. Conclusion

The agencies have conducted a thorough economic analysis of the proposal, examining its potential effects on the U.S. banking system and the broader economy. This assessment encompassed proposed changes in risk-weighted assets, capital requirements and their potential effects on lending and trading activities, market liquidity, and competition among financial institutions. The analysis suggests that the proposal would improve the measurement of various risks faced by banking organizations, increasing the risk sensitivity of the regulatory capital framework. Furthermore, the proposed changes to risk weights are broadly expected to support enhanced financial intermediation by covered banking organizations. The analysis also suggests that the cumulative change in capital under the combined proposals (or of each proposal on a standalone basis) is expected to maintain a level of capital that is within range of estimates for optimal capital in the U.S. banking system, and thus reasonable.

Furthermore, by aligning more closely with international standards, the proposed revisions to risk weights aim to enhance Category I and II banking organizations' global competitiveness without compromising their strong capital positions. Based on this economic analysis, the agencies conclude that the benefits of the proposal justify its costs. The agencies invite comment on all aspects of this economic analysis.

IX. Technical Amendments to the Capital Rule

The proposal would make certain technical corrections and clarifications to several provisions of the capital rule, as described below. Most of these proposed corrections or technical changes are self-explanatory, such as updates to terminology to align with the proposal, and would apply only to

banking organizations that would be subject to subpart E. In addition, there are several transition provisions and temporary provisions that have expired or no longer apply that the proposal would remove from the capital rule. The proposal would also make technical updates to various aspects of the capital rule to account for the proposed changes to subparts E and F of the capital rule related to the removal and replacement of the current internal model-based approaches for credit risk, operational risk, and market risk. Also, the proposal would make certain technical corrections to the rule to address errors, such as updating the numbering of footnotes in certain sections and correcting the definition of qualifying master netting agreement to include criteria that were originally included and inadvertently deleted. These revisions are not all applicable to each agency and would only apply to a given agency as appropriate.

In § ___.1, the proposal would clarify the application of notice and response procedures for reservation of authority actions, would clean up expired effective date provisions, and would clarify the when standards apply to banking organizations that change from one category to another. The proposal would introduce a severability provision to clarify the agencies' intent with respect to the ongoing effectiveness of the proposal in the event that any particular provision or application of the rule is stayed or determined to be invalid. The proposed severability provision reflects the agencies' view that invalidation of a particular provision or application of the capital rule would not render the entire regulation or regulatory scheme unworkable.

In § ___.2, the proposal would remove references to subpart E for purposes of the internal models approach in the definition of residential mortgage exposure and the treatment of residential mortgages managed as part of a segment of exposures with homogenous risk characteristics.

In § ___.2 of the Board's and the OCC's capital rule, the proposal would correct the definition of qualifying master netting agreement to put back certain paragraphs related to a walkaway clause. Under the 2013 capital rule,⁷⁶⁴ the definition of qualifying master netting agreement required that the agreement not contain a walkaway clause and that a banking organization must comply with certain operational requirements with respect to the agreement. When the Board and

⁷⁶¹ See "2025 List of Global Systemically Important Banks (G-SIBs)," (November 2025), available at: <https://www.fsb.org/2025/11/2025-list-of-global-systemically-important-banks-g-sibs/#g-sibs-2012-2025>. Some Category III banking organizations are approaching the Category II thresholds for either Total Assets or Cross-Jurisdictional Activity.

⁷⁶² See Sebastian Doerr, "Deposit Diversification and Funding Stability," (September 2025), available at: <http://dx.doi.org/10.2139/ssrn.4788627>. They leverage a gravity model of firm expansion trends away from their headquarters, along with the staggered repeal of interstate branching limitations across states, to assess the impact of exogenous increases in a bank's deposit-base geographical diversification. They find that it increases a bank's funding stability, through a greater reliance on insured demand deposits, and empowers banks to increase liquidity creation and better continue lending when exposed to a negative localized shock like a natural disaster.

⁷⁶³ See Cecilia Caglio, Jennifer Dlugosz, & Marcelo Rezende, "Flight to Safety in the Regional Bank Stress of 2023," SSRN Working Paper (February 25, 2025), available at: <https://doi.org/10.2139/ssrn.4457140>.

⁷⁶⁴ See 78 FR 62018 (Oct. 11, 2013).

OCC finalized the restrictions in the qualified financial contracts stay rule⁷⁶⁵ and made conforming amendments to the capital rule, certain paragraphs related to a walkaway clause in the definition of qualifying master netting agreement were removed in error. The Board and OCC propose to correct the error by inserting back these paragraphs.

In § _____.10(c)(2)(i) of the capital rule, the proposal would clarify in the definition of total leverage exposure that total leverage exposure amount could be reduced by any AACL for on-balance sheet assets. The capital rule defines total leverage exposure to include the carrying value of on-balance sheet assets without any adjustment for AACL. The definition of carrying value does not allow for the reduction in the on-balance sheet amount by any credit loss allowances, except for allowances related to AFS securities and purchased credit deteriorated assets. In the numerator of the supplementary leverage ratio, the AACL flows through earnings and is reflected in Tier 1 capital. To align the numerator and the denominator of the SLR, the proposed change would allow banking organizations to net the AACL from the denominator of the SLR.

The proposal would make a technical correction to § _____.10(c)(2)(ix) of the capital rule to clarify the treatment of a guarantee by a clearing member banking organization of the performance of a clearing member client on repo-style transaction that the clearing member client has with a central counterparty. Consistent with the treatment of such exposures under the risk-based framework, the proposal would require the clearing member banking organization to treat the guarantee of client performance on a repo-style transaction as a repo-style style transaction, just as it must treat such a guarantee of client performance on a derivative contract as a derivative contract.

Under the capital rule, § _____.300(a) covers the 2016 to 2018 transition for the capital conservation buffer and countercyclical capital buffer. § _____.300(c) covers the transition for non-qualifying capital instruments that expired in calendar year 2022. § _____.300(e) covers the transition for prompt corrective action. § _____.300(f) covers simplifications early adoption and has expired by its terms.⁷⁶⁶ § _____.300(g) of the capital rule covers SA-CCR transition and § _____.300(h) covers the default fund contribution

transition, both of which expired on January 1, 2022. The proposal would update the terminology in § _____.300(a) and (c) of the capital rule and would remove § _____.300(f) to (h).

§ _____.303 of the capital rule covers a temporary exclusion from total leverage exposure that ended March 31, 2021. Consistent with the community bank leverage ratio proposed rule, the proposal would remove § _____.304 of the capital rule, which covers temporary changes to the community bank leverage ratio framework that applied until December 31, 2021.⁷⁶⁷ The proposal would remove § _____.303 and § _____.304 of the capital rule. Similarly, § _____.12(a)(4) of the capital rule covers temporary relief for the community bank leverage ratio that applied until December 31, 2021, and would therefore be removed from the capital rule.

On November 12, 2025, the Financial Accounting Standards Board (FASB) issued Accounting Standards Update (ASU) 2025–08, “Financial Instruments—Credit Losses (Topic 326): Purchased Loans,” which amends the guidance on accounting for purchased loans. Upon adoption of ASU 2025–08, the population of acquired financial assets subject to the “gross-up approach” will be expanded to include purchased seasoned loans. The “gross-up approach” under U.S. GAAP requires a banking organization to record an allowance for credit losses on purchased credit deteriorated assets⁷⁶⁸ as well as purchased seasoned loans as of the date of acquisition with an offsetting gross-up adjustment to the purchase price of the assets or loans.

In the agencies’ final rule implementing the current expected credit losses (CECL) methodology in 2019 (CECL final rule), the agencies amended the capital rule to identify which allowance for credit losses under the new CECL accounting standard would be eligible for inclusion in a banking organization’s tier 2 capital.⁷⁶⁹ The CECL final rule addressed the treatment of allowance for credit losses related to purchase credit deteriorated assets. As ASU 2025–08 requires banking organizations to apply the gross approach to both purchase credit deteriorated assets and purchased seasoned loans, the agencies are proposing to apply the capital rule’s

treatment of allowance for credit losses on purchase credit deteriorated assets to allowance for credit losses on purchased seasoned loans. In particular, the proposal would modify the term adjusted allowance for credit losses (AACL) adopted in the CECL final rule to exclude credit loss allowances on purchased seasoned loans in addition to those on purchase credit deteriorated assets and available-for-sale (AFS) debt securities. A banking organization would continue to be able to include AACL in its tier 2 capital up to 1.25 percent of the banking organization’s total credit risk weighted assets. The proposal would also amend the definition of carrying value to require the carrying value of purchased seasoned loans to be calculated net of ACLs like the capital rule’s current treatment of PCD assets.

In defining AACL, the agencies intend to include only those ACLs that have been fully charged against earnings or retained earnings. Including in tier 2 capital ACLs that have not been charged against earnings would diminish the quality of regulatory capital. Since the initial ACL amount for a PSL recorded on a banking organization’s balance sheet would not be established through a charge to earnings, the agencies believe the treatment currently applied to the initial ACL for purchase credit deteriorated assets also would be appropriate for the ACL on purchased seasoned loans. Due to concerns of undue complexity and burden on banking organizations, the agencies are not proposing a bifurcated approach for the treatment of purchased seasoned loans whereby a banking organization could include post-acquisition ACLs on PSLs in tier 2 capital when the banking organization’s purchased seasoned loan balances exceed a materiality threshold. The agencies believe that requiring banking organizations to calculate the carrying value of purchased seasoned loans net of ACLs appropriately offsets the effects of excluding post-acquisition ACLs on PSLs in the calculation of regulatory capital. Therefore, the agencies are proposing to exclude the entire ACL on PSLs from AACL, even though post-acquisition increases in ACLs for PSLs would be established through a charge against earnings.

In addition, the agencies are proposing to amend the definitions of AACL and carrying value to provide the same treatment as purchase credit deteriorated assets to other assets that may in the future become subject to the gross approach following a change to GAAP by FASB.

The agencies are also proposing a technical amendment to the current

⁷⁶⁵ See 82 FR 42882 (Sept. 12, 2017).

⁷⁶⁶ See 84 FR 61804 (Nov. 13, 2019).

⁷⁶⁷ See 90 FR 55048 (Dec. 1, 2025).

⁷⁶⁸ Purchase credit deteriorated assets are acquired individual financial assets (or acquired groups of financial assets with shared risk characteristics) that, as of the date of acquisition and as determined by an acquirer’s assessment, have experienced a more-than-insignificant deterioration in credit quality since origination.

⁷⁶⁹ See 86 FR 4224 (Feb. 14, 2019).

capital rule to remove the definition of allowance for loan and lease losses (ALLL) from section _____.2 of the capital rule. The definition of ALLL in the current capital rule is no longer meaningful given the introduction and adoption of the current expected credit loss (CECL) methodology by the FSAB under ASU 2016–13, “Financial Instruments—Credit Losses (Topic 326).”

A. Additional OCC Technical Amendments

Definition of Financial Collateral

In § _____.2 of the OCC’s capital rule, the proposed rule would correct an error in the definition of financial collateral by changing the word “and” in paragraph (2) “in which the national bank and Federal Savings association has a perfected . . . [emphasis added]” to “or.” The proposed correction would clarify that this requirement in the definition of financial collateral applies to national banks or Federal Savings associations, as relevant.

B. Additional FDIC Technical Amendments

In addition to the joint technical amendments described above, the FDIC is proposing technical amendments to certain provisions of the capital rule in part 324 of the FDIC’s regulations. Specifically, the FDIC proposes to correct a spelling error in the definition of “financial institution” in § 324.2. The FDIC also proposes to merge the definition of “bank” into the definition of “FDIC-supervised institution” and to remove “bank” as a defined term in the FDIC’s capital rule. Additionally, the FDIC proposes to correct the footnote numbering in part 324 so that each section with any footnote would begin with footnote 1. This would affect the footnotes in §§ 324.2, 324.4, 324.11, 324.20, and 324.22.

The FDIC also proposes removing expired or obsolete provisions from various sections in part 324, including section 324.1(f), footnote 10 in § 324.4, § 324.10(b)(5), and § 324.10(d)(4).

Finally, the FDIC proposes amending §§ 324.401 and 324.403 of the prompt corrective action provisions of subpart H to remove outdated transitions and obsolete references to part 325, and to replace references to the advanced approaches consistent with the proposal.

X. Related Proposals and Proposed Amendments to Related Rules

A. Related Proposals

The agencies are also issuing a proposal that would modify certain

aspects of the capital requirements applicable to banking organizations not covered by the expanded risk-based approach. That proposal would revise the risk-based capital treatment of certain exposure categories under the standardized approach, focusing on improving the calibration and risk sensitivity of risk weights that are particularly material to lending activities. Consistent with this proposal, the standardized approach proposal would modify the definition of regulatory capital by removing the threshold-based deduction for mortgage servicing assets, including for banking organizations subject to the community bank leverage ratio framework. In addition, the standardized approach proposal would require Category III and IV banking organizations to recognize most elements of accumulated other comprehensive income in their regulatory capital.

The Board is separately issuing the GSIB surcharge proposal that would amend the Board’s framework under the capital rule for identifying and establishing risk-based surcharges for global systemically important bank holding companies (GSIBs). The GSIB surcharge proposal would also amend the FR Y–15, which is the source of inputs to the implementation of the GSIB framework under the capital rule. The proposal would modify certain coefficients used to calculate GSIB surcharges under method 2 of the GSIB surcharge framework and provide for annual adjustments of these coefficients going forward. The proposal would modify the measurement and weighting of the weighted short-term wholesale funding systemic indicator in method 2. For certain systemic indicators currently measured only as of a single date each year, the proposal would change to reporting of average values to reduce the effects of temporary changes to indicator values around measurement dates. The proposal would reduce cliff effects and enhance the sensitivity of the surcharge to changes in the method 2 score by calculating surcharges based on narrower score band ranges. To improve risk capture, the proposal would also make improvements to the measurement of some systemic indicators used in the GSIB surcharge framework and the framework for determining prudential standards for large banking organizations. The proposal would also make several additional amendments to the FR Y–15 to improve the consistency of data reporting and streamline the reporting process.

As discussed in section IV.A.3. of this **SUPPLEMENTARY INFORMATION**, the proposal would modify the credit

conversion factors applicable to large banking organizations. The proposal would introduce a 40 percent conversion factor for all conditional equity and credit commitments regardless of maturity, which would replace the current capital rule’s 20 percent and 50 percent conversion factors for conditional equity and credit commitments. The proposal would also introduce a 5 percent credit conversion for certain low-utilization retail exposures and a treatment for retail commitments with no pre-set limit. To account for this aspect of the proposal with the agencies supplementary leverage ratio framework, the supplementary leverage ratio framework would incorporate these conversion factors for banking organizations that are subject to the expanded risk-based approach to ensure alignment between the two frameworks.

Question 198: What modifications, if any, should the agencies consider to this proposal due to related proposals and why?

B. OCC Amendments

Lending Limits Rule

The OCC’s lending limit rule⁷⁷⁰ includes a definition of eligible credit derivative, which references the definition of eligible guarantee in the capital rule.⁷⁷¹ This proposed rule would revise the definition of eligible guarantee in 12 CFR part 3 to add a requirement that an eligible guarantee must be provided by an eligible guarantor, also as defined in 12 CFR part 3. To avoid imposing this additional requirement of an eligible guarantor for eligible credit derivatives, as defined for lending limit purposes, the OCC is proposing to revise the definition of eligible credit derivative in 12 CFR part 32 to scope out the new proposed requirement of an eligible guarantor.

C. Board Amendments

In connection with this proposal, the Board is proposing amendments to various regulations that reference the capital rule in order to make appropriate conforming amendments to reflect this proposal. For example, references to advanced approaches risk-weighted assets would be removed and replaced with expanded total risk-weighted assets, consistent with the proposal. Such conforming changes would be made to Regulation H (12 CFR part 208), Regulation Y (12 CFR part 225), Regulation LL (12 CFR part 238), and Regulation YY (12 CFR part 252). To the

⁷⁷⁰ 12 CFR part 32.

⁷⁷¹ See 12 CFR 32.2(m)(1).

extent that other Board rules rely on items determined under the capital rule, changes to the capital rule could impact the effective requirements of such other Board rules. In addition to these proposed amendments, as discussed elsewhere in this document, the proposal would amend Regulation Y, Regulation LL, and Regulation YY as appropriate to reflect the proposed stress capital buffer framework.

Question 199: What modifications, if any, should the Board consider to this proposal or to other Board rules indirectly affected by this proposal?

XI. Administrative Law Matters

A. Paperwork Reduction Act

Certain provisions of the proposal contain “collections of information” within the meaning of the Paperwork Reduction Act of 1995 (PRA). In accordance with the requirements of the PRA, the agencies may not conduct or sponsor, and a respondent is not required to respond to, an information collection unless it displays a currently valid Office of Management and Budget (OMB) control number. The information collection requirements contained in this joint proposal have been submitted to OMB for review and approval by the OCC and FDIC under section 3507(d) of the PRA (44 U.S.C. 3507(d)) and section 1320.11 of OMB’s implementing regulations (5 CFR part 1320). The Board reviewed the proposal under the authority delegated to the Board by OMB.

The proposal contains revisions to current information collections subject to the PRA. To implement these requirements, the agencies would revise and extend for three years the (1) Reporting, Recordkeeping, and Disclosure Requirements Associated with Regulatory Capital Rules (OMB Nos. 1557–0318, 3064–0153, and 7100–0313) and (2) Reporting, Recordkeeping, and Disclosure Requirements Associated with Market Risk Capital Rules (OMB Nos. 1557–0247, 3064–0178, and 7100–0314). These information collections are also being revised by the standardized approach proposal. For ease of reference, the proposed revisions to these information collections by this proposal as well as the standardized approach proposal will be addressed in a separate **Federal Register** notice.

The Board would also revise and extend for three years the (1) Financial Statements for Holding Companies (FR Y–9; OMB No. 7100–0128), (2) the Capital Assessments and Stress Testing (FR Y–14A/Q/M; OMB No. 7100–0341), and (3) the Systemic Risk Report (FR Y–

15; OMB No. 7100–0352). The proposed revisions to these Board reports will be addressed in one or more separate **Federal Register** notices.

Finally, the agencies, under the auspices of the FFIEC, would also propose related revisions to (1) all versions of the Consolidated Reports of Condition and Income (Call Reports) (FFIEC 031, FFIEC 041, and FFIEC 051; OMB Nos. 1557–0081; 3064–0052, and 7100–0036), (2) the Regulatory Capital Reporting for Institutions Subject to the Advanced Capital Adequacy Framework (FFIEC 101; OMB Nos. 1557–0239, 3064–0159, and 7100–0319), and (3) the Market Risk Regulatory Report for Institutions Subject to the Market Risk Capital Rule (FFIEC 102; OMB Nos. 1557–0325, 3064–0199, and 7100–0365). The proposed revisions to these FFIEC reports will be addressed in one or more separate **Federal Register** notices.

B. Regulatory Flexibility Act OCC

The Regulatory Flexibility Act (RFA), 5 U.S.C. 601 *et seq.*, requires an agency, in connection with a proposed rule, to prepare an Initial Regulatory Flexibility Analysis describing the impact of the rule on small entities (defined by the Small Business Administration (SBA) for purposes of the RFA to include commercial banks and savings institutions with total assets of \$850 million or less (NAICS Code: 522110) and \$47 million for trust companies (NAICS Code: 523991)) or to certify that the proposed rule would not have a significant economic impact on a substantial number of small entities. The OCC currently supervises approximately 609 small entities.⁷⁷²

The OCC estimates that the proposed rule would impact none of these small entities, as the scope of the rule only applies to large national banks and FSAs and their subsidiaries. Therefore, the OCC certifies that the proposed rule would not have a significant economic impact on a substantial number of small entities.

Board

The Board is providing an initial regulatory flexibility analysis with

⁷⁷² Consistent with the General Principles of Affiliation 13 CFR 121.103(a), OCC staff count the assets of affiliated financial institutions when determining whether to classify an OCC-supervised institution as a small entity. OCC staff use December 31, 2024, to determine size because a “financial institution’s assets are determined by averaging the assets reported on its four quarterly financial statements for the preceding year.” See footnote 8 of the U.S. Small Business Administration’s *Table of Size Standards*.

respect to this proposed rule. The Regulatory Flexibility Act⁷⁷³ (RFA) requires an agency to consider whether the rule it proposes will have a significant economic impact on a substantial number of small entities.⁷⁷⁴ In connection with a proposed rule, the RFA requires an agency to prepare and invite public comment on an initial regulatory flexibility analysis describing the impact of the rule on small entities, unless the agency certifies that the proposed rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. An initial regulatory flexibility analysis must contain (1) a description of the reasons why action by the agency is being considered; (2) a succinct statement of the objectives of, and legal basis for, the proposed rule; (3) a description of, and, where feasible, an estimate of the number of small entities to which the proposed rule will apply; (4) a description of the projected reporting, recordkeeping, and other compliance requirements of the proposed rule, including an estimate of the classes of small entities that will be subject to the requirement and the type of professional skills necessary for preparation of the report or record; (5) an identification, to the extent practicable, of all relevant Federal rules which may duplicate, overlap with, or conflict with the proposed rule; and (6) a description of any significant alternatives to the proposed rule which accomplish the stated objectives of applicable statutes and minimize any significant economic impact of the proposed rule on small entities.⁷⁷⁵

The Board has considered the potential impact of the proposed rule on small entities in accordance with the RFA. Based on its analysis and for the reasons stated below, the Board believes that this proposed rule will not have a significant economic impact on a substantial number of small entities. Nevertheless, the Board is publishing and inviting comment on this initial regulatory flexibility analysis. The proposal would also make

⁷⁷³ 5 U.S.C. 601 *et seq.*

⁷⁷⁴ Under regulations issued by the U.S. Small Business Administration (SBA), a small entity includes a depository institution, bank holding company, or savings and loan holding company with total assets of \$850 million or less. See 13 CFR 121.201. Consistent with the SBA’s General Principles of Affiliation, the Board includes the assets of all domestic and foreign affiliates toward the applicable size threshold when determining whether to classify a particular entity as a small entity. See 13 CFR 121.103. As of the second quarter of 2025, there were approximately 2,796 small bank holding companies and approximately 157 small savings and loan holding companies, and approximately 443 small state member banks.

⁷⁷⁵ 5 U.S.C. 603(b)–(c).

corresponding changes to the Board's reporting forms.

As discussed in detail in sections I through X of this **SUPPLEMENTARY INFORMATION**, the proposed rule would substantially revise the capital requirements applicable to large banking organizations and to banking organizations with significant trading activity. The revisions set forth in the proposal would improve the calculation of risk-based capital requirements to better reflect the risks of these banking organizations' exposures, reduce the complexity of the framework, enhance the consistency of requirements across these banking organizations, change the definition of capital, amend certain dollar-based regulatory thresholds, and facilitate more effective supervisory and market assessments of capital adequacy. The revisions would include replacing current requirements that include the use of banking organizations' internal models for credit risk and operational risk with standardized approaches and replacing the current market risk and credit valuation adjustment risk requirements with revised approaches. Requirements under the proposal would generally be consistent with international capital standards issued by the Basel Committee.

Congress has authorized the agencies to establish risk-based capital requirements and standards for banking organizations subject to this proposal. Section 165 of the Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act),⁷⁷⁶ as amended by section 401 of the Economic Growth, Regulatory Relief, and Consumer Protection Act,⁷⁷⁷ requires the Board to establish enhanced prudential standards that include risk-based capital requirements for bank holding companies with \$250 billion or more in total consolidated assets.⁷⁷⁸ The prompt

corrective action framework in section 38 of the Federal Deposit Insurance Act (FDI Act) requires the agencies to prescribe capital standards for insured depository institutions that include a risk-based capital requirement and provides that the agencies may establish any additional relevant capital measures to carry out the purpose of that section.⁷⁷⁹ Various other statutory authorities provide the agencies with broad discretionary authority to set capital requirements and standards for banking organizations supervised by the agencies, including national banking associations, state-chartered banks, savings associations, and depository institution holding companies.⁷⁸⁰

As discussed in more detail in section II of this **SUPPLEMENTARY INFORMATION**, the proposed rule would apply to Category I and II banking organizations, as well as to banking organizations with significant trading activity. Under the proposed rule, a banking organization with significant trading activity would include any banking organization with average aggregate trading assets and trading liabilities, excluding customer and proprietary broker-dealer reserve bank accounts, over the previous four calendar quarters equal to \$5 billion or more, or equal to 10 percent or more of total consolidated assets at quarter end as reported on the most recent quarterly regulatory report. Additionally, the proposal would allow other banking organizations to opt into the expanded risk-based approach. Banking organizations that choose this option would also be subject to the definition of capital that applies to Category I and II banking organizations. Accordingly, essentially all banking organizations to which the proposed rule would apply exceed the SBA's \$850 million total asset threshold, except for small entities that opt into the framework set out in the proposed rule. A small entity could choose not to opt into the framework set out in this proposal and would not be

required to make any changes to its current reporting, recordkeeping, or compliance systems in order to elect not to adopt this framework; the proposed rule, therefore, would not impose mandatory requirements or costs on any small entities.

As discussed in more detail in the Paperwork Reduction Act section, the proposed rule, once final, would require changes to the Consolidated Financial Statements for Holding Companies report (FR Y-9C) and the Capital Assessments and Stress Testing reports (FR Y-14A and FR Y-14Q).

The Board is aware of no other Federal rules that duplicate, overlap, or conflict with the proposed changes to the capital rule. The Board also is aware of no significant alternatives to the proposed rule that would accomplish the stated objectives of applicable statutes. Because the proposed rule generally would not apply to any small entities supervised by the Board, there are no alternatives that could minimize the impact of the proposed rule on small entities.

Therefore, the Board believes that the proposed rule would not have a significant economic impact on a substantial number of small entities supervised by the Board.

The Board welcomes comment on all aspects of its analysis. In particular, the Board requests that commenters describe the nature of any impact on small entities and provide empirical data to illustrate and support the extent of the impact.

FDIC

The Regulatory Flexibility Act (RFA) generally requires an agency, in connection with a proposed rulemaking, to prepare and make available for public comment an initial regulatory flexibility analysis that describes the impact of the proposed rule on small entities.⁷⁸¹ However, an initial regulatory flexibility analysis is not required if the agency certifies that the proposed rule will not, if promulgated, have a significant economic impact on a substantial number of small entities. The Small Business Administration (SBA) has defined "small entities" to include banking organizations with total assets of less than or equal to \$850 million.⁷⁸²

⁷⁸¹ 5 U.S.C. 601 *et seq.*

⁷⁸² The SBA defines a small banking organization as having \$850 million or less in assets, where an organization's "assets are determined by averaging the assets reported on its four quarterly financial statements for the preceding year." See 86 FR 69118 which amends 13 CFR 121.201, (effective December 19, 2022.). In its determination, the "SBA counts the receipts, employees, or other measure of size of the concern whose size is at issue and all of its domestic and foreign affiliates." See 13 CFR

⁷⁷⁶ Dodd-Frank Wall Street Reform and Consumer Protection Act, Public Law 111-203, 124 Stat. 1376 (2010).

⁷⁷⁷ Economic Growth, Regulatory Relief, and Consumer Protection Act, Public Law 115-174, 132 Stat. 1296 (2018).

⁷⁷⁸ See 12 U.S.C. 5365(a)(1), (b)(1)(A)(i). Section 165 of the Dodd-Frank Act also provides that the Board may apply any prudential standard established under section 165 to any bank holding company with \$100 billion or more in total consolidated assets to which the prudential standard does not otherwise apply, under certain circumstances. 12 U.S.C. 5365(a)(2)(C). Section 165, in relevant part, also applies to foreign banks or companies that are treated as a bank holding company for purposes of the Bank Holding Company Act. See 12 U.S.C. 3106(a), 5311(a)(1). See also section 401(g) of the Economic Growth, Regulatory Relief, and Consumer Protection Act (regarding the Board's authority to establish enhanced prudential standards for foreign banking organizations with total consolidated assets of \$100 billion or more). 12 U.S.C. 5365 note.

⁷⁷⁹ See 12 U.S.C. 1831o(c)(1)(A), (c)(1)(B)(i).

⁷⁸⁰ See 12 U.S.C. 93a (national banking associations); 12 U.S.C. 248(i), 324, 327, 329 (state member banks); 12 U.S.C. 1463 (savings associations); 12 U.S.C. 1467a(g)(1) (savings and loan holding companies); 12 U.S.C. 1844(b) (bank holding companies); 12 U.S.C. 3106 (certain U.S. operations of foreign banking organizations); 12 U.S.C. 3902(1)-(2), 3907(a), 3909(a), (c)(1)-(2) (depository institutions; affiliates of depository institutions, including holding companies; and certain U.S. operations of foreign banking organizations); 12 U.S.C. 5371 (insured depository institutions, depository institution holding companies, and nonbank financial companies supervised by the Board). Additional statutory authorities relevant to the agencies' capital rule can be found in the authority citations in the capital rule. See 12 CFR part 3 (OCC); 12 CFR part 217 (Board); 12 CFR part 324 (FDIC).

For the reasons described below, the FDIC certifies that the proposed rule would not have a significant economic impact on a substantial number of small entities.

As discussed in section IV, the proposed rule, if enacted, would revise the risk-based capital requirements applicable to Category I and II holding companies and their subsidiary Depository Institutions (DIs).⁷⁸³ Specifically, these banking organizations would be subject to a single set of risk-based capital ratio requirements based on the expanded risk-based approach, as defined in section III. According to Call Reports, there are 2,802 FDIC-supervised DIs that report risk-based capital.⁷⁸⁴ Of these, approximately 2,085 would be considered small entities for the purposes of the RFA.⁷⁸⁵ As of June 30, 2025, there were 9 top-tier U.S. depository institution holding companies and 22 U.S.-based depository institutions that report risk-based capital figures and are subject to Category I or II standards.⁷⁸⁶ As of June 30, 2025, the FDIC supervised one DI that is a subsidiary of a holding company subject to the Category I capital standards and no DIs that are subsidiaries of holding companies subject to the Category II capital standards.⁷⁸⁷ This FDIC-supervised DI is not considered a small entity for the purposes of the RFA because it is a subsidiary of a holding company with over \$850 million in total assets. Therefore, no FDIC-supervised small entities would be subject to the expanded risk-based approach should the proposed rule be enacted.

As discussed in section II.A, the proposed rule would allow any non-Category I or II covered banking organization to elect to use the expanded risk-based approach. Electing

the expanded risk-based approach would entail compliance with other requirements, notably the need to capitalize separately for operational risk and ineligibility to elect the AOCI filter for banking organizations below the Category IV threshold. Banking organizations electing to use the expanded risk-based approach would be required to fully implement its applicable provisions, including the capital, operational risk, recordkeeping, reporting, and disclosure elements. Further, they would be required to reflect most elements of AOCI in regulatory capital even if they subsequently change to the standardized approach.

Banking organizations that qualify as small entities have simpler business models with risk management and reporting systems designed for their size and activities. If they elect the requirements under the proposal, they may be required to set up, operate, maintain, and keep records on more granular systems that would not likely yield benefits that would warrant the additional costs to these small entities.

As mentioned, the agencies are concurrently publishing a separate proposal that revises the standardized approach risk-based capital requirements. Small entities that use the proposed standardized approach or elect to use the CBLR framework would avoid the expanded risk-based approach requirements designed for larger, more complex banking organizations.⁷⁸⁸

Under the scenario in which all three frameworks are finalized as proposed, the agencies believe that FDIC-supervised small entities are most likely to choose as their required capital framework either (1) the concurrently proposed revised standardized approach or (2) the recently proposed revised CBLR, as these two frameworks are better suited to the size and complexity of small entities than is the proposed expanded risk-based approach. For eligible small entities, the two options present a basic tradeoff between lower required capital under the proposed revised standardized approach and

simpler reporting requirements under proposed revised CBLR.⁷⁸⁹

For these reasons, the FDIC does not expect a substantial number of small entities to elect to use the proposed expanded risk-based approach.

Some effects of the proposal on small entities would occur regardless of whether the entities adopt the expanded-risk based approach. First, aspects of the proposal discussed in sections III and IV.A may indirectly support small entities by increasing the attractiveness of correspondent lending models and other forms of loan participation agreements.⁷⁹⁰ Smaller lenders can cultivate customers via their superior local knowledge while turning to larger banking organizations for funding and for their facility with securitization markets.⁷⁹¹ The proposed removal of the mortgage servicing assets deduction treatment would also make mortgage lending relationships under these types of models more attractive, particularly for Ginnie Mae securitizations where lenders must pool together multiple loans themselves. Second, the proposed reduction in capital requirements in the expanded risk-based approach, in principle, could have competitiveness impacts in certain lending markets that may indirectly affect small entities. However, the agencies designed this proposal and the standardized approach proposal concurrently, in part to mitigate potential competitiveness impacts on smaller banking organizations. Several changes in proposed risk weights applicable to Category I and II banking organizations through the expanded risk-based approach have corresponding changes to proposed risk weights applicable to smaller banking organizations (including small entities) through the standardized approach proposal. Therefore, the agencies believe indirect competitiveness effects on small entities generally would be

^{121.103.} Following these regulations, the FDIC uses a covered entity's affiliated and acquired assets, averaged over the preceding four quarters, to determine whether the covered entity is "small" for the purposes of RFA.

⁷⁸³ Covered banking organizations surpassing certain trading asset thresholds would also be subject to the proposal.

⁷⁸⁴ Call Reports data, June 30, 2025. The count of potential covered entities excludes six insured, domestic branches of foreign banks.

⁷⁸⁵ Call Reports data, June 30, 2025.

⁷⁸⁶ On November 1, 2019, the banking agencies established four risk-based categories in order to tailor requirements under the agencies' regulatory capital and liquidity rules to banking organizations with assets of \$100 billion or more (84 FR 59230). These Tailored Categories are defined in 12 CFR part 252 (84 FR 59032). The tailored holding company and depository institutions counts are based on June 2025 Call Reports, FR Y-9C data, and FR Y-15 data.

⁷⁸⁷ Counts are based on June 30, 2025 Call Reports, FR Y-9C data, and FR Y-15 data.

⁷⁸⁸ The CBLR criteria currently require a banking organization to have less than \$10 billion in total assets, meet a minimum required ratio of tangible equity capital to its average total consolidated assets of 9 percent, hold off-balance sheet exposures of 25 percent or less of total consolidated assets, and hold total trading assets plus trading liabilities of 5 percent or less of total consolidated assets. As of June 30, 2025, over 1,000 FDIC-supervised DI elect to use the CBLR framework. A recent proposal would reduce the required leverage ratio from 9 percent to 8 percent, and extend the grace period for an eligible banking organization that fails to meet the qualifying criteria after opting into the CBLR framework. 90 FR 55048 (Dec. 1, 2025).

⁷⁸⁹ See the Economic Impact section of the Regulatory Capital and Standardized Approach for Risk-weighted Assets Notice of Proposed Rulemaking for more information on small banking organizations' incentives to select between the standardized approach and the CBLR.

⁷⁹⁰ See Michael Poprik, "Loan Participations: Lessons Learned During a Period of Economic Malaise," *Federal Reserve Bank of Richmond Community and Regional Supervision* (2013), <https://www.communitybankingconnections.org/articles/2013/q2/loan-participations>.

⁷⁹¹ See Richard Stanton, Johan Walden, & Nancy Wallace, "The Industrial Organization of the US Residential Mortgage Market," *Annual Review of Financial Economics*, no. 6 (2014), available at: <https://doi.org/10.1146/annurev-financial-110613-034324> and David Benson, You Suk Kim, & Karen Pence, "Bank Aggregator Exit, Nonbank Entry, and Credit Supply in the Mortgage Industry," *Working Paper* (2023), <https://www.fdic.gov/system/files/2024-07/kim-paper.pdf>.

small. The agencies do not have the data necessary to estimate the magnitudes of these additional effects on small entities, but believe that these effects do not rise to a significant level for a substantial number of small entities.

For the reasons outlined above, the FDIC certifies that the proposed rule, if adopted, would not have a significant economic effect on a substantial number of small entities.

C. Plain Language

Section 722 of the Gramm-Leach Bliley Act⁷⁹² requires the Federal banking agencies⁷⁹³ to use plain language in all proposed and final rules published after January 1, 2000. The agencies have sought to present the proposal in a simple and straightforward manner and invite comments on the use of plain language and whether any part of the proposal could be more clearly stated. For example:

- Have the agencies presented the material in an organized manner that meets your needs? If not, how could this material be better organized?
- Are the requirements in the notice of proposed rulemaking clearly stated? If not, how could the proposed rule be more clearly stated?
- Does the proposed rule contain language that is not clear? If so, which language requires clarification?
- Would a different format (grouping and order of sections, use of headings, paragraphing) make the proposed rule easier to understand? If so, what changes to the format would make the proposed rule easier to understand?
- What else could the agencies do to make the proposed rule easier to understand?

D. Riegle Community Development and Regulatory Improvement Act of 1994

Pursuant to section 302(a) of the Riegle Community Development and Regulatory Improvement Act (RCDRIA),⁷⁹⁴ in determining the effective date and administrative compliance requirements for new regulations that impose additional reporting, disclosure, or other requirements on insured depository institutions, each Federal banking agency must consider, consistent with principles of safety and soundness and the public interest, any administrative burdens that such regulations would place on depository institutions, including small depository institutions,

and customers of depository institutions, as well as the benefits of such regulations. In addition, section 302(b) of RCDRIA requires new regulations and amendments to regulations that impose additional reporting, disclosures, or other new requirements on insured depository institutions generally to take effect on the first day of a calendar quarter that begins on or after the date on which the regulations are published in final form, with certain exceptions, including for good cause.⁷⁹⁵

The agencies note that comment on these matters has been solicited in other sections of this **SUPPLEMENTARY INFORMATION** section, and that the requirements of RCDRIA will be considered as part of the overall rulemaking process. In addition, the agencies also invite any other comments that further will inform the agencies' consideration of RCDRIA.

E. OCC Unfunded Mandates Reform Act of 1995 Determination

The OCC has analyzed the proposed rule under the factors in the Unfunded Mandates Reform Act of 1995 (UMRA) (2 U.S.C. 1532). Under this analysis, the OCC considered whether the proposed rule includes a Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100 million or more in any one year, adjusted annually for inflation (currently \$187 million⁷⁹⁶).

To estimate the compliance costs of the proposal, OCC staff reviewed the new mandates that affect OCC-supervised banks, and then considered costs that may arise from compliance with these mandates, including the total hours needed per bank, on average, for systems development, data acquisition, data aggregation and reporting, calculation and verification, training, and risk management. Based on internal discussions with OCC subject matter experts, OCC staff estimate a one-time implementation cost of approximately \$110 million.⁷⁹⁷ Thus, the OCC

concludes that the expenditures imposed by the rule will be less than \$187 million. Accordingly, the UMRA does not require that a written statement accompany this rule.

F. Executive Orders 12866, 13563 and 14192

Executive Order 12866 (Regulatory Planning and Review)⁷⁹⁸ and Executive Order 13563 (Improving Regulation and Regulatory Review)⁷⁹⁹ direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits. This proposed rule was drafted and reviewed in accordance with Executive Order 12866 and Executive Order 13563. Within OMB, the Office of Information and Regulatory Affairs (OIRA) has determined that this rulemaking is 'an economically significant regulatory action' under section 3(f)(1) of Executive Order 12866. Accordingly, the draft rule was submitted to OIRA for review. As noted in other sections of the **SUPPLEMENTARY INFORMATION** of this document, the agencies have assessed the costs and benefits of this rulemaking and have made a reasoned determination that the benefits of this rulemaking justify its costs. The proposal, if finalized as proposed, is not expected to be an Executive Order 14192 regulatory action.

G. Providing Accountability Through Transparency Act of 2023

The Providing Accountability Through Transparency Act of 2023 (5 U.S.C. 553(b)(4)) requires that a notice of proposed rulemaking include the internet address of a summary of not more than 100 words in length of the proposed rule, in plain language, that shall be posted on the internet website under section 206(d) of the E-Government Act of 2002 (44 U.S.C. 3501 note).

In summary, the bank regulatory agencies request comment on a proposal to revise the risk-based capital requirements that apply to the largest, most internationally active firms to substantially simplify the framework, better align minimum requirements with risk, improve the consistency of requirements across U.S. firms, consider overlaps with the stress capital buffer requirement, and align requirements with international standards while ensuring the framework accounts for specific features of U.S. markets.

⁷⁹² Public Law 106–102, section 722, 113 Stat. 1338, 1471 (1999).

⁷⁹³ The Federal banking agencies are the OCC, Board, and FDIC.

⁷⁹⁴ 12 U.S.C. 4802(a).

⁷⁹⁵ 12 U.S.C. 4802.

⁷⁹⁶ OCC staff estimate the UMRA inflation adjustment using the change in the annual average of the U.S. GDP Implicit Price Deflator between 1995 and 2024, which are the most recent annual data available. According to Bureau of Economic Analysis data released on March 27, 2025, the deflator was 66.939 in 1995 and 125.230 in 2024, resulting in an inflation adjustment factor of 1.87 (125.230/66.939 = 1.87 rounded to the nearest hundredth, and \$100 million × 1.87 = \$187 million).

⁷⁹⁷ These compliance cost estimates are subject to considerable uncertainty. They should be interpreted as approximate, order-of-magnitude estimates rather than precise measures of the actual costs individual banks will incur.

⁷⁹⁸ E.O. 12866, 58 FR 51735 (Oct. 4, 1993).

⁷⁹⁹ E.O. 13563, 76 FR 3821 (Jan. 21, 2011).

The proposal and such a summary can be found at <https://www.regulations.gov> by searching for Docket ID OCC–2026–0265 and <https://occ.gov/topics/laws-and-regulations/occ-regulations/proposed-issuances/index-proposed-issuances.html>, <https://www.federalreserve.gov/supervisionreg/reglisting.htm>, and <https://www.fdic.gov/federal-register-publications>.

Text of Common Rule

Subpart E—Risk-Weighted Assets—Expanded Risk-Based Approach

§ _____.100 Purpose and Applicability

(a) *Purpose*. This subpart sets forth methodologies for determining expanded total risk-weighted assets for purposes of the expanded capital ratio calculations.

(b) *Applicability*.

(1) This subpart applies to any Category I [BANKING ORGANIZATION], any Category II [BANKING ORGANIZATION], and any [BANKING ORGANIZATION] that elects to use this subpart under § _____.10(b).

(2) The [AGENCY] may apply this subpart to any [BANKING ORGANIZATION] if the [AGENCY] deems it necessary or appropriate to ensure safe and sound banking practices.

(c) Notwithstanding any other provision of this section, a market risk [BANKING ORGANIZATION] must exclude from its calculation of risk-weighted assets under this subpart the risk-weighted asset amounts of all market risk covered positions, as defined in subpart F of this part (except foreign exchange positions that are not trading positions, OTC derivative positions, cleared transactions, and unsettled transactions).

§ _____.101 Definitions

(a) Terms that are set forth in § _____.2 and used in this subpart have the definitions assigned thereto in § _____.2 unless otherwise defined in paragraph (b) of this section.

(b) For purposes of this subpart, the following terms are defined as follows:

Acquisition, development, or construction (ADC) exposure means a loan secured by real estate for the purpose of acquiring, developing, or constructing residential or commercial real estate properties, as well as all land development loans, and all other land loans.

Bank exposure means an exposure to a depository institution, foreign bank, or credit union.

Dependent on the cash flows generated by the real estate means, for a real estate exposure, that the underwriting, at the time of origination, considers the cash flows generated by lease, rental, or sale of the real estate securing the loan as a source of repayment. For purposes of this definition, a residential mortgage exposure that is secured by the borrower's principal residence is deemed not dependent on the cash flows generated by the real estate.

Dividend income means all dividends received on securities not consolidated in the [BANKING ORGANIZATION]'s financial statements.

Grade A bank exposure means:

(1) A bank exposure for which the depository institution, foreign bank, or credit union is investment grade and whose most recent capital ratios meet or exceed the higher of:

(i) The minimum capital requirements and any additional amounts necessary to not be subject to limitations on distributions and discretionary bonus payments under capital rules established by the prudential supervisor of the depository institution, foreign bank, or credit union; and

(ii) If applicable, the capital ratio requirements for the well capitalized capital category under the regulations of the appropriate Federal banking agency implementing 12 U.S.C. 1831o or under similar regulations of the National Credit Union Administration.

(2) Notwithstanding paragraph (1) of this definition, an exposure is not a Grade A bank exposure if:

(i) The capital ratios for the depository institution, foreign bank, or credit union have not been publicly disclosed within the previous 6 months;

(ii) The external auditor of the depository institution, foreign bank, or credit union has issued an adverse audit opinion or has expressed substantial doubt about the ability of the depository institution, foreign bank, or credit union to continue as a going concern within the previous 12 months; or

(iii) For a foreign bank, the capital standards imposed by the home country supervisor on the foreign bank are not broadly consistent with the Capital Accord of the Basel Committee on Banking Supervision.

Grade B bank exposure means:

(1) A bank exposure that is not a Grade A bank exposure and for which the depository institution, foreign bank, or credit union is speculative grade or investment grade and whose most recent capital ratios meet or exceed the higher of:

(i) The minimum capital requirements under capital rules established by the

prudential supervisor of the depository institution, foreign bank, or credit union; and

(ii) If applicable, the capital ratio requirements for the adequately capitalized category under the regulations of the appropriate Federal banking agency implementing 12 U.S.C. 1831o or under similar regulations of the National Credit Union Administration.

(2) Notwithstanding paragraph (1) of this definition, an exposure to a depository institution, foreign bank, or credit union is not a Grade B bank exposure if:

(i) The capital ratios for the depository institution, foreign bank, or credit union have not been publicly disclosed within the previous 6 months;

(ii) The external auditor of the depository institution, foreign bank, or credit union has issued an adverse audit opinion or has expressed substantial doubt about the ability of the depository institution, foreign bank, or credit union to continue as a going concern within the previous 12 months; or

(iii) For a foreign bank, the capital standards imposed by the home country supervisor on the foreign bank are not broadly consistent with the Capital Accord of the Basel Committee on Banking Supervision.

Grade C bank exposure means a bank exposure for which the depository institution, foreign bank, or credit union does not qualify as a Grade A bank exposure or a Grade B bank exposure.

Interest-earning assets means the sum of all gross outstanding loans and leases, securities that pay interest, interest-bearing balances, Federal funds sold, and securities purchased under agreement to resell.

Investment management means asset management, wealth management and private banking, including professional management of mutual funds and institutional accounts, and professional portfolio management and advisory services for individuals.

Investment services means asset servicing (which include custody, fund services, securities lending, liquidity services, collateral management, and other asset servicing; as well as recording keeping services for 401K and employee benefit plans, but exclude funding or guarantee products offered to such clients), issuer services (which include corporate trust, shareowner services, depository receipts, and other issuer services), and other investment services (which include clearing and other investment services).

Noninterest expense for BI means other noninterest expense, based on the consolidated financial statements of the

[BANKING ORGANIZATION], excluding expenses that relate to non-financial services received by the [BANKING ORGANIZATION] and operational losses. Noninterest expense for BI does not include salaries and employee benefits, expenses of premises and fixed assets, goodwill impairment losses, or amortization expense and impairment losses for other intangible assets.

Non-lending treasury services means cash management, global payments, and deposit services (and excludes any lending or card activities).

Operational loss means all losses (excluding insurance or tax effects) resulting from an operational loss event, including any reduction in previously reported capital levels attributable to restatements or corrections of financial statements. Operational loss includes all expenses associated with an operational loss event except for opportunity costs, forgone revenue, and costs related to risk management and control enhancements implemented to prevent future operational losses. Operational loss does not include losses that are also credit losses and are related to exposures within the scope of the credit risk-weighted assets framework (except for retail credit card losses arising from non-contractual, third-party-initiated fraud, which are operational losses).

Operational loss event means an event that results in loss due to inadequate or failed internal processes, people, and systems or from external events. This includes legal loss events and restatements or corrections of financial statements that result in a reduction of capital relative to amounts previously reported. Losses with a common underlying trigger must be grouped into a single operational loss event. Operational loss events are classified according to the following seven operational loss event types:

(1) Internal fraud, which means the operational loss event type that comprises operational losses resulting from an act involving at least one internal party of a type intended to defraud, misappropriate property, or circumvent regulations, the law, or company policy excluding diversity and discrimination noncompliance events.

(2) External fraud, which means the operational loss event type that comprises operational losses resulting from an act by a third party of a type intended to defraud, misappropriate property, or circumvent the law. Retail credit card losses arising from non-contractual, third-party-initiated fraud (for example, identity theft) are external fraud operational losses.

(3) Employment practices and workplace safety, which means the operational loss event type that comprises operational losses resulting from an act inconsistent with employment, health, or safety laws or agreements, payment of personal injury claims, or payment arising from diversity and discrimination noncompliance events.

(4) Clients, products, and business practices, which means the operational loss event type that comprises operational losses resulting from the nature or design of a product or from an unintentional or negligent failure to meet a professional obligation to specific clients (including fiduciary and suitability requirements).

(5) Damage to physical assets, which means the operational loss event type that comprises operational losses resulting from the loss of or damage to physical assets from natural disaster or other events.

(6) Business disruption and system failures, which means the operational loss event type that comprises operational losses resulting from disruption of business or system failures, including hardware, software, telecommunications, utility outage or disruptions.

(7) Execution, delivery, and process management, which means the operational loss event type that comprises operational losses resulting from failed transaction processing or process management or losses arising from relations with trade counterparties and vendors.

Operational risk means the risk of loss resulting from inadequate or failed internal processes, people, and systems or from external events (including legal risk but excluding strategic risk).

Other real estate exposure means a real estate exposure that is not a regulatory commercial real estate exposure, a regulatory residential real estate exposure, a pre-sold construction loan, a statutory multifamily mortgage, an HVCRE exposure, or an ADC exposure.

Project finance exposure means a corporate exposure:

(1) For which the [BANKING ORGANIZATION] relies on the revenues generated by a single project, both as the source of repayment and as security for the loan;

(2) The exposure is to an entity that was created specifically to finance the project, operate the physical assets of the project, or do both; and

(3) The borrowing entity has an immaterial amount of assets, activities, or sources of income, apart from those related to the project being financed.

Project finance operational phase exposure means a project finance exposure where the project has positive net cash flow that is sufficient to support the debt service and expenses of the project and any other remaining contractual obligation, in accordance with the [BANKING ORGANIZATION]'s applicable loan underwriting criteria for permanent financings, and where the outstanding long-term debt on the project is declining.

Real estate exposure means an exposure that is neither a sovereign exposure nor an exposure to a PSE and that is:

- (1) A residential mortgage exposure;
- (2) An exposure that is primarily secured by collateral in the form of real estate;
- (3) A pre-sold construction loan;
- (4) A statutory multifamily mortgage;
- (5) An HVCRE exposure; or
- (6) An ADC exposure.

Regulatory commercial real estate exposure means a real estate exposure that is not a regulatory residential real estate exposure, an ADC exposure, a pre-sold construction loan, a statutory multifamily mortgage, or an HVCRE exposure, and that meets the following criteria:

- (1) The exposure must be primarily secured by fully completed real estate;
- (2) The [BANKING ORGANIZATION] holds a first priority security interest in the property that is legally enforceable in all relevant jurisdictions; provided that when the [BANKING ORGANIZATION] also holds a junior security interest in the same property and no other party holds an intervening security interest, the [BANKING ORGANIZATION] must treat the exposures as a single regulatory commercial real estate exposure;
- (3) The exposure is made in accordance with prudent underwriting standards, including standards relating to the loan amount as a percent of the value of the property;
- (4) During underwriting of the loan, the [BANKING ORGANIZATION] must have applied underwriting policies that took into account the ability of the borrower to repay in a timely manner based on clear and measurable underwriting standards that enable the [BANKING ORGANIZATION] to evaluate relevant credit factors;
- (5) The property must be valued in accordance with § _____.5; and
- (6) Involves a loan that has not been restructured or modified.

Regulatory residential real estate exposure means a real estate exposure that is a first-lien residential mortgage exposure, that is not an ADC exposure, a pre-sold construction loan, a statutory

multifamily mortgage, or an HVCRE exposure, and that meets the following criteria:

(1) The exposure:

- (i) Is secured by a property that is either owner-occupied or rented;
- (ii) Is made in accordance with prudent underwriting standards, including standards relating to the loan amount as a percent of the value of the property;
- (iii) Involves a loan, for which the [BANKING ORGANIZATION] applied underwriting policies that took into account the ability of the borrower to repay in a timely manner based on clear and measurable underwriting standards that enable the [BANKING ORGANIZATION] to evaluate these credit factors, during underwriting of the loan;
- (iv) Is secured by property that is valued in accordance with § _____.5; and
- (v) Involves a loan that has not been restructured or modified, provided that a loan modified or restructured solely pursuant to the U.S. Treasury's Home Affordable Mortgage Program is not modified or restructured for purposes of this section.

(2) When a [BANKING ORGANIZATION] holds the first-lien and junior-lien(s) mortgage exposure, and no other party holds an intervening lien, the [BANKING ORGANIZATION] must treat the exposures as a single regulatory residential real estate exposure.

Regulatory retail exposure means a retail exposure that meets both of the following criteria:

- (1) *Product criterion.* The exposure is a revolving credit or line of credit or a term loan or lease; and
- (2) *Aggregate limit.* The sum of the notional amount of the exposure and the notional amounts of all other retail exposures to the obligor and to its affiliates does not exceed \$1 million, as adjusted pursuant to § _____.4.

Retail exposure means an exposure that is not a real estate exposure and that meets the following criteria:

- (1) The exposure is to a natural person or persons, or
- (2) The exposure is to an SME and satisfies the criteria in paragraphs (1) through (2) of the definition of *regulatory retail exposure*.

Senior securitization exposure means a securitization exposure that has a first-priority claim on the cash flows from the underlying exposures. When determining whether a securitization exposure has a first-priority claim on the cash flows from the underlying exposures, a [BANKING ORGANIZATION] is not required to

consider amounts due under interest rate derivative, currency derivative, and servicer cash advance facility contracts; fees due; and other similar payments. Both the most senior commercial paper issued by an ABCP program and a liquidity facility that supports the ABCP program may be senior securitization exposures if the liquidity facility provider's right to reimbursement of the drawn amounts is senior to all claims on the cash flows from the underlying exposures except amounts due under interest rate derivative, currency derivative, and servicer cash advance facility contracts; fees due; and other similar payments.

Small or medium-sized entity (SME) means an entity in which the reported annual revenues or sales for the consolidated group of which the entity is a part are less than or equal to \$50 million, as adjusted pursuant to § _____.4, for the most recent fiscal year.

Subordinated exposure means an exposure that is a corporate exposure, a bank exposure, or an exposure to a GSE that is subordinated by its terms or separate intercreditor agreement to the general creditors of the obligor, including an exposure to preferred stock that is not an equity exposure.

Transactor exposure means a regulatory retail exposure that is a credit facility where the balance has been repaid in full at each scheduled repayment date for the previous 12 months or an overdraft facility where there has been no drawdown over the previous 12 months.

Total interest expense means interest expenses related to all financial liabilities and other interest expenses.

Total interest income means interest income from all financial assets and other interest income.

Risk-Weighted Assets for Credit Risk

§ _____.110 Calculation of Total Risk-Weighted Assets for General Credit Risk

(a) *General risk-weighting requirements.* A [BANKING ORGANIZATION] must apply risk weights to its exposures as follows:

(1) A [BANKING ORGANIZATION] must determine the exposure amount of each on-balance sheet exposure, each derivative contract, and each off-balance sheet commitment, trade and transaction-related contingency, guarantee, repo-style transaction, financial standby letter of credit, forward agreement, or other similar transaction that is not:

- (i) An unsettled transaction subject to § _____.117;
- (ii) A cleared transaction subject to § _____.116;

(iii) A default fund contribution subject to § _____.116;

(iv) A securitization exposure subject to §§ _____.130 through _____.134;

(v) An equity exposure (other than an equity derivative contract) subject to §§ _____.140 through _____.142.

(2) The [BANKING ORGANIZATION] must multiply each exposure amount by the risk weight appropriate to the exposure based on the exposure type or counterparty, eligible guarantor, or financial collateral to determine the risk-weighted asset amount for each exposure.

(b) *Total risk-weighted assets for general credit risk.* Total credit risk-weighted assets equals the sum of the risk-weighted asset amounts calculated under this section.

§ _____.111 General Risk Weights

(a) *Sovereign exposures—(1) Exposures to the U.S. government.* (i) Notwithstanding any other requirement in this subpart, a [BANKING ORGANIZATION] must assign a zero percent risk weight to:

(A) An exposure to the U.S. government, its central bank, or a U.S. government agency; and

(B) The portion of an exposure that is directly and unconditionally guaranteed by the U.S. government, its central bank, or a U.S. government agency. This includes a deposit or other exposure, or the portion of a deposit or other exposure, that is insured or otherwise unconditionally guaranteed by the FDIC or the National Credit Union Administration.

(ii) A [BANKING ORGANIZATION] must assign a 20 percent risk weight to the portion of an exposure that is conditionally guaranteed by the U.S. government, its central bank, or a U.S. government agency. This includes an exposure, or the portion of an exposure, that is conditionally guaranteed by the FDIC or the National Credit Union Administration.

(iii) A [BANKING ORGANIZATION] must assign a zero percent risk weight to a Paycheck Protection Program covered loan as defined in section 7(a)(36) of the Small Business Act (15 U.S.C. 636(a)(36)).

(2) *Other sovereign exposures.* In accordance with Table 1 to § _____.111, a [BANKING ORGANIZATION] must assign a risk weight to a sovereign exposure based on the CRC applicable to the sovereign or the sovereign's OECD membership status if there is no CRC applicable to the sovereign.

Table 1 to § __.111—Risk Weights for Sovereign Exposures

		Risk Weight (in percent)
CRC	0-1	0
	2	20
	3	50
	4-6	100
	7	150
OECD Member with No CRC		0
Non-OECD Member with No CRC		100
Sovereign Default		150

(3) *Certain sovereign exposures.* Notwithstanding paragraph (a)(2) of this section, a [BANKING ORGANIZATION] may assign to a sovereign exposure a risk weight that is lower than the applicable risk weight in Table 1 to § __.111 if:

- (i) The exposure is denominated in the sovereign's currency;
- (ii) The [BANKING ORGANIZATION] has at least an equivalent amount of liabilities in that currency; and
- (iii) The risk weight is not lower than the risk weight that the home country supervisor allows an organization engaged in the business of banking under its jurisdiction to assign to the same exposures to the sovereign.

(4) *Exposures to a non-OECD member sovereign with no CRC.* Except as provided in paragraphs (a)(3), (5) and (6) of this section, a [BANKING ORGANIZATION] must assign a 100 percent risk weight to an exposure to a sovereign if the sovereign does not have a CRC.

(5) *Exposures to an OECD member sovereign with no CRC.* Except as provided in paragraph (a)(6) of this section, a [BANKING ORGANIZATION] must assign a 0 percent risk weight to an exposure to a sovereign that is a member of the OECD if the sovereign does not have a CRC.

(6) *Sovereign default.* A [BANKING ORGANIZATION] must assign a 150 percent risk weight to a sovereign exposure immediately upon determining that an event of sovereign default has occurred, or if an event of sovereign default has occurred during the previous five years.

(b) *Specified supranational entities and multilateral development banks (MDBs).* A [BANKING ORGANIZATION] must assign a zero percent risk weight to exposures to a specified supranational entity or an MDB.

(c) *Exposures to GSEs.* (1) A [BANKING ORGANIZATION] must

assign a 20 percent risk weight to an exposure to a GSE that is not:

- (i) An equity exposure; or
- (ii) A subordinated exposure.

(2) A [BANKING ORGANIZATION] must assign a 150 percent risk weight to a subordinated exposure to a GSE, unless a different risk weight is provided under paragraph (c)(3) of this section.

(3) A [BANKING ORGANIZATION] must assign a 20 percent risk weight to a subordinated exposure to a Federal Home Loan Bank or the Federal Agricultural Mortgage Corporation (Farmer Mac).

(d) *Exposures to a depository institution, a foreign bank, or a credit union.* (1) A [BANKING ORGANIZATION] must assign a risk weight to a bank exposure in accordance with Table 2 of this section, unless otherwise provided under paragraph (d)(3) or (d)(4) of this section.

Table 2 to § __.111—Bank Exposures

Category of Bank Exposure	Grade A Bank Exposure		Grade B Bank Exposure	Grade C Bank Exposure
	Meeting the criteria in (d)(2)	Otherwise		
Base risk weight	30%	40%	75%	150%
Risk weight for a foreign bank exposure that is a self-liquidating, trade-related contingent item that arises from the movement of goods and that has a maturity of three months or less	20%	20%	50%	150%

(2) A [BANKING ORGANIZATION] must assign a 30 percent risk weight to a Grade A bank exposure for which the obligor is:

(i) A qualifying community banking organization (as defined in 12 CFR 3.12, 12 CFR 217.12, or 12 CFR 324.12, as applicable) that is subject to the community bank leverage ratio framework (as defined in 12 CFR 3.12, 12 CFR 217.12, or 12 CFR 324.12, as applicable); or

(ii) A depository institution, foreign bank, or credit union not described in paragraph (d)(2)(i) of this section and whose most recent capital ratios or net worth ratio, as applicable, meet or exceed the following:

(A) For a depository institution that is a Category I, II, or III banking organization, a common equity tier 1 capital ratio of 14 percent and a supplementary leverage ratio of 5 percent;

(B) For a depository institution not described in paragraph (d)(2)(i)(A) of this section, a common equity tier 1 capital ratio of 14 percent and a tier 1 leverage ratio of 5 percent;

(C) For a credit union, a net worth ratio of 9 percent; or

(D) For a foreign bank, a common equity tier 1 capital ratio of 14 percent and a leverage ratio of 5 percent, each under the capital requirements imposed by the home country supervisor on that foreign bank.

(3) Notwithstanding paragraphs (d)(1) and (2) of this section, a [BANKING

ORGANIZATION] must not assign a risk weight to an exposure to a foreign bank lower than the risk weight applicable to a sovereign exposure of the home country of the foreign bank unless:

(i) The exposure is in the local currency of the home country of the foreign bank;

(ii) For an exposure to a branch of the foreign bank in a foreign jurisdiction that is not the home country of the foreign bank, the exposure is in the local currency of the jurisdiction in which the foreign branch operates; or

(iii) The exposure is a self-liquidating, trade-related contingent item that arises from the movement of goods and that has a maturity of three months or less.

(4) Notwithstanding paragraph (d)(1), (d)(2), or (d)(3) of this section, a [BANKING ORGANIZATION] must assign:

(i) A risk weight under § __.141 to a bank exposure that is an equity exposure; and

(ii) A 150 percent risk weight to a bank exposure that is a subordinated exposure or an exposure to a covered debt instrument.

(e) *Exposures to public sector entities (PSEs)*—(1) *Exposures to U.S. PSEs.* (i) A [BANKING ORGANIZATION] must assign a 20 percent risk weight to a general obligation exposure of a PSE that is organized under the laws of the United States or any state or political subdivision thereof.

(ii) A [BANKING ORGANIZATION] must assign a 50 percent risk weight to a revenue obligation exposure of a PSE

that is organized under the laws of the United States or any state or political subdivision thereof.

(2) *Exposures to foreign PSEs.* (i) Except as provided in paragraphs (e)(1) and (3) of this section, a [BANKING ORGANIZATION] must assign a risk weight to a general obligation exposure to a PSE, in accordance with Table 3 to § __.111, based on the CRC that corresponds to the PSE's home country or the OECD membership status of the PSE's home country if there is no CRC applicable to the PSE's home country.

(ii) Except as provided in paragraphs (e)(1) and (e)(3) of this section, a [BANKING ORGANIZATION] must assign a risk weight to a revenue obligation exposure of a PSE, in accordance with Table 4 to § __.111, based on the CRC that corresponds to the PSE's home country; or the OECD membership status of the PSE's home country if there is no CRC applicable to the PSE's home country.

(3) A [BANKING ORGANIZATION] may assign a lower risk weight than would otherwise apply under Tables 3 or 4 to § __.111 to an exposure to a foreign PSE if:

(i) The PSE's home country supervisor allows banks under its jurisdiction to assign a lower risk weight to such exposures; and

(ii) The risk weight is not lower than the risk weight that corresponds to the PSE's home country in accordance with Table 1 to § __.111.

Table 3 to § __.111—Risk Weights for Non-U.S. PSE General Obligations

		Risk Weight (in percent)
CRC	0-1	20
	2	50
	3	100
	4-7	150
OECD Member with No CRC		20
Non-OECD Member with No CRC		100
Sovereign Default		150

Table 4 to § __.111—Risk Weights for non-U.S. PSE Revenue Obligations

		Risk Weight (in percent)
CRC	0-1	50
	2-3	100
	4-7	150
OECD Member with No CRC		50
Non-OECD Member with No CRC		100
Sovereign Default		150

(4) *Exposures to PSEs from an OECD member sovereign with no CRC.* (i) A [BANKING ORGANIZATION] must assign a 20 percent risk weight to a general obligation exposure to a PSE whose home country is an OECD member sovereign with no CRC.

(ii) A [BANKING ORGANIZATION] must assign a 50 percent risk weight to a revenue obligation exposure to a PSE whose home country is an OECD member sovereign with no CRC.

(5) Exposures to PSEs whose home country is not an OECD member sovereign with no CRC. A [BANKING ORGANIZATION] must assign a 100 percent risk weight to an exposure to a PSE whose home country is not a member of the OECD and does not have a CRC.

(6) A [BANKING ORGANIZATION] must assign a 150 percent risk weight to a PSE exposure immediately upon

determining that an event of sovereign default has occurred in a PSE's home country or if an event of sovereign default has occurred in the PSE's home country during the previous five years.

(f) *Real estate exposures—*(1) *Statutory multifamily mortgages.* A [BANKING ORGANIZATION] must assign a 50 percent risk weight to a statutory multifamily mortgage.

(2) *Pre-sold construction loans.* A [BANKING ORGANIZATION] must assign a 50 percent risk weight to a pre-sold construction loan, unless the purchase contract is cancelled, in which case a [BANKING ORGANIZATION] must assign a 100 percent risk weight.

(3) *High-volatility commercial real estate (HVCRE) exposures.* A [BANKING ORGANIZATION] must assign a 150 percent risk weight to an HVCRE exposure.

(4) *ADC exposures that are not HVCRE exposures.* A [BANKING ORGANIZATION] must assign a 100 percent risk weight to an ADC exposure that is not an HVCRE exposure.

(5) *Regulatory residential real estate exposure.* (i) A [BANKING ORGANIZATION] must assign a risk weight to a regulatory residential real estate exposure that is not dependent on the cash flows generated by the real estate based on the exposure's LTV ratio in accordance with Table 5 to § __.111.

(ii) A [BANKING ORGANIZATION] must assign a risk weight to a regulatory residential real estate exposure that is dependent on the cash flows generated by the real estate based on the exposure's LTV ratio in accordance with Table 6 to § __.111.

Table 5 to § __.111—Risk Weights for Regulatory Residential Real Estate Exposures Not Dependent on Real Estate Cash Flows

Risk weights for regulatory residential real estate exposures that are not dependent on the cash flows generated by the real estate						
	LTV ratio ≤ 50%	50% < LTV ratio ≤ 60%	60% < LTV ratio ≤ 80%	80% < LTV ratio ≤ 90%	90% < LTV ratio ≤ 100%	LTV ratio > 100%
Risk weight	20%	25%	30%	40%	50%	70%

Table 6 to § __.111—Risk Weights for Regulatory Residential Real Estate Exposures Dependent on Real Estate Cash Flows

Risk weights for regulatory residential real estate exposures that are dependent on the cash flows generated by the real estate						
	LTV ratio ≤ 50%	50% < LTV ratio ≤ 60%	60% < LTV ratio ≤ 80%	80% < LTV ratio ≤ 90%	90% < LTV ratio ≤ 100%	LTV ratio > 100%
Risk weight	30%	35%	45%	60%	75%	105%

(6) *Regulatory commercial real estate exposure.* (i) A [BANKING ORGANIZATION] must assign a risk weight to a regulatory commercial real estate exposure that is not dependent on the cash flows generated by the real estate based on the exposure's LTV and the risk weight applicable to the

borrower under this section, in accordance with Table 7 to § __.111, provided that if the [BANKING ORGANIZATION] cannot determine the risk weight applicable to the borrower under this section, the risk weight of the borrower is 100 percent.

(ii) A [BANKING ORGANIZATION] must assign a risk weight to a regulatory commercial real estate exposure that is dependent on the cash flows generated by the real estate based on the exposure's LTV in accordance with Table 8 to § __.111.

TABLE 7 TO § __.111—RISK WEIGHTS FOR REGULATORY COMMERCIAL REAL ESTATE EXPOSURES NOT DEPENDENT ON REAL ESTATE CASH FLOWS

Risk weight	LTV ratio ≤ 60%	LTV ratio > 60%
	Lesser of 60% or the risk-weight applicable to the borrower under this section	Risk weight applicable to the borrower under this section

Table 8 to § __.111—Risk Weights for Regulatory Commercial Real Estate Exposures Dependent on Real Estate Cash Flows

Risk weight	LTV ratio ≤ 60%	60% < LTV ratio ≤ 80%	LTV ratio > 80%
	70%	90%	110%

(7) *Other real estate exposures.* A [BANKING ORGANIZATION] must assign an other real estate exposure a 150 percent risk weight, unless the exposure is a residential mortgage

exposure that is not dependent on the cash flows generated by the real estate, which must be assigned a 100 percent risk weight.

(8) *Past due real estate exposures.* Notwithstanding any other provision of

this subpart, a [BANKING ORGANIZATION] must assign a 150 percent risk weight to a real estate exposure that is 90 days past due or on nonaccrual, unless the exposure is a

residential mortgage exposure that is not dependent on the cash flows generated by the real estate, which must be assigned a 100 percent risk weight.

(g) *Retail exposures.* A [BANKING ORGANIZATION] must assign a risk weight to a retail exposure according to the following:

(1) *Regulatory retail exposures—(i) Regulatory retail exposures that are not transactor exposures.* A [BANKING ORGANIZATION] must assign a 75 percent risk weight to a regulatory retail exposure that is not a transactor exposure.

(ii) *Transactor exposures.* A [BANKING ORGANIZATION] must assign a 45 percent risk weight to a transactor exposure.

(2) *Other retail exposures.* A [BANKING ORGANIZATION] must assign a 100 percent risk weight to retail exposures that are not regulatory retail exposures.

(h) *Corporate exposures.* A [BANKING ORGANIZATION] must assign a 100 percent risk weight to a corporate exposure unless the corporate exposure receives a different risk weight under paragraphs (h)(1) through (5) of this section.

(1) Unless the corporate exposure receives a different risk weight under paragraphs (h)(2) through (5) of this section, a [BANKING ORGANIZATION] may assign a 65 percent risk weight to a corporate exposure to a company that is investment grade, if the exposure is not a subordinated exposure. For the purposes of this paragraph (h)(1), a [BANKING ORGANIZATION] may determine that a company is investment grade only by relying on one or more internal credit risk rating systems that meet the requirements in paragraphs (h)(1)(i) through (v) of this section.

(i) The internal credit risk rating system must be used to inform material business and risk management decisions of the [BANKING ORGANIZATION], such as those related to accounting, regulatory reporting, risk management and measurement, loan loss reserve estimation, capital planning, loan pricing, or board decision making.

(ii) The internal credit risk rating system must define which obligor rating grades resulting from that system are considered to be investment grade, as that term is defined in § _____.2.

(iii) The internal credit risk rating system must:

(A) Assign accurate and timely obligor rating grades based on clearly defined criteria; and

(B) Assign a rating grade for each obligor at least annually and whenever the [BANKING ORGANIZATION] receives new material information

regarding the creditworthiness of the obligor.

(iv) The internal credit risk rating system does not solely rely on third-party assessments of credit risk and incorporates quantitative and qualitative factors relating to the historical and projected patterns of payment behaviors of similar obligors or products, financial situation and performance of each obligor, and any relevant developments that affect the investment grade determination.

(v) At least annually, the [BANKING ORGANIZATION] must validate the robustness, consistency, and reliability of the internal credit risk rating system, using data from at least one full credit cycle, and update the internal credit risk rating system to address any deficiencies exposed as part of the validation. As part of the validation required by this paragraph (h)(1)(v), the [BANKING ORGANIZATION] must:

(A) Evaluate whether the performance of obligors identified by the internal credit risk rating system as investment grade is consistent with the definition of investment grade in § _____.2, including by benchmarking the ratings resulting from the internal credit risk rating system with external information relating to the creditworthiness of obligors;

(B) Assess the reliability, accuracy, completeness, timeliness, and appropriateness of the data sources and other information used as part of the investment grade determinations;

(C) Incorporate available information, including information regarding the performance of companies that have ceased operations or that have been sold to a third party, that is reasonably expected to support a robust evaluation of the internal credit risk rating system;

(D) Ensure the validation process is independent of the internal credit risk rating system's development, implementation, and operation, or subject the validation process to an independent review of its adequacy and effectiveness;

(E) Incorporate default data covering at least the preceding five years, or a longer period as necessary to reflect at least one period of economic downturn conditions, provided that if the [BANKING ORGANIZATION] has relevant and material reference data that span a longer period of time, the [BANKING ORGANIZATION] must incorporate such data in its validation; and

(F) Not place undue weight on data from periods of favorable or benign economic conditions relative to periods of economic downturn conditions.

(2) Unless the corporate exposure receives a different risk weight under paragraphs (h)(3) through (5) of this section, a [BANKING ORGANIZATION] must assign a 100 percent risk weight to a corporate exposure that is for the purpose of acquiring or financing equipment or physical commodities where repayment of the exposure is dependent on the physical assets being financed or acquired.

(3) Unless the corporate exposure receives a different risk weight under paragraphs (h)(4) through (5) of this section, a [BANKING ORGANIZATION] must assign risk weights to certain project finance exposures as follows:

(i) A [BANKING ORGANIZATION] must assign a 100 percent risk weight to a project finance operational phase exposure, and

(ii) A [BANKING ORGANIZATION] must assign a 130 percent risk weight to a project finance exposure that is not a project finance operational phase exposure.

(4) Unless the corporate exposure receives a different risk weight under paragraph (h)(5) of this section, a [BANKING ORGANIZATION] must assign risk weights to certain exposures to a QCCP as follows:

(i) A [BANKING ORGANIZATION] must assign a 2 percent risk weight to an exposure to a QCCP arising from the [BANKING ORGANIZATION] posting cash collateral to the QCCP in connection with a cleared transaction that meets the requirements of § _____.116(b)(3)(i)(A) and a 4 percent risk weight to an exposure to a QCCP arising from the [BANKING ORGANIZATION] posting cash collateral to the QCCP in connection with a cleared transaction that meets the requirements of § _____.116(b)(3)(i)(B); and

(ii) A [BANKING ORGANIZATION] must assign a 2 percent risk weight to an exposure to a QCCP arising from the [BANKING ORGANIZATION] posting cash collateral to the QCCP in connection with a cleared transaction that meets the requirements of § _____.116(c)(3)(i).

(5) A [BANKING ORGANIZATION] must assign a 150 percent risk weight to a corporate exposure that is a subordinated exposure or an exposure to a covered debt instrument.

(i) *Past due exposures.* Notwithstanding any other provision of this subpart, a [BANKING ORGANIZATION] must assign a 150 percent risk weight to any exposure that is not a sovereign exposure or a real estate exposure and that is 90 days past due or on nonaccrual, provided that:

(1) A [BANKING ORGANIZATION] may assign a risk weight to the guaranteed portion of a past due exposure based on the risk weight that applies under § _____.120 if the guarantee or credit derivative meets the requirements of that section; and

(2) A [BANKING ORGANIZATION] may assign a risk weight to the collateralized portion of a past due exposure or the protected portion of a past due exposure covered by a prepaid credit protection arrangement based on the risk weight that applies under § _____.121 if the collateral or prepaid credit protection arrangement meets the requirements of that section.

(j) *Other assets.* (1)(i) A bank holding company or savings and loan holding company must assign a zero percent risk weight to cash owned and held in all offices of subsidiary depository institutions or in transit, and to gold bullion held in a subsidiary depository institution's own vaults, or held in another depository institution's vaults on an allocated basis, to the extent the gold bullion assets are offset by gold bullion liabilities.

(ii) A [BANKING ORGANIZATION] must assign a zero percent risk weight to cash owned and held in all offices of the [BANKING ORGANIZATION] or in transit; to gold bullion held in the [BANKING ORGANIZATION]'s own vaults or held in another depository institution's vaults on an allocated basis, to the extent the gold bullion assets are offset by gold bullion liabilities; and to exposures that arise from the settlement of cash transactions (such as equities, fixed income, spot foreign exchange and spot commodities) with a central counterparty where there is no assumption of ongoing counterparty credit risk by the central counterparty after settlement of the trade and associated default fund contributions.

(2) A [BANKING ORGANIZATION] must assign a 20 percent risk weight to cash items in the process of collection.

(3) A [BANKING ORGANIZATION] must assign a 100 percent risk weight to DTAs arising from temporary differences that the [BANKING ORGANIZATION] could realize through net operating loss carrybacks.

(4) A [BANKING ORGANIZATION] must assign a 250 percent risk weight to:

(i) MSAs; and

(ii) The portion of DTAs arising from temporary differences that the [BANKING ORGANIZATION] could not realize through net operating loss carrybacks to the extent such DTAs are not deducted from common equity tier 1 capital pursuant to § _____.22(d).

(5) A [BANKING ORGANIZATION] must assign a 100 percent risk weight to all assets not specifically assigned a different risk weight under this subpart and that are not deducted from tier 1 or tier 2 capital pursuant to § _____.22.

(6) Notwithstanding the requirements of this section, a [BANKING ORGANIZATION] may assign an asset that is not included in one of the categories provided in this section to the risk weight category applicable under the capital rules applicable to bank holding companies and savings and loan holding companies at 12 CFR part 217, provided that all of the following conditions apply:

(i) The [BANKING ORGANIZATION] is not authorized to hold the asset under applicable law other than debt previously contracted or similar authority; and

(ii) The risks associated with the asset are substantially similar to the risks of assets that are otherwise assigned to a risk weight category of less than 100 percent under this subpart.

(k) *Insurance assets*—(1) *Assets held in a separate account.* (i) A bank holding company or savings and loan holding company must risk-weight the individual assets held in a separate account that does not qualify as a non-guaranteed separate account as if the individual assets were held directly by the bank holding company or savings and loan holding company.

(ii) A bank holding company or savings and loan holding company must assign a zero percent risk weight to an asset that is held in a non-guaranteed separate account.

(2) *Policy loans.* A bank holding company or savings and loan holding company must assign a 20 percent risk weight to a policy loan.

§ _____.112 Off-Balance Sheet Exposures

(a) *General.* (1) A [BANKING ORGANIZATION] must calculate the exposure amount of an off-balance sheet exposure using the credit conversion factors (CCFs) in paragraph (b) of this section. In the case of commitments, a [BANKING ORGANIZATION] must calculate the exposure amount by multiplying the committed but undrawn amount of the commitment by the applicable CCF.

(2) Where a [BANKING ORGANIZATION] commits to provide a commitment, the [BANKING ORGANIZATION] may apply the lower of the two applicable CCFs.

(3) Where a [BANKING ORGANIZATION] provides a commitment structured as a syndication or participation, the [BANKING

ORGANIZATION] is only required to calculate the exposure amount for its pro rata share of the commitment.

(4) Where a [BANKING ORGANIZATION] provides a commitment, enters into a repurchase agreement, or provides a credit-enhancing representation and warranty, and such commitment, repurchase agreement, or credit-enhancing representation and warranty is not a securitization exposure, the exposure amount shall be no greater than the maximum contractual amount of the commitment, repurchase agreement, or credit-enhancing representation and warranty, as applicable.

(5) For purposes of this section, if a commitment that is a retail exposure does not have an express contractual maximum amount that can be drawn, the committed but undrawn amount of the commitment is equal to the highest total drawn amount over the period since the commitment was created or the prior 24 months, whichever period is shorter, minus the current drawn amount.

(6) For purposes of this subpart, with respect to a repurchase or reverse repurchase transaction, or a securities borrowing or securities lending transaction, a [BANKING ORGANIZATION] must reflect in expanded total risk-weighted assets either:

(i) The exposure amount under this section and the risk-weighted asset amount for securities or posted collateral, where the credit risk of the securities lent or posted as collateral remains with the [BANKING ORGANIZATION]; or

(ii) The exposure for counterparty credit risk according to §§ _____.113 through _____.115.

(b) *Credit conversion factors*—

(1) *10 percent CCF.* A [BANKING ORGANIZATION] must apply a 10 percent CCF to the unused portion of a commitment that is unconditionally cancelable by the [BANKING ORGANIZATION].

(2) *20 percent CCF.* A [BANKING ORGANIZATION] must apply a 20 percent CCF to the amount of self-liquidating trade-related contingent items that arise from the movement of goods, with an original maturity of one year or less.

(3) *40 percent CCF.* A [BANKING ORGANIZATION] must apply a 40 percent CCF to commitments, regardless of the maturity of the facility, unless they qualify for a lower or higher CCF.

(4) *50 percent CCF.* A [BANKING ORGANIZATION] must apply a 50 percent CCF to the amount of the following off-balance-sheet items and

other similar transactions, regardless of whether a lower CCF would otherwise apply under paragraphs (b)(1) through (3) of this section:

(i) Transaction-related contingent items, including performance bonds, bid bonds, warranties, and performance standby letters of credit; and

(ii) Note issuance facilities and revolving underwriting facilities.

(5) *100 percent CCF.* A [BANKING ORGANIZATION] must apply a 100 percent CCF to the amount of the following off-balance-sheet items and other similar transactions:

(i) Guarantees;

(ii) Repurchase agreements (the off-balance sheet component of which equals the sum of the current fair values of all positions the [BANKING ORGANIZATION] has sold subject to repurchase);

(iii) Credit-enhancing representations and warranties that are not securitization exposures;

(iv) Off-balance sheet securities lending transactions (the off-balance sheet component of which equals the sum of the current fair values of all positions the [BANKING ORGANIZATION] has lent under the transaction);

(v) Off-balance sheet securities borrowing transactions (the off-balance sheet component of which equals the sum of the current fair values of all non-cash positions the [BANKING

ORGANIZATION] has posted as collateral under the transaction);

(vi) Financial standby letters of credit; and

(vii) Forward agreements.

§ _____.113 Counterparty Credit Risk

(a) *General.* (1) To determine the exposure amount for transactions with counterparty credit risk, a [BANKING ORGANIZATION]:

(i) Must use the standardized approach for counterparty credit risk (SA-CCR) in § _____.114 for a derivative contract or netting set that only includes derivative contracts;

(ii) May use SA-CCR in § _____.114 for a netting set of transactions that are not cleared transactions and that are subject to a qualifying cross-product master netting agreement that includes one or more derivative contracts and one or more repo-style transactions, subject to paragraph (b) of this section; and

(iii) May use the collateral haircut approach in § _____.115 for a repo-style transaction, eligible margin loan, or a netting set of repo-style transactions or eligible margin loans.

(b) *Qualifying cross-product master netting agreements.* (1) For purposes of determining the exposure amount for a netting set of transactions subject to a qualifying cross-product master netting agreement under § _____.114, a [BANKING ORGANIZATION] may elect to treat any repo-style transaction that is not a cleared transaction subject to the

qualifying cross-product master netting agreement as a derivative contract.

(2) The exposure amount of a set of transactions subject to a qualifying cross-product master netting agreement for purposes of (b)(1), must be calculated as follows:

$$\text{Exposure Amount}_{NSCP} = (1 - MR_{NSCP}) * (\text{Exposure Amount}_{\text{repo-style transactions}} + \text{Exposure Amount}_{\text{derivatives}}) + MR_{NSCP} * \text{Extended SA-CCR Exposure Amount}$$

Where:

(i) *Exposure Amount_{repo-style transactions}* is the exposure amount for repo-style transactions in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the collateral haircut approach, under § _____.115;

(ii) *Exposure Amount_{derivatives}* is the exposure amount for derivatives in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the standardized approach for counterparty credit risk, under § _____.114;

(iii) *Extended SA-CCR Exposure Amount* is the exposure amount for both repo-style transactions and derivatives that are in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the standardized approach for counterparty credit risk, under § _____.114; and

(iv) *MR_{NSCP}* is the Maturity Ratio for a given netting set that is subject to a qualifying cross-product master netting agreement, calculated as follows:

$$MR_{NSCP} = \frac{\sum NAWM \text{ of the repo - style transactions}_i}{\max (\sum NAWM \text{ of the repo - style transactions}_i, \sum NAWM \text{ of the derivative transactions}_i)}$$

Where:

(A) $\sum NAWM \text{ of the repo-style transaction}_i$ is the notional average weighted maturity of all *i* repo-style transactions subject to the qualifying cross-product master netting agreement, subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.

(B) $\sum NAWM \text{ of the derivative transaction}_i$ is the notional average weighted maturity of all *i* derivative transactions subject to the qualifying cross-product master netting agreement subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.

§ _____.114 Derivative Contracts: Standardized Approach

(a)(1) *Exposure amount for derivative contracts.* A [BANKING ORGANIZATION] must determine the exposure amount for a derivative contract using the standardized approach for counterparty credit risk (SA-CCR) under this section. A [BANKING ORGANIZATION] may reduce the exposure amount calculated

according to this section by the credit valuation adjustment that the [BANKING ORGANIZATION] has recognized in its balance sheet valuation of any derivative contracts in the netting set. For purposes of paragraph (a) of this section, the credit valuation adjustment does not include any adjustments to common equity tier 1 capital attributable to changes in the fair value of the [BANKING ORGANIZATION]'s liabilities that are due to changes in its own credit risk since the inception of the transaction with the counterparty. A [BANKING ORGANIZATION] may determine the exposure amount for a repo-style transaction using the SA-CCR under this section, as provided in § _____.113(b), subject to paragraph (a)(2) of this section.

(2) *Exposure amount for repo-style transactions.* If a [BANKING ORGANIZATION] is using the SA-CCR for a repo-style transaction as described in § _____.113(b), the [BANKING

ORGANIZATION] must make the adjustments described in paragraphs (a)(2)(i) through (iii) of this section.

(i) For purposes of this section, the [BANKING ORGANIZATION] must:

(A) Treat a repo-style transaction that has multiple underlying instruments as separate repo-style transactions for each distinct underlying instrument;

(B) Treat a repo-style transaction with a debt instrument as the underlying instrument as either a credit derivative that references the underlying debt instrument or an interest rate derivative that references the interest rate of the underlying debt instrument, based on the primary risk factor of the repo-style transaction;

(C) Treat a repo-style transaction with an equity instrument as the underlying instrument as an equity derivative that references the underlying equity instrument;

(D) Not apply paragraph (d) of this section to a repo-style transaction with

an equity instrument as the underlying instrument; and

(E) Treat a repo-style transaction as a client-facing derivative transaction where the [BANKING ORGANIZATION] is either acting as a financial intermediary and enters into an offsetting transaction with a qualifying central counterparty (QCCP) or where the [BANKING ORGANIZATION] provides a guarantee on the performance of a client on a transaction between the client and a QCCP.

(ii) For purposes of the supervisory delta under paragraph (i)(3) of this section, a [BANKING ORGANIZATION] must use a supervisory delta of 1 for a repurchase transaction or a securities lending transaction, and must use a supervisory delta of -1 for a reverse repurchase transaction or a securities borrowing transaction;

(iii) For purposes of the maturity factor under paragraph (i)(4) of this section, MPOR cannot be less than five business days plus the periodicity of re-margining expressed in business days minus one business day.

(b) *Definitions.* For purposes of this section, the following definitions apply:

End date means the last date of the period referenced by an interest rate or credit derivative contract or, if the derivative contract references another instrument, by the underlying instrument, except as otherwise provided in this section.

Start date means the first date of the period referenced by an interest rate or credit derivative contract or, if the derivative contract references the value of another instrument, by underlying instrument, except as otherwise provided in this section.

Hedging set means:

(i) With respect to interest rate derivative contracts, all such contracts within a netting set that reference the same reference currency;

(ii) With respect to exchange rate derivative contracts, all such contracts within a netting set that reference the same currency pair;

(iii) With respect to credit derivative contract, all such contracts within a netting set;

(iv) With respect to equity derivative contracts, all such contracts within a netting set;

(v) With respect to a commodity derivative contract, all such contracts within a netting set that reference one of the following commodity categories: Energy, metal, agricultural, or other commodities;

(vi) With respect to basis derivative contracts, all such contracts within a netting set that reference the same pair

of risk factors and are denominated in the same currency; or

(vii) With respect to volatility derivative contracts, all such contracts within a netting set that reference one of interest rate, exchange rate, credit, equity, or commodity risk factors, separated according to the requirements under paragraphs (i) through (v) of this definition.

(viii) If the risk of a derivative contract materially depends on more than one of interest rate, exchange rate, credit, equity, or commodity risk factors, the [AGENCY] may require a [BANKING ORGANIZATION] to include the derivative contract in each appropriate hedging set under paragraphs (i) through (v) of this definition.

(c) *Credit derivatives.*

Notwithstanding paragraphs (a) and (b) of this section:

(1) A [BANKING ORGANIZATION] that purchases a credit derivative that is recognized under § _____.120 as a credit risk mitigant for an exposure that is not a market risk covered position under subpart F of this part is not required to calculate a separate counterparty credit risk capital requirement under this section so long as the [BANKING ORGANIZATION] does so consistently for all such credit derivatives and either includes all or excludes all such credit derivatives that are subject to a master netting agreement from any measure used to determine counterparty credit risk exposure to all relevant counterparties for risk-based capital purposes.

(2) A [BANKING ORGANIZATION] that is the protection provider in a credit derivative must treat the credit derivative as an exposure to the reference obligor and is not required to calculate a counterparty credit risk capital requirement for the credit derivative under this section, so long as it does so consistently for all such credit derivatives and either includes all or excludes all such credit derivatives that are subject to a master netting agreement from any measure used to determine counterparty credit risk exposure to all relevant counterparties for risk-based capital purposes (unless the [BANKING ORGANIZATION] is treating the credit derivative as a market risk covered position under subpart F of this part, in which case the [BANKING ORGANIZATION] must calculate a counterparty credit risk capital requirement under this section).

(d) *Equity derivatives.* A [BANKING ORGANIZATION] must treat an equity derivative contract as an equity exposure and compute a risk-weighted asset amount for the equity derivative

contract under §§ _____.140 through _____.142 (unless the [BANKING ORGANIZATION] is treating the contract as a market risk covered position under subpart F of this part). In addition, if the [BANKING ORGANIZATION] is treating the contract as a market risk covered position under subpart F of this part, the [BANKING ORGANIZATION] must also calculate a risk-based capital requirement for the counterparty credit risk of an equity derivative contract under this section. If the [BANKING ORGANIZATION] risk weights an equity derivative contract under §§ _____.140 through _____.142, the [BANKING ORGANIZATION] may choose not to hold risk-based capital against the counterparty credit risk of the equity derivative contract, as long as it does so for all such contracts. Where an equity derivative contract is subject to a qualified master netting agreement, a [BANKING ORGANIZATION] using §§ _____.140 through _____.142 must either include all or exclude all of the contracts from any measure used to determine counterparty credit risk exposure.

(e) *Exposure amount.* (1) The exposure amount of a netting set, as calculated under this section, is equal to 1.4 multiplied by the sum of the replacement cost of the netting set, as calculated under paragraph (f) of this section, and the potential future exposure of the netting set, as calculated under paragraph (g) of this section.

(2) Notwithstanding the requirements of paragraph (e)(1) of this section, the exposure amount of a netting set subject to a variation margin agreement, excluding a netting set that is subject to a variation margin agreement under which the counterparty to the variation margin agreement is not required to post variation margin, is equal to the lesser of the exposure amount of the netting set calculated under paragraph (e)(1) of this section and the exposure amount of the netting set calculated under paragraph (e)(1) of this section as if the netting set were not subject to a variation margin agreement.

(3) Notwithstanding the requirements of paragraph (e)(1) of this section, the exposure amount of a netting set that consists of only sold options in which the premiums have been fully paid by the counterparty to the options and where the options are not subject to a variation margin agreement is zero.

(4) Notwithstanding the requirements of paragraph (e)(1) of this section, the exposure amount of a netting set in which the counterparty is a commercial end-user is equal to the sum of replacement cost, as calculated under

paragraph (f) of this section, and the potential future exposure of the netting set, as calculated under paragraph (g) of this section.

(5) For purposes of the exposure amount calculated under paragraph (e)(1) of this section and all calculations that are part of that exposure amount, a [BANKING ORGANIZATION] may elect to treat a derivative contract that is a cleared transaction or a client-facing derivative transaction and that is not subject to a variation margin agreement as one that is subject to a variation margin agreement, if the derivative contract is subject to a requirement that the counterparties make daily cash payments to each other to account for changes in the fair value of the derivative contract and to reduce the net position of the contract to zero. If a [BANKING ORGANIZATION] makes an election under this paragraph (e)(5) for one derivative contract, it must treat all

other derivative contracts within the same netting set that are eligible for an election under this paragraph (e)(5) as derivative contracts that are subject to a variation margin agreement.

(6) For purposes of the exposure amount calculated under paragraph (e)(1) of this section and all calculations that are part of that exposure amount, a [BANKING ORGANIZATION] may elect to treat a credit derivative contract, equity derivative contract, or commodity derivative contract that references an index as if it were multiple derivative contracts each referencing one component of the index, provided that the derivative contract is not an option or a CDO tranche.

(7) For purposes of the exposure amount calculated under paragraph (e)(1) of this section and all calculations that are part of that exposure amount, with respect to a client-facing derivative transaction or netting set of client-facing

derivative transactions, a clearing member [BANKING ORGANIZATION] may multiply the standard supervisory haircuts applied for purposes of the net independent collateral amount and variation margin amount by the scaling factor of the square root of $\frac{1}{2}$ (which equals 0.707107). If the [BANKING ORGANIZATION] determines that a longer period is appropriate, the [BANKING ORGANIZATION] must use a larger scaling factor to adjust for a longer holding period as provided below by the formula in this paragraph. In addition, the [AGENCY] may require the [BANKING ORGANIZATION] to set a longer holding period if the [AGENCY] determines that a longer period is appropriate due to the nature, structure, or characteristics of the transaction or is commensurate with the risks associated with the transaction.

$$\text{Scaling factor} = \sqrt{H/10}$$

Where H = the holding period greater than or equal to five days

(f) *Replacement cost of a netting set—*
(1) *Netting set subject to a variation margin agreement under which the counterparty must post variation margin.* The replacement cost of a netting set subject to a variation margin agreement, excluding a netting set that is subject to a variation margin agreement under which the counterparty is not required to post variation margin, is the greater of:

(i) The sum of the fair values (after excluding any valuation adjustments) of the derivative contracts within the netting set less the sum of the net independent collateral amount and the variation margin amount applicable to such derivative contracts;

(ii) The sum of the variation margin threshold and the minimum transfer amount applicable to the derivative contracts within the netting set less the net independent collateral amount

applicable to such derivative contracts; or

(iii) Zero.

(2) *Netting sets not subject to a variation margin agreement under which the counterparty must post variation margin.* The replacement cost of a netting set that is not subject to a variation margin agreement under which the counterparty must post variation margin to the [BANKING ORGANIZATION] is the greater of:

(i) The sum of the fair values (after excluding any valuation adjustments) of the derivative contracts within the netting set less the sum of the net independent collateral amount and variation margin amount applicable to such derivative contracts; or

(ii) Zero.

(3) *Multiple netting sets subject to a single variation margin agreement.* Notwithstanding paragraphs (f)(1) and

(2) of this section, the replacement cost for multiple netting sets subject to a single variation margin agreement must be calculated according to paragraph (j)(1) of this section.

(4) *Netting set subject to multiple variation margin agreements or a hybrid netting set.* Notwithstanding paragraphs (f)(1) and (2) of this section, the replacement cost for a netting set subject to multiple variation margin agreements or a hybrid netting set must be calculated according to paragraph (k)(1) of this section.

(g) *Potential future exposure of a netting set.* The potential future exposure of a netting set is the product of the PFE multiplier and the aggregated amount.

(1) *PFE multiplier.* The PFE multiplier is calculated according to the following formula:

$$\text{PFE multiplier} = \min \left\{ 1; 0.05 + 0.95 * e^{\left(\frac{V-C}{1.9 * A} \right)} \right\}$$

Where:

V is the sum of the fair values (after excluding any valuation adjustments) of the derivative contracts within the netting set;

C is the sum of the net independent collateral amount and the variation margin amount applicable to the derivative contracts within the netting set; and

A is the aggregated amount of the netting set.

(2) *Aggregated amount.* The aggregated amount is the sum of all hedging set amounts, as calculated under paragraph (h) of this section, within a netting set.

(3) *Multiple netting sets subject to a single variation margin agreement.* Notwithstanding paragraphs (g)(1) and (2) of this section and when calculating

the potential future exposure for purposes of total leverage exposure under § _____.10(c)(2)(ii), the potential future exposure for multiple netting sets subject to a single variation margin agreement must be calculated according to paragraph (j)(2) of this section.

(4) *Netting set subject to multiple variation margin agreements or a hybrid*

netting set. Notwithstanding paragraphs (g)(1) and (2) of this section and when calculating the potential future exposure for purposes of total leverage exposure under § _____.10(c)(2)(ii), the potential future exposure for a netting set subject

to multiple variation margin agreements or a hybrid netting set must be calculated according to paragraph (k)(2) of this section.

(h) *Hedging set amount*—(1) *Interest rate derivative contracts.* To calculate the hedging set amount of an interest

rate derivative contract hedging set, a [BANKING ORGANIZATION] may use either of the formulas provided in paragraphs (h)(1)(i) and (ii) of this section:

(i) Formula 1 is as follows:

Hedging set amount

$$= [(AddOn_{TB1}^{IR})^2 + (AddOn_{TB2}^{IR})^2 + (AddOn_{TB3}^{IR})^2 + 1.4 * AddOn_{TB1}^{IR} * AddOn_{TB2}^{IR} + 1.4 * AddOn_{TB2}^{IR} * AddOn_{TB3}^{IR} + 0.6 * AddOn_{TB1}^{IR} * AddOn_{TB3}^{IR}]^{\frac{1}{2}}$$

(ii) Formula 2 is as follows:

$$Hedging\ set\ amount = |AddOn_{TB1}^{IR}| + |AddOn_{TB2}^{IR}| + |AddOn_{TB3}^{IR}|$$

Where in paragraphs (h)(1)(i) and (ii) of this section:

$AddOn_{TB1}^{IR}$ is the sum of the adjusted derivative contract amounts, as calculated under paragraph (i) of this section, within the hedging set with an end date of less than one year from the present date;

$AddOn_{TB2}^{IR}$ is the sum of the adjusted derivative contract amounts, as calculated under paragraph (i) of this section, within the hedging set with an end date of one to five years from the present date; and

$AddOn_{TB3}^{IR}$ is the sum of the adjusted derivative contract amounts, as calculated under paragraph (i) of this section, within the hedging set with an end date of more than five years from the present date.

(2) *Exchange rate derivative contracts.* For an exchange rate derivative contract hedging set, the hedging set amount equals the absolute value of the sum of the adjusted derivative contract

amounts, as calculated under paragraph (i) of this section, within the hedging set.

(3) *Credit derivative contracts and equity derivative contracts.* The hedging

set amount of a credit derivative contract hedging set or equity derivative contract hedging set within a netting set is calculated according to the following formula:

Hedging set amount

$$= \left[\left(\sum_{k=1}^K \rho_k * AddOn(Ref_k) \right)^2 + \sum_{k=1}^K (1 - (\rho_k)^2) * (AddOn(Ref_k))^2 \right]^{\frac{1}{2}}$$

Where:

k is each reference entity within the hedging set.

K is the number of reference entities within the hedging set.

AddOn (Ref_k) equals the sum of the adjusted derivative contract amounts, as determined under paragraph (i) of this section, for all derivative contracts

within the hedging set that reference entity k.
ρ_k equals the applicable supervisory correlation factor, as provided in Table 2 to § _____.114.

(4) *Commodity derivative contracts.* The hedging set amount of a commodity derivative contract hedging set within a netting set is calculated according to the following formula:

Hedging set amount

$$= \left[\left(\rho * \sum_{k=1}^K \text{AddOn}(\text{Type}_k) \right)^2 + (1 - (\rho)^2) * \sum_{k=1}^K (\text{AddOn}(\text{Type}_k))^2 \right]^{\frac{1}{2}}$$

Where:

k is each commodity type within the hedging set.

K is the number of commodity types within the hedging set.

AddOn (Type_k) equals the sum of the adjusted derivative contract amounts, as determined under paragraph (i) of this section, for all derivative contracts within the hedging set that reference commodity type.

ρ equals the applicable supervisory correlation factor, as provided in Table 2 to § _____.114.

(5) *Basis derivative contracts and volatility derivative contracts.*

Notwithstanding paragraphs (h)(1) through (4) of this section, a [BANKING ORGANIZATION] must calculate a

separate hedging set amount for each basis derivative contract hedging set and each volatility derivative contract hedging set. A [BANKING ORGANIZATION] must calculate such hedging set amounts using one of the formulas under paragraphs (h)(1) through (4) of this section that corresponds to the primary risk factor of the hedging set being calculated.

(i) *Adjusted derivative contract amount—(1) Summary.* To calculate the adjusted derivative contract amount of a derivative contract, a [BANKING ORGANIZATION] must determine the adjusted notional amount of the derivative contract, pursuant to paragraph (i)(2) of this section, and

multiply the adjusted notional amount by each of the supervisory delta adjustment, pursuant to paragraph (i)(3) of this section, the maturity factor, pursuant to paragraph (i)(4) of this section, and the applicable supervisory factor, as provided in Table 2 to § _____.114.

(2) *Adjusted notional amount.* (i)(A) For an interest rate derivative contract or a credit derivative contract, the adjusted notional amount equals the product of the notional amount of the derivative contract, as measured in U.S. dollars using the exchange rate on the date of the calculation, and the supervisory duration, as calculated by the following formula:

$$\text{Supervisory duration} = \max \left\{ \frac{e^{-0.05 * \left(\frac{S}{250} \right)} - e^{-0.05 * \left(\frac{E}{250} \right)}}{0.05}, 0.04 \right\}$$

Where:

S is the number of business days from the present day until the start date of the derivative contract, or zero if the start date has already passed; and

E is the number of business days from the present day until the end date of the derivative contract.

(B) For purposes of paragraph (i)(2)(i)(A) of this section:

(1) For an interest rate derivative contract or credit derivative contract that is a variable notional swap, the notional amount is equal to the time-weighted average of the contractual notional amounts of such a swap over the remaining life of the swap; and

(2) For an interest rate derivative contract or a credit derivative contract that is a leveraged swap, in which the notional amount of all legs of the derivative contract are divided by a factor and all rates of the derivative contract are multiplied by the same factor, the notional amount is equal to the notional amount of an equivalent unleveraged swap.

(ii)(A) For an exchange rate derivative contract, the adjusted notional amount is the notional amount of the non-U.S.

denominated currency leg of the derivative contract, as measured in U.S. dollars using the exchange rate on the date of the calculation. If both legs of the exchange rate derivative contract are denominated in currencies other than U.S. dollars, the adjusted notional amount of the derivative contract is the largest leg of the derivative contract, as measured in U.S. dollars using the exchange rate on the date of the calculation.

(B) Notwithstanding paragraph (i)(2)(ii)(A) of this section, for an exchange rate derivative contract with multiple exchanges of principal, the [BANKING ORGANIZATION] must set the adjusted notional amount of the derivative contract equal to the notional amount of the derivative contract multiplied by the number of exchanges of principal under the derivative contract.

(iii)(A) For an equity derivative contract or a commodity derivative contract, the adjusted notional amount is the product of the fair value of one unit of the reference instrument underlying the derivative contract and

the number of such units referenced by the derivative contract.

(B) Notwithstanding paragraph (i)(2)(iii)(A) of this section, when calculating the adjusted notional amount for an equity derivative contract or a commodity derivative contract that is a volatility derivative contract, the [BANKING ORGANIZATION] must replace the unit price with the underlying volatility referenced by the volatility derivative contract and replace the number of units with the notional amount of the volatility derivative contract.

(3) *Supervisory delta adjustment.* (i) For a derivative contract that is not an option contract or collateralized debt obligation tranche, the supervisory delta adjustment is 1 if the fair value of the derivative contract increases when the value of the primary risk factor increases and – 1 if the fair value of the derivative contract decreases when the value of the primary risk factor increases.

(ii)(A) For a derivative contract that is an option contract, the supervisory delta adjustment is determined by the

formulas in Table 1 to § ___.114, as applicable:

Table 1 to § __.114—Supervisory Delta Adjustment for Options Contracts

	Bought	Sold
Call Options	$\Phi \left(\frac{\ln \left(\frac{P + \lambda}{K + \lambda} \right) + 0.5 * \sigma^2 * T / 250}{\sigma * \sqrt{T / 250}} \right)$	$-\Phi \left(\frac{\ln \left(\frac{P + \lambda}{K + \lambda} \right) + 0.5 * \sigma^2 * T / 250}{\sigma * \sqrt{T / 250}} \right)$
Put Options	$-\Phi \left(\frac{\ln \left(\frac{P + \lambda}{K + \lambda} \right) + 0.5 * \sigma^2 * T / 250}{\sigma * \sqrt{T / 250}} \right)$	$\Phi \left(\frac{\ln \left(\frac{P + \lambda}{K + \lambda} \right) + 0.5 * \sigma^2 * T / 250}{\sigma * \sqrt{T / 250}} \right)$

(B) As used in the formulas in Table 1 § ___.114:

(1) ϕ is the standard normal cumulative distribution function;

(2) P equals the current fair value of the instrument or risk factor, as applicable, underlying the option;

(3) K equals the strike price of the option;

(4) T equals the number of business days until the latest contractual exercise date of the option;

(5) The same value of λ must be used for all option contracts that reference the same underlying risk factor or instrument or, in the case of interest rate option contracts, all interest rate option contracts that are denominated in the same currency. λ equals zero for all derivative contracts except those option contracts where it is possible for P to have negative values. For option contracts where it is possible for P to

have negative values, to determine the value of λ for a given risk factor or instrument, a [BANKING ORGANIZATION] must find the lowest value, L, of P and K of all option contracts that reference this risk factor or instrument or, in the case of interest rate option contracts, the lowest value, L, of P and K of all interest rate option contracts in a given currency, that the [BANKING ORGANIZATION] has with all counterparties. Then, λ is set as follows: when the underlying risk factor is an interest rate, $\lambda = \max\{-L + 0.1\%, 0\}$; otherwise, $\lambda = \max\{-1.1 \cdot L, 0\}$; and

(6) σ equals the supervisory option volatility, as provided in Table 2 to § ___.114.

(C) Notwithstanding paragraph (i)(3)(ii)(B)(5) of this section, a [BANKING ORGANIZATION] may, with the prior approval of the [AGENCY],

specify a value for λ in accordance with this paragraph for an option contract, other than an interest rate option contract described in paragraph (i)(3)(ii)(B)(5) of this section, if a different value for λ would be appropriate considering the range of values for the instrument or risk factor, as appropriate, underlying the option contract. A [BANKING ORGANIZATION] that specifies a value for λ in accordance with this paragraph for an option contract must assign the same value for λ to all option contracts with the same instrument or risk factor, as applicable, underlying the option that the [BANKING ORGANIZATION] has with all counterparties.

(iii)(A) For a derivative contract that is a collateralized debt obligation tranche, the supervisory delta adjustment is determined by the following formula:

$$\text{Supervisory delta adjustment} = \frac{15}{(1 + 14 * A) * (1 + 14 * D)}$$

(B) As used in the formula in paragraph (i)(3)(iii)(A) of this section:

(1) A is the attachment point, which equals the ratio of the notional amounts of all underlying exposures that are subordinated to the [BANKING ORGANIZATION]'s exposure to the total notional amount of all underlying exposures, expressed as a decimal value between zero and one;¹

(2) D is the detachment point, which equals one minus the ratio of the notional amounts of all underlying

exposures that are senior to the [BANKING ORGANIZATION]'s exposure to the total notional amount of all underlying exposures, expressed as a decimal value between zero and one; and

(3) The resulting amount is designated with a positive sign if the collateralized debt obligation tranche was used by the [BANKING ORGANIZATION] to purchase credit protection and is designated with a negative sign if the collateralized debt obligation tranche

was used by the [BANKING ORGANIZATION] to sell credit protection.

(4) *Maturity factor.* (i)(A) The maturity factor of a derivative contract that is subject to a variation margin agreement, excluding derivative contracts that are subject to a variation margin agreement under which the counterparty is not required to post variation margin, is determined by the following formula:

$$\text{Maturity factor} = \frac{3}{2} \sqrt{\frac{\text{MPOR}}{250}}$$

Where MPOR refers to the period from the most recent exchange of collateral covering a netting set of derivative contracts with a defaulting counterparty until the derivative contracts are closed out and the resulting market risk is re-hedged.

(B) Notwithstanding paragraph (i)(4)(i)(A) of this section:

(1) For a derivative contract that is not a client-facing derivative transaction, MPOR cannot be less than ten business days plus the periodicity of re-margining expressed in business days minus one business day;

(2) For a derivative contract that is a client-facing derivative transaction, MPOR cannot be less than five business days plus the periodicity of re-margining expressed in business days minus one business day; and

(3) For a derivative contract that is within a netting set that is composed of more than 5,000 derivative contracts that are not cleared transactions, or a netting set that contains one or more trades involving illiquid collateral or a derivative contract that cannot be easily replaced, MPOR cannot be less than twenty business days.

(4) Notwithstanding paragraphs (i)(4)(i)(A) and (B) of this section, for a netting set subject to more than two outstanding disputes over margin that lasted longer than the MPOR over the previous two quarters, the applicable floor is twice the amount provided in paragraphs (i)(4)(i)(A) and (B) of this section.

(ii) The maturity factor of a derivative contract that is not subject to a variation margin agreement, or derivative contracts under which the counterparty is not required to post variation margin, is determined by the following formula:

$$\text{Maturity factor} = \sqrt{\frac{\min\{M; 250\}}{250}}$$

Where M equals the greater of 10 business days and the remaining maturity of the contract, as measured in business days.

(iii) For purposes of paragraph (i)(4) of this section, if a [BANKING ORGANIZATION] has elected pursuant to paragraph (e)(5) of this section to treat a derivative contract that is a cleared transaction that is not subject to a variation margin agreement as one that is subject to a variation margin agreement, the [BANKING ORGANIZATION] must treat the derivative contract as subject to a variation margin agreement with maturity factor as determined according to paragraph (i)(4)(i) of this section, and daily settlement does not change the end date of the period referenced by the derivative contract.

(5) *Derivative contract as multiple effective derivative contracts.* A [BANKING ORGANIZATION] must separate a derivative contract into separate derivative contracts, according to the following rules:

(i) For an option where the counterparty pays a predetermined amount if the value of the underlying asset is above or below the strike price and nothing otherwise (binary option), the option must be treated as two separate options. For purposes of paragraph (i)(3)(ii) of this section, a binary option with strike price K must be represented as the combination of one bought European option and one sold European option of the same type as the original option (put or call) with the strike prices set equal to $0.95 * K$ and $1.05 * K$ so that the payoff of the binary option is reproduced exactly outside the region between the two strike prices. The absolute value of the sum of the adjusted derivative contract amounts of the bought and sold options is capped at the payoff amount of the binary option.

(ii) For a derivative contract that can be represented as a combination of standard option payoffs (such as collar, butterfly spread, calendar spread, straddle, and strangle), a [BANKING

ORGANIZATION] must treat each standard option component as a separate derivative contract.

(iii) For a derivative contract that includes multiple-payment options, (such as interest rate caps and floors), a [BANKING ORGANIZATION] may represent each payment option as a combination of effective single-payment options (such as interest rate caplets and floorlets).

(iv) A [BANKING ORGANIZATION] may not decompose linear derivative contracts (such as swaps) into components.

(j) *Multiple netting sets subject to a single variation margin agreement—(1) Calculating replacement cost.* Notwithstanding paragraph (f) of this section, a [BANKING ORGANIZATION] must assign a single replacement cost to multiple netting sets that are subject to a single variation margin agreement under which the counterparty must post variation margin, calculated according to the following formula:

Replacement Cost

$$\begin{aligned} &= \max \left\{ \sum_{NS} \max\{V_{NS}; 0\} - \max\{C_{MA}; 0\}; 0 \right\} \\ &+ \max \left\{ \sum_{NS} \min\{V_{NS}; 0\} - \min\{C_{MA}; 0\}; 0 \right\} \end{aligned}$$

Where:

NS is each netting set subject to the variation margin agreement MA;

V_{NS} is the sum of the fair values (after excluding any valuation adjustments) of the derivative contracts within the netting set NS; and

C_{MA} is the sum of the net independent collateral amount and the variation margin amount applicable to the derivative contracts within the netting sets subject to the single variation margin agreement.

(2) *Calculating potential future exposure.* Notwithstanding paragraph (g) of this section, a [BANKING ORGANIZATION] must assign a single potential future exposure to multiple netting sets that are subject to a single variation margin agreement under which the counterparty must post variation margin equal to the sum of the potential future exposure of each such netting set, each calculated according to paragraph (g) of this section as if such nettings sets were not subject to a variation margin agreement.

(k) *Netting set subject to multiple variation margin agreements or a hybrid netting set—(1) Calculating replacement cost.* To calculate replacement cost for either a netting set subject to multiple variation margin agreements under which the counterparty to each variation margin agreement must post

variation margin, or a netting set composed of at least one derivative contract subject to variation margin agreement under which the counterparty must post variation margin and at least one derivative contract that is not subject to such a variation margin agreement, the calculation for replacement cost is provided under paragraph (f)(1) of this section, except that the variation margin threshold equals the sum of the variation margin thresholds of all variation margin agreements within the netting set and the minimum transfer amount equals the sum of the minimum transfer amounts of all the variation margin agreements within the netting set.

(2) *Calculating potential future exposure.* (i) To calculate potential future exposure for a netting set subject to multiple variation margin agreements under which the counterparty to each variation margin agreement must post variation margin, or a netting set composed of at least one derivative contract subject to a variation margin agreement under which the counterparty to the derivative contract must post variation margin and at least one derivative contract that is not subject to such a variation margin agreement, a [BANKING ORGANIZATION] must divide the

netting set into sub-netting sets (as described in paragraph (k)(2)(ii) of this section) and calculate the aggregated amount for each sub-netting set. The aggregated amount for the netting set is calculated as the sum of the aggregated amounts for the sub-netting sets. The multiplier is calculated for the entire netting set.

(ii) For purposes of paragraph (k)(2)(i) of this section, the netting set must be divided into sub-netting sets as follows:

(A) All derivative contracts within the netting set that are not subject to a variation margin agreement or that are subject to a variation margin agreement under which the counterparty is not required to post variation margin form a single sub-netting set. The aggregated amount for this sub-netting set is calculated as if the netting set is not subject to a variation margin agreement.

(B) All derivative contracts within the netting set that are subject to variation margin agreements in which the counterparty must post variation margin and that share the same value of the MPOR form a single sub-netting set. The aggregated amount for this sub-netting set is calculated as if the netting set is subject to a variation margin agreement, using the MPOR value shared by the derivative contracts within the netting set.

Table 2 to § __.114—Supervisory Option Volatility, Supervisory Correlation Parameters, and Supervisory Factors for Derivative Contracts

Asset Class	Category	Type	Supervisory Option Volatility (Percent)	Supervisory Correlation Factor (Percent)	Supervisory Factor ¹ (Percent)
Interest rate	N/A	N/A	50	N/A	0.50
Exchange rate	N/A	N/A	15	N/A	4.0
Credit, single name	Investment grade	N/A	100	50	0.46
	Speculative grade	N/A	100	50	1.3
	Sub-speculative grade	N/A	100	50	6.0
Credit, index	Investment Grade	N/A	80	80	0.38
	Speculative Grade	N/A	80	80	1.06
Equity, single name	N/A	N/A	120	50	32
Equity, index	N/A	N/A	75	80	20
Commodity	Energy	Electricity	150	40	40
		Other	70	40	18
	Metals	N/A	70	40	18
	Agricultural	N/A	70	40	18
	Other	N/A	70	40	18

¹ The applicable supervisory factor for basis derivative contract hedging sets is equal to one-half of the supervisory factor provided in this table 2, and the applicable supervisory factor for volatility derivative contract hedging sets is equal to 5 times the supervisory factor provided in this table 2.

¹ In the case of a first-to-default credit derivative, there are no underlying exposures that are subordinated to the [BANKING ORGANIZATION]'s exposure. In the case of a second-or-subsequent-to-default credit derivative, the smallest (n-1) notional amounts of the underlying exposures are subordinated to the [BANKING ORGANIZATION]'s exposure.

§ __.115 Collateral Haircut Approach for Repo-Style Transactions and Eligible Margin Loans

(a) *Collateral haircut approach—Exposure amount for eligible margin loans and repo-style transactions.* A [BANKING ORGANIZATION] may recognize the credit risk mitigation benefits of financial collateral that

secures an eligible margin loan, repo-style transaction, or netting set of eligible margin loans or repo-style transactions, and of any collateral that secures a repo-style transaction that is included in the [BANKING ORGANIZATION]'s measure for market risk under subpart F of this part, by using the collateral haircut approach covered in paragraph (b) of this section.

(b) *Exposure amount calculation.* For purposes of the collateral haircut approach, a [BANKING ORGANIZATION] must determine the exposure amount for an eligible margin loan, repo-style transaction, or netting set of eligible margin loans or repo-style transactions according to the following formula:

$$E^* = \max \left\{ 0; \left(\sum_i E_i - \sum_i C_i \right) + \left(0.4 \times \text{net}_{\text{exposure}} \right) + \left(0.6 \times \frac{\text{gross}_{\text{exposure}}}{\sqrt{N}} \right) + \left(\sum_{fx} (E_{fx} \times H_{fx}) \right) \right\}$$

Where:

- (1) E^* is the exposure amount of the eligible margin loan, repo-style transaction, or netting set after credit risk mitigation;
- (2) E_i is the current fair value of the instrument, cash, or gold the [BANKING ORGANIZATION] has lent, sold subject to repurchase, or posted as collateral to the counterparty;

- (3) C_i is the current fair value of the instrument, cash, or gold the banking organization has borrowed, purchased subject to resale, or taken as collateral from the counterparty;
- (4) $\text{net}_{\text{exposure}} = |\sum_s E_s H_s|$;
- (5) $\text{gross}_{\text{exposure}} = \sum_s E_s |H_s|$;
- (6) E_s is the absolute value of the net position in a given instrument or in gold, where the net position in a given instrument or

gold equals the sum of the current fair values of the instrument or gold the [BANKING ORGANIZATION] has lent, sold subject to repurchase, or posted as collateral to the counterparty, minus the sum of the current fair values of that same instrument or gold the [BANKING ORGANIZATION] has borrowed, purchased subject to resale, or taken as collateral from the counterparty;

- (7) H_s is the haircut appropriate to E_s as described in Table 1 to § _____.115, as applicable. H_s has a positive sign if the instrument or gold is net lent, sold subject to repurchase, or posted as collateral to the counterparty; H_s has a negative sign if the instrument or gold is net borrowed, purchased subject to resale, or taken as collateral from the counterparty;
- (8) N is the number of instruments with a unique Committee on Uniform Securities Identification Procedures (CUSIP) designation or foreign equivalent that the [BANKING ORGANIZATION] lends, sells subject to repurchase, posts as collateral, borrows, purchases subject to resale, or takes as collateral in the eligible margin loan, repo-style transaction, or netting set, including all collateral that the [BANKING ORGANIZATION] elects to include within the credit risk mitigation framework, except that instruments where the value E_s is less than one tenth of the value of the largest E_s in the eligible margin loan, repo-style transaction, or netting set are not included in the count or gold, with any amount of gold given a value of one;
- (9) E_{fx} is the absolute value of the net position in each currency f_x different from the settlement currency;
- (10) H_{fx} is the haircut appropriate for currency mismatch of currency f_x .
- (c) *Market price volatility and currency mismatch haircuts.* (1) A [BANKING ORGANIZATION] must use the haircuts for market price volatility (H_s) in Table 1 to § _____.115, as adjusted in certain circumstances as provided in paragraphs (c)(3) through (5) of this section.

Table 1 to § __.115—Market Price Volatility Haircuts

Residual Maturity		Securities issued by a sovereign or an issuer described in § __.111(b) ¹ (percent)				Other investment-grade securities (percent)	
		Issuer risk weight of 0%	Issuer risk weight of 20% or 50%	Issuer risk weight of 100%	GSE exposures	Exposures other than GSE exposures or securitization exposures	Senior securitization exposures with risk weight <100%
Debt Securities	Less than or equal to 1 year	0.5	1.0	15.0	1.0	2.0	4.0
	Greater than 1 year and less than or equal to 3 years	2.0	3.0	15.0	4.0	4.0	12.0
	Greater than 3 years and less than or equal to 5 years					6.0	
	Greater than 5 years and less than or equal to 10 years	4.0	6.0	15.0	8.0	12.0	24.0
	Greater than 10 years					20.0	
	Main index equities (including convertible bonds) and gold					20.0	
	Other publicly traded equities and convertible bonds					30.0	
	Mutual funds and exchange traded funds	Highest haircut applicable to any security in which the fund can invest, unless the banking organization can apply the full look-through approach for equity investments in funds § __.142(b), in which case the banking organization may use a weighted average of haircuts applicable to the securities held by the fund.					
	Cash on deposit					0.0	
	Other exposure types ²					30.0	

¹ Includes a foreign PSE that receives a zero percent risk weight.

² Includes senior securitization exposures with a risk weight greater than or equal to 100 percent and sovereign exposures with a risk weight greater than 100 percent.

(2) For currency mismatches, a [BANKING ORGANIZATION] must use a haircut for foreign exchange rate volatility (H_{fx}) of 8 percent, as adjusted in certain circumstances under paragraphs (b)(3) and (4) of this section.

(3) For repo-style transactions, a [BANKING ORGANIZATION] may multiply the haircuts provided in paragraphs (b)(1) and (2) of this section by the square root of $\frac{1}{2}$ (which equals 0.707107).

(4) A [BANKING ORGANIZATION] must adjust the haircuts provided in paragraphs (c)(1) and (2) of this section upward on the basis of a holding period longer than ten business days for eligible margin loans or a holding period longer than five business days for repo-style transactions that are not cleared transactions under the following conditions. If the number of trades in a

netting set exceeds 5,000 at any time during a quarter, a [BANKING ORGANIZATION] must adjust the haircuts provided in paragraphs (c)(1) and (2) of this section upward on the basis of a holding period of twenty business days for the following quarter except in the calculation of exposure amount for purposes of § _____.116. If a netting set contains one or more trades involving illiquid collateral, a [BANKING ORGANIZATION] must adjust the haircuts provided in paragraphs (c)(1) and (2) of this section upward on the basis of a holding period

of twenty business days. If over the two previous quarters more than two margin disputes on a netting set have occurred that lasted longer than the holding period, then the [BANKING ORGANIZATION] must adjust the haircuts provided in paragraphs (c)(1) and (2) of this section upward for that netting set on the basis of a holding period that is at least two times the minimum holding period for that netting set. The [BANKING ORGANIZATION] must adjust the haircuts upward using the following formula:

$$H_a = H_s \sqrt{T_m/T_s}$$

Where:

- (i) T_m equals a holding period of longer than 10 business days for eligible margin loans or longer than 5 business days for repo-style transactions;
- (ii) H_s equals the market price volatility haircut provided in Table 1 to § _____.115 or to the foreign exchange rate volatility haircut provided in paragraph (c)(2) of this section; and
- (iii) T_s equals 10 business days for eligible margin loans or 5 business days for repo-style transactions.

(5) If the instruments a [BANKING ORGANIZATION] has lent, sold subject to repurchase, or posted as collateral do not meet the definition of financial collateral, the [BANKING ORGANIZATION] must use a 30 percent haircut for market price volatility (H_s).

§ _____.116 Cleared Transactions

(a) *General requirements*—(1) *Clearing member clients*. A [BANKING ORGANIZATION] that is a clearing member client must use the methodologies described in paragraph (b) of this section to calculate risk-weighted assets for a cleared transaction.

(2) *Clearing members*. A [BANKING ORGANIZATION] that is a clearing member must use the methodologies described in paragraph (c) of this section to calculate its risk-weighted assets for a cleared transaction and paragraph (d) of this section to calculate its risk-weighted assets for its default fund contribution to a CCP.

(b) *Clearing member client [BANKING ORGANIZATIONS]*—(1) *Risk-weighted assets for cleared transactions*. (i) To determine the risk-weighted asset amount for a cleared transaction, a [BANKING ORGANIZATION] that is a clearing member client must multiply the trade exposure amount for the cleared transaction, calculated in

accordance with paragraph (b)(2) of this section, by the risk weight appropriate for the cleared transaction, determined in accordance with paragraph (b)(3) of this section.

(ii) A clearing member client [BANKING ORGANIZATION]'s total risk-weighted assets for cleared transactions is the sum of the risk-weighted asset amounts for all of its cleared transactions.

(2) *Trade exposure amount*. (i) For a cleared transaction that is a derivative contract or a netting set of derivative contracts, trade exposure amount equals the exposure amount for the derivative contract or netting set of derivative contracts calculated using § _____.114, plus the fair value of the collateral posted by the clearing member client [BANKING ORGANIZATION] and held by the CCP, clearing member, or custodian in a manner that is not bankruptcy remote.

(ii) For a cleared transaction that is a repo-style transaction or netting set of repo-style transactions, trade exposure amount equals the exposure amount for the repo-style transaction calculated using § _____.115, plus the fair value of the collateral posted by the clearing member client [BANKING ORGANIZATION] and held by the CCP, clearing member, or custodian in a manner that is not bankruptcy remote.

(3) *Cleared transaction risk weights*.

(i) For a cleared transaction with a QCCP, a clearing member client [BANKING ORGANIZATION] must apply a risk weight of:

(A) Two percent if the collateral posted by the [BANKING ORGANIZATION] to the QCCP or clearing member is subject to an arrangement that prevents any loss to the clearing member client [BANKING ORGANIZATION] due to the joint default or a concurrent insolvency,

liquidation, or receivership proceeding of the clearing member and any other clearing member clients of the clearing member; and the clearing member client [BANKING ORGANIZATION] has conducted sufficient legal review to conclude with a well-founded basis (and maintains sufficient written documentation of that legal review) that in the event of a legal challenge (including one resulting from an event of default or from liquidation, insolvency, or receivership proceedings) the relevant court and administrative authorities would find the arrangements to be legal, valid, binding, and enforceable under the law of the relevant jurisdictions; or

(B) Four percent, if the requirements of paragraph (b)(3)(i)(A) of this section are not met.

(ii) For a cleared transaction with a CCP that is not a QCCP, a clearing member client [BANKING ORGANIZATION] must apply the risk weight applicable to the CCP under § _____.111.

(4) *Collateral*. (i) Notwithstanding any other requirement of this section, collateral posted by a clearing member client [BANKING ORGANIZATION] that is held by a custodian (in its capacity as a custodian) in a manner that is bankruptcy remote from the CCP, clearing member, and other clearing member clients of the clearing member, is not subject to a capital requirement under this section.

(ii) A clearing member client [BANKING ORGANIZATION] must calculate a risk-weighted asset amount for any collateral provided to a CCP, clearing member or a custodian in connection with a cleared transaction in accordance with requirements under subpart E or F of this part, as applicable.

(c) *Clearing member [BANKING ORGANIZATION]*—(1) *Risk-weighted*

assets for cleared transactions. (i) To determine the risk-weighted asset amount for a cleared transaction, a clearing member [BANKING ORGANIZATION] must multiply the trade exposure amount for the cleared transaction, calculated in accordance with paragraph (c)(2) of this section by the risk weight appropriate for the cleared transaction, determined in accordance with paragraph (c)(3) of this section.

(ii) A clearing member [BANKING ORGANIZATION]'s total risk-weighted assets for cleared transactions is the sum of the risk-weighted asset amounts for all of its cleared transactions.

(2) *Trade exposure amount.* A clearing member [BANKING ORGANIZATION] must calculate its trade exposure amount for a cleared transaction as follows:

(i) For a cleared transaction that is a derivative contract or a netting set of derivative contracts, trade exposure amount equals the exposure amount for the derivative contract or netting set of derivative contracts calculated using § _____.114, plus the fair value of the collateral posted by the clearing member [BANKING ORGANIZATION] and held by the CCP in a manner that is not bankruptcy remote.

(ii) For a cleared transaction that is a repo-style transaction or netting set of repo-style transactions, trade exposure amount equals the exposure amount for the repo-style transaction calculated using the methodology set forth in § _____.115, plus the fair value of the collateral posted by the clearing member [BANKING ORGANIZATION] and held by the CCP in a manner that is not bankruptcy remote.

(3) *Cleared transaction risk weights.* (i) A clearing member [BANKING

ORGANIZATION] must apply a risk weight of 2 percent to the trade exposure amount for a cleared transaction with a QCCP.

(ii) For a cleared transaction with a CCP that is not a QCCP, a clearing member [BANKING ORGANIZATION] must apply the risk weight applicable to the CCP according to § _____.111.

(iii) Notwithstanding paragraphs (c)(3)(i) and (ii) of this section, a clearing member [BANKING ORGANIZATION] may apply a risk weight of zero percent to the trade exposure amount for a cleared transaction with a QCCP where the clearing member [BANKING ORGANIZATION] is acting as a financial intermediary on behalf of a clearing member client, the transaction offsets another transaction that satisfies the requirements set forth in § _____.3(a), and the clearing member [BANKING ORGANIZATION] is not obligated to reimburse the clearing member client in the event of the QCCP default.

(4) *Collateral.* (i) Notwithstanding any other requirement of this section, collateral posted by a clearing member [BANKING ORGANIZATION] that is held by a custodian in a manner that is bankruptcy remote from the CCP is not subject to a capital requirement under this section.

(ii) A clearing member [BANKING ORGANIZATION] must calculate a risk-weighted asset amount for any collateral provided to a CCP, clearing member or a custodian in connection with a cleared transaction in accordance with requirements under subparts E or F of this part, as applicable.

(d) *Default fund contributions—*(1) *General requirement.* A clearing member [BANKING ORGANIZATION] must determine the risk-weighted asset

amount for a default fund contribution to a CCP at least quarterly, or more frequently if, in the opinion of the [BANKING ORGANIZATION] or the [AGENCY], there is a material change in the financial condition of the CCP. The total risk-weighted assets for default fund contributions of a clearing member [BANKING ORGANIZATION] is the sum of the [BANKING ORGANIZATION]'s risk-weighted assets for all of its default fund contributions to all CCPs of which the [BANKING ORGANIZATION] is a clearing member.

(2) *Risk-weighted asset amount for default fund contributions to nonqualifying CCPs.* A clearing member [BANKING ORGANIZATION]'s risk-weighted asset amount for default fund contributions to CCPs that are not QCCPs equals the sum of such default fund contributions multiplied by 1,250 percent, or an amount determined by the [AGENCY], based on factors such as size, structure, and membership characteristics of the CCP and riskiness of its transactions, in cases where such default fund contributions may be unlimited.

(3) *Risk-weighted asset amount for default fund contributions to QCCPs.* A clearing member [BANKING ORGANIZATION]'s risk-weighted asset amount for default fund contributions to QCCPs equals the sum of its capital requirement, KCM for each QCCP, as calculated under the methodology set forth in paragraph (d)(4) of this section, multiplied by 12.5.

(4) *Capital requirement for default fund contributions to a QCCP.* A clearing member [BANKING ORGANIZATION]'s capital requirement for its default fund contribution to a QCCP (KCM) is equal to:

$$K_{CM} = \max \left\{ K_{CCP} * \left(\frac{DF^{pref}}{DF_{CCP} + DF_{CCPCM}^{pref}} \right); 0.16 \text{ percent} * DF^{pref} \right\}$$

Where:

K_{CCP} is the hypothetical capital requirement of the QCCP, as determined under paragraph (d)(5) of this section;

DF^{pref} is the prefunded default fund contribution of the clearing member [BANKING ORGANIZATION] to the QCCP;

DF_{CCP}^{pref} is the QCCP's own prefunded amounts that are contributed to the default waterfall and are junior or *pari passu*

with prefunded default fund contributions of clearing members of the CCP; and

DF_{CCPCM}^{pref} is the total prefunded default fund contributions from clearing members of the QCCP to the QCCP.

(5) *Hypothetical capital requirement of a QCCP.* Where a QCCP has provided its KCCP, a [BANKING ORGANIZATION] must rely on such disclosed figure instead of calculating

KCCP under this paragraph (d)(5), unless the [BANKING ORGANIZATION] determines that a more conservative figure is appropriate based on the nature, structure, or characteristics of the QCCP. The hypothetical capital requirement of a QCCP (K_{CCP}), as determined by the [BANKING ORGANIZATION], is equal to:

$$K_{CCP} = \sum_{CM_i} EA_i * 1.6 \text{ percent}$$

Where:

CM_i is each clearing member of the QCCP; and

EA_i is the exposure amount of the QCCP to each clearing member of the QCCP to the QCCP, as determined under paragraph (d)(6) of this section.

(6) *Exposure amount of a QCCP to a clearing member.* (i) The exposure amount of a QCCP to a clearing member is equal to the sum of the exposure amount for derivative contracts determined under paragraph (d)(6)(ii) of this section and the exposure amount for repo-style transactions determined under paragraph (d)(6)(iii) of this section.

(ii) With respect to any derivative contracts between the QCCP and the clearing member and any guarantees that the clearing member has provided to the QCCP with respect to performance of a clearing member client on a derivative contract, the exposure amount is equal to the exposure amount of the QCCP to the clearing member for all such derivative contracts and guaranteed derivative contracts calculated under SA-CCR in § _____.114 (or, with respect to a QCCP located outside the United States, under a substantially identical methodology in effect in the jurisdiction) using a value of 10 business days for purposes of § _____.114(i)(4), provided that for this calculation, in place of the net independent collateral amount, the calculation must include the fair value amount of the independent collateral, as adjusted by the market price volatility haircut under Table 1 to § _____.115, as applicable, posted to the QCCP by the clearing member, including collateral posted on behalf of a client of the clearing member in connection with a derivative contract for which the clearing member has provided guarantees to the QCCP, plus the amount of the prefunded default fund contribution, as adjusted by the market price volatility haircut under Table 1 to § _____.115, as applicable, plus the amount of the prefunded default fund contribution of the clearing member to the QCCP.

(iii) With respect to any repo-style transactions between the clearing member and the QCCP that are cleared transactions, exposure amount (EA) is equal to:

$$EA = \max \{EBRMI - IM_i - DFi; 0\}$$

Where:

$EBRMI$ is the exposure amount of the QCCP to each clearing member for all repo-style transactions between the QCCP and the clearing member, as determined under § _____.115 and without recognition of the initial margin collateral posted by the clearing member to the QCCP with respect to the repo-style transactions or the prefunded default fund contribution of the clearing member institution to the QCCP;

IM_i is the initial margin collateral posted by each clearing member to the QCCP with respect to the repo-style transactions; and

DF_i is the prefunded default fund contribution of each clearing member to the QCCP that is not already deducted in paragraph (d)(6)(ii) of this section.

(iv) Exposure amount must be calculated separately for each clearing member's sub-client accounts and sub-house account (*i.e.*, for the clearing member's proprietary activities). If the clearing member's collateral and its client's collateral are held in the same default fund contribution account, then the exposure amount of that account is the sum of the exposure amount for the client-related transactions within the account and the exposure amount of the house-related transactions within the account. For purposes of determining such exposure amounts, the independent collateral of the clearing member and its client must be allocated in proportion to the respective total amount of independent collateral posted by the clearing member to the QCCP.

(v) If any account or sub-account contains both derivative contracts and repo-style transactions, the exposure amount of that account is the sum of the exposure amount for the derivative contracts within the account and the exposure amount of the repo-style transactions within the account. If independent collateral is held for an account containing both derivative contracts and repo-style transactions, then such collateral must be allocated to the derivative contracts and repo-style transactions in proportion to the respective product specific exposure amounts, calculated, excluding the effects of collateral, according to § _____.115 for repo-style transactions and to § _____.114 for derivative contracts.

(vi) Notwithstanding any other provision of paragraph (d) of this section, with the prior approval of the [AGENCY], a [BANKING ORGANIZATION] may determine the risk-weighted asset amount for a default

fund contribution to a QCCP according to § _____.35(d)(3)(i) through (iii).

§ _____.117 Unsettled Transactions

(a) *Definitions.* For purposes of this section:

(1) *Delivery-versus-payment (DvP) transaction* means a securities or commodities transaction in which the buyer is obligated to make payment only if the seller has made delivery of the securities or commodities and the seller is obligated to deliver the securities or commodities only if the buyer has made payment.

(2) *Payment-versus-payment (PvP) transaction* means a foreign exchange transaction in which each counterparty is obligated to make a final transfer of one or more currencies only if the other counterparty has made a final transfer of one or more currencies.

(3) A transaction has a normal settlement period if the contractual settlement period for the transaction is equal to or less than the market standard for the instrument underlying the transaction and equal to or less than five business days.

(4) Positive current exposure of a [BANKING ORGANIZATION] for a transaction is the difference between the transaction value at the agreed settlement price and the current market price of the transaction, if the difference results in a credit exposure of the [BANKING ORGANIZATION] to the counterparty.

(b) *Scope.* This section applies to all transactions involving securities, foreign exchange instruments, and commodities that have a risk of delayed settlement or delivery. This section does not apply to:

(1) Cleared transactions that are marked-to-market daily and subject to daily receipt and payment of variation margin;

(2) Repo-style transactions, including unsettled repo-style transactions;

(3) One-way cash payments on OTC derivative contracts; or

(4) Transactions with a contractual settlement period that is longer than the normal settlement period (which are treated as OTC derivative contracts).

(c) *System-wide failures.* In the case of a system-wide failure of a settlement, clearing system or central counterparty, the [AGENCY] may waive risk-based capital requirements for unsettled and failed transactions until the situation is rectified.

(d) *Delivery-versus-payment (DvP) and payment-versus-payment (PvP)*

transactions. A [BANKING ORGANIZATION] must hold risk-based capital against any DvP or PvP transaction with a normal settlement period if the [BANKING ORGANIZATION]'s counterparty has

not made delivery or payment within five business days after the settlement date. The [BANKING ORGANIZATION] must determine its risk-weighted asset amount for such a transaction by multiplying the positive current

exposure of the transaction for the [BANKING ORGANIZATION] by the appropriate risk weight in Table 1 to § __.117.

Table 1 to § __.117—Risk Weights for Unsettled DvP and PvP Transactions

Number of business days after contractual settlement date	Risk weight to be applied to positive current exposure (in percent)
From 5 to 15	100.0
From 16 to 30	625.0
From 31 to 45	937.5
46 or more	1,250.0

(e) *Non-DvP/non-PvP (non-delivery-versus-payment/non-payment-versus-payment) transactions.* (1) A [BANKING ORGANIZATION] must hold risk-based capital against any non-DvP/non-PvP transaction with a normal settlement period if the [BANKING ORGANIZATION] has delivered cash, securities, commodities, or currencies to its counterparty but has not received its corresponding deliverables by the end of the same business day. The [BANKING ORGANIZATION] must continue to hold risk-based capital against the transaction until the [BANKING ORGANIZATION] has received its corresponding deliverables.

(2) From the business day after the [BANKING ORGANIZATION] has made its delivery until five business days after the counterparty delivery is due, the [BANKING ORGANIZATION] must calculate the risk-weighted asset amount for the transaction by treating the current fair value of the deliverables owed to the [BANKING ORGANIZATION] as an exposure to the counterparty and using the applicable counterparty risk weight under this subpart.

(3) If the [BANKING ORGANIZATION] has not received its deliverables by the fifth business day after counterparty delivery was due, the [BANKING ORGANIZATION] must assign a 1,250 percent risk weight to the current fair value of the deliverables owed to the [BANKING ORGANIZATION].

(f) *Total risk-weighted assets for unsettled transactions.* Total risk-weighted assets for unsettled transactions is the sum of the risk-weighted asset amounts of all DvP, PvP, and non-DvP/non-PvP transactions.

Credit Risk Mitigation

§ __.120 Guarantees and Credit Derivatives: Substitution Approach

(a) Scope—(1) A [BANKING ORGANIZATION] may recognize the credit risk mitigation benefits of an eligible guarantee or eligible credit derivative that is not an nth-to-default credit derivative by substituting the risk weight associated with the protection provider for the risk weight assigned to an exposure, as provided under this section.

(2) This section applies to exposures for which:

(i) Credit risk is fully covered by an eligible guarantee or eligible credit derivative; or

(ii) Credit risk is covered on a pro rata basis (that is, on a basis in which the [BANKING ORGANIZATION] and the protection provider share losses proportionately) by an eligible guarantee or eligible credit derivative.

(3) Exposures on which there is a tranching of credit risk (reflecting at least two different levels of seniority) generally are securitization exposures subject to §§ __.130 through __.134.

(4) If multiple eligible guarantees or eligible credit derivatives cover a single exposure described in this section, a [BANKING ORGANIZATION] may treat the hedged exposure as multiple separate exposures, each covered by a single eligible guarantee or eligible credit derivative, and may calculate a separate risk-weighted asset amount for each separate exposure as described in paragraph (c) of this section.

(5) If a single eligible guarantee or eligible credit derivative covers multiple hedged exposures described in paragraph (a)(2) of this section, a

[BANKING ORGANIZATION] must treat each hedged exposure as covered by a separate eligible guarantee or eligible credit derivative and must calculate a separate risk-weighted asset amount for each exposure as described in paragraph (c) of this section.

(b) *Rules of recognition.* (1) A [BANKING ORGANIZATION] may only recognize the credit risk mitigation benefits of eligible guarantees and eligible credit derivatives that are not nth-to-default credit derivatives.

(2) A [BANKING ORGANIZATION] may only recognize the credit risk mitigation benefits of an eligible credit derivative to hedge an exposure that is different from the credit derivative's reference exposure used for determining the derivative's cash settlement value, deliverable obligation, or occurrence of a credit event if:

(i) The reference exposure ranks *pari passu* with, or is subordinated to, the hedged exposure;

(ii) The reference exposure and the hedged exposure are to the same legal entity; and

(iii) Legally enforceable cross-default or cross-acceleration clauses are in place to ensure payments under the credit derivative are triggered when the obligated party of the hedged exposure fails to pay under the terms of the hedged exposure.

(c) *Substitution approach*—(1) *Full coverage.* If an eligible guarantee or eligible credit derivative meets the conditions in paragraphs (a) and (b) of this section and the protection amount (P) of the guarantee or credit derivative is greater than or equal to the exposure amount of the hedged exposure, a [BANKING ORGANIZATION] may recognize the guarantee or credit

derivative in determining the risk-weighted asset amount for the hedged exposure by substituting the risk weight applicable to the guarantor or credit derivative protection provider under this subpart for the risk weight assigned to the exposure.

(2) *Partial coverage.* If an eligible guarantee or eligible credit derivative meets the conditions in paragraphs (a) and (b) of this section and the protection amount (P) of the guarantee or credit derivative is less than the exposure amount of the hedged exposure, the [BANKING ORGANIZATION] must treat the hedged exposure as two separate exposures (protected and unprotected) in order to recognize the credit risk mitigation benefit of the guarantee or credit derivative.

(i) The [BANKING ORGANIZATION] may calculate the risk-weighted asset amount for the protected exposure under this subpart E, where the applicable risk weight is the risk weight applicable to the guarantor or credit derivative protection provider.

(ii) The [BANKING ORGANIZATION] must calculate the risk-weighted asset amount for the unprotected exposure under this subpart E, where the applicable risk weight is that of the unprotected portion of the hedged exposure.

(iii) The treatment provided in this section is applicable when the credit risk of an exposure is covered on a partial pro rata basis and may be applicable when an adjustment is made to the effective notional amount of the guarantee or credit derivative under paragraph (d), (e), or (f) of this section.

(d) *Maturity mismatch adjustment.* (1) A [BANKING ORGANIZATION] that recognizes an eligible guarantee or eligible credit derivative in determining the risk-weighted asset amount for a hedged exposure must adjust the effective notional amount of the credit risk mitigant to reflect any maturity mismatch between the hedged exposure and the credit risk mitigant.

(2) A maturity mismatch occurs when the residual maturity of a credit risk mitigant is less than that of the hedged exposure(s).

(3) The residual maturity of a hedged exposure is the longest possible remaining time before the obligated party of the hedged exposure is scheduled to fulfil its obligation on the hedged exposure. If a credit risk mitigant has embedded options that may reduce its term, the [BANKING ORGANIZATION] (protection purchaser) must adjust the residual

maturity of the credit risk mitigant. If a call is at the discretion of the protection provider, the residual maturity of the credit risk mitigant is at the first call date. If the call is at the discretion of the [BANKING ORGANIZATION] (protection purchaser), but the terms of the arrangement at origination of the credit risk mitigant contain a positive incentive for the [BANKING ORGANIZATION] to call the transaction before contractual maturity, the remaining time to the first call date is the residual maturity of the credit risk mitigant.

(4) A credit risk mitigant with a maturity mismatch may be recognized only if its original maturity is greater than or equal to one year and its residual maturity is greater than three months.

(5) When a maturity mismatch exists, the [BANKING ORGANIZATION] must apply the following adjustment to reduce the effective notional amount of the credit risk mitigant:

$$P_m = E \times (t - 0.25) / (T - 0.25),$$

where:

- (i) P_m = effective notional amount of the credit risk mitigant, adjusted for maturity mismatch;
- (ii) E = effective notional amount of the credit risk mitigant;
- (iii) t = the lesser of T or the residual maturity of the credit risk mitigant, expressed in years; and
- (iv) T = the lesser of five or the residual maturity of the hedged exposure, expressed in years.

(e) *Adjustment for credit derivatives without restructuring as a credit event.*

(1) If a [BANKING ORGANIZATION] recognizes an eligible credit derivative that does not include as a credit event a restructuring of the hedged exposure involving forgiveness or postponement of principal, interest, or fees that results in a credit loss event (that is, a charge-off, specific provision, or other similar debit to the profit and loss account), the [BANKING ORGANIZATION] must apply the adjustment in paragraph (e)(2) of this section to reduce the effective notional amount of the credit derivative unless:

(i) The terms of the hedged exposure and the reference exposure, if different from the hedged exposure, allow the maturity, principal, coupon, currency, or seniority status of the exposure to be amended outside of receivership, insolvency, liquidation, or similar proceeding only by unanimous consent of all parties, and

(ii) The [BANKING ORGANIZATION] has conducted sufficient legal review to

conclude with a well-founded basis (and maintains sufficient written documentation of that legal review) that the hedged exposure is subject to the U.S. Bankruptcy Code, the Federal Deposit Insurance Act, or a domestic or foreign insolvency regime with similar features that allow for a company to liquidate, reorganize, or restructure and provides for an orderly settlement of creditor claims.

(2) The [BANKING ORGANIZATION] must apply the following adjustment to reduce the effective notional amount of any eligible credit derivative that is subject to adjustment under paragraph (e)(1) of this section:

$$Pr = P_m \times 0.60,$$

where:

- (i) Pr = effective notional amount of the credit risk mitigant, adjusted for lack of restructuring event (and maturity mismatch, if applicable); and
- (ii) P_m = effective notional amount of the credit risk mitigant (adjusted for maturity mismatch, if applicable).

(f) *Currency mismatch adjustment.* (1) If a [BANKING ORGANIZATION] recognizes an eligible guarantee or eligible credit derivative that is denominated in a currency different from that in which the hedged exposure is denominated, the [BANKING ORGANIZATION] must apply the following formula to the effective notional amount of the guarantee or credit derivative:

$$P_c = Pr \times (1 - H_{FX}),$$

where:

- (i) P_c = effective notional amount of the credit risk mitigant, adjusted for currency mismatch (and maturity mismatch and lack of restructuring event, if applicable);
- (ii) Pr = effective notional amount of the credit risk mitigant (adjusted for maturity mismatch and lack of restructuring event, if applicable); and
- (iii) H_{FX} = haircut appropriate for the currency mismatch between the credit risk mitigant and the hedged exposure, as determined under paragraphs (f)(2) through (3) of this section.

(2) Subject to paragraph (f)(3) of this section, a [BANKING ORGANIZATION] must set H_{FX} equal to eight percent.

(3) A [BANKING ORGANIZATION] must increase H_{FX} as determined under paragraph (f)(2) of this section if the [BANKING ORGANIZATION] revalues the guarantee or credit derivative less frequently than once every 10 business days using the following formula:

$H_{FX} = 8\% \times \sqrt{\frac{T_M}{10}}$, where T_M equals the greater of 10 or the number of business days between revaluations.

§ _____.121 Collateralized Transactions and Prepaid Credit Protection Arrangements

(a) *Financial Collateral.* To recognize the risk-mitigating effects of financial collateral, a [BANKING ORGANIZATION] may use the simple approach in paragraph (b) of this section for any exposure for which the [BANKING ORGANIZATION] does not use §§ _____.113 through _____.115 to calculate the exposure amount for counterparty credit risk. A [BANKING ORGANIZATION] must use the same approach to recognize the risk-mitigating effects of financial collateral for similar exposures or transactions.

(b) *The simple approach—(1) General requirements.* To qualify for the simple approach under this paragraph (b), the financial collateral must meet the following requirements:

(i) The collateral must be revalued at least every six months;

(ii) The legal mechanism by which financial collateral is pledged or transferred must be enforceable in the relevant jurisdictions and ensure that the [BANKING ORGANIZATION] has the contractual right, as applicable to the characteristics of the financial collateral and exposure, to liquidate or take legal possession of the financial collateral, setoff amounts owed to the obligor against amounts owed to the [BANKING ORGANIZATION] and close out any transaction giving rise to the secured exposure, in a timely manner, in the event of the default, insolvency or bankruptcy (or one or more otherwise-defined credit events set out in the transaction documentation) of the obligor;

(iii) If the financial collateral has been pledged or transferred by a party other than the obligor of the secured exposure, the bankruptcy or insolvency of the pledgor or transferor must not terminate or impair the enforceability of the legal mechanism that establishes the [BANKING ORGANIZATION]'s rights in respect of the financial collateral; and

(iv) The [BANKING ORGANIZATION] must be able to reasonably demonstrate the ability to protect and enforce its rights in respect of any financial collateral.

(2) *Risk weight substitution.* (i) A [BANKING ORGANIZATION] may apply a risk weight to the portion of an exposure that is secured by financial collateral that meets the requirements of paragraph (b) of this section, up to the

protection amount of the financial collateral as adjusted by paragraph (d) of this section, based on the risk weight assigned to the collateral under this subpart. For repurchase agreements, reverse repurchase agreements, and securities lending and borrowing transactions, the collateral is the instruments, gold, and cash the [BANKING ORGANIZATION] has borrowed, purchased subject to resale, or taken as collateral from the counterparty under the transaction. Except as provided in paragraph (b)(3) of this section, the risk weight assigned to the portion of the exposure secured by financial collateral may not be less than 20 percent.

(ii) A [BANKING ORGANIZATION] must apply a risk weight to the amount of an exposure in excess of the protection amount of financial collateral securing the exposure based on the risk weight applicable to the exposure under this subpart.

(3) *Exceptions to the 20 percent risk weight floor and other requirements.* Notwithstanding paragraph (b)(2)(i) of this section, a [BANKING ORGANIZATION] may assign a zero percent risk weight up to the protection amount of the financial collateral where:

(i) The financial collateral is cash on deposit; or

(ii) The financial collateral is an exposure to a sovereign that qualifies for a zero percent risk weight under § _____.111, and the [BANKING ORGANIZATION] has discounted the fair value of the collateral by 20 percent.

(c) *Eligible prepaid credit protection arrangements.* (1) *Scope.* A [BANKING ORGANIZATION] may recognize the credit risk mitigation benefits of an eligible prepaid credit protection arrangement as provided under this paragraph.

(2) *Application.* This paragraph applies to exposures, including securitization exposures, for which:

(i) Credit risk is fully covered by an eligible prepaid credit protection arrangement; or

(ii) Credit risk is covered on a pro rata basis (that is, on a basis in which the [BANKING ORGANIZATION] and the protection provider share losses proportionately) by an eligible prepaid credit protection arrangement.

(3) *Tranching of credit risk.* Exposures on which there is a tranching of credit risk (reflecting at least two different levels of seniority) generally are

securitization exposures subject to § _____.130 through _____.134.

(4) *Multiple eligible prepaid credit protection arrangements.* If multiple eligible prepaid credit protection arrangements cover a single exposure, a [BANKING ORGANIZATION] may treat the hedged exposure as multiple separate exposures each covered by a single eligible credit protection arrangement and may calculate a separate risk-weighted asset amount for each separate exposure as described in paragraph (c)(6) of this section.

(5) *Single eligible credit protection arrangements.* If a single eligible credit protection arrangement covers multiple hedged exposures, a [BANKING ORGANIZATION] must treat each hedged exposure as covered by a separate eligible credit protection arrangement and must calculate a separate risk-weighted asset amount for each exposure as described in paragraph (c)(6) of this section.

(6) *Prepaid credit protection arrangements—The substitution approach.* (i) *Full coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the protection amount (P) of the prepaid credit protection arrangement is greater than or equal to the exposure amount of the reference exposure, a [BANKING ORGANIZATION] may assign a zero percent risk weight to the reference exposure.

(ii) *Partial coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the protection amount (P) of the prepaid credit protection arrangement is less than the exposure amount of the reference exposure, the [BANKING ORGANIZATION] must treat the reference exposure as two separate exposures (protected and unprotected) in order to recognize the credit risk mitigation benefit of the prepaid credit protection arrangement.

(A) The [BANKING ORGANIZATION] may apply a risk-weight of zero percent for the protected exposure.

(B) The [BANKING ORGANIZATION] must calculate the risk-weighted asset amount for the unprotected exposure under this subpart E, where the applicable risk weight is that of the unprotected portion of the reference exposure.

(C) The treatment provided in this section is applicable when the credit risk of a reference exposure is covered on a partial pro rata basis and may be applicable when an adjustment is made to the effective notional amount of the prepaid credit protection arrangement under paragraph (d) of this section.

(d) *Required adjustments—(1)*

Maturity mismatch adjustment. (i) A [BANKING ORGANIZATION] that recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section must adjust the amount of credit risk mitigation recognized to reflect any maturity mismatch.

(ii) A maturity mismatch occurs when:

(A) The residual maturity of the legal mechanism by which financial collateral is pledged is less than that of the secured exposure(s); or

(B) The residual maturity of an eligible prepaid credit protection arrangement is less than that of the reference exposure.

(iii) The residual maturity of a secured exposure under paragraph (b) of this section or a reference exposure under paragraph (c) of this section is the longest possible remaining time before the obligated party of the secured exposure or reference exposure is scheduled to fulfil its obligation on the exposure. For purposes of this paragraph (d)(1)(iii):

(A) For an eligible prepaid credit protection arrangement, if the terms of the arrangement include embedded options that may reduce its term, the [BANKING ORGANIZATION] (protection purchaser) must adjust the residual maturity. If a call is at the discretion of the protection provider, the residual maturity is at the first call date. If the call is at the discretion of the [BANKING ORGANIZATION] (protection purchaser), but the terms of the arrangement at origination contain a positive incentive for the [BANKING ORGANIZATION] to cancel the

arrangement before contractual maturity, the remaining time to the first call date is the residual maturity.

(B) For financial collateral that is not cash on deposit at the [BANKING ORGANIZATION], but including cash held for the [BANKING ORGANIZATION] by a third-party custodian or trustee, the residual maturity of any amount of such financial collateral is the earliest date on which the [BANKING ORGANIZATION]'s rights in respect of such amount of financial collateral may be terminated without the pledgor being subject to a contemporaneous requirement to pledge additional financial collateral. For financial collateral that is cash on deposit at the [BANKING ORGANIZATION], the residual maturity of any amount of such cash collateral is the earliest date on which a depositor may withdraw such amount, notwithstanding any notice requirements or early withdrawal fees or penalties.

(iv) The credit risk mitigation benefits of financial collateral or an eligible prepaid credit protection arrangement with a maturity mismatch may be recognized only if the original maturity of the legal mechanism by which financial collateral is pledged or the eligible prepaid credit protection arrangement is greater than or equal to one year and its residual maturity is greater than three months.

(v) When a maturity mismatch exists, the [BANKING ORGANIZATION] must apply the following adjustment to reduce the protection amount:

$$P_m = E \times (t - 0.25) / (T - 0.25),$$

where:

(A) P_m = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement, adjusted for maturity mismatch;

(B) E = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement;

(C) t = the lesser of T or the residual maturity of the arrangement, expressed in years; and

(D) T = the lesser of five or the residual maturity of the secured exposure or reference exposure, expressed in years.

(2) *Currency mismatch adjustment.* (i) If a [BANKING ORGANIZATION] recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section that is denominated in a currency different from that in which the secured or reference exposure is denominated, the [BANKING ORGANIZATION] must apply the following formula to the fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement:

$$P_c = P_r \times (1 - H_{FX}),$$

where:

(A) P_c = fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement, adjusted for currency mismatch (and maturity mismatch, if applicable);

(B) P_r = fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement (adjusted for maturity mismatch, if applicable); and

(C) H_{FX} = haircut appropriate for the currency mismatch between the financial collateral and the secured exposure or the eligible prepaid credit protection arrangement and the reference exposure, as determined under paragraphs (d)(2)(ii) through (iii) of this section.

(ii) Subject to paragraph (d)(2)(iii) of this section, a [BANKING ORGANIZATION] must set H_{FX} equal to eight percent.

(iii) A [BANKING ORGANIZATION] must increase H_{FX} as determined under paragraph (d)(2)(ii) of this section if the [BANKING ORGANIZATION] revalues the financial collateral or eligible prepaid credit protection arrangement less frequently than once every 10 business days using the following formula:

$$H_{FX} = 8\% \times \sqrt{\frac{T_M}{10}}, \text{ where } T_M \text{ equals the greater of 10 or the number of business days}$$

between revaluations.

Risk-Weighted Assets for Securitization Exposures

§ _____.130 Operational Criteria for Recognizing the Transfer of Risk.

(a) *Operational criteria for traditional securitizations.* A [BANKING ORGANIZATION] that transfers exposures it has originated or purchased to a third party in connection with a traditional securitization may exclude the exposures from the calculation of its risk-weighted assets only if each condition in this section is satisfied. A [BANKING ORGANIZATION] that meets these conditions must hold risk-based capital against any credit risk it retains in connection with the securitization. A [BANKING ORGANIZATION] that fails to meet these conditions must hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO strip that does not constitute after-tax gain-on-sale. If the transferred exposures are in connection with a resecuritization and all of the conditions in this paragraph (a) are satisfied, the [BANKING ORGANIZATION] must exclude the exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the resecuritization. The conditions are:

(1) The exposures are not reported on the [BANKING ORGANIZATION]'s consolidated balance sheet under GAAP;

(2) The [BANKING ORGANIZATION] has transferred to one or more third parties credit risk associated with the underlying exposures;

(3) Any clean-up calls relating to the securitization are eligible clean-up calls; and

(4) The securitization does not:

(i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and

(ii) Contain an early amortization provision.

(b) *Operational criteria for synthetic securitizations.* For synthetic securitizations, a [BANKING ORGANIZATION] may recognize for risk-based capital purposes the use of a credit risk mitigant to hedge underlying exposures only if each condition in this paragraph (b) is satisfied. A [BANKING ORGANIZATION] that meets these conditions must hold risk-based capital against any credit risk of the exposures it retains in connection with the

synthetic securitization. A [BANKING ORGANIZATION] that fails to meet these conditions or chooses not to recognize the credit risk mitigant for purposes of this section must instead hold risk-based capital against the underlying exposures as if they had not been synthetically securitized. If the synthetic securitization is a resecuritization and all of the conditions in this paragraph (b) are satisfied, the [BANKING ORGANIZATION] must exclude the underlying securitization exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the resecuritization. The conditions are:

(1) The credit risk mitigant is:

(i) Financial collateral;

(ii) A guarantee that meets all criteria as set forth in the definition of *eligible guarantee* in § _____.2, except for the criteria in paragraph (3) of that definition;

(iii) A credit derivative that is not an nth-to-default credit derivative and that meets all criteria as set forth in the definition of *eligible credit derivative* in § _____.2, except for the criteria in paragraph (3) of the definition of *eligible guarantee* in § _____.2; or

(iv) A prepaid credit protection arrangement that meets all criteria as set forth in the definition of *eligible prepaid credit protection arrangement* in § _____.2, except for the criteria in paragraph (3) of that definition.

(2) The [BANKING ORGANIZATION] transfers credit risk associated with the underlying exposures to one or more third parties, and the terms and conditions in the credit risk mitigants employed do not include provisions that:

(i) Allow for the termination of the credit protection due to deterioration in the credit quality of the underlying exposures;

(ii) Require the [BANKING ORGANIZATION] to alter or replace the underlying exposures to improve the credit quality of the underlying exposures;

(iii) Increase the [BANKING ORGANIZATION]'s cost of credit protection in response to deterioration in the credit quality of the underlying exposures;

(iv) Increase the yield payable to parties other than the [BANKING ORGANIZATION] in response to a deterioration in the credit quality of the underlying exposures; or

(v) Provide for increases in a retained first loss position or credit enhancement provided by the [BANKING ORGANIZATION] after the inception of the securitization;

(3) The [BANKING ORGANIZATION] obtains a well-reasoned opinion from legal counsel that confirms the enforceability of the credit risk mitigant in all relevant jurisdictions;

(4) Any clean-up calls relating to the securitization are eligible clean-up calls;

(5) No synthetic excess spread is permitted within the synthetic securitization;

(6) Any applicable minimum payment threshold for the credit risk mitigant is consistent with standard market practice; and

(7) The securitization does not:

(i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and

(ii) Contain an early amortization provision.

(c) *Due diligence requirements for securitization exposures.* (1) Except for exposures that are deducted from common equity tier 1 capital and exposures subject to § _____.132(h), if a [BANKING ORGANIZATION] is unable to demonstrate to the satisfaction of the [AGENCY] a comprehensive understanding of the features of a securitization exposure that would materially affect the performance of the exposure, the [BANKING ORGANIZATION] must assign the securitization exposure a risk weight of 1,250 percent. The [BANKING ORGANIZATION]'s analysis must be commensurate with the complexity of the securitization exposure and the materiality of the exposure in relation to its capital.

(2) A [BANKING ORGANIZATION] must demonstrate its comprehensive understanding of a securitization exposure under paragraph (c)(1) of this section, for each securitization exposure by:

(i) Conducting an analysis of the risk characteristics of a securitization exposure prior to acquiring the exposure and documenting such analysis within 3 business days after acquiring the exposure, considering:

(A) Structural features of the securitization that would materially impact the performance of the exposure, for example, the contractual cash flow waterfall, waterfall-related triggers, credit enhancements, liquidity enhancements, fair value triggers, the performance of organizations that service the exposure, and deal-specific definitions of default;

(B) Relevant information regarding—
(1) The performance the underlying credit exposure(s), for example, the percentage of loans 30, 60, and 90 days past due; default rates; prepayment

rates; loans in foreclosure; property types; occupancy; average credit score or other measures of creditworthiness; average LTV ratio; and industry and geographic diversification data on the underlying exposure(s); and

(2) For resecuritization exposures, in addition to the information described in paragraph (c)(2)(i)(B)(1) of this section, performance information on the underlying securitization exposures, which may include the issuer name and credit quality, and the characteristics and performance of the exposures underlying the securitization exposures; and

(C) Relevant market data of the securitization, for example, bid-ask spread, most recent sales price and historic price volatility, trading volume, implied market rating, and size, depth and concentration level of the market for the securitization; and

(ii) On an on-going basis (no less frequently than quarterly), evaluating, reviewing, and updating as appropriate the analysis required under paragraph (c)(1) of this section for each securitization exposure.

§ _____.131 Exposure Amount of a Securitization Exposure

(a) *On-balance sheet securitization exposure.* The exposure amount of an on-balance sheet securitization exposure (excluding a repo-style transaction, eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative) is equal to the [BANKING ORGANIZATION]'s carrying value of the exposure. For a credit derivative, a [BANKING ORGANIZATION] must apply § _____.132(i) or (j), as applicable.

(b) *Off-balance sheet securitization exposure.* Except as provided in § _____.132(h), the exposure amount of an off-balance sheet securitization exposure that is not a repo-style transaction, eligible margin loan, OTC derivative contract (other than a credit derivative), or cleared transaction (other than a credit derivative) is the notional amount of the exposure. For an off-balance sheet securitization exposure to an ABCP program, such as an eligible ABCP liquidity facility, the notional amount may be reduced to the maximum potential amount that the [BANKING ORGANIZATION] could be required to fund given the ABCP program's current underlying assets (calculated without regard to the current credit quality of those assets).

(c) *Repo-style transaction, eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative.* The exposure amount of a

securitization exposure that is a repo-style transaction, eligible margin loan, or OTC derivative contract (other than a credit derivative) is the exposure amount as calculated in accordance with §§ _____.113 through _____.115 or § _____.112, as applicable, and the exposure amount of a securitization exposure that is a cleared transaction that is not a credit derivative is the exposure amount as calculated in § _____.116.

§ _____.132 Risk-Weighted Assets for Securitization Exposures

(a) *General approach.* Except as provided elsewhere in this section and in § _____.130:

(1) A [BANKING ORGANIZATION] may, subject to the limitation under paragraph (e) of this section, apply the securitization standardized approach (SEC-SA) in § _____.133 to the exposure if the exposure meets the following requirements:

(i) The [BANKING ORGANIZATION] has accurate information on A , D , W , and K_G (as defined in § _____.133) for the exposure. Data used to assign the parameters described in this paragraph (a)(1)(i) must be the most currently available data. If the contracts governing the underlying exposures of the securitization require payments on a monthly or quarterly basis, the data used to assign the parameters described in this paragraph (a)(1)(i) must be no more than 91 calendar days old.

(ii) The [BANKING ORGANIZATION] has accurate information regarding whether the exposure is a resecuritization exposure.

(2) If the securitization exposure is an interest rate derivative contract, an exchange rate derivative contract, or a cash collateral account related to an interest rate or exchange rate derivative contract, the [BANKING ORGANIZATION] must assign a risk weight to the exposure equal to the risk weight of a securitization exposure that is *pari passu* to the interest rate derivative contract or exchange rate derivative contract or, if such an exposure does not exist, the risk weight of any subordinate securitization exposure.

(3) If the [BANKING ORGANIZATION] cannot apply, or chooses not to apply, the securitization standardized approach in § _____.133, the [BANKING ORGANIZATION] must apply a 1,250 percent risk weight to the exposure.

(b) *Total risk-weighted assets for securitization exposures.* A [BANKING ORGANIZATION]'s total risk-weighted assets for securitization exposures equals the sum of the risk-weighted

asset amount for securitization exposures that the [BANKING ORGANIZATION] risk weights under §§ _____.132 through _____.134, as applicable.

(c) *After-tax gain-on-sale resulting from a securitization.* Notwithstanding any other provision of this subpart, a [BANKING ORGANIZATION] must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from a securitization as well as the portion of a CEIO that does not constitute an after-tax gain-on sale.

(d) *Overlapping exposures.* (1) If a [BANKING ORGANIZATION] has multiple securitization exposures that provide duplicative coverage of the underlying exposures of a securitization (such as when a [BANKING ORGANIZATION] provides a program-wide credit enhancement and multiple pool-specific liquidity facilities to an ABCP program), the [BANKING ORGANIZATION] is not required to hold duplicative risk-based capital against the overlapping position. Instead, the [BANKING ORGANIZATION] may apply to the overlapping position the applicable risk-based capital treatment that results in the highest risk-based capital requirement.

(2) If a [BANKING ORGANIZATION] has two or more securitization exposures that partially overlap with each other, the [BANKING ORGANIZATION] may treat the exposures as overlapping and apply the treatment under paragraph (d)(1). For purposes of such a treatment under this paragraph (d)(2), the [BANKING ORGANIZATION] must include in expanded total risk-weighted assets the risk-weighted asset amount for a hypothetical securitization exposure that would fully overlap with all of the partially overlapping exposures.

(3) If a [BANKING ORGANIZATION] has a securitization exposure under this subpart that is an overlapping exposure with a securitization exposure that is a market risk covered position under subpart F of this part, the [BANKING ORGANIZATION] may assign to the overlapping securitization exposure the applicable risk-based capital treatment under either this subpart or subpart F, whichever results in the highest risk-based capital requirement.

(e) *Implicit support.* If a [BANKING ORGANIZATION] provides support to a securitization in excess of the [BANKING ORGANIZATION]'s contractual obligation to provide credit support to the securitization:

(1) The [BANKING ORGANIZATION] must calculate a risk-weighted asset amount for underlying exposures

associated with the securitization as if the exposures had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the securitization and any portion of a CEIO strip that does not constitute after-tax gain-on-sale; and

(2) The [BANKING ORGANIZATION] must disclose publicly:

(i) That it has provided implicit support to the securitization; and

(ii) The risk-based capital impact to the [BANKING ORGANIZATION] of providing such implicit support.

(f) *Undrawn portion of a servicer cash advance facility.* (1) Notwithstanding any other provision of this subpart, a [BANKING ORGANIZATION] that is a servicer under an eligible servicer cash advance facility is not required to hold risk-based capital against potential future cash advance payments that it may be required to provide under the contract governing the facility.

(2) For a [BANKING ORGANIZATION] that acts as a servicer, the exposure amount for a servicer cash advance facility that is not an eligible servicer cash advance facility is equal to the amount of all potential future cash advance payments that the [BANKING ORGANIZATION] may be contractually required to provide during the subsequent 12-month period under the contract governing the facility.

(g) *Interest-only mortgage-backed securities.* Notwithstanding any other provision of this subpart, the risk weight for a non-credit-enhancing interest-only mortgage-backed security may not be less than 100 percent.

(h) *Small-business loans and leases on personal property transferred with retained contractual exposure.* (1) Regardless of any other provision of this subpart, a [BANKING ORGANIZATION] that has transferred small-business loans and leases on personal property (small-business obligations) with recourse must include in risk-weighted assets only its contractual exposure to the small-business obligations if all the following conditions are met:

(i) The transaction must be treated as a sale under GAAP;

(ii) The [BANKING ORGANIZATION] establishes and maintains, pursuant to GAAP, a non-capital reserve sufficient to meet the [BANKING ORGANIZATION]'s reasonably estimated liability under the contractual obligation;

(iii) The small-business obligations are to businesses that meet the criteria for a small-business concern established by the Small Business Administration under section 3(a) of the Small Business Act (15 U.S.C. 632 *et seq.*); and

(iv) The [BANKING ORGANIZATION] is well capitalized for purposes of the Prompt Corrective Action framework (12 U.S.C. 1831o). For purposes of determining whether a [BANKING ORGANIZATION] is well capitalized for purposes of this paragraph (h), the [BANKING ORGANIZATION]'s capital ratios must be calculated without regard to the capital treatment for transfers of small-business obligations with recourse specified in paragraph (h)(1) of this section.

(2) The total outstanding amount of contractual exposure retained by a [BANKING ORGANIZATION] on transfers of small-business obligations receiving the capital treatment specified in paragraph (h)(1) of this section cannot exceed 15 percent of the [BANKING ORGANIZATION]'s total capital.

(3) If a [BANKING ORGANIZATION] ceases to be well capitalized, or exceeds the 15 percent capital limitation provided in paragraph (h)(2) of this section, the capital treatment specified in paragraph (h)(1) of this section will continue to apply to any transfers of small-business obligations with retained contractual exposure that occurred during the time that the [BANKING ORGANIZATION] was well capitalized and did not exceed the capital limit.

(4) The risk-based capital ratios of the [BANKING ORGANIZATION] must be calculated without regard to the capital treatment for transfers of small-business obligations specified in paragraph (h)(1) of this section for purposes of:

(i) Determining whether a [BANKING ORGANIZATION] is adequately capitalized, undercapitalized, significantly undercapitalized, or critically undercapitalized under the [AGENCY]'s prompt corrective action regulations; and

(ii) Reclassifying a well-capitalized [BANKING ORGANIZATION] to adequately capitalized and requiring an adequately capitalized [BANKING ORGANIZATION] to comply with certain mandatory or discretionary supervisory actions as if the [BANKING ORGANIZATION] were in the next lower prompt-corrective-action category.

(i) *Nth-to-default credit derivatives—(1) Protection provider.* A [BANKING ORGANIZATION] providing protection through a first-to-default or second-or-later-to-default derivative is subject to capital requirements on such instruments under this paragraph (i)(1).

(i) *First-to-default.* For first-to-default derivatives, a [BANKING ORGANIZATION] must aggregate by simple summation the risk weights of the assets covered up to a maximum of

1,250 percent and multiply by the nominal amount of the protection provided by the credit derivative to obtain the risk-weighted asset amount.

(ii) *Nth-to-default.* For second-or-later-to-default derivatives, in aggregating the risk weights, a [BANKING ORGANIZATION] may exclude the asset with the lowest risk-weighted amount from the risk-weighted capital calculation. This risk-based capital treatment applies for nth-to-default derivatives for which the n-1 assets with the lowest risk-weighted amounts can be excluded from the risk-weighted capital calculation.

(2) *Protection purchaser.* A [BANKING ORGANIZATION] is not permitted to recognize purchased protection in the form of an nth-to-default credit derivative as a credit risk mitigant. A [BANKING ORGANIZATION] must calculate the counterparty credit risk of a purchased nth-to-default credit derivative under §§ _____.113 through _____.114.

(j) *Guarantees, credit derivatives other than nth-to-default credit derivatives, and prepaid credit protection arrangements—(1) Protection provider.* For a guarantee, credit derivative (other than an nth-to-default credit derivative), or prepaid credit protection arrangement provided by a [BANKING ORGANIZATION] that covers the full amount or a pro rata share of a securitization exposure's principal and interest, the [BANKING ORGANIZATION] must risk-weight the guarantee, credit derivative, or prepaid credit protection arrangement under paragraph (a) of this section as if it held the portion of the securitization exposure covered by the guarantee, credit derivative, or prepaid credit protection arrangement.

(2) *Protection purchaser.* (i) A [BANKING ORGANIZATION] that purchases a credit derivative (other than an nth-to-default credit derivative) that is recognized under § _____.134 as a credit risk mitigant (including via recognized collateral) is not required to compute a separate counterparty credit risk capital requirement under §§ _____.113 through _____.114.

(ii) If a [BANKING ORGANIZATION] cannot, or chooses not to, recognize protection purchased in the form of a credit derivative as a credit risk mitigant under § _____.134, the [BANKING ORGANIZATION] must determine the exposure amount of the credit derivative under § _____.114.

(A) If the [BANKING ORGANIZATION] purchases credit protection from a counterparty the activities of which are limited to those appropriate for the specific purpose of

holding the underlying exposures of a securitization, the [BANKING ORGANIZATION] must determine the risk weight for the exposure according to § _____.111.

(B) If the [BANKING ORGANIZATION] purchases credit protection from a counterparty the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, the [BANKING ORGANIZATION] must determine the risk weight for the exposure according to this section.

(k) *Look-through approach.* (1) Subject to paragraph (k)(2) of this section, a [BANKING ORGANIZATION] may assign a risk weight to a senior securitization exposure that is not a resecuritization exposure equal to the greater of:

(i) The weighted-average risk weight, calculated without reference to, or use

of, the risk weight under § _____.141(b)(3)(iii), of all the underlying exposures where the weight for each exposure in the weighted-average calculation is determined by the unpaid principal amount of the exposure; and

(ii) 15 percent.

(2) A [BANKING ORGANIZATION] may assign a risk weight under this paragraph (k) only if the [BANKING ORGANIZATION] has knowledge of the composition of all of the underlying exposures.

(l) *NPL securitization.*

Notwithstanding any other provision of this subpart except for paragraph (e) of this section:

(1) If the nonrefundable purchase price discount for the NPL securitization is greater than or equal to 50 percent of the outstanding balance of the pool of exposures at inception of the transaction, the risk weight for a senior

securitization exposure to an NPL securitization is 100 percent.

(2) If the [BANKING ORGANIZATION] is an originating [BANKING ORGANIZATION] with respect to the NPL securitization, the [BANKING ORGANIZATION] may hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO that does not constitute an after-tax gain-on-sale.

§ _____.133 Securitization standardized approach (SEC-SA)

(a) *In general.* The risk weight assigned to a securitization exposure, or portion of a securitization exposure, is calculated according to the following formula:

$$RW_{SEC-SA} = \begin{cases} \max(RW_{FLOOR}, 1,250\% \cdot K_A), & K_A \leq A \\ \max\left(RW_{FLOOR}, \left(\frac{K_A - A}{D - A}\right) \cdot 1,250\% + \left(\frac{D - K_A}{D - A}\right) \cdot 1,250\% \cdot K_{SEC-SA}\right), & A < K_A < D \\ 1,250\%, & D \leq K_A \end{cases}$$

Where:

- (1) K_A is calculated under paragraph (b) of this section;
- (2) A (attachment point) equals the greater of zero and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of underlying exposures that are subordinated to the exposure of the [BANKING ORGANIZATION] to the current dollar amount of the underlying exposures, as adjusted in accordance with paragraph (a)(6) of this section;
- (3) D (detachment point) equals the greater of zero and the sum of parameter A and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of the securitization exposures that are *pari passu* with the exposure (that is, have equal seniority with respect to credit risk) to the current dollar amount of the underlying exposures, as adjusted in accordance with paragraph (a)(6) of this section;
- (4) RW_{FLOOR} equals 100 percent for resecuritization exposures and NPL securitization exposures and 15 percent for all other securitization exposures; and
- (5) K_{SEC-SA} is calculated according to the following formula:

$$K_{SEC-SA} = \frac{e^{a \cdot u} - e^{a \cdot l}}{a \cdot (u - l)}$$

Where:

(i) α equals

$$-\frac{1}{p \cdot K_A}$$

(as K_A is defined in this paragraph (a)), where p equals 1.5 for a resecuritization exposure and 0.5 for all other securitization exposures;

(ii) μ equals $D - K_A$ (as D and K_A are defined in paragraph (a) of this section);

(iii) l equals $\max(A - K_A, 0)$ (as A and K_A are defined in paragraph (a) of this section); and

(iv) e equals the base of the natural logarithm.

(6) A [BANKING ORGANIZATION] must include in the calculation of and the funded portion of any reserve account funded by the accumulated cash flows from the underlying exposures that is subordinated to the [BANKING ORGANIZATION]'s securitization exposure. Interest rate derivative contracts, exchange rate derivative contracts, and cash collateral accounts related to these contracts must not be included in the calculation of and . If the securitization exposure includes a nonrefundable purchase price discount, the nonrefundable purchase price discount must be

included in the numerator and denominator of and A and D .

(b) *Calculation of K_A .* K_A is calculated under this paragraph (b) according to the following formula:

$$K_A = (1 - W) \cdot K_G + (W \cdot 0.5)$$

Where:

- (1) W equals the ratio, expressed as a decimal value between zero and one, of the sum of the dollar amounts of any underlying exposures of the securitization that are not securitization exposures and that meet any of the criteria in paragraphs (b)(1)(i) through (vii) of this section to the outstanding balance of all underlying exposures:
 - (i) Ninety days or more past due;
 - (ii) Subject to a bankruptcy or insolvency proceeding;
 - (iii) In the process of foreclosure;
 - (iv) Held as real estate owned;
 - (v) Has contractually deferred payments for 90 days or more, other than principal or interest payments deferred on:
- (A) Federally guaranteed student loans, in accordance with the terms of those guarantee programs; or
- (B) Consumer loans, including non-federally-guaranteed student loans, provided that such payments are deferred pursuant to provisions included in the contract at the time funds are disbursed that provide for period(s) of deferral that are not initiated

- based on changes in the creditworthiness of the borrower; or
- (vi) Is in default; and
- (vii) Notwithstanding paragraphs (1)(i) through (vi) of this paragraph, an exposure that is directly and unconditionally guaranteed by the U.S. Government, its central bank, or a U.S. Government agency may be excluded from the calculation of W up to the amount of the guarantee; and
- (2) K_G equals the weighted average (with unpaid principal used as the weight for each credit exposure and fair value used for each equity exposure) total capital requirement, expressed as a decimal value between zero and one, of the underlying exposures calculated using this subpart E (that is, an average risk weight of 100 percent represents a value of K_G equal to 0.08), as adjusted in accordance with this paragraph (b)(2). For purposes of K_G , the determination of the capital requirement associated with an underlying exposure that is an equity exposure cannot use the risk weight under § _____.141(b)(3)(iii). For interest rate derivative contracts and exchange rate derivative contracts, the positive current exposure times the risk weight of the counterparty multiplied by 0.08 must be included in the numerator of K_G but must be excluded from the denominator of K_G .

§ _____.134 Recognition of Credit Risk Mitigants for Securitization Exposures

(a) *General.* (1) An originating [BANKING ORGANIZATION] that has obtained a credit risk mitigant to hedge its exposure to a synthetic or traditional securitization that satisfies the operational criteria provided in § _____.130 may recognize the credit risk mitigant under § _____.120 or § _____.121, but only as provided in this section.

(2) An investing [BANKING ORGANIZATION] that has obtained a credit risk mitigant to hedge a securitization exposure may recognize the credit risk mitigant under § _____.120 or § _____.121, but only as provided in this section.

(3) If the recognized credit risk mitigant hedges a portion of the [BANKING ORGANIZATION]'s securitization exposure, the [BANKING ORGANIZATION] must calculate its capital requirements for the hedged and unhedged portions of the exposure separately. For each unhedged portion, the [BANKING ORGANIZATION] must calculate capital requirements according to § _____.131 and § _____.132. For each hedged portion, the [BANKING ORGANIZATION] may recognize the credit risk mitigant under § _____.120 or § _____.121, but only as provided in this section.

(4) When a [BANKING ORGANIZATION] purchases or sells credit protection on a portion of a senior

tranche, the lower-priority portion, whether hedged or unhedged, must be considered a non-senior securitization exposure.

(b) *Mismatches.* A [BANKING ORGANIZATION] must make any applicable adjustment to the protection amount as required in §§ _____.120 or _____.121 for any hedged securitization exposure. In the context of a synthetic securitization, when a credit risk mitigant described in § _____.130(b)(1)(ii) through (iv) covers multiple hedged exposures that have different residual maturities, the [BANKING ORGANIZATION] must use the longest residual maturity of any of the hedged exposures as the residual maturity of all hedged exposures.

Risk-Weighted Assets for Equity Exposures

§ _____.140 Introduction and Exposure Measurement

(a) *General.* (1) *Calculation of risk-weighted asset amounts.* To calculate its risk-weighted asset amounts for equity exposures that are not equity exposures in investment funds, a [BANKING ORGANIZATION] must use the approach provided in § _____.141. A [BANKING ORGANIZATION] must use the approaches provided in § _____.142 to calculate its risk-weighted asset amounts for other equity exposures as provided in § _____.142.

(2) *Separate accounts.* A [BANKING ORGANIZATION] must treat an investment in a separate account (as defined in § _____.2) as if it were an equity exposure subject to § _____.142.

(3) *Stable value protection.*—(i) *Stable value protection* means a contract where the provider of the contract is obligated to pay:

(A) The policy owner of a separate account an amount equal to the shortfall between the fair value and cost basis of the separate account when the policy owner of the separate account surrenders the policy; or

(B) The beneficiary of the contract an amount equal to the shortfall between the fair value and book value of a specified portfolio of assets.

(ii) A [BANKING ORGANIZATION] that purchases stable value protection on its investment in a separate account must treat the portion of the carrying value of its investment in the separate account attributable to the stable value protection as an exposure to the provider of the protection and the remaining portion of the carrying value of its separate account as an equity exposure subject to § _____.142.

(iii) A [BANKING ORGANIZATION] that provides stable value protection

must treat the exposure as an equity derivative with an adjusted carrying value determined as the sum of paragraphs (b)(1) and (2) of this section.

(b) *Adjusted carrying value.* For purposes of §§ _____.140 through _____.142, the adjusted carrying value of an equity exposure is:

(1) For the on-balance sheet component of an equity exposure, the [BANKING ORGANIZATION]'s carrying value of the exposure;

(2) For the off-balance sheet component of an equity exposure that is not an equity commitment, the effective notional principal amount of the exposure, the size of which is equivalent to a hypothetical on-balance sheet position in the underlying equity instrument that would evidence the same change in fair value (measured in dollars) given a small change in the price of the underlying equity instrument, minus the adjusted carrying value of the on-balance sheet component of the exposure as calculated in paragraph (b)(1) of this section; and

(3) For a commitment to acquire an equity exposure (an equity commitment), the effective notional principal amount of the exposure is multiplied by the following conversion factors (CFs):

(i) Conditional equity commitments receive a 40 percent conversion factor.

(ii) Unconditional equity commitments receive a 100 percent conversion factor.

§ _____.141 Simple Risk-Weight Approach (SRWA)

(a) *General.* A [BANKING ORGANIZATION]'s total risk-weighted assets for equity exposures equals the sum of the risk-weighted asset amounts for each of the [BANKING ORGANIZATION]'s equity exposures that are not equity exposures subject to § _____.142, as determined under this section, and the risk-weighted asset amounts for each of the [BANKING ORGANIZATION]'s equity exposures subject to § _____.142, as determined under § _____.142.

(b) *Computation for individual equity exposures.* A [BANKING ORGANIZATION] must determine the risk-weighted asset amount for an equity exposure that is not an equity exposure subject to § _____.142 by multiplying the adjusted carrying value of the exposure or the effective portion and ineffective portion of a hedge pair (as defined in paragraph (c) of this section) by the lowest applicable risk weight in this paragraph (b).

(1) *Zero percent risk weight equity exposures.* An equity exposure to a

sovereign, a specified supranational entity, an MDB, and any other entity whose credit exposures receive a zero percent risk weight under § _____.111 may be assigned a zero percent risk weight.

(2) *20 percent risk weight equity exposures.* An equity exposure to a PSE, Federal Home Loan Bank, or the Federal Agricultural Mortgage Corporation (Farmer Mac) must be assigned a 20 percent risk weight.

(3) *100 percent risk weight.* The equity exposures set forth in this paragraph (b)(3) must be assigned a 100 percent risk weight:

(i) An equity exposure that qualifies as a community development investment under section 24 (Eleventh) of the National Bank Act, excluding equity exposures to an unconsolidated small business investment company and equity exposures held through a consolidated small business investment company described in section 302 of the Small Business Investment Act.

(ii) The effective portion of a hedge pair; and

(iii) Equity exposures, excluding significant investments in the capital of an unconsolidated institution in the form of common stock and exposures to an investment firm that would meet the definition of a traditional securitization were it not for the [AGENCY]'s application of paragraph (8) of that definition in § _____.2 and has greater than immaterial leverage, to the extent that the aggregate adjusted carrying value of the exposures does not exceed 10 percent of the [BANKING ORGANIZATION]'s total capital.

(A) To compute the aggregate adjusted carrying value of a [BANKING ORGANIZATION]'s equity exposures for purposes of this section, the [BANKING ORGANIZATION] may exclude equity exposures described in (b)(1), (2), (3)(i), (3)(ii), and (3)(iii) of this section, the equity exposure in a hedge pair with the smaller adjusted carrying value, and a proportion of each equity exposure to an investment fund equal to the proportion of the assets of the investment fund that are not equity exposures or that meet the criterion of paragraph (b)(3)(i) of this section. If a [BANKING ORGANIZATION] does not know the actual holdings of the investment fund, the [BANKING ORGANIZATION] may calculate the proportion of the assets of the fund that are not equity exposures based on the terms of the prospectus, partnership agreement, or similar contract that defines the fund's permissible investments. If the sum of the investment limits for all exposure classes within the fund exceeds 100

percent, the [BANKING ORGANIZATION] must assume for purposes of this section that the investment fund invests to the maximum extent possible in equity exposures.

(B) When determining which of a [BANKING ORGANIZATION]'s equity exposures qualifies for a 100 percent risk weight under this section, a [BANKING ORGANIZATION] first must include equity exposures to unconsolidated small business investment companies or held through consolidated small business investment companies described in section 302 of the Small Business Investment Act, then must include publicly traded equity exposures (including those held indirectly through investment funds), and then must include non-publicly traded equity exposures (including those held indirectly through investment funds).

(4) *250 percent risk weight.* Significant investments in the capital of unconsolidated financial institutions in the form of common stock that are not deducted from capital pursuant to § _____.22(d)(2) must be assigned a 250 percent risk weight.

(5) *300 percent risk weight.* An equity exposure that is publicly traded (other than an equity exposure described in paragraph (b)(7) of this section and including the ineffective portion of a hedge pair) must be assigned a 300 percent risk weight.

(6) *400 percent risk weight.* An equity exposure that is not publicly traded and is not described in paragraph (b)(7) of this section must be assigned a 400 percent risk weight.

(7) *600 percent risk weight.* An equity exposure to an investment firm must be assigned a 600 percent risk weight, provided that the investment firm:

(i) Would meet the definition of a traditional securitization were it not for the application of paragraph (8) of that definition; and

(ii) Has greater than immaterial leverage.

(c) *Hedge transactions—*

(1) *Hedge pair.* A hedge pair comprises two equity exposures that form an effective hedge so long as each equity exposure is publicly traded or has a return that is primarily based on a publicly traded equity exposure.

(2) *Effective hedge.* Two equity exposures form an effective hedge if the exposures either have the same remaining maturity or each has a remaining maturity of at least three months; the hedge relationship is formally documented in a prospective manner (that is, before the [BANKING ORGANIZATION] acquires at least one

of the equity exposures); the documentation specifies the measure of effectiveness (E) the [BANKING ORGANIZATION] will use for the hedge relationship throughout the life of the transaction; and the hedge relationship has an E greater than or equal to 0.8. A [BANKING ORGANIZATION] must measure E at least quarterly and must use one of three alternative measures of E as set forth in this paragraph (c)(2).

(i) Under the dollar-offset method of measuring effectiveness, the [BANKING ORGANIZATION] must determine the ratio of value change (RVC). The RVC is the ratio of the cumulative sum of the changes in value of one equity exposure to the cumulative sum of the changes in the value of the other equity exposure. If RVC is positive, the hedge is not effective and E equals 0. If RVC is negative and greater than or equal to -1 (that is, between zero and -1), then E equals the absolute value of RVC. If RVC is negative and less than -1 , then E equals 2 plus RVC.

(ii) Under the variability-reduction method of measuring effectiveness:

$$E = 1 - \frac{\sum_{t=1}^T (X_t - X_{t-1})^2}{\sum_{t=1}^T (A_t - A_{t-1})^2}$$

Where:

(A) $X_t = A_t - B_t$

(B) A_t = the value at time t of one exposure in a hedge pair;

(C) B_t = the value at time t of the other exposure in a hedge pair;

(iii) Under the regression method of measuring effectiveness, E equals the coefficient of determination of a regression in which the change in value of one exposure in a hedge pair is the dependent variable and the change in value of the other exposure in a hedge pair is the independent variable. However, if the estimated regression coefficient is positive, then E equals zero.

(3) The effective portion of a hedge pair is E multiplied by the greater of the adjusted carrying values of the equity exposures forming a hedge pair.

(4) The ineffective portion of a hedge pair is $(1-E)$ multiplied by the greater of the adjusted carrying values of the equity exposures forming a hedge pair.

§ _____.142 Equity Exposures to Investment Funds

(a) *Available approaches.*

(1) Unless the exposure meets the requirements for a community development equity exposure in § _____.141(b)(3)(i), a [BANKING ORGANIZATION] must determine the risk-weighted asset amount of an equity exposure to an investment fund under the full look-through approach

described in paragraph (b) of this section, the simple look-through approach described in paragraph (c), or the alternative modified look-through approach described in paragraph (d) of this section, provided, however, that the minimum risk weight that may be assigned to an equity exposure under this section is 20 percent.

(2) The risk-weighted asset amount of an equity exposure to an investment fund that meets the requirements for a community development equity exposure in § _____.141(b)(3)(i) is its adjusted carrying value.

(3) If an equity exposure to an investment fund is part of a hedge pair and the [BANKING ORGANIZATION] does not use the full look-through approach, the [BANKING ORGANIZATION] must use the ineffective portion of the hedge pair as determined under § _____.141(b)(4)(i) as the adjusted carrying value for the equity exposure to the investment fund. The risk-weighted asset amount of the effective portion of the hedge pair is equal to its adjusted carrying value.

(b) *Full look-through approach.* A [BANKING ORGANIZATION] that is able to calculate a risk-weighted asset amount for its proportional ownership share of each exposure held by the investment fund (as calculated under this subpart E of this part as if the proportional ownership share of each exposure were held directly by the [BANKING ORGANIZATION]) may set the risk-weighted asset amount of the [BANKING ORGANIZATION]'s exposure to the fund equal to the product of:

(1) The aggregate risk-weighted asset amounts of the exposures held by the fund as if they were held directly by the [BANKING ORGANIZATION]; and

(2) The [BANKING ORGANIZATION]'s proportional ownership share of the fund.

(c) *Simple modified look-through approach.* Under the simple modified look-through approach, the risk-weighted asset amount for a [BANKING ORGANIZATION]'s equity exposure to an investment fund equals the adjusted carrying value of the equity exposure multiplied by the highest risk weight that applies to any exposure the fund is permitted to hold under its prospectus, partnership agreement, or similar contract that defines the fund's permissible investments (excluding derivative contracts that are used for hedging rather than speculative purposes and that do not constitute a material portion of the fund's exposures).

(d) *Alternative modified look-through approach.* Under the alternative

modified look-through approach, a [BANKING ORGANIZATION] may assign the adjusted carrying value of an equity exposure to an investment fund on a pro rata basis to different risk weight categories under this subpart based on the investment limits in the fund's prospectus, partnership agreement, or similar contract that defines the fund's permissible investments. The risk-weighted asset amount for the [BANKING ORGANIZATION]'s equity exposure to the investment fund equals the sum of each portion of the adjusted carrying value assigned to an exposure type multiplied by the applicable risk weight under this subpart. If the sum of the investment limits for all exposure types within the fund exceeds 100 percent, the [BANKING ORGANIZATION] must assume that the fund invests to the maximum extent permitted under its investment limits in the exposure type with the highest applicable risk weight under this subpart and continues to make investments in order of the exposure type with the next highest risk weight under this subpart until the maximum total investment level is reached. If more than one exposure type applies to an exposure, the [BANKING ORGANIZATION] must use the highest applicable risk weight. A [BANKING ORGANIZATION] may exclude derivative contracts held by the fund that are used for hedging rather than for speculative purposes and do not constitute a material portion of the fund's exposures.

Risk-Weighted Assets for Operational Risk

§ _____.150 Operational Risk Capital

(a) *Risk-weighted assets for operational risk.* Risk-weighted assets for operational risk equals the product of the business indicator component, as calculated pursuant to paragraph (b) of this section, multiplied by 12.5.

(b) *Business indicator component.* A [BANKING ORGANIZATION]'s business indicator component is calculated as follows:

(1) If the [BANKING ORGANIZATION]'s business indicator is less than or equal to \$1 billion, as adjusted pursuant to § _____.4, the business indicator component equals the product of the business indicator and 0.12.

(2) If the [BANKING ORGANIZATION]'s business indicator is greater than \$1 billion, as adjusted pursuant to § _____.4, and less than or equal to \$30 billion, as adjusted pursuant to § _____.4, the business indicator component equals \$120

million, as adjusted pursuant to § _____.4, plus the product of:

(i) The business indicator less \$1 billion, as adjusted pursuant to § _____.4; and

(ii) 0.15.

(3) If the [BANKING ORGANIZATION]'s business indicator is greater than \$30 billion, as adjusted pursuant to § _____.4, the business indicator component equals \$4.47 billion, as adjusted pursuant to § _____.4 plus the product of:

(i) The business indicator less \$30 billion, as adjusted pursuant to § _____.4; and

(ii) 0.18.

(c) *Business indicator.*

(1) A [BANKING ORGANIZATION]'s business indicator equals the sum of the interest, lease, and dividend component and the noninterest component.

(i) The interest, lease, and dividend component is calculated using the following formula:

Interest, lease, and dividend component = $\min(\text{Avg3y}(\text{Abs}(\text{total interest income} - \text{total interest expense})), 0.0225 * \text{Avg3y}(\text{interest earning assets})) + \text{Avg3y}(\text{dividend income})$

where Avg3y refers to the three-year average of the expression in parenthesis; Abs refers to the absolute value of the expression in parenthesis; and total interest income, total interest expense, interest earning assets, and dividend income are the amounts determined in accordance with paragraph (c)(2) of this section.

(ii) The noninterest component is calculated using the following formula:

Noninterest component = $\text{Avg3y}(\text{Abs}(\text{total noninterest income} + \text{realized gains (losses) on held-to-maturity securities} + \text{realized gains (losses) on available-for-sale debt securities} - \text{noninterest expense for BI} - 0.7 * (\text{total noninterest income from investment management, investment services, and non-lending treasury services} - \text{noninterest expense for BI from investment management, investment services, and non-lending treasury services})) + \text{total operational losses})$

where Avg3y refers to the three-year average of the expression in parenthesis; Abs refers to the absolute value of the expression in parenthesis; and total noninterest income, realized gains (losses) on held-to-maturity securities, realized gains (losses) on available-for-sale debt securities, noninterest expense for BI, total noninterest income from investment management, investment services, and non-lending treasury

services, noninterest expense for BI from investment management, investment services, and non-lending treasury services, and total operational losses are the amounts determined in accordance with paragraph (c)(2) of this section.

(2) For purposes of paragraph (c)(1) of this section, to calculate the three-year average of the Abs(total interest income – total interest expense), dividend income, Abs(total noninterest income + realized gains (losses) on held-to-maturity securities + realized gains (losses) on available-for-sale debt securities – noninterest expense for BI – 0.7*(total noninterest income from investment management, investment services, and non-lending treasury services – noninterest expense for BI from investment management, investment services, and non-lending treasury services)), and total operational losses, a [BANKING ORGANIZATION] must calculate the average of the values of each of these items for each of the three most recent preceding four-calendar-quarter periods. The total operational losses for a four-calendar quarter period equals the sum of all operational losses for each quarter in that period. To calculate the three-year average of interest-earning assets, a [BANKING ORGANIZATION] must divide by 12 the sum of the quarter-end values of interest-earning assets over each of the previous 12 quarters. For purposes of the calculations in this paragraph, the amounts used must be based on the consolidated financial statements of the [BANKING ORGANIZATION].

(3) For purposes of paragraph (c)(1) of this section, a [BANKING ORGANIZATION] must exclude loss provisions and reversals of provisions, except for those relating to operational loss events, from the calculation of the business indicator.

(4) For purposes of paragraph (c)(1) of this section, a [BANKING ORGANIZATION] must reflect three full years of data for entities that were acquired by or merged with the [BANKING ORGANIZATION], including for any period prior to the acquisition or merger, in the [BANKING ORGANIZATION]'s business indicator.

(5) With the prior approval of the [AGENCY], a [BANKING ORGANIZATION] may exclude from the calculation of its business indicator any interest income, interest expense, dividend income, interest-earning assets, noninterest income, realized gains (losses) on held-to-maturity securities, realized gains (losses) on available-for-sale debt securities, noninterest expense for BI, noninterest

income from investment management, investment services, and non-lending treasury services, noninterest expense for BI from investment management, investment services, and non-lending treasury services, and operational losses associated with an activity if the [BANKING ORGANIZATION] has ceased to directly or indirectly conduct the activity. Approval by the [AGENCY] requires a demonstration that the activity does not carry legacy legal exposure.

(d) *Operational risk management and operational loss event data collection processes.*

(1) A [BANKING ORGANIZATION] must:

(i) Have an operational risk management function that:

(A) Is independent of business line management; and

(B) Is responsible for designing, implementing, and overseeing the [BANKING ORGANIZATION]'s internal loss event data collection processes as specified in paragraph (d)(2) of this section and for overseeing the processes that implement paragraph (d)(1)(ii);

(ii) Report operational loss events and other relevant operational risk information to business unit management, senior management, and the board of directors (or a designated committee of the board).

(2) A [BANKING ORGANIZATION] must have operational loss event data collection processes that meet the following requirements:

(i) The processes must produce operational loss event data that satisfies the following criteria:

(A) Operational loss event data must be comprehensive and capture all operational loss events that resulted in operational losses equal to or higher than \$20,000, as adjusted pursuant to § _____.4, (before any recoveries are taken into account) from all activities and exposures of the [BANKING ORGANIZATION];

(B) Operational loss event data must include operational loss event data relative to entities that have been acquired by or merged with the [BANKING ORGANIZATION] for ten full years, including for any period prior to the acquisition or merger during the ten-year period; and

(C) Operational loss event data must include gross operational loss amounts, recovery amounts, the date when the event occurred or began (occurrence date), the date when the [BANKING ORGANIZATION] became aware of the event (discovery date), and the date (or dates) when losses or recoveries related to the event were recognized in the [BANKING ORGANIZATION]'s profit

and loss accounts (accounting date). The [BANKING ORGANIZATION] must be able to map its operational loss event data into the seven operational loss event type categories. In addition, the [BANKING ORGANIZATION] must collect descriptive information about the drivers of operational loss events.

(ii) Procedures for the identification and collection of internal loss event data must be documented.

(iii) The [BANKING ORGANIZATION] must have processes to independently review the comprehensiveness and accuracy of operational loss event data.

(iv) The [BANKING ORGANIZATION] must subject the procedures in paragraph (d)(2)(ii) of this section and the processes in (d)(2)(iii) of this section to regular independent reviews by internal or external audit functions.

Disclosures

§ _____.160 Purpose and Scope

Sections _____.160 through _____.162 establish public disclosure requirements related to the capital requirements for a [BANKING ORGANIZATION] that calculates expanded total risk-weighted assets pursuant to this subpart E, unless the [BANKING ORGANIZATION] is a consolidated subsidiary of a bank holding company, savings and loan holding company, or depository institution that is subject to these disclosure requirements, or a subsidiary of a non-U.S. banking organization that is subject to comparable public disclosure requirements in its home jurisdiction.

§ _____.161 Disclosure Requirements

(a) A [BANKING ORGANIZATION] described in § _____.160 must provide timely public disclosures each calendar quarter of the information in the applicable tables in § _____.162, except as provided in paragraph (d) of this section. If a significant change occurs to the information required to be reported in the applicable tables in § _____.162 or to the [BANKING ORGANIZATION]'s financial condition as reported on the Call Report, for a bank; FR Y–9C, for a bank holding company or savings and loan holding company; or FFIEC 101, as applicable, then a brief discussion of this change and its likely impact must be disclosed as soon as practicable thereafter. Qualitative disclosures that typically do not change each quarter (for example, a general summary of the [BANKING ORGANIZATION]'s risk management objectives and policies, reporting system, and definitions) may be disclosed annually after the end of the fourth calendar quarter, provided

that any significant changes are disclosed in the interim. The [BANKING ORGANIZATION]'s management may provide all of the disclosures required by § ___.162 in one place on the [BANKING ORGANIZATION]'s public website or may provide the disclosures in more than one public financial report or other regulatory report. If the [BANKING ORGANIZATION] does not provide all of the disclosures as required by § ___.162 in one place on the [BANKING ORGANIZATION]'s public website, the [BANKING ORGANIZATION] must provide a summary table specifically indicating the location(s) of all such disclosures on the [BANKING ORGANIZATION]'s public website.

(b) A [BANKING ORGANIZATION] described in § ___.160 must have a formal disclosure policy approved by the board of directors that addresses its approach for determining the disclosures it makes. The policy must address the associated internal controls and disclosure controls and procedures. The board of directors and senior

management are responsible for establishing and maintaining an effective internal control structure over financial reporting, including the disclosures required by this subpart, and must ensure that appropriate review of the disclosures takes place. One or more senior officers of the [BANKING ORGANIZATION] must attest that the disclosures meet the requirements of this subpart.

(c) If a [BANKING ORGANIZATION] described in § ___.160 reasonably concludes that specific commercial or financial information that it would otherwise be required to disclose under this section would be exempt from disclosure by the [AGENCY] under the Freedom of Information Act (5 U.S.C. 552), then the [BANKING ORGANIZATION] is not required to disclose that specific information pursuant to this section. However, the [BANKING ORGANIZATION] must disclose more general information about the subject matter of the requirement, together with the fact that, and the

reason why, the specific items of information have not been disclosed.

(d) A [BANKING ORGANIZATION] described in § ___.160 is required to make the disclosures in Table 4 of § ___.162 only if the [BANKING ORGANIZATION] is subject to § ___.11(b).

§ ___.162 Disclosures by [BANKING ORGANIZATION] Described in § ___.160

(a) *General disclosures.* Except as provided in § ___.161, a [BANKING ORGANIZATION] described in § ___.160 must make the disclosures described in Tables 1 through 13 to § ___.162. The [BANKING ORGANIZATION] must make these disclosures publicly available for each of the last twelve quarters, or such shorter period beginning in the quarter in which the [BANKING ORGANIZATION] becomes subject to subpart E of this part.

BILLING CODE 4810-33-6210-01-6714-01-P

Table 1 to § ___.162—Scope of Application

Table 1 to § ___.162—Scope of Application

Qualitative Disclosures	(a)	The name of the top corporate entity in the group to which subpart E of this part applies.
	(b)	A brief description of the differences in the basis for consolidating entities ¹ for accounting and regulatory purposes, with a description of those entities:
		(1) That are fully consolidated;
		(2) That are deconsolidated and deducted from total capital;
		(3) For which the total capital requirement is deducted; and
		(4) That are neither consolidated nor deducted (for example, where the investment in the entity is assigned a risk weight in accordance with this subpart).
	(c)	Any restrictions, or other major impediments, on transfer of funds or total capital within the group.
	(d)	The aggregate amount of surplus capital of insurance subsidiaries included in the total capital of the consolidated group.

¹ Entities include securities, insurance, and other financial subsidiaries; commercial subsidiaries (where permitted); and significant minority equity investments in insurance, financial, and commercial entities.

Table 2 to § ___.162—Capital Structure

Qualitative Disclosures	(a)	Summary information on the terms and conditions of the main features of all regulatory capital instruments.

Table 3 to § __.162—Capital Adequacy

Qualitative disclosures	(a)	A summary discussion of the [BANKING ORGANIZATION]'s approach to assessing the adequacy of its capital to support current and future activities.

Table 4 to § __.162—Countercyclical Capital Buffer

Qualitative disclosures	(a)	The [BANKING ORGANIZATION] must publicly disclose the geographic breakdown of its private sector credit exposures used in the calculation of the countercyclical capital buffer.

(b) *Risk management-related disclosure requirements.* (1) The [BANKING ORGANIZATION] must describe its risk management objectives and policies for the organization overall, in particular:

(i) How the business model determines and interacts with the overall risk profile (for example, the key risks related to the business model and how each of these risks is reflected and described in the risk disclosures) and how this risk profile aligns with the parameters of the risk tolerance approved by the [BANKING ORGANIZATION]'s board of directors;

(ii) The risk governance structure, including: responsibilities attributed throughout the [BANKING ORGANIZATION] (for example, oversight and delegation of authority; breakdown of responsibilities by type of risk, business unit, etc.); and relationships between the structures involved in risk management processes

(for example, board of directors, executive management, separate risk committee, risk management structure, compliance function, internal audit function);

(iii) Channels to communicate, define, and enforce the risk culture within the [BANKING ORGANIZATION] (for example, code of conduct; manuals containing operating limits or procedures to treat violations or breaches of risk thresholds; procedures to raise and share risk issues between business lines and risk functions);

(iv) The scope and nature of risk reporting and/or measurement systems;

(v) Description of the process of risk information reporting provided to the board and senior management, in particular the scope and main content of reporting on risk exposure;

(vi) Qualitative information on stress testing (for example, portfolios subject to stress testing, scenarios adopted and

methodologies used, and use of stress testing in risk management); and

(vii) The strategies and processes to manage, hedge, and mitigate risks that arise from the [BANKING ORGANIZATION]'s business model, and the processes for monitoring the continuing effectiveness of hedges and mitigants.

(2) For each separate risk area that is the subject of Tables 5 through 13 to § __.162, the [BANKING ORGANIZATION] must describe its risk management objectives and policies, including:

(i) The strategies and processes;

(ii) The structure and organization of the relevant risk management function;

(iii) The scope and nature of risk reporting and/or measurement systems; and

(iv) Policies for hedging and/or mitigating risk and strategies and processes for monitoring the continuing effectiveness of hedges/mitigants.

Table 5 to § __.162¹—Credit Risk: General Disclosures

Qualitative Disclosures	(a)	The general qualitative disclosure requirement with respect to credit risk (excluding counterparty credit risk disclosed in accordance with Table 6), including the:
		(1) Policy for determining past due or delinquency status;
		(2) Policy for placing loans on nonaccrual;
		(3) Policy for returning loans to accrual status;
		(4) Definition of and policy for identifying impaired loans (for financial accounting purposes);
		(5) Description of the methodology that the [BANKING ORGANIZATION] uses to estimate its adjusted allowance for credit losses, as applicable, including statistical methods used where applicable;
		(6) Policy for charging-off uncollectible amounts; and
		(7) Discussion of the [BANKING ORGANIZATION]'s credit risk management policy.
	(b)	The [BANKING ORGANIZATION] must describe its risk management objectives and policies for credit risk, focusing in particular on:
		(1) How the business model translates into the components of the [BANKING ORGANIZATION]'s credit risk profile;
		(2) Criteria and approach used for defining credit risk management policy and for setting credit risk limits;
		(3) Structure and organization of the credit risk management and control function;
		(4) Relationships between the credit risk management, risk control, compliance, and internal audit functions; and
		(5) Scope and main content of the reporting on credit risk exposure and on the credit risk management function to executive management and the board of directors.

¹Table 5 does not cover equity exposures, which should be reported in table 9.

Table 6 to § __.162—General Disclosure for Counterparty Credit Risk-Related Exposures

Qualitative Disclosures	The general qualitative disclosure requirement with respect to OTC (a) derivatives, eligible margin loans, and repo-style transactions, including a discussion of: (1) The methodology used to assign economic capital and credit limits for counterparty credit exposures; (2) Policies for securing collateral, valuing and managing collateral, and establishing credit reserves; (3) The primary types of collateral taken; (4) The policies with respect to wrong-way risk exposures; and (5) The impact of the amount of collateral the [BANKING ORGANIZATION] would have to provide given a deterioration in the [BANKING ORGANIZATION]'s own creditworthiness. (b) The [BANKING ORGANIZATION] must provide risk management objectives and policies related to counterparty credit risk, including: (1) The method used to assign the operating limits defined in terms of internal capital for counterparty credit exposures and for CCP exposures; (2) Policies relating to guarantees and other risk mitigants and assessments concerning counterparty risk, including exposures towards CCPs; (3) Policies with respect to wrong-way risk exposures; and (4) The impact in terms of the amount of collateral that the bank would be required to provide given a credit rating downgrade.

Table 7 to § __.162—Credit Risk Mitigation^{1,2}

Qualitative Disclosures	(a) The general qualitative disclosure requirement with respect to credit risk mitigation, including: (1) Policies and processes for, and an indication of the extent to which the [BANKING ORGANIZATION] uses, on- or off-balance sheet netting; (2) Policies and processes for collateral valuation and management; (3) A description of the main types of collateral taken by the [BANKING ORGANIZATION]; (4) Information about (market or credit) risk concentrations with respect to credit risk mitigation; and (5) A meaningful breakdown of its credit derivative, guarantee, and prepaid credit protection arrangement providers, including a breakdown by rating class or by type of counterparty (e.g., banks, other financial institutions, non-financial institutions).

¹ At a minimum, a [BANKING ORGANIZATION] must provide the disclosures in Table 7 in relation to credit risk mitigation that has been recognized for the purposes of reducing capital requirements under this subpart. Where relevant, a [BANKING ORGANIZATION] is encouraged to give further information about mitigants that have not been recognized for that purpose.

² Credit derivatives and eligible prepaid credit protection arrangements that are treated, for the purposes of this subpart, as synthetic securitization exposures should be excluded from the credit risk mitigation disclosures and included within those relating to securitization (Table 8 to § __.162).

Table 8 to § __.162—Securitization

Qualitative Disclosures	(a) The general qualitative disclosure requirement with respect to a securitization (including synthetic securitizations), including a discussion of: (1) The [BANKING ORGANIZATION]'s objectives for securitizing assets, including the extent to which these activities transfer credit risk of the underlying exposures away from the [BANKING ORGANIZATION] to other entities and including the type of risks assumed and retained with resecuritization activity;¹ (2) The nature of the risks (e.g., liquidity risk) inherent in the securitized assets; (3) The roles played by the [BANKING ORGANIZATION] in the securitization process² and an indication of the extent of the [BANKING ORGANIZATION]'s involvement in each of them; (4) The processes in place to monitor changes in the credit and market risk of securitization exposures, including how those processes differ for resecuritization exposures; (5) The [BANKING ORGANIZATION]'s policy for mitigating the credit risk retained through securitization and resecuritization exposures; and (6) The risk-based capital approaches that the [BANKING ORGANIZATION] follows for its securitization exposures including the type of securitization exposure to which each approach applies. (b) A list of: (1) The type of traditional securitizations that the [BANKING ORGANIZATION], as sponsor, uses to securitize third-party exposures. The [BANKING ORGANIZATION] must indicate whether it has exposure to these SPEs, either on- or off-balance sheet; (2) Entities to which the [BANKING ORGANIZATION] provides implicit support and the associated capital impact for each of them (as required in § __.130(e)); and (3) Affiliated entities: (i) That the [BANKING ORGANIZATION] manages or advises; and (ii) That invest either in the securitization exposures that the [BANKING ORGANIZATION] has securitized or in traditional securitizations that the [BANKING ORGANIZATION] sponsors.³ (c) Summary of the [BANKING ORGANIZATION]'s accounting policies for securitization activities, including: (1) Whether the transactions are treated as sales or financings; (2) Recognition of gain-on-sale; (3) Methods and key assumptions applied in valuing retained or purchased interests; (4) Changes in methods and key assumptions from the previous period for valuing retained interests and impact of the changes; (5) Treatment of synthetic securitizations; (6) How exposures intended to be securitized are valued and whether they are recorded under subpart E of this part; and

(7) Policies for recognizing liabilities on the balance sheet for arrangements that could require the [BANKING ORGANIZATION] to provide financial support for securitized assets.

(d) If a [BANKING ORGANIZATION] provides support to a securitization as described in section __.132(e), disclosure indicating:

(1) That it has provided implicit support to the securitization; and

(2) The risk-based capital impact to the [BANKING ORGANIZATION] of providing such implicit support.

¹The [BANKING ORGANIZATION] should describe the structure of resecuritizations in which it participates; this description should be provided for the main categories of resecuritization products in which the [BANKING ORGANIZATION] is active.

²For example, these roles may include originator, investor, servicer, provider of credit enhancement, sponsor, liquidity provider, or swap provider.

³Such affiliated entities may include, for example, money market funds, to be listed individually, and personal and private trusts, to be noted collectively.

Table 9 to § __.162—Equities Not Subject to Subpart F of This Part

Qualitative Disclosures (a) The general qualitative disclosure requirement with respect to equity risk for equities not subject to subpart F of this part, including:

- (1) Differentiation between holdings on which capital gains are expected and those taken under other objectives including for relationship and strategic reasons; and
- (2) Discussion of important policies covering the valuation of and accounting for equity holdings not subject to subpart F of this part. This includes the accounting techniques and valuation methodologies used, including key assumptions and practices affecting valuation as well as significant changes in these practices.

Table 10 to § __.162—Interest Rate Risk for Non-Trading Activities

Qualitative disclosures (a) The general qualitative disclosure requirement, including the nature of interest rate risk for non-trading activities and key assumptions, including assumptions regarding loan prepayments and behavior of non-maturity deposits, and frequency of measurement of interest rate risk for non-trading activities.

Table 11 to § __.162—Additional Disclosure Related to the Credit Quality of Assets

Qualitative Disclosures	The [BANKING ORGANIZATION] must provide the following disclosures: The scope of exposures that qualify as “past due” for accounting purposes and the (a) differences, if any, between the scope of exposures treated as past due for accounting and those treated as past due for regulatory capital purposes. The scope of exposures that qualify as past due exposures under section __.111(h)(5)(i) of this part or past due real estate exposures under section __.111(f)(8) of this part that (b) are not exposures for which credit losses are measured under ASC Topic 326 and for which the [BANKING ORGANIZATION] has recorded a partial write-off/write-down. The scope of exposures that qualify as “loan modification to borrowers experiencing financial difficulty” for accounting purposes and the differences, if any, between the scope (c) of exposures treated as “past due exposures” or “past due real estate exposures” due to the [BANKING ORGANIZATION] having agreed to a distressed restructuring of the exposure for regulatory capital purposes.

Table 12 to § __.162—General Qualitative Information on a [BANKING ORGANIZATION]’S Operational Risk Framework

Qualitative Disclosures	The [BANKING ORGANIZATION] must describe: (a) Its policies, frameworks, and guidelines for the management of operational risk; (b) The structure and organization of its operational risk management and control function; (c) The systems and data used to calculate the operational risk capital requirement; (d) The scope and context of its reporting framework on operational risk to executive management and to the board of directors; and — The risk mitigation and risk transfer used in the management of operational risk. This (e) includes mitigation by policy, including the policies on risk culture, risk appetite, and — outsourcing, and by the establishment of controls.

(c) *Regulatory capital instrument and other instruments eligible for total loss absorbing capacity (TLAC) disclosures.* (1) A [BANKING ORGANIZATION] described in § __.160 must provide a description of the main features of its regulatory capital instruments, in accordance with Table 13 to § __.162. If the [BANKING ORGANIZATION] issues or repays a capital instrument, or in the event of a redemption, conversion, write down, or other material change in the nature of an existing instrument, but in no event less frequently than semiannually, the

[BANKING ORGANIZATION] must update the disclosures provided in accordance with Table 13 of this section. A [BANKING ORGANIZATION] also must disclose the full terms and conditions of all instruments included in regulatory capital.

(2) In addition to the disclosure requirement in § __.162(c)(1), a [BANKING ORGANIZATION] that is a global systemically important BHC also must provide a description of the main features of each eligible debt security, as defined in 12 CFR 252.61, that the [BANKING ORGANIZATION] has

issued and outstanding, in accordance with Table 13 to § __.162. If the global systemically important BHC issues or repays an eligible debt security, or in the event of a redemption, conversion, write down, or other material change in the nature of an existing instrument, but in no event less frequently than semiannually, the global systemically important BHC must update the disclosures provided in accordance with Table 13 to § __.162. A global systemically important BHC also must disclose the full terms and conditions of all eligible debt securities.

Table 13 to § __.162—Main Features of Regulatory Capital Instruments and of Other TLAC-Eligible Instruments

Qualitative Disclosures	(a) For each regulatory capital instrument and any other instrument that is an eligible debt security as defined in 12 CFR 252.61, the [BANKING ORGANIZATION] must provide the following information: (1) The issuer's legal entity. (2) The unique identifier. (3) The governing law(s) of the instrument. (4) The regulatory capital treatment. (5) The level(s) within the [BANKING ORGANIZATION] at which the instrument is included in capital. (6) The instrument type. (7) The amount recognized in regulatory capital. (8) The par value of the instrument. (9) The accounting classification as debt or equity. (10) The original date of issuance. (11) Whether perpetual or dated. (12) The original maturity date. (13) Whether an issuer call option subject to prior supervisory approval exists. (14) For an instrument with an issuer call option: (i) the first date of call if the instrument has a call option on a specific date (day, month, and year); (ii) the instrument has a tax and/or regulatory event call; and (iii) the redemption price. (15) Whether there are subsequent call option dates and, if so, their frequency. (16) Whether the coupon or dividend is fixed over the life of the instrument, floating over the life of the instrument, currently fixed but will move to a floating rate in the future, or currently floating but will move to a fixed rate in the future. (17) The coupon rate of the instrument and any related index that the coupon or dividend rate references. (18) Whether the non-payment of a coupon or dividend on the instrument prohibits the payment of dividends on common shares. (19) Whether the issuer has full, partial, or no discretion over whether a coupon or dividend is paid. (20) Whether there is a step-up or other incentive to redeem. (21) Whether the dividends or coupons are cumulative or non-cumulative. (22) Whether the instrument is convertible or non-convertible. (23) If the instrument is convertible, the conditions under which the instrument will convert, including point of non-viability. Where one or more authorities have the ability to trigger conversion, the authorities should be listed. For each of the authorities, state whether the legal basis for the authority to trigger conversion is provided by the terms of the contract of the instrument (a contractual approach) or statutory means (a statutory approach). (24) If the instrument is convertible, whether the instrument will: (i) always convert fully; (ii) may convert fully or partially; or (iii) will always convert partially.

- (25) If the instrument is convertible, the rate of conversion into the more loss-absorbent instrument.
- (26) If the instrument is convertible, whether conversion is mandatory or optional.
- (27) If the instrument is convertible, the instrument type into which it is convertible.
- (28) If the instrument is convertible, the issuer of the instrument into which it converts.
- (29) Whether a write-down feature exists.
- (30) If there is a write-down feature, the trigger at which write-down occurs, including point of non-viability. Where one or more authorities have the ability to trigger write-down, the authorities should be listed. For each of the authorities it should be stated whether the legal basis for the authority to trigger conversion is provided by the terms of the contract of the instrument or statutory means.
- (31) If there is a write-down feature, for each write-down trigger separately, whether the instrument will: (i) always be written down fully; (ii) may be written down partially; or (iii) will always be written down partially.
- (32) If there is a write-down feature, whether the write-down is permanent or temporary.
- (33) For instruments that have a temporary write-down, a description of the writeup mechanism.
- (34) The type of subordination.
- (35) A description of the position in subordination hierarchy in liquidation, including by specifying the instrument type immediately senior to instrument in the insolvency creditor hierarchy of the legal entity concerned.

*Subpart F—Risk-Weighted Assets—
Market Risk and Credit Valuation
Adjustment (CVA)*

§ _____.201 Purpose, Applicability, and Reservations of Authority.

(a) *Purpose.* This subpart establishes risk-based capital requirements in a manner that:

(1) For [BANKING ORGANIZATIONS] with significant exposure to market risk, provides methods for these [BANKING ORGANIZATIONS] to calculate their standardized measure for market risk and, if applicable, their models-based measure for market risk, and establishes public disclosure requirements; and

(2) For [BANKING ORGANIZATIONS] with significant exposure to CVA risk, provides methods for these [BANKING ORGANIZATIONS] to calculate their basic measure for CVA risk and, if applicable, their standardized measure for CVA risk, and establishes public disclosure requirements.

(b) *Applicability*—(1) *Market risk.* The market risk capital requirements and related reporting and public disclosure requirements specified in §§ _____.203 through _____.217 apply to a [BANKING ORGANIZATION] that meets one or more of the standards in this paragraph (b)(1):

(i) The [BANKING ORGANIZATION] is a depository institution holding company that is either a Category I

[BANKING ORGANIZATION] or a Category II [BANKING ORGANIZATION]; or

(ii) The [BANKING ORGANIZATION] has aggregate trading assets and trading liabilities, excluding customer and proprietary broker-dealer reserve bank accounts, equal to:

(A) 10 percent or more of quarter-end total assets as reported on the most recent quarterly [REGULATORY REPORT]; or

(B) \$5 billion, [as adjusted pursuant to § _____.4], or more, on average for the four most recent quarters as reported in the [BANKING ORGANIZATION]'s [REGULATORY REPORT]s.

(2) *CVA risk.* The CVA risk-based capital requirements specified in §§ _____.220 through _____.225 and related reporting and public disclosure requirements specified in § _____.217 apply to any [BANKING ORGANIZATION] that is:

(i) A depository institution holding company that is a Category I [BANKING ORGANIZATION] or a Category II [BANKING ORGANIZATION];

(ii) A depository institution subsidiary of an institution described in paragraph (b)(2)(i) of this section where such subsidiary is subject to the market risk framework pursuant to § _____.201(b)(1); or

(iii) A [BANKING ORGANIZATION] that is subject to the market risk framework pursuant to § _____.201(b)(1) and engages in OTC derivative contracts

with an aggregate gross notional value, as reported on the [BANKING ORGANIZATION]'s [REGULATORY REPORT]s of \$1 trillion[, as adjusted pursuant to 12 CFR 217.4,] or more on average for the prior four quarters.

(3) *Initial applicability.* A [BANKING ORGANIZATION] must satisfy the requirements of this subpart beginning [on the first day of] the quarter after a [BANKING ORGANIZATION] meets the criteria of paragraph (b)(1) or (b)(2) of this section, as applicable.

(4) *Monitoring of trading assets and liabilities.* A [BANKING ORGANIZATION] must monitor (i) its aggregate trading assets and trading liabilities to determine the applicability of this subpart F in accordance with paragraph (b)(1) of this section; and (ii) the aggregate gross notional value of the OTC derivative contracts the [BANKING ORGANIZATION] engages in to determine the applicability of this subpart F in accordance with paragraph (b)(2) of this section.

(5) *Ongoing applicability.* (i) A [BANKING ORGANIZATION] that is subject to the market risk capital requirements and related reporting and public disclosure requirements of this subpart F shall remain subject to those requirements unless and until it does not meet any of the standards in paragraph (b)(1) of this section, applying the adjusted thresholds specified in paragraph (b)(1)(ii)(B) of this section effective on the date of comparison.

(ii) A [BANKING ORGANIZATION] that is subject to the CVA risk-based capital requirements and related reporting and public disclosure requirements of this subpart F shall remain subject to those requirements unless and until it does not meet any of the standards in paragraph (b)(2) of this section, applying the adjusted thresholds specified in paragraph (b)(2)(iii) of this section effective on the date of comparison.

(6) *Exclusions.* The [AGENCY] may exclude a [BANKING ORGANIZATION] that meets one or more of the standards of paragraph (b)(1) of this section or in paragraph (b)(2) of this section from application of §§ _____.203 through _____.217 or §§ _____.220 through _____.225 if the [AGENCY] determines that the exclusion is appropriate based on the level of market risk or level of CVA risk, respectively, of the [BANKING ORGANIZATION] and is consistent with safe and sound banking practices.

(7) *Data availability.* A [BANKING ORGANIZATION] that does not have four quarters of aggregate data on trading assets and trading liabilities (excluding customer and proprietary broker-dealer reserve bank accounts) or gross notional value of OTC derivatives must calculate the average in paragraph (b)(1)(ii) or paragraph (b)(2)(iii) of this section, respectively, by averaging as much data as the [BANKING ORGANIZATION] has available, unless the [AGENCY] notifies the [BANKING ORGANIZATION] in writing to use an alternative method.

(c) *Reservations of authority.* (1) The [AGENCY] may apply §§ _____.203 through _____.217 or §§ _____.220 through _____.225 to any [BANKING ORGANIZATION] if the [AGENCY] deems it necessary or appropriate because of the level of market risk or CVA risk, respectively, of the [BANKING ORGANIZATION] or to ensure safe and sound banking practices.

(2) The [AGENCY] may require a [BANKING ORGANIZATION] to hold an amount of capital greater than otherwise required under this subpart F if the [AGENCY] determines that the [BANKING ORGANIZATION]'s capital requirement for market risk or CVA risk as calculated under this subpart F is not commensurate with the market risk or the CVA risk of the [BANKING ORGANIZATION]'s market risk covered positions or CVA risk covered positions, respectively.

(3) If the [AGENCY] determines that the risk-based capital requirement calculated under this subpart F by the [BANKING ORGANIZATION] for one or

more market risk covered positions or CVA risk covered positions or categories of such positions is not commensurate with the risks associated with those market risk covered positions or CVA risk covered positions or categories of such positions, the [AGENCY] may require the [BANKING ORGANIZATION] to assign a different risk-based capital requirement to the market risk covered positions or CVA risk covered positions or categories of such positions that more accurately reflects the risk of the market risk covered positions or CVA risk covered positions or categories of such positions.

(4) The [AGENCY] may also require a [BANKING ORGANIZATION] to calculate market risk capital requirements for specific positions or categories of positions under this subpart F instead of risk-based capital requirements under subpart D or subpart E of this part, as applicable; or to calculate risk-based capital requirements for specific exposures or categories of exposures under subpart D or subpart E of this part, as applicable, instead of market risk capital requirements under this subpart F, as appropriate, to more accurately reflect the risks of the positions or exposures. In such cases, the [AGENCY] may alternatively require a [BANKING ORGANIZATION] to apply the capital add-ons for re-designations as described in § _____.204(f).

(5) The [AGENCY] may require a [BANKING ORGANIZATION] that calculates the models-based measure for market risk to modify the methodology or observation period used to measure market risk.

(d) In making determinations under paragraphs (b)(6), (b)(7), and (c)(1) through (5) of this section, the [AGENCY] will apply notice and response procedures generally in the same manner as the notice and response procedures set forth in [12 CFR 3.404, 263.202, and 324.5(c)]. Nothing in this subpart F limits the authority of the [AGENCY] under any other provision of law or regulation to take supervisory or enforcement action, including action to address unsafe or unsound practices or conditions, deficient capital levels, or violations of law.

§ _____.202 Definitions

(a) Terms set forth in § _____.2 and used in this subpart F have the definitions assigned thereto in § _____.2.

(b) For the purposes of this subpart F, the following terms are defined as follows:

Actual profit and loss means the actual profit and loss derived from the daily trading activity for market risk

covered positions. Intraday trading and net interest income must be included; valuation adjustments for which separate regulatory capital requirements have been otherwise specified, fees, reserves, and commissions must be excluded.

Backtesting means the comparison of a [BANKING ORGANIZATION]'s daily actual profit and loss and hypothetical profit and loss with the VaR-based measure as described in §§ _____.204(g) and _____.213(b).

Basic CVA hedge means an eligible CVA hedge that is included in the basic CVA approach capital requirement under the standardized measure for CVA risk, pursuant to § _____.221(c)(3).

Basic CVA risk covered position means a CVA risk covered position that is included in the basic CVA approach capital requirement, pursuant to § _____.221(c)(2).

Cash equity position means an equity position that is not a derivative contract.

Commodity position means a market risk covered position for which price risk arises from changes in the price of one or more commodities.

Commodity risk means the risk of loss that could arise from changes in underlying commodity risk factors.

Corporate position means a market risk covered position that is a corporate exposure.

Correlation trading position means:

(1) Except as provided in paragraph (2) of this definition:

(i) A securitization position for which all or substantially all of the value of the underlying exposures reference the credit exposures to single name companies for which a two-way market exists, or on commonly traded indices based on such exposures, for which a two-way market exists; or

(ii) A position that is not a securitization position and that hedges a position described in paragraph (1)(i) of this definition.

(2) Notwithstanding paragraph (1) of this definition, a correlation trading position does not include:

(i) A rescritization position;

(ii) A derivative of a securitization position that does not provide a pro rata share in the proceeds of a securitization tranche; or

(iii) A securitization position for which the underlying assets or reference exposures are retail exposures, residential mortgage exposures, or commercial mortgage exposures.

Counterparty credit spread risk means the risk of loss resulting from a change in the credit spread of a counterparty that results in an increase in CVA.

Covered bond means a bond issued by a financial institution that satisfies all of

the criteria in paragraphs (1) through (6) of this definition from inception through its remaining maturity:

(1) The bond is subject to a specific regulatory regime under the law of the jurisdiction governing the bond that is designed to protect bond holders;

(2) The bond has a pool of underlying assets consisting exclusively of:

(i) Claims on, or guaranteed by, sovereigns, their central banks, PSEs, or MDBs;

(ii) Claims secured by first lien residential mortgages that would qualify for a 55 percent or lower risk weight under subpart E of this part; or

(iii) Claims secured by commercial real estate that would qualify for a 100 percent or lower risk weight under subpart E of this part and have a loan-to-value ratio of 60 percent or lower; and

(3) If the pool of underlying assets has any claims described in paragraphs (2)(ii) or (2)(iii) of this definition, then, for purposes of calculating the loan-to-value ratios for these assets:

(i) The collateral is valued at or less than the current fair market value under which the property could be sold under private contract between a willing seller and an arm's-length buyer on the date of valuation;

(ii) The issuing financial institution monitors the value of the collateral regularly and at least once per year; and

(iii) A qualified professional evaluates the property when information indicates that the value of the collateral may have declined materially relative to general market prices or when a credit event, such as a default, occurs;

(4) The nominal value of the pool of assets assigned to the bond exceeds the bond's nominal outstanding value by at least 10 percent;

(5) If the law governing the bond does not provide for the requirement in paragraph (4) of this definition, then the issuing financial institution discloses publicly on a regular basis that the issuing financial institution in practice meets the requirement in paragraph (4) of this definition; and

(6) The proceeds deriving from the bond are invested by law in assets that, during the entire duration of the bond—

(i) Are capable of covering claims attached to the bond; and

(ii) In the event of the failure of the issuer, would be used on a priority basis for the payment of principal and accrued interest.

Credit spread risk means the risk of loss that could arise from changes in underlying credit spread risk factors.

Credit valuation adjustment (CVA) means the fair value adjustment to reflect counterparty credit risk in the valuation of derivative contracts.

Cross-currency basis means the basis spread added to the associated reference rate of the non-USD leg or non-EUR leg of a cross-currency basis swap.

Currency union means an agreement by treaty among countries or territorial entities, under which the members agree to use a single currency, where the currency used is described in § _____.209(b)(1)(iv).

Curvature risk means the incremental risk of loss of a market risk covered position that is not captured by the delta capital requirement arising from changes in the value of an option or embedded option and is measured based on two stress scenarios (curvature scenarios) involving an upward shock and a downward shock to each prescribed curvature risk factor.

Customer and proprietary broker-dealer reserve bank accounts means segregated accounts established by a subsidiary of a [BANKING ORGANIZATION] that fulfill the requirements of 17 CFR 240.15c3-3 or 17 CFR 1.20.

CVA hedge means a transaction that a [BANKING ORGANIZATION] enters into with a third party or an internal trading desk and manages for the purpose of mitigating CVA risk.

CVA risk means the risk of loss due to an increase in CVA resulting from the deterioration in the creditworthiness of a counterparty perceived by the market or changes in the exposure of CVA risk covered positions.

CVA risk covered position means a position that is a derivative contract that is not a cleared transaction or a client-facing derivative transaction, provided that a position that is an eligible credit derivative the credit risk mitigation benefits of which are recognized under § _____.36 or § _____.120, as applicable, may be excluded from being a CVA risk covered position.

Default risk means the risk of loss on a non-securitization debt or equity position or a securitization position that could result from the failure of an obligor to make timely payments of principal or interest on its debt obligations, and the risk of loss that could result from bankruptcy, insolvency, or similar proceeding.

Default risk position means a market risk covered position, including a defaulted market risk covered position, that is subject to default risk.

Delta risk means the risk of loss that could result from changes in the value of a position due to small changes in underlying risk factors. Delta risk is measured based on the sensitivities of a position to prescribed delta risk factors, which are specified in §§ _____.207 and _____.208 for purposes of calculating the

sensitivities-based capital requirement and §§ _____.224 and _____.225 for purposes of calculating the standardized CVA approach capital requirement.

Eligible CVA hedge. (1) Except as provided in paragraph (2) of this definition, *eligible CVA hedge* means a CVA hedge with an external party or a CVA hedge that is the CVA segment of an internal risk transfer that:

(i) For purposes of calculating the basic CVA approach capital requirement, is a CVA hedge of counterparty credit spread risk, specifically:

(A) An index credit default swap (CDS); or

(B) A single-name CDS or a single-name contingent CDS that:

(1) References the counterparty directly; or

(2) References an affiliate of the counterparty; or

(3) References an entity that belongs to the same sector and region as the counterparty.

(ii) For purposes of calculating the standardized CVA approach capital requirement, can include:

(A) Instruments that hedge variability of the counterparty credit spread component of CVA risk; and

(B) Instruments that hedge the exposure component of CVA risk.

(2) Notwithstanding paragraph (1) of this definition, an eligible CVA hedge does not include:

(i) A CVA hedge that is not a whole transaction;

(ii) A securitization position;

(iii) A correlation trading position; and

(iv) A CVA hedge at a [BANKING ORGANIZATION] that is not required to apply the CVA risk-based capital requirements, pursuant to § _____.201(b)(2).

Emerging market economy means a country or territorial entity that is not a liquid market economy.

Equity position means a market risk covered position that is not a securitization position or a correlation trading position and that has a value that reacts primarily to changes in equity prices.

Equity risk means the risk of loss that could arise from changes in underlying equity risk factors.

Equity repo rate means the equity repurchase agreement rate.

Exotic exposure means an underlying exposure that is not in scope of any of the risk classes under the sensitivities-based capital requirement or is not captured by the default risk capital requirement, which includes, but is not limited to, longevity risk, weather risk, and natural disaster risk.

Expected shortfall (ES) means a measure of the average of all potential losses exceeding the VaR at a given confidence level and over a specified horizon, as specified in § _____.215.

Exposure model means a CVA exposure model used by the [BANKING ORGANIZATION] for financial reporting purposes or such a CVA exposure model that has been adjusted to satisfy the requirements of this subpart F.

Foreign exchange risk means the risk of loss that could arise from changes in underlying foreign exchange risk factors.

Foreign exchange position means a position for which price risk arises from changes in foreign exchange rates.

GSE debt means an exposure to a GSE that is not an equity exposure or exposure to a subordinated debt instrument issued by a GSE.

Hedge means a position or positions that offset all, or substantially all, of the price risk of another position or positions.

Hybrid instrument means an instrument that has characteristics in common with both debt and equity instruments, including traditional convertible bonds.

Hypothetical profit and loss means the change in the value of the market risk covered positions that would have occurred due to changes in the market data at end of current day if the end-of-previous-day market risk covered positions remained unchanged. Valuation adjustments that are updated daily must be included, unless the [BANKING ORGANIZATION] has received approval from the [AGENCY] to exclude them. Valuation adjustments for which separate regulatory capital requirements have been otherwise specified, commissions, fees, reserves, net interest income, and intraday trading must be excluded.

Idiosyncratic risk means the risk of loss in the value of a position that arises from changes in risk factors unique to the issuer.

Idiosyncratic risk factor means categories of risk factors that present idiosyncratic risk.

Interest rate risk means the risk of loss that could arise from changes in underlying interest rate risk factors.

Internal risk management model means a valuation model that the independent risk control unit within the [BANKING ORGANIZATION] uses to report market risks and risk-theoretical profits and losses to senior management.

Internal risk transfer means a transfer, executed through internal derivatives trades:

(1) Of credit risk or interest rate risk arising from an exposure capitalized under subpart D or subpart E of this part to a trading desk under this subpart F; or

(2) Of CVA risk from a CVA desk (or the functional equivalent if a [BANKING ORGANIZATION] does not have any CVA desks) to a trading desk under this subpart F.

Large market cap means a market capitalization equal to or greater than \$2 billion, [as adjusted pursuant to § _____.4].

Liquid market economy means:

(1) A country or territorial entity that, based on an annual review, the [BANKING ORGANIZATION] has determined meets all of the following criteria:

(i) The country or territorial entity has at least \$10,000 in gross domestic product per capita in current prices;

(ii) The country or territorial entity has at least \$95 billion in total market capitalization of all domestic stock markets;

(iii) The country or territorial entity has export diversification such that no single sector or commodity comprises more than 50 percent of the country or territorial entity's total annual exports;

(iv) The country or territorial entity does not impose material controls on liquidation of direct investment; and

(v) The country or territorial entity does not have sovereign entities, public sector entities, or sovereign-controlled enterprises subject to sanctions by the U.S. Office of Foreign Assets Control.

(2) A country or territorial entity that is in a currency union with at least one country or territorial entity that meets the criteria in paragraph (1) of this definition.

Liquidity horizon means the time required to exit or hedge a market risk covered position without materially affecting market prices in stressed market conditions.

Look-through approach means an approach in which a [BANKING ORGANIZATION] treats a market risk covered position that has multiple underlying exposures, such as an index instrument, multi-underlying option, an equity position in an investment fund, or a correlation trading position, as if the underlying exposures were held directly by the [BANKING ORGANIZATION].

Market capitalization means the aggregate value of all outstanding publicly traded shares issued by a company and its affiliates as determined by multiplying each share price by the number of outstanding shares.

Market risk means the risk of loss that could result from market movements,

such as changes in the level of interest rates, credit spreads, equity prices, foreign exchange rates, or commodity prices.

Market risk covered position. (1) Except as provided in paragraph (2) of this definition, *market risk covered position* means the following positions:

(i) A trading asset or trading liability (whether on- or off-balance sheet),⁸⁰⁰ as reported on [REGULATORY REPORT], that is a trading position, a position that is held for the purpose of regular dealing or making a market in securities or in other instruments, or hedges another market risk covered position and that is free of any restrictive covenants on its tradability or where the [BANKING ORGANIZATION] is able to hedge the material risk elements of the position in a two-way market;⁸⁰¹ and

(ii) The following positions, regardless of whether the position is a trading asset or trading liability, and hedges of such positions:

(A) A foreign exchange position or commodity position, excluding:

(1) A CVA hedge; and

(2) Any structural position in a foreign currency that the [BANKING ORGANIZATION] chooses to exclude with prior approval from the [AGENCY];

(B) A publicly traded equity position that is not excluded from being a market risk covered position by paragraph (2)(iv) of this definition;

(C) An equity position in an investment fund that is not excluded from being a market risk covered position by paragraph (2)(vi) of this definition;

(D) A net short risk position of \$20 million, [as adjusted pursuant to § _____.4], or more;

(E) An embedded derivative on instruments issued by the [BANKING ORGANIZATION] that relates to the [BANKING ORGANIZATION]'s credit or equity risk that the [BANKING ORGANIZATION] either:

(1) Bifurcates for accounting purposes; or

(2) Elects the fair value option for purposes of financial reporting;

(F) With prior approval from the [AGENCY], an entire instrument with an embedded derivative issued by the [BANKING ORGANIZATION] that relates to credit or equity risk, for which the [BANKING ORGANIZATION] elects the fair value option for purposes of financial reporting;

⁸⁰⁰ Securities subject to repurchase and lending agreements are included as if they are still owned by the lender.

⁸⁰¹ A position that hedges a trading position must be within the scope of the [BANKING ORGANIZATION]'s hedging strategy as described in § _____.203(a)(2).

(G) The trading desk segment of an eligible internal risk transfer of credit risk as described in § _____.205(g)(1)(i);

(H) The trading desk segment of an eligible internal risk transfer of interest rate risk as described in § _____.205(g)(1)(ii);

(I) A position arising from a transaction between a trading desk and an external party conducted as part of an internal risk transfer that meets the criteria described in § _____.205(g);

(J) The trading desk segment of an eligible internal risk transfer of CVA risk as described in § _____.205(g); and

(K) Instruments resulting from securities underwriting commitments, where the securities are expected to be purchased by the [BANKING ORGANIZATION] on the settlement date but are not securities expected to be purchased by the [BANKING ORGANIZATION] for held to maturity (HTM) or available for sale (AFS) purposes.

(2) Notwithstanding paragraph (1) of this definition, a market risk covered position does not include:

(i) An intangible asset, including a servicing asset;

(ii) A hedge of a trading position that the [AGENCY] determines to be outside the scope of the [BANKING ORGANIZATION]'s trading and hedging strategy required in § _____.203(a)(2);

(iii) An instrument that, in form or substance, acts as a liquidity facility that provides support to asset-backed commercial paper;

(iv) A publicly traded equity position with restrictions on tradability;

(v) A non-publicly traded equity position that is not an equity position in an investment fund;

(vi) An equity position in an investment fund that does not meet at least one of the two following criteria:

(A) The [BANKING ORGANIZATION] has access to the investment fund's prospectus, partnership agreement, or similar contract that defines the fund's permissible investments and investment limits and is able to use the look-through approach to calculate market risk capital requirements for its proportional ownership share of each exposure held by the investment fund; or

(B) The [BANKING ORGANIZATION] has access to the investment fund's prospectus, partnership agreement, or similar contract that defines the fund's permissible investments and investment limits and obtains daily price quotes for the investment fund;

(vii) Any position a [BANKING ORGANIZATION] holds with the intent to securitize;

(viii) Real estate directly held by the [BANKING ORGANIZATION] or an affiliate;

(ix) A derivative instrument or an exposure to a fund that has material exposure to the instrument types described in paragraphs (2)(i) through (viii) of this definition as underlying assets;

(x) An equity position arising from a deferred compensation plan, or bank owned life insurance or corporate owned life insurance owned by an affiliate of [BANKING ORGANIZATION] that is consistent with the requirements of [Volcker Rule § _____.10(c)(7)];

(xi) A significant investment in the capital of unconsolidated financial institutions in the form of common stock that is not deducted from capital pursuant to § _____.22(d)(2), as applicable;

(xii) An instrument held for the purpose of hedging a particular risk of a position in the types of instruments described in paragraphs (2)(i) through (xi) of this definition;

(xiii) A CVA hedge;

(xiv) An equity position in an investment fund that the [BANKING ORGANIZATION] or an affiliate organizes and offers, which the [BANKING ORGANIZATION] acquired for the purpose of providing such fund with sufficient initial equity for investment to permit the fund to attract unaffiliated investors and which the [BANKING ORGANIZATION] has held for fewer than five years from the date on which the investment adviser or similar entity to the fund begins making investments pursuant to the written investment strategy for the fund; and

(xv) Hedges that are effective hedges, pursuant to the treatment in § _____.52(c) or § _____.141(c), as applicable.

Mid-prime RMBS means a security that references underlying exposures that consist primarily of residential mortgages that is not a prime RMBS or a sub-prime RMBS.

Model-eligible position means a market risk covered position on a model-eligible trading desk that is not a model-ineligible position.

Model-eligible trading desk means a trading desk (including a notional trading desk) that received approval of the [AGENCY] to be a model-eligible trading desk pursuant to § _____.212(b)(2) and continues to remain a model-eligible trading desk.

Model-ineligible position means an equity position in an investment fund where the [BANKING ORGANIZATION] is not able to identify the underlying positions held by an investment fund on a quarterly basis, a securitization

position, or a correlation trading position.

Model-ineligible trading desk means a trading desk that is not a model-eligible trading desk.

Modellable risk factor means a risk factor that satisfies both the risk factor qualitative test in § _____.214(b)(2) and the risk factor quantitative test in § _____.214(b)(3), consistent with § _____.214(b)(1).

Net short risk position means a position that is calculated by comparing the notional amounts of a [BANKING ORGANIZATION]'s long and short positions for a given exposure, provided that the notional amounts of the short position exceed the notional amounts of the long position and that the position is:⁸⁰²

(1) From a credit derivative that the [BANKING ORGANIZATION] recognizes as a guarantee for risk-weighted asset amount calculation purposes under subpart D or subpart E of this part and other exposures recognized under subpart D or subpart E of this part;

(2) Arises under subpart D or subpart E of this part from the credit risk segment of an internal risk transfer described in § _____.205(g)(1)(i) that the [BANKING ORGANIZATION] recognizes as a guarantee for risk-weighted asset amount calculation purposes under subpart D or subpart E of this part; and

(3) An equity position or a credit position that arises under subpart D or subpart E of this part that is not referenced in paragraph (1) or (2) of this definition provided that:

(i) For a [BANKING ORGANIZATION] that hedges at the single name level, the notional amounts of the positions are compared at the name or obligor level; and

(ii) For a [BANKING ORGANIZATION] that hedges at the portfolio level using indices, the notional amounts of the positions are compared at the portfolio level.

Non-modellable risk factor means a type A non-modellable risk factor or a type B non-modellable risk factor.

Non-securitization position means a market risk covered position that is not a securitization position or a correlation trading position and that has a value that reacts primarily to changes in interest rates or credit spreads.

Non-securitization debt or equity position means a non-securitization

⁸⁰² For equity derivatives, the notional long and short positions are based on the adjusted notional amount, which is the product of the current price of one unit of the stock (for example, a share of equity) and the number of units referenced by the trade.

position or an equity position that is subject to default risk.

Notional trading desk means a trading desk created for regulatory capital purposes to account for market risk covered positions arising under subpart D or subpart E of this part, such as net short risk positions, embedded derivatives on instruments issued by the [BANKING ORGANIZATION] that relate to credit or equity risk that the [BANKING ORGANIZATION] either bifurcates for accounting purposes or elects the fair value option for purposes of financial reporting, instruments with an embedded derivative issued by the [BANKING ORGANIZATION] that relate to credit or equity risk, for which the [BANKING ORGANIZATION] elects the fair value option for purposes of financial reporting, and foreign exchange positions and commodity positions. Notional trading desks are not required to fulfill the requirements set forth in § _____.203(b)(2) and (c).

Pension fund means:

(1) An employee benefit plan (as defined in 29 U.S.C. 1002(3)) that is not exempt from ERISA, under 29 U.S.C. 1003(b), and that complies with the tax deferral qualification requirements provided in the Internal Revenue Code;

(2) A governmental plan (as defined in 29 U.S.C. 1002(32)) that complies with the tax deferral qualification requirements provided in the Internal Revenue Code; or

(3) A fund for employee benefit plans subject to ERISA that is exempt from the definition of an investment company under section 3(c)(11) of the Investment Company Act (15 U.S.C. 80a-1 *et seq.*).

Pricing model means:

(1) A valuation model used for financial reporting such as models used in reporting actual profits and losses; or

(2) A valuation model used for internal risk management.

Prime RMBS means a security that references underlying exposures that consist primarily of qualified residential mortgages as defined under 12 CFR 244.13(a).

Profit and loss attribution (PLA) means a method for assessing the robustness of a [BANKING ORGANIZATION]'s internal models used to calculate the ES-based measure in § _____.215(b) by comparing the risk-theoretical profit and loss predicted by the internal models with the hypothetical profit and loss.

PSE position means a market risk covered position that is an exposure to a public sector entity (PSE).

P-value means the probability, when using the VaR-based measure for purposes of backtesting, of observing a profit that is less than, or a loss that is

greater than, the profit or loss that actually occurred on a given date.

Real price means:

(1) A price at which the [BANKING ORGANIZATION] has executed a transaction;

(2) A price provided by a regulated exchange, a qualifying central counterparty, a sovereign entity, or a specified supranational entities and multilateral development banks (MDBs);

(3) A verifiable price for an actual transaction between other arm's-length parties or a bona fide competitive bid or offer by a party transacting at arm's length either made to or received by the [BANKING ORGANIZATION] itself or obtained from a third-party provider, provided that, for any transaction, bid, or offer obtained from a third-party provider:

(i) The transaction, bid, or offer has been processed through a third-party provider; or

(ii) The third-party provider agrees to provide evidence of the transaction, bid, or offer to the [BANKING ORGANIZATION] upon request.

Reference credit spread risk means the risk of loss that could arise from changes in the underlying credit spread risk factors that drive the exposure component of CVA risk.

Resecuritization position means a market risk covered position that is a resecuritization exposure.

Residential mortgage-backed security (RMBS) means a prime RMBS, mid-prime RMBS, or sub-prime RMBS.

Risk class means:

(1) For the purpose of calculating the sensitivities-based capital requirement, one of the classes specified in § _____.206(a)(1);

(2) For the purpose of calculating the models-based non-default capital requirement, one of the following: interest rate risk, equity risk, foreign exchange risk, commodity risk, credit risk, and any other risk class established by the agency; and

(3) For the purpose of calculating the standardized CVA approach capital requirement, one of the classes relevant to the capital requirement specified in § _____.224.

Risk factor means underlying variables, such as market rates and prices that affect the value of a market risk covered position or a CVA risk covered position. For purposes of calculating the sensitivities-based capital requirement, the risk factors are specified in § _____.208. For purposes of calculating the standardized CVA approach capital requirement, the risk factors are specified in § _____.225.

Risk-theoretical profit and loss means the daily trading desk-level profit and

loss on the end-of-previous-day market risk covered positions generated by the [BANKING ORGANIZATION]'s internal risk management models. The risk-theoretical profit and loss must take into account all risk factors, including non-modellable risk factors that can be included in the [BANKING ORGANIZATION]'s internal risk management models.

Securitization position means a market risk covered position that is a securitization exposure.

Securitization position non-CTP means a securitization position other than a correlation trading position.

Small market cap means a market capitalization of less than \$2 billion, as adjusted pursuant to § _____.4.

Sovereign position means a market risk covered position that is a sovereign exposure.

Standardized CVA hedge means a CVA hedge that is an eligible CVA hedge that:

(1) Is not a basic CVA hedge; and
(2) Is included in the standardized CVA approach capital requirement.

Standardized CVA risk covered position means a CVA risk covered position that is not a basic CVA risk covered position.

Structural position in a foreign currency means a position that is not a trading position and that is:

(1) Subordinated debt, equity, or minority interest in a consolidated subsidiary that is denominated in a foreign currency;

(2) Capital assigned to foreign branches that is denominated in a foreign currency;

(3) A position related to an unconsolidated subsidiary or another item that is denominated in a foreign currency and that is deducted from the [BANKING ORGANIZATION]'s tier 1 or tier 2 capital; or

(4) A position designed to hedge a [BANKING ORGANIZATION]'s capital ratios or earnings against the effect on paragraph (1), (2), or (3) of this definition of adverse exchange rate movements.

Sub-prime RMBS means a security that references underlying exposures consisting primarily of higher-priced mortgage loans as defined in 12 CFR 1026.35, high-cost mortgages as defined in 12 CFR 1026.32, or both.

Systematic risk means the risk of loss that could arise from changes in risk factors that represent broad market movements and that are not specific to an issue or issuer.

Systematic risk factors means categories of risk factors that present systematic risk, such as economy, region, and sector.

Term repo-style transaction means a repo-style transaction that has an original maturity in excess of one business day.

Time effects means the effects on the profit and loss solely due to the passage of time.

Trading desk means a unit of organization of a [BANKING ORGANIZATION] that purchases or sells market risk covered positions that is:

(1) Structured by the [BANKING ORGANIZATION] to implement a well-defined business strategy;

(2) Organized to ensure appropriate setting, monitoring, and management review of the desk's trading and hedging limits and strategies; and

(3) Characterized by a clearly defined unit of organization that:

(i) Engages in coordinated trading activity with a unified approach to the key elements described in § _____.203(b)(2) and (c);

(ii) Operates subject to a common and calibrated set of risk metrics, risk levels, and joint trading limits;

(iii) Submits compliance reports and other information as a unit for monitoring by management; and

(iv) Books its trades together.

Trading position means a position that is held by a [BANKING ORGANIZATION] for the purpose of short-term resale or with the intent of benefiting from actual or expected short-term price movements, or to lock in arbitrage profits.

Two-way market means a market where there are independent bona fide offers to buy and sell so that a price reasonably related to the last sales price or current bona fide competitive bid and offer quotations can be determined within one day and settled at that price within a relatively short time frame conforming to trade custom.

Type A non-modellable risk factor means a risk factor that satisfies the risk factor qualitative test in § _____.214(b)(2) but not the risk factor quantitative test in § _____.214(b)(3), consistent with § _____.214(b)(1).

Type B non-modellable risk factor means a risk factor that is not a modellable risk factor or a type A non-modellable risk factor, consistent with § _____.214(b)(1).

Value-at-Risk (VaR) means the estimate of the maximum amount that the value of one or more market risk covered positions could decline due to market price or rate movements during a fixed holding period within a stated confidence interval.

Vega risk means the risk of loss that could arise from changes in the value of a position due to changes in the

volatility of the underlying exposure. Vega risk is measured based on the sensitivities of a position to prescribed vega risk factors as specified in §§ _____.207 and _____.208 for purposes of calculating the sensitivities-based capital requirement and §§ _____.224 and _____.225 for purposes of calculating the standardized CVA approach capital requirement.

§ _____.203 General Requirements for Market Risk

(a) Market risk covered positions—(1) Identification of market risk covered positions. A [BANKING ORGANIZATION] must have clearly defined policies and procedures for determining its market risk covered positions, which the [BANKING ORGANIZATION] must update at least annually. These policies and procedures must include:

(i) Identification of trading assets and trading liabilities that are trading positions and of trading positions that are correlation trading positions;

(ii) Identification of trading assets and trading liabilities that are positions held for the purpose of regular dealing or making a market in securities or other instruments;

(iii) Identification of equity positions in an investment fund that are market risk covered positions;

(iv) Identification of positions that are market risk covered positions, regardless of whether the position is a trading asset or trading liability, including net short risk positions (and the calculation of such positions), eligible internal risk transfer positions as described in § _____.205(g), embedded derivatives on instruments issued by the [BANKING ORGANIZATION] that relate to credit or equity risk that the [BANKING ORGANIZATION] either bifurcates for accounting purposes or elects the fair value option for purposes of financial reporting, and instruments with an embedded derivative issued by the [BANKING ORGANIZATION] that relate to credit or equity risk, for which the [BANKING ORGANIZATION] elects the fair value option for purposes of financial reporting;

(v) Consideration of the extent to which a position, or a hedge of its material risks, can be marked-to-market daily by reference to a two-way market;

(vi) Consideration of possible impairments to the liquidity of a position or its hedge;

(vii) Identification of positions that must be excluded from market risk covered positions; and

(viii) A process for determining whether a position needs to be re-designated after its initial identification

as a market risk covered position or otherwise, which must include re-designation restrictions and a description of the events or circumstances under which a [BANKING ORGANIZATION] would consider a re-designation, a process for identifying such events or circumstances, and a process for obtaining senior management approval and for notifying the [AGENCY] of material re-designations.

(2) *Market risk trading and hedging strategies.* A [BANKING ORGANIZATION] must have clearly defined trading and hedging strategies for its market risk covered positions that are approved by senior management of the [BANKING ORGANIZATION].

(i) The trading strategy must articulate the expected holding period of, and the market risk associated with, each portfolio of market risk covered positions.

(ii) The hedging strategy must articulate for each portfolio of market risk covered positions the level of market risk that the [BANKING ORGANIZATION] is willing to accept and must detail the instruments, techniques, and strategies that the [BANKING ORGANIZATION] will use to hedge the risk of the portfolio.

(b) *Trading desks—(1) Trading desk structure.* A [BANKING ORGANIZATION] must define its trading desk structure. That structure must include:

(i) Definition of each trading desk;

(ii) Identification of model-eligible trading desks, consistent with § _____.212(b);

(iii) Identification of model-ineligible trading desks used in both the standardized measure for market risk and the models-based measure for market risk (as applicable);

(iv) Identification of trading desks that are used for internal risk transfers (as applicable); and

(v) Identification of notional trading desks (as applicable).

(2) *Trading desk policies.* For each trading desk that is not a notional trading desk, a [BANKING ORGANIZATION] must have a clearly defined policy that is approved by senior management of the [BANKING ORGANIZATION] and describes the general strategy of the trading desk, the risk and position limits established for the trading desk, and the internal controls and governance structure established to oversee the risk-taking activities of the trading desk, and that includes, at a minimum:

(i) A written description of the general strategy of the trading desk that addresses the economics of the business

strategy, the primary activities, and the trading and hedging strategies of the trading desk;

(ii) A clearly defined trading strategy for the trading desk's market risk covered positions, approved by senior management of the [BANKING ORGANIZATION], which details the types of market risk covered positions purchased and sold by the trading desk; indicates which of these are the main types of market risk covered positions purchased and sold by the trading desk; and articulates the expected holding period of, and the market risk associated with, each portfolio of market risk covered positions held by the trading desk;

(iii) A clearly defined hedging strategy for the trading desk's market risk covered positions, approved by senior management of the [BANKING ORGANIZATION], which articulates for each trading desk the level of market risk the [BANKING ORGANIZATION] is willing to accept and details the instruments, techniques, and strategies that the trading desk will use to hedge the risk of the portfolio; and

(iv) A business strategy that includes regular reports on the revenue, costs, and market risk capital requirements of the trading desk.

(c) *Active management of market risk covered positions.* A [BANKING ORGANIZATION] must have clearly defined policies and procedures describing the internal controls, ongoing monitoring, management, and authorization procedures, including escalation procedures, for actively managing all market risk covered positions. At a minimum, these policies and procedures must identify the key groups and personnel responsible for overseeing the activities of the [BANKING ORGANIZATION]'s trading desks that are not notional trading desks and require:

(1) Determining the fair value of the market risk covered positions on a daily basis;

(2) Ongoing assessment of the ability of trading desks to hedge market risk covered positions and portfolio risks and of the extent of market liquidity;

(3) Establishment by each trading desk of clear trading limits with well-defined trader mandates and articulation of why the risk factors used to establish the limits appropriately reflect the general strategy of the trading desk;

(4) Establishment and daily monitoring by trading desks of the following risk-management measurements:

(i) Trading limits, usage, and remediation of breaches;

(ii) Sensitivities to risk factors;

(iii) VaR and expected shortfall (as applicable);

(iv) Backtesting and p-values at the trading desk level and at the aggregate level for all model-eligible trading desks (as applicable);

(v) Comprehensive profit and loss attribution (as applicable); and

(vi) Market risk covered positions and transaction volumes;

(5) Establishment and daily monitoring by a risk control unit independent of the trading business unit of the risk-management measurements listed in paragraph (c)(4) of this section;

(6) Strategy to appropriately mitigate risks when stress tests reveal particular vulnerabilities to a given set of circumstances;

(7) Daily monitoring by senior management of information described in paragraphs (c)(1) through (4) of this section;

(8) Reassessment of established limits on market risk covered positions, performed by senior management annually or more frequently; and

(9) Assessments of the quality of market inputs to the valuation process, the soundness of key assumptions, the reliability of parameter estimation in pricing models, and the stability and accuracy of model calibration under alternative market scenarios, performed by qualified personnel annually or more frequently.

(d) *Stress testing.* (1) A [BANKING ORGANIZATION] must stress test its market risk covered positions at the aggregate level and on each trading desk at a frequency appropriate to manage risk, but in no case less frequently than quarterly. The stress tests must take into account concentration risk (including but not limited to concentrations in single issuers, industries, sectors, or markets), illiquidity under stressed market conditions, and risks arising from the [BANKING ORGANIZATION]'s trading activities that may not be adequately captured in the standardized measure for market risk or in the models-based measure for market risk, as applicable.

(2) The results of the stress testing must be reviewed by the [BANKING ORGANIZATION]'s senior management when available, and reflected in the policies and limits set by the [BANKING ORGANIZATION]'s management and its board of directors (or a committee thereof).

(e) *Control and oversight.* (1) A [BANKING ORGANIZATION] must have in place internal market risk management systems and processes for identifying, measuring, monitoring, and

managing market risk that are conceptually sound.

(2) A [BANKING ORGANIZATION] must have a risk control unit that is responsible for the design and implementation of the [BANKING ORGANIZATION]'s market risk management system and that reports directly to senior management and is independent from the business trading units.

(3) A [BANKING ORGANIZATION] must have an internal audit function independent of business line management that at least annually assesses the effectiveness of the controls supporting the [BANKING ORGANIZATION]'s market risk measurement systems, including the activities of the business trading units and independent risk control unit, the initial designation of positions as market risk covered positions and any re-designations of positions, compliance with policies and procedures, and the calculation of the [BANKING ORGANIZATION]'s measures for market risk under this subpart F, including the mapping of risk factors to liquidity horizons, as applicable. At least annually, the internal audit function must report its findings to the [BANKING ORGANIZATION]'s board of directors (or a committee thereof).

(f) *Valuation of market risk covered positions.* A [BANKING ORGANIZATION] must have a process for the prudent valuation of its market risk covered positions that includes policies and procedures on the valuation of its market risk covered positions, determining the fair value of its market risk covered positions, independent price verification, and independent validation of the valuation models and valuation adjustments or reserves.

(g) *Internal assessment of capital adequacy.* A [BANKING ORGANIZATION] must have a rigorous process for assessing its overall capital adequacy in relation to its market risk. The assessment must take into account risks that may not be captured fully by the standardized measure for market risk or in the models-based measure for market risk, including concentration and liquidity risk under stressed market conditions.

(h) *Due diligence requirements for securitization positions.* (1) A [BANKING ORGANIZATION] must demonstrate to the satisfaction of the [AGENCY] a comprehensive understanding of the features of a securitization position that would materially affect the performance of the position. The [BANKING ORGANIZATION]'s analysis must be

commensurate with the complexity of the securitization position and the materiality of the position in relation to its regulatory capital under this part.

(2) A [BANKING ORGANIZATION] must demonstrate its comprehensive understanding of a securitization position under this paragraph (h), for each securitization position by:

(i) Conducting an analysis of the risk characteristics of a securitization position prior to acquiring the exposure and documenting such analysis promptly after acquiring the exposure, considering:

(A) Structural features of the securitization that would materially impact the performance of the exposure, which may include the contractual cash flow waterfall, waterfall-related triggers, credit enhancements, liquidity enhancements, fair value triggers, the performance of organizations that service the exposure, and deal-specific definitions of default;

(B) Relevant information regarding—

(1) The performance of the underlying credit exposure(s) by exposure amount, which may include the percentage of loans 30, 60, and 90 days past due; default rates; prepayment rates; loans in foreclosure; property types; occupancy; average credit score or other measures of creditworthiness; average loan-to-value ratio; and industry and geographic diversification data on the underlying exposure(s); and

(2) For resecuritization positions, performance information on the underlying securitization exposures by exposure amount, which may include the issuer name and credit quality, and the characteristics and performance of the exposures underlying the securitization exposures, in addition to the information described in paragraph (h)(2)(i)(B)(1) of this section; and

(C) Relevant market data of the securitization, which may include bid-ask spreads, most recent sales price and historical price volatility, trading volume, implied market rating, and size, depth and concentration level of the market for the securitization; and

(ii) On an ongoing basis (not less frequently than quarterly), evaluating and updating as appropriate the analysis required under this section for each securitization position.

(i) *Documentation.* (1) A [BANKING ORGANIZATION] must adequately document all material aspects of its identification, management, and valuation of market risk covered positions, including internal risk transfers and any re-designations of its positions, including market risk covered positions; its control, oversight and

review processes; and its internal assessment of capital adequacy.

(2) A [BANKING ORGANIZATION] must adequately document its trading desk structure and must document policies describing how each trading desk satisfies the applicable requirements in this section.

(3) A [BANKING ORGANIZATION] that calculates the models-based measure for market risk must adequately document all material aspects of its internal models, including validation and review processes and results and an explanation of the empirical techniques used to measure market risk.

(4) A [BANKING ORGANIZATION] that calculates the models-based measure for market risk must document policies and procedures around processes related to:

(i) The risk factor qualitative and quantitative tests, including the description of the mapping of real price observations to risk factors, as described in §§ _____.214(b)(2) and (3);

(ii) Data alignment of hypothetical profit and loss and risk-theoretical profit and loss time series used in PLA testing as described in § _____.213(c)(1); and

(iii) The assignment of risk factors to liquidity horizons as described in § _____.215(b)(1) and any empirical correlations recognized with respect to risk classes.

§ _____.204 Measure for Market Risk

(a) *General requirements.* (1) A [BANKING ORGANIZATION] must calculate its measure for market risk as the standardized measure for market risk in accordance with paragraph (b) of this section, unless the [BANKING ORGANIZATION] has one or more model-eligible trading desks, in which case the [BANKING ORGANIZATION] must calculate its measure for market risk as the models-based measure for market risk in accordance with paragraph (c) of this section. A [BANKING ORGANIZATION] must calculate the standardized measure for market risk at least weekly and must calculate the models-based measure for market risk daily.

(2) Notwithstanding paragraph (a)(1) of this section, when a [BANKING ORGANIZATION] is required to calculate market risk capital for a trading desk on a stand-alone basis, the [BANKING ORGANIZATION] must calculate its measure for market risk as the sum of:

(i) The primary measure, calculated by applying the provisions of paragraph (a)(1) of this section to all market risk covered positions that are not included in a stand-alone measure for market risk

in paragraph (a)(2)(ii) of this section; and

(ii) The stand-alone measure for each trading desk that is required to calculate market risk capital on a stand-alone basis, calculated by applying the provisions of paragraph (a)(1) of this section to the positions on that trading desk as if those positions were the entire portfolio of market risk covered positions.

(b) *Standardized measure for market risk.* The standardized measure for market risk equals the sum of the standardized non-default capital requirement as defined in this paragraph (b), the default risk capital requirement as defined in paragraph (d) of this section, the fallback capital requirement as defined in paragraphs (e)(1) and (2) of this section, and the capital add-ons for re-designations as defined in paragraph (f) of this section. The standardized non-default capital requirement equals the sum of the sensitivities-based capital requirement and the residual risk add-on as defined under this paragraph (b).

(1) *Sensitivities-based capital requirement.* A [BANKING ORGANIZATION]'s sensitivities-based capital requirement equals the sensitivities-based capital requirement, as calculated in accordance with §§ _____.206 through _____.209 for market risk covered positions.

(2) *Residual risk add-on.* A [BANKING ORGANIZATION]'s residual risk add-on equals any residual risk add-on that is required under § _____.211(a) and calculated in accordance with § _____.211(c) for market risk covered positions.

(c) *Models-based measure for market risk.* The models-based measure for market risk equals:

$$\text{Models-based measure for market risk} = \text{NDCR} + \text{DRC} + \text{fallback capital requirement} + \text{capital add-on for redesignations}$$

Where:

(1) NDCR is the non-default capital requirement under the models-based measure and is calculated as follows, except that, with supervisory approval, the non-default capital requirement under the models-based measure can instead be equal to $SA_{all\ desks}$:

$$NDCR = IMA_{G,A} + (SA_{all\ desks} - SA_{G,A})$$

Where:

(i) $IMA_{G,A}$ is the models-based non-default capital requirement calculated for model-eligible positions on model-eligible trading desks and is calculated as follows:

$$IMA_{G,A} = \max((IMCC_{t-1} + SES_{t-1}), ((m_c \times IMCC_{average}) + SES_{average})) + PLA_{add-on}$$

Where:

- (A) *IMCC* is the internally modelled capital calculation, which is the aggregate capital measure for modellable risk factors and type A non-modellable risk factors based on the weighted average of the constrained and unconstrained ES-based measures and calculated in accordance with § _____.215(c) for the most recent outcome, denoted as $t - 1$, and for the average of the previous 60 business days, denoted as *average*;
- (B) *SES* is the stressed expected shortfall, which is the aggregate capital measure for non-modellable risk factors, calculated in accordance with § _____.215(d) for the most recent outcome, denoted as $t - 1$, and for the average of the previous 60 business days, denoted as *average*;
- (C) The capital multiplier m_c equals 1.5 unless otherwise specified in paragraph (g) of this section; and
- (D) *PLA add-on* equals any PLA add-on that is required under § _____.212(b)(2)(ii)(D), § _____.212(b)(4), or § _____.213(c)(3)(iii) and is calculated in accordance with § _____.213(c)(4);
- (ii) *SA_{all desks}* equals the standardized non-default capital requirement as defined in paragraph (b) of this section for market risk covered positions on all trading desks;
- (iii) *SA_{G,A}* equals the standardized non-default capital requirement as defined in paragraph (b) of this section for model-eligible positions on model-eligible trading desks;
- (2) *DRC* is the *default risk capital requirement* as defined in paragraph (d) of this section;
- (3) *Fallback capital requirement* is defined in paragraph (e) of this section; and
- (4) *Capital add-on for redesignations* is defined in paragraph (f) of this section.
- (d) *Default risk capital requirement.* A [BANKING ORGANIZATION]'s default risk capital requirement equals the sum of the default risk capital requirements for non-securitization debt or equity positions, correlation trading positions, and securitization positions non-CTP, as calculated in accordance with § _____.210 for market risk covered positions.
- (e) *Fallback capital requirement—*(1) *Calculation of the fallback capital requirement.* Unless the [BANKING ORGANIZATION] receives prior approval of the [AGENCY] to use alternative techniques that appropriately measure the market risk associated with those market risk covered positions, a [BANKING ORGANIZATION]'s fallback capital requirement equals the sum of:
 - (i) The standardized non-default capital requirement and the default risk capital requirement for any market risk covered positions described by paragraph (e)(3)(ii)(A) for which the [BANKING ORGANIZATION] is able to calculate all parts of those capital requirements; and
 - (ii) The sum of the absolute value of the fair values of all other market risk covered positions that must be included in the fallback capital requirement in accordance with paragraphs (e)(2)(ii) and (e)(3)(ii) of this section, respectively.
- (2) *Standardized measure for market risk—*(i) *Market risk covered positions excluded from certain calculations.* Notwithstanding paragraph (b) of this section, for a [BANKING ORGANIZATION] that calculates the standardized measure for market risk, if for any reason, a [BANKING ORGANIZATION] is unable to calculate the sensitivities-based capital requirement or the default risk capital requirement for a market risk covered position, that position must be excluded from the calculation of the standardized non-default capital requirement and the default risk capital requirement.
- (ii) *Market risk covered positions included in the fallback capital requirement.* A [BANKING ORGANIZATION] that calculates the standardized measure for market risk must include all market risk covered positions excluded under paragraph (e)(2)(i) of this section in the calculation of the fallback capital requirement.
- (3) *Models-based measure for market risk—*(i) *Market risk covered positions excluded from certain calculations.* Notwithstanding paragraph (c) of this section, for a [BANKING ORGANIZATION] that calculates the models-based measure for market risk: in cases where, for any reason, a [BANKING ORGANIZATION] is unable to calculate any portion of *SA_{all desks}*, *IMA_{G,A}*, *SA_{G,A}*, *SA_i* as part of the calculation of the *PLA add-on*, or the default risk capital requirement for a market risk covered position subject to that calculation, that market risk covered position must be excluded from the calculation of *IMA_{G,A}*, *SA_{all desks}*, *SA_{G,A}*, *SA_i*, and the default risk capital requirement, unless the [BANKING ORGANIZATION] receives prior approval from the [AGENCY].
- (ii) *Market risk covered positions included in the fallback capital requirement.* A [BANKING ORGANIZATION] that calculates the models-based measure for market risk must include the following market risk covered positions in the calculation of the fallback capital requirement:
 - (A) All model-eligible positions excluded from the calculation of *IMA_{G,A}* under paragraph (e)(3)(i) of this section; and
 - (B) All market risk covered positions excluded from the calculation of *SA_{all desks}* under paragraph (e)(3)(i) of this section; and
 - (C) All market risk covered positions excluded from the default risk capital requirement under paragraph (e)(3)(i) of this section.
- (f) *Capital add-ons for re-designations.*
 - (1) After the initial designation of an exposure to be capitalized under subpart D or subpart E of this part or a position to be capitalized as a market risk covered position under this subpart F, a [BANKING ORGANIZATION] may make a re-designation if:
 - (i) The [BANKING ORGANIZATION] receives prior approval of senior management and documents the re-designation; and
 - (ii) The [BANKING ORGANIZATION] sends notification within 30 days of any material re-designation to the [AGENCY].
 - (2) For each re-designation, a [BANKING ORGANIZATION] must calculate its capital add-on for re-designation following the provisions below.
 - (i) For the calculation of Expanded Total Risk-Weighted Assets, the capital add-on for re-designation is the higher of zero and the total capital requirement under subpart E of this part and under this subpart F before the re-designation minus the total capital requirement under subpart E of this part and under this subpart after the re-designation.
 - (ii) For the calculation of Standardized Total Risk-Weighted Assets, the capital add-on for re-designation is the higher of zero and the total capital requirement under subpart D of this part and under this subpart F before the re-designation minus the total capital requirement under subpart D of this part and under this subpart after the re-designation.
 - (iii) The capital add-on for re-designation must initially be calculated at the time of the re-designation.
 - (iv) The capital add-on for re-designation may decrease over time, proportionate to the decrease in the balance sheet value of the position from the time of re-designation.
 - (v) Notwithstanding paragraphs (f)(2)(i) through (iv) of this section, with

- prior notification to the [AGENCY], no capital add-on for re-designation is required if the re-designation is due to circumstances that are outside of the [BANKING ORGANIZATION]'s control, including any re-designation required for accounting purposes or a change in the characteristics of the exposure or position that would change its qualification as a market risk covered position.
- (3) Any re-designation is irrevocable unless the [BANKING ORGANIZATION] receives approval of the [AGENCY].
- (g) *Aggregate trading portfolio backtesting and capital multiplier.*
- (1) Beginning on the business day a [BANKING ORGANIZATION] begins calculating the models-based measure for market risk, the [BANKING ORGANIZATION] must generate backtesting data by separately comparing each business day's aggregate actual profit and loss for transactions on model-eligible trading desks and aggregate hypothetical profit and loss for transactions on model-eligible trading desks with the corresponding aggregate VaR-based measures for that business day calibrated to a one-day holding period and at a one-tail, 99.0th percent confidence level for market risk covered positions on model-eligible trading desks, subject to § _____.212(b)(1)(iii)(B) of this part. Time effects must be treated in a consistent manner in the hypothetical profit and loss used for backtesting.
- (i) An exception for actual profit and loss occurs when the aggregate actual loss exceeds the corresponding aggregate VaR-based measure. An exception for hypothetical profit and loss occurs when the aggregate hypothetical loss exceeds the corresponding VaR-based measure.
- (ii) If either the business day's actual or hypothetical profit and loss is not available or impossible to compute for a particular day, an exception for actual profit and loss or for hypothetical profit and loss, respectively, occurs. If the VaR-based measure for a business day is not available or impossible to compute for a particular day, exceptions for actual profit and loss and for hypothetical profit and loss occur. No exception occurs if the unavailability or impossibility is related to an official holiday.
- (iii) With approval of the [AGENCY], a [BANKING ORGANIZATION] may consider an exception not to have occurred if:
- (A) The [BANKING ORGANIZATION] can demonstrate that the exception is due to technical issues that are unrelated to the [BANKING ORGANIZATION]'s internal models;
- (B) The [BANKING ORGANIZATION] can demonstrate that one or more non-modellable risk factors caused the relevant loss, and the portion of the aggregate stressed expected shortfall, as described in paragraph (c)(2)(ii) of this section, that can be attributed to these non-modellable risk factors for that business day exceeds the difference between the [BANKING ORGANIZATION]'s VaR-based measure and the actual or hypothetical loss for that business day; or
- (C) The [BANKING ORGANIZATION] can demonstrate that one or more model-ineligible positions caused the relevant loss, and the portion of the aggregate non-default capital requirement under the models-based measure, as described in paragraph (c)(2)(ii) of this section, that can be attributed to these model-ineligible positions for that business day exceeds the difference between the [BANKING ORGANIZATION]'s VaR-based measure and the actual or hypothetical loss for that business day.
- (2) A [BANKING ORGANIZATION] must specify the scope of its model-eligible trading desks for the purposes of this paragraph (g) by determining which trading desks are model-eligible trading desks and taking into consideration any changes to the model eligibility status of trading desks as soon as practicable. A [BANKING ORGANIZATION] must use this scope of model-eligible trading desks for the purposes of this paragraph (g) unless the [AGENCY] notifies the [BANKING ORGANIZATION] in writing that a different scope of model-eligible trading desks must be used.
- (3) A [BANKING ORGANIZATION] that calculates the models-based measure for market risk must conduct aggregate trading portfolio backtesting on a quarterly basis. In order to conduct aggregate trading portfolio backtesting, a [BANKING ORGANIZATION] must count the number of exceptions that have occurred over the most recent 250 business days, provided that in the first year that the [BANKING ORGANIZATION] begins backtesting, the [BANKING ORGANIZATION] must count the number of exceptions that have occurred since the date that the [BANKING ORGANIZATION] began backtesting. A [BANKING ORGANIZATION] must count exceptions for aggregate actual profit and loss separately from exceptions for aggregate hypothetical profit and loss. The overall number of exceptions is the greater of the number of exceptions for aggregate actual profit and loss and the number of exceptions for aggregate hypothetical profit and loss.
- (4) A [BANKING ORGANIZATION] must use the multiplication factor in Table 1 to § _____.204 that corresponds to the overall number of exceptions identified in paragraph (g)(3) of this section to determine the multiplication factor for the models-based non-default capital requirement under paragraph (c)(2)(iii) of this section until the [BANKING ORGANIZATION] conducts aggregate trading portfolio backtesting for the next quarter, unless the [AGENCY] notifies the [BANKING ORGANIZATION] in writing that a different adjustment or other action is appropriate.

Table 1 to § __.204—Backtesting Capital Multiplier (m_c)

Number of exceptions	Multiplication factor
0	1.50
1	1.50
2	1.50
3	1.50
4	1.50
5	1.70
6	1.76
7	1.83
8	1.88
9	1.92
10 or more	2.00

(h) *Maximum loss.* Notwithstanding any other paragraph of this section, a [BANKING ORGANIZATION] may cap the market risk capital requirements of a market risk covered position at the maximum loss of that market risk covered position.

§ __.205 Treatment of Certain Market Risk Covered Positions and Term Repo-Style Transactions the [BANKING ORGANIZATION] Elects To Include in Market Risk: Net Short Risk Positions; Defaulted and Distressed Positions; Hybrid Instruments; Index Instruments and Multi-Underlying Options; Equity Positions in an Investment Fund; Certain Term Repo-Style Transactions; and Internal Risk Transfers.

(a) *Net short risk positions.* A [BANKING ORGANIZATION] must calculate its net short risk positions on a quarterly basis.

(b) *Treatment of defaulted and distressed market risk covered positions.*

(1) For purposes of calculating the default risk capital requirement, a [BANKING ORGANIZATION] must include defaulted market risk covered positions. Notwithstanding § __.204, a [BANKING ORGANIZATION] is not required to include defaulted and distressed market risk covered positions in the standardized non-default capital requirement or the models-based non-default capital requirement.

(2) A [BANKING ORGANIZATION] may treat a distressed position as a defaulted position for the purpose of calculating market risk capital requirements.

(c) *Treatment of hybrid instruments that are market risk covered positions.* For purposes of calculating the standardized non-default capital requirement, a [BANKING

ORGANIZATION] must assign risk sensitivities of hybrid instruments into the applicable risk classes such as interest rate, credit spread, and equity risk for calculating the delta, vega, and curvature capital requirements. For the default risk capital requirement, a [BANKING ORGANIZATION] must decompose a hybrid instrument into a non-securitization position and an equity position and calculate the default risk capital requirement for each position respectively.

(d) *Index instruments and multi-underlying options.* For a market risk covered position that is an index instrument or a multi-underlying option, the [BANKING ORGANIZATION] must apply:

(1) For purposes of calculating the standardized non-default capital requirement,

(i) One of the following approaches to calculate the delta capital requirement and the curvature capital requirement:

(A) The look-through approach; or

(B) The single-sensitivity approach, whereby a single sensitivity is calculated to the index and assigned to the relevant bucket in § __.209, in accordance with:

(1) For an equity or credit index where at least 75 percent of the market or notional value, respectively, of the underlying constituents, taking into account the weightings of such index, relate to the same sector, the sensitivity must be assigned to the corresponding sector bucket, otherwise the sensitivity must be mapped to an index bucket;

(2) For an equity index that is not described in paragraph (d)(1)(i)(B)(1) of this section, if at least 75 percent of the market value of the constituents in the index, taking into account the weightings of such index, is invested in

large market cap and liquid market economy, then the sensitivity must be assigned to bucket 12 in Table 8 to § __.209; otherwise, the sensitivity must be assigned to bucket 13 in Table 8 to § __.209;

(3) For a credit index that is not described in paragraph (d)(1)(i)(B)(1) of this section, if at least 75 percent of the notional value of the constituents in the index taking into account the weightings of such index, is invested in investment grade positions, the sensitivity must be assigned to bucket 19 in Table 3 to § __.209; otherwise, the sensitivity must be assigned to bucket 20 in Table 3 to § __.209;

(4) For an index that is not described in paragraphs (d)(1)(i)(B)(1) through (3) of this section, the [BANKING ORGANIZATION] must allocate the index proportionately to the relevant risk classes following the methodology in paragraphs (d)(1)(i)(B)(1) through (3) of this section;

(5) For credit indices, the [BANKING ORGANIZATION] may calculate the delta sensitivity for interest rate risk specified in § __.207(b)(1) or the delta sensitivity for any credit spread risk specified in § __.207(b)(2) as delta sensitivity for equity risk specified in § __.207(b)(3) multiplied by effective duration; and

(6) For options on credit indices, the [BANKING ORGANIZATION] must calculate curvature capital requirement specified in § __.206(d) for interest rate risk and credit spread risk for non-securitization positions using the risk weights specified in § __.209(d) multiplied by the duration of the fund; and

(ii) One of the following approaches to calculate the vega capital requirement:

(A) The look-through approach;
 (B) For an index, the vega capital requirement with respect to the implied volatility based on the appropriate sector specific bucket or index bucket, which is the same sector specific bucket or index bucket used to calculate the delta capital requirement and the curvature capital requirement in paragraph (d)(1)(i)(B) of this section if the [BANKING ORGANIZATION] calculates the delta capital requirement and the curvature capital requirement under paragraph (d)(1)(i)(B) of this section; or

(C) For a multi-underlying option, the vega capital requirement based on the implied volatility of the option; and

(2) For purposes of calculating the models-based non-default capital requirement, one of the following approaches:

(i) The look-through approach;
 (ii) The hypothetical portfolio approach, consistent with paragraph (e)(3)(ii) of this section; or
 (iii) After receiving prior approval of the [AGENCY], an alternative modelling approach; and

(3) For purposes of calculating the default risk capital requirement, one of the following approaches:

(i) The look-through approach provided that a [BANKING ORGANIZATION] must set the gross default exposure assigned to a single name, referenced by the instrument, equal to the difference between the value of the instrument assuming only the single name defaults and assuming the LGD for the single name is the appropriate LGD specified in § _____.210(b)(1)(iv) and the value of the instrument assuming none of the single names referenced by the instrument default;

(ii) A single exposure mapped to an appropriate bucket, provided that the index or option substantially meets the criteria for that bucket; or

(iii) A single sub-speculative exposure.

(e) *Treatment of equity positions in an investment fund.* For an equity position in an investment fund that is a market risk covered position, the [BANKING ORGANIZATION] must apply the following provisions.

(1) A [BANKING ORGANIZATION] must determine whether it is able to use the look-through approach to calculate market risk capital requirements for its proportional ownership share of all or a portion of the underlying positions in the fund. If a [BANKING ORGANIZATION] is able to use the look-through approach to calculate market capital requirements for only a portion of the underlying positions in

the fund, the [BANKING ORGANIZATION] must treat the equity position in the investment fund as two separate market risk covered positions: one market risk covered position for which the [BANKING ORGANIZATION] is able to apply the look-through approach and one market risk covered position for which the [BANKING ORGANIZATION] is not able to apply the look-through approach, with each position representing the proportional amount of the original position corresponding to the portion of the investment fund that the [BANKING ORGANIZATION] is able to use the look-through approach or not able to use the look-through approach, respectively.

(2) With respect to a position subject to this paragraph (e) for which the [BANKING ORGANIZATION] is able to use the look-through approach to calculate market risk capital requirements, the [BANKING ORGANIZATION] must apply the treatment specified in paragraph (d) of this section.

(3) With respect to a position subject to this paragraph (e) for which the [BANKING ORGANIZATION] is not able to use the look-through approach to calculate market risk capital requirements, the [BANKING ORGANIZATION] must apply one of the following three methods in paragraphs (e)(3)(i) through (e)(3)(iii) of this section, provided that the [BANKING ORGANIZATION] must not include such market risk covered positions in the calculation of the models-based non-default capital requirement:

(i) *Tracked index method.* For an investment fund that closely tracks an index benchmark, the [BANKING ORGANIZATION] treats the investment fund as the tracked index and calculates the standardized non-default capital requirement by applying the treatment specified in paragraphs (d)(1)(i)(B) and (d)(1)(ii)(B) of this section, and the default risk capital requirement by applying the treatment specified in paragraph (d)(3) of this section.

(ii) *Hypothetical portfolio approach.* The [BANKING ORGANIZATION] decomposes the investment fund into a hypothetical portfolio for the standardized non-default capital requirement and the default risk capital requirement, provided that the hypothetical portfolio either:

(A) Assumes the fund invests to the maximum extent permitted under the fund's investment limits in the exposure types subject to the highest applicable risk weights, provided that if more than one risk weight can be applied to a given exposure, the maximum risk

weight applicable must be used, that cause the fund to be fully invested; or

(B) Is based on the most recent quarterly disclosure of the investment fund's holdings of underlying positions.

(iii) *Backstop fund method.* (A) For purposes of calculating the standardized non-default capital requirement, a [BANKING ORGANIZATION] may allocate the equity position in an investment fund to the other sector bucket 11 in Table 8 to § _____.209. If an investment fund's investment mandate permits the investment fund to maintain exposure types as described in § _____.211(a), the [BANKING ORGANIZATION] must apply the residual risk add-on to the portion of the fund permitted to be invested in such exposure types, assuming the fund would invest in such exposure types to the maximum extent permitted under the mandate.

(B) For purposes of calculating the default risk capital requirement, the [BANKING ORGANIZATION] must calculate the default risk capital requirement based on either:

(1) A hypothetical portfolio, as described in paragraph (e)(3)(ii) of this section; or

(2) A single sub-speculative equity exposure.

(f) *Term repo-style transactions that the [BANKING ORGANIZATION] elects to include in market risk.* A [BANKING ORGANIZATION] may elect to include a term repo-style transaction in market risk, provided that the [BANKING ORGANIZATION]:

(1) Includes all such term repo-style transactions consistently over time;

(2) Marks the transaction to market;

(3) Captures the market price risk and the issuer-default risk of the transaction by:

(i) Including the risk factor sensitivity to each applicable risk factor pursuant to § _____.208; and

(ii) Calculating the default risk capital requirement under § _____.210 using:

(A) For the calculation of Expanded Total Risk-Weighted Assets, the exposure amount that would apply to the transaction under §§ _____.113 through _____.115 multiplied by 8 percent; or

(B) For the calculation of Standardized Total Risk-Weighted Assets, the collateral haircut approach that would apply to the transaction under § _____.37(c) multiplied by 8 percent;

(4) Recognizes:

(i) For the calculation of Expanded Total Risk-Weighted Assets, the credit risk mitigation benefits of collateral pursuant to § _____.115; or

(ii) For the calculation of Standardized Total Risk-Weighted

Assets, the credit risk mitigation benefits of collateral pursuant to § _____.37(c); and

(5) Treats the term repo-style transactions the [BANKING ORGANIZATION] elects to include in market risk as market risk covered positions for the purposes of calculations under this part.

(g) *Internal risk transfers.* (1) A [BANKING ORGANIZATION] that is subject to the market risk capital requirements in this subpart F may recognize the risk mitigation benefits of an external hedge under subpart D or subpart E of this part if the internal risk transfer meets the applicable criteria in this paragraph (g).

(i) *Credit risk.* A [BANKING ORGANIZATION] may capitalize under subpart D or subpart E of this part the leg of an eligible internal risk transfer to hedge credit risk transferred by the trading desk to another unit within the [BANKING ORGANIZATION].

(A) For credit risk, an eligible internal risk transfer means an internal risk transfer for which:

(1) The documentation of the internal risk transfer identifies the exposure under subpart D or subpart E of this part that is being hedged and its source(s) of credit risk;

(2) The terms of the internal risk transfer, aside from amount, are identical to the terms of the external hedge of credit risk at trade initiation; and

(3) The external hedge meets the requirements of § _____.36 or § _____.120, as applicable.

(B) If the amount of the internal risk transfer exceeds the exposure being hedged under subpart D or subpart E of this part, the [BANKING ORGANIZATION] must treat the amount equal to the exposure being hedged under subpart D or subpart E of this part as an eligible internal risk transfer, and the excess amount as a separate internal risk transfer that is not an eligible internal risk transfer, which must be capitalized as a net short credit position.

(ii) *Interest rate risk.* A [BANKING ORGANIZATION] may capitalize the trading desk segment of an eligible internal risk transfer as a market risk covered position. For interest rate risk, an eligible internal risk transfer means an internal risk transfer:

(A) For which the documentation of the internal risk transfer identifies the exposure being hedged and its source(s) of interest rate risk;

(B) If the position is on a dedicated notional trading desk, that desk calculates market risk capital on a

stand-alone basis, pursuant to § _____.204(a)(2)(ii); and

(C) Is executed on a trading desk that the [BANKING ORGANIZATION] has established for conducting internal risk transfers to hedge interest rate risk and that has received approval from the [AGENCY] to execute such internal risk transfers to hedge interest rate risk.

(2) *CVA risk.* A [BANKING ORGANIZATION] that is subject to the market risk capital requirements and CVA risk-based capital requirements in this subpart F may hedge CVA risk arising from a derivative contract through internal CVA hedges executed with the [BANKING ORGANIZATION]'s trading desk, using an eligible internal risk transfer.

(i) The [BANKING ORGANIZATION] may consider the internal risk transfer of CVA risk to be an eligible internal risk transfer, if the following requirements are satisfied:

(A) The CVA segment of the transaction is an eligible CVA hedge; and

(B) The documentation of the internal risk transfer of CVA risk identifies the CVA risk being hedged and the source(s) of such risk.

(ii) The [BANKING ORGANIZATION] must designate a CVA desk or the functional equivalent to manage internal risk transfers of CVA risk to the [BANKING ORGANIZATION]'s trading desks.

§ _____.206 Sensitivities-Based Capital Requirement

(a) Overview of the calculation. A [BANKING ORGANIZATION] must follow the steps below to calculate the sensitivities-based capital requirement:

(1) The [BANKING ORGANIZATION] must identify the market risks in each of its portfolios of market risk covered positions and include the relevant risk classes in its calculation of the sensitivities-based capital requirement. The risk classes are:

- (i) Interest rate risk;
- (ii) Credit spread risk for non-securitization positions;
- (iii) Credit spread risk for correlation trading positions;
- (iv) Credit spread risk for securitization positions non-CTP;
- (v) Equity risk;
- (vi) Commodity risk; and
- (vii) Foreign exchange risk.

(2) For each market risk covered position, a [BANKING ORGANIZATION] must identify all of the relevant risk factors as described in § _____.208 for which it will calculate sensitivities for delta risk and vega risk as described in § _____.207 and curvature scenarios for curvature risk as described

in both paragraph (d) of this section and in § _____.207. A [BANKING ORGANIZATION] must also identify the corresponding buckets related to these risk factors as described in § _____.209.

(3) To calculate risk-weighted sensitivities a [BANKING ORGANIZATION] must aggregate the delta sensitivities and vega sensitivities, respectively, for each risk factor across all market risk covered positions and apply the corresponding risk weights as described in § _____.209(b) and (c). To calculate the net curvature risk position, a [BANKING ORGANIZATION] must aggregate the incremental loss beyond the delta capital requirement by applying an upward and downward shock to each risk factor in accordance with paragraph (d)(1) of this section.

(4) For each bucket, a [BANKING ORGANIZATION] must calculate a bucket-level risk position separately for delta risk and vega risk by aggregating the risk-weighted sensitivities across risk factors with common characteristics as described in paragraphs (b)(2) and (c)(2) of this section. Similarly, for curvature risk, a [BANKING ORGANIZATION] must calculate a bucket-level risk position for each bucket by aggregating the net curvature risk positions within each bucket as described in paragraph (d)(2) of this section.

(5) To calculate the risk class-level capital requirement a [BANKING ORGANIZATION] must aggregate the bucket-level risk positions for each risk class for delta risk, vega risk, and curvature risk (separately) under three correlation scenarios in accordance with paragraphs (b)(3), (c)(3), and (d)(3) of this section. For each risk class, the risk class-level capital requirement is the sum of the delta capital requirement, the vega capital requirement and the curvature capital requirement for the respective correlation scenario.

(i) The delta capital requirement is described in paragraph (b) of this section.

(ii) The vega capital requirement is described in paragraph (c) of this section.

(iii) The curvature capital requirement is described in paragraph (d) of this section.

(iv) The correlation scenarios are provided in paragraph (e) of this section and § _____.209.

(6) To calculate the sensitivities-based capital requirement, a [BANKING ORGANIZATION] must sum the risk class-level capital requirements for each risk class under each correlation scenario. The sensitivities-based capital requirement equals the largest capital

requirement produced under the three correlation scenarios.

(b) *Delta capital requirement.* For each risk class, a [BANKING ORGANIZATION] must calculate the delta capital requirement for all of its market risk covered positions, except for market risk covered positions whose value at any point in time exclusively depends on an exotic exposure. To calculate the delta capital requirement, for each risk class, a [BANKING ORGANIZATION] must calculate its market risk covered positions' delta sensitivities in accordance with § _____.207 to the relevant risk factors specified in § _____.208, multiply the

sensitivities by the corresponding risk weights specified in paragraph § _____.209(b), and aggregate the resulting risk-weighted delta sensitivities in accordance with the following:

(1) *Weighted sensitivity calculation.* For each risk factor, a [BANKING ORGANIZATION] must calculate the delta sensitivity as described in § _____.207. A [BANKING ORGANIZATION] must net the delta sensitivities of a risk factor k , irrespective of the market risk covered positions from which they derive, to produce a net delta sensitivity, s_k , across all market risk covered positions. The

risk-weighted delta sensitivity, WS_k , equals the product of the net sensitivity, s_k , and the corresponding risk weight specified in paragraph § _____.209(b).

(2) *Within bucket aggregation.* For each bucket, b , specified in paragraph § _____.209(b), a [BANKING ORGANIZATION] must calculate the delta bucket-level risk position, K_b , by aggregating the risk-weighted delta sensitivities of all risk factors that are within the same bucket, using the correlation parameter ρ_{kl} as specified in §§ _____.206(e) and _____.209(b), as follows:

$$K_b = \sqrt{\max\left(\left(\sum_k WS_k^2 + \sum_k \sum_{k \neq l} \rho_{kl} WS_k WS_l\right), 0\right)}.$$

(3) *Across bucket aggregation.* A [BANKING ORGANIZATION] must calculate the delta capital requirement for each risk class by aggregating the

delta bucket-level risk positions across all of the buckets within the risk class, using the cross-bucket correlation parameter γ_{bc} as specified in

§§ _____.206(e) and _____.209(b), as follows:

$$\text{delta capital requirement}_{(\text{risk class})} = \sqrt{\sum_b K_b^2 + \sum_b \sum_{b \neq c} \gamma_{bc} S_b S_c}.$$

Where:

- (i) $S_b = \sum_k WS_k$ for all risk factors in bucket b and $S_c = \sum_k WS_k$ for all risk factors in bucket c ; and
- (ii) If S_b and S_c produce a negative number for the overall sum of

$$\sum_b K_b^2$$

$\sum_b \sum_{b \neq c} \gamma_{bc} S_b S_c$, the [BANKING ORGANIZATION] must calculate the delta capital requirement using an alternative specification, whereby:

(A) $S_b = \max(\min(\sum_k WS_k K_b), -K_b)$ for all risk factors in bucket b ; and

(B) $S_c = \max(\min(\sum_k WS_k K_c), -K_c)$ for all risk factors in bucket c .

(c) *Vega capital requirement.* For each risk class, a [BANKING ORGANIZATION] must calculate the vega capital requirement for market risk covered positions that are options or are positions with embedded optionality,

including positions with material prepayment risk. Callable and puttable bonds that are priced based on yield to maturity are not required to estimate vega capital requirement. To calculate the vega capital requirement, for each risk class, a [BANKING ORGANIZATION] must calculate its market risk covered positions' vega sensitivities in accordance with § _____.207 to the relevant risk factors specified in § _____.208, multiply the sensitivities by the corresponding risk weights specified in § _____.209(c), and aggregate the resulting risk-weighted sensitivities for vega risk in accordance with the following:

(1) *Weighted sensitivity calculation.* For each risk factor, a [BANKING ORGANIZATION] must calculate the vega sensitivity as described in § _____.207(c). A [BANKING

ORGANIZATION] must net the vega sensitivities of a risk factor k , irrespective of the market risk covered positions from which they derive, to produce a net vega sensitivity, s_k , across all market risk covered positions. The risk-weighted vega sensitivity, WS_k , equals the product of the net sensitivity s_k and the corresponding risk weight specified in § _____.209(c).

(2) *Within bucket aggregation.* Unless otherwise specified in § _____.209(c), for each bucket, b , specified in § _____.209(c), a [BANKING ORGANIZATION] must calculate the vega bucket-level risk position, K_b , by aggregating the risk-weighted vega sensitivities of all risk factors that are within the same bucket, using the correlation parameter, ρ_{kl} , as specified in §§ _____.206(e) and _____.209(c), as follows:

$$K_b = \sqrt{\max\left(\left(\sum_k WS_k^2 + \sum_k \sum_{k \neq l} \rho_{kl} WS_k WS_l\right), 0\right)}.$$

(3) *Across bucket aggregation.* A [BANKING ORGANIZATION] must calculate the vega capital requirement for each risk class by aggregating the

vega bucket-level risk positions across all of the buckets within the risk class, using the cross-bucket correlation parameter, γ_{bc} , specified in

§§ _____.206(e) and _____.209(c), as follows:

$$\text{vega capital requirement}_{(\text{risk class})} = \sqrt{\sum_b K_b^2 + \sum_b \sum_{c \neq b} \gamma_{bc} S_b S_c}.$$

Where:

- (i) $S_b = \sum_k WS_k$ for all risk factors in bucket b and $S_c = \sum_k WS_k$ for all risk factors in bucket c ; and
- (ii) If S_b and S_c produce a negative number for the overall sum of $\sigma_b K_b^2 + \sum_b \sum_{c \neq b} \gamma_{bc} S_b S_c$, the [BANKING ORGANIZATION] must calculate the vega capital requirement using an alternative specification, whereby:
 - (A) $S_b = \max(\min(\sigma_k WS_k, K_b), -K_b)$ for all risk factors in bucket b ; and
 - (B) $S_c = \max(\min(\sigma_k WS_k, K_c), -K_c)$ for all risk factors in bucket c .

(d) *Curvature capital requirement.* For each risk class, a [BANKING ORGANIZATION] must calculate the

curvature capital requirement by applying an upward shock and a downward shock to each risk factor and calculate the incremental loss in excess of that already captured by the delta capital requirement for all market risk covered positions that are options or positions with embedded optionality, including positions with material prepayment risk, using the approach in paragraph (d)(1) of this section and in accordance with §§ _____.207 and _____.209(d). A [BANKING ORGANIZATION] may, on a trading desk by trading desk basis, choose to include market risk covered positions

without optionality in the calculation of its curvature capital requirement, provided that the [BANKING ORGANIZATION] does so consistently through time.

(1) *Curvature risk position calculation.* For each market risk covered position for which the curvature capital requirement is calculated, an upward shock and a downward shock must be applied to risk factor, k . The size of the shock, *i.e.*, the risk weight, is specified in § _____.209(d). The net curvature risk position for the portfolio is calculated as,

$$CVR_k^+ = - \sum_i \left(V_i(x_k^{RW(\text{Curvature})^+}) - V_i(x_k) - (RW_k^{\text{Curvature}} \times s_{ik}) \right)$$

$$CVR_k^- = - \sum_i \left(V_i(x_k^{RW(\text{Curvature})^-}) - V_i(x_k) + (RW_k^{\text{Curvature}} \times s_{ik}) \right)$$

Where:

- (i) i is a market risk covered position subject to curvature risk for risk factor k ;
- (ii) x_k is the current level of risk factor k ;
- (iii) $V_i(x_k)$ is the value of market risk covered position i at the current level of risk factor k ;
- (iv) $V_i(x_k(RW(\text{curvature})^+))$ and $V_i(RW(\text{curvature})^-)$ denote the value of market risk covered position i after x_k is shifted (*i.e.*, “shocked”) upward and downward, respectively;
- (v) $RW_k(\text{curvature})$ is the risk weight for curvature risk for factor k and market risk covered position i ; and
- (vi) s_{ik} is the delta sensitivity of market risk covered position i with respect to curvature risk factor k , such that:

(A) For the following risk classes, s_{ik} is the delta sensitivity of market risk covered position i :

- (1) Foreign exchange risk; and
- (2) Equity risk;

(B) For the following risk classes, s_{ik} is the sum of the delta sensitivities to all tenors of the relevant curve of market risk covered position i with respect to curvature risk factor k :

- (1) Interest rate risk;
- (2) Credit spread risk for non-securitization positions;
- (3) Credit spread risk for correlation trading positions;
- (4) Credit spread risk for securitization positions non-CTP; and

(5) Commodity risk; and

(C) The delta sensitivity s_{ik} must be the delta sensitivity described in § _____.207 used in calculating the delta capital requirement.

(2) *Within bucket aggregation.* Unless otherwise specified in § _____.209(d), for each bucket specified in § _____.209(d), a [BANKING ORGANIZATION] must calculate a curvature bucket-level risk position by aggregating the net curvature risk positions within the bucket using the correlation parameter, γ_{kl} , as specified in §§ _____.206(e) and _____.209(d) as follows:

$$K_b = \max(K^+_b, K^-_b)$$

$$\text{where } \begin{cases} K_b^+ = \sqrt{\max \left(\left(\sum_k \max(CVR_k^+, 0)^2 + \sum_{l \neq k} \sum_k \rho_{kl} CVR_k^+ CVR_l^+ \psi(CVR_k^+, CVR_l^+) \right), 0 \right)} \\ K_b^- = \sqrt{\max \left(\left(\sum_k \max(CVR_k^-, 0)^2 + \sum_{l \neq k} \sum_k \rho_{kl} CVR_k^- CVR_l^- \psi(CVR_k^-, CVR_l^-) \right), 0 \right)} \end{cases};$$

and

(i) The bucket-level capital requirement, K_b , is calculated as the greater of the capital requirement under the upward scenario, K_b^+ , or the capital requirement under the downward scenario, K_b^- ; and

(ii) In the specific case where $K_b^+ = K_b^-$, if $\sum_k CVR_k^+ > \sum_k CVR_k^-$, the upward

scenario is selected, otherwise the

downward scenario is selected; and
(iii) $\Psi(CVR_k, CVR_l) = 0$ if CVR_k and CVR_l both have negative signs; and $\Psi(CVR_k, CVR_l) = 1$ otherwise.

(3) *Across bucket aggregation.* A [BANKING ORGANIZATION] must calculate the curvature capital requirement for each risk class by

aggregating the curvature bucket-level risk positions across buckets within each risk class, using the prescribed cross-bucket correlation parameter, as specified in §§ _____.206(e) and _____.209(d), as follows:

*curvature capital requirement*_(risk class)

$$= \sqrt{\max \left(\left(\sum_b K_b^2 + \sum_{c \neq b} \sum_b \gamma_{bc} S_b S_c \psi(S_b, S_c) \right), 0 \right)}$$

Where:

- (i) $S_b = \sum_k CVR_k^+$ for all risk factors in bucket b when the upward scenario has been selected for bucket b , and $S_b = \sum_k CVR_k^-$ otherwise; and
(ii) $\Psi(S_b, S_c) = 0$, if S_b and S_c both have negative signs, and $\Psi(S_b, S_c) = 1$ otherwise.

(e) *Correlation scenarios.* A [BANKING ORGANIZATION] must

repeat the aggregation of the bucket-level risk positions and risk class-level capital requirements for delta risk, vega risk, and curvature risk for three different values of the correlation parameters (correlation between risk factors within a bucket) and (correlation across buckets within a risk class) as specified below:

(1) For the medium correlation scenario, the correlation parameters and specified in § _____.209 apply;

(2) For the high correlation scenario, the specified correlation parameters and are uniformly multiplied by 1.25, with and subject to a cap at 100 percent; and

(3) For the low correlation scenario, the specified correlation parameters and are replaced by,

$$\rho_{kl}^{low} = \max((2 \times \rho_{kl}) - 100\%, 75\% \times \rho_{kl}), \text{ and}$$

$$\gamma_{bc}^{low} = \max((2 \times \gamma_{bc}) - 100\%, 75\% \times \gamma_{bc}).$$

§ _____.207 Sensitivities-Based Capital Requirement: Calculation of Delta Sensitivities, Vega Sensitivities and Curvature Scenarios

(a) *General requirements.* For purposes of calculating the delta capital requirement, the vega capital requirement, and the curvature capital requirement, a [BANKING ORGANIZATION] must calculate the delta sensitivities, vega sensitivities, and curvature scenarios in accordance with the requirements set forth in this section.

(1) To calculate delta sensitivities, a [BANKING ORGANIZATION] must use

the sensitivity definitions for delta risk as provided in paragraph (b) of this section.

(2) To calculate its vega sensitivities, a [BANKING ORGANIZATION] must use the sensitivity definitions for vega risk as provided in paragraph (c) of this section.

(3) A [BANKING ORGANIZATION] must calculate delta sensitivities, vega sensitivities, and curvature scenarios based on pricing models.

(4) For each risk factor as provided in § _____.208, a [BANKING ORGANIZATION] must calculate the delta sensitivities, vega sensitivities,

and curvature scenarios as the change in the value of a market risk covered position as a result of applying a specified shift to each risk factor, assuming all other relevant risk factors are held at the current level. In cases where applying this assumption is ambiguous, a [BANKING ORGANIZATION] must perform the calculation consistently with the models specified in paragraph (a)(3) of this section. With prior approval from the [AGENCY], a [BANKING ORGANIZATION] may calculate delta sensitivities, vega sensitivities, and

curvature scenarios using an alternative basis.

(5) When calculating delta sensitivities for market risk covered positions that are options or positions with embedded options, a [BANKING ORGANIZATION] must use one of the following assumptions:

(i) The dynamics of the implied volatility are such that when the price of the underlying changes, the implied volatility of an option or a market risk covered position with an embedded option will remain unchanged for any given moneyness (sticky delta rule); or

(ii) When the price of the underlying changes, the implied volatility of an option or a market risk covered position with an embedded option will remain unchanged for any given strike price (sticky strike rule); or

(iii) With prior approval from the [AGENCY], another assumption.

(6) The curvature scenarios and sensitivities to the delta risk factors for credit spread risk for securitization positions non-CTP (as specified in § _____.208(d)) must be calculated with respect to the spread of the tranche rather than the spread of the underlying position.

(7) The curvature scenarios and sensitivities to the delta risk factors for credit spread risk for correlation trading positions (as specified in § _____.208(e)) must be computed with respect to the underlying names of the securitization position or nth-to-default position.

(8) A [BANKING ORGANIZATION] must calculate the delta sensitivities, vega sensitivities, and curvature scenarios for each risk class in the reporting currency of the [BANKING

ORGANIZATION], except for the foreign exchange risk class where, with prior approval of the [AGENCY], the [BANKING ORGANIZATION] may calculate sensitivities and curvature scenarios relative to a base currency instead of the reporting currency as specified in § _____.208(h).

(9) A [BANKING ORGANIZATION] must calculate all sensitivities ignoring the impact of CVA on fair values.

(b) *Sensitivity definitions for delta risk*—(1) *Interest rate risk*. The delta sensitivity for interest rate risk is calculated by changing the interest rate at tenor of the relevant interest rate curve in a given currency by one basis point (0.0001 in absolute terms) and dividing the resulting change in the value of the market risk covered position, by 0.0001 as follows:

$$S_{k,r_t} = \frac{V_i(r_t + 0.0001, cs_t) - V_i(r_t, cs_t)}{0.0001}$$

Where:

- (i) k is a given risk factor;
- (ii) i is a given market risk covered position;
- (iii) r_t is the interest rate curve at tenor t ;
- (iv) cs_t is the credit spread curve at tenor t ; and

(v) V_i is the value of the market risk covered position as a function of the interest rate curve and credit spread curve.

(2) *Credit spread risk*. The delta sensitivity for credit spread risk for non-securitization positions, credit spread risk for securitization positions non-CTP, and credit spread risk for

correlation trading positions is calculated by changing the relevant credit spread at tenor by one basis point (0.0001 in absolute terms) and dividing the resulting change in the value of the market risk covered position, by 0.0001 as follows:

$$S_{k,cs_t} = \frac{V_i(r_t, cs_t + 0.0001) - V_i(r_t, cs_t)}{0.0001}$$

Where:

- (i) k is a given risk factor;
- (ii) i is a given market risk covered position;
- (iii) r_t is the interest rate curve at tenor t ;
- (iv) cs_t is the credit spread curve at tenor t ; and

(v) V_i is the value of the market risk covered position as a function of the interest rate curve and credit spread curve.

(3) *Equity risk*. A [BANKING ORGANIZATION] must calculate the delta sensitivity for equity risk using the equity spot price and the equity repo rate as follows:

(i) A [BANKING ORGANIZATION] must calculate the delta sensitivity for equity spot price by changing the relevant equity spot price by one percentage point (0.01 in relative terms) and dividing the resulting change in the value of the market risk covered position, by 0.01 as follows:

$$S_k = \frac{V_i(1.01 EQ_k) - V_i(EQ_k)}{0.01}$$

Where:

- (A) k is a given equity;
- (B) i is a given market risk covered position;
- (C) EQ_k is the value of equity k ; and
- (D) V_i is the value of market risk covered position as a function of the price of equity k .

(ii) A [BANKING ORGANIZATION] must calculate the delta sensitivity for equity repo rate by applying a parallel shift to the equity repo rate term structure by one basis point (0.0001 in absolute terms) and dividing the

resulting change in the value of the market risk covered position, V_i , by 0.0001 as follows:

$$S_k = \frac{V_i(RTS_k + 0.0001) - V_i(RTS_k)}{0.0001}$$

Where:

- (A) k is a given equity;
- (B) RTS_k is the repo term structure of equity k ; and

(C) V_i is the value of market risk covered position as a function of the repo term structure of equity k .

(4) *Commodity risk.* A [BANKING ORGANIZATION] must calculate the delta sensitivity for commodity risk by

changing the relevant commodity spot price by one percentage point (0.01 in relative terms) and dividing the resulting change in the value of the market risk covered position (V_i) by 0.01 as follows:

$$S_k = \frac{V_i(1.01 CTY_k) - V_i(CTY_k)}{0.01}$$

Where:

- (i) k is a given commodity;
- (ii) CTY_k is the exchange rate between a given currency and a [BANKING ORGANIZATION]'s reporting currency or base currency, as applicable, where the foreign exchange spot rate is the current market price of one unit of another currency expressed in the units of the [BANKING ORGANIZATION]'s
- (iii) V_i is the value of market risk covered position as a function of the spot price of commodity k :

(5) *Foreign exchange risk.* A [BANKING ORGANIZATION] must calculate the delta sensitivity for foreign exchange risk by changing the relevant exchange rate by one percentage point

(0.01 in relative terms) and dividing the resulting change in the value of the market risk covered position, V_i , by 0.01 as follows:

$$S_k = \frac{V_i(1.01 FX_k) - V_i(FX_k)}{0.01}$$

Where:

- (i) k is a given currency;
- (ii) FX_k is the exchange rate between a given currency and a [BANKING ORGANIZATION]'s reporting currency or base currency, as applicable, where the foreign exchange spot rate is the current market price of one unit of another currency expressed in the units of the [BANKING ORGANIZATION]'s
- (iii) V_i is the value of market risk covered position as a function of the exchange rate k .

reporting currency or base currency, as applicable; and

(iii) V_i is the value of market risk covered position as a function of the exchange rate k .

(c) *Sensitivity definitions for vega risk.* (1) A [BANKING ORGANIZATION] must calculate the vega sensitivity to a given risk factor (provided in § _____.208)

by multiplying vega by the volatility of the option as follows:

$$S_k = \text{vega} \times \text{volatility}$$

Where:

- (i) *vega* is defined as the change in the value of the option V_i as a result of a small amount of change to the volatility σ_i , which can be represented as

$$\frac{\partial V_i}{\partial \sigma_i}$$

and

- (ii) *Volatility* is defined as either the implied volatility or at-the-money volatility of the option, depending on which is used by the models used to calculate vega sensitivity to determine the intrinsic value of volatility in the price of the option.

(2) For interest rate risk, a [BANKING ORGANIZATION] must map the implied volatility of the option to one or more tenors specified in the risk factors definitions in § _____.208(b)(2).

(3) A [BANKING ORGANIZATION] must assign market risk covered positions that are options or positions with embedded options that do not have a maturity to the longest prescribed maturity tenor.

(4) A [BANKING ORGANIZATION] must map market risk covered positions that are options or positions with embedded options that do not have a strike price, that have multiple strike prices, or are barrier options, to the

strike prices and maturities used for models used to calculate vega sensitivity to value these positions.

§ _____.208 Sensitivities-Based Capital Requirement: Risk Factor Definitions

(a) For purposes of calculating the sensitivities-based capital requirement, a [BANKING ORGANIZATION] must identify all of the relevant risk factors in accordance with the requirements in this section for its market risk covered positions. Where specified, a [BANKING ORGANIZATION] must use the tenors or maturities specified in this section and assign risk factors and corresponding sensitivities to specified tenors or maturities by linear interpolation or a method that is most consistent with the pricing functions used by the internal risk management models.

(b) *Risk factors for interest rate risk—*
(1) *Delta risk factors for interest rate*

risk. The delta risk factors for interest rate risk are defined for each currency and consist of interest rate risk factors as well as inflation rate risk factors and cross-currency basis risk factors, as applicable.

(i) For each currency, the delta risk factors for interest rate risk are defined along two dimensions:

(A) An interest rate curve, for the currency, in which interest rate-sensitive market risk covered positions are denominated; and

(B) Tenor: 0.25 years, 0.5 years, 1 year, 2 years, 3 years, 5 years, 10 years, 15 years, 20 years, and 30 years.

(ii) For each currency (each interest rate risk bucket), a [BANKING ORGANIZATION] must calculate, in addition to paragraph (b)(1)(i) of this section, separate delta sensitivities for each of the following delta risk factors, as applicable:

(A) *Inflation rate risk factors.* Inflation rate risk factors apply to any market risk

covered position whose cash flows are functionally dependent on a measure of inflation (inflation positions). Inflation rate risk factors must be based on the market-implied inflation rates for each currency where term structure is not recognized. All inflation rate risk for a given currency must be aggregated as the sum of the delta sensitivities to the inflation rate risk factors of all inflation positions.

(B) *Cross-currency basis risk factors.* The delta risk factors for interest rate risk include one of two possible cross-currency basis risk factors for each currency where term structure is not recognized. The two cross-currency basis risk factors are basis of each currency over USD or basis of each currency over EUR. Cross-currency bases that do not relate to either basis over USD or basis over EUR must be computed either on “basis over USD” or “basis over EUR,” but not both.

(2) *Vega risk factors for interest rate risk.* The vega risk factors for interest rate risk are defined for each currency and consist of:

(i) The implied volatilities of inflation rate risk-sensitive options as defined along paragraph (b)(2)(iii)(A) of this section;

(ii) The implied volatilities of cross-currency basis risk-sensitive options as defined along paragraph (b)(2)(iii)(A) of this section; and

(iii) The implied volatilities of interest rate risk-sensitive options as defined along paragraphs (b)(2)(iii)(A) and (B) of this section.

(A) The maturity of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years; and

(B) The residual maturity of the underlying instrument at the expiry date of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(3) *Curvature risk factors for interest rate risk.* The curvature risk factors for interest rate risk are defined along one dimension, the relevant interest rate curve, per currency, where term structure is not recognized. To calculate curvature scenarios, a [BANKING ORGANIZATION] must shift all tenors provided in paragraph (b)(1)(i)(B) of this section, in parallel. There is no curvature capital requirement for inflation risk and cross-currency basis risks.

(c) *Risk factors for credit spread risk for non-securitization positions—(1) Delta risk factors for credit spread risk for non-securitization positions.* The delta risk factors for credit spread risk for non-securitization positions are defined along two dimensions:

(i) The issuer credit spread curve; and

(ii) Tenor: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(2) *Vega risk factors for credit spread risk for non-securitization positions.* For each credit spread curve, the vega risk factors for credit spread risk for non-securitization positions are the implied volatilities of options as defined along one dimension for the maturity of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(3) *Curvature risk factors for credit spread risk for non-securitization positions.* The curvature risk factors for credit spread risk for non-securitization positions are defined along the relevant issuer credit spread curves. For purposes of calculating curvature scenarios, a [BANKING ORGANIZATION] must ignore the bond-CDS basis and treat the bond-inferred spread curve of an issuer and the CDS-inferred spread curve of that same issuer as a single spread curve. To calculate curvature scenarios, a [BANKING ORGANIZATION] must shift all tenors provided in paragraph (c)(1)(ii) of this section, in parallel.

(d) *Risk factors for credit spread risk for securitization positions non-CTP—*

(1) *Delta risk factors for credit spread risk for securitization positions non-CTP.* The delta risk factors for credit spread risk for securitization positions non-CTP are defined along two dimensions:

(i) The tranche credit spread curve; and

(ii) Tenor of the tranche: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(2) *Vega risk factors for credit spread risk for securitization positions non-CTP.* For each tranche credit spread curve, the vega risk factors for credit spread risk for securitization positions non-CTP are the implied volatilities of options as defined along one dimension for the maturity of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(3) *Curvature risk factors for credit spread risk for securitization positions non-CTP.* The curvature risk factors for credit spread risk for securitization positions non-CTP are defined along one dimension, the relevant tranche credit spread curves. For purposes of calculating curvature scenarios, a [BANKING ORGANIZATION] must ignore the bond-CDS basis and treat the bond-inferred spread curve of a tranche and the CDS-inferred spread curve of that same tranche as a single spread curve. To calculate curvature scenarios, a [BANKING ORGANIZATION] must shift all tenors provided in paragraph (d)(1)(ii) of this section in parallel.

(e) *Risk factors for credit spread risk for correlation trading positions—(1) Delta risk factors for credit spread risk*

for correlation trading positions. The delta risk factors for credit spread risk for correlation trading positions are defined along two dimensions:

(i) The underlying credit spread curve; and

(ii) Tenor of the underlying name: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(2) *Vega risk factors for credit spread risk for correlation trading positions.* For each underlying credit spread curve, the vega risk factors for the credit spread risk for correlation trading positions are the implied volatilities of options as defined along one dimension for the maturity of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(3) *Curvature risk factors for credit spread risk for correlation trading positions.* The curvature risk factors for credit spread risk for correlation trading positions are defined along one dimension, the relevant underlying credit spread curves. For purposes of calculating curvature scenarios, a [BANKING ORGANIZATION] must disregard the bond-CDS basis and treat the bond-inferred spread curve of a given name in an index and the CDS-inferred spread curve of that same underlying name as a single spread curve. To calculate curvature scenarios, a [BANKING ORGANIZATION] must shift all tenors provided in paragraph (e)(1)(ii) of this section in parallel.

(f) *Risk factors for equity risk—(1) Delta risk factors for equity risk.* The delta risk factors for equity risk are defined for each issuer and consist of equity spot prices and equity repo rates, as appropriate.

(2) *Vega risk factors for equity risk.* The vega risk factors for equity risk are defined for each issuer and consist of the implied volatilities of the spot prices of equity risk-sensitive options as defined along the maturity of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(3) *Curvature risk factors for equity risk.* The curvature risk factors for equity risk are defined for each issuer and consist of all equity spot prices. There are no curvature risk factors for equity repo rates.

(g) *Risk factors for commodity risk—(1) Delta risk factors for commodity risk.* The delta risk factors for commodity risk are all commodity spot prices or forward prices and are defined along two dimensions for each commodity:

(i) The contracted delivery location of the commodity; and

(ii) Remaining maturity of the contract: 0 years, 0.25 years, 0.5 years, 1 year, 2 years, 3 years, 5 years, 10 years, 15 years, 20 years, and 30 years.

(2) *Vega risk factors for commodity risk.* The vega risk factors for commodity risk are the implied volatilities of commodity-sensitive options as defined along one dimension for each commodity, the maturity of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(3) *Curvature risk factors for commodity risk.* The curvature risk factors for commodity risk are defined along one dimension per commodity, the constructed curve per commodity spot prices or forward prices, consistent with the delta risk factor, where term structure is not recognized. For the calculation of sensitivities, all tenors provided in paragraph (g)(1)(ii) of this section, are to be shifted in parallel.

(h) *Risk factors for foreign exchange risk—(1) Delta risk factors for foreign exchange risk.* The delta risk factors for foreign exchange risk are all the exchange rates between the currency in which a market risk covered position is denominated and the reporting currency.

(i) For market risk covered positions that reference an exchange rate between a pair of non-reporting currencies, the delta risk factors for foreign exchange risk are all the exchange rates between:

(A) The reporting currency; and

(B) The currency in which a market risk covered position is denominated and any other currencies referenced by the market risk covered position.

(ii) Alternatively, a [BANKING ORGANIZATION] may calculate delta risk factors for foreign exchange risk relative to a base currency instead of the reporting currency if approved by the [AGENCY]. In such case a [BANKING ORGANIZATION] must account for the foreign exchange risk against the base currency and the foreign exchange risk

between the reporting currency and the base currency (*i.e.*, translation risk). The resulting foreign exchange risk calculated relative to the base currency must be converted to the capital requirements in the reporting currency using the spot reporting/base exchange rate reflecting the foreign exchange risk between the base currency and the reporting currency.

(A) To use this alternative, a [BANKING ORGANIZATION] may only consider a single currency as its base currency; and

(B) A [BANKING ORGANIZATION] must demonstrate to the [AGENCY] that calculating foreign exchange risk relative to its base currency provides an appropriate risk representation of the [BANKING ORGANIZATION]'s market risk covered positions and that the translation risk between the base currency and the reporting currency is addressed.

(2) *Vega risk factors for foreign exchange risk.* The vega risk factors for foreign exchange risk-sensitive options are the implied volatility of options that reference exchange rates between currency pairs defined along the maturity of the option: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(3) *Curvature risk factors for foreign exchange risk.* The curvature risk factors for foreign exchange risk are all the exchange rates between the currency in which a market risk covered position is denominated and the reporting currency.

(i) For market risk covered positions that reference an exchange rate between a pair of non-reporting currencies, the curvature risk factors for foreign exchange risk are all the exchange rates between:

(A) The reporting currency; and

(B) The currency in which a market risk covered position is denominated and any other currencies referenced by the market risk covered position.

(ii) If the [BANKING ORGANIZATION] has received prior approval of the [AGENCY] to use the base currency approach in paragraph (h)(1)(ii) of this section, curvature risk factors for foreign exchange risk must be calculated relative to the base currency instead of the reporting currency, and then converted to the capital requirements in the reporting currency using the spot reporting/base exchange rate.

§ ___.209 Sensitivities-Based Method: Definitions of Buckets, Risk Weights and Correlation Parameters

(a) For the purpose of calculating the sensitivities-based capital requirement, a [BANKING ORGANIZATION] must identify all of the relevant buckets, corresponding risk weights and correlation parameters for each risk class as provided in paragraph (b) of this section (delta capital requirement), paragraph (c) of this section (vega capital requirement), and paragraph (d) of this section (curvature capital requirement), for its market risk covered positions.

(b) *Delta capital requirement—(1) Delta buckets, risk weights, and correlations for interest rate risk.* (i) A [BANKING ORGANIZATION] must establish a separate interest rate risk bucket for each currency.

(ii) For calculating risk-weighted delta sensitivities, the risk weights for each tenor of an interest rate curve are set out in Table 1 to § ___.209.

Table 1 to § ___.209—Delta Risk Weights for Interest Rate Risk

Tenor	0.25 year	0.5 year	1 year	2 year	3 year
Risk weight	1.7%	1.7%	1.6%	1.3%	1.2%
Tenor	5 year	10 year	15 year	20 year	30 year
Risk weight	1.1%	1.1%	1.1%	1.1%	1.1%

(iii) The risk weight for inflation rate risk factors and cross-currency basis risk factors equals 1.6 percent.

(iv) For United States Dollar, Australian Dollar, Canadian Dollar, Euro, Japanese Yen, Swedish Krona, and United Kingdom Pound, and any other

currencies specified by the [AGENCY], a [BANKING ORGANIZATION] may divide the risk weights in paragraphs (b)(1)(ii) and (iii) of this section by $\sqrt{2}$.

(v) For purposes of aggregating risk-weighted delta sensitivities of interest rate risk within a bucket as specified in § ___.206(b)(2), a [BANKING ORGANIZATION] must use the following correlation parameters:

(A) The correlation parameter ρ_{kl} between risk-weighted delta sensitivities WS_k and WS_l within the same bucket, with the same tenor but different interest rate curves equals 99.9 percent.

(B) The correlation parameter ρ_{kl} between risk-weighted delta sensitivities WS_k and WS_l within the same bucket, with different tenors and the same interest rate curve are set out in Table 2 to § ___.209.

Table 2 to § ___.209—Interest Rate Risk Correlation Parameter (ρ_{kl}) within the Same Bucket, with Different Tenors and the Same Interest Rate Curve

	0.25 year	0.5 year	1 year	2 year	3 year	5 year	10 year	15 year	20 year	30 year
0.25 year	100.0%	97.0%	91.4%	81.1%	71.9%	56.6%	40.0%	40.0%	40.0%	40.0%
0.5 year		100.0%	97.0%	91.4%	86.1%	76.3%	56.6%	41.9%	40.0%	40.0%
1 year			100.0%	97.0%	94.2%	88.7%	76.3%	65.7%	56.6%	41.9%
2 year				100.0%	98.5%	95.6%	88.7%	82.3%	76.3%	65.7%
3 year					100.0%	98.0%	93.2%	88.7%	84.4%	76.3%
5 year						100.0%	97.0%	94.2%	91.4%	86.1%
10 year							100.0%	98.5%	97.0%	94.2%
15 year								100.0%	99.0%	97.0%
20 year									100.0%	98.5%
30 year										100.0%

(C) The correlation parameter ρ_{kl} between risk-weighted delta sensitivities WS_k and WS_l within the same bucket, with different tenors and different interest rate curves equals the correlation parameter ρ_{kl} specified in Table 2 to § ___.209 multiplied by 99.9 percent.

(D) The correlation parameter ρ_{kl} between risk-weighted delta sensitivities WS_k and WS_l to different inflation curves within the same bucket equals 99.9 percent.

(E) The correlation parameter ρ_{kl} between a risk-weighted delta sensitivity WS_k to the inflation curve and a risk weighted delta sensitivity WS_l to a given tenor of the relevant interest rate curve equals 40 percent.

(F) The correlation parameter ρ_{kl} equals zero percent between risk-

weighted delta sensitivity WS_k to a cross-currency basis curve and a risk weighted delta sensitivity WS_l to each of the following curves:

- (1) A given tenor of the relevant interest rate curve;
- (2) The inflation curve; and
- (3) Any other cross-currency basis curve.

(vi) For purposes of aggregating delta bucket-level risk positions across buckets within the interest rate risk class as specified in § ___.206(b)(3), the cross-bucket correlation parameter Y_{bc} equals 50 percent.

(2) *Delta buckets, risk weights, and correlations for credit spread risk for non-securitizations.* (i) For credit spread risk for non-securitizations, a [BANKING ORGANIZATION] must establish buckets along two dimensions,

credit quality and sector, as set out in Table 3 to § ___.209. In assigning a delta sensitivity to a sector, a [BANKING ORGANIZATION] must follow market convention. A [BANKING ORGANIZATION] must assign each delta sensitivity to one and only one of the sector buckets in Table 3 to § ___.209. Delta sensitivities that a [BANKING ORGANIZATION] cannot assign to a sector must be assigned to the other sector, bucket 18 in Table 3 to § ___.209.

(ii) For calculating risk weighted delta sensitivities for credit spread risk for non-securitizations, a [BANKING ORGANIZATION] must use the risk weights in Table 3 to § ___.209. The risk weights are the same for all tenors within a bucket.

BILLING CODE 4810-33-6210-01-6714-01-P

Table 3 to § __.209—Delta Buckets and Risk Weights for Credit Spread Risk for Non-Securitizations

Bucket number	Credit quality category	Sector	Risk weight
1	Investment grade	Sovereign exposures, MDBs, and specified supranational entities	0.5%
2		PSEs, government-backed non-financials, GSE debt, education, and public administration	1.0%
3		Financials including government-backed financials and real estate activities	5.0%
4		Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	3.0%
5		Consumer goods and services, transportation and storage, and administrative and support service activities	3.0%
6		Technology and telecommunications	2.0%
7		Health care, utilities, and professional and technical activities	1.5%
8		Covered bonds	1.5%
9	Speculative grade	Sovereign exposures, MDBs, and specified supranational entities	3.0%
10	Speculative grade and sub-speculative grade	PSEs, government-backed non-financials, education, and public administration	4.0%
11		Financials including government-backed financials and real estate activities	12.0%
12		Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	7.0%
13		Consumer goods and services, transportation and storage, and administrative and support service activities	8.5%
14		Technology and telecommunications	5.5%
15		Health care, utilities, and professional and technical activities	5.0%
16		Covered bonds	2.5%
17	Sub-speculative grade	Sovereign exposures, MDBs, and specified supranational entities	7.0%
18	Other sector		12.0%

19	Investment grade indices	1.5%
20	Speculative grade and sub-speculative grade indices	5.0%

BILLING CODE 4810-33-6210-01-6714-01-C

(iii) For purposes of aggregating risk weighted delta sensitivities of credit spread risk for non-securitizations

within a bucket as specified in § _____.206(b)(2), a [BANKING ORGANIZATION] must use the following correlation parameters:

(A) For buckets 1 to 17, the correlation parameter ρ_{kl} between risk weighted delta sensitivities WS_k and WS_l equals:

$$\rho_{kl} = \rho_{kl}^{(name)} \times \rho_{kl}^{(tenor)} \times \rho_{kl}^{(basis)}$$

Where:

(1) $\rho_{kl}^{(name)}$ equals 100 percent if the two names of the delta sensitivities to risk factors k and l are identical, and 35 percent otherwise;

(2) $\rho_{kl}^{(tenor)}$ equals 100 percent if the two tenors of the delta sensitivities to risk factors k and l are identical, and 65 percent otherwise; and

(3) $\rho_{kl}^{(basis)}$ equals 100 percent if the two delta sensitivities are related to the same curve, and 99.9 percent otherwise.

(B) For bucket 18, the risk delta bucket level risk position equals the sum of the absolute values of the risk weighted delta sensitivities allocated to this bucket,

$$K_{b(\text{other bucket})} = \sum_k |WS_k|.$$

(C) For buckets 19 and 20, the correlation parameter ρ_{kl} between risk

weighted delta sensitivities WS_k and WS_l equals:

$$\rho_{kl} = \rho_{kl}^{(name)} \times \rho_{kl}^{(tenor)} \times \rho_{kl}^{(basis)}$$

Where:

(1) $\rho_{kl}^{(name)}$ equals 100 percent if the two names of the delta sensitivities to risk factors k and l are identical, and 80 percent otherwise;

(2) $\rho_{kl}^{(tenor)}$ equals 100 percent if the two tenors of the delta sensitivities to risk factors k and l are identical, and 65 percent otherwise; and

(3) $\rho_{kl}^{(basis)}$ equals 100 percent if the two delta sensitivities are related to the same curves, and 99.9 percent otherwise.

(iv) For purposes of aggregating delta bucket-level risk positions across buckets within the credit spread risk for non-

securitizations risk class as specified in § _____.206(b)(3), a [BANKING

ORGANIZATION] must calculate the cross-bucket correlation parameter γ_{bc} as follows:

$$\gamma_{bc} = \gamma_{bc}^{(credit\ quality)} \times \gamma_{bc}^{(sector)}$$

Where:

(A) $\gamma_{bc}^{(credit\ quality)}$ equals 50 percent where the two buckets b and c are both in the set of buckets 1 to 17, and have a different credit quality category, where speculative and sub-speculative grade is treated as one credit quality category; $\gamma_{bc}^{(credit\ quality)}$ equals 100 percent otherwise; and

(B) $\gamma_{bc}^{(sector)}$ equals 100 percent if the two buckets belong to the same sector, and the specified values set out in Table 4 to § __.209 otherwise.

TABLE 4 TO § __.209—Credit spread risk for non-securitizations correlation parameter $\gamma_{bc}^{(sector)}$ where the buckets do not belong to the same sector

Bucket	1, 9, or 17	2 or 10	3 or 11	4 or 12	5 or 13	6 or 14	7 or 15	8 or 16	18	19	20
1, 9, or 17		75%	10%	20%	25%	20%	15%	10%	0%	45%	45%
2 or 10			5%	15%	20%	15%	10%	10%	0%	45%	45%
3 or 11				5%	15%	20%	5%	20%	0%	45%	45%
4 or 12					20%	25%	5%	5%	0%	45%	45%
5 or 13						25%	5%	15%	0%	45%	45%
6 or 14							5%	20%	0%	45%	45%
7 or 15								5%	0%	45%	45%
8 or 16									0%	45%	45%
18										0%	0%
19											75%
20											

(3) *Delta buckets, risk weights, and correlations for credit spread risk for correlation trading positions.* (i) For credit spread risk for correlation trading positions, a [BANKING ORGANIZATION] must establish buckets along two dimensions, credit quality and sector as set out in Table 5

to § __.209. In assigning a delta sensitivity to a sector, a [BANKING ORGANIZATION] must follow market convention. A [BANKING ORGANIZATION] must assign each delta sensitivity to one and only one of the sector buckets in Table 5 to § __.209. Delta sensitivities that a

[BANKING ORGANIZATION] cannot assign to a sector must be assigned to the other sector, bucket 16 in Table 5 to § __.209.

(ii) For calculating risk weighted delta sensitivities for credit spread risk for correlation trading positions, a [BANKING ORGANIZATION] must use

the risk weights in Table 5 to § ___.209. The risk weights are the same for all tenors within a bucket.

Table 5 to § ___.209—Delta Buckets and Risk Weights for Credit Spread Risk for Correlation Trading Positions

Bucket number	Credit quality category	Sector	Risk weight
1	Investment grade	Sovereign exposures, MDBs, and specified supranational entities	4.0%
2		PSEs, government-backed non-financials, GSE debt, education, and public administration	4.0%
3		Financials including government-backed financials	8.0%
4		Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	5.0%
5		Consumer goods and services, transportation and storage, and administrative and support service activities	4.0%
6		Technology and telecommunications	3.0%
7		Health care, utilities, and professional and technical activities	2.0%
8	Speculative grade	Sovereign exposures, MDBs, and specified supranational entities	13.0%
9	Speculative grade and sub-speculative grade	PSEs, government-backed non-financials, education, and public administration	13.0%
10		Financials including government-backed financials	16.0%
11		Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	10.0%
12		Consumer goods and services, transportation and storage, and administrative and support service activities	12.0%
13		Technology and telecommunications	12.0%
14		Health care, utilities, and professional and technical activities	12.0%
15	Sub-speculative grade	Sovereign exposures, MDBs, and specified supranational entities	16.0%
16	Other sector		13.0%

(iii) For purposes of aggregating risk weighted delta sensitivities of credit spread risk for correlation trading positions within a bucket as specified in

§ ___.206(b)(2), a [BANKING ORGANIZATION] must use the following correlation parameters:

(A) For buckets 1 to 15, the correlation parameter ρ_{kl} between risk weighted delta sensitivities WS_k and WS_l equals:

$$\rho_{kl} = \rho_{kl}^{(name)} \times \rho_{kl}^{(tenor)} \times \rho_{kl}^{(basis)}$$

Where:

(1) $\rho_{kl}^{(name)}$ equals 100 percent if the two names of delta sensitivities to risk factors k and l are identical, and 35 percent otherwise;

(2) $\rho_{kl}^{(tenor)}$ equals 100 percent if the two tenors of the delta sensitivities to risk factors k and l are identical, and 65 percent otherwise; and

(3) $\rho_{kl}^{(basis)}$ equals 100 percent if the two delta sensitivities are related to same curve, and 99 percent otherwise.

(B) For bucket 16, the delta bucket-level risk position equals the sum of the absolute values of the risk weighted delta sensitivities allocated to this bucket,

$$K_{b(\text{other bucket})} = \sum_k |WS_k|.$$

(C) For purposes of aggregating delta bucket-level risk positions across buckets within the credit spread risk for correlation trading positions risk class

as specified in § __.206(b)(3), a [BANKING ORGANIZATION] must calculate the cross-bucket correlation parameter Y_{bc} as follows:

$$Y_{bc} = \gamma_{bc}^{(credit\ quality)} \times \gamma_{bc}^{(sector)}$$

Where:

(1) $\gamma_{bc}^{(credit\ quality)}$ equals 50 percent where the two buckets b and c are both in buckets 1 to 16 and have a different credit quality category, where speculative and sub-speculative grade is treated as one credit quality category; $\gamma_{bc}^{(credit\ quality)}$ equals 100 percent otherwise; and

(2) $\gamma_{bc}^{(sector)}$ equals 100 percent if the two buckets belong to the same sector, and the specified values set out in Table 6 to § __.209 otherwise.

TABLE 6 to § __.209—Credit spread risk for correlation trading positions correlation parameter $\gamma_{bc}^{(sector)}$ where the buckets do not belong to the same sector

Bucket	1, 8, or 15	2 or 9	3 or 10	4 or 11	5 or 12	6 or 13	7 or 14	16
1, 8, or 15		75%	10%	20%	25%	20%	15%	0%
2 or 9			5%	15%	20%	15%	10%	0%
3 or 10				5%	15%	20%	5%	0%
4 or 11					20%	25%	5%	0%
5 or 12						25%	5%	0%
6 or 13							5%	0%
7 or 14								0%
16								

(4) *Delta buckets, risk weights, and correlations for credit spread risk for securitization positions non-CTP.* (i) For credit spread risk for securitization positions non-CTP, a [BANKING ORGANIZATION] must establish buckets along two dimensions, credit quality and sector, as set out in Table 7 to § _____.209. In assigning a delta

sensitivity to a credit quality, a [BANKING ORGANIZATION] must take into account the structural features of the securitization position non-CTP. In assigning a delta sensitivity to a sector, a [BANKING ORGANIZATION] must follow market convention. Delta sensitivities of any tranche that a [BANKING ORGANIZATION] cannot

assign to a sector must be assigned to the other sector bucket.

(ii) For calculating risk weighted delta sensitivities for credit spread risk for securitization positions non-CTP, a [BANKING ORGANIZATION] must use the risk weights in Table 7 to § _____.209.

TABLE 7 TO § __.209—DELTA Buckets and Risk Weights for Credit Spread Risk for Securitization Positions Non-CTP

Bucket number	Credit quality category	Sector	Risk weight
1	Senior investment grade	Prime RMBS	0.90%
2		Mid-prime RMBS	1.50%
3		Sub-prime RMBS	2.00%
4		Commercial mortgage-backed securities	2.00%
5		Asset-backed securities – Student loans	0.80%
6		Asset-backed securities – Credit cards and personal loans	1.20%
7		Asset-backed securities – Auto and dealer floorplan	1.20%
8		Collateralized loan obligation non-CTP	1.40%
9	Non-senior investment grade	Prime RMBS	1.13%
10		Mid-prime RMBS	1.88%
11		Sub-prime RMBS	2.50%
12		Commercial mortgage-backed securities	2.50%
13		Asset-backed securities – Student loans	1.00%
14		Asset-backed securities – Credit cards and personal loans	1.50%
15		Asset-backed securities – Auto and dealer floorplan	1.50%
16		Collateralized loan obligation non-CTP	1.75%
17	Speculative and sub-speculative grade	Prime RMBS	1.58%
18		Mid-prime RMBS	2.63%
19		Sub-prime RMBS	3.50%
20		Commercial mortgage-backed securities	3.50%
21		Asset-backed securities – Student loans	1.40%
22		Asset-backed securities – Credit cards and personal loans	2.10%
23		Asset-backed securities – Auto and dealer floorplan	2.10%
24		Collateralized loan obligation non-CTP	2.45%
25	Other sector		3.50%

(iii) For purposes of aggregating risk weighted delta sensitivities of credit spread risk for securitization positions non-CTP within a bucket as specified in

§ __.206(b)(2), a [BANKING ORGANIZATION] must use the following correlation parameters:

(A) For buckets 1 through 24, the correlation parameter ρ_{kl} between risk weighted delta sensitivities WS_k and WS_l , equals:

$$\rho_{kl} = \rho_{kl}^{(tranche)} \times \rho_{kl}^{(tenor)} \times \rho_{kl}^{(basis)}$$

Where:

(1) $\rho_{kl}^{(tranche)}$ equals 100 percent where the two delta sensitivities to risk factors k and l

are within the same bucket and related to the same tranche, with more than 80 percent overlap in notional terms and 40 percent otherwise;

(2) $\rho_{kl}^{(tenor)}$ equals 100 percent if the two tenors of the delta sensitivities to risk factors k

and l are identical, and 80 percent otherwise; and

(3) $\rho_{kl}^{(basis)}$ equals 100 percent if the two delta sensitivities reference the same curve, and

99.9 percent otherwise.

(B) For bucket 25, the delta bucket-level risk position equals the sum of the absolute values of the risk weighted delta sensitivities allocated to this bucket,

$$K_{b(\text{other bucket})} = \sum_k |WS_k|.$$

(iv) For purposes of aggregating delta bucket-level risk positions across buckets within the credit spread risk for securitization positions non-CTP risk class as specified in § _____.206(b)(3), the cross-bucket correlation parameter equals zero percent.

(5) *Delta buckets, risk weights, and correlations for equity risk.* (i) For equity

risk, a [BANKING ORGANIZATION] must establish buckets along three dimensions, market capitalization, economy and sector as set out in Table 8 to § _____.209. To assign a delta sensitivity to an economy, a [BANKING ORGANIZATION], at least annually, must review and update the countries and territorial entities that satisfy the requirements of a liquid market economy using the most recent economic data available. To assign a delta sensitivity to a sector, a [BANKING ORGANIZATION] must follow market convention by using classifications that are commonly used in the market for grouping issuers by industry sector. A [BANKING

ORGANIZATION] must assign each issuer to one of the sector buckets and must assign all issuers from the same industry to the same sector. Delta sensitivities of any equity issuer that a [BANKING ORGANIZATION] cannot assign to a sector must be assigned to the other sector. For multinational, multi-sector equity issuers, the allocation to a particular bucket must be done according to the most material economy and sector in which the issuer operates.

(ii) For calculating risk weighted delta sensitivities for equity risk, a [BANKING ORGANIZATION] must use the risk weights in Table 8 to § _____.209.

Table 8 to § __.209—Delta Buckets and Risk Weights for Equity Risk

Bucket number	Market cap	Economy	Sector	Risk weight for equity spot price	Risk weight for equity repo rate
1	Large market cap	Emerging market economy	Consumer goods and services, transportation and storage, administrative and support service activities, healthcare, and utilities	55%	0.55%
2			Telecommunications and industrials	60%	0.60%
3			Basic materials, energy, agriculture, manufacturing, and mining and quarrying	45%	0.45%
4			Financials including government-backed financials, real estate activities, and technology	55%	0.55%
5		Liquid market economy	Consumer goods and services, transportation and storage, administrative and support service activities, healthcare, and utilities	30%	0.30%
6			Telecommunications and industrials	35%	0.35%
7			Basic materials, energy, agriculture, manufacturing, and mining and quarrying	40%	0.40%
8			Financials including government-backed financials, real estate activities, and technology	50%	0.50%
9	Small market cap	Emerging market economy	All sectors described under bucket numbers 1, 2, 3 and 4	70%	0.70%
10		Liquid market economy	All sectors described under bucket numbers 5, 6, 7 and 8	50%	0.50%
11	Other sector			70%	0.70%
12	Equity indices that are both large market cap and liquid market economy (non-sector specific)			15%	0.15%
13	Other equity indices (non-sector specific)			25%	0.25%

(iii) For purposes of aggregating risk weighted delta sensitivities of equity risk within a bucket as specified in § __.206(b)(2), a [BANKING

ORGANIZATION] must use the following correlation parameters:

(A) For buckets 1 through 10 and 12 through 13, the correlation parameter p_{kl}

between two risk weighted delta sensitivities WS_k and WS_l is as follows:

(1) p_{kl} equals 99.9 percent, where one delta sensitivity is to an equity spot

price and the other delta sensitivity is to an equity repo rate, and both are related to the same equity issuer;

(2) Where both delta sensitivities are to equity spot prices, or both delta sensitivities are to equity repo rates, p_{kl} equals:

(i) 15 percent between delta sensitivities assigned to buckets 1, 2, 3, and 4 of Table 8 to § _____.209 (large market cap, emerging market economy);

(ii) 25 percent between delta sensitivities assigned to buckets 5, 6, 7,

or 8 of Table 8 to § _____.209 (large market cap, liquid market economy);

(iii) 7.5 percent between delta sensitivities assigned to bucket 9 of Table 8 to § _____.209 (small market cap, emerging market economy);

(iv) 12.5 percent between delta sensitivities assigned to bucket 10 of Table 8 to § _____.209 (small market cap, liquid market economy); and

(v) 80 percent between delta sensitivities assigned to buckets 12 or 13 of Table 8 to § _____.209 (either index bucket); and

(3) Where one delta sensitivity is to an equity spot price and the other delta sensitivity is to an equity repo rate, and each delta sensitivity is related to a different equity issuer, the applicable correlation parameter equals p_{kl} , as defined in paragraph (b)(5)(iii)(A)(2) of this section, multiplied by 99.9 percent; and

(B) For bucket 11, the delta bucket-level risk position equals the sum of the absolute values of the risk weighted delta sensitivities allocated to this bucket,

$$K_{b(\text{other bucket})} = \sum_k |WS_k|.$$

(iv) For purposes of aggregating delta bucket-level risk positions across buckets within the equity risk class as specified in § _____.206(b)(3), the cross-bucket correlation parameter y_{bc} equals:

(A) 15 percent if bucket b and bucket c fall within buckets 1 to 10 of Table 8 to § _____.209;

(B) Zero percent if either of bucket b and bucket c is bucket 11 of Table 8 to § _____.209;

(C) 75 percent if bucket b and bucket c are buckets 12 and 13 of Table 8 to § _____.209 (*i.e.*, one is bucket 12 and one is bucket 13); and

(D) 45 percent otherwise.

(6) *Delta buckets, risk weights, and correlations for commodity risk.*

(i) For commodity risk, a [BANKING ORGANIZATION] must establish buckets for each commodity type as set out in Table 9 to § _____.209. A [BANKING ORGANIZATION] must

assign each contract to one of the commodity buckets and must assign all contracts with the same underlying commodity to the same bucket. Delta sensitivities of any contract that a [BANKING ORGANIZATION] cannot assign to a commodity type must be assigned to the other commodity bucket.

(ii) For calculating risk weighted delta sensitivities for commodity risk, a [BANKING ORGANIZATION] must use the risk weights in Table 9 to § _____.209.

Table 9 TO § __.209—Delta Buckets and Risk Weights for Commodity Risk

Bucket number	Commodity bucket	Examples of commodities allocated to each commodity bucket (non-exhaustive)	Risk weight
1	Energy - solid combustibles	Coal, charcoal, wood pellets, and nuclear fuel	30%
2	Energy - liquid combustibles	Light-sweet crude oil, heavy crude oil, West Texas Intermediate (WTI) crude, Brent crude, etc. (i.e., various types of crude oil) Bioethanol, biodiesel, etc. (i.e., various biofuels) Propane, ethane, gasoline, methanol, butane, etc. (i.e., various petrochemicals) Jet fuel, kerosene, gasoil, fuel oil, naphtha, heating oil, diesel, etc. (i.e., various refined fuels)	35%
3	Energy - carbon trading	Certified emissions reductions, in-delivery month EU allowance, Regional Greenhouse Gas Initiative CO2 allowance, renewable energy certificates, etc. (i.e., various carbon trading emissions)	60%
4	Freight	Capesize, Panamax, Handysize, Supramax, etc. (i.e., various types of dry-bulk route) Suezmax, Aframax, very large crude carriers (i.e., various liquid-bulk/gas shipping route)	80%
5	Metals – non-precious	Aluminum, copper, lead, nickel, tin, zinc, etc. (i.e., various basic metals) Steel billet, steel wire, steel coil, steel scrap, steel rebar, iron ore, tungsten, vanadium, titanium, tantalum, etc. (i.e., steel raw materials) Cobalt, manganese, molybdenum, etc. (i.e., various minor metals)	40%
6	Gaseous combustibles and electricity	Natural gas and liquefied natural gas Spot electricity, day-ahead electricity, peak electricity, off-peak electricity, etc. (i.e., various electricity types)	45%
7	Precious metals (including gold)	Gold, silver, platinum and palladium	20%
8	Grains and oilseed	Corn, wheat, soybean seed, soybean oil, soybean meal, oats, palm oil, canola, barley, rapeseed seed, rapeseed oil, rapeseed meal, red bean, sorghum, coconut oil, olive oil, peanut oil, sunflower oil, and rice	35%
9	Livestock and dairy	Live cattle, feeder cattle, hog, poultry, lamb, fish, shrimp, milk, whey, eggs, butter, and cheese	25%
10	Forestry and agriculturals	Cocoa, arabica coffee, robusta coffee, tea, citrus juice, orange juice, potatoes, sugar, cotton, wool, lumber, pulp, and rubber	35%
11	Other commodity	Potash, fertilizer, phosphate rocks, etc. (i.e., various industrial materials) Rare earths, terephthalic acid, flat glass	50%
12	Commodity index		30%

(iii) For purposes of aggregating risk weighted delta sensitivities of

commodity risk within a bucket as specified in § __.206(b)(2), a

[BANKING ORGANIZATION] must use the following correlation parameters:

(A) For buckets 1 through 12, the correlation parameter ρ_{kl} between two

risk weighted delta sensitivities WS_k and WS_l equals:

$$\rho_{kl} = \rho_{kl}^{(cty)} \times \rho_{kl}^{(tenor)} \times \rho_{kl}^{(basis)}$$

Where:

(1) $\rho_{kl}^{(cty)}$ equals 100 percent where the two delta sensitivities to risk factors k and l are identical, and the intra-bucket correlation parameters set out in Table 10 to § __.209 otherwise;

(2) $\rho_{kl}^{(tenor)}$ equals 100 percent if the two tenors of the delta sensitivities to risk factors k and l are identical, and 99 percent otherwise; and

(3) $\rho_{kl}^{(basis)}$ equals 100 percent if the two delta sensitivities are identical in the delivery location of a commodity, and 99.9 percent otherwise.

Table 10 to § __.209—Commodity Risk Correlation Parameter $\rho_{kl}^{(cty)}$ for Intra-Bucket Correlations

Bucket number	Commodity bucket	Correlation ($\rho_{kl}^{(cty)}$)
1	Energy – Solid combustibles	55%
2	Energy – Liquid combustibles	95%
3	Energy – Carbon trading	40%
4	Freight	80%
5	Metals – non-precious	60%
6	Gaseous combustibles and electricity	65%
7	Precious metals (including gold)	55%
8	Grains and oilseed	45%
9	Livestock and dairy	15%
10	Forestry and other agriculturals	40%
11	Other commodity	15%
12	Commodity index	50%

(iv) For purposes of aggregating delta bucket-level risk positions across buckets within the commodity risk class as specified in § __.206(b)(3), the cross-bucket correlation parameter y_{bc} equals:

(A) 20 percent if bucket b and bucket c fall within buckets 1 to 10 or 12 of Table 10 to § __.209; and

(B) Zero percent if either bucket b or bucket c is bucket number 11 of Table 10 to § __.209.

(7) *Delta buckets, risk weights, and correlations for foreign exchange risk.* (i)

For foreign exchange risk, a [BANKING ORGANIZATION] must establish buckets for each exchange rate between the currency in which a market risk covered position is denominated and the reporting currency (or alternative base currency).

(ii) For calculating risk weighted delta sensitivities for foreign exchange risk, a [BANKING ORGANIZATION] must apply a risk weight equal to 15 percent, except for any currency pair formed by the following list of currencies, a [BANKING ORGANIZATION] may

divide the above risk weight by the $\sqrt{2}$: United States Dollar, Australian Dollar, Brazilian Real, Canadian Dollar, Chinese Yuan, Euro, Hong Kong Dollar, Indian Rupee, Japanese Yen, Mexican Peso, New Zealand Dollar, Norwegian Krone, Singapore Dollar, South African Rand, South Korean Won, Swedish Krona, Swiss Franc, Turkish Lira, United Kingdom Pound, and any additional currencies specified by the [AGENCY].

(iii) For purposes of aggregating delta bucket-level risk positions across buckets within the foreign exchange risk

class, the cross-bucket correlation parameter γ_{bc} equals 60 percent.

(c) *Vega capital requirement*—(1) *Vega buckets.* For each risk class, a [BANKING ORGANIZATION] must use the same buckets as specified in paragraph (b) of this section for the calculation of the vega capital requirement.

(2) *Vega risk weights.* For calculating risk weighted sensitivities for vega risk as described in § ___.206(c)(1), a [BANKING ORGANIZATION] must use the corresponding risk weight for each risk class specified in Table 11 to § ___.209.

(i) Equity risk (large market cap and indices) applies to vega risk factors that

correspond to buckets 1 to 8, 12 and 13 of Table 8 to § ___.209.

(ii) Equity risk (small market cap and other sector) applies to vega risk factors that correspond to buckets 9 to 11 of Table 8 to § ___.209.

Table 11 to § ___.209—Vega Risk Weights		
	Risk class	Risk weights
1	Interest rate risk	100%
2	Credit spread risk for non-securitizations	100%
3	Credit spread risk for correlation trading positions	100%
4	Credit spread risk for securitization positions non-CTP	100%
5	Equity risk (large market cap and indices)	77.78%
6	Equity risk (small market cap and other sector)	100%
7	Commodity risk	100%
8	Foreign exchange risk	100%

(3) *Vega correlation parameters.* For purposes of aggregating risk weighted vega sensitivities within a bucket as

specified in § ___.206(c)(2) a [BANKING ORGANIZATION] must use the following correlation parameters:

(i) For interest rate risk, where tenor is a dimension of the risk factor, correlation parameter ρ_{kl} equals:

$$\rho_{kl} = \min \left(\left(\rho_{kl}^{(option\ maturity)} \times \rho_{kl}^{(underlying\ maturity)} \right), 1 \right)$$

Where:

(A) $\rho_{kl}^{(option\ maturity)}$ equals $e^{-\alpha \times \frac{|T_k - T_l|}{\min\{T_k, T_l\}}}$, with α set at 1 percent and T_k (respectively

T_l) denoting the maturity of the option from which the vega sensitivity VR_k (VR_l) is derived, expressed as a number of years; and

(B) $\rho_{kl}^{(underlying\ maturity)}$ equals $e^{-\alpha \times \frac{|T_k^U - T_l^U|}{\min\{T_k^U, T_l^U\}}}$, with α set at 1 percent and T_k^U

(respectively T_l^U) denoting the maturity of the underlying of the option from which the

sensitivity VR_k (VR_l) is derived, expressed as a number of years after the maturity of the option.

(ii) Except as noted in paragraph (c)(3)(iii) of this section, for purposes of aggregating risk weighted vega sensitivities within a bucket of:

(A) Interest rate risk, where term structure is not recognized (inflation rate risk factors and cross-currency basis risk factors); and

(B) The other risk classes (numbered 2 through 8 in Table 11 to § _____.209), the correlation parameter ρ_{kl} equals:

$$\rho_{kl} = \min \left(\left(\rho_{kl}^{(delta)} \times \rho_{kl}^{(option\ maturity)} \right), 1 \right)$$

Where:

(A) $\rho_{kl}^{(option\ maturity)}$ equals $e^{-\alpha \times \frac{|T_k - T_l|}{\min\{T_k, T_l\}}}$, with α set at 1 percent and T_k (respectively

T_l) denoting the maturity of the option from which the vega sensitivity VR_k (VR_l) is derived, expressed as a number of years; and

(2) $\rho_{kl}^{(delta)}$ equals the correlation between the delta risk factors that correspond to vega risk factors k and l . For instance, if k is the vega risk factor from equity option X and l is the vega risk factor from equity option Y then $\rho_{kl}^{(delta)}$ is the delta correlation applicable between X and Y . Specifically:

(i) For the risk classes of credit spread risk for non-securitization positions and credit spread risk for correlation trading positions, the vega risk correlation parameter, $\rho_{kl}^{(delta)}$, equals the corresponding delta correlation parameter, $\rho_{kl}^{(name)}$, as specified in paragraphs

(b)(2)(iii)(A)(I) and (b)(3)(iii)(A)(I) of this section, respectively;

(ii) For the risk class of credit spread risk for securitization positions non-CTP, the vega

risk correlation parameter, $\rho_{kl}^{(\text{delta})}$, equals the corresponding delta correlation parameter,

$\rho_{kl}^{(\text{tranche})}$, as specified in paragraph (b)(4)(iii)(A)(I) of this section; and

(iii) For the risk class of commodity risk, the vega risk correlation parameter, $\rho_{kl}^{(\text{delta})}$,

equals the corresponding delta correlation parameter, $\rho_{kl}^{(\text{cty})}$, as specified in paragraph

(b)(6)(iii)(A)(I) of this section.

(iii) For purposes of aggregating risk weighted vega sensitivities within the other sector buckets (for credit spread risk for non-securitizations, bucket 18 in Table 3 to § _____.209, for credit spread risk for correlation trading positions, bucket 16 in Table 5 to § _____.209, for credit spread risk for securitization positions non-CTP, bucket 25 in Table 7 to § _____.209, and for equity risk, bucket 11 in Table 8 to § _____.209), the vega bucket-level risk position equals the sum of the absolute values of the risk weighted vega sensitivities allocated to this bucket.

(iv) For purposes of aggregating vega bucket-level risk positions across different buckets within a risk class as specified in § _____.206(c)(3), a [BANKING ORGANIZATION] must use the same cross-bucket correlation parameters γ_{bc} as specified for delta risk in paragraph (b) of this section.

(d) *The curvature capital requirement*—(1) *Curvature buckets*. For each risk class, a [BANKING ORGANIZATION] must use the same buckets as specified in paragraph (b) of this section for the calculation of the curvature capital requirement.

(2) *Curvature risk weights*. (i) For calculating the net curvature risk position CVR_k , as described in § _____.206(d)(1), for the risk classes of

foreign exchange risk and equity risk, the curvature risk weight that represents a shock to risk factor k is a relative shift equal to the delta risk weight corresponding to risk factor k .

(A) For options that do not reference a [BANKING ORGANIZATION]'s reporting currency or base currency as an underlying exposure, a [BANKING ORGANIZATION] may divide the net curvature risk positions CVR_k^+ and CVR_k^- for foreign exchange risk by a scalar of 1.5.

(B) A [BANKING ORGANIZATION] may apply the scalar of 1.5 consistently to all market risk covered positions subject to foreign exchange risk, provided curvature scenarios are calculated for all currencies, including curvature scenarios calculated by shocking the reporting currency (or base currency where used) relative to all other currencies.

(ii) For calculating the net curvature risk position CVR_k , as described in § _____.206(d)(1), for the risk classes below, the curvature risk weight corresponding to risk factor k is the consistent, relative shock to all tenor points for each curve based on the highest prescribed delta risk weight for each bucket:

(A) Interest rate risk;

(B) Credit spread risk for non-securitization positions;

(C) Credit spread risk for correlation trading positions;

(D) Credit spread risk for securitization positions non-CTP; and

(E) Commodity risk.

(iii) A [BANKING ORGANIZATION] may floor credit spreads at zero in cases where applying the delta risk weight described in paragraph (d)(2)(ii) of this section results in negative credit spreads for the credit spread risk classes referenced in paragraphs (d)(2)(ii)(B) through (D) of this section.

(3) *Curvature correlation parameters*. For purposes of aggregating the net curvature risk positions within a bucket as described in § _____.206(d)(2), a [BANKING ORGANIZATION] must use the following correlation parameters:

(i) Except as noted in paragraph (d)(3)(vi) of this section, for the risk class of interest rate risk, the curvature risk correlation parameter, ρ_{kl} , equals 99.8 percent where risk factors k and l relate to different interest rate curves and 100 percent otherwise;

(ii) Except as noted in paragraph (d)(3)(vi) of this section, for the risk classes of credit spread risk for non-securitization positions and credit spread risk for correlation trading positions, the curvature risk correlation parameter, ρ_{kl} , equals the corresponding delta correlation parameter,

$$\rho_{kl}^{(\text{name})}$$

as specified in paragraphs (b)(2)(iii)(A)(1) and (b)(3)(iii)(A)(1) of this section, respectively, squared.

(iii) Except as noted in paragraph (d)(3)(vi) of this section, for the risk class of credit spread risk for securitization positions non-CTP, the

curvature risk correlation parameter, ρ_{kl} , equals the corresponding delta correlation parameter,

$$\rho_{kl}^{(tranche)} :$$

as specified in paragraph (b)(4)(iii)(A) of this section, squared;

(iv) Except as noted in paragraph (d)(3)(vi) of this section, for the risk class of commodity risk, the curvature

risk correlation parameter, ρ_{kl} , equals the corresponding delta correlation parameter,

$$\rho_{kl}^{(cty)}$$

as specified in paragraph (b)(6)(iii)(A)(1) of this section, squared;

(v) Except as noted in paragraph (d)(3)(vi) of this section, for the risk class of equity risk, the curvature risk correlation parameter equals the corresponding delta correlation parameters, ρ_{kl} , as specified in

paragraph (b)(5)(iii)(A)(2) of this section, squared;

(vi) For purposes of aggregating the net curvature risk positions within the other sector buckets (for credit spread risk for non-securitizations, bucket 18 in Table 3 to § _____.209, for credit spread risk for correlation trading positions,

bucket 16 in Table 5 to § _____.209, for credit spread risk for securitization positions non-CTP, bucket 25 in Table 7 to § _____.209, and for equity risk, bucket 11 in Table 8 to § _____.209), the curvature bucket-level risk position equals:

$$K_{b(\text{other bucket})} = \max \left(\sum_k \max(CVR_k^+, 0), \sum_k \max(CVR_k^-, 0) \right).$$

(4) For purposes of aggregating curvature bucket-level risk positions across buckets within each risk class as specified in § _____.206(d)(3), a [BANKING ORGANIZATION] must calculate the cross-bucket correlation parameters γ_{bc} for curvature risk by squaring the corresponding delta correlation parameters γ_{bc} .

(5) In applying the high and low correlations scenarios in § _____.206(e), a [BANKING ORGANIZATION] must calculate the curvature capital requirements by applying the correlation parameters ρ_{kl} as calculated in paragraph (d)(3) of this section and the cross-bucket correlation parameter γ_{bc} as calculated in paragraph (d)(4) of this section.

§ _____.210 Default Risk Capital Requirement

(a) *Overview of the default risk capital requirements.* (1) A [BANKING ORGANIZATION] must calculate default risk capital requirements for its default risk positions across the following default risk categories:

(i) Non-securitization debt or equity positions, other than U.S. sovereign exposures, specified supranational entities, or MDBs;

(ii) Securitization positions non-CTP; and

(iii) Correlation trading positions.

(2) For each default risk category, the default risk capital requirement must be calculated as follows:

(i) Assign each default risk position to one of the prescribed buckets.

(ii) Calculate the gross default exposure for each default risk position.

(iii) Calculate obligor-level net default exposure by offsetting, where permissible, the gross default exposure amounts of long and short default risk positions.

(A) To account for defaults within the one-year capital horizon, a [BANKING ORGANIZATION] must scale the gross default exposures for default risk positions of maturity less than one year, and their hedges, by the corresponding fraction of a year. The maturity weighting applied to the gross default exposure for any default risk position with a maturity of less than three months (such as short-term lending) must be floored at three months. No scaling is applied to the gross default exposures for default risk positions with maturities of one year or greater.

(1) A [BANKING ORGANIZATION] may assign unhedged cash equity positions to a maturity of either three months or one year. For cash equity positions that hedge derivative contracts, a [BANKING ORGANIZATION] may assign the same maturity to the cash equity position as the maturity of the derivative contract it hedges.

(2) For derivative transactions, eligibility for offsetting treatment is determined by the maturity of the

derivative contract, not the maturity of the underlying. In the case where a default risk position can be delivered into a derivative contract that it hedges in fulfillment of the contract, a [BANKING ORGANIZATION] may align the maturity of the default risk position with the derivative contract it hedges to permit full offsetting.

(B) A [BANKING ORGANIZATION] may offset gross default exposures of different maturities that meet the offsetting criterion specified for the default risk category as follows:

(1) Gross default exposures with maturities longer than the one-year capital horizon may be fully offset;

(2) Gross default exposures with a mix of long and short exposures where some maturities are less than the one-year capital horizon must be weighted by the ratio of each gross default exposure's maturity relative to the one-year capital horizon. In the case where long and short gross default exposures both have maturities under the one-year capital horizon, scaling must be applied to both the long and short gross default exposure.

(iv) Within a bucket, a [BANKING ORGANIZATION] must:

(A) Calculate a hedge benefit ratio (HBR) to recognize hedging between long and short net default exposures within a bucket as follows:

$$HBR = \frac{\sum \text{net default exposure}_{(long)}}{\sum \text{net default exposure}_{(long)} + \sum |\text{net default exposure}_{(short)}|}$$

Where:

(1) *Net default exposure_(long)* equals the aggregate net long default exposure, calculated as the simple sum of the net long default exposures across obligors;

(2) *Net default exposure_(short)* equals the aggregate net short default exposure, calculated as the simple sum of the net short default exposures across obligors.

(B) Assign risk weights to the obligor-level net default exposures using the corresponding risk weights specified for the default risk category; and

(C) Generate bucket-level default risk capital requirements by aggregating risk weighted obligor-level net default exposures according to the specified aggregation formulas in paragraphs (b)(3)(ii), (c)(3)(iii) and (d)(3)(iv) of this section.

(v) The default risk capital requirement for non-securitization debt and equity positions or securitization positions non-CTP equals the sum of the bucket-level default risk capital requirements.

(3) The default risk capital requirement for correlation trading positions must be calculated in accordance with the aggregation formula in paragraph (d)(3)(v) of this section, provided that such positions may be decomposed into single positions, applying the appropriate loss given default rates and risk weights for non-securitization debt or equity positions, specified below.

(4) A [BANKING ORGANIZATION] may not recognize any diversification benefits across default risk categories. The overall default risk capital requirement is the sum of the default risk capital requirement for each default risk category.

(b) *Default risk capital requirement for non-securitization debt or equity positions*—(1) *Gross default exposure*.

(i) A [BANKING ORGANIZATION] must calculate the gross default exposure for each non-securitization debt or equity position.

(ii) A [BANKING ORGANIZATION] must determine the long and short

direction of a gross default exposure with respect to whether there would be a loss (long) or a gain (short) in the event of a default.

(iii) A [BANKING ORGANIZATION] must calculate the gross default exposure based on the loss given default (LGD) rate, notional amount (or face value) and the cumulative profit and loss (P&L) already realized on the non-securitization position, as follows:

Gross default exposure_(long) = $\max((LGD \text{ rate} \times \text{national amount} + P\&L), 0)$,

Gross default exposure_(short) = $\max((LGD \text{ rate} \times \text{national amount} + P\&L), 0)$,

(iv) A [BANKING ORGANIZATION] must assign LGD rates to non-securitization debt or equity positions as follows:

(A) 100 percent for equity, non-senior debt and defaulted positions;

(B) 75 percent for senior debt, unless a lower LGD is assigned;

(C) 75 percent for GSE debt issued, but not guaranteed, by GSEs;

(D) 50 percent for positions in a PSE that is organized under the laws of the United States or any state or political subdivision thereof;

(E) 25 percent for GSE debt guaranteed by GSEs;

(F) 25 percent for covered bonds; and

(G) Zero percent if the value of the non-securitization debt or equity position is not linked to the recovery rate of the defaulter.

(v) For credit derivatives, a [BANKING ORGANIZATION] must use the LGD rate of the reference exposure.

(vi) A [BANKING ORGANIZATION] must reflect the notional amount of a non-securitization debt or equity position that gives rise to a long (short) gross default exposure as a positive (negative) value and the loss (gain) as a negative (positive) value. If the contractual or legal terms of the derivative contract allow for the unwinding of the instrument, with no exposure to default risk, the gross default exposure equals zero.

(vii) For all non-securitization debt or equity positions, the notional amount equals the amount of the non-securitization debt or equity position relative to which the loss of principal is calculated. For a call option on a non-securitization position, the notional amount to be used in the gross default exposure calculation is zero.

(2) *Net default exposure*. To calculate the net default exposure to an obligor, a [BANKING ORGANIZATION] must sum the maturity-weighted default exposures to the issuer and in doing so, may offset long and short gross default exposures to the same obligor, provided the short gross default exposures have the same or lower seniority relative to the long gross default exposures. In determining whether a market risk covered position that has an eligible guarantee is an exposure to the underlying obligor or an exposure to the eligible guarantor, the credit risk mitigation requirements set out in § _____.36 and § _____.120 apply. For purposes of this section, GSEs may be considered eligible guarantors and each GSE must be considered a separate obligor, provided that a [BANKING ORGANIZATION] may fully offset long and short gross default exposures to Uniform Mortgage-Backed Securities that are issued by two different obligors.

(3) *Calculation of the default risk capital requirement for non-securitization debt or equity positions*.

(i) To calculate the default risk capital requirement for non-securitization debt or equity positions, a [BANKING ORGANIZATION] must assign each non-securitization debt or equity position to one of four buckets:

(A) Non-U.S. sovereign exposures;

(B) PSE and GSE debt positions;

(C) Corporate positions; and

(D) Defaulted positions.

(ii) A [BANKING ORGANIZATION] must calculate the bucket-level default risk capital requirement, DRC_b , for each bucket, b , for non-securitization debt or equity positions as follows:

$$DRC_b = \max \left(\left(\left(\sum_{i \in long} RW_i \times net\ default\ exposure_i \right) - HBR \times \left(\sum_{i \in short} RW_i \times |net\ default\ exposure_i| \right) \right), 0 \right)$$

Where:

i refers to a non-securitization debt or equity position belonging to bucket b and the

corresponding risk weights, RW_i , are set out in Table 1 to § __.210:

Table 1 to § __.210—Default Risk Weights for Non-Securitization Debt or Equity Positions by Credit Quality Category

Bucket	Credit quality category		
	Investment grade	Speculative grade	Sub-speculative grade
Non-U.S. sovereign positions	0.6%	22.0%	50.0%
PSE and GSE debt positions	2.1%	22.0%	50.0%
Corporate positions	4.1%	22.0%	50.0%
Defaulted positions	100%		

(iii) The default risk capital requirement for non-securitization debt or equity positions equals the sum of the four bucket-level default risk capital requirements.

(c) *Default risk capital requirement for securitization positions non-CTP*—(1) *Gross default exposure*. A [BANKING ORGANIZATION] must determine the gross default exposure for each securitization position non-CTP using the approach for non-securitization debt or equity positions in paragraphs (b)(1)(i) and (ii) of this section, treating each securitization position non-CTP as a non-securitization debt or equity position. The gross default exposure for a securitization position non-CTP equals the position's market value.

(2) *Net default exposure*. (i) A [BANKING ORGANIZATION] may offset long and short securitization positions non-CTP if the positions have the same underlying asset pools and belong to the same tranche.

(ii) A [BANKING ORGANIZATION] may offset long and short securitization positions non-CTP with one or more long and short non-securitization

positions by decomposing the exposures of the non-tranched index instruments. To recognize offsetting for securitization positions non-CTP, a [BANKING ORGANIZATION] must sum the equivalent underlying assets of the decomposed non-tranche index instruments to the equivalent replicating tranches that span the entire capital structure of the securitized instrument. Non-securitization positions that are recognized as offsetting in this way must be excluded from the calculation of the default risk capital requirement for non-securitization debt or equity positions under paragraph (b) of this section.

(iii) Securitization positions non-CTP that can be replicated through decomposition may offset. Specifically, if a collection of long securitization positions non-CTP can be replicated by a collection of short securitization positions non-CTP, then the long and short securitization positions non-CTP may offset.

(3) *Calculation of the default risk capital requirement for securitization positions non-CTP*. (i) To calculate the

default risk capital requirement for securitization positions non-CTP, a [BANKING ORGANIZATION] must assign each securitization position non-CTP to one of the following buckets:

(A) Corporate positions;
(B) Asset class buckets defined along two dimensions:

(1) Asset class: asset-backed commercial paper, auto loans/leases, RMBS, credit cards, commercial mortgage-backed securities, collateralized loan obligations, collateralized debt obligations squared, small and medium enterprises, student loans, other retail, and other wholesale; and

(2) Region: Asia, Europe, North America, and other.

(ii) When assigning securitization positions non-CTP to a bucket, a [BANKING ORGANIZATION] must rely on market convention for classifying securitization positions non-CTP by asset class and region of the underlying assets. In addition, a [BANKING ORGANIZATION] must assign:

(A) Each securitization position non-CTP to exactly one bucket and must

assign all securitization positions non-CTP with underlying exposures in the same asset class and region to the same bucket;

(B) Any securitization position non-CTP that is not a corporate position and

that a [BANKING ORGANIZATION] cannot assign to a specific asset class or region, must be assigned to one of the “other” buckets.

(iii) A [BANKING ORGANIZATION] must calculate the bucket-level default

risk capital requirement, for each DRC_b , bucket, b , for securitization positions non-CTP as follows:

$$DRC_b = \max \left(\left(\left(\sum_{i \in \text{long}} RW_i \times \text{net default exposure}_i \right) - HBR \times \left(\sum_{i \in \text{short}} RW_i \times |\text{net default exposure}_i| \right) \right), 0 \right)$$

Where:

(A) i refers to a securitization position non-CTP belonging to bucket b ;

(B) HBR equals the hedge benefit ratio specified in paragraph (a)(3)(i) of this section; and

(C) RW_i equals:

- (1) For the calculation of Expanded Total Risk-Weighted Assets, the corresponding risk weight that would apply to the securitization exposure under § _____.132 or § _____.133 multiplied by 8 percent; or
- (2) For the calculation of Standardized Total Risk-Weighted Assets, the corresponding risk weight that would apply to the securitization exposure under § _____. 42,

§ _____.43, or § _____.44 multiplied by 8 percent.

- (3) Provided that a [BANKING ORGANIZATION] may cap the default risk capital requirement for an individual cash securitization position non-CTP at its fair value.

(iv) The default risk capital requirement for securitization positions non-CTP equals the sum of the bucket-level default risk capital requirements.

(d) *Default risk capital requirement for correlation trading positions*—(1) *Gross default exposure*. (i) A [BANKING ORGANIZATION] must determine the

gross default exposure for each correlation trading position using the approach for non-securitization debt or equity positions in paragraphs (b)(1)(i) and (ii) of this section, including the determination of the direction (long or short) of the correlation trading position, provided that the gross default exposure for a correlation trading position is its market value.

(ii) A [BANKING ORGANIZATION] must treat a Nth-to-default position as a tranching position with attachment and detachment points calculated as:

$$\text{Attachment point} = \frac{(N-1)}{\text{Total names}},$$

$$\text{Detachment point} = \frac{N}{\text{Total names}}.$$

Where:

“total names” is the total number of single names in the underlying basket or pool.

(2) *Net default exposure*. (i) A [BANKING ORGANIZATION] may recognize offsetting for correlation trading positions that are otherwise identical, except for maturity, including index tranches of the same series.

(ii) A [BANKING ORGANIZATION] may offset combinations of long gross default exposures and combinations of short gross default exposures of tranches that are perfect replications of non-tranching correlation trading positions.

(iii) A [BANKING ORGANIZATION] may offset long and short gross default exposures of the types of exposures listed in paragraphs (d)(2)(i) and (ii)

through decomposition of a correlation trading position, including an equivalent exposure that arises from decomposition, provided that the long and short gross default exposures are otherwise equivalent except for a residual component and that a [BANKING ORGANIZATION] must account for the residual exposure in the calculation of the net default exposure.

(iv) A [BANKING ORGANIZATION] may offset long and short gross default exposures of different tranches of the same index and series through replication and decomposition, if the residual component has the attachment and detachment point nested with the original tranche or the combination of tranches. A [BANKING

ORGANIZATION] must account for the residual component of the unhedged tranche.

(3) *Calculation of the default risk capital requirement for correlation trading positions*. (i) To calculate the default risk capital requirement for a correlation trading position, a [BANKING ORGANIZATION] must assign each index to a bucket of its own.

(ii) A [BANKING ORGANIZATION] must assign a bespoke correlation trading position that is substantially similar to an index to the bucket corresponding to the index. A [BANKING ORGANIZATION] must assign each bespoke correlation trading position that is not substantially similar to an index to a bucket of its own.

(iii) For a non-securitization position that hedges a correlation trading position, a [BANKING ORGANIZATION] must assign such

position and the related correlation trading position to the same bucket.
(iv) A [BANKING ORGANIZATION] must calculate the bucket-level default

risk capital requirement, DRC_b , for each bucket, b , for correlation trading positions as follows:

$$DRC_b = \left(\sum_{i \in long} RW_i \times net\ default\ exposure_i \right) - HBR_{CTP} \times \left(\sum_{i \in short} RW_i \times |net\ default\ exposure_i| \right)$$

Where:

- (A) i refers to a correlation trading position belonging to bucket b .
(B) HBR_{CTP} equals the hedge benefit ratio specified in paragraph (a)(2)(iv)(A) of this section, but calculated using the combined long and short net default exposures across all indices in the correlation trading position default risk category.
(C) The summation of risk-weighted net default exposures in the formula spans all exposures relating to the index.
(D) RW_i equals:

- (1) For tranching correlation trading positions:
(i) For the calculation of Expanded Total Risk-Weighted Assets, the corresponding risk weight that would apply to the securitization exposure under § _____.132 or § _____.133 multiplied by 8 percent; or
(ii) For the calculation of Standardized Total Risk-Weighted Assets, the corresponding risk weight that would apply to the securitization exposure under § _____.42, § _____.43, or § _____.44 multiplied by 8 percent.
(2) For non-tranched hedges of correlation trading positions or decomposed single

name exposures, the same loss given default rates and risk weights as for non-securitization debt or equity positions, provided that such hedges or decomposed single exposures must be excluded from the calculation of the default risk capital requirement for non-securitization debt or equity positions.

(v) A [BANKING ORGANIZATION] must calculate the default risk capital requirement for correlation trading positions by aggregating the bucket-level capital requirements as follows:

$$DRC_{CTP} = \max \left(\sum_b (\max(DRC_b, 0) + 0.5 \times \min(DRC_b, 0)), 0 \right).$$

§ _____.211 Residual Risk Add-On

(a) *Included positions.* A [BANKING ORGANIZATION] must calculate the residual risk add-on for all market risk covered positions identified as follows:

(1) Market risk covered positions that have an exotic exposure.

(2) Market risk covered positions that are:

(i) Correlation trading positions with three or more underlying exposures, except for market risk covered positions that are hedges of correlation trading positions;

(ii) Subject to the curvature capital requirement, but are not market risk covered positions without optionality that a [BANKING ORGANIZATION] chooses to include in the calculation of its curvature capital requirement as described under § _____.206(d), or subject to the vega capital requirements and have pay-offs that cannot be replicated as a finite linear combination of vanilla options or the underlying instrument;

(iii) Options or positions with embedded options that do not have a maturity; and

(iv) Options or positions with embedded options that do not have a

strike price or barrier, or that have multiple strike prices or barriers;

(3) The portion of the exposure amount resulting from an equity position in an investment fund required to be included in the residual risk add-on under § _____.205(e)(3)(iii); and

(4) Any other market risk covered positions that the [AGENCY] determines must be subject to the residual risk add-on in order to capture the material risks of the position.

(b) *Excluded positions.* (1) Notwithstanding paragraph (a)(2) of this section, a [BANKING ORGANIZATION] may exclude the following market risk covered positions from the residual risk add-on:

(i) Market risk covered position that are listed;

(ii) Market risk covered position that are eligible to be cleared by a CCP or QCCP; and

(iii) Market risk covered position that are options without path dependent pay-offs or with two or fewer underlyings.

(2) Notwithstanding paragraphs (a)(1) and (2) of this section, a [BANKING ORGANIZATION] may exclude the

following market risk covered positions from the residual risk add-on:

(i) In the case where a market risk covered position is a transaction that exactly matches that with a third-party transaction (back-to-back transactions), both transactions;

(ii) In the case where a market risk covered position can be delivered into a derivative contract that it hedges in fulfillment of the contract, both the market risk covered position and the derivative contract;

(iii) Securities issued or guaranteed by the U.S. government or GSE debt;

(iv) Any market risk covered position that is subject to the fallback capital requirement;

(v) Internal transactions between two trading desks, if only one trading desk is a model-eligible trading desk; and

(vi) Any other market risk covered positions that the [AGENCY] determines are not required to be subject to the residual risk add-on because the material risks are sufficiently capitalized under this subpart F.

(c) *Calculation of the residual risk add-on.* (1) The residual risk add-on equals the sum of the gross effective notional amounts of market risk covered

positions identified in paragraph (a) of this section, multiplied by the prescribed risk weight as set out as follows:

(i) The risk weight for market risk covered positions identified in paragraph (a)(1) of this section is 1.0 percent.

(ii) The risk weight for market risk covered positions identified in paragraph (a)(2) of this section is 0.1 percent.

(2) For purposes of calculating the residual risk add-on, the gross effective notional amount means the notional amount as a [BANKING ORGANIZATION] reports in the most recent Call Report or FR Y–9C.

Models-Based Non-Default Capital Requirement

§ _____.212 Operational Requirements for the Models-Based Measure for Market Risk

(a) *General requirements.* In order to calculate the models-based measure for market risk, a [BANKING ORGANIZATION] must:

(1) Have at least one model-eligible trading desk; and

(2) Receive prior approval from the [AGENCY] of the [BANKING ORGANIZATION]'s trading desk structure.

(b) *Trading desk identification and approval process—*(1) *Identification of trading desks.* A [BANKING ORGANIZATION] must identify a trading desk for which the [BANKING ORGANIZATION] will seek approval to be a model-eligible trading desk and in making this identification must:

(i) Consider whether having the trading desk be a model-eligible trading desk would better reflect the market risk of the market risk covered positions on the trading desk;

(ii) Exclude any trading desk that includes more than de minimis amounts of model-ineligible positions; and

(iii) For any trading desk that includes de minimis amounts of model-ineligible positions:

(A) Not consider model-ineligible positions on model-eligible trading desks to be model-eligible positions for the calculations in § _____.215; and

(B) Exclude model-ineligible positions on model-eligible trading desks from aggregate trading portfolio backtesting, under § _____.204(g), and the relevant trading desks' backtesting and PLA-testing, under § _____.213, unless the [BANKING ORGANIZATION] receives approval from the [AGENCY] to include such positions for backtesting and PLA-testing purposes.

(2) *Approval process for trading desks.* A [BANKING ORGANIZATION]

must receive prior approval of the [AGENCY] for a trading desk to be a model-eligible trading desk. To receive such approval, a [BANKING ORGANIZATION] must:

(i) Receive approval by [AGENCY] of the internal models to be used by the trading desk pursuant to § _____.212(c); and

(ii) Comply with one of the following:

(A) Provide at least 250 business days of trading desk level backtesting and, beginning [THREE YEARS AFTER EFFECTIVE DATE], PLA test results for the trading desk to the [AGENCY];

(B) Provide at least 125 business days of trading desk level backtesting and, beginning [THREE YEARS AFTER EFFECTIVE DATE], PLA test results for the trading desk to the [AGENCY] and demonstrate to the satisfaction of the [AGENCY] that the internal models will be able to meet the backtesting and, beginning [THREE YEARS AFTER EFFECTIVE DATE], PLA testing on an ongoing basis;

(C) Demonstrate that the trading desk consists of similar market risk covered positions to another trading desk of the [BANKING ORGANIZATION], which has been approved by the [AGENCY] and has provided at least 250 business days of trading desk level backtesting and, beginning [THREE YEARS AFTER EFFECTIVE DATE], PLA test results to the [AGENCY]; or

(D) Beginning [THREE YEARS AFTER EFFECTIVE DATE], subject the trading desk to the PLA add-on until the trading desk provides at least 250 business days of trading desk-level backtesting and PLA test results, produces results in the PLA test green zone, and passes trading desk-level backtesting.

(3) *Changes to trading desk structure.* (i) A [BANKING ORGANIZATION] must receive prior approval from the [AGENCY] before the [BANKING ORGANIZATION] implements any change to its trading desk structure that would result in a material change in the [BANKING ORGANIZATION]'s market risk capital requirements for a portfolio of market risk covered positions.

(ii) A [BANKING ORGANIZATION] must promptly notify the [AGENCY] when the [BANKING ORGANIZATION] makes any change to its trading desk structure that would result in a non-material change in the [BANKING ORGANIZATION]'s market risk capital requirements for a portfolio of market risk covered positions.

(4) The [AGENCY] may rescind its approval of a model-eligible trading desk or subject such trading desk to the PLA add-on if the [AGENCY] determines that the trading desk no longer complies with any of the

applicable requirements of this subpart F, provided that the trading desk may not be subjected to the PLA add-on if the approval for a stressed expected shortfall methodology used by the trading desk was rescinded. A model-eligible trading desk that becomes subject to the PLA add-on under this paragraph (b)(4) shall remain subject to the PLA add-on until the [AGENCY] determines that the trading desk is no longer subject to the PLA add-on under this paragraph (b)(4).

(c) *Approval of internal models and stressed expected shortfall methodologies—*(1) *Initial approval.* A [BANKING ORGANIZATION] must receive prior approval of the [AGENCY] to use an internal model for the ES-based measure in § _____.215(b), and the stressed expected shortfall methodologies in § _____.215(d). To receive [AGENCY] approval of an internal model or methodology, a [BANKING ORGANIZATION] must demonstrate:

(i) The internal model properly measures all the material risks of the market risk covered positions to which it is applied;

(ii) The internal model has been properly validated, consistent with paragraph (d)(3) of this section;

(iii) The level of sophistication of the internal model or methodology is commensurate with the complexity and amount of its market risk covered positions; and

(iv) The internal model or methodology meets the applicable requirements of this subpart F.

(2) *Changes to internal models and stressed expected shortfall methodologies.* (i) A [BANKING ORGANIZATION] must receive prior approval from the [AGENCY] before the [BANKING ORGANIZATION] implements any change to an approved model, including any change to its modelling assumptions, that would result in a material change in the [BANKING ORGANIZATION]'s ES-based measure for a trading desk, the [BANKING ORGANIZATION]'s IMCC, or the [BANKING ORGANIZATION]'s stressed expected shortfall.

(ii) A [BANKING ORGANIZATION] must promptly notify the [AGENCY] when the [BANKING ORGANIZATION] makes any change to an approved model, including any change to its modelling assumptions, that would result in a non-material change in the [BANKING ORGANIZATION]'s ES-based measure for a trading desk, the [BANKING ORGANIZATION]'s IMCC, or the [BANKING ORGANIZATION]'s stressed expected shortfall.

(3) If the [AGENCY] determines that the [BANKING ORGANIZATION] no longer complies with this subpart F or that the [BANKING ORGANIZATION]'s internal models or methodologies fail to accurately reflect the risks of any of the [BANKING ORGANIZATION]'s market risk covered positions, the [AGENCY] may rescind its approval of an internal model or methodology previously approved under paragraph (c)(1) of this section, or impose the PLA add-on on the trading desk using the internal model for the ES-based measure pursuant to paragraph (b)(4) of this section. When approval for an internal model or methodology is rescinded, any trading desk that had used that internal model or methodology must be a model-eligible trading desk.

(d) *Review, risk management, and validation.* (1) A [BANKING ORGANIZATION] must, no less frequently than annually, review its internal models in light of developments in financial markets and modeling technologies, and enhance those internal models as appropriate to ensure that they continue to meet the [AGENCY]'s standards for model approval and employ risk measurement methodologies that are the most appropriate for the [BANKING ORGANIZATION]'s market risk covered positions.

(2) A [BANKING ORGANIZATION] must integrate the internal models used for calculating the ES-based measure in § _____.215(b) into its daily risk management process.

(3) A [BANKING ORGANIZATION] must validate its internal models initially and on an ongoing basis. A [BANKING ORGANIZATION] must revalidate its internal models when it makes any material changes to the models or when there have been significant structural changes in the market or changes in the composition of the [BANKING ORGANIZATION]'s market risk covered positions that might lead to the [BANKING ORGANIZATION]'s internal models to be no longer adequate. The [BANKING ORGANIZATION]'s validation process must be independent of the internal models' development, implementation, and operation, or the validation process must be subjected to an independent review of its adequacy and effectiveness. Validation must include:

(i) An evaluation of the conceptual soundness of the internal models;

(ii) An evaluation that the internal models adequately reflect all material risks and that assumptions are appropriate and do not underestimate risk;

(iii) An ongoing monitoring process that includes verification of processes and the comparison of the [BANKING ORGANIZATION]'s model outputs with relevant internal and external data sources or estimation techniques;

(iv) An outcomes analysis process that includes backtesting and PLA testing at the trading desk level; and

(v) Backtesting conducted at the aggregate level for all model-eligible trading desks.

(e) *Supervisory action for model-eligible trading desks.* If required by the [AGENCY], a [BANKING ORGANIZATION] that has one or more model-eligible trading desks must calculate the standardized measure for market risk for one or more specified model-eligible trading desks as if that trading desk were a stand-alone regulatory portfolio, as directed by the [AGENCY].

§ _____.213 Trading Desk-Level Backtesting and PLA Testing

(a) A model-eligible trading desk must conduct backtesting as described in paragraph (b) of this section and PLA testing as described in paragraph (c) of this section at the trading desk level on a quarterly basis.

(b) *Trading desk-level backtesting requirements.* (1) Beginning on the business day a trading desk becomes a model-eligible trading desk, the [BANKING ORGANIZATION] must generate backtesting data by separately comparing each business day's actual profit and loss and hypothetical profit and loss with the corresponding VaR-based measure calculated by the [BANKING ORGANIZATION]'s internal models for that business day, at both the 97.5th percentile and the 99.0th percentile one-tail confidence levels at the trading desk level. Time effects must be treated in a consistent manner in the hypothetical profit and loss used for backtesting.

(i) An exception for actual profit and loss at either percentile occurs when the actual loss of the model-eligible trading desk exceeds the corresponding VaR-based measure calculated at that percentile. An exception for hypothetical profit and loss at either percentile occurs when the hypothetical loss of the model-eligible trading desk exceeds the corresponding VaR-based measure calculated at that percentile.

(ii) If either the business day's actual or hypothetical profit and loss is not available or the [BANKING ORGANIZATION] is unable to compute the business day's actual or hypothetical profit and loss, an exception for actual profit and loss or for hypothetical profit and loss, respectively, at each percentile

occurs. If the VaR-based measure for a business day is not available or the [BANKING ORGANIZATION] is unable to compute the VaR-based measure for a particular business day, exceptions for actual profit and loss and for hypothetical profit and loss at each percentile occur. No exception will occur if the unavailability or inability is related to an official holiday.

(iii) With approval of the [AGENCY], a [BANKING ORGANIZATION] may consider an exception not to have occurred if:

(A) The [BANKING ORGANIZATION] can demonstrate that the exception is due to technical issues that are unrelated to the [BANKING ORGANIZATION]'s internal models; or

(B) The [BANKING ORGANIZATION] can demonstrate that one or more non-modellable risk factors caused the relevant loss, and the portion of the stressed expected shortfall, as defined in § _____.204(c)(2)(ii), that can be attributed to these non-modellable risk factors on that business day exceeds the difference between the [BANKING ORGANIZATION]'s VaR-based measure and the actual or hypothetical loss for that business day.

(2) In order to conduct backtesting, a [BANKING ORGANIZATION] must count the number of exceptions over the most recent 250 business days. A [BANKING ORGANIZATION] must count exceptions for actual profit and loss at each percentile separately from exceptions for hypothetical profit and loss.

(3) If any given model-eligible trading desk experiences either more than 12 exceptions for actual profit and loss or 12 exceptions for hypothetical profit and loss at the 99.0th percentile, or 30 exceptions for actual profit and loss or 30 exceptions for hypothetical profit and loss at the 97.5th percentile in the most recent 250 business day period, then the trading desk becomes a model-eligible trading desk, upon the completion of the [AGENCY]'s quarterly review of the relevant backtesting data.

(4) Notwithstanding paragraphs (b)(2) and (3) of this section, in cases where a model-eligible trading desk is approved pursuant to § _____.212(b)(2)(ii)(B), (C) or (D):

(i) The model-eligible trading desk that has fewer than 250 business days of backtesting data available must use all available backtesting data; and

(ii) The [BANKING ORGANIZATION] must prorate the number of allowable exceptions under paragraph (b)(3) of this section by the number of business days for which backtesting data are available for the model-eligible trading desk.

(5) A trading desk that becomes a model-ineligible trading desk under paragraph (b)(3) of this section becomes a model-eligible trading desk when:

(i) The trading desk experiences less than or equal to 12 exceptions for actual profit and loss and 12 exceptions for hypothetical profit and loss at the 99.0th percentile, and 30 exceptions for actual profit and loss and 30 exceptions for hypothetical profit and loss at the 97.5th percentile in the most recent 250 business day period and, beginning [THREE YEARS AFTER EFFECTIVE DATE], the trading desk produces results in the PLA test green zone or PLA test amber zone; or

(ii) The [BANKING ORGANIZATION] receives approval of the [AGENCY].

(c) *Trading desk level PLA test requirements*—(1) *General requirements*. At the trading desk level, the [BANKING ORGANIZATION] must compare each of its most recent 250 business days' hypothetical profit and loss with the corresponding daily risk-theoretical profit and loss. Time effects must be treated in a consistent manner in the hypothetical profit and loss and the risk-theoretical profit and loss.

(i) For the purpose of PLA testing, the [BANKING ORGANIZATION] may align risk-theoretical profit and loss input data for its risk factors with the data used in hypothetical profit and loss, where the [BANKING ORGANIZATION] is able to demonstrate that hypothetical profit and loss input data can be used

appropriately for risk-theoretical profit and loss purposes.

(ii) The [BANKING ORGANIZATION] may adjust risk-theoretical profit and loss input data when the input data for a given risk factor that is included in both the risk-theoretical profit and loss and the hypothetical profit and loss differs due to different market data sources, time fixing of market data sources, or transformations of market data into input data suitable for the risk factors of the underlying valuation engines. When transforming input data into a format that can be applied to the risk factors used in internal risk management models, the [BANKING ORGANIZATION] must demonstrate that no differences in the risk factors or in the valuation models have been omitted.

(iii) The [BANKING ORGANIZATION] must be able to assess the effect that input data alignments would have on the risk-theoretical profit and loss. The [BANKING ORGANIZATION] must be able to compare the risk-theoretical profit and loss based on the hypothetical profit and loss aligned market data with the risk-theoretical profit and loss based on market data without alignment. This comparison must be performed when designing or changing the input data alignment process or at the request of the [AGENCY].

(2) *PLA test metric*. (i) A [BANKING ORGANIZATION] must calculate the Kolmogorov-Smirnov metric in this

paragraph (c)(2) at the trading desk level, using the most recent 250 business days of the risk-theoretical profit and loss and the hypothetical profit and loss.

(ii) A [BANKING ORGANIZATION] must calculate the empirical cumulative distribution function of the risk-theoretical profit and loss where, for any value of risk-theoretical profit and loss, the empirical cumulative distribution is the product of 0.004 and the number of risk-theoretical profit and loss observations that are less than or equal to the specified risk-theoretical profit and loss.

(iii) A [BANKING ORGANIZATION] must calculate the empirical cumulative distribution function of hypothetical profit and loss where, for any value of hypothetical profit and loss, the empirical cumulative distribution is the product of 0.004 and the number of hypothetical profit and loss observations that are less than or equal to the specified hypothetical profit and loss.

(iv) A [BANKING ORGANIZATION] must calculate the Kolmogorov-Smirnov metric as the largest absolute difference observed between these two empirical cumulative distribution functions at any profit and loss value.

(3) *PLA test evaluation*. (i) A [BANKING ORGANIZATION] must identify the PLA test zone of the trading desk's PLA test results as set out in Table 1 to § __.213.

Table 1 to § __.213—PLA Test Zones

PLA test zone	Kolmogorov-Smirnov (KS) metric
Green zone	$KS < 0.09$
Amber zone	$0.09 \leq KS \leq 0.12$
Red zone	$KS > 0.12$

(ii) Notwithstanding paragraph (c)(3)(i) of this section, the [AGENCY] may determine that a [BANKING ORGANIZATION] must identify the PLA test zone of a trading desk's PLA test results as a different PLA test zone.

(iii) Beginning [THREE YEARS AFTER EFFECTIVE DATE], upon the completion of the quarterly review of the relevant PLA test data, a trading desk that produces results in the PLA test amber zone, pursuant to paragraph (c)(3)(i) or (c)(3)(ii) of this section, is subject to the PLA add-on.

(iv) Beginning [THREE YEARS AFTER EFFECTIVE DATE], upon the completion of the quarterly review of the relevant PLA test data, a trading desk that produces results in the PLA test red zone, pursuant to paragraph (c)(3)(i) or (c)(3)(ii) of this section, is a model-ineligible trading desk.

(v) A trading desk that becomes a model-ineligible trading desk under paragraph (c)(3)(iv) of this section will become a model-eligible trading desk when:

(A) The trading desk produces results in the PLA test green zone or PLA test

amber zone; and in the most recent 250 business day period, the trading desk experiences less than or equal to 12 backtesting exceptions for actual profit and loss and 12 exceptions for hypothetical profit and loss at the 99.0th percentile, or less than or equal to 30 backtesting exceptions for actual profit and loss and 30 backtesting exceptions for hypothetical profit and loss at the 97.5th percentile; or

(B) The [BANKING ORGANIZATION] receives approval of the [AGENCY].

(4) *PLA add-on*. The PLA add-on, if required under paragraph (c)(3)(iii) of

this section, § _____.212(b)(2)(ii)(D), or § _____.212(b)(4), equals:

$PLA\ add-on = k$

$$\times \max \left(\left(SA_{G,A} \right. \right. \\ \left. \left. - \max \left((IMCC_{t-1} + SES_{t-1}), \left((m_c \times IMCC_{average}) + SES_{average} \right) \right) \right), 0 \right)$$

where,

(i) $k = 0.5 \times \frac{\sum_{i \in A} SA_i}{\sum_{i \in G,A} SA_i}$; where

- (A) SA_i denotes the standardized non-default capital requirement for market risk covered positions on trading desk, i ;
- (B) $\sum_{i \in A} SA_i$ equals the sum of the standardized non-default capital requirement, calculated separately, for each trading desk i that is subject to the PLA add-on; and
- (C) $\sum_{i \in G,A} SA_i$ equals the sum of the standardized non-default capital requirement, calculated separately, for each model-eligible trading desk i (including trading desks subject to the PLA add-on); and
- (ii) All other terms have the meaning specified in § _____.204(c)(2).

§ _____.214 Risk Factor Identification

(a) *Identification of risk factors.* A [BANKING ORGANIZATION] must identify an appropriate set of risk factors to be used for purposes of calculating the internally modelled capital calculation, $IMCC$, and the stressed expected shortfall, SES , subject to the requirements below:

(1) The set of risk factors must be sufficient to represent the risks inherent in the market risk covered positions held by model-eligible trading desks;

(2) The [BANKING ORGANIZATION] must include all risk factors included in the [BANKING ORGANIZATION]'s internal risk management models or models used in reporting actual profits and losses; and

(3) The [BANKING ORGANIZATION] must include all risk factors that are specified in § _____.208 for each corresponding risk class, unless the [BANKING ORGANIZATION] is able to support the omission of specific risk classes to the satisfaction of the [AGENCY].

(b) *Risk factor eligibility tests.* (1) *Conduct of tests and classification of risk factors.* A [BANKING

ORGANIZATION] must classify each risk factor according to the risk factor qualitative test specified in paragraph (b)(2) of this section and the risk factor quantitative test specified in paragraph (b)(3) of this section as follows:

(i) A risk factor that passes both the risk factor quantitative test and the risk factor qualitative test is a modellable risk factor;

(ii) A risk factor that passes the risk factor qualitative test but fails the risk factor quantitative test is a type A non-modellable risk factor; and

(iii) A risk factor that is not a modellable risk factor or a type A non-modellable risk factor is a type B non-modellable risk factor.

(2) *Risk factor qualitative test.* To pass the risk factor qualitative test, the data that a [BANKING ORGANIZATION] uses to calculate the models-based non-default capital requirement corresponding to a risk factor must be consistent with each of the standards in this paragraph (b)(2).

(i) The data must allow the internal models used to calculate the ES-based measure to capture both idiosyncratic risk and systematic risk, if applicable.

(ii) The data must allow the internal models used to calculate the ES-based measure to reflect volatility and correlation of risk factors of market risk covered positions.

(iii) The data must be reflective of prices observed or quoted in the market. Where data used are not derived from real price observations, the [BANKING ORGANIZATION] must be able to demonstrate that the data used are reasonably representative of real price observations.

(iv) The data must be updated at a sufficient frequency to adequately

reflect the performance of the risk factor, and at a minimum on a weekly basis. Where the [BANKING ORGANIZATION] uses regressions to estimate risk factor parameters, these must be re-estimated on a regular basis. The [BANKING ORGANIZATION] must have clear policies and procedures for backfilling and gap-filling missing data and for updating the sources of data used.

(v) The data to determine the liquidity horizon-adjusted ES-based measure must be reflective of market prices observed or quoted in the period of stress specified in § _____.215(b)(5). The data should be sourced directly from the historical period whenever possible. The [BANKING ORGANIZATION] must empirically justify any instances where the market prices used in the period of stress are different from the market prices actually observed during that period. In cases where market risk covered positions that are currently traded did not exist during a period of significant financial stress, the [BANKING ORGANIZATION] must demonstrate that the prices used match changes in prices or spreads of similar instruments during the stress period.

(vi) The data may include proxies provided the [BANKING ORGANIZATION] can demonstrate to the satisfaction of the [AGENCY] that the proxies are appropriate and that the following standards are satisfied:

(A) There is sufficient evidence demonstrating the appropriateness of the proxies, such as an appropriate track record for their representation of a market risk covered position;

(B) The proxies have sufficiently similar characteristics to the

transactions they represent in terms of volatility level and correlations; and

(C) The proxies are appropriate for the region, credit spread, quality and type of instrument they are intended to represent.

(vii) The [AGENCY] has not determined that the data is unsuitable to calibrate the [BANKING ORGANIZATION]'s ES-based measure.

(3) *Risk factor quantitative test.* To conduct the risk factor quantitative test, a [BANKING ORGANIZATION] must identify real price observations that meet the requirements set forth in paragraph (b)(3)(i) and allocate each real price observation into a bucket for a risk factor, as specified in paragraph (b)(3)(ii). To pass the risk factor quantitative test, a [BANKING ORGANIZATION] must identify real price observations in the bucket corresponding to the risk factor over the prior 12 months equal to or greater than the minimum number of real price observations specified in paragraph (b)(3)(iii).

(i) *Requirements for real price observations.*

(A) A real price is representative of a risk factor provided it can be used by the [BANKING ORGANIZATION] to inform the value of the risk factor.

(B) The [BANKING ORGANIZATION] must not count more than one real price observation in a single day.

(C) When a [BANKING ORGANIZATION] uses real prices from a third-party provider:

(1) The third-party provider must provide a minimum necessary set of identifier information to enable the [BANKING ORGANIZATION] to map real prices observed to risk factors;

(2) The third-party provider that is not a U.S. Government agency, an exchange, or a QCCP must be subject to an audit regarding the validity of its pricing

information and the results and reports of this audit must be made public or available on request to the [BANKING ORGANIZATION], provided that if the audit of a third-party provider is not satisfactory to the [AGENCY], the data from the third-party provider may not be used for purposes of the risk factor quantitative test; and

(3) When the real price observations are provided with a time lag, the period used for the risk factor quantitative test may differ from the period used to calibrate the [BANKING ORGANIZATION]'s ES-based measure, provided that the difference is no greater than one month.

(ii) *Bucketing approaches.* For the risk factor quantitative test, a [BANKING ORGANIZATION] must allocate real price observations into buckets corresponding to risk factors and must count all real price observations allocated to a bucket in order to establish whether the risk factors in the bucket pass the risk factor quantitative test. To allocate real price observations into buckets, the [BANKING ORGANIZATION] must group risk factors on a curve or surface level. Real price observations may be mapped to more than one risk factor. Each bucket may be defined by using either of the bucketing approaches specified in this paragraph (b)(3)(ii).

(A) *Own bucketing approach.* Under this approach, each bucket must include only one risk factor. Each risk factor must correspond to a risk factor included in the risk-theoretical profit and loss of the [BANKING ORGANIZATION].

(B) *Standard bucketing approach.* Under this approach, the [BANKING ORGANIZATION] must use the standard buckets as set out as follows:

(1) For interest rate, foreign exchange and commodity risk factors with a

single maturity dimension (excluding implied volatilities), (t , where t is measured in years), the buckets corresponding to the t values in row (A) of Table 1 to § _____.214 must be used.

(2) For interest rate, foreign exchange and commodity risk factors with several maturity dimensions (excluding implied volatilities) (δ , where δ is measured in years), the buckets corresponding to the δ values in row (B) of Table 1 to § _____.214 must be used.

(3) Credit spread and equity risk factors with one or several maturity dimensions (excluding implied volatilities) (δ , where δ is measured in years), the buckets corresponding to the δ values in row (C) of Table 1 to § _____.214 must be used.

(4) For any risk factors with one or several strike dimensions (the probability that an option is “in the money” at maturity, δ), the buckets corresponding to the δ values in row (D) of Table 1 to § _____.214 must be used.

(5) For expiry and strike dimensions of implied volatility risk factors (excluding those of interest rate swaptions), only the buckets corresponding to the t or δ values in rows (C) and (D), respectively, of Table 1 to § _____.214 must be used.

(6) For maturity, expiry and strike dimensions of implied volatility risk factors from options on swaps, only the buckets corresponding to the t or δ values in row (B), (C) and (D), respectively, of Table 1 to § _____.214 must be used.

(7) For options markets where alternative definitions of moneyness are customary, a [BANKING ORGANIZATION] must convert the standard buckets to the market-standard convention using the [BANKING ORGANIZATION]'s own pricing models.

Table 1 To § __.214—Standard Bucketing Approach: Standard Buckets

Row	Bucket								
	1	2	3	4	5	6	7	8	9
(A)	$0 \leq t < 0.75$	$0.75 \leq t < 1.5$	$1.5 \leq t < 4.0$	$4 \leq t < 7$	$7 \leq t < 12$	$12 \leq t < 18$	$18 \leq t < 25$	$25 \leq t < 35$	$35 \leq t < \infty$
(B)	$0 \leq t < 0.75$	$0.75 \leq t < 4.0$	$4 \leq t < 10$	$10 \leq t < 18$	$18 \leq t < 30$	$30 \leq t < \infty$			
(C)	$0 \leq t < 1.50$	$1.5 \leq t < 3.5$	$3.5 \leq t < 7.5$	$7.5 \leq t < 15$	$15 \leq t < \infty$				
(D)	$0 \leq \delta < 0.05$	$0.05 \leq \delta < 0.3$	$0.3 \leq \delta < 0.7$	$0.7 \leq \delta < 0.95$	$0.95 \leq \delta < 1.00$				

(C) For purposes of the risk factor quantitative test, a real price observation must be counted in a single bucket based on the maturity or based on the probability that an option is “in the money” at maturity associated with the position, provided that real price observations that have been identified within the prior 12 months must be either:

- (1) Counted in the maturity bucket to which they were initially allocated; or
- (2) Re-allocated to the shorter maturity bucket that reflects the market risk covered position’s remaining maturity.

(D) A [BANKING ORGANIZATION] may decompose risks associated with credit or equity indices into systematic risk factors within its internal models designed to capture market-wide movements for a given economy, region or sector.

(iii) *Minimum sufficient number of real price observations.*

(A) The minimum sufficient number of real price observations is 24 if the

liquidity horizon is 10 or 20 days, and 16 otherwise.

(B) Notwithstanding other provisions of this paragraph (b)(3), for new issuances, the observation period for the risk factor quantitative test may begin on the issuance date and the number of real price observations required to pass the risk factor quantitative test may be prorated until 12 months after the issuance date.

(c) *Calibration.* The [BANKING ORGANIZATION] must choose the most appropriate data for modellable risk factors and type A non-modellable risk factors to calibrate the ES-based measure. For the calibration of the ES-based measure, the [BANKING ORGANIZATION] may use different data than the data used to pass the risk factor quantitative test.

§ __.215 The Models-Based Non-Default Capital Requirement

(a) A [BANKING ORGANIZATION] that calculates the models-based non-

default capital requirement must calculate the ES-based measure, the internally modelled capital calculation, *IMCC*, and the stressed expected shortfall, *SES*, in accordance with this section.

(b) *ES-based measure.* Any internal model used by a [BANKING ORGANIZATION] to calculate the ES-based measure must meet the following minimum requirements.

(1) The ES-based measure must be computed for each business day at the trading desk level, at the aggregate level, and on the aggregate for each risk class for all model-eligible trading desks.

(2) The ES-based measure must be calculated using a one-tail, 97.5th percentile confidence level.

(3) A liquidity horizon-adjusted ES-based measure must be calculated from an ES-based measure at a base liquidity horizon of 10 days, with scaling applied to this base horizon result as specified below:

$$ES = \sqrt{\left(ES_T(P)\right)^2 + \sum_{j \geq 2} \left(ES_T(P, j) \sqrt{\frac{(LH_j - LH_{j-1})}{T}}\right)^2}$$

Where:

- (i) *ES* is the liquidity horizon-adjusted ES-based measure;
- (ii) *T* is the length of the base liquidity horizon, 10 days;

- (iii) $ES_T(P)$ is *ES* at base liquidity horizon *T* of a portfolio with market risk covered positions *P*;
- (iv) $ES_T(P, j)$ is the at base liquidity horizon *T* of a portfolio with market risk covered positions *T* for all risk factors whose liquidity horizon is at least as long as the

- liquidity horizon corresponding to the index value *j*, LH_j as specified in Table 1 to § __.215;
- (v) LH_j is the liquidity horizon corresponding to the index value, *j*, specified in Table 1 to § __.215.

Table 1 to § .215—Liquidity Horizons, j

<i>j</i>	<i>LH_j (lengths in days)</i>
1	10
2	20
3	40
4	60
5	120

(4) The time series of changes in risk factors over the base liquidity horizon *T* may be calculated using observations of price differentials from overlapping 10-day periods, provided, a [BANKING ORGANIZATION] must not scale up from a shorter horizon.

(5) *Stress period.* A [BANKING ORGANIZATION] must identify a 12-month period of stress over the observation horizon in which the [BANKING ORGANIZATION]'s model-eligible positions would experience the largest loss, pursuant to policies and procedures approved by the [AGENCY]. Such policies and procedures must:

(i) Base the identification of the period of stress using either the full set of risk factors or a reduced set of risk factors;

(ii) Provide that when using a reduced set of risk factors to identify the period

of stress the [BANKING ORGANIZATION] must:

(A) Specify a reduced set of risk factors for which there is a sufficiently long history of observations that meet requirements of the risk factor qualitative test specified in § .214(b)(2) and for which:

(1) The [BANKING ORGANIZATION] uses data that are reflective of market prices observed or quoted in the historical stress period used by the expected shortfall model and sourced from the historical stress period, when possible;

(2) Where the market prices used for the historical stress period in the expected shortfall calculation differ from the market prices actually observed for that period, the [BANKING ORGANIZATION] empirically justifies the selection of the stress period; and

(3) For model-eligible positions that did not exist during the historical stress period, the [BANKING ORGANIZATION] demonstrates that the prices used match changes in the prices or spreads of instruments that traded during that period and that are similar to the model-eligible positions;

(B) Update the reduced set of risk factors whenever the [BANKING ORGANIZATION] updates its 12-month period of stress; and

(C) Ensure that the variation of the full ES-based measure explained by the ES-based measure for the reduced set of risk factors over the previous 60 business days is at least 75 percent, where, on date *t*, the variation explained equals

$$1 - \frac{\sum_{h=t-60}^{t-1} (ES_{F,C,h} - ES_{R,C,h})^2}{\sum_{h=t-60}^{t-1} (ES_{F,C,h} - \text{Mean}(ES_{F,C}))^2}$$

Where:

- (1) $ES_{F,C,h}$ is the liquidity horizon-adjusted ES-based measure based on the most recent 12-month observation period (the current ES-based measure) using the full set of risk factors calculated at date *h*, which ranges from one day prior to date *t* to 60 days prior to date *t*;
- (2) $ES_{R,C,h}$ is the current liquidity horizon-adjusted ES-based measure using the reduced set of risk factors calculated at date *h*, which ranges from one day prior to date *t* to 60 days prior to date *t*; and
- (3) $\text{Mean}(ES_{F,C})$ is the mean of $ES_{F,C}$ over the previous 60 business days.

(iii) Consider 12-month periods going back to, at a minimum, 2007;

(iv) Equally weight observations within the 12-month period; and

(v) Provide for updating, as appropriate, the 12-month stressed period at least quarterly, or whenever there are material changes in the risk factors in the portfolio.

(6) *Liquidity horizon-adjusted ES-based measure.* A [BANKING ORGANIZATION] must calibrate the liquidity horizon-adjusted ES-based measure to a period of stress for its entire portfolio of model-eligible positions using one of the two approaches set forth in this paragraph (b)(6).

(i) *Direct approach.* A [BANKING ORGANIZATION] using the direct approach must use the full set of risk factors to calculate the liquidity horizon-adjusted ES-based measure,

provided a [BANKING ORGANIZATION] may use proxies to fill in data on missing risk factors in accordance with § .214(b)(2)(vi).

(ii) *Indirect approach.* A [BANKING ORGANIZATION] using the indirect approach must follow the steps below to calculate the liquidity horizon-adjusted ES-based measure:

(A) Calculate a liquidity horizon-adjusted ES-based measure in accordance with paragraph (b)(3) of this section;

(B) Convert the three types of liquidity horizon-adjusted ES-based measures defined below into one liquidity horizon-adjusted ES-based measure, as follows:

$$ES = ES_{R,S} \cdot \max \left(1, \frac{ES_{F,C}}{ES_{R,C}} \right)$$

Where:

- (1) $ES_{R,C}$ is the liquidity horizon-adjusted ES-based measure for the [BANKING ORGANIZATION]'s model-eligible positions using the reduced set of risk factors calculated based on the 12-month period of stress;
- (2) $ES_{F,C}$ is the liquidity horizon-adjusted ES-based measure based on the most recent 12-month observation period (the current ES-based measure) using the full set of risk factors; and
- (3) $ES_{R,C}$ is the liquidity horizon-adjusted ES-based measure for the [BANKING ORGANIZATION]'s model-eligible positions using the reduced set of risk factors.

(7) *Input data.* A [BANKING ORGANIZATION] must update its input data for internal models used to calculate the ES-based measure no less frequently than quarterly and reassess its input data whenever market prices are subject to material changes. This updating process must be flexible enough to allow for updates when warranted by material changes in market prices.

(8) *Risk capture.* Internal models used to calculate the ES-based measure must address non-linearities, as well as correlation and relevant basis risks, such as basis risk between credit default swaps and bonds.

(9) *Empirical correlations.* A [BANKING ORGANIZATION] may recognize empirical correlations within risk classes. Empirical correlations across risk classes are constrained by the aggregation scheme as described in paragraph (c) of this section.

(10) *Options.* With respect to options, a [BANKING ORGANIZATION]'s internal models used to calculate the ES-based measure must:

(i) Capture the risks associated with options, including non-linear price characteristics, within each of the risk classes;

(ii) Have a set of risk factors that captures the volatilities of the underlying rates and prices of options; and

(iii) Model the volatility surface across both strike price and maturity.

(11) *Assignment of liquidity horizons.* At a minimum on a quarterly basis, a [BANKING ORGANIZATION] must map each of its risk factors to one of the risk factor categories and corresponding liquidity horizons, n , in Table 2 to § _____.215 and must assign a liquidity horizon of 10, 20, 40, 60, or 120 days to each of its risk factors, in accordance with the requirements of this paragraph (b)(11).

(i) A [BANKING ORGANIZATION] must assign a liquidity horizon to a risk factor on a particular trading desk, which must be greater than or equal to the minimum liquidity horizon corresponding to the value, n , for the risk factor category in Table 2 to § _____.215, unless otherwise specified in paragraphs (b)(11)(ii) and (iii) of this section.

(ii) If the maturity of a market risk covered position is shorter than the respective liquidity horizon, n , of the risk factor category as set forth in Table 2 to § _____.215, the minimum liquidity horizon is the next longer liquidity horizon, n , from the maturity of the market risk covered position.

(iii) The minimum liquidity horizon for credit and equity indices and other similar multi-underlying instruments must be the shortest liquidity horizon, n , that is equal to or longer than the weighted average of the liquidity horizons of the underlyings, calculated by multiplying the respective liquidity horizon, n , of the risk factor category as set forth in Table 2 to § _____.215 of each individual underlying by its weight in the index and summing the weighted liquidity horizons across all underlyings.

¹ Any currency pair formed by the following list of currencies: United States Dollar, Australian Dollar, Brazilian Real, Canadian Dollar, Chinese Yuan, Euro, Hong Kong Dollar, Indian Rupee,

Japanese Yen, Mexican Peso, New Zealand Dollar, Norwegian Krone, Singapore Dollar, South African Rand, South Korean Won, Swedish Krona, Swiss Franc, Turkish Lira, United Kingdom Pound, and

any additional currencies specified by the [AGENCY] under § _____.209(b)(7)(ii).

Table 2 to § __.215—Liquidity Horizon n by Risk Factor Category

Risk factor category	n	Risk factor category	n
Interest rate and inflation: United States Dollar, Australian Dollar, Canadian Dollar, Euro, Japanese Yen, Swedish Krona, and United Kingdom Pound and the domestic currency of a [BANKING ORGANIZATION]	10	Equity (small market cap): volatility	60
Interest rate and inflation: unspecified currencies	20	Equity: other types	60
Interest rate: volatility	60	Foreign exchange rate: specified currency pairs ¹	10
Interest rate: other types	60	Foreign exchange rate: currency pairs	20
Credit spread: sovereign exposures, MDBs, and specified supranational entities (investment grade)	20	Foreign exchange: volatility	40
Credit spread: sovereign exposures, MDBs, and specified supranational entities (speculative grade and sub- speculative grade)	40	Foreign exchange: other types	40
Credit spread: GSE debt	40		
Credit spread: corporate positions (investment grade)	40	Energy and carbon emissions trading price	20
Credit spread: corporate positions (speculative grade and sub-speculative grade)	60	Precious metals and non-ferrous metals price	20
Credit spread: volatility	120	Other commodities	60
Credit spread: other types	120	Energy and carbon emissions trading price: volatility	60
Equity (large market cap or index)	10	Precious metals and non-ferrous metals price: volatility	60
Equity (small market cap)	20	Other commodities: volatility	120
Equity (large market cap or index): volatility	20	Commodity: other types	120

(c) *Internally modelled capital calculation.* A [BANKING ORGANIZATION] must calculate an internally modelled capital calculation,

IMCC, on each business day in accordance with the below:
(1) For all model-eligible trading desks, a [BANKING ORGANIZATION] must include in its internal models used to calculate the aggregate liquidity

horizon-adjusted ES-based measure all modellable risk factors and type A non-modellable risk factors.
(2) The [BANKING ORGANIZATION] must calculate its aggregate liquidity horizon-adjusted ES-based measure,

$IMCC(C)$, using the liquidity horizon-adjusted ES-based measure specified in paragraph (b) of this section, with no supervisory constraints on cross-risk class correlations.

(3) The [BANKING ORGANIZATION] must also calculate a series of partial liquidity horizon-adjusted ES-based measures (with risk factors of all other

risk classes held constant) for each risk class using the liquidity horizon-adjusted ES-based measure specified in paragraph (b) of this section. These partial, non-diversifiable liquidity horizon-adjusted ES-based measures, $IMCC(C_i)$, must be summed to provide an aggregated risk class ES-based

measure. The stress period used to calculate $IMCC(C)$ and $IMCC(C_i)$ must be the same.

(4) The internally modelled capital calculation, $IMCC$, must be calculated as the weighted average of the constrained and unconstrained ES-based measures as follows:

$$IMCC = \omega(IMCC(C)) + (1 - \omega) \left(\sum_i IMCC(C_i) \right)$$

Where:

- (i) w equals 0.5;
- (ii) i is the index of risk classes, which are the following: interest rate risk, credit spread risk, equity risk, commodity risk and foreign exchange risk;
- (iii) $IMCC(C)$ equals the aggregate liquidity horizon-adjusted ES-based measure specified in paragraph (c)(2) of this section; and
- (iv) $IMCC(C_i)$ equals the partial liquidity horizon-adjusted ES-based measure specified in paragraph (c)(3) of this section for risk class i .

(d) *Stressed expected shortfall.* (1)

General. A [BANKING ORGANIZATION] must calculate a stressed expected shortfall, SES , that meets the following requirements:

(i) The [BANKING ORGANIZATION] must calculate a capital measure for each non-modellable risk factor using a stress scenario that is calibrated to be at least as conservative as the ES-based measure, as described in paragraph (b),

used for the internally modelled capital calculation, as described in paragraph (c), provided that:

(A) To determine the applicable stress scenario, the [BANKING ORGANIZATION] must select a common 12-month period of stress for all non-modellable risk factors in the same risk class,

(B) In determining the stress scenario, a [BANKING ORGANIZATION] may use proxies, provided the proxies meet the standards in § _____.214(b)(2)(vi),

(C) Methodologies used to calculate any stressed expected shortfall must address non-linearities, as well as correlation and relevant basis risks, such as basis risk between credit default swaps and bonds; and

(D) For each non-modellable risk factor, the liquidity horizon of the stress scenario must be the greater of (1) the risk factor's liquidity horizon assigned

pursuant to paragraph (b)(1) of this section and (2) 20 days; and

(E) When the [BANKING ORGANIZATION] cannot determine a stress scenario capital measure for any risk factor under paragraph (d)(1)(i) of this section, the [BANKING ORGANIZATION] must use the scenario capital requirement that produces the maximum possible loss for each risk factor as the stress scenario capital requirement, for purposes of calculating the stressed expected shortfall.

(ii) Notwithstanding paragraph (d)(i) of this section, with approval of the [AGENCY], a [BANKING ORGANIZATION] also may use an alternative approach to determine the stress scenario.

(2) *Stressed expected shortfall calculation.* A [BANKING ORGANIZATION] must calculate the stressed expected shortfall, SES , for all non-modellable risk factors, as follows:

$$SES = \sqrt{\left(\sum_{k=1}^K SES_{NM,k}^2 \right) + \left((1 - \rho_b) \sum_{j=1}^J SES_{NM,j}^2 + \rho_b \left(\sum_{j=1}^J SES_{NM,j} \right)^2 \right)}$$

Where:

- (i) $SES_{NM,k}$ is the stress scenario capital measure for the type A non-modellable risk factor k ;
- (ii) K is the number of type A non-modellable risk factors;
- (iii) ρ_b is 0.36;
- (iv) $SES_{NM,j}$ is the stress scenario capital measure for the type B non-modellable risk factor j ; and
- (v) J is the number of type B non-modellable risk factors.

§ _____.216 [RESERVED]

§ _____.217 Market Risk Reporting and Disclosures

(a) *Scope.* Paragraphs (b) through (f) of this section apply to [BANKING ORGANIZATIONS] subject to the market risk capital requirements as described in § _____.201(b)(1) and paragraphs (b) through (e) and (g) of this section apply to [BANKING ORGANIZATIONS] subject to the CVA risk-based capital requirements as described in § _____.201(b)(2), provided that a [BANKING ORGANIZATION] that is a consolidated subsidiary of a bank

holding company, a covered savings and loan holding company that is a banking organization as defined in 12 CFR 238.2, or a depository institution that is subject to these requirements or of a non-U.S. banking organization that is subject to comparable public disclosure requirements in its home jurisdiction is not required to make the disclosures required by paragraphs (f) or (g) of this section.

(b) *Timing.* A [BANKING ORGANIZATION] must make the reports and disclosures described herein beginning on [THE FIRST DATE OF THE QUARTER THE RULE TAKES

EFFECT]. A [BANKING ORGANIZATION] must make timely public reports and disclosures each calendar quarter. If a significant change occurs, such that the most recent reporting amounts are no longer reflective of the [BANKING ORGANIZATION]'s capital adequacy and risk profile, then a brief discussion of this change and its likely impact must be provided in a public disclosure as soon as practicable thereafter. Qualitative disclosures that typically do not change each quarter may be disclosed annually, provided any significant changes are disclosed in the interim.

(c) *Reporting and disclosure policy.* The [BANKING ORGANIZATION] must have a formal reporting and disclosure policy approved by the board of directors that addresses the [BANKING ORGANIZATION]'s approach for determining its market risk and CVA risk reports and disclosures. The policy must address the associated internal controls and reporting and disclosure controls and procedures. The board of directors and senior management must ensure that appropriate verification of the reports and disclosures takes place and that effective internal controls and reporting and disclosure controls and procedures are maintained. One or more senior officers of the [BANKING ORGANIZATION] must attest that the reports and disclosures meet the requirements of this subpart F, and the board of directors and senior management are responsible for establishing and maintaining an effective internal control structure over financial reporting, including the reports and disclosures required by this section.

(d) *Proprietary and confidential information.* If a [BANKING ORGANIZATION] reasonably believes that reporting or disclosure of specific commercial or financial information would materially prejudice its position by making public certain information that is either proprietary or confidential in nature, the [BANKING ORGANIZATION] is not required to publicly report or disclose these specific items, but must report or disclose more general information about the subject matter of the requirement, together with the fact that, and the reason why, the specific items of information have not been disclosed.

(e) *Location.* The [BANKING ORGANIZATION] must either provide all of the public reports and disclosures required by this section in one place on the [BANKING ORGANIZATION]'s public website or provide the reporting and disclosures in more than one public

financial report or other public regulatory reports, provided that the [BANKING ORGANIZATION] publicly provides a summary table specifically indicating the location(s) of all such reporting and disclosures.

(f) *Market risk disclosures and reports—(1) Quarterly public disclosures.* A [BANKING ORGANIZATION] must disclose publicly the following information at least quarterly:

(i) The aggregate amount of on-balance sheet and off-balance sheet securitization positions by exposure type;

(ii) The soundness criteria on which the [BANKING ORGANIZATION]'s internal capital adequacy assessment is based and a description of each methodology used to achieve a capital adequacy assessment that is consistent with the required soundness criteria, including, for a [BANKING ORGANIZATION] that calculates the models-based measure for market risk, for categories of non-modellable risk factors;

(iii) The aggregate amount of correlation trading positions; and

(iv) For a [BANKING ORGANIZATION] that calculates the models-based measure for market risk, a comparison of VaR-based estimates with actual gains or losses experienced by the [BANKING ORGANIZATION] for each material portfolio of market risk covered positions, including an analysis of important outliers.

(2) *Annual public disclosures.* A [BANKING ORGANIZATION] must provide timely public disclosures of the following information at least annually:

(i) A description of the structure and organization of the market risk management system, including a description of the market risk governance structure established to implement the strategies and processes of the [BANKING ORGANIZATION] described in this paragraph (f);

(ii) A description of the policies and processes for determining whether a position is designated as a market risk covered position and the risk management policies for monitoring market risk covered positions;

(iii) The composition of material portfolios of market risk covered positions;

(iv) A description of the scope and nature of risk reporting and/or measurement systems and the strategies and processes implemented by the [BANKING ORGANIZATION] to identify, measure, monitor and control the [BANKING ORGANIZATION]'s market risks, including policies for hedging;

(v) A description of the trading desk structure and the types of market risk covered positions included on the trading desks or in trading desk categories, which must include:

(A) A description of the model-eligible trading desks for which a [BANKING ORGANIZATION] calculates the models-based non-default capital requirement; and

(B) Any changes in the scope of model-ineligible trading desks and the market risk covered positions on those trading desks.

(vi) The [BANKING ORGANIZATION]'s valuation policies, procedures, and methodologies for each material portfolio of market risk covered positions including, for securitization positions, the methods and key assumptions used for valuing such securitization positions, any significant changes since the last reporting period, and the impact of such change;

(vii) The characteristics of the internal models used for purposes of calculating the models-based measure for market risk and the specific approaches used in the validation of these models. For the models-based non-default capital requirement, this must include a general description of the model(s) used to calculate the ES-based measure in § _____.215(b), the frequency by which data is updated, and a description of the calculation based on current and stressed observations.

(viii) A description of the approaches used for validating and evaluating the accuracy of internal models and modeling processes for purposes of this subpart F;

(ix) For each market risk category (that is, interest rate risk, credit spread risk, equity risk, foreign exchange risk, and commodity risk), a description of the stress tests applied to the market risk covered positions subject to the category;

(x) The results of the comparison of the [BANKING ORGANIZATION]'s internal estimates for purposes of this subpart F with actual outcomes during a sample period not used in model development;

(xi) A description of the [BANKING ORGANIZATION]'s processes for monitoring changes in the credit and market risk of securitization positions, including how those processes differ for res securitization positions; and

(xii) A description of the [BANKING ORGANIZATION]'s policy governing the use of credit risk mitigation to mitigate the risks of securitization positions and res securitization positions.

(3) *Public reports.* A [BANKING ORGANIZATION] subject to the market risk capital requirements as described in

§ ___.201(b)(1) must provide, in the manner and form prescribed by the [AGENCY], a public report of its measure for market risk, on a quarterly basis. A [BANKING ORGANIZATION] must report additional information and reports as the [AGENCY] may require.

(4) *Confidential supervisory reports.*

(i) A [BANKING ORGANIZATION] that calculates the models-based measure for market risk must provide to the [AGENCY], in the manner and form prescribed by the [AGENCY], a confidential supervisory report of backtesting and PLA testing information, on a quarterly basis.

(ii) A [BANKING ORGANIZATION] must report to the [AGENCY] the following information at the aggregate level for all model-eligible trading desks for each business day over the previous 500 business days, or all available business days, if 500 business days are not available, with no more than a 20-day lag:

(A) Daily VaR-based measures calibrated to the 99.0th percentile as described in § ___.204(g)(1);

(B) Daily ES-based measure calculated in accordance with § ___.215(b) calibrated at the 97.5th percentile;

(C) The actual profit and loss;

(D) The hypothetical profit and loss;

and

(E) The p-value of the profit or loss on each day, which is the probability of observing a profit that is less than, or a loss that is greater than, the amount reported for purposes of paragraph (f)(4)(ii)(C) of this section based on the model used to calculate the VaR-based measure described in paragraph (f)(4)(ii)(A) of this section.

(iii) A [BANKING ORGANIZATION] must report to the [AGENCY] the following information for each trading desk for each business day over the previous 500 business days, or all available business days, if 500 business days are not available, with no more than a 20-day lag:

(A) Daily VaR-based measures for the trading desk calibrated at both the 97.5th percentile and the 99.0th percentile as described in § ___.213(b)(1);

(B) Daily ES-based measure calculated in accordance with § ___.215(b) calibrated at the 97.5th percentile;

(C) The actual profit and loss;

(D) The hypothetical profit and loss;

(E) Risk-theoretical profit and loss; and

(F) The p-values of the profit or loss on each day (that is, the probability of observing a profit that is less than, or a loss that is greater than, the amount reported for purposes of paragraph (f)(4)(iii)(C) of this section based on the model used to calculate the VaR-based measure described in paragraph (f)(4)(iii)(A) of this section).

(g) *CVA risk disclosures and reports—*
(1) *Risk management-related disclosure requirements.* Except as provided in paragraphs (a) and (d) of this section, a [BANKING ORGANIZATION] subject to the CVA risk-based capital requirements as described in § ___.201(b)(2) must make the disclosures described in Tables 1 and 2 to § ___.217. The [BANKING ORGANIZATION] must make these disclosures publicly available for each of the last twelve quarters, or such shorter period beginning in the quarter in which the [BANKING ORGANIZATION] becomes subject to subpart F of this part.

Table 1 to § __.217—General Qualitative Disclosure Requirements Related To CVA

Qualitative Disclosures	The [BANKING ORGANIZATION] must describe its risk management objectives and policies for CVA risk as follows:
	(a) An explanation and/or a description of the [BANKING ORGANIZATION]'s processes implemented to identify, measure, monitor and control the [BANKING ORGANIZATION]'s CVA risks, including policies for hedging CVA risk and the processes for monitoring the continuing effectiveness of hedges.

Table 2 to § __.217—Qualitative Disclosures for Banks Using the SA-CVA

Qualitative Disclosures	The [BANKING ORGANIZATION] must provide the following information on its CVA risk management framework:
	(a) A description of the [BANKING ORGANIZATION]'s CVA risk management framework.
	(b) A description of how senior management is involved in the CVA risk management framework.
	An overview of the governance of the CVA risk management framework (e.g.,
	(c) documentation, independent risk control unit, independent review, independence of the data acquisition from the lines of business).

CVA Risk-Based Capital Requirements
§ ___.220 General Requirements for CVA Risk

(a) *Identification of CVA risk covered positions and eligible CVA hedges.* A [BANKING ORGANIZATION] must:

(1) Identify all CVA risk covered positions and all transactions that hedge or are intended to hedge CVA risk;

(2) Identify all eligible CVA hedges and ineligible CVA hedges; and

(3) For a [BANKING ORGANIZATION] that has approval to

use the standardized measure for CVA risk, identify all eligible CVA hedges for the purposes of calculating the basic CVA approach capital requirement and all eligible CVA hedges for the purpose of calculating the standardized CVA approach capital requirement.

(b) *CVA hedging policy.* A [BANKING ORGANIZATION] that hedges its CVA risk must have a clearly defined hedging policy for CVA risk that is reviewed and approved by senior management at least annually. The hedging policy must quantify the level of CVA risk that the [BANKING ORGANIZATION] is willing to accept and must detail the instruments, techniques, and strategies that the [BANKING ORGANIZATION] will use to hedge CVA risk.

(c) *Documentation.* A [BANKING ORGANIZATION] must have policies and procedures for determining its CVA risk-based capital requirement. A [BANKING ORGANIZATION] must adequately document all material aspects of its identification and management of CVA risk covered positions and eligible CVA hedges, and control, oversight, and review processes. A [BANKING ORGANIZATION] that calculates the standardized measure for CVA risk must adequately document:

- (1) Policies and procedures of the CVA desk, or similar dedicated function, and the independent risk control unit;
- (2) The internal auditing process;
- (3) The internal policies, controls, and procedures concerning the [BANKING ORGANIZATION]'s CVA calculations for financial reporting purposes;
- (4) The initial and ongoing validation of the [BANKING ORGANIZATION]'s models used for calculating regulatory CVA under § ___.224(d), including exposure models; and
- (5) The [BANKING ORGANIZATION]'s process to assess the performance of models used for calculating regulatory CVA under § ___.224(d), including exposure models, and implement remedies.

§ ___.221 Measure for CVA Risk

(a) *General requirements.* A [BANKING ORGANIZATION] must calculate its measure for CVA risk as the basic measure for CVA risk in accordance with paragraph (b) of this section, unless the [BANKING ORGANIZATION] has prior approval of the [AGENCY] and chooses to calculate its measure for CVA risk as the standardized measure for CVA risk in accordance with paragraph (c) of this section.

(b) *Basic measure for CVA risk.* The basic measure for CVA risk equals the basic CVA approach capital requirement as provided in § ___.222 for all CVA risk covered positions and eligible CVA hedges, plus any additional capital requirement for CVA risk established by the [AGENCY] pursuant to § ___.201(c).

(c) *Standardized measure for CVA risk.* The standardized measure for CVA risk equals the sum of the standardized CVA approach capital requirement as provided in paragraph (c)(1) of this section for all standardized CVA risk covered positions and standardized CVA hedges, the basic CVA approach capital requirement as provided in § ___.222 for all basic CVA risk covered positions and basic CVA hedges, and any additional capital requirement for CVA risk established by the [AGENCY] pursuant to § ___.201(c).

(1) The standardized CVA approach capital requirement equals the sum of the CVA delta capital requirement and the CVA vega capital requirement as calculated in accordance with § ___.224.

(2) A [BANKING ORGANIZATION] that has received approval from the [AGENCY] to use the standardized measure for CVA risk must include the following CVA risk covered positions as basic CVA risk covered positions to be

included in the calculation of the basic CVA approach capital requirement:

(i) Any CVA risk covered position that the [AGENCY] specifies must be included in the basic CVA approach capital requirement pursuant to § ___.223(a)(1);

(ii) Any CVA risk covered position in a netting set that the [BANKING ORGANIZATION] chooses to exclude from the calculation of the standardized CVA approach capital requirement; and

(iii) Any CVA risk covered position in a partial netting set designated for inclusion in the basic CVA approach.

(3) A [BANKING ORGANIZATION] that has received approval from the [AGENCY] to use the standardized measure for CVA risk must include the following eligible CVA hedges as basic CVA hedges to be included in the calculation of the basic CVA approach capital requirement:

(i) Any eligible CVA hedge that the [AGENCY] specifies must be included in the basic CVA approach capital requirement pursuant to § ___.223(a)(1); and

(ii) Any CVA hedge that is an eligible CVA hedge for purposes of calculating the basic CVA approach capital requirement that the [BANKING ORGANIZATION] chooses to include in the basic CVA approach capital requirement.

§ ___.222 Basic CVA Approach

(a) *Basic CVA approach capital requirement.* The basic CVA approach capital requirement equals K_{basic} , which is calculated as follows:

$$K_{basic} = 0.65 \cdot (\beta \cdot K_{unhedged} + (1 - \beta) \cdot K_{hedged})$$

Where:

- (1) The parameter, β , equals 0.25;
- (2) $K_{unhedged}$ is calculated as follows:

$$K_{unhedged} = \sqrt{\left(\rho \cdot \sum_c SCVA_c\right)^2 + (1 - \rho^2) \cdot \sum_c SCVA_c^2}$$

Where:

- (i) The correlation parameter, ρ , equals 50 percent;

(ii) $\sum_c ()$ refers to a summation across all counterparties, c , of CVA risk covered positions;

(iii) $SCVA_c$ is equal to:

$$SCVA_c = \frac{1}{\alpha} \cdot RW_c \cdot \sum_{NS} (M_{NS} \cdot EAD_{NS} \cdot DF_{NS})$$

Where:

(A) α equals:

- (1) 1 for counterparties for which the [BANKING ORGANIZATION]

calculates exposure amount under § ___.114(e)(4); and

- (2) 1.4 for all other counterparties.
- (B) $\Sigma_{NS}(\)$ refers to a summation across all netting sets with the counterparty;
- (C) M_{NS} is the effective maturity for the netting set, NS , measured in years, calculated as the weighted-average remaining maturity of the individual CVA risk covered positions within the netting set, with the weight of each individual position equal to the notional amount of the position divided by the aggregate notional amount of all positions in the netting set;
- (D) EAD_{NS} is the EAD of the netting set, NS , which must be determined using the same methodology it uses to calculate the exposure amount for counterparty credit risk for its OTC derivative contracts under § _____.34 or §§ _____.113 through _____.114, as applicable;

(E) DF_{NS} is a discount factor equal to $\frac{1-e^{-0.05 \cdot M_{NS}}}{0.05 \cdot M_{NS}}$; and

- (F) RW_c is the risk weight for counterparty c , based on the sector and credit quality of the counterparty, as specified in Table 1 to § _____.222.

Table 1 to § _____.222—Supervisory Risk Weights, RW_c

Sector of counterparty	Credit quality of counterparty		
	Investment grade	Speculative grade / sub-speculative grade	
Sovereign exposures, MDBs, and specified supranational entities	0.5%	3.0%	7.0%
PSEs, government-backed non-financials, GSEs, education, and public administration	1.0%	4.0%	
Financials, including government-backed financials	5.0%	12.0%	
Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	3.0%	7.0%	
Consumer goods and services, transportation and storage, and administrative and support service activities	3.0%	8.5%	
Technology and telecommunications	2.0%	5.5%	
Health care, utilities, and professional and technical activities	1.5%	5.0%	
Other sector	5.0%	12.0%	

- (3) K_{hedged} is calculated as follows:

$$K_{hedged} = \sqrt{\left(\rho \cdot \sum_c (SCVA_c - SNH_c) - IH\right)^2 + (1 - \rho^2) \cdot \sum_c (SCVA_c - SNH_c)^2 + \sum_c HMA_c}$$

Where:

- (i) The correlation parameter, ρ , is defined in paragraph (a)(2)(i) of this section;
- (ii) $\Sigma_c(\)$ refers to a summation across all counterparties, c , of CVA risk covered positions, $SCVA_c$, as defined in paragraph (a)(2)(iii) of this section;
- (iii) SNH_c is calculated as follows:

$$SNH_c = \sum_{h \in c} (r_{hc} \cdot RW_h \cdot M_h^{SN} \cdot B_h^{SN} \cdot DF_h^{SN})$$

Where:

(A) $\sum_{h \in c} ()$ refers to a summation across all single-name eligible CVA hedges, h , that the [BANKING ORGANIZATION] uses to hedge the CVA risk of counterparty, c ;

(B) r_{hc} is the correlation between the credit spread of counterparty, c , and the credit spread of a single-name hedge, h , of counterparty, c , as specified in Table 2 to § _____.222;

(C) RW_h is the risk weight of single-name hedge, h , as prescribed in Table 1 to § _____.222, for the sector and credit quality of the reference name of the hedge;

(D) M_h^{SN} is the remaining maturity of single-name hedge, h , measured in years;

(E) B_h^{SN} is the notional amount of single-name hedge, h , provided that, for single-name contingent CDS, the notional amount is determined by the current market value of the reference portfolio or instrument; and

(F) DF_h^{SN} is the discount factor and is calculated as $\frac{1 - e^{(-0.05 \cdot M_h^{SN})}}{0.05 \cdot M_h^{SN}}$.

Table 2 to § _____.222—Correlations Between Credit Spread of Counterparty, c , and a Single-Name Hedge, h

Single-name hedge, h , of counterparty, c	Value of r_{hc}
References counterparty, c , directly	100%
References an affiliate of counterparty, c	80%
References an entity that belongs to the same sector and region as the counterparty, c	50%

(iv) IH is calculated as follows:

$$IH = \sum_i (RW_i \cdot M_i^{ind} \cdot B_i^{ind} \cdot DF_i^{ind})$$

Where:

(A) $\sum_i ()$ refers to a summation across all eligible CVA hedges that are index hedges, i , that the [BANKING ORGANIZATION] uses to hedge CVA risk;

(B) RW_i is the risk weight of the index hedge, i , as follows:

(1) For an index hedge where all index constituents belong to the same sector and are of the same credit quality, the value in Table 1 to § _____.222 corresponding to that sector and credit quality, multiplied by 0.7; or

(2) For an index spanning multiple sectors or with a mixture of investment grade constituents and other grade constituents, the notional-weighted average of the risk weights from Table 1 to § _____.222 corresponding to the sectors and credit qualities of the constituents, multiplied by 0.7;

(C) M_i^{ind} is the remaining maturity of the index hedge, i , measured in years;

(D) B_i^{ind} is the notional amount of the index hedge, i ; and

(E) DF_i^{ind} is the discount factor and is calculated as $\frac{1 - e^{(-0.05 \cdot M_i^{ind})}}{0.05 \cdot M_i^{ind}}$; and

(v) HMA_c is calculated as follows where all terms have the same definitions

as set out in paragraph (a)(3)(iii) of this section:

$$HMA_c = \sum_{h \in c} \left((1 - r_{hc}^2) \cdot (RW_h \cdot M_h^{SN} \cdot B_h^{SN} \cdot DF_h^{SN})^2 \right)$$

(b) [Reserved]

§ _____.223 Requirements for the Standardized Measure for CVA Risk

(a) *Eligibility requirements.* (1) A [BANKING ORGANIZATION] must receive approval of the [AGENCY] prior to using the standardized measure for CVA risk for calculating CVA capital requirements. Such approval may specify certain CVA risk covered positions and eligible CVA hedges that must be included in the calculation of the basic CVA approach capital requirement. In order to be eligible to use the standardized measure for CVA risk, a [BANKING ORGANIZATION] must meet the following requirements:

(i) A [BANKING ORGANIZATION] must be able to calculate, on at least a monthly basis, regulatory CVA and CVA sensitivities to market risk factors and counterparty credit spreads specified in § _____.224 and § _____.225;

(ii) A [BANKING ORGANIZATION] must have a CVA desk, or a similar dedicated function, responsible for CVA risk management and hedging consistent with the [BANKING ORGANIZATION]'s policies and procedures;

(iii) A [BANKING ORGANIZATION] must determine the EAD for derivative contracts using the standardized approach for counterparty credit risk as specified in § _____.114; and

(iv) A [BANKING ORGANIZATION] must meet all of the requirements listed in paragraph (b) of this section and the requirements in § _____.220(c) on an ongoing basis.

(2) The [AGENCY] may rescind its approval of the use of the standardized measure for CVA risk (in whole or in part), if the [AGENCY] determines that the model no longer complies with this subpart or fails to reflect accurately the CVA risk of the [BANKING

ORGANIZATION]'s CVA risk covered positions.

(3) The [AGENCY] may specify that one or more CVA risk covered positions or one or more eligible CVA hedges must be included in the basic CVA approach capital requirement or prescribe an alternative capital requirement, if the [AGENCY] determines that the [BANKING ORGANIZATION]'s implementation of the standardized CVA approach capital requirement no longer complies with this subpart F or fails to reflect accurately the CVA risk.

(b) *Ongoing requirements.* (1) Exposure models used in the calculation of regulatory CVA under § _____.224(d) must be part of a CVA risk management framework that includes the identification, measurement, management, approval, and internal reporting of CVA risk.

(2) Senior management must have oversight of the risk control process.

(3) A [BANKING ORGANIZATION] must have an independent risk control unit that is responsible for the effective initial and ongoing validation (no less than annual) of the models used for calculating regulatory CVA under § _____.224(d), including exposure models. This unit must be independent from the business unit that evaluates counterparties and sets limits, a [BANKING ORGANIZATION]'s trading desks, and the CVA desk, or similar dedicated function, and must report directly to senior management of the [BANKING ORGANIZATION].

(4) A [BANKING ORGANIZATION] must document the process for initial and ongoing validation of its models used for calculating regulatory CVA under § _____.224(d), including exposure models, which must recreate the analysis, to a level of detail that would enable a third party to understand how the models operate, their limitations,

and their key assumptions. This documentation must set out the minimum frequency (no less than annual) with which ongoing validation will be conducted as well as other circumstances (such as a sudden change in market behavior) under which additional validation must be conducted more frequently. In addition, the documentation must sufficiently describe how the validation is conducted with respect to data flows and portfolios, what analyses are used, and how representative counterparty portfolios are constructed.

(5) A [BANKING ORGANIZATION] must test the pricing models used to calculate exposure for given paths of market risk factors against appropriate independent benchmarks for a wide range of market states as part of the initial and ongoing model validation process. A [BANKING ORGANIZATION]'s pricing models for options must account for the non-linearity of option value with respect to market risk factors.

(6) An independent review of the overall CVA risk management process must be conducted as part of the [BANKING ORGANIZATION]'s own regular internal auditing process. This review must include both the activities of the CVA desk, or similar dedicated function, and of the independent risk control unit.

(7) A [BANKING ORGANIZATION] must define criteria on which to assess the exposure models and their inputs and have a written policy in place to describe the process to assess the performance of exposure models and remedy unacceptable performance.

(8) A [BANKING ORGANIZATION]'s exposure models must capture transaction-specific information in order to aggregate exposures at the level of the netting set. A [BANKING ORGANIZATION] must verify that

transactions are assigned to the appropriate netting set within the model.

(9) A [BANKING ORGANIZATION]'s exposure models must reflect transaction terms and specifications accurately. The terms and specifications must reside in a secure database that is subject to formal and periodic audit no less than annually. The transmission of transaction terms and specifications data to the exposure model must also be subject to internal audit, and formal reconciliation processes must be in place between the internal model and source data systems to verify on an ongoing basis that transaction terms and specifications are being reflected correctly or at least conservatively.

(10) A [BANKING ORGANIZATION] must acquire current and historical market data that are either independent of the lines of business or validated independently from the lines of business and be compliant with applicable accounting standards. The data must be input into the exposure models in a timely and complete fashion, and maintained in a secure database subject to formal and periodic audit. A [BANKING ORGANIZATION]

must also have a well-developed data integrity process to handle the data of erroneous and anomalous observations. In the case where an exposure model relies on proxy market data, a [BANKING ORGANIZATION] must set internal policies to identify suitable proxies and the [BANKING ORGANIZATION] must demonstrate empirically on an ongoing basis that the proxy provides a conservative representation of the underlying risk under adverse market conditions.

§ ___.224 Calculation of the Standardized CVA Approach

(a) *General.* A [BANKING ORGANIZATION] must calculate the CVA delta capital requirement pursuant to paragraph (b) of this section and the CVA vega capital requirement pursuant to paragraph (c) of this section, in both cases for all standardized CVA risk covered positions and for the market value of all standardized CVA hedges, in accordance with the requirements set forth below.

(1) For each standardized CVA risk covered position and standardized CVA hedge, a [BANKING ORGANIZATION] must identify all of the relevant risk

factors as described in § ___.225 for which it will calculate sensitivities for delta risk and vega risk as described in paragraphs (b) and (c) of this section. A [BANKING ORGANIZATION] must also identify the corresponding buckets related to these risk factors as described in § ___.225.

(2) A [BANKING ORGANIZATION] must assign a standardized CVA hedge that mitigates credit spread delta risk either to the counterparty credit spread risk class or to the reference credit spread risk class.

(b) *CVA delta capital requirement.* (1) General. The CVA delta capital requirement equals the sum of the risk class-level CVA delta capital requirements calculated pursuant to paragraph (b)(4) of this section for each of the following six risk classes:

- (i) Interest rate risk;
- (ii) Foreign exchange risk;
- (iii) Counterparty credit spread risk;
- (iv) Reference credit spread risk;
- (v) Equity risk; and
- (vi) Commodity risk.

(2) *Net weighted sensitivity calculation.* For each risk factor, k , specified in § ___.225(a), a [BANKING ORGANIZATION] must:

(i) Calculate the CVA delta sensitivity of aggregate regulatory CVA to the risk factor,

S_k^{CVA} , and the CVA delta sensitivity of the aggregate market value of standardized CVA hedges

to the risk factor, S_k^{Hdg} , pursuant to paragraph (e) of this section.

(ii) Calculate the weighted CVA delta sensitivity to the risk factor, WS_k^{CVA} , and the

weighted hedge delta sensitivity to the risk factor, WS_k^{Hdg} , by multiplying S_k^{CVA} and S_k^{Hdg} ,

respectively, by the corresponding risk weight, RW_k , specified in § ___.225(a):

$$WS_k^{CVA} = RW_k \cdot S_k^{CVA}$$

$$WS_k^{Hdg} = RW_k \cdot S_k^{Hdg}$$

(iii) Calculate the net weighted delta sensitivity, WS_k , by subtracting the weighted hedge

delta sensitivity, WS_k^{Hdg} , from the weighted CVA delta sensitivity, WS_k^{CVA} :

$$WS_k = WS_k^{CVA} - WS_k^{Hdg}$$

(3) *Within bucket aggregation.* For each bucket, b , as provided in

§ ___.225(a), a [BANKING ORGANIZATION] must calculate the

bucket-level CVA delta capital requirement, k_b , by aggregating the net

weighted delta sensitivities for each risk factor in a bucket, b , using the buckets and correlation parameters, ρ_{kl} , applicable to each risk class as specified in § _____.225(a), as follows:

$$K_b = \sqrt{\sum_{k \in b} WS_k^2 + \sum_{k \in b} \sum_{l \in b, l \neq k} (\rho_{kl} \cdot WS_k \cdot WS_l) + R \cdot \sum_{k \in b} (WS_k^{Hdg})^2}$$

Where:
 R is the hedging disallowance parameter equal to 0.01.

(4) *Across bucket aggregation.* A [BANKING ORGANIZATION] must

calculate the risk class-level CVA delta capital requirement, K , by aggregating the bucket-level CVA delta capital requirements, K_b , for each bucket in the risk class using the correlation

parameters, γ_{bc} , applicable to each risk class as specified in § _____.225(a), as follows:

$$K = m_{CVA} \cdot \sqrt{\sum_b K_b^2 + \sum_b \sum_{c \neq b} (\gamma_{bc} \cdot S_b \cdot S_c)}$$

Where:

(i) S_b is defined for bucket, b , as:

$$S_b = \max \left(\min \left(\sum_{k \in b} WS_k, K_b \right), -K_b \right)$$

(ii) S_c is defined for bucket c as:

$$S_c = \max \left(\min \left(\sum_{k \in c} WS_k, K_c \right), -K_c \right)$$

(iii) The multiplier, m_{CVA} , equals 1, unless the [AGENCY] notifies the [BANKING ORGANIZATION] in writing that a different value must be used. The [AGENCY] may increase a [BANKING ORGANIZATION]'s multiplier if it determines that the [BANKING ORGANIZATION]'s CVA model risk warrants it.

(c) *CVA vega capital requirement.* (1) *General.* The CVA vega capital requirement equals the sum of the risk class-level CVA vega capital requirements calculated pursuant to paragraph (c)(4) of this section for each of the following five risk classes:

(i) Interest rate risk;

(ii) Foreign exchange risk;
 (iii) Reference credit spread risk;
 (iv) Equity risk; and
 (v) Commodity risk.

(2) *Net weighted sensitivity calculation.* For each risk factor, k , specified in § _____.225(b), a [BANKING ORGANIZATION] must:

(i) Calculate the CVA vega sensitivity of aggregate regulatory CVA to the risk factor, S_k^{CVA} , and the CVA vega sensitivity of the aggregate market value of standardized CVA hedges to the risk factor, S_k^{Hdg} , pursuant to paragraph (e) of this section.

(ii) Calculate the weighted CVA vega sensitivity to the risk factor, WS_k^{CVA} , and the weighted hedge vega sensitivity to the risk factor, WS_k^{Hdg} , by multiplying S_k^{CVA} and S_k^{Hdg} , respectively, by the corresponding risk weight, RW_k , specified in § __.225(b):

$$WS_k^{CVA} = RW_k \cdot S_k^{CVA}$$

$$WS_k^{Hdg} = RW_k \cdot S_k^{Hdg}$$

(iii) Calculate the net weighted vega sensitivity, WS_k , by subtracting the weighted hedge vega sensitivity, WS_k^{Hdg} , from the weighted CVA vega sensitivity, WS_k^{CVA} :

$$WS_k = WS_k^{CVA} - WS_k^{Hdg}$$

(3) *Within bucket aggregation.* For each bucket, b , as provided in § __.225(b), a [BANKING ORGANIZATION] must calculate the

bucket-level CVA vega capital requirement, K_b , by aggregating the net weighted vega sensitivities for each risk factor in a bucket, b , using the buckets

and correlation parameters, ρ_{kl} , applicable to each risk class as specified in § __.225(b), as follows:

$$K_b = \sqrt{\sum_{k \in b} WS_k^2 + \sum_{k \in b} \sum_{l \in b, l \neq k} (\rho_{kl} \cdot WS_k \cdot WS_l) + R \sum_{k \in b} (WS_k^{Hdg})^2}$$

Where:

R is the hedging disallowance parameter equal to 0.01.

(4) *Across bucket aggregation.* A [BANKING ORGANIZATION] must

calculate the risk class-level CVA vega capital requirement, K , by aggregating the bucket-level CVA vega capital requirements, K_b , for each bucket in the risk class using the correlation

parameters, Y_{bc} , applicable to each risk class as specified in § __.225(b), as follows:

$$K = m_{CVA} \cdot \sqrt{\sum_b K_b^2 + \sum_b \sum_{c \neq b} (Y_{bc} \cdot S_b \cdot S_c)}$$

Where:

(i) S_b is defined for bucket b as:
 $S_b = \max(\min(\sum_k \epsilon_b WS_k, K_b), -K_b)$

(ii) S_c is defined for bucket c as:
 $S_c = \max(\min(\sum_k \epsilon_c WS_k, K_c), -K_c)$

(iii) The multiplier, m_{CVA} , equals 1, unless the [AGENCY] notifies the [BANKING ORGANIZATION] in writing that a different value must be used. The [AGENCY] may increase a [BANKING

ORGANIZATION]'s multiplier if it determines that the [BANKING ORGANIZATION]'s CVA model risk warrants it.

(d) *Calculation of regulatory CVA.* A [BANKING ORGANIZATION] must calculate aggregate regulatory CVA as the sum of regulatory CVA for each counterparty.

(1) A [BANKING ORGANIZATION] must calculate regulatory CVA at the

counterparty level as the expected loss resulting from default of the counterparty and assuming non-default of the [BANKING ORGANIZATION]. In expressing the regulatory CVA, non-zero losses must have a positive sign.

(2) The calculation of regulatory CVA must be based, at a minimum, on the following inputs, consistent with the requirements of this paragraph (d) of this section:

(i) Term structure of market-implied probability of default;

(ii) Market-consensus expected loss-given-default; and

(iii) Simulated paths of discounted future exposure.

(3) The term structure of market-implied probability of default must be estimated from credit spreads observed in the markets. For counterparties whose credit is not actively traded (illiquid counterparties), the market-implied probability of default must be estimated from proxy credit spreads, estimated for such counterparties according to the following requirements:

(i) A [BANKING ORGANIZATION] must estimate the credit spread curves of illiquid counterparties from credit spreads observed in the markets of the counterparty's liquid peers via an algorithm that is based, at a minimum, on the following inputs:

(A) A measure of credit quality;

(B) Industry; and

(C) Region;

(ii) A [BANKING ORGANIZATION] may map an illiquid counterparty to a single liquid reference name if the [BANKING ORGANIZATION] demonstrates to the [AGENCY] that such mapping is appropriate; and

(iii) When no credit spread of any of the counterparty's peers is available due to the counterparty's specific type, a [BANKING ORGANIZATION] may use an estimate of credit risk to proxy the spread of an illiquid counterparty; provided that where a [BANKING ORGANIZATION] uses historical probabilities of default as part of this assessment, the resulting spread must relate to credit markets and cannot be based on historical probabilities of default alone.

(4) The market-consensus expected loss-given-default value must be the same as the one used to calculate the market-implied probability of default from credit spreads unless the seniority of the exposure resulting from CVA risk covered positions differs from the seniority of senior unsecured bonds.

(5) The simulated paths of discounted future exposure are produced by pricing all standardized CVA risk covered positions with the counterparty along simulated paths of relevant market risk factors and discounting the prices to today using risk-free interest rates along the path.

(6) All market risk factors material for the transactions with a counterparty must be simulated as stochastic processes for an appropriate number of paths defined on an appropriate set of future time points extending to the maturity of the longest transaction.

(7) For transactions with a significant level of dependence between exposure and the counterparty's credit quality, a [BANKING ORGANIZATION] must account for this dependence in regulatory CVA calculations.

(8) For margined counterparties, only financial collateral that qualifies for inclusion in the net independent collateral amount or variation margin amount under §§ _____.113 through _____.114 may be recognized as a risk mitigant.

(9) For margined counterparties, the simulated paths of discounted future exposure must capture the effects of margining collateral that is recognized as a risk mitigant along each exposure path. All of the relevant contractual features such as the nature of the margin agreement (unilateral vs bilateral), the frequency of margin calls, the type of collateral, thresholds, independent amounts, initial margins, and minimum transfer amounts must be appropriately captured by the exposure model. To determine collateral available to a [BANKING ORGANIZATION] at a given exposure measurement time point, the exposure model must assume that the counterparty will not post or return any collateral within a certain time period immediately prior to that time point, the margin period of risk (MPoR). For all standardized CVA risk covered positions, the MPoR must not be less than 9 + N business days. For purposes of this paragraph (d)(9), N is the re-margining period specified in the margin agreement.

(10) A [BANKING ORGANIZATION] must obtain the simulated paths of discounted future exposure using the same CVA exposure models used by the [BANKING ORGANIZATION] for financial reporting purposes, adjusted to meet the requirements of this section. For purposes of this section, a [BANKING ORGANIZATION] must use the same model calibration process, market data, and transaction data as the [BANKING ORGANIZATION] uses in its CVA calculations for financial reporting purposes, adjusted to meet the requirements of this calculation.

(11) A [BANKING ORGANIZATION]'s generation of market risk factor paths underlying the exposure models must satisfy the following requirements:

(i) Drifts of risk factors must be consistent with a risk-neutral probability measure and a [BANKING ORGANIZATION] may not calibrate drifts of risk factors on a historical basis;

(ii) A [BANKING ORGANIZATION] must calibrate the volatilities and correlations of market risk factors to market data; provided that, where sufficient data from a liquid derivatives

market does not exist, a [BANKING ORGANIZATION] may calibrate volatilities and correlations of market risk factors on a historical basis; and

(iii) The distribution of modelled risk factors must adequately account for the possible non-normality of the distribution of exposures.

(12) For purposes of the calculation of the regulatory CVA, a [BANKING ORGANIZATION] must recognize netting in the same manner as used by the [BANKING ORGANIZATION] for financial reporting purposes.

(e) *CVA Sensitivities*. For purposes of calculating the CVA delta capital requirement and the CVA vega capital requirement, a [BANKING ORGANIZATION] must calculate the CVA delta sensitivities and CVA vega sensitivities in accordance with the requirements set forth below.

(1) *Reference value*. For purposes of calculating the CVA delta sensitivity or CVA vega sensitivity of aggregate regulatory CVA to a risk factor, , the reference value is the aggregate regulatory CVA of all standardized CVA risk covered positions. For purposes of calculating the CVA delta sensitivity or CVA vega sensitivity of aggregate market value of standardized CVA hedges to a risk factor, , the reference value is the aggregate market value of all standardized CVA hedges.

(2) *CVA delta sensitivities definitions*—(i) *Interest rate risk*. (A) For currencies specified in § _____.225(a)(1)(ii), a [BANKING ORGANIZATION] must calculate the CVA delta sensitivity to each delta risk factor by changing the risk-free yield for a given tenor for all curves in a given currency by 0.0001 and dividing the resulting change in the reference value by 0.0001. A [BANKING ORGANIZATION] must measure the delta sensitivity to the inflation rate by changing the inflation rate by 0.0001 and dividing the resulting change in the reference value by 0.0001.

(B) For currencies not specified in § _____.225(a)(1)(ii), a [BANKING ORGANIZATION] must measure the CVA delta sensitivity to each delta risk factor by applying a parallel shift to all risk-free yield curves in a given currency by 0.0001 and dividing the resulting change in the reference value by 0.0001. A [BANKING ORGANIZATION] must measure the delta sensitivity to the inflation rate by changing the inflation rate by 0.0001 and dividing the resulting change in the reference value by 0.0001.

(ii) *Foreign exchange risk*. A [BANKING ORGANIZATION] must measure the CVA delta sensitivity to each delta risk factor by multiplying the

current value of the exchange rate between the [BANKING ORGANIZATION]'s reporting currency and the other currency (*i.e.*, the value of one unit of another currency expressed in units of the reporting currency) by 1.01 and dividing the resulting change in the reference value by 0.01. For transactions that reference an exchange rate between a pair of non-reporting currencies, a [BANKING ORGANIZATION] must measure the CVA delta sensitivities to the foreign exchange spot rate between the [BANKING ORGANIZATION]'s reporting currency and each of the referenced non-reporting currencies.

(iii) *Counterparty credit spread risk.* For each entity and each tenor point, a [BANKING ORGANIZATION] must measure the CVA delta sensitivity to each delta risk factor for counterparty credit risk by shifting the relevant credit spread by 0.0001 and dividing the resulting change in the reference value by 0.0001.

(iv) *Reference credit spread risk.* A [BANKING ORGANIZATION] must measure the CVA delta sensitivity to each delta risk factor for reference credit spread risk by simultaneously shifting all of the credit spreads for all tenors of all reference names in the bucket by 0.0001 and dividing the resulting change in the reference value by 0.0001.

(v) *Equity risk.* A [BANKING ORGANIZATION] must measure the CVA delta sensitivity to each delta risk factor for equity risk by multiplying the current values of all of the equity spot prices for all reference names in the bucket by 1.01 and dividing the resulting change in the reference value by 0.01.

(vi) *Commodity risk.* A [BANKING ORGANIZATION] must measure the CVA delta sensitivities to each delta risk factor for commodity risk by multiplying the current values of all of the spot prices of all commodities in the bucket by 1.01 and dividing the resulting change in the reference value by 0.01.

(3) *CVA vega sensitivities definitions—(i) Interest rate risk.* A [BANKING ORGANIZATION] must measure the CVA vega sensitivity to each vega risk factor by multiplying the current values of all interest rate or inflation rate volatilities, respectively, by 1.01 and dividing the resulting change in the reference value by 0.01.

(ii) *Foreign exchange risk.* A [BANKING ORGANIZATION] must measure the CVA vega sensitivity to each vega risk factor for foreign exchange risk by multiplying the current values of all volatilities for a given exchange rate between the

[BANKING ORGANIZATION]'s reporting currency and another currency by 1.01 and dividing the resulting change in the reference value by 0.01.

For transactions that reference an exchange rate between a pair of non-reporting currencies, a [BANKING ORGANIZATION] must measure the volatilities of the foreign exchange spot rates between the [BANKING ORGANIZATION]'s reporting currency and each of the referenced non-reporting currencies.

(iii) *Reference credit spread risk.* A [BANKING ORGANIZATION] must measure the CVA vega sensitivity to each vega risk factor for reference credit spread risk by multiplying the current values of the volatilities of all credit spreads of all tenors for all reference names in the bucket by 1.01 and dividing the resulting change in the reference values by 0.01.

(iv) *Equity risk.* A [BANKING ORGANIZATION] must measure the CVA vega sensitivity to each risk factor for equity risk by multiplying the current values of the volatilities for all reference names in the bucket by 1.01 and dividing the resulting change in the reference value by 0.01.

(v) *Commodity risk.* A [BANKING ORGANIZATION] must measure the CVA vega sensitivity to each vega risk factor for commodity risk by multiplying the current values of the volatilities for all commodities in the bucket by 1.01 and dividing the resulting change in the reference value by 0.01.

(4) Notwithstanding paragraphs (e)(2) and (3) of this section, a [BANKING ORGANIZATION] may use smaller values of risk factor changes than what is specified in paragraphs (e)(2) and (3) of this section if doing so is consistent with internal risk management calculations.

(5) When CVA vega sensitivities are calculated, the volatility shift must apply to both types of volatilities that appear in exposure models:

(i) Volatilities used for generating risk factor paths; and

(ii) Volatilities used for pricing options.

(6) In cases where a standardized CVA risk covered position or a standardized CVA hedge references an index, the sensitivities of the aggregate regulatory CVA or the market value of the eligible CVA hedge to all risk factors upon which the value of the index depends must be calculated. The sensitivity of the aggregate regulatory CVA or the market value of the standardized CVA hedge to risk factor, , must be calculated by applying the shift of risk factor, , to all index constituents that depend on

this risk factor and recalculating the aggregate regulatory CVA or the market value of the standardized CVA hedge.

(7) Notwithstanding paragraph (e)(6) of this section, for credit and equity indices:

(i) For the risk classes of counterparty credit spread risk, reference credit spread risk, and equity risk, a [BANKING ORGANIZATION] may choose to introduce a set of additional risk factors that directly correspond to the indices (index risk factors);

(ii) If a [BANKING ORGANIZATION] chooses to introduce such additional risk factors, a [BANKING ORGANIZATION] must calculate CVA sensitivities to the index risk factors in addition to sensitivities to the other index risk factors; and

(iii) For a standardized CVA risk covered position or a standardized CVA hedge whose underlying is an index, its contribution to sensitivities to the index constituents is replaced with its contribution to a single sensitivity to the underlying index, provided that:

(A) For equity indices where at least 75 percent of market value of the constituents of the index, taking into account the weightings of the constituents, are mapped to the same sector, the entire index must be mapped to that sector and treated as a single-name sensitivity in that bucket;

(B) For credit indices where at least 75 percent of notional value of the constituents of the index, taking into account the weightings of the constituents, are mapped to the same sector, the entire index must be mapped to that sector and treated as a single-name sensitivity in that bucket; and

(C) In all other cases, the sensitivity must be mapped to the applicable index bucket.

§ _____.225 Standardized CVA Approach: Definitions of Buckets, Risk Factors, Risk Weights, and Correlation Parameters

(a) *CVA delta capital requirement—(1) Interest rate risk—(i) Delta buckets for interest rate risk.* A [BANKING ORGANIZATION] must establish a separate interest rate risk bucket for each currency.

(ii) For the purposes of this section, specified currencies mean United States Dollar, Australian Dollar, Canadian Dollar, Euro, Japanese Yen, Swedish Krona, and United Kingdom Pound, and any additional currencies specified by the [AGENCY].

(A) *Delta risk factors for interest rate risk, specified currencies.* The delta risk factors for interest rate risk for the specified currencies are the absolute changes of the inflation rate and of the

risk-free yields for the following five tenors: 1 year, 2 years, 5 years, 10 years, and 30 years.

(B) *Delta risk weights for interest rate risk, specified currencies.* The delta risk weights, RW_k , for interest rate risk for

the specified *currencies* are set out in Table 1 to § __.225.

Table 1 to § __.225—Delta Risk Weights for Interest Rate Risk (Specified Currencies)

Risk factor	Risk free yields					Inflation
	1 year	2 years	5 years	10 years	30 years	
Risk weight	1.11%	0.93%	0.74%	0.74%	0.74%	1.11%

(C) *Delta within-bucket correlation parameter for interest rate risk,*

specified currencies. The correlation parameters, ρ_{kl} , related to the specified

currencies are set out in Table 2 to § __.225.

Table 2 to § __.225—Delta Correlation Parameters, ρ_{kl} , for Interest Rate Risk (Specified Currencies)

	1 year	2 years	5 years	10 years	30 years	Inflation
1 year	100%	91%	72%	55%	31%	40%
2 years		100%	87%	72%	45%	40%
5 years			100%	91%	68%	40%
10 years				100%	83%	40%
30 years					100%	40%
Inflation						100%

(iii) For currencies not specified in paragraph (a)(2)(ii) of this section:

(A) *Delta risk factors for interest rate risk, other currencies.* The delta risk factors for interest rate risk equal the absolute change of the inflation rate and the parallel shift of the entire risk-free yield curve for a given currency;

(B) *Delta risk weights for interest rate risk, other currencies.* The delta risk weights, RW_k , for both the risk-free yield curve and the inflation rate equal 1.58 percent; and

(C) *Delta within-bucket correlation parameter for interest rate risk, other currencies.* The correlation parameter, ρ_{kl} , between the risk-free yield curve and the inflation rate equals 40 percent.

(iv) *Delta cross-bucket correlation parameter for interest rate risk.* The delta cross-bucket correlation parameter, γ_{bc} , 50 percent for all currency pairs.

(2) *Foreign exchange risk—(i) Delta buckets for foreign exchange risk.* A [BANKING ORGANIZATION] must establish a separate delta foreign exchange risk bucket for each currency, except for a [BANKING ORGANIZATION]'s own reporting currency.

(ii) *Delta risk factors for foreign exchange risk.* The delta risk factors for foreign exchange risk equal the relative change of the foreign exchange spot rate between a given currency and a [BANKING ORGANIZATION]'s reporting currency or base currency, where the foreign exchange spot rate is the current market price of one unit of another currency expressed in the units of the [BANKING ORGANIZATION]'s reporting currency or base currency.

(iii) *Delta risk weights for foreign exchange risk.* The delta risk weights, RW_k , for foreign exchange risk for all exchange rates between the [BANKING ORGANIZATION]'s reporting currency or base currency and another currency equal 11 percent.

(iv) *Delta cross-bucket correlation parameter for foreign exchange risk.* The delta cross-bucket correlation parameter, γ_{bc} , equals 60 percent for all currency pairs.

(3) *Counterparty credit spread risk—(i) Delta buckets for counterparty credit spread risk.* Delta buckets for counterparty credit spread risk are set out in Table 3 to § __.225. Delta buckets 1 to 7 represent the non-index risk factors and bucket 8 is available for

the optional treatment of indices. Under the optional treatment of indices, only standardized CVA hedges of counterparty credit spread risk and reference indices can be assigned to bucket 8, whereas buckets 1 to 7 must be used for calculations of CVA delta sensitivities for standardized CVA risk covered positions and all single-name and all non-index hedges. For any CVA index hedge assigned to buckets 1 to 7, the sensitivity of the hedge to each index constituent must be calculated as described in § __.224(e)(6).

(ii) *Delta risk factors for counterparty credit spread risk.* The delta risk factors for counterparty credit spread risk equal the absolute shifts of credit spreads of individual entities (counterparties and reference names for counterparty credit spread hedges) and indices (under the optional treatment of indices) for the following tenors: 0.5 years, 1 year, 3 years, 5 years, and 10 years.

(iii) *Delta risk weights for counterparty credit spread risk.* The delta risk weights, RW_k , for counterparty credit spread risk are set out in Table 3 to § __.225. The same risk weight for a given bucket and given credit quality applies to all tenors.

Table 3 to § __.225—Delta Buckets and Risk Weights for Counterparty Credit Spread Risk

Bucket number	Sector	Risk Weights		
		Investment grade names	Speculative grade names	Sub-speculative grade names
1	(a) Sovereign exposures, MDBs, and specified supranational entities	0.5%	3.0%	7.0%
	(b) PSEs, government-backed non-financials, GSE debt, and education and public administration	1.0%	4.0%	
	(c) Government-backed financials	5.0%	12.0%	
2	Financials	5.0%	12.0%	
3	Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	3.0%	7.0%	
4	Consumer goods and services, transportation and storage, and administrative and support service activities	3.0%	8.5%	
5	Technology and telecommunications	2.0%	5.5%	
6	Health care, utilities, and professional and technical activities	1.5%	5.0%	
7	Other sector	5.0%	12.0%	
8	Indices	1.5%	5.0%	

(iv) *Delta within-bucket correlation parameters, ρ_{kl} , for counterparty credit spread risk.* The delta correlation parameters, ρ_{kl} , for counterpart credit spread risk must be defined as follows:

(A) For buckets 1 through 7 of Table 3 to § __.225, a [BANKING ORGANIZATION] must calculate the correlation parameter, ρ_{kl} , between two weighted sensitivities WS_k and WS_l as follows:

$$\rho_{kl} = \rho_{kl}^{(tenor)} \cdot \rho_{kl}^{(name)} \cdot \rho_{kl}^{(quality)}$$

where,

(1) $\rho_{kl}^{(tenor)}$ equals 100 percent if the two tenors are the same, and 90 percent otherwise;

(2) $\rho_{kl}^{(name)}$ equals 100 percent if the two names are the same, 90 percent if the two names are distinct but are affiliates, and 50 percent otherwise; and

(3) $\rho_{kl}^{(quality)}$ equals 100 percent if the credit quality of the two names is the same (where speculative and sub-speculative grade is treated as one credit quality category), and 80 percent otherwise.

(B) For bucket 8 of Table 3 to § _____.225, a [BANKING ORGANIZATION] must calculate the

correlation parameter, , between two weighted sensitivities and as follows:

$$\rho_{kl} = \rho_{kl}^{(tenor)} \cdot \rho_{kl}^{(name)} \cdot \rho_{kl}^{(quality)}$$

where,

(1) $\rho_{kl}^{(tenor)}$ equals 100 percent if the two tenors are the same, and 90 percent otherwise;

(2) $\rho_{kl}^{(name)}$ equals 100 percent if the two indices are the same and of the same series, 90 percent if the two indices are the same but of distinct series, and 80 percent otherwise; and

(3) $\rho_{kl}^{(quality)}$ equals 100 percent if the credit quality of the two indices is the same (where speculative and sub-speculative grade is treated as one credit quality category), and 80 percent otherwise.

(v) *Delta cross-bucket correlation parameters for counterparty credit*

spread risk. The delta cross-bucket correlation parameters, , for

counterparty credit spread risk are set out in Table 4 to § _____.225.

Table 4 to § __.225—Delta Cross-Bucket Correlations for Counterparty Credit Spread
Delta Risk

Bucket number	1	2	3	4	5	6	7	8
1	100%	10%	20%	25%	20%	15%	0%	70%
2		100%	5%	15%	20%	5%	0%	70%
3			100%	20%	25%	5%	0%	70%
4				100%	25%	5%	0%	70%
5					100%	5%	0%	70%
6						100%	0%	70%
7							100%	0%
8								100%

(4) *Reference credit spread risk*—(i) *Delta buckets for reference credit spread risk.* Delta buckets for reference credit spread risk are set out in Table 5 to § __.225.

(ii) *Delta risk factors for reference credit spread risk.* The delta risk factor for reference credit spread risk equals the simultaneous absolute shift of all credit spreads for all tenors of all reference names in the bucket.

(iii) *Delta risk weights for reference credit spread risk.* The delta risk weights, RW_k , for reference credit spread risk are set out in Table 5 to § __.225.

Table 5 to § __.225—Delta and Vega Buckets and Delta Risk Weights for Reference Credit Spread Risk

Bucket number	Credit quality	Sector	Delta risk weights
1	Investment grade	Sovereign exposures, MDBs, and specified supranational entities	0.5%
2		PSEs, government-backed non-financials, GSE debt, and education and public administration	1.0%
3		Financials including government-backed financials and real estate activities	5.0%
4		Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	3.0%
5		Consumer goods and services, transportation and storage, and administrative and support service activities	3.0%
6		Technology and telecommunications	2.0%
7		Health care, utilities, and professional and technical activities	1.5%
8	Speculative grade	Sovereign exposures, MDBs, and specified supranational entities	3.0%
	Sub-speculative grade		7.0%
9	Speculative grade and sub-speculative grade	PSEs, government-backed non-financials, GSE debt, and education and public administration	4.0%
10		Financials including government-backed financials and real estate activities	12.0%
11		Basic materials, energy, industrials, agriculture, manufacturing, and mining and quarrying	7.0%
12		Consumer goods and services, transportation and storage, and administrative and support service activities	8.5%
13		Technology and telecommunications	5.5%
14		Health care, utilities, and professional and technical activities	5.0%
15		Other sector	12.0%
16	Investment grade	Indices	1.5%
17	Speculative grade and sub-speculative grade	Indices	5.0%

(iv) *Delta cross-bucket correlation parameters for reference credit spread risk.* The delta cross-bucket correlation

parameter, γ_{bc} , for reference credit spread risk equals:

(A) The cross-bucket correlation parameters, γ_{bc} , between buckets of the

same credit quality (where speculative and sub-speculative grade is treated as one credit quality category) are set out in Table 6 to § __.225.

Table 6 to § __.225—Delta and Vega Cross-Bucket Correlations for Reference Credit Spread Risk (Same Credit Quality)

Bucket number	1 or 8	2 or 9	3 or 10	4 or 11	5 or 12	6 or 13	7 or 14	15	16	17
1 or 8	100%	75%	10%	20%	25%	20%	15%	0%	45%	45%
2 or 9		100%	5%	15%	20%	15%	10%	0%	45%	45%
3 or 10			100%	5%	15%	20%	5%	0%	45%	45%
4 or 11				100%	20%	25%	5%	0%	45%	45%
5 or 12					100%	25%	5%	0%	45%	45%
6 or 13						100%	5%	0%	45%	45%
7 or 14							100%	0%	45%	45%
15								100%	0%	0%
16									100%	75%
17										100%

(B) The cross-bucket correlation parameters, γ_{bc} , between buckets 1 to 14 of different credit quality (where speculative and sub-speculative grade is treated as one credit quality category), are set out in Table 7 to § __.225.

Table 7 to § __.225—Delta and Vega Cross-Bucket Correlations for Reference Credit Spread Risk (Different Credit Quality)

Bucket number	1 or 8	2 or 9	3 or 10	4 or 11	5 or 12	6 or 13	7 or 14
1 or 8	50.0%	37.5%	5.0%	10.0%	12.5%	10.0%	7.5%
2 or 9		50.0%	2.5%	7.5%	10.0%	7.5%	5.0%
3 or 10			50.0%	2.5%	7.5%	10.0%	2.5%
4 or 11				50.0%	10.0%	12.5%	2.5%
5 or 12					50.0%	12.5%	2.5%
6 or 13						50.0%	2.5%
7 or 14							50.0%

(5) *Equity risk*—(i) *Delta buckets for equity risk*. For equity risk, a [BANKING ORGANIZATION] must establish buckets along three dimensions: the reference entity's market capitalization, economy and sector as set out in Table 8 to § __.225. To assign a delta sensitivity to an economy, a [BANKING ORGANIZATION], at least annually, must review and update the countries and territorial entities that satisfy the

requirements of a liquid market economy using the most recent economic data available. To assign a delta sensitivity to a sector, a [BANKING ORGANIZATION] must follow market convention by using classifications that are commonly used in the market for grouping issuers by industry sector. A [BANKING ORGANIZATION] must assign each issuer to one of the sector buckets and

must assign all issuers from the same industry to the same sector. Delta sensitivities of any equity issuer that a [BANKING ORGANIZATION] cannot assign to a sector must be assigned to the other sector. For multinational, multi-sector equity issuers, the allocation to a particular bucket must be done according to the most material economy and sector in which the issuer operates.

Table 8 to § __.225—Delta and Vega Buckets and Delta Risk Weights for Equity Risk

Bucket number	Size	Economy	Sector	Delta risk weight
1	Large market cap	Emerging market economies	Consumer goods and services, transportation and storage, administrative and support service activities, healthcare, and utilities	55%
2			Telecommunications and industrials	60%
3			Basic materials, energy, agriculture, manufacturing, and mining and quarrying	45%
4			Financials including government-backed financials, real estate activities, and technology	55%
5		Liquid market economies	Consumer goods and services, transportation and storage, administrative and support service activities, healthcare, and utilities	30%
6			Telecommunications and industrials	35%
7			Basic materials, energy, agriculture, manufacturing, and mining and quarrying	40%
8			Financials including government-backed financials, real estate activities, and technology	50%
9	Small market cap	Emerging market economies	All sectors described under bucket numbers 1, 2, 3, and 4	70%
10		Liquid market economies	All sectors described under bucket numbers 5, 6, 7, and 8	50%
11	Other sector			70%
12	Large market cap and liquid market economies		Indices	15%
13	Other		Indices	25%

(ii) *Delta risk factors for equity risk.* The delta risk factor for equity risk equals the simultaneous relative shift of all equity spot prices for all reference entities in the bucket.

(iii) *Delta risk weights for equity risk.* The delta risk weights, RW_k , for equity risk are set out in Table 8 to § __.225.

(iv) *Delta cross-bucket correlation parameters for equity risk.* The delta cross-bucket correlation parameter, γ_{bc} , for equity risk equals 15 percent for all

cross-bucket pairs in Table 8 to § __.225 assigned to bucket numbers 1 to 10 and zero percent for all cross-bucket pairs that include bucket 11. The cross-bucket correlation between buckets 12 and 13 in Table 8 to § __.225 equals 75 percent and the cross-bucket correlation between buckets 12 or 13 and any of the buckets 1 through 10 equals 45 percent.

(6) *Commodity risk—(i) Delta buckets for commodity risk.* Delta buckets for

commodity risk are set out in Table 9 § __.225.

(ii) *Delta risk factors for commodity risk.* The delta risk factor for commodity risk equals the simultaneous relative shift of all of the commodity spot prices for all commodities in the bucket.

(iii) *Delta risk weights for commodity risk.* The delta risk weights, RW_k , for commodity risk are set out in Table 9 to § __.225.

Table 9 to § __.225—Delta and Vega Buckets and Delta Risk Weights for Commodity Risk

Bucket number	Commodity group	Examples	Delta risk weight
1	Energy – Solid combustibles	Coal, charcoal, wood pellets, and nuclear fuel	30%
2	Energy – Liquid combustibles	Crude oil (such as Light-sweet, heavy, West Texas Intermediate, and Brent); biofuels (such as bioethanol and biodiesel); petrochemicals (such as propane, ethane, gasoline, methanol, and butane); and refined fuels (such as jet fuel, kerosene, gasoil, fuel oil, naphtha, and heating oil and diesel)	35%
3	Energy – Carbon trading	Carbon emissions trading (such as certified emissions reductions, in-delivery month EU allowance, Regional Greenhouse Gas Initiative CO2 allowance, and renewable energy certificates)	60%
4	Freight	Dry-bulk route (such as Capesize, Panamax, Handysize, and Supramax); and liquid-bulk/gas shipping route (such as Suczmax, Aframax, and very large crude carriers)	80%
5	Metals – non-precious	Base metal (such as aluminum, copper, lead, nickel, tin, and zinc); steel raw materials (such as steel billet, steel wire, steel coil, steel scrap and steel rebar, iron ore, tungsten, vanadium, titanium, and tantalum); and minor metals (such as cobalt, manganese, molybdenum)	40%
6	Gaseous combustibles and electricity	Natural gas and liquefied natural gas; and electricity (such as spot, day-ahead, peak, and off-peak)	45%
7	Precious metals (including gold)	Gold, silver, platinum, and palladium	20%
8	Grains and oilseed	Corn; wheat; soybean (such as soybean seed, soybean oil and soybean meal); oats; palm oil; canola; barley; rapeseed (such as rapeseed seed, rapeseed oil, and rapeseed meal); red bean, sorghum; coconut oil; olive oil; peanut oil; sunflower oil; and rice	35%
9	Livestock and dairy	Cattle (such live and feeder), hog, poultry, lamb, fish, shrimp, and dairy (such as milk, whey, eggs, butter, and cheese)	25%
10	Forestry and other agriculturals	Cocoa; coffee (such as arabica and robusta); tea; citrus and orange juice; potatoes; sugar; cotton; wool; lumber and pulp; and rubber	35%
11	Other commodity	Industrial minerals (such as potash, fertilizer, and phosphate rocks), rare earths, terephthalic acid, and flat glass	50%
12	Commodity Index		30%

(iv) *Delta cross-bucket correlation parameters for commodity risk.* The

delta cross-bucket correlation, γ_{bc} , for commodity risk equals 20 percent for all

cross-bucket pairs in Table 9 to § __.225 assigned to bucket numbers 1

to 10 or 12 and zero percent for all cross-bucket pairs that include bucket 11.

(b) *CVA vega capital requirement*—(1) *Interest rate risk.*

(i) *Vega buckets for interest rate risk.* A [BANKING ORGANIZATION] must establish a separate vega interest rate risk bucket for each currency.

(ii) *Vega risk factors for interest rate risk.* The vega risk factors for interest rate risk for all currencies equal a simultaneous relative change of all inflation rate volatilities for each currency and a simultaneous relative change of all interest rate volatilities for each currency.

(iii) *Vega risk weights for interest rate risk.* The vega risk weights, RW_k , for interest rate risk equal 100 percent.

(iv) *Vega within-bucket correlation parameters for interest rate risk.* The vega within-bucket correlation parameter, ρ_{kl} , for interest rate risk equals 40 percent.

(v) *Vega cross-bucket correlation parameter for interest rate risk.* The vega cross-bucket correlation parameter, γ_{bc} , for interest rate risk equals 50 percent for all currency pairs.

(2) *Foreign exchange risk*—(i) *Vega buckets for foreign exchange risk.* A [BANKING ORGANIZATION] must establish a separate vega foreign exchange risk bucket for each currency, except for a [BANKING ORGANIZATION]'s own reporting currency.

(ii) *Vega risk factors for foreign exchange risk.* The vega risk factors for foreign exchange risk equal the simultaneous, relative change of all volatilities for the exchange rate between a [BANKING ORGANIZATION]'s reporting currency or base currency and each other currency.

(iii) *Vega risk weights for foreign exchange risk.* The vega risk weights, , for foreign exchange risk equal 100 percent.

(iv) *Vega cross-bucket correlation parameter for foreign exchange risk.* The vega cross-bucket correlation parameter, , for foreign exchange risk equals 60 percent for all currency pairs.

(3) *Reference credit spread risk*—(i) *Vega buckets for reference credit spread risk.* Vega buckets for reference credit spread risk are set out in Table 5 § _____.225.

(ii) *Vega risk factors for reference credit spread risk.* The vega risk factors for reference credit spread risk equal the simultaneous relative shift of the volatilities of all credit spreads of all tenors for all reference names in the bucket.

(iii) *Vega risk weights for reference credit spread risk.* The vega risk weights, , for reference credit spread risk equal 100 percent.

(iv) *Vega cross-bucket correlation parameters for reference credit spread risk.* The vega cross-bucket correlation parameter, , for reference credit spread risk is defined in the same manner as the delta cross-bucket correlation parameter for reference credit spread risk, pursuant to paragraph (a)(4)(iv) of this section.

(4) *Equity risk*—(i) *Vega buckets for equity risk.* The vega buckets for equity risk are defined in the same manner as the delta buckets for equity risk, pursuant to paragraph (a)(5)(i) of this section.

(ii) *Vega risk factors for equity risk.* The vega risk factor for equity risk equals the simultaneous relative shift of the volatilities for all reference entities in the bucket.

(iii) *Vega risk weights for equity risk.* The vega risk weights, , for equity risk equal 78 percent for large market cap buckets and 100 percent otherwise.

(iv) *Vega cross-bucket correlation parameters for equity risk.* The vega cross-bucket correlation parameter, , for equity risk equals 15 percent for all cross-bucket pairs within Table 8 to § _____.225 that fall within bucket numbers 1 to 10 and zero percent for all cross-bucket pairs that include bucket 11. The cross-bucket correlation between buckets 12 and 13, in Table 8 to § _____.225, is set at 75 percent and the cross-bucket correlation between buckets 12 or 13 and any of the buckets 1 to 10 is 45 percent.

(5) *Commodity risk*—(i) *Vega buckets for commodity risk.* The vega buckets for commodity risk are defined in the same manner as the delta buckets for commodity risk, pursuant to paragraph (a)(6)(i) of this section.

(ii) *Vega risk factors for commodity risk.* The vega risk factor for commodity risk equals the simultaneous relative shift of the volatilities for all commodities in the bucket.

(iii) *Vega risk weights for commodity risk.* The vega risk weights for commodity risk are 100 percent.

(iv) *Vega cross-bucket correlation parameters for commodity risk.* The vega cross-bucket correlation parameter, , for commodity risk equals 20 percent for all cross-bucket pairs in Table 9 to § _____.225 that fall within bucket numbers 1 to 10 or 12 and zero percent for all cross-bucket pairs that include bucket 11.

End of Common Rule.

List of Subjects

12 CFR Part 3

Administrative practice and procedure, Banks, banking, Federal Reserve System, Investments, National banks, Reporting and recordkeeping requirements, Savings association.

12 CFR Part 6

Federal Reserve System, National banks, Penalties.

12 CFR Part 32

National banks, Reporting and recordkeeping requirements, Savings Associations.

12 CFR Part 208

Confidential business information, Crime, Currency, Federal Reserve System, Mortgages, Reporting and recordkeeping requirements, Securities.

12 CFR Part 217

Administrative practice and procedure, Banks, banking, Capital, Federal Reserve System, Holding companies.

12 CFR Part 225

Administrative practice and procedure, Banks, banking, Federal Reserve System, Holding companies, Reporting and recordkeeping requirements, Securities.

12 CFR Part 238

Administrative practice and procedure, Banks, banking, Federal Reserve System, Holding companies, Reporting and recordkeeping requirements, Securities.

12 CFR Part 252

Administrative practice and procedure, Banks, banking, Credit, Federal Reserve System, Holding companies, Investments, Qualified financial contracts, Reporting and recordkeeping requirements, Securities.

12 CFR Part 324

Administrative practice and procedure, Banks, Banking, Capital adequacy, Reporting and recordkeeping requirements, Savings associations, State non-member banks.

Adoption of Common Rule

The proposed adoption of the common rule by the agencies, as modified by the agency-specific text, is set forth below:

DEPARTMENT OF THE TREASURY**Office of the Comptroller of the Currency****12 CFR Chapter I****Authority and Issuance**

For the reasons set forth in the common preamble, the OCC proposes to amend parts 3, 6, and 32 of chapter I of title 12 of the Code of Federal Regulations as follows:

PART 3—CAPITAL ADEQUACY STANDARDS

- 1. The authority citation for part 3 continues to read as follows:

Authority: 12 U.S.C. 93a, 161, 1462, 1462a, 1463, 1464, 1818, 1828(n), 1828 note, 1831n note, 1835, 3907, 3909, 5412(b)(2)(B), and Pub. L. 116–136, 134 Stat. 281.

- 2. In § 3.1, revise paragraphs (c)(3)(ii), (c)(4)(i) and (iii), and (f), and add paragraph (g) to read as follows:

§ 3.1 Purpose, applicability, reservations of authority, and timing.

* * * * *

(c) * * *

(3) * * *

(i) Each national bank or Federal savings association subject to subpart D of this part must use the methodologies in subpart D (and subpart F of this part if the national bank or Federal savings association meets the trading activity threshold to be a market risk national bank or Federal savings association) to calculate standardized total risk-weighted assets.

(ii) Each national bank or Federal savings association subject to subpart E of this part must use the methodologies in subpart E (and subpart F of this part if the national bank or Federal savings association meets the trading activity threshold to be a market risk national bank or Federal savings association) to calculate expanded total risk-weighted assets.

(4) * * *

(i) Except for a national bank or Federal savings association subject to subpart E of this part, each national bank or Federal savings association with total consolidated assets of \$50 billion or more must make the public disclosures described in subpart D of this part.

* * * * *

(iii) Each national bank or Federal savings association subject to subpart E of this part must make the public disclosures described in subpart E of this part.

* * * * *

(f) *Transitions and timing.*—(1) *Transitions.* Notwithstanding any other

provision of this part, a national bank or Federal savings association must make any adjustments provided in subpart G of this part for purposes of implementing this part.

(2) *Timing.* A national bank or Federal savings association that changes from one category to another category, or that changes from having no category to having a category, must comply with the requirements of its category in this part, including applicable transition provisions of the requirements in this part, no later than on the first day of the second quarter following the change in the national bank's or Federal savings association's category.

(g) *Severability.* If any provision of this part, or the application thereof to any person or circumstances, is held invalid, such invalidity shall not affect the validity of other provisions or the application of such provision to other persons or circumstances that can be given effect without the invalid provision or application.

- 3. In § 3.2:

- a. Revise the definition of “Adjusted allowances for credit losses (AACL)”;
- b. Remove the definitions for “Advanced approaches national bank or Federal savings association”, “Advanced approaches total risk-weighted assets”, “Advanced market risk-weighted assets”, and “Allowances for loan and lease losses (ALLL)”;
- c. Revise the definition for “Carrying value”;
- d. Add, in alphabetical order, the definition for “Category I national bank or Federal savings association”;
- e. Revise the definitions for “Category II national bank or Federal savings association” and “Category III national bank or Federal savings association”;
- f. Add, in alphabetical order, the definition for “Category IV national bank or Federal savings association”;
- g. Revise footnote 3 to the definition for “Cleared transaction”;
- h. Revise the definition for “Commitment”;
- i. Revise the definition for “Corporate exposure”;
- j. Remove the definition for “Credit-risk-weighted assets”;
- k. Add, in alphabetical order, the definition for “CVA risk-weighted assets”;
- l. Add, in alphabetical, order the definition for “Dependent on the cash flows generated by the real estate”;
- m. Revise the definition for “Effective notional amount”;
- n. Revise the definition for “Eligible clean-up call”;
- o. Remove the definition for “Eligible credit reserves”;
- p. Revise the definition for “Eligible guarantee”;

■ q. Add, in alphabetical order, the definition for “Eligible prepaid credit protection arrangement”;

■ r. Add, in alphabetical, order the definition for “Expanded total risk-weighted assets”;

■ s. Remove the definition for “Expected credit loss (ECL)”;

■ t. Revise the definition for “Exposure amount”;

■ u. Revise paragraph (4)(i)(A) in the definition of “Financial institution”;

■ v. Revise the definition for “Market risk national bank or Federal savings association”;

■ w. Add, in alphabetical, order the definition for “Market risk-weighted assets”;

■ x. Revise the definitions for “Net independent collateral amount” and “Netting set”;

■ y. Add, in alphabetical order, the definitions for “Non-performing loan securitization (NPL securitization)” and “Nonrefundable purchase price discount (NRPPD)”;

■ z. Revise the definition for “Non-significant investment in the capital of an unconsolidated financial institution”;

■ aa. Add, in alphabetical, order the definition for “Prepaid credit protection arrangement”;

■ bb. Revise the definition for “Protection amount (P)”;

■ cc. Add, in alphabetical order, the definition of “Qualifying cross-product master netting agreement”;

■ dd. Revise paragraphs (3) and (4) of the definition for “Qualifying master netting agreement”;

■ ee. In the definition of “Residential mortgage exposure”;

■ i. Remove paragraph (2);

■ ii. Redesignate paragraphs (1)(i) and (1)(ii) as paragraphs (1) and (2), respectively; and

■ iii. In paragraph (2) (as redesignated), remove the words “family; and” and add, in their place, the word “family.”;

■ ff. Remove the definition for “Securitization special purpose entity (securitization SPE)”;

■ gg. Revise the definition for “Significant investment in the capital of an unconsolidated financial institution”;

■ hh. Remove the definition for “Specific wrong-way risk”;

■ ii. Add, in alphabetical order, the definition of “Specified supranational entity”;

■ jj. Revise the definitions for “Speculative grade” and “Standardized market risk-weighted assets”;

■ kk. Revise the definitions for “Standardized total risk-weighted assets”, “Sub-speculative grade”, and “Synthetic securitization”;

- ll. Add, in alphabetical order, the definition for “Synthetic excess spread”;
- mm. Add, in alphabetical order, the definition for “Total credit risk-weighted assets”;
- nn. Revise the definition for “Traditional securitization”;
- oo. Remove the definition for “Value-at-risk (VaR)”;
- pp. Revise the definition for “Variation margin amount”; and
- qq. Remove the definition for “Unconditionally cancelable”.

The additions and revisions read as follows:

§ 3.2 Definitions

* * * * *

Adjusted allowances for credit losses (AACL) means valuation allowances that have been established through a charge against earnings or retained earnings for expected credit losses on financial assets measured at amortized cost and a lessor’s net investment in leases that have been established to reduce the amortized cost basis of the assets to amounts expected to be collected as determined in accordance with GAAP. For purposes of this part, adjusted allowances for credit losses include allowances for expected credit losses on off-balance sheet credit exposures not accounted for as insurance as determined in accordance with GAAP. Adjusted allowances for credit losses exclude allocated transfer risk reserves and allowances created that reflect credit losses on purchased credit deteriorated assets, purchased seasoned loans, assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, and available-for-sale debt securities.

* * * * *

Carrying value means, with respect to an asset, the value of the asset on the balance sheet of the national bank or Federal savings association as determined in accordance with GAAP. For all assets other than available-for-sale debt securities, purchased credit deteriorated assets, purchased seasoned loans, or assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, the carrying value is not reduced by any associated credit loss allowance that is determined in accordance with GAAP.

* * * * *

Category I national bank or Federal savings association means a national bank or Federal savings association that is a subsidiary of a global systemically important BHC, as defined pursuant to 12 CFR 252.5.

Category II national bank or Federal savings association means a national bank or Federal savings association that is not a subsidiary of a global systemically important BHC, as defined pursuant to 12 CFR 252.5, and that:

(1) Is a subsidiary of a Category II banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2)(i) Has total consolidated assets, calculated based on the average of the national bank’s or Federal savings association’s total consolidated assets for the four most recent calendar quarters as reported on the Call Report, equal to \$700 billion or more. If the national bank or Federal savings association has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or the average of the most recent quarters, as applicable; or

(ii)(A) Has total consolidated assets, calculated based on the average of the national bank’s or Federal savings association’s total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more but less than \$700 billion. If the national bank or Federal savings association has not filed the Call Report for each of the four most recent quarters, total consolidated assets is based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; and

(B) Has cross-jurisdictional activity, calculated based on the average of its cross-jurisdictional activity for the four most recent calendar quarters, of \$75 billion or more. Cross-jurisdictional activity is the sum of cross-jurisdictional claims and cross-jurisdictional liabilities, calculated in accordance with the instructions to the FR Y–15 or equivalent reporting form.

(3) After meeting the criteria in paragraph (2) of this definition, a national bank or Federal savings association continues to be a Category II national bank or Federal savings association until the national bank or Federal savings association has:

(i) Less than \$700 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; and

(ii) (A) Less than \$75 billion in cross-jurisdictional activity for each of the four most recent calendar quarters. Cross-jurisdictional activity is the sum of cross-jurisdictional claims and cross-jurisdictional liabilities, calculated in accordance with the instructions to the

FR Y–15 or equivalent reporting form; or

(B) Less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters.

* * * * *

Category III national bank or Federal savings association means a national bank or Federal savings association that is not a Category II national bank or Federal savings association, and that:

(1) Is a subsidiary of a Category III banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2)(i) Has total consolidated assets, calculated based on the average of the national bank’s or Federal savings association’s total consolidated assets for the four most recent calendar quarters as reported on the Call Report, equal to \$250 billion or more. If the national bank or Federal savings association has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; or

(ii)(A) Has total consolidated assets, calculated based on the average of the national bank’s or Federal savings association’s total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more but less than \$250 billion. If the depository institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; and

(B) Has at least one of the following in paragraphs (2)(ii)(B)(1) through (3) of this definition, each calculated as the average of the four most recent calendar quarters, or if the national bank or Federal savings association has not filed each applicable reporting form for each of the four most recent calendar quarters, for the most recent quarter or quarters, as applicable:

(1) Total nonbank assets, calculated in accordance with the instructions to the FR Y–9LP or equivalent reporting form, equal to \$75 billion or more;

(2) Off-balance sheet exposure equal to \$75 billion or more. Off-balance sheet exposure is a national bank’s or Federal savings association’s total exposure, calculated in accordance with the instructions to the Call Report or

equivalent reporting form, minus the total consolidated assets of the national bank or Federal savings association, as reported on the Call Report; or

(3) Weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, equal to \$75 billion or more.

(iii) After meeting the criteria in paragraph (2)(ii) of this definition, a national bank or Federal savings association continues to be a Category III national bank or Federal savings association until the national bank or Federal savings association:

(A) Has:

(1) Less than \$250 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters;

(2) Less than \$75 billion in total nonbank assets, calculated in accordance with the instructions to the FR Y-9LP or equivalent reporting form, for each of the four most recent calendar quarters;

(3) Less than \$75 billion in weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, for each of the four most recent calendar quarters; and

(4) Less than \$75 billion in off-balance sheet exposure for each of the four most recent calendar quarters. Off-balance sheet exposure is a national bank's or Federal savings association's total exposure, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, minus the total consolidated assets of the national bank or Federal savings association, as reported on the Call Report; or

(B) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(C) Is a Category II national bank or Federal savings association.

* * * * *

Category IV national bank or Federal savings association means a national bank or Federal savings association that is not a Category II national bank or Federal savings association, or a Category III national bank or Federal savings association and that:

(1) Is a subsidiary of a Category IV banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2) Has total consolidated assets, calculated based on the average of the national bank's or Federal savings association's total consolidated assets for the four most recent calendar

quarters as reported on the Call Report, of \$100 billion or more. If the national bank or Federal savings association has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on the average of its total consolidated assets, as reported on the Call Report, for the most recent quarter(s) available.

(3) After meeting the criterion in paragraph (4)(iii) of this definition, a national bank or Federal savings association continues to be a Category IV national bank or Federal savings association until it:

(i) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(ii) Is a Category II national bank or Federal savings association or Category III national bank or Federal savings association.

* * * * *

Cleared transaction * * *

(2) * *³

* * * * *

Commitment means a contractual arrangement under which a national bank or Federal savings association and an obligor agree to terms applicable to one or more future extensions of credit, purchases of assets, or issuances of credit substitutes by the national bank or Federal savings association, whether or not such arrangement is unconditionally cancelable. A commitment is unconditionally cancelable if, by its terms, it either: (a) provides that a national bank or Federal savings association is not obligated to extend credit, purchase assets, or issue credit substitutes; or (b) permits a national bank or Federal savings association, at any time, with or without cause, to refuse to extend credit, purchase assets, or issue credit substitutes under the arrangement (to the extent permitted under applicable law).

* * * * *

Corporate exposure means an exposure to a company that is not:

(1) An exposure to a sovereign, a specified supranational entity, a multilateral development bank (MDB), a depository institution, a foreign bank, or a credit union, a public sector entity (PSE);

(2) An exposure to a Government-Sponsored Enterprises (GSE);

(3) For purposes of subpart D of this part, a residential mortgage exposure;

(4) A pre-sold construction loan;

(5) A statutory multifamily mortgage;

(6) A high volatility commercial real estate (HVCRE) exposure;

(7) A cleared transaction;

(8) A default fund contribution;

(9) A securitization exposure;

(10) An equity exposure;

(11) An unsettled transaction;

(12) A policy loan;

(13) A separate account;

(14) A Paycheck Protection Program covered loan as defined in section 7(a)(36) or (37) of the Small Business Act (15 U.S.C. 636(a)(36)–(37));

(15) For purposes of subpart E of this part, a real estate exposure, as defined in § 3.101 of this part; or

(16) For purposes of subpart E of this part, a retail exposure as defined in § 3.101 of this part.

* * * * *

CVA risk-weighted assets means the measure for CVA risk calculated under § 3.221(a) multiplied by 12.5.

* * * * *

Dependent on the cash flows

generated by the real estate means, for a real estate exposure, the underwriting, at the time of origination, includes the cash flows generated by lease, rental, or sale of the real estate securing the loan as a source of repayment. For purposes of this definition, a residential mortgage exposure that is secured by the borrower's principal residence is deemed not dependent on the cash flows generated by the real estate.

* * * * *

Effective notional amount means for an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, the lesser of the contractual notional amount of the credit risk mitigant and the exposure amount of the hedged exposure, multiplied by the percentage coverage of the credit risk mitigant.

* * * * *

Eligible clean-up call means a clean-up call that:

(1) Is exercisable solely at the discretion of the originating national bank or Federal savings association or servicer;

(2) Is not structured to avoid allocating losses to securitization exposures held by investors or otherwise structured to provide credit enhancement to the securitization; and

(3) Is only exercisable:

(i) For a traditional securitization, when 10 percent or less of the principal amount of the underlying exposures or securitization exposures (determined as of the inception of the securitization) is outstanding;

(ii) For a synthetic securitization, when 10 percent or less of the principal amount of the reference portfolio of underlying exposures (determined as of the inception of the securitization) is outstanding;

(iii) Upon the occurrence of a regulatory event that significantly changes the risk-weighted asset amount for the securitization exposure under this part; or

(iv) Upon the occurrence of a tax event that significantly changes the tax treatment of the securitization exposure under applicable tax laws.

* * * * *

Eligible guarantee means a guarantee that:

(1) Is written;

(2) Is either:

(i) Unconditional, or

(ii) A contingent obligation of the U.S. government or its agencies, the enforceability of which is dependent upon some affirmative action on the part of the beneficiary of the guarantee or a third party (for example, meeting servicing requirements);

(3) Covers all or a pro rata portion of all contractual payments of the obligated party on the reference exposure;

(4) Gives the beneficiary a direct claim against the protection provider;

(5) Is not unilaterally cancelable by the protection provider for reasons other than the breach of the contract by the beneficiary;

(6) Except for a guarantee by a sovereign, is legally enforceable against the protection provider in a jurisdiction where the protection provider has sufficient assets against which a judgment may be attached and enforced;

(7) Requires the protection provider to make payment to the beneficiary on the occurrence of a default (as defined in the guarantee) of the obligated party on the reference exposure in a timely manner without the beneficiary first having to take legal actions to pursue the obligor for payment;

(8) Does not increase the beneficiary's cost of credit protection on the guarantee in response to deterioration in the credit quality of the reference exposure;

(9) Is not provided by an affiliate of the national bank or Federal savings association, unless the affiliate is an insured depository institution, foreign bank, securities broker or dealer, or insurance company that:

(i) Does not control the national bank or Federal savings association; and

(ii) Is subject to consolidated supervision and regulation comparable to that imposed on depository institutions, U.S. securities broker-dealers, or U.S. insurance companies (as the case may be); and

(10) Is provided by an eligible guarantor.

* * * * *

Eligible prepaid credit protection arrangement means a prepaid credit protection arrangement that:

(1) Is written;

(2) Is unconditional;

(3) Covers all or a pro rata portion of all contractual payments due to be paid on the reference exposure or reference exposures;

(4) Provides that the amount and timing of payments due from the protection purchaser to the protection provider are incorporated into the arrangement and the arrangement only allows these terms to change in the event of a breach of the arrangement by the protection purchaser;

(5) Provides that entry of the protection provider into receivership, insolvency, liquidation, conservatorship, or similar proceeding does not change the amounts or timing of payments due to be paid by the protection purchaser under the arrangement;

(6) Is legally valid and enforceable under applicable law of the relevant jurisdictions;

(7) Upon a failure by the obligor on the one or more reference exposures to make a contractually required payment, or the occurrence of other credit events as described in the arrangement, allows the protection purchaser promptly to reduce the outstanding balance of the initial principal amount due to the protection provider by the loss of the protection purchaser on the reference exposures without input from the protection provider; and

(8) Does not increase the protection purchaser's cost of credit protection in response to deterioration in the credit quality of any of the reference exposures.

* * * * *

Expanded total risk-weighted assets means:

(1) The sum of:

(i) Total credit risk-weighted assets;

(ii) Total risk-weighted assets for equity exposures as calculated under §§ 3.141 and 3.142;

(iii) Risk-weighted assets for operational risk as calculated under § 3.150;

(iv) Market risk-weighted assets, if applicable; and

(v) CVA risk-weighted assets, if applicable; minus

(vi) Any amount of the national bank's or Federal savings association's adjusted allowance for credit losses that is not included in tier 2 capital and any amount of allocated transfer risk reserves.

* * * * *

Exposure amount means:

(1) For the on-balance sheet component of an exposure (other than an available-for-sale or held-to-maturity security, if the national bank or Federal savings association has made an AOCI opt-out election (as defined in § 3.22(b)(2)); a derivative contract; a repo-style transaction or an eligible margin loan for which the national bank or Federal savings association determines the exposure amount under § 3.37, §§ 3.113 through 3.115 or § 3.121, as applicable; a cleared transaction; a default fund contribution; or a securitization exposure), the national bank's or Federal savings association's carrying value of the exposure.

(2) For a security (that is not a securitization exposure, equity exposure, or preferred stock classified as an equity security under GAAP) classified as available-for-sale or held-to-maturity if the national bank or Federal savings association has made an AOCI opt-out election (as defined in § 3.22(b)(2)), the national bank's or Federal savings association's carrying value (including net accrued but unpaid interest and fees) for the exposure less any net unrealized gains on the exposure and plus any net unrealized losses on the exposure.

(3) For available-for-sale preferred stock classified as an equity security under GAAP if the national bank or Federal savings association has made an AOCI opt-out election (as defined in § 3.22(b)(2)), the national bank's or Federal savings association's carrying value of the exposure less any net unrealized gains on the exposure that are reflected in such carrying value but excluded from the national bank's or Federal savings association's regulatory capital components.

(4) For the off-balance sheet component of an exposure (other than a derivative contract; a repo-style transaction or an eligible margin loan for which the national bank or Federal savings association calculates the exposure amount under § 3.37 or § 3.121, as applicable; a cleared transaction; a default fund contribution; or a securitization exposure), the notional amount of the off-balance sheet component multiplied by the appropriate credit conversion factor (CCF) in § 3.33 or § 3.112, as applicable.

(5) For an exposure that is a derivative contract (other than a cleared transaction), the exposure amount determined under § 3.34 or §§ 3.113 through 3.114, as applicable.

(6) For an exposure that is a cleared transaction, the exposure amount determined under § 3.35 or § 3.116, as applicable.

(7) For an exposure that is an eligible margin loan or repo-style transaction (other than a cleared transaction) for which the bank calculates the exposure amount as provided in § 3.37 or §§ 3.113 through 3.115, as applicable, the exposure amount determined under § 3.37 or §§ 3.113 through 3.115, as applicable.

(8) For an exposure that is a securitization exposure, the exposure amount determined under § 3.42 or § 3.131, as applicable.

* * * * *

Financial institution means:

* * * * *

(4) * * *

(i) * * *

(A) An investment in GAAP equity instruments of the company with an adjusted carrying value or exposure amount equal to or greater than \$10 million, as adjusted pursuant to § 3.4; or

* * * * *

Market risk national bank or Federal savings association means a national bank or Federal savings association that is described in § 3.201(b)(1).

* * * * *

Market risk-weighted assets means the measure for market risk calculated pursuant to § 3.204(a) multiplied by 12.5.

* * * * *

Net independent collateral amount means the fair value amount of the independent collateral, as adjusted by the haircuts under § 3.121(c)(2)(iii), as applicable, that a counterparty to a netting set has posted to a national bank or Federal savings association less the fair value amount of the independent collateral, as adjusted by the haircuts under § 3.121(c)(2)(iii), as applicable, posted by the national bank or Federal savings association to the counterparty, excluding such amounts held in a bankruptcy-remote manner or posted to a QCCP and held in conformance with the operational requirements in § 3.3.

* * * * *

Netting set means: a group of transactions with a single counterparty that are subject to a qualifying master netting agreement. For derivative contracts, netting set also includes a single derivative contract between a national bank or Federal savings association and a single counterparty.

* * * * *

Non-performing loan securitization (NPL securitization) means a traditional securitization, that is not a resecuritization, where parameter W (as defined in § 3.133(b)(1)) for the underlying exposures is greater than or equal to 90 percent at the origination

cut-off date and at any subsequent date on which exposures are added to or removed from the pool of underlying exposures due to replenishment or restructuring.

Nonrefundable purchase price discount (NRPPD) means the difference between the outstanding principal balance of the underlying exposures at the time of sale and the price at which these exposures are sold by the originator to a company the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, when neither originator nor the original lender are reimbursed for this difference. In cases where the originator underwrites tranches of an NPL securitization for subsequent sale, the NRPPD may include the differences between the outstanding principal balance of the underlying exposures at the time of sale and the price at which all of the tranches are first sold to unrelated third parties. For any given piece of a securitization tranche, only its initial sale from the originator to investors is taken into account in the determination of NRPPD. The purchase prices of subsequent re-sales of a securitization tranche are not considered.

* * * * *

Non-significant investment in the capital of an unconsolidated financial institution means an investment by a national bank or Federal savings association subject to subpart E of this part in the capital of an unconsolidated financial institution where the national bank or Federal savings association owns 10 percent or less of the issued and outstanding common stock of the unconsolidated financial institution.

* * * * *

Prepaid credit protection arrangement means a contractual arrangement under which a protection purchaser transfers the credit risk of one or more reference exposures to a protection provider where:

(1) The protection provider pays an initial principal amount in cash to the protection purchaser at the inception of the transaction; and

(2) The protection purchaser is obligated to repay the initial principal amount to the protection provider on or before the maturity date of the transaction, less any losses that the protection purchaser realizes or otherwise recognizes due to nonpayment of all contractual payments due to be paid on the reference exposure or reference exposures by the obligors.

* * * * *

Protection amount (P) means, with respect to an exposure hedged by an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, or secured by financial collateral, the effective notional amount of the guarantee, credit derivative, or prepaid credit protection arrangement, or the fair value of the financial collateral, reduced to reflect any currency mismatch, maturity mismatch, or lack of restructuring coverage (as provided in §§ 3.36–3.37 or §§ 3.120–3.121, as appropriate).

* * * * *

Qualifying cross-product master netting agreement means a qualifying master netting agreement that provides for termination and close-out netting across multiple types of financial transactions or qualifying master netting agreements in the event of a counterparty's default, provided that the underlying financial transactions are derivative contracts or repo-style transactions that are not cleared transactions. In order to treat an agreement as a qualifying cross-product master netting agreement, a national bank or Federal savings association must comply with the requirements of § 3.3(c) of this part with respect to that agreement.

* * * * *

Qualifying master netting agreement means a written, legally enforceable agreement provided that:

* * * * *

(3) The agreement does not contain a walkaway clause (that is, a provision that permits a non-defaulting counterparty to make a lower payment than it otherwise would make under the agreement, or no payment at all, to a defaulter or the estate of a defaulter, even if the defaulter or the estate of the defaulter is a net creditor under the agreement); and

(4) In order to recognize an agreement as a qualifying master netting agreement for purposes of this subpart, a national bank or Federal savings association must comply with the requirements of § 3.3(d) with respect to that agreement.

* * * * *

Significant investment in the capital of an unconsolidated financial institution means an investment by a national bank or Federal savings association subject to subpart E of this part in the capital of an unconsolidated financial institution where the national bank or Federal savings association owns more than 10 percent of the issued and outstanding common stock of the unconsolidated financial institution.

* * * * *

Specified supranational entity means the Bank for International Settlements, the European Central Bank, the European Commission, the International Monetary Fund, the European Stability Mechanism, or the European Financial Stability Facility.

* * * * *

Speculative grade means that the entity to which the national bank or Federal savings association is exposed through a loan or security, or the reference entity with respect to a credit derivative, has adequate capacity to meet financial commitments in the near term, but is vulnerable to adverse economic conditions, such that should economic conditions deteriorate, the issuer or the reference entity would present an elevated default risk.

* * * * *

Standardized market risk-weighted assets means the standardized measure for market risk calculated under § 3.204(b) multiplied by 12.5.

* * * * *

Standardized total risk-weighted assets means:

(1) The sum of:

(i) Total risk-weighted assets for general credit risk as calculated under § 3.31;

(ii) Total risk-weighted assets for cleared transactions and default fund contributions as calculated under § 3.35;

(iii) Total risk-weighted assets for unsettled transactions as calculated under § 3.38;

(iv) Total risk-weighted assets for securitization exposures as calculated under § 3.42;

(v) Total risk-weighted assets for equity exposures as calculated under § 3.52 and § 3.53; and

(vi) For a market risk national bank or federal savings association only, market risk-weighted assets; less

(2) Any amount of the national bank's or Federal savings association's adjusted allowance for credit losses, as applicable, that is not included in tier 2 capital and any amount of "allocated transfer risk reserves."

* * * * *

Sub-speculative grade means that the entity to which the national bank or Federal savings association is exposed through a loan or security, or the reference entity with respect to a credit derivative, depends on favorable economic conditions to meet its financial commitments, such that should such economic conditions deteriorate the issuer or the reference entity likely would default on its financial commitments.

* * * * *

Synthetic securitization means a transaction in which:

(1) All or a portion of the credit risk of one or more underlying exposures is retained or transferred to one or more third parties through the use of one or more credit derivatives, or guarantees (other than a guarantee that transfers only the credit risk of an individual retail exposure) or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures; and

(4) All or substantially all of the underlying exposures are financial exposures with credit risk (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities).

* * * * *

Total credit risk-weighted assets means the sum of:

(1) Total risk-weighted assets for general credit risk as calculated under § 3.110;

(2) Total risk-weighted assets for cleared transactions and default fund contributions as calculated under § 3.116;

(3) Total risk-weighted assets for unsettled transactions as calculated under § 3.117; and

(4) Total risk-weighted assets for securitization exposures as calculated under § 3.132.

* * * * *

Traditional securitization means a transaction in which:

(1) All or a portion of the credit or equity risk of one or more underlying exposures is transferred to one or more third parties other than through the use of credit derivatives, guarantees, or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures;

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities);

(5) The underlying exposures are not owned by an operating company;

(6) The underlying exposures are not owned by a small business investment company defined in section 302 of the Small Business Investment Act;

(7) The underlying exposures are not owned by a firm an investment in which qualifies as a community development investment under section 24(Eleventh) of the National Bank Act;

(8) The OCC may determine that a transaction in which the underlying exposures are owned by an investment firm that exercises substantially unfettered control over the size and composition of its assets, liabilities, and off-balance sheet exposures is not a traditional securitization based on the transaction's leverage, risk profile, or economic substance;

(9) The OCC may deem a transaction that meets the definition of a traditional securitization, notwithstanding paragraph (5), (6), or (7) of this definition, to be a traditional securitization based on the transaction's leverage, risk profile, or economic substance; and

(10) The transaction is not:

(i) An investment fund;

(ii) A collective investment fund (as defined in 12 CFR 9.18 (national banks), 12 CFR 151.40 (Federal saving associations));

(iii) An employee benefit plan (as defined in paragraphs (3) and (32) of section 3 of ERISA), a "governmental plan" (as defined in 29 U.S.C. 1002(32)) that complies with the tax deferral qualification requirements provided in the Internal Revenue Code, or any similar employee benefit plan established under the laws of a foreign jurisdiction;

(iv) A synthetic exposure to the capital of a financial institution to the extent deducted from capital under § 3.22; or

(v) Registered with the SEC under the Investment Company Act of 1940 (15 U.S.C. 80a-1) or foreign equivalents thereof.

* * * * *

Variation margin amount means the fair value amount of the variation margin, as adjusted by the standard supervisory haircuts under § 3.121(c)(2)(iii), as applicable, that a counterparty to a netting set has posted to a national bank or Federal savings association less the fair value amount of the variation margin, as adjusted by the standard supervisory haircuts under § 3.121(c)(2)(iii), as applicable, posted by the national bank or Federal savings association to the counterparty.

* * * * *

Footnotes—3.2

³ For the standardized approach treatment of these exposures, see § 3.34(e) (OTC derivative contracts) or § 3.37(c) (repo-style transactions). For the treatment of these exposures under subpart E, see § 3.113.

* * * * *

■ 4. In § 3.3, revise paragraph (c) to read as follows:

§ 3.3 Operational requirements for counterparty credit risk.

* * * * *

(c) *Qualifying cross-product master netting agreement.* In order to recognize an agreement as a qualifying cross-product master netting agreement as defined in § 3.2, a national bank or Federal savings association must obtain a written legal opinion verifying the validity and enforceability of the agreement under applicable law of the relevant jurisdictions if the counterparty fails to perform upon an event of default, including upon receivership, insolvency, liquidation, or similar proceeding.

* * * * *

■ 5. Add a new section § 3.4 to read as follows:

§ 3.4 Threshold Indexing.

(a) *Methodology.* The dollar thresholds specified in paragraph (c) of this section shall be adjusted by multiplying the baseline threshold values specified in paragraph (c) of this section by one plus the cumulative percent change in the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured from the effective date of this rule, as further described in paragraph (b) of this section, and shall be rounded in accordance with paragraph (d) of this section.

(b) *Frequency.* (1) *In general—biennial adjustments.* Except as otherwise provided in paragraph (b)(2) and (b)(3) of this section, the adjustments described in paragraph (a) of this section shall be effective on October 1 following each consecutive two year period ending August 30, and using the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers as of August 30 of that year.

(2) *Off-year adjustments.* In the event that the OCC determines, during a year where no adjustment would be made under paragraph (b)(1), that the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured over the twelve month period ending August 30 of that year, is such that an adjustment under this section would be appropriate for that year, the OCC may make an

adjustment under this section for that year.

(3) *Periods of negative inflation.* Notwithstanding paragraph (b)(1) or (b)(2) of this section, if an adjustment of dollar thresholds using the cumulative percent change of the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers from the effective date of this rule or the most recent adjustment, as applicable, would not result in an increase from the current dollar thresholds, no adjustment will be made pursuant to paragraph (a) of this section.

(c) *Specified thresholds.* The thresholds in the following sections shall be adjusted in accordance with paragraph (a) of this section relative to the baseline threshold values as specified below.

(1) § 3.2, definition of Financial institution, paragraph (4)(i)(A), baseline threshold value \$10 million;

(2) § 3.101, definition of Regulatory retail exposure, paragraph (2), baseline threshold value \$1 million;

(3) § 3.101, definition of Small or medium-sized entity (SME), baseline threshold value \$50 million;

(4) § 3.150(b)(1), baseline threshold value \$1 billion;

(5) § 3.150(b)(2), baseline threshold values \$1 billion, \$30 billion, and \$120 million;

(6) § 3.150(b)(2)(i), baseline threshold value \$1 billion;

(7) § 3.150(b)(3), baseline threshold values \$30 billion and \$4.47 billion

(8) § 3.150(b)(3)(i), baseline threshold value \$30 billion;

(9) § 3.150(d)(2)(i)(A), baseline threshold value \$20,000;

(10) § 3.201(b)(1)(ii)(B), baseline threshold value \$5 billion;

(11) § 3.201(b)(2)(ii), baseline threshold value \$1 trillion;

(12) § 3.202 “Large market cap”, baseline threshold value \$2 billion;

(13) § 3.202, “Market risk covered position” (1)(ii)(D), baseline value \$20 million;

(14) § 3.202, “Small market cap”, baseline threshold value \$2 billion.

(d) *Rounding.* When adjusting thresholds under this section, each threshold shall be rounded based on the size of the threshold (e.g., thousands, millions, billions) to the nearest number with two significant digits.

(e) *Effective date of threshold adjustments.* The OCC shall announce the thresholds adjusted in accordance with this section by publication in the **Federal Register**. Such adjusted thresholds shall be effective on October 1 of the year during which an adjustment is made.

(f) *Failure to publish in the Federal Register.* In the event, for any reason,

the thresholds adjusted in accordance with this section are not published in the **Federal Register** in a year in which an adjustment is made under this section, the thresholds specified in paragraph (c) of this section will adjust as provided in this section and be effective on October 1, notwithstanding the lack of publication in the **Federal Register**.

* * * * *

■ 6. Add a new section § 3.5 to read as follows:

§ 3.5 Calculation of loan-to-value (LTV) ratio.

(a) *Loan-to-Value ratio.* The loan-to-value (LTV) ratio must be calculated as the extension of credit divided by the value of the property.

(b) *Extension of credit.* For purposes of a LTV ratio calculated under this section, the extension of credit is equal to the total outstanding amount of the loan including any undrawn committed amount of the loan.

(c) *Value of the property.* (1) For purposes of a LTV ratio calculated under this section, the value of the property is the market value of all real estate properties securing or being improved by the extension of credit plus the amount of any readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 34, appendix A to subpart D, that secures the extension of credit, subject to the following:

(i) For exposures subject to 12 CFR part 34, subpart C, the market value of property is a valuation that meets all requirements of that rule.

(ii) For exposures not subject to 12 CFR part 34, subpart C:

(A) The market value of real estate must be obtained from an independent valuation of the property using prudently conservative valuation criteria;

(B) The valuation must be done independently from the national bank's or Federal savings association's origination and underwriting process, and

(C) To ensure that the market value of the real estate is determined in a prudently conservative manner, the valuation must exclude expectations of price increases and must be adjusted downward to take into account the potential for the current market price to be significantly above the value that would be sustainable over the life of the loan.

(2) In the case where the exposure finances the purchase of the property, the value of the property is the lower of the market value obtained under

paragraph (c)(1)(i) or (ii), as applicable, and the actual acquisition cost.

(3) The value of the property must be measured at the time of origination, except in the following circumstances:

(i) The OCC requires a national bank or Federal savings association to revise the value of the property downward;

(ii) The value of the property must be adjusted downward due to an extraordinary event that results in a permanent reduction of the property value; or

(iii) The value of the property may be increased to reflect modifications made to the property that increase the market value, as determined according to the requirements in paragraphs (c)(1)(i) or (ii) of this section.

(4) Readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 34, appendix A to subpart D, must be appropriately discounted by the national bank or Federal savings association consistent with the national bank's or Federal savings association's usual practices for making loans secured by such collateral.

* * * * *

■ 7. In § 3.10:

■ a. Revise paragraph (a)(1)(v);

■ b. Revise paragraph (b);

■ c. Revise paragraph (c);

■ d. Revise paragraph (d) introductory text; and

■ e. Revise paragraph (d)(3)(ii).

The revisions read as follows:

§ 3.10 Minimum capital requirements.

(a) * * *

(1) * * *

(v) For a Category I national bank or Federal savings association, a Category II national bank or Federal Savings association, and a Category III national bank or Federal savings association, a supplementary leverage ratio of 3 percent.

* * * * *

(b) *Standardized capital ratio calculations.* For a national bank or Federal savings association that is not a Category I national bank or Federal savings association or a Category II national bank or Federal savings association:

(1) *Common equity tier 1 capital ratio.* The national bank's or Federal savings association's common equity tier 1 capital ratio is the ratio of the national bank's or Federal savings association's common equity tier 1 capital to selected total risk-weighted assets;

(2) *Tier 1 capital ratio.* The national bank's or Federal savings association's tier 1 capital ratio is the ratio of the national bank's or Federal savings association's tier 1 capital to selected total risk-weighted assets;

(3) *Total capital ratio.* The national bank's or Federal savings association's total capital ratio is the ratio of the national bank's or Federal savings association's total capital to selected total risk-weighted assets; and

(4) *Leverage ratio.* The national bank's or Federal savings association's leverage ratio is the ratio of the national bank's or Federal savings association's tier 1 capital to the national bank's or Federal savings association's average total consolidated assets as reported on the national bank's or Federal savings association's Call Report, minus amounts deducted from tier 1 capital under § 3.22(a), (c) and (d).

(5) *Selected total risk-weighted assets.* A national bank's or Federal savings association's selected total risk-weighted assets is either the national bank's or Federal savings association's standardized total risk-weighted assets or expanded total risk-weighted assets, as selected by the national bank or Federal savings association. A national bank or Federal savings association may change its choice for selected total risk-weighted assets by providing the OCC with prior notice of the change at least four full calendar quarters before the calendar quarter in which the change will take effect.

(c) *Supplementary leverage ratio.* (1) The supplementary leverage ratio of a Category I national bank or Federal savings association, a Category II national bank or Federal Savings association, or a Category III national bank or Federal savings association is the ratio of its tier 1 capital to total leverage exposure. Total leverage exposure is calculated as the sum of:

(i) The mean of the on-balance sheet assets calculated as of each day of the reporting quarter; and

(ii) The mean of the off-balance sheet exposures calculated as of the last day of each of the most recent three months, minus the applicable deductions under § 3.22(a), (c), and (d).

(2) For purposes of this part, total leverage exposure means the sum of the items described in paragraphs (c)(2)(i) through (viii) of this section, as adjusted pursuant to paragraph (c)(2)(ix) of this section for a clearing member national bank or Federal savings association and paragraph (c)(2)(x) of this section for a custody bank:

(i) The balance sheet carrying value of all of the national bank's or Federal savings association's on-balance sheet assets, net of adjusted allowances for credit losses, plus the value of securities sold under a repurchase transaction or a securities lending transaction that qualifies for sales treatment under GAAP, less amounts deducted from tier

1 capital under § 3.22(a), (c), and (d), less the value of securities received in security-for-security repo-style transactions, where the national bank or Federal savings association acts as a securities lender and includes the securities received in its on-balance sheet assets but has not sold or re-hypothecated the securities received, and, for a national bank or Federal savings association that uses the Standardized approach for counterparty credit risk (SA-CCR) § 3.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, less the fair value of any derivative contracts;

(ii) (A) For a national bank or Federal savings association that uses the current exposure methodology under § 3.34(b) for its standardized total risk-weighted assets, the potential future credit exposure (PFE) for each derivative contract or each single-product netting set of derivative contracts (including a cleared transaction except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the national bank or Federal savings association, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP), to which the national bank or Federal savings association is a counterparty as determined under § 3.34, but without regard to § 3.34(c), provided that:

(1) A national bank or Federal savings association may choose to exclude the PFE of all credit derivatives or other similar instruments through which it provides credit protection when calculating the PFE under § 3.34, but without regard to § 3.34(c), provided that it does not adjust the net-to-gross ratio (NGR); and

(2) A national bank or Federal savings association that chooses to exclude the PFE of credit derivatives or other similar instruments through which it provides credit protection pursuant to paragraph (c)(2)(ii)(A) of this section must do so consistently over time for the calculation of the PFE for all such instruments; or

(B) (1) For a national bank or Federal savings association that uses SA-CCR under § 3.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, the PFE under SA-CCR for each derivative contract or single product netting set to which the national bank or Federal savings association is a counterparty (including cleared transactions except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the national

bank or Federal savings association, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP), as determined under § 3.114(g), in which the term C in § 3.114(g)(1) equals zero, and, for any counterparty that is not a commercial end-user, multiplied by 1.4. For purposes of this paragraph (c)(2)(ii)(A), a national bank or Federal savings association may set the value of the term C in § 3.114(g)(1) equal to the amount of collateral posted by a clearing member client of the national bank or Federal savings association in connection with the client-facing derivative transactions within the netting set; and

(2) A national bank or Federal savings association may choose to exclude the PFE of all credit derivatives or other similar instruments through which it provides credit protection when calculating the PFE under § 3.114, provided that it does so consistently over time for the calculation of the PFE for all such instruments;

(iii)(A)(1) For a national bank or Federal savings association that uses the current exposure methodology under § 3.34(b) for its standardized total risk-weighted assets, the amount of cash collateral that is received from a counterparty to a derivative contract and that has offset the mark-to-fair value of the derivative asset, or cash collateral that is posted to a counterparty to a derivative contract and that has reduced the national bank's or Federal savings association's on-balance sheet assets, unless such cash collateral is all or part of variation margin that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section; and

(2) The variation margin is used to reduce the current credit exposure of the derivative contract, calculated as described in § 3.34(b), and not the PFE; and

(3) For the purpose of the calculation of the NGR described in § 3.34(b)(2)(ii)(B), variation margin described in paragraph (c)(2)(iii)(A)(2) of this section may not reduce the net current credit exposure or the gross current credit exposure; or

(B)(1) For a national bank or Federal savings association that uses Standardized approach for derivative contracts under § 3.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, the replacement cost under § 3.114 of each derivative contract or single product netting set of derivative contracts to which the national bank or Federal savings association is a

counterparty, calculated according to the following formula, and, for any counterparty that is not a commercial end-user, multiplied by 1.4:

$$\text{Replacement Cost} = \max\{V - \text{CVM}_r + \text{CVM}_p; 0\}$$

Where:

V equals the fair value for each derivative contract or each netting set of derivative contracts (including a cleared transaction except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the national bank or Federal savings association, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP);

CVM_r equals the amount of cash collateral received from a counterparty to a derivative contract and that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section, or, in the case of a client-facing derivative transaction, the amount of collateral received from the clearing member client; and

CVM_p equals the amount of cash collateral that is posted to a counterparty to a derivative contract and that has not offset the fair value of the derivative contract and that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section, or, in the case of a client-facing derivative transaction, the amount of collateral posted to the clearing member client;

(2) Notwithstanding paragraph (c)(2)(iii)(A)(1) of this section, where multiple netting sets are subject to a single variation margin agreement, a national bank or Federal savings association must apply the formula for replacement cost provided in § 3.114(j)(1), in which the term CMA may only include cash collateral that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section; and

(3) For purposes of paragraph (c)(2)(iii)(A)(1) of this section, a national bank or Federal savings association must treat a derivative contract that references an index as if it were multiple derivative contracts each referencing one component of the index if the national bank or Federal savings association elected to treat the derivative contract as multiple derivative contracts under § 3.114(e)(6);

(C) For derivative contracts that are not cleared through a QCCP, the cash collateral received by the recipient counterparty is not segregated (by law, regulation, or an agreement with the counterparty);

(D) Variation margin is calculated and transferred on a daily basis based on the mark-to-fair value of the derivative contract;

(E) The variation margin transferred under the derivative contract or the governing rules of the CCP or QCCP for a cleared transaction is the full amount that is necessary to fully extinguish the net current credit exposure to the counterparty of the derivative contracts, subject to the threshold and minimum transfer amounts applicable to the counterparty under the terms of the derivative contract or the governing rules for a cleared transaction;

(F) The variation margin is in the form of cash in the same currency as the currency of settlement set forth in the derivative contract, provided that for the purposes of this paragraph (c)(2)(iii)(F), currency of settlement means any currency for settlement specified in the governing qualifying master netting agreement and the credit support annex to the qualifying master netting agreement, or in the governing rules for a cleared transaction; and

(G) The derivative contract and the variation margin are governed by a qualifying master netting agreement between the legal entities that are the counterparties to the derivative contract or by the governing rules for a cleared transaction, and the qualifying master netting agreement or the governing rules for a cleared transaction must explicitly stipulate that the counterparties agree to settle any payment obligations on a net basis, taking into account any variation margin received or provided under the contract if a credit event involving either counterparty occurs;

(iv) The effective notional principal amount (that is, the apparent or stated notional principal amount multiplied by any multiplier in the derivative contract) of a credit derivative, or other similar instrument, through which the national bank or Federal savings association provides credit protection, provided that:

(A) The national bank or Federal savings association may reduce the effective notional principal amount of the credit derivative by the amount of any reduction in the mark-to-fair value of the credit derivative if the reduction is recognized in common equity tier 1 capital;

(B) The national bank or Federal savings association may reduce the effective notional principal amount of the credit derivative by the effective notional principal amount of a purchased credit derivative or other similar instrument, provided that the remaining maturity of the purchased credit derivative is equal to or greater than the remaining maturity of the credit derivative through which the national bank or Federal savings

association provides credit protection and that:

(1) With respect to a credit derivative that references a single exposure, the reference exposure of the purchased credit derivative is to the same legal entity and ranks *pari passu* with, or is junior to, the reference exposure of the credit derivative through which the national bank or Federal savings association provides credit protection; or

(2) With respect to a credit derivative that references multiple exposures, the reference exposures of the purchased credit derivative are to the same legal entities and rank *pari passu* with the reference exposures of the credit derivative through which the national bank or Federal savings association provides credit protection, and the level of seniority of the purchased credit derivative ranks *pari passu* to the level of seniority of the credit derivative through which the national bank or Federal savings association provides credit protection;

(3) Where a national bank or Federal savings association has reduced the effective notional principal amount of a credit derivative through which the national bank or Federal savings association provides credit protection in accordance with paragraph (c)(2)(iv)(A) of this section, the national bank or Federal savings association must also reduce the effective notional principal amount of a purchased credit derivative used to offset the credit derivative through which the national bank or Federal savings association provides credit protection, by the amount of any increase in the mark-to-fair value of the purchased credit derivative that is recognized in common equity tier 1 capital; and

(4) Where the national bank or Federal savings association purchases credit protection through a total return swap and records the net payments received on a credit derivative through which the national bank or Federal savings association provides credit protection in net income, but does not record offsetting deterioration in the mark-to-fair value of the credit derivative through which the national bank or Federal savings association provides credit protection in net income (either through reductions in fair value or by additions to reserves), the national bank or Federal savings association may not use the purchased credit protection to offset the effective notional principal amount of the related credit derivative through which the national bank or Federal savings association provides credit protection;

(v) Where a national bank or Federal savings association acting as a principal has more than one repo-style transaction with the same counterparty and has offset the gross value of receivables due from a counterparty under reverse repurchase transactions by the gross value of payables under repurchase transactions due to the same counterparty, the gross value of receivables associated with the repo-style transactions less any on-balance sheet receivables amount associated with these repo-style transactions included under paragraph (c)(2)(i) of this section, unless the following criteria are met:

(A) The offsetting transactions have the same explicit final settlement date under their governing agreements;

(B) The right to offset the amount owed to the counterparty with the amount owed by the counterparty is legally enforceable in the normal course of business and in the event of receivership, insolvency, liquidation, or similar proceeding; and

(C) Under the governing agreements, the counterparties intend to settle net, settle simultaneously, or settle according to a process that is the functional equivalent of net settlement, (that is, the cash flows of the transactions are equivalent, in effect, to a single net amount on the settlement date), where both transactions are settled through the same settlement system, the settlement arrangements are supported by cash or intraday credit facilities intended to ensure that settlement of both transactions will occur by the end of the business day, and the settlement of the underlying securities does not interfere with the net cash settlement;

(vi) The counterparty credit risk of a repo-style transaction, including where the national bank or Federal savings association acts as an agent for a repo-style transaction and indemnifies the customer with respect to the performance of the customer's counterparty in an amount limited to the difference between the fair value of the security or cash its customer has lent and the fair value of the collateral the borrower has provided, calculated as follows:

(A) If the transaction is not subject to a qualifying master netting agreement, the counterparty credit risk (E^*) for transactions with a counterparty must be calculated on a transaction by transaction basis, such that each transaction i is treated as its own netting set, in accordance with the following formula, where E_i is the fair value of the instruments, gold, or cash that the national bank or Federal savings

association has lent, sold subject to repurchase, or provided as collateral to the counterparty, and C_i is the fair value of the instruments, gold, or cash that the national bank or Federal savings association has borrowed, purchased subject to resale, or received as collateral from the counterparty:

$E_i^* = \max \{0, [E_i - C_i]\}$; and

(B) If the transaction is subject to a qualifying master netting agreement, the counterparty credit risk (E^*) must be calculated as the greater of zero and the total fair value of the instruments, gold, or cash that the national bank or Federal savings association has lent, sold subject to repurchase or provided as collateral to a counterparty for all transactions included in the qualifying master netting agreement ($\sum E_i$), less the total fair value of the instruments, gold, or cash that the national bank or Federal savings association borrowed, purchased subject to resale or received as collateral from the counterparty for those transactions ($\sum C_i$), in accordance with the following formula:

$E^* = \max \{0, [\sum E_i - \sum C_i]\}$

(vii) If a national bank or Federal savings association acting as an agent for a repo-style transaction provides a guarantee to a customer of the security or cash its customer has lent or borrowed with respect to the performance of the customer's counterparty and the guarantee is not limited to the difference between the fair value of the security or cash its customer has lent and the fair value of the collateral the borrower has provided, the amount of the guarantee that is greater than the difference between the fair value of the security or cash its customer has lent and the value of the collateral the borrower has provided;

(viii) The credit equivalent amount of all off-balance sheet exposures of the national bank or Federal savings association, excluding repo-style transactions, repurchase or reverse repurchase or securities borrowing or lending transactions that qualify for sales treatment under GAAP, and derivative transactions, determined using:

(A) For a national bank or Federal savings association that elects to calculate its standardized total risk-weighted assets under § 3.10(b), the applicable credit conversion factor under § 3.33(b), provided, however, that the minimum credit conversion factor that may be assigned to an off-balance sheet exposure under this paragraph is 10 percent; or

(B) For a national bank or Federal savings association that elects to

calculate its expanded total risk-weighted assets under § 3.10(b), a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, the applicable credit conversion factor under § 3.112(b), provided, however, that the minimum credit conversion factor that may be assigned to an off-balance sheet exposure under this paragraph is 10 percent; and

(ix) For a national bank or Federal savings association that is a clearing member:

(A) A clearing member national bank or Federal savings association that guarantees the performance of a clearing member client with respect to a cleared transaction must treat its exposure to the clearing member client as a derivative contract or repo-style transaction, as applicable, for purposes of determining its total leverage exposure;

(B) A clearing member national bank or Federal savings association that guarantees the performance of a CCP with respect to a transaction cleared on behalf of a clearing member client must treat its exposure to the CCP as a derivative contract or repo-style transaction, as applicable, for purposes of determining its total leverage exposure;

(C) A clearing member national bank or Federal savings association that does not guarantee the performance of a CCP with respect to a transaction cleared on behalf of a clearing member client may exclude its exposure to the CCP for purposes of determining its total leverage exposure;

(D) A national bank or Federal savings association that is a clearing member may exclude from its total leverage exposure the effective notional principal amount of credit protection sold through a credit derivative contract, or other similar instrument, that it clears on behalf of a clearing member client through a CCP as calculated in accordance with paragraph (c)(2)(iv) of this section;

(E) Notwithstanding paragraphs (c)(2)(ix)(A) through (C) of this section, a national bank or Federal savings association may exclude from its total leverage exposure a clearing member's exposure to a clearing member client for a derivative contract if the clearing member client and the clearing member are affiliates and consolidated for financial reporting purposes on the national bank's or Federal savings association's balance sheet; and

(F) Notwithstanding paragraph (c)(2)(ix)(A), a national bank or Federal savings association that has elected

under § 3.113(c) to treat any repo-style transactions subject to a qualifying cross-product master netting agreement as derivative contracts must treat any such repo-style transactions as a derivative contract for purposes of this paragraph (c).

(x) A custody bank shall exclude from its total leverage exposure the lesser of:

(A) The amount of funds that the custody bank has on deposit at a qualifying central bank; and

(B) The amount of funds in deposit accounts at the custody bank that are linked to fiduciary or custodial and safekeeping accounts at the custody bank. For purposes of this paragraph (c)(2)(x), a deposit account is linked to a fiduciary or custodial and safekeeping account if the deposit account is provided to a client that maintains a fiduciary or custodial and safekeeping account with the custody bank and the deposit account is used to facilitate the administration of the fiduciary or custodial and safekeeping account.

(d) *Expanded capital ratio calculations.* A Category I national bank or Federal savings association, or a Category II national bank or Federal savings association that elects to use expanded total risk-weighted assets for purposes of § 3.10(a)(5) must determine its regulatory capital ratios as described in paragraphs (d)(1) through (4) of this section.

(1) *Common equity tier 1 capital ratio.* The national bank's or Federal savings association's common equity tier 1 capital ratio is the ratio of the national bank's or Federal savings association's common equity tier 1 capital to expanded total risk-weighted assets;

(2) *Tier 1 capital ratio.* The national bank's or Federal savings association's tier 1 capital ratio is the ratio of the national bank's or Federal savings association's tier 1 capital to expanded total risk-weighted assets;

(3) *Total capital ratio.* The national bank's or Federal savings association's total capital ratio is the ratio of the national bank's or Federal savings association's total capital to expanded total risk-weighted assets; and

(4) *Leverage ratio.* The national bank's or Federal savings association's leverage ratio is the ratio of the national bank's or Federal savings association's tier 1 capital to the national bank's or Federal savings association's average total consolidated assets as reported on the national bank's or Federal savings association's Call Report, minus amounts deducted from tier 1 capital under § 3.22(a), (c) and (d).

* * * * *

■ 8. In § 3.11, revise paragraphs (a)(2)(iv), (b)(1), (b)(1)(ii), and (b)(1)(iii) to read as follows:

§ 3.11 Capital conservation buffer and countercyclical capital buffer amount.

* * * * *

(a) * * *

(2) * * *

(iv) Private sector credit exposure.

Private sector credit exposure means an exposure to a company or an individual that is not an exposure to a sovereign, a specified supranational entity, a MDB, a PSE, or a GSE.

* * * * *

(b) * * *

(1) *General.* A Category I or Category II national bank or Federal savings association, and a Category III national bank or Federal savings association, must calculate a countercyclical capital buffer amount in accordance with paragraphs (b)(1)(i) through (iv) of this section for purposes of determining its maximum payout ratio under Table 1 to this section.

(i) * * *

(ii) *Amount.* A Category I or Category II national bank or Federal savings association, and a Category III national bank or Federal savings association, has a countercyclical capital buffer amount determined by calculating the weighted average of the countercyclical capital buffer amounts established for the national jurisdictions where the national bank's or Federal savings association's private sector credit exposures are located, as specified in paragraphs (b)(2) and (3) of this section.

(iii) *Weighting.* The weight assigned to a jurisdiction's countercyclical capital buffer amount is calculated by dividing the total risk-weighted assets for the national bank's or Federal savings association's private sector credit exposures located in the jurisdiction by the total risk-weighted assets for all of the national bank's or Federal savings association's private sector credit exposures. The methodology a national bank or Federal savings association uses for determining risk-weighted assets for purposes of this paragraph (b) must be the methodology that determines its risk-based capital ratios under § 3.10. Notwithstanding the previous sentence, the risk-weighted asset amount for a private sector credit exposure that is a covered position under subpart F of this part is its standardized default risk capital requirement as determined under § 3.210 multiplied by 12.5.

* * * * *

■ 9. In § 3.12, revise paragraph (a)(2) and remove paragraph (a)(4).

The revision reads as follows:

§ 3.12 Community bank leverage ratio framework.

(a) * * *

(2) For purposes of this section, a qualifying community banking organization means a national bank or Federal savings association that is not a Category I national bank or Federal savings association, or a Category II national bank or savings association, and that satisfies all of the following criteria:

* * * * *

■ 10. In § 3.20, revise paragraphs (c)(1)(xiv) and (d)(1)(xi) and (d)(3) to read as follows:

§ 3.20 Capital components and eligibility criteria for regulatory capital instruments.

* * * * *

(c) * * *

(1) * * *

(xiv) For a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), the governing agreement, offering circular, or prospectus of an instrument issued after the date upon which the national bank or Federal savings association becomes a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), must disclose that the holders of the instrument may be fully subordinated to interests held by the U.S. government in the event that the national bank or Federal savings association enters into a receivership, insolvency, liquidation, or similar proceeding.

* * * * *

(d) * * *

(1) * * *

(xi) For a Category I national bank or Federal savings association, a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), the governing agreement, offering circular, or prospectus of an instrument issued after the date on which the national bank or Federal savings association becomes a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), must disclose that the holders of the instrument may

be fully subordinated to interests held by the U.S. government in the event that the national bank or Federal savings association enters into a receivership, insolvency, liquidation, or similar proceeding.

* * * * *

(3) AACL up to 1.25 percent of a national bank's or Federal savings association's standardized total risk-weighted assets or total credit risk-weighted assets, as applicable, not including any amount of AACL (and excluding, in the case of a market risk national bank or Federal savings association, its market risk weighted assets).

* * * * *

■ 11. In § 3.21:

■ a. In paragraph (a)(1), remove the words “an advanced approaches national bank or Federal savings association” and add in their place the words “Category I national bank or Federal savings association, Category II national bank or Federal savings association, or national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5)”;

■ b. Revise paragraph (b):

The revision reads as follows:

§ 3.21 Minority interest.

* * * * *

(b)(1) *Applicability.* For purposes of § 3.20, a Category I national bank or Federal savings association, a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), is subject to the minority interest limitations in this paragraph (b) if:

(i) A consolidated subsidiary of the national bank or Federal savings association has issued regulatory capital that is not owned by the national bank or federal savings association; and

(ii) For each relevant regulatory capital ratio of the consolidated subsidiary, the ratio exceeds the sum of the subsidiary's minimum regulatory capital requirements plus its capital conservation buffer.

(2) *Difference in capital adequacy standards at the subsidiary level.* For purposes of the minority interest calculations in this section, if the consolidated subsidiary issuing the capital is not subject to capital adequacy standards similar to those of the national bank or Federal savings association, the national bank or Federal savings association must assume that the capital adequacy standards of the national bank or Federal savings association apply to the subsidiary.

(3) *Common equity tier 1 minority interest includable in the common equity tier 1 capital of the national bank or Federal savings association.* For each consolidated subsidiary of a national bank or Federal savings association, the amount of common equity tier 1 minority interest the national bank or Federal savings association may include in common equity tier 1 capital is equal to:

(i) The common equity tier 1 minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's common equity tier 1 capital that is not owned by the national bank or Federal savings association, multiplied by the difference between the common equity tier 1 capital of the subsidiary and the lower of:

(A) The amount of common equity tier 1 capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus payments under § 3.11 or equivalent standards established by the subsidiary's home country supervisor; or

(B)(1) The expanded total risk-weighted assets of the national bank or Federal savings association that relate to the subsidiary multiplied by

(2) The common equity tier 1 capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 3.11 or equivalent standards established by the subsidiary's home country supervisor.

(4) *Tier 1 minority interest includable in the tier 1 capital of the national bank or Federal savings association.* For each consolidated subsidiary of the national bank or Federal savings association, the amount of tier 1 minority interest the national bank or Federal savings association may include in tier 1 capital is equal to:

(i) The tier 1 minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's tier 1 capital that is not owned by the national bank or Federal savings association multiplied by the difference between the tier 1 capital of the subsidiary and the lower of:

(A) The amount of tier 1 capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus payments under § 3.11 or equivalent standards established by the subsidiary's home country supervisor, or

(B)(1) The expanded total risk-weighted assets of the national bank or

Federal savings association that relate to the subsidiary multiplied by

(2) The tier 1 capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 3.11 or equivalent standards established by the subsidiary's home country supervisor.

(5) *Total capital minority interest includable in the total capital of the national bank or Federal savings association.* For each consolidated subsidiary of the national bank or Federal savings association, the amount of total capital minority interest the national bank or Federal savings association may include in total capital is equal to:

(i) The total capital minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's total capital that is not owned by the national bank or Federal savings association multiplied by the difference between the total capital of the subsidiary and the lower of:

(A) The amount of total capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus payments under § 3.11 or equivalent standards established by the subsidiary's home country supervisor, or

(B) (1) The expanded total risk-weighted assets of the national bank or Federal savings association that relate to the subsidiary multiplied by

(2) The total capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 3.11 or equivalent standards established by the subsidiary's home country supervisor.

* * * * *

■ 12. In § 3.22:

■ a. Revise paragraphs (a)(1) and (a)(4);
■ b. Remove paragraph (a)(6);
■ c. Redesignate paragraph (a)(7) as new paragraph (a)(6), and redesignate paragraph (a)(8) and the new paragraph (a)(7);

■ d. In paragraph (b)(2)(i) and (b)(2)(iv), remove the words “an advanced approaches national bank or Federal savings association” and add in their place the words “a Category I national bank or Federal savings association, a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5),”;

■ e. Revise paragraph (b)(2)(ii);

■ f. In paragraph (b)(2)(iii) and (b)(2)(iv), remove the words “an advanced

approaches national bank or Federal savings association” and add in their place the words “a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5)”;

■ g. In footnote 21, in paragraph (b)(2)(iii), remove the words “12 CFR part 225 (Board); 12 CFR part 325, and 12 CFR part 390” and add in their place “12 CFR part 217 (Board); and 12 CFR part 325 (FDIC)”;

■ h. In footnote 22, in paragraph (b)(2)(iv)(A), remove the words “12 CFR part 225 (Board); 12 CFR part 325, and 12 CFR part 390” and add in their place “12 CFR part 217 (Board); and 12 CFR part 325 (FDIC)”;

■ i. In footnote 23, in paragraph (c), remove the words “ALLL or AACL, as applicable,” and add in its places “AACL”;

■ j. Revise paragraphs (c)(2);

■ k. In paragraph (c)(4), remove the words “an advanced approaches national bank or Federal savings association” and replace them with a Category I national bank or Federal savings association or a Category II national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5);

■ l. Revise paragraphs (c)(5)(i) through (iv);

■ m. Revise paragraphs (c)(6);

■ n. Revise paragraph (d)(1).

■ o. Remove and reserve paragraph (d)(1)(iii);

■ p. Revise paragraph (d)(2);

■ q. Revise paragraph (f); and

■ r. Revise paragraph (g).

The revisions read as follows:

§ 3.22 Regulatory capital adjustments and deductions.

(a) * * *

(1) * * *

(ii) For a national bank or Federal savings association subject to subpart E of this part, goodwill that is embedded in the valuation of a significant investment in the capital of an unconsolidated financial institution in the form of common stock (and that is reflected in the consolidated financial statements of the national bank or Federal savings association), in accordance with paragraph (d) of this section;

* * * * *

(4)(i) Any gain-on-sale in connection with a securitization exposure; and

(ii) For a Category I national bank or Federal savings association or a

Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), the portion of any CEO that does not constitute an after-tax gain-on-sale;

* * * * *

(b) * * *

(2) * * *

(i) A national bank or Federal savings association that is not a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), may make a one-time election to opt out of the requirement to include all components of AOCI (with the exception of accumulated net gains and losses on cash flow hedges related to items that are not fair-valued on the balance sheet) in common equity tier 1 capital (AOCI opt-out election). A national bank or Federal savings association that makes an AOCI opt-out election in accordance with this paragraph (b)(2) must adjust common equity tier 1 capital as follows:

(A) Subtract any net unrealized gains and add any net unrealized losses on available-for-sale securities;

(B) Subtract any accumulated net gains and add any accumulated net losses on cash flow hedges;

(C) Subtract any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans (excluding, at the national bank's or Federal savings association's option, the portion relating to pension assets deducted under paragraph (a)(5) of this section); and

(D) Subtract any net unrealized gains and add any net unrealized losses on held-to-maturity securities that are included in AOCI.

(ii) A national bank or Federal savings association that is not a Category I national bank or Federal savings association, a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must make its AOCI opt-out election in the Call Report, during the first reporting period after the national bank or Federal savings association is required to comply with subpart A of this part. If the national bank or Federal savings association was previously a Category I national bank or Federal savings association, a Category II

national bank or Federal savings association, or a national bank or Federal savings association that used expanded total risk-weighted assets for purposes of § 3.10(a)(5), the national bank or Federal savings association may not make an AOCI opt-out election under this paragraph (b)(2)(ii).

* * * * *

* * * * *

(c) * * * 23

(1) Investment in the national bank's or Federal savings association's own capital or covered debt instruments. A national bank or Federal savings association must deduct an investment in the national bank's or Federal savings association's own capital instruments; and a Category I national bank or Federal savings association, a Category II national bank or Federal savings association, and a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) also must deduct an investment in the national bank's or Federal savings association's own covered debt instruments, as follows:

* * * * *

(iv) A Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must deduct an investment in the institution's own covered debt instruments from its tier 2 capital elements, as applicable. If the national bank or Federal savings association does not have a sufficient amount of tier 2 capital to effect this deduction, the national bank or Federal savings association must deduct the shortfall amount from the next higher (that is, more subordinated) component of regulatory capital.

* * * * *

(2) Corresponding deduction approach. For purposes of subpart C of this part, the corresponding deduction approach is the methodology used for the deductions from regulatory capital related to reciprocal cross holdings (as described in paragraph (c)(3) of this section), investments in the capital of unconsolidated financial institutions for a national bank or Federal savings association that is not a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) (as described in paragraph

(c)(4) of this section), non-significant investments in the capital of unconsolidated financial institutions for a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) (as described in paragraph (c)(5) of this section), and non-common stock significant investments in the capital of unconsolidated financial institutions for a Category I national bank or Federal savings association or a Category II national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) (as described in paragraph (c)(6) of this section). Under the corresponding deduction approach, a national bank or Federal savings association must make deductions from the component of capital for which the underlying instrument would qualify if it were issued by the national bank or Federal savings association itself, as described in paragraphs (c)(2)(i) through (iii) of this section. If the national bank or Federal savings association does not have a sufficient amount of a specific component of capital to effect the required deduction, the shortfall must be deducted according to paragraph (f) of this section.

* * * * *

(ii) * * *

(D) For a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), a tier 2 capital instrument if it is a covered debt instrument.

* * * * *

(3) * * *

(ii) A Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must deduct an investment in any covered debt instrument that the institution holds reciprocally with another financial institution, where such reciprocal cross holdings result from a formal or informal arrangement to swap, exchange, or otherwise intend to hold each other's capital or covered debt instruments, by applying the corresponding deduction approach in paragraph (c)(2) of this section.

(4) Investments in the capital of unconsolidated financial institutions. A national bank or Federal savings association that is not a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must deduct its investments in the capital of unconsolidated financial institutions (as defined in § 3.2) that exceed 25 percent of the sum of the national bank or Federal savings association's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section by applying the corresponding deduction approach in paragraph (c)(2) of this section.²⁴ The deductions described in this section are net of associated DTLs in accordance with paragraph (e) of this section. In addition, with the prior written approval of the OCC, a national bank or Federal savings association that underwrites a failed underwriting, for the period of time stipulated by the OCC, is not required to deduct an investment in the capital of an unconsolidated financial institution pursuant to this paragraph (c) to the extent the investment is related to the failed underwriting.²⁵

(5) * * *

(i) A Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must deduct its non-significant investments in the capital of unconsolidated financial institutions (as defined in § 3.2) that, in the aggregate and together with any investment in a covered debt instrument (as defined in § 3.2) issued by a financial institution in which the national bank or Federal savings association does not have a significant investment in the capital of the unconsolidated financial institution (as defined in § 3.2), exceeds 10 percent of the sum of the national bank's or Federal savings association's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section (the 10 percent threshold for non-significant investments) by applying the corresponding deduction approach in paragraph (c)(2) of this section.²⁶ The deductions described in this paragraph

are net of associated DTLs in accordance with paragraph (e) of this section. In addition, with the prior written approval of the OCC, a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) that underwrites a failed underwriting, for the period of time stipulated by the OCC, is not required to deduct from capital a non-significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph (c)(5) to the extent the investment is related to the failed underwriting.²⁷ For any calculation under this paragraph (c)(5)(i), a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) may exclude the amount of an investment in a covered debt instrument under paragraph (c)(5)(iii) or (iv) of this section, as applicable.

(ii) For a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), the amount to be deducted under this paragraph (c)(5) from a specific capital component is equal to:

(A) The national bank's or Federal savings association's aggregate non-significant investments in the capital of an unconsolidated financial institution and, if applicable, any investments in a covered debt instrument subject to deduction under this paragraph (c)(5), exceeding the 10 percent threshold for non-significant investments, multiplied by

(B) The ratio of the national bank's or Federal savings association's aggregate non-significant investments in the capital of an unconsolidated financial institution (in the form of such capital component) to the national bank's or Federal savings association's total non-significant investments in unconsolidated financial institutions, with an investment in a covered debt instrument being treated as tier 2 capital for this purpose.

(iii) For purposes of applying the deduction under paragraph (c)(5)(i) of this section, a Category II national bank or Federal savings association, or a national bank or Federal savings

association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5), may exclude from the deduction the amount of the national bank's or Federal savings association's gross long position, in accordance with § 3.22(h)(2), in investments in covered debt instruments issued by financial institutions in which the national bank or Federal savings association does not have a significant investment in the capital of the unconsolidated financial institutions up to an amount equal to 5 percent of the sum of the national bank's or Federal savings association's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section, net of associated DTLs in accordance with paragraph (e) of this section.

(iv) Prior to applying the deduction under paragraph (c)(5)(i) of this section:

(A) A Category I national bank or Federal savings association may designate any investment in a covered debt instrument as an excluded covered debt instrument, as defined in § 3.2.

(B) A Category I national bank or Federal savings association must deduct, according to the corresponding deduction approach in paragraph (c)(2) of this section, its gross long position, calculated in accordance with paragraph (h)(2) of this section, in a covered debt instrument that was originally designated as an excluded covered debt instrument, in accordance with paragraph (c)(5)(iv)(A) of this section, but no longer qualifies as an excluded covered debt instrument.

(C) A Category I national bank or Federal savings association must deduct according to the corresponding deduction approach in paragraph (c)(2) of this section the amount of its gross long position, calculated in accordance with paragraph (h)(2) of this section, in a direct or indirect investment in a covered debt instrument that was originally designated as an excluded covered debt instrument, in accordance with paragraph (c)(5)(iv)(A) of this section, and has been held for more than thirty business days.

(D) A Category I national bank or Federal savings association must deduct according to the corresponding deduction approach in paragraph (c)(2) of this section its gross long position, calculated in accordance with paragraph (h)(2) of this section, of its aggregate position in excluded covered debt instruments that exceeds 5 percent of the sum of the national bank's or Federal savings association's common equity tier 1 capital elements minus all

deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section, net of associated DTLs in accordance with paragraph (e) of this section.

(6) Significant investments in the capital of unconsolidated financial institutions that are not in the form of common stock. If a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) has a significant investment in the capital of an unconsolidated financial institution, the national bank or Federal savings association must deduct from capital any such investment issued by the unconsolidated financial institution that is held by the national bank or Federal savings association other than an investment in the form of common stock, as well as any investment in a covered debt instrument issued by the unconsolidated financial institution, by applying the corresponding deduction approach in paragraph (c)(2) of this section.²⁸ The deductions described in this section are net of associated DTLs in accordance with paragraph (e) of this section. In addition, with the prior written approval of the OCC, for the period of time stipulated by the OCC, a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) that underwrites a failed underwriting is not required to deduct the significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph (c)(6) if such investment is related to such failed underwriting.

* * * * *

(d) *Certain DTAs subject to common equity tier 1 capital deduction thresholds.*

(1) A national bank or Federal savings association that is not a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must make deductions from regulatory capital as described in this paragraph (d)(1).

* * * * *

(2) A Category I national bank or Federal savings association, or a

Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must make deductions from regulatory capital as described in this paragraph (d)(2).

(i) A Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must deduct from common equity tier 1 capital elements the amount of each of the items set forth in this paragraph (d)(2) that, individually, exceeds 10 percent of the sum of the national bank's or Federal savings association's common equity tier 1 capital elements, less adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c) of this section (the 10 percent common equity tier 1 capital deduction threshold).

(A) DTAs arising from temporary differences that the national bank or Federal savings association could not realize through net operating loss carrybacks, net of any related valuation allowances and net of DTLs, in accordance with paragraph (e) of this section. A Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) is not required to deduct from the sum of its common equity tier 1 capital elements DTAs (net of any related valuation allowances and net of DTLs, in accordance with § 3.22(e)) arising from timing differences that the national bank or Federal savings association could realize through net operating loss carrybacks. The national bank or Federal savings association must risk weight these assets at 100 percent. For a national bank or Federal savings association that is a member of a consolidated group for tax purposes, the amount of DTAs that could be realized through net operating loss carrybacks may not exceed the amount that the national bank or Federal savings association could reasonably expect to have refunded by its parent holding company.

(B) Significant investments in the capital of unconsolidated financial institutions in the form of common stock, net of associated DTLs in accordance with paragraph (e) of this section.³⁰ Significant investments in the capital of unconsolidated financial institutions in the form of common stock subject to the 10 percent common

equity tier 1 capital deduction threshold may be reduced by any goodwill embedded in the valuation of such investments deducted by the national bank or Federal savings association pursuant to paragraph (a)(1) of this section. In addition, with the prior written approval of the OCC, for the period of time stipulated by the OCC, a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) that underwrites a failed underwriting is not required to deduct a significant investment in the capital of an unconsolidated financial institution in the form of common stock pursuant to this paragraph (d)(2) if such investment is related to such failed underwriting.

(ii) A Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) must deduct from common equity tier 1 capital elements the items listed in paragraph (d)(2)(i) of this section that are not deducted as a result of the application of the 10 percent common equity tier 1 capital deduction threshold, and that, in aggregate, exceed 17.65 percent of the sum of the national bank's or Federal savings association's common equity tier 1 capital elements, minus adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c) of this section, minus the items listed in paragraph (d)(2)(i) of this section (the 15 percent common equity tier 1 capital deduction threshold). Any goodwill that has been deducted under paragraph (a)(1) of this section can be excluded from the significant investments in the capital of unconsolidated financial institutions in the form of common stock.³¹

(iii) For purposes of calculating the amount of DTAs subject to the 10 and 15 percent common equity tier 1 capital deduction thresholds, a Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) may exclude DTAs and DTLs relating to adjustments made to common equity tier 1 capital under paragraph (b) of this section. A Category I national bank or Federal savings association or a Category II national

bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) that elects to exclude DTAs relating to adjustments under paragraph (b) of this section also must exclude DTLs and must do so consistently in all future calculations. A Category I national bank or Federal savings association or a Category II national bank or Federal savings association or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) may change its exclusion preference only after obtaining the prior approval of the OCC.

* * * * *

(f) *Insufficient amounts of a specific regulatory capital component to effect deductions.* Under the corresponding deduction approach, if a national bank or Federal savings association does not have a sufficient amount of a specific component of capital to effect the full amount of any deduction from capital required under paragraph (d) of this section, the national bank or Federal savings association must deduct the shortfall amount from the next higher (that is, more subordinated) component of regulatory capital. Any investment by a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, or a national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) in a covered debt instrument must be treated as an investment in the tier 2 capital for purposes of this paragraph (f). Notwithstanding any other provision of this section, a qualifying community banking organization (as defined in § 3.12) that has elected to use the community bank leverage ratio framework pursuant to § 3.12 is not required to deduct any shortfall of tier 2 capital from its additional tier 1 capital or common equity tier 1 capital.

(g) *Treatment of assets that are deducted.* A national bank or Federal savings association must exclude from standardized total risk-weighted assets and, as applicable, expanded total risk-weighted assets any item that is required to be deducted from regulatory capital.

* * * * *

Footnotes—3.22

* * * * *

²³ The national bank or Federal savings association must calculate amounts deducted under paragraphs (c) through (f) of this section after it calculates the amount of

AACL includable in tier 2 capital under § 3.20(d)(3).

²⁴ With the prior written approval of the OCC, for the period of time stipulated by the OCC, a national bank or Federal savings association is not required to deduct a non-significant investment in the capital instrument of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph if the financial institution is in distress and if such investment is made for the purpose of providing financial support to the financial institution, as determined by the OCC.

²⁵ Any non-significant investments in the capital of an unconsolidated financial institution that is not required to be deducted under this paragraph (c)(4) or otherwise under this section must be assigned the appropriate risk weight under subparts D, E, or F of this part, as applicable.

²⁶ With the prior written approval of the OCC, for the period of time stipulated by the OCC, a Category I national bank or Federal savings association or a Category II national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) is not required to deduct a non-significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph if the financial institution is in distress and if such investment is made for the purpose of providing financial support to the financial institution, as determined by the OCC.

²⁷ Any non-significant investment in the capital of an unconsolidated financial institution or any investment in a covered debt instrument that is not required to be deducted under this paragraph (c)(5) or otherwise under this section must be assigned the appropriate risk weight under subparts D, E, or F of this part, as applicable.

²⁸ With prior written approval of the OCC, for the period of time stipulated by the OCC, a Category I national bank or Federal savings association or a Category II national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) is not required to deduct a significant investment in the capital of an unconsolidated financial institution, including an investment in a covered debt instrument, under this paragraph (c)(6) or otherwise under this section if such investment is made for the purpose of providing financial support to the financial institution as determined by the OCC.

* * * * *

³⁰ With the prior written approval of the OCC, for the period of time stipulated by the OCC, a Category I national bank or Federal savings association or a Category II national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) is not required to deduct a significant investment in the capital instrument of an unconsolidated financial institution in distress in the form of common stock pursuant to this section if such investment is made for the purpose of providing financial support to the financial institution as determined by the OCC.

³¹ The amount of the items in paragraph (d)(2) of this section that is not deducted from common equity tier 1 capital pursuant to this section must be included in the risk-weighted assets of the Category I national bank or Federal savings association or the Category II national bank or Federal savings association that uses expanded total risk-weighted assets for purposes of § 3.10(a)(5) and assigned the appropriate risk weight for the investment under subpart E of this part for purposes of expanded total risk-weighted assets.

* * * * *

■ 13. In § 3.30

■ a. Revise paragraph (a);

■ b. In paragraph (b), remove the words “covered positions” and add in their place the words “market risk covered positions”.

The revisions read as follows:

§ 3.30 Applicability.

(a) This subpart sets forth methodologies for determining standardized total risk-weighted assets. This subpart applies to any national bank or Federal savings association that elects to use this subpart under § 3.10(b).

* * * * *

■ 14. In § 3.34, revise paragraph (a) to read as follows:

§ 3.34 Derivative contracts.

(a) *Exposure amount for derivative contracts.* A national bank or Federal savings association must use the current exposure methodology (CEM) described in paragraph (b) of this section to calculate the exposure amount for all its OTC derivative contracts, unless the national bank or Federal savings association makes the election provided in paragraph (a)(2) of this section.

(2) A national bank or Federal savings association that is not subject to subpart E of this part may elect to calculate the exposure amount for all its OTC derivative contracts under the standardized approach for counterparty credit risk (SA-CCR) in § 3.114 by notifying the OCC, rather than calculating the exposure amount for all its derivative contracts using CEM. A national bank or Federal savings association that elects under this paragraph (a)(1)(ii) to calculate the exposure amount for its OTC derivative contracts under SA-CCR must apply the treatment of cleared transactions under § 3.116 to its derivative contracts that are cleared transactions and to all default fund contributions associated with such derivative contracts, rather than applying § 3.35. A national bank or Federal savings association that is not subject to subpart E of this part must use the same methodology to calculate the

exposure amount for all its derivative contracts and, if a national bank or Federal savings association has elected to use SA-CCR under this paragraph (a)(1)(ii), the national bank or Federal savings association may change its election only with prior approval of the OCC.

* * * * *

■ 15. Revise § 3.35(a)(3) to read as follows:

§ 3.35 Cleared transactions.

(a) * * *

(3) Alternate requirements.

Notwithstanding any other provision of this section, a national bank or Federal savings association that has elected to use SA-CCR under § 3.34(a), must apply § 3.116 to its derivative contracts that are cleared transactions rather than this section.

* * * * *

§ 3.37 [Amended]

■ 16. In § 3.37, revise paragraph (c)(1) to read as follows:

(c) *Collateral haircut approach*—(1) General. A national bank or Federal savings association may recognize the credit risk mitigation benefits of financial collateral that secures an eligible margin loan, repo-style transaction, collateralized derivative contract, or single-product netting set of such transactions, and of any collateral that secures a repo-style transaction that is included in the national bank's or Federal savings association's measure for market risk under subpart F of this part by using the collateral haircut approach in this section. A national bank or Federal savings association may use the standard supervisory haircuts in paragraph (c)(3) of this section or, with prior written approval of the OCC, its own estimates of haircuts according to paragraph (c)(4) of this section.

* * * * *

■ 17. Revise § 3.61 to read as follows:

§ 3.61 Purpose and scope.

Sections 3.61 through 3.63 of this subpart establish public disclosure requirements related to the capital requirements described in subpart B of this part for a national bank or Federal savings association with total consolidated assets of \$50 billion or more as reported on the national bank's or Federal savings association's most recent year-end Call Report that is not a national bank or Federal savings association subject to subpart E of this part. A national bank or Federal savings association with total consolidated assets of \$50 billion or more as reported on the national bank's or Federal savings association's most recent year-

end Call Report that is not subject to subpart E of this part must comply with § 3.62 unless it is a consolidated subsidiary of a bank holding company, savings and loan holding company, or depository institution that is subject to the disclosure requirements of § 3.62 or a subsidiary of a non-U.S. banking organization that is subject to comparable public disclosure requirements in its home jurisdiction. For purposes of this section, total

consolidated assets are determined based on the average of the national bank's or Federal savings association's total consolidated assets in the four most recent quarters as reported on the Call Report or the average of the national bank or Federal savings association's total consolidated assets in the most recent consecutive quarters as reported quarterly on the national bank's or Federal savings association's Call Report if the national bank or

Federal savings association has not filed such a report for each of the most recent four quarters.

■ 18. In § 3.63:

■ a. In Table 3, revise entry (c); and

■ b. Remove paragraphs (d) and (e);

The revision reads as follows:

§ 3.63 Disclosures by national banks and Federal savings associations described in § 3.61.

* * * * *

Table 3 to § 3.63—Capital Adequacy

TABLE 3 TO § 3.63—CAPITAL ADEQUACY

*	*	*	*	*	*
			(c)	Market risk-weighted assets as calculated under subpart F of this part 3.	
*	*	*	*	*	*

* * * * *

■ 19. Subparts E and F are amended as follows:

Subparts E and F [Amended]

■ a. Remove subparts E and F and replace with subparts E and F as set forth at the end of the common preamble;

■ b. Remove “[AGENCY]” and add “OCC” in its place wherever it appears;

■ c. Remove “[BANKING ORGANIZATION]” and add “national bank or Federal savings association” in its place wherever it appears;

■ d. Remove “[BANKING ORGANIZATIONS]” and add “national banks or Federal savings associations” in its place wherever it appears;

■ e. Remove “[BANKING ORGANIZATION]’s” and add “national bank’s or Federal savings association’s” in its place, wherever it appears;

■ f. Remove “[REAL ESTATE LENDING GUIDELINES]” and add “12 CFR part 34, appendix A to subpart D” in its place wherever it appears; and

■ g. Remove “[APPRAISAL RULE]” and add “12 CFR part 34, subpart C” in its place wherever it appears.

■ 20. In § 3.111:

■ a. Remove paragraph (j)(1)(i);

■ b. Redesignate paragraph (j)(1)(ii) as paragraph (j)(1); and

■ c. Remove paragraph (k).

■ 21. In § 3.300:

■ a. Revise paragraph (a);

■ b. Remove paragraphs (b), (c), and (d);

■ c. Redesignate paragraph (e) as paragraph (b); and

■ d. Remove paragraphs (f), (g), and (h).

The revision reads as follows:

§ 3.300 Transitions.

(a) *Transition adjustments* for AOCI. Beginning [January 1, 2027], a national bank or Federal savings association that uses expanded total risk-weighted assets

for purposes of § 3.10(a)(5) that had made an AOCI opt-out election under § 3.22(b)(2) effective [December 31, 2026] must subtract from the sum of its common equity tier 1 elements, before making deductions required under § 3.22(c) or (d), the AOCI adjustment amount multiplied by the percentage provided in Table 1 to § 3.300.

The transition AOCI adjustment amount is the sum of:

(1) Net unrealized gains or losses on available-for-sale debt securities, plus

(2) Accumulated net gains or losses on cash flow hedges, plus

(3) Any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans, plus

(4) Net unrealized holding gains or losses on held-to-maturity securities that are included in AOCI.

TABLE 1 TO § 3.300

Transition AOCI adjustment	
Transition period	Percentage applicable to transition AOCI adjustment amount
January 1, 2027 to December 31, 2027	100
January 1, 2028 to December 31, 2028	80
January 1, 2029 to December 31, 2029	60
January 1, 2030 to December 31, 2030	40
January 1, 2031 to December 31, 2031	20
January 1, 2032 and thereafter	0

* * * * *

■ 22. Remove and reserve § 3.301

■ 23. In § 3.302, remove the words “advanced approaches total risk-weighted assets” and add in their place

the words “expanded total risk-weighted assets”.

■ 24. Remove and reserve §§ 3.303 and 3.304.

■ 25. In § 3.305, remove the words “advanced approaches total risk-

weighted assets” and add in their place the words “expanded total risk-weighted assets”.

PART 6—PROMPT CORRECTIVE ACTION

■ 26. The authority citation for part 6 continues to read as follows:

Authority: 12 U.S.C. 93a, 1831o, 5412(b)(2)(B).

■ 27. In § 6.2:

■ a. Remove the definition for “Advanced approaches national bank or advanced approaches Federal savings association”;

■ b. Add, in alphabetical order, the definition for Category I national bank or Federal savings association;

■ c. Add, in alphabetical order, the definition for Category II national bank or Federal savings association;

■ d. Add, in alphabetical order, the definition for Category III national bank or Federal savings association;

■ e. Add, in alphabetical order, the definition for “National bank or Federal savings association subject to part 3, subpart E of this chapter”; and

■ f. Revise the definition for “Total risk-weighted assets”.

The addition and revision read as follows:

§ 6.2 Definitions.

* * * * *

Category I national bank or Federal savings association means a bank that is a Category I Board-regulated institution as defined in 12 CFR 3.2.

Category II national bank or Federal savings association means a bank that is a Category II Board-regulated institution as defined in 12 CFR 3.2.

Category III national bank or Federal savings association means a bank that is a Category III Board-regulated institution as defined in 12 CFR 3.2.

* * * * *

National bank or Federal savings association subject to part 3, subpart E of this chapter means a bank that is subject to part 3, subpart E of this chapter.

* * * * *

Total risk-weighted assets means standardized total risk-weighted assets, and for a national bank or Federal savings association subject to part 3, subpart E of this chapter, also includes expanded risk-weighted assets, as defined in § 3.2 of this chapter.

* * * * *

■ 28. In § 6.4, revise paragraphs (a)(1)(iv)(B), (b)(2)(iv)(B), and (b)(3)(iv)(B) to read as follows:

§ 6.4 Capital measures and capital categories.

(a) * * *

(1) * * *

(iv) * * *

(B) With respect to a Category I national bank or Federal savings association or a Category II national bank or Federal savings association; and

* * * * *

(b) * * *

(2) * * *

(iv) * * *

(B) With respect to a Category I national bank or Federal savings association, a Category II national bank or Federal savings association, or a Category III national bank or Federal savings association, the national bank or Federal savings association has a supplementary leverage ratio of 3.0 percent or greater;

* * * * *

(3) * * *

(iv) * * *

(B) With respect to a Category I national bank or Federal savings association, a Category II national bank or Federal savings association, or a Category III national bank or Federal savings association, the national bank or Federal savings association has a supplementary leverage ratio of less than 3.0 percent.

* * * * *

PART 32—LENDING LIMITS

■ 29. The authority citation for part 32 continues to read as follows:

Authority: 12 U.S.C. 1 *et seq.*, 12 U.S.C. 84, 93a, 1462a, 1463, 1464(u), 5412(b)(2)(B), and 15 U.S.C. 1639h.

■ 30. In § 32.2, remove the designations for paragraphs (a) through (ee) and arrange the definitions in alphabetical order and in the definition for “Eligible credit derivative”, revise paragraph (1).

The revision reads as follows:

§ 32.2 Definitions

* * * * *

Eligible credit derivative * * *

(1) The derivative contract meets the requirements of paragraphs (1) through (9) of an eligible guarantee, as defined in § 3.2 of this chapter, and has been confirmed by the protection purchaser and the protection provider;

* * * * *

Board of Governors of the Federal Reserve System

12 CFR Chapter II

Authority and Issuance

For the reasons set forth in the common preamble, the Board of Governors of the Federal Reserve System proposes to amend chapter II of title 12 of the Code of Federal Regulations as follows:

PART 208—MEMBERSHIP OF STATE BANKING INSTITUTIONS IN THE FEDERAL RESERVE SYSTEM (REGULATION H)

■ 31. The authority citation for part 208 continues to read as follows:

Authority: 12 U.S.C. 24, 36, 92a, 93a, 248(a), 248(c), 321–338a, 371d, 461, 481–486, 601, 611, 1814, 1816, 1817(a)(3), 1817(a)(12), 1818, 1820(d)(9), 1833(j), 1828(o), 1831, 1831o, 1831p-1, 1831r-1, 1831w, 1831x, 1835a, 1882, 2901–2907, 3105, 3310, 3331–3351, 3905–3909, 5371, and 5371 note; 15 U.S.C. 78b, 78l(b), 78l(i), 78o-4(c)(5), 78q, 78q-1, 78w, 1681s, 1681w, 6801, and 6805; 31 U.S.C. 5318; 42 U.S.C. 4012a, 4104a, 4104b, 4106, and 4128.

Subpart D—Prompt Corrective Action

■ 32. Revise § 208.41 to read as follows:

§ 208.41 Definitions for purposes of this subpart.

For purposes of this subpart, except as modified in this section or unless the context otherwise requires, the terms used have the same meanings as set forth in section 38 and section 3 of the FDI Act. As used in this subpart:

Bank means an insured depository institution as defined in section 3 of the FDI Act (12 U.S.C. 1813).

Category I bank means a bank that is a Category I Board-regulated institution as defined in 12 CFR 217.2.

Category II bank means a bank that is a Category II Board-regulated institution as defined in 12 CFR 217.2.

Category III bank means a bank that is a Category III Board-regulated institution as defined in 12 CFR 217.2.

Common equity tier 1 capital means the amount of capital as defined in § 217.2 of this chapter.

Common equity tier 1 risk-based capital ratio means the ratio of common equity tier 1 capital to total risk-weighted assets, as calculated in accordance with § 217.10(b) or § 217.10(d) of this chapter, as applicable.

Control—(1) Control has the same meaning assigned to it in section 2 of the Bank Holding Company Act (12 U.S.C. 1841), and the term controlled shall be construed consistently with the term control.

(2) *Exclusion for fiduciary ownership.* No insured depository institution or company controls another insured depository institution or company by virtue of its ownership or control of shares in a fiduciary capacity. Shares shall not be deemed to have been acquired in a fiduciary capacity if the acquiring insured depository institution or company has sole discretionary authority to exercise voting rights with respect to the shares.

(3) *Exclusion for debts previously contracted.* No insured depository institution or company controls another insured depository institution or company by virtue of its ownership or control of shares acquired in securing or collecting a debt previously contracted in good faith, until two years after the date of acquisition. The two-year period may be extended at the discretion of the appropriate Federal banking agency for up to three one-year periods.

Controlling person means any person having control of an insured depository institution and any company controlled by that person.

Global systemically important BHC has the same meaning as in § 217.2 of this chapter.

Leverage ratio means the ratio of tier 1 capital to average total consolidated assets, as calculated in accordance with § 217.10 of this chapter.

Management fee means any payment of money or provision of any other thing of value to a company or individual for the provision of management services or advice to the bank, or related overhead expenses, including payments related to supervisory, executive, managerial, or policy making functions, other than compensation to an individual in the individual's capacity as an officer or employee of the bank.

Supplementary leverage ratio means the ratio of tier 1 capital to total leverage exposure, as calculated in accordance with § 217.10 of this chapter.

Tangible equity means the amount of tier 1 capital, plus the amount of outstanding perpetual preferred stock (including related surplus) not included in tier 1 capital.

Tier 1 capital means the amount of capital as defined in § 217.20 of this chapter.

Tier 1 risk-based capital ratio means the ratio of tier 1 capital to total risk-weighted assets, as calculated in accordance with § 217.10(b) or § 217.10(d) of this chapter, as applicable.

Total assets means quarterly average total assets as reported in a bank's Call Report, minus items deducted from tier 1 capital. At its discretion the Federal Reserve may calculate total assets using a bank's period-end assets rather than quarterly average assets.

Total leverage exposure means the total leverage exposure as defined in § 217.10(c)(2) of this chapter.

Total risk-based capital ratio means the ratio of total capital to total risk-weighted assets, as calculated in accordance with § 217.10(b) or § 217.10(d) of this chapter, as applicable.

Total risk-weighted assets means standardized total risk-weighted assets or expanded total risk-weighted assets, each as defined in § 217.2 of this chapter.

Subpart D [Amended]

■ 33. In § 208.43, remove the words “an advanced approaches bank or bank that is a Category III Board-regulated institution (as defined in § 217.2 of this chapter)” wherever they appear and add in their place the words “a Category I bank, Category II bank, or Category III bank.”

Subpart G—Financial Subsidiaries of State Member Banks

■ 34. In § 208.73:

■ a. Revise paragraph (a) introductory text;

■ b. Remove paragraph (b); and

■ c. Redesignate paragraphs (c) through (f) as (b) through (e), respectively.

The revision reads as follows:

§ 208.73 What additional provisions are applicable to state member banks with financial subsidiaries?

(a) *Capital requirements.* A state member bank that controls or holds an interest in a financial subsidiary must comply with the rules set forth in § 217.22(a)(7) of Regulation Q (12 CFR 217.22(a)(7)) in determining its compliance with applicable regulatory capital standards (including the well capitalized standard of § 208.71(a)(1)).

* * * * *

■ 35. In Appendix C, revise footnote 2 to read as follows:

Appendix C to Part 208—Interagency Guidelines for Real Estate Lending Policies

* * * * *

² The term “total capital” refers to that term as defined in 12 CFR part 3, 12 CFR part 217, or 12 CFR part 324, as applicable.

PART 217—CAPITAL ADEQUACY OF BANK HOLDING COMPANIES, SAVINGS AND LOAN HOLDING COMPANIES, AND STATE MEMBER BANKS (REGULATION Q)

■ 36. The authority citation for part 217 reads as follows:

Authority: 12 U.S.C. 248(a), 321–338a, 481–486, 1462a, 1467a, 1818, 1828, 1831n, 1831o, 1831p-1, 1831w, 1835, 1844(b), 1851, 3904, 3906–3909, 4808, 5365, 5368, 5371, and 5371 note, and sec. 4012, Pub. L. 116–136, 134 Stat. 281.

■ 37. Revise subparts E and F of part 217 as set forth at the end of the common preamble.

■ 38. In part 217, subparts E and F:

■ a. Remove “[AGENCY]” and add “Board” in its place wherever it appears;

■ b. Remove “[BANKING ORGANIZATION]” and add “Board-regulated institution” in its place wherever it appears; and

■ c. Remove “_____” and add “217.” in its place wherever it appears.

Subpart A—General Provisions

■ 39. In § 217.1:

■ a. Revise paragraph (c)(4);

■ b. Add paragraph (c)(6);

■ c. Revise paragraphs (e) and (f); and

■ d. Add paragraph (h).

The addition and revision read as follows:

§ 217.1 Purpose, applicability, reservations of authority, and timing.

* * * * *

(c) * * *

(4) *Risk-weighted assets.* Each Board-regulated institution must calculate either standardized total risk-weighted assets or expanded total risk-weighted assets, as necessary to satisfy the requirements of § 217.10(b) or (d), as applicable.

* * * * *

(6) *Transitions.* Notwithstanding any other provision of this part, a Board-regulated institution must make any adjustments provided in subpart G of this part for purposes of implementing this part.

* * * * *

(e) *Notice and response procedures.* In making a determination under this part, unless more specifically provided for, the Board will apply notice and response procedures in the same manner and to the same extent as the notice and response procedures in 12 CFR 263.202.

(f) *Timing.* A Board-regulated institution that changes from one category of Board-regulated institution to another of such categories, or that changes from having no category of Board-regulated institution to having a such category, must comply with the requirements of its category in this part, including applicable transition provisions of the requirements in this part, no later than on the first day of the second quarter following the change in the company's category.

* * * * *

(h) *Severability.* If any provision of this part, or the application thereof to any person or circumstances, is held invalid, such invalidity shall not affect the validity of other provisions or the application of such provision to other persons or circumstances that can be

given effect without the invalid provision or application.

* * * * *

■ 40. In § 217.2:

- a. Revise the definition of “Adjusted allowances for credit losses (AACL)”;
- b. Remove the definitions for “Advanced approaches Board-regulated institution”, “Advanced approaches total risk-weighted assets”, and “Advanced market risk-weighted assets”;
- c. Remove the definition of “Allowances for loan and lease losses (ALLL)”;
- d. Revise the definition for “Carrying value”;
- e. Add, in alphabetical order, the definition for “Category I Board-regulated institution”;
- f. In the definition for “Category II Board-regulated institution”:
- i. Remove paragraph (3);
- ii. Redesignate paragraph (4) as paragraph (3);
- iii. Revise newly redesignated paragraph (3)(i);
- iv. In newly redesignated paragraph (3)(iii) introductory text, remove the words “paragraph (4)(i) of this section” and add, in their place, the words “paragraph (3)(ii) of this definition”;
- g. In the definition of “Category III Board-regulated institution”:
- i. Remove paragraph (3);
- ii. Redesignate paragraph (4) as paragraph (3);
- iii. Revise newly redesignated paragraph (3) introductory text;
- iv. Revise newly redesignated paragraph (3)(i); and
- vi. In newly redesignated paragraph (3)(iv) introductory text, remove the words “paragraph (4)(ii) of this definition” and add, in their place, the words “paragraph (3)(ii) of this definition”;
- h. Add, in alphabetical order, the definition for “Category IV Board-regulated institution”;
- i. Revise footnote 3 to paragraph (2) of the definition for “Cleared transaction.”
- j. Revise the definition for “Commitment”;
- k. Revise the definition for “Corporate exposure”;
- l. Remove the definition for “Credit-risk-weighted assets”;
- m. Add, in alphabetical order, the definitions for “CVA risk-weighted assets” and “Dependent on the cash flows generated by the real estate”;
- n. Revise the definitions for “Effective notional amount” and “Eligible clean-up call”;
- o. Remove the definition for “Eligible credit reserves”;
- p. Revise the definition for “Eligible guarantee”;

- q. Add, in alphabetical order, the definitions for “Eligible prepaid credit protection arrangement” and “Expanded total risk-weighted assets”;
- r. Remove the definition for “Expected credit loss (ECL)”;
- s. Revise the definition for “Exposure amount”;
- t. Revise paragraph (4)(i)(A) in the definition of “Financial institution”;
- u. Revise the definition of “Market risk Board-regulated institution”;
- v. Add, in alphabetical order, the definition for “Market risk-weighted assets”;
- w. Revise the definitions for “Net independent collateral amount” and “Netting set”;
- x. Add, in alphabetical order, the definitions for “Non-performing loan securitization (NPL securitization)” and “Nonrefundable purchase price discount (NRPPD)”;
- y. Revise the definition for “Non-significant investment in the capital of an unconsolidated financial institution”;
- z. Add, in alphabetical order, the definition for “Prepaid credit protection arrangement”;
- aa. Revise the definition for “Protection amount (P)”;
- bb. Add, in alphabetical order, the definition for “Qualifying Cross Product Master Netting Agreement”;
- cc. Revise paragraphs (3) and (4) of the definition for “Qualifying master netting agreement”;
- dd. In the definition of “Residential mortgage exposure”:
- i. Remove paragraph (2);
- ii. Redesignate paragraphs (1)(i) and (1)(ii) as paragraphs (1) and (2), respectively; and
- iii. In newly redesignated paragraph (2), remove the words “family; and” and add, in their place, the word “family.”;
- ee. Remove the definition for “Securitization special purpose entity (securitization SPE)”;
- ff. Revise the definition for “Significant investment in the capital of an unconsolidated financial institution”;
- gg. Remove the definition for “Specific wrong-way risk”;
- hh. Add, in alphabetical order, the definition for “Specified supranational entity”;
- ii. Revise the definitions for “Speculative grade”, “Standardized market risk-weighted assets”, “Standardized total risk-weighted assets” and “Sub-speculative grade”;
- jj. Add, in alphabetical order, the definition for “Synthetic excess spread”;
- kk. Revise the definition for “Synthetic securitization”;

- ll. Add, in alphabetical order, the definition for “Total credit risk-weighted assets”;

- mm. Revise the definition for “Traditional securitization”;

- nn. Remove the definition for “Value-at-risk (VaR)”;

- oo. Revise the definition for “Variation margin amount”; and

- pp. Remove the definition of “Unconditionally cancelable”.

The additions and revisions read as follows:

§ 217.2 Definitions.

* * * * *

Adjusted allowances for credit losses (AACL) means valuation allowances that have been established through a charge against earnings or retained earnings for expected credit losses on financial assets measured at amortized cost and a lessor’s net investment in leases that have been established to reduce the amortized cost basis of the assets to amounts expected to be collected as determined in accordance with GAAP. For purposes of this part, adjusted allowances for credit losses include allowances for expected credit losses on off-balance sheet credit exposures not accounted for as insurance as determined in accordance with GAAP. Adjusted allowances for credit losses exclude allocated transfer risk reserves and allowances created that reflect credit losses on purchased credit deteriorated assets, purchased seasoned loans, assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, and available-for-sale debt securities.

* * * * *

Carrying value means, with respect to an asset, the value of the asset on the balance sheet of the Board-regulated institution as determined in accordance with GAAP. For all assets other than available-for-sale debt securities, purchased credit deteriorated assets, purchased seasoned loans, or assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, the carrying value is not reduced by any associated credit loss allowance that is determined in accordance with GAAP.

Category I Board-regulated institution means:

(1) A global systemically important BHC; or

(2) A state member bank that is a subsidiary of a global systemically important BHC.

* * * * *

Category II Board-regulated institution means:

* * * * *

(3) * * *

(i) Is a subsidiary of a Category II banking organization, as defined pursuant to § 252.5 of this chapter or § 238.10 of this chapter, as applicable; or

* * * * *

Category III Board-regulated institution means:

* * * * *

(3) A state member bank that is not a Category II Board-regulated institution and that:

(i) Is a subsidiary of a Category III banking organization, as defined pursuant to § 252.5 of this chapter or § 238.10 of this chapter, as applicable; or

* * * * *

Category IV Board-regulated institution means:

(1) A depository institution holding company that is identified as a Category IV banking organization pursuant to § 252.5 of this chapter or § 238.10 of this chapter, as applicable;

(2) A U.S. intermediate holding company that is identified as a Category IV banking organization pursuant to § 252.5 of this chapter;

(3) A state member bank that is not a Category II Board-regulated institution or Category III Board-regulated institution and that:

(i) Is a subsidiary of a Category IV banking organization, as defined pursuant to § 252.5 of this chapter or § 238.10 of this chapter, as applicable; or

(ii) Has total consolidated assets, calculated based on the average of the depository institution's total consolidated assets for the four most recent calendar quarters as reported on the Call Report of \$100 billion or more. If the depository institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or the average of the most recent consecutive quarters, as applicable.

(iii) After meeting the criterion in paragraph (3)(ii) of this definition, a state member bank continues to be a Category IV Board-regulated institution until the state member bank:

(A) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(B) Is a Category II or Category III Board-regulated institution.

* * * * *

*Cleared transaction * * **

(2) * * * 3

³ For the standardized approach treatment of these exposures, see § 217.34(e) (OTC derivative contracts) or § 217.37(c) (repo-style transactions). For the expanded risk-based treatment of these exposures, see § 217.113.

* * * * *

Commitment means a contractual arrangement, under which a Board-regulated institution and an obligor agree to terms applicable to one or more future extensions of credit, purchases of assets, or issuances of credit substitutes by the Board-regulated institution, whether or not such arrangement is unconditionally cancelable. A commitment is unconditionally cancelable if, by its terms, it either: (a) provides that a Board-regulated institution is not obligated to extend credit, purchase assets, or issue credit substitutes; or (b) permits a Board-regulated institution, at any time, with or without cause, to refuse to extend credit, purchase assets, or issue credit substitutes under the arrangement (to the extent permitted under applicable law).

* * * * *

Corporate exposure means an exposure to a company that is not:

(1) An exposure to a sovereign, a specified supranational entity, a multilateral development bank (MDB), a depository institution, a foreign bank, or a credit union, a public sector entity (PSE);

(2) An exposure to a government-sponsored enterprise (GSE);

(3) For purposes of subpart D of this part, a residential mortgage exposure;

(4) A pre-sold construction loan;

(5) A statutory multifamily mortgage;

(6) A high volatility commercial real estate (HVCRE) exposure;

(7) A cleared transaction;

(8) A default fund contribution;

(9) A securitization exposure;

(10) An equity exposure;

(11) An unsettled transaction;

(12) A policy loan;

(13) A separate account;

(14) A Paycheck Protection Program covered loan as defined in section 7(a)(36) or (37) of the Small Business Act (15 U.S.C. 636(a)(36)–(37));

(15) For purposes of subpart E of this part, a real estate exposure, as defined in § 217.101; or

(16) For purposes of subpart E of this part, a retail exposure as defined in § 217.101.

* * * * *

CVA risk-weighted assets means the measure for CVA risk calculated under § 217.221(a) multiplied by 12.5.

* * * * *

Dependent on the cash flows generated by the real estate means, for a real estate exposure, the underwriting, at the time of origination, includes the cash flows generated by lease, rental, or sale of the real estate securing the loan as a source of repayment. For purposes of this definition, a residential mortgage exposure that is secured by the borrower's principal residence is deemed not dependent on the cash flows generated by the real estate.

* * * * *

Effective notional amount means for an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, the lesser of the contractual notional amount of the credit risk mitigant and the exposure amount of the hedged exposure, multiplied by the percentage coverage of the credit risk mitigant.

* * * * *

Eligible clean-up call means a clean-up call that:

(1) Is exercisable solely at the discretion of the originating Board-regulated institution or servicer;

(2) Is not structured to avoid allocating losses to securitization exposures held by investors or otherwise structured to provide credit enhancement to the securitization; and

(3) Is only exercisable:

(i) For a traditional securitization, when 10 percent or less of the principal amount of the underlying exposures or securitization exposures (determined as of the inception of the securitization) is outstanding;

(ii) For a synthetic securitization, when 10 percent or less of the principal amount of the reference portfolio of underlying exposures (determined as of the inception of the securitization) is outstanding;

(iii) Upon the occurrence of a regulatory event that significantly changes the risk-weighted asset amount for the securitization exposure under this part; or

(iv) Upon the occurrence of a tax event that significantly changes the tax treatment of the securitization exposure under applicable tax laws.

* * * * *

Eligible guarantee means a guarantee that:

(1) Is written;

(2) Is either:

(i) Unconditional, or

(ii) A contingent obligation of the U.S. government or its agencies, the enforceability of which is dependent

upon some affirmative action on the part of the beneficiary of the guarantee or a third party (for example, meeting servicing requirements);

(3) Covers all or a pro rata portion of all contractual payments of the obligated party on the reference exposure;

(4) Gives the beneficiary a direct claim against the protection provider;

(5) Is not unilaterally cancelable by the protection provider for reasons other than the breach of the contract by the beneficiary;

(6) Except for a guarantee by a sovereign, is legally enforceable against the protection provider in a jurisdiction where the protection provider has sufficient assets against which a judgment may be attached and enforced;

(7) Requires the protection provider to make payment to the beneficiary on the occurrence of a default (as defined in the guarantee) of the obligated party on the reference exposure in a timely manner without the beneficiary first having to take legal actions to pursue the obligor for payment;

(8) Does not increase the beneficiary's cost of credit protection on the guarantee in response to deterioration in the credit quality of the reference exposure;

(9) Is not provided by an affiliate of the Board-regulated institution, unless the affiliate is an insured depository institution, foreign bank, securities broker or dealer, or insurance company that:

(i) Does not control the Board-regulated institution; and

(ii) Is subject to consolidated supervision and regulation comparable to that imposed on depository institutions, U.S. securities broker-dealers, or U.S. insurance companies (as the case may be); and

(10) Is provided by an eligible guarantor.

* * * * *

Eligible prepaid credit protection arrangement means a prepaid credit protection arrangement that:

(1) Is written;

(2) Is unconditional;

(3) Covers all or a pro rata portion of all contractual payments due to be paid on the reference exposure or reference exposures;

(4) Provides that the amount and timing of payments due from the protection purchaser to the protection provider are incorporated into the arrangement and the arrangement only allows these terms to change in the event of a breach of the arrangement by the protection purchaser;

(5) Provides that entry of the protection provider into receivership,

insolvency, liquidation, conservatorship, or similar proceeding does not change the amounts or timing of payments due to be paid by the protection purchaser under the arrangement;

(6) Is legally valid and enforceable under applicable law of the relevant jurisdictions;

(7) Upon a failure by the obligor on the one or more reference exposures to make a contractually required payment, or the occurrence of other credit events as described in the arrangement, allows the protection purchaser promptly to reduce the outstanding balance of the initial principal amount due to the protection provider by the loss of the protection purchaser on the reference exposures without input from the protection provider; and

(8) Does not increase the protection purchaser's cost of credit protection in response to deterioration in the credit quality of any of the reference exposures.

* * * * *

Expanded total risk-weighted assets means the sum of:

(1) Total credit risk-weighted assets;

(2) Total risk-weighted assets for equity exposures as calculated under § 217.141 and 217.142;

(3) Risk-weighted assets for operational risk as calculated under § 217.150;

(4) Market risk-weighted assets, if applicable; and

(5) CVA risk-weighted assets, if applicable; minus

(6) Any amount of the Board-regulated institution's adjusted allowance for credit losses that is not included in tier 2 capital and any amount of allocated transfer risk reserves.

* * * * *

Exposure amount means:

(1) For the on-balance sheet component of an exposure (other than an available-for-sale or held-to-maturity security, if the Board-regulated institution has made an AOCI opt-out election (as defined in § 217.22(b)(2)); a derivative contract; a repo-style transaction or an eligible margin loan for which the Board-regulated institution determines the exposure amount under § 217.37, §§ 217.113 through 217.115, or § 217.121, as applicable; a cleared transaction; a default fund contribution; or a securitization exposure), the Board-regulated institution's carrying value of the exposure.

(2) For a security (that is not a securitization exposure, equity exposure, or preferred stock classified as

an equity security under GAAP) classified as available-for-sale or held-to-maturity if the Board-regulated institution has made an AOCI opt-out election (as defined in § 217.22(b)(2)), the Board-regulated institution's carrying value (including net accrued but unpaid interest and fees) for the exposure less any net unrealized gains on the exposure and plus any net unrealized losses on the exposure.

(3) For available-for-sale preferred stock classified as an equity security under GAAP if the Board-regulated institution has made an AOCI opt-out election (as defined in § 217.22(b)(2)), the Board-regulated institution's carrying value of the exposure less any net unrealized gains on the exposure that are reflected in such carrying value but excluded from the Board-regulated institution's regulatory capital components.

(4) For the off-balance sheet component of an exposure (other than a derivative contract; a repo-style transaction or an eligible margin loan for which the Board-regulated institution calculates the exposure amount under § 217.37 or § 217.121, as applicable; a cleared transaction; a default fund contribution; or a securitization exposure), the notional amount of the off-balance sheet component multiplied by the appropriate credit conversion factor (CCF) in § 217.33 or § 217.112, as applicable.

(5) For an exposure that is a derivative contract (other than a cleared transaction), the exposure amount determined under § 217.34 or §§ 217.113 through 217.114, as applicable.

(6) For an exposure that is a cleared transaction, the exposure amount determined under § 217.35 or § 217.116, as applicable.

(7) For an exposure that is an eligible margin loan or repo-style transaction (other than a cleared transaction) for which the bank calculates the exposure amount as provided in § 217.37 or §§ 217.113 through 217.115, as applicable, the exposure amount determined under § 217.37 or §§ 217.113 through 217.115, as applicable.

(8) For an exposure that is a securitization exposure, the exposure amount determined under § 217.42 or § 217.131, as applicable.

* * * * *

Financial institution means:

* * * * *

(4) * * *

(i) * * *

(A) An investment in GAAP equity instruments of the company with an

adjusted carrying value or exposure amount equal to or greater than \$10 million, as adjusted pursuant to § 217.4; or

* * * * *

Market risk Board-regulated institution means a Board-regulated institution that is described in § 217.201(b)(1).

Market risk-weighted assets means the measure for market risk calculated pursuant to § 217.204(a) multiplied by 12.5.

* * * * *

Net independent collateral amount means the fair value amount of the independent collateral, as adjusted by the haircuts under § 217.121(c)(2)(iii), as applicable, that a counterparty to a netting set has posted to a Board-regulated institution less the fair value amount of the independent collateral, as adjusted by the haircuts under § 217.121(c)(2)(iii), as applicable, posted by the Board-regulated institution to the counterparty, excluding such amounts held in a bankruptcy-remote manner or posted to a QCCP and held in conformance with the operational requirements in § 217.3.

Netting set means a group of transactions with a single counterparty that are subject to a qualifying master netting agreement. For derivative contracts, netting set also includes a single derivative contract between a Board-regulated institution and a single counterparty.

* * * * *

Non-performing loan securitization (NPL securitization) means a traditional securitization, that is not a resecuritization, where parameter W (as defined in § 217.133(b)(1)) for the underlying exposures is greater than or equal to 90 percent at the origination cut-off date and at any subsequent date on which exposures are added to or removed from the pool of underlying exposures due to replenishment or restructuring.

Nonrefundable purchase price discount (NRPPD) means the difference between the outstanding principal balance of the underlying exposures at the time of sale and the price at which these exposures are sold by the originator to a company the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, when neither originator nor the original lender are reimbursed for this difference. In cases where the originator underwrites tranches of an NPL securitization for subsequent sale, the NRPPD may include the differences between the outstanding principal

balance of the underlying exposures at the time of sale and the price at which all of the tranches are first sold to unrelated third parties. For any given piece of a securitization tranche, only its initial sale from the originator to investors is taken into account in the determination of NRPPD. The purchase prices of subsequent re-sales of a securitization tranche are not considered.

Non-significant investment in the capital of an unconsolidated financial institution means an investment by a Category I Board-regulated institution or a Category II Board-regulated institution in the capital of an unconsolidated financial institution where the Category I Board-regulated institution or Category II Board-regulated institution owns 10 percent or less of the issued and outstanding common stock of the unconsolidated financial institution.

* * * * *

Prepaid credit protection arrangement means a contractual arrangement under which a protection purchaser transfers the credit risk of one or more reference exposures to a protection provider where:

(1) The protection provider pays an initial principal amount in cash to the protection purchaser at the inception of the transaction; and

(2) The protection purchaser is obligated to repay the initial principal amount to the protection provider on or before the maturity date of the transaction, less any losses that the protection purchaser realizes or otherwise recognizes due to nonpayment of all contractual payments due to be paid on the reference exposure or reference exposures by the obligors.

* * * * *

Protection amount (P) means, with respect to an exposure hedged by an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, or secured by financial collateral, the effective notional amount of the guarantee, credit derivative, or prepaid credit protection arrangement, or the fair value of the financial collateral, reduced to reflect any currency mismatch, maturity mismatch, or lack of restructuring coverage (as provided in § 217.36–217.37 or § 217.120–121, as applicable).

* * * * *

Qualifying cross-product master netting agreement means a qualifying master netting agreement that provides for termination and close-out netting across multiple types of financial transactions or qualifying master netting agreements in the event of a counterparty's default, provided that the

underlying financial transactions are derivative contracts or repo-style transactions that are not cleared transactions. In order to treat an agreement as a qualifying cross-product master netting agreement, a Board-regulated institution must comply with the requirements of § 217.3(c) of this part with respect to that agreement.

* * * * *

Qualifying master netting agreement means a written, legally enforceable agreement provided that:

* * *

(3) The agreement does not contain a walkaway clause (that is, a provision that permits a non-defaulting counterparty to make a lower payment than it otherwise would make under the agreement, or no payment at all, to a defaulter or the estate of a defaulter, even if the defaulter or the estate of the defaulter is a net creditor under the agreement); and

(4) In order to recognize an agreement as a qualifying master netting agreement for purposes of this subpart, a Board-regulated institution must comply with the requirements of § 217.3(d) with respect to that agreement.

* * * * *

Significant investment in the capital of an unconsolidated financial institution means an investment by a Category I Board-regulated institution or a Category II Board-regulated institution in the capital of an unconsolidated financial institution where the Category I Board-regulated institution or a Category II Board-regulated institution owns more than 10 percent of the issued and outstanding common stock of the unconsolidated financial institution.

* * * * *

Specified supranational entity means the Bank for International Settlements, the European Central Bank, the European Commission, the International Monetary Fund, the European Stability Mechanism, or the European Financial Stability Facility.

* * * * *

Speculative grade means that the entity to which the Board-regulated institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, has adequate capacity to meet financial commitments in the near term, but is vulnerable to adverse economic conditions, such that should economic conditions deteriorate, the issuer or the reference entity would present an elevated default risk.

Standardized market risk-weighted assets means the standardized measure for market risk calculated under § 217.204(b) multiplied by 12.5.

Standardized total risk-weighted assets means:

(1) The sum of:

(i) Total risk-weighted assets for general credit risk as calculated under § 217.31;

(ii) Total risk-weighted assets for cleared transactions and default fund contributions as calculated under § 217.35;

(iii) Total risk-weighted assets for unsettled transactions as calculated under § 217.38;

(iv) Total risk-weighted assets for securitization exposures as calculated under § 217.42;

(v) Total risk-weighted assets for equity exposures as calculated under § 217.52 and § 217.53; and

(vi) For a market risk Board-regulated institution only, market risk-weighted assets; less

(2) Any amount of the Board-regulated institution's adjusted allowance for credit losses that is not included in tier 2 capital and any amount of allocated transfer risk reserves.

* * * * *

Sub-speculative grade means that the entity to which the Board-regulated institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, depends on favorable economic conditions to meet its financial commitments, such that should such economic conditions deteriorate the issuer or the reference entity likely would default on its financial commitments.

* * * * *

Synthetic securitization means a transaction in which:

(1) All or a portion of the credit risk of one or more underlying exposures is retained or transferred to one or more third parties through the use of one or more credit derivatives, guarantees (other than a guarantee that transfers only the credit risk of an individual retail exposure), or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures; and

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities).

* * * * *

Total credit risk-weighted assets means the sum of:

(1) Total risk-weighted assets for general credit risk as calculated under § 217.110;

(2) Total risk-weighted assets for cleared transactions and default fund contributions as calculated under § 217.116;

(3) Total risk-weighted assets for unsettled transactions as calculated under § 217.117; and

(4) Total risk-weighted assets for securitization exposures as calculated under § 217.132.

* * * * *

Traditional securitization means a transaction in which:

(1) All or a portion of the credit or equity risk of one or more underlying exposures is transferred to one or more third parties other than through the use of credit derivatives, guarantees, or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures;

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities);

(5) The underlying exposures are not owned by an operating company;

(6) The underlying exposures are not owned by a small business investment company defined in section 302 of the Small Business Investment Act;

(7) The underlying exposures are not owned by a firm an investment in which qualifies as a community development investment under section 24(Eleventh) of the National Bank Act;

(8) The Board may determine that a transaction in which the underlying exposures are owned by an investment firm that exercises substantially unfettered control over the size and composition of its assets, liabilities, and off-balance sheet exposures is not a traditional securitization based on the transaction's leverage, risk profile, or economic substance;

(9) The Board may deem a transaction that meets the definition of a traditional securitization, notwithstanding paragraph (5), (6), or (7) of this definition, to be a traditional securitization based on the transaction's leverage, risk profile, or economic substance; and

(10) The transaction is not:

(i) An investment fund;

(ii) A collective investment fund (as defined in 12 CFR 208.34);

(iii) An employee benefit plan (as defined in paragraphs (3) and (32) of section 3 of ERISA), a "governmental plan" (as defined in 29 U.S.C. 1002(32)) that complies with the tax deferral qualification requirements provided in the Internal Revenue Code, or any similar employee benefit plan established under the laws of a foreign jurisdiction;

(iv) A synthetic exposure to the capital of a financial institution to the extent deducted from capital under § 217.22; or

(v) Registered with the SEC under the Investment Company Act of 1940 (15 U.S.C. 80a-1) or foreign equivalents thereof.

* * * * *

Variation margin amount means the fair value amount of the variation margin, as adjusted by the standard supervisory haircuts under § 217.121(c)(2)(iii), as applicable, that a counterparty to a netting set has posted to a Board-regulated institution less the fair value amount of the variation margin, as adjusted by the standard supervisory haircuts under § 217.121(c)(2)(iii), as applicable, posted by the Board-regulated institution to the counterparty.

* * * * *

■ 41. In § 217.3, revise paragraph (c) to read as follows:

§ 217.3 Operational requirements for counterparty credit risk.

* * * * *

(c) *Qualifying cross-product master netting agreement.* In order to recognize an agreement as a qualifying cross-product master netting agreement as defined in § 217.2, a Board-regulated institution must obtain a written legal opinion verifying the validity and enforceability of the agreement under applicable law of the relevant jurisdictions if the counterparty fails to perform upon an event of default, including upon receivership, insolvency, liquidation, or similar proceeding

* * * * *

■ 42. Add a new section § 217.4 to read as follows:

§ 217.4 Threshold Indexing.

(a) *Methodology.* The dollar thresholds specified in paragraph (c) of this section shall be adjusted by multiplying the baseline threshold values specified in paragraph (c) of this section by one plus the cumulative percent change in the non-seasonally

adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured from the effective date of this rule, as further described in paragraph (b) of this section, and shall be rounded in accordance with paragraph (d) of this section.

(b) *Frequency.* (1) *In general—biennial adjustments.* Except as otherwise provided in paragraph (b)(2) and (b)(3) of this section, the adjustments described in paragraph (a) of this section shall be effective on October 1 following each consecutive two year period ending August 30, and using the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers as of August 30 of that year.

(2) *Off-year adjustments.* In the event that the Board determines, during a year where no adjustment would be made under paragraph (b)(1), that the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured over the twelve month period ending August 30 of that year, is such that an adjustment under this section would be appropriate for that year, the Board may make an adjustment under this section for that year.

(3) *Periods of negative inflation.* Notwithstanding paragraph (b)(1) or (b)(2) of this section, if an adjustment of dollar thresholds using the cumulative percent change of the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers from the effective date of this rule or the most recent adjustment, as applicable, would not result in an increase from the current dollar thresholds, no adjustment will be made pursuant to paragraph (a) of this section.

(c) *Specified thresholds.* The thresholds in the following sections shall be adjusted in accordance with paragraph (a) of this section relative to the baseline threshold values as specified below.

(1) § 217.2, definition of Financial institution, paragraph (4)(i)(A), baseline threshold value \$10 million;

(2) § 217.101, definition of Regulatory retail exposure, paragraph (2), baseline threshold value \$1 million;

(3) § 217.101, definition of Small or medium-sized entity (SME), baseline threshold value \$50 million;

(4) § 217.150(b)(1), baseline threshold value \$1 billion;

(5) § 217.150(b)(2), baseline threshold values \$1 billion, \$30 billion, and \$120 million;

(6) § 217.150(b)(2)(i), baseline threshold value \$1 billion;

(7) § 217.150(b)(3), baseline threshold values \$30 billion and \$4.47 billion

(8) § 217.150(b)(3)(i), baseline threshold value \$30 billion;

(9) § 217.150(d)(2)(i)(A), baseline threshold value \$20,000;

(10) § 217.201(b)(1)(ii)(B), baseline threshold value \$5 billion;

(11) § 217.201(b)(2)(ii), baseline threshold value \$1 trillion;

(12) § 217.202 “Large market cap”, baseline threshold value \$2 billion;

(13) § 217.202, “Market risk covered position” (1)(ii)(D), baseline value \$20 million;

(14) § 217.202, “Small market cap”, baseline threshold value \$2 billion.

(d) *Rounding.* When adjusting thresholds under this section, each threshold shall be rounded based on the size of the threshold (e.g., thousands, millions, billions) to the nearest number with two significant digits.

(e) *Effective date of threshold adjustments.* The [AGENCY] shall announce the thresholds adjusted in accordance with this section by publication in the **Federal Register**. Such adjusted thresholds shall be effective on October 1 of the year during which an adjustment is made.

(f) *Failure to publish in the Federal Register.* In the event, for any reason, the thresholds adjusted in accordance with this section are not published in the **Federal Register** in a year in which an adjustment is made under this section, the thresholds specified in paragraph (c) of this section will adjust as provided in this section and be effective on October 1, notwithstanding the lack of publication in the **Federal Register**.

* * * * *

■ 43. Add § 217.5 “Calculation of loan-to-value (LTV) ratio.”

The addition reads as follows:

§ 217.5 Calculation of loan-to-value (LTV) ratio.

(a) *Loan-to-Value ratio.* The loan-to-value (LTV) ratio must be calculated as the extension of credit divided by the value of the property.

(b) *Extension of credit.* For purposes of a LTV ratio calculated under this section, the extension of credit is equal to the total outstanding amount of the loan including any undrawn committed amount of the loan.

(c) *Value of the property.* (1) For purposes of a LTV ratio calculated under this section, the value of the property is the market value of all real estate properties securing or being improved by the extension of credit plus the amount of any readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 208, appendix C, that secures the

extension of credit, subject to the following:

(i) For exposures subject to 12 CFR 208 subpart E or 12 CFR 225 subpart G, as applicable, the market value of property is a valuation that meets all requirements of that rule.

(ii) For exposures not subject to 12 CFR 208 subpart E or 12 CFR 225 subpart G, as applicable:

(A) The market value of real estate must be obtained from an independent valuation of the property using prudently conservative valuation criteria;

(B) The valuation must be done independently from the [BANKING ORGANIZATION]’s origination and underwriting process, and

(C) To ensure that the market value of the real estate is determined in a prudently conservative manner, the valuation must exclude expectations of price increases and must be adjusted downward to account for the potential for the current market price to be significantly above the value that would be sustainable over the life of the loan.

(2) In the case where the exposure includes the financing to purchase the property, the value of the property is the lower of the market value obtained under paragraph (c)(1)(i) or (c)(1)(ii) of this section, as applicable, and the actual acquisition cost.

(3) The value of the property must be measured at the time of origination, except in the following circumstances:

(i) The [AGENCY] requires a [BANKING ORGANIZATION] to revise the value of the property downward;

(ii) The value of the property must be adjusted downward due to an extraordinary event that results in a permanent reduction of the property value; or

(iii) The value of the property may be increased to reflect modifications made to the property that increase the market value, as determined according to the requirements in paragraphs (c)(1)(i) or (ii) of this section.

(4) Readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 208, appendix C, must be appropriately discounted by the [BANKING ORGANIZATION] consistent with the [BANKING ORGANIZATION]’s usual practices for making loans secured by such collateral.

Subpart B—Capital Ratio Requirements and Buffers

■ 44. In § 217.10:

■ a. Revise paragraph (a)(1)(v);

■ b. Revise paragraph (b);

■ c. Revise paragraph (c);

■ d. Revise paragraph (d) introductory text; and

■ e. Revise paragraph (d)(3)(ii).

The revisions read as follows:

§ 217.10 Minimum capital requirements.

(a) * * *

(1) * * *

(v) For a Category I Board-regulated institution, Category II Board-regulated institution, or Category III Board-regulated institution, a supplementary leverage ratio of 3 percent.

* * * * *

(b) *Standardized capital ratio calculations.* For a Board-regulated institution that is not a Category I Board-regulated institution or Category II Board-regulated institution:

(1) *Common equity tier 1 capital ratio.* The Board-regulated institution's common equity tier 1 capital ratio is the ratio of the Board-regulated institution's common equity tier 1 capital to selected total risk-weighted assets;

(2) *Tier 1 capital ratio.* The Board-regulated institution's tier 1 capital ratio is the ratio of the Board-regulated institution's tier 1 capital to selected total risk-weighted assets;

(3) *Total capital ratio.* The Board-regulated institution's total capital ratio is the ratio of the Board-regulated institution's total capital to selected total risk-weighted assets; and

(4) *Leverage ratio.* The Board-regulated institution's leverage ratio is the ratio of the Board-regulated institution's tier 1 capital to the Board-regulated institution's average total consolidated assets as reported on the Board-regulated institution's Call Report, for a state member bank, or the Consolidated Financial Statements for Bank Holding Companies (FR Y-9C), for a bank holding company or savings and loan holding company, as applicable minus amounts deducted from tier 1 capital under § 217.22(a), (c) and (d).

(5) *Selected total risk-weighted assets.* A Board-regulated institution's selected total risk-weighted assets is either the Board-regulated institution's standardized total risk-weighted assets or expanded total risk-weighted assets, as selected by the Board-regulated institution. A Board-regulated institution may change its choice for selected total risk-weighted assets by providing the Board with prior notice of the change at least four full calendar quarters before the calendar quarter in which the change will take effect.

(c) *Supplementary leverage ratio.* (1) The supplementary leverage ratio of a Category I Board-regulated institution, Category II Board-regulated institution, or Category III Board-regulated institution is the ratio of its tier 1 capital to total leverage exposure. Total

leverage exposure is calculated as the sum of:

(i) The mean of the on-balance sheet assets calculated as of each day of the reporting quarter; and

(ii) The mean of the off-balance sheet exposures calculated as of the last day of each of the most recent three months, minus the applicable deductions under § 217.22(a), (c), and (d).

(2) For purposes of this part, *total leverage exposure* means the sum of the items described in paragraphs (c)(2)(i) through (viii) of this section, as adjusted pursuant to paragraph (c)(2)(ix) of this section for a clearing member Board-regulated institution and paragraph (c)(2)(x) of this section for a custodial banking organization:

(i) The balance sheet carrying value of all of the Board-regulated institution's on-balance sheet assets, net of adjusted allowances for credit losses, *plus* the value of securities sold under a repurchase transaction or a securities lending transaction that qualifies for sales treatment under GAAP, *less* amounts deducted from tier 1 capital under § 217.22(a), (c), and (d), less the value of securities received in security-for-security repo-style transactions, where the Board-regulated institution acts as a securities lender and includes the securities received in its on-balance sheet assets but has not sold or re-hypothecated the securities received, and, for a Board-regulated institution that uses the standardized approach for counterparty credit risk (SA-CCR) under § 217.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, less the fair value of any derivative contracts;

(ii) (A) For a Board-regulated institution that uses the current exposure methodology under § 217.34(b) for its standardized total risk-weighted assets, the potential future credit exposure (PFE) for each derivative contract or each single-product netting set of derivative contracts (including a cleared transaction except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the Board-regulated institution, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP), to which the Board-regulated institution is a counterparty as determined under § 217.34, but without regard to § 217.34(c), provided that:

(1) A Board-regulated institution may choose to exclude the PFE of all credit derivatives or other similar instruments through which it provides credit

protection when calculating the PFE under § 217.34, but without regard to § 217.34(c), provided that it does not adjust the net-to-gross ratio (NGR); and

(2) A Board-regulated institution that chooses to exclude the PFE of credit derivatives or other similar instruments through which it provides credit protection pursuant to paragraph (c)(2)(ii)(A) of this section must do so consistently over time for the calculation of the PFE for all such instruments; or

(B) (1) For a Board-regulated institution that uses SA-CCR under § 217.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, the PFE under SA-CCR for each derivative contract or single product netting set of derivative contracts to which the Board-regulated institution is a counterparty (including cleared transactions except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the Board-regulated institution, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP), as determined under § 217.114(g), in which the term C in § 217.114(g)(1) equals zero, and, for any counterparty that is not a commercial end-user, multiplied by 1.4. For purposes of this paragraph (c)(2)(ii)(A), a Board-regulated institution may set the value of the term C in § 217.114(g)(1) equal to the amount of collateral posted by a clearing member client of the Board-regulated institution in connection with the client-facing derivative transactions within the netting set; and

(2) A Board-regulated institution may choose to exclude the PFE of all credit derivatives or other similar instruments through which it provides credit protection when calculating the PFE under § 217.114, provided that it does so consistently over time for the calculation of the PFE for all such instruments;

(iii)(A)(1) For a Board-regulated institution that uses the current exposure methodology under § 217.34(b) for its standardized total risk-weighted assets, the amount of cash collateral that is received from a counterparty to a derivative contract and that has offset the mark-to-fair value of the derivative asset, or cash collateral that is posted to a counterparty to a derivative contract and that has reduced the Board-regulated institution's on-balance sheet assets, unless such cash collateral is all or part of variation margin that satisfies the conditions in

paragraphs (c)(2)(iii)(C) through (G) of this section; and

(2) The variation margin is used to reduce the current credit exposure of the derivative contract, calculated as described in § 217.34(b), and not the PFE; and

(3) For the purpose of the calculation of the NGR described in

§ 217.34(b)(2)(ii)(B), variation margin described in paragraph (c)(2)(iii)(A)(2) of this section may not reduce the net current credit exposure or the gross current credit exposure; or

(B)(1) For a Board-regulated institution that uses SA-CCR under § 217.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, the replacement cost under § 217.114 of each derivative contract or single product netting set of derivative contracts to which the Board-regulated institution is a counterparty, calculated according to the following formula, and, for any counterparty that is not a commercial end-user, multiplied by 1.4:

$$\text{Replacement Cost} = \max\{V - \text{CVM}_r + \text{CVM}_p; 0\}$$

Where:

V equals the fair value for each derivative contract or each netting set of derivative contracts (including a cleared transaction except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the Board-regulated institution, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP);

CVM_r equals the amount of cash collateral received from a counterparty to a derivative contract and that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section, or, in the case of a client-facing derivative transaction, the amount of collateral received from the clearing member client; and

CVM_p equals the amount of cash collateral that is posted to a counterparty to a derivative contract and that has not offset the fair value of the derivative contract and that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section, or, in the case of a client-facing derivative transaction, the amount of collateral posted to the clearing member client;

(2) Notwithstanding paragraph (c)(2)(iii)(A)(1) of this section, where multiple netting sets are subject to a single variation margin agreement, a Board-regulated institution must apply the formula for replacement cost provided in § 217.114(j)(1), in which the term CMA may only include cash collateral that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section; and

(3) For purposes of paragraph (c)(2)(iii)(A)(1) of this section, a Board-regulated institution must treat a derivative contract that references an index as if it were multiple derivative contracts each referencing one component of the index if the Board-regulated institution elected to treat the derivative contract as multiple derivative contracts under § 217.114(e)(6);

(C) For derivative contracts that are not cleared through a QCCP, the cash collateral received by the recipient counterparty is not segregated (by law, regulation, or an agreement with the counterparty);

(D) Variation margin is calculated and transferred on a daily basis based on the mark-to-fair value of the derivative contract;

(E) The variation margin transferred under the derivative contract or the governing rules of the CCP or QCCP for a cleared transaction is the full amount that is necessary to fully extinguish the net current credit exposure to the counterparty of the derivative contracts, subject to the threshold and minimum transfer amounts applicable to the counterparty under the terms of the derivative contract or the governing rules for a cleared transaction;

(F) The variation margin is in the form of cash in the same currency as the currency of settlement set forth in the derivative contract, provided that for the purposes of this paragraph (c)(2)(iii)(F), currency of settlement means any currency for settlement specified in the governing qualifying master netting agreement and the credit support annex to the qualifying master netting agreement, or in the governing rules for a cleared transaction; and

(G) The derivative contract and the variation margin are governed by a qualifying master netting agreement between the legal entities that are the counterparties to the derivative contract or by the governing rules for a cleared transaction, and the qualifying master netting agreement or the governing rules for a cleared transaction must explicitly stipulate that the counterparties agree to settle any payment obligations on a net basis, taking into account any variation margin received or provided under the contract if a credit event involving either counterparty occurs;

(iv) The effective notional principal amount (that is, the apparent or stated notional principal amount multiplied by any multiplier in the derivative contract) of a credit derivative, or other similar instrument, through which the Board-regulated institution provides credit protection, provided that:

(A) The Board-regulated institution may reduce the effective notional principal amount of the credit derivative by the amount of any reduction in the mark-to-fair value of the credit derivative if the reduction is recognized in common equity tier 1 capital;

(B) The Board-regulated institution may reduce the effective notional principal amount of the credit derivative by the effective notional principal amount of a purchased credit derivative or other similar instrument, provided that the remaining maturity of the purchased credit derivative is equal to or greater than the remaining maturity of the credit derivative through which the Board-regulated institution provides credit protection and that:

(1) With respect to a credit derivative that references a single exposure, the reference exposure of the purchased credit derivative is to the same legal entity and ranks *pari passu* with, or is junior to, the reference exposure of the credit derivative through which the Board-regulated institution provides credit protection; or

(2) With respect to a credit derivative that references multiple exposures, the reference exposures of the purchased credit derivative are to the same legal entities and rank *pari passu* with the reference exposures of the credit derivative through which the Board-regulated institution provides credit protection, and the level of seniority of the purchased credit derivative ranks *pari passu* to the level of seniority of the credit derivative through which the Board-regulated institution provides credit protection;

(3) Where a Board-regulated institution has reduced the effective notional principal amount of a credit derivative through which the Board-regulated institution provides credit protection in accordance with paragraph (c)(2)(iv)(A) of this section, the Board-regulated institution must also reduce the effective notional principal amount of a purchased credit derivative used to offset the credit derivative through which the Board-regulated institution provides credit protection, by the amount of any increase in the mark-to-fair value of the purchased credit derivative that is recognized in common equity tier 1 capital; and

(4) Where the Board-regulated institution purchases credit protection through a total return swap and records the net payments received on a credit derivative through which the Board-regulated institution provides credit protection in net income, but does not record offsetting deterioration in the mark-to-fair value of the credit

derivative through which the Board-regulated institution provides credit protection in net income (either through reductions in fair value or by additions to reserves), the Board-regulated institution may not use the purchased credit protection to offset the effective notional principal amount of the related credit derivative through which the Board-regulated institution provides credit protection;

(v) Where a Board-regulated institution acting as a principal has more than one repo-style transaction with the same counterparty and has offset the gross value of receivables due from a counterparty under reverse repurchase transactions by the gross value of payables under repurchase transactions due to the same counterparty, the gross value of receivables associated with the repo-style transactions less any on-balance sheet receivables amount associated with these repo-style transactions included under paragraph (c)(2)(i) of this section, unless the following criteria are met:

(A) The offsetting transactions have the same explicit final settlement date under their governing agreements;

(B) The right to offset the amount owed to the counterparty with the amount owed by the counterparty is legally enforceable in the normal course of business and in the event of receivership, insolvency, liquidation, or similar proceeding; and

(C) Under the governing agreements, the counterparties intend to settle net, settle simultaneously, or settle according to a process that is the functional equivalent of net settlement, (that is, the cash flows of the transactions are equivalent, in effect, to a single net amount on the settlement date), where both transactions are settled through the same settlement system, the settlement arrangements are supported by cash or intraday credit facilities intended to ensure that settlement of both transactions will occur by the end of the business day, and the settlement of the underlying securities does not interfere with the net cash settlement;

(vi) The counterparty credit risk of a repo-style transaction, including where the Board-regulated institution acts as an agent for a repo-style transaction and indemnifies the customer with respect to the performance of the customer's counterparty in an amount limited to the difference between the fair value of the security or cash its customer has lent and the fair value of the collateral the borrower has provided, calculated as follows:

(A) If the transaction is not subject to a qualifying master netting agreement, the counterparty credit risk (E^*) for transactions with a counterparty must be calculated on a transaction by transaction basis, such that each transaction i is treated as its own netting set, in accordance with the following formula, where E_i is the fair value of the instruments, gold, or cash that the Board-regulated institution has lent, sold subject to repurchase, or provided as collateral to the counterparty, and C_i is the fair value of the instruments, gold, or cash that the Board-regulated institution has borrowed, purchased subject to resale, or received as collateral from the counterparty:

$$E_i^* = \max \{0, [E_i - C_i]\}; \text{ and}$$

(B) If the transaction is subject to a qualifying master netting agreement, the counterparty credit risk (E^*) must be calculated as the greater of zero and the total fair value of the instruments, gold, or cash that the Board-regulated institution has lent, sold subject to repurchase or provided as collateral to a counterparty for all transactions included in the qualifying master netting agreement ($\sum E_i$), less the total fair value of the instruments, gold, or cash that the Board-regulated institution borrowed, purchased subject to resale or received as collateral from the counterparty for those transactions ($\sum C_i$), in accordance with the following formula:

$$E^* = \max \{0, [\sum E_i - \sum C_i]\}$$

(vii) If a Board-regulated institution acting as an agent for a repo-style transaction provides a guarantee to a customer of the security or cash its customer has lent or borrowed with respect to the performance of the customer's counterparty and the guarantee is not limited to the difference between the fair value of the security or cash its customer has lent and the fair value of the collateral the borrower has provided, the amount of the guarantee that is greater than the difference between the fair value of the security or cash its customer has lent and the value of the collateral the borrower has provided;

(viii) The credit equivalent amount of all off-balance sheet exposures of the Board-regulated institution, excluding repo-style transactions, repurchase or reverse repurchase or securities borrowing or lending transactions that qualify for sales treatment under GAAP, and derivative transactions, determined using:

(A) For a Board-regulated institution that elects to calculate its standardized total risk-weighted assets under § 217.10(b), the applicable credit

conversion factor under § 217.33(b), provided, however, that the minimum credit conversion factor that may be assigned to an off-balance sheet exposure under this paragraph is 10 percent; or

(B) For a Board-regulated institution that elects to calculate its expanded total risk-weighted assets under § 217.10(b), a Category I Board-regulated institution, or a Category II Board-regulated institution, the applicable credit conversion factor under § 217.112(b), provided, however, that the minimum credit conversion factor that may be assigned to an off-balance sheet exposure under this paragraph is 10 percent; and

(ix) For a Board-regulated institution that is a clearing member:

(A) A clearing member Board-regulated institution that guarantees the performance of a clearing member client with respect to a cleared transaction must treat its exposure to the clearing member client as a derivative contract or repo-style transaction, as applicable, for purposes of determining its total leverage exposure;

(B) A clearing member Board-regulated institution that guarantees the performance of a CCP with respect to a transaction cleared on behalf of a clearing member client must treat its exposure to the CCP as a derivative contract or repo-style transaction, as applicable, for purposes of determining its total leverage exposure;

(C) A clearing member Board-regulated institution that does not guarantee the performance of a CCP with respect to a transaction cleared on behalf of a clearing member client may exclude its exposure to the CCP for purposes of determining its total leverage exposure;

(D) A Board-regulated institution that is a clearing member may exclude from its total leverage exposure the effective notional principal amount of credit protection sold through a credit derivative contract, or other similar instrument, that it clears on behalf of a clearing member client through a CCP as calculated in accordance with paragraph (c)(2)(iv) of this section;

(E) Notwithstanding paragraphs (c)(2)(ix)(A) through (C) of this section, a Board-regulated institution may exclude from its total leverage exposure a clearing member's exposure to a clearing member client for a derivative contract if the clearing member client and the clearing member are affiliates and consolidated for financial reporting purposes on the Board-regulated institution's balance sheet; and

(F) Notwithstanding paragraph (c)(2)(ix)(A), a Board-regulated

institution that has elected under § 217.113(c) to treat any repo-style transactions subject to a qualifying cross-product master netting agreement as derivative contracts must treat any such repo-style transactions as a derivative contract for purposes of this paragraph (c).

(x) A custodial banking organization shall exclude from its total leverage exposure the lesser of:

(A) The amount of funds that the custodial banking organization has on deposit at a qualifying central bank; and

(B) The amount of funds in deposit accounts at the custodial banking organization that are linked to fiduciary or custodial and safekeeping accounts at the custodial banking organization. For purposes of this paragraph (c)(2)(x), a deposit account is linked to a fiduciary or custodial and safekeeping account if the deposit account is provided to a client that maintains a fiduciary or custodial and safekeeping account with the custodial banking organization and the deposit account is used to facilitate the administration of the fiduciary or custodial and safekeeping account.

(d) *Expanded capital ratio calculations.* For a Category I Board-regulated institution or a Category II Board-regulated institution:

(1) *Common equity tier 1 capital ratio.* The Board-regulated institution's common equity tier 1 capital ratio is the ratio of the Board-regulated institution's common equity tier 1 capital to expanded total risk-weighted assets;

(2) *Tier 1 capital ratio.* The Board-regulated institution's tier 1 capital ratio is the ratio of the Board-regulated institution's tier 1 capital to expanded total risk-weighted assets;

(3) *Total capital ratio.* The Board-regulated institution's total capital ratio is the ratio of the Board-regulated institution's total capital to expanded total risk-weighted assets; and

(4) *Leverage ratio.* The Board-regulated institution's leverage ratio is the ratio of the Board-regulated institution's tier 1 capital to the Board-regulated institution's average total consolidated assets as reported on the Board-regulated institution's Call Report, for a state member bank, or the Consolidated Financial Statements for Bank Holding Companies (FR Y–9C), for a bank holding company or savings and loan holding company, as applicable minus amounts deducted from tier 1 capital under § 217.22(a), (c) and (d).

* * * * *

■ 45. Revise § 217.11 to read as follows:

§ 217.11 Capital conservation buffer, countercyclical capital buffer amount, and GSIB surcharge.

(a) *Capital conservation buffer—(1) Composition of the capital conservation buffer.* The capital conservation buffer is composed solely of common equity tier 1 capital.

(2) *Definitions.* For purposes of this section, the following definitions apply:

(i) *Eligible retained income.* The eligible retained income of a Board-regulated institution is the greater of:

(A) The Board-regulated institution's net income, calculated in accordance with the instructions to the FR Y–9C or Call Report, as applicable, for the four calendar quarters preceding the current calendar quarter, net of any distributions and associated tax effects not already reflected in net income; and

(B) The average of the Board-regulated institution's net income, calculated in accordance with the instructions to the FR Y–9C or Call Report, as applicable, for the four calendar quarters preceding the current calendar quarter.

(ii) *Maximum payout amount.* A Board-regulated institution's maximum payout amount for the current calendar quarter is equal to the Board-regulated institution's eligible retained income, multiplied by its maximum payout ratio.

(iii) *Maximum payout ratio.* The maximum payout ratio is the percentage of eligible retained income that a Board-regulated institution can pay out in the form of distributions and discretionary bonus payments during the current calendar quarter. For a Board-regulated institution that is not subject to 12 CFR 225.8 or 238.170, and that is not a state member bank that is a subsidiary of a globally systemically important BHC, the maximum payout ratio is determined by the Board-regulated institution's capital conservation buffer, calculated as of the last day of the previous calendar quarter, as set forth in table 1 to § 217.11. For a Board-regulated institution that is subject to 12 CFR 225.8 or 238.170 or that is a state member bank that is a subsidiary of a global systemically important BHC, the maximum payout ratio is determined under paragraph (c)(1)(ii) of this section.

(iv) *Private sector credit exposure.* Private sector credit exposure means an exposure to a company or an individual that is not an exposure to a sovereign, a specified supranational entity, a MDB, a PSE, or a GSE.

(v) *Leverage buffer requirement.* (A) A global systemically important BHC's leverage buffer requirement is 50 percent of the most recent method 1 surcharge (expressed as a percentage) that the Board-regulated institution was

required to calculate pursuant to § 217.403(b), subject to the effective date provisions of § 217.403(d).

(B) The leverage buffer requirement of a state member bank that is a subsidiary of a global systemically important BHC is equal to the lesser of 1.0 percent or 50 percent of the most recent method 1 surcharge (expressed as a percentage) that the global systemically important BHC that controls the state member bank was required to calculate pursuant to § 217.403(b), subject to the effective date provisions of § 217.403(d).

(vi) *Stress capital buffer requirement.* (A) The stress capital buffer requirement for a Board-regulated institution subject to 12 CFR 225.8 or 238.170 is the stress capital buffer requirement determined under 12 CFR 225.8 or 238.170 except as provided in paragraph (a)(2)(vi)(B) of this section.

(B) If a Board-regulated institution subject to 12 CFR 225.8 or 238.170 has not yet received a stress capital buffer requirement, its stress capital buffer requirement for purposes of this part is 2.5 percent.

(3) *Calculation of capital conservation buffer.* (i) A Board-regulated institution that is not subject to 12 CFR 225.8 or 238.170 has a capital conservation buffer equal to the lowest of the following ratios, calculated as of the last day of the previous calendar quarter:

(A) The Board-regulated institution's common equity tier 1 capital ratio minus the Board-regulated institution's minimum common equity tier 1 capital ratio requirement under § 217.10;

(B) The Board-regulated institution's tier 1 capital ratio minus the Board-regulated institution's minimum tier 1 capital ratio requirement under § 217.10; and

(C) The Board-regulated institution's total capital ratio minus the Board-regulated institution's minimum total capital ratio requirement under § 217.10; or

(ii) Notwithstanding paragraphs (a)(3)(i)(A) through (C) of this section, if a Board-regulated institution's common equity tier 1, tier 1, or total capital ratio is less than or equal to the Board-regulated institution's minimum common equity tier 1, tier 1, or total capital ratio requirement under § 217.10, respectively, the Board-regulated institution's capital conservation buffer is zero.

(4) *Limits on distributions and discretionary bonus payments.* (i) A Board-regulated institution that is not subject to 12 CFR 225.8 or 238.170 shall not make distributions or discretionary bonus payments or create an obligation to make such distributions or payments during the current calendar quarter that,

in the aggregate, exceed its maximum payout amount.

(ii) A Board-regulated institution that is not subject to 12 CFR 225.8 or 238.170 and that has a capital conservation buffer that is greater than 2.5 percent plus 100 percent of its applicable countercyclical capital buffer amount in accordance with paragraph (b) of this section is not subject to a maximum payout amount under paragraph (a)(2)(ii) of this section.

(iii) Except as provided in paragraph (a)(4)(iv) of this section, a Board-

regulated institution that is not subject to 12 CFR 225.8 or 238.170 may not make distributions or discretionary bonus payments during the current calendar quarter if the Board-regulated institution's:

(A) Eligible retained income is negative; and

(B) Capital conservation buffer was less than 2.5 percent as of the end of the previous calendar quarter.

(iv) Notwithstanding the limitations in paragraphs (a)(4)(i) through (iii) of this section, the Board may permit a

Board-regulated institution that is not subject to 12 CFR 225.8 or 238.170 to make a distribution or discretionary bonus payment upon a request of the Board-regulated institution, if the Board determines that the distribution or discretionary bonus payment would not be contrary to the purposes of this section, or to the safety and soundness of the Board-regulated institution. In making such a determination, the Board will consider the nature and extent of the request and the particular circumstances giving rise to the request.

TABLE 1 TO § 217.11—CALCULATION OF MAXIMUM PAYOUT AMOUNT

Capital conservation buffer	Maximum payout ratio
Greater than 2.5 percent plus 100 percent of the Board-regulated institution's applicable countercyclical capital buffer amount.	No payout ratio limitation applies.
Less than or equal to 2.5 percent plus 100 percent of the Board-regulated institution's applicable countercyclical capital buffer amount, and greater than 1.875 percent plus 75 percent of the Board-regulated institution's applicable countercyclical capital buffer amount.	60 percent.
Less than or equal to 1.875 percent plus 75 percent of the Board-regulated institution's applicable countercyclical capital buffer amount, and greater than 1.25 percent plus 50 percent of the Board-regulated institution's applicable countercyclical capital buffer amount.	40 percent.
Less than or equal to 1.25 percent plus 50 percent of the Board-regulated institution's applicable countercyclical capital buffer amount and greater than 0.625 percent plus 25 percent of the Board-regulated institution's applicable countercyclical capital buffer amount.	20 percent.
Less than or equal to 0.625 percent plus 25 percent of the Board-regulated institution's applicable countercyclical capital buffer amount.	0 percent.

(v) Additional limitations on distributions may apply under 12 CFR 225.4 and 263.202 to a Board-regulated institution that is not subject to 12 CFR 225.8 or 238.170.

(b) *Countercyclical capital buffer amount*—(1) *General*. A Category I Board-regulated institution, Category II Board-regulated institution, or Category III Board-regulated institution must calculate a countercyclical capital buffer amount in accordance with this paragraph (b) for purposes of determining its maximum payout ratio under Table 1 to § 217.11 section and, if applicable, Table 2 to § 217.11.

(i) *Extension of capital conservation buffer*. The countercyclical capital buffer amount is an extension of the capital conservation buffer as described in paragraph (a) or (c) of this section, as applicable.

(ii) *Amount*. A Category I Board-regulated institution, Category II Board-regulated institution, or Category III Board-regulated institution has a countercyclical capital buffer amount determined by calculating the weighted average of the countercyclical capital buffer amounts established for the national jurisdictions where the Board-regulated institution's private sector credit exposures are located, as specified in paragraphs (b)(2) and (3) of this section.

(iii) *Weighting*. The weight assigned to a jurisdiction's countercyclical capital buffer amount is calculated by dividing the total risk-weighted assets for the Board-regulated institution's private sector credit exposures located in the jurisdiction by the total risk-weighted assets for all of the Board-regulated institution's private sector credit exposures. The methodology a Board-regulated institution uses for determining risk-weighted assets for purposes of this paragraph (b) must be the methodology that determines its risk-based capital ratios under § 217.10. Notwithstanding the previous sentence, the risk-weighted asset amount for a private sector credit exposure that is a covered position under subpart F of this part is its standardized default risk capital requirement as determined under § 217.210 multiplied by 12.5.

(iv) *Location*. (A) Except as provided in paragraphs (b)(1)(iv)(B) and (C) of this section, the location of a private sector credit exposure is the national jurisdiction where the borrower is located (that is, where it is incorporated, chartered, or similarly established or, if the borrower is an individual, where the borrower resides).

(B) If, in accordance with subpart D or E of this part, the Board-regulated institution has assigned to a private sector credit exposure a risk weight associated with a protection provider on

a guarantee or credit derivative, the location of the exposure is the national jurisdiction where the protection provider is located.

(C) The location of a securitization exposure is the location of the underlying exposures, or, if the underlying exposures are located in more than one national jurisdiction, the national jurisdiction where the underlying exposures with the largest aggregate unpaid principal balance are located. For purposes of this paragraph (b), the location of an underlying exposure shall be the location of the borrower, determined consistent with paragraph (b)(1)(iv)(A) of this section.

(2) *Countercyclical capital buffer amount for credit exposures in the United States*—(i) *Initial countercyclical capital buffer amount with respect to credit exposures in the United States*. The initial countercyclical capital buffer amount in the United States is zero.

(ii) *Adjustment of the countercyclical capital buffer amount*. The Board will adjust the countercyclical capital buffer amount for credit exposures in the United States in accordance with applicable law.¹

¹ The Board expects that any adjustment will be based on a determination made jointly by the Board, OCC, and FDIC.

(iii) *Range of countercyclical capital buffer amount*. The Board will adjust

the countercyclical capital buffer amount for credit exposures in the United States between zero percent and 2.5 percent of risk-weighted assets.

(iv) *Adjustment determination.* The Board will base its decision to adjust the countercyclical capital buffer amount under this section on a range of macroeconomic, financial, and supervisory information indicating an increase in systemic risk including, but not limited to, the ratio of credit to gross domestic product, a variety of asset prices, other factors indicative of relative credit and liquidity expansion or contraction, funding spreads, credit condition surveys, indices based on credit default swap spreads, options implied volatility, and measures of systemic risk.

(v) *Effective date of adjusted countercyclical capital buffer amount—*

(A) *Increase adjustment.* A determination by the Board under paragraph (b)(2)(ii) of this section to increase the countercyclical capital buffer amount will be effective 12 months from the date of announcement, unless the Board establishes an earlier effective date and includes a statement articulating the reasons for the earlier effective date.

(B) *Decrease adjustment.* A determination by the Board to decrease the established countercyclical capital buffer amount under paragraph (b)(2)(ii) of this section will be effective on the day following announcement of the final determination or the earliest date permissible under applicable law or regulation, whichever is later.

(vi) *Twelve-month sunset.* The countercyclical capital buffer amount will return to zero percent 12 months after the effective date that the adjusted countercyclical capital buffer amount is announced, unless the Board announces a decision to maintain the adjusted countercyclical capital buffer amount or adjust it again before the expiration of the 12-month period.

(3) *Countercyclical capital buffer amount for foreign jurisdictions.* The Board will adjust the countercyclical capital buffer amount for private sector credit exposures to reflect decisions made by foreign jurisdictions consistent with due process requirements described in paragraph (b)(2) of this section.

(c) *Calculation of buffers for Board-regulated institutions subject to 12 CFR 225.8 or 238.170—*(1) *Limits on distributions and discretionary bonus payments.* (i) *General.* A Board-regulated institution that is subject to 12 CFR 225.8 or 238.170, or that is a state member bank that is a subsidiary of a global systemically important BHC,

shall not make distributions or discretionary bonus payments or create an obligation to make such distributions or payments during the current calendar quarter that, in the aggregate, exceed its maximum payout amount.

(ii) *Maximum payout ratio.* The maximum payout ratio of a Board-regulated institution that is subject to 12 CFR 225.8 or 238.170, or that is a state member bank that is a subsidiary of a globally systemically important BHC, is the lowest of the payout ratios determined by its capital conservation buffer; and, if applicable, leverage buffer; as set forth in Table 2 to § 217.11.

(iii) *Capital conservation buffer requirement.* A Board-regulated institution that is subject to 12 CFR 225.8 or 238.170 has a capital conservation buffer requirement equal to its stress capital buffer requirement plus its applicable countercyclical capital buffer amount in accordance with paragraph (b) of this section plus its applicable GSIB surcharge in accordance with paragraph (d) of this section. A Board-regulated institution that is a state member bank subsidiary of a global systemically important BHC has a capital conservation buffer requirement equal to 2.5 percent.

(iv) *No maximum payout amount limitation.* A Board-regulated institution that is subject to 12 CFR 225.8 or 238.170, or that is a state member bank that is a subsidiary of a global systemically important BHC, is not subject to a maximum payout amount under paragraph (a)(2)(ii) of this section if it has:

(A) A capital conservation buffer, calculated under paragraph (c)(2) of this section, that is greater than its capital conservation buffer requirement calculated under paragraph (c)(1)(iii) of this section; and

(B) If applicable, a leverage buffer, calculated under paragraph (c)(3) of this section, that is greater than its leverage buffer requirement as set forth in paragraph (a)(2)(v) of this section.

(v) *Negative eligible retained income.* Except as provided in paragraph (c)(1)(vi) of this section, a Board-regulated institution that is subject to 12 CFR 225.8 or 238.170, or that is a state member bank that is a subsidiary of a global systemically important BHC, may not make distributions or discretionary bonus payments during the current calendar quarter if, as of the end of the previous calendar quarter, the Board-regulated institution's:

(A) Eligible retained income is negative; and

(B)(1) Capital conservation buffer was less than its capital conservation buffer requirement; or

(2) If applicable, leverage buffer was less than its leverage buffer requirement.

(vi) *Prior approval.* Notwithstanding the limitations in paragraphs (c)(1)(i) through (v) of this section, the Board may permit a Board-regulated institution that is subject to 12 CFR 225.8 or 238.170, or that is a state member bank that is a subsidiary of a global systemically important BHC, to make a distribution or discretionary bonus payment upon a request of the Board-regulated institution, if the Board determines that the distribution or discretionary bonus payment would not be contrary to the purposes of this section, or to the safety and soundness of the Board-regulated institution. In making such a determination, the Board will consider the nature and extent of the request and the particular circumstances giving rise to the request.

(vii) *Other limitations on distributions.* Additional limitations on distributions may apply under 12 CFR 225.4, 225.8, 238.170, 252.63, 252.165, and 263.202 to a Board-regulated institution that is subject to 12 CFR 225.8 or 238.170.

(2) *Capital conservation buffer.* (i) The capital conservation buffer for Board-regulated institutions subject to 12 CFR 225.8 or 238.170, or that is a state member bank that is a subsidiary of a global systemically important BHC, is composed solely of common equity tier 1 capital.

(ii) A Board-regulated institution that is subject to 12 CFR 225.8 or 238.170, or that is a state member bank that is a subsidiary of a global systemically important BHC, has a capital conservation buffer that is equal to the lowest of the following ratios, calculated as of the last day of the previous calendar quarter:

(A) The Board-regulated institution's common equity tier 1 capital ratio minus the Board-regulated institution's minimum common equity tier 1 capital ratio requirement under § 217.10;

(B) The Board-regulated institution's tier 1 capital ratio minus the Board-regulated institution's minimum tier 1 capital ratio requirement under § 217.10; and

(C) The Board-regulated institution's total capital ratio minus the Board-regulated institution's minimum total capital ratio requirement under § 217.10; or

(iii) Notwithstanding paragraph (c)(2)(ii) of this section, if a Board-regulated institution's common equity tier 1, tier 1, or total capital ratio is less than or equal to the Board-regulated institution's minimum common equity tier 1, tier 1, or total capital ratio requirement under § 217.10,

respectively, the Board-regulated institution's capital conservation buffer is zero.

(3) *Leverage buffer.* (i) The leverage buffer is composed solely of tier 1 capital.

(ii) A Category I Board-regulated institution has a leverage buffer that is equal to the global systemically important BHC's supplementary leverage ratio minus 3 percent, calculated as of the last day of the previous calendar quarter.

(iii) Notwithstanding paragraph (c)(3)(ii) of this section, if a Category I Board-regulated institution's supplementary leverage ratio is less than or equal to 3 percent, the Category I Board-regulated institution's leverage buffer is zero.

TABLE 2 TO § 217.11—CALCULATION OF MAXIMUM PAYOUT RATIO

Capital buffer ¹	Payout ratio
Greater than the Board-regulated institution's buffer requirement ²	No payout ratio limitation applies.
Less than or equal to 100 percent of the Board-regulated institution's buffer requirement, and greater than 75 percent of the Board-regulated institution's buffer requirement ...	60 percent.
Less than or equal to 75 percent of the Board-regulated institution's buffer requirement, and greater than 50 percent of the Board-regulated institution's buffer requirement ...	40 percent.
Less than or equal to 50 percent of the Board-regulated institution's buffer requirement, and greater than 25 percent of the Board-regulated institution's buffer requirement ...	20 percent.
Less than or equal to 25 percent of the Board-regulated institution's buffer requirement	0 percent.

¹A Board-regulated institution's "capital buffer" means each of, as applicable, its capital conservation buffer and leverage buffer.

²A Board-regulated institution's "buffer requirement" means each of, as applicable, its capital conservation buffer requirement and leverage buffer requirement.

(d) *GSIB surcharge.* A global systemically important BHC must use its GSIB surcharge calculated in accordance with subpart H of this part for purposes of determining its maximum payout ratio under Table 2 to § 217.11.

Subpart C—Definition of Capital

■ 46. In § 217.20, revise paragraphs (c)(1)(xiv), (d)(1)(xi) and (d)(3) to read as follows:

§ 217.20 Capital components and eligibility criteria for regulatory capital instruments.

* * * * *

(c) * * *

(1) * * *

(xiv) For a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5), the governing agreement, offering circular, or prospectus of an instrument issued after the date upon which the Board-regulated institution becomes a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) must disclose that the holders of the instrument may be fully subordinated to interests held by the U.S. government in the event that the Board-regulated institution enters into a receivership, insolvency, liquidation, or similar proceeding.

* * * * *

(d) * * *

(1) * * *

(xi) For a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5), the governing agreement, offering circular, or prospectus of an instrument issued after the date on which the Board-regulated institution becomes a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) must disclose that the holders of the instrument may be fully subordinated to interests held by the U.S. government in the event that the Board-regulated institution enters into a receivership, insolvency, liquidation, or similar proceeding.

* * * * *

(3) AACL up to 1.25 percent of the Board-regulated institution's standardized total risk-weighted assets or total credit risk-weighted assets, as applicable, not including any amount of the AACL (and excluding the case of a market risk Board-regulated institution, its market risk weighted assets).

* * * * *

■ 47. In § 217.21:

■ a. In paragraph (a)(1), remove the words "an advanced approaches Board-

regulated institution" and add in their place the words "a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5)"; and

■ b. Revise paragraph (b).

The revision reads as follows:

§ 217.21 Minority interest.

* * * * *

(b) (1) *Applicability.* For purposes of § 217.20, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) is subject to the minority interest limitations in this paragraph (b) if:

(i) A consolidated subsidiary of the Board-regulated institution has issued regulatory capital that is not owned by the Board-regulated institution; and

(ii) For each relevant regulatory capital ratio of the consolidated subsidiary, the ratio exceeds the sum of the subsidiary's minimum regulatory capital requirements plus its capital conservation buffer.

(2) *Difference in capital adequacy standards at the subsidiary level.* For purposes of the minority interest calculations in this section, if the consolidated subsidiary issuing the capital is not subject to capital adequacy standards similar to those of the Board-regulated institution, the Board-regulated institution must assume that the capital adequacy standards of the Board-regulated institution apply to the subsidiary.

(3) *Common equity tier 1 minority interest includable in the common equity tier 1 capital of the Board-regulated institution.* For each consolidated subsidiary of a Board-regulated institution, the amount of common equity tier 1 minority interest the Board-regulated institution may include in common equity tier 1 capital is equal to:

(i) The common equity tier 1 minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's common equity tier 1 capital that is not owned by the Board-regulated institution, multiplied by the difference between the common equity tier 1 capital of the subsidiary and the lower of:

(A) The amount of common equity tier 1 capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus payments under § 217.11 or equivalent standards

established by the subsidiary's home country supervisor; or

(B)(1) The expanded total risk-weighted assets of the Board-regulated institution that relate to the subsidiary multiplied by

(2) The common equity tier 1 capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 217.11 or equivalent standards established by the subsidiary's home country supervisor.

(4) *Tier 1 minority interest includable in the tier 1 capital of the Board-regulated institution.* For each consolidated subsidiary of the Board-regulated institution, the amount of tier 1 minority interest the Board-regulated institution may include in tier 1 capital is equal to:

(i) The tier 1 minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's tier 1 capital that is not owned by the Board-regulated institution multiplied by the difference between the tier 1 capital of the subsidiary and the lower of:

(A) The amount of tier 1 capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus payments under § 217.11 or equivalent standards established by the subsidiary's home country supervisor, or

(B)(1) The expanded total risk-weighted assets of the Board-regulated institution that relate to the subsidiary multiplied by

(2) The tier 1 capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 217.11 or equivalent standards established by the subsidiary's home country supervisor.

(5) *Total capital minority interest includable in the total capital of the Board-regulated institution.* For each consolidated subsidiary of the Board-regulated institution, the amount of total capital minority interest the Board-regulated institution may include in total capital is equal to:

(i) The total capital minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's total capital that is not owned by the Board-regulated institution multiplied by the difference between the total capital of the subsidiary and the lower of:

(A) The amount of total capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on

distributions and discretionary bonus payments under § 217.11 or equivalent standards established by the subsidiary's home country supervisor, or

(B)(1) The expanded total risk-weighted assets of the Board-regulated institution that relate to the subsidiary multiplied by

(2) The total capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 217.11 or equivalent standards established by the subsidiary's home country supervisor.

* * * * *

■ 48. In § 217.22:

■ a. Revise paragraphs (a)(1) and (4); and

■ b. Remove paragraph (a)(6); and

■ c. Redesignate paragraph (a)(7) as new paragraph (a)(6); and

■ d. Revise paragraphs (b)(2)(i) and (b)(2)(ii);

■ e. In paragraph (b)(2)(iii), remove the words "an advanced approaches Board-regulated institution" and add in their place the words "a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5)";

■ f. In paragraph (b)(2)(iv), remove the words "or FR Y-9SP";

■ g. In footnote 22, in paragraph (b)(2)(iv)(A), remove the words "12 CFR part 225 (Board)", and add in its place "12 CFR part 217 (Board)";

■ h. In footnote 23, in paragraph (c), remove the words "ALLL or AACL, as applicable," and add in its places "AACL";

■ i. Revise paragraph (c)(2);

■ j. In paragraph (c)(4), remove the words "an advanced approaches Board-regulated institution" and add in their place the words "a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5)";

■ k. Revise paragraphs (c)(5)(i) through (iv); and

■ l. Revise paragraphs (c)(6) and (d)(2).

The revisions read as follows:

§ 217.22 Regulatory capital adjustments and deductions.

(a) * * *

(1)(i) Goodwill, net of associated deferred tax liabilities (DTLs) in accordance with paragraph (e) of this section; and

(ii) For a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-

regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5), goodwill that is embedded in the valuation of a significant investment in the capital of an unconsolidated financial institution in the form of common stock (and that is reflected in the consolidated financial statements of the Board-regulated institution), in accordance with paragraph (d) of this section;

* * * * *

(4) (i) Any gain-on-sale in connection with a securitization exposure;

(ii) For a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5), the portion of any CEO that does not constitute an after-tax gain-on-sale;

(b) * * *

(2) AOCI opt-out election.

(i) A Board-regulated institution that is not a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses the expanded total risk-weighted assets for purposes of § 217.10(a)(5) may make a one-time election to opt out of the requirement to include all components of AOCI (with the exception of accumulated net gains and losses on cash flow hedges related to items that are not fair-valued on the balance sheet) in common equity tier 1 capital (AOCI opt-out election). A Board-regulated institution that makes an AOCI opt-out election in accordance with this paragraph (b)(2) must adjust common equity tier 1 capital as follows:

(A) Subtract any net unrealized gains and add any net unrealized losses on available-for-sale securities;

(B) Subtract any accumulated net gains and add any accumulated net losses on cash flow hedges;

(C) Subtract any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans (excluding, at the Board-regulated institution's option, the portion relating to pension assets deducted under paragraph (a)(5) of this section); and

(D) Subtract any net unrealized gains and add any net unrealized losses on held-to-maturity securities that are included in AOCI.

(ii) A Board-regulated institution that is not a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded

total risk-weighted assets for purposes of § 217.10(a)(5) must make its AOCI opt-out election in the Call Report, for a state member bank, or FR Y–9C, for a bank holding company or savings and loan holding company, during the first reporting period after the Board-regulated institution is required to comply with subpart A of this part. If the Board-regulated institution was previously a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5), the Board-regulated institution may not make an AOCI opt-out election under this paragraph (b)(2)(ii).

* * * * *

(c) * * *

(2) *Corresponding deduction approach.* For purposes of subpart C of this part, the corresponding deduction approach is the methodology used for the deductions from regulatory capital related to reciprocal cross holdings (as described in paragraph (c)(3) of this section), investments in the capital of unconsolidated financial institutions for a Board-regulated institution that is not a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) (as described in paragraph (c)(4) of this section), non-significant investments in the capital of unconsolidated financial institutions for a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) (as described in paragraph (c)(5) of this section), and non-common stock significant investments in the capital of unconsolidated financial institutions for a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) (as described in paragraph (c)(6) of this section). Under the corresponding deduction approach, a Board-regulated institution must make deductions from the component of capital for which the underlying instrument would qualify if it were issued by the Board-regulated institution itself, as described in paragraphs (c)(2)(i) through (iii) of this section. If the Board-regulated institution does not have a sufficient amount of a specific component of capital to effect the required deduction,

the shortfall must be deducted according to paragraph (f) of this section.

* * * * *

(5) * * *

(i) A Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) must deduct its non-significant investments in the capital of unconsolidated financial institutions (as defined in § 217.2) that, in the aggregate and together with any investment in a covered debt instrument (as defined in § 217.2) issued by a financial institution in which the Board-regulated institution does not have a significant investment in the capital of the unconsolidated financial institution (as defined in § 217.2), exceeds 10 percent of the sum of the Board-regulated institution's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section (the 10 percent threshold for non-significant investments) by applying the corresponding deduction approach in paragraph (c)(2) of this section.²⁶ The deductions described in this paragraph are net of associated DTLs in accordance with paragraph (e) of this section. In addition, with the prior written approval of the Board, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) that underwrites a failed underwriting, for the period of time stipulated by the Board, is not required to deduct from capital a non-significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph (c)(5) to the extent the investment is related to the failed underwriting.²⁷ For any calculation under this paragraph (c)(5)(i), a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) may exclude the amount of an investment in a covered debt instrument under paragraph (c)(5)(iii) or (iv) of this section, as applicable.

(ii) For a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5), the amount to be

deducted under this paragraph (c)(5) from a specific capital component is equal to:

(A) The Board-regulated institution's aggregate non-significant investments in the capital of an unconsolidated financial institution and, if applicable, any investments in a covered debt instrument subject to deduction under this paragraph (c)(5), exceeding the 10 percent threshold for non-significant investments, multiplied by

(B) The ratio of the Board-regulated institution's aggregate non-significant investments in the capital of an unconsolidated financial institution (in the form of such capital component) to the Board-regulated institution's total non-significant investments in unconsolidated financial institutions, with an investment in a covered debt instrument being treated as tier 2 capital for this purpose.

(iii) For purposes of applying the deduction under paragraph (c)(5)(i) of this section, a Category II Board-regulated institution or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) may exclude from the deduction the amount of the Board-regulated institution's gross long position, in accordance with § 217.22(h)(2), in investments in covered debt instruments issued by financial institutions in which the Board-regulated institution does not have a significant investment in the capital of the unconsolidated financial institutions up to an amount equal to 5 percent of the sum of the Board-regulated institution's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section, net of associated DTLs in accordance with paragraph (e) of this section.

(iv) Prior to applying the deduction under paragraph (c)(5)(i) of this section:

(A) A Category I Board-regulated institution may designate any investment in a covered debt instrument as an excluded covered debt instrument, as defined in § 217.2.

(B) A Category I Board-regulated institution must deduct, according to the corresponding deduction approach in paragraph (c)(2) of this section, its gross long position, calculated in accordance with paragraph (h)(2) of this section, in a covered debt instrument that was originally designated as an excluded covered debt instrument, in accordance with paragraph (c)(5)(iv)(A) of this section, but no longer qualifies as an excluded covered debt instrument.

(C) A Category I Board-regulated institution must deduct according to the corresponding deduction approach in paragraph (c)(2) of this section the amount of its gross long position, calculated in accordance with paragraph (h)(2) of this section, in a direct or indirect investment in a covered debt instrument that was originally designated as an excluded covered debt instrument, in accordance with paragraph (c)(5)(iv)(A) of this section, and has been held for more than thirty business days.

(D) A Category I Board-regulated institution must deduct according to the corresponding deduction approach in paragraph (c)(2) of this section its gross long position, calculated in accordance with paragraph (h)(2) of this section, of its aggregate position in excluded covered debt instruments that exceeds 5 percent of the sum of the Board-regulated institution's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section, net of associated DTLs in accordance with paragraph (e) of this section.

(6) *Significant investments in the capital of unconsolidated financial institutions that are not in the form of common stock.* If a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) has a significant investment in the capital of an unconsolidated financial institution, the Board-regulated institution must deduct from capital any such investment issued by the unconsolidated financial institution that is held by the Board-regulated institution other than an investment in the form of common stock, as well as any investment in a covered debt instrument issued by the unconsolidated financial institution, by applying the corresponding deduction approach in paragraph (c)(2) of this section.²⁸ The deductions described in this section are net of associated DTLs in accordance with paragraph (e) of this section. In addition, with the prior written approval of the Board, for the period of time stipulated by the Board, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) that underwrites a failed underwriting is not required to deduct the significant investment in the capital of an unconsolidated financial institution or an investment in a

covered debt instrument pursuant to this paragraph (c)(6) if such investment is related to such failed underwriting.

* * * * *

(d) * * *

(2) A Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) must make deductions from regulatory capital as described in this paragraph (d)(2).

(i) A Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) must deduct from common equity tier 1 capital elements the amount of each of the items set forth in this paragraph (d)(2) that, individually, exceeds 10 percent of the sum of the Board-regulated institution's common equity tier 1 capital elements, less adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c) of this section (the 10 percent common equity tier 1 capital deduction threshold).

(A) DTAs arising from temporary differences that the Board-regulated institution could not realize through net operating loss carrybacks, net of any related valuation allowances and net of DTLs, in accordance with paragraph (e) of this section. A Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) is not required to deduct from the sum of its common equity tier 1 capital elements DTAs (net of any related valuation allowances and net of DTLs, in accordance with § 217.22(e)) arising from timing differences that the Board-regulated institution could realize through net operating loss carrybacks. The Board-regulated institution must risk weight these assets at 100 percent. For a state member bank that is a member of a consolidated group for tax purposes, the amount of DTAs that could be realized through net operating loss carrybacks may not exceed the amount that the state member bank could reasonably expect to have refunded by its parent holding company.

(B) Significant investments in the capital of unconsolidated financial institutions in the form of common stock, net of associated DTLs in accordance with paragraph (e) of this section.³⁰ Significant investments in the capital of unconsolidated financial institutions in the form of common

stock subject to the 10 percent common equity tier 1 capital deduction threshold may be reduced by any goodwill embedded in the valuation of such investments deducted by the Board-regulated institution pursuant to paragraph (a)(1) of this section. In addition, with the prior written approval of the Board, for the period of time stipulated by the Board, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) that underwrites a failed underwriting is not required to deduct a significant investment in the capital of an unconsolidated financial institution in the form of common stock pursuant to this paragraph (d)(2) if such investment is related to such failed underwriting.

(ii) A Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) must deduct from common equity tier 1 capital elements the items listed in paragraph (d)(2)(i) of this section that are not deducted as a result of the application of the 10 percent common equity tier 1 capital deduction threshold, and that, in aggregate, exceed 17.65 percent of the sum of the Board-regulated institution's common equity tier 1 capital elements, minus adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c) of this section, minus the items listed in paragraph (d)(2)(i) of this section (the 15 percent common equity tier 1 capital deduction threshold). Any goodwill that has been deducted under paragraph (a)(1) of this section can be excluded from the significant investments in the capital of unconsolidated financial institutions in the form of common stock.³¹

(iii) For purposes of calculating the amount of DTAs subject to the 10 and 15 percent common equity tier 1 capital deduction thresholds, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) may exclude DTAs and DTLs relating to adjustments made to common equity tier 1 capital under paragraph (b) of this section. A Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) that elects to exclude DTAs relating to adjustments under paragraph (b) of this section also

must exclude DTLs and must do so consistently in all future calculations. A Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) may change its exclusion preference only after obtaining the prior approval of the Board.

* * * * *

²⁶ With the prior written approval of the Board, for the period of time stipulated by the Board, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) is not required to deduct a non-significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph if the financial institution is in distress and if such investment is made for the purpose of providing financial support to the financial institution, as determined by the Board.

²⁷ Any non-significant investment in the capital of an unconsolidated financial institution or any investment in a covered debt instrument that is not required to be deducted under this paragraph (c)(5) or otherwise under this section must be assigned the appropriate risk weight under subparts E or F of this part, as applicable.

²⁸ With prior written approval of the Board, for the period of time stipulated by the Board, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) is not required to deduct a significant investment in the capital of an unconsolidated financial institution, including an investment in a covered debt instrument, under this paragraph (c)(6) or otherwise under this section if such investment is made for the purpose of providing financial support to the financial institution as determined by the Board.

* * * * *

³⁰ With the prior written approval of the Board, for the period of time stipulated by the Board, a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5) is not required to deduct a significant investment in the capital instrument of an unconsolidated financial institution in distress in the form of common stock pursuant to this section if such investment is made for the purpose of providing financial support to the financial institution as determined by the Board.

³¹ The amount of the items in paragraph (d)(2) of this section that is not deducted from common equity tier 1 capital pursuant to this section must be included in the risk-weighted assets of the Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institution that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5)

and assigned the appropriate risk weight for the investment under subpart E of this part for purposes of expanded total risk-weighted assets.

Subpart D—Risk-Weighted Assets—Standardized Approach

§ 217.30 [Amended]

■ 49. In § 217.30

■ a. Revise paragraph (a);

■ b. In paragraph (b), remove the words “covered positions” and add in their place the words “market risk covered positions”.

The revisions read as follows:

* * * * *

(a) This subpart sets forth methodologies for determining standardized total risk-weighted assets. This subpart applies to any Board-regulated institution that elects to use this subpart under § _____.10(b).

* * * * *

§ 217.34 Derivative Contracts.

■ 50. In § 217.34, revise paragraph (a) to read as follows:

* * * * *

(a) *Exposure amount for derivatives contracts*—(1) A Board-regulated institution must use the current exposure methodology (CEM) described in paragraph (b) of this section to calculate the exposure amount for all its OTC derivative contracts, unless the Board-regulated institution makes the election provided in paragraph (a)(2) of this section.

(2) A Board-regulated institution may elect to calculate the exposure amount for all its OTC derivative contracts under the standardized approach for counterparty credit risk (SA-CCR) in § 217.114 by notifying the Board, rather than calculating the exposure amount for all its derivative contracts using CEM. A Board-regulated institution that elects under this paragraph (a)(2) to calculate the exposure amount for its OTC derivative contracts under SA-CCR must apply the treatment of cleared transactions under § 217.116 to its derivative contracts that are cleared transactions and to all default fund contributions associated with such derivative contracts, rather than applying § 217.35. A Board-regulated institution must use the same methodology to calculate the exposure amount for all its derivative contracts and, if a Board-regulated institution has elected to use SA-CCR under this paragraph (a)(2), the Board-regulated institution may change its election only with prior approval of the Board.

* * * * *

§ 217.35 Cleared transactions.

■ 51. In § 217.35, revise paragraph (a)(3) to read as follows:

(a) * * *

(3) *Alternate requirements.*

Notwithstanding any other provision of this section, a Board-regulated institution that has elected to use SA-CCR under § 217.34(a) must apply § 217.116 to its derivative contracts that are cleared transactions rather than this section.

* * * * *

■ 52. In § 217.37, revise paragraph (c)(1) to read as follows:

§ 217.37 Collateralized transactions.

* * * * *

(c) *Collateral haircut approach*—(1) *General.* A Board-regulated institution may recognize the credit risk mitigation benefits of financial collateral that secures an eligible margin loan, repo-style transaction, collateralized derivative contract, or single-product netting set of such transactions, and of any collateral that secures a repo-style transaction that is included in the Board-regulated institution’s measure for market risk under subpart F of this part by using the collateral haircut approach in this section. A Board-regulated institution may use the standard supervisory haircuts in paragraph (c)(3) of this section or, with prior written approval of the Board, its own estimates of haircuts according to paragraph (c)(4) of this section.

* * * * *

§ 217.61217.37 Collateralized transactions.

* * * * *

(c) *Collateral haircut approach*—(1) *General.* A Board-regulated institution may recognize the credit risk mitigation benefits of financial collateral that secures an eligible margin loan, repo-style transaction, collateralized derivative contract, or single-product netting set of such transactions, and of any collateral that secures a repo-style transaction that is included in the Board-regulated institution’s measure for market risk under subpart F of this part by using the collateral haircut approach in this section. A Board-regulated institution may use the standard supervisory haircuts in paragraph (c)(3) of this section or, with prior written approval of the Board, its own estimates of haircuts according to paragraph (c)(4) of this section.

* * * * *

§ 217.61 [Amended]

■ 53. In § 217.61:

■ a. Remove the citation “§ 217.172” wherever it appears, and add in its place

the citations “§§ 217.160 and 217.161”; and

■ b. Remove the sentence “An advanced approaches Board-regulated institution that has not received approval from the

Board to exit parallel run pursuant to § 217.121(d) is subject to the disclosure requirements described in §§ 217.62 and 217.63.”.

■ 54. In § 217.63:

■ a. In table 3, revise entry (c); and

■ b. Remove paragraphs (d) and (e).

The revision reads as follows:

§ 217.63 Disclosures by Board-regulated institutions described in § 217.61.

* * * * *

TABLE 3 TO § 217.63—CAPITAL ADEQUACY

*	*	*	*	*	*
		(c)	Market risk-weighted assets as calculated under subpart F of this part 217.		
*	*	*	*	*	*

* * * * *

Subpart E—Risk-Weighted Assets—Expanded Risk-Based Approach

§ 217.141 Simple risk-weight approach (SRWA).

■ 55. In § 217.141, revise paragraph (b)(3)(i) to read as follows:

(b) * * *

(3) * * *

(i) Community development equity exposures.

(A) For state member banks and bank holding companies, an equity exposure that qualifies as a community development investment under 12 U.S.C. 24 (Eleventh), excluding equity exposures to an unconsolidated small business investment company and equity exposures held through a consolidated small business investment company described in section 302 of the Small Business Investment Act of 1958 (15 U.S.C. 682).

(B) For savings and loan holding companies, an equity exposure that is

designed primarily to promote community welfare, including the welfare of low- and moderate-income communities or families, such as by providing services or employment, and excluding equity exposures to an unconsolidated small business investment company and equity exposures held through a small business investment company described in section 302 of the Small Business Investment Act of 1958 (15 U.S.C. 682).

* * * * *

Subpart G—Transition Provisions

■ 56. In § 217.300:

■ a. Revise paragraph (a);

■ b. Remove and reserve paragraphs (f) through (i).

The revision and addition read as follows:

§ 217.300 Transitions.

(a) *Transition adjustments for AOCI.* Beginning [January 1, 2027], a Board-regulated institution that uses expanded

total risk-weighted assets for purposes of § 217.10(a)(5) that had made an AOCI opt-out election under § 217.22(b)(2) effective [December 31, 2026] must subtract from the sum of its common equity tier 1 elements, before making deductions required under § 217.22(c) or (d), the AOCI adjustment amount multiplied by the percentage provided in Table 1 to § 217.300.

The transition AOCI adjustment amount is the sum of:

(1) Net unrealized gains or losses on available-for-sale debt securities, plus

(2) Accumulated net gains or losses on cash flow hedges, plus

(3) Any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans, plus

(4) Net unrealized holding gains or losses on held-to-maturity securities that are included in AOCI.

TABLE 1 TO § 217.300

Transition AOCI Adjustment	
Transition period	Percentage applicable to transition AOCI adjustment amount
January 1, 2027 to December 31, 2027	100
January 1, 2028 to December 31, 2028	80
January 1, 2029 to December 31, 2029	60
January 1, 2030 to December 31, 2030	40
January 1, 2031 to December 31, 2031	20
January 1, 2032 and thereafter	0

* * * * *

§ 217.301 [Removed and Reserved]

■ 57. Remove and reserve § 217.301.

* * * * *

§ 217.303 [Removed and Reserved]

■ 58. Remove and reserve § 217.303.

§ 217.304 [Removed and Reserved]

■ 59. Remove and reserve § 217.304.

§§ 217.1, 217.2, 217.10, 217.12, 217.22, 217.35, 217.61, 217.300, 217.302, 217.305, Appendix A to Part 217 [Amended]

■ 60. In the table below, for each section indicated in the left column, remove the

words indicated in the middle column from wherever it appears in the section, and add the words indicated in the right column:

Sections:	Remove the following words:	Add the following words:
217.1 217.2 217.12(a)(2) introductory text 217.22(b)(1)(ii), (b)(1)(iii), (c)(1), (c)(2)(ii)(D), (c)(3)(ii), footnote [24] of (c)(4), (c)(5)(iii), (d)(1), and (f); 217.61 217.300(c) 217.1(c)(5)(iii) 217.2 217.22(b)(1)(ii), (b)(1)(iii), (c)(1), (c)(2)(ii)(D), (c)(3)(ii), (c)(5)(iii), (d)(1), and (f); and 217.1 217.10(d); 217.22(g); 217.302; and 217.305 217.22(b)(1)(ii) and (b)(1)(iii) 217.2, in the definition of “qualifying central counterparty (QCCP)” 217.35(a)(3) Part 217 Appendix A Part 217 Appendix A, paragraph 1.(a) ...	“an advanced approaches Board-regu- lated institution” “advanced approaches Board-regulated institution” “advanced approaches total risk- weighted assets” “an advanced approaches Board-regu- lated institution” “§ 217.133” “advanced approaches institutions” “advanced approaches banking organi- zations” “(FDIC)”	“a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institu- tion that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5).” “Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institu- tion that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5).” “expanded total risk-weighted assets” “a Category I Board-regulated institution, a Category II Board-regulated institution, or a Board-regulated institu- tion that uses expanded total risk-weighted assets for purposes of § 217.10(a)(5).” “§ 217.114” “Category I–II institutions and institutions the elect to use the expanded risk-based approach” “Category I–II banking organizations and institutions that elect to use the expanded risk-based approach” “(FDIC, and together with the Board and OCC, the agen- cies)”

■ 61. In Appendix A to part 217, revise footnotes 2 and 4 to read as follows:

Appendix A to Part 217—The Federal Reserve Board’s Framework for Implementing the Countercyclical Capital Buffer

* * * * *

² 12 CFR 217.11(b). The CCyB applies only to Category I–III banking organizations. See, e.g., 12 CFR 217.100(b).

* * * * *

⁴ The CcyB was subject to a phase-in arrangement between 2016 and 2019.

* * * * *

PART 225—BANK HOLDING COMPANIES AND CHANGE IN BANK CONTROL (REGULATION Y)

■ 63. The authority citation for part 225 continues to read as follows:

Authority: 12 U.S.C. 1817(j)(13), 1818, 1828(o), 1831i, 1831p–1, 1843(c)(8), 1844(b), 1972(1), 3106, 3108, 3310, 3331–3351, 3906, 3907, and 3909; 15 U.S.C. 1681s, 1681w, 6801, and 6805.

Subpart A—General Provisions

■ 64. In § 225.8:

■ a. Remove paragraph (d)(1);
■ b. Redesignate paragraphs (d)(2) through (21) as (d)(1) through (20), respectively;

■ c. Revise newly redesignated paragraphs (d)(9) and (16); and

■ d. Revise paragraph (f)(2).

The revisions and addition read as follows:

§ 225.8 Capital planning and stress capital buffer requirement.

* * * * *

(d) * * *

(9) *Effective capital distribution limitations* means any limitations on capital distributions established by the Board by order or regulation, including pursuant to 12 CFR 217.11, 225.4, 252.63, 252.165, and 263.202.

* * * * *

(16) *Regulatory capital ratio* means a capital ratio for which the Board has established minimum requirements for the bank holding company by regulation or order, including, as applicable, any regulatory capital ratios calculated under 12 CFR part 217 and the deductions required under 12 CFR 248.12.

* * * * *

(f) * * *

(2) *Stress capital buffer requirement calculation.* A bank holding company's stress capital buffer requirement is equal to the greater of:

(i) The following calculation:

(A) The bank holding company's common equity tier 1 capital ratio as of the last day of the previous capital plan cycle, unless otherwise determined by the Board; minus

(B) The bank holding company's lowest projected common equity tier 1 capital ratio in any quarter of the planning horizon under a supervisory stress test; plus

(C) The ratio of:

(1) The sum of the bank holding company's planned common stock

dividends (expressed as a dollar amount) for each of the fourth through seventh quarters of the planning horizon; to

(2) The risk-weighted assets of the bank holding company in the quarter in which the bank holding company had its lowest projected common equity tier 1 capital ratio in any quarter of the planning horizon under a supervisory stress test; and

(ii) 2.5 percent.

* * * * *

PART 238—SAVINGS AND LOAN HOLDING COMPANIES (REGULATION LL)

■ 65. The authority citation for part 238 continues to read as follows:

Authority: 5 U.S.C. 552, 559; 12 U.S.C. 1462, 1462a, 1463, 1464, 1467, 1467a, 1468, 5365; 1813, 1817, 1829e, 1831i, 1972; 15 U.S.C. 78l.

Subpart O—Supervisory Stress Test Requirements for Covered Savings and Loan Holding Companies

■ 66. In § 238.130:

■ a. Remove the definition of

“Advanced approaches”; and

■ b. Revise the definition of “Regulatory capital ratio”.

The revision reads as follows:

§ 238.130 Definitions.

* * * * *

Regulatory capital ratio means a capital ratio for which the Board has established minimum requirements for the company by regulation or order, including, as applicable, any regulatory capital ratios calculated under 12 CFR part 217 and the deductions required under 12 CFR 248.12.

* * * * *

Subpart P—Company-Run Stress Test Requirements for Savings and Loan Holding Companies

■ 67. In § 238.141:

■ a. Remove the definition of

“Advanced approaches”; and

■ b. Revise the definition of “Regulatory capital ratio”.

The revision reads as follows:

§ 238.141 Definitions.

* * * * *

Regulatory capital ratio means a capital ratio for which the Board has established minimum requirements for the company by regulation or order,

including, as applicable, any regulatory capital ratios calculated under 12 CFR part 217 and the deductions required under 12 CFR 248.12.

* * * * *

Subpart Q—Single Counterparty Credit Limits for Covered Savings and Loan Holding Companies

■ 68. In § 238.151:

■ a. Remove the words “in table 1 to § 217.132 of this chapter” wherever they appear and add in their place the words “in table 1 to § 217.37 of this chapter or in table 1 to § 217.121 of this chapter, as applicable”;

■ b. Remove the words “(12 CFR part 217, subpart D)” in paragraph (e)(4) and add in their place the words “(12 CFR part 217, subpart D or E, as applicable)”; and

■ c. Revise paragraph (q).

The revisions read as follows:

§ 238.151 Definitions.

* * * * *

(q) *Exempt counterparty* means an entity that is identified as exempt from the requirements of this subpart under § 252.77, or that is otherwise excluded from this subpart, including any sovereign entity assigned a zero percent risk weight under the standardized approach or the expanded risk-based approach in the Board's Regulation Q, as applicable (12 CFR part 217, subpart D or E, as applicable).

* * * * *

§ 238.153 [Amended]

■ 69. In § 238.153, remove the words “any of the methods that the covered company is authorized to use under 12 CFR part 217, subparts D and E” wherever they appear and add in their place the words “any of the methods that the covered company is authorized to use under 12 CFR part 217, subparts D or E, as applicable”.

§ 238.154 [Amended]

■ 70. Remove the words “the currency mismatch adjustment approach of § 217.37(c)(3)(ii) of the Board's Regulation Q (12 CFR 217.37(c)(3)(ii))” in paragraph (h)(1) and add in their place “the currency mismatch adjustment approach of § 217.37(c)(3)(ii) or § 217.115(c)(2), as applicable, of the Board's Regulation Q (12 CFR 217.37(c)(3)(ii) or 217.115(c)(2), as applicable)”.

Subpart S—Capital Planning and Stress Capital Buffer Requirement

- 71. In § 238.170:
 - a. Remove paragraph (d)(1);
 - b. Redesignate paragraphs (d)(2) through (18) as (d)(1) through (17), respectively;
 - c. Revise newly redesignated paragraphs (d)(9) and (14); and
 - d. Revise paragraph (f)(2).

The revisions and addition read as follows:

§ 238.170 Capital planning and stress capital buffer requirement.

* * * * *

(d) * * *

(9) *Effective capital distribution limitations* means any limitations on capital distributions established by the Board by order or regulation, including pursuant to 12 CFR 217.11.

* * * * *

(14) *Regulatory capital ratio* means a capital ratio for which the Board has established minimum requirements for the covered savings and loan holding company by regulation or order, including, as applicable, any regulatory capital ratios calculated under 12 CFR part 217 and the deductions required under 12 CFR 248.12.

* * * * *

(f) * * *

(2) *Stress capital buffer requirement calculation.* A covered savings and loan holding company's stress capital buffer requirement is equal to the greater of:

(i) The following calculation:

(A) The covered savings and loan holding company's common equity tier 1 capital ratio as of the last day of the previous capital plan cycle, unless otherwise determined by the Board; minus

(B) The covered savings and loan holding company's lowest projected common equity tier 1 capital ratio in any quarter of the planning horizon under a supervisory stress test; plus

(C) The ratio of:

(1) The sum of the covered savings and loan holding company's planned common stock dividends (expressed as a dollar amount) for each of the fourth through seventh quarters of the planning horizon; to

(2) The risk-weighted assets of the covered savings and loan holding company in the quarter in which the covered savings and loan holding company had its lowest projected common equity tier 1 capital ratio in any quarter of the planning horizon under a supervisory stress test; and

(ii) 2.5 percent.

* * * * *

PART 252—ENHANCED PRUDENTIAL STANDARDS (REGULATION YY)

- 72. The authority citation for part 252 continues to read as follows:

Authority: 12 U.S.C. 321–338a, 481–486, 1467a, 1818, 1828, 1831n, 1831o, 1831p–1, 1831w, 1835, 1844(b), 1844(c), 3101 *et seq.*, 3101 note, 3904, 3906–3909, 4808, 5361, 5362, 5365, 5366, 5367, 5368, 5371.

Subpart B—Company-Run Stress Test Requirements for State Member Banks With Total Consolidated Assets Over \$250 Billion

- 73. In § 252.12:

- a. Remove the definition of “Advanced approaches”; and

- b. Revise the definition of “Regulatory capital ratio”.

The revision reads as follows:

§ 252.12 Definitions.

* * * * *

Regulatory capital ratio means a capital ratio for which the Board has established minimum requirements for the state member bank by regulation or order, including, as applicable, any regulatory capital ratios calculated under 12 CFR part 217 and the deductions required under 12 CFR 248.12.

* * * * *

Subpart E—Supervisory Stress Test Requirements for Certain U.S. Banking Organizations With \$100 Billion or More in Total Consolidated Assets and Nonbank Financial Companies Supervised by the Board

- 74. In § 252.42:

- a. Remove the definition of “Advanced approaches”; and

- b. Revise the definition of “Regulatory capital ratio”.

The revision reads as follows:

§ 252.42 Definitions.

* * * * *

Regulatory capital ratio means a capital ratio for which the Board has established minimum requirements for the company by regulation or order, including, as applicable, any regulatory capital ratios calculated under 12 CFR part 217 and the deductions required under 12 CFR 248.12.

* * * * *

Subpart F—Company-Run Stress Test Requirements for Certain U.S. Bank Holding Companies and Nonbank Financial Companies Supervised by the Board

- 75. In § 252.52:

- a. Remove the definition of “Advanced approaches”; and

- b. Revise the definition of “Regulatory capital ratio”.

The revision reads as follows:

§ 252.52 Definitions.

* * * * *

Regulatory capital ratio means a capital ratio for which the Board has established minimum requirements for the company by regulation or order, including, as applicable, any regulatory capital ratios calculated under 12 CFR part 217 and the deductions required under 12 CFR 248.12.

* * * * *

Subpart G—External Long-Term Debt Requirement, External Total Loss-Absorbing Capacity Requirement and Buffer, and Restrictions on Corporate Practices for U.S. Global Systemically Important Banking Organizations

- 76. In § 252.61:

- a. Revise the definition of “Common equity tier 1 capital ratio”;

- b. Revision the definition of “Supplementary leverage ratio”;

- c. Revise the definition of “Total leverage exposure”; and

- d. Revise the definition of “Total risk-weighted assets”.

The revisions read as follows:

§ 252.61 Definitions.

* * * * *

Common equity tier 1 capital ratio has the same meaning as in 12 CFR 217.10(b)(1) and 12 CFR 217.10(d)(1).

* * * * *

Supplementary leverage ratio has the same meaning as in 12 CFR 217.10(c)(1).

* * * * *

Total leverage exposure has the same meaning as in 12 CFR 217.10(c)(2).

Total risk-weighted assets means standardized total risk-weighted assets or expanded total risk-weighted assets, as applicable under part 217 of this chapter.

* * * * *

Subpart H—Single-Counterparty Credit Limits

- 77. In § 252.71:

- a. Remove the words “in Table 1 to § 217.132 of the Board's Regulation Q (12 CFR 217.132)” wherever they appear and add in their place the words “in Table 1 to § 217.121 of the Board's Regulation Q (12 CFR 217.121)”;

- b. Remove the words “(12 CFR part 217, subpart D)” in paragraph (e)(4) and add in their place the words “(12 CFR part 217, subpart D or E, as applicable)”;

- and
- c. Revise paragraph (q).

The revisions read as follows:

§ 252.71 Definitions.

* * * * *

(q) *Exempt counterparty* means an entity that is identified as exempt from the requirements of this subpart under § 252.77, or that is otherwise excluded from this subpart, including any sovereign entity assigned a zero percent risk weight under the standardized approach or the expanded risk-based approach in the Board's Regulation Q, as applicable (12 CFR part 217, subpart D or E, as applicable).

* * * * *

§ 252.73 [Amended]

■ 78. In § 252.73, remove the words “any of the methods that the covered company is authorized to use under the Board's Regulation Q (12 CFR part 217, subparts D and E)” wherever they appear and add, in their place, the words “any of the methods that the covered company is authorized to use under the Board's Regulation Q (12 CFR part 217, subparts D or E, as applicable)”.

§ 272.74 [Amended]

■ 79. In § 252.74, remove the words “the currency mismatch adjustment approach of § 217.37(c)(3)(ii) of the Board's Regulation Q (12 CFR 217.37(c)(3)(ii))” in paragraph (h)(1) and add in their place “the currency mismatch adjustment approach of § 217.37(c)(3)(ii) or § 217.115(c)(2), as applicable, of the Board's Regulation Q (12 CFR 217.37(c)(3)(ii) or 217.115(c)(2), as applicable)”.

Subpart N—Enhanced Prudential Standards for Foreign Banking Organizations With Total Consolidated Assets of \$100 Billion or More and Combined U.S. Assets of Less Than \$100 Billion

■ 80. In § 252.147, revise paragraph (e)(1)(i) to read as follows:

§ 252.147 U.S. intermediate holding company requirement for foreign banking organizations with combined U.S. assets of less than \$100 billion and U.S. non-branch assets of \$50 billion or more.

* * * * *

(e) * * *

(1) * * *

(i) A U.S. intermediate holding company must comply with 12 CFR part 217 in the same manner as a bank holding company.

* * * * *

Subpart O—Enhanced Prudential Standards for Foreign Banking Organizations With Total Consolidated Assets of \$100 Billion or More and Combined U.S. Assets of \$100 Billion or More

■ 81. In § 252.153, revise paragraph (e)(1)(i) to read as follows:

§ 252.153 U.S. intermediate holding company requirement for foreign banking organizations with combined U.S. assets of \$100 billion or more and U.S. non-branch assets of \$50 billion or more.

* * * * *

(e) * * *

(1) * * *

(i) A U.S. intermediate holding company must comply with 12 CFR part 217 in the same manner as a bank holding company.

* * * * *

Subpart P—Covered IHC Long-Term Debt Requirement, Covered IHC Total Loss Absorbing Capacity Requirement and Buffer, and Restrictions on Corporate Practices for Intermediate Holding Companies of Global Systemically Important Foreign Banking Organizations

■ 82. In § 252.161:

■ a. Revise the definition of “Common equity tier 1 capital ratio”;

■ b. Remove the definition of “Standardized total risk-weighted assets”;

■ c. Revise the definition of “Supplementary leverage ratio”;

■ d. Revise the definition of “Total leverage exposure”; and

■ e. Revise the definition of “Total risk-weighted assets”.

The revisions read as follows:

§ 252.161 Definitions.

* * * * *

Common equity tier 1 capital ratio has the same meaning as in 12 CFR 217.10(b)(1) and 12 CFR 217.10(d)(1).

* * * * *

Supplementary leverage ratio has the same meaning as in 12 CFR 217.10(c)(1).

* * * * *

Total leverage exposure has the same meaning as in 12 CFR 217.10(c)(2).

Total risk-weighted assets means standardized total risk-weighted assets or expanded total risk-weighted assets, as applicable under part 217 of this chapter.

* * * * *

Subpart Q—Single Counterparty Credit Limits

■ 83. In § 252.171:

■ a. Remove the words “in Table 1 to § 217.132 of the Board's Regulation Q

(12 CFR 217.132)” wherever they appear and add in their place the words “in Table 1 to § 217.121 of the Board's Regulation Q (12 CFR 217.121)”;

■ b. Remove the words “(12 CFR part 217, subpart D)” in paragraph (f)(4) and add in their place the words “(12 CFR part 217, subpart D or E, as applicable)”;

and

■ c. Revise paragraph (r).

The revisions read as follows:

§ 252.171 Definitions.

* * * * *

(r) *Exempt counterparty* means an entity that is identified as exempt from the requirements of this subpart under § 252.177, or that is otherwise excluded from this subpart, including any sovereign entity assigned a zero percent risk weight under the standardized approach or the expanded risk-based approach in the Board's Regulation Q, as applicable (12 CFR part 217, subpart D or E, as applicable).

* * * * *

§ 252.173 [Amended]

■ 84. In § 252.173, remove the words “any of the methods that the covered company is authorized to use under the Board's Regulation Q (12 CFR part 217, subparts D and E)” wherever they appear and add, in their place, the words “any of the methods that the covered company is authorized to use under the Board's Regulation Q (12 CFR part 217, subparts D or E, as applicable)”.

§ 252.174 [Amended]

■ 85. In § 252.174, remove the words “the currency mismatch adjustment approach of § 217.37(c)(3)(ii) of the Board's Regulation Q (12 CFR 217.37(c)(3)(ii))” in paragraph (h)(1) and add in their place “the currency mismatch adjustment approach of § 217.37(c)(3)(ii) or § 217.115(c)(2), as applicable, of the Board's Regulation Q (12 CFR 217.37(c)(3)(ii) or 217.115(c)(2), as applicable)”.

Federal Deposit Insurance Corporation
12 CFR Chapter III

Authority and Issuance

For the reasons stated in the common preamble, the Federal Deposit Insurance Corporation proposes to amend 12 CFR part 324 as follows:

PART 324—CAPITAL ADEQUACY OF FDIC—SUPERVISED INSTITUTIONS

■ 86. The authority citation for part 324 continues to read as follows:

Authority: 12 U.S.C. 1815(a), 1815(b), 1816, 1818(a), 1818(b), 1818(c), 1818(t), 1819(Tenth), 1828(c), 1828(d), 1828(i),

1828(n), 1828(o), 1831o, 1835, 3907, 3909, 4808; 5371; 5412; Public Law 102–233, 105 Stat. 1761, 1789, 1790 (12 U.S.C. 1831n note); Public Law 102–242, 105 Stat. 2236, 2355, as amended by Public Law 103–325, 108 Stat. 2160, 2233 (12 U.S.C. 1828 note); Public Law 102–242, 105 Stat. 2236, 2386, as amended by Public Law 102–550, 106 Stat. 3672, 4089 (12 U.S.C. 1828 note); Public Law 111–203, 124 Stat. 1376, 1887 (15 U.S.C. 78o–7 note), Public Law 115–174; section 4014 § 201, Public Law 116–136, 134 Stat. 281 (15 U.S.C. 9052).

■ 87. Revise subpart E and subpart F of part 324 as set forth at the end of the common preamble.

■ 88. For purposes of part 324, subpart E and subpart F of the common rule are amended as follows:

■ a. Remove “[AGENCY]” and add “FDIC” in its place wherever it appears;

■ b. Remove “[BANKING ORGANIZATION]” and add “FDIC-supervised institution” in its place wherever it appears;

■ c. Remove “[BANKING ORGANIZATIONS]” and add “FDIC-supervised institutions” in its place wherever it appears;

■ d. Remove “[REAL ESTATE LENDING GUIDELINES]” and add “12 CFR part 365, Subpart A, Appendix A” in its place wherever it appears;

■ e. Remove “[APPRAISAL RULE]” and add “12 CFR part 323, Subpart A” in its place wherever it appears;

■ f. Remove “____.” and add “324.” in its place wherever it appears;

■ g. Remove “[REGULATORY REPORT]” and add “Call Report” in its place wherever it appears.

Subpart A—General Provisions

■ 89. In § 324.1:

■ a. Revise paragraph (c)(3);

■ b. Revise paragraph (e);

■ c. Revise paragraph (f); and

■ d. Add paragraph (g).

The additions and revisions read as follows:

§ 324.1 Purpose, applicability, reservations of authority, and timing.

* * * * *

(c) * * *

(3) *Risk-weighted assets.* Each FDIC-supervised institution must calculate either standardized total risk-weighted assets or expanded total risk-weighted assets, as necessary to satisfy the requirements of § 324.10(b) or (d), as applicable.

* * * * *

(e) *Notice and response procedures.* In making a determination under this part, unless more specifically provided for, the FDIC will apply notice and response procedures in the same manner and to the same extent as the

notice and response procedures in 12 CFR 324.7(c).

* * * * *

(f) *Transitions and timing*—(1) Transitions. Notwithstanding any other provision of this part, an FDIC-supervised institution must make any adjustments provided in subpart G of this part for purposes of implementing this part.

(2) *Timing.* An FDIC-supervised institution that changes from one category to another category, or that changes from having no category to having a category, must comply with the requirements of its category in this part, including applicable transition provisions of the requirements in this part, no later than on the first day of the second quarter following the change in the FDIC-supervised institution’s category.

* * * * *

(g) *Severability.* If any provision of this part, or the application thereof to any person or circumstances, is held invalid, such invalidity shall not affect the validity of other provisions or the application of such provision to other persons or circumstances that can be given effect without the invalid provision or application.

* * * * *

■ 90. Amend § 324.2 as follows:

■ a. Redesignate footnotes 3 through 9 as footnotes 1 through 7, respectively;

■ b. Revise the definition of “Adjusted allowances for credit losses (AACL)”;

■ c. Remove the definitions for “Advanced approaches FDIC-supervised institution”, “Advanced approaches total risk-weighted assets”, and “Advanced market risk-weighted assets”;

■ d. Remove the definition of “Allowances for loan and lease losses (ALLL)”;

■ e. Remove the definition for “Bank”;

■ f. Revise the definition for “Carrying value”;

■ g. Add, in alphabetical order, the definition for “Category I FDIC-supervised institution”;

■ h. Revise the definitions for “Category II FDIC-supervised institution” and “Category III FDIC-supervised institution”;

■ i. Add the definition for “Category IV FDIC-supervised institution” in alphabetical order;

■ j. Revise newly redesignated footnote 1 to paragraph (2) of the definition for “Cleared transaction”;

■ k. Revise the definition for “Commitment”;

■ l. Revise the definition for “Corporate exposure”;

■ m. Remove the definition for “Credit-risk-weighted assets”;

■ n. Add the definition for “CVA risk-weighted assets” in alphabetical order;

■ o. Add the definition of “Dependent on the cash flows generated by the real estate” in alphabetical order;

■ p. Revise the definitions for “Effective notional amount” and “Eligible clean-up call”;

■ q. Remove the definition for “Eligible credit reserves”;

■ r. Revise the definition for “Eligible guarantee”;

■ s. Add the definitions for “Eligible prepaid credit protection arrangement”, “ERBA FDIC-supervised institution”, and “Expanded total risk-weighted assets” in alphabetical order;

■ t. Remove the definition for “Expected credit loss (ECL)”;

■ u. Revise the definitions for “Exposure amount”, “FDIC-supervised institution”, paragraphs (4)(i)(A) and (5)(i) of “Financial institution”, and “Market risk FDIC-supervised institution”;

■ v. Add the definition for “Market risk-weighted assets” in alphabetical order;

■ w. Revise the definitions for “Net independent collateral amount” and “Netting set”;

■ x. Add, in alphabetical order, the definitions for “Non-performing loan securitization (NPL securitization)” and “Nonrefundable purchase price discount (NRPPD)”;

■ y. Revise the definition for “Protection amount (P)”;

■ z. Add the definition for “Prepaid credit protection arrangement” and “Qualifying cross-product master netting agreement” in alphabetical order;

■ aa. In the definition for “Residential mortgage exposure”;

■ i. Remove paragraph (2);

■ ii. Redesignate paragraphs (1)(i) and (ii) as paragraphs (1) and (2), respectively; and

■ iii. In newly redesignated paragraph (2), remove the words “family; and” and add, in their place, the word “family.”;

■ bb. Remove the definition for “Securitization special purpose entity (securitization SPE)”;

■ cc. Remove the definition for “Specific wrong-way risk”;

■ dd. Add the definition of “Specified supranational entity” in alphabetical order;

■ ee. Revise the definitions for “Speculative grade”, “Standardized market risk-weighted assets”, “Standardized total risk-weighted assets”, and “Sub-speculative grade”;

■ ff. Add, in alphabetical order, the definition for “Synthetic excess spread”;

■ gg. Revise the definition of “Synthetic securitization”;

- hh. Add the definition for “Total credit risk-weighted assets” in alphabetical order;
- ii. Revise the definition for “Traditional securitization”;
- jj. Remove the definition for “Value-at-Risk (VaR)”;
- kk. Revise the definition for “Variation margin amount”; and
- ll. Remove the definition of “Unconditionally cancelable”.

The additions and revisions read as follows:

§ 324.2 Definitions

* * * * *

Adjusted allowances for credit losses (AACL) means valuation allowances that have been established through a charge against earnings or retained earnings for expected credit losses on financial assets measured at amortized cost and a lessor’s net investment in leases that have been established to reduce the amortized cost basis of the assets to amounts expected to be collected as determined in accordance with GAAP. For purposes of this part, adjusted allowances for credit losses include allowances for expected credit losses on off-balance sheet credit exposures not accounted for as insurance as determined in accordance with GAAP. Adjusted allowances for credit losses exclude allocated transfer risk reserves and allowances created that reflect credit losses on purchased credit deteriorated assets, purchased seasoned loans, assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, and available-for-sale debt securities.

* * * * *

Carrying value means, with respect to an asset, the value of the asset on the balance sheet of the FDIC-supervised institution as determined in accordance with GAAP. For all assets other than available-for-sale debt securities, purchased credit deteriorated assets, purchased seasoned loans, or assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, the carrying value is not reduced by any associated credit loss allowance that is determined in accordance with GAAP.

Category I FDIC-supervised institution means an FDIC-supervised institution that is a subsidiary of a global systemically important BHC, as defined pursuant to 12 CFR 252.5.

Category II FDIC-supervised institution means an FDIC-supervised institution that is not a subsidiary of a global systemically important BHC, as

defined pursuant to 12 CFR 252.5, and that:

- (1) Is a subsidiary of a Category II banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or
- (2)(i) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution’s total consolidated assets for the four most recent calendar quarters, as reported on the Call Report, equal to \$700 billion or more. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or the average of the most recent quarters, as applicable; or
- (ii)(A) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution’s total consolidated assets for the four most recent calendar quarters, as reported on the Call Report, of \$100 billion or more but less than \$700 billion. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent quarters, total consolidated assets is based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; and
- (B) Has cross-jurisdictional activity, calculated based on the average of its cross-jurisdictional activity for the four most recent calendar quarters, of \$75 billion or more. Cross-jurisdictional activity is the sum of cross-jurisdictional claims and cross-jurisdictional liabilities, calculated in accordance with the instructions to the FR Y–15 or equivalent reporting form.

(3) After meeting the criteria in paragraph (2) of this definition, an FDIC supervised-institution continues to be a Category II FDIC-supervised institution until the FDIC-supervised institution has:

- (i) Less than \$700 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; and
- (ii) (A) Less than \$75 billion in cross-jurisdictional activity for each of the four most recent calendar quarters. Cross-jurisdictional activity is the sum of cross-jurisdictional claims and cross-jurisdictional liabilities, calculated in accordance with the instructions to the FR Y–15 or equivalent reporting form; or
- (B) Less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters.

Category III FDIC-supervised institution means an FDIC-supervised

institution that is not a Category II FDIC-supervised institution and that:

- (1) Is a subsidiary of a Category III banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or
- (2)(i) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution’s total consolidated assets for the four most recent calendar quarters as reported on the Call Report, equal to \$250 billion or more. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; or
- (ii)(A) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution’s total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more but less than \$250 billion. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; and
- (B) Has at least one of the following in paragraphs (2)(ii)(B)(1) through (3) of this definition, each calculated as the average of the four most recent calendar quarters, or if the FDIC-supervised institution has not filed each applicable reporting form for each of the four most recent calendar quarters, for the most recent quarter or quarters, as applicable:
 - (1) Total nonbank assets, calculated in accordance with the instructions to the FR Y–9LP or equivalent reporting form, equal to \$75 billion or more;
 - (2) Off-balance sheet exposure equal to \$75 billion or more. Off-balance sheet exposure is the FDIC-supervised institution’s total exposure, calculated in accordance with the instructions to the FR Y–15 or equivalent reporting form, minus the FDIC-supervised institution’s total consolidated assets, as reported on the Call Report; or
 - (3) Weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y–15 or equivalent reporting form, equal to \$75 billion or more.
- (iii) After meeting the criteria in paragraph (2)(ii) of this definition, an FDIC-supervised institution continues to be a Category III FDIC-supervised institution until the FDIC-supervised institution:
 - (A) Has:

(1) Less than \$250 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters;

(2) Less than \$75 billion in total nonbank assets, calculated in accordance with the instructions to the FR Y-9LP or equivalent reporting form, for each of the four most recent calendar quarters;

(3) Less than \$75 billion in weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, for each of the four most recent calendar quarters; and

(4) Less than \$75 billion in off-balance sheet exposure for each of the four most recent calendar quarters. Off-balance sheet exposure is an FDIC-supervised institution's total exposure, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, minus the total consolidated assets of the FDIC-supervised institution, as reported on the Call Report; or

(B) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(C) Is a Category II FDIC-supervised institution.

Category IV FDIC-supervised institution means an FDIC-supervised institution that is not a Category II FDIC-supervised institution or a Category III FDIC-supervised institution, and that:

(1) Is a subsidiary of a Category IV banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution's total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on the average of its total consolidated assets, as reported on the Call Report, for the most recent quarter(s) available.

(3) After meeting the criterion in paragraph (2) of this definition, an FDIC-supervised institution continues to be a Category IV FDIC-supervised institution until it:

(i) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(ii) Is a Category II FDIC-supervised institution or Category III FDIC-supervised institution.

* * * * *

Cleared transaction * * *

(2) * * * 1

¹ For the standardized approach treatment of these exposures, see § 324.34(e) (OTC derivative contracts) or § 324.37(c) (repo-style transactions). For the expanded risk-based approach treatment of these exposures, see § 324.113.

* * * * *

Commitment means a contractual arrangement, under which an FDIC-supervised institution and an obligor agree to terms applicable to one or more future extensions of credit, purchases of assets, or issuances of credit substitutes by the FDIC-supervised institution, whether or not such arrangement is unconditionally cancelable. A commitment is unconditionally cancelable if, by its terms, it either: (a) provides that an FDIC-supervised institution is not obligated to extend credit, purchase assets, or issue credit substitutes; or (b) permits a FDIC-supervised institution, at any time, with or without cause, to refuse to extend credit, purchase assets, or issue credit substitutes under the arrangement (to the extent permitted under applicable law).

* * * * *

Corporate exposure means an exposure to a company that is not:

(1) An exposure to a sovereign, a specified supranational entity, a multilateral development bank (MDB), a depository institution, a foreign bank, or a credit union, a public sector entity (PSE);

(2) An exposure to a government-sponsored enterprise (GSE);

(3) For purposes of subpart D of this part, a residential mortgage exposure;

(4) A pre-sold construction loan;

(5) A statutory multifamily mortgage;

(6) A high volatility commercial real estate (HVCRE) exposure;

(7) A cleared transaction;

(8) A default fund contribution;

(9) A securitization exposure;

(10) An equity exposure;

(11) An unsettled transaction;

(12) A policy loan;

(13) A separate account;

(14) A Paycheck Protection Program covered loan as defined in section 7(a)(36) or (37) of the Small Business Act (15 U.S.C. 636(a)(36)–(37));

(15) For purposes of subpart E of this part, a real estate exposure, as defined in § 324.101; or

(16) For purposes of subpart E of this part, a retail exposure as defined in § 324.101.

* * * * *

CVA risk-weighted assets means the measure for CVA risk calculated under § 324.221(a) multiplied by 12.5.

* * * * *

Dependent on the cash flows

generated by the real estate means, for a real estate exposure, the underwriting, at the time of origination, includes the cash flows generated by lease, rental, or sale of the real estate securing the loan as a source of repayment. For purposes of this definition, a residential mortgage exposure that is secured by the borrower's principal residence is deemed not dependent on the cash flows generated by the real estate.

* * * * *

Effective notional amount means for an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, the lesser of the contractual notional amount of the credit risk mitigant and the exposure amount of the hedged exposure, multiplied by the percentage coverage of the credit risk mitigant.

* * * * *

Eligible clean-up call means a clean-up call that:

(1) Is exercisable solely at the discretion of the originating FDIC-supervised institution or servicer;

(2) Is not structured to avoid allocating losses to securitization exposures held by investors or otherwise structured to provide credit enhancement to the securitization; and

(3) Is only exercisable:

(i) For a traditional securitization, when 10 percent or less of the principal amount of the underlying exposures or securitization exposures (determined as of the inception of the securitization) is outstanding;

(ii) For a synthetic securitization, when 10 percent or less of the principal amount of the reference portfolio of underlying exposures (determined as of the inception of the securitization) is outstanding;

(iii) Upon the occurrence of a regulatory event that significantly changes the risk-weighted asset amount for the securitization exposure under this part; or

(iv) Upon the occurrence of a tax event that significantly changes the tax treatment of the securitization exposure under applicable tax laws.

* * * * *

Eligible guarantee means a guarantee that:

(1) Is written;

(2) Is either:

(i) Unconditional, or

(ii) A contingent obligation of the U.S. government or its agencies, the enforceability of which is dependent upon some affirmative action on the part of the beneficiary of the guarantee or a third party (for example, meeting servicing requirements);

(3) Covers all or a pro rata portion of all contractual payments of the obligated party on the reference exposure;

(4) Gives the beneficiary a direct claim against the protection provider;

(5) Is not unilaterally cancelable by the protection provider for reasons other than the breach of the contract by the beneficiary;

(6) Except for a guarantee by a sovereign, is legally enforceable against the protection provider in a jurisdiction where the protection provider has sufficient assets against which a judgment may be attached and enforced;

(7) Requires the protection provider to make payment to the beneficiary on the occurrence of a default (as defined in the guarantee) of the obligated party on the reference exposure in a timely manner without the beneficiary first having to take legal actions to pursue the obligor for payment;

(8) Does not increase the beneficiary's cost of credit protection on the guarantee in response to deterioration in the credit quality of the reference exposure;

(9) Is not provided by an affiliate of the FDIC-supervised institution, unless the affiliate is an insured depository institution, foreign bank, securities broker or dealer, or insurance company that:

(i) Does not control the FDIC-supervised institution; and

(ii) Is subject to consolidated supervision and regulation comparable to that imposed on depository institutions, U.S. securities broker-dealers, or U.S. insurance companies (as the case may be); and

(10) Is provided by an eligible guarantor.

* * * * *

Eligible prepaid credit protection arrangement means a prepaid credit protection arrangement that:

(1) Is written;

(2) Is unconditional;

(3) Covers all or a pro rata portion of all contractual payments due to be paid on the reference exposure or reference exposures;

(4) Provides that the amount and timing of payments due from the protection purchaser to the protection provider are incorporated into the arrangement and the arrangement only allows these terms to change in the event of a breach of the arrangement by the protection purchaser;

(5) Provides that entry of the protection provider into receivership, insolvency, liquidation, conservatorship, or similar proceeding does not change the amounts or timing

of payments due to be paid by the protection purchaser under the arrangement;

(6) Is legally valid and enforceable under applicable law of the relevant jurisdictions;

(7) Upon a failure by the obligor on the one or more reference exposures to make a contractually required payment, or the occurrence of other credit events as described in the arrangement, allows the protection purchaser promptly to reduce the outstanding balance of the initial principal amount due to the protection provider by the loss of the protection purchaser on the reference exposures without input from the protection provider; and

(8) Does not increase the protection purchaser's cost of credit protection in response to deterioration in the credit quality of any of the reference exposures.

* * * * *

ERBA FDIC-supervised institution means an FDIC-supervised institution that is described in § 324.100(b).

* * * * *

Expanded total risk-weighted assets means the sum of:

(1) Total credit risk-weighted assets;

(2) Total risk-weighted assets for equity exposures as calculated under §§ 324.141 and 324.142;

(3) Risk-weighted assets for operational risk as calculated under § 324.150;

(4) Market risk-weighted assets, if applicable; and

(5) CVA risk-weighted assets, if applicable; minus

(6) Any amount of the FDIC-supervised institution's adjusted allowance for credit losses that is not included in tier 2 capital and any amount of allocated transfer risk reserves.

* * * * *

Exposure amount means:

(1) For the on-balance sheet component of an exposure (other than an available-for-sale or held-to-maturity security, if the FDIC-supervised institution has made an AOCI opt-out election (as defined in § 324.22(b)(2)); a derivative contract; a repo-style transaction or an eligible margin loan for which the FDIC-supervised institution determines the exposure amount under § 324.37, §§ 324.113 through 324.115, or § 324.121, as applicable; a cleared transaction; a default fund contribution; or a securitization exposure), the FDIC-supervised institution's carrying value of the exposure.

(2) For a security (that is not a securitization exposure, equity

exposure, or preferred stock classified as an equity security under GAAP) classified as available-for-sale or held-to-maturity if the FDIC-supervised institution has made an AOCI opt-out election (as defined in § 324.22(b)(2)), the FDIC-supervised institution's carrying value (including net accrued but unpaid interest and fees) for the exposure less any net unrealized gains on the exposure and plus any net unrealized losses on the exposure.

(3) For available-for-sale preferred stock classified as an equity security under GAAP if the FDIC-supervised institution has made an AOCI opt-out election (as defined in § 324.22(b)(2)), the FDIC-supervised institution's carrying value of the exposure less any net unrealized gains on the exposure that are reflected in such carrying value but excluded from the FDIC-supervised institution's regulatory capital components.

(4) For the off-balance sheet component of an exposure (other than a derivative contract; a repo-style transaction or an eligible margin loan for which the FDIC-supervised institution calculates the exposure amount under § 324.37 or § 324.121, as applicable; a cleared transaction; a default fund contribution; or a securitization exposure), the notional amount of the off-balance sheet component multiplied by the appropriate credit conversion factor (CCF) in § 324.33 or § 324.112, as applicable.

(5) For an exposure that is a derivative contract (other than a cleared transaction), the exposure amount determined under § 324.34 or §§ 324.113 through 324.114, as applicable.

(6) For an exposure that is a cleared transaction, the exposure amount determined under § 324.35 or § 324.116, as applicable.

(7) For an exposure that is an eligible margin loan or repo-style transaction (other than a cleared transaction) for which the FDIC-supervised institution calculates the exposure amount as provided in § 324.37 or §§ 324.113 through 324.115, as applicable, the exposure amount determined under § 324.37 or § 324.113 through 324.115, as applicable.

(8) For an exposure that is a securitization exposure, the exposure amount determined under § 324.42 or § 324.131, as applicable.

* * * * *

FDIC-supervised institution means an FDIC-insured, state-chartered commercial or savings bank that is not a member of the Federal Reserve System

and for which the FDIC is the appropriate Federal banking agency pursuant to section 3(q) of the Federal Deposit Insurance Act (12 U.S.C. 1813(q)), or a state savings association.

* * * * *

Financial institution * * *

(4) * * *

(i) * * *

(A) An investment in GAAP equity instruments of the company with an adjusted carrying value or exposure amount equal to or greater than \$10 million, as adjusted pursuant to § 217.4; or

* * * * *

(5) * * *

(i) 85 percent or more of the total consolidated annual gross revenues (as determined in accordance with applicable accounting standards) of the company in either of the two most recent calendar years were derived, directly or indirectly, by the company on a consolidated basis from the activities; or

* * * * *

Market risk FDIC-supervised institution means an FDIC-supervised institution that is described in § 324.201(b)(1).

Market risk-weighted assets means the measure for market risk calculated pursuant to § 324.204(a) multiplied by 12.5.

* * * * *

Net independent collateral amount means the fair value amount of the independent collateral, as adjusted by the haircuts under § 324.121(c)(2)(iii), as applicable, that a counterparty to a netting set has posted to an FDIC-supervised institution less the fair value amount of the independent collateral, as adjusted by the haircuts under § 324.121(c)(2)(iii), as applicable, posted by the FDIC-supervised institution to the counterparty, excluding such amounts held in a bankruptcy-remote manner or posted to a QCCP and held in conformance with the operational requirements in § 324.3.

Netting set means a group of transactions with a single counterparty that are subject to a qualifying master netting agreement. For derivative contracts, netting set also includes a single derivative contract between an FDIC-supervised institution and a single counterparty.

* * * * *

Non-performing loan securitization (NPL securitization) means a traditional securitization, that is not a resecutization, where parameter W (as defined in § 324.133(b)(1)) for the underlying exposures is greater than or equal to 90 percent at the origination

cut-off date and at any subsequent date on which exposures are added to or removed from the pool of underlying exposures due to replenishment or restructuring.

Nonrefundable purchase price discount (NRPPD) means the difference between the outstanding principal balance of the underlying exposures at the time of sale and the price at which these exposures are sold by the originator to a company the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, when neither originator nor the original lender are reimbursed for this difference. In cases where the originator underwrites tranches of an NPL securitization for subsequent sale, the NRPPD may include the differences between the outstanding principal balance of the underlying exposures at the time of sale and the price at which all of the tranches are first sold to unrelated third parties. For any given piece of a securitization tranche, only its initial sale from the originator to investors is taken into account in the determination of NRPPD. The purchase prices of subsequent re-sales of a securitization tranche are not considered.

* * * * *

Prepaid credit protection arrangement means a contractual arrangement under which a protection purchaser transfers the credit risk of one or more reference exposures to a protection provider where:

(1) The protection provider pays an initial principal amount in cash to the protection purchaser at the inception of the transaction; and

(2) The protection purchaser is obligated to repay the initial principal amount to the protection provider on or before the maturity date of the transaction, less any losses that the protection purchaser realizes or otherwise recognizes due to nonpayment of all contractual payments due to be paid on the reference exposure or reference exposures by the obligors.

* * * * *

Protection amount (P) means, with respect to an exposure hedged by an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, or secured by financial collateral, the effective notional amount of the guarantee, credit derivative, or prepaid credit protection arrangement, or the fair value of the financial collateral, reduced to reflect any currency mismatch, maturity mismatch, or lack of restructuring

coverage (as provided in § 324.36–324.37 or § 324.120–121, as applicable).

* * * * *

Qualifying cross-product master netting agreement means a qualifying master netting agreement that provides for termination and close-out netting across multiple types of financial transactions or qualifying master netting agreements in the event of a counterparty's default, provided that the underlying financial transactions are derivative contracts or repo-style transactions that are not cleared transactions. In order to treat an agreement as a qualifying cross-product master netting agreement, an FDIC-supervised institution must comply with the requirements of § 324.3(c) of this part with respect to that agreement.

* * * * *

Specified supranational entity means the Bank for International Settlements, the European Central Bank, the European Commission, the International Monetary Fund, the European Stability Mechanism, or the European Financial Stability Facility.

* * * * *

Speculative grade means that the entity to which the FDIC-supervised institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, has adequate capacity to meet financial commitments in the near term, but is vulnerable to adverse economic conditions, such that should economic conditions deteriorate, the issuer or the reference entity would present an elevated default risk.

Standardized market risk-weighted assets means the standardized measure for market risk calculated under § 324.204(b) multiplied by 12.5.

Standardized total risk-weighted assets means:

(1) The sum of:

(i) Total risk-weighted assets for general credit risk as calculated under § 324.31;

(ii) Total risk-weighted assets for cleared transactions and default fund contributions as calculated under § 324.35;

(iii) Total risk-weighted assets for unsettled transactions as calculated under § 324.38;

(iv) Total risk-weighted assets for securitization exposures as calculated under § 324.42;

(v) Total risk-weighted assets for equity exposures as calculated under § 324.52 and § 324.53; and

(vi) For a market risk FDIC-supervised institution only, market risk-weighted assets; less

(2) Any amount of the FDIC-supervised institution's adjusted

allowance for credit losses that is not included in tier 2 capital and any amount of allocated transfer risk reserves.

* * * * *

Sub-speculative grade means that the entity to which the FDIC-supervised institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, depends on favorable economic conditions to meet its financial commitments, such that should such economic conditions deteriorate the issuer or the reference entity likely would default on its financial commitments.

* * * * *

Synthetic securitization means a transaction in which:

(1) All or a portion of the credit risk of one or more underlying exposures is retained or transferred to one or more third parties through the use of one or more credit derivatives, guarantees (other than a guarantee that transfers only the credit risk of an individual retail exposure), or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures; and

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities).

* * * * *

Total credit risk-weighted assets means the sum of:

(1) Total risk-weighted assets for general credit risk as calculated under § 324.110;

(2) Total risk-weighted assets for cleared transactions and default fund contributions as calculated under § 324.116;

(3) Total risk-weighted assets for unsettled transactions as calculated under § 324.117; and

(4) Total risk-weighted assets for securitization exposures as calculated under § 324.132.

* * * * *

Traditional securitization means a transaction in which:

(1) All or a portion of the credit or equity risk of one or more underlying exposures is transferred to one or more third parties other than through the use of credit derivatives, guarantees, or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures;

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities);

(5) The underlying exposures are not owned by an operating company;

(6) The underlying exposures are not owned by a small business investment company defined in section 302 of the Small Business Investment Act;

(7) The underlying exposures are not owned by a firm an investment in which qualifies as a community development investment under section 24 (Eleventh) of the National Bank Act;

(8) The FDIC may determine that a transaction in which the underlying exposures are owned by an investment firm that exercises substantially unfettered control over the size and composition of its assets, liabilities, and off-balance sheet exposures is not a traditional securitization based on the transaction's leverage, risk profile, or economic substance;

(9) The FDIC may deem a transaction that meets the definition of a traditional securitization, notwithstanding paragraph (5), (6), or (7) of this definition, to be a traditional securitization based on the transaction's leverage, risk profile, or economic substance; and

(10) The transaction is not:

(i) An investment fund;

(ii) A collective investment fund (as defined in 12 CFR 344.3 (state nonmember bank), and 12 CFR 390.203 (state savings association);

(iii) An employee benefit plan (as defined in paragraphs (3) and (32) of section 3 of ERISA), a "governmental plan" (as defined in 29 U.S.C. 1002(32)) that complies with the tax deferral qualification requirements provided in the Internal Revenue Code, or any similar employee benefit plan established under the laws of a foreign jurisdiction;

(iv) A synthetic exposure to the capital of a financial institution to the extent deducted from capital under § 324.22; or

(v) Registered with the SEC under the Investment Company Act of 1940 or foreign equivalents thereof.

* * * * *

Variation margin amount means the fair value amount of the variation margin, as adjusted by the standard supervisory haircuts under § 324.121(c)(2)(iii), as applicable, that a counterparty to a netting set has posted to an FDIC-supervised institution less the fair value amount of the variation margin, as adjusted by the standard supervisory haircuts under § 324.121(c)(2)(iii), as applicable, posted by the FDIC-supervised institution to the counterparty.

* * * * *

■ 91. In § 324.3, revise paragraph (c) to read as follows:

§ 324.3 Operational requirements for counterparty credit risk.

* * * * *

(c) *Qualifying cross-product master netting agreement.* In order to recognize an agreement as a qualifying cross-product master netting agreement as defined in § 324.2, an FDIC-supervised institution must obtain a written legal opinion verifying the validity and enforceability of the agreement under applicable law of the relevant jurisdictions if the counterparty fails to perform upon an event of default, including upon receivership, insolvency, liquidation, or similar proceeding

* * * * *

§ 324.4 [Redesignated as § 324.6]

■ 92. Redesignate § 324.4 as § 324.6.

■ a. Redesignate footnote 10 as footnote 1.

■ b. Revise newly redesignated footnote 1.

The revision reads as follows:

§ 324.6 Inadequate capital as an unsafe or unsound practice or condition.

* * * * *

¹ The term total assets shall have the same meaning as provided in 12 CFR 324.401(g).

§ 324.5 [Redesignated as § 324.7]

■ 93. Redesignate § 324.5 as § 324.7.

■ a. In paragraph (a), remove the reference "§§ 324.4 and 324.10" and adding in its place the reference "§§ 324.6 and 324.10".

■ 94. Add section § 324.4 to read as follows:

§ 324.4 Threshold Indexing.

(a) *Methodology.* The dollar thresholds specified in paragraph (c) of this section shall be adjusted by multiplying the baseline threshold values specified in paragraph (c) of this section by one plus the cumulative percent change in the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured from the effective

date of this rule, as further described in paragraph (b) of this section, and shall be rounded in accordance with paragraph (d) of this section.

(b) *Frequency.* (1) *In general—biennial adjustments.* Except as otherwise provided in paragraph (b)(2) and (b)(3) of this section, the adjustments described in paragraph (a) of this section shall be effective on October 1 following each consecutive two year period ending August 30, and using the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers as of August 30 of that year.

(2) *Off-year adjustments.* In the event that the FDIC determines, during a year where no adjustment would be made under paragraph (b)(1), that the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured over the twelve month period ending August 30 of that year, is such that an adjustment under this section would be appropriate for that year, the FDIC may make an adjustment under this section for that year.

(3) *Periods of negative inflation.* Notwithstanding paragraph (b)(1) or (b)(2) of this section, if an adjustment of dollar thresholds using the cumulative percent change of the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers from the effective date of this rule or the most recent adjustment, as applicable, would not result in an increase from the current dollar thresholds, no adjustment will be made pursuant to paragraph (a) of this section.

(c) *Specified thresholds.* The thresholds in the following sections shall be adjusted in accordance with paragraph (a) of this section relative to the baseline threshold values as specified below.

(1) § 324.2, definition of Financial institution, paragraph (4)(i)(A), baseline threshold value \$10 million;

(2) § 324.101, definition of Regulatory retail exposure, paragraph (2), baseline threshold value \$1 million;

(3) § 324.101, definition of Small or medium-sized entity (SME), baseline threshold value \$50 million;

(4) § 324.150(b)(1), baseline threshold value \$1 billion;

(5) § 324.150(b)(2), baseline threshold values \$1 billion, \$30 billion, and \$120 million;

(6) § 324.150(b)(2)(i), baseline threshold value \$1 billion;

(7) § 324.150(b)(3), baseline threshold values \$30 billion and \$4.47 billion

(8) § 324.150(b)(3)(i), baseline threshold value \$30 billion;

(9) § 324.150(d)(2)(i)(A), baseline threshold value \$20,000;

(10) § 324.201(b)(1)(ii)(B), baseline threshold value \$5 billion;

(11) § 324.201(b)(2)(ii), baseline threshold value \$1 trillion;

(12) § 324.202 “Large market cap”, baseline threshold value \$2 billion;

(15) § 324.202, “Market risk covered position” (1)(ii)(D), baseline value \$20 million;

(16) § 324.202, “Small market cap”, baseline threshold value \$2 billion.

(d) *Rounding.* When adjusting thresholds under this section, each threshold shall be rounded based on the size of the threshold (e.g., thousands, millions, billions) to the nearest number with two significant digits.

(e) *Effective date of threshold adjustments.* The FDIC shall announce the thresholds adjusted in accordance with this section by publication in the **Federal Register**. Such adjusted thresholds shall be effective on October 1 of the year during which an adjustment is made.

(f) *Failure to publish in the Federal Register.* In the event, for any reason, the thresholds adjusted in accordance with this section are not published in the **Federal Register** in a year in which an adjustment is made under this section, the thresholds specified in paragraph (c) of this section will adjust as provided in this section and be effective on October 1, notwithstanding the lack of publication in the **Federal Register**.

* * * * *

■ 95. Add § 324.5 “Calculation of loan-to-value (LTV) ratio.”

The addition reads as follows:

§ 324.5 Calculation of loan-to-value (LTV) ratio.

(a) *Loan-to-Value ratio.* The loan-to-value (LTV) ratio must be calculated as the extension of credit divided by the value of the property.

(b) *Extension of credit.* For purposes of a LTV ratio calculated under this section, the extension of credit is equal to the total outstanding amount of the loan including any undrawn committed amount of the loan.

(c) *Value of the property.* (1) For purposes of a LTV ratio calculated under this section, the value of the property is the market value of all real estate properties securing or being improved by the extension of credit plus the amount of any readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 365, subpart A, Appendix A, that secures the extension of credit, subject to the following:

(i) For exposures subject to 12 CFR part 323, subpart A, the market value of property is a valuation that meets all requirements of that rule.

(ii) For exposures not subject to 12 CFR part 323, subpart A:

(A) The market value of real estate must be obtained from an independent valuation of the property using prudently conservative valuation criteria;

(B) The valuation must be done independently from the FDIC-supervised institution’s origination and underwriting process, and

(C) To ensure that the market value of the real estate is determined in a prudently conservative manner, the valuation must exclude expectations of price increases and must be adjusted downward to account for the potential for the current market price to be significantly above the value that would be sustainable over the life of the loan.

(2) In the case where the exposure includes the financing to purchase the property, the value of the property is the lower of the market value obtained under paragraph (c)(1)(i) or (c)(1)(ii) of this section, as applicable, and the actual acquisition cost.

(3) The value of the property must be measured at the time of origination, except in the following circumstances:

(i) The FDIC requires an FDIC-supervised institution to revise the value of the property downward;

(ii) The value of the property must be adjusted downward due to an extraordinary event that results in a permanent reduction of the property value; or

(iii) The value of the property may be increased to reflect modifications made to the property that increase the market value, as determined according to the requirements in paragraphs (c)(1)(i) or (ii) of this section.

(4) Readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 365, subpart A, Appendix A, must be appropriately discounted by the FDIC-supervised institution consistent with the FDIC-supervised institution’s usual practices for making loans secured by such collateral.

Subpart B—Capital Ratio Requirements and Buffers

■ 96. In § 324.10:

■ a. Revise paragraphs (a)(1)(v), (b), (c), (d); and

■ b. Add paragraph (b)(6).

The revisions read as follows:

§ 324.10 Minimum capital requirements.

* * * * *

(a) * * *

(1) * * *

(v) For an Category I FDIC-supervised institution, Category II FDIC-supervised institution, or Category III FDIC-supervised institution, a supplementary leverage ratio of 3 percent.

* * * * *

(b) *Standardized capital ratio calculations.* For an FDIC-supervised institution that is not a Category I FDIC-supervised institution or Category II FDIC-supervised institution:

(1) *Common equity tier 1 capital ratio.* The FDIC-supervised institution's common equity tier 1 capital ratio is the ratio of the FDIC-supervised institution's common equity tier 1 capital to selected total risk-weighted assets;

(2) *Tier 1 capital ratio.* The FDIC-supervised institution's tier 1 capital ratio is the ratio of the FDIC-supervised institution's tier 1 capital to selected total risk-weighted assets;

(3) *Total capital ratio.* The FDIC-supervised institution's total capital ratio is the ratio of the FDIC-supervised institution's total capital to selected total risk-weighted assets; and

(4) *Leverage ratio.* The FDIC-supervised institution's leverage ratio is the ratio of the FDIC-supervised institution's tier 1 capital to the FDIC-supervised institution's average total consolidated assets as reported on the FDIC-supervised institution's Call Report, minus amounts deducted from tier 1 capital under § 324.22(a), (c) and (d).

(5) *State savings association tangible capital ratio.* A state savings association's tangible capital ratio is the ratio of the state savings association's core capital (tier 1 capital) to total assets. For purposes of this paragraph (b)(5), the term total assets shall have the meaning provided in § 324.401(g).

(6) *Selected total risk-weighted assets.* An FDIC-supervised institution's selected total risk-weighted assets is either the FDIC-supervised institution's standardized total risk-weighted assets or expanded total risk-weighted assets, as selected by the FDIC-supervised institution. An FDIC-supervised institution may change its choice for selected total risk-weighted assets by providing the FDIC with prior notice of the change at least four full calendar quarters before the calendar quarter in which the change will take effect.

(c) *Supplementary leverage ratio.* (1) The supplementary leverage ratio of a Category I FDIC-supervised institution, Category II FDIC-supervised institution, or Category III FDIC-supervised institution is the ratio of its tier 1 capital to total leverage exposure. Total

leverage exposure is calculated as the sum of:

(i) The mean of the on-balance sheet assets calculated as of each day of the reporting quarter; and

(ii) The mean of the off-balance sheet exposures calculated as of the last day of each of the most recent three months, minus the applicable deductions under § 324.22(a), (c), and (d).

(2) For purposes of this part, *total leverage exposure* means the sum of the items described in paragraphs (c)(2)(i) through (viii) of this section, as adjusted pursuant to paragraph (c)(2)(ix) of this section for a clearing member FDIC-supervised institution and paragraph (c)(2)(x) of this section for a custody bank:

(i) The balance sheet carrying value of all of the FDIC-supervised institution's on-balance sheet assets, net of adjusted allowances for credit losses, *plus* the value of securities sold under a repurchase transaction or a securities lending transaction that qualifies for sales treatment under GAAP, less amounts deducted from tier 1 capital under § 324.22(a), (c), and (d), less the value of securities received in security-for-security repo-style transactions, where the FDIC-supervised institution acts as a securities lender and includes the securities received in its on-balance sheet assets but has not sold or re-hypothecated the securities received, and, for an FDIC-supervised institution that uses the standardized approach for counterparty credit risk (SA-CCR) under § 324.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, less the fair value of any derivative contracts;

(ii) (A) For an FDIC-supervised institution that uses the current exposure methodology under § 324.34(b) for its standardized total risk-weighted assets, the potential future credit exposure (PFE) for each derivative contract or each single-product netting set of derivative contracts (including a cleared transaction except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the FDIC-supervised institution, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP), to which the FDIC-supervised institution is a counterparty as determined under § 324.34, but without regard to § 324.34(c), provided that:

(1) An FDIC-supervised institution may choose to exclude the PFE of all credit derivatives or other similar instruments through which it provides

credit protection when calculating the PFE under § 324.34, but without regard to § 324.34(c), provided that it does not adjust the net-to-gross ratio (NGR); and

(2) An FDIC-supervised institution that chooses to exclude the PFE of credit derivatives or other similar instruments through which it provides credit protection pursuant to paragraph (c)(2)(ii)(A) of this section must do so consistently over time for the calculation of the PFE for all such instruments; or

(B) (1) For an FDIC-supervised institution that uses SA-CCR under § 324.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, the PFE under SA-CCR each derivative contract or single product netting set of derivative contracts to which the FDIC-supervised institution is a counterparty (including cleared transactions except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the FDIC-supervised institution, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP), as determined under § 324.114(g), in which the term C in § 324.114(g)(1) equals zero, and, for any counterparty that is not a commercial end-user, multiplied by 1.4. For purposes of this paragraph (c)(2)(ii)(A), an FDIC-supervised institution may set the value of the term C in § 324.114(g)(1) equal to the amount of collateral posted by a clearing member client of the FDIC-supervised institution in connection with the client-facing derivative transactions within the netting set; and

(2) An FDIC-supervised institution may choose to exclude the PFE of all credit derivatives or other similar instruments through which it provides credit protection when calculating the PFE under § 324.114, provided that it does so consistently over time for the calculation of the PFE for all such instruments;

(iii)(A)(1) For an FDIC-supervised institution that uses the current exposure methodology under § 324.34(b) for its standardized total risk-weighted assets, the amount of cash collateral that is received from a counterparty to a derivative contract and that has offset the mark-to-fair value of the derivative asset, or cash collateral that is posted to a counterparty to a derivative contract and that has reduced the FDIC-supervised institution's on-balance sheet assets, unless such cash collateral is all or part of variation margin that satisfies the conditions in

paragraphs (c)(2)(iii)(C) through (G) of this section; and

(2) The variation margin is used to reduce the current credit exposure of the derivative contract, calculated as described in § 324.34(b), and not the PFE; and

(3) For the purpose of the calculation of the NGR described in

§ 324.34(b)(2)(ii)(B), variation margin described in paragraph (c)(2)(iii)(A)(2) of this section may not reduce the net current credit exposure or the gross current credit exposure; or

(B)(1) For an FDIC-supervised institution that uses SA-CCR under § 324.114 for its standardized total risk-weighted assets or expanded total risk-weighted assets, the replacement cost under § 324.114 of each derivative contract or single product netting set of derivative contracts to which the FDIC-supervised institution is a counterparty, calculated according to the following formula, and, for any counterparty that is not a commercial end-user, multiplied by 1.4:

$$\text{Replacement Cost} = \max\{V - \text{CVM}_r + \text{CVM}_p; 0\}$$

Where:

V equals the fair value for each derivative contract or each netting set of derivative contracts (including a cleared transaction except as provided in paragraph (c)(2)(ix) of this section and, at the discretion of the FDIC-supervised institution, excluding a forward agreement treated as a derivative contract that is part of a repurchase or reverse repurchase or a securities borrowing or lending transaction that qualifies for sales treatment under GAAP);

CVM_r equals the amount of cash collateral received from a counterparty to a derivative contract and that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section, or, in the case of a client-facing derivative transaction, the amount of collateral received from the clearing member client; and

CVM_p equals the amount of cash collateral that is posted to a counterparty to a derivative contract and that has not offset the fair value of the derivative contract and that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section, or, in the case of a client-facing derivative transaction, the amount of collateral posted to the clearing member client;

(2) Notwithstanding paragraph (c)(2)(iii)(A)(1) of this section, where multiple netting sets are subject to a single variation margin agreement, an FDIC-supervised institution must apply the formula for replacement cost provided in § 324.114(j)(1), in which the term CMA may only include cash collateral that satisfies the conditions in paragraphs (c)(2)(iii)(C) through (G) of this section; and

(3) For purposes of paragraph (c)(2)(iii)(A) of this section, an FDIC-supervised institution must treat a derivative contract that references an index as if it were multiple derivative contracts each referencing one component of the index if the FDIC-supervised institution elected to treat the derivative contract as multiple derivative contracts under § 324.114(e)(6);

(C) For derivative contracts that are not cleared through a QCCP, the cash collateral received by the recipient counterparty is not segregated (by law, regulation, or an agreement with the counterparty);

(D) Variation margin is calculated and transferred on a daily basis based on the mark-to-fair value of the derivative contract;

(E) The variation margin transferred under the derivative contract or the governing rules of the CCP or QCCP for a cleared transaction is the full amount that is necessary to fully extinguish the net current credit exposure to the counterparty of the derivative contracts, subject to the threshold and minimum transfer amounts applicable to the counterparty under the terms of the derivative contract or the governing rules for a cleared transaction;

(F) The variation margin is in the form of cash in the same currency as the currency of settlement set forth in the derivative contract, provided that for the purposes of this paragraph (c)(2)(iii)(F), currency of settlement means any currency for settlement specified in the governing qualifying master netting agreement and the credit support annex to the qualifying master netting agreement, or in the governing rules for a cleared transaction; and

(G) The derivative contract and the variation margin are governed by a qualifying master netting agreement between the legal entities that are the counterparties to the derivative contract or by the governing rules for a cleared transaction, and the qualifying master netting agreement or the governing rules for a cleared transaction must explicitly stipulate that the counterparties agree to settle any payment obligations on a net basis, taking into account any variation margin received or provided under the contract if a credit event involving either counterparty occurs;

(iv) The effective notional principal amount (that is, the apparent or stated notional principal amount multiplied by any multiplier in the derivative contract) of a credit derivative, or other similar instrument, through which the FDIC-supervised institution provides credit protection, provided that:

(A) The FDIC-supervised institution may reduce the effective notional principal amount of the credit derivative by the amount of any reduction in the mark-to-fair value of the credit derivative if the reduction is recognized in common equity tier 1 capital;

(B) The FDIC-supervised institution may reduce the effective notional principal amount of the credit derivative by the effective notional principal amount of a purchased credit derivative or other similar instrument, provided that the remaining maturity of the purchased credit derivative is equal to or greater than the remaining maturity of the credit derivative through which the FDIC-supervised institution provides credit protection; and that:

(1) With respect to a credit derivative that references a single exposure, the reference exposure of the purchased credit derivative is to the same legal entity and ranks *pari passu* with, or is junior to, the reference exposure of the credit derivative through which the FDIC-supervised institution provides credit protection; or

(2) With respect to a credit derivative that references multiple exposures, the reference exposures of the purchased credit derivative are to the same legal entities and rank *pari passu* with the reference exposures of the credit derivative through which the FDIC-supervised institution provides credit protection, and the level of seniority of the purchased credit derivative ranks *pari passu* to the level of seniority of the credit derivative through which the FDIC-supervised institution provides credit protection;

(3) Where an FDIC-supervised institution has reduced the effective notional principal amount of a credit derivative through which the FDIC-supervised institution provides credit protection in accordance with paragraph (c)(2)(iv)(A) of this section, the FDIC-supervised institution must also reduce the effective notional principal amount of a purchased credit derivative used to offset the credit derivative through which the FDIC-supervised institution provides credit protection, by the amount of any increase in the mark-to-fair value of the purchased credit derivative that is recognized in common equity tier 1 capital; and

(4) Where the FDIC-supervised institution purchases credit protection through a total return swap and records the net payments received on a credit derivative through which the FDIC-supervised institution provides credit protection in net income, but does not record offsetting deterioration in the mark-to-fair value of the credit

derivative through which the FDIC-supervised institution provides credit protection in net income (either through reductions in fair value or by additions to reserves), the FDIC-supervised institution may not use the purchased credit protection to offset the effective notional principal amount of the related credit derivative through which the FDIC-supervised institution provides credit protection;

(v) Where an FDIC-supervised institution acting as a principal has more than one repo-style transaction with the same counterparty and has offset the gross value of receivables due from a counterparty under reverse repurchase transactions by the gross value of payables under repurchase transactions due to the same counterparty, the gross value of receivables associated with the repo-style transactions less any on-balance sheet receivables amount associated with these repo-style transactions included under paragraph (c)(2)(i) of this section, unless the following criteria are met:

(A) The offsetting transactions have the same explicit final settlement date under their governing agreements;

(B) The right to offset the amount owed to the counterparty with the amount owed by the counterparty is legally enforceable in the normal course of business and in the event of receivership, insolvency, liquidation, or similar proceeding; and

(C) Under the governing agreements, the counterparties intend to settle net, settle simultaneously, or settle according to a process that is the functional equivalent of net settlement, (that is, the cash flows of the transactions are equivalent, in effect, to a single net amount on the settlement date), where both transactions are settled through the same settlement system, the settlement arrangements are supported by cash or intraday credit facilities intended to ensure that settlement of both transactions will occur by the end of the business day, and the settlement of the underlying securities does not interfere with the net cash settlement;

(vi) The counterparty credit risk of a repo-style transaction, including where the FDIC-supervised institution acts as an agent for a repo-style transaction and indemnifies the customer with respect to the performance of the customer's counterparty in an amount limited to the difference between the fair value of the security or cash its customer has lent and the fair value of the collateral the borrower has provided, calculated as follows:

(A) If the transaction is not subject to a qualifying master netting agreement, the counterparty credit risk (E^*) for transactions with a counterparty must be calculated on a transaction by transaction basis, such that each transaction i is treated as its own netting set, in accordance with the following formula, where E_i is the fair value of the instruments, gold, or cash that the FDIC-supervised institution has lent, sold subject to repurchase, or provided as collateral to the counterparty, and C_i is the fair value of the instruments, gold, or cash that the FDIC-supervised institution has borrowed, purchased subject to resale, or received as collateral from the counterparty:

$$E_i^* = \max \{0, [E_i - C_i]\}; \text{ and}$$

(B) If the transaction is subject to a qualifying master netting agreement, the counterparty credit risk (E^*) must be calculated as the greater of zero and the total fair value of the instruments, gold, or cash that the FDIC-supervised institution has lent, sold subject to repurchase or provided as collateral to a counterparty for all transactions included in the qualifying master netting agreement ($\sum E_i$), less the total fair value of the instruments, gold, or cash that the FDIC-supervised institution borrowed, purchased subject to resale or received as collateral from the counterparty for those transactions ($\sum C_i$), in accordance with the following formula:

$$E^* = \max \{0, [\sum E_i - \sum C_i]\}$$

(vii) If an FDIC-supervised institution acting as an agent for a repo-style transaction provides a guarantee to a customer of the security or cash its customer has lent or borrowed with respect to the performance of the customer's counterparty and the guarantee is not limited to the difference between the fair value of the security or cash its customer has lent and the fair value of the collateral the borrower has provided, the amount of the guarantee that is greater than the difference between the fair value of the security or cash its customer has lent and the value of the collateral the borrower has provided;

(viii) The credit equivalent amount of all off-balance sheet exposures of the FDIC-supervised institution, excluding repo-style transactions, repurchase or reverse repurchase or securities borrowing or lending transactions that qualify for sales treatment under GAAP, and derivative transactions, determined using:

(A) For an FDIC-supervised institution that elects to calculate its standardized total risk-weighted assets under § 324.10(b), the applicable credit

conversion factor under § 324.33(b), provided, however, that the minimum credit conversion factor that may be assigned to an off-balance sheet exposure under this paragraph is 10 percent; or

(B) For an FDIC-supervised institution that elects to calculate its expanded total risk-weighted assets under § 324.10(b), a Category I FDIC-supervised institution, a Category II FDIC-supervised institution, the applicable credit conversion factor under § 324.112(b), provided, however, that the minimum credit conversion factor that may be assigned to an off-balance sheet exposure under this paragraph is 10 percent; and

(ix) For an FDIC-supervised institution that is a clearing member:

(A) A clearing member FDIC-supervised institution that guarantees the performance of a clearing member client with respect to a cleared transaction must treat its exposure to the clearing member client as a derivative contract or repo-style transaction, as applicable, for purposes of determining its total leverage exposure;

(B) A clearing member FDIC-supervised institution that guarantees the performance of a CCP with respect to a transaction cleared on behalf of a clearing member client must treat its exposure to the CCP as a derivative contract or repo-style transaction, as applicable, for purposes of determining its total leverage exposure;

(C) A clearing member FDIC-supervised institution that does not guarantee the performance of a CCP with respect to a transaction cleared on behalf of a clearing member client may exclude its exposure to the CCP for purposes of determining its total leverage exposure;

(D) An FDIC-supervised institution that is a clearing member may exclude from its total leverage exposure the effective notional principal amount of credit protection sold through a credit derivative contract, or other similar instrument, that it clears on behalf of a clearing member client through a CCP as calculated in accordance with paragraph (c)(2)(iv) of this section;

(E) Notwithstanding paragraphs (c)(2)(ix)(A) through (C) of this section, an FDIC-supervised institution may exclude from its total leverage exposure a clearing member's exposure to a clearing member client for a derivative contract if the clearing member client and the clearing member are affiliates and consolidated for financial reporting purposes on the FDIC-supervised institution's balance sheet; and

(F) Notwithstanding paragraph (c)(2)(ix)(A), an FDIC-supervised institution that has elected under § 324.113(c) to treat any repo-style transactions subject to a qualifying cross-product master netting agreement as derivative contracts must treat any such repo-style transactions as a derivative contract for purposes of this paragraph (c).

(x) A custody bank shall exclude from its total leverage exposure the lesser of:

(A) The amount of funds that the custody bank has on deposit at a qualifying central bank; and

(B) The amount of funds in deposit accounts at the custody bank that are linked to fiduciary or custodial and safekeeping accounts at the custody bank. For purposes of this paragraph (c)(2)(x), a deposit account is linked to a fiduciary or custodial and safekeeping account if the deposit account is provided to a client that maintains a fiduciary or custodial and safekeeping account with the custody bank and the deposit account is used to facilitate the administration of the fiduciary or custodial and safekeeping account.

* * * * *

(d) *Expanded capital ratio calculations.* For a Category I FDIC-supervised institution, a Category II FDIC-supervised institution, or an ERBA FDIC-supervised institution:

(1) *Common equity tier 1 capital ratio.* The FDIC-supervised institution's common equity tier 1 capital ratio is the ratio of the FDIC-supervised institution's common equity tier 1 capital to expanded total risk-weighted assets;

(2) *Tier 1 capital ratio.* The FDIC-supervised institution's tier 1 capital ratio is the ratio of the FDIC-supervised institution's tier 1 capital to expanded total risk-weighted assets;

(3) *Total capital ratio.* The FDIC-supervised institution's total capital ratio is the ratio of the FDIC-supervised institution's total capital to expanded total risk-weighted assets; and

(4) *Leverage ratio.* The FDIC-supervised institution's leverage ratio is the ratio of the FDIC-supervised institution's tier 1 capital to the FDIC-supervised institution's average total consolidated assets as reported on the FDIC-supervised institution's Call Report, minus amounts deducted from tier 1 capital under § 324.22(a), (c) and (d).

(5) *State savings association tangible capital ratio.* A state savings association's tangible capital ratio is the ratio of the state savings association's core capital (tier 1 capital) to total assets. For purposes of this paragraph,

the term total assets shall have the meaning provided in 12 CFR 324.401(g).

* * * * *

■ 97. In § 324.11:

■ a. Revise paragraph (a)(2)(iv);

■ b. In paragraph (b)(1), remove the words “An advanced approaches FDIC-supervised institution or a Category III FDIC-supervised institution” and add in their place the words “A Category I FDIC-supervised institution, a Category II FDIC-supervised institution, or a Category III FDIC-supervised institution”;

■ c. Revise paragraph (b)(1)(iii); and

■ d. In paragraph (b)(2)(ii), redesignate footnote 11 as footnote 1.

The revision reads as follows:

§ 324.11 Capital conservation buffer and countercyclical capital buffer amount

* * * * *

(a) * * *

(2) * * *

(iv) Private sector credit exposure.

Private sector credit exposure means an exposure to a company or an individual that is not an exposure to a sovereign, a specified supranational entity, a MDB, a PSE, or a GSE.

(b) * * *

(1) * * *

(iii) *Weighting.* The weight assigned to a jurisdiction's countercyclical capital buffer amount is calculated by dividing the total risk-weighted assets for the FDIC-supervised institution's private sector credit exposures located in the jurisdiction by the total risk-weighted assets for all of the FDIC-supervised institution's private sector credit exposures. The methodology an FDIC-supervised institution uses for determining risk-weighted assets for purposes of this paragraph (b) must be the methodology that determines its risk-based capital ratios under § 324.10. Notwithstanding the previous sentence, the risk-weighted asset amount for a private sector credit exposure that is a covered position under subpart F of this part is its standardized default risk capital requirement as determined under § 324.210 multiplied by 12.5.

* * * * *

§ 324.12 [Amended]

■ 98. In § 324.12, remove paragraph (a)(4).

Subpart C—Definition of Capital

■ 99. In § 324.20:

■ a. Revise paragraphs (c)(1)(xiv), (d)(1)(xi), and (d)(3); and

■ b. Redesignate footnotes 12 through 23 as footnotes 1 through 12, respectively;

The revisions read as follows:

§ 324.20 Capital components and eligibility criteria for regulatory capital instruments.

* * * * *

(c) * * *

(1) * * *

(xiv) For an ERBA FDIC-supervised institution, the governing agreement, offering circular, or prospectus of an instrument issued after the date upon which the FDIC-supervised institution becomes subject to this part must disclose that the holders of the instrument may be fully subordinated to interests held by the U.S. government in the event that the FDIC-supervised institution enters into a receivership, insolvency, liquidation, or similar proceeding.

* * * * *

(d) * * *

(1) * * *

(xi) For an ERBA FDIC-supervised institution, the governing agreement, offering circular, or prospectus of an instrument issued after the date on which the FDIC-supervised institution becomes subject to this part must disclose that the holders of the instrument may be fully subordinated to interests held by the U.S. government in the event that the FDIC-supervised institution enters into a receivership, insolvency, liquidation, or similar proceeding.

* * * * *

(3) AACL up to 1.25 percent of the FDIC-supervised institution's standardized total risk-weighted assets or total credit risk-weighted assets, as applicable, not including any amount of the AACL (and excluding the case of a market risk FDIC-supervised institution, its market risk weighted assets).

* * * * *

■ 100. In § 324.21:

■ a. Revise paragraph (b).

The revision reads as follows:

§ 324.21 Minority interest.

* * * * *

(b) (1) *Applicability.* For purposes of § 324.20, an ERBA FDIC-supervised institution is subject to the minority interest limitations in this paragraph (b) if:

(i) A consolidated subsidiary of the FDIC-supervised institution has issued regulatory capital that is not owned by the FDIC-supervised institution; and

(ii) For each relevant regulatory capital ratio of the consolidated subsidiary, the ratio exceeds the sum of the subsidiary's minimum regulatory capital requirements plus its capital conservation buffer.

(2) *Difference in capital adequacy standards at the subsidiary level.* For purposes of the minority interest

calculations in this section, if the consolidated subsidiary issuing the capital is not subject to capital adequacy standards similar to those of the ERBA FDIC-supervised institution, the ERBA FDIC-supervised institution must assume that the capital adequacy standards of the FDIC-supervised institution apply to the subsidiary.

(3) *Common equity tier 1 minority interest includable in the common equity tier 1 capital of the FDIC-supervised institution.* For each consolidated subsidiary of an ERBA FDIC-supervised institution, the amount of common equity tier 1 minority interest the FDIC-supervised institution may include in common equity tier 1 capital is equal to:

(i) The common equity tier 1 minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's common equity tier 1 capital that is not owned by the FDIC-supervised institution, multiplied by the difference between the common equity tier 1 capital of the subsidiary and the lower of:

(A) The amount of common equity tier 1 capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus payments under § 324.11 or equivalent standards established by the subsidiary's home country supervisor; or

(B) (1) The expanded total risk-weighted assets of the FDIC-supervised institution that relate to the subsidiary multiplied by

(2) The common equity tier 1 capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 324.11 or equivalent standards established by the subsidiary's home country supervisor.

(4) *Tier 1 minority interest includable in the tier 1 capital of the FDIC-supervised institution.* For each consolidated subsidiary of the ERBA FDIC-supervised institution, the amount of tier 1 minority interest the FDIC-supervised institution may include in tier 1 capital is equal to:

(i) The tier 1 minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's tier 1 capital that is not owned by the FDIC-supervised institution multiplied by the difference between the tier 1 capital of the subsidiary and the lower of:

(A) The amount of tier 1 capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus

payments under § 324.11 or equivalent standards established by the subsidiary's home country supervisor, or

(B) (1) The expanded total risk-weighted assets of the FDIC-supervised institution that relate to the subsidiary multiplied by

(2) The tier 1 capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 324.11 or equivalent standards established by the subsidiary's home country supervisor.

(5) *Total capital minority interest includable in the total capital of the FDIC-supervised institution.* For each consolidated subsidiary of the ERBA FDIC-supervised institution, the amount of total capital minority interest the FDIC-supervised institution may include in total capital is equal to:

(i) The total capital minority interest of the subsidiary; minus

(ii) The percentage of the subsidiary's total capital that is not owned by the FDIC-supervised institution multiplied by the difference between the total capital of the subsidiary and the lower of:

(A) The amount of total capital the subsidiary must hold, or would be required to hold pursuant to this paragraph (b), to avoid restrictions on distributions and discretionary bonus payments under § 324.11 or equivalent standards established by the subsidiary's home country supervisor, or

(B) (1) The expanded total risk-weighted assets of the FDIC-supervised institution that relate to the subsidiary multiplied by

(2) The total capital ratio the subsidiary must maintain to avoid restrictions on distributions and discretionary bonus payments under § 324.11 or equivalent standards established by the subsidiary's home country supervisor.

* * * * *

■ 101. In § 324.22:

■ a. Redesignate footnotes 22 through 31 as footnotes 1 through 10, respectively;

■ b. Revise newly redesignated footnotes 1, 5, 6, 7, 9, and 10;

■ c. Revise paragraph (a)(4);

■ d. Remove and reserve paragraph (a)(6);

■ e. Revise paragraph (b)(1)(ii);

■ f. Revise paragraphs (b)(2)(i), (b)(2)(ii), (b)(2)(iii), and (b)(2)(iv) introductory text, and (c)(2) introductory text; and

■ g. Revise paragraphs (c)(5), (c)(6), (d)(1) introductory text, (d)(2), and (f),

The revisions read as follows:

§ 324.22 Regulatory capital adjustments and deductions

* * * * *

(a) * * *

(4) (i) Any gain-on-sale in connection with a securitization exposure;

(ii) For an ERBA FDIC-supervised institution, the portion of any CEIO that does not constitute an after-tax gain-on-sale;

* * * * *

(b) * * *

(1) * * *

(ii) An ERBA FDIC-supervised institution, and an FDIC-supervised institution that has not made an AOCI opt-out election (as defined in paragraph (b)(2) of this section), must deduct any accumulated net gains and add any accumulated net losses on cash flow hedges included in AOCI that relate to the hedging of items that are not recognized at fair value on the balance sheet.

* * * * *

(2) AOCI opt-out election.

(i) An FDIC-supervised institution that is not an ERBA FDIC-supervised institution may make a one-time election to opt out of the requirement to include all components of AOCI (with the exception of accumulated net gains and losses on cash flow hedges related to items that are not fair-valued on the balance sheet) in common equity tier 1 capital (AOCI opt-out election). An FDIC-supervised institution that makes an AOCI opt-out election in accordance with this paragraph (b)(2) must adjust common equity tier 1 capital as follows:

(A) Subtract any net unrealized gains and add any net unrealized losses on available-for-sale securities;

(B) Subtract any accumulated net gains and add any accumulated net losses on cash flow hedges;

(C) Subtract any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans (excluding, at the FDIC-supervised institution's option, the portion relating to pension assets deducted under paragraph (a)(5) of this section); and

(D) Subtract any net unrealized gains and add any net unrealized losses on held-to-maturity securities that are included in AOCI.

* * * * *

(ii) An FDIC-supervised institution that is not an ERBA FDIC-supervised institution must make its AOCI opt-out election in the Call Report during the first reporting period after the FDIC-supervised institution is required to comply with subpart A of this part. If

the FDIC-supervised institution was previously an ERBA FDIC-supervised institution, the FDIC-supervised institution may not make an AOCI opt-out election under this paragraph (b)(2)(ii).

(iii) With respect to an FDIC-supervised institution that is not an ERBA FDIC-supervised institution, each of its subsidiary banking organizations that is subject to regulatory capital requirements issued by the Federal Reserve, the FDIC, or the OCC1 must elect the same option as the FDIC-supervised institution pursuant to this paragraph (b)(2).

(iv) With prior notice to the FDIC, an FDIC-supervised institution resulting from a merger, acquisition, or purchase transaction and that is not an ERBA FDIC-supervised institution may change its AOCI opt-out election in its Call Report filed for the first reporting period after the date required for such FDIC-supervised institution to comply with subpart A of this part as set forth in § 324.1(f) if:

* * * * *

(c) * * *

(2) *Corresponding deduction approach.* For purposes of subpart C of this part, the corresponding deduction approach is the methodology used for the deductions from regulatory capital related to reciprocal cross holdings (as described in paragraph (c)(3) of this section), investments in the capital of unconsolidated financial institutions for an FDIC-supervised institution that is not an ERBA FDIC-supervised institution (as described in paragraph (c)(4) of this section), non-significant investments in the capital of unconsolidated financial institutions for an ERBA FDIC-supervised institution (as described in paragraph (c)(5) of this section), and non-common stock significant investments in the capital of unconsolidated financial institutions for an ERBA FDIC-supervised institution (as described in paragraph (c)(6) of this section). Under the corresponding deduction approach, an FDIC-supervised institution must make deductions from the component of capital for which the underlying instrument would qualify if it were issued by the FDIC-supervised institution itself, as described in paragraphs (c)(2)(i) through (iii) of this section. If the FDIC-supervised institution does not have a sufficient amount of a specific component of capital to effect the required deduction, the shortfall must be deducted according to paragraph (f) of this section.

* * * * *

(5) * * *

(i) An ERBA FDIC-supervised institution must deduct its non-significant investments in the capital of unconsolidated financial institutions (as defined in § 324.2) that, in the aggregate and together with any investment in a covered debt instrument (as defined in § 324.2) issued by a financial institution in which the FDIC-supervised institution does not have a significant investment in the capital of the unconsolidated financial institution (as defined in § 324.2), exceeds 10 percent of the sum of the FDIC-supervised institution's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section (the 10 percent threshold for non-significant investments) by applying the corresponding deduction approach in paragraph (c)(2) of this section.⁵ The deductions described in this paragraph are net of associated DTLs in accordance with paragraph (e) of this section. In addition, with the prior written approval of the FDIC, an ERBA FDIC-supervised institution that underwrites a failed underwriting, for the period of time stipulated by the FDIC, is not required to deduct from capital a non-significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph (c)(5) to the extent the investment is related to the failed underwriting.⁶ For any calculation under this paragraph (c)(5)(i), an ERBA FDIC-supervised institution may exclude the amount of an investment in a covered debt instrument under paragraph (c)(5)(iii) or (iv) of this section, as applicable.

(ii) For an ERBA FDIC-supervised institution, the amount to be deducted under this paragraph (c)(5) from a specific capital component is equal to:

(A) The FDIC-supervised institution's aggregate non-significant investments in the capital of an unconsolidated financial institution and, if applicable, any investments in a covered debt instrument subject to deduction under this paragraph (c)(5), exceeding the 10 percent threshold for non-significant investments, multiplied by

(B) The ratio of the FDIC-supervised institution's aggregate non-significant investments in the capital of an unconsolidated financial institution (in the form of such capital component) to the FDIC-supervised institution's total non-significant investments in unconsolidated financial institutions, with an investment in a covered debt

instrument being treated as tier 2 capital for this purpose.

* * * * *

(iii) For purposes of applying the deduction under paragraph (c)(5)(i) of this section, an ERBA FDIC-supervised institution that is not a Category I FDIC-supervised institution may exclude from the deduction the amount of the FDIC-supervised institution's gross long position, in accordance with § 324.22(h)(2), in investments in covered debt instruments issued by financial institutions in which the FDIC-supervised institution does not have a significant investment in the capital of the unconsolidated financial institutions up to an amount equal to 5 percent of the sum of the FDIC-supervised institution's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section, net of associated DTLs in accordance with paragraph (e) of this section.

(iv) Prior to applying the deduction under paragraph (c)(5)(i) of this section:

(A) A Category I FDIC-supervised institution may designate any investment in a covered debt instrument as an excluded covered debt instrument, as defined in § 324.2.

(B) A Category I FDIC-supervised institution must deduct, according to the corresponding deduction approach in paragraph (c)(2) of this section, its gross long position, calculated in accordance with paragraph (h)(2) of this section, in a covered debt instrument that was originally designated as an excluded covered debt instrument, in accordance with paragraph (c)(5)(iv)(A) of this section, but no longer qualifies as an excluded covered debt instrument.

(C) A Category I FDIC-supervised institution must deduct according to the corresponding deduction approach in paragraph (c)(2) of this section the amount of its gross long position, calculated in accordance with paragraph (h)(2) of this section, in a direct or indirect investment in a covered debt instrument that was originally designated as an excluded covered debt instrument, in accordance with paragraph (c)(5)(iv)(A) of this section, and has been held for more than thirty business days.

(D) A Category I FDIC-supervised institution must deduct according to the corresponding deduction approach in paragraph (c)(2) of this section its gross long position, calculated in accordance with paragraph (h)(2) of this section, of its aggregate position in excluded covered debt instruments that exceeds 5

percent of the sum of the FDIC-supervised institution's common equity tier 1 capital elements minus all deductions from and adjustments to common equity tier 1 capital elements required under paragraphs (a) through (c)(3) of this section, net of associated DTLs in accordance with paragraph (e) of this section.

* * * * *

(6) *Significant investments in the capital of unconsolidated financial institutions that are not in the form of common stock.* If an ERBA FDIC-supervised institution has a significant investment in the capital of an unconsolidated financial institution, the FDIC-supervised institution must deduct from capital any such investment issued by the unconsolidated financial institution that is held by the FDIC-supervised institution other than an investment in the form of common stock, as well as any investment in a covered debt instrument issued by the unconsolidated financial institution, by applying the corresponding deduction approach in paragraph (c)(2) of this section.⁷ The deductions described in this section are net of associated DTLs in accordance with paragraph (e) of this section. In addition, with the prior written approval of the FDIC, for the period of time stipulated by the FDIC, an ERBA FDIC-supervised institution that underwrites a failed underwriting is not required to deduct the significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph (c)(6) if such investment is related to such failed underwriting.

(d) *Certain DTAs subject to common equity tier 1 capital deduction thresholds.*

(1) An FDIC-supervised institution that is not an ERBA FDIC-supervised institution must make deductions from regulatory capital as described in this paragraph (d)(1).

* * * * *

(2) An ERBA FDIC-supervised institution must make deductions from regulatory capital as described in this paragraph (d)(2).

(i) An ERBA FDIC-supervised institution must deduct from common equity tier 1 capital elements the amount of each of the items set forth in this paragraph (d)(2) that, individually, exceeds 10 percent of the sum of the FDIC-supervised institution's common equity tier 1 capital elements, less adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c) of this

section (the 10 percent common equity tier 1 capital deduction threshold).

(A) DTAs arising from temporary differences that the FDIC-supervised institution could not realize through net operating loss carrybacks, net of any related valuation allowances and net of DTLs, in accordance with paragraph (e) of this section. An ERBA FDIC-supervised institution is not required to deduct from the sum of its common equity tier 1 capital elements DTAs (net of any related valuation allowances and net of DTLs, in accordance with § 324.22(e)) arising from timing differences that the FDIC-supervised institution could realize through net operating loss carrybacks. The FDIC-supervised institution must risk weight these assets at 100 percent. For an FDIC-supervised institution that is a member of a consolidated group for tax purposes, the amount of DTAs that could be realized through net operating loss carrybacks may not exceed the amount that the FDIC-supervised institution could reasonably expect to have refunded by its parent holding company.

(B) Significant investments in the capital of unconsolidated financial institutions in the form of common stock, net of associated DTLs in accordance with paragraph (e) of this section.⁹ Significant investments in the capital of unconsolidated financial institutions in the form of common stock subject to the 10 percent common equity tier 1 capital deduction threshold may be reduced by any goodwill embedded in the valuation of such investments deducted by the FDIC-supervised institution pursuant to paragraph (a)(1) of this section. In addition, with the prior written approval of the FDIC, for the period of time stipulated by the FDIC, an ERBA FDIC-supervised institution that underwrites a failed underwriting is not required to deduct a significant investment in the capital of an unconsolidated financial institution in the form of common stock pursuant to this paragraph (d)(2) if such investment is related to such failed underwriting.

(ii) An ERBA FDIC-supervised institution must deduct from common equity tier 1 capital elements the items listed in paragraph (d)(2)(i) of this section that are not deducted as a result of the application of the 10 percent common equity tier 1 capital deduction threshold, and that, in aggregate, exceed 17.65 percent of the sum of the FDIC-supervised institution's common equity tier 1 capital elements, minus adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c) of this

section, minus the items listed in paragraph (d)(2)(i) of this section (the 15 percent common equity tier 1 capital deduction threshold). Any goodwill that has been deducted under paragraph (a)(1) of this section can be excluded from the significant investments in the capital of unconsolidated financial institutions in the form of common stock.¹⁰

(iii) For purposes of calculating the amount of DTAs subject to the 10 and 15 percent common equity tier 1 capital deduction thresholds, an ERBA FDIC-supervised institution may exclude DTAs and DTLs relating to adjustments made to common equity tier 1 capital under paragraph (b) of this section. An ERBA FDIC-supervised institution that elects to exclude DTAs relating to adjustments under paragraph (b) of this section also must exclude DTLs and must do so consistently in all future calculations. An ERBA FDIC-supervised institution may change its exclusion preference only after obtaining the prior approval of the FDIC.

* * * * *

(f) *Insufficient amounts of a specific regulatory capital component to effect deductions.* Under the corresponding deduction approach, if an FDIC-supervised institution does not have a sufficient amount of a specific component of capital to effect the full amount of any deduction from capital required under paragraph (d) of this section, the FDIC-supervised institution must deduct the shortfall amount from the next higher (that is, more subordinated) component of regulatory capital. Any investment by an ERBA FDIC-supervised institution in a covered debt instrument must be treated as an investment in the tier 2 capital for purposes of this paragraph (f). Notwithstanding any other provision of this section, a qualifying community banking organization (as defined in § 324.12) that has elected to use the community bank leverage ratio framework pursuant to § 324.12 is not required to deduct any shortfall of tier 2 capital from its additional tier 1 capital or common equity tier 1 capital.

* * * * *

¹ These rules include the regulatory capital requirements set forth at 12 CFR part 3 (OCC); 12 CFR part 217 (Board); 12 CFR part 324 (FDIC).

* * * * *

⁵ With the prior written approval of the FDIC, for the period of time stipulated by the FDIC, an ERBA FDIC-supervised institution is not required to deduct a non-significant investment in the capital of an unconsolidated financial institution or an investment in a covered debt instrument pursuant to this paragraph if the financial

asset calculation.**

* * * * *

(c) *Regulatory capital instrument and other instruments eligible for total loss absorbing capacity (TLAC) disclosures.* An FDIC-supervised institution described in § 324.160 must provide a description of the main features of its regulatory capital instruments, in accordance with table 13 to paragraph (c). If the FDIC-supervised institution issues or repays a capital instrument, or in the event of a redemption, conversion, write down, or other material change in the nature of an existing instrument, but in no event less frequently than semiannually, the FDIC-supervised institution must update the disclosures provided in accordance with table 13 to paragraph (c). An FDIC-supervised institution also must disclose the full terms and conditions of all instruments included in regulatory capital.

TABLE 13 TO PARAGRAPH (C)—MAIN FEATURES OF REGULATORY CAPITAL INSTRUMENTS AND OF OTHER TLAC-ELIGIBLE INSTRUMENTS

Qualitative Disclosures.	(a)	For each regulatory capital instrument and any other instrument that is an eligible debt security as defined in 12 CFR 252.61, the FDIC-supervised institution must provide the following information:
		(1) The issuer's legal entity. (2) The unique identifier. (3) The governing law(s) of the instrument. (4) The regulatory capital treatment. (5) The level(s) within the FDIC-supervised institution at which the instrument is included in capital. (6) The instrument type. (7) The amount recognized in regulatory capital. (8) The par value of the instrument. (9) The accounting classification as debt or equity. (10) The original date of issuance. (11) Whether perpetual or dated. (12) The original maturity date. (13) Whether an issuer call option subject to prior supervisory approval exists. (14) For an instrument with an issuer call option: (i) the first date of call if the instrument has a call option on a specific date (day, month, and year); (ii) the instrument has a tax and/or regulatory event call; and (iii) the redemption price. (15) Whether there are subsequent call option dates and, if so, their frequency. (16) Whether the coupon or dividend is fixed over the life of the instrument, floating over the life of the instrument, currently fixed but will move to a floating rate in the future, or currently floating but will move to a fixed rate in the future. (17) The coupon rate of the instrument and any related index that the coupon or dividend rate references. (18) Whether the non-payment of a coupon or dividend on the instrument prohibits the payment of dividends on common shares. (19) Whether the issuer has full, partial, or no discretion over whether a coupon or dividend is paid. (20) Whether there is a step-up or other incentive to redeem. (21) Whether the dividends or coupons are cumulative or non-cumulative. (22) Whether the instrument is convertible or non-convertible. (23) If the instrument is convertible, the conditions under which the instrument will convert, including point of non-viability. Where one or more authorities have the ability to trigger conversion, the authorities should be listed. For each of the authorities, state whether the legal basis for the authority to trigger conversion is provided by the terms of the contract of the instrument (a contractual approach) or statutory means (a statutory approach). (24) If the instrument is convertible, whether the instrument will: (i) always convert fully; (ii) may convert fully or partially; or (iii) will always convert partially. (25) If the instrument is convertible, the rate of conversion into the more loss-absorbent instrument. (26) If the instrument is convertible, whether conversion is mandatory or optional. (27) If the instrument is convertible, the instrument type into which it is convertible. (28) If the instrument is convertible, the issuer of the instrument into which it converts. (29) Whether a write-down feature exists. (30) If there is a write-down feature, the trigger at which write-down occurs, including point of non-viability. Where one or more authorities have the ability to trigger write-down, the authorities should be listed. For each of the authorities it should be stated whether the legal basis for the authority to trigger conversion is provided by the terms of the contract of the instrument or statutory means.

TABLE 13 TO PARAGRAPH (c)—MAIN FEATURES OF REGULATORY CAPITAL INSTRUMENTS AND OF OTHER TLAC-ELIGIBLE INSTRUMENTS—Continued

		(31) If there is a write-down feature, for each write-down trigger separately, whether the instrument will: (i) always be written down fully; (ii) may be written down partially; or (iii) will always be written down partially. (32) If there is a write-down feature, whether the write-down is permanent or temporary. (33) For instruments that have a temporary write-down, a description of the writeup mechanism. (34) The type of subordination. (35) A description of the position in subordination hierarchy in liquidation, including by specifying the instrument type immediately senior to instrument in the insolvency creditor hierarchy of the legal entity concerned.

Subpart F—Risk-weighted Assets—Market Risk and Credit Valuation Adjustment (CVA)

■ 111. In § 324.201:

■ a. Revise paragraphs (b)(1) and (b)(2); and

■ b. In paragraph (d), remove “[12 CFR 3.404, 263.202, and 324.5(c)]” and add “12 CFR 324.7(c)” in its place wherever it appears.

The revisions are as follows:

§ 324.201 Purpose, applicability, and reservation of authority.

* * * * *

(b) * * *

(1) *Market risk*. The market risk capital requirements and related reporting and public disclosure requirements specified in §§ _____.203 through _____.217 apply to an FDIC-supervised institution that has aggregate trading assets and trading liabilities, excluding customer and proprietary broker-dealer reserve bank accounts, equal to:

(i) 10 percent or more of quarter-end total assets as reported on the most recent quarterly Call Report; or

(ii) \$5 billion, as adjusted pursuant to § 324.4, or more, on average for the four most recent quarters as reported in the

FDIC-supervised institution’s Call Reports.

* * * * *

(2) *CVA Risk*. The CVA risk-based capital requirements specified in §§ 324.220 through 324.225 apply to any FDIC-supervised institution that is:

(i) A subsidiary of a global systemically important BHC or a Category II depository institution holding company and subject to the market risk framework pursuant to § 324.201(b)(1); or

(ii) An FDIC-supervised institution that is subject to the market risk framework pursuant to § 324.201(b)(1) and engages in OTC derivative contracts with an aggregate gross notional value, as reported on the FDIC-supervised institution’s Call Reports of \$1 trillion [, as adjusted pursuant to § 324.4,] or more on average for the prior four quarters.

* * * * *

* * * * *

Subpart G—Transition Provisions

■ 112. In § 324.300:

■ a. Revise paragraph (a); and

■ b. Remove and reserve paragraphs (f) through (h).

The revision and addition read as follows:

§ 324.300 Transitions.

(a) *Transition adjustments for AOCI*. Beginning [January 1, 2027], an FDIC-supervised institution that uses expanded total risk-weighted assets for purposes of § 324.10(a)(5) and that had made an AOCI opt-out election under § 324.22(b)(2) effective [December 31, 2026] must subtract from the sum of its common equity tier 1 elements, before making deduction required under § 324.22(c) or (d), the AOCI adjustment amount multiplied by the percentage provided in Table 1 to § 324.300.

The transition AOCI adjustment amount is the sum of:

(1) Net unrealized gains or losses on available-for-sale debt securities, plus

(2) Accumulated net gains or losses on cash flow hedges, plus

(3) Any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans, plus

(4) Net unrealized holding gains or losses on held-to-maturity securities that are included in AOCI.

TABLE 1 TO § 324.300

Transition AOCI adjustment	
Transition period	Percentage applicable to transition AOCI adjustment amount
January 1, 2027 to December 31, 2027	100
January 1, 2028 to December 31, 2028	80
January 1, 2029 to December 31, 2029	60
January 1, 2030 to December 31, 2030	40
January 1, 2031 to December 31, 2031	20
January 1, 2032 and thereafter	0

* * * * *

§ 324.301 Current expected credit losses (CECL) transition.

■ 113. Remove and reserve § 324.301.

§ 324.303 [Removed and Reserved]

■ 114. Remove and reserve § 324.303.

§ 324.304 [Removed and Reserved]

■ 115. Remove and reserve § 324.304.

Subpart H—Prompt Corrective Action

■ 116. In § 324.401, revise paragraphs (c), (f), and (g).

The revisions read as follows:

§ 324.401 Authority, purpose, scope, other supervisory authority, disclosure of capital categories, and transition procedures

* * * * *

(c) *Scope*. This subpart H implements the provisions of section 38 of the FDI Act as they apply to FDIC-supervised institutions and insured branches of foreign banks for which the FDIC is the appropriate Federal banking agency. Certain of these provisions also apply to officers, directors and employees of those insured institutions. In addition, certain provisions of this subpart apply

to all insured depository institutions that are deemed critically undercapitalized.

* * * *

(f) *Timing.* The calculation of the definitions of common equity tier 1 capital, the common equity tier 1 risk-based capital ratio, the leverage ratio, the supplementary leverage ratio, tangible equity, tier 1 capital, the tier 1 risk-based capital ratio, total assets, total leverage exposure, the total risk-based capital ratio, and total risk-weighted assets under this subpart H is subject to the timing provisions at 12 CFR 324.1(f) and the transitions at 12 CFR part 324, subpart G.

(g) For purposes of subpart H, total assets means quarterly average total assets as reported in an FDIC-supervised institution's Call Report, minus amounts deducted from tier 1 capital under § 324.22(a), (c), and (d). At its discretion, the FDIC may calculate total

assets using an FDIC-supervised institution's period-end assets rather than quarterly average assets.

■ 117. Amend § 324.403, by revising paragraphs (a)(1)(iv)(B), (b)(2)(vi), and (b)(3)(v) to read as follows:

§ 324.403 Capital measures and capital category definitions.

(a) * * *

(1) * * *

(iv) * * *

(B) With respect to a Category I FDIC-supervised institution, Category II FDIC-supervised institution, or Category III FDIC-supervised institution, the supplementary leverage ratio.

* * * *

(b) * * *

(2) * * *

(vi) A Category I FDIC-supervised institution, Category II FDIC-supervised institution, or Category III FDIC-supervised institution will be deemed to be "adequately capitalized" if it satisfies

paragraphs (b)(2)(i) through (v) of this section and has a supplementary leverage ratio of 3.0 percent or greater, as calculated in accordance with § 324.10.

(3) * * *

(v) A Category I FDIC-supervised institution, Category II FDIC-supervised institution, or Category III FDIC-supervised institution will be deemed to be "undercapitalized" if it has a supplementary leverage ratio of less than 3.0 percent, as calculated in accordance with § 324.10.

* * * *

§ § 324.1, 324.2, 324.10, 324.12, 324.22, 324.61, 324.302, 324.305 [Amended]

■ 118. In the table below, for each section indicated in the left column, remove the words indicated in the middle column from wherever it appears in the section, and add the words indicated in the right column:

Sections:	Remove the following words:	Add the following words:
324.1	"advanced approaches FDIC-supervised institution".	"ERBA FDIC-supervised institution."
324.2		
324.12(a)(2) introductory text		
324.21(a)(1)		
324.22 (a)(1)(ii), (b)(1)(iii), (c)(2)(ii)(D), (c)(3)(ii), and (c)(4), and		
324.61		
324.22(g)	"advanced approaches total risk-weighted assets".	"expanded total risk-weighted assets."
324.302, and		
324.305		
324.2, in the definition of "qualifying central counterparty (QCCP)".	"§ 324.133"	"§ 324.114."

Regulatory Capital Rules: Regulatory Capital and Standardized Approach for Risk-Weighted Assets

AGENCY: Office of the Comptroller of the Currency (OCC), Treasury; the Board of Governors of the Federal Reserve System (Board); and the Federal Deposit Insurance Corporation (FDIC).

ACTION: Notice of proposed rulemaking.

SUMMARY: The Office of the Comptroller of the Currency, the Board of Governors of the Federal Reserve System, and the Federal Deposit Insurance Corporation are proposing to modify certain aspects of the regulatory capital rule (the proposal). The proposal would revise the risk-based capital treatment of certain exposure categories under the standardized approach, focusing on improving the calibration and risk sensitivity of risk weights that are particularly material to covered banking organizations' lending activities. The proposal would also modify the definition of regulatory capital by removing the threshold-based deduction for mortgage servicing assets for all banking organizations subject to the regulatory capital rule, including banking organizations subject to the community bank leverage ratio framework. In addition, the proposal would require Category III and IV banking organizations to recognize most elements of accumulated other comprehensive income in their regulatory capital. The agencies are concurrently publishing a separate proposal, which would require Category I and II banking organizations to use a new framework to calculate risk-weighted assets, called the expanded risk-based approach and would allow other banking organizations to elect to use the expanded risk-based approach.

DATES: Comments must be received by June 18, 2026.

ADDRESSES: Comments should be directed to:

OCC: Commenters are encouraged to submit comments through the Federal eRulemaking Portal, if possible. Please use the title “Regulatory Capital Rules: Regulatory Capital and Standardized Approach for Risk-weighted Assets” to facilitate the organization and distribution of the comments and identify the number of the specific question(s) to which you are responding. You may submit comments by any of the following methods:

- *Federal eRulemaking Portal—Regulations.gov:*

Go to <https://regulations.gov/>. Enter Docket ID “OCC–2026–0034” in the Search Box and click “Search.” Public comments can be submitted via the “Comment” box below the displayed document information or by clicking on the document title and then clicking the “Comment” box on the top-left side of the screen. For help with submitting effective comments, please click on “Commenter’s Checklist.” For assistance with the *Regulations.gov* site, please call 1–866–498–2945 (toll free) Monday–Friday, 9 a.m.–5 p.m. EST, or email regulationshelpdesk@gsa.gov.

- *Mail:* Chief Counsel’s Office, Attention: Comment Processing, Office of the Comptroller of the Currency, 400 7th Street SW, Suite 3E–218, Washington, DC 20219.

- *Hand Delivery/Courier:* 400 7th Street SW, Suite 3E–218, Washington, DC 20219.

Instructions: You must include “OCC” as the agency name and Docket ID “OCC–2026–0034” in your comment. In general, the OCC will enter all comments received into the docket and publish the comments on the *Regulations.gov* website without change, including any business or personal information provided such as name and address information, email addresses, or phone numbers. Comments received, including attachments and other supporting materials, are part of the public record and subject to public disclosure. Do not include any information in your comment or supporting materials that you consider confidential or inappropriate for public disclosure.

You may review comments and other related materials that pertain to this action by the following method:

- *Viewing Comments Electronically—Regulations.gov:*

Go to <https://regulations.gov/>. Enter Docket ID “OCC–2026–0034” in the Search Box and click “Search.” Click on

the “Dockets” tab and then the document’s title. After clicking the document’s title, click the “Browse All Comments” tab. Comments can be viewed and filtered by clicking on the “Sort By” drop-down on the right side of the screen or the “Refine Comments Results” options on the left side of the screen. Supporting materials can be viewed by clicking on the “Browse Documents” tab. Click on the “Sort By” drop-down on the right side of the screen or the “Refine Results” options on the left side of the screen checking the “Supporting & Related Material” checkbox. For assistance with the *Regulations.gov* site, please call 1–866–498–2945 (toll free) Monday–Friday, 9 a.m.–5 p.m. EST, or email regulationshelpdesk@gsa.gov.

The docket may be viewed after the close of the comment period in the same manner as during the comment period.

Board: You may submit comments, identified by Docket No. R–1888, and RIN 7100–AH21 by any of the following methods:

- *Agency Website:* <https://www.federalreserve.gov/apps/proposals/>. Follow the instructions for submitting comments, including attachments. *Preferred Method.*
- *Mail:* Benjamin W. McDonough, Secretary, Board of Governors of the Federal Reserve System, 20th Street and Constitution Avenue NW, Washington, DC 20551.
- *Hand Delivery/Courier:* Same as mailing address.
- *Other Means:* publiccomments@frb.gov. You must include the docket number in the subject line of the message.

Comments received are subject to public disclosure. In general, comments received will be made available on the Board’s website at <https://www.federalreserve.gov/apps/proposals/> without change and will not be modified to remove personal or business information including confidential, contact, or other identifying information. Comments should not include any information such as confidential information that would not be appropriate for public disclosure. Comments should identify the number for the specific question(s) to which they respond. Public comments may also be viewed electronically or in person in Room M–4365A, 2001 C St. NW, Washington, DC 20551, between 9 a.m. and 5 p.m. during Federal business weekdays.

FDIC: You may submit comments to the FDIC, identified by RIN 3064–AG23 and identify the number for the specific question(s) to which you are

responding, by any of the following methods:

Agency Website: <https://www.fdic.gov/resources/regulations/federal-register-publications>. Follow instructions for submitting comments on the FDIC's website.

Email: comments@FDIC.gov. Include RIN 3064-AG23 in the subject line of the message.

Mail: Jennifer M. Jones, Deputy Executive Secretary, Attention: Comments—RIN 3064-AG23, Federal Deposit Insurance Corporation, 550 17th Street NW, Washington, DC 20429.

Hand Delivered/Courier: Comments may be hand-delivered to the guard station at the rear of the 550 17th Street NW building (located on F Street NW) on business days between 7 a.m. and 5 p.m.

Public Inspection: Comments received, including any personal information provided, may be posted without change to <https://www.fdic.gov/resources/regulations/federal-register-publications>. Commenters should submit only information that the commenter wishes to make available publicly. The FDIC may review, redact, or refrain from posting all or any portion of any comment that it may deem to be inappropriate for publication, such as irrelevant or obscene material. The FDIC may post only a single representative example of identical or substantially identical comments, and in such cases will generally identify the number of identical or substantially identical comments represented by the posted example. All comments that have been redacted, as well as those that have not been posted, that contain comments on the merits of this document will be retained in the public comment file and will be considered as required under all applicable laws. All comments may be accessible under the Freedom of Information Act.

I. Introduction and Overview

The Office of the Comptroller of the Currency (OCC), the Board of Governors of the Federal Reserve System (Board), and the Federal Deposit Insurance Corporation (FDIC) (collectively, the agencies) are proposing to modify aspects of the capital rule. Specifically, the proposal would revise certain elements of the calculation of the denominator of the risk-based capital ratios (risk-weighted assets) under the standardized approach and make certain adjustments to the definition of regulatory capital.¹ The proposed

changes aim to improve risk sensitivity while generally retaining the simplicity of the current framework. Elements of the proposal would also address comments received from the Economic Growth and Regulatory Paperwork Reduction Act (EGRPRA) public notices.² The banking organizations that would be subject to the changes to risk-weighted assets under this proposal are referred to as “covered banking organizations” herein.

The prompt corrective action framework in section 38 of the Federal Deposit Insurance Act (FDI Act) requires the agencies to set capital standards for insured depository institutions that include a risk-based capital requirement and provides that the agencies may establish any additional relevant capital measures to carry out the purpose of that section.³ Various other statutory authorities provide the agencies with broad discretionary authority to set capital requirements and standards for banking organizations supervised by the agencies, including national banking associations, state-chartered banks, savings associations, and depository institution holding companies.⁴ Further, Congress has authorized the agencies to establish enhanced risk-based capital requirements and standards for larger banking organizations subject to the capital rule.⁵

¹ “Changes to Applicability Thresholds for Regulatory Capital and Liquidity Requirements,” 84 FR 59230 (Nov. 1, 2019).

² The agencies, together with the Federal Financial Institutions Examination Council, commenced a review under the Economic Growth and Regulatory Paperwork Reduction Act of 1996 in 2024 to identify outdated or otherwise unnecessary regulatory requirements. The agencies will continue reviewing and considering these comments as part of any final rulemaking. Public Law 104–208, Div. A, Title II, section 2222, 110 Stat. 3009–414, (1996) (codified at 12 U.S.C. 3311). See also Regulatory Publication and Review Under the Economic Growth and Regulatory Paperwork Reduction Act of 1996, 90 FR 35241 (Jul. 25, 2025).

³ See 12 U.S.C. 1831o(c)(1)(A), (c)(1)(B)(i).

⁴ See 12 U.S.C. 93a (national banking associations); 12 U.S.C. 248(i), 324, 327, 329 (state member banks); 12 U.S.C. 1463 (savings associations); 12 U.S.C. 1467a(g)(1) (savings and loan holding companies); 12 U.S.C. 1844(b) (bank holding companies); 12 U.S.C. 3106 (certain U.S. operations of foreign banking organizations); 12 U.S.C. 3902(1)–(2), 3907(a), 3909(a), (c)(1)–(2) (depository institutions; affiliates of depository institutions, including holding companies; and certain U.S. operations of foreign banking organizations); 12 U.S.C. 5371 (insured depository institutions, depository institution holding companies, and nonbank financial companies supervised by the Board).

⁵ See, e.g., section 165 of the Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act), as amended by section 401 of the Economic Growth, Regulatory Relief, and Consumer Protection Act, which requires the Board to establish enhanced prudential standards that include risk-based capital requirements for bank holding companies with \$250 billion or more in total consolidated assets.

In a concurrent notice of proposed rulemaking, the agencies are seeking comment on changes to the risk-based capital framework that would apply to Category I and II banking organizations as well as banking organizations with significant trading activity (expanded risk-based proposal).⁶ That proposal would introduce a new “expanded risk-based approach”—which would include requirements for credit risk, equity risk, and operational risk—and a revised market risk framework. Notably, the expanded risk-based proposal would allow banking organizations of any size to elect to use the expanded risk-based approach to determine requirements for credit risk, equity risk, and operational risk in place of the standardized approach.⁷

Analysis undertaken by the agencies in connection with the expanded risk-based proposal included evaluating the appropriateness of the risk weights applicable to exposures at the business-line level. That analysis informs the changes in this proposal, including revisions to risk weights that are particularly material to lending activities. Specifically, the analysis suggests revisions would be appropriate to the risk weights applicable to residential mortgage exposures, corporate exposures, and certain exposures in the current standardized approach’s “other assets” category. The proposal would reduce the risk weight applicable to corporate exposures from 100 percent to 95 percent and the risk weight applicable to all assets not specifically assigned a different risk weight under the rule from 100 percent to 90 percent. The proposal would also introduce a broader range of risk weights for residential mortgage exposures, based on more granular risk factors. In addition, the proposal would adopt the same definition of commitment as the expanded risk-based proposal and would align the credit conversion factors for certain off-

⁶ Banking organizations with significant trading activities that are not Category I or II banking organizations would apply (1) the market risk framework under the expanded risk-based proposal and (2) the standardized approach in this proposal (unless they elect to use expanded risk-based approach under the expanded risk-based proposal) to determine their risk-weighted assets.

⁷ The agencies consider the proposed requirements under the expanded risk-based approach to be appropriate for Category I and II banking organizations given their risk profiles, complexity, risk management resources, and international activities. Although the expanded risk-based proposal poses more operational complexity relative to this proposal, the expanded risk-based proposal would allow other banking organizations to elect to use it. A banking organization that elects to do so would be subject to the same definition of capital as Category I and II banking organizations.

¹ The standardized approach does not apply to banking organizations that have elected to use the community bank leverage ratio framework. Under the terms of a concurrent proposal, the standardized approach would not apply to Category I or II banking organizations or to banking organizations that elect to use the expanded risk-based approach. In 2019, the agencies adopted rules establishing four categories of capital standards for U.S. banking organizations with \$100 billion or more in total consolidated assets and foreign banking organizations with \$100 billion or more in combined U.S. assets. Under this framework, Category I standards apply to U.S.-domiciled bank holding companies identified as GSIBs and their depository institution subsidiaries. Category II standards apply to banking organizations with at least \$700 billion in total consolidated assets or at least \$75 billion in cross-jurisdictional activity and their depository institution subsidiaries. Category III standards apply to banking organizations with total consolidated assets of at least \$250 billion or at least \$75 billion in weighted short-term wholesale funding, nonbank assets, or off-balance sheet exposure and their depository institution subsidiaries. Category IV standards apply to banking organizations with total consolidated assets of at least \$100 billion that do not meet the thresholds for a higher category and their depository institution subsidiaries. See 12 CFR 3.2 (OCC); 12 CFR 217.400, 238.10, 252.5, (Board); 12 CFR 324.2 (FDIC); “Prudential Standards for Large Bank Holding Companies, Savings and Loan Holding Companies, and Foreign Banking Organizations,” 84 FR 59032 (Nov. 1, 2019);

balance sheet exposures, including equity commitments, with that proposal.

These changes focus on exposure categories that comprise a substantial amount of total risk-weighted assets for covered banking organizations and aim to balance a more risk-sensitive calibration of the requirements with retaining the simplicity of the standardized approach.^{8 9}

To improve risk sensitivity, this proposal would also make targeted adjustments to the existing methodologies for determining exposure amounts for counterparty credit risk and risk-weighted asset amounts for securitizations, as well as for recognizing the benefits of credit risk mitigants. These targeted adjustments would align with adjustments included in the expanded risk-based proposal. Improving the risk sensitivity of the regulatory capital framework would mean that a banking organization's capital requirements more readily increase or decrease due to changes in the risk of its business activities.

In addition to changes to the calculation of risk-weighted assets, the proposal would modify the definition of regulatory capital by removing the threshold-based deduction of mortgage servicing assets (MSAs). All MSAs would receive a 250 percent risk weight under the proposal, consistent with the risk weight in the current capital rule for MSAs that do not exceed the deduction threshold. This proposed revision would promote mortgage origination and servicing by banking organizations in a risk-appropriate manner and would apply to all banking organizations subject to the regulatory capital rule, including banking organizations subject to the community bank leverage ratio framework.¹⁰

The proposal would require Category III and IV banking organizations to include most elements of accumulated

other comprehensive income (AOCI) in common equity tier 1 capital, consistent with the current treatment applicable to Category I and II banking organizations.¹¹ This change would better reflect the capital adequacy and loss-absorbing capacity of Category III and IV banking organizations in their regulatory capital ratios. The proposal would include a transition period five years from the effective date of any final rule for Category III and IV banking organizations to phase-in the effect of recognizing AOCI in regulatory capital; this transition period would provide sufficient time to adapt to the changes while minimizing any potential adverse impact.¹²

The proposal would also amend certain dollar-based regulatory thresholds in the standardized approach to reflect inflation and ensure that such thresholds preserve their intended application in real terms over time. Finally, the proposal would not make any modifications to the enhanced disclosure requirements under section .63 of the capital rule but seeks comment on whether certain modifications would be appropriate.¹³

Taken together, the proposed changes aim to improve the risk sensitivity of the framework while retaining its simplicity. The agencies expect the proposal to reduce the common equity tier 1 capital requirements applicable to Category III and IV holding companies by 3.0 percent and the capital requirements applicable to smaller holding companies¹⁴ by 7.8 percent. The reduction in requirements for Category III and IV holding companies reflects a 6.1 percent reduction due to the revised risk-weighted assets combined with an estimated 3.1 percent increase in capital requirements due to an estimated long-run average impact of including AOCI in regulatory capital. Similarly, the agencies expect the proposal to reduce the common equity tier 1 capital requirements applicable to

depository institution subsidiaries of Category III and IV banking organizations by 4.7 percent, and those applicable to smaller depository institutions by 8.0 percent. The agencies performed economic analysis to assess the potential effects of the proposal (see Section VI). The improvements in risk sensitivity of capital requirements and associated benefits expected to result from the proposal justify the proposal's expected costs.

The agencies seek comment on all aspects of the proposal.

II. Definition of Capital

The proposal would broadly maintain the definition of capital applicable to covered banking organizations in the current capital rule with two modifications. The proposal would (1) eliminate the requirement to deduct MSAs above a threshold from common equity tier 1 capital for all covered banking organizations¹⁵ and (2) require Category III and IV banking organizations to recognize certain elements of AOCI in common equity tier 1 capital.

A. Removal of the Mortgage Servicing Asset Deduction

Under the current capital rule, covered banking organizations must deduct from common equity tier 1 capital amounts of MSAs that exceed 25 percent of the banking organization's common equity tier 1 capital. Under the proposal, covered banking organizations would no longer be required to deduct any amount of MSAs from common equity tier 1 capital. Instead, MSAs would be subject to a 250 percent risk weight, consistent with the treatment in the current capital rule for MSAs that do not exceed the deduction threshold.¹⁶

An MSA arises when a banking organization sells a loan to a third party but retains the obligation to service the loan in exchange for a fee. Banking organizations may also purchase, sell, or transfer MSAs separately from the underlying mortgage loans.

MSAs can be a useful tool for banking organizations to manage interest rate risk. The value of MSAs generally

⁸ See Table V.G.1 in the Data Appendix (Section V.G.) for a breakdown of the size of the exposure categories whose treatment would be revised under this proposal.

⁹ The calculation of the risk-weighted assets under the expanded risk-based approach is more complex than under the standardized approach as it is more granular and includes several additional risk factors. The expanded risk-based approach would also include an operational risk capital requirement and the requirement to use the standardized approach for counterparty credit risk to determine the exposure amount for derivative contracts. Banking organizations subject to the expanded risk-based approach would also be subject to a more risk-sensitive but complex definition of capital, including the requirement to include most elements of accumulated other comprehensive income in regulatory capital.

¹⁰ The expanded risk-based approach proposal contains a corresponding change that would apply to Category I and II banking organizations.

¹¹ AOCI generally includes accumulated unrealized gains and losses on certain assets and liabilities that have not been included in net income but are included in equity under U.S. generally accepted accounting principles (for example, unrealized gains and losses on securities designated as available-for-sale).

¹² This transition period would mirror the transition period under the expanded risk-based proposal provided to banking organizations that elect to use the expanded risk-based approach and that do not currently recognize AOCI in their regulatory capital.

¹³ The agencies anticipate proposing revisions to several reporting forms of the agencies filed by covered banking organizations that would align with the proposed revisions to the capital rule.

¹⁴ Refers to holding companies with total assets under \$100 billion that are required to report risk-based capital information on the FR Y9-C.

¹⁵ In addition, the proposal would require a covered banking organization to deduct from common equity tier 1 capital any portion of a credit-enhancing interest only strip that does not constitute an after-tax-gain-on sale, as discussed in section III.E.5.f.

¹⁶ This revision would also be consistent with comments received under EGRPRA as commenters requested removal of the MSA threshold. The expanded risk-based approach proposal would make the same modification to the definition of regulatory capital for Category I and II banking organizations and banking organizations that elect to use the expanded risk-based approach.

increases when interest rates rise, which extends the expected duration of related servicing fees. As a result, they may provide a hedge against losses on other assets that decline in value in the same interest rate environment.¹⁷

Moreover, MSAs are important for banking organizations to maintain their relationship with borrowers by retaining customer-facing relationships even after transferring the underlying loans, allowing cross-selling of products. Banking organizations can also improve efficiency by increasing scale. A deduction approach for MSAs can discourage banking organizations from creating economies of scale, which can hinder their ability to compete in mortgage underwriting or servicing businesses and to manage risks.

At the same time, MSAs have long been subject to elevated capital requirements because of the high level of uncertainty regarding the ability of banking organizations to realize value from these assets, especially under adverse financial conditions. MSAs may face significant valuation risk, which mainly stems from prepayment risk, default risk, and liquidity risk. For example, increased refinancing of mortgage loans due to lower interest rates can quickly erode the value of MSA portfolios, as can increased incidents of mortgage defaults. MSAs can also be difficult to value, as bank portfolios of MSAs can be heterogeneous and MSA valuations rely on assessments of future economic variables. Maintaining the 250 percent risk weight for MSAs would promote regulatory capital requirements that are commensurate with the risk of these assets.

Question 1: What are the advantages and disadvantages of the proposed treatment of MSAs? What are the implications of the proposed treatment of MSAs for banking organizations' mortgage origination business? To what extent does the 250 percent risk weight appropriately reflect the risk of these assets throughout the economic cycle? Given the potential volatility of MSAs under certain circumstances, what are the advantages and disadvantages of the agencies imposing a higher limit on MSA as a percentage of common equity tier 1 capital (for example, 100 percent) and why? What are the advantages and

disadvantages of differentiating the treatment of MSAs based on the size of the banking organization (for example, banking organizations with assets under \$10 billion or over \$100 billion) or applicable capital framework (for example, banking organizations that elect the community bank leverage ratio framework)?

B. Recognition of Accumulated Other Comprehensive Income for Category III and IV Banking Organizations

Under the current capital rule, Category I and II banking organizations are required to include most elements of AOCI in regulatory capital. All other banking organizations, including all covered banking organizations, had the option to make a one-time election to opt-out of recognizing most elements of AOCI and related deferred tax assets and liabilities within regulatory capital.¹⁸ Under the proposal, Category III and IV banking organizations would be required to include all AOCI components in common equity tier 1 capital, except gains and losses on cash-flow hedges where the hedged item is not recognized on a covered banking organization's balance sheet at fair value. This would require all net unrealized gains and losses on holdings of available-for-sale debt securities from changes in fair value to flow through to common equity tier 1 capital, including those that result primarily from fluctuations in benchmark interest rates.¹⁹ This treatment would align with the treatment of AOCI for banking organizations subject to the expanded risk-based proposal.

¹⁸ See 12 CFR 3.22(b) (OCC); 12 CFR 217.22(b) (Board); 12 CFR 324.22(b) (FDIC). A banking organization that made an opt-out election is currently required to adjust common equity tier 1 capital as follows: subtract any net unrealized holding gains and add any net unrealized holding losses on available-for-sale securities; subtract any accumulated net gains and add any accumulated net losses on cash flow hedges; subtract any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans (excluding, at the banking organization's option, the portion relating to pension assets deducted under § 22(a)(5) of the current capital rule); and, subtract any net unrealized holding gains and add any net unrealized holding losses on held-to-maturity securities that are included in AOCI.

¹⁹ Available-for-sale securities refers to debt securities. Accounting Standards Update 2016–01 eliminated the classification of available-for-sale equity securities under Accounting Standards Codification Subtopic 321–10 and generally requires investments in equity securities to be measured at fair value with changes in fair value recognized in net income. Changes in the fair value of (i.e., the unrealized gains and losses on) a banking organization's equity securities are recognized through net income rather than other comprehensive income.

AOCI is an important indicator that regulators and market observers use to evaluate the capital strength of a banking organization. The requirement to recognize elements of AOCI in regulatory capital has helped improve the transparency of regulatory capital ratios for Category I and II banking organizations, as it better reflects a banking organization's actual loss-absorbing capacity at a specific point in time, notwithstanding the potential volatility that such recognition may pose for its regulatory capital ratios. Category III and IV banking organizations have the tools and access to capital markets to manage the volatility of regulatory capital that recognition of AOCI in capital may cause. In addition, as noted in the expanded risk-based proposal, any banking organization that elects to apply the expanded risk-based approach would be required to include AOCI in regulatory capital. Given the more complex nature of the expanded risk-based proposal, these electing banking organizations are expected to have the ability to manage the volatility which may arise from the recognition of AOCI in capital, even if they are smaller banking organizations.

AOCI contributes to a banking organization's balance sheet equity and may be used by market participants in evaluating a banking organization's capital position.²⁰ Adverse trends in a banking organization's balance sheet equity can result in negative market perception and have liquidity implications.²¹ Banking organizations that do not include AOCI in regulatory capital are often reluctant to sell available-for-sale securities that have unrealized losses, as the losses would have to be recognized upon sale, thereby reducing regulatory capital. However, banking organizations may need to take such steps to meet liquidity needs. Recognizing elements of AOCI in regulatory capital achieves a better alignment of regulatory capital with a banking organization's point-in-time loss-absorbing capacity.

Question 2: What are the advantages and disadvantages of requiring Category III and IV banking organizations to recognize AOCI in their regulatory capital? What other scope of application for the proposed AOCI treatment should the agencies consider and why? Please provide any supporting data and analysis.

²⁰ See 84 FR 59230, 59249 (Nov. 1, 2019).

²¹ See Interagency Advisory on Interest Rate Risk Management (OCC Bulletin 2010–1, SR 10–1, FIL 2–2012, Jan. 11, 2010).

¹⁷ In a rising rate environment, the expected life of a mortgage will increase due to reduced prepayments. As a result, MSAs will increase in value, as the banking organization will collect servicing fees over a longer period of time. The increased value of MSAs act as a natural hedge against existing mortgage-backed securities which would be expected to trade at a discount in such an environment.

The proposal includes transition provisions that would provide Category III and IV banking organizations that do not currently recognize AOCI in their regulatory capital with a phase-in for reflecting AOCI in their regulatory capital over a five-year period from the effective date of any final rule.²² Such a banking organization would determine its AOCI adjustment amount as the sum of: (1) net unrealized gains or losses on available-for-sale securities, plus (2) accumulated net gains or losses on cash

flow hedges, plus (3) any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans, plus (4) net unrealized holding gains or losses on held-to-maturity securities that are included in AOCI. This AOCI adjustment amount would be transitioned as set forth in Table 1 below for Category III and IV banking organizations that have previously made

the AOCI opt-out election.²³ If the banking organization's AOCI adjustment amount is positive, it would multiply this amount by the percentage of the appropriate transition period provided in Table 1 below and subtract the resulting amount from its common equity tier 1 capital. If the AOCI adjustment amount is negative, the banking organization would perform the same calculation and add back the resulting amount to its common equity tier 1 capital.

Table 1 to § .300 Transition AOCI Adjustment Amount

Transition period	Percentage applicable to AOCI adjustment amount
January 1, 2027 to December 31, 2027	100
January 1, 2028 to December 31, 2028	80
January 1, 2029 to December 31, 2029	60
January 1, 2030 to December 31, 2030	40
January 1, 2031 to December 31, 2031	20
January 1, 2032 to thereafter	0

Question 3: What are the advantages and disadvantages of the proposed transition provisions for AOCI adjustments? What alternatives to the proposed transition provisions should the agencies consider, and why? For example, what are the costs and benefits of different transition-period durations or different recognition percentages in each period of the transition?

Question 4: Under the proposal, Category III or IV banking organizations would recognize AOCI in common equity tier 1 capital through a transition period, with only a portion of AOCI recognized during the transition. Category III and IV banking organizations with positive AOCI (for example, from unrealized gains on available-for-sale securities) would recognize less AOCI in its regulatory capital ratios during the transition period than they would if the full AOCI amount were recognized immediately. What are the costs and benefits of making the transition period optional, allowing Category III and IV banking organizations to elect to recognize the full AOCI amount on the effective date of the rule? Please provide relevant data to support your views, including information on the magnitude of AOCI

at Category III and IV banking organizations and how it has varied over time and in different interest rate environments.

Question 5: The expanded risk-based proposal would provide covered banking organizations under this proposal the choice to adopt the expanded risk-based approach. The expanded risk-based proposal includes the same AOCI transition period for banking organizations that do not currently recognize AOCI in their regulatory capital and that elect to use the expanded risk-based approach. What are the costs and benefits of applying the same AOCI transition provisions to banking organizations that elect to adopt the expanded risk-based approach as would apply to Category III and IV banking organizations under the standardized approach? Should banking organizations that elect to adopt the expanded risk-based approach be subject to different AOCI transition provisions? If so, what alternative transition provisions would be appropriate, and why?

III. Calculation of Risk-Weighted Assets Under the Standardized Approach

Under the proposal, a covered banking organization would continue to

follow the mechanics of the current capital rule for determining its standardized total risk-weighted assets.²⁴ Accordingly, such a banking organization would calculate its risk-weighted asset amounts for its on- and off-balance sheet exposures and, if applicable, risk-weighted assets for market risk covered positions. Risk-weighted asset amounts generally are determined by assigning on-balance sheet assets to broad risk-weight categories according to the counterparty, or, if relevant, the guarantor or collateral. Similarly, risk-weighted asset amounts for off-balance sheet items are calculated using a two-step process: (1) multiplying the amount of the off-balance sheet exposure by a conversion factor to determine a credit equivalent amount or adjusted carrying value, and (2) assigning the credit equivalent amount or adjusted carrying value to a relevant risk-weight category.

A. General Risk Weight Treatment

To improve the risk sensitivity of the standardized approach, the proposal would make targeted revisions to the general risk weight treatment of certain exposure categories that are particularly material to bank lending activities. As more specifically discussed below, the

²² This transition period would mirror the transition period under the expanded risk-based proposal provided to banking organizations that elect to use the expanded risk-based approach and

that do not currently recognize AOCI in their regulatory capital.

²³ For simplicity and illustrative purposes, the transition table assumes an effective date of January 1, 2027.

²⁴ See generally, 12 CFR part 3, subpart D (OCC); 12 CFR part 217, subpart D (Board); 12 CFR part 324, subpart D (FDIC).

proposal would (1) introduce a more risk-sensitive treatment for residential mortgage exposures and (2) amend the risk weights applicable to corporate exposures and to all assets not specifically assigned a different risk weight under the current standardized approach. The risk weights applicable to all other exposure categories would remain unchanged under the proposal.

1. Residential Mortgage Exposures

Under the proposal, a residential mortgage exposure would continue to be defined as an exposure that is primarily secured by a first or subsequent lien on one-to-four family residential property or an exposure with an original and outstanding amount of \$1 million or less that is primarily secured by a first or subsequent lien on a residential property that is not one-to-four family.²⁵ A residential mortgage exposure would not include an ADC exposure, a pre-sold construction loan, a statutory multifamily mortgage, or an HVCRE exposure.

To improve risk sensitivity, the proposal would introduce a loan-to-value (LTV)-based approach for assigning risk weights to certain residential mortgage exposures as discussed in section III.A.1.b. of this **SUPPLEMENTARY INFORMATION**. LTV ratios are a useful credit risk indicator as higher levels of homeowner equity generally reduce the likelihood of borrower default and provide lenders with a degree of protection against credit losses.

The proposed LTV-based approach would further differentiate risk weights based on whether a residential mortgage is dependent on cash flows generated by the real estate securing the extension of credit. Residential mortgage exposures in which the primary source of repayment is dependent on cash flows generated by the real estate can expose a banking organization to elevated credit risk relative to residential mortgage exposures where the source of repayment does not face such dependency, as the obligor may be unable to meet its financial commitments when cash flows from the property decrease, such as when tenants default or properties are unexpectedly vacant.²⁶ Residential mortgage exposures that are dependent on such cash flows to repay the loan can also be more affected by local market conditions and, thus, present elevated credit risk relative to exposures that are

serviceable by the income, cash, or other assets of the obligor. For example, an increase in the supply of competitive rental property could lower rental prices and suppress cash flows needed to support repayment of the loan.

If the underwriting process at origination of the residential mortgage exposure considers any cash flows generated by the real estate securing the loan, such as from rental payments, then the exposure would meet the proposal's definition of dependent on the cash flows generated by the real estate. Evaluating the dependence on cash flows generated from the real estate is a conservative and straightforward measure of credit risk. Reliance on cash flows from the property for repayment of a loan indicates increased risk of nonpayment relative to when the borrower has sufficient funds from other sources for full repayment of the loan. Given their increased credit risk, the proposal would assign higher risk weights to residential mortgage exposures that are dependent on proceeds or cash flows generated from the real estate itself to service the loan.

Under the proposal, additional loan characteristics can affect whether an exposure would be considered dependent on cash flows from the real estate. The proposal's definition of dependent on the cash flows generated by the real estate would exclude any residential mortgage exposure that is secured by the obligor's principal residence, as such mortgage exposures present reduced credit risk relative to real estate exposures that are secured by the obligor's non-principal residence.²⁷ For residential properties that are not the obligor's principal residence, including vacation homes and other second homes, such properties would be considered dependent on the cash flows generated by the real estate unless the covered banking organization has relied solely on the obligor's personal income and resources, rather than rental income (or resale or refinance of the property), to ascertain the obligor's capacity to repay the loan.²⁸

²⁷ See Breck Robinson, Federal Reserve Bank of Richmond, and Richard M. Todd, Federal Reserve Bank of Minneapolis, "The Role of Non-Owner-Occupied Homes in the Current Housing and Foreclosure Cycle," which cites multiple studies that loans on non-owner occupied properties have higher loss rates on mortgages to non-occupant owners than on mortgages to owner-occupants, at least after controlling for credit scores and other standard underwriting criteria. Pg. 6. https://www.richmondfed.org/~media/richmondfedorg/publications/research/working_papers/2010/pdf/wp10-11.pdf.

²⁸ For example, if (1) a borrower purchases a two-unit property with the intention of making one unit their principal residence, (2) the borrower intends to rent out the second unit to a third party, and (3)

To be eligible to use the proposed LTV-based approach, a residential mortgage exposure would be required to: (1) be secured by a property that is either owner-occupied or rented; (2) be made in accordance with prudent underwriting standards, including relating to the loan amount as a percent of the value of the property;²⁹ (3) not be 90 days or more past due or carried in nonaccrual status; and (4) not be restructured or modified.^{30 31} Additionally, the property would need to be valued in accordance with the proposed requirements included in the proposed LTV ratio calculation, as discussed below. Consistent with the current capital rule, residential mortgage exposures that do not meet the above criteria or are a junior lien residential mortgage exposure would continue to receive a 100 percent risk weight.

Question 6: The agencies seek comment on the set of residential mortgage exposures that are eligible to use the LTV-based approach. What are the advantages and disadvantages of aligning the scope of mortgages eligible to use the LTV-based approach with the current capital rule's 50 percent risk-weight category for residential mortgage exposures? What other alternatives should the agencies consider? Should covered banking organizations have the option to adopt the LTV-based approach or the option to retain the current treatment which applies less risk-sensitive risk weights of 50 and 100 percent?

Question 7: The agencies seek comment on the appropriateness of using an LTV-based approach to determine risk-weights for residential mortgages as a standardized approach and the operational or administrative

the covered banking organization considered the cash flows from the rental unit as a source of repayment, the exposure would not meet the proposal's definition of dependent on the cash flows generated by the real estate because the property securing the exposure is the borrower's principal residence.

²⁹ The agencies expect these underwriting standards to align with the agencies' safety and soundness and real estate lending guidelines. See 12 CFR part 30, appendix C and 12 CFR part 34, appendix A to subpart D (OCC); 12 CFR part 208, appendix C (Board); 12 CFR parts 364 and 365 (FDIC).

³⁰ Consistent with the current capital rule and under the proposal, when a covered banking organization holds the first-lien and junior-lien(s) residential mortgage exposures and no other party holds an intervening lien, the covered banking organization would be required to combine the exposures and treat them as a single first-lien residential mortgage exposure.

³¹ These requirements generally align with the current capital rule's requirements for first-lien residential mortgages that are eligible for a 50 percent risk weight.

²⁵ See 12 CFR _____.2.

²⁶ See Board of Governors of the Federal Reserve System, Financial Stability Report (November 2020), <https://www.federalreserve.gov/publications/files/financial-stability-report-20201109.pdf>.

burden associated with its implementation. What are the advantages or disadvantages of using an LTV-based approach for the standardized approach? What alternative approaches should the agencies consider, and why? Please provide examples of potential operational or administrative challenges associated with implementing the LTV-based approach.

a. Calculating the Loan-to-Value Ratio

Under the proposal and in line with the expanded risk-based approach proposal, covered banking organizations would use an LTV ratio to assign a risk weight applicable to certain residential mortgage exposures. The proposed calculation of the LTV ratio would generally align with the real estate lending guidelines, except with respect to the recognition of private mortgage insurance.

A covered banking organization would calculate the LTV ratio for purposes of Table III.1 and Table III.2 below by dividing the extension of credit by the value of the property. The extension of credit means the total outstanding amount of the loan, including any undrawn committed amount. The total outstanding amount reflects the current amortized balance as the loan pays down, which would allow a covered banking organization to assign a lower risk weight to a loan over time as the principal is repaid. Similarly, if an extension of credit increases, a covered banking organization would reflect that increase in the LTV ratio.

For the LTV ratio calculation, a covered banking organization would calculate the loan amount without making any adjustments for credit loss provisions or private mortgage insurance. Not recognizing private mortgage insurance for these purposes would be consistent with the current capital rule's definition of eligible guarantor, which does not recognize an insurance company predominately engaged in the business of providing credit protection (such as a monoline bond insurer or re-insurer).³² During the 2007–2009 housing market stress, the performance of private mortgage insurance deteriorated at the same time as the underlying exposures.³³ Under

the proposal and consistent with the current capital rule, private mortgage insurance is considered when a covered banking organization identifies which of its residential mortgage exposures are made in accordance with prudent underwriting standards and eligible to use the proposed risk weights discussed in section III.A.1.b. of this

SUPPLEMENTARY INFORMATION.³⁴

The value of the property would mean the value at the time of origination of all real estate properties securing the extension of credit, including the increased estimated value of the property if the property is being improved by an extension of credit. The value of the property would also include the fair value of any readily marketable collateral and other acceptable collateral, as defined in the real estate lending guidelines, that secures the extension of credit.

For exposures subject to the Real Estate Lending, Appraisal Standards, and Minimum Requirements for Appraisal Management Companies or Appraisal Standards for Federally Related Transactions (collectively, the appraisal rule),³⁵ the market value of real estate would be a valuation that meets all requirements of that rule. For exposures not subject to the appraisal rule, the proposal would require that (1) the market value of real estate be obtained from an independent valuation of the property using prudently conservative valuation criteria and (2) the valuation be done independently from the covered banking organization's origination and underwriting process. Most residential mortgage exposures held by insured depository institutions are subject to the agencies' appraisal rule, which also provides for evaluations in some cases, and provides for certain exceptions, such as where a lien on real estate is taken as an abundance of caution. To help ensure that the value of the real estate is determined in a prudently conservative manner, the proposal would also provide that, for exposures not subject to the appraisal rule, the valuations of the real estate properties would need to exclude expectations of price increases and be adjusted downward to take into account the potential for the current market prices to be significantly above

the values that would be sustainable over the life of the loan.

In addition, when the residential mortgage exposure finances the purchase of a property, the value would be the lower of (1) the actual acquisition cost of the property and (2) the market value obtained from either (i) the valuation requirements under the appraisal rule (if applicable) or (ii) as described above, an independent valuation using prudently conservative valuation criteria that is separate from the covered banking organization's origination and underwriting process.

Using the value of a property at origination when calculating the LTV ratio protects against volatility risk or short-term market price inflation. For purposes of the LTV ratio calculation, the proposal would require covered banking organizations to use the value of the property at the time of origination, except under the following circumstances: (1) the covered banking organization's primary Federal supervisor requires the covered banking organization to revise the property value downward; (2) an extraordinary event occurs resulting in a permanent reduction of the property value (for example, a natural disaster); or (3) modifications are made to the property that increase its market value and are supported by an appraisal or independent evaluation using prudently conservative criteria. These proposed exceptions are intended to constrain the use of values other than the value of the property at loan origination only to exceptional circumstances that are sufficiently material to warrant use of a revised valuation.

For purposes of determining the value of the property, the proposal would use the definition of readily marketable collateral and other acceptable collateral consistent with the real estate lending guidelines. Therefore, readily marketable collateral would mean insured deposits, financial instruments, and bullion in which the covered banking organization has a perfected security interest. Financial instruments and bullion would need to be salable under ordinary circumstances with reasonable promptness at a fair market value determined by quotations based on actual transactions, in an auction or on similarly available daily bid and ask price market. Other acceptable collateral would mean any collateral in which the covered banking organization has a perfected security interest that has a quantifiable value and is accepted by the covered banking organization in accordance with safe and sound lending practices. Under the proposal, other acceptable collateral would include,

³² A guarantor is not an eligible guarantor under the current capital rule if the guarantor's creditworthiness is positively correlated with the credit risk of the exposures for which it has provided guarantees. 78 FR 62141 (Oct. 11, 2013). See definition of eligible guarantor in § __.2 of the capital rule. 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

³³ See Laurie Goodman and Karan Kuhl, "Sixty Years of Private Mortgage Insurance in the United States", The Urban Institute Housing Finance

Policy Center, August 2017.Pg. 7, https://www.urban.org/sites/default/files/publication/92676/2017_08_18_sixty_years_of_pmi_finalizedv3_3.pdf.

³⁴ See 12 CFR __.32(g)(1)(ii).

³⁵ See 12 CFR part 34, subpart C or subpart G (OCC); 12 CFR part 208, subpart E or 12 CFR part 225, subpart G (Board); 12 CFR part 323 (FDIC).

among other items, unconditional irrevocable standby letters of credit for the benefit of the covered banking organization. Readily marketable collateral and other acceptable collateral must be appropriately discounted by the covered banking organization consistent with the banking organization’s usual practices for making loans secured by such collateral. The reasonableness of a covered banking organization’s underwriting criteria would continue to be reviewed through the supervisory process to help ensure its real estate lending policies are consistent with safe and sound banking practices.

Question 8: The agencies have considered various alternatives relating to how private mortgage insurance should be recognized for residential mortgages exposures beyond the proposed treatment of considering private mortgage insurance when identifying which residential mortgage exposures meet the requirements to be considered prudently underwritten and eligible to use the proposed LTV-based approach. What would be the pros and

cons of providing explicit recognition of private mortgage insurance in the calculation of LTV ratios for purposes of determining the risk weights for residential exposures? What, if any, increases in procyclicality and incentives for increased risk-taking by covered banking organizations might such recognition create? What conditions could the agencies impose on such recognition to mitigate concerns about the wrong-way risk of monoline credit insurance? In recognition that private mortgage insurance may not provide protection under all relevant stress events, what are the advantages and disadvantages of recognizing a portion (such as 50 percent) of the value of the private mortgage insurance in determining the total outstanding amount of the loan in the calculation of the LTV ratio? Please provide any data and analysis supporting alternative approaches.

b. Risk Weights for Residential Mortgage Exposures

Under the proposal, a covered banking organization would assign a

risk weight to an eligible residential mortgage exposure based on the exposure’s LTV ratio without private mortgage insurance and based on whether repayment is dependent on the cash flows generated by the real estate, in accordance with Tables III.1 and III.2 below.³⁶ LTV ratios and source of repayment would factor into the risk-weight treatment for residential mortgage exposures because they are key determinants of risk for real estate exposures.

The proposed risk weights would recognize the reduction in risk due to amortization, as the borrower pays down principal and builds equity.³⁷ Given the increased risk sensitivity of the LTV-based approach relative to the current standardized approach, the risk weights for eligible residential mortgage exposures would decrease throughout the life of the loan as the obligor makes payments. Lower LTVs are strongly associated with lower realized loss given default.³⁸

Table III.1: Proposed Risk Weights for Residential Mortgage Exposures that are Not Dependent on the Cash Flows of the Real Estate

	LTV Ratio ≤ 50%	50% < LTV Ratio ≤ 60%	60% < LTV Ratio ≤ 80%	80% < LTV Ratio ≤ 90%	90% < LTV Ratio ≤ 100%	LTV Ratio > 100%
Risk Weight	25%	30%	35%	45%	55%	75%

Table III.2: Proposed Risk Weights for Residential Mortgage Exposures Dependent on the Cash Flows of the Real Estate

	LTV Ratio ≤ 50%	50% < LTV Ratio ≤ 60%	60% < LTV Ratio ≤ 80%	80% < LTV Ratio ≤ 90%	90% < LTV Ratio ≤ 100%	LTV Ratio > 100%
Risk Weight	35%	40%	50%	65%	80%	110%

The proposed risk weights in Tables III.1 and III.2 would appropriately balance the benefits of risk sensitivity, transparency, and consistency in

requirements across covered banking organizations.

Relative to the current standardized approach, the proposed risk weights in Tables III.1 and III.2 would also align

more closely with the treatment of regulatory residential real estate exposures under the expanded risk-based proposal. Consistent with the general risk weights in the current

³⁶ The risk weight assigned to loans does not impact the appropriate treatment of loans under the agencies’ other regulations and guidance, such as the supervisory LTV limits under the real estate lending guidelines. See Appendix C to Part 208, Title 12.

³⁷ For purposes of the LTV ratio calculation, the proposal would require covered banking organizations to use the value of the property at the time of origination, except under limited circumstances. See also Luis Otero González, Pablo Durán Santomil, Milagros Vivel Búa and Rubén Lado Sestayo, “The Impact of Loan-to-Value on The

Default Rate of Residential MBS” Journal of Credit Risk (July 2016), <https://www.risk.net/journal-of-credit-risk/2465626/the-impact-of-loan-to-value-on-the-default-rate-of-residential-mortgage-backed-securities>.
³⁸ Keç, Turalay. “Macroprudential regulation: history, theory and policy.” BIS Paper 86c (2016).

standardized approach and in contrast with the proposed expanded risk-based approach, there is not a separate operational risk-based capital requirement. Therefore, the proposed risk weights for residential mortgage exposures under this proposal would not account exclusively for credit risk. The difference in risk weights between the two proposals is, therefore, explained by the differing approaches for how risk categories, such as specific credit and operational risk-based requirements, factor into each proposal's methodology for assigning risk weights.³⁹

Question 9: The agencies seek comment on the proposed risk-weights for residential mortgage exposures in Tables III.1 and III.2. What alternative approaches, if any, should the agencies consider to account for risks other than credit risk posed by covered banking organizations' residential mortgage lending activities? What alternative risk weights, if any, should the agencies consider, and why? Please provide any supporting data.

Question 10: What are the advantages and disadvantages of the proposed LTV-based approach for residential mortgage exposures that are dependent on the cash flows of the property? What, if any, implementation challenges would the requirement to determine whether an exposure is dependent on the cash flows of the property present? What would be the advantages and disadvantages of an alternative LTV-based approach that differentiates risk weights on whether the property securing the residential mortgage exposure is owner occupied? If the agencies were to implement such an approach for purposes of the final rule, what would be the appropriate risk-weight calibration? The agencies encourage commenters to provide data and supporting analysis.

2. Corporate Exposures and Certain Other Assets

The proposal would update the risk weights applicable to (1) corporate exposures and (2) all assets not specifically assigned a different risk weight under the capital rule and that are not deducted from regulatory capital (other assets).

³⁹ The calibration of the operational risk add-on followed a similar logic to the one used for corporate exposures and other assets (discussed below). Given that operational risk represents approximately 12 percent of risk-weighted assets for traditional lending under the expanded risk-based approach and assuming an average 35 percent risk weight for eligible residential real estate exposures, an operational risk add-on of approximately 5 percentage points to residential real estate risk weights would be appropriate.

Under the proposal, the risk weight applicable to corporate exposures would be reduced from 100 percent to 95 percent and the risk weight applicable to other assets would be reduced from 100 percent to 90 percent.⁴⁰ These changes aim to balance a more risk-sensitive calibration with maintaining the simplicity of the standardized approach. The proposal would maintain the existing definition of corporate exposure and other assets.

When analyzing the risk-based capital requirements for specific business lines under the expanded risk-based proposal, the agencies determined that the current risk weights for certain exposure categories may not appropriately reflect risks. The expanded risk-based proposal includes reduced risk weights relative to the current standardized approach for corporate exposures that are deemed investment grade and retail exposures that exhibit reduced credit risk. These changes in the expanded risk-based proposal are intended to increase sensitivity to risk of the capital requirements for the banking organizations covered by that proposal. However, the increased complexity and operational burden for achieving these enhancements in risk sensitivity would not be appropriate for a standardized approach that applies to smaller and less complex banking organizations. To better calibrate the standardized approach's general risk weights for similar exposures while retaining their simplicity, the agencies conducted additional data analysis.

The risk weights assigned to corporate exposures and other assets under this proposal are informed by the risk weights for credit risk and operational risk that would apply to domestic Category III and IV banking organizations under the expanded risk-based approach. Specifically, the exposure categories that would be risk-weighted as corporate exposures and other assets were approximated using exposures reported in the special data collection, risk-weighted as under the expanded risk-based proposal.⁴¹ This

⁴⁰ The other assets category is composed of exposures to individuals, other real estate owned, and other exposures not specifically assigned a different risk weight.

⁴¹ In late 2023, the Board collected data on risk-weighted assets from 32 large bank holding companies based on the specific requirements contained in a July 27, 2023, capital proposal. See <https://www.federalreserve.gov/newsevents/pressreleases/bcreg20231020b.htm>. Corporate exposures were proxied using data reported in line items containing corporate exposures (item 8), certain real estate exposures (items 6.d, 6.g, 6.h, and 6.i), and certain off-balance sheet items (items 13 to 25 and 27), where those items were assigned one

analysis resulted in a weighted-average credit risk weight of 85 percent for corporate exposures and 77 percent for other assets.

In addition to credit risk, the expanded risk-based proposal would assign risk-weighted asset requirements for the operational risk of these exposures. Consistent with the simple risk weighting of the standardized approach, this proposal would reflect a nominal add-on to account for operational risk. Analysis in the expanded risk-based proposal suggests that risk-weighted assets for operational risk would represent approximately 12 percent of credit risk-weighted assets for traditional lending activities.⁴² Assuming approximately an 80 percent credit risk weight for these activities, this would result in approximately a 10 percentage points risk-weight add-on for operational risk. Moreover, the methodology used to determine the weighted-average risk weight for other assets under the expanded risk-based approach is likely slightly underestimated because the portfolios of non-Category III or IV banking organizations subject to the standardized approach likely include fewer transactor retail exposures (with relatively low risk weights) as smaller banking organizations have more limited credit card portfolios. Therefore, this proposal would assign risk weights of 95 percent for corporate exposures and 90 percent for other assets.

Question 11: The agencies seek comment on the proposed risk weight for corporate exposures. What alternative risk-weight should the agencies consider, and why? Please provide any supporting data.

Question 12: The agencies seek comment on the proposed risk weight for exposures to assets not otherwise assigned to a specific risk weight under the current standardized approach and that are not deducted from tier 1 or tier 2 capital pursuant to § __.22. What are the advantages and disadvantages of the proposed risk weight of 90 percent for this set of exposures? What alternative risk-weight should the agencies

of the possible risk-weights corresponding to corporate exposure under the expanded risk-based approach proposal. Other asset exposures were proxied using data reported in line items containing retail exposures (item 7), other assets (item 9), and certain off-balance sheet items (items 13) where such exposures were assigned a risk weight corresponding to either retail exposures or a risk weight of 100 percent.

⁴² See Table VII.6 in the expanded risk-based proposal. This calculation is based on the risk-weighted assets estimated to apply to the traditional lending activities of Category I and II bank holding companies.

consider, and why? Please provide any supporting data.

Question 13: The agencies seek comment on whether to create a separate category, or separate categories, for retail exposures in the proposed standardized approach. What would be the advantages and disadvantages of creating a separate category for retail exposures? What are the appropriate criteria for defining retail exposures (for example, the criteria used to define retail exposures under the expanded risk-based proposal)? What risk weight would be appropriate for retail exposures for covered banking organizations? In a revised treatment where retail exposures are segregated into their own risk-weight category, would it be appropriate to set a 100 percent risk weight for other assets (not including retail exposures) and why? Please provide relevant data to support your views, including information on the historical loss rates and risk characteristics of retail exposures.

B. Off-Balance Sheet Exposures

The proposal would better capture the risk of certain off-balance sheet exposures relative to the current standardized approach by revising the definition of commitment to clarify the off-balance sheet exposures that would be subject to risk-based capital requirements and modifying the conversion factors applicable to certain credit and equity commitments.

1. Definition of Commitment

The current capital rule defines a commitment as any legally binding arrangement that obligates a banking organization to extend credit or to purchase assets.⁴³ Such an arrangement is treated as a commitment even when the banking organization has the unilateral right to cancel the arrangement at any time. The agencies have received questions from banking organizations regarding whether certain types of arrangements, such as advised credit lines and uncommitted lines, would be commitments even if they are unconditionally cancelable. In addition, the agencies have observed an inconsistent application of the current definition of commitment.

Consistent with the expanded risk-based proposal, the proposal would revise the definition of commitment to clarify that any contractual arrangement under which a banking organization and an obligor agree to the terms applicable to one or more future extensions of

credit, purchases of assets, or issuances of credit substitutes by the banking organization is a commitment, whether or not the arrangement is unconditionally cancelable. Consistent with the current capital rule, an unconditionally cancelable commitment would include a commitment that permits a banking organization to, at any time, with or without cause, refuse to extend credit, purchase assets, or issue credit substitutes under the arrangement (to the extent permitted under applicable law). Similarly, the proposal clarifies that a contractual arrangement to extend credit, purchase assets, or issue credit substitutes, but which does not obligate the banking organization to do so, is also considered a commitment that is unconditionally cancelable.⁴⁴ This approach would promote comparable treatment across banking organizations subject to the capital rule.

Commitments represent an arrangement where the banking organization could expect to purchase assets or to extend credit to an obligor, in which case the credit becomes an on-balance sheet asset. The scope of the definition is, therefore, not intended to be limited to those situations in which the banking organization is obligated to provide some amount of credit to an obligor. The agencies do not, however, intend for the definition of commitment to include arrangements where a banking organization has merely offered potential terms to a potential obligor or that continue to be subject to negotiation between the parties. For the purpose of the regulatory capital rule, a commitment does not and would not include pre-approval letters for residential mortgage loans, credit card offers, or other offers that have not yet been agreed upon by both parties to the transaction.

Examples of arrangements that would generally be considered commitments under the proposal include fronting commitments, where a banking organization agrees to fund the obligations of other members of a syndicate of lenders, and commitment letters, where a banking organization agrees to provide financing in connection with an acquisition or other transaction to be entered into by the obligor. The proposal would also include other off-balance sheet activities such as advised lines or “uncommitted” facilities as commitments (even if they are unconditionally cancelable or

provide that the banking organization is not obligated to perform). For example, an arrangement under which a banking organization retains full discretion as to whether to extend credit to a potential borrower, but under which the banking organization and the potential borrower have agreed to the material terms on which such lending would take place if the banking organization chose to extend credit, is an unconditionally cancelable commitment under the proposal. An unconditionally cancelable commitment also includes an arrangement where a banking organization provides an initial line of credit with an additional amount that the banking organization may extend in the future subject to prior approval by the banking organization, with the agreed upon terms of the future unconditionally cancelable line.

Exposures without pre-set limits on the amount of credit that can be extended also can be unconditionally cancelable commitments. With some retail products, such as with charge cards, the banking organization does not disclose a pre-set credit limit to its obligors. For charge cards, or similar types of off-balance sheet exposures, each attempt to borrow by an obligor is individually underwritten and requires the approval of the banking organization. Nevertheless, because the banking organization and the borrower have agreed to the material terms on which such lending would take place, such arrangements meet the definition of commitment and, therefore, should be treated as unconditionally cancelable commitments for regulatory capital purposes.⁴⁵

Question 14: The agencies seek comment on the clarification to the definition of commitment. Does the proposal appropriately capture as off-balance sheet exposures arrangements where the covered banking organization is not legally obligated to extend credit, purchase assets, or issue credit substitutes but which nonetheless arise out of a contractual arrangement to extend credit or purchase assets? To what extent would the proposed definition affect a covered banking organization's business practices regarding commitments and similar arrangements, including how covered banking organizations treat such arrangements for regulatory capital and reporting purposes? Please provide any rationale or data that may be helpful for the agencies to consider.

⁴³ See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁴⁴ The proposal would remove the definition of “unconditionally cancelable” and revise the definition of “commitment” to indicate which commitments are considered unconditionally cancelable.

⁴⁵ See section V.F. for the proposed methodology to determine the exposure amount for retail exposures with no pre-set limit.

2. Conversion Factors

Consistent with the current rule, under the proposed rule a covered banking organization would calculate the exposure amount of an off-balance sheet exposure by multiplying the off-balance sheet component, which is usually the contractual amount or adjusted carrying value, by the applicable conversion factor. The resulting exposure amount would then be assigned to the relevant risk-weight category for the exposure. The proposal would retain the same conversion factors from the current capital rule, except with respect to commitments.⁴⁶

Under the current standardized approach, commitments that are not unconditionally cancelable with an original maturity of one year or less receive a 20 percent credit conversion factor and those with an original maturity of more than one year receive a 50 percent credit conversion factor.⁴⁷ The proposal would simplify the conversion factors applicable to the unused portion of a credit or equity commitment that is not unconditionally cancelable. For these commitments, the proposal would no longer differentiate conversion factors by original maturity of one year or less and greater than one year.

Under the proposal, a credit commitment that is not unconditionally cancelable would be subject to a credit conversion factor of 40 percent regardless of the maturity of the facility.⁴⁸ Removing the one-year mark as a dividing line between substantially different treatments would remove any regulatory incentive to structure transactions around that line. The 40 percent credit conversion factor would align with the expanded risk-based

proposal and reflect that most outstanding commitments that are not unconditionally cancelable have a maturity greater than one year.⁴⁹

The proposal would also simplify the treatment of conditional commitments to acquire an equity exposure by removing the differentiation of conversion factors by maturity. Under the proposal a covered banking organization would be required to multiply the effective notional principal amount of a conditional commitment by a 40 percent conversion factor to calculate its adjusted carrying value.⁵⁰

Question 15: What additional factors, if any, should the agencies consider for determining the applicable credit conversion factors for commitments?

Question 16: What are the advantages and disadvantages relative to the proposal of using the current treatment for commitments, that are not unconditionally cancelable which differentiates credit conversion factors based on maturity, and would apply a 20 percent credit conversion factor to those commitments with an original maturity of one year or less, and a 50 percent credit conversion factor to those with an original maturity of more than one year?

Question 17: What are the advantages and disadvantages of applying the proposed 40 percent credit conversion factor for commitments regardless of maturity that are not unconditionally cancelable to the supplementary leverage ratio framework and to the Size Category of the FR Y-15?

3. Commitments With No Pre-Set Limit

Most off-balance sheet exposures, such as credit card lines, allow obligors to borrow up to a specified amount. However, some off-balance sheet exposures such as charge cards do not have an explicit contractual pre-set credit limit. For commitments that do not have an express contractual maximum amount or pre-set limit, the proposal would include an approach to calculate a proxy for the committed but undrawn amount of the commitment (undrawn exposure amount). This approach would generally align with that under the expanded risk-based

proposal, except for a broader scope of application under this proposal given the objective to retain a simpler and less granular framework.

The proxy for the undrawn exposure amount is particularly important for covered banking organizations subject to the supplementary leverage ratio framework. Consistent with the current rule, under the proposal, covered banking organizations would apply a zero percent credit conversion factor to the unused portion of a commitment that is unconditionally cancelable for risk-based capital purposes. However, for purposes of the supplementary leverage ratio the minimum credit conversion factor that may be assigned to an off-balance sheet exposure is 10 percent.⁵¹

The undrawn exposure amount would be calculated by using the exposure's highest drawn amount over the previous 24 months as an indicator of the amount of credit a covered banking organization is likely to extend to an obligor in the future. Specifically, under the proposal, a covered banking organization would first identify the largest drawn amount by an obligor over the prior 24 months or, if the covered banking organization has offered the product to the obligor for fewer than 24 months, the largest drawn amount since the commitment was first issued. The off-balance sheet exposure amount would be calculated by first subtracting the current drawn amount from the largest drawn amount and then multiplying this difference by the applicable credit conversion factor. The risk-weighted asset amount would be the off-balance sheet exposure amount multiplied by the applicable risk weight for the obligor.

A substantial share of uncapped commitments is in the form of charge cards to individuals, and these exposures have characteristics that suggest the highest drawn balance method described above is a reasonable proxy to estimate the undrawn exposure amount. A charge card does not have a pre-set credit limit, its balance is generally required to be paid in full at the end of each statement period, and charge card transactions are generally underwritten separately and reviewed by the issuing banking organization for approval or denial. Therefore, a charge card obligor's spending pattern, which reflects a covered banking organization's approval of the charge card obligor's usage, is indicative of the off-balance sheet exposure amount for a charge card.

⁴⁶ Note issuance facilities and revolving underwriting facilities are forms of revolving credit. Notes issued under note issuance facilities and revolving underwriting facilities are short-term instruments issued under a legally binding medium-term contractual arrangement. Under a revolving underwriting facility, the underwriting banking organization agrees to provide loans should the issue fail, but under a note issuance facility the banking organization could either lend to the issuer or purchase the outstanding notes. Consistent with the current rule and with the Basel standards, the proposal would require banking organizations to apply a 50 percent credit conversion factor to the off-balance sheet amount of note issuance facilities and revolving underwriting facilities, regardless of whether a lower credit conversion factor would otherwise apply.

⁴⁷ 12 CFR 3.33(b)(2) (OCC); 12 CFR 217.33(b)(2) (Board); 12 CFR 324.33(b)(2) (FDIC).

⁴⁸ Under the proposal, a 40 percent conversion factor would also apply to commitments that are not unconditionally cancelable commitments for purposes of calculating the total leverage exposure for the supplementary leverage ratio framework and for the calculation of the Size Category of the FR Y-15 Systemic Risk Report form.

⁴⁹ In Q2 2025, prior to application of conversion factors, commitments with maturity less than one year accounted for under 20 percent of aggregate risk-weighted assets associated with commitments of Category III and smaller bank holding companies (See FR Y-9C Schedule HC-R Part II, items 18.a and b).

⁵⁰ Aside from this change, the equity framework would retain the current capital rule's methods for calculating the adjusted carrying value for equity exposures. Under the proposal, the risk-weighted asset amount calculation for equity exposures would also be consistent with the current rule.

⁵¹ See 12 CFR 3.10(c)(2)(viii) (OCC); 12 CFR 217.10(c)(2)(viii) (Board); 12 CFR 324.10(c)(2)(viii) (FDIC).

As an example of the proposed treatment, assume an obligor's charge card had a maximum drawn amount of \$4,000 during the period of the prior 24 months and a current drawn amount of \$3,000.⁵² To determine the off-balance sheet exposure amount of the charge card, the covered banking organization would (1) identify the maximum drawn amount over the prior 24 months (\$4,000), (2) subtract the applicable drawn amount of \$3,000 from \$4,000 (\$1,000), and (3) multiply \$1,000 by the applicable credit conversion factor.⁵³

Question 18: What are the advantages and disadvantages of the proposed treatment for commitments with no express contractual maximum amount or pre-set limit? What other time period or approach should the agencies consider for calculating the highest drawn amount (for example, using month-end balance or statement balances), and why?

Question 19: What would be the advantages and disadvantages of applying a multiplier to the highest drawn amount to calculate the off-balance sheet exposure amount (for example, multiplying the highest drawn balance by a figure between 1.5 and 3) to calculate the off-balance sheet exposure amount?⁵⁴ If applied, how should such multiplier be calibrated? What data should the agencies use to calibrate such a multiplier?

Question 20: The agencies seek feedback on commitments that contain no express contractual maximum amount but also contain features such as a "pay over time" limit, which allows a borrower to carry a balance with interest on certain charges. What would be the advantages and disadvantages of incorporating the "pay over time" limit as a floor when calculating the highest drawn amount under the proposal? For example, assume the maximum drawn amount over the prior 24 months is \$4,000 and the "pay over time" limit is \$5,000. Under this alternative, the applicable drawn amount would be subtracted from \$5,000 instead of \$4,000.

⁵² The maximum balance would reflect the highest daily drawn amount for the account with no pre-set limit over the period.

⁵³ The applicable credit conversion factor for these types of exposures, assuming they are unconditionally cancelable commitments, would continue to be zero percent under the standardized approach and 10 percent under the supplementary leverage ratio.

⁵⁴ If a multiplier of two were applied to the maximum drawn amount over the prior 24 months, under the example presented above, the off-balance sheet exposure amount would equal \$5,000, which corresponds to \$4,000 times two minus \$3,000. The other steps of the process would remain unchanged and would result in a risk-weighted asset amount of \$225 for the off-balance sheet exposure.

Question 21: The agencies seek comment on whether the specific treatment described above is appropriate for all commitments with no contractual maximum or pre-set limit. What are the advantages and disadvantages of instead limiting the proposed treatment for such commitments to a narrower set of exposure categories (such as the scope under the expanded risk-based proposal) and why? What alternative treatments, if any, should the agencies consider for determining the exposure amount when no contractual maximum or pre-set limit exists? Describe in detail the types of alternative treatments that the agencies should consider, and provide supporting rationale or data that may be helpful for the agencies.

C. Derivative Contracts

Under the proposal and consistent with the current capital rule, a covered banking organization would use the current exposure methodology to calculate the exposure amount for derivative contracts unless it elects to use the standardized approach for counterparty credit risk (SA-CCR).⁵⁵ To promote consistency, a covered banking organization that elects to use SA-CCR would apply the same revised SA-CCR framework that is proposed in the expanded risk-based proposal regardless of whether the banking organization is subject to the standardized approach or the expanded risk-based approach.⁵⁷ The revised SA-CCR framework would better reflect the risk-reducing effects of netting arrangements and collateral.

Specifically, the revised SA-CCR framework would recognize qualifying cross-product master netting agreements for non-cleared transactions and incorporate certain non-cleared repo-style transactions, including client-facing transactions. The revised framework would also permit the netting of collateralized-to-market and settled-to-market client-facing derivative transactions. In addition, the proposal would make technical revisions to promote consistent implementation of SA-CCR and better reflect counterparty credit risk. The accompanying expanded risk-based approach proposal provides further details on the changes to the SA-CCR framework.

D. Credit Risk Mitigation

The current capital rule permits covered banking organizations to

recognize certain types of credit risk mitigants, such as guarantees, credit derivatives, and collateral, for risk-based capital purposes provided the credit risk mitigants satisfy the qualification standards under the rule.⁵⁸ Credit derivatives and guarantees can reduce the credit risk of an exposure by placing a legal obligation on a third-party protection provider to compensate the banking organization for losses associated with a credit event of the original obligor.⁵⁹ Similarly, the use of collateral often can reduce the credit risk of an exposure by creating the right of a banking organization to take ownership of and liquidate the collateral in the event of a default by the counterparty. Prudent use of such mitigants can help a banking organization reduce the credit risk of an exposure and in some circumstances reduce the risk-based capital requirement associated with that exposure.

Credit risk mitigants recognized for risk-based capital purposes must be of sufficiently high quality to effectively reduce credit risk. For guarantees and credit derivatives, the current capital rule primarily looks to the creditworthiness of the guarantor and the features of the underlying contract to determine whether these forms of credit risk mitigation may be recognized for risk-based capital purposes (eligible guarantee or eligible credit derivative). With respect to collateralized transactions, the current capital rule primarily looks to the liquidity profile and quality of the collateral received (such as the creditworthiness of the issuer of the collateral) and the nature of the banking organization's security interest to determine whether the collateral qualifies as financial collateral that may be recognized for purposes of risk-based capital.⁶⁰

The proposal would largely incorporate the treatments for collateralized transactions, guarantees, and credit derivatives from the current capital rule with enhancements to increase risk sensitivity. For eligible guarantees and eligible credit

⁵⁸ Consistent with the current capital rule, the proposal would not require covered banking organizations to recognize a credit risk mitigant that it has obtained. Credit derivatives that a covered banking organization cannot or chooses not to recognize as a credit risk mitigant would be subject to a separate counterparty credit risk capital requirement.

⁵⁹ Credit events are defined in the documents governing the credit risk mitigant and often include events such as failure to pay principal and interest and entry into insolvency or similar proceedings.

⁶⁰ See definition of financial collateral in § __.2 of the capital rule. 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁵⁵ See 12 CFR 3.34 (OCC); 12 CFR 217.34 (Board); 12 CFR 324.34 (FDIC).

⁵⁶ 85 FR 4362 (Jan. 24, 2020).

⁵⁷ See expanded risk-based proposal section IV.A.4.

derivatives, the proposal would generally retain the substitution approach from the current capital rule with two modifications. Specifically, the proposal would modify the treatment for eligible credit derivatives that do not include restructuring as a credit event and no longer permit the recognition of credit protection from nth-to-default credit derivatives.⁶¹

For collateralized transactions where financial collateral secures exposures that are not derivative contracts or netting sets of derivative contracts, the proposal would generally retain the simple approach from the current capital rule with the following two modifications.⁶² First, the proposal would replace the requirement that financial collateral be subject to a collateral agreement with conditions including the requirement that the covered banking organization have the right to liquidate or take legal possession of the collateral upon an event of default. Second, the proposal would permit covered banking organizations to recognize, under the simple approach, the credit risk mitigation benefits of financial collateral with a maturity or currency mismatch, after applying certain adjustments. The proposal would also update the collateral haircut approach to partially recognize the netting and diversification benefits that may be present in repo-style transactions, eligible margin loans, collateralized derivative contracts and single product netting sets of such transactions.⁶³

The proposal would also introduce eligible prepaid credit protection arrangements as a credit risk mitigant available to all exposure types, including securitizations, and permit covered banking organizations to recognize the credit risk mitigation benefits of the protection amount of the prepaid credit protection arrangement, discounted to reflect any applicable maturity and currency mismatch adjustments.

1. Guarantees and Credit Derivatives

a. Substitution Approach

Consistent with the current capital rule, the proposal would permit a

covered banking organization to recognize the credit risk-mitigation benefits of eligible guarantees and eligible credit derivatives by substituting the risk weight applicable to the eligible guarantor or counterparty to the eligible credit derivative (protection provider) for the risk weight applicable to the hedged exposure. To recognize the risk mitigating benefits of a guarantee or credit derivative for risk-based capital purposes, the proposal would continue to require the issuer of or counterparty to the eligible guarantee or eligible credit derivative, respectively, to be an eligible guarantor.⁶⁴ The proposal would rely on the definition of eligible guarantor in § _____.2 of the capital rule, which, among other criteria, requires an entity to have issued and outstanding an unsecured debt security without credit enhancement that is investment grade at the time the guarantee is issued or anytime thereafter.

Question 22: The agencies seek comment on the requirement that the entity has issued and outstanding an unsecured debt security without credit enhancement that is investment grade to meet the definition of an eligible guarantor. What, if any, alternatives to this requirement should the agencies consider to help ensure that eligible guarantors can be expected to perform on guarantees, and what would the pros and cons of those alternatives be?

b. Adjustment for Credit Derivatives Without Restructuring

Credit derivative contracts in certain jurisdictions include debt restructuring as a credit event that triggers a payment obligation by the protection provider to the protection purchaser. Such restructurings of the hedged exposure may involve forgiveness or postponement of principal, interest, or fees that result in a loss to investors. Consistent with the current capital rule, the proposal would generally require a banking organization that seeks to recognize the credit risk-mitigation benefits of an eligible credit derivative that does not include a restructuring of the reference exposure as a credit event to reduce the effective notional amount of the credit derivative by 40 percent to account for any unmitigated losses that could occur as a result of a restructuring of the hedged exposure.

Under the proposal, however, the 40 percent adjustment would not apply to

eligible credit derivatives without restructuring as a credit event if both of the following requirements are satisfied: (1) the terms of the hedged exposure (and the reference exposure, if different from the hedged exposure) allow the maturity, principal, coupon, currency, or seniority status to be amended outside of receivership, insolvency, liquidation, or similar proceeding only by unanimous consent of all parties; and (2) the covered banking organization has conducted sufficient legal review to conclude with a well-founded basis (and maintains sufficient written documentation of that legal review) that the hedged exposure is subject to the U.S. Bankruptcy Code or a domestic or foreign insolvency regime with similar features that allows for a company to reorganize or restructure and provides for an orderly settlement of creditor claims.

The unanimous consent requirement would mean that, for restructurings occurring outside of an insolvency proceeding, all holders of the hedged exposure (and the reference exposure, if different from the hedged exposure) must agree to any restructuring for the restructuring to occur, and no holder can vote against the restructuring or abstain. This unanimous consent requirement would reduce the risk that a covered banking organization would suffer a credit loss on the hedged exposure that would not be offset by a payment under the eligible credit derivative. Banking organizations generally would only be incentivized to vote for a restructuring if the terms of the restructuring provide a more beneficial outcome to the banking organization relative to insolvency proceedings that would trigger payment under the eligible credit derivative. Additionally, the unanimous consent requirement for the reference exposure, if different from the hedged exposure, would provide an additional layer of security by significantly reducing the probability of reaching a restructuring agreement that results in a loss of principal or interest for creditors without triggering payment under the eligible credit derivative. The unanimous consent requirement would need to be satisfied through the terms of the hedged exposure (and the reference exposure, if different from the hedged exposure), which could be accomplished through a contractual provision of the exposure or the operation of the applicable law.

The requirement that the hedged exposure be subject to the U.S. Bankruptcy Code or a similar domestic or foreign insolvency regime would help to ensure that any restructuring is done

⁶¹ See section III.E.5.b. of this **SUPPLEMENTARY INFORMATION**.

⁶² The collateral haircut approach also would be available to covered banking organizations to recognize the benefits of collateral for eligible margin loans and repo-style transactions.

⁶³ Consistent with the expanded risk-based approach, the proposal would increase simplicity, consistency and comparability of capital requirements eliminating the option for banking organizations to use of their own estimates of haircuts for purposes of the collateral haircut approach.

⁶⁴ Under the advanced approaches framework in the current capital rule, an eligible guarantee need not be issued by an eligible guarantor unless the exposure is a securitization exposure. Under the proposal, an eligible guarantee would need to be issued by an eligible guarantor.

in an orderly, predictable, and regulated process. In the event that the obligor of the hedged exposure defaults and the default is not cured, the obligor would either be required to enter insolvency proceedings, which would trigger payment under the credit derivative, or the obligor would be required to pursue restructuring outside of insolvency, which could not occur without the banking organization's consent. Together, the proposed conditions are intended to ensure that credit derivatives that do not include restructuring as a credit event but provide similarly effective protection as those that do contain such provisions would be afforded similar recognition under the capital framework.

Question 23: The agencies seek comment on allowing covered banking organizations to recognize in full the effective notional amount of credit derivatives that do not include restructuring as a credit event, if certain conditions are met. What are the cost and benefits of this approach? What, if any, less restrictive conditions for receiving full recognition should the agencies consider that would more appropriately capture credit derivatives that provide similar protection as those that include restructuring as a credit event receive and why? For example, what would be the advantages and disadvantages of requiring the consent of all parties directly and adversely affected by a restructuring, rather than the unanimous consent of all parties? What would be the advantages and disadvantages of requiring the consent of all parties affected by any change in lien position or priority in the hedged or referenced exposure?

Question 24: To what extent is the proposed treatment of eligible credit derivatives that do not include restructuring of the reference exposure as a credit event relevant outside of the United States and how should this be considered for purposes of the proposal?

Question 25: In order for a covered banking organization to recognize the credit risk mitigation benefits of an eligible credit derivative, the current capital rule requires that legally-enforceable cross-default or cross-acceleration clauses be in place and that the reference exposure and the hedged exposure be to the same legal entity. What would be the advantages and disadvantages of allowing recognition of credit derivatives where (1) the reference exposure is to a different legal entity than the hedged exposure, (2) the reference exposure's legal entity is guaranteed by its parent company, and (3) the parent company is subject to a binding cross-default or

cross-acceleration provision related to the hedged exposure's debt?

2. Collateralized Transactions

a. Simple Approach

Consistent with the current capital rule, a covered banking organization would be permitted to recognize the risk-mitigating benefits of financial collateral using the simple approach by substituting the risk weight applicable to an exposure with the risk weight applicable to the financial collateral securing the exposure, generally subject to a 20 percent floor.

Under the current capital rule, a requirement for recognizing the credit risk mitigation benefit of financial collateral under the simple approach is that the collateral must be subject to a collateral agreement for at least the life of the exposure. The proposal would not include this requirement under the simple approach because the requirement is overly broad and not relevant for certain transaction types. For example, while the right to close out a transaction would be relevant with respect to a repurchase agreement, it may not be relevant with respect to a loan. Instead, the proposal would require that the legal mechanism by which the financial collateral is pledged or transferred be enforceable and provide the covered banking organization with an ability to exercise its applicable legal rights with respect to the collateral in a timely manner upon an event of default. Depending on the characteristics of the type of exposure and the financial collateral in question, those rights may include the right to liquidate or take legal possession of the financial collateral, to set off amounts owed by the covered banking organization against amounts owed by the obligor, and to close out the underlying transaction. However, not all of these rights may be applicable with respect to all types of exposures and financial collateral, and a covered banking organization would only be required to have those rights that are applicable for the type of exposure and financial collateral in question. This requirement, in combination with the definition of financial collateral—which, in part, requires a covered banking organization to have a perfected, first-priority security interest (or the legal equivalent thereof) in the collateral—and the other requirements of § ___.37(b)(1) would provide a sufficient basis for recognizing the collateral under the simple approach.

The requirement under the current capital rule that financial collateral be subject to a collateral agreement often

prevents a covered banking organization from recognizing financial collateral as a credit risk mitigant under the simple approach if the covered banking organization's exercise of its rights may be stayed in a bankruptcy of the obligor. This has generally meant that a covered banking organization could not use the simple approach to recognize financial collateral in respect of collateralized loans because the exercise of a covered banking organization's collateral rights with respect to a loan would often be subject to a stay in the bankruptcy or insolvency of a borrower under the applicable law. Under the proposal, the fact that a covered banking organization's rights may be subject to a stay in the event of an obligor's bankruptcy would not preclude the banking organization from recognizing the credit risk mitigation benefits of financial collateral, provided the banking organization has a well-founded basis for concluding that it will be able to exercise its rights in a timely manner. The proposed change would permit covered banking organizations to recognize the credit risk mitigation benefits of financial collateral that protects exposures arising from many types of loans and traditional credit products. Other elements of the simple approach, such as the 20 percent risk-weight floor, help to address the risk of declines in the value of collateral.

Typically, financial collateral in respect of a collateralized transaction is pledged by the obligor of that exposure. In some cases, collateral may be pledged or transferred by a party other than the obligor. A third-party pledgor may be the parent or an affiliate of an obligor or an unrelated party that is providing credit risk protection to the banking organization. While collateral provided by a third party may be an effective credit risk mitigant, it may also pose unique risks. In particular, depending on the laws of the applicable jurisdictions and the terms of the relevant legal agreements, the bankruptcy or insolvency of a pledgor prior to an event of default of the obligor may terminate or impair the banking organization's rights to the collateral. In these circumstances, financial collateral does not provide an effective credit risk mitigant. Consequently, the proposal would require that the bankruptcy or insolvency of a third-party pledgor not result in the termination or impairment of the covered banking organization's rights in respect of the financial collateral.

There may be situations where obligors have the ability to remove collateral that they are contractually obligated to maintain when a banking

organization is experiencing stress. This risk is most apparent when financial collateral takes the form of cash on deposit at a banking organization, where a banking organization's deposit systems may not reflect the obligor's contractual obligation to maintain the deposit at the banking organization. It may also arise, in respect of other types of financial collateral, depending on the custody arrangement and associated controls in respect of the collateral. Financial collateral is not an effective credit risk mitigant if a banking organization cannot appropriately safeguard its rights in respect of such financial collateral. Consequently, the proposal would also require a covered banking organization to be able to reasonably demonstrate the ability to protect and enforce its rights in respect of any financial collateral.

Other safeguards relating to the simple approach are intended to sufficiently calibrate the benefits of the proposal's recognition of financial collateral for a broader scope of products. For example, the maturity mismatch adjustment, which is described in greater detail below, reduces the benefit of financial collateral based on the difference between the residual maturity of the legal mechanism by which financial collateral is pledged and that of the secured exposure. Additionally, for a situation with a maturity mismatch, the proposal would only allow for recognition of the credit risk mitigant where the original maturity of the legal mechanism is greater than or equal to one year and the residual maturity of the legal mechanism is greater than three months. These requirements, taken together with the other requirements in section _____.121 of the proposal, would incentivize covered banking organizations to utilize credit risk mitigants that provide effective credit risk transfer.

Question 26: Under the simple approach, the current capital rule requires that collateral be revalued at

least every six months. The agencies recognize that, in practice, most collateral agreements for liquid collateral provide for more frequent valuation. The proposal would remove the requirement for collateral agreements. Given that financial collateral is generally liquid, what would be the advantages and disadvantages of requiring a more frequent minimum revaluation interval—such as quarterly—under the simple approach? Please provide rationale supporting or opposing a more frequent revaluation requirement.

Question 27: The proposal would maintain the current capital rule's definition of financial collateral and allow covered banking organizations to recognize the risk-mitigating benefits of cash on deposit, including cash held by a third-party custodian or trustee. The agencies invite comment on whether the definition of financial collateral is sufficiently clear with respect to cash collateral held for a covered banking organization by a third-party custodian or trustee. What would be the advantages or disadvantages of revising the "cash on deposit" prong of the definition of financial collateral to explicitly recognize cash on deposit at any third-party depository institution, regardless of whether it is a custodian or trustee? In addition, what would be the appropriate risk weight for the collateralized exposure where the financial collateral is, directly or indirectly, in the form of a deposit claim on a third-party depository institution and why? What would be the advantages and disadvantages of subjecting the collateralized exposure to the 20 percent risk weight floor? What, if any, other alternative approaches should the agencies consider and why?

b. Collateral Haircut Approach

Under the proposal, as under the current capital rule, a covered banking organization would be permitted to recognize the credit risk-mitigation benefits of collateral supporting repo-

style transactions, eligible margin loans, collateralized derivative contracts, and single product⁶⁵ netting sets of such transactions by adjusting its exposure amount to its counterparty to recognize financial collateral received and any collateral posted to the counterparty. The collateral haircut approach would continue to require a covered banking organization to adjust the fair value of the collateral received and posted to account for any potential market price volatility in the value of the collateral during the margin period of risk, as well as to address any currency mismatch. To increase the risk-sensitivity of the collateral haircut approach, the proposal would modify certain of the standard market price volatility haircuts. At the same time, to reduce unwarranted divergence in risk-weighted assets, the proposal would no longer allow a covered banking organization to use its own internal estimates for calculating haircuts.

i. Formula for Determining Exposure Amount

The proposal would introduce a new formula for calculating the exposure amount of eligible margin loans, repo-style transactions, or netting sets thereof. The proposed exposure amount equation is revised from the current formula to improve the recognition of the risk-mitigating benefits of netting and portfolio diversification. The proposed formula would revert to the current collateral haircut approach formula in cases where there are no variables to populate the second and the third components as described below. The modification would increase the risk sensitivity of the capital requirement for such transactions relative to the current collateral haircut approach. Under the proposal, the exposure amount (E^*) of a netting set of eligible margin loans or repo-style transactions or an individual transaction that is not part of a netting set would be determined according to the following formula:

$$E^* = \max \left\{ 0; \left(\sum_i E_i - \sum_i C_i \right) + (0.4 \times \text{net}_{\text{exposure}}) + \left(0.6 \times \frac{\text{gross}_{\text{exposure}}}{\sqrt{N}} \right) + \left(\sum_{fx} (E_{fx} \times H_{fx}) \right) \right\}$$

⁶⁵ SA-CCR is proposed for use under Subpart D § 217.34(a)(3) and § 217.37(f) for repo-style

transactions that are subject to a qualifying cross-

product master netting agreement with derivative contracts

Where:

- E^* is the exposure amount of the eligible margin loan, repo-style transaction, or netting set after credit risk mitigation.
- E_i is the current fair value of the instrument, cash, or gold the banking organization has lent, sold subject to repurchase, or posted as collateral to the counterparty.
- C_i is the current fair value of the instrument, cash, or gold the banking organization has borrowed, purchased subject to resale, or taken as collateral from the counterparty.
- $net_{exposure} = |\sum_s E_s H_s|$
- $gross_{exposure} = \sum_s E_s |H_s|$
- E_s is the absolute value of the net position in a given instrument or in gold (where the net position in a given instrument or gold equals the sum of the current fair values of the instrument or gold the banking organization has lent, sold subject to repurchase, or posted as collateral to the counterparty, minus the sum of the current fair values of that same instrument or gold the banking organization has borrowed, purchased subject to resale, or taken as collateral from the counterparty).
- H_s is the haircut appropriate to E_s as described in Table 1 to § _____.37, as applicable. H_s has a positive sign if the instrument or gold is net lent, sold subject to repurchase, or posted as collateral to the counterparty; H_s has a negative sign if the instrument or gold is net borrowed, purchased subject to resale, or taken as collateral from the counterparty.
- N is the number of instruments with a unique Committee on Uniform Securities Identification Procedures (CUSIP) designation or foreign equivalent, with certain exceptions. N includes any instrument with a unique CUSIP that the banking organization lends, sells subject to repurchase, or posts as collateral, as well as any instrument with a unique CUSIP that the banking organization borrows, purchases subject to resale, or takes as collateral. However, N would not include collateral instruments that the banking organization is not permitted to include within the credit risk mitigation framework (such as nonfinancial collateral that is not part of a repo-style transaction included in the banking organization's market risk weighted assets) or elects not to include within the credit risk mitigation

framework. The number of instruments for N would also not include any instrument (or gold) for which the value E_s is less than one-tenth of the value of the largest E_s in the netting set. Any amount of gold would be given a value of one.

- E_{fx} is the absolute value of the net position in each currency fx different from the settlement currency.
- H_{fx} is the haircut appropriate for currency mismatch of currency fx .

The first component in the above formula ($\sum_i E_i - \sum_i C_i$) would capture the baseline exposure of eligible margin loans, repo-style transactions, or netting sets thereof, after accounting for the value of any collateral received. The second ($0.4 \times net_{exposure}$) and third ($0.6 \times (gross_{exposure} / \sqrt{N})$) components in the above formula would allow for the partial recognition of the netting and diversification benefit of instruments exchanged between a covered banking organization and a given counterparty within a netting set. The net exposure component partially recognizes the offsetting of gross exposures between a given instrument that is both lent and received as collateral within a netting set. Additionally, because the contribution from the gross exposure component to the exposure amount would decrease proportionally with an increase in the number of unique instruments by CUSIP designations or foreign equivalent, the gross exposure component would capture the impact of diversification in the types of instruments lent or received. The fourth component ($\sum_{fx} (E_{fx} \times H_{fx})$) would capture any adjustment to reflect currency mismatch, if applicable.

When determining the market price volatility and currency mismatch haircuts, the covered banking organization would use the market price volatility haircuts described in the following section and a standard 8 percent currency mismatch haircut, subject to certain adjustments.

Question 28: What are the pros and cons of basing N for purposes of the collateral haircut approach on the number of unique CUSIPs in a netting

set? What alternatives should the agencies consider and how would such alternatives align with the goal of identifying the number of instruments for purposes of measuring diversification in the pool?

Question 29: The agencies seek comment on the appropriateness of the proposed collateral haircut approach formula, in particular for banking organizations that use the current exposure methodology for derivatives. What are the advantages and disadvantages of revising the collateral haircut approach to align with the formula in the expanded risk-based approach proposal? What, if any, risks may not be appropriately captured by the proposed change for banking organizations that use the current exposure methodology for derivative transactions and why?

ii. Market Price Volatility Haircuts

Under the proposal, a covered banking organization would apply the market price volatility haircut appropriate for the type of collateral, as provided in Table 1 to § _____.37 below, when calculating the exposure amount for repo-style transactions, eligible margin loans, collateralized derivative contracts, and single-product netting sets thereof using the collateral haircut approach and in the calculation of the net independent collateral amount and the variation margin amount for collateralized derivative transactions using SA-CCR, if applicable.⁶⁶ Consistent with the current capital rule, the proposal would require covered banking organizations to apply an 8 percent supervisory haircut, subject to adjustments, to the absolute value of the net position in each currency that is different from the settlement currency.

Proposed Table 1 to § _____.37

⁶⁶ As described in section III.C. of this Supplementary Information, under the proposal and consistent with the current capital rule, a covered banking organization would use the current exposure methodology to calculate the exposure amount for derivative contracts unless it elects to use SA-CCR.

Market Price Volatility Haircuts

(Haircuts in percent)

Residual Maturity		Securities issued by a sovereign or an issuer described in § __.32(b) ⁶⁷ (percent)			Other investment-grade securities (percent)		
		Issuer risk weight of zero	Issuer risk weight of 20 or 50	Issuer risk weight of 100	GSE exposures	Exposures other than GSE or securitization exposures	Senior securitization exposures with risk weight <100
Debt Securities	Less than or equal to 1 year	0.5	1.0	15.0	1.0	2.0	4.0
	Greater than 1 year and less than or equal to 3 years	2.0	3.0	15.0	4.0	4.0	12.0
	Greater than 3 years and less than or equal to 5 years					6.0	
	Greater than 5 years and less than or equal to 10 years	4.0	6.0	15.0	8.0	12.0	24.0
	Greater than 10 years					20.0	
Main index equities (including convertible bonds) and gold					20.0		
Other publicly traded equities and convertible bonds					30.0		
Mutual funds and exchange traded funds					Highest haircut applicable to any security in which the fund can invest, unless the banking organization can apply the full look-through approach for equity exposures to investment funds in § __.53(b), in which case the banking organization may use a weighted average of haircuts applicable to the securities held by the fund.		
Cash on deposit					0.0		
Other exposure types ⁶⁸					30.0		

The proposed haircuts would strike a balance between simplicity and risk sensitivity relative to the supervisory haircuts in the current capital rule by introducing additional granularity with respect to residual maturity, which is a meaningful driver for distinguishing between the market price volatility of different instruments, and by streamlining other aspects of the collateral haircut approach where the exposure's risk weight figures less prominently in the instrument's market price volatility, as described below.

The proposal would apply haircuts primarily based on residual maturity, rather than a combination of residual maturity and underlying risk weight as under the current capital rule, for non-sovereign investment grade debt securities. These haircuts are derived from observed stress volatilities during 10-business day periods during the 2008 financial crisis. Debt securities with longer maturities are subject to higher price volatility from changes in both interest rates and the creditworthiness of the issuer.

Because securitization exposures tend to be more volatile than corporate debt, the proposal would provide a distinct category of market price volatility haircuts for certain securitization exposures consistent with the current capital rule. The proposal would distinguish between non-senior and senior securitization exposures to enhance risk sensitivity.⁶⁹ Because senior securitization exposures absorb losses only after more junior securitization exposures, these exposures have an added layer of security and distinct market price volatility. Therefore, the proposal would only specify term-based haircuts for investment grade senior securitization exposures that receive a risk weight of less than 100 percent under the securitization framework. Other securitization exposures would receive the 30 percent market price volatility haircut applicable to "other" exposure types.

The proposal would require a banking organization to apply market price volatility haircuts of 20 percent for main index equities (including convertible bonds) and gold, 30 percent for other publicly traded equities and convertible

bonds, and 30 percent for other exposure types. Equities in a main index typically are more liquid than those that are not included in a main index, in part because investors may seek to replicate the index by purchasing the referenced equities or engaging in derivative transactions involving the index or equities within the index. The lower haircuts for equities included in a main index under the proposal would reflect the higher liquidity of those securities compared to other publicly traded equities or exposure types, which would generally help to reduce losses to banking organizations when liquidating those securities during stress conditions.

For collateral in the form of mutual fund shares, the proposal would be consistent with the current collateral haircut approach in which a covered banking organization would apply the highest haircut applicable to any security in which the fund can invest. Under the proposal, a covered banking organization could treat exchange traded fund (ETF) shares in the same manner as mutual fund shares and apply haircuts based on the underlying instruments in the fund. Given that ETFs (like mutual funds) may benefit from diversification and tend to have lower levels of price volatility compared to non-pooled investment vehicles, a look-through approach is more risk sensitive than applying the publicly traded equities haircut for ETF shares. The proposal also would include an alternative method available to a covered banking organization if the mutual fund or ETF qualifies for the full look-through approach for purposes of the equity framework under the current rule.⁷⁰ This alternative method would provide a more risk-sensitive calculation of the haircut on fund shares collateral by using the weighted average of haircuts applicable to the instruments held by the fund.⁷¹

In addition, consistent with the expanded risk-based approach proposal, the proposal would require a covered banking organization to apply a market price volatility haircut of 30 percent to address the potential market price volatility for any instruments that the covered banking organization has lent, sold subject to repurchase, or posted as

collateral that is not of a type otherwise specified in Table 1 to § _____.37.

Question 30: The agencies seek comment on the appropriateness of the calibration of the market price volatility haircuts. Commenters are encouraged to submit data with their response.

3. Prepaid Credit Protection

The proposal would introduce eligible prepaid credit protection arrangements as an additional type of credit risk mitigant. The proposal would define a prepaid credit protection arrangement as a contractual agreement in which a protection purchaser receives an initial amount in cash from a protection provider that the protection purchaser is required to repay, less any losses that the protection purchaser incurs due to a credit event on the protected exposures, such as borrower default on the protected exposures. In this type of arrangement, the amount paid by the protection provider is not collateral that secures a future obligation of the protection provider; rather, it is consideration for a right to future payments, contingent on the performance of the protected exposure(s), from the protection purchaser. This form of credit risk mitigant effectively transfers credit risk to the protection provider, as the banking organization's liability created by the prepaid credit protection arrangement generally would be reduced at the same time the banking organization incurs a loss on the protected exposure(s). A common example of a prepaid credit protection arrangement are fully funded credit-linked notes issued by a banking organization that transfer the credit risk of a reference exposure or portfolio of reference exposures to third party investors.⁷²

Under the proposal, a prepaid credit protection arrangement would be required to meet specific requirements to be recognized for risk-based capital purposes as an eligible prepaid credit protection arrangement. Specifically, the proposal would define an eligible prepaid credit protection arrangement as a prepaid credit protection arrangement that:

- (1) Is written;
- (2) Is unconditional;
- (3) Covers all or a pro rata portion of all contractual payments due to be paid

⁶⁹ Includes a foreign PSE that receives a zero percent risk weight.

⁶⁸ Includes senior securitization exposures with the risk weight greater than or equal to 100 percent and sovereign exposures with a risk weight greater than 100 percent.

⁶⁹ As described in section III.E.5.e. of this **SUPPLEMENTARY INFORMATION**, the proposal would define a senior securitization exposure as an exposure that has a first priority claim on the cash flows from the underlying exposures.

⁷⁰ See 12 CFR 3.53(b) (OCC); 12 CFR 217.53(b) (Board); 12 CFR 324.53(b) (FDIC).

⁷¹ If the mutual fund qualifies for the full look-through approach in § _____.53(b) of the capital rule but would be treated as a market risk covered position if the covered banking organization held the mutual fund directly, the proposal would allow a covered banking organization that is subject to market risk capital requirements to apply the alternative method to calculate the haircut.

⁷² See e.g., Frequently Asked Questions, 12 CFR part 217, Q2 and Q3, <https://www.federalreserve.gov/supervisionreg/legalinterpretations/reg-q-frequently-asked-questions.htm>. This revision would also be consistent with comments received under EGRPRA as commenters requested recognition of the risk-mitigation benefits of credit-linked notes.

on the reference exposure or reference exposures;

(4) Provides that the amount and timing of payments due from the protection purchaser to the protection provider are incorporated into the arrangement and the arrangement only allows these terms to change in the event of a breach of the arrangement by the protection purchaser;

(5) Provides that entry of the protection provider into receivership, insolvency, liquidation, conservatorship, or similar proceeding does not change the amounts or timing of payments due by the protection purchaser under the arrangement;

(6) Is legally valid and enforceable under applicable law of the relevant jurisdictions;

(7) Upon a failure by the obligor on the one or more reference exposures to make a contractually required payment, or the occurrence of other credit events as described in the arrangement, allows the protection purchaser promptly to reduce the outstanding balance of the initial principal amount due to the protection provider by the loss of the protection purchaser on the reference exposures without input from the protection provider; and

(8) Does not increase the protection purchaser's cost of credit protection in response to deterioration in the credit quality of any of the reference exposures.

The protection amount of an eligible prepaid credit protection arrangement would be the effective notional amount of the prepaid credit protection, reduced to reflect any currency mismatch or maturity mismatch. The effective notional amount for an eligible prepaid credit protection arrangement would be the lesser of the contractual notional amount of the credit risk mitigant and the exposure amount of the reference exposure(s), multiplied by the percentage coverage of the credit risk mitigant.

Under the proposal, if the protection amount of the eligible prepaid credit protection arrangement is greater than or equal to the exposure amount of the reference exposure, a covered banking organization would be allowed to assign a zero percent risk weight to the exposure.

If the protection amount of the eligible prepaid credit protection arrangement is less than the exposure amount of the reference exposure(s) and any losses are shared on a pro rata basis between the covered banking organization and the protection

provider,⁷³ the proposal would require the covered banking organization to treat the reference exposure(s) as two separate exposures, protected and unprotected, in order to recognize the credit risk mitigation benefit of the eligible prepaid credit protection arrangement. In such cases, a covered banking organization would apply a zero percent risk weight to the protected exposure. The covered banking organization would calculate its risk-weighted asset amount for the unprotected exposure under the standardized approach using the risk weight assigned to the exposure and an exposure amount equal to the exposure amount of the original reference exposure minus the protection amount.

Question 31: Under the definition of eligible prepaid credit protection arrangement, the proposal would require that a protection purchaser be able to reduce the outstanding balance due to the protection provider promptly upon realizing or otherwise recognizing a loss on the reference exposure, in the event that the obligor on one or more reference exposures fails to make a contractually required payment, or the occurrence of other credit events as described in the arrangement. What, if any, are the exposure types in respect of which, or circumstances when, a protection purchaser may be exposed to losses before such losses are manifested in a way that would permit a reduction in the protection purchaser's repayment obligation? For example, what would be the instances where nonpayment or other loss on the reference exposure may not always result in an accounting write-down of the eligible prepaid credit protection arrangement at the same time? What, if any, changes to the proposed definitions of prepaid credit protection arrangement and eligible prepaid credit protection arrangement should the agencies consider to further ensure that a protection purchaser would be able to reduce its repayment obligation on a prepaid credit protection arrangement as contemporaneously as possible with the manifestation of losses in respect of a reference exposure?

Question 32: The proposal would define the protection amount of an eligible prepaid credit protection arrangement to mean the effective notional amount of the prepaid credit protection. Certain credit-linked notes that may qualify as eligible prepaid credit protection under the proposal, are sometimes accounted for on a fair value

basis. The fair value of such credit-linked notes may be affected by factors other than losses or credit events (for example, a change in interest rates) in respect of the reference exposure. As a result, at the time that credit losses in respect of the reference exposure are realized, the fair value of the credit-linked note, and the amount by which the covered banking organization may set off its losses in respect of the reference exposure, may be less than the notional amount of the note. What, if any, modifications to the proposal should the agencies consider to address the risk that a covered banking organization may not be able to set off losses on a reference exposure against the full notional amount of a prepaid credit protection instrument? What would be the advantages and disadvantages of defining the protection amount of an eligible prepaid credit protection instrument to be the instrument's carrying value (for example, the fair value if the covered banking organizations elects this accounting treatment)?

Question 33: The definition of prepaid credit protection requires that the protection purchaser is obligated to repay the initial principal amount to the protection provider on or before the maturity date of the transaction, less any losses that the protection purchaser realizes or otherwise recognizes due to nonpayment of all contractual payments due to be paid on the reference exposure by the obligors. The agencies seek comment as to whether the definition is sufficiently broad to capture the types of prepaid credit protection arrangements that covered banking organizations may enter into to transfer credit risk. For example, may prepaid credit protection arrangements be structured to allow for a reduction in the initial principal amount of the arrangement upon the recognition of losses on one or more reference exposures due to credit quality deterioration of the exposures, even in the absence of any nonpayment. If so, what if any changes to the definition of prepaid credit protection should the agencies consider?

4. Maturity and Currency Mismatch Adjustment

The simple approach in the current capital rule does not permit a covered banking organization to recognize credit risk mitigation benefits where the transaction is subject to a collateral agreement that has a shorter tenor than

⁷³ Exposures on which there is a tranching of credit risk (reflecting at least two different levels of seniority) generally are securitization exposures, as described in section III.E. of this **SUPPLEMENTARY INFORMATION**.

that of the secured exposure.⁷⁴ To improve the risk sensitivity of the simple approach, the proposal would permit covered banking organizations to recognize financial collateral and prepaid credit protection with a maturity mismatch after adjusting the fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement to reflect any maturity mismatch.⁷⁵

Under the proposal, the residual maturity of an eligible prepaid credit protection arrangement would be determined in the same manner as applies to eligible credit derivatives and eligible guarantees under the current capital rule. For financial collateral that is not cash on deposit at the covered banking organization, but including cash held for the covered banking organization by a third-party custodian or trustee, the residual maturity of any amount of such financial collateral would be the earliest date on which the covered banking organization's rights in respect of such amount of financial collateral may be terminated without the pledgor being subject to a contemporaneous requirement to pledge additional financial collateral. For financial collateral that is cash on deposit at the covered banking organization, the residual maturity of any amount of such collateral would be the earliest date on which a depositor may withdraw such amount, notwithstanding any notice requirements or early withdrawal fees or penalties. For example, if an obligor is subject to a loan covenant requiring the obligor to maintain a certain deposit balance at the covered banking

organization until the maturity of the loan, the residual maturity of the cash on deposit would be the remaining maturity of the loan. Any amount of a deposit balance that an obligor is contractually permitted to withdraw, however, would have a residual maturity of the earliest date on which the deposit may be withdrawn. If an obligor may withdraw a deposit at any time, including where an obligor may be subject to a notice period or an early withdrawal fee or penalty, the residual maturity would be zero, notwithstanding any stated maturity date of the deposit instrument.

Under the proposal, a covered banking organization would be required to apply the same adjustment to reduce the fair value of the financial collateral or the effective notional amount of the prepaid credit protection arrangement as currently applies to eligible credit derivatives and eligible guarantees under the substitution approach:

$$P_m = E \times [(t - 0.25) / (T - 0.25)]$$

Where:

P_m = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement, adjusted for maturity mismatch;

E = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement;

t = the lesser of T or the residual maturity of the credit risk mitigant, expressed in years; and

T = the lesser of five or the residual maturity of the secured exposure or reference exposure, as applicable, expressed in years.

Similarly, the proposal would eliminate the current capital rule's requirement that financial collateral be denominated in the same currency as the secured exposure for a covered banking organization to use the simple approach. The proposal would permit covered banking organizations to recognize the credit risk mitigation benefits of financial collateral and eligible prepaid credit protection arrangements when denominated in a different currency than the currency of the secured exposure, after adjusting the fair value or the effective notional amount, as applicable, to reflect any currency mismatch. Under the proposal, a covered banking organization would use the following formula to adjust the fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement:

$$P_c = P_r \times (1 - H_{FX})$$

Where:

P_c = fair value of the financial collateral or effective notional amount of the eligible

prepaid credit protection arrangement, adjusted for currency mismatch (and maturity mismatch, if applicable).

P_r = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement (adjusted for maturity mismatch, if applicable).

H_{FX} = haircut appropriate for the currency mismatch between the financial collateral and the secured exposure or the eligible prepaid credit protection arrangement and the reference exposure.

Consistent with substitution approach for guarantees and credit derivatives in the current capital rule, the proposal would require covered banking organizations to use a standard supervisory haircut of 8 percent for H_{FX} (based on a ten business-day holding period and daily marking-to-market and re-margining). If a covered banking organization revalues the financial collateral or eligible prepaid credit protection arrangement less frequently than once every 10 business days, the proposal would require the covered banking organization to scale up the haircut using the following square root of time formula:

$$H_{FX} = 8\% \times \sqrt{\frac{T_M}{10}}$$

Where:

T_M = the greater of 10 or the number of business days between revaluations.

Question 34: The agencies seek comment on the effectiveness of the credit risk mitigation of collateral and eligible prepaid credit protection arrangement when there is a maturity mismatch between the credit risk mitigant and the hedged reference portfolio, for example, longer-dated assets that are protected by a shorter-dated prepaid credit protection arrangement. The agencies seek comment on whether the covered banking organization has effectively mitigated credit risk if the losses on the assets are estimated to occur after the expiration of the prepaid credit protection arrangement. Does the proposed maturity mismatch adjustment sufficiently capitalize for the residual risks of hedging longer-dated assets with shorter-term prepaid credit protection arrangement? Please provide supporting data and analysis.

E. Securitization Framework

The securitization framework is designed to produce capital requirements for exposures that involve tranching of the credit risk of one or

⁷⁴ For determining maturity mismatch, the comparison is between the remaining maturity of the protected exposure against the remaining maturity of the legal mechanism by which financial collateral is pledged. For example, if the legal mechanism by which financial collateral is pledged to a 5-year loan has a 5-year term, even if the remaining maturity of the collateral is 2 years, there would be no maturity mismatch under the proposal as long as the security interest transfers without any breaks to the proceeds of the matured collateral or replacement collateral.

⁷⁵ The proposal would define residual maturity as the longest possible remaining time before the obligated party of the secured exposure is scheduled to fulfill its obligation on the reference exposure. If a contract has embedded options that may reduce its term, the proposal would require the covered banking organization to adjust the residual maturity of the contract. If a call is at the discretion of the protection provider, the residual maturity of the contract would be at the first call date. If the call is at the discretion of the covered banking organization, but the terms of the arrangement at origination of the contract contain a positive incentive for the covered banking organization to cancel the contract before contractual maturity, the remaining time to the first call date would be the residual maturity of the contract.

more underlying financial exposures.⁷⁶ The risk and complexity posed by securitizations differ relative to direct exposures to the underlying financial exposures because the credit risk of those exposures is divided into different levels of risk using a wide range of structural mechanisms.⁷⁷ The performance of a securitization exposure depends not only on the structure of the securitization, but also on the performance of the underlying exposures⁷⁸ and certain parties to the securitization structure, including the asset servicer and any liquidity facility provider. Such structural features and the involvement of these parties make securitization exposures susceptible to additional risks as compared to direct exposures to the underlying financial exposures.

The proposed securitization framework would incorporate the securitization framework in the current standardized approach with the following modifications: (1) a revised definition of and additional operational requirements for synthetic

securitizations; (2) a modified treatment for resecuritizations that meet the operational requirements; (3) a modified definition of an eligible clean-up call; (4) a new securitization standardized approach (SEC-SA), as a replacement to the standardized supervisory formula approach (SSFA), which includes, relative to the SSFA, modified definitions of attachment point and detachment point, a modified definition of the W parameter, modifications to the definition of K_G , a lower risk-weight floor for securitization exposures that are not resecuritization exposures, and a higher risk-weight floor for resecuritization exposures; (5) a revised treatment for purchased and sold nth-to-default credit derivatives that would prohibit covered banking organizations from recognizing any risk-mitigating benefit for such exposures; (6) a revised treatment for certain derivative contracts that are not credit derivatives and a new treatment for derivative contracts that do not provide credit enhancement; (7) new provisions to expand the scope of securitization exposures for which a covered banking organization may apply the overlapping exposure treatment; (8) a new treatment and eligibility criteria for certain senior securitization exposures (the “look-through approach”); (9) a modification to the treatment for credit-enhancing interest only strips; (10) a new framework for non-performing loan securitizations; and (11) elimination of the gross-up approach. The proposal would also introduce certain minor technical edits to the definitions of traditional securitization and synthetic securitization to clarify the existing scope of exposures subject to the securitization framework under the current capital rule.

Question 35: This proposal retains the current securitization framework, except as noted above and below, to align with the proposed expanded risk-based approach. As such, this proposal would not retain the gross-up approach under the current capital rule, which generally only is applicable to banking organizations not subject to the market risk rule. What are the advantages and disadvantages of retaining the gross-up approach for certain banking organizations, consistent with the current capital rule?

1. Definitions

The proposal would generally retain the existing definitions of traditional securitization and synthetic securitization under the current capital rule, except for (1) revising the definition of synthetic securitization to include prepaid credit protection

arrangements, and (2) introducing technical modifications to the definitions of traditional securitization and synthetic securitization that are intended to clarify the existing scope of exposures subject to the securitization framework under the current capital rule.

a. Synthetic Securitization

As discussed in section III.D.3. of this **SUPPLEMENTARY INFORMATION**, the proposal would permit covered banking organizations to recognize risk mitigating benefits of eligible prepaid credit protection arrangements. Consistent with these provisions, the proposal would revise the definitional and operational criteria for synthetic securitizations to include prepaid credit protection arrangements as structures that can qualify as synthetic securitizations and to include eligible prepaid credit protection arrangements as an eligible credit risk mitigant within the securitization framework. Under the proposal, a transaction would meet the definitional and operational criteria of synthetic securitization if all or a portion of the credit risk of one or more underlying exposures is transferred to one or more third parties through prepaid credit protection arrangements, and the transaction satisfies all other requirements of the securitization framework under the proposal.

b. Technical Modifications

The proposal would modify paragraph (3) within the definitions of traditional securitization and synthetic securitization to clarify that the performance of the securitization exposure is expected to depend solely upon the performance of the underlying exposures, aside from the performance of common supporting transaction participants such as servicers and trustees. For example, a transaction would not satisfy this criterion if there is an expectation that any sources outside of the underlying exposures would fund the interest or principal payments due on the securitization exposures.

Consistent with the current capital rule, the proposed modification would continue to permit certain transactions where a party provides a specified amount of credit protection to qualify as a securitization exposure. As an example, consider a multi-seller ABCP conduit that funds itself entirely with a single class of commercial paper and purchases assets such as wholesale loan exposures from multiple sellers. As is typical in such multi-seller ABCP conduits, each seller provides first-loss protection by over-collateralizing its

⁷⁶ To segment the credit risk of the underlying financial exposures (“reference portfolio”), securitization exposures divide the reference portfolio into different slices (known as “tranches”) such that any cash flows or losses are allocated to the various tranches based on a predetermined order of priority. This payment structure is sometimes referred to as the cash flow waterfall (or simply the “waterfall”) and dictates the manner in which interest or principal payments from the reference portfolio must be allocated, creating different risk-return profiles for each tranche.

⁷⁷ For example, assume a covered banking organization extends a loan to a bankruptcy remote special purpose entity which holds financial exposures (including equity securities) and the fair value of the underlying financial assets exceeds that of the loan. Under this transaction, the underlying financial exposures are pledged as collateral to the lender. As the excess collateral would initially absorb any losses arising from non-payment on the loan (after which the covered banking organization would be exposed to any subsequent losses), the loan would generally be viewed as tranching and could qualify as a securitization exposure under the proposal, if the transaction satisfies all of the other applicable requirements. Consistent with the current capital rule, to the extent the fair value of the collateral declines such that it no longer exceeds the outstanding principal balance of the, the covered banking organization’s exposure to the borrower, the transaction would no longer involve tranching of credit or equity risk—and thus would not qualify as a securitization exposure under the proposal. Rather, the covered banking organization would be required to calculate risk-based capital requirements for the exposure using the general risk-weight framework as described in section III.A. of this **SUPPLEMENTARY INFORMATION**.

⁷⁸ Consistent with the current capital rule, the proposal would define equity exposure to include exposures to equity instruments that do not have mandatory contractual payments, among other requirements. Accordingly, under the proposal, the performance of underlying equity exposures would refer to both changes in the fair value of the equity exposures and whether the issuer(s) of the equity exposures is subject to a bankruptcy or insolvency proceeding.

loans sold to the conduit. To ensure a high credit rating on the commercial paper issued by the ABCP conduit, a banking organization sponsor may provide either a pool-specific liquidity facility or a program-wide credit enhancement such as a guarantee on a portion of the losses not protected by the seller over-collateralization. Consistent with the current capital rule, under the proposal, commercial paper issued by the ABCP conduit with a pool-specific liquidity facility generally would be a securitization exposure because the pool-specific liquidity facility represents a tranche of the credit risk of the underlying exposures (that is the repayment of the liquidity facility depends upon the underlying exposures) and losses are allocated through subordination. Conversely, if the sponsor provides a program-wide credit enhancement that covers all credit losses across multiple asset pools without reference to asset-level performance (not just those above the seller-provided credit enhancement) or seller-specific subordination, the commercial paper generally would not be a securitization exposure, as the commercial paper holders are primarily exposed to the default risk of the sponsor instead of the underlying exposures and the commercial paper does not represent a tranching risk position. The proposed modification is intended to clarify that a securitization exposure to such program-wide guarantees, including guarantees provided by an operating company to a special purpose entity it establishes, generally would not satisfy the definition of traditional or synthetic securitization.

Additionally, the proposal would modify paragraph (1) of the definition of traditional securitization to clarify that a transaction transferring equity risk could be subject to the securitization framework if all of the other definitional criteria are satisfied. The securitization framework generally applies to exposures to companies with material liabilities that are not operating companies,⁷⁹ and whose underlying exposures are primarily financial exposures (including when all or substantially all of the underlying assets are equity exposures). For exposures to companies with material liabilities that are not operating companies and whose underlying exposures are all or substantially all financial exposures, the risk-based capital treatment under the current capital rule reflects how the risk of exposures to such entities depends primarily on the degree of leverage

employed by the company. Accordingly, the current capital rule generally requires covered banking organizations to apply the securitization framework to determine the risk-weighted asset amount for exposures to non-operating companies with material liabilities, unless the primary Federal supervisor determines that the exposure is not a traditional securitization based on the transaction's leverage, risk profile or economic substance. The proposal would modify paragraph (1) of definition of traditional securitization to clarify that this treatment would also apply to exposures to such companies with material liabilities, where all or a portion of the credit or equity risk of one or more underlying exposures is transferred to one or more third parties (other than through the use of credit derivatives or guarantees or prepaid credit protection arrangements).⁸⁰ As a result, the proposed definition of traditional securitization would continue to include exposures to companies with material liabilities that are not operating companies, where all or substantially all of the underlying assets are financial exposures, and whose funding structure results in the risk associated with the underlying exposures being separated into at least two tranches with different levels of seniority.

Question 36: What additional clarifications, if any, should the agencies consider for the proposed modification to paragraph (3) of the definition of traditional and synthetic securitization and why?

Question 37: What additional clarifications, if any, should the agencies consider for the proposed modification to paragraph (1) of the definition of traditional securitization and why? What would be the advantages and disadvantages of making similar changes to paragraph (1) of the definition of synthetic securitization?

Question 38: The agencies seek comment on the appropriateness of requiring covered banking organizations to use the general risk-weight framework for certain overcollateralized exposures if the fair value of underlying equity exposures declines such that there is no longer overcollateralization? What would be the advantages and

disadvantages of requiring covered banking organizations to use the general risk-weight framework (rather than the securitization framework) to determine the applicable risk weight for securitization exposures where the underlying exposures are primarily equity exposures and the fair value of the underlying equity exposures has significantly declined? What criteria should the agencies consider to capture only those securitization exposures for which such an approach would more appropriately capture the risk and why?

2. Operational Requirements

The proposed operational requirements would be consistent with the operational requirements in the current capital rule, with five exceptions as described below and directly above in section III.E.1.a. of this **SUPPLEMENTARY INFORMATION**. In addition, for resecuritization exposures that meet the operational requirements, the proposal would eliminate the option for covered banking organizations to treat the exposures as if they had not been securitized.⁸¹

a. Early Amortization Provisions

Early amortization provisions cause investors in securitization exposures to be repaid before the original stated maturity when certain conditions are triggered. For example, many securitizations of revolving credit facilities, most commonly credit-card receivable securitizations, contain provisions that require the securitization to be wound down and investors repaid on an accelerated basis if excess spread falls below a certain threshold. This decrease in excess spread would typically be caused by credit deterioration in the underlying exposures. Such provisions can expose the originating banking organization to increased credit and liquidity risk and potentially increased capital requirements after the early amortization is triggered as the banking organization could be obligated to fund the borrowers' future draws on the revolving lines of credit.⁸² In such an

⁸¹ In the case of non-performing loan securitizations, as described in section III.E.5.g. of this **SUPPLEMENTARY INFORMATION**, the proposal would allow a covered banking organization that meets the operational requirements to choose to hold risk-based capital against the transferred exposures as if they had not been securitized and deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction.

⁸² Under the capital rule, an originating banking organization, with respect to a securitization, means a banking organization that: (1) directly or indirectly originated or securitized the underlying exposures included in the securitization; or (2) serves as an ABCP program sponsor to the

⁷⁹ See 78 FR 62112 (Oct. 11, 2013).

⁸⁰ Consistent with the current capital rule, under the proposal, a covered banking organization would use the equity framework to calculate risk-based capital requirements for equity exposures to companies where all or substantially all of the underlying assets are financial assets and that have no material liabilities. See definition of investment fund in § _____.2 of the current capital rule and the treatment of equity exposures to investment funds in § _____.53 of the proposed rule.

instance, the originating banking organization may have to either find a new funding source, whether internal or external, to cover the new draws or reduce the borrowers' credit line availability.

The proposal would expand the applicability of the operational requirements regarding early amortization provisions to synthetic securitizations, similar to their application to traditional securitizations under the current capital rule. The current capital rule defines an early amortization provision as a provision in the documentation governing a securitization that, when triggered, causes investors in the securitization exposures to be repaid before the original stated maturity of the securitization exposures, with certain exceptions.⁸³ Under the proposal, if a synthetic securitization includes an early amortization provision and references one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit, the covered banking organization would be required to hold risk-based capital against the underlying exposures as if they had not been synthetically securitized. Aligning this treatment for both traditional and synthetic securitizations would provide greater consistency within the securitization framework and reduce the likelihood that a covered banking organization would provide implicit support for synthetic securitization exposures.

Question 39: What, if any, additional exceptions to the early amortization provision definition should the agencies consider and why, provided such exceptions would not incentivize a covered banking organization to provide implicit support to a securitization exposure? In particular, is the current rule's exception where early amortization "is triggered solely by events not directly related to the performance of the underlying exposures or the originating institution (such as material changes in tax laws or regulations)" sufficiently clear? What types of early termination events should

qualify as events not directly related to either the performance of the underlying exposures or the originating banking organization? Should events not directly related to the performance of the underlying exposures or the originating banking organization include customary provisions designed to protect against non-performance of various contractual obligations by one of the parties facilitating the securitization (including the originating banking organization, if it has such a transaction facilitating role, for example by acting as a servicer)? Commenters are also asked to describe under what circumstances could a provision in a revolving loan securitization that, when triggered, causes investors in the securitization exposures to be repaid before the original stated maturity of the securitization exposures, leaves investors "fully exposed to future draws by borrowers on the underlying exposures even after the provision is triggered", or otherwise should be deemed not to be an early amortization provision. What are the advantages and disadvantages of "fully exposed" encompassing only cash-funded exposures versus also including exposures in the form of contractual commitments to provide funding?

b. Synthetic Excess Spread

The proposal would prohibit a covered banking organization that is an originating banking organization from recognizing the risk-mitigating benefits of a synthetic securitization that includes synthetic excess spread. Synthetic excess spread would be defined as any contractual provision in a synthetic securitization that is designed to absorb losses prior to any of the tranches of the securitization structure. Synthetic excess spread is a form of credit enhancement provided by the originating banking organization to the investors in the synthetic securitization; therefore, the originating banking organization should maintain capital against the credit exposure represented by the synthetic excess spread. However, a risk-based capital requirement for synthetic excess spread may not be determinable with sufficient precision to promote comparability across banking organizations because the amount of synthetic excess spread made available to investors in the synthetic securitization would depend upon the maturity of the underlying exposures, which itself depends on whether any of the underlying exposures have defaulted or prepaid. In particular, the total amount of synthetic excess spread made available at inception to investors over the life of the

transaction may not be known *ex ante*, as the outstanding balance of the securitization in future years is unknown. Therefore, if a synthetic securitization structure includes synthetic excess spread, the proposal would require the covered banking organization to maintain capital against all the underlying exposures as if they had not been synthetically securitized.

Question 40: What clarifications or modifications should the agencies consider for the above proposed definition of synthetic excess spread and why?

Question 41: What are the advantages and disadvantages of the proposed treatment of synthetic securitizations with synthetic excess spread? If the agencies were to permit a covered banking organization that is an originating banking organization to recognize the credit risk-mitigation benefits of securitizations with synthetic excess spread, how should the exposure amount of the synthetic excess spread be calculated, and what would be the appropriate capital requirement for synthetic excess spread?

c. Minimum Payment Threshold

Under the proposal, the operational requirements for synthetic securitizations would include a new requirement that any applicable minimum payment threshold for the credit risk mitigant be consistent with standard market practice.⁸⁴ A contractual minimum payment threshold refers to the delinquency condition that must exist before a credit event is deemed to have occurred under the terms of the credit protection. The proposed minimum payment threshold criterion is intended to prohibit a covered banking organization that is an originating banking organization from recognizing any risk mitigating benefit for a synthetic securitization whose minimum payment threshold is so large that it allows for material losses to occur without triggering the credit protection acquired by the protection purchaser, as such provisions would interfere with an effective transfer of credit risk.

Question 42: What are the benefits and drawbacks of the proposed minimum payment threshold criterion? What, if any, additional criteria or clarifications should the agencies consider and why?

securitization. See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁸³ Under the capital rule, the exceptions to the definition of early amortization provision are a provision that: (1) is triggered solely by events not directly related to the performance of the underlying exposures or the originating banking organization (such as material changes in tax laws or regulations); or (2) leaves investors fully exposed to future draws by borrowers on the underlying exposures even after the provision is triggered. See definition of early amortization provision in § _____.2 of the capital rule. 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁸⁴ For example, for derivative contracts written under ISDA Master Agreement documentation, standard market practice for contractual minimum payment thresholds would generally be \$1 million (or the equivalent in other currencies), such as established in ISDA Credit Derivatives Definitions. See ISDA Credit Derivatives Definitions Section 4.5 "Failure to Pay" and Section 4.9(d) "Payment Requirement."

d. Resecuritization Exposures

For a resecuritization exposure arising from a traditional securitization, if the operational requirements have been met, a covered banking organization that is an originating banking organization would be required to exclude the transferred exposures from the calculation of its risk-weighted assets and maintain risk-based capital against any credit risk it retains in connection with the resecuritization. Unlike in the case of a securitization exposure that is not a resecuritization exposure, the proposal would not provide the option for a covered banking organization to elect to treat a resecuritization exposure as if the underlying exposures had not been resecuritized. While a securitization of non-securitized assets can be used to diversify or transfer credit risk of those exposures, a resecuritization might not offer similar risk reduction or diversification benefits, particularly if the underlying exposures reflect similar high-risk tranches of other securitizations. Therefore, these resecuritization exposures warrant a higher regulatory capital requirement than that applicable to the underlying exposures.

Similarly, for a resecuritization that is a synthetic securitization, if the operational requirements have been met, a covered banking organization that is an originating banking organization would be required to recognize for risk-based capital purposes the use of a credit risk mitigant to hedge the underlying exposures and must hold capital against any credit risk of the resecuritization exposures it retains in connection with the synthetic securitization.

e. Clean-Up Calls

The proposal would use the definition of a clean-up call in the current capital rule without change. The capital rule defines a clean-up call as a contractual provision that permits an originating banking organization or servicer to call securitization exposures before their stated maturity date or call date. For an originating banking organization to exclude the underlying exposures from its risk-based capital calculation, any clean-up call associated with a securitization must be an eligible clean-up call.

The proposal would expand the definition of an eligible clean-up call. Under the current capital rule, an eligible clean-up call is defined as a clean-up call that is exercisable solely at the discretion of the originator or servicer, is not structured to avoid allocating losses to securitization

exposures held by investors or otherwise structured to provide credit enhancement to the securitization, and is only exercisable when 10 percent or less of the principal amount of the initial pool of underlying or reference exposures is outstanding. The proposal would expand the definition of an eligible clean-up call to also include clean-up calls exercisable when certain regulatory and tax events occur, in addition to the existing criteria under the current capital rule. Specifically, the modification would permit the exercise of a clean-up call upon the occurrence of (1) a regulatory event that significantly changes the risk-weighted asset amount for the securitization exposure under applicable risk-weighted asset standards of the agencies, or (2) a tax event that significantly changes the tax treatment of the securitization exposure under applicable tax laws. The events must represent final actions, such as a final rule adopted by the agencies or taxing authority, or a law enacted by Congress. Proposed rules or legislative bills would not satisfy this requirement.

Question 43: What, if any, other modifications should the agencies consider for the definition of an eligible clean-up call and why?

3. Exposure Amount of a Securitization Exposure

The proposal would maintain the exposure calculation methodology in the current capital rule for both on-balance-sheet and off-balance-sheet securitization exposures. The exposure amount for an on-balance-sheet securitization exposure that is not a repo-style transaction, an eligible margin loan, or a derivative contract (other than a credit derivative) would equal the carrying value of the exposure.⁸⁵ For off-balance-sheet securitization exposures that are not a repo-style transaction, eligible margin loan, or derivative contract (other than a credit derivative), the exposure amount would equal the notional amount of the exposure.⁸⁶ For a

⁸⁵ Consistent with the current rule, under the proposal, the exposure amount of an on-balance sheet securitization exposure that is an available-for-sale or held-to-maturity security held by a banking organization that has made an AOCI opt-out election would be the banking organization's carrying value (including net accrued but unpaid interest and fees), less any net unrealized gains on the exposure and plus any net unrealized losses on the exposure.

⁸⁶ The proposal would generally maintain the current capital rule's treatment for off-balance sheet securitization exposures to ABCP programs, with certain exceptions. The proposal would not include the specific treatments provided for such exposures in __.42(c)(3)(ii)–(iii) and __.44 in the current capital rule. The other elements of the proposed

securitization exposure that is a repo-style transaction, eligible margin loan, or derivative contract (other than a credit derivative), the exposure amount would be calculated based on the proposed counterparty credit risk framework, described in sections III.C. and III.D.2.b. of this **SUPPLEMENTARY INFORMATION**.

*Question 44: What, if any, clarifications should the agencies consider regarding the determination of the exposure amount for securitization exposures where one or more of the underlying exposures are off-balance sheet exposures (such as unfunded commitments)? Specifically, what are the advantages and disadvantages of a modification that would clarify that covered banking organizations could apply the same credit conversion factors described in section III.B.2. of this **SUPPLEMENTARY INFORMATION** when calculating the components of the SEC-SA (K_G , W parameter, attachment point A and detachment point D) for a securitization exposure where one or more of the underlying exposures are off-balance sheet exposures? What would be the effect of such a clarification on the volatility of the capital requirements?*

4. Securitization Standardized Approach (SEC-SA)

Under the proposal, a covered banking organization would determine the capital requirements for most securitization exposures under the SEC-SA. The SEC-SA would be substantively similar to the SSFA in the current capital rule except for certain changes as discussed below. Under the SEC-SA, a covered banking organization would determine the risk weight for a securitization exposure based on the risk weight of the underlying exposures that are adjusted to reflect (1) delinquencies in such exposures, (2) the securitization exposure's subordination level in the allocation of losses, and (3) the heightened correlation and additional risks inherent in securitizations relative to direct exposures to the underlying financial exposures.

To calculate the risk weight for a securitization exposure using the SEC-SA, a covered banking organization would be required to have accurate information on the parameters used in the SEC-SA calculation. If the covered banking organization cannot, or chooses not to, apply the SEC-SA, the covered

securitization framework (for example, the look through approach for senior securitization exposures) are intended to better reflect the risk of such exposures.

banking organization would be required to apply a 1,250 percent risk weight to the securitization exposure. For synthetic securitizations, the proposal would permit covered banking organizations to choose not to recognize

the credit risk mitigant and hold risk-based capital against the underlying exposures as if they had not been synthetically securitized.

Under the proposed SEC-SA, the risk weight assigned to a securitization

exposure, or portion of a securitization exposure, would be determined according to the formula under § _____.44(a) of the proposed rule, expressed as:

RW_{SEC-SA}

$$= \begin{cases} \max(RW_{FLOOR}, 1,250\% \cdot K_{SEC-SA}), & K_A \leq A \\ \max\left(RW_{FLOOR}, \left(\frac{K_A - A}{D - A}\right) \cdot 1,250\% + \left(\frac{D - K_A}{D - A}\right) \cdot 1,250\% \cdot K_{SEC-SA}\right), & A < K_A < D \\ 1,250\%, & D \leq K_A \end{cases}$$

Where:

- RW_{FLOOR} is equal to 100 percent for resecuritization exposures and 15 percent for all other securitization exposures.

- K_A represents the delinquency-adjusted, weighted-average capital requirement of the underlying exposures, as described in section III.E.4.c. of this **SUPPLEMENTARY INFORMATION**.
- A represents the attachment point of the securitization exposure, as described in

section III.E.4.a. of this **SUPPLEMENTARY INFORMATION**.

- D represents the detachment point of the securitization exposure, as described in section III.E.4.a. of this **SUPPLEMENTARY INFORMATION**.

- $K_{SEC-SA} = \frac{e^{a \cdot u} - e^{a \cdot l}}{a \cdot (u - l)}$

- $a = -\frac{1}{p \cdot K_A}$, where p equals 1.5 for a resecuritization exposure and 0.5 for all

other securitization exposures.

- $u = D - K_A$
- $l = \max(A - K_A, 0)$
- e equals the base of the natural logarithm.

a. Definition of Attachment Point and Detachment Point

Under the current capital rule, the attachment point (parameter A) of a securitization exposure equals the ratio of (1) the current dollar amount of underlying exposures that are subordinated to the exposure of the banking organization to (2) the current dollar amount of underlying exposures. Any reserve account funded by the accumulated cash flows from the underlying exposures that is subordinated to the covered banking organization's securitization exposure may be included in the calculation of parameter A to the extent that cash is present in the account. The current capital rule generally requires a covered banking organization to recognize cash or securities that are included in a reserve account in the calculation of parameter A.⁸⁷

The proposal would generally retain the existing definitions of attachment point and detachment point under the current capital rule, with one modification. Specifically, the proposal would not allow a covered banking organization to include interest rate derivative contracts and exchange rate derivative contracts, or the cash collateral accounts related to these instruments, in the calculation of parameters A and D. The agencies are proposing this treatment because assets held in a funded reserve account, whether cash or securities, can provide credit enhancement to a securitization exposure, whereas interest rate and foreign exchange derivatives (and any cash collateral held against these derivatives) do not.⁸⁸

organizations to treat any assets that are included in a reserve account as underlying exposures of the securitization exposure, which must be reflected in parameters A and D as well as K_G and the W parameter.

⁸⁸ For example, assume a securitization has assets denominated in U.S. dollars and liabilities denominated in euros, and that the securitization executes a USD-EUR foreign exchange swap with a covered banking organization. The transaction

b. Definition of W Parameter

Under the current capital rule, parameter W, which is expressed as a decimal value between zero and one, reflects the proportion of underlying exposures that are not performing or are delinquent, according to criteria outlined in the rule.⁸⁹ The proposal would retain the current capital rule's definition of parameter W, with two modifications. Specifically, the proposal would revise the definition of parameter

would serve to hedge the foreign exchange risk of the securitization's assets and liabilities but would not provide credit enhancement to any of the tranches of the securitization.

⁸⁹ Consistent with the current capital rule, the proposal would define equity exposure to include exposures to equity instruments that do not have mandatory contractual payments, among other requirements. Accordingly, under the proposal, for purposes of determining the W parameter for a securitization exposure, a covered banking organization would not treat an underlying equity exposure as being past due or in default on payments, but could treat an underlying equity exposure as subject to a bankruptcy or insolvency proceeding if the issuer of the equity exposure were subject to such a proceeding. See definition of equity exposure in § _____.2 of the capital rule. 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁸⁷ Consistent with the current capital rule, the proposal would require covered banking

W to (1) exclude any exposure that is directly and unconditionally guaranteed by the U.S. government, its central bank, or a U.S. government agency from the calculation of W, up to the amount of the guarantee; and (2) clarify that for resecuritization exposures, any underlying exposure that is a securitization exposure would only be included in the denominator of the ratio and would be excluded from the numerator of the ratio.

Under the proposal, a covered banking organization would exclude from the calculation of parameter W any exposure that is directly and unconditionally guaranteed by the U.S. government, its central bank, or a U.S. government agency, up to the amount of the guarantee. By allowing covered banking organizations to reflect the risk mitigation effects of the U.S. government's guarantee, the proposed modification is intended to more appropriately align the capital requirement with the risk of such securitization exposures. For example, when a covered banking organization invests in a securitization exposure where all of the underlying exposures are unconditionally guaranteed by the U.S. government, the covered banking organization may set parameter W equal to zero.

For resecuritization exposures, parameter W would be the ratio of the sum of the current dollar amount of any underlying exposures of the resecuritization that meet any of the criteria in paragraphs _____.42(b)(1)(i) through (vi) of the proposal that are not securitization exposures to the current dollar amount of all underlying exposures. Underlying securitization exposures do not need to be included in the numerator of parameter W because the risk weight of the underlying securitization exposure as calculated by the SEC-SA would already reflect the impact of any delinquent or otherwise nonperforming loans within the underlying securitization exposure. For example, if a resecuritization with a notional amount of \$10 million includes underlying securitization exposures with a notional amount of \$5 million and underlying non-securitization exposures with a notional amount of \$5 million, and if \$500,000 of the non-securitization exposures are delinquent, the numerator for the W parameter would be \$500,000 while the denominator for the W parameter would be \$10 million. This reflects the fact that the risk associated with securitization exposures generally arises from the underlying assets failing to perform as expected, resulting in investors receiving less cashflow than expected

from the securitization exposure, rather than from securitization exposure itself failing to make payments due to investors.

Question 45: The agencies seek comment on the appropriateness of requiring covered banking organizations to only include equity exposures when the issuer is subject to a bankruptcy or insolvency proceeding in the W parameter calculation. What, if any, alternative approaches (such as requiring covered banking organizations to include equity exposures when the issuer has an obligation to the banking organization that is 90-days or more past due) should the agencies consider that would more appropriately capture the proportion of underlying exposures that are not performing or are delinquent and why? What, if any, operational concerns could such alternatives pose?

c. Delinquency-Adjusted (K_A) and Non-Adjusted (K_G) Weighted-Average Capital Requirement of the Underlying Exposures

Under the proposal, K_A would reflect the delinquency-adjusted, weighted-average capital requirement of the underlying exposures and would be a function of K_G and parameter W. Under this approach, in order to calculate parameter W, and thus K_A , the covered banking organization must know the delinquency status of all underlying exposures in the securitization. K_G would equal the weighted average total capital requirement of the underlying exposures (with the unpaid principal used as the weight for each exposure), calculated using the proposed risk weights in the standardized approach, as described in section III.A. of this **SUPPLEMENTARY INFORMATION**.

The proposal would retain the current capital rule's definition of K_G , with two modifications. First, for interest rate derivative contracts and exchange rate derivative contracts, the proposal would require covered banking organizations to include in the numerator of K_G (and exclude from the denominator of K_G) the product of (1) the positive current exposure, (2) the risk weight of the counterparty, and (3) 0.08. This accounts for the issue where, if amounts related to interest rate and exchange rate derivative contracts were included in both the numerator and denominator of K_G , these contracts could reduce the capital requirement of securitization exposures even though interest rate and exchange rate derivative contracts do not provide any credit enhancement to a securitization.

Second, the proposal would clarify the existing requirement that covered

banking organizations must determine the risk weight applicable to an underlying equity exposure under the simple risk-weight approach in § _____.52 of the current capital rule based on the characteristics of the underlying equity exposure. Consistent with the treatment under the current capital rule, covered banking organizations would not be able to consider the underlying equity exposures as a non-significant equity exposure that receive a 100 percent risk weight when determining K_G . Unlike equity exposures to investment funds (as defined), traditional securitizations can include transactions with companies that have material liabilities and structures that allocate losses based on a predetermined order of priority (rather than on a pro-rata basis). Accordingly, unlike the look-through approaches applicable to underlying equity securities held by investment funds, the proposal would clarify that covered banking organizations may not calculate risk-based capital requirements for securitization exposures with underlying equity exposures as though the underlying equity exposures were on the covered banking organization's balance sheet. This clarification to the current capital rule promotes the risk sensitivity of the securitization framework by requiring covered banking organizations to reflect a risk weight based on the underlying exposure's risk characteristics and appropriately differentiates between the risk-based capital treatment applicable to investment funds and to securitization exposures.

Question 46: Recognizing that banking organizations may not always know the delinquency status of each underlying exposure, what would be the benefits and drawbacks of allowing a covered banking organization to use the SEC-SA if the covered banking organization knows the delinquency status for most, but not all, of the underlying exposures? For example, if the covered banking organization knew the delinquency status of 95 percent of the exposures, what would be the benefits and drawbacks of allowing the covered banking organization to (1) split the underlying exposures into two subpools, (2) calculate a weighted average of the K_A of the subpool comprising the underlying exposures for which the delinquency status is known, (3) assign a value of 1 for K_A of the other subpool comprising exposures for which the delinquency status is unknown, and (4) assign a K_A for the entire pool equal to the weighted average of the K_A for each subpool? What other approaches,

if any, should the agencies consider and why?

Question 47: *The agencies seek comment on the appropriateness of requiring covered banking organizations to reflect underlying past due exposures in both the K_G and the W parameter components when calculating K_A . To what extent could including past due exposures in both components result in overly punitive capital requirements for such exposures under SEC-SA? What, if any, alternatives (such as not applying the heightened 150 risk weight for past due exposures for purposes of calculating K_G) should the agencies consider and why? Commenters are encouraged to provide specific examples, including calculations and supporting data.*

d. Supervisory Risk-Weight Floors

Consistent with the SSFA in the current capital rule, the SEC-SA would require covered banking organizations to apply a risk-weight floor to all securitization exposures. The proposed risk-weight floor is intended to ensure that covered banking organizations maintain a minimum level of capital to account for risks that may not otherwise be captured by SEC-SA, such as modeling risks and correlation. The proposal would apply a risk-weight floor of 15 percent for securitization exposures that are not resecuritization exposures. The 15 percent risk-weight floor is most relevant for more senior securitization exposures. While junior tranches can absorb a significant amount of credit or equity risk, senior tranches are still exposed to some amount of credit or equity risk on the underlying exposures. Therefore, a minimum capital requirement continues to be appropriate for all securitization exposures.

For resecuritization exposures, the proposed SEC-SA approach would require covered banking organizations to apply a risk-weight floor of 100 percent. The proposed 100 percent supervisory risk-weight floor for resecuritization exposures is intended to capture the greater complexity of such exposures and heightened correlation risks inherent in the underlying securitization exposures.⁹⁰

⁹⁰ In a typical securitization exposure that is not a resecuritization, each underlying exposure is subject to idiosyncratic default risks (for example, the employment status of each obligor) which may exhibit lower relative default correlation. In a resecuritization exposure, the underlying exposures, which are typically tranches of securitizations, usually have credit enhancement from more junior tranches that protects against many idiosyncratic risks. Systematic risks are more likely to generate defaults in the underlying exposures of resecritizations than idiosyncratic

Question 48: *The agencies seek comment on the proposed 100 percent risk-weight floor for resecuritization exposures. What modifications, if any, should the agencies consider to the 100 percent risk-weight floor for resecuritization exposures and why? For example, what would be the pros and cons of excluding certain types of resecuritization exposures—such as resecritizations of servicer cash advance receivables—from the 100 percent risk-weight floor and why? Commenters are encouraged to provide data (such as loss history) to support their recommendations.*

5. Exceptions to the SEC-SA Risk-Based Capital Treatment for Securitization Exposures

Securitization exposures sometimes contain features that, if not accounted for, could produce inconsistent outcomes under the SEC-SA, or in some cases make the calculation of the risk weight inoperable. Therefore, the proposal would include additional approaches for certain types of securitization exposures to more appropriately align the capital requirement with the risk of such securitization exposures.

a. Purchased Credit Derivatives

As discussed previously in section III.E.1.b. of this **SUPPLEMENTARY INFORMATION**, the proposal would modify paragraph (1) of the definition of traditional securitization to clarify that the securitization framework generally applies to exposures to companies with material liabilities that are not operating companies, and whose underlying exposures are primarily financial exposures. To further clarify the scope of exposures subject to the securitization framework under the current capital rule, the proposal would also remove the definition of securitization special purpose entity (SPE).

Under the current capital rule, if a covered banking organization purchases a credit derivative (other than an nth-to-default credit derivative) that is recognized as a credit risk mitigant (including via recognized collateral) under the securitization framework, the covered banking organization is not required to compute a separate counterparty credit risk capital requirement. For purchased credit derivatives that a covered banking organization cannot or chooses not to

recognize as a credit risk mitigant under the securitization framework, the current capital rule requires the covered banking organization to calculate an exposure amount using SA-CCR and to determine the applicable risk weight based on whether or not the counterparty is a securitization SPE.⁹¹ Specifically, if the counterparty is a securitization SPE, the covered banking organization must determine the risk weight based on the securitization framework; if the counterparty is not a securitization SPE, the covered banking organization must apply the risk weight applicable to the counterparty under the general risk-weight framework.

Consistent with the proposed technical modification to the definition of traditional securitization,⁹² the proposal would (1) remove the definition of securitization SPE, and (2) clarify that the risk weight applicable to purchased credit derivatives that a covered banking organization cannot or chooses not to recognize as a credit risk mitigant would be based on whether the counterparty is a securitization (*i.e.*, a non-operating company that holds the underlying exposures of a securitization transaction).

b. Nth-to-Default Credit Derivatives

Nth-to-default credit derivatives provide credit protection on a group of reference exposures only after a specific number (n) of the reference exposures default.⁹³ As nth-to-default credit derivatives tranche the credit risk of the reference exposures based on the order in which defaults occur within the group of reference exposures, such credit derivatives would generally

⁹¹ Securitization SPE under § ____ . 2 of the current capital rule means a corporation, trust, or other entity organized for the specific purpose of holding underlying exposures of a securitization, the activities of which are limited to those appropriate to accomplish this purpose, and the structure of which is intended to isolate the underlying exposures held by the entity from the credit risk of the seller of the underlying exposures to the entity. See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁹² The proposal would retain the existing definition of securitization exposure under the current capital rule. Under § ____ . 2 of the current capital rule, securitization exposure means (1) an on-balance sheet or off-balance sheet credit exposure (including credit-enhancing representations and warranties) that arises from a traditional securitization or synthetic securitization (including a resecritization), or (2) an exposure that directly or indirectly references a securitization exposure described in paragraph (1) of this definition. See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

⁹³ Consistent with the current capital rule, the proposal would define an nth-to-default credit derivative as a credit derivative that provides credit protection only for the nth-defaulting reference exposure in a group of reference exposures. See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

qualify as securitization exposures under the proposal, consistent with the current capital rule. Under the current capital rule, covered banking organizations that have purchased credit protection in the form of an nth-to-default credit derivative may recognize the risk-mitigating benefit of that derivative under the credit risk mitigation framework applicable to securitization exposures if certain conditions are met. If a covered banking organization sells protection in the form of an nth-to-default credit derivative, the current capital rule requires the covered banking organization to calculate risk-weighted assets as the product of (1) the exposure amount produced by SA-CCR, and (2) either the risk weight produced by the SSFA or a 1,250 percent risk weight.

Nth-to-default credit derivatives provide protection only for a limited number of default event(s) and, therefore, do not provide continuous or comprehensive coverage of credit risk for the entire basket of reference exposures. Furthermore, the current capital treatment of nth-to-default credit derivatives may not appropriately capture the default correlation among the reference exposures. For example, assume a covered banking organization with exposure to five corporate entities purchases an nth-to-default credit derivative that pays out upon the default of the second of the five corporate entities. In such a case, the covered banking organization would remain exposed to any losses incurred upon the first corporate entity default, as well as losses from any defaults beyond the second corporate entity default, if applicable. Conversely, a covered banking organization that sells an nth-to-default credit derivative that provides protection against the default of the second corporate entity could incur losses exceeding the premiums collected from the protection purchaser if the defaults of the underlying corporates are highly correlated. Furthermore, the risk weight produced by the SEC-SA may not appropriately capture the risk of sold nth-to-default credit derivatives, which are priced based on the expected default correlation among the reference exposures.⁹⁴

⁹⁴ As a standardized approach, the SEC-SA calculation does not explicitly capture default correlation among the underlying exposures (such as the possibility that multiple underlying exposures will default simultaneously or that the default of one underlying exposure may affect the likelihood of another underlying exposure defaulting). Instead, default correlation effects are implicitly incorporated through the supervisory parameter (ρ) in the SEC-SA calculation, which

Accordingly, while nth-to-default credit derivatives would continue to be securitization exposures, the proposal would not permit covered banking organizations to recognize any risk-mitigating benefit for nth-to-default credit derivatives for which the covered banking organization is the protection purchaser under the proposed securitization framework. Rather, the proposal would require covered banking organizations to calculate risk-weighted assets for counterparty credit risk using the exposure amount produced by current exposure methodology or SA-CCR, as described in section III.C. of this **SUPPLEMENTARY INFORMATION** and the risk weight applicable to the protection provider under the general risk-weight framework.

Similarly, while nth-to-default credit derivatives in which the covered banking organization is the seller of protection would continue to be securitization exposures, the proposal would prohibit the covered banking organization from using the SEC-SA to determine the applicable risk weight. Rather, the proposal would generally require covered banking organizations to calculate the risk-weighted asset amount by multiplying the notional amount of the protection provided by the nth-to-default credit derivative by the sum of the risk weights applicable to each of the underlying reference exposures, up to a maximum of 1,250 percent. In aggregating the risk weights for second- or later-to-default credit derivatives, the proposal would permit covered banking organizations to exclude the (n-1) assets with the lowest risk weights from the calculation.⁹⁵ This approach would require a covered banking organization to maintain capital based on the risk characteristics of all the underlying reference exposures in the basket on which it is providing protection, while recognizing that the covered banking organization is not

serves as a proxy for the concentration and correlation of the underlying exposures.

⁹⁵ For example, assume a covered banking organization sells a first-to-default credit derivative that provides protection on three underlying entities, two of which would be subject to the 95 percent risk weight for corporate exposures under the proposal and one to the 20 percent risk weight for GSEs. The proposal would require the covered banking organization to multiply the sum of the three risk-weights (210 percent) by the notional amount of protection provided by the first-to-default credit derivative. If the covered banking organization sold a second-to-default credit derivative that provided protection on the same three entities, the proposal would require the covered banking organization to multiply the sum of the two highest applicable risk-weights (190 percent) by the notional amount of protection provided by the second-to-default credit derivative.

required to make a payment unless “n” names in the basket default.

c. Derivative Contracts That Do Not Provide Credit Enhancements

The proposal would revise the risk weight for securitization exposures that are derivative contracts (other than protection provided by a covered banking organization in the form of a credit derivative) that have a first priority claim on the cash flows from the underlying exposures, notwithstanding amounts due under interest rate or currency derivative contracts, fees, or other similar payments. The current capital rule permits covered banking organizations to assign a risk-weighted asset amount for such securitization exposures equal to the exposure amount calculated under current exposure methodology or SA-CCR, as applicable, (corresponding to a 100 percent risk weight). The proposal would eliminate this option. Instead, a covered banking organization would determine the risk-weighted asset amount by multiplying (1) the exposure amount produced by the counterparty credit risk framework, as described in section III.C. of this **SUPPLEMENTARY INFORMATION**, and (2) either the risk weight applicable to the exposure under the securitization framework or a 1,250 percent risk weight. The proposed treatment would be more risk sensitive and more accurately reflect the risks of such exposures than a flat 100 percent risk weight.

Additionally, the proposal would provide a new treatment for certain interest rate or foreign exchange derivative contracts that qualify as securitization exposures. Some securitizations either make payments to investors in a different currency from the underlying exposures or make fixed payments to investors when the cash flows received on the underlying exposures are linked to a floating interest rate. To neutralize these foreign exchange or interest rate risks, a securitization may enter into a derivative contract that mirrors the currency or interest rate mismatch between the exposures and the tranches. Cash flows required to be paid to the derivative counterparty tend to have a claim senior to the investors in the cash flow waterfall, and therefore tend not to provide credit enhancement.

The proposal would require a covered banking organization that acts as a counterparty to these types of interest rate and foreign exchange derivatives to set the risk weight on such derivatives equal to the risk weight calculated under the SEC-SA for a securitization exposure that is *pari passu* to the

derivative contract or, if such an exposure does not exist, the risk weight of the next subordinated tranche of the securitization exposure. A covered banking organization may otherwise not be able to calculate a risk weight for these derivative contracts using the SEC-SA because the attachment and detachment points under the proposed formula could equal one another, rendering the formula inoperable. The proposed treatment is intended to appropriately reflect how the credit risk associated with these derivative contracts would be commensurate with or less than the credit risk associated with a pari passu tranche or the next subordinated tranche of a securitization exposure.

Question 49: The current capital rule provides covered banking organizations the option to assign a 100 percent risk weight to securitization exposures that are derivative contracts (other than protection provided by a covered banking organization in the form of a credit derivative) that have a first priority claim on the cash flows from the underlying exposures (notwithstanding amounts due under interest rate or currency derivative contracts, fees, or other similar payments). The agencies seek comment on the advantages and disadvantages of retaining this option. What, if any, operational burden would covered banking organizations face if this option were retained or eliminated? What, if any, clarifications should the agencies consider regarding the determination of the attachment point and detachment point for such securitization exposures, and why?

d. Overlapping Exposures

To enhance the risk sensitivity of the securitization framework, the proposal would introduce new provisions to address instances where one of the covered banking organization's securitization exposures would preclude the covered banking organization from incurring losses under all circumstances on one or more separate securitization exposures also held by the covered banking organization (overlapping exposures). The standardized approach of the current capital rule includes provisions to limit the double counting of risks in situations involving overlapping securitization exposures. If a covered banking organization has multiple securitization exposures that provide duplicative coverage to the underlying exposures of a securitization (such as when a covered banking organization provides a program-wide credit enhancement and multiple pool-specific liquidity facilities to an ABCP program),

the covered banking organization is not required to hold duplicative risk-based capital against the overlapping position. Instead, the covered banking organization may apply to the overlapping position the applicable risk-based capital treatment under the securitization framework that results in the highest risk-based capital requirement.

The proposal would expand the treatment of overlapping exposures to allow covered banking organizations to also apply this treatment (1) where one or more of the overlapping securitization exposures would be subject to the securitization framework in § _____.43 of the proposal and other(s) to the proposed market risk framework, and (2) to securitization exposures that partially overlap for purposes of the securitization framework in § _____.43 of the proposal.

First, to the extent that (1) a covered banking organization is subject to market risk capital requirements, and (2) one or more of the such securitization exposures would be subject to securitization framework and others to the revised market risk framework, the proposal would allow the covered banking organization to reflect only the greater of the risk-based capital requirement produced by the securitization framework or the market risk capital framework, provided the covered banking organization is able to calculate and compare the capital requirements for the relevant exposures.

Second, if a covered banking organization has two or more securitization exposures that partially overlap, the proposal would permit the covered banking organization to treat the exposures as overlapping exposures, provided the covered banking organization can demonstrate that one of its securitization exposures can fully absorb losses arising from its other securitization exposures. For example, if a covered banking organization provides a program-wide credit enhancement to an ABCP conduit that covers only the portion of the losses above the seller-provided protection⁹⁶ and the covered banking organization also holds commercial paper issued by the ABCP conduit, the covered banking organization would be permitted to reflect the risk-weighted asset amount only for the program-wide credit enhancement, provided the covered banking organization demonstrates, for purposes of calculating risk-based

capital requirements, that the program-wide credit enhancement would require the covered banking organization to fully absorb any losses arising from the ABCP conduit. As the risk-based capital requirement for the program-wide credit enhancement would be treated as covering any losses on the commercial paper, the proposal would not require the covered banking organization to also maintain additional risk-based capital against the securitization exposure(s) arising from the commercial paper.

In this regard, the proposal aims to increase risk sensitivity by allowing covered banking organizations to appropriately reflect the risk of such overlapping exposures within the calculation of risk-weighted assets while also providing sufficient flexibility if doing so would impose significant burden.⁹⁷

Question 50: What challenges, if any, would the option to recognize an overlap between market risk covered and noncovered positions introduce? To what degree do covered banking organizations anticipate recognizing overlaps between market risk covered and noncovered positions?

e. Look-Through Approach for Senior Securitization Exposures

The proposal would introduce a provision that would allow a covered banking organization to assign to a senior securitization exposure that is not a resecuritization exposure a risk weight equal to the weighted average risk weight of the underlying exposures, provided that the covered banking organization has knowledge of the composition of all of the underlying exposures (also referred to as the "look-through approach"). For purposes of calculating the weighted-average risk weight, the proposal would require a covered banking organization to use (1) the unpaid principal amount of underlying exposures as the weight for each exposure, and (2) determine the risk weight applicable to an underlying equity exposure based on the characteristics of the underlying equity exposure.⁹⁸

⁹⁷ For example, the proposed market risk capital framework would require banking organizations to calculate risk-based capital requirements at the trading desk level. Thus, the cost associated with requiring covered banking organizations to calculate market risk capital requirements for an individual securitization exposure may outweigh any improvement in risk sensitivity associated with the proposed treatment for overlapping exposures described above. See section V.A. of the expanded risk-based proposal.

⁹⁸ As discussed in section III.E.4.c. of this SUPPLEMENTARY INFORMATION, the non-significant equity exposure treatment does not apply to equity securities underlying a securitization.

⁹⁶ For example, typically in the case of multi-seller ABCP conduits, each seller provides first-loss protection by over-collateralizing the conduit to which it sells loans.

The proposal would define a senior securitization exposure as an exposure that has a first priority claim on the cash flows from the underlying exposures. When determining whether a securitization exposure has a first priority claim on the cash flows from the underlying exposures, a covered banking organization would not be required to consider amounts due under interest rate derivative contracts, currency derivative contracts, and servicer cash advance facility contracts,⁹⁹ or any fees and other similar payments to be made by the securitization to other parties. Both the most senior commercial paper issued by an ABCP program and a liquidity facility that supports the ABCP program may be senior securitization exposures if the liquidity facility provider's right to reimbursement of the drawn amounts is senior to all claims on the cash flows from the underlying exposures, except amounts due under interest rate derivative contracts, currency derivative contracts, and servicer cash advance facility contracts, fees due, and other similar payments. Accordingly, under the proposed look-through approach, if a senior securitization exposure's underlying exposures consists solely of past due loans with a weighted-average risk weight of 150 percent, the risk weight for the senior securitization exposure would be no more than 150 percent.

Consistent with the proposed 15 percent floor under the SEC-SA, the proposal would require covered banking organizations to floor the total risk-based capital requirement under the look-through approach at 15 percent. The proposed 15 percent floor is intended to appropriately reflect the minimum amount of risk-based capital that a covered banking organization should maintain for senior securitization exposures given that the process of securitization can introduce risks that are not present in directly holding the underlying exposures. For example, the transformation of risk profiles through the securitization process and the introduction of payment waterfalls, among other structural features, can add complexity to modeling and correlation assumptions.

Question 51: What are the advantages and disadvantages of the proposed 15

⁹⁹ Consistent with the current capital rule, the proposal would define a servicer cash advance facility as a facility under which the servicer of the underlying exposures of a securitization may advance cash to ensure an uninterrupted flow of payments to investors in the securitization, including advances made to cover foreclosure costs or other expenses to facilitate the timely collection of the underlying exposures. See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

percent risk weight floor in the look-through approach and why?

f. Credit-Enhancing Interest Only Strips

The proposal would require a covered banking organization to deduct from common equity tier 1 capital any portion of a credit-enhancing interest-only strip¹⁰⁰ that does not constitute an after-tax-gain-on sale, regardless of whether the securitization exposure meets the proposed operational requirements. The proposed treatment for credit-enhancing interest-only strips would be different than under standardized approach in the current capital rule, which requires a risk weight of 1,250 percent for these items. The proposal would require covered banking organizations to deduct credit-enhancing interest-only strips from common equity tier 1 capital because valuations of credit-enhancing interest-only strips can include a high degree of subjectivity and, just like assets subject to deduction under the current capital rule such as goodwill and other intangible assets, covered banking organizations may not be able to fully realize value from credit-enhancing interest-only strips based on their balance sheet carrying amounts. While a deduction is generally equivalent to a 1,250 percent risk weight when the covered banking organization maintains an 8 percent risk-based capital ratio, given the various capital ratios, buffers, and add-ons applicable to covered banking organizations, applying a deduction provides a more consistent treatment across capital ratios.

g. Non-Performing Loan Securitizations

The proposal would define a non-performing loan securitization as a traditional securitization, that is not a res securitization, where parameter W for the underlying exposures is greater than or equal to 90 percent at the origination cut-off date¹⁰¹ and at any subsequent date on which exposures are added to

¹⁰⁰ Consistent with the current capital rule, the proposal would define a credit-enhancing interest-only strip as an on-balance sheet asset that, in form or in substance (1) represents a contractual right to receive some or all of the interest and no more than a minimal amount of principal due on the underlying exposures of a securitization; and (2) exposes the holder of the CEIO to credit risk directly or indirectly associated with the underlying exposures that exceeds a pro rata share of the holder's claim on the underlying exposures, whether through subordination provisions or other credit-enhancement techniques. See 12 CFR 3.2 (OCC); 12 CFR 217.2 (Board); 12 CFR 324.2 (FDIC).

¹⁰¹ Cut-off date is the date on which the composition of the underlying exposures collateralizing a securitization transaction is established. This means that all exposures to be included in a securitization must already be in existence and meet the non-performing loan criteria as of that date.

or removed from the pool of underlying exposures due to replenishment or restructuring. A securitization exposure that meets the definition of a res securitization exposure would be excluded from the definition of a non-performing loan securitization.

In a typical non-performing loan securitization, the originating banking organization sells non-performing loans to a securitization at a significant discount to the outstanding loan balances, reflecting the nonperforming nature of the underlying exposures. This nonrefundable purchase price discount functions as a form of credit enhancement to investors. Unlike securitizations of performing loans, which principally depend on the cash flows of the underlying loans, the performance of non-performing loan securitizations depends in part on the performance of workouts on defaulted loans and on the liquidation of underlying collateral for those loans which are unable to be cured, both which are uncertain and could be volatile.

Consistent with the expanded risk-based approach proposal, the proposal would introduce a specific capital treatment for non-performing loan securitization exposures. A covered banking organization would assign a risk weight of 100 percent to a non-performing loan securitization exposure if the following conditions are satisfied: (1) the transaction structure meets the definition of a traditional securitization; (2) the securitization contains a credit enhancement in the form of a nonrefundable purchase price discount greater than or equal to 50 percent of the outstanding principal balance of the underlying exposures at inception of the transaction; and (3) the covered banking organization's securitization exposure is a senior securitization exposure, as described in section III.E.5.e. of this **SUPPLEMENTARY INFORMATION**.¹⁰² Applying the SEC-SA to senior securitizations of non-performing loans that meet these criteria would result in capital requirements that do not appropriately reflect the nonrefundable purchase price discount associated with these transactions. The SEC-SA is calibrated on the assumption that the underlying exposures at origination of the securitization are generally

¹⁰² If the covered banking organization is an originating banking organization with respect to the non-performing loan securitization, the covered banking organization may maintain risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO strip that does not constitute an after-tax gain-on-sale.

performing and is therefore inappropriate for senior exposures to securitizations of non-performing loans that meet these criteria.

If the non-performing loan securitization exposure is not a senior securitization exposure or the nonrefundable purchase price discount is less than 50 percent, the covered banking organization would be required to apply the SEC-SA to determine the applicable risk weight (including by reflecting all delinquent exposures in the calculation of parameter W), subject to a risk weight floor of 100 percent. Compared to other securitizations, the higher supervisory risk-weight floor of 100 percent for non-performing loan securitization exposures reflects the greater dependence of non-performing loan securitizations on the servicer's ability to generate recovery cashflows through loan workouts, borrower renegotiations, or enforcement against collateral. If the securitization exposure does not meet the requirements for use of the SEC-SA, the proposal would require the covered banking organization to assign a risk weight of 1,250 to the securitization exposure.

Question 52: The agencies seek comment on the proposed 100 percent risk-weight floor for non-performing loan securitization exposures. What modifications, if any, should the agencies consider to the 100 percent risk-weight floor for non-performing loan securitization exposures and why? Commenters are encouraged to provide data (such as loss history) to support their recommendations.

i. Attachment and Detachment Points for NPL Securitizations Subject to the SEC-SA

Under the proposal, the nonrefundable purchase price discount would equal the difference between the outstanding principal balance of the underlying exposures at the time of sale and the price at which these exposures are sold by the securitization originator¹⁰³ on a final basis, without recourse, to a company the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization. The purchase price discount would be considered non-refundable when neither the securitization originator nor the original lender is reimbursed with respect to that difference. For any given tranche of the securitization, a covered banking

organization may take into account only the initial sale from the securitization originator in the determination of the non-refundable purchase price discount. In cases where the securitization originator underwrites tranches of a non-performing loan securitization for subsequent sale, a covered banking organization that is an investing banking organization may include in the calculation of the nonrefundable purchase price discount the difference between the outstanding principal balance of the underlying exposures at time of sale and the price at which the securitization originator subsequently sells all of the underwritten tranches to unrelated third parties.

Because the calculation of both parameters A and D depend on the current dollar amount of the underlying exposures, any nonrefundable purchase price discount associated with a securitization would be included in both the numerator and denominator of parameters A and D. For example, assume an originating banking organization sells on a final basis, without recourse, a pool of mortgage loans with an outstanding principal balance of \$100 million to a securitization at a price of \$60 million. The nonrefundable purchase price discount would be the difference between the outstanding principal balances of the underlying mortgages at the time of sale to the securitization and the price at which the originating banking organization sold these mortgages to the securitization company (that is, \$40 million). Assume that the securitization company issues \$60 million in securitization tranches of which the originating banking organization purchases the senior \$50 million tranche and an investing banking organization purchases the \$10 million subordinate tranche. Parameter A for the investing banking organization's exposure would equal 40 percent (that is, the ratio of \$40 million to \$100 million). In this case, the purchase price discount functions as the effective first-loss position in the securitization structure. Likewise, the originating banking organization would treat both the nonrefundable purchase price discount and the investing banking organization's tranche as subordinate and would set parameter A at 50 percent.

If, in the example above, after selling the \$100 million pool of mortgage loans to a securitization company at a price of \$60 million, the originating banking organization underwrites both the senior tranche and the subordinate tranche and later sells both tranches to third parties at a 20 percent discount

(that is, the \$10 million subordinated tranche is sold for a price of \$8 million and the \$50 million senior tranche is sold for a price of \$40 million), the proposal would allow the investing banking organizations to assign an attachment point that reflects the extent to which losses have effectively been absorbed by the non-refundable purchase price discount, as measured by the difference between the outstanding principal amount of the underlying exposures (\$100 million) and the aggregate price at which the originating bank subsequently sells those securitization tranches to unrelated third parties (\$48 million). The originating banking organization as underwriter absorbs the additional 20 percent price discount at the sale of the tranches.¹⁰⁴ Thus, the investing banking organization that purchases the \$8 million subordinate tranche would be permitted to assign an attachment point of 52 percent and a detachment point of 60 percent to its securitization exposure; the investing banking organization that purchases the \$40 million senior tranche would be permitted to assign an attachment point of 60 percent and a detachment point of 100 percent to its securitization exposure.

6. Credit Risk Mitigation for Securitization Exposures

The proposal would incorporate the credit risk mitigation framework for securitization exposures in the current capital rule, with one exception. A covered banking organization that purchases or sells tranching credit protection, whether hedged or unhedged, referencing part of a senior tranche would not be allowed to treat the lower-priority portion that the credit protection does not reference as a senior securitization exposure. For example, if a covered banking organization holds a securitization exposure with an attachment point of 20 percent and a detachment point of 100 percent and the covered banking organization purchases an eligible guarantee with an attachment point of 50 percent and a detachment point of 100 percent, the covered banking organization's residual

¹⁰⁴ Under the proposal, a purchase price discount would only qualify as a non-refundable purchase price discount if neither the securitization originator nor the original lender receive reimbursement of the discount. If, in the above example, the securitization company repays the originating banking organization, acting in its role as underwriter, for the purchase price discount from the sale of the tranches to third-party investors, the purchase price discount would not qualify as a non-refundable purchase price discount and the investing banking organizations would not be permitted to recognize such a discount in the calculation of parameters A and D.

¹⁰³ While originator typically refers to the party originating the underlying loans, in the non-performing loan context it refers to the party arranging the non-performing loan securitization (that is, the securitizer).

exposure, which attaches at 20 percent and detaches at 50 percent, would be considered a non-senior securitization exposure, and the covered banking organization would not be permitted to apply the look-through approach to this exposure. A covered banking organization that purchases a mezzanine tranche that attaches at 20 percent and detaches at 50 percent has a similar economic exposure to a covered banking organization that purchases a senior tranche that attaches at 20 percent and detaches at 100 percent and then purchases credit protection that attaches at 50 percent and detaches at 100 percent. Because the former transaction would not be considered a senior securitization exposure eligible for the look-through approach, the latter transaction likewise should not be eligible for the look-through approach. Alternatively, the covered banking organization may choose not to recognize the tranching credit protection. In this case, the proposal would allow the covered banking organization to treat the securitization exposure (which attaches at 20 percent and detaches at 100 percent) as a senior securitization exposure.

F. Indexing of Thresholds

The capital rule uses certain thresholds to differentiate requirements based on a banking organization's size, risk profile, and complexity as well as on the characteristics of the exposures. However, static dollar-based thresholds can lead to unintended consequences if threshold levels are not periodically updated or indexed to inflation. For example, covered banking organizations can become subject to additional requirements and burden over time for reasons unrelated to changes in their risk profile. Under the proposal, certain dollar-based thresholds would be adjusted in the future to reflect inflation, pursuant to a pre-determined indexing methodology.¹⁰⁵ Indexing dollar-based thresholds would preserve threshold levels in real terms, which would efficiently and transparently preserve the thresholds' intended application and align with intended policy objectives over time.

The proposed indexing methodology would adjust thresholds based on the consumer price index for urban wage earners and clerical workers (CPI-W) published by the U.S. Bureau of Labor Statistics. The use of CPI-W to index thresholds is consistent with other bank

regulations, such as those relating to the Community Reinvestment Act and the Board's Regulation CC.¹⁰⁶ Further, the indexing methodology included under the proposal would generally align with the methodology used to adjust certain thresholds within FDIC regulations.¹⁰⁷ Specifically, certain dollar thresholds would be adjusted at the end of every consecutive two-year period based on the cumulative percent change of the non-seasonally adjusted CPI-W since the effective date of any final rule. This two-year period is intended to provide an appropriate cadence for capturing meaningful changes in inflation on a timely basis while minimizing the burden of adjustment. To address the possibility of periods of unusual inflation, the indexing methodology would also allow for discretionary adjustment to thresholds by the agencies during an off year. The proposal would also not lower thresholds in the event of deflation.¹⁰⁸ Additionally, thresholds adjusted under the proposed indexing methodology would be rounded based on the size of the threshold (e.g., billions, millions, thousands), generally, to the nearest two significant digits, as appropriate.¹⁰⁹

The proposal would index the following thresholds: (1) the \$1 million threshold used to determine whether a mortgage qualifies as a residential mortgage exposure; (2) the \$10 million threshold used to determine whether a company in which a covered banking organization owns equity instruments meets the definition of financial institution; and (3) the \$50 billion threshold used to determine whether a covered banking organization is subject to enhanced public disclosure requirements.

To effectuate threshold changes under the proposal, the agencies would announce threshold adjustments pursuant to the indexing methodology

¹⁰⁶ The agencies' regulations that implement the Community Reinvestment Act define small and intermediate-small banks by reference to asset-size criteria expressed in dollar amounts, which are adjusted annually based on the year-to-year change in inflation through a **Federal Register** notice. Specifically, this adjustment corresponds to the average of the Consumer Price Index for Urban Wage Earners and Clerical Workers, not seasonally adjusted, for each 12-month period ending in November, with rounding to the nearest million. See e.g., Community Reinvestment Act Regulations Asset-Size Thresholds, 89 FR 106480, 106481 (Dec. 30, 2024). See also 12 CFR 229.11.

¹⁰⁷ See Adjusting and Indexing Certain Regulatory Thresholds, 90 FR 55789 (Dec. 1, 2025).

¹⁰⁸ Any periods of deflation would be reflected in future threshold increases, as threshold adjustments in the future would be based on the positive net cumulative change in CPI-W.

¹⁰⁹ For example, a threshold that would otherwise be calculated as \$5.964 million would be rounded to \$6.0 million, or the nearest \$0.1 million.

by publishing the updated thresholds. Threshold adjustments would be calculated based on cumulative CPI-W data through August of the year in which the adjustment is made, relative to the same initial baseline.¹¹⁰

Question 53: What are the advantages and disadvantages of the proposed approach for indexing thresholds? What alternatives should the agencies consider and why? What are the advantages and disadvantages of using a different index for adjusting thresholds, such as nominal GDP or the GDP deflator, instead of CPI-W?

Question 54: Are there specific thresholds within the proposal that can result in an increase in operational burden when indexed? If so, which are they and why?

Question 55: What are the advantages and disadvantages of discretionary off-year adjustments for periods of unusual inflation? Should the agencies consider a framework for adjustment in off years, such as based on inflation or other threshold and, if so, why?

IV. Disclosure Requirements

Meaningful public disclosures of a banking organization's activities and the features of its risk profile work in tandem with the regulatory and supervisory frameworks by helping to support robust market discipline. In this way, meaningful public disclosures help to support the safety and soundness of banking organizations and the financial system more broadly.

Under the current capital rule, all covered banking organizations with total consolidated assets \$50 billion or more are subject to the public disclosure requirements.¹¹¹ Under the proposal, the \$50 billion total consolidated asset threshold in section _____.61 of the capital rule would adopt a mechanism to adjust the public disclosure threshold for inflation, as described in Section III.F of this **SUPPLEMENTARY INFORMATION**.¹¹²

In addition, to account for the changes proposed under this proposal, the agencies anticipate separately proposing revisions to the Consolidated Reports of Condition and Income (Call Report).

¹¹⁰ The U.S. Bureau of Labor Statistics publishes the CPI-W on a monthly basis.

¹¹¹ See 12 CFR _____.61 to _____.63. For the purposes of the disclosure requirements threshold, total consolidated assets are determined based on the average of a covered banking organization's total consolidated assets in the four most recent quarters or the average of the covered banking organization's total consolidated assets in the most recent consecutive quarters if the Board-regulated institution has not filed such a report for each of the most recent four quarters. See 12 CFR _____.61.

¹¹² See 12 CFR _____.2, "Annual inflation index" and 12 CFR _____.4.

¹⁰⁵ This revision would also be consistent with comments received under EGRPRA as commenters requested indexing of thresholds going forward to reflect inflation.

Similarly, the Board anticipates proposing corresponding revisions to the Consolidated Financial Statements for Holding Companies (FR Y-9C), the Capital Assessments and Stress Testing (FR Y-14A and FR Y-14Q), and the Systemic Risk Report (FR Y-15) to reflect the changes to the capital rule that would be required under this proposal and the expanded risk-based approach proposal.

The agencies are considering proposing reporting changes that would include many of the quantitative disclosure requirements currently provided under section _____.173 of the current capital rule for Category I and II banking organizations. To reduce duplication in anticipation of these proposed reporting changes, the expanded risk-based approach proposal would remove all quantitative disclosures required under section _____.173 of the capital rule.¹¹³ Covered banking organizations subject to public disclosure requirements under section _____.63 of the capital rule would not be subject to the same regulatory reporting requirements as Category I and II banking organizations.¹¹⁴ As such, this proposal would not make any modifications to the disclosure requirements under section _____.63 of the capital rule.

Question 56: Many of the quantitative disclosures required by section _____.63 of the capital rule are also reported in other publicly available regulatory reports such as the Call Report or FR Y-9C. The agencies request comment on the public disclosure requirements

under section _____.63 of the current capital rule and whether each of the mandated quantitative disclosures is necessary given other regulatory reporting requirements imposed on banking organizations. What duplicative quantitative disclosures should the agencies consider modifying, and why? What are the advantages and disadvantages of removing all quantitative disclosures from section _____.63 and reflecting them in regulatory reports, consistent with the approach being contemplated in the expanded risk-based approach proposal?

Question 57: The agencies invite comment on the utility of the proposed public disclosure requirements. What additional considerations, if any, should the agencies consider with regard to the scope and granularity of the proposal's disclosure requirements? What are the advantages and disadvantages of the proposed disclosure requirements?

V. Estimated Impact on Capital Requirements

As previously discussed, the proposed rule would amend aspects of the capital requirements for covered banking organizations. In particular, the proposed rule would revise the calculation of risk-weighted assets for certain asset classes for covered banking organizations. The changes in risk-weighted assets would in turn affect covered banking organizations' risk-based capital requirements. The proposed rule would also modify the securitization framework and the credit risk mitigation framework. Further, the proposed rule would remove the threshold-based deduction for mortgage servicing assets for covered banking organizations.¹¹⁵ Finally, the proposed

rule would require Category III and IV banking organizations to include most components of accumulated other comprehensive income (AOCI) in the numerator of their regulatory capital ratios.

This section estimates the impact of these proposed revisions to the regulatory capital framework on risk-weighted assets and capital requirements. The following section examines the effect on covered banking organizations, their customers, their competitors, and the banking industry at large.

Summary

The analysis estimates the change in risk-weighted assets and common equity tier 1 and tier 1 capital requirements that would result from the proposal. This impact is estimated separately for holding companies and depository institutions, and for three size groups of these banking organizations: (1) Category III and IV holding companies, which have assets over \$100 billion, and their subsidiaries;¹¹⁶ (2) covered banking organizations with between \$10 billion and \$100 billion in assets; and (3) covered banking organizations with less than \$10 billion in assets that have not elected to use the community bank leverage ratio (CBLR) framework. The estimated impact of the proposal across all covered banking organizations is summarized by Table V.1. Table V.2 further breaks down the impact across banking organizations in the different size groups.

community bank leverage ratio framework. In addition, the expanded risk-based proposal would remove the deduction treatment of mortgage servicing assets for Category I and II banking organizations.

¹¹⁶ Smaller subsidiaries of Category III and IV holding companies are included in only this first group of banking organizations.

¹¹³ See section VI. of the expanded risk-based proposal.

¹¹⁴ For example, the Regulatory Capital Reporting for Institutions Subject to the Advanced Capital Adequacy Framework (FFIEC 101) or the Market Risk Regulatory Report for Institutions Subject to the Market Risk Capital Rule (FFIEC 102).

¹¹⁵ This proposed change would also apply to banking organizations that elect to use the

Table V.1: Summary of the Proposal's Estimated Impact on Risk-Weighted Assets and Common Equity Tier 1 (CET1) and Tier 1 Capital Requirements (%)

	Risk-Weighted Assets	Capital Requirements	
		CET 1	Tier 1
Covered Depository Institutions			
No AOCI	-8.6	-8.6	-7.4
With AOCI impact ¹¹⁷		-6.4	-5.7
Covered Holding Companies			
No AOCI	-8.8	-6.8	-6.9
With AOCI impact		-4.8	-5.3

Source: Special data collection, FR Y-9C, FFIEC Call Reports, and agency calculations as described in sections V.D. and V.F.

The agencies estimate that the proposal would decrease aggregate risk-weighted assets by 8.6 percent for covered banking organizations that are depository institutions (covered depository institutions), relative to the current standardized approach. The changes in risk-weighted assets would in turn decrease these depository institutions' common equity tier 1 capital requirements by 8.6 percent and tier 1 capital requirements by 7.4 percent, after taking into account leverage ratio requirements and before considering changes to the numerator of the capital ratios. The proposed changes would require depository institution subsidiaries of Category III and IV holding companies to recognize AOCI in regulatory capital, subject to a five-year transition period. The agencies assess the impact of AOCI recognition with a long-run perspective and estimate that this proposed change would partially offset the expected decrease in capital requirements. As a result, taking into account AOCI recognition (in addition to leverage ratio requirements),

aggregate common equity tier 1 and tier 1 capital requirements for covered depository institutions decrease by 6.4 and 5.7 percent, respectively, as shown in Table V.1.¹¹⁸

Similarly, the agencies estimate that the proposal would decrease aggregate risk-weighted assets by 8.8 percent for covered banking organizations that are depository institution holding companies (covered holding companies), relative to the current standardized approach. The changes in risk-weighted assets would in turn decrease these covered holding companies' common equity tier 1 capital requirements by 6.8 percent and tier 1 capital requirements by 6.9 percent, after taking into account leverage ratio requirements and before considering changes to the numerator of the capital ratios. Taking into account AOCI impacts and leverage ratio requirements, covered holding companies would see decreases in common equity tier 1 and tier 1 capital requirements of 4.8 and 5.3 percent, respectively, as shown in Table V.1.

In the current capital regulation framework, Category III and IV holding companies are further subject to a stress capital buffer requirement which would dampen the impact of changes in risk-weighted assets on capital requirements.¹¹⁹ This stress capital buffer requirement is informed by the Board's supervisory stress test, to which changes have been recently proposed.¹²⁰ Table V.2 shows that the impact of the proposed stress test changes as if the proposed model changes and proposed revisions to the global market shock scenario design had been implemented in the 2024 and 2025 stress tests, independent of other factors that affect the determination of a banking organization's stress capital buffer

¹¹⁹ Stress capital buffer requirements expressed in dollar terms are affected by risk-weighted assets primarily to the extent that they are subject to a floor equal to 2.5 percent of risk-weighted assets.

¹²⁰ The "proposed stress test changes" refer to the proposed model changes and revisions to the global market shock component announced in connection with the Board's proposal to enhance the transparency and public accountability of the Board's supervisory stress test. See Board, Enhanced Transparency and Public Accountability of the Supervisory Stress Test Models and Scenarios; Modifications to the Capital Planning and Stress Capital Buffer Requirement Rule, Enhanced Prudential Standards Rule, and Regulation LL, 90 FR 51856 (Nov. 18, 2025) (the "Stress Test Transparency Proposal").

¹¹⁷ As described below in section V.E, the impact of AOCI is represented as a change in requirements by adding the estimated long-run impact of AOCI on equity to requirements. Under the proposal, recognizing most elements of AOCI in regulatory capital would be mandatory only for Category III and IV banking organizations and their subsidiaries.

¹¹⁸ The impact of AOCI recognition in regulatory capital can be affected by the interest rate environment, bank balance sheet management, and changes in the accounting standards. The estimate reported here represents a long-run average and does not consider the transition provisions (see *Infra* fn [121]).

requirement.¹²¹ The cumulative estimated impact of the proposal's risk-weighted asset changes, the long-run average estimate of AOCI recognition,

and the proposed stress testing model and scenario changes would decrease Category III and IV holding companies' common equity tier 1 and tier 1 capital

requirements by approximately 5.3 and 5.6 percent, respectively.

Table V.2: Summary of the Proposal's Estimated Impact on Risk-Weighted Assets and Common Equity Tier 1 (CET1) and Tier 1 Capital Requirements (%), by Banking Organization Size

	Risk-Weighted Assets	Capital Requirements	
		CET 1	Tier 1
Depository Institutions			
Category III/IV Sub., No AOCI	-9.1	-9.1	-7.8
Category III/IV Sub., AOCI		-4.7	-4.3
Assets \$10 to \$100 bn	-8.3	-8.3	-7.5
Assets Below \$10 bn	-7.7	-7.7	-6.6
Holding Companies			
Category III/IV, No AOCI	-9.5	-6.1	-6.4
Category III/IV, AOCI		-3.0	-3.8
Category III/IV, AOCI and Proposed Stress Test Changes		-5.3	-5.6
Assets \$10 to \$100 bn	-7.9	-7.9	-7.9
Assets Below \$10 bn	-7.5	-7.5	-7.4

Importantly, risk-weighted asset and capital impact estimates assume banking activity and risk exposures remain unchanged. As the proposal and its incentives come into effect, covered

banking organizations may change their behavior.

Baseline

This analysis compares estimated outcomes under the proposal to a baseline in which the current capital regulations remain unchanged. For the

¹²¹ The estimated capital impact described in this cumulative analysis with respect to the proposed stress test changes announced in the Stress Test Transparency Proposal incorporates the underlying data published by the Board in the Stress Test Transparency Proposal, without changes to the underlying data. That proposal included illustrative

analysis that considered the potential effects of the proposed stress test model and scenario changes, independent of other factors and components that inform the Board's stress capital buffer determinations for specific bank holding companies, within the 2024 and 2025 supervisory stress tests. As stated in the Stress Test

Transparency Proposal, in aggregate, the proposed stress test model and scenario changes are not expected to materially change capital requirements for bank holding companies subject to the supervisory stress test, across various stress scenarios and jump-off conditions at the start of the test.

estimation of economic outcomes in both the proposal and the baseline states, this analysis assumes such states would have in place all other relevant statutes and regulations applicable to covered banking organizations that existed as of June 30, 2025. Covered banking organizations' financials other than items affected by capital requirements in these states are assumed to be identical to those on Reports of Income and Condition (Call Reports) and Consolidated Financial Statements for Holding Companies (FR Y-9C) as of June 30, 2025. In addition, agencies use the results of a special data collection in 2023 to inform its analysis.¹²²

¹²² See section VII.D.1 of the expanded risk-based proposal for further discussion of the special collection data.

In conjunction with this proposal, the agencies are issuing the expanded risk-based proposal that would generally apply to Category I and II banking organizations and any other banking organizations that choose to adopt the proposed expanded risk-based approach, and would also revise the market risk capital framework for banking organizations with significant trading activity. The agencies have also published a notice of proposed rulemaking that would lower the CBLR framework's leverage requirement from 9 percent to 8 percent (CBLR proposal).¹²³ The majority of this analysis does not address potential overlaps among the three rulemakings. However, where appropriate, this

¹²³ 90 FR 55048 (Dec. 1, 2025).

analysis considers interaction effects when these other rulemakings are finalized before or at the same time as the proposal.

Scope

The proposal would affect risk-weighted asset calculations for all covered banking organizations. As of June 30, 2025, there are 2,741 covered depository institutions and 344 covered holding companies.¹²⁴ Table V.3 summarizes the total assets and capital levels for the covered banking organizations.

¹²⁴ Holding companies with assets under \$3 billion are not required to report risk-based capital information on the FR Y9-C. For these smaller holding companies, economic activity is largely represented by their depository institution subsidiaries.

Table V.3: Summary of Covered Banking Organizations

Covered depository institutions	Count	Total Assets (billion)	Risk-Weighted Assets (billion)	CET1 capital (billion)	Tier 1 capital (billion)	Required CET1 capital (billion)	Required Tier 1 capital (billion)
Subsidiaries of Category III and IV holding companies	35	\$6,034	\$4,213	\$604	\$608	\$295	\$371
Total assets between \$10 billion and \$100 billion	115	\$3,272	\$2,426	\$316	\$318	\$170	\$209
Total assets below \$10 billion	2,591	\$2,769	\$2,071	\$295	\$296	\$145	\$179
Total	2,741	\$12,075	\$8,711	\$1,216	\$1,222	\$610	\$759
Covered holding companies	Count	Total Assets (billion)	Risk-Weighted Assets (billion)	CET1 capital (billion)	Tier 1 capital (billion)	Required CET1 capital (billion)	Required Tier 1 capital (billion)
Category III and IV	25	\$6,972	\$4,655	\$597	\$659	\$371	\$449
Total assets between \$10 billion and \$100 billion	109	\$3,351	\$2,431	\$322	\$334	\$170	\$207
Total assets below \$10 billion	210	\$1,100	\$864	\$110	\$115	\$60	\$73
Total	344	\$11,423	\$7,950	\$1,029	\$1,108	\$602	\$729

Source: FFIEC Call Reports and FR Y-9C, June 30, 2025.

Notes:

Counts of covered banking organizations exclude Category I and II banking organizations and banking organizations that elected to use the CBLR framework as of June 30, 2025. There are 1,714 depository institutions that elected to use the CBLR framework as of June 30, 2025 with \$796 billion in total assets, and 26 holding companies that elected to use the CBLR framework as of June 30, 2025, with \$100 billion in total assets.

Dollar values represent aggregate assets and capital levels for each cohort of depository institutions and holding companies. Assets and capital levels for cohorts may not add up to the totals due to rounding.

CET1 capital and tier 1 capital denote the values that covered banking organizations reported on Call Reports and the FR Y-9C, as applicable, as of June 30, 2025.

Required CET1 capital is 7% of risk-weighted assets for depository institutions (4.5% adequately capitalized threshold plus 2.5% capital conservation buffer), and 4.5% plus 2.5% capital conservation buffer or firm-specific stress capital buffer requirement, as

applicable, for holding companies.

Required tier 1 capital equals the maximum of required risk-based tier 1 capital, required leverage tier 1 capital, and supplementary leverage ratio (SLR) required tier 1 capital. Required risk-based tier 1 capital is 8.5% of risk-weighted assets for depository institutions (6% adequately capitalized threshold plus 2.5% capital conservation buffer), and 6% plus 2.5% capital conservation buffer or firm-specific stress capital buffer, as applicable, for holding companies. Required leverage tier 1 capital equals 5% of average assets for depository institutions and 4% of average assets for holding companies.

Required SLR tier 1 capital equals 3% of total leverage exposure for Category III holding companies and subsidiary depository institutions.

For Category III and IV holding companies, required capital considers the average of each holding company's two most recent stress capital buffer requirements, effective as of October 1, 2024 and October 1, 2025.

As shown in Table V.3, Category III and IV entities currently represent the largest share of total risk-weighted assets and capital among covered banking organizations. In contrast, covered banking organizations with total assets under \$10 billion constitute the largest group by number but hold substantially smaller risk-weighted asset shares. Covered banking organizations with total assets between \$10 billion and \$100 billion fall in the middle on both metrics.

A. Impact on Risk-Weighted Assets by Lending Category

Covered banking organizations' risk-based capital requirements are expressed as a percentage of their risk-weighted assets. The proposal would revise calculations of risk-weighted assets, which would in turn affect these banking organizations' risk-based capital requirements.

In this section, the agencies estimate how the proposed risk weight revisions would directly change covered banking organizations' risk-weighted assets relative to the baseline. Over the long term, covered banking organizations may adjust their asset allocations across categories to re-optimize returns under the new risk weights. The long-term effects of the proposed rule on covered entities' risk-weighted assets may therefore differ from the estimates presented here. This analysis assumes that asset levels reported as of June 30, 2025, remain constant under both the baseline and the proposal.¹²⁵

In developing these estimates, the agencies apply the proposal's risk weights to exposures included in Call Report schedule RC-R and FR Y-9C schedule HC-R for depository institutions and holding companies, respectively. For more information on

data and methodology, please see section V.F.

In connection with the expanded risk-based proposal, the agencies have evaluated the appropriateness of risk weights in the current rule. This analysis suggests that lower risk-weights would better align with the actual risks in bank lending activities related to residential mortgage, corporate, and retail exposures, as well as other assets.¹²⁶ Informed by this analysis and to have more consistency between the expanded risk-based approach and the standardized approach, the proposal implements the following major changes: (1) broader range of risk weights for residential mortgage exposures, based on LTV ratios and source of repayment, (2) reduction in the risk weight assigned to corporate exposures from 100 percent to 95 percent, (3) reduction in the risk weight assigned to other assets from 100 percent to 90 percent and (4) replacement of the 20 percent and 50 percent maturity-based credit conversion factors for commitments that are not unconditionally cancelable with a single 40 percent credit conversion factor. Additionally, the proposal adopts the changes in the expanded risk-based proposal regarding the securitization framework and the credit risk mitigation including the recognition of financial collateral for a broader range of transactions.¹²⁷

To produce a more precise assessment of the impact of the proposal, this analysis estimates the impact on risk-weighted assets to the most granular extent possible given existing regulatory reports. In many cases, the analysis

employs simplifying assumptions and relies on aggregated line items from current regulatory reports to estimate the effect of the proposal. See Section V.F for further details.

As mentioned previously, the proposal would modify the capital treatment of residential mortgage exposures. Under the current capital rule, owner-occupied or rented residential mortgage exposures secured by a first lien on one-to-four family residential properties that are prudently underwritten generally receive a 50 percent risk weight. Other residential mortgage exposures receive a 100 percent risk weight. Under the proposal, residential mortgage exposures currently eligible for the 50 percent risk weight would be risk-weighted according to two LTV-based lookup tables, which are applied based on the residential mortgage exposures' source of repayment. Residential mortgage exposures that are not dependent on the cash flows of the underlying real estate would have risk weights that range from 25 percent to 75 percent, whereas residential mortgage exposures that are dependent on the cash flows of the underlying real estate would have risk weights that range from 35 percent to 110 percent. These changes would represent a substantial increase in risk sensitivity of the capital framework.

Due to the limitations of current regulatory reports, the agencies utilize the 2023 special data collection to estimate the LTV distribution of residential mortgage exposures and the proportion of them that are dependent on the cash flows of the underlying real estate. This special data collection indicates that the significant majority of residential mortgage loans by Category III and IV banking organizations would be risk-weighted as residential mortgage exposures that are not dependent on the

¹²⁵ Section VI discusses covered institutions' plausible responses to the proposal and the effects thereof.

¹²⁶ "Retail" exposures are not a defined category of exposures under the current or proposed standardized approach. Additionally, as described in Section III.A.2, "other assets" refers to all assets not specifically assigned a different risk weight under the rule and that are not deducted from regulatory capital.

¹²⁷ See section IV.A.5 of the expanded risk-based approach proposal.

cash flows of the real estate.¹²⁸ Per Table V.4, the analysis indicates that the risk-weighted assets for residential mortgage exposures would decrease by 29.8 percent for covered depository institutions and by 30.4 percent for covered holding companies, relative to the baseline. The decrease in risk-

¹²⁸ The 2023 special collection data indicate that, in aggregate, approximately 97 percent of residential exposures are not dependent on the cash flows of the real estate for firms that submitted data.

weighted assets would, in turn, result in a significant decrease in the capital required to support residential mortgage lending.

Relating more generally to residential mortgage lending, the proposal would remove the 25 percent deduction threshold for mortgage servicing assets, while retaining the 250 percent risk weight.¹²⁹ Per Table V.4, the impact of

¹²⁹ The proposal would remove the 25 percent deduction threshold for mortgage servicing assets

removing the threshold deduction is not material for risk-weighted assets; however, this proposed change may incentivize banks to re-enter the mortgage servicing business or expand their existing operations.

for all banking organizations subject to the regulatory capital rule, including banking organizations subject to the community bank leverage ratio framework. The 250 percent risk weight for mortgage servicing assets would not apply to banking organizations subject to the community bank leverage ratio framework.

Table V.4: Impact on Risk-Weighted Assets

Current and revised standardized approach (SA) risk-weighted assets, covered banking organizations, billions							
		Depository institutions			Holding companies		
		Current SA	Revised SA	Change	Current SA	Revised SA	Change
General Risk Weights	Residential mortgages	\$755	\$530	-29.8%	\$606	\$421	-30.4%
	Commercial real estate	\$1,896	\$1,801	-5.0%	\$1,426	\$1,354	-5.0%
	Other corporate exposures	\$3,023	\$2,808	-7.1%	\$3,095	\$2,878	-7.0%
	Retail	\$1,297	\$1,167	-10.0%	\$1,182	\$1,063	-10.0%
	Securitization	\$117	\$96	-17.6%	\$108	\$88	-18.0%
	Commitments	\$20	\$17	-11.3%	\$17	\$15	-12.2%
	Other assets from 100% to 90% risk weight	\$473	\$426	-10.0%	\$494	\$445	-10.0%
	MSA deduction elimination	\$0.0	\$0.4		\$0.0	\$0.0	
	Exposures shifting from market risk framework to standardized approach	\$0.0	\$1.3		\$0.0	\$3.3	
	Allowance deduction change	\$0.0	(\$6.5)		\$0.0	(\$5.9)	
	Other assets – risk weights unchanged	\$1,119	\$1,119	0.0%	\$865	\$865	0.0%
Market risk		\$12	\$4.2	-66.2%	\$157	\$95.7	-39.2%
Credit valuation adjustment (CVA) risk		\$0.0	\$2		\$0.0	\$29.7	
Risk-weighted assets for trading-related activities (market risk and CVA risk, subtotal)		\$12	\$6	-48.4%	\$157	\$125	-20.3%
Total		\$8,711	\$7,966	-8.6%	\$7,950	\$7,253	-8.8%
Source: Special data collection of 2023; FFIEC Call Reports; and FR Y-9C, June 30, 2025. Other corporate exposures category includes unused commitments currently risk-weighted at 100%, and repo currently risk-weighted at 100%; all such exposures are risk-weighted at 95% under the revised SA. The Commitments row includes all unused commitments except those currently risk-weighted at 100%. All commitments under one year have a credit conversion factor change from 0.2 to 0.4, those over one year have credit conversion factor change from 0.5 to 0.4. "Allowance deduction change" accounts for the change in deduction for excess adjusted allowance for credit losses (AACL) to risk-weighted assets that occurs when credit risk-weighted assets change. This change in risk-weighted assets would reflect a change in RC-R and HC-R part II. item 29.							

The proposal would decrease the risk weight for corporate exposures uniformly by five percentage points. Under both the current and proposed rule, the corporate exposure category is a broad one that includes a wide range of exposures to companies without specific regulatory treatment under the rule.¹³⁰ Among these various corporate

exposure types, the agencies separately analyze the impact on commercial real estate, which is generally a material asset class for banking organizations, along with "other corporate exposures."

As shown in Table V.4, the agencies estimate a decrease in risk-weighted assets of 5 percent for identified exposures to commercial real estate, at both the holding company and

depository institution levels, compared to the baseline. The commercial real estate exposures are based on current regulatory reporting items, including multifamily loans, that would likely not qualify for other specialized treatments under the capital rule, such as the treatment for high volatility commercial real estate exposures.

Per Table V.4, the other corporate exposure category is the largest asset class for covered banking organizations

¹³⁰ In the capital impact analysis of the expanded risk-based approach proposal, corporate exposures

do not include any commercial real estate exposures.

in terms of the quantity of risk-weighted assets. Other corporate exposures include a wide range of exposures such as commercial and industrial loans, loans to non-depository financial institutions, and certain farm loans, as well as unfunded commitments to companies and repo-style transactions and derivatives. The estimated impact to risk-weighted assets for other corporate exposures in Table V.4 includes estimated changes both due to the risk weight change and due to the exposure measurement change as a result of applying a 40 percent credit conversion factor. Estimated risk-weighted assets for other corporate exposures decrease by approximately 7 percent for covered banking organizations, relative to the baseline. Given its large share, the decrease is close to 30 percent of the total estimated decrease in risk-weighted assets.

The proposed changes to the treatment of commitments would have effects beyond those associated with other corporate exposures. Banking organizations may also extend commitments that are not unconditionally cancelable and that have varying maturities to other entities such as public sector entities. The agencies estimate that the proposed change on such commitments that were not included in the other corporate exposure category would result in a decrease of risk-weighted assets of 11.3 percent for depository institutions and 12.2 percent for holding companies, relative to the baseline. However, these constitute a relatively small share of overall exposures.

The proposal would also lower the risk weight for other assets from 100 percent to 90 percent. The other asset category in the capital rule includes a range of exposures such as exposures to individuals and other real estate owned that are not otherwise assigned a specialized capital treatment under the rule. To gain a more granular understanding of the proposal's impact, the agencies estimate the impact on retail exposures as well as other assets currently assigned a 100 percent risk weight.

Retail exposures typically include loans to individuals such as credit card loans, revolving credit plans, and automobile loans. Using existing regulatory reporting information, the agencies identified such exposures and per Table V.4, estimate a decrease of 10 percent in risk-weighted assets, relative to the baseline, consistent with the decline in the risk weight from 100 percent to 90 percent. The agencies separately estimate the impact on other assets that are not associated with retail

exposures. These exposures can include premises and fixed assets and other real estate owned. Per Table V.4, the agencies estimate a 10 percent decrease in risk-weighted assets for covered banking organizations, relative to the baseline.

As discussed in Section III.E, the agencies are proposing to also include many of the changes to the securitization framework in the revised standardized approach that are also included in the expanded risk-based proposal. These changes would likely serve to lower the capital requirements for a given securitization transaction, incentivize the use of the securitization framework to reduce risk weights for assets held on-balance sheet, and encourage the sale of pools of assets to securitization trusts, relative to the baseline. Per Table V.4, the agencies estimate that there will be an approximately 18 percent decrease in risk-weighted assets for securitization exposures for covered banking organizations, relative to the baseline.

As noted above, the proposal also includes changes to the credit risk mitigation framework which would increase the options available to substitute the risk weight of loans with the risk weight of financial collateral such as U.S. Treasury securities and cash on deposit. The agencies have not estimated the impact of this proposed change due to insufficient data to develop a reasonably accurate estimate. Given the prevalence of U.S. Treasury securities and deposits in the banking system, the agencies note that the decrease to capital requirements could be significant, although the impact will depend in part on an obligor's willingness to encumber their securities and deposits for a period of time in order to satisfy the proposal's qualifying criteria.

B. Trading-Related Impact on Risk-Weighted Assets

Banking organizations subject to the revised standardized approach would also be subject to capital requirements for market risk and credit valuation adjustment (CVA) risk to the extent that they have significant amounts of trading activity.¹³¹ As discussed in the expanded risk-based proposal, the applicability of the market risk and CVA risk frameworks would be modified relative to the current rule.¹³² As a result, some banking organizations

would no longer be required to apply the market risk framework and instead would have their trading assets risk-weighted according to the risk weights in the revised standardized approach. Per Table V.4, the agencies estimate that this would result in an increase in risk-weighted assets of \$1 billion for depository institutions and \$3 billion for holding companies, relative to the baseline. However, this change should be considered together with the changes in risk-weighted assets for the market risk and CVA risk frameworks.

Under the current capital rule, depository institutions and holding companies with over \$1 billion in trading assets must calculate market risk-weighted assets. The expanded risk-based proposal would raise the threshold to \$5 billion indexed for inflation to U.S. CPI-W, eliminating the requirement for depository institutions and holding companies with between \$1 billion and \$5 billion in trading assets. The expanded risk-based proposal would also add a CVA risk-weighted asset calculation for depository institutions that are subsidiaries of Category I or II depository institution holding companies and are subject to the market risk framework, and for other banking organizations that are subject to the market risk framework that also have at least \$1 trillion in over-the-counter notional derivative exposure. Eight depository institutions and 17 holding companies subject to the proposed revised standardized approach would be subject to the market risk framework under the expanded risk-based proposal. One of these depository institutions and 6 of these holding companies would also be subject to capital requirements for CVA risk. Raising the market risk threshold removes the market risk requirement for 7 covered depository institutions and 9 covered holding companies.

Revisions to the market risk framework within the expanded risk-based proposal and removal of market risk capital requirements for some covered banking organizations would result in a large decline in aggregate market risk-weighted assets for covered banking organizations, which is partially offset by the addition of the CVA risk requirement. Relative to the baseline, risk-weighted assets for trading-related activities would decrease by 48.4 percent for covered depository institutions and by 20.3 percent for covered holding companies. However, the changes are small relative to the total reduction in risk-weighted assets under the proposal. For covered depository institutions, the estimated \$6 billion decline in aggregate trading-

¹³¹ Credit valuation adjustment risk is the exposure to changes in the valuation of derivative contracts driven by changes in counterparty credit risk.

¹³² See section II.A of the expanded risk-based proposal.

related risk-weighted assets is less than one percent of the estimated total \$745 billion decline in risk-weighted assets under the proposal, relative to the baseline. For covered holding companies, the estimated \$32 billion decline in aggregate trading-related risk-weighted assets is 4.6 percent of the estimated total \$697 billion decline in risk-weighted assets under the proposal, relative to the baseline. Please see the expanded risk-based proposal for a comprehensive discussion of the regulatory capital and economic effects of the proposed changes to the market risk and CVA risk frameworks.¹³³

C. Impact on Risk-Weighted Assets by Bank Size

The proposal, together with the market risk and CVA risk capital requirements of the expanded risk-based proposal, would result in an estimated decrease in risk-weighted assets of 8.6 percent for covered depository institutions and 8.8 percent for covered holding companies, per Table V.4, relative to the baseline. Table V.5 presents estimated risk-weighted assets under the baseline and the proposal for three groups of covered banking organizations: Category III and IV; those with total assets between \$10 billion and \$100 billion; and those with assets under \$10 billion (excluding banking organizations that opted into the CBLR framework as of June 30, 2025). Relative to the baseline, total risk-weighted assets under the proposal would decrease by 9.1 percent for Category III and IV depository institutions, by 8.3 percent for depository institutions with assets between \$10 billion and \$100 billion and by 7.7 percent for covered depository institutions with assets under \$10 billion.

Table V.5: Impact on Risk-Weighted Assets by Bank Size

RWA totals	Depository institutions			Holding companies		
Bank Cohort	Current SA	Revised SA	Change	Current SA	Revised SA	Change
Category III and IV	\$4,213	\$3,828	-9.1%	\$4,655	\$4,214	-9.5%
Total assets between \$10 billion and \$100 billion	\$2,426	\$2,225	-8.3%	\$2,431	\$2,239	-7.9%
Total assets below \$10 billion	\$2,071	\$1,913	-7.7%	\$866	\$799	-7.5%

Source: Special data collection of 2023; FFIEC Call Reports; and FR Y-9C, June 30, 2025.

Differences in risk-weighted asset impact across bank size cohorts is driven by differences in the other corporate exposures category as classified in Table V.4, specifically unused commitments. Covered depository institutions and holding companies with assets under \$10 billion have a greater proportion of unused commitments that are not unconditionally cancelable and that have a maturity of under one year, which would, under the proposal, have a credit conversion factor change from 20 percent to 40 percent. This change doubles the recorded exposure amount. Under the proposal, unused commitments that are corporate exposures are risk-weighted at 95 percent, down from 100 percent under the baseline, so the proposal would increase the risk-weighted asset amount for unused commitments under one year

by 90 percent, relative to the baseline.¹³⁴

Conversely, Category III and IV depository institutions and holding companies, and to a lesser extent depository institutions and holding companies with assets between \$10 billion and \$100 billion, have a greater proportion of unused commitments that are not unconditionally cancelable and that have a maturity of over one year. The proposal would apply a credit conversion factor of 40 percent to unused commitments over one year, down from a credit conversion factor of 50 percent under the baseline. The reduction in the credit conversion factor from 50 percent to 40 percent lowers the exposure amount for those unused commitments by 20 percent. The risk-weighted asset amount for unused commitments with a maturity of over one year decreases by 24 percent under the proposal.¹³⁵

All exposures in the other corporate exposures category would have risk weights reduced from 100 percent to 95 percent under the proposal, and a credit conversion factor is applied to unused commitments within this exposure category. Therefore, in the absence of unused commitments, risk-weighted assets for other corporate exposures would decrease by 5 percent under the proposal. For covered depository institutions and holding companies with assets under \$10 billion, risk-weighted assets for other corporate exposures would decline by less than 5 percent (4.3 percent and 4.7 percent, respectively) relative to the baseline, a result that reflects these banking organizations' greater proportion of unused commitments with a maturity of under one year. For Category III and IV depository institutions and for holding companies and depository institutions and holding companies with assets between \$10 billion and \$100 billion,

¹³³ See sections VII and VIII.E of the expanded risk-based proposal.

¹³⁴ $(0.4 \times 95\% - 0.2 \times 100\%) / (0.2 \times 100\%) = 90$ percent.

¹³⁵ $(0.4 \times 95 - 0.5 \times 100) / (0.5 \times 100\%) = -24$ percent

risk-weighted assets for other corporate exposures would decline by more than 5 percent relative to the baseline.¹³⁶ This result reflects these banking organizations' greater proportion of unused commitments with a maturity of over one year.

D. Impact of Changes to Risk-Weighted Assets on Required Capital

As detailed above, the proposed standardized approach would revise calculations of risk-weighted assets for covered banking organizations. The changes in risk-weighted assets would in turn affect these banking organizations' risk-based capital requirements. The impact on required capital would depend on each banking organization's risk exposures as well as the other capital requirements to which the banking organization may or may not be subject. The estimated capital impact considers all applicable minimum capital ratio and buffer requirements, including the stress capital buffer requirement applicable to Category III and IV holding companies. In many instances, this impact analysis summarizes the estimated impact on minimum capital and capital buffer requirements in a single number. However, a banking organization's

minimum regulatory capital ratio and capital buffer requirements are separate requirements with distinct, complementary purposes, and banking organizations are subject to different consequences for falling below minimum capital ratio and buffer requirements.¹³⁷ Please see section V.F for additional details on the data and estimation methodology.

Section V.E considers the long-run average estimate of the impact of AOCI changes on required capital for Category III and IV holding companies and their depository institution subsidiaries, whereas results presented in this section do not include the impact of AOCI recognition.

As shown in Table V.6, the agencies estimate that for covered depository institutions, the impact of risk-weight changes in the proposal on common equity tier 1 capital requirements would be a decrease of 8.6 percent. For depository institution subsidiaries of Category III and IV holding companies, the risk-weight changes in the proposal would decrease aggregate common equity tier 1 capital requirements by 9.1 percent relative to current requirements. For depository institutions with total assets between \$10 billion to \$100 billion, and for covered depository

institutions with total assets below \$10 billion, the aggregate impact of the proposal on common equity tier 1 capital requirements would be a decrease of 8.3 and 7.7 percent, respectively, relative to the baseline.¹³⁸

Binding tier 1 capital impacts for depository institutions are similar to the impacts for common equity tier 1 capital. However, they may also reflect the requirements of the tier 1 leverage ratio and the supplementary leverage ratio. The agencies estimate that, in aggregate, tier 1 capital requirements for covered depository institutions would decrease by 7.4 percent due to the risk-weight changes in the proposal. For depository institution subsidiaries of Category III and IV holding companies, the agencies estimate that risk-weight changes in the proposal would decrease aggregate tier 1 capital requirements by 7.8 percent relative to current requirements. For depository institutions with total assets between \$10 billion to \$100 billion and for covered depository institutions with total assets below \$10 billion, the aggregate impact of the proposal on tier 1 capital requirements would be an estimated decrease of 7.5 and 6.6 percent, respectively.

Table V.6. Covered Depository Institutions: Capital Impact of Changes to Risk-Weighted Assets

Panel A: Common Equity Tier 1 Minimum Plus Buffer Requirements for Depository Institutions

Depository institutions	Current SA	Revised SA	% change from current
Subsidiaries of Category III and IV holding companies	\$295	\$268	-9.1%
Total assets between \$10 billion and \$100 billion	\$170	\$156	-8.3%
Total assets below \$10 billion	\$145	\$134	-7.7%
Total	\$610	\$558	-8.6%

¹³⁶ For additional detail, see section V.G.

¹³⁷ Under the capital rule, a banking organization that is subject to risk-based capital requirements

must maintain capital ratios above the sum of its minimum requirements and buffer requirements to avoid restrictions on capital distributions and certain discretionary bonus payments.

¹³⁸ Both groups of depository institutions exclude subsidiaries of Category I–IV holding companies.

Panel B: Binding Tier 1 Minimum Plus Buffer Requirements for Depository Institutions

	Current						
	Current SA	Leverage	SLR	Binding	Revised SA	Revised binding	% change from current
Depository institutions							
Subsidiaries of Category III and IV holding companies	\$358	\$292	\$126	\$371	\$325	\$342	-7.8%
Total assets between \$10 billion and \$100 billion	\$206	\$159	\$0	\$209	\$189	\$193	-7.5%
Total assets below \$10 billion	\$176	\$137	\$0	\$179	\$163	\$167	-6.6%
Total	\$740	\$589	\$126	\$759	\$677	\$702	-7.4%

Source: Special data collection of 2023; FFIEC Call Reports; and FR Y-9C, June 30, 2025.

As shown in Table V.7 and based on the methodology outlined in section V.F, the agencies estimate that, in aggregate, common equity tier 1 capital requirements of covered holding companies would decrease by 6.8 percent due to the risk-weight changes in the proposal. For Category III and IV holding companies, risk-weight changes in the proposal would decrease aggregate common equity tier 1 capital requirements by 6.1 percent relative to current requirements. For holding companies with total assets between \$10

billion to \$100 billion and for covered holding companies with total assets below \$10 billion, the aggregate impact of the proposal on common equity tier 1 capital requirements would be a decrease of 7.9 and 7.5 percent, respectively.

The agencies estimate that the impact of risk-weight changes in the proposal on tier 1 capital requirements for all holding companies combined would be a decrease of 6.9 percent. For Category III and IV holding companies, the agencies estimate that risk-weight changes in the proposal would decrease

aggregate tier 1 capital requirements by 6.4 percent relative to current requirements. The aggregate impact of the proposal on tier 1 capital requirements would be a decrease of 7.9 percent for holding companies with total assets between \$10 billion to \$100 billion, and a decrease of 7.4 percent for covered holding companies with total assets below \$10 billion. As discussed above, results in Table V.7 do not include effects of AOCI recognition for Category III and IV banking organizations.

Table V.7. Covered Holding Companies: Capital Impact of Changes to Risk-Weighted Assets

Panel A: Common Equity Tier 1 Minimum Plus Buffer Requirements for Holding Companies

	Current	Revised SA	% change from current
Holding companies			
Category III and IV	\$371	\$348	-6.1%
Total assets between \$10 billion and \$100 billion	\$170	\$157	-7.9%
Total assets below \$10 billion	\$60	\$56	-7.5%
Total	\$602	\$561	-6.8%

Panel B: Binding Tier 1 Minimum Plus Buffer Requirements for Holding Companies

	Current				Revised SA	Revised binding	% change from current
	Risk- based	Leverage	SLR	Binding			
Holding companies							
Category III and IV	\$441	\$270	\$154	\$449	\$412	\$421	-6.4%
Total assets between \$10 billion and \$100 billion	\$207	\$131	\$0	\$207	\$190	\$190	-7.9%
Total assets below \$10 billion	\$73	\$44	\$0	\$73	\$68	\$68	-7.4%
Total	\$721	\$444	\$154	\$729	\$670	\$679	-6.9%

Source: Special data collection of 2023; FFIEC Call Reports; and FR Y-9C, June 30, 2025.

In addition to the estimated capital impacts discussed above, some covered banking organizations could be affected by a provision in the expanded risk-based proposal that would give them the option to apply the expanded risk-based approach instead of the proposed revised standardized approach. The expanded risk-based proposal includes a discussion of potential impacts of this option for covered banking organizations. Overall, the incentives to adopt the expanded risk-based approach would be limited, in part, by the proposed revisions to the standardized risk weights.

E. Impact of AOCI Recognition

The proposal would revise the regulatory capital calculation for Category III and IV banking organizations by requiring them to recognize most elements of AOCI in regulatory capital. Under the current capital framework, most Category III and IV banking organizations have opted to exclude AOCI from their regulatory capital. The proposal would withdraw this option and provide a transition period for firms that have made such an election to phase in the effects of recognizing AOCI in their regulatory capital, as discussed in Section II.B.

For Category III and IV holding companies that opted out of the AOCI inclusion, the majority of AOCI is attributable to unrealized losses on current or former available-for-sale securities. Capital market and yield curve developments can at times lead to substantial AOCI fluctuation. Since 2015, the aggregate AOCI related to the security holdings of Category III and IV holding companies fluctuated between

an unrealized gain of \$16 billion and an unrealized loss of \$112 billion. Therefore, the agencies assess the impact of AOCI inclusion from a long-run perspective, which provides a more representative measure of the risk and portfolio management practices of banking organizations through the cycle.¹³⁹

The agencies use quarterly FR Y-9C data from 1996 Q1 to 2025 Q3 to estimate the effect of AOCI recognition. A historical data series is used to represent a full range of economic environments and to reduce the influence of short-term volatility. Some of the main factors affecting AOCI, include: (1) the impact of interest rate environment (as interest rates increase, the market valuations of available-for-sale securities decline, resulting in higher unrealized losses), (2) the effects of bank's balance sheet management, including reallocation of security

holdings from available-for-sale to held-to-maturity, and 3) the effects of accounting rules and standards pertaining to treatment of available-for-sale and held-to-maturity securities. Based on the size of securities portfolios as of 2025 Q3, the estimated long-run average impact of the proposed AOCI inclusion would be to reduce regulatory capital, or effectively increase capital requirements, by \$11.5 billion and \$13.0 billion for all opted-out Category III and IV holding companies and their depository institution subsidiaries, respectively, relative to the baseline.¹⁴⁰

The agencies estimate that the average long-run effect of the proposed recognition of AOCI on depository institution subsidiaries of Category III and IV holding companies would be equivalent to a 4.5 percent increase in common equity tier 1 capital requirements, relative to the baseline. This 4.5 percent increase would

¹³⁹ The literature emphasizes that the economic impact of AOCI should be evaluated from a longer-run perspective, as banks dynamically adjust portfolio composition and securities classification in ways that attenuate the relevance of short-run mark-to-market fluctuations (Kim, Kim, and Ryan, 2019, 2025; Granja et al., 2024). Reference sources: Kim, Sehwa, Seil Kim, & Stephen G. Ryan. 2019. "Economic Consequences of the AOCI Filter Removal for Advanced Approaches Banks." *The Accounting Review* 94 (6): 309–335; Kim, Sehwa and Kim, Seil and Ryan, Stephen G., 2025. "Banks' Motivations for Designating Securities as Held to Maturity" Columbia Business School Research Paper No. 4452667, *The Accounting Review*, forthcoming. Available at SSRN: <https://ssrn.com/abstract=4452667>; Granja, Joao and Jiang, Erica Xuewei and Matvos, Gregor and Piskorski, Tomasz, & Seru, Amit, Book Value Risk Management of Banks: Limited Hedging, HTM Accounting, and Rising Interest Rates (April 2, 2024). University of Chicago, Becker Friedman Institute for Economics Working Paper No. 2024–37. Available at SSRN: <https://ssrn.com/abstract=4781916>.

¹⁴⁰ The –\$11.5 billion estimate is calculated as the amortized cost of securities multiplied by the long-run average AOCI impact factor, which is constructed as follows. First, an AOCI impact is estimated for each holding company that has opted to exclude AOCI from regulatory capital as the sum of (i) net unrealized gains or losses on available for sale debt securities and (ii) held-to-maturity (HTM) securities (where included in AOCI, e.g., due to transfers from AFS to HTM), and (iii) AOCI attributed to defined benefit postretirement plans, i.e., FR Y-9C Schedule HC-R Part I items 9.a, d, and e. This impact is aggregated across all such holding companies and divided by the total amortized cost of their securities, as securities portfolios have historically been the source of almost all AOCI (FR Y-9C Schedule HC-B item 8, columns A and C). This scaled impact is averaged across each quarter from 1996 Q1 to 2025 Q3. The average of these quarterly totals is –81.1 basis points. Similarly, the long-run average AOCI impact factor and the long-run impact for depository institutions that opted to exclude AOCI from regulatory capital is –90 basis points.

partially offset the estimated 9.1 percent decrease in required common equity tier 1 capital due to risk-weighted asset changes. Therefore, the estimated cumulative impact of the proposal on common equity tier 1 capital requirements for depository institution subsidiaries of Category III and IV holding companies would be a decrease of 4.7 percent. Similarly, the agencies estimate that the average long-run impact of the proposed recognition of AOCI on depository institution subsidiaries of Category III and IV holding companies would be equivalent to a 3.5 percent increase in tier 1 capital requirements, partially offsetting the estimated 7.8 percent decrease in required tier 1 capital due to risk-weighted asset changes. Therefore, the estimated cumulative impact of the proposal on tier 1 capital requirements for depository institution subsidiaries of Category III and IV holding companies would be a decrease of 4.3 percent.¹⁴¹

For Category III and IV holding companies, the average long-run impact of AOCI recognition would be equivalent to a 3.1 percent and 2.6 percent relative increase in the respective common equity tier 1 and tier 1 capital requirements, relative to the baseline. The required capital increases would partially offset the estimated 6.1 percent and 6.4 percent decreases in required common equity tier 1 capital and tier 1 capital, respectively, due to risk-weighted asset changes. The cumulative impact of the proposal on common equity tier 1 capital requirements and tier 1 capital requirements for Category III and IV holding companies are estimated to be decreases of 3.0 percent and 3.8, respectively. Note, however, that these estimates of the impact of AOCI do not account for interactions with the stress capital buffer requirement or the five-year transition provisions. Specifically, with AOCI, stress scenarios involving reductions in interest rates would see increases in capital reflecting appreciation in the market value of holding companies' available-for-sale securities, which could affect the size of firms' stress capital buffer and associated capital requirements, and which are not reflected in through-the-cycle long-run estimates on AOCI impact used in this analysis.

Finally, if affected banking organizations do not adjust their AOCI management in response to the

proposed changes (for example by adjusting the relative size, fair value hedging, or interest rate sensitivity of their available-for-sale security portfolios), AOCI recognition could increase variation in regulatory capital ratios over time due to market-driven fluctuations in security values.

F. Data and Estimation Methodology

The agencies estimated risk-weighted assets under the proposal for covered banking organizations, as of the second quarter of 2025. In developing these estimates, the agencies primarily relied on line items from regulatory financial reports (Consolidated Reports of Condition and Income (Call Reports), FFIEC 101, and FFIEC 102 for depository institutions and FR Y-9C for holding companies, supplemented with data on stress capital buffer requirements.¹⁴² The estimates also rely in part on the distribution of residential real estate exposures across various risk weights contained in the 2023 special data collection, which are used to inform the impact of the proposal's risk-weight treatment for residential mortgage exposures, as applied to residential mortgage exposure amounts as of the second quarter of 2025.¹⁴³

¹⁴² Reporting forms issued by the Federal Financial Institutions Examination Council (FFIEC) are available at www.ffiec.gov and reporting forms issued by the Federal Reserve Board are available at www.federalreserve.gov. The "Call Report" collectively refers to the data from the FFIEC 031, 041, and 051 forms. Specifically, see FFIEC 031 Form Statistics and FFIEC 041 Form Statistics. For FFIEC 051 ("FFIEC 051 Form Statistics"), see FFIEC, Reporting Forms, Consolidated Reports of Condition and Income for a Bank with Domestic Offices Only and Total Assets Less than \$5 Billion: FFIEC 051 (version June 2023). Bulk data download available at: <https://cdr.ffiec.gov/public/PWS/DownloadBulkData.aspx>. Certain financial reports filed by banking organizations, including portions of the FFIEC 101 and FFIEC 102 reports, are not available publicly because they contain confidential supervisory information and are confidential business information of the reporting banking organizations.

¹⁴³ To estimate residential real estate risk-weighted assets under the proposal's residential treatment for the Category III and IV holding companies that participated in the 2023 special data collection and their depository institution subsidiaries, the agencies first calculated firm-specific average residential real estate risk-weights according to the proposal that were informed by the firm-specific loan-to-value distribution of residential mortgage exposures contained in the 2023 special data collection. These firm-specific risk-weights were then applied to residential real estate items currently risk weighted at 50 percent (Schedule RC-R and HC-R items 4.a. Column H and 5.a. Column H). For holding companies that did not submit data under the 2023 special data collection, or depository institutions that did not have a parent holding company that submitted data under the 2023 special data collection, the average of the firm-specific average residential risk-weights that were derived from the 2023 special data collection were applied to each firm's residential real estate items currently risk weighted at 50

The 2023 special data collection captures respondents' exposures as of June 30, 2023.¹⁴⁴ Of the 37 banking organizations covered by the 2023 proposal, 32 banking organizations (representing 95 percent of the total assets) provided substantially complete data in the collection. For additional information on how this special collection data was employed in the agencies' estimation methodology, please refer to the expanded risk-based proposal.

The 2023 special data collection did not have depository institutions as participants. However, because subsidiary depository institutions are often the most significant operating companies within a covered depository institution holding company, the agency estimates generally assume that the proposal's risk-weight treatment for residential mortgage exposures would impact risk weighted assets and capital requirements of depository institutions subsidiaries of Category III and IV holding companies similarly to their parent holding companies. The agencies acknowledge, however, that there is likely some variation among banking organizations and that the residential mortgage exposures of some depository institutions may not closely resemble those of their holding companies.

For both covered depository institutions and holding companies, the proposal's 95 percent corporate risk weight was applied to an estimate of corporate exposures that are currently risk-weighted at 100 percent. This includes exposures contained in the FR Y-9C and Call Report that are classified as commercial and industrial, agricultural, secured by farmland, commercial real estate, non-depository financial institutions, reverse repurchase agreements, federal funds, unused commitments, available-for-sale securities, and held-to-maturity securities.¹⁴⁵ Similarly, the proposal's

percent (Schedule RC-R and HC-R items 4.a. Column H and 5.a. Column H).

¹⁴⁴ One banking organization submitted data as of the third quarter of 2023, instead of as of June 30, 2023.

¹⁴⁵ The agencies first estimate the amount of corporate exposures relative to all exposures that are likely to be predominantly risk-weighted at 100 percent in Call Report Schedule RC-C and FR Y-9C Schedule HC-C, and then applying this ratio to items RC-R 4.d. Column I and 5.d. Column I, all other loans and leases held for investment and held for sale, respectively, currently risk-weighted at 100 percent. Corporate exposures from Call Report Schedule RC-C and FR Y-9C Schedule HC-C include loans secured by multifamily (item 1.d.), loans secured by nonfarm, nonresidential property (items 1.e.(1) and 1.e.(2)), commercial and industrial loans (items 4.a. and 4.b.), loans to non-depository financial institutions (item 9.a.), loans secured by farmland (item 1.b.), and loans to finance agricultural production (item 3.).

¹⁴¹ While the impact on capital ratios without AOCI can be viewed as a point-in-time estimate (as of 2025 Q2), the impact of AOCI is estimated through-the-cycle, without taking into account a 5-year transition period, which creates a mild timing mismatch in a cumulative impact estimation.

retail and other assets risk weight of 90 percent was applied to an estimate of retail and other exposures that are currently risk-weighted at 100 percent. This includes exposures contained within the FR Y-9C and Call Report that are classified as or related to credit cards, other revolving credit plans to individuals, autos, other consumer loans, leases, and other exposures contained in HC-R or RC-R part II, item 8 (All other assets) that are currently risk-weighted at 100 percent.¹⁴⁶

In addition to the application of the corporate 95 percent risk weight to commitments currently risk-weighted at 100 percent, unused commitments generally were adjusted by the change in credit conversion factor, which increases from 20 percent to 40 percent

All exposures that are likely to be predominantly risk-weighted at 100 percent include the corporate items listed above, plus the following items: loans to individuals (items 6.a through 6.d.), and lease financial receivables (items 10.a. and 10.b.).

Additional items from Schedule RC-R and Schedule HC-R that are currently risk-weighted at 100 percent are also added to corporate exposures include: Held-to-maturity securities (item 2.a. Column I), available-for-sale debt securities (item 2.b., adjusted to remove non-trading equity securities item 2.c. from Schedules RC and HC), federal funds sold (item 3.a. Column I), financial standby letters of credit (item 12. Column I), performance standby letters of credit and transaction-related contingent items (item 13. Column I), commercial and similar letters of credit with an original maturity of one year or less (item 14. Column I), repo-style transactions (item 16. Column I), all other off-balance sheet liabilities (item 17. Column I), unused commitments (items 18.a. and 18.b.), and over-the-counter derivatives (item 10. Column I).

¹⁴⁶ The agencies estimate retail and other exposures similarly to corporate exposures, by taking a ratio of retail exposures from Schedules RC-C and HC-C (items 6.a through 6.d.) to all exposures that are likely to be predominantly risk-weighted at 100 percent from Schedules RC-C and HC-C (all items listed previously) and applying this ratio to RC-R 4.d. Column I and 5.d. Column I, all other loans and leases held for investment and held for sale, respectively, currently risk-weighted at 100 percent. One additional item from Schedule RC-R and Schedule HC-R that is currently risk-weighted at 100 percent, all other assets (item 8. Column I), is also added to retail and other exposures.

for commitments with a maturity of less than one year and decreases from 50 percent to 40 percent for commitments with a maturity of greater than one year.¹⁴⁷

The proposal would reduce the risk-weight floor for securitizations from 20 percent to 15 percent. The proposal's securitization treatment was proxied by lowering the average risk weight by five percentage points for securitization exposures that are not currently risk-weighted at 1,250 percent.¹⁴⁸

Due to data limitations, the agencies did not attempt to estimate the impact of the proposal's reverse repurchase agreement exposure methodology, and therefore such exposures were not modified from those currently reported in the FR Y-9C and Call Reports.

However, the proposal's 90 percent corporate risk-weight was applied to reverse repurchase agreements currently risk-weighted at 100 percent.¹⁴⁹

Please refer to the expanded risk-based proposal data and estimation methodology related to market risk and CVA for more information.

1. Capital Impact Estimation Methodology—Regulatory Capital Buffers and Floors

The impact analysis reported in this section summarizes the estimated impact on minimum capital and capital

buffer requirements, taken together. A banking organization's minimum regulatory capital and buffer requirements are separate requirements with distinct, complementary purposes, and banking organizations are subject to different consequences for falling below minimum capital ratio and buffer requirements. The estimated capital impact considers applicable minimum capital ratio and buffer requirements, in particular, including the stress capital buffer requirement. The stress capital buffer requirement depends on risk-weighted assets under both the current capital rule and the proposal. The impact estimates presented here account for the changes to this buffer that are mechanically driven by changes in risk-weighted assets from the proposal.

Under the regulatory capital framework, the risk-weighted assets used to calculate the applicable stress capital buffer requirement are based on balance sheet data from an earlier date than the date of analysis used in the capital impacts contained in this section.¹⁵⁰ To adjust the applicable stress capital buffer to reflect the proposal, the agencies assumed that the percentage difference in risk-weighted assets between the revised standardized approach and the current standardized approach would have been the same on those earlier dates as it would have been on June 30, 2025. The agencies applied this percentage difference in risk-weighted assets to modify the applicable stress capital buffer requirements when estimating the impact of the proposal on capital requirements.

G. Data Appendix

BILLING CODE 4810-33-P; 6210-01-P; 6714-01-P

¹⁴⁷ The agencies apply the change in credit conversion factor to unused commitment line items 18.a. (original maturity of one year or less) and 18.b. (original maturity exceeding one year) from Schedules RC-R and HC-R for all risk-weighted columns (Columns C through S).

¹⁴⁸ The agencies calculate securitization exposures that are not currently risk-weighted at 1,250 percent by summing the following risk-weighted asset items from Columns T and U of Schedules RC-R and HC-R: on-balance sheet securitization exposures (items 9.a through 9.d), and off-balance sheet securitization exposures (item 10.).

¹⁴⁹ The agencies estimate repo-related risk-weighted assets under the proposal by applying the 90 percent corporate risk-weight to Schedule RC-R and HC-R item 16. Column I.

¹⁵⁰ The stress capital buffer requirements applicable to banking organizations as of June 30, 2025, are based on the results of the 2024 supervisory stress test, which utilized balance sheet data and risk-weighted assets from December 31, 2023.

VI. Economic Analysis

This section evaluates the projected economic effect of the proposal by analyzing its key costs and benefits. The proposal aims to improve the alignment of risk weights under the standardized approach to the risks of underlying exposures while maintaining simplicity and capital sufficiency. Improved risk alignment helps avoid unintended inefficiencies and potential misallocation of resources from capital regulation. Covered banking organizations will likely respond differently to these changes based on

their financial conditions, business strategies, and market opportunities. Given the effects of regulatory capital requirements on the real economy, the proposal would increase financial intermediation, improve economic efficiency, and support economic growth through capital formation, business expansion, and household wealth-building, while still maintaining appropriate safeguards against financial system risks.

A. Reasonable Alternatives

This analysis begins with an evaluation of alternative approaches to

the proposed rule. Specifically, this subsection compares the proposal to three reasonable alternatives for revising risk-weighted asset standards for the covered banking organizations. These alternatives, alongside the proposal, represent different approaches intended to promote robust capital levels while balancing the inherent tradeoff between risk sensitivity and simplicity in the capital framework.

Alternative 1 would require all banking organizations that are subject to risk-based capital requirements to adopt the expanded risk-based approach, as would be required for Category I and II

banking organizations under the expanded risk-based proposal. This alternative would implement a more risk-sensitive capital framework for all affected banking organizations but would also require more operational complexity for smaller banking organizations. Under this alternative, some smaller banking organizations (those with assets under \$10 billion and satisfying the other requirements of the CBLR framework) could choose to avoid the additional operational complexity by adopting the CBLR framework.

In aggregate, the expanded risk-based approach would require covered banking organizations to hold less capital than estimated under the standardized approach, as modified by proposal. Assuming no change in which banking organizations opt into the CBLR framework, under Alternative 1 covered depository institutions' risk-weighted assets would decrease by an estimated 11.6 percent relative to current requirements, compared to the estimated 8.6 percent decrease under the proposal. This reduction in risk-weighted assets would result in a more substantial decrease in regulatory capital requirements for covered depository institutions relative to current requirements under Alternative 1 than under the proposal. However, under this alternative, the compliance burdens associated with the regulatory capital framework for these banking organizations would increase significantly.

Alternative 2 would require adoption of the expanded risk-based approach only for Category III and IV banking organizations while applying the proposal for all other covered banking organizations. Category III and IV banking organizations are the largest and most complex banking organizations not covered by the expanded risk-based proposal.¹⁵¹ Therefore, these organizations are most likely to be able to absorb the additional costs of operational complexity for the benefit of the enhanced risk sensitivity of the expanded risk-based approach.

Under Alternative 2, aggregate risk-weighted assets for depository institution subsidiaries of Category III and IV holding companies would decrease by an estimated 9.4 percent, relative to the baseline, slightly more than the estimated 9.1 percent decrease

under the proposal.¹⁵² As a result of this similar change in risk-weighted assets, aggregate required capital for depository institutions subsidiaries of Category III and IV holding companies would decrease by a similar amount under Alternative 2 as under the proposal, compared to the baseline.

Alternative 3 would replace the LTV-based risk-weight tables for residential real estate in the proposal with simplified flat risk weights: 35% for residential mortgage exposures not dependent on the cash flows of the real estate and 45% for residential mortgage exposures that are dependent on the cash flows of the real estate. While the proposal modestly increases operational complexity relative to the baseline, this alternative would maintain the simplicity of the current Standardized Approach. However, this alternative lacks the enhanced risk sensitivity that the proposal's LTV-based lookup tables would provide for mortgage exposures.

Under Alternative 3, aggregate risk-weighted assets for covered depository institutions would decrease by an estimated 8.4 percent, relative to the baseline, similar to the estimated 8.6 percent decrease under the proposal. As a result, aggregate required capital for covered depository institutions would decrease by a similar amount under Alternative 3 as under the proposal, compared to the baseline.

The agencies assessed that the provisions of the proposal best balance the competing goals of risk alignment and simplicity, while also promoting robust capital levels. Alternative 1 would impose unnecessary operational complexity on smaller banking organizations, including those ineligible for the CBLR framework. Covered banking organizations can already elect to use the expanded risk-based proposal when they judge that the adoption is beneficial. Alternative 2 offers minimal advantages over the current proposal, as Category III and IV banking organizations can already elect to use the expanded risk-based proposal when they judge that the adoption is beneficial. Rather than mandating a specific size threshold for this approach, the proposal appropriately allows banking organizations to make this determination based on their own internal analysis. Alternative 3, while simpler, would generate only modest operational cost savings. Loan-to-value calculations can be automated using existing loan information and smaller banking organizations concerned about

compliance costs retain the option to adopt the CBLR framework. Based on these considerations, the agencies assess that the current proposal is the best approach among all these reasonable alternative considerations to most effectively enhance risk sensitivity while limiting additional operational burden and maintaining robust capital standards.

B. Effects on Lending

Bank lending remains the core economic function of the banking sector, with banks continuing to serve as the primary intermediaries supplying credit to households and nonfinancial firms. Within the banking system, covered banking organizations of this proposal play an important role in the U.S. lending landscape, accounting for a little more than one half of total loans and leases outstanding in the banking system as of 2025 Q2.¹⁵³

This subsection examines how the proposal could affect lending activities of covered banking organizations. As previously discussed, the proposed rule would generally reduce risk-weighted assets for covered institutions, thereby reducing required capital.¹⁵⁴ The financial intermediation literature provides evidence that when banks face higher risk-based capital requirements, they typically reduce lending to decrease risk-weighted assets and sometimes transfer higher funding costs to borrowers through increased interest rates.¹⁵⁵ Conversely, a reduction in risk weights would, in general, promote lending activities by increasing credit

¹⁵³ The agencies calculate that total loans and leases held for investment and held for sale for covered banking organizations represent about 57.6% of the Call Report and FR Y-9C filers. Data sources are compiled to the top-tier holder level based on reports from FFIEC 031, 041, and 051, as well as FR Y-9C. Line items consist of rcfd2122 in FFIEC031, rcon2122 in FFIEC041, rcon2122 in FFIEC051, and bhck2122 in FR Y-9C.

¹⁵⁴ Based on the same data source and estimation methodology, fewer than 20 covered banking organizations would experience a slight increase in capital requirements under the proposal. All of these institutions have tier 1 and CET 1 capital ratios over 11 percent under both the proposal and the baseline. The proposal would affect any one of these covered institutions' capital buffer by no more than half a percentage point.

¹⁵⁵ See, among others, Ragnar E. Juelsrud and Ella Getz Wold, (2020). "Risk-weighted capital requirements and portfolio rebalancing." *Journal of Financial Intermediation*, 41, 100806; Reint Gropp, Thomas Mosk, Steven Ongena, and Carlo Wix, (2019) "Banks response to higher capital requirements. Evidence from a quasi-natural experiment." *The Review of Financial Studies* 32, 266–299; Jose M. Berrospide and Rochelle M. Edge, (2024) "Bank capital buffers and lending, firm financing and spending: What can we learn from five years of stress test results?" *Journal of Financial Intermediation* 57, 101061.

¹⁵¹ While the expanded risk-based proposal leaves an option for all banking organizations to elect to use the expanded risk-based approach, the impact analysis in this standardized approach proposal assumes that covered banking organizations do not adopt the expanded risk-based approach.

¹⁵² The small difference is due to the close calibration of the proposed standardized approach to the expanded risk-based approach.

availability and potentially lowering interest rates.

To estimate the potential benefits for lending activity by asset class associated with reduced risk-weighted assets, this analysis employs several simplifying assumptions.

First, banking organizations generally maintain capital levels above regulatory capital requirements, including applicable buffer requirements. This excess—often called the “management buffer”—varies across institutions as it reflects firm-specific considerations. By reducing required capital, the proposed rule would increase the size of these management buffers. Covered banking organizations might respond to this increase in various ways: they could maintain their new management buffer levels, transfer some or all of the additional capital to equity holders, or reduce their management buffers by increasing interest-earning assets.

For the purpose of this analysis, the agencies apply a general method to estimate lending effects and assume that

covered entities experiencing a decrease in capital requirements under the proposal would increase interest-earning assets to target management buffers equal to their current management buffers (as of June 30, 2025).¹⁵⁶ Implicitly, this also assumes that the leverage ratio requirement would not be binding under the proposed capital framework. In other words, this analysis begins by assuming that each covered institution would fully deploy its decrease in risk-weighted assets toward new lending.

Second, this analysis assumes that, under the proposal, each covered institution’s marginal propensity to lend any capital in excess of the current management buffer to any particular asset class would be equivalent to the current share of that asset class to total assets. It is plausible that some covered institutions would apply a portion of the incremental management buffers to increase their activity in other asset classes, but to simplify the estimates, this analysis assumes all covered

institutions that increase lending would do so within the same asset class.

Following these two assumptions, the agencies adopt a simple approach to estimating asset-class level lending changes. For each asset class, the analysis converts the reduction in risk-weighted assets into potential new lending by dividing the estimated reduction by the proposed applicable risk weight. Specifically, the estimated incremental lending for each affected asset class equals the product of the dollar amount of the reduction in risk-weighted assets for that asset class and the inverse of its average proposed risk weight. Table VI.1 presents asset-class level estimates of the potential lending effects resulting from the proposed reduction in risk weights. While the way each banking organization responds to the proposal would likely depend on its individual circumstances, this approach provides a broad estimate of the proposal’s potential impact on lending, at the aggregate level.

Table VI.1 Estimated Additional Balance Sheet Capacity Under the Proposal by Asset Class

(All covered depository institutions. Based on 8.5 percent required capital ratio)

Asset class	Average proposed risk weight	Reduction in risk-weighted assets (billions)	Reduction in required capital (billions)	Additional balance sheet capacity (Potential lending) (billions)
RRE mortgage loans	35%	\$225	\$19.1	\$643
CRE mortgage loans	95%	\$95	\$8.1	\$100
Corporate	95%	\$215	\$18.3	\$226
Retail	90%	\$130	\$11.1	\$144
Securitizations	23%	\$21	\$1.8	\$91
Other assets	90%	\$47	\$4.0	\$52
Totals	N/A	\$733	\$62.3	\$1,256

Source: Special data collection of 2023, FFIEC Call Reports, and FR Y-9C, June 30, 2025.

Note: RRE is residential real estate; CRE is commercial real estate; Securitization risk weight is an estimated average effective risk weight of the proposal.

The agencies recognize that these assumptions may result in overestimates of lending growth—not all covered

banking organizations would use all of their additional management buffers to increase interest-earning assets.

Decisions on balance sheet deployment would likely depend on other factors such as banking organizations’ strategic

¹⁵⁶ Covered banking organizations’ financials other than items affected by capital requirements in

these states are assumed to be identical to those on Reports of Income and Condition (Call Reports) and

Consolidated Financial Statements for Holding Companies (FR Y-9C) as of June 30, 2025.

plans, growth outlooks, risk assessments, as well as market conditions such as demand for credit driven by factors exogenous to bank capital regulation. In addition, over the long term, covered banking organizations are likely to re-optimize their portfolios to achieve more efficient risk-adjusted returns relative to their risk tolerances and strategic plans.

Additionally, the above analysis considers covered banking organizations in aggregate. As discussed earlier, a small portion of them could see an increase in capital requirements from the proposal. These entities are unlikely to observe an increase in their lending capacity according to the above simplified framework.

Furthermore, numerous credit market supply and demand factors would influence the provision and pricing of loans across different asset classes. Depending on the covered banking organization's underwriting practices and risk appetites, some portion of the incremental lending may increase risk exposures. The agencies do not have the information necessary to determine precisely how each covered banking organization would respond to the proposal. As such, the analysis is intended to illustrate the potential magnitude of aggregate and distributional effects on lending by the proposal.

The expanded risk-based proposal would amend risk weights by asset class for Category I and II banking organizations. For most asset classes, risk-weighted assets applicable to bank lending activities would decline for both covered banking organizations as a result of this proposal and for Category I and II banking organizations as a result of the expanded risk-based proposal. Therefore, to the extent that the proposals cause banking organizations to increase lending, the combined economy-wide impact of the proposals may be larger than the estimates presented herein.

1. Effects on Residential Real Estate Lending

The proposal would generally implement reductions in risk weights for loans secured by residential real estate, whether originated by the covered institution or purchased from another lender. Under the baseline, a prudently underwritten first lien residential mortgage on a property that is either owner-occupied or rented generally receives a 50 percent risk weight; other residential mortgages receive a 100 percent risk weight. The proposal would assign risk weights to the former according to the loan-to-

value (LTV) ratio of the mortgage, among other factors. For this set of mortgage loans, the average risk weight would fall from 50 percent to approximately 35 percent,¹⁵⁷ on average, a 30 percent reduction.

Under the proposal, the agencies estimate that aggregate residential real estate risk-weighted assets for covered depository institutions would fall by an estimated \$225 billion (see Table VI.1), relative to the baseline and holding constant the volume of lending activity. The proposed revised risk weights based on LTV ratios would decline over time as mortgage balances are paid down, potentially adding future balance sheet capacity. The estimates do not account for this. Applying the simplified approach introduced above, this yields an estimate of increased lending capacity by about \$643 billion, as shown in Table VI.1.¹⁵⁸ Should the covered depository institutions choose to increase their residential real estate lending at this scale, it may place downward pressure on loan prices.

2. Effects on Commercial Real Estate Lending

Risk weights for non-construction commercial real estate loans would fall from 100 percent to 95 percent under the proposal. This 5 percent reduction in the risk weight would decrease risk-weighted assets by an estimated \$95 billion relative to the baseline, assuming no change in the volume of commercial real estate assets. Applying the methodology introduced above, this would yield an aggregate \$100 billion that could be applied to additional lending and asset purchases within this asset class. Should the covered depository institutions choose to increase their commercial real estate lending at this scale, it may place downward pressure on loan prices.

3. Effects on Corporate Lending

Under the baseline, all on-balance-sheet and off-balance-sheet corporate exposures generally receive a 100 percent risk weight. Risk weights for on-balance sheet corporate lending would fall to 95 percent under the proposal, a 5 percent reduction. Off-balance-sheet exposures, typically consisting of

unutilized portions of credit lines, are subject to additional considerations through credit conversion factors.

The proposal would reduce corporate lending risk-weighted assets by an estimated \$215 billion, relative to the baseline and holding the volume of lending activity constant. This would yield an aggregate \$226 billion that could be applied to additional lending and asset purchases within this asset class. Should the covered depository institutions choose to increase their corporate lending at this scale, it may place downward pressure on loan prices.

4. Effects on Retail Lending

Risk weights for retail loans, including but not limited to unsecured personal loans, auto loans, home equity lines of credit, credit cards, other real estate owned, and other assets such as property, plant, and equipment, would decrease from 100 percent to 90 percent. This 10 percent reduction would reduce risk-weighted assets by an estimated \$130 billion, relative to the baseline and assuming no change in the volume or composition of retail loan assets. This would yield an aggregate \$144 billion that could be applied to additional lending and asset purchases within this asset class. Should the covered depository institutions choose to increase their retail lending at this scale, it may place downward pressure on loan prices.

5. Effects on Securitization

The proposal would generally implement reductions in risk weights for securitized assets. There are many factors that affect a banking organization's decision to hold securitized assets or engage in securitization activities. For the purposes of this analysis the agencies estimate the changes in holdings of securitized assets to illustrate the potential balance sheet effects of this aspect of the proposed rule, holding all else equal. The analysis provides an initial upper-bound estimate based on the direct effects of changes in capital requirements within the asset class alone.

The proposal reduces the minimum risk weight for senior securitization positions from 20 percent in the current standardized approach to 15 percent. These proposed changes would reduce risk-weighted assets by an estimated \$21 billion, relative to the baseline, assuming no change in the volume or composition of securitization positions. The proposal would yield an estimated aggregate \$91 billion that could be applied to additional securitization

¹⁵⁷ This 35 percent average proposed risk weight is based on special data collection participant Category III and IV holding companies' residential real estate exposures, as applied to the proposal's LTV-based risk weight classes. Non-Category I and II holding companies that report mortgage data on the FR Y-14 show a similar 34 percent average risk weight under the proposal as of June 30, 2025.

¹⁵⁸ The estimation of the incremental lending effects for the residential real estate is as follows: \$225 billion drop in risk-weighted assets * 1/35% average proposed risk weight = \$643 billion.

activity. Should the covered banking organizations choose to increase their securitization activities at this scale, it may place downward pressure on prices of securitized assets.¹⁵⁹

The estimated effects on securitized assets of covered banking organizations are influenced by many factors and, therefore, highly uncertain.¹⁶⁰ First, the propensity to engage in securitization activity can depend on the differences in funding costs for retail deposits, debt, or equity. Second, banking organizations may engage in securitization activity to transfer credit risk to third parties and thereby manage the credit risk of their asset portfolios. Third, banking organizations may engage in securitization activity to generate higher returns relative to holding the constituent assets in their portfolio. Finally, the propensity to engage in securitization activity or hold securitized assets can be affected by different regulatory capital treatments for securities and loans.

The estimated volume and distribution of securitization activities for covered banking organizations may also be influenced by interactions between the proposed risk weight changes for different asset classes. The proposal would directly reduce securitization risk weights and capital requirements, thereby incentivizing additional securitization activities, all else equal. However, the assets subject to securitization (e.g., residential- and commercial real estate loans, among others) themselves would experience risk weight changes under the proposal that could influence banking organizations' securitization decisions. For example, proposed reductions in risk weights for residential real estate loans would reduce minimum capital requirements for these assets and decrease banking organizations' incentives to securitize these loans in order to reduce their capital requirements, all else equal. However, the proposal may have little direct effect on their incentives to securitize these loans if they primarily do so as a means of accessing low-cost funding and liquidity, or to manage the quality of their assets.

¹⁵⁹ Such an increase in securitization activity may also impact their risk profiles.

¹⁶⁰ Discussion based on Doku, Solomon Y., Alper Kara, and Yifan Zhou, (2019), "Securitization, Bank Behavior and Financial Stability: A Systematic Review of the Recent Empirical Literature," *International Review of Financial Analysis* 61: 245–254, and Affinito, Massimiliano and Edoardo Tagliaferri, (2010), "Why Do (or Did?) Banks Securitise Their Loans? Evidence from Italy," *Journal of Financial Stability* 6: 189–202.

6. Effects on Lending Related to Other Assets

Other assets not classified within one of the preceding asset classes, such as other real estate owned assets,¹⁶¹ generally would decrease from a 100 percent risk weight to 90 percent under the proposal. This 10 percent reduction would reduce risk-weighted assets by an estimated \$47 billion, relative to the baseline and assuming no change in the volume or composition of the assets. The proposal would yield an aggregate \$52 billion that could be applied to additional lending and asset purchases within this asset class. Should the covered depository institutions choose to increase their other assets lending at this scale, it may place downward pressure on loan prices.

In summary, across the six asset classes discussed in this subsection, the agencies' upper-bound estimate shows the proposal could potentially generate up to \$1.26 trillion in new lending and securitization activity, relative to the baseline and predicated on certain assumptions. The potential new lending (\$1.17 trillion, exclusive of securitization effects), equivalent to 9 percent of total loans and leases outstanding among all commercial banking organizations in the U.S.,¹⁶² may support business investment and consumers, and contribute to economic growth.

7. Effects of Portfolio Re-Optimization on Lending

Research finds that changes in regulatory capital frameworks can encourage banking organizations to shift their asset portfolios. This is because in general, banking organizations would optimize portfolio holdings to maximize risk-adjusted returns.¹⁶³ Therefore,

¹⁶¹ "Other real estate owned" assets are defined as real estate acquired in any manner for debts previously contracted (including, but not limited to, real estate acquired through foreclosure and real estate acquired by deed in lieu of foreclosure), even if the bank has not yet received title to the property, and real estate collateral underlying a loan when the bank has obtained physical possession of the collateral. Call Reports Schedule RC-F Instructions, "Other Assets". <https://www.fdic.gov/resources/bankers/call-reports/crinst-031-041/2019/2019-03-rc-f.pdf>.

¹⁶² All commercial banking organizations in the U.S. collectively held \$12.9 trillion in seasonally adjusted loans and leases in bank credit as of June 30, 2025. Federal Reserve, H8 "Assets and Liabilities of Commercial Banks in the United States" Table 2.

¹⁶³ Empirical studies supporting this view include Haubrich, Joseph G. and Paul Wachtel, 1993, "Capital Requirements and Shifts in Commercial Bank Portfolios." *Economic Review*, Federal Reserve Bank of Cleveland, vol. 29 (Q III), pages 2–15, and with more recent data, Hoshi, Takeo & Ke Wang, 2021. "Bank Regulatory Reforms and Declining Diversity of Bank Credit Allocation,"

under the proposal, some covered banking organizations may re-optimize their asset portfolios to the proposed changes in risk weighting. In particular, the more risk-sensitive proposed risk weights could incentivize covered banking organizations to adjust their loan portfolios to minimize their capital requirements per unit of expected returns within the asset class.

This incentive to reoptimize within an asset class would be prominent in the residential real estate lending sector due to the increased granularity of asset treatment based on LTV ratios. The proposal's introduction of several risk weight classes below the current 50 percent baseline risk weight for prudently underwritten exposures would incentivize covered institutions to originate or purchase lower-LTV residential mortgages and to retain any residential mortgages as servicers, because the risk weights would decline as the outstanding balances and LTVs fall over time. Alternatively, covered banking organizations may quickly sell or securitize high-LTV mortgages that they originate, rather than hold these high risk-weighted assets on their balance sheets. As a result, the proposal could lead to a gradual increase in the share of lower-LTV residential real estate exposures held by covered banking organizations. The agencies do not have the data to provide a robust estimate of this potential effect.

Portfolio re-optimization may also occur across asset classes, as covered institutions may shift investments from one asset class to another to maximize risk-adjusted returns under the proposed new risk weighting system. The proposed 30 percent average reduction in risk weights for residential real estate exposures would strengthen incentives, relative to other asset classes, for covered banking organizations to hold these assets. Incentives to hold asset classes that would receive 10 percent (retail lending, other assets) and 5 percent (commercial real estate, corporate lending) reductions in their risk weights would likely increase as well. Responses from covered banking organizations may include incremental new lending and asset purchases as discussed above, and the shifting of assets currently invested in different asset classes on their balance sheets. The agencies expect these across-asset class reallocations to increase lending, particularly in residential real estate, retail lending, and other assets that would experience

CARF F-Series working paper, Center for Advanced Research in Finance, Faculty of Economics, The University of Tokyo.

relatively larger drops in their risk weights. To the extent that resources shift away from other asset classes, some reduction in certain lending and securities portfolios may occur. The agencies do not have the data to provide robust estimates of these potential effects.

C. Economic Efficiency

Regulatory capital frameworks that assign capital requirements that are not aligned with risk have distortionary effects on banking organizations' investment decisions. Any such distortion would result in the inefficient allocation of capital by discouraging investments in assets with higher-than-appropriate risk weights. The proposal would revise certain risk weights to improve how regulatory capital ratios capture the underlying economic risks of banking organizations' balance sheets and activities. Covered banking organizations may respond by decreasing their capital levels or increasing their assets or both.¹⁶⁴ Aggregated to an industry level, the proposal's incentives for increased lending, through the revisions to risk weights, may contribute to overall economic efficiency by improving economy-wide financial resource allocation relative to the baseline.¹⁶⁵ Empirical evidence suggests that allocative efficiency is a key contributor to productivity growth and economic output.¹⁶⁶

D. Effects on Competitiveness

As compared to the baseline, the proposal would generally increase the competitiveness of covered banking organizations, relative to competitors in the markets they serve, through increased economies of scale and reduced funding costs for certain assets with reduced risk weights. In addition, the proposal would provide more granular risk-weight assignments to residential mortgages, generally increasing the competitiveness of covered institutions in that market.

1. General Competitiveness

As compared to the baseline, the proposal would decrease tier 1 capital requirements for covered depository institution subsidiaries of Category III and IV holding companies by 4.3

percent and would decrease tier 1 capital requirements for covered depository institutions with assets under \$100 billion by 7.1 percent. At the bank level, the median covered depository institution would experience a tier 1 capital requirement decrease of 6.2 percent, and nearly 10 percent of covered depository institutions would experience a decrease over 10 percent. These lower requirements would allow covered banking organizations to benefit from economies of scale by expanding their balance sheets, potentially increasing their competitiveness. The increased balance sheet capacity would also enable covered banking organizations to adapt to specific changes in the markets they serve or to pursue new markets that may generate long-run efficiency gains.

2. Competitiveness in Specific Asset Classes

Regulatory capital requirements impose economic costs on covered banking organizations, including the cost of obtaining capital. When the regulatory capital requirement is tied to a specific asset class, banks may pass a portion of the regulatory capital costs onto the borrower of that asset through reduced lending supply and higher interest rates and fees. As the proposal reduces the regulatory capital costs for certain financial products (through a reduction in the applicable risk weight), covered banking organizations would be able to increase their share of those markets by offering reduced interest rates and fees, along with a greater availability of such financial products.

For example, the proposal would reduce the risk weights, and concomitant regulatory capital costs, of corporate lending by 5 percent.¹⁶⁷ Covered banking organizations that engage in corporate lending may be able to offer lower prices to their customers due to the decrease in regulatory costs. These effects may accrue more to the larger covered banking organizations—as Tables V.G.1–3 shows, Category III and IV depository institutions hold, in dollar terms, approximately twice the volume of non-CRE corporate loans as covered depository institutions with assets between \$10 billion and \$100 billion and three times as much as covered depository institutions with assets below \$10 billion. This ordering is reversed in other markets—covered depository institutions with assets below \$10 billion hold twice as much volume of commercial real estate loans as Category III and IV institutions. The reduction in capital costs under the

proposal would make these smaller banking organizations more competitive in this space.

For some assets, the proposal would increase all covered banking organizations' ability to compete with nonbank financial intermediaries. Of particular note, Tables V.G.1–3 show that, in the market for residential real estate lending, all three size categories of covered depository institutions hold approximately the same amount of risk-weighted assets and would accrue similar aggregate reductions in required capital, with concomitant increases in competitiveness for all covered depository institutions relative to nonbanks. The share of bank activity in the residential real estate lending market has decreased substantially since the 2008 financial crisis;¹⁶⁸ the increased competitiveness brought about by the proposal may slow or even partially reverse the migration of activity to the nonbank sector, particularly in residential mortgage markets.¹⁶⁹

The proposal would also introduce more granular risk weights for certain assets—particularly residential mortgages that are owner-occupied or rented and meet prudential underwriting standards.¹⁷⁰ Currently, and under the baseline, these exposures are all given identical risk weights of 50 percent. Under the proposal, the exposures' risk weights would vary according to their cash flow dependency and LTV ratios: from 25 percent for those residential mortgages with LTV ratios of 50 percent or less to 110 percent for those with LTV ratios greater than 100 percent and that are dependent on the cash flows generated by the mortgaged property. Given that risk weights are proportional to the real economic costs of holding required capital, the granularity introduced by the proposal would increase a covered institution's competitiveness for residential mortgages with low LTV

¹⁶⁸ For example, see Figure 4 of the Financial Stability Oversight Council's Report on Nonbank Mortgage Servicing 2024, available at <https://home.treasury.gov/system/files/261/FSOC-2024-Nonbank-Mortgage-Servicing-Report.pdf>.

¹⁶⁹ The agencies acknowledge that there could be many reasons that residential real estate lending has migrated to nonbanks, including stricter non-capital regulatory requirements. In addition, nonbanks also innovated technologically and expanded access to borrowers who were underserved by banks after the crisis. See, for example, Greg Buchak, Gregor Matvos, Tomasz Piskorski & Amit Seru, "Fintech, Regulatory Arbitrage, and the Rise of Shadow Banks," *Journal of Financial Economics*, 130(3), 453–483 (December 2018) ("Buchak et al. (2018)"), <https://doi.org/10.1016/j.jfineco.2018.03.011>.

¹⁷⁰ Among other qualifications delineated in proposed 12 CFR _____.32(g).

¹⁶⁴ The agencies discuss covered institutions' responses in Section VII.B in this proposal.

¹⁶⁵ The estimated effects on lending discussed in Section VII.B could vary with the economic cycle and associated fluctuations in credit demand.

¹⁶⁶ Shao, Lin and Rongsheng Tang, 2024, "Allocative Efficiency and the Productivity Slowdown." Bank for International Settlements working paper 1185.

¹⁶⁷ See proposed 12 CFR _____.32(f).

ratios and that are not dependent on the cash flows of the mortgaged property.

This increased competitiveness for specific subgroups of residential real estate loans may drive market activity for the sale of mortgages; some covered institutions may purchase low-LTV loans from nonbanks or other banks that originate-to-distribute. Covered banking organizations may also compete for these loans against mortgage loan securitization entities, both private and government-backed.

On the other hand, the increased risk weights for high-LTV residential mortgages, or those with cash flows dependent on the mortgaged property, would decrease covered banking organizations' competitiveness in the market for these assets. The proposed regulatory capital cost increase for these high-LTV loans may induce some covered banking organizations to adopt larger originate-to-distribute business lines rather than hold these assets on their balance sheets.

E. Effects on Safety and Soundness

As previously discussed in Section VI.B on lending effects and Section VI.C on economic efficiency, lower capital requirements under the proposal could enable up to \$1.17 trillion¹⁷¹ in additional lending to businesses and consumers, potentially supporting investment and contributing to economic growth. However, these economic benefits must be weighed against a possible modest increase in the risk of bank failures or other economy-wide bank-related stress event. The agencies evaluate the proposal using the academic literature on the effects of capital requirements, as discussed in Section VIII.D of the expanded risk-based proposal, which provides a range of capital levels over which benefits exceed costs in the long run.

Academic literature examines how capital requirements affect the probability of systemic financial crises. The Basel Committee's long-term economic impact assessment of capital

and liquidity requirements (BCBS 2010 study) shows that higher capital and liquidity requirements reduce the likelihood of systemic crises.¹⁷² Conversely, lower capital requirements increase this likelihood. In the context of this proposal and using covered depository institutions as the sample, under the baseline, the aggregate common equity tier 1 capital ratio for covered depository institutions is 14.0 percent.¹⁷³ If covered depository institutions reduce their common equity tier 1 capital by the estimated 8.6 percent reduction in requirements, they would maintain an aggregate common equity tier 1 ratio of 12.8 percent relative to current risk-weighted assets. According to models used in the BCBS 2010 study, with no changes in liquidity, a decrease in tangible common equity to risk-weighted assets from 14.0 percent to 12.8 percent would increase the annual probability of a systemic crisis from 0.4 percent to 0.5 percent.¹⁷⁴ However, the study notes the result is subject to considerable model and estimation uncertainty. Moreover, the literature does not agree on the correlation between capital levels and the likelihood of crises. For example, Jorda et al. (2021) finds no robust evidence in long-run data that capital ratios are closely related to rising risks of financial instability.¹⁷⁵

Beyond systemic effects, lower capital requirements also increase risks at the individual institution level. To the extent that covered banking organizations reduce their capital and increase their leverage in response to the proposal, there would be attendant economic costs due to increased risk of bank failure. All else equal, lower capital increases the size and likelihood of losses at individual institutions, as

well as the potential for shifting losses from shareholders to creditors and the Deposit Insurance Fund in the event of failure. Such losses may also lead to spillover effects and additional costs to the financial system. However, as described further below, the agencies believe that mitigating factors would appropriately offset these safety and soundness risks.

Optimal Capital Levels

This subsection presents an abbreviated discussion of the cumulative effects of this proposal and the expanded risk-based proposal through the lens of the academic literature on optimal levels of capital.¹⁷⁶ In Table VI.2, the agencies situate the capital requirements under the proposal in the context of optimal capital levels from the BCBS 2010 study and the extant literature.¹⁷⁷ The agencies caution that significant uncertainties and limitations remain on how to measure these benefits and costs, and different approaches used in various studies yield different estimates of the optimal level of capital.¹⁷⁸ Under the proposal, covered depository institutions are projected to maintain an aggregate common equity tier 1 ratio of 12.8 percent relative to current risk-weighted assets. This level falls within the range of optimal values discussed in the literature.¹⁷⁹

¹⁷⁶ For a more detailed discussion on this literature, see Section VIII.D of the expanded risk-based proposal.

¹⁷⁷ The BCBS 2010 study developed a framework in which the benefits of higher capital stem from a reduced probability of a financial crisis. These benefits can be quantified by estimating the degree to which higher bank capital reduces the probability of a crisis and multiplying this reduction in probability by the expected economic output loss caused by a crisis. The cost of higher capital requirements stems from the increased cost of funding for banks, which can lead to higher interest rates on lending and thus lower economic activity, depending on market structure, competition, and other factors. The trade-off between these benefits and costs yields the optimal level of capital in the banking system.

¹⁷⁸ The studies are discussed further in Sections VIII.D.2 and VIII.D.3 of the expanded risk-based proposal.

¹⁷⁹ The estimated common equity tier 1 capital ratio for the entire U.S. banking industry of about 13 percent, also falls within the range of optimal values. See Section VIII.D of the expanded risk-based proposal.

¹⁷² See Basel Committee, "An Assessment of the Long-Term Economic Impact of Stronger Capital and Liquidity Requirements" (Aug. 2010), <https://www.bis.org/publ/bcbs173.pdf> ("BCBS 2010 study").

¹⁷³ For depository institutions, \$1,216 billion in common equity tier 1 capital held as of June 30, 2025, divided by \$8,711 billion in RWA under the baseline (from Table V.3) equals about 14 percent.

¹⁷⁴ BCBS 2010 study, Tables 3 and A2.2.

¹⁷¹ As previously noted, the \$1.17 trillion in potential new lending (exclusive of securitization effects) makes up 9 percent of the \$12.9 trillion in seasonally adjusted loans and leases in bank credit held by all commercial banking organizations in the U.S. as of June 30, 2025. Federal Reserve, H8 "Assets and Liabilities of Commercial Banks in the United States" Table 2.

Table VI.2: Estimated Levels of Capital Under the Proposals and Optimal Level of Capital in the Literature

Estimated common equity tier 1 capital ratio under both proposals: 13 percent	
Study	Optimal Level of Capital
BCBS 2010 study	10 to 14 percent
Fender and Lewrick (2016)	8 to 11 percent
Miles, Yang, and Marcheggiano (2013)	16 to 20 percent
Brooke et al. (2015)	10 to 14 percent
Firestone et al. (2019)	13 to 26 percent
Soederhuizen et al. (2023)	16 to 31 percent
Jorda et al. (2021)	^a
Admati and Hellwig (2024)	^b
Begenau (2020)	12.4 percent
Begenau and Landvoigt (2022)	16 percent
Elenev et al. (2021)	6 percent
Begenau et al. (2026)	^c
Davyduik (2017)	6 percent
Notes:	
a. The analytical framework in Jorda et al. (2021) does not yield an estimate of the optimal level of bank capital.	
b. Admati and Hellwig (2024) argue that the level of optimal capital in the banking system ought to be much higher than current capital levels.	
c. Optimal capital requirements in Begenau et al. (2026) are lower than current values.

Several limitations exist in applying academic studies on optimal capital levels to evaluate the proposals.¹⁸⁰ First, the literature on optimal capital levels examines the effects due to a direct change in the required capital for a certain quantity of risky assets, rather than changes in capital requirements

resulting from revised risk weights, as proposed here. Second, banking organizations use a broad range of loss-absorbing instruments to meet different capital requirements. While a few exceptions, such as Brooke et al. (2015), distinguish between these different capital instruments, most do not. This makes it challenging to determine which capital ratio is most applicable to mapping the results of a given study to

the U.S. banking system. Third, optimal capital levels can differ across jurisdictions. For example, differences in the degree to which an economy relies on bank-based versus market-based finance may affect the optimal level of capital in the banking system.¹⁸¹

¹⁸⁰ See section VIII.D.4 of the expanded risk-based proposal for additional details.

¹⁸¹ Section VIII.D.4 of the expanded risk-based proposal also notes the limitation that the optimal capital level literature, including the studies based on optimizing macroeconomic agents, almost

While the proposed capital levels fall within the optimal range identified in the literature and are thus reasonable, several factors may further mitigate the safety and soundness concerns stemming from the estimated reductions in capital requirements. All covered banking organizations would continue to be subject to robust supervisory and regulatory standards, as well as leverage ratio requirements which would provide a backstop to any significant decreases in the tier 1 capital ratio. Additionally, certain depository institutions would continue to be subject to resolution planning requirements. Moreover, capital requirements under the proposal for specific asset classes would generally remain sufficient to cover anticipated losses due to a stress event.¹⁸² As of June 30, 2025, covered depository institutions held more than \$1.2 trillion in common equity tier 1 capital in aggregate.¹⁸³ The above analysis suggests that existing levels of capital, in addition to other regulatory requirements noted above, would appropriately mitigate safety and soundness risks.

Finally, as discussed in Section VI.D on competitiveness effects, the proposal may slow or partially reverse the migration of lending activity from the banking sector to the nonbank sector, which has implications for financial stability. Nonbanks are typically less regulated and not subject to the same comprehensive prudential regulations and supervision as banks. To the extent

exclusively focuses on capitalizing for the risks posed by banks' loan portfolios rather than the risk associated with trading activity or the potential macroeconomic effect of changes in the provision of trading activity. Under the proposal, total risk-weighted assets applicable to lending could increase while the change in risk-weighted assets for other banking activities for which the risk weights change in the proposal are *de minimis*. This limitation would not be applicable to evaluating the proposal.

¹⁸² For example, the agencies estimate that, under the proposal, first or subsequent liens on one-to-four family residential properties that are prudently underwritten would have an average risk weight of approximately 35 percent, resulting in a three percent tier 1 capital requirement (equal to 35 percent of the 8.5 percent minimum tier 1 capital ratio) that covered banking organizations must hold against these exposures. This three percent would remain sufficient to cover anticipated mortgage losses under a stress event, as estimated as a result of recent supervisory stress tests (See 2025 Federal Reserve Stress Test Results (June 2025) at <https://www.federalreserve.gov/publications/files/2025-dfast-results-20250627.pdf>) or in response to the 2023 proposal (See Laurie Goodman and Zhu, Jun, "Bank Capital Notice of Proposed Rulemaking," (September 18, 2023) at <https://www.urban.org/research/publication/bank-capital-notice-proposed-rulemaking>).

¹⁸³ As shown in Table V.3, as of June 30, 2025, covered depository institutions are required to hold common equity tier 1 capital of \$610 billion, in aggregate, and reported common equity tier 1 capital levels of \$1,216 billion.

the proposal leads to migration of lending activity back to the regulated banking sector, it could benefit financial stability.

F. Other Costs

The proposal would impose transitional costs on all covered banking organizations. All covered banking organizations would need to establish or revise internal recordkeeping systems, policies and procedures to track compliance with the amended supervisory capital requirements. Costs to establish internal recordkeeping systems, policies and procedures likely would be non-recurring, whereas costs associated with monitoring the performance of and revising such systems, policies and procedures likely would be ongoing and recurring. For instance, covered banking organizations would now have to separately identify and delineate certain residential mortgages by their cash flow dependencies and their LTV ratios. The agencies do not have the information necessary to estimate these costs but acknowledge that they may be material for smaller covered banking organizations or covered banking organizations with significant residential mortgage exposures.¹⁸⁴

G. Interactions With CBLR Proposal

The agencies anticipate limited interactions between this proposal and the CBLR proposal. Banking organizations that qualify to use and adopt the CBLR framework are considered to have met the minimum risk-based capital requirements; depository institutions that qualify to use and adopt the CBLR framework are considered well-capitalized. Therefore, the agencies anticipate no direct interaction between the proposals, insofar as no banking organizations would face tradeoffs or considerations around satisfying both requirements simultaneously.

The proposal could affect a banking organization's decision to adopt the CBLR framework. CBLR-eligible banking organizations generally face a tradeoff between lower required capital under the risk-based framework¹⁸⁵ and simpler reporting requirements under the CBLR framework. This proposal generally reduces capital requirements under the risk-based capital framework, increasing the benefit of remaining under the risk-based framework. The

proposal also slightly increases the reporting complexity of the risk-based framework, which would increase the benefits of adopting CBLR framework. While these changes are relatively minor and do not significantly alter the basic tradeoff between lower required capital under the risk-based framework and simpler reporting requirements under CBLR, they could lead to more CBLR eligible banking organizations choosing to remain subject to the risk-based framework.

H. Conclusion

The analysis above represents a thorough estimation of the economic effects of the proposal on covered banking organizations as well as other affected entities, the U.S. banking system and the broader economy, relative to a baseline in which the proposal was not adopted. The agencies estimate that the proposal would generate broad benefits for covered banking organizations as well as their customers and the economy at large. Specifically, the proposal would lower capital requirements and expand, by up to \$1.26 trillion, the balance sheet capacity of covered banking organizations. In addition, the proposal would better align capital requirements with the underlying risk of exposures and increase allocative efficiency. The proposal would decrease risk weights for certain asset classes, which would reduce funding costs for these assets and enhance the competitiveness of covered institutions in applicable markets.

As noted in the analysis, covered banking organizations would likely respond differently based on their business models and market positions—potentially adjusting asset portfolios, modifying management capital buffers, or adopting alternative regulatory capital regimes; this heterogeneity in responses lends uncertainty to the agencies' analysis. Nevertheless, the agencies estimate that the proposal is likely to lead to increased lending activities in several asset classes. Greater market participation by covered institutions would directly benefit consumers through lower borrowing costs and improved credit access. The projected increase in lending would support economic growth by facilitating capital formation, business expansion, and household wealth-building through homeownership and other forms of credit access.

Costs of the proposal would include a moderate increase in the risk of loss associated with financial instability, bank failure, or other economy-wide bank-related stress events. The agencies

¹⁸⁴ The small number of banking organizations with trading assets between \$1 and \$5 billion that would no longer be subject to market risk capital requirements could see a reduction in compliance costs.

¹⁸⁵ See 90 FR 55048, 55051 (Dec. 1, 2025).

believe these costs would be low, given that the capital ratios for covered institutions are significantly higher than the proposed required levels, which in turn are generally higher than expected stress loss levels and remain within the range of optimal capital levels discussed in the literature. There may also be material transition costs for smaller covered institutions.

Based on the economic analysis summarized above, the agencies conclude that the expected benefits of the proposal justify its expected costs. The agencies invite comment on all aspects of the economic impact analysis.

VII. Technical Amendments to the Capital Rule

A. Accounting Standards Update 2025–08

On November 12, 2025, the Financial Accounting Standards Board (FASB) issued Accounting Standards Update (ASU) 2025–08, “Financial Instruments—Credit Losses (Topic 326): Purchased Loans,” which amends the guidance on accounting for purchased loans. Upon adoption of ASU 2025–08, the population of acquired financial assets subject to the “gross-up approach” will be expanded to include purchased seasoned loans. The “gross-up approach” under U.S. generally accepted accounting practices (GAAP) requires a banking organization to record an allowance for credit losses on purchased credit deteriorated assets¹⁸⁶ as well as purchased seasoned loans as of the date of acquisition with an offsetting gross-up adjustment to the purchase price of the assets or loans.

In the agencies’ final rule implementing the current expected credit losses (CECL) methodology in 2019 (CECL final rule), the agencies amended the capital rule to identify which allowance for credit losses under the new CECL accounting standard would be eligible for inclusion in a covered banking organization’s tier 2 capital.¹⁸⁷ The CECL final rule addressed the treatment of allowance for credit losses related to purchase credit deteriorated assets. As ASU 2025–08 requires covered banking organizations to apply the gross approach to both purchase credit deteriorated assets and purchased seasoned loans, the agencies are proposing to apply the capital rule’s treatment of allowance for credit losses

on purchase credit deteriorated (PCD) assets to allowance for credit losses on purchased seasoned loans. In particular, the proposal would modify the term adjusted allowance for credit losses (AACL) adopted in the CECL final rule to exclude credit loss allowances on purchased seasoned loans in addition to those on purchase credit deteriorated assets and available-for-sale (AFS) debt securities. A covered banking organization would continue to be able to include AACL in its tier 2 capital up to 1.25 percent of the covered banking organization’s standardized total risk weighted assets (excluding its market risk-weighted assets, if applicable). The proposal would also amend the definition of carrying value to require the carrying value of purchased seasoned loans to be calculated net of allowances for credit losses (ACL) like the capital rule’s current treatment of PCD assets.

In defining AACL, the agencies intend to include only those ACLs that have been fully charged against earnings or retained earnings. Including in tier 2 capital ACLs that have not been charged against earnings would diminish the quality of regulatory capital. Because the initial ACL amount for a PSL recorded on a covered banking organization’s balance sheet would not be established through a charge to earnings, the agencies believe the treatment currently applied to the initial ACL for purchase credit deteriorated assets also would be appropriate for the ACL on purchased seasoned loans. Due to concerns of undue complexity and burden on covered banking organizations, the agencies are not proposing a bifurcated approach for the treatment of purchased seasoned loans whereby a covered banking organization could include post-acquisition ACLs on PSLs in tier 2 capital when the covered banking organization’s purchased seasoned loan balances exceed a materiality threshold. The agencies believe that requiring covered banking organizations to calculate the carrying value of purchased seasoned loans net of ACLs appropriately offsets the effects of excluding post-acquisition ACLs on PSLs in the calculation of regulatory capital. Therefore, the agencies are proposing to exclude the entire ACL on PSLs from AACL, even though post-acquisition increases in ACLs for PSLs would be established through a charge against earnings.

In addition, the agencies are proposing to amend the definitions of AACL and carrying value to provide the same treatment as purchase credit deteriorated assets to other assets that may in the future become subject to the

gross approach following a change to GAAP by FASB.

B. Allowance for Loan and Lease Losses Definition

The agencies are proposing a technical amendment to the current capital rule to remove the definition of allowance for loan and lease losses (ALLL) from section _____.2 of the capital rule. The definition of ALLL in the current capital rule is no longer meaningful given the introduction and adoption of the current expected credit loss (CECL) methodology by the FASB under ASU 2016–13, “Financial Instruments—Credit Losses (Topic 326).”

C. Clarifications to Procedures, Effective Dates, and Severability

In § _____.1, the proposal would clarify the application of notice and response procedures for reservation of authority actions, would clean up expired effective date provisions, would clarify the criteria for when standards apply to covered banking organizations that change from one category to another. The proposal would introduce a severability provision to clarify the agencies’ intent with respect to the effectiveness of the proposal in the event that any particular provision or application of the rule is determined to be invalid.

VIII. Related Proposals and Proposed Amendments to Related Rules

A. Related proposals

Concurrently with this proposal, the agencies also are issuing a proposal that would modernize the capital requirements applicable to Category I and II banking organizations (expanded risk-based approach) and the market risk capital framework applicable to banking organizations with significant trading activity (expanded risk-based proposal). All other banking organizations would be permitted, but not required, to use the expanded risk-based approach as discussed in section I. of the Supplementary Information section.

The expanded risk-based proposal would include standardized frameworks for credit risk, equity risk, and operational risk, as well as a revised market risk framework. Relative to the current U.S. standardized approach, this new credit risk framework would provide for improved risk sensitivity and granularity by incorporating additional relevant metrics into the treatments for several new and existing exposure categories, including exposures to depository institutions,

¹⁸⁶ Purchase credit deteriorated assets are acquired individual financial assets (or acquired groups of financial assets with shared risk characteristics) that, as of the date of acquisition and as determined by an acquirer’s assessment, have experienced a more-than-insignificant deterioration in credit quality since origination.

¹⁸⁷ See 86 FR 4224 (Feb. 14, 2019).

foreign banks, and credit unions, corporate exposures, project finance exposures, and retail exposures (which could include small- or medium-sized entities). The equity risk framework is largely consistent with the current U.S. standardized approach. The expanded risk-based approach also would introduce a standardized operational risk capital requirement, calculated based on a banking organization's income and expenses. These items would serve as proxies for measuring operational risk and determining an operational risk capital requirement across the range of activities conducted by large U.S. banking organizations.

The revised market risk framework, which would apply to Category I and II banking organizations as well as other banking organizations with significant trading activity, would replace the current market risk capital framework. The revised market risk framework is designed to better capture tail risk and the risk of less liquid positions. It consists of a standardized measure for market risk and a models-based measure for market risk that may be used with supervisory approval. The agencies are seeking comment on any burden or operational challenges associated with discretionary use of the expanded risk-based approach.

B. Board Amendments

In connection with this proposal, the Board is proposing amendments to certain regulations (Regulation LL, 12 CFR part 238, and Regulation YY, 12 CFR part 252) that reference the capital rule in order to make appropriate conforming amendments to reflect this proposal.

Question 58: What modifications, if any, should the agencies consider to this proposal or to other rules indirectly affected by this proposal?

IX. Administrative Law Matters

A. Paperwork Reduction Act

Certain provisions of the proposal contain "collections of information" within the meaning of the Paperwork Reduction Act of 1995 (PRA). In accordance with the requirements of the PRA, the agencies may not conduct or sponsor, and a respondent is not required to respond to, an information collection unless it displays a currently valid Office of Management and Budget (OMB) control number. The information collection requirements contained in this joint proposal have been submitted to OMB for review and approval by the OCC and FDIC under section 3507(d) of the PRA (44 U.S.C. 3507(d)) and section 1320.11 of OMB's implementing

regulations (5 CFR part 1320). The Board reviewed the proposal under the authority delegated to the Board by OMB.

The proposal contains revisions to current information collections subject to the PRA. To implement these requirements, the agencies would revise and extend for three years the Reporting, Recordkeeping, and Disclosure Requirements Associated with Regulatory Capital Rules (OMB Nos. 1557–0318, 3064–0153, and 7100–0313). This information collection is also being revised by the expanded risk-based proposal. For ease of reference, the proposed revisions to this information collection by this proposal as well as the expanded risk-based proposal will be addressed in a separate **Federal Register** notice.

The Board would also revise and extend for three years the (1) Financial Statements for Holding Companies (FR Y 9; OMB No. 7100–0128), (2) the Capital Assessments and Stress Testing (FR Y 14A/Q/M; OMB No. 7100–0341), and (3) other affect reports. The proposed revisions to these Board reports will be addressed in a separate **Federal Register** notice.

Finally, the agencies, under the auspices of the FFIEC, would also propose related revisions to (1) all versions of the Consolidated Reports of Condition and Income (Call Reports) (FFIEC 031, FFIEC 041, and FFIEC 051; OMB Nos. 1557–0081; 3064–0052, and 7100–0036). The proposed revisions to these FFIEC reports will be addressed in one or more separate **Federal Register** notices.

B. Regulatory Flexibility Act

FDIC

The Regulatory Flexibility Act (RFA) generally requires an agency, in connection with a proposed rule, to prepare and make available for public comment an initial regulatory flexibility analysis that describes the impact of the proposed rule on small entities.¹⁸⁸ However, an initial regulatory flexibility analysis is not required if the agency certifies that the proposed rule will not, if promulgated, have a significant economic impact on a substantial number of small entities. The Small Business Administration (SBA) has defined "small entities" to include banking organizations with total assets of less than or equal to \$850 million.¹⁸⁹

¹⁸⁸ 5 U.S.C. 601 *et seq.*

¹⁸⁹ The SBA defines a small banking organization as having \$850 million or less in assets, where an organization's "assets are determined by averaging the assets reported on its four quarterly financial statements for the preceding year." See 13 CFR

For the reasons described below, the FDIC believes that the proposal, if adopted, will have a significant economic effect on a substantial number of FDIC-supervised insured depository institutions that meet the definition of a "small entity" under the RFA (small FDIC-supervised IDI). As such, the FDIC has prepared and is making available for public comment the following initial regulatory flexibility analysis. An initial regulatory flexibility analysis must contain (1) a description of the reasons why action by the agency is being considered; (2) a succinct statement of the objectives of, and legal basis for, the proposed rule; (3) a description of, and, where feasible, an estimate of the number of small entities to which the proposed rule will apply; (4) a description of the projected reporting, recordkeeping, and other compliance requirements of the proposed rule, including an estimate of the classes of small entities that will be subject to the requirement and the type of professional skills necessary for preparation of the report or record; (5) an identification, to the extent practicable, of all relevant Federal rules which may duplicate, overlap with, or conflict with the proposed rule; and (6) a description of any significant alternatives to the proposed rule which accomplish the stated objectives of applicable statutes and minimize any significant economic impact of the proposed rule on small entities.¹⁹⁰ A final regulatory flexibility analysis will be conducted after consideration of comments received during the public comment period.

Reasons Why Action Is Being Considered

As noted in Section I. Introduction and overview, in connection with the expanded risk-based proposal, the agencies evaluated the appropriateness of the risk weights applicable to exposures at the business-line level. Specifically, the evaluation suggested revisions would be appropriate to the risk weights applicable to residential mortgage exposures, corporate exposures, and certain exposures in the current standardized approach's "other assets" category. In addition, the

121.201 (as amended by 87 FR 69118, effective December 19, 2022). In its determination, the "SBA counts the receipts, employees, or other measure of size of the concern whose size is at issue and all of its domestic and foreign affiliates." See 13 CFR 121.103. Following these regulations, the FDIC uses an insured depository institution's affiliated and acquired assets, averaged over the preceding four quarters, to determine whether the insured depository institution is "small" for the purposes of RFA.

¹⁹⁰ 5 U.S.C. 603(b)–(c).

agencies considered comments received from the EGRPA public notices.

Statement of the Objectives and Legal Basis for the Proposal

As previously noted, the proposed changes aim to improve risk sensitivity while generally retaining the simplicity of the current framework. For further discussion of the policy objectives of the proposal please refer to Section I. Introduction and overview.

The prompt corrective action framework in section 38 of the Federal Deposit Insurance Act (FDI Act) requires the agencies to set capital standards for insured depository institutions that include a risk-based capital requirement and provides that the agencies may establish any additional relevant capital measures to carry out the purpose of that section.¹⁹¹ Various other statutory authorities provide the agencies with broad discretionary authority to set capital requirements and standards for banking organizations supervised by the agencies, including national banking associations, state-chartered banks, savings associations, and depository institution holding companies.¹⁹² Further, Congress has authorized the agencies to establish enhanced risk-based capital requirements and standards for larger banking organizations subject to the capital rule.¹⁹³

Description of the Proposal and an Estimate of the Number of Small Entities

The proposal would reduce the risk weight applicable to corporate exposures from 100 percent to 95 percent and the risk weight applicable to all assets not specifically assigned a different risk weight under the rule from 100 percent to 90 percent. The proposal would also introduce a broader range of

risk weights for residential mortgage exposures, based on more granular risk factors. In addition, the proposal would adopt the same definition of commitment as the expanded risk-based proposal and would align the credit conversion factors for certain off-balance sheet exposures, including equity commitments, with the expanded risk-based proposal. These changes focus on exposure categories that comprise a substantial amount of total risk-weighted assets for covered banking organizations and aim to balance a more risk-sensitive calibration of the requirements with retaining the simplicity of the standardized approach.¹⁹⁴ See Table V.G.1 in the Data Appendix (Section V.G.) for a breakdown of the size of the exposure categories whose treatment would be revised under this proposal.

To improve risk sensitivity, this proposal would also make targeted adjustments to the existing methodologies for determining exposure amounts for counterparty credit risk and risk-weighted asset amounts for securitizations, as well as for recognizing the benefits of credit risk mitigants. These targeted adjustments would align with adjustments included in the expanded risk-based proposal.

In addition to changes to the calculation of risk-weighted assets, the proposal would modify the definition of regulatory capital by removing the threshold-based deduction of mortgage servicing assets (MSAs). All MSAs would receive a 250 percent risk weight under the proposal, consistent with the risk weight in the current capital rule for MSAs that do not exceed the deduction threshold. This proposed revision would promote mortgage origination and servicing by banking organizations in a risk-appropriate manner and would apply to all banking organizations subject to the regulatory capital rule, including banking organizations subject to the community bank leverage ratio framework.

The proposal would require Category III and IV banking organizations to include most elements of AOCI in

common equity tier 1 capital, consistent with the current treatment applicable to Category I and II banking organizations.¹⁹⁵ This change would better reflect the capital adequacy and loss-absorbing capacity of Category III and IV banking organizations in their regulatory capital ratios.

As of June 30, 2025, the FDIC supervises 2,802 depository institutions,¹⁹⁶ of which 2,085 would be considered small entities for the purposes of the RFA.¹⁹⁷

Significant Impact Determination

To determine if the proposal, if adopted, will have a significant economic effect on a substantial number of small FDIC-supervised IDIs, the analysis focuses on the small FDIC-supervised IDIs that would be subject to the changes to risk-weighted assets under this proposal. As of June 30, 2025, 1,082 small FDIC-supervised IDIs report risk-weighted assets (small FDIC-supervised IDIs that report RWAs).¹⁹⁸ These institutions would have the choice to calculate risk weighted assets based on this proposal or the expanded risk-based proposal. For purposes of this analysis, the FDIC assumed these entities would select the revised standardized approach to calculate their risk-weighted assets. These institutions represent over 51 percent of all small FDIC-supervised IDIs, and they hold over 58 percent of total assets of small FDIC-supervised IDIs.¹⁹⁹

As discussed in Section V. Estimated impact on capital requirements, the agencies estimate that this proposal, if adopted, would decrease risk-weighted assets and corresponding common equity tier 1 capital requirements for covered depository institutions by approximately \$745 billion and \$52 billion (or 8.6 percent for both), respectively, relative to a baseline in which the current regulations remain unchanged.²⁰⁰ For small FDIC-supervised IDIs that report RWAs, the

¹⁹¹ See 12 U.S.C. 1831o(c)(1)(A), (c)(1)(B)(i).

¹⁹² See 12 U.S.C. 93a (national banking associations); 12 U.S.C. 248(i), 324, 327, 329 (state member banks); 12 U.S.C. 1463 (savings associations); 12 U.S.C. 1467a(g)(1) (savings and loan holding companies); 12 U.S.C. 1844(b) (bank holding companies); 12 U.S.C. 3106 (certain U.S. operations of foreign banking organizations); 12 U.S.C. 3902(1)–(2), 3907(a), 3909(a), (c)(1)–(2) (depository institutions; affiliates of depository institutions, including holding companies; and certain U.S. operations of foreign banking organizations); 12 U.S.C. 5371 (insured depository institutions, depository institution holding companies, and nonbank financial companies supervised by the Board).

¹⁹³ See e.g., section 165 of the Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act), as amended by section 401 of the Economic Growth, Regulatory Relief, and Consumer Protection Act, which requires the Board to establish enhanced prudential standards that include risk-based capital requirements for bank holding companies with \$250 billion or more in total consolidated assets.

¹⁹⁴ The calculation of the risk-weighted assets under the expanded risk-based approach is more complex and burdensome than under the standardized approach as it is more granular and includes several additional risk factors. The expanded risk-based approach would also include an operational risk capital requirement and the requirement to use the standardized approach for counterparty credit risk to determine the exposure amount for derivative contracts. Banking organizations subject to the expanded risk-based approach would also be subject to a more risk-sensitive but complex definition of capital, including the requirement to include most elements of accumulated other comprehensive income in regulatory capital.

¹⁹⁵ AOCI generally includes accumulated unrealized gains and losses on certain assets and liabilities that have not been included in net income yet are included in equity under U.S. generally accepted accounting principles (for example, unrealized gains and losses on securities designated as available-for-sale).

¹⁹⁶ The count of FDIC-supervised institutions excludes six insured, domestic branches of foreign banks. None would be considered small entities for the purposes of the RFA. Call Report data, June 30, 2025.

¹⁹⁷ Call Report data, June 30, 2025.

¹⁹⁸ Call Report data, June 30, 2025. As of June 30, 2025, 1,003 small, FDIC-supervised IDIs currently elect to use the CBLR framework.

¹⁹⁹ Call Report data, June 30, 2025.

²⁰⁰ See Section V. Estimated impact on capital requirements, for a discussion of the baseline, data, and the estimation methodology.

FDIC estimates that the proposal would decrease aggregate risk-weighted assets and common equity tier 1 capital requirements by \$19 billion and \$1.3 billion (or 7.8 percent for both), respectively, relative to the baseline.²⁰¹ By reducing required capital, the proposal would increase the size of management buffers.²⁰² Across the 1,082 small FDIC-supervised IDIs that report RWAs as of June 30, 2025, the proposal would increase the common equity tier 1 management buffer by an average of \$1.2 million, ranging from \$1,600 to \$7.1 million, relative to the baseline.

As noted in Section VI.B. Effects on lending, covered banking organizations, including small FDIC-supervised IDIs, may respond to the proposal in different ways. Many small FDIC-supervised IDIs would likely reduce the additional management buffer under the proposal by expanding their holdings of earning assets. If under the proposal, every small FDIC-supervised IDI that reports RWAs expanded its earning assets to achieve a management buffer equal to its buffer as of June 30, 2025, the result would be an increase in aggregate earning assets of approximately \$31 billion for such institutions and a corresponding increase in aggregate interest income of \$1.1 billion.²⁰³ At the individual institution level, the

resulting increase in net interest income would exceed 2.5 percent of total annualized net interest income, as of June 30, 2025, for over 98 percent of small FDIC-supervised IDIs that report RWAs, and exceed 5 percent for over 87 percent of these IDIs.

The FDIC recognizes that not all small FDIC-supervised IDIs would deplete all of their additional management buffer under the proposal to accumulate earning assets. Thus, the estimate presented above may overestimate the significance of the impact of the proposal on small FDIC-supervised IDIs that report RWAs. As a sensitivity analysis, the FDIC estimates that even if the small FDIC-supervised IDIs that report RWAs use only a third of their additional management buffer to accumulate earning assets, the resulting increase in net interest income would exceed 2.5 percent of total annualized net interest income, as of June 30, 2025, for over 60 percent of these IDIs, and exceed 5 percent for over 10 percent of these IDIs. Given the size of these potential effects, the FDIC believes the impact of the proposal would likely be significant for a substantial number of small entities.

Economic Impact

As noted above, the proposal would expand by approximately \$31 billion the aggregate balance sheet capacity of small FDIC-supervised IDIs that report RWAs. The proposal could have other potential economic effects on small FDIC-supervised IDIs, as summarized here and discussed in detail in Section VI. Economic analysis.²⁰⁴ The proposal would better align capital requirements with the underlying risk of exposures and increase allocative efficiencies. The proposal would decrease risk weights for certain asset classes, which would reduce funding costs for these assets and enhance the competitiveness of small FDIC-supervised IDIs in applicable markets.

As noted in the analysis, small FDIC-supervised IDIs would likely respond differently based on their business models and market positions—potentially adjusting asset portfolios, modifying management capital buffers, or adopting alternative regulatory capital regimes; this heterogeneity in responses lends uncertainty to the FDIC's analysis. Nevertheless, the FDIC estimates that the proposal is likely to lead to increased lending activities in several asset classes. Greater market

participation by small FDIC-supervised IDIs would directly benefit consumers through lower borrowing costs and improved credit access. The projected increase in lending would support economic growth by facilitating capital formation, business expansion, and household wealth-building through homeownership and other forms of credit access.

Costs of the proposal would include a marginal increase in the risk of loss associated with financial instability or failure. The FDIC believes the costs associated with this risk would be low, given that small FDIC-supervised IDIs would continue to be subject to robust supervisory and regulatory standards and leverage requirements and that the estimated common equity tier 1 capital ratio for small FDIC-supervised IDIs that report RWAs under the proposal falls within the range of optimal values discussed in the literature.²⁰⁵ There may also be transition costs for small FDIC-supervised covered IDIs.

Reporting, Recordkeeping, and Other Compliance Requirements of the Proposal

As described in section IX.A., the proposal contains revisions to FDIC's current information collections subject to the Paperwork Reduction Act of 1995 (PRA).²⁰⁶ To implement these requirements, the FDIC would revise and extend for three years the Reporting, Recordkeeping, and Disclosure Requirements Associated with Regulatory Capital Rules (OMB No. 3064–0153). The FDIC, under the auspices of the FFIEC, would also propose related revisions to all versions of the Call Reports (OMB No. 3064–0052). All small FDIC-supervised IDIs that report RWAs would be subject to the revisions. The proposed revisions to these information collections will be addressed in a separate **Federal Register** notice.

Alternatives Considered

As discussed in Section VI.A, the agencies compare the proposal to three reasonable alternatives for revising risk-weighted asset standards.

Alternative 1 would require all banking organizations that are subject to risk-based capital requirements to adopt the expanded risk-based approach, as

²⁰¹ Using the data and methodology discussed in Section V. Estimated impact on capital requirements, the FDIC estimates that three small, FDIC-supervised IDIs that report RWAs would experience a slight increase in capital requirements under the proposal.

²⁰² IDIs generally maintain capital levels above regulatory capital requirements, including any applicable buffer requirements. The excess above such requirements is called "management buffers." See VI.B. Effects on lending for a more detailed discussion.

²⁰³ For each small, FDIC-supervised IDI that reports RWAs, the FDIC first estimates the decrease in RWA under the proposal. Second, assuming an increase in balance sheet capacity equal to this decrease in RWA, the FDIC estimates the increase in earning assets for the institution, where earnings assets equals the increase in balance sheet capacity divided by the average risk weight under the proposal. Average risk weight under the proposal is obtained by dividing the total RWA under the proposal by the institution's assets as of June 30, 2025. Finally, multiplying the increase in earning assets by the institution's reported annualized net interest margin yields the additional net interest income generated under the proposal.

For example, consider a hypothetical \$500 million small institution with existing RWA of \$350 million, RWA under the proposal of \$325 million, and a net interest margin of 3 percent. It experiences a decrease of \$25 million in RWA under the proposal and its average risk weight under the proposal is 65 percent (\$325 million/\$500 million). Under the proposal, it could generate earning assets of \$38 million, or \$25 million divided by 65 percent. At a hypothetical annualized net interest margin of 3 percent, the \$38 million in additional earning assets would generate \$1.14 million in additional net interest income.

²⁰⁴ See Section VI.G. Interactions with CBLR proposal for a discussion of the economic impact on the 1,003 small, FDIC-supervised IDIs that currently elect to use the CBLR framework.

²⁰⁵ As of June 30, 2025, the 1,082 small, FDIC-supervised IDIs that report RWAs examined in this analysis hold \$37 billion in common equity tier 1 against an estimated \$225 billion in RWA under the proposal, resulting in a common equity tier 1 ratio of approximately 17 percent. See Section VI.E Effects on safety and soundness for additional discussion.

²⁰⁶ 44 U.S.C. 3501 *et. seq.*

would be required for Category I and II banking organizations under the expanded risk-based proposal. This alternative would implement a more risk-sensitive capital framework for all affected banking organizations but would also require more operational complexity for smaller banking organizations. Under this alternative, some smaller banking organizations (those with assets under \$10 billion and satisfying the other requirements of the CBLR framework) could choose to avoid the additional operational complexity by adopting the CBLR framework.

In aggregate, the expanded risk-based approach would require covered banking organizations to hold less capital than estimated under the standardized approach, as modified by proposal. Assuming no change in which banking organizations opt into the CBLR framework, under Alternative 1, covered depository institutions' risk-weighted assets would decrease by an estimated 11.6 percent relative to current requirements, compared to the estimated 8.6 percent decrease under the proposal. This reduction in risk-weighted assets would result in a more substantial decrease in regulatory capital requirements for covered depository institutions relative to current requirements under Alternative 1 than under the proposal. However, under this alternative, the compliance burdens associated with the regulatory capital framework for these banking organizations would increase significantly.

Alternative 2 would require the adoption of the expanded risk-based approach only for Category III and IV banking organizations while applying the proposal for all other covered banking organizations. Category III and IV banking organizations are the largest and most complex banking organizations not covered by the expanded risk-based proposal. Therefore, these organizations are most likely to be able to absorb the additional costs of operational complexity for the benefit of the enhanced risk sensitivity of the expanded risk-based approach.

Under Alternative 2, aggregate risk-weighted assets for depository institution subsidiaries of Category III and IV holding companies would decrease by an estimated 9.4 percent, relative to the baseline, slightly more than the estimated 9.1 percent decrease under the proposal.²⁰⁷ As a result of this similar change in risk-weighted assets, aggregate required capital for depository

institutions subsidiaries of Category III and IV holding companies would decrease by a similar amount under Alternative 2 as under the proposal, compared to the baseline.

Alternative 3 would replace the LTV-based risk-weight tables for residential real estate in the proposal with simplified flat risk weights: 35% for residential mortgage exposures not dependent on the cash flows of the real estate and 45% for residential mortgage exposures that are dependent on the cash flows of the real estate. While the proposal modestly increases operational complexity relative to the baseline, this alternative would maintain the simplicity of the current standardized approach for residential mortgage exposures. However, this alternative lacks the enhanced risk sensitivity that the proposal's LTV-based lookup tables would provide for mortgage exposures.

The agencies assessed that the provisions of the proposal best balance the competing goals of risk alignment and simplicity, while also promoting robust capital levels. Alternative 1 would impose unnecessary operational complexity on smaller banking organizations, including those ineligible for the CBLR framework. Alternative 2 offers minimal advantages over the current proposal, as Category III and IV banking organizations can already elect to use the expanded risk-based proposal when they judge that the adoption is beneficial. Rather than mandating a specific size threshold for this approach, the proposal appropriately allows banking organizations to make this determination based on their own internal analysis. Alternative 3, while simpler, would generate only modest operational cost savings. Loan-to-value calculations can be automated using existing loan information and smaller banking organizations concerned about compliance costs retain the option to adopt the CBLR framework. Based on these considerations, the agencies assess that the current proposal is the best approach among all these reasonable alternative considerations to most effectively enhance risk sensitivity while limiting additional operational burden and maintaining robust capital standards.

Other Statutes and Federal Rules

The FDIC has not identified any likely duplication, overlap, and/or potential conflict between this proposal and any other federal rule.

The FDIC invites comments on all aspects of the supporting information provided in this RFA section. In particular, would the proposal have any

significant effects on small entities that the FDIC has not identified?

Board

The Board is providing an initial regulatory flexibility analysis with respect to this proposed rule. The Regulatory Flexibility Act²⁰⁸ (RFA) requires an agency to consider whether the rules it proposes will have a significant economic impact on a substantial number of small entities.²⁰⁹ In connection with a proposed rule, the RFA requires an agency to prepare and invite public comment on an initial regulatory flexibility analysis describing the impact of the rule on small entities, unless the agency certifies that the proposed rule, if promulgated, would not have a significant economic impact on a substantial number of small entities. An initial regulatory flexibility analysis must contain: (1) a description of the reasons why action by the agency is being considered; (2) a succinct statement of the objectives of, and legal basis for, the proposed rule; (3) a description of, and, where feasible, an estimate of the number of small entities to which the proposed rule will apply; (4) a description of the projected reporting, recordkeeping, and other compliance requirements of the proposed rule, including an estimate of the classes of small entities that will be subject to the requirement and the type of professional skills necessary for preparation of the report or record; (5) an identification, to the extent practicable, of all relevant Federal rules which may duplicate, overlap with, or conflict with the proposed rule; and (6) a description of any significant alternatives to the proposed rule which accomplish its stated objectives and minimize any significant economic impact of the proposed rule on small entities.²¹⁰

The Board has considered the potential impact of the proposed rule on small entities in accordance with the RFA. The Board is publishing and inviting comment on this initial regulatory flexibility analysis.

As discussed in detail above, the proposed rule would revise the risk-based capital treatment of certain

²⁰⁸ 5 U.S.C. 601 *et seq.*

²⁰⁹ Under regulations issued by the U.S. Small Business Administration (SBA), a small entity includes a depository institution, bank holding company, or savings and loan holding company with total assets of \$850 million or less. *See* 13 CFR 121.201. Consistent with the SBA's General Principles of Affiliation, the Board includes the assets of all domestic and foreign affiliates toward the applicable size threshold when determining whether to classify a particular entity as a small entity. *See* 13 CFR 121.103.

²¹⁰ 5 U.S.C. 603(b)–(c).

²⁰⁷ The small difference is due to the close calibration of the proposed standardized approach to the expanded risk-based approach.

exposure categories under the standardized approach, including the risk weights for traditional lending activities to improve their calibration and risk sensitivity. The proposal would also modify the definition of regulatory capital by removing the threshold-based deduction for mortgage servicing assets for all banking organizations subject to the regulatory capital rule, including banking organizations subject to the community bank leverage ratio framework. In addition, the proposal would require Category III and IV banking organizations to recognize most elements of accumulated other comprehensive income in their regulatory capital. The proposed changes aim to better reflect the risks of these banking organizations' exposures while generally retaining the simplicity of the current framework.

As noted above, the prompt corrective action framework in section 38 of the FDI Act requires the agencies to prescribe capital standards for insured depository institutions that include a risk-based capital requirement and provides that the agencies may establish any additional relevant capital measures to carry out the purpose of that section.²¹¹ Various statutory authorities provide the agencies with broad discretionary authority to set capital requirements and standards for banking organizations supervised by the agencies, including national banking associations, state-chartered banks, savings associations, and depository institution holding companies.²¹² Elements of the proposal would also be responsive to comments received from the EGRPA public notices.²¹³ Further, Congress has also authorized the

agencies to establish risk-based capital requirements and standards for larger banking organizations subject to the capital rule and this proposal.²¹⁴

As of the second quarter of 2025, there were approximately 2,796 small bank holding companies and approximately 157 small savings and loan holding companies, and approximately 443 small state member banks. The proposed rule would apply to all small entities supervised by the Board; however, small entities that are bank holding companies or savings and loan holding companies are generally subject to the Small Bank Holding Company and Savings and Loan Holding Company Policy Statement and would not be impacted by the proposed rule.²¹⁵

While the proposal slightly increases the reporting complexity of the risk-based framework for small entities that have not elected to use the CBLR framework,²¹⁶ the proposal would also generally reduce capital requirements for small entities under the risk-based framework. As described in sections V. and VI. of this **SUPPLEMENTARY INFORMATION**, the improvements in risk sensitivity of capital requirements expected to result from the proposal and associated benefits justify the proposal's expected costs. For small entities, the proposal would provide meaningfully improved risk sensitivity to a large portion of covered banking organizations' exposures from a total risk-weighted assets perspective, while allowing them to avoid the regulatory burden of implementing the expanded risk-based approach set forth in the expanded risk-based proposal. In particular, small entities would not be required to manage potential volatility that may rise from the recognition of AOCI in regulatory capital. They also would avoid mandatory application of SA-CCR and a separate calculation of an operational risk capital requirement. Further, the proposal would amend

certain dollar-based regulatory thresholds in the standardized approach to reflect inflation and ensure that such thresholds preserve their intended application in real terms over time.

The Board is aware of no other federal rules that duplicate, overlap, or conflict with the proposal. Although the Board considered several alternatives, as discussed in more detail in section VI.A. of this **SUPPLEMENTARY INFORMATION**, the proposal is the best alternative for improving risk sensitivity while limiting additional operational costs and maintaining robust capital standards, particularly for small entities. Accordingly, the Board believes that there are no significant alternatives to the proposal that would accomplish the stated objectives and minimize the economic impact of the proposal on small entities.

The Board welcomes comment on all aspects of its analysis. In particular, the Board requests that commenters describe the nature of any impact on small entities and provide empirical data to illustrate and support the extent of the impact.

OCC

In accordance with section 3(a) of the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) (RFA), the OCC is publishing this summary of its Initial Regulatory Flexibility Analysis (IRFA) for this NPR. The RFA requires an agency to publish in the **Federal Register** its IRFA or a summary of its IRFA at the time of the publication of its general notice of proposed rulemaking or to certify that the proposed rule will not have a significant economic impact on a substantial number of small entities. For its IRFA, the OCC analyzed the potential economic impact of this NPR on the small entities that it regulates.

The OCC welcomes comment on all aspects of the summary of its IRFA. A final regulatory flexibility analysis will be conducted after consideration of comments received during the public comment period.

A. Reasons Why the Proposed Rule Is Being Considered by the Agencies; Statement of the Objectives of the Proposed Rule; and Legal Basis

As discussed in the **SUPPLEMENTARY INFORMATION** section above, the agencies are proposing to revise their capital requirements to help ensure standards are appropriately calibrated and that the framework is functioning as intended. The primary objective of the proposal is to improve the risk sensitivity of the regulatory capital framework for covered banks. Risk-sensitive capital requirements help align regulatory

²¹¹ See 12 U.S.C. 1831o(c)(1)(A), (c)(1)(B)(i).

²¹² See 12 U.S.C. 93a (national banking associations); 12 U.S.C. 248(i), 324, 327, 329 (state member banks); 12 U.S.C. 1463 (savings associations); 12 U.S.C. 1467a(g)(1) (savings and loan holding companies); 12 U.S.C. 1844(b) (bank holding companies); 12 U.S.C. 3106 (certain U.S. operations of foreign banking organizations); 12 U.S.C. 3902(1)–(2), 3907(a), 3909(a), (c)(1)–(2) (depository institutions; affiliates of depository institutions, including holding companies; and certain U.S. operations of foreign banking organizations); 12 U.S.C. 5371 (insured depository institutions, depository institution holding companies, and nonbank financial companies supervised by the Board).

²¹³ The agencies, together with the Federal Financial Institutions Examination Council, commenced a review under the Economic Growth and Regulatory Paperwork Reduction Act of 1996 in 2024 to identify outdated or otherwise unnecessary regulatory requirements. The agencies will continue reviewing and considering these comments as part of any final rulemaking. Public Law 104–208, Div. A, Title II, section 2222, 110 Stat. 3009–414, (1996) (codified at 12 U.S.C. 3311). See also Regulatory Publication and Review Under the Economic Growth and Regulatory Paperwork Reduction Act of 1996, 90 FR 35241 (Jul. 25, 2025).

²¹⁴ See, e.g., section 165 of the Dodd-Frank Act, as amended by section 401 of the Economic Growth, Regulatory Relief, and Consumer Protection Act, which requires the Board to establish enhanced prudential standards that include risk-based capital requirements for bank holding companies with \$250 billion or more in total consolidated assets.

²¹⁵ See 12 CFR part 225 appendix C.

²¹⁶ As a result of the proposal, small entities that have not elected to use the CBLR framework would need to establish or revise internal recordkeeping systems, policies and procedures to track compliance with the amended supervisory capital requirements. For instance, such small entities would now have to separately identify and delineate certain residential mortgages by their cash flow dependencies and their LTVs. Small entities that elect to use the CBLR would not need to implement these changes.

capital with the underlying risk profile of bank exposures. The proposal also aims to promote appropriately calibrated capital levels, which can enhance the efficiency of capital by limiting systemic risk without unduly constraining routine bank activities. Together, these features reduce the opportunities for regulatory arbitrage and support prudent risk taking, thereby improving the resilience of individual institutions and the stability of the financial system.

B. Small Entities Affected by the Proposal

As of December 31, 2024, the OCC supervised approximately 609 small entities, of which 359 will be impacted by the proposal's changes to risk-based capital requirements.²¹⁷ Thus, a substantial number of small entities will be impacted by the proposed rule.

C. Projected Reporting, Recordkeeping, and Other Compliance Requirements

This NPR includes changes to the risk-based capital requirements that address the definition of capital and the calculation of risk-weighted assets and affect small banking organizations. The proposed rules in this NPR that would

affect small banking organizations include:

1. Changing the denominator of the risk-based capital ratios by revising the asset and exposure risk weights;
2. Revising the treatment of counterparty credit risk; and
3. Revising the numerator of the risk-based capital ratios by, among other changes, removing the deduction from regulatory capital for concentrations of mortgage servicing assets that exceed 25 percent of common equity tier 1 capital.

These changes are designed to enhance the risk-sensitivity of the calculation of risk-weighted assets. Therefore, capital requirements may go down for some assets and up for others. To comply with the proposed rules in this NPR, covered small banking organizations would be required to change their internal reporting processes. These changes would require some additional personnel training and expenses related to new systems (or modification of existing systems) for calculating regulatory capital ratios. Additionally, covered small banking organizations that hold certain exposures would be required to obtain additional information under the proposed rules in order to determine the applicable risk weights.

To estimate the compliance costs of the proposal, the OCC reviewed the new mandates that affect OCC-supervised banks. OCC staff then considered costs that may arise from compliance with these mandates. The OCC's cost estimate includes an estimate of the time required to implement the mandates and the estimated average hourly wage of the bank employees who might be responsible for tasks associated with achieving this compliance. In the

cost estimate, OCC staff used a compensation rate of \$131 per hour.²¹⁸

In determining the total hours needed per bank for one-time implementation costs to ensure compliance with the proposal, OCC staff considered the total hours needed per bank, on average, for systems development, data acquisition, data aggregation and reporting, calculation and verification, training, and risk management. As part of this determination, OCC staff also considered the scope of applicability of the rule's key provisions and bank size category.²¹⁹ Based on internal discussions with OCC subject matter experts, OCC staff estimated the total hours needed for one-time implementation efforts per bank.²²⁰ OCC staff then multiply the anticipated total hours by the hourly compensation rate of \$131. The results are summarized below.

²¹⁸ To estimate wages the OCC reviewed May 2024 data for wages (by industry and occupation) from the U.S. Bureau of Labor Statistics (BLS) for credit intermediation and related activities (NAICS 5220A1). To estimate compensation costs associated with the rule, the OCC uses \$131.10 per hour, which is based on the average of the 90th percentile for six occupations adjusted for inflation (3.6 percent as of Q1 2025), plus an additional 35.6 percent for benefits (based on the percent of total compensation allocated to benefits as of Q4 2024 for NAICS 522: credit intermediation and related activities).

²¹⁹ Assuming an average total hour estimate for all banks in a given size category is a simplifying assumption. OCC staff recognize in practice that even across banks within the same category, there would be heterogeneity of time needed to ensure compliance based on size, complexity, balance sheet composition, and market risk approach selected by the bank. OCC staff will look to comment letters for further insight into these costs for the final rule stage.

²²⁰ These compliance cost estimates are subject to considerable uncertainty. They should be interpreted as approximate, order-of-magnitude estimates rather than precise measures of the actual costs individual banks will incur.

²¹⁷ The OCC bases its estimate of the number of small entities on the Small Business Administration's size thresholds for commercial banks and savings institutions NAICS Code: 522110), and trust companies (NAICS Code: 523991), which are \$850 million and \$47 million, respectively. Consistent with the General Principles of Affiliation 13 CFR 121.103(a), the OCC counts the assets of affiliated financial institutions when determining whether to classify an OCC-supervised institution as a small entity. The OCC uses December 31, 2024, to determine size because a "financial institution's assets are determined by averaging the assets reported on its four quarterly financial statements for the preceding year." See footnote 8 of the U.S. Small Business Administration's *Table of Size Requirements*.

Implementation Cost per Bank and in Aggregate

Category	Count	Total Hours per Bank	Hourly Wage	Cost per Bank	Aggregate Cost per Category
Category III and IV banks subject to risk-based capital requirements	25	5,838	131	\$764,778	\$19,119,450
Non-Category I to IV banks subject to risk-based capital requirements	622	4,192	131	\$549,152	\$341,572,544
Banks electing to use the CBLR framework	308	0	131	\$0	\$0
Total	955				\$ 360,691,994

Aggregating the per bank compliance costs for all 955 affected OCC-supervised banks results in an aggregate one-time implementation cost estimate of approximately \$361 million.

D. Identification of Duplicative, Overlapping, or Conflicting Federal Rules

The OCC is unaware of any duplicative, overlapping, or conflicting federal rules. As noted previously, the OCC anticipates issuing a separate proposal to implement reporting requirements that are tied to (but do not overlap or duplicate) the requirements of the proposed rule. The OCC seeks comments and information regarding any such federal rules that are duplicative, overlapping, or otherwise in conflict with the proposed rule.

E. Discussion of Significant Alternatives to the Proposed Rule

The agencies have sought to incorporate flexibility into the proposed rule and lessen burden and complexity for smaller banking organizations wherever possible, consistent with safety and soundness and applicable law. The agencies are requesting comment on potential options for simplifying the rule and reducing burden.

The agencies welcome comment on any significant alternatives to the proposed rules applicable to covered small banking organizations that would minimize their impact on those entities.

C. Plain Language

Section 722 of the Gramm-Leach Bliley Act²²¹ requires the Federal banking agencies to use plain language in all proposed and final rules published after January 1, 2000. The agencies have sought to present the proposed rule in a simple and straightforward manner and invite comments on the use of plain language and whether any part of the proposed rule could be more clearly stated. For example:

- Have the agencies presented the material in an organized manner that meets your needs? If not, how could this material be better organized?
- Are the requirements in the notice of proposed rulemaking clearly stated? If not, how could the proposed rule be more clearly stated?
- Does the proposed rule contain language that is not clear? If so, which language requires clarification?
- Would a different format (grouping and order of sections, use of headings, paragraphing) make the proposed rule easier to understand? If so, what changes to the format would make the proposed rule easier to understand?
- What else could the agencies do to make the proposed rule easier to understand?

²²¹ Public Law 106–102, section 722, 113 Stat. 1338, 1471 (1999).

D. Riegle Community Development and Regulatory Improvement Act of 1994

Pursuant to section 302(a) of the Riegle Community Development and Regulatory Improvement Act (RCDRIA),²²² in determining the effective date and administrative compliance requirements for new regulations that impose additional reporting, disclosure, or other requirements on insured depository institutions, each Federal banking agency must consider, consistent with principles of safety and soundness and the public interest, any administrative burdens that such regulations would place on depository institutions, including small depository institutions, and customers of depository institutions, as well as the benefits of such regulations. In addition, section 302(b) of RCDRIA requires new regulations and amendments to regulations that impose additional reporting, disclosures, or other new requirements on insured depository institutions generally to take effect on the first day of a calendar quarter that begins on or after the date on which the regulations are published in final form, with certain exceptions, including for good cause.²²³

The agencies note that comment on these matters has been solicited in other sections of this **SUPPLEMENTARY INFORMATION** section, and that the

²²² 12 U.S.C. 4802(a).

²²³ 12 U.S.C. 4802.

requirements of RCDRIA will be considered as part of the overall rulemaking process. In addition, the agencies also invite any other comments that further will inform the agencies' consideration of RCDRIA.

E. OCC Unfunded Mandates Reform Act of 1995 Determination

The OCC has analyzed the proposed rule under the factors in the Unfunded Mandates Reform Act of 1995 (UMRA) (2 U.S.C. 1532). Under this analysis, the OCC considered whether the proposed rule includes a Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100 million or more in any one year (adjusted annually for inflation).

The OCC has determined this proposed rule is likely to result in the expenditure by the private sector of \$100 million or more in any one year (adjusted annually for inflation). The OCC has prepared an impact analysis and identified and considered alternative approaches. When the supplemental proposal is published in the **Federal Register**, the full text of the OCC's analysis will be available at: <https://www.regulations.gov>.

F. Providing Accountability Through Transparency Act of 2023

The Providing Accountability Through Transparency Act of 2023 (5 U.S.C. 553(b)(4)) requires that a notice of proposed rulemaking include the internet address of a summary of not more than 100 words in length of the proposed rule, in plain language, that shall be posted on the internet website under section 206(d) of the E-Government Act of 2002 (44 U.S.C. 3501 note).

In summary, the bank regulatory agencies request comment on a proposal to revise the U.S. standardized approach to better align certain capital requirements with the risk of firms' exposures, and ensure that all large banking organizations are required to account for accumulated other comprehensive income (AOCI) in their regulatory capital to better reflect their loss-absorbing capacity.

The proposal and such a summary can be found at <https://www.regulations.gov> by searching for Docket ID OCC-2026-0034 and <https://occ.gov/topics/laws-and-regulations/occ-regulations/proposed-issuances/index-proposed-issuances.html>, <https://www.federalreserve.gov/supervisionreg/reglisting.htm>, and <https://www.fdic.gov/federal-register-publications>.

G. Executive Orders 128866, 13563, and 14192

Executive Order 12866 (Regulatory Planning and Review)²²⁴ and Executive Order 13563 (Improving Regulation and Regulatory Review)²²⁵ direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits. This proposed rule was drafted and reviewed in accordance with Executive Order 12866 and Executive Order 13563. Within OMB, the Office of Information and Regulatory Affairs (OIRA) has determined that this rulemaking is an economically significant regulatory action under section 3(f)(1) of Executive Order 12866. Accordingly, the draft rule was submitted to OIRA for review. As noted in other sections of the **SUPPLEMENTARY INFORMATION** of this document, the agencies have assessed the costs and benefits of this rulemaking and have made a reasoned determination that the benefits of this rulemaking justify its costs. The proposal, if finalized as proposed, is not expected to be an Executive Order 14192 regulatory action.

DEPARTMENT OF THE TREASURY

Office of the Comptroller of the Currency

12 CFR Chapter I

Authority and Issuance

For the reasons set forth in the preamble, the OCC proposes to amend part 3 of chapter I of title 12 of the Code of Federal Regulations as follows:

PART 3—CAPITAL ADEQUACY STANDARDS

■ 1. The authority citation for part 3 continues to read as follows:

Authority: 12 U.S.C. 93a, 161, 1462, 1462a, 1463, 1464, 1818, 1828(n), 1828 note, 1831n note, 1835, 3907, 3909, 5412(b)(2)(B), and Pub. L. 116–136, 134 Stat. 281.

■ 2. In § 3.1:

■ a. Revise paragraphs (c)(4)(i), (e) and (f); and

■ b. Add paragraph (g).

The addition and revision read as follows:

§ 3.1 Purpose, applicability, reservations of authority, and timing.

* * * * *

(c) * * *

(4) * * *

(i) Except for an advanced approaches national bank or Federal savings association that is making public disclosures pursuant to the requirements in subpart E of this part, each national bank or Federal savings association with total consolidated assets of \$50 billion or more, as adjusted pursuant to § 3.4, must make the public disclosures described in subpart D of this part.

* * * * *

(e) *Notice and response procedures.* In making a determination under this part, unless more specifically provided for, the OCC will apply notice and response procedures in the same manner and to the same extent as the notice and response procedures in 12 CFR 4.404.

(f) *Timing.* A national bank or Federal savings association that changes from one category of national bank or Federal savings association to another of such categories, or that changes from having no category to having a such category, must comply with the requirements of its category in this part, including applicable transition provisions of the requirements in this part, no later than on the first day of the second quarter following the change in the national

²²⁴ E.O. 12866, 58 FR 51735 (Oct. 4, 1993).

²²⁵ E.O. 13563, 76 FR 3821 (Jan. 21, 2011).

bank's or Federal savings association's category.

* * * * *

(g) *Severability*. If any provision of this part, or the application thereof to any national bank or Federal savings association, is held invalid, such invalidity shall not affect the validity of other provisions or the application of such provision to other national banks or Federal savings associations that can be given effect without the invalid provision or application.

* * * * *

■ 3. In § 3.2:

- a. Revise the definition of “Adjusted allowances for credit losses (AACL)”;
- b. Remove the definition of “Allowances for loan and lease losses (ALLL)”;
- c. Revise the definition of “Carrying value”;
- d. Revise the definition for “Category III national bank or Federal savings association”;
- e. Add, in alphabetical order, the definition for “Category IV national bank or Federal savings association”;
- f. Revise the definition for “Commitment”;
- g. Add, in alphabetical order, the definition for “Dependent on the cash flows generated by the real estate”;
- h. Revise the definitions for “Effective notional amount”, “Eligible clean-up call”, and “Eligible guarantee”;
- i. Add, in alphabetical order, the definition for “Eligible prepaid credit protection arrangement”;
- j. Revise paragraph (4)(i)(A) in the definition of “Financial institution”;
- k. Revise the definition for “Netting set”;
- l. Add, in alphabetical order, the definitions for “Non-performing loan securitization (NPL securitization)”, “Nonrefundable purchase price discount (NRPPD)”, and “Prepaid credit protection arrangement”;
- m. Revise the definition for “Protection amount (P)”;
- n. Add, in alphabetical order, the definition for “Qualifying Cross Product Master Netting Agreement”;
- o. Revise paragraphs (3) and (4) of the definition for “Qualifying master netting agreement”;
- p. Revise paragraph (1)(ii) of the definition for “Residential mortgage exposure”;
- q. Remove the definition for “Securitization special purpose entity (SPE)”;
- r. Add, in alphabetical order, the definitions for “Senior securitization exposure” and “Specified supranational entity”;
- s. Revise the definition for “Speculative grade”;

■ t. Add, in alphabetical order, the definition for “Synthetic excess spread”;

■ u. In the definition of “Standardized total risk-weighted assets”, remove the words “§ 3.42” and add, in their place, the words “§ 3.43”;

■ v. Revise the definitions for “Sub-speculative grade”, “Synthetic securitization”, and “Traditional securitization”.

The additions and revisions read as follows:

Adjusted allowances for credit losses (AACL) means valuation allowances that have been established through a charge against earnings or retained earnings for expected credit losses on financial assets measured at amortized cost and a lessor's net investment in leases that have been established to reduce the amortized cost basis of the assets to amounts expected to be collected as determined in accordance with GAAP. For purposes of this part, adjusted allowances for credit losses include allowances for expected credit losses on off-balance sheet credit exposures not accounted for as insurance as determined in accordance with GAAP. Adjusted allowances for credit losses exclude allocated transfer risk reserves and allowances created that reflect credit losses on purchased credit deteriorated assets, purchased seasoned loans, assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, and available-for-sale debt securities.

* * * * *

Carrying value means, with respect to an asset, the value of the asset on the balance sheet of the national bank or Federal savings association as determined in accordance with GAAP. For all assets other than available-for-sale debt securities, purchased credit deteriorated assets, purchased seasoned loans, or assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, the carrying value is not reduced by any associated credit loss allowance that is determined in accordance with GAAP.

* * * * *

Category III national bank or Federal savings association means a national bank or Federal savings association that is not a Category I national bank or Federal savings association, or a Category II national bank or Federal savings association, and that:

- (1) Is a subsidiary of a Category III banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2) (i) Has total consolidated assets, calculated based on the average of the national bank's or Federal savings association's total consolidated assets for the four most recent calendar quarters as reported on the Call Report, equal to \$250 billion or more. If the national bank or Federal savings association has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; or

(ii) (A) Has total consolidated assets, calculated based on the average of the national bank's or Federal savings association's total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more but less than \$250 billion. If the depository institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; and

(B) Has at least one of the following in paragraphs (2)(ii)(B)(1) through (3) of this definition, each calculated as the average of the four most recent calendar quarters, or if the national bank or Federal savings association has not filed each applicable reporting form for each of the four most recent calendar quarters, for the most recent quarter or quarters, as applicable:

(1) Total nonbank assets, calculated in accordance with the instructions to the FR Y-9LP or equivalent reporting form, equal to \$75 billion or more;

(2) Off-balance sheet exposure equal to \$75 billion or more. Off-balance sheet exposure is a national bank's or Federal savings association's total exposure, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, minus the total consolidated assets of the national bank or Federal savings association, as reported on the Call Report; or

(3) Weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, equal to \$75 billion or more.

(iii) After meeting the criteria in paragraph (2)(ii) of this definition, a national bank or Federal savings association continues to be a Category III national bank or Federal savings association until the national bank or Federal savings association:

(A) Has:

(1) Less than \$250 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters;

(2) Less than \$75 billion in total nonbank assets, calculated in accordance with the instructions to the FR Y-9LP or equivalent reporting form, for each of the four most recent calendar quarters;

(3) Less than \$75 billion in weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, for each of the four most recent calendar quarters; and

(4) Less than \$75 billion in off-balance sheet exposure for each of the four most recent calendar quarters. Off-balance sheet exposure is a national bank's or Federal savings association's total exposure, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, minus the total consolidated assets of the national bank or Federal savings association, as reported on the Call Report; or

(B) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(C) Is a Category II national bank or Federal savings association.

* * * * *

Category IV national bank or Federal savings association means a national bank or Federal savings association that is not a Category I national bank or Federal savings association, a Category II national bank or Federal savings association, or a Category III national bank or Federal savings association and that:

(1) Is a subsidiary of a Category IV banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2) Has total consolidated assets, calculated based on the average of the national bank's or Federal savings association's total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more. If the national bank or Federal savings association has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on the average of its total consolidated assets, as reported on the Call Report, for the most recent quarter(s) available.

(3) After meeting the criterion in paragraph (2) of this definition, a national bank or Federal savings association continues to be a Category IV national bank or Federal savings association until it:

(i) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(ii) Is a Category II national bank or Federal savings association or Category III national bank or Federal savings association.

* * * * *

Commitment means a contractual arrangement, under which a national bank or Federal savings association and an obligor agree to terms applicable to one or more future extensions of credit, purchases of assets, or issuances of credit substitutes by the national bank or Federal savings association, whether or not such arrangement is unconditionally cancelable. A commitment is unconditionally cancellable if, by its terms, it either: (a) provides that a national bank or Federal savings association is not obligated to extend credit, purchase assets, or issue credit substitutes; or (b) permits a national bank or Federal savings association, at any time, with or without cause, to refuse to extend credit, purchase assets, or issue credit substitutes under the arrangement (to the extent permitted under applicable law).

* * * * *

Dependent on the cash flows generated by the real estate means, for a real estate exposure, the underwriting, at the time of origination, considers the cash flows generated by lease, rental, or sale of the real estate securing the loan as a source of repayment. For purposes of this definition, a residential mortgage exposure that is secured by the borrower's principal residence is deemed not dependent on the cash flows generated by the real estate.

* * * * *

Effective notional amount means for an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, the lesser of the contractual notional amount of the credit risk mitigant and the exposure amount of the hedged exposure, multiplied by the percentage coverage of the credit risk mitigant.

* * * * *

Eligible clean-up call means a clean-up call that:

(1) Is exercisable solely at the discretion of the originating national bank or Federal savings association or servicer;

(2) Is not structured to avoid allocating losses to securitization exposures held by investors or otherwise structured to provide credit enhancement to the securitization; and

(3) Is only exercisable:

(i) For a traditional securitization, when 10 percent or less of the principal amount of the underlying exposures or securitization exposures (determined as of the inception of the securitization) is outstanding;

(ii) For a synthetic securitization, when 10 percent or less of the principal amount of the reference portfolio of underlying exposures (determined as of the inception of the securitization) is outstanding;

(iii) Upon the occurrence of a regulatory event that significantly changes the risk-weighted asset amount for the securitization exposure under this part; or

(iv) Upon the occurrence of a tax event that significantly changes the tax treatment of the securitization exposure under applicable tax laws.

* * * * *

Eligible guarantee means a guarantee that:

(1) Is written;

(2) Is either:

(i) Unconditional, or

(ii) A contingent obligation of the U.S. government or its agencies, the enforceability of which is dependent upon some affirmative action on the part of the beneficiary of the guarantee or a third party (for example, meeting servicing requirements);

(3) Covers all or a pro rata portion of all contractual payments of the obligated party on the reference exposure;

(4) Gives the beneficiary a direct claim against the protection provider;

(5) Is not unilaterally cancelable by the protection provider for reasons other than the breach of the contract by the beneficiary;

(6) Except for a guarantee by a sovereign, is legally enforceable against the protection provider in a jurisdiction where the protection provider has sufficient assets against which a judgment may be attached and enforced;

(7) Requires the protection provider to make payment to the beneficiary on the occurrence of a default (as defined in the guarantee) of the obligated party on the reference exposure in a timely manner without the beneficiary first having to take legal actions to pursue the obligor for payment;

(8) Does not increase the beneficiary's cost of credit protection on the guarantee in response to deterioration in the credit quality of the reference exposure;

(9) Is not provided by an affiliate of the national bank or Federal savings association, unless the affiliate is an insured depository institution, foreign bank, securities broker or dealer, or insurance company that:

(i) Does not control the national bank or Federal savings association; and
(ii) Is subject to consolidated supervision and regulation comparable to that imposed on depository institutions, U.S. securities broker-dealers, or U.S. insurance companies (as the case may be); and

(10) Is provided by an eligible guarantor.

* * * * *

Eligible prepaid credit protection arrangement means a prepaid credit protection arrangement that:

(1) Is written;

(2) Is unconditional;

(3) Covers all or a pro rata portion of all contractual payments due to be paid on the reference exposure or reference exposures;

(4) Provides that the amount and timing of payments due from the protection purchaser to the protection provider are incorporated into the arrangement and the arrangement only allows these terms to change in the event of a breach of the arrangement by the protection purchaser;

(5) Provides that entry of the protection provider into receivership, insolvency, liquidation, conservatorship, or similar proceeding does not change the amounts or timing of payments due to be paid by the protection purchaser under the arrangement;

(6) Is legally valid and enforceable under applicable law of the relevant jurisdictions;

(7) Upon a failure by the obligor on the one or more reference exposures to make a contractually required payment, or the occurrence of other credit events as described in the arrangement, allows the protection purchaser promptly to reduce the outstanding balance of the initial principal amount due to the protection provider by the loss of the protection purchaser on the reference exposures without input from the protection provider; and

(8) Does not increase the protection purchaser's cost of credit protection in response to deterioration in the credit quality of any of the reference exposure.

* * * * *

Financial institution means:

* * * * *

(4) * * *

(i) * * *

(A) An investment in GAAP equity instruments of the company with an adjusted carrying value or exposure amount equal to or greater than \$10 million, as adjusted pursuant to § 3.4; or

* * * * *

Netting set means a group of transactions with a single counterparty

that are subject to a qualifying master netting agreement. For derivative contracts, netting set also includes a single derivative contract between a national bank or Federal savings association and a single counterparty.

* * * * *

Non-performing loan securitization (NPL securitization) means a traditional securitization, that is not a resecuritization, where parameter W (as defined in § 3.44(b)(1)) for the underlying exposures in a pool is greater than or equal to 90 percent at the origination cut-off date and at any subsequent date on which exposures are added to or removed from the pool of underlying exposures due to replenishment or restructuring.

Nonrefundable purchase price discount (NRPPD) means the difference between the outstanding principal balance of the underlying exposures at the time of sale and the price at which these exposures are sold by the originator to a company the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, when neither originator nor the original lender are reimbursed for this difference. In cases where the originator underwrites tranches of an NPL securitization for subsequent sale, the NRPPD may include the differences between the outstanding principal balance of the underlying exposures at the time of sale and the price at which all of the tranches are first sold to unrelated third parties. For any given piece of a securitization tranche, only its initial sale from the originator to investors is taken into account in the determination of NRPPD. The purchase prices of subsequent re-sales of a securitization tranche are not considered.

* * * * *

Prepaid credit protection arrangement means a contractual arrangement under which a protection purchaser transfers the credit risk of one or more reference exposures to a protection provider where:

(1) The protection provider pays an initial principal amount in cash to the protection purchaser at the inception of the transaction; and

(2) The protection purchaser is obligated to repay the initial principal amount to the protection provider on or before the maturity date of the transaction, less any losses that the protection purchaser realizes or otherwise recognizes due to nonpayment of all contractual payments

due to be paid on the reference exposure or reference exposures by the obligors.

* * * * *

Protection amount (P) means, with respect to an exposure hedged by an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, or secured by financial collateral, the effective notional amount of the guarantee, credit derivative, or prepaid credit protection arrangement, or the fair value of the financial collateral, reduced to reflect any currency mismatch, maturity mismatch, or lack of restructuring coverage (as provided in § 3.36–3.37 or § 3.120–121, as applicable).

* * * * *

Qualifying cross-product master netting agreement means a qualifying master netting agreement that provides for termination and close-out netting across multiple types of financial transactions or qualifying master netting agreements in the event of a counterparty's default, provided that the underlying financial transactions are derivative contracts or repo-style transactions that are not cleared transactions. In order to treat an agreement as a qualifying cross-product master netting agreement, a national bank or Federal savings association must comply with the requirements of § 3.3(c) of this part with respect to that agreement.

* * * * *

Qualifying master netting agreement means a written, legally enforceable agreement provided that:

* * * * *

(3) The agreement does not contain a walkaway clause (that is, a provision that permits a non-defaulting counterparty to make a lower payment than it otherwise would make under the agreement, or no payment at all, to a defaulter or the estate of a defaulter, even if the defaulter or the estate of the defaulter is a net creditor under the agreement); and

(4) In order to recognize an agreement as a qualifying master netting agreement for purposes of this subpart, a national bank or Federal savings association must comply with the requirements of § 3.3(d) with respect to that agreement.

* * * * *

Residential mortgage exposure means an exposure (other than a securitization exposure, equity exposure, statutory multifamily mortgage, or presold construction loan):

(1) * * *

(ii) With an original and outstanding amount of \$1 million or less, as adjusted pursuant to § 3.4, that is primarily secured by a first or subsequent lien on

residential property that is not one-to-four family; and

* * * * *

Senior securitization exposure means a securitization exposure that has a first-priority claim on the cash flows from the underlying exposures. When determining whether a securitization exposure has a first-priority claim on the cash flows from the underlying exposures, a national bank or Federal savings association is not required to consider amounts due under interest rate derivative, currency derivative, and servicer cash advance facility contracts; fees due; and other similar payments. Both the most senior commercial paper issued by an ABCP program and a liquidity facility that supports the ABCP program may be senior securitization exposures if the liquidity facility provider's right to reimbursement of the drawn amounts is senior to all claims on the cash flows from the underlying exposures except amounts due under interest rate derivative, currency derivative, and servicer cash advance facility contracts; fees due; and other similar payments.

* * * * *

Specified supranational entity means the Bank for International Settlements, the European Central Bank, the European Commission, the International Monetary Fund, the European Stability Mechanism, or the European Financial Stability Facility.

* * * * *

Speculative grade means that the entity to which the national bank or Federal savings association is exposed through a loan or security, or the reference entity with respect to a credit derivative, has adequate capacity to meet financial commitments in the near term, but is vulnerable to adverse economic conditions, such that should economic conditions deteriorate, the issuer or the reference entity would present an elevated default risk.

* * * * *

Sub-speculative grade means that the entity to which the national bank or Federal savings association is exposed through a loan or security, or the reference entity with respect to a credit derivative, depends on favorable economic conditions to meet its financial commitments, such that should such economic conditions deteriorate the issuer or the reference entity likely would default on its financial commitments.

* * * * *

Synthetic excess spread means any contractual provisions in a synthetic securitization that are designed to

absorb losses prior to any of the tranches of the securitization structure.

Synthetic securitization means a transaction in which:

(1) All or a portion of the credit risk of one or more underlying exposures is retained or transferred to one or more third parties through the use of one or more credit derivatives, guarantees (other than a guarantee that transfers only the credit risk of an individual retail exposure), or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures; and

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities).

* * * * *

Traditional securitization means a transaction in which:

(1) All or a portion of the credit or equity risk of one or more underlying exposures is transferred to one or more third parties other than through the use of credit derivatives, guarantees, or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures;

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities);

(5) The underlying exposures are not owned by an operating company;

(6) The underlying exposures are not owned by a small business investment company defined in section 302 of the Small Business Investment Act;

(7) The underlying exposures are not owned by a firm an investment in which qualifies as a community development investment under section 24(Eleventh) of the National Bank Act;

(8) The OCC may determine that a transaction in which the underlying exposures are owned by an investment firm that exercises substantially unfettered control over the size and

composition of its assets, liabilities, and off-balance sheet exposures is not a traditional securitization based on the transaction's leverage, risk profile, or economic substance;

(9) The OCC may deem a transaction that meets the definition of a traditional securitization, notwithstanding paragraph (5), (6), or (7) of this definition, to be a traditional securitization based on the transaction's leverage, risk profile, or economic substance; and

(10) The transaction is not:

(i) An investment fund;

(ii) A collective investment fund (as defined in 12 CFR 9.18 (national banks), 12 CFR 151.40 (Federal saving associations));

(iii) An employee benefit plan (as defined in paragraphs (3) and (32) of section 3 of ERISA), a "governmental plan" (as defined in 29 U.S.C. 1002(32)) that complies with the tax deferral qualification requirements provided in the Internal Revenue Code, or any similar employee benefit plan established under the laws of a foreign jurisdiction;

(iv) A synthetic exposure to the capital of a financial institution to the extent deducted from capital under § 3.22; or

(v) Registered with the SEC under the Investment Company Act of 1940 (15 U.S.C. 80a-1) or foreign equivalents thereof.

* * * * *

■ 4. Add § 3.4 to read as follows:

§ 3.4 Threshold Indexing.

(a) *Methodology.* The dollar thresholds specified in paragraph (c) of this section shall be adjusted by multiplying the baseline threshold values specified in paragraph (c) of this section by one plus the cumulative percent change in the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured from the effective date of this rule, as further described in paragraph (b) of this section, and shall be rounded in accordance with paragraph (d) of this section.

(b) *Frequency.* (1) *In general—biennial adjustments.* Except as otherwise provided in paragraph (b)(2) and (b)(3) of this section, the adjustments described in paragraph (a) of this section shall be effective on October 1 following each consecutive two year period ending August 30, and using the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers as of August 30 of that year.

(2) *Off-year adjustments.* In the event that the OCC determines, during a year

where no adjustment would be made under paragraph (b)(1), that the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured over the twelve month period ending August 30 of that year, is such that an adjustment under this section would be appropriate for that year, the OCC may make an adjustment under this section for that year.

(3) *Periods of negative inflation.* Notwithstanding paragraph (b)(1) or (b)(2) of this section, if an adjustment of dollar thresholds using the cumulative percent change of the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers from the effective date of this rule or the most recent adjustment, as applicable, would not result in an increase from the current dollar thresholds, no adjustment will be made pursuant to paragraph (a) of this section.

(c) *Specified thresholds.* The thresholds in the following sections shall be adjusted in accordance with paragraph (a) of this section relative to the baseline threshold values as specified below.

(1) Section 3.1(c)(4)(i), baseline threshold value \$50 billion.

(2) Section 3.2, paragraph (4)(i)(A) of the definition of “Financial institution,” baseline threshold value \$10 million;

(3) Section 3.2, definition of “Residential mortgage exposure,” baseline threshold value \$1 million;

(4) Section 3.61, baseline threshold value \$50 billion.

(d) *Rounding.* When adjusting thresholds under this section, each threshold shall be rounded based on the size of the threshold (e.g., thousands, millions, billions) to the nearest number with two significant digits.

(e) *Effective date of threshold adjustments.* The OCC shall announce the thresholds adjusted in accordance with this section by publication in the **Federal Register**. Such adjusted thresholds shall be effective on October 1 of the year during which an adjustment is made.

(f) *Failure to publish in the **Federal Register**.* In the event, for any reason, the thresholds adjusted in accordance with this section are not published in the **Federal Register** in a year in which an adjustment is made under this section, the thresholds specified in paragraph (c) of this section will adjust as provided in this section and be effective on October 1, notwithstanding the lack of publication in the **Federal Register**.

* * * * *

■ 5. Add § 3.5 to read as follows:

§ 3.5 Calculation of loan-to-value (LTV) ratio.

(a) *Loan-to-value ratio.* The loan-to-value (LTV) ratio must be calculated as the extension of credit divided by the value of the property.

(b) *Extension of credit.* For purposes of a LTV ratio calculated under this § 3.5, the extension of credit is equal to the total outstanding amount of the loan including any undrawn committed amount of the loan.

(c) *Value of the property.* (1) For purposes of a LTV ratio calculated under this § 3.5, the value of the property is the market value of all real estate properties securing or being improved by the extension of credit plus the amount of any readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 34, appendix A to subpart D, that secures the extension of credit, subject to the following:

(i) For exposures subject to 12 CFR part 34, subpart C, the market value of property is a valuation that meets all requirements of that rule.

(ii) For exposures not subject to 12 CFR part 34, subpart C:

(A) The market value of real estate must be obtained from an independent valuation of the property using prudently conservative valuation criteria;

(B) The valuation must be done independently from the national bank's or Federal savings association's origination and underwriting process; and

(C) To ensure that the market value of the real estate is determined in a prudently conservative manner, the valuation must exclude expectations of price increases and must be adjusted downward to account for the potential for the current market price to be significantly above the value that would be sustainable over the life of the loan.

(2) In the case where the exposure includes the financing to purchase the property, the value of the property is the lower of the market value obtained under paragraph (c)(1)(i) or (c)(1)(ii) of this section, as applicable, and the actual acquisition cost.

(3) The value of the property must be measured at the time of origination, except in the following circumstances:

(i) The OCC requires a national bank or Federal savings association to revise the value of the property downward;

(ii) The value of the property must be adjusted downward due to an extraordinary event that results in a permanent reduction of the property value; or

(iii) The value of the property may be increased to reflect modifications made

to the property that increase the market value, as determined according to the requirements in paragraphs (c)(1)(i) or (c)(1)(ii) of this section.

(4) Readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 34, appendix A to subpart D, must be appropriately discounted by the national bank or Federal savings association consistent with the national bank's or Federal savings association's usual practices for making loans secured by such collateral.

■ 6. Amend § 3.22 by:

■ a. Redesignating footnotes 22 through 31 as footnotes 1 through 10; and

■ b. Revising paragraph (b), the heading of paragraph (d), and paragraph (d)(1).

The revisions read as follows:

§ 3.22 Regulatory capital adjustments and deductions.

* * * * *

(b) *Regulatory adjustments to common equity tier 1 capital.*

(1) A national bank or Federal savings association must adjust the sum of common equity tier 1 capital elements pursuant to the requirements set forth in this paragraph (b). Such adjustments to common equity tier 1 capital must be made net of the associated deferred tax effects.

(i) A national bank or Federal savings association that makes an AOCI opt-out election (as defined in paragraph (b)(2) of this section), must make the adjustments required under paragraph (b)(2)(i) of this section.

(ii) A national bank or Federal savings association that is an advanced approaches national bank or Federal savings association, Category III national bank or Federal savings association, or Category IV national bank or Federal savings association, and a national bank or Federal savings association that has not made an AOCI opt-out election (as defined in paragraph (b)(2) of this section), must deduct any accumulated net gains and add any accumulated net losses on cash flow hedges included in AOCI that relate to the hedging of items that are not recognized at fair value on the balance sheet.

(iii) A national bank or Federal savings association must deduct any net gain and add any net loss related to changes in the fair value of liabilities that are due to changes in the national bank's or Federal savings association's own credit risk. An advanced approaches national bank or Federal savings association, Category III national bank or Federal savings association, or Category IV national bank or Federal savings association must deduct the difference between its credit spread premium and the risk-free rate for

derivatives that are liabilities as part of this adjustment.

(2) AOCI opt-out election.

(i) A national bank or Federal savings association that is not an advanced approaches national bank or Federal savings association, Category III national bank or Federal savings association, or Category IV national bank or Federal savings association may make a one-time election to opt out of the requirement to include all components of AOCI (with the exception of accumulated net gains and losses on cash flow hedges related to items that are not fair-valued on the balance sheet) in common equity tier 1 capital (AOCI opt-out election). A national bank or Federal savings association that makes an AOCI opt-out election in accordance with this paragraph (b)(2) must adjust common equity tier 1 capital as follows:

(A) Subtract any net unrealized gains and add any net unrealized losses on available-for-sale securities;

(B) Subtract any accumulated net gains and add any accumulated net losses on cash flow hedges;

(C) Subtract any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans (excluding, at the national bank's or Federal savings association's option, the portion relating to pension assets deducted under paragraph (a)(5) of this section); and

(D) Subtract any net unrealized gains and add any net unrealized losses on held-to-maturity securities that are included in AOCI.

(ii) (A) A national bank or Federal savings association that is not an advanced approaches national bank or Federal savings association, Category III national bank or Federal savings association, or Category IV national bank or Federal savings association must make its AOCI opt-out election in the Call Report during the first reporting period after the national bank or Federal savings association is required to comply with subpart A of this part as set forth in § 3.1(f).

(B) Notwithstanding paragraph (b)(ii)(A) of this section, if a national bank or Federal savings association was previously an advanced approaches national bank or Federal savings association, Category III national bank or Federal savings association, or Category IV national bank or Federal savings association, the national bank or Federal savings association must make its AOCI opt-out election in the Call Report during the first reporting period after the national bank or Federal savings association ceased to be an

advanced approaches national bank or Federal savings association, Category III national bank or Federal savings association, or Category IV national bank or Federal savings association.

(iii) With respect to a national bank or Federal savings association that is not an advanced approaches national bank or Federal savings association, Category III national bank or Federal savings association, or Category IV national bank or Federal savings association, each of its subsidiary banking organizations that is subject to regulatory capital requirements issued by the Board of Governors of the Federal Reserve, the Federal Deposit Insurance Corporation, or the Office of the Comptroller of the Currency²¹ must elect the same option as the national bank or Federal savings association pursuant to this paragraph (b)(2).

(iv) With prior notice to the OCC, a national bank or Federal savings association resulting from a merger, acquisition, or purchase transaction and that is not an advanced approaches national bank or Federal savings association, a Category III national bank or Federal savings association, or a Category IV national bank or Federal savings association, may make a new AOCI opt-out election in the Call Report filed by the resulting national bank or Federal savings association for the first reporting period after it is required to comply with subpart A of this part as set forth in § 3.1(f) if:

(A) Other than as set forth in paragraph (b)(2)(iv)(C) of this section, the merger, acquisition, or purchase transaction involved the acquisition or purchase of all or substantially all of either the assets or voting stock of another banking organization that is subject to regulatory capital requirements issued by the Board of Governors of the Federal Reserve, the Federal Deposit Insurance Corporation, or the Office of the Comptroller of the Currency;²²

(B) Prior to the merger, acquisition, or purchase transaction, only one of the banking organizations involved in the transaction made an AOCI opt-out election under this section; and

(C) A national bank or Federal savings association may, with the prior approval of the OCC, change its AOCI opt-out election under this paragraph (b) in the case of a merger, acquisition, or purchase transaction that meets the requirements set forth at paragraph (b)(2)(iv)(B) of this section, but does not meet the requirements of paragraph (b)(2)(iv)(A) of this section. In making such a determination, the OCC may consider the terms of the merger, acquisition, or purchase transaction, as

well as the extent of any changes to the risk profile, complexity, and scope of operations of the national bank or Federal savings association resulting from the merger, acquisition, or purchase transaction.

* * * * *

(d) *Certain DTAs subject to common equity tier 1 capital deduction thresholds.*

(1) A national bank or Federal savings association that is not an advanced approaches national bank or Federal savings association must make deductions from regulatory capital as described in this paragraph (d)(1).

(i) The national bank or Federal savings association must deduct from common equity tier 1 capital elements the amount of DTAs as described in paragraph (d)(1)(ii) of this section that exceeds 25 percent of the sum of the national bank's or Federal savings association's common equity tier 1 capital elements, less adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c)(3) of this section (the 25 percent common equity tier 1 capital deduction threshold).²⁹

(ii) The national bank or Federal savings association must deduct from common equity tier 1 capital elements the amount of DTAs arising from temporary differences that the national bank or Federal savings association could not realize through net operating loss carrybacks, net of any related valuation allowances and net of DTLs, in accordance with paragraph (e) of this section. A national bank or Federal savings association is not required to deduct from the sum of its common equity tier 1 capital elements DTAs (net of any related valuation allowances and net of DTLs, in accordance with § 3.22(e)) arising from timing differences that the national bank or Federal savings association could realize through net operating loss carrybacks. The national bank or Federal savings association must risk weight these assets at 100 percent. For a national bank or Federal savings association that is a member of a consolidated group for tax purposes, the amount of DTAs that could be realized through net operating loss carrybacks may not exceed the amount that the national bank or Federal savings association could reasonably expect to have refunded by its parent holding company.

(iii) For purposes of calculating the amount of DTAs subject to deduction pursuant to paragraph (d)(1) of this section, a national bank or Federal savings association may exclude DTAs and DTLs relating to adjustments made

to common equity tier 1 capital under paragraph (b) of this section. A national bank or Federal savings association that elects to exclude DTAs relating to adjustments under paragraph (b) of this section also must exclude DTLs and must do so consistently in all future calculations. A national bank or Federal savings association may change its exclusion preference only after obtaining the prior approval of the OCC.

* * * * *

²² These rules include the regulatory capital requirements set forth at 12 CFR part 3 (OCC); 12 CFR part 225 (Board); 12 CFR part 325, and 12 CFR part 390 (FDIC).

* * * * *

²⁹ The amount of the items in paragraph (d)(1) of this section that is not deducted from common equity tier 1 capital must be included in the risk-weighted assets of the

national bank or Federal savings association and assigned a 250 percent risk weight.

* * * * *

■ 7. In § 3.32:

■ a. Revise paragraph (f)(1);

■ b. Revise paragraph (g)(1);

■ c. Revise paragraph (l)(5).

The revisions read as follows:

§ 3.32 General risk weights.

* * * * *

(f) Corporate exposures.

(1) A national bank or Federal savings association must assign a 95 percent risk weight to all its corporate exposures, except as provided in paragraphs (f)(2) and (f)(3) of this section.

* * * * *

(g) Residential mortgage exposures.

(1) A national bank or Federal savings association must assign a risk weight in

accordance with Table 5 to § 3.32 or Table 6 to § 3.32, as applicable, to a first-lien residential mortgage exposure that:

(i) Is secured by a property that is either owner-occupied or rented;

(ii) Is made in accordance with prudent underwriting standards, including relating to the loan amount as a percent of the appraised value of the property;

(iii) Is not 90 days or more past due or carried in nonaccrual status; and

(iv) Is not restructured or modified, provided that a loan modified or restructured solely pursuant to the U.S. Treasury's Home Affordable Mortgage Program is not modified or restructured for purposes of this section.

TABLE 5—RISK WEIGHTS FOR RESIDENTIAL MORTGAGES THAT ARE NOT DEPENDENT ON THE CASH FLOWS GENERATED BY THE REAL ESTATE BASED ON LTV¹

	LTV ratio ≤ 50%	50% < LTV ratio ≤ 60%	60% < LTV ratio ≤ 80%	80% < LTV ratio ≤ 90%	90% < LTV ratio ≤ 100%	LTV ratio > 100%
Risk Weight	25%	30%	35%	45%	55%	75%

¹ LTV is calculated in accordance with § 3.5.

TABLE 6—PROPOSED RISK WEIGHTS FOR RESIDENTIAL MORTGAGE EXPOSURES DEPENDENT ON THE CASH FLOWS GENERATED BY THE REAL ESTATE AND BASED ON LTV²

	LTV ratio ≤ 50%	50% < LTV ratio ≤ 60%	60% < LTV ratio ≤ 80%	80% < LTV ratio ≤ 90%	90% < LTV ratio ≤ 100%	LTV ratio > 100%
Risk Weight	35%	40%	50%	65%	80%	110%

¹ LTV is calculated in accordance with § 3.5.

(2) A national bank or Federal savings association must assign a 100 percent risk weight to a first-lien residential mortgage exposure that does not meet the criteria in paragraph (g)(1) of this section or for which the national bank or Federal savings association cannot calculate the LTV in accordance with 12 CFR 3.5, and to junior-lien residential mortgage exposures.

(3) For the purpose of this paragraph (g), if a national bank or Federal savings association holds the first-lien and junior-lien(s) residential mortgage exposures, and no other party holds an intervening lien, the national bank or Federal savings association must combine the exposures and treat them as a single first-lien residential mortgage exposure.

* * * * *

(l) * * *

(5) A national bank or Federal savings association must assign a 90 percent risk weight to all assets not specifically assigned a different risk weight under this subpart D and that are not deducted

from tier 1 or tier 2 capital pursuant to § 3.22.

* * * * *

■ 8. In § 3.33:

■ a. Add paragraph (a)(5);

■ b. Remove paragraph (b)(2)(ii) and redesignate paragraph (b)(2)(i) as paragraph (b)(2);

■ c. Revise paragraph (b)(3);

■ d. Redesignate paragraph (b)(4) as new paragraph (b)(5); and

■ e. Add new paragraph (b)(4).

The revision reads as follows:

§ 3.33 Off-balance sheet exposures.

(a) *General.*

* * * * *

(5) For purposes of this section if a commitment does not have an express contractual maximum amount that can be drawn, the committed but undrawn amount of the commitment is equal to the highest total drawn amount over the period since the commitment was created or the prior 24 months, whichever period is shorter, minus the current drawn amount.

* * * * *

(b) *Credit conversion factors—*

* * * * *

(2) *20 percent CCF.* A national bank or Federal savings association must apply a 20 percent CCF to the amount of self-liquidating, trade-related contingent items that arise from the movement of goods, with an original maturity of one year or less.

(3) *40 percent CCF.* A national bank or Federal savings association must apply a 40 percent CCF to commitments, regardless of the maturity of the facility, unless they qualify for a lower or higher CCF.

(4) *50 percent CCF.* A national bank or Federal savings association must apply a 50 percent CCF to the amount of:

(i) Transaction-related contingent items, including performance bonds, bid bonds, warranties, and performance standby letters of credit; and

(ii) Note issuance facilities and revolving underwriting facilities.

(5) *100 percent CCF.* * * *

* * * * *

■ 9. Amend § 3.34 by revising paragraph (c)(2) to read as follows:

§ 3.34 Derivative contracts.

* * * *

(c) * * *

(2) As an alternative to the simple approach, a national bank or Federal savings association using CEM under paragraph (b) of this section may recognize the credit risk mitigation benefits of financial collateral that secures such a contract or netting set if the financial collateral is marked-to-fair value on a daily basis and subject to a daily margin maintenance requirement by applying a risk weight to the uncollateralized portion of the exposure, after adjusting the exposure amount calculated under paragraph (b)(1) or (2) of this section using the collateral haircut approach in § 3.37(e). The national bank or Federal savings association must substitute the exposure amount calculated under paragraph (b)(1) or (2) of this section for $\sum_i E_i$ in the equation in § 3.37(e)(2).

* * * *

■ 10. Amend § 3.36 by revising paragraph (e) to read as follows:

§ 3.36 Guarantees and credit derivatives: substitution treatment.

* * * *

(e) *Adjustment for credit derivatives without restructuring as a credit event.*

(1) If a national bank or Federal savings association recognizes an eligible credit derivative that does not include as a credit event a restructuring of the hedged exposure involving forgiveness or postponement of principal, interest, or fees that results in a credit loss event (that is, a charge-off, specific provision, or other similar debit to the profit and loss account), the national bank or Federal savings association must apply the adjustment in paragraph (e)(2) of this section to reduce the effective notional amount of the credit derivative unless:

(i) The terms of the hedged exposure and the reference exposure, if different from the hedged exposure, allow the maturity, principal, coupon, currency, or seniority status of the exposure to be amended outside of receivership, insolvency, liquidation, or similar proceeding only by unanimous consent of all parties; and

(ii) The national bank or Federal savings association has conducted sufficient legal review to conclude with a well-founded basis (and maintains sufficient written documentation of that legal review) that the hedged exposure is subject to the U.S. Bankruptcy Code, the Federal Deposit Insurance Act, or a domestic or foreign insolvency regime

with similar features that allow for a company to liquidate, reorganize, or restructure and provides for an orderly settlement of creditor claims.

(2) The national bank or Federal savings association must apply the following adjustment to reduce the effective notional amount of any eligible credit derivative that is subject to adjustment under paragraph (e)(1) of this section:

$$Pr = Pm \times 0.60$$

Where:

- (i) Pr = effective notional amount of the credit risk mitigant, adjusted for lack of restructuring event (and maturity mismatch, if applicable); and
- (ii) Pm = effective notional amount of the credit risk mitigant (adjusted for maturity mismatch, if applicable).

* * * *

■ 11. Amend § 3.37 to read as follows:

§ 3.37 Collateralized transactions and prepaid credit protection arrangements.

(a) *Financial Collateral.* (1) To recognize the risk-mitigating effects of financial collateral, a national bank or Federal savings association may use:

- (i) The simple approach in paragraph (b) of this section; or
- (ii) The collateral haircut approach in paragraph (e) of this section for repo-style transactions, eligible margin loans, collateralized derivative contracts, and single-product netting sets of such transactions, subject to paragraph (a)(3) of this section.

(2) A national bank or Federal savings association must use the same approach to recognize the risk-mitigating effects of financial collateral for similar exposures or transactions.

(3) A national bank or Federal savings association that has elected under § 3.34(a)(1)(ii) to use the standardized approach for counterparty credit risk (SA-CCR) for derivative contracts may elect to also use SA-CCR for repo-style transactions that are subject to a qualifying cross-product master netting agreement with derivative contracts, subject to the requirements of paragraph (f) of this section. A national bank or Federal savings association that uses SA-CCR to determine the exposure amount of a derivative contract or netting set may use not the simple approach in paragraph (b) of this section or the collateral haircut approach under paragraph (e) of this section for the exposures for which SA-CCR is used.

(b) *The simple approach*—(1) *General requirements.* To qualify for the simple approach under this paragraph (b), the financial collateral must meet the following requirements:

- (i) The collateral must be revalued at least every six months;

(ii) The legal mechanism by which financial collateral is pledged or transferred must be enforceable in the relevant jurisdictions and ensure that the national bank or Federal savings association has the contractual right, as applicable to the characteristics of the financial collateral and exposure, to liquidate or take legal possession of the financial collateral, setoff amounts owed to the obligor against amounts owed to the national bank or Federal savings association and close out any transaction giving rise to the secured exposure, in a timely manner, in the event of the default, insolvency or bankruptcy (or one or more otherwise-defined credit events set out in the transaction documentation) of the obligor; and

(iii) The national bank or Federal savings association must be able to reasonably demonstrate the ability to protect and enforce its rights in respect of any financial collateral.

(2) *Risk weight substitution.* (i) A national bank or Federal savings association may apply a risk weight to the portion of an exposure that is secured by financial collateral that meets the requirements of paragraph (b) of this section, up to the protection amount of the financial collateral as adjusted by paragraph (d) of this section, based on the risk weight assigned to the collateral under this subpart. For repurchase agreements, reverse repurchase agreements, and securities lending and borrowing transactions, the collateral is the instruments, gold, and cash the national bank or Federal savings association has borrowed, purchased subject to resale, or taken as collateral from the counterparty under the transaction. Except as provided in paragraph (b)(3) of this section, the risk weight assigned to the protected portion of the exposure may not be less than 20 percent.

(ii) A national bank or Federal savings association must apply a risk weight to the amount of an exposure in excess of the protection amount of financial collateral securing the exposure based on the risk weight applicable to the exposure under this subpart.

(3) *Exceptions to the 20 percent risk weight floor and other requirements.* Notwithstanding paragraph (b)(2)(i) of this section, a national bank or Federal savings association may assign a zero percent risk weight up to the protection amount of the financial collateral where:

- (i) The financial collateral is cash on deposit; or
- (ii) The financial collateral is an exposure to a sovereign that qualifies for a zero percent risk weight under § 3.32, and the national bank or Federal savings

association has discounted the fair value of the collateral by 20 percent.

(c) *Eligible prepaid credit protection arrangements.* (1) *Scope.* A national bank or Federal savings association may recognize the credit risk mitigation benefits of an eligible prepaid credit protection arrangement as provided under this paragraph.

(2) *Application.* This paragraph applies to exposures, including securitization exposures, for which:

(i) Credit risk is fully covered by an eligible prepaid credit protection arrangement; or

(ii) Credit risk is covered on a pro rata basis (that is, on a basis in which the national bank or Federal savings association and the protection provider share losses proportionately) by an eligible prepaid credit protection arrangement.

(3) *Tranching of credit risk.* Exposures on which there is a tranching of credit risk (reflecting at least two different levels of seniority) generally are securitization exposures subject to § 3.41 through § 3.45.

(4) *Multiple eligible prepaid credit protection arrangements.* If multiple eligible prepaid credit protection arrangements cover a single exposure, a national bank or Federal savings association may treat the hedged exposure as multiple separate exposures each covered by a single eligible credit protection arrangement and may calculate a separate risk-weighted asset amount for each separate exposure as described in paragraph (c)(6) of this section.

(5) *Single eligible credit protection arrangements.* If a single eligible credit protection arrangement covers multiple hedged exposures, a national bank or Federal savings association must treat each hedged exposure as covered by a separate eligible credit protection arrangement and must calculate a separate risk-weighted asset amount for each exposure as described in paragraph (c)(6) of this section.

(6) *Prepaid credit protection arrangements—The substitution approach.* (i) *Full coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the protection amount (P) of the prepaid credit protection arrangement is greater than or equal to the exposure amount of the reference exposure, a national bank or Federal savings association may assign a zero percent risk weight to the reference exposure.

(ii) *Partial coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the

protection amount (P) of the prepaid credit protection arrangement is less than the exposure amount of the reference exposure, the national bank or Federal savings association must treat the reference exposure as two separate exposures (protected and unprotected) in order to recognize the credit risk mitigation benefit of the prepaid credit protection arrangement.

(A) The national bank or Federal savings association may apply a risk-weight of zero percent for the protected exposure.

(B) The national bank or Federal savings association must calculate the risk-weighted asset amount for the unprotected exposure under this subpart D, where the applicable risk weight is that of the unprotected portion of the reference exposure.

(C) The treatment provided in this section is applicable when the credit risk of a reference exposure is covered on a partial pro rata basis and may be applicable when an adjustment is made to the effective notional amount of the prepaid credit protection arrangement under paragraph (d) of this section.

(d) *Required adjustments—*(1) *Maturity mismatch adjustment.* (i) A national bank or Federal savings association that recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section must adjust the amount of credit risk mitigation recognized to reflect any maturity mismatch.

(ii) A maturity mismatch occurs when:

(A) The residual maturity of the legal mechanism by which financial collateral is pledged is less than that of the secured exposure(s); or

(B) The residual maturity of an eligible prepaid credit protection arrangement is less than that of the reference exposure.

(iii) The residual maturity of a secured exposure under paragraph (b) of this section or a reference exposure under paragraph (c) of this section is the longest possible remaining time before the obligated party of the secured exposure or reference exposure is scheduled to fulfil its obligation on the exposure. For purposes of this paragraph (d)(1)(iii):

(A) For an eligible prepaid credit protection arrangement, if the terms of the arrangement include embedded options that may reduce its term, the national bank or Federal savings association (protection purchaser) must adjust the residual maturity. If a call is at the discretion of the protection

provider, the residual maturity is at the first call date. If the call is at the discretion of the national bank or Federal savings association (protection purchaser), but the terms of the arrangement at origination contain a positive incentive for the national bank or Federal savings association to cancel the arrangement before contractual maturity, the remaining time to the first call date is the residual maturity.

(B) For financial collateral that is not cash on deposit at the national bank or Federal savings association, but including cash held for the national bank or Federal savings association by a third-party custodian or trustee, the residual maturity of any amount of such financial collateral is the earliest date on which the national bank's or Federal savings association's rights in respect of such amount of financial collateral may be terminated without the pledgor being subject to a contemporaneous requirement to pledge additional financial collateral. For financial collateral that is cash on deposit at the national bank or Federal savings association, the residual maturity of any amount of such cash collateral is the earliest date on which a depositor may withdraw such amount, notwithstanding any notice requirements or early withdrawal fees or penalties.

(iv) The credit risk mitigation benefits of financial collateral or an eligible prepaid credit protection arrangement with a maturity mismatch may be recognized only if the original maturity of the legal mechanism by which financial collateral is pledged or the eligible prepaid credit protection arrangement is greater than or equal to one year and its residual maturity is greater than three months.

(v) When a maturity mismatch exists, the national bank or Federal savings association must apply the following adjustment to reduce the protection amount:

$$P_m = E \times (t - 0.25) / (T - 0.25)$$

Where:

(A) P_m = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement, adjusted for maturity mismatch;

(B) E = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement;

(C) t = the lesser of T or the residual maturity of the arrangement, expressed in years; and

(D) T = the lesser of five or the residual maturity of the secured exposure or reference exposure, expressed in years.

(2) *Currency mismatch adjustment.* (i) If a national bank or Federal savings association recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section that is denominated in a currency different from that in which the secured or reference exposure is denominated, the national bank or Federal savings association must apply the following formula to the fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement:

$$H_{FX} = 8\% \times \sqrt{\frac{T_M}{10}}, \text{ where } T_M \text{ equals the greater of 10 or the number of business days}$$

between revaluations.

(e) *Collateral haircut approach—Exposure amount for eligible margin loans and repo-style transactions.* (1) *General.* A national bank or Federal savings association may recognize the credit risk mitigation benefits of financial collateral that secures an eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set of eligible margin

$$P_c = P_r \times (1 - H_{FX})$$

Where:

- (A) P_c = fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement, adjusted for currency mismatch (and maturity mismatch, if applicable);
- (B) P_r = fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement (adjusted for maturity mismatch, if applicable); and
- (C) H_{FX} = haircut appropriate for the currency mismatch between the financial collateral and the secured exposure or the eligible prepaid credit protection

arrangement and the reference exposure, as determined under paragraphs (d)(2)(ii) through (iii) of this section.

(ii) Subject to paragraph (d)(2)(iii) of this section, a national bank or Federal savings association must set H_{FX} equal to eight percent.

(iii) A national bank or Federal savings association must increase H_{FX} as determined under paragraph (d)(2)(ii) of this section if the national bank or Federal savings association revalues the financial collateral or eligible prepaid credit protection arrangement less frequently than once every 10 business days using the following formula:

loans, repo-style transactions, or collateralized derivative contracts, and of any collateral that secures a repo-style transaction that is included in the national bank's or Federal savings association's measure for market risk under subpart F of this part, by using the collateral haircut approach covered in this paragraph (e) of this section.

(2) *Exposure amount calculation.* For purposes of the collateral haircut

approach, a national bank or Federal savings association must determine the exposure amount for an eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set of eligible margin loans, repo-style transactions, or collateralized derivative contracts according to the following formula:

$$E^* = \max \left\{ 0; \left(\sum_i E_i - \sum_i C_i \right) + \left(0.4 \times \text{net}_{\text{exposure}} \right) + \left(0.6 \times \frac{\text{gross}_{\text{exposure}}}{\sqrt{N}} \right) + \right.$$

$$\left. \left(\sum_{fx} (E_{fx} \times H_{fx}) \right) \right\} \text{ where:}$$

- (i) E^* is the exposure amount of the eligible margin loan, repo-style transaction, or netting set after credit risk mitigation;
- (ii) E_i is:
 - (A) For eligible margin loans and repo-style transactions and netting sets thereof, the current fair value of the instrument, cash, or gold the national bank or Federal savings association has lent, sold subject to repurchase, or posted as collateral to the counterparty; and
 - (B) For collateralized derivative contracts and netting sets thereof, the exposure amount of the OTC derivative contract or netting set calculated under § 3.34(b)(1) or (2);
- (iii) C_i is the current fair value of the instrument, cash, or gold the banking organization has borrowed, purchased subject to resale, or taken as collateral from the counterparty;
- (iv) $\text{net}_{\text{exposure}} = |\sum_s E_s H_s|$;
- (v) $\text{gross}_{\text{exposure}} = \sum_s E_s |H_s|$;
- (vi) E_s is the absolute value of the net position in a given instrument or in gold, where the net position in a given instrument or gold equals the sum of the

- current fair values of the instrument or gold the national bank or Federal savings association has lent, sold subject to repurchase, or posted as collateral to the counterparty, minus the sum of the current fair values of that same instrument or gold the national bank or Federal savings association has borrowed, purchased subject to resale, or taken as collateral from the counterparty;
- (vii) H_s is the haircut appropriate to E_s as described in Table 1 to § 3.37, as applicable. H_s has a positive sign if the instrument or gold is net lent, sold subject to repurchase, or posted as collateral to the counterparty; H_s has a negative sign if the instrument or gold is net borrowed, purchased subject to resale, or taken as collateral from the counterparty;
- (viii) N is the number of instruments with a unique Committee on Uniform Securities Identification Procedures (CUSIP) designation or foreign equivalent that the national bank or Federal savings association lends, sells subject to

repurchase, posts as collateral, borrows, purchases subject to resale, or takes as collateral in the eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set, including all collateral that the national bank or Federal savings association elects to include within the credit risk mitigation framework, except that instruments where the value E_s is less than one tenth of the value of the largest E_s in the eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set are not included in the count or gold, with any amount of gold given a value of one;

- (ix) E_{fx} is the absolute value of the net position in each currency fx different from the settlement currency;
- (x) H_{fx} is the haircut appropriate for currency mismatch of currency fx .

(3) *Market price volatility and currency mismatch haircuts.* (i) A national bank or Federal savings association must use the haircuts for

market price volatility (H_s) in Table 1 to paragraphs (e)(3)(iii) through (v) of this section, as adjusted in certain circumstances as provided in

TABLE 1 TO § 3.37—MARKET PRICE VOLATILITY HAIRCUTS

Residual maturity	Securities issued by a sovereign or an issuer described in § 3.32(b) ¹ (percent)				Other investment-grade securities (percent)	
	Issuer risk weight of 0%	Issuer risk weight of 20% or 50%	Issuer risk weight of 100%	GSE exposures	Exposures other than GSE exposures or securitization exposures	Senior securitization exposures with risk weight <100%
Debt Securities:						
Less than or equal to 1 year	0.5	1.0	15.0	1.0	2.0	4.0
Greater than 1 year and less than or equal to 3 years	2.0	3.0	15.0	4.0	4.0	12.0
Greater than 3 years and less than or equal to 5 years					6.0	
Greater than 5 years and less than or equal to 10 years	4.0	6.0	15.0	8.0	12.0	24.0
Greater than 10 years					20.0	
Main index equities (including convertible bonds) and gold	20.0					
Other publicly traded equities and convertible bonds	30.0					
Mutual funds and exchange traded funds	Highest haircut applicable to any security in which the fund can invest, unless the banking organization can apply the full look-through approach for equity investments in funds § 3.53(b), in which case the banking organization may use a weighted average of haircuts applicable to the securities held by the fund.					
Cash on deposit	0.0					
Other exposure types ²	30.0					

¹ Includes a foreign PSE that receives a zero percent risk weight.

² Includes senior securitization exposures with a risk weight greater than or equal to 100 percent and sovereign exposures with a risk weight greater than 100 percent.

(ii) For currency mismatches, a national bank or Federal savings association must use a haircut for foreign exchange rate volatility (H_{fx}) of 8 percent, as adjusted in certain circumstances under paragraphs (e)(3)(iii) and (iv) of this section.

(iii) For repo-style transactions, a national bank or Federal savings association may multiply the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section by the square root of $\frac{1}{2}$ (which equals 0.707107).

(iv) A national bank or Federal savings association must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period longer than ten business days for eligible margin loans and derivative contracts that are not client-facing derivative transactions or a holding period longer than five business days for repo-style transactions and client-facing derivative transactions that are not cleared transactions under the following conditions. If the number of trades in a netting set exceeds 5,000 at any time during a quarter, a national bank or Federal savings association must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period of twenty business days for the following quarter except in the calculation of exposure amount for purposes of § 3.35. If a netting set contains one or more trades involving illiquid collateral, a national bank or

Federal savings association must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period of twenty business days. If over the two previous quarters more than two margin disputes on a netting set have occurred that lasted longer than the holding period, then the national bank or Federal savings association must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward for that netting set on the basis of a holding period that is at least two times the minimum holding period for that netting set. The national bank or Federal savings association must adjust the haircuts upward using the following formula:

$$H_a = H_s \sqrt{T_m/T_s}$$

Where:

- (A) T_m equals a holding period of longer than 10 business days for eligible margin loans and derivative contracts other than client-facing derivative transactions or longer than 5 business days for repo-style transactions and client-facing derivative transactions;
- (B) H_s equals the market price volatility haircut provided in Table 1 to § 3.37 or to the foreign exchange rate volatility haircut provided in paragraph (e)(3)(ii) of this section; and
- (C) T_s equals 10 business days for eligible margin loans and derivative contracts other than client-facing derivative transactions or 5 business days for repo-style transactions and client-facing derivative transactions.

(5) If the instruments a national bank or Federal savings association has lent, sold subject to repurchase, or posted as collateral do not meet the definition of financial collateral, the national bank or Federal savings association must use a 30 percent haircut for market price volatility (H_s).

(f) *Election to apply SA-CCR to certain repo-style transactions.* (1) A national bank or Federal savings association that elects to determine the exposure amount using SA-CCR for its derivative contracts under paragraph (a)(1)(ii) of § 3.34 may elect under paragraph (a)(3) of this section to use SA-CCR to determine the exposure amount for a set of repo-style transactions and derivative contracts that are subject to a qualifying cross-product master netting agreement. A national bank or Federal savings association makes such an election with respect to a qualifying cross-product master netting agreement must make the adjustments described in paragraphs (f)(2) and (3) in order to determine the exposure amount of the set of repo-style transactions and derivative contracts under SA-CCR.

(2) The exposure amount of a set of transactions subject to a qualifying cross-product master netting agreement for purposes of (f)(1), *Exposure Amount_{NSCP}*, must be calculated as follows:

$$\text{Exposure Amount}_{NSCP} = (1 - MR_{NSCP}) * (\text{Exposure Amount}_{repo-style transactions})$$

$$+ \text{Exposure Amount}_{\text{derivatives}}) + MR_{NSCP} * \text{Extended SA} - CCR \text{ Exposure Amount}$$

Where:

- (i) *Exposure Amount_{repo-style transactions}* is the exposure amount for repo-style transactions in the netting set that is subject to a qualifying cross-product master netting agreement, calculated

- using the collateral haircut approach, under paragraph (e) of this section;
- (ii) *Exposure Amount_{derivatives}* is the exposure amount for derivatives in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the standardized approach to counterparty credit risk, under § 3.132(c)(5);
- (iii) *Extended SA – CCR Exposure Amount* is the exposure amount for both repo-style

- transactions and derivatives that are in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the standardized approach to counterparty credit risk, under § 3.132(c)(5); and
- (iv) *MR_{NSCP}* is the Maturity Ratio for a given netting set that is subject to a qualifying cross-product master netting agreement, calculated as follows:

$$MR_{NSCP} = \frac{\sum NAWM \text{ of the repo – style transactions}_i}{\max(\sum NAWM \text{ of the repo – style transactions}_i, \sum NAWM \text{ of the derivative transactions}_i)}$$

Where:

- (A) $\sum NAWM \text{ of the repo-style transactions}_i$ is the notional average weighted maturity of all *i* repo-style transactions subject to the qualifying cross-product master netting agreement, subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.
- (B) $\sum NAWM \text{ of the derivative transactions}_i$ is the notional average weighted maturity of all *i* derivative transactions subject to the qualifying cross-product master netting agreement subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.

(3) For purposes of applying SA–CCR to a repo-style transaction, the national bank or Federal savings association must make the adjustments described in paragraphs (f)(3)(i) through (iii) of this section.

(i) For purposes of this section, the national bank or Federal savings association must:

(A) Treat a repo-style transaction that has multiple underlying instruments as separate repo-style transactions for each distinct underlying instrument;

(B) Treat a repo-style transaction with a debt instrument as the underlying instrument as either a credit derivative that references the underlying debt instrument or an interest rate derivative that references the interest rate of the underlying debt instrument, based on the primary risk factor of the repo-style transaction;

(C) Treat a repo-style transaction with an equity instrument as the underlying instrument as an equity derivative that references the underlying equity instrument;

(D) Not apply paragraph (c)(4) of § 3.132 to a repo-style transaction with an equity instrument as the underlying instrument; and

(E) Treat a repo-style transaction as a client-facing derivative transaction where the national bank or Federal savings association is either acting as a financial intermediary and enters into an offsetting transaction with a

qualifying central counterparty (QCCP) or where the national bank or Federal savings association provides a guarantee on the performance of a client on a transaction between the client and a QCCP.

(ii) For purposes of the supervisory delta under paragraph (c)(9)(iii) of § 3.132, a national bank or Federal savings association must use a supervisory delta of 1 for a repurchase transaction or a securities lending transaction, and must use a supervisory delta of –1 for a reverse repurchase transaction or a securities borrowing transaction;

(iii) For purposes of the maturity factor under paragraph (c)(9)(iv) of § 3.132, MPOR cannot be less than five business days plus the periodicity of re-margining expressed in business days minus one business day.

* * * * *

■ 12. Amend § 3.41 to read as follows:

§ 3.41 Operational criteria for recognizing the transfer of risk.

(a) *Operational criteria for traditional securitizations.* A national bank or Federal savings association that transfers exposures it has originated or purchased to a third party in connection with a traditional securitization may exclude the exposures from the calculation of its risk-weighted assets only if each condition in this section is satisfied. A national bank or Federal savings association that meets these conditions must hold risk-based capital against any credit risk it retains in connection with the securitization. A national bank or Federal savings association that fails to meet these conditions must hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO strip that does not constitute after-tax gain-on-sale. If the transferred exposures are in connection with a securitization and all of the

conditions in this paragraph (a) are satisfied, the national bank or Federal savings association must exclude the exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the securitization. The conditions are:

(1) The exposures are not reported on the national bank's or Federal savings association's consolidated balance sheet under GAAP;

(2) The national bank or Federal savings association has transferred to one or more third parties credit risk associated with the underlying exposures;

(3) Any clean-up calls relating to the securitization are eligible clean-up calls; and

(4) The securitization does not:

(i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and

(ii) Contain an early amortization provision.

(b) *Operational criteria for synthetic securitizations.* For synthetic securitizations, a national bank or Federal savings association may recognize for risk-based capital purposes the use of a credit risk mitigant to hedge underlying exposures only if each condition in this paragraph (b) is satisfied. A national bank or Federal savings association that meets these conditions must hold risk-based capital against any credit risk of the exposures it retains in connection with the synthetic securitization. A national bank or Federal savings association that fails to meet these conditions or chooses not to recognize the credit risk mitigant for purposes of this section must instead hold risk-based capital against the underlying exposures as if they had not been synthetically securitized. If the synthetic securitization is a securitization and all of the conditions in this paragraph (b) are satisfied, the national bank or Federal savings

association must exclude the underlying securitization exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the resecuritization. The conditions are:

- (1) The credit risk mitigant is:
 - (i) Financial collateral;
 - (ii) A guarantee that meets all criteria as set forth in the definition of *eligible guarantee* in § 3.2, except for the criteria in paragraph (3) of that definition;
 - (iii) A credit derivative that is not an nth-to-default credit derivative and that meets all criteria as set forth in the definition of *eligible credit derivative* in § 3.2, except for the criteria in paragraph (3) of the definition of *eligible guarantee* in § 3.2; or

- (iv) A prepaid credit protection arrangement that meets all criteria as set forth in the definition of *eligible prepaid credit protection arrangement* in § 3.2, except for the criteria in paragraph (3) of that definition.

(2) The national bank or Federal savings association transfers credit risk associated with the underlying exposures to one or more third parties, and the terms and conditions in the credit risk mitigants employed do not include provisions that:

- (i) Allow for the termination of the credit protection due to deterioration in the credit quality of the underlying exposures;
- (ii) Require the national bank or Federal savings association to alter or replace the underlying exposures to improve the credit quality of the underlying exposures;
- (iii) Increase the national bank's or Federal savings association's cost of credit protection in response to deterioration in the credit quality of the underlying exposures;
- (iv) Increase the yield payable to parties other than the national bank or Federal savings association in response to a deterioration in the credit quality of the underlying exposures; or
- (v) Provide for increases in a retained first loss position or credit enhancement provided by the national bank or Federal savings association after the inception of the securitization;

(3) The national bank or Federal savings association obtains a well-reasoned opinion from legal counsel that confirms the enforceability of the credit risk mitigant in all relevant jurisdictions;

(4) Any clean-up calls relating to the securitization are eligible clean-up calls;

(5) No synthetic excess spread is permitted within the synthetic securitization;

(6) Any applicable minimum payment threshold for the credit risk mitigant is consistent with standard market practice; and

(7) The securitization does not:

- (i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and
- (ii) Contain an early amortization provision.

(c) *Due diligence requirements for securitization exposures.* (1) Except for exposures that are deducted from common equity tier 1 capital and exposures subject to § 3.43(h), if a national bank or Federal savings association is unable to demonstrate to the satisfaction of the OCC a comprehensive understanding of the features of a securitization exposure that would materially affect the performance of the exposure, the national bank or Federal savings association must assign the securitization exposure a risk weight of 1,250 percent. The national bank's or Federal savings association's analysis must be commensurate with the complexity of the securitization exposure and the materiality of the exposure in relation to its capital.

(2) A national bank or Federal savings association must demonstrate its comprehensive understanding of a securitization exposure under paragraph (c)(1) of this section, for each securitization exposure by:

(i) Conducting an analysis of the risk characteristics of a securitization exposure prior to acquiring the exposure and documenting such analysis within 3 business days after acquiring the exposure, considering:

(A) Structural features of the securitization that would materially impact the performance of the exposure, for example, the contractual cash flow waterfall, waterfall-related triggers, credit enhancements, liquidity enhancements, fair value triggers, the performance of organizations that service the exposure, and deal-specific definitions of default;

(B) Relevant information regarding—

(1) The performance of the underlying credit exposure(s), for example, the percentage of loans 30, 60, and 90 days past due; default rates; prepayment rates; loans in foreclosure; property types; occupancy; average credit score or other measures of creditworthiness; average LTV ratio; and industry and geographic diversification data on the underlying exposure(s); and

(2) For resecuritization exposures, in addition to the information described in paragraph (c)(2)(i)(B)(1) of this section, performance information on the

underlying securitization exposures, which may include the issuer name and credit quality, and the characteristics and performance of the exposures underlying the securitization exposures; and

(C) Relevant market data of the securitization, for example, bid-ask spread, most recent sales price and historic price volatility, trading volume, implied market rating, and size, depth and concentration level of the market for the securitization; and

(ii) On an on-going basis (no less frequently than quarterly), evaluating, reviewing, and updating as appropriate the analysis required under paragraph (c)(1) of this section for each securitization exposure.

* * * * *

■ 13. Amend § 3.42 to read as follows:

§ 3.42 Exposure amount of a securitization exposure.

(a) *On-balance sheet securitization exposure.* The exposure amount of an on-balance sheet securitization exposure (excluding a repo-style transaction, eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative) is equal to the national bank's or Federal savings association's carrying value of the exposure. For a credit derivative, a national bank or Federal savings association must apply § 3.43(i) or (j), as applicable.

(b) *Off-balance sheet securitization exposure.* Except as provided in § 3.43(h), the exposure amount of an off-balance sheet securitization exposure that is not a repo-style transaction, eligible margin loan, OTC derivative contract (other than a credit derivative), or cleared transaction (other than a credit derivative) is the notional amount of the exposure. For an off-balance sheet securitization exposure to an ABCP program, such as an eligible ABCP liquidity facility, the notional amount may be reduced to the maximum potential amount that the national bank or Federal savings association could be required to fund given the ABCP program's current underlying assets (calculated without regard to the current credit quality of those assets).

(c) *Repo-style transaction, eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative.* The exposure amount of a securitization exposure that is a repo-style transaction, eligible margin loan, or OTC derivative contract (other than a credit derivative) is the exposure amount as calculated in accordance with §§ 3.34 or 3.37, or § 3.33, as applicable, and the exposure amount of

a securitization exposure that is a cleared transaction that is not a credit derivative is the exposure amount as calculated in § 3.35.

* * * * *

■ 14. Amend § 3.43 to read as follows:

§ 3.43 Risk-weighted assets for securitization exposures.

(a) *General approach.* Except as provided elsewhere in this section and in § 3.41:

(1) A national bank or Federal savings association may, subject to the limitation under paragraph (e) of this section, apply the securitization standardized approach (SEC-SA) in § 3.44 to the exposure if the exposure meets the following requirements:

(i) The national bank or Federal savings association has accurate information on A, D, W, and K_G (as defined in § 3.44) for the exposure. Data used to assign the parameters described in this paragraph (a)(1)(i) must be the most currently available data. If the contracts governing the underlying exposures of the securitization require payments on a monthly or quarterly basis, the data used to assign the parameters described in this paragraph (a)(1)(i) must be no more than 91 calendar days old.

(ii) The national bank or Federal savings association has accurate information regarding whether the exposure is a securitization exposure.

(2) If the securitization exposure is an interest rate derivative contract, an exchange rate derivative contract, or a cash collateral account related to an interest rate or exchange rate derivative contract, the national bank or Federal savings association must assign a risk weight to the exposure equal to the risk weight of a securitization exposure that is *pari passu* to the interest rate derivative contract or exchange rate derivative contract or, if such an exposure does not exist, the risk weight of any subordinate securitization exposure.

(3) If the national bank or Federal savings association cannot apply, or chooses not to apply, the securitization standardized approach in § 3.44, the national bank or Federal savings association must apply a 1,250 percent risk weight to the exposure.

(b) *Total risk-weighted assets for securitization exposures.* A national bank's or Federal savings association's total risk-weighted assets for securitization exposures equals the sum of the risk-weighted asset amount for securitization exposures that the national bank or Federal savings association risk weights under §§ 3.43 through 3.45, as applicable.

(c) *After-tax gain-on-sale resulting from a securitization.* Notwithstanding any other provision of this subpart, a national bank or Federal savings association must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from a securitization as well as the portion of a CEIO that does not constitute an after-tax gain-on-sale.

(d) *Overlapping exposures.* (1) If a national bank or Federal savings association has multiple securitization exposures that provide duplicative coverage of the underlying exposures of a securitization (such as when a national bank or Federal savings association provides a program-wide credit enhancement and multiple pool-specific liquidity facilities to an ABCP program), the national bank or Federal savings association is not required to hold duplicative risk-based capital against the overlapping position. Instead, the national bank or Federal savings association may apply to the overlapping position the applicable risk-based capital treatment that results in the highest risk-based capital requirement.

(2) If a national bank or Federal savings association has one or more securitization exposures that partially overlap with each other, the national bank or Federal savings association may treat the exposures as overlapping and apply the treatment under paragraph (d)(1). For purposes of such a treatment under this paragraph (d)(2), the national bank or Federal savings association must include in expanded total risk-weighted assets the risk-weighted asset amount for a hypothetical securitization exposure that would fully overlap with all of the partially overlapping exposures.

(3) If a national bank or Federal savings association has a securitization exposure under this subpart that is an overlapping exposure with a securitization exposure that is a market risk covered position under subpart F of this part, the national bank or Federal savings association may assign to the overlapping securitization exposure the applicable risk-based capital treatment under either this subpart or subpart F, whichever results in the highest risk-based capital requirement.

(e) *Implicit support.* If a national bank or Federal savings association provides support to a securitization in excess of the national bank's or Federal savings association's contractual obligation to provide credit support to the securitization:

(1) The national bank or Federal savings association must calculate a risk-weighted asset amount for underlying exposures associated with

the securitization as if the exposures had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the securitization and any portion of a CEIO strip that does not constitute after-tax gain-on-sale; and

(2) The national bank or Federal savings association must disclose publicly:

(i) That it has provided implicit support to the securitization; and

(ii) The risk-based capital impact to the national bank or Federal savings association of providing such implicit support.

(f) *Undrawn portion of a servicer cash advance facility.* (1) Notwithstanding any other provision of this subpart, a national bank or Federal savings association that is a servicer under an eligible servicer cash advance facility is not required to hold risk-based capital against potential future cash advance payments that it may be required to provide under the contract governing the facility.

(2) For a national bank or Federal savings association that acts as a servicer, the exposure amount for a servicer cash advance facility that is a not an eligible servicer cash advance facility is equal to the amount of all potential future cash advance payments that the national bank or Federal savings association may be contractually required to provide during the subsequent 12-month period under the contract governing the facility.

(g) *Interest-only mortgage-backed securities.* Notwithstanding any other provision of this subpart, the risk weight for a non-credit-enhancing interest-only mortgage-backed security may not be less than 100 percent.

(h) *Small-business loans and leases on personal property transferred with retained contractual exposure.* (1) Regardless of any other provision of this subpart, a national bank or Federal savings association that has transferred small-business loans and leases on personal property (small-business obligations) with recourse must include in risk-weighted assets only its contractual exposure to the small-business obligations if all the following conditions are met:

(i) The transaction must be treated as a sale under GAAP;

(ii) The national bank or Federal savings association establishes and maintains, pursuant to GAAP, a non-capital reserve sufficient to meet the national bank's or Federal savings association's reasonably estimated liability under the contractual obligation;

(iii) The small-business obligations are to businesses that meet the criteria for a small-business concern established by the Small Business Administration under section 3(a) of the Small Business Act (15 U.S.C. 632 *et seq.*); and

(iv) The national bank or Federal savings association is well capitalized as defined in 12 CFR 6.4. For purposes of determining whether a national bank or Federal savings association is well capitalized for purposes of this paragraph (h), the national bank's or Federal savings association's capital ratios must be calculated without regard to the capital treatment for transfers of small-business obligations with recourse specified in paragraph (h)(1) of this section.

(2) The total outstanding amount of contractual exposure retained by a national bank or Federal savings association on transfers of small-business obligations receiving the capital treatment specified in paragraph (h)(1) of this section cannot exceed 15 percent of the national bank's or Federal savings association's total capital.

(3) If a national bank or Federal savings association ceases to be well capitalized under 12 CFR 6.4, or exceeds the 15 percent capital limitation provided in paragraph (h)(2) of this section, the capital treatment specified in paragraph (h)(1) of this section will continue to apply to any transfers of small-business obligations with retained contractual exposure that occurred during the time that the national bank or Federal savings association was well capitalized and did not exceed the capital limit.

(4) The risk-based capital ratios of the national bank or Federal savings association must be calculated without regard to the capital treatment for transfers of small-business obligations specified in paragraph (h)(1) of this section for purposes of:

(i) Determining whether a national bank or Federal savings association is adequately capitalized, undercapitalized, significantly undercapitalized, or critically undercapitalized under the OCC's prompt corrective action regulations; and

(ii) Reclassifying a well-capitalized national bank or Federal savings association to adequately capitalized and requiring an adequately capitalized national bank or Federal savings association to comply with certain mandatory or discretionary supervisory actions as if the national bank or Federal savings association were in the next lower prompt-corrective-action category.

(i) *Nth-to-default credit derivatives—(1) Protection provider.* A national bank or Federal savings association providing protection through a first-to-default or second-or-later-to-default derivative is subject to capital requirements on such instruments under this paragraph (i)(1).

(i) *First-to-default.* For first-to-default derivatives, a national bank or Federal savings association must aggregate by simple summation the risk weights of the assets covered up to a maximum of 1,250 percent and multiply by the nominal amount of the protection provided by the credit derivative to obtain the risk-weighted asset amount.

(ii) *Nth-to-default.* For second-or-later-to-default derivatives, in aggregating the risk weights, a national bank or Federal savings association may exclude the asset with the lowest risk-weighted amount from the risk-weighted capital calculation. This risk-based capital treatment applies for nth-to-default derivatives for which the n-1 assets with the lowest risk-weighted amounts can be excluded from the risk-weighted capital calculation.

(2) *Protection purchaser.* A national bank or Federal savings association is not permitted to recognize purchased protection in the form of an nth-to-default credit derivative as a credit risk mitigant. A national bank or Federal savings association must calculate the counterparty credit risk of a purchased nth-to-default credit derivative under §§ 3.34.

(j) *Guarantees, credit derivatives other than nth-to-default credit derivatives, and prepaid credit protection arrangements—(1) Protection provider.* For a guarantee, credit derivative (other than an nth-to-default credit derivative), or prepaid credit protection arrangement provided by a national bank or Federal savings association that covers the full amount or a pro rata share of a securitization exposure's principal and interest, the national bank or Federal savings association must risk-weight the guarantee, credit derivative, or prepaid credit protection arrangement under paragraph (a) of this section as if it held the portion of the securitization exposure covered by the guarantee, credit derivative, or prepaid credit protection arrangement.

(2) *Protection purchaser.* (i) A national bank or Federal savings association that purchases a credit derivative (other than an nth-to-default credit derivative) that is recognized under § 3.45 as a credit risk mitigant (including via recognized collateral) is not required to compute a separate counterparty credit risk capital requirement under §§ 3.34.

(ii) If a national bank or Federal savings association cannot, or chooses not to, recognize protection purchased in the form of a credit derivative as a credit risk mitigant under § 3.45, the national bank or Federal savings association must determine the exposure amount of the credit derivative under § 3.34.

(A) If the national bank or Federal savings association purchases credit protection from a counterparty, the national bank or Federal savings association must determine the risk weight for the exposure according to § 3.32.

(B) If the national bank or Federal savings association purchases credit protection from a counterparty, the national bank or Federal savings association must determine the risk weight for the exposure according to this section.

(k) *Look-through approach.* (1) Subject to paragraph (k)(2) of this section, a national bank or Federal savings association may assign a risk weight to a senior securitization exposure that is not a resecuritization exposure equal to the greater of:

(i) The weighted-average risk weight, calculated without reference to, or the use of the risk weight under § 3.52(b)(3)(iii), of all the underlying exposures where the weight for each exposure in the weighted-average calculation is determined by the unpaid principal amount of the exposure; and

(ii) 15 percent.

(2) A national bank or Federal savings association may assign a risk weight under this paragraph (k) only if the national bank or Federal savings association has knowledge of the composition of all of the underlying exposures.

(l) *NPL securitization.* Notwithstanding any other provision of this subpart except for paragraph (e) of this section:

(1) If the nonrefundable purchase price discount for the NPL securitization is greater than or equal to 50 percent of the unpaid principal balance of the pool of exposures, the risk weight for a senior securitization exposure to an NPL securitization is 100 percent.

(2) If the national bank or Federal savings association is an originating national bank or Federal savings association with respect to the NPL securitization, the national bank or Federal savings association may hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the

transaction and any portion of a CEIO that does not constitute an after-tax gain-on-sale.

* * * * *

■ 15. Amend § 3.44 to read as follows:

$$RW_{SEC-SA} = \begin{cases} \max(RW_{FLOOR}, 1,250\% \cdot K_{SEC-SA}), & K_A \leq A \\ \max\left(RW_{FLOOR}, \left(\frac{K_A - A}{D - A}\right) \cdot 1,250\% + \left(\frac{D - K_A}{D - A}\right) \cdot 1,250\% \cdot K_{SEC-SA}\right), & A < K_A < D \\ 1,250\%, & D \leq K_A \end{cases}$$

Where:

- (1) K_A is calculated under paragraph (b) of this section;
- (2) A (attachment point) equals the greater of zero and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of underlying exposures that are subordinated to the exposure of the national bank or Federal savings association to the current dollar amount of the underlying exposures, as adjusted in accordance with paragraph (a)(6) of this section;
- (3) D (detachment point) equals the greater of zero and the sum of the parameter A and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of the securitization exposures that are ranked senior or pari passu with the exposure (that is, have equal seniority with respect to credit risk) to the current dollar amount of the underlying exposures, as adjusted in accordance with paragraph (a)(6) of this section;
- (4) RW_{FLOOR} equals 100 percent for resecuritization exposures and NPL securitization exposures and 15 percent for all other securitization exposures; and
- (5) K_{SEC-SA} is calculated according to the following formula:

$$K_{SEC-SA} = \frac{e^{a \cdot u} - e^{a \cdot l}}{a \cdot (u - l)}$$

Where:

- (i) a equals $-(1/p \cdot K_A)$ (as K_A is defined in this paragraph (a)), where p equals 1.5 for a resecuritization exposure and 0.5 for all other securitization exposures;
- (ii) u equals $D - K_A$ (as D and K_A are defined in paragraph (a) of this section);
- (iii) l equals $\max(A - K_A, 0)$ (as A and K_A are defined in paragraph (a) of this section); and
- (iv) e equals the base of the natural logarithm.

(6) A national bank or Federal savings association must include in the calculation of A and D the funded portion of any reserve account funded by the accumulated cash flows from the underlying exposures that is subordinated to the national bank's or

§ 3.44 Securitization standardized approach (SEC-SA).

(a) *In general.* The risk weight RW_{SEC-SA} assigned to a securitization exposure, or portion of a securitization

exposure, is calculated according to the following formula:

Federal savings association's securitization exposure. Interest rate derivative contracts, exchange rate derivative contracts, and cash collateral accounts related to these contracts must not be included in the calculation of A and D . If the securitization exposure includes a nonrefundable purchase price discount, the nonrefundable purchase price discount must be included in the numerator and denominator of A and D .

(b) *Calculation of K_A .* K_A is calculated under this paragraph (b) according to the following formula:

$$K_A = (1 - W) \cdot K_G + (W \cdot 0.5)$$

Where:

- (1) W equals the ratio, expressed as a decimal value between zero and one, of the sum of the dollar amounts of any underlying exposures of the securitization that are not securitization exposures and that meet any of the criteria in paragraphs (b)(1)(i) through (vii) of this section to the outstanding balance measured in dollars of all underlying exposures:
 - (i) Ninety days or more past due;
 - (ii) Subject to a bankruptcy or insolvency proceeding;
 - (iii) In the process of foreclosure;
 - (iv) Held as real estate owned;
 - (v) Has contractually deferred payments for 90 days or more, other than principal or interest payments deferred on:
 - (A) Federally guaranteed student loans, in accordance with the terms of those guarantee programs; or
 - (B) Consumer loans, including non-federally-guaranteed student loans, provided that such payments are deferred pursuant to provisions included in the contract at the time funds are disbursed that provide for period(s) of deferral that are not initiated based on changes in the creditworthiness of the borrower; or
 - (vi) Is in default; and
 - (vii) Notwithstanding paragraphs (1)(i) through (vi) of this paragraph, an exposure that is directly and unconditionally guaranteed by the U.S. Government, its central bank, or a U.S. Government agency may be excluded

- from the calculation of W up to the amount of the guarantee; and
- (2) K_G equals the weighted average (with unpaid principal used as the weight for each credit exposure and fair value used for each equity exposure) total capital requirement, expressed as a decimal value between zero and one, of the underlying exposures calculated using this subpart D (that is, an average risk weight of 100 percent represents a value of K_G equal to 0.08), as adjusted in accordance with this paragraph (b)(2). For purposes of K_G , the determination of the capital requirement associated with an underlying exposure that is an equity exposure cannot use the risk weight under § 3.52(b)(3)(iii). For interest rate derivative contracts and exchange rate derivative contracts, the positive current exposure times the risk weight of the counterparty multiplied by 0.08 must be included in the numerator of K_G but must be excluded from the denominator of K_G .

* * * * *

■ 16. Amend § 3.45 by:

- a. Adding paragraphs (a)(3) and (a)(4).
- b. Revising paragraph (b).

The additions and revisions read as follows:

§ 3.45 Recognition of credit risk mitigants for securitization exposures.

* * * * *

- (3) If the recognized credit risk mitigant hedges a portion of the national bank's or Federal savings association's securitization exposure, the national bank or Federal savings association must calculate its capital requirements for the hedged and unhedged portions of the exposure separately. For each unhedged portion, the national bank or Federal savings association must calculate capital requirements according to § 3.42 and § 3.43. For each hedged portion, the national bank or Federal savings association may recognize the credit risk mitigant under § 3.36 or § 3.37, but only as provided in this section.

(4) When a national bank or Federal savings association purchases or sells credit protection on a portion of a senior tranche, the lower-priority portion, whether hedged or unhedged, must be considered a non-senior securitization exposure.

* * * * *

(b) *Mismatches*. A national bank or Federal savings association must make any applicable adjustment to the protection amount as required in § 3.36 for any hedged securitization exposure. In the context of a synthetic securitization, when a credit risk mitigant described in § 3.41(b)(1)(ii) through (iv) covers multiple hedged exposures that have different residual maturities, the national bank or Federal savings association must use the longest residual maturity of any of the hedged exposures as the residual maturity of all hedged exposures.

* * * * *

■ 17. Amend § 3.51 by:

■ a. Revising paragraph (b).

The revisions read as follows:

§ 3.51 Introduction and exposure measurement.

* * * * *

(b) *Adjusted carrying value*. For purposes of §§ 3.51 through 3.53, the adjusted carrying value of an equity exposure is:

* * * * *

(4) For a commitment to acquire an equity exposure (an equity commitment), the effective notional principal amount of the exposure is multiplied by the following conversion factors (CFs):

(i) Conditional equity commitments receive a 40 percent conversion factor.

(ii) Unconditional equity commitments receive a 100 percent conversion factor.

* * * * *

■ 18. Revise § 3.61 to read as follows:

§ 3.61 Purpose and scope.

Sections 3.61 through 3.63 of this subpart establish public disclosure requirements related to the capital requirements described in subpart B of this part for a national bank or Federal savings association with total consolidated assets of \$50 billion, as adjusted pursuant to § 3.4, or more as reported on the national bank's or Federal savings association's most recent year-end Call Report, that is not an advanced approaches national bank or Federal savings association making public disclosures pursuant to § 3.172. An advanced approaches national bank or Federal savings association that has not received approval from the OCC to exit parallel run pursuant to § 3.121(d) is subject to the disclosure requirements described in §§ 3.62 and 3.63. A national bank or Federal savings association with total consolidated assets of \$50 billion, as adjusted pursuant to § 3.4, or more as reported on the national bank's or Federal savings association's most recent year-end Call Report, that is not an advanced approaches national bank or Federal savings association making public disclosures subject to § 3.172 must comply with § 3.62 unless it is a consolidated subsidiary of a bank holding company, savings and loan holding company, or depository institution that is subject to the disclosure requirements of § 3.62 or a subsidiary of a non-U.S. banking organization that is subject to comparable public disclosure requirements in its home jurisdiction.

For purposes of this section, total consolidated assets are determined based on the average of the national bank's or Federal savings association's total consolidated assets in the four most recent quarters as reported on the Call Report, or the average of the national bank's or Federal savings association's total consolidated assets in the most recent consecutive quarters as reported quarterly on the Call Report, if the national bank or Federal savings association has not filed such a report for each of the most recent four quarters.

* * * * *

■ 19. Amend § 3.300 by revising paragraph (a) to read as follows:

§ 3.300 Transitions.

(a) *Transition adjustments for AOCI*. Beginning [January 1, 2027], a Category III national bank or Federal savings association or a Category IV national bank or Federal savings association that had made an AOCI opt-out election under § 3.22(b)(2) effective [December 31, 2026], must subtract from the sum of its common equity tier 1 elements, before making deductions required under § 3.22(c) or (d), the transition AOCI adjustment amount multiplied by the percentage provided in Table 1 to § 3.300. The transition AOCI adjustment amount is the sum of:

(1) Net unrealized gains or losses on available-for-sale securities, plus

(2) Accumulated net gains or losses on cash flow hedges, plus

(3) Any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans, plus

(4) Net unrealized holding gains or losses on held-to-maturity securities that are included in AOCI.

TABLE 1 TO § 3.300

Transition AOCI Adjustment	
Transition period	Percentage applicable to transition AOCI adjustment amount
January 1, 2027 to December 31, 2027	100
January 1, 2028 to December 31, 2028	80
January 1, 2029 to December 31, 2029	60
January 1, 2030 to December 31, 2030	40
January 1, 2031 to December 31, 2031	20
January 1, 2032 and thereafter	0

* * * * *

Board of Governors of the Federal Reserve System

12 CFR Chapter II

Authority and Issuance

For the reasons set forth in the preamble, the Board of Governors of the Federal Reserve System proposes to

amend chapter II of title 12 of the Code of Federal Regulations as follows:

PART 217—CAPITAL ADEQUACY OF BANK HOLDING COMPANIES, SAVINGS AND LOAN HOLDING COMPANIES, AND STATE MEMBER BANKS (REGULATION Q)

■ 20. The authority citation for part 217 continues to read as follows:

Authority: 12 U.S.C. 248(a), 321–338a, 481–486, 1462a, 1467a, 1818, 1828, 1831n, 1831o, 1831p–1, 1831w, 1835, 1844(b), 1851, 3904, 3906–3909, 4808, 5365, 5368, 5371, and 5371 note, and sec. 4012, Pub. L. 116–136, 134 Stat. 281.

■ 21. In § 217.1:

■ a. Revise paragraphs (c)(5)(i), (e) and (f); and

■ b. Add paragraph (h).

The addition and revision read as follows:

§ 217.1 Purpose, applicability, reservations of authority, and timing.

* * * *

(c) * * *

(5) * * *

(i) Except for an advanced approaches Board-regulated institution that is making public disclosures pursuant to the requirements in subpart E of this part, each Board-regulated institution with total consolidated assets of \$50 billion or more, as adjusted pursuant to § 217.4, must make the public disclosures described in subpart D of this part.

* * * *

(e) *Notice and response procedures.* In making a determination under this part, unless more specifically provided for, the Board will apply notice and response procedures in the same manner and to the same extent as the notice and response procedures in 12 CFR 263.202.

(f) *Timing.* A Board-regulated institution that changes from one category of Board-regulated institution to another of such categories, or that changes from having no category of Board-regulated institution to having such a category, must comply with the requirements of its category in this part, including applicable transition provisions of the requirements in this part, no later than on the first day of the second quarter following the change in the company's category.

* * * *

(h) *Severability.* If any provision of this part, or the application thereof to any Board-regulated institution, is held invalid, such invalidity shall not affect the validity of other provisions or the application of such provision to Board-regulated institutions that can be given effect without the invalid provision or application.

* * * *

■ 22. In § 217.2:

■ a. Revise the definition of “Adjusted allowances for credit losses (AACL)”;

■ b. Remove the definition of “Allowances for loan and lease losses (ALLL)”;

■ c. Revise the definition of “Carrying value”;

■ d. In the definition of “Category III Board-regulated institution (217.2):

■ i. Remove paragraph (3);

■ ii. Redesignate paragraph (4) as paragraph (3);

■ iii. Revise newly redesignated paragraph (3) introductory text;

■ iv. Revise newly redesignated paragraph (3)(i); and

■ v. In newly redesignated paragraph (3)(iv) introductory text, remove the words “paragraph (4)(ii) of this definition” and add, in their place, the words “paragraph (3)(ii) of this definition”;

■ e. Add, in alphabetical order, the definition for “Category IV Board-regulated institution”;

■ f. Revise the definition for “Commitment”;

■ g. Add, in alphabetical order, the definition for “Dependent on the cash flows generated by the real estate”;

■ h. Revise the definitions for “Effective notional amount”, “Eligible clean-up call”, and “Eligible guarantee”;

■ i. Add, in alphabetical order, the definition for “Eligible prepaid credit protection arrangement”;

■ j. Revise paragraph (4)(i)(A) in the definition of “Financial institution”;

■ k. Revise the definition for “Netting set”;

■ l. Add, in alphabetical order, the definitions for “Non-performing loan securitization (NPL securitization)”, “Nonrefundable purchase price discount (NRPPD)”, and “Prepaid credit protection arrangement”;

■ m. Revise the definition for “Protection amount (P)”;

■ n. Add, in alphabetical order, the definition for “Qualifying Cross Product Master Netting Agreement”;

■ o. Revise paragraphs (3) and (4) of the definition for “Qualifying master netting agreement”;

■ p. Revise paragraph (1)(ii) of the definition for “Residential mortgage exposure”;

■ q. Remove the definition for “Securitization special purpose entity (SPE)”;

■ r. Add, in alphabetical order, the definitions for “Senior securitization exposure” and “Specified supranational entity”;

■ s. Revise the definition for “Speculative grade”;

■ t. In the definition of “Standardized total risk-weighted assets”, remove the

words “§ 217.42” and add, in their place, the words “§ 217.43”;

■ u. Revise the definition for “Sub-speculative grade”;

■ v. Add, in alphabetical order, the definition for “Synthetic excess spread”;

■ w. Revise the definitions for “Synthetic securitization”, and

“Traditional securitization”.

The additions and revisions read as follows:

Adjusted allowances for credit losses (AACL) means valuation allowances that have been established through a charge against earnings or retained earnings for expected credit losses on financial assets measured at amortized cost and a lessor's net investment in leases that have been established to reduce the amortized cost basis of the assets to amounts expected to be collected as determined in accordance with GAAP. For purposes of this part, adjusted allowances for credit losses include allowances for expected credit losses on off-balance sheet credit exposures not accounted for as insurance as determined in accordance with GAAP. Adjusted allowances for credit losses exclude allocated transfer risk reserves and allowances created that reflect credit losses on purchased credit deteriorated assets, purchased seasoned loans, assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, and available-for-sale debt securities.

* * * *

Carrying value means, with respect to an asset, the value of the asset on the balance sheet of the Board-regulated institution as determined in accordance with GAAP. For all assets other than available-for-sale debt securities, purchased credit deteriorated assets, purchased seasoned loans, or assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, the carrying value is not reduced by any associated credit loss allowance that is determined in accordance with GAAP.

* * * *

Category III Board-regulated institution means:

* * * *

(3) A state member bank that is not a Category II Board-regulated institution and that:

(i) Is a subsidiary of a Category III banking organization, as defined pursuant to § 252.5 of this chapter or § 238.10 of this chapter, as applicable; or

* * * *

Category IV Board-regulated institution means:

(1) A depository institution holding company that is identified as a Category IV banking organization pursuant to § 252.5 of this chapter or § 238.10 of this chapter, as applicable;

(2) A U.S. intermediate holding company that is identified as a Category IV banking organization pursuant to § 252.5 of this chapter;

(3) A state member bank that is not a Category II Board-regulated institution or Category III Board-regulated institution and that:

(i) Is a subsidiary of a Category IV banking organization, as defined pursuant to § 252.5 of this chapter or § 238.10 of this chapter, as applicable; or

(ii) Has total consolidated assets, calculated based on the average of the depository institution's total consolidated assets for the four most recent calendar quarters as reported on the Call Report of \$100 billion or more. If the depository institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or the average of the four most recent quarters, as applicable.

(iii) After meeting the criterion in paragraph (3)(ii) of this definition, a state member bank continues to be a Category IV Board-regulated institution until the state member bank:

(A) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(B) Is a Category II or Category III Board-regulated institution.

* * * * *

Commitment means a contractual arrangement, under which a Board-regulated institution and an obligor agree to terms applicable to one or more future extensions of credit, purchases of assets, or issuances of credit substitutes by the Board-regulated institution, whether or not such arrangement is unconditionally cancelable. A commitment is unconditionally cancelable if, by its terms, it either: (a) provides that a Board-regulated institution is not obligated to extend credit, purchase assets, or issue credit substitutes; or (b) permits a Board-regulated institution, at any time, with or without cause, to refuse to extend credit, purchase assets, or issue credit substitutes under the arrangement (to the extent permitted under applicable law).

* * * * *

Dependent on the cash flows generated by the real estate means, for a real estate exposure, the underwriting, at the time of origination, considers the cash flows generated by lease, rental, or sale of the real estate securing the loan as a source of repayment. For purposes of this definition, a residential mortgage exposure that is secured by the borrower's principal residence is deemed not dependent on the cash flows generated by the real estate.

* * * * *

Effective notional amount means for an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, the lesser of the contractual notional amount of the credit risk mitigant and the exposure amount of the hedged exposure, multiplied by the percentage coverage of the credit risk mitigant.

* * * * *

Eligible clean-up call means a clean-up call that:

(1) Is exercisable solely at the discretion of the originating Board-regulated institution or servicer;

(2) Is not structured to avoid allocating losses to securitization exposures held by investors or otherwise structured to provide credit enhancement to the securitization; and

(3) Is only exercisable:

(i) For a traditional securitization, when 10 percent or less of the principal amount of the underlying exposures or securitization exposures (determined as of the inception of the securitization) is outstanding;

(ii) For a synthetic securitization, when 10 percent or less of the principal amount of the reference portfolio of underlying exposures (determined as of the inception of the securitization) is outstanding;

(iii) Upon the occurrence of a regulatory event that significantly changes the risk-weighted asset amount for the securitization exposure under applicable risk-weighted asset standards; or

(iv) Upon the occurrence of a tax event that significantly changes the tax treatment of the securitization exposure under applicable tax laws.

* * * * *

Eligible guarantee means a guarantee that:

(1) Is written;

(2) Is either:

(i) Unconditional, or

(ii) A contingent obligation of the U.S. government or its agencies, the enforceability of which is dependent upon some affirmative action on the part of the beneficiary of the guarantee or a third party (for example, meeting servicing requirements);

(3) Covers all or a pro rata portion of all contractual payments of the obligated party on the reference exposure;

(4) Gives the beneficiary a direct claim against the protection provider;

(5) Is not unilaterally cancelable by the protection provider for reasons other than the breach of the contract by the beneficiary;

(6) Except for a guarantee by a sovereign, is legally enforceable against the protection provider in a jurisdiction where the protection provider has sufficient assets against which a judgment may be attached and enforced;

(7) Requires the protection provider to make payment to the beneficiary on the occurrence of a default (as defined in the guarantee) of the obligated party on the reference exposure in a timely manner without the beneficiary first having to take legal actions to pursue the obligor for payment;

(8) Does not increase the beneficiary's cost of credit protection on the guarantee in response to deterioration in the credit quality of the reference exposure;

(9) Is not provided by an affiliate of the Board-regulated institution, unless the affiliate is an insured depository institution, foreign bank, securities broker or dealer, or insurance company that:

(i) Does not control the Board-regulated institution; and

(ii) Is subject to consolidated supervision and regulation comparable to that imposed on depository institutions, U.S. securities broker-dealers, or U.S. insurance companies (as the case may be); and

(10) Is provided by an eligible guarantor.

* * * * *

Eligible prepaid credit protection arrangement means a prepaid credit protection arrangement that:

(1) Is written;

(2) Is unconditional;

(3) Covers all or a pro rata portion of all contractual payments due to be paid on the reference exposure or reference exposures;

(4) Provides that the amount and timing of payments due from the protection purchaser to the protection provider are incorporated into the arrangement and the arrangement only allows these terms to change in the event of a breach of the arrangement by the protection purchaser;

(5) Provides that entry of the protection provider into receivership, insolvency, liquidation, conservatorship, or similar proceeding does not change the amounts or timing

of payments due to be paid by the protection purchaser under the arrangement;

(6) Is legally valid and enforceable under applicable law of the relevant jurisdictions;

(7) Upon a failure by the obligor on the one or more reference exposures to make a contractually required payment, or the occurrence of other credit events as described in the arrangement, allows the protection purchaser promptly to reduce the outstanding balance of the initial principal amount due to the protection provider by the loss of the protection purchaser on the reference exposures without input from the protection provider; and

(8) Does not increase the protection purchaser's cost of credit protection in response to deterioration in the credit quality of any of the reference exposure.

* * * * *

Financial institution means:

* * * * *

(4) * * *

(i) * * *

(A) An investment in GAAP equity instruments of the company with an adjusted carrying value or exposure amount equal to or greater than \$10 million, as adjusted pursuant to § 217.4; or

* * * * *

Netting set means a group of transactions with a single counterparty that are subject to a qualifying master netting agreement. For derivative contracts, netting set also includes a single derivative contract between a Board-regulated institution and a single counterparty.

* * * * *

Non-performing loan securitization (NPL securitization) means a traditional securitization, that is not a resecuritization, where parameter W (as defined in § 217.44(b)(1)) for the underlying exposures in a pool is greater than or equal to 90 percent at the origination cut-off date and at any subsequent date on which exposures are added to or removed from the pool of underlying exposures due to replenishment or restructuring.

Nonrefundable purchase price discount (NRPPD) means the difference between the outstanding principal balance of the underlying exposures at the time of sale and the price at which these exposures are sold by the originator to a company the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, when neither originator nor the original lender are reimbursed for this difference. In cases where the

originator underwrites tranches of an NPL securitization for subsequent sale, the NRPPD may include the differences between the outstanding principal balance of the underlying exposures at the time of sale and the price at which all of the tranches are first sold to unrelated third parties. For any given piece of a securitization tranche, only its initial sale from the originator to investors is taken into account in the determination of NRPPD. The purchase prices of subsequent re-sales of a securitization tranche are not considered.

* * * * *

Prepaid credit protection arrangement means a contractual arrangement under which a protection purchaser transfers the credit risk of one or more reference exposures to a protection provider where:

(1) The protection provider pays an initial principal amount in cash to the protection purchaser at the inception of the transaction; and

(2) The protection purchaser is obligated to repay the initial principal amount to the protection provider on or before the maturity date of the transaction, less any losses that the protection purchaser realizes or otherwise recognizes due to nonpayment of all contractual payments due to be paid on the reference exposure or reference exposures by the obligors.

* * * * *

Protection amount (P) means, with respect to an exposure hedged by an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, or secured by financial collateral, the effective notional amount of the guarantee, credit derivative, or prepaid credit protection arrangement, or the fair value of the financial collateral, reduced to reflect any currency mismatch, maturity mismatch, or lack of restructuring coverage (as provided in § 217.36–217.37 or § 217.120–121, as applicable).

* * * * *

Qualifying cross-product master netting agreement means a qualifying master netting agreement that provides for termination and close-out netting across multiple types of financial transactions or qualifying master netting agreements in the event of a counterparty's default, provided that the underlying financial transactions are derivative contracts or repo-style transactions that are not cleared transactions. In order to treat an agreement as a qualifying cross-product master netting agreement, a Board-regulated institution must comply with

the requirements of § 217.3(c) of this part with respect to that agreement.

* * * * *

Qualifying master netting agreement means a written, legally enforceable agreement provided that:

* * * * *

(3) The agreement does not contain a walkaway clause (that is, a provision that permits a non-defaulting counterparty to make a lower payment than it otherwise would make under the agreement, or no payment at all, to a defaulter or the estate of a defaulter, even if the defaulter or the estate of the defaulter is a net creditor under the agreement); and

(4) In order to recognize an agreement as a qualifying master netting agreement for purposes of this subpart, a Board-regulated institution must comply with the requirements of § 217.3(d) with respect to that agreement.

* * * * *

Residential mortgage exposure means an exposure (other than a securitization exposure, equity exposure, statutory multifamily mortgage, or presold construction loan):

(1) * * *

(ii) With an original and outstanding amount of \$1 million or less, as adjusted pursuant to § 217.4, that is primarily secured by a first or subsequent lien on residential property that is not one-to-four family; and

* * * * *

Senior securitization exposure means a securitization exposure that has a first-priority claim on the cash flows from the underlying exposures. When determining whether a securitization exposure has a first-priority claim on the cash flows from the underlying exposures, a Board-regulated institution is not required to consider amounts due under interest rate derivative, currency derivative, and servicer cash advance facility contracts; fees due; and other similar payments. Both the most senior commercial paper issued by an ABCP program and a liquidity facility that supports the ABCP program may be senior securitization exposures if the liquidity facility provider's right to reimbursement of the drawn amounts is senior to all claims on the cash flows from the underlying exposures except amounts due under interest rate derivative, currency derivative, and servicer cash advance facility contracts; fees due; and other similar payments.

* * * * *

Specified supranational entity means the Bank for International Settlements, the European Central Bank, the European Commission, the International Monetary Fund, the European Stability

Mechanism, or the European Financial Stability Facility.

* * * * *

Speculative grade means that the entity to which the Board-regulated institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, has adequate capacity to meet financial commitments in the near term, but is vulnerable to adverse economic conditions, such that should economic conditions deteriorate, the issuer or the reference entity would present an elevated default risk.

* * * * *

Sub-speculative grade means that the entity to which the Board-regulated institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, depends on favorable economic conditions to meet its financial commitments, such that should such economic conditions deteriorate the issuer or the reference entity likely would default on its financial commitments.

* * * * *

Synthetic excess spread means any contractual provisions in a synthetic securitization that are designed to absorb losses prior to any of the tranches of the securitization structure.

* * * * *

Synthetic securitization means a transaction in which:

(1) All or a portion of the credit risk of one or more underlying exposures is retained or transferred to one or more third parties through the use of one or more credit derivatives, guarantees (other than a guarantee that transfers only the credit risk of an individual retail exposure), or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures; and

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities).

* * * * *

Traditional securitization means a transaction in which:

(1) All or a portion of the credit or equity risk of one or more underlying exposures is transferred to one or more third parties other than through the use

of credit derivatives, guarantees, or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures;

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities);

(5) The underlying exposures are not owned by an operating company;

(6) The underlying exposures are not owned by a small business investment company defined in section 302 of the Small Business Investment Act;

(7) The underlying exposures are not owned by a firm an investment in which qualifies as a community development investment under section 24(Eleventh) of the National Bank Act;

(8) The Board may determine that a transaction in which the underlying exposures are owned by an investment firm that exercises substantially unfettered control over the size and composition of its assets, liabilities, and off-balance sheet exposures is not a traditional securitization based on the transaction's leverage, risk profile, or economic substance;

(9) The Board may deem a transaction that meets the definition of a traditional securitization, notwithstanding paragraph (5), (6), or (7) of this definition, to be a traditional securitization based on the transaction's leverage, risk profile, or economic substance; and

(10) The transaction is not:

(i) An investment fund;

(ii) A collective investment fund (as defined in 12 CFR 208.34);

(iii) An employee benefit plan (as defined in paragraphs (3) and (32) of section 3 of ERISA), a "governmental plan" (as defined in 29 U.S.C. 1002(32)) that complies with the tax deferral qualification requirements provided in the Internal Revenue Code, or any similar employee benefit plan established under the laws of a foreign jurisdiction;

(iv) A synthetic exposure to the capital of a financial institution to the extent deducted from capital under § 217.22; or

(v) Registered with the SEC under the Investment Company Act of 1940 (15 U.S.C. 80a–1) or foreign equivalents thereof.

* * * * *

■ 23. Add § 217.4 to read as follows:

§ 217.4 Threshold Indexing.

(a) *Methodology*. The dollar thresholds specified in paragraph (c) of this section shall be adjusted by multiplying the baseline threshold values specified in paragraph (c) of this section by one plus the cumulative percent change in the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured from the effective date of this rule, as further described in paragraph (b) of this section, and shall be rounded in accordance with paragraph (d) of this section.

(b) *Frequency*. (1) *In general—biennial adjustments*. Except as otherwise provided in paragraph (b)(2) and (b)(3) of this section, the adjustments described in paragraph (a) of this section shall be effective on October 1 following each consecutive two year period ending August 30, and using the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers as of August 30 of that year.

(2) *Off-year adjustments*. In the event that the [AGENCY] determines, during a year where no adjustment would be made under paragraph (b)(1), that the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured over the twelve month period ending August 30 of that year, is such that an adjustment under this section would be appropriate for that year, the [AGENCY] may make an adjustment under this section for that year.

(3) *Periods of negative inflation*. Notwithstanding paragraph (b)(1) or (b)(2) of this section, if an adjustment of dollar thresholds using the cumulative percent change of the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers from the effective date of this rule or the most recent adjustment, as applicable, would not result in an increase from the current dollar thresholds, no adjustment will be made pursuant to paragraph (a) of this section.

(c) *Specified thresholds*. The thresholds in the following sections shall be adjusted in accordance with paragraph (a) of this section relative to the baseline threshold values as specified below.

(1) Section 217.1(c)(5)(i), baseline threshold value \$50 billion.

(2) Section 217.2, paragraph (4)(i)(A) of the definition of "Financial institution," baseline threshold value \$10 million;

(3) Section 217.2, definition of “Residential mortgage exposure,” baseline threshold value \$1 million;

(4) Section 217.61, baseline threshold value \$50 billion.

(d) *Rounding*. When adjusting thresholds under this section, each threshold shall be rounded based on the size of the threshold (e.g., thousands, millions, billions) to the nearest number with two significant digits.

(e) *Effective date of threshold adjustments*. The [AGENCY] shall announce the thresholds adjusted in accordance with this section by publication in the **Federal Register**. Such adjusted thresholds shall be effective on October 1 of the year during which an adjustment is made.

(f) *Failure to publish in the Federal Register*. In the event, for any reason, the thresholds adjusted in accordance with this section are not published in the **Federal Register** in a year in which an adjustment is made under this section, the thresholds specified in paragraph (c) of this section will adjust as provided in this section and be effective on October 1, notwithstanding the lack of publication in the **Federal Register**.

* * * * *

■ 24. Add § 217.5 to read as follows:

§ 217.5 Calculation of loan-to-value (LTV) ratio.

(a) *Loan-to-value ratio*. The loan-to-value (LTV) ratio must be calculated as the extension of credit divided by the value of the property.

(b) *Extension of credit*. For purposes of a LTV ratio calculated under this § 217.5, the extension of credit is equal to the total outstanding amount of the loan including any undrawn committed amount of the loan.

(c) *Value of the property*. (1) For purposes of a LTV ratio calculated under this § 217.5, the value of the property is the market value of all real estate properties securing or being improved by the extension of credit plus the amount of any readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 208, appendix C, that secures the extension of credit, subject to the following:

(i) For exposures subject to [APPRAISAL RULE], the market value of property is a valuation that meets all requirements of that rule.

(ii) For exposures not subject to [APPRAISAL RULE]:

(A) The market value of real estate must be obtained from an independent valuation of the property using prudently conservative valuation criteria;

(B) The valuation must be done independently from the Board-regulated institution’s origination and underwriting process; and

(C) To ensure that the market value of the real estate is determined in a prudently conservative manner, the valuation must exclude expectations of price increases and must be adjusted downward to account for the potential for the current market price to be significantly above the value that would be sustainable over the life of the loan.

(2) In the case where the exposure includes the financing to purchase the property, the value of the property is the lower of the market value obtained under paragraph (c)(1)(i) or (c)(1)(ii) of this section, as applicable, and the actual acquisition cost.

(3) The value of the property must be measured at the time of origination, except in the following circumstances:

(i) The [AGENCY] requires a Board-regulated institution to revise the value of the property downward;

(ii) The value of the property must be adjusted downward due to an extraordinary event that results in a permanent reduction of the property value; or

(iii) The value of the property may be increased to reflect modifications made to the property that increase the market value, as determined according to the requirements in paragraphs (c)(1)(i) or (c)(1)(ii) of this section.

(4) Readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 208, appendix C, must be appropriately discounted by the Board-regulated institution consistent with the Board-regulated institution’s usual practices for making loans secured by such collateral.

■ 25. Amend § 217.22 by:

■ a. Redesignating footnotes 22 through 31 as footnotes 1 through 10; and

■ b. Revising paragraph (b), the heading of paragraph (d), and paragraph (d)(1).

The revisions read as follows:

§ 217.22 Regulatory capital adjustments and deductions.

* * * * *

(b) *Regulatory adjustments to common equity tier 1 capital*.

(1) A Board-regulated institution must adjust the sum of common equity tier 1 capital elements pursuant to the requirements set forth in this paragraph (b). Such adjustments to common equity tier 1 capital must be made net of the associated deferred tax effects.

(i) A Board-regulated institution that makes an AOCI opt-out election (as defined in paragraph (b)(2) of this section), must make the adjustments required under paragraph (b)(2)(i) of this section.

(ii) A Board-regulated institution that is an advanced approaches Board-regulated institution, Category III Board-regulated institution, or Category IV Board-regulated institution, and a Board-regulated institution that has not made an AOCI opt-out election (as defined in paragraph (b)(2) of this section), must deduct any accumulated net gains and add any accumulated net losses on cash flow hedges included in AOCI that relate to the hedging of items that are not recognized at fair value on the balance sheet.

(iii) A Board-regulated institution must deduct any net gain and add any net loss related to changes in the fair value of liabilities that are due to changes in the Board-regulated institution’s own credit risk. An advanced approaches Board-regulated institution, Category III Board-regulated institution, or Category IV Board-regulated institution must deduct the difference between its credit spread premium and the risk-free rate for derivatives that are liabilities as part of this adjustment.

(2) AOCI opt-out election.

(i) A Board-regulated institution that is not an advanced approaches Board-regulated institution, Category III Board-regulated institution, or Category IV Board-regulated institution may make a one-time election to opt out of the requirement to include all components of AOCI (with the exception of accumulated net gains and losses on cash flow hedges related to items that are not fair-valued on the balance sheet) in common equity tier 1 capital (AOCI opt-out election). A Board-regulated institution that makes an AOCI opt-out election in accordance with this paragraph (b)(2) must adjust common equity tier 1 capital as follows:

(A) Subtract any net unrealized gains and add any net unrealized losses on available-for-sale securities;

(B) Subtract any accumulated net gains and add any accumulated net losses on cash flow hedges;

(C) Subtract any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans (excluding, at the Board-regulated institution’s option, the portion relating to pension assets deducted under paragraph (a)(5) of this section); and

(D) Subtract any net unrealized gains and add any net unrealized losses on held-to-maturity securities that are included in AOCI.

(ii)(A) A Board-regulated institution that is not an advanced approaches Board-regulated institution, Category III

Board-regulated institution, or Category IV Board-regulated institution must make its AOCI opt-out election in the Call Report, for a state member bank, or FR Y–9C, for a bank holding company or savings and loan holding company, during the first reporting period after the Board-regulated institution is required to comply with subpart A of this part as set forth in § 217.1(f).

(B) Notwithstanding paragraph (b)(ii)(A) of this section, if a Board-regulated institution was previously an advanced approaches Board-regulated institution, Category III Board-regulated institution, or Category IV Board-regulated institution, the Board-regulated institution must make its AOCI opt-out election in the Call Report, for a state member bank, or FR Y–9C, for a bank holding company or savings and loan holding company, during the first reporting period after the Board-regulated institution ceased to be an advanced approaches Board-regulated institution, Category III Board-regulated institution, or Category IV Board-regulated institution.

(iii) Each depository institution subsidiary of a Board-regulated institution that is not an advanced approaches Board-regulated institution, Category III Board-regulated institution, or Category IV Board-regulated institution must elect the same option as the Board-regulated institution pursuant to paragraph (b)(2) of this section.

(iv) With prior notice to the Board, a Board-regulated institution resulting from a merger, acquisition, or purchase transaction and that is not an advanced approaches Board-regulated institution, a Category III Board-regulated institution, or a Category IV Board-regulated institution, may make a new AOCI opt-out election in the Call Report (for a state member bank), or FR Y–9C or FR Y–9SP, as applicable (for bank holding companies or savings and loan holding companies) filed by the resulting Board-regulated institution for the first reporting period after it is required to comply with subpart A of this part as set forth in § 217.1(f) if:

(A) Other than as set forth in paragraph (b)(2)(iv)(C) of this section, the merger, acquisition, or purchase transaction involved the acquisition or purchase of all or substantially all of either the assets or voting stock of another banking organization that is subject to regulatory capital requirements issued by the Board of Governors of the Federal Reserve, the Federal Deposit Insurance Corporation, or the Office of the Comptroller of the Currency;¹

(B) Prior to the merger, acquisition, or purchase transaction, only one of the

banking organizations involved in the transaction made an AOCI opt-out election under this section; and

(C) A Board-regulated institution may, with the prior approval of the Board, change its AOCI opt-out election under this paragraph (b) in the case of a merger, acquisition, or purchase transaction that meets the requirements set forth at paragraph (b)(2)(iv)(B) of this section, but does not meet the requirements of paragraph (b)(2)(iv)(A) of this section. In making such a determination, the Board may consider the terms of the merger, acquisition, or purchase transaction, as well as the extent of any changes to the risk profile, complexity, and scope of operations of the Board-regulated institution resulting from the merger, acquisition, or purchase transaction.

(3) *Regulatory capital requirement for insurance underwriting risks.* A bank holding company or savings and loan holding company must deduct an amount equal to the regulatory capital requirement for insurance underwriting risks established by the regulator of any insurance underwriting activities of the company. The bank holding company or savings and loan holding company must take the deduction 50 percent from tier 1 capital and 50 percent from tier 2 capital. If the amount deductible from tier 2 capital exceeds the Board-regulated institution's tier 2 capital, the Board-regulated institution must deduct the excess from tier 1 capital.

* * * * *

(d) *Certain DTAs subject to common equity tier 1 capital deduction thresholds.*

(1) A Board-regulated institution that is not an advanced approaches Board-regulated institution must make deductions from regulatory capital as described in this paragraph (d)(1).

(i) The Board-regulated institution must deduct from common equity tier 1 capital elements the amount of DTAs as described in paragraph (d)(1)(ii) of this section that exceeds 25 percent of the sum of the Board-regulated institution's common equity tier 1 capital elements, less adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c)(3) of this section (the 25 percent common equity tier 1 capital deduction threshold).²

(ii) The Board-regulated institution must deduct from common equity tier 1 capital elements the amount of DTAs arising from temporary differences that the Board-regulated institution could not realize through net operating loss carrybacks, net of any related valuation allowances and net of DTLs, in

accordance with paragraph (e) of this section. A Board-regulated institution is not required to deduct from the sum of its common equity tier 1 capital elements DTAs (net of any related valuation allowances and net of DTLs, in accordance with § 217.22(e)) arising from timing differences that the Board-regulated institution could realize through net operating loss carrybacks. The Board-regulated institution must risk weight these assets at 100 percent. For a state member bank that is a member of a consolidated group for tax purposes, the amount of DTAs that could be realized through net operating loss carrybacks may not exceed the amount that the state member bank could reasonably expect to have refunded by its parent holding company.

(iii) For purposes of calculating the amount of DTAs subject to deduction pursuant to paragraph (d)(1) of this section, a Board-regulated institution may exclude DTAs and DTLs relating to adjustments made to common equity tier 1 capital under paragraph (b) of this section. A Board-regulated institution that elects to exclude DTAs relating to adjustments under paragraph (b) of this section also must exclude DTLs and must do so consistently in all future calculations. A Board-regulated institution may change its exclusion preference only after obtaining the prior approval of the Board.

* * * * *

¹ These rules include the regulatory capital requirements set forth at 12 CFR part 3 (OCC); 12 CFR part 225 (Board); 12 CFR part 325, and 12 CFR part 390 (FDIC).

* * * * *

² The amount of the items in paragraph (d)(1) of this section that is not deducted from common equity tier 1 capital must be included in the risk-weighted assets of the Board-regulated institution and assigned a 250 percent risk weight.

- * * * * *
- 26. In § 217.32:
- a. Revise paragraph (f)(1);
 - b. Revise paragraph (g);
 - c. Revise paragraph (l)(5).

The revisions read as follows:

§ 217.32 General risk weights.

* * * * *

(f) Corporate exposures.

(1) A Board-regulated institution must assign a 95 percent risk weight to all its corporate exposures, except as provided in paragraphs (f)(2) and (f)(3) of this section.

* * * * *

(g) Residential mortgage exposures.

(1) A Board-regulated institution must assign a risk weight in accordance with Table 5 to § 217.32 or Table 6 to

§ 217.32, as applicable, to a first-lien residential mortgage exposure that:

- (i) Is secured by a property that is either owner-occupied or rented;
- (ii) Is made in accordance with prudent underwriting standards,

including relating to the loan amount as a percent of the appraised value of the property;

- (iii) Is not 90 days or more past due or carried in nonaccrual status; and

(iv) Is not restructured or modified, provided that a loan modified or restructured solely pursuant to the U.S. Treasury's Home Affordable Mortgage Program is not modified or restructured for purposes of this section.

TABLE 5—RISK WEIGHTS FOR RESIDENTIAL MORTGAGES THAT ARE NOT DEPENDENT ON THE CASH FLOWS GENERATED BY THE REAL ESTATE BASED ON LTV ¹

	LTV ratio ≤ 50%	50% < LTV ratio ≤ 60%	60% < LTV ratio ≤ 80%	80% < LTV ratio ≤ 90%	90% < LTV ratio ≤ 100%	LTV Ratio > 100%
Risk Weight	25%	30%	35%	45%	55%	75%

¹ LTV is calculated in accordance with § 217.5.

TABLE 6—PROPOSED RISK WEIGHTS FOR RESIDENTIAL MORTGAGE EXPOSURES DEPENDENT ON THE CASH FLOWS GENERATED BY THE REAL ESTATE AND BASED ON LTV ¹

	LTV ratio ≤ 50%	50% < LTV ratio ≤ 60%	60% < LTV ratio ≤ 80%	80% < LTV ratio ≤ 90%	90% < LTV ratio ≤ 100%	LTV Ratio > 100%
Risk Weight	35%	40%	50%	65%	80%	110%

¹ LTV is calculated in accordance with § 217.5.

(2) A Board-regulated institution must assign a 100 percent risk weight to a first-lien residential mortgage exposure that does not meet the criteria in paragraph (g)(1) of this section or for which the Board-regulated institution cannot calculate the LTV in accordance with 12 CFR 217.5, and to junior-lien residential mortgage exposures.

(3) For the purpose of this paragraph (g), if a Board-regulated institution holds the first-lien and junior-lien(s) residential mortgage exposures, and no other party holds an intervening lien, the Board-regulated institution must combine the exposures and treat them as a single first-lien residential mortgage exposure.

* * * * *

(1) * * *

(5) A Board-regulated institution must assign a 90 percent risk weight to all assets not specifically assigned a different risk weight under this subpart D and that are not deducted from tier 1 or tier 2 capital pursuant to § 217.22.

* * * * *

■ 27. Amend § 217.33 by:

- a. Adding paragraph (a)(5); and
- b. Revising paragraph (b).

The revisions read as follows:

§ 217.33 Off-balance sheet exposures.

(a) * * *

(5) For purposes of this section, if a commitment does not have an express contractual maximum amount that can be drawn, the committed but undrawn amount of the commitment is equal to the highest total drawn amount over the period since the commitment was created or the prior 24 months,

whichever period is shorter, minus the current drawn amount.

* * * * *

(b) *Credit conversion factors—*

(1) *Zero percent CCF.* A Board-regulated institution must apply a zero percent CCF to the unused portion of a commitment that is unconditionally cancelable by the Board-regulated institution.

(2) *20 percent CCF.* A Board-regulated institution must apply a 20 percent CCF to the amount of self-liquidating trade-related contingent items that arise from the movement of goods, with an original maturity of one year or less.

(3) *40 percent CCF.* A Board-regulated institution must apply a 40 percent CCF to commitments, regardless of the maturity of the facility, unless they qualify for a lower or higher CCF.

(4) *50 percent CCF.* A Board-regulated institution must apply a 50 percent CCF to the amount of:

(i) Transaction-related contingent items, including performance bonds, bid bonds, warranties, and performance standby letters of credit; and

(ii) Note issuance facilities and revolving underwriting facilities.

(5) *100 percent CCF.* A Board-regulated institution must apply a 100 percent CCF to the amount of the following off-balance-sheet items and other similar transactions:

(i) Guarantees;

(ii) Repurchase agreements (the off-balance sheet component of which equals the sum of the current fair values of all positions the Board-regulated institution has sold subject to repurchase);

(iii) Credit-enhancing representations and warranties that are not securitization exposures;

(iv) Off-balance sheet securities lending transactions (the off-balance sheet component of which equals the sum of the current fair values of all positions the Board-regulated institution has lent under the transaction);

(v) Off-balance sheet securities borrowing transactions (the off-balance sheet component of which equals the sum of the current fair values of all non-cash positions the Board-regulated institution has posted as collateral under the transaction);

(vi) Financial standby letters of credit; and

(vii) Forward agreements.

* * * * *

■ 28. Amend § 217.34 by revising paragraph (c)(2) to read as follows:

§ 217.34 Derivative contracts.

* * * * *

(c) * * *

(2) As an alternative to the simple approach, a Board-regulated institution using CEM under paragraph (b) of this section may recognize the credit risk mitigation benefits of financial collateral that secures such a contract or netting set if the financial collateral is marked-to-fair value on a daily basis and subject to a daily margin maintenance requirement by applying a risk weight to the uncollateralized portion of the exposure, after adjusting the exposure amount calculated under paragraph (b)(1) or (2) of this section using the collateral haircut approach in § 217.37(e). The Board-regulated institution must substitute the exposure

amount calculated under paragraph (b)(1) or (2) of this section for $\Sigma_i E_i$ in the equation in § 217.37(e)(2).

* * * * *

■ 29. Amend § 217.36 by revising paragraph (e) to read as follows:

§ 217.36 Guarantees and credit derivatives: substitution treatment.

* * * * *

(e) *Adjustment for credit derivatives without restructuring as a credit event.*

(1) If a Board-regulated institution recognizes an eligible credit derivative that does not include as a credit event a restructuring of the hedged exposure involving forgiveness or postponement of principal, interest, or fees that results in a credit loss event (that is, a charge-off, specific provision, or other similar debit to the profit and loss account), the Board-regulated institution must apply the adjustment in paragraph (e)(2) of this section to reduce the effective notional amount of the credit derivative unless:

(i) The terms of the hedged exposure and the reference exposure, if different from the hedged exposure, allow the maturity, principal, coupon, currency, or seniority status of the exposure to be amended outside of receivership, insolvency, liquidation, or similar proceeding only by unanimous consent of all parties; and

(ii) The Board-regulated institution has conducted sufficient legal review to conclude with a well-founded basis (and maintains sufficient written documentation of that legal review) that the hedged exposure is subject to the U.S. Bankruptcy Code, the Federal Deposit Insurance Act, or a domestic or foreign insolvency regime with similar features that allow for a company to liquidate, reorganize, or restructure and provides for an orderly settlement of creditor claims.

(2) The Board-regulated institution must apply the following adjustment to reduce the effective notional amount of any eligible credit derivative that is subject to adjustment under paragraph (e)(1) of this section:

$$Pr = Pm \times 0.60$$

Where:

- (i) Pr = effective notional amount of the credit risk mitigant, adjusted for lack of restructuring event (and maturity mismatch, if applicable); and
- (ii) Pm = effective notional amount of the credit risk mitigant (adjusted for maturity mismatch, if applicable).

* * * * *

■ 30. Revise § 217.37 to read as follows:

§ 217.37 Collateralized transactions and prepaid credit protection arrangements.

(a) *Financial Collateral.* (1) To recognize the risk-mitigating effects of financial collateral, a Board-regulated institution may use:

(i) The simple approach in paragraph (b) of this section; or

(ii) The collateral haircut approach in paragraph (e) of this section for repo-style transactions, eligible margin loans, collateralized derivative contracts, and single-product netting sets of such transactions, subject to paragraph (a)(3) of this section.

(2) A Board-regulated institution must use the same approach to recognize the risk-mitigating effects of financial collateral for similar exposures or transactions.

(3) A Board-regulated institution that has elected under § 217.34(a)(1)(ii) to use the standardized approach for counterparty credit risk (SA-CCR) for derivative contracts may elect to also use SA-CCR for repo-style transactions that are subject to a qualifying cross-product master netting agreement with derivative contracts, subject to the requirements of paragraph (f) of this section. A Board-regulated institution that uses SA-CCR to determine the exposure amount of a derivative contract or netting set may use not the simple approach in paragraph (b) of this section or the collateral haircut approach under paragraph (e) of this section for the exposures for which SA-CCR is used.

(b) *The simple approach—(1) General requirements.* To qualify for the simple approach under this paragraph (b), the financial collateral must meet the following requirements:

(i) The collateral must be revalued at least every six months;

(ii) The legal mechanism by which financial collateral is pledged or transferred must be enforceable in the relevant jurisdictions and ensure that the Board-regulated institution has the contractual right, as applicable to the characteristics of the financial collateral and exposure, to liquidate or take legal possession of the financial collateral, setoff amounts owed to the obligor against amounts owed to the Board-regulated institution and close out any transaction giving rise to the secured exposure, in a timely manner, in the event of the default, insolvency or bankruptcy (or one or more otherwise-defined credit events set out in the transaction documentation) of the obligor; and

(iii) The Board-regulated institution must be able to reasonably demonstrate the ability to protect and enforce its

rights in respect of any financial collateral.

(2) *Risk weight substitution.* (i) A Board-regulated institution may apply a risk weight to the portion of an exposure that is secured by financial collateral that meets the requirements of paragraph (b) of this section, up to the protection amount of the financial collateral as adjusted by paragraph (d) of this section, based on the risk weight assigned to the collateral under this subpart. For repurchase agreements, reverse repurchase agreements, and securities lending and borrowing transactions, the collateral is the instruments, gold, and cash the Board-regulated institution has borrowed, purchased subject to resale, or taken as collateral from the counterparty under the transaction. Except as provided in paragraph (b)(3) of this section, the risk weight assigned to the protected portion of the exposure may not be less than 20 percent.

(ii) A Board-regulated institution must apply a risk weight to the amount of an exposure in excess of the protection amount of financial collateral securing the exposure based on the risk weight applicable to the exposure under this subpart.

(3) *Exceptions to the 20 percent risk weight floor and other requirements.* Notwithstanding paragraph (b)(2)(i) of this section, a Board-regulated institution may assign a zero percent risk weight up to the protection amount of the financial collateral where:

(i) The financial collateral is cash on deposit; or

(ii) The financial collateral is an exposure to a sovereign that qualifies for a zero percent risk weight under § 217.32, and the Board-regulated institution has discounted the fair value of the collateral by 20 percent.

(c) *Eligible prepaid credit protection arrangements.* (1) *Scope.* A Board-regulated institution may recognize the credit risk mitigation benefits of an eligible prepaid credit protection arrangement as provided under this paragraph.

(2) *Application.* This paragraph applies to exposures, including securitization exposures, for which:

(i) Credit risk is fully covered by an eligible prepaid credit protection arrangement; or

(ii) Credit risk is covered on a pro rata basis (that is, on a basis in which the Board-regulated institution and the protection provider share losses proportionately) by an eligible prepaid credit protection arrangement.

(3) *Tranching of credit risk.* Exposures on which there is a tranching of credit risk (reflecting at least two different

levels of seniority) generally are securitization exposures subject to § 217.41 through § 217.45.

(4) *Multiple eligible prepaid credit protection arrangements.* If multiple eligible prepaid credit protection arrangements cover a single exposure, a Board-regulated institution may treat the hedged exposure as multiple separate exposures each covered by a single eligible credit protection arrangement and may calculate a separate risk-weighted asset amount for each separate exposure as described in paragraph (c)(6) of this section.

(5) *Single eligible credit protection arrangements.* If a single eligible credit protection arrangement covers multiple hedged exposures, a Board-regulated institution must treat each hedged exposure as covered by a separate eligible credit protection arrangement and must calculate a separate risk-weighted asset amount for each exposure as described in paragraph (c)(6) of this section.

(6) *Prepaid credit protection arrangements—The substitution approach.* (i) *Full coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the protection amount (P) of the prepaid credit protection arrangement is greater than or equal to the exposure amount of the reference exposure, a Board-regulated institution may assign a zero percent risk weight to the reference exposure.

(ii) *Partial coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the protection amount (P) of the prepaid credit protection arrangement is less than the exposure amount of the reference exposure, the Board-regulated institution must treat the reference exposure as two separate exposures (protected and unprotected) in order to recognize the credit risk mitigation benefit of the prepaid credit protection arrangement.

(A) The Board-regulated institution may apply a risk-weight of zero percent for the protected exposure.

(B) The Board-regulated institution must calculate the risk-weighted asset amount for the unprotected exposure under this subpart D, where the applicable risk weight is that of the unprotected portion of the reference exposure.

(C) The treatment provided in this section is applicable when the credit risk of a reference exposure is covered on a partial pro rata basis and may be applicable when an adjustment is made to the effective notional amount of the

prepaid credit protection arrangement under paragraph (d) of this section.

(d) *Required adjustments—(1) Maturity mismatch adjustment.* (i) A Board-regulated institution that recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section must adjust the amount of credit risk mitigation recognized to reflect any maturity mismatch.

(ii) A maturity mismatch occurs when:

(A) The residual maturity of the legal mechanism by which financial collateral is pledged is less than that of the secured exposure(s); or

(B) The residual maturity of an eligible prepaid credit protection arrangement is less than that of the reference exposure.

(iii) The residual maturity of a secured exposure under paragraph (b) of this section or a reference exposure under paragraph (c) of this section is the longest possible remaining time before the obligated party of the secured exposure or reference exposure is scheduled to fulfil its obligation on the exposure. For purposes of this paragraph (d)(1)(iii):

(A) For an eligible prepaid credit protection arrangement, if the terms of the arrangement include embedded options that may reduce its term, the Board-regulated institution (protection purchaser) must adjust the residual maturity. If a call is at the discretion of the protection provider, the residual maturity is at the first call date. If the call is at the discretion of the Board-regulated institution (protection purchaser), but the terms of the arrangement at origination contain a positive incentive for the Board-regulated institution to cancel the arrangement before contractual maturity, the remaining time to the first call date is the residual maturity.

(B) For financial collateral that is not cash on deposit at the Board-regulated institution, but including cash held for the Board-regulated institution by a third-party custodian or trustee, the residual maturity of any amount of such financial collateral is the earliest date on which the Board-regulated institution's rights in respect of such amount of financial collateral may be terminated without the pledgor being subject to a contemporaneous requirement to pledge additional financial collateral. For financial collateral that is cash on deposit at the Board-regulated institution, the residual maturity of any amount of such cash collateral is the earliest date on which a depositor may

withdraw such amount, notwithstanding any notice requirements or early withdrawal fees or penalties.

(iv) The credit risk mitigation benefits of financial collateral or an eligible prepaid credit protection arrangement with a maturity mismatch may be recognized only if the original maturity of the legal mechanism by which financial collateral is pledged or the eligible prepaid credit protection arrangement is greater than or equal to one year and its residual maturity is greater than three months.

(v) When a maturity mismatch exists, the Board-regulated institution must apply the following adjustment to reduce the protection amount:

$$P_m = E \times (t - 0.25) / (T - 0.25)$$

Where:

- (A) P_m = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement, adjusted for maturity mismatch;
- (B) E = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement;
- (C) t = the lesser of T or the residual maturity of the arrangement, expressed in years; and
- (D) T = the lesser of five or the residual maturity of the secured exposure or reference exposure, expressed in years.

(2) *Currency mismatch adjustment.* (i) If a Board-regulated institution recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section that is denominated in a currency different from that in which the secured or reference exposure is denominated, the Board-regulated institution must apply the following formula to the fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement:

$$P_c = P_r \times (1 - H_{FX})$$

Where:

- (A) P_c = fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement, adjusted for currency mismatch (and maturity mismatch, if applicable);
- (B) P_r = fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement (adjusted for maturity mismatch, if applicable); and
- (C) H_{FX} = haircut appropriate for the currency mismatch between the financial collateral and the secured exposure or the eligible prepaid credit protection arrangement and the reference exposure,

as determined under paragraphs (d)(2)(ii) through (iii) of this section.

(ii) Subject to paragraph (d)(2)(iii) of this section, a Board-regulated

institution must set H_{FX} equal to eight percent.

(iii) A Board-regulated institution must increase H_{FX} as determined under paragraph (d)(2)(ii) of this section if the

Board-regulated institution revalues the financial collateral or eligible prepaid credit protection arrangement less frequently than once every 10 business days using the following formula:

$$H_{FX} = 8\% \times \sqrt{\frac{T_M}{10}}, \text{ where } T_M \text{ equals the greater of 10 or the number of business days}$$

between revaluations.

(e) *Collateral haircut approach—Exposure amount for eligible margin loans and repo-style transactions.* (1) *General.* A Board-regulated institution may recognize the credit risk mitigation benefits of financial collateral that secures an eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set of eligible margin loans, repo-style

transactions, or collateralized derivative contracts, and of any collateral that secures a repo-style transaction that is included in the Board-regulated institution's measure for market risk under subpart F of this part, by using the collateral haircut approach covered in this paragraph (e) of this section.

(2) *Exposure amount calculation.* For purposes of the collateral haircut

approach, a Board-regulated institution must determine the exposure amount for an eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set of eligible margin loans, repo-style transactions, or collateralized derivative contracts according to the following formula:

$$E^* = \max \left\{ 0; \left(\sum_i E_i - \sum_i C_i \right) + \left(0.4 \times \text{net}_{\text{exposure}} \right) + \left(0.6 \times \frac{\text{gross}_{\text{exposure}}}{\sqrt{N}} \right) + \left(\sum_{fx} (E_{fx} \times H_{fx}) \right) \right\} \text{ where:}$$

(i) E^* is the exposure amount of the eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set after credit risk mitigation;

(ii) E_i is:

(A) For eligible margin loans and repo-style transactions and netting sets thereof, the current fair value of the instrument, cash, or gold the Board-regulated institution has lent, sold subject to repurchase, or posted as collateral to the counterparty; and,

(B) For collateralized derivative contracts and netting sets thereof, the exposure amount of the OTC derivative contract or netting set calculated under § 217.34(b)(1) or (2);

(iii) C_i is the current fair value of the instrument, cash, or gold the banking organization has borrowed, purchased subject to resale, or taken as collateral from the counterparty;

(iv) $\text{net}_{\text{exposure}} = |\sum_s E_s H_s|$;

(v) $\text{gross}_{\text{exposure}} = \sum_s E_s |H_s|$;

(vi) E_s is the absolute value of the net position in a given instrument or in gold, where the net position in a given instrument or gold equals the sum of the current fair values of the instrument or

gold the Board-regulated institution has lent, sold subject to repurchase, or posted as collateral to the counterparty, minus the sum of the current fair values of that same instrument or gold the Board-regulated institution has borrowed, purchased subject to resale, or taken as collateral from the counterparty;

(vii) H_s is the haircut appropriate to E_s as described in Table 1 to § 217.37, as applicable. H_s has a positive sign if the instrument or gold is net lent, sold subject to repurchase, or posted as collateral to the counterparty; H_s has a negative sign if the instrument or gold is net borrowed, purchased subject to resale, or taken as collateral from the counterparty;

(viii) N is the number of instruments with a unique Committee on Uniform Securities Identification Procedures (CUSIP) designation or foreign equivalent that the Board-regulated institution lends, sells subject to repurchase, posts as collateral, borrows, purchases subject to resale, or takes as collateral in the eligible margin loan, repo-style transaction, collateralized derivative contract, or

netting set, including all collateral that the Board-regulated institution elects to include within the credit risk mitigation framework, except that instruments where the value E_s is less than one tenth of the value of the largest E_s in the eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set are not included in the count or gold, with any amount of gold given a value of one;

(ix) E_{fx} is the absolute value of the net position in each currency fx different from the settlement currency;

(x) H_{fx} is the haircut appropriate for currency mismatch of currency fx .

(3) *Market price volatility and currency mismatch haircuts.* (i) A Board-regulated institution must use the haircuts for market price volatility (H_s) in Table 1 to § 217.37, as adjusted in certain circumstances as provided in paragraphs (e)(3)(iii) through (v) of this section.

TABLE 1 TO § 217.37—MARKET PRICE VOLATILITY HAIRCUTS

Residual maturity	Securities issued by a sovereign or an issuer described in § 217.32(b) ¹ (percent)				Other investment-grade securities (percent)	
	Issuer risk weight of 0%	Issuer risk weight of 20% or 50%	Issuer risk weight of 100%	GSE exposures	Exposures other than GSE exposures or securitization exposures	Senior securitization exposures with risk weight <100%
Debt Securities:						

TABLE 1 TO § 217.37—MARKET PRICE VOLATILITY HAIRCUTS—Continued

Residual maturity	Securities issued by a sovereign or an issuer described in § 217.32(b) ¹ (percent)				Other investment-grade securities (percent)	
	Issuer risk weight of 0%	Issuer risk weight of 20% or 50%	Issuer risk weight of 100%	GSE exposures	Exposures other than GSE exposures or securitization exposures	Senior securitization exposures with risk weight <100%
Less than or equal to 1 year	0.5	1.0	15.0	1.0	2.0	4.0
Greater than 1 year and less than or equal to 3 years	2.0	3.0	15.0	4.0	4.0	12.0
Greater than 3 years and less than or equal to 5 years					6.0	
Greater than 5 years and less than or equal to 10 years	4.0	6.0	15.0	8.0	12.0	24.0
Greater than 10 years					20.0	
Main index equities (including convertible bonds) and gold	20.0					
Other publicly traded equities and convertible bonds	30.0					
Mutual funds and exchange traded funds	Highest haircut applicable to any security in which the fund can invest, unless the banking organization can apply the full look-through approach for equity investments in funds § 217.53(b), in which case the banking organization may use a weighted average of haircuts applicable to the securities held by the fund.					
Cash on deposit	0.0					
Other exposure types ²	30.0					

¹ Includes a foreign PSE that receives a zero percent risk weight.

² Includes senior securitization exposures with a risk weight greater than or equal to 100 percent and sovereign exposures with a risk weight greater than 100 percent.

(ii) For currency mismatches, a Board-regulated institution must use a haircut for foreign exchange rate volatility (H_{fx}) of 8 percent, as adjusted in certain circumstances under paragraphs (e)(3)(iii) and (iv) of this section.

(iii) For repo-style transactions, a Board-regulated institution may multiply the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section by the square root of $\frac{1}{2}$ (which equals 0.707107).

(iv) A Board-regulated institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period longer than ten business days for eligible margin loans and derivative contracts that are not client-facing derivative transactions or a holding period longer than five business days for repo-style transactions and client-facing derivative transactions that are not cleared transactions under the following conditions. If the number of trades in a netting set exceeds 5,000 at any time during a quarter, a Board-regulated institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period of twenty business days for the following quarter except in the calculation of exposure amount for purposes of § 217.35. If a netting set contains one or more trades involving illiquid collateral, a Board-regulated institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period of twenty business days. If over the two previous quarters more than two margin disputes on a netting set have occurred that lasted longer than

the holding period, then the Board-regulated institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward for that netting set on the basis of a holding period that is at least two times the minimum holding period for that netting set. The Board-regulated institution must adjust the haircuts upward using the following formula:

$$H_a = H_s \sqrt{T_m/T_s}$$

Where:

- (A) T_m equals a holding period of longer than 10 business days for eligible margin loans and derivative contracts other than client-facing derivative transactions or longer than 5 business days for repo-style transactions and client-facing derivative transactions;
- (B) H_s equals the market price volatility haircut provided in Table 1 to § 217.37 or to the foreign exchange rate volatility haircut provided in paragraph (e)(3)(ii) of this section; and
- (C) T_s equals 10 business days for eligible margin loans and derivative contracts other than client-facing derivative transactions or 5 business days for repo-style transactions and client-facing derivative transactions.

(v) If the instruments a Board-regulated institution has lent, sold subject to repurchase, or posted as collateral do not meet the definition of financial collateral, the Board-regulated institution must use a 30 percent haircut for market price volatility (H_s).

(f) *Election to apply SA-CCR to certain repo-style transactions.* (1) A Board-regulated institution that elects to determine the exposure amount using SA-CCR for its derivative contracts under paragraph (a)(1)(ii) of § 217.34

may elect under paragraph (a)(3) of this section to use SA-CCR to determine the exposure amount for a set of repo-style transactions and derivative contracts that are subject to a qualifying cross-product master netting agreement. A Board-regulated institution that makes such an election with respect to a qualifying cross-product master netting agreement must make the adjustments described in paragraphs (f)(2) and (3) in order to determine the exposure amount of the set of repo-style transactions and derivative contracts under SA-CCR.

(2) The exposure amount of a set of transactions subject to a qualifying cross-product master netting agreement for purposes of (f)(1), *Exposure Amount_{NSCP}*, must be calculated as follows:

$$\text{Exposure Amount}_{NSCP} = (1 - MR_{NSCP}) * (\text{Exposure Amount}_{repo-style transactions} + \text{Exposure Amount}_{derivatives}) + MR_{NSCP} * \text{Extended SA-CCR Exposure Amount}$$

Where:

- (i) *Exposure Amount_{repo-style transactions}* is the exposure amount for repo-style transactions in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the collateral haircut approach, under paragraph (e) of this section;
- (ii) *Exposure Amount_{derivatives}* is the exposure amount for derivatives in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the standardized approach to counterparty credit risk, under § 217.132(c)(5);
- (iii) *Extended SA-CCR Exposure Amount* is the exposure amount for both repo-style transactions and derivatives that are in the netting set that is subject to a

qualifying cross-product master netting agreement, calculated using the standardized approach to counterparty credit risk, under § 217.132(c)(5); and

(iv) MR_{NSCP} is the Maturity Ratio for a given netting set that is subject to a qualifying cross-product master netting agreement, calculated as follows:

$$MR_{NSCP} = \frac{\sum NAWM \text{ of the repo - style transactions}_i}{\max(\sum NAWM \text{ of the repo - style transactions}_i, \sum NAWM \text{ of the derivative transactions}_i)}$$

Where:

- (A) $\sum NAWM \text{ of the repo-style transactions}_i$ is the notional average weighted maturity of all i repo-style transactions subject to the qualifying cross-product master netting agreement, subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.
- (B) $\sum NAWM \text{ of the derivative transactions}_i$ is the notional average weighted maturity of all i derivative transactions subject to the qualifying cross-product master netting agreement subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.

(3) For purposes of applying SA-CCR to a repo-style transaction, the Board-regulated must make the adjustments described in paragraphs (f)(3)(i) through (iii) of this section.

(i) For purposes of this section, the Board-regulated institution must:

(A) Treat a repo-style transaction that has multiple underlying instruments as separate repo-style transactions for each distinct underlying instrument;

(B) Treat a repo-style transaction with a debt instrument as the underlying instrument as either a credit derivative that references the underlying debt instrument or an interest rate derivative that references the interest rate of the underlying debt instrument, based on the primary risk factor of the repo-style transaction;

(C) Treat a repo-style transaction with an equity instrument as the underlying instrument as an equity derivative that references the underlying equity instrument;

(D) Not apply paragraph (c)(4) of § 217.132 to a repo-style transaction with an equity instrument as the underlying instrument; and

(E) Treat a repo-style transaction as a client-facing derivative transaction where the Board-regulated institution is either acting as a financial intermediary and enters into an offsetting transaction with a qualifying central counterparty (QCCP) or where the Board-regulated institution provides a guarantee on the performance of a client on a transaction between the client and a QCCP.

(ii) For purposes of the supervisory delta under paragraph (c)(9)(iii) of § 217.132, a Board-regulated institution must use a supervisory delta of 1 for a

repurchase transaction or a securities lending transaction, and must use a supervisory delta of -1 for a reverse repurchase transaction or a securities borrowing transaction;

(iii) For purposes of the maturity factor under paragraph (c)(9)(iv) of § 217.132, MPOR cannot be less than five business days plus the periodicity of re-margining expressed in business days minus one business day.

* * * * *

■ 31. Revise § 217.41 to read as follows:

§ 217.41 Operational criteria for recognizing the transfer of risk.

(a) *Operational criteria for traditional securitizations.* A Board-regulated institution that transfers exposures it has originated or purchased to a third party in connection with a traditional securitization may exclude the exposures from the calculation of its risk-weighted assets only if each condition in this section is satisfied. A Board-regulated institution that meets these conditions must hold risk-based capital against any credit risk it retains in connection with the securitization. A Board-regulated institution that fails to meet these conditions must hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO strip that does not constitute after-tax gain-on-sale. If the transferred exposures are in connection with a resecuritization and all of the conditions in this paragraph (a) are satisfied, the Board-regulated institution must exclude the exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the resecuritization. The conditions are:

(1) The exposures are not reported on the Board-regulated institution's consolidated balance sheet under GAAP;

(2) The Board-regulated institution has transferred to one or more third parties credit risk associated with the underlying exposures;

(3) Any clean-up calls relating to the securitization are eligible clean-up calls; and

(4) The securitization does not:

(i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and

(ii) Contain an early amortization provision.

(b) *Operational criteria for synthetic securitizations.* For synthetic securitizations, a Board-regulated institution may recognize for risk-based capital purposes the use of a credit risk mitigant to hedge underlying exposures only if each condition in this paragraph (b) is satisfied. A Board-regulated institution that meets these conditions must hold risk-based capital against any credit risk of the exposures it retains in connection with the synthetic securitization. A Board-regulated institution that fails to meet these conditions or chooses not to recognize the credit risk mitigant for purposes of this section must instead hold risk-based capital against the underlying exposures as if they had not been synthetically securitized. If the synthetic securitization is a resecuritization and all of the conditions in this paragraph (b) are satisfied, the Board-regulated institution must exclude the underlying securitization exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the resecuritization. The conditions are:

(1) The credit risk mitigant is:

(i) Financial collateral;

(ii) A guarantee that meets all criteria as set forth in the definition of *eligible guarantee* in § 217.2, except for the criteria in paragraph (3) of that definition;

(iii) A credit derivative that is not an nth-to-default credit derivative and that meets all criteria as set forth in the definition of *eligible credit derivative* in § 217.2, except for the criteria in paragraph (3) of the definition of *eligible guarantee* in § 217.2; or

(iv) A prepaid credit protection arrangement that meets all criteria as set forth in the definition of *eligible prepaid credit protection arrangement* in § 217.2, except for the criteria in paragraph (3) of that definition.

(2) The Board-regulated institution transfers credit risk associated with the

underlying exposures to one or more third parties, and the terms and conditions in the credit risk mitigants employed do not include provisions that:

(i) Allow for the termination of the credit protection due to deterioration in the credit quality of the underlying exposures;

(ii) Require the Board-regulated institution to alter or replace the underlying exposures to improve the credit quality of the underlying exposures;

(iii) Increase the Board-regulated institution's cost of credit protection in response to deterioration in the credit quality of the underlying exposures;

(iv) Increase the yield payable to parties other than the Board-regulated institution in response to a deterioration in the credit quality of the underlying exposures; or

(v) Provide for increases in a retained first loss position or credit enhancement provided by the Board-regulated institution after the inception of the securitization;

(3) The Board-regulated institution obtains a well-reasoned opinion from legal counsel that confirms the enforceability of the credit risk mitigant in all relevant jurisdictions;

(4) Any clean-up calls relating to the securitization are eligible clean-up calls;

(5) No synthetic excess spread is permitted within the synthetic securitization;

(6) Any applicable minimum payment threshold for the credit risk mitigant is consistent with standard market practice; and

(7) The securitization does not:

(i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and

(ii) Contain an early amortization provision.

(c) *Due diligence requirements for securitization exposures.* (1) Except for exposures that are deducted from common equity tier 1 capital and exposures subject to § 217.43(h), if a Board-regulated institution is unable to demonstrate to the satisfaction of the Board a comprehensive understanding of the features of a securitization exposure that would materially affect the performance of the exposure, the Board-regulated institution must assign the securitization exposure a risk weight of 1,250 percent. The Board-regulated institution's analysis must be commensurate with the complexity of the securitization exposure and the materiality of the exposure in relation to its capital.

(2) A Board-regulated institution must demonstrate its comprehensive understanding of a securitization exposure under paragraph (c)(1) of this section, for each securitization exposure by:

(i) Conducting an analysis of the risk characteristics of a securitization exposure prior to acquiring the exposure and documenting such analysis within 3 business days after acquiring the exposure, considering:

(A) Structural features of the securitization that would materially impact the performance of the exposure, for example, the contractual cash flow waterfall, waterfall-related triggers, credit enhancements, liquidity enhancements, fair value triggers, the performance of organizations that service the exposure, and deal-specific definitions of default;

(B) Relevant information regarding—

(1) The performance of the underlying credit exposure(s), for example, the percentage of loans 30, 60, and 90 days past due; default rates; prepayment rates; loans in foreclosure; property types; occupancy; average credit score or other measures of creditworthiness; average LTV ratio; and industry and geographic diversification data on the underlying exposure(s); and

(2) For resecuritization exposures, in addition to the information described in paragraph (c)(2)(i)(B)(1) of this section, performance information on the underlying securitization exposures, which may include the issuer name and credit quality, and the characteristics and performance of the exposures underlying the securitization exposures; and

(C) Relevant market data of the securitization, for example, bid-ask spread, most recent sales price and historic price volatility, trading volume, implied market rating, and size, depth and concentration level of the market for the securitization; and

(ii) On an on-going basis (no less frequently than quarterly), evaluating, reviewing, and updating as appropriate the analysis required under paragraph (c)(1) of this section for each securitization exposure.

* * * * *

■ 32. Revise § 217.42 to read as follows:

§ 217.42 Exposure amount of a securitization exposure.

(a) *On-balance sheet securitization exposure.* (1) The exposure amount of an on-balance sheet securitization exposure (excluding an available-for-sale or held-to-maturity security where the Board-regulated institution has made an AOCI opt-out election under § 217.22(b)(2), a repo-style transaction,

eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative) is equal to the Board-regulated institution's carrying value of the exposure. For a credit derivative, a Board-regulated institution must apply § 217.43(i) or (j), as applicable.

(2) The exposure amount of an on-balance sheet securitization exposure that is an available-for-sale or held-to-maturity security held by a Board-regulated institution that has made an AOCI opt-out election under § 217.22(b)(2) is the Board-regulated institution's carrying value (including net accrued but unpaid interest and fees), less any net unrealized gains on the exposure and plus any net unrealized losses on the exposure.

(b) *Off-balance sheet securitization exposure.* Except as provided in § 217.43(h), the exposure amount of an off-balance sheet securitization exposure that is not a repo-style transaction, eligible margin loan, OTC derivative contract (other than a credit derivative), or cleared transaction (other than a credit derivative) is the notional amount of the exposure. For an off-balance sheet securitization exposure to an ABCP program, such as an eligible ABCP liquidity facility, the notional amount may be reduced to the maximum potential amount that the Board-regulated institution could be required to fund given the ABCP program's current underlying assets (calculated without regard to the current credit quality of those assets).

(c) *Repo-style transaction, eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative.* The exposure amount of a securitization exposure that is a repo-style transaction, eligible margin loan, or OTC derivative contract (other than a credit derivative) is the exposure amount as calculated in accordance with §§ 217.34 or 217.37, or § 217.33, as applicable, and the exposure amount of a securitization exposure that is a cleared transaction that is not a credit derivative is the exposure amount as calculated in § 217.35.

* * * * *

■ 33. Revise § 217.43 to read as follows:

§ 217.43 Risk-weighted assets for securitization exposures.

(a) *General approach.* Except as provided elsewhere in this section and in § 217.41:

(1) A Board-regulated institution may, subject to the limitation under paragraph (e) of this section, apply the securitization standardized approach (SEC-SA) in § 217.44 to the exposure if

the exposure meets the following requirements:

(i) The Board-regulated institution has accurate information on A , D , W , and K_G (as defined in § 217.44) for the exposure. Data used to assign the parameters described in this paragraph (a)(1)(i) must be the most currently available data. If the contracts governing the underlying exposures of the securitization require payments on a monthly or quarterly basis, the data used to assign the parameters described in this paragraph (a)(1)(i) must be no more than 91 calendar days old.

(ii) The Board-regulated institution has accurate information regarding whether the exposure is a resecuritization exposure.

(2) If the securitization exposure is an interest rate derivative contract, an exchange rate derivative contract, or a cash collateral account related to an interest rate or exchange rate derivative contract, the Board-regulated institution must assign a risk weight to the exposure equal to the risk weight of a securitization exposure that is *pari passu* to the interest rate derivative contract or exchange rate derivative contract or, if such an exposure does not exist, the risk weight of any subordinate securitization exposure.

(3) If the Board-regulated institution cannot apply, or chooses not to apply, the securitization standardized approach in § 217.44, the Board-regulated institution must apply a 1,250 percent risk weight to the exposure.

(b) *Total risk-weighted assets for securitization exposures.* A Board-regulated institution's total risk-weighted assets for securitization exposures equals the sum of the risk-weighted asset amount for securitization exposures that the Board-regulated institution risk weights under §§ 217.43 through 217.45, as applicable.

(c) *After-tax gain-on-sale resulting from a securitization.* Notwithstanding any other provision of this subpart, a Board-regulated institution must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from a securitization as well as the portion of a CEIO that does not constitute an after-tax gain-on sale.

(d) *Overlapping exposures.* (1) If a Board-regulated institution has multiple securitization exposures that provide duplicative coverage of the underlying exposures of a securitization (such as when a Board-regulated institution provides a program-wide credit enhancement and multiple pool-specific liquidity facilities to an ABCP program), the Board-regulated institution is not required to hold duplicative risk-based capital against the overlapping position.

Instead, the Board-regulated institution may apply to the overlapping position the applicable risk-based capital treatment that results in the highest risk-based capital requirement.

(2) If a Board-regulated institution has two or more securitization exposures that partially overlap with each other, the Board-regulated institution may treat the exposures as overlapping and apply the treatment under paragraph (d)(1). For purposes of such a treatment under this paragraph (d)(2), the Board-regulated institution must include in expanded total risk-weighted assets the risk-weighted asset amount for a hypothetical securitization exposure that would fully overlap with all of the partially overlapping exposures.

(3) If a Board-regulated institution has a securitization exposure under this subpart that is an overlapping exposure with a securitization exposure that is a market risk covered position under subpart F of this part, the Board-regulated institution may assign to the overlapping securitization exposure the applicable risk-based capital treatment under either this subpart or subpart F, whichever results in the highest risk-based capital requirement.

(e) *Implicit support.* If a Board-regulated institution provides support to a securitization in excess of the Board-regulated institution's contractual obligation to provide credit support to the securitization:

(1) The Board-regulated institution must calculate a risk-weighted asset amount for underlying exposures associated with the securitization as if the exposures had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the securitization and any portion of a CEIO strip that does not constitute after-tax gain-on-sale; and

(2) The Board-regulated institution must disclose publicly:

(i) That it has provided implicit support to the securitization; and

(ii) The risk-based capital impact to the Board-regulated institution of providing such implicit support.

(f) *Undrawn portion of a servicer cash advance facility.* (1) Notwithstanding any other provision of this subpart, a Board-regulated institution that is a servicer under an eligible servicer cash advance facility is not required to hold risk-based capital against potential future cash advance payments that it may be required to provide under the contract governing the facility.

(2) For a Board-regulated institution that acts as a servicer, the exposure amount for a servicer cash advance facility that is not an eligible servicer cash advance facility is equal to the

amount of all potential future cash advance payments that the Board-regulated institution may be contractually required to provide during the subsequent 12-month period under the contract governing the facility.

(g) *Interest-only mortgage-backed securities.* Notwithstanding any other provision of this subpart, the risk weight for a non-credit-enhancing interest-only mortgage-backed security may not be less than 100 percent.

(h) *Small-business loans and leases on personal property transferred with retained contractual exposure.* (1) Regardless of any other provision of this subpart, a Board-regulated institution that has transferred small-business loans and leases on personal property (small-business obligations) with recourse must include in risk-weighted assets only its contractual exposure to the small-business obligations if all the following conditions are met:

(i) The transaction must be treated as a sale under GAAP;

(ii) The Board-regulated institution establishes and maintains, pursuant to GAAP, a non-capital reserve sufficient to meet the Board-regulated institution's reasonably estimated liability under the contractual obligation;

(iii) The small-business obligations are to businesses that meet the criteria for a small-business concern established by the Small Business Administration under section 3(a) of the Small Business Act (15 U.S.C. 632 *et seq.*); and

(iv) The Board-regulated institution is well capitalized for purposes of the Prompt Corrective Action framework (12 U.S.C. 1831o). For purposes of determining whether a Board-regulated institution is well capitalized for purposes of this paragraph (h), the Board-regulated institution's capital ratios must be calculated without regard to the capital treatment for transfers of small-business obligations with recourse specified in paragraph (h)(1) of this section.

(2) The total outstanding amount of contractual exposure retained by a Board-regulated institution on transfers of small-business obligations receiving the capital treatment specified in paragraph (h)(1) of this section cannot exceed 15 percent of the Board-regulated institution's total capital.

(3) If a Board-regulated institution ceases to be well capitalized, or exceeds the 15 percent capital limitation provided in paragraph (h)(2) of this section, the capital treatment specified in paragraph (h)(1) of this section will continue to apply to any transfers of small-business obligations with retained contractual exposure that occurred during the time that the Board-regulated

institution was well capitalized and did not exceed the capital limit.

(4) The risk-based capital ratios of the Board-regulated institution must be calculated without regard to the capital treatment for transfers of small-business obligations specified in paragraph (h)(1) of this section for purposes of:

(i) Determining whether a Board-regulated institution is adequately capitalized, undercapitalized, significantly undercapitalized, or critically undercapitalized under the Board's prompt corrective action regulations; and

(ii) Reclassifying a well-capitalized Board-regulated institution to adequately capitalized and requiring an adequately capitalized Board-regulated institution to comply with certain mandatory or discretionary supervisory actions as if the Board-regulated institution were in the next lower prompt-corrective-action category.

(i) *Nth-to-default credit derivatives*—(1) *Protection provider*. A Board-regulated institution providing protection through a first-to-default or second-or-later-to-default derivative is subject to capital requirements on such instruments under this paragraph (i)(1).

(i) *First-to-default*. For first-to-default derivatives, a Board-regulated institution must aggregate by simple summation the risk weights of the assets covered up to a maximum of 1,250 percent and multiply by the nominal amount of the protection provided by the credit derivative to obtain the risk-weighted asset amount.

(ii) *Nth-to-default*. For second-or-later-to-default derivatives, in aggregating the risk weights, a Board-regulated institution may exclude the asset with the lowest risk-weighted amount from the risk-weighted capital calculation. This risk-based capital treatment applies for nth-to-default derivatives for which the n-1 assets with the lowest risk-weighted amounts can be excluded from the risk-weighted capital calculation.

(2) *Protection purchaser*. A Board-regulated institution is not permitted to recognize purchased protection in the form of an nth-to-default credit derivative as a credit risk mitigant. A Board-regulated institution must

calculate the counterparty credit risk of a purchased nth-to-default credit derivative under §§ 217.34.

(j) *Guarantees, credit derivatives other than nth-to-default credit derivatives, and prepaid credit protection arrangements*—(1) *Protection provider*. For a guarantee, credit derivative (other than an nth-to-default credit derivative), or prepaid credit protection arrangement provided by a Board-regulated institution that covers the full amount or a pro rata share of a securitization exposure's principal and interest, the Board-regulated institution must risk-weight the guarantee, credit derivative, or prepaid credit protection arrangement under paragraph (a) of this section as if it held the portion of the securitization exposure covered by the guarantee, credit derivative, or prepaid credit protection arrangement.

(2) *Protection purchaser*. (i) A Board-regulated institution that purchases a credit derivative (other than an nth-to-default credit derivative) that is recognized under § 217.45 as a credit risk mitigant (including via recognized collateral) is not required to compute a separate counterparty credit risk capital requirement under §§ 217.34.

(ii) If a Board-regulated institution cannot, or chooses not to, recognize protection purchased in the form of a credit derivative as a credit risk mitigant under § 217.45, the Board-regulated institution must determine the exposure amount of the credit derivative under § 217.34.

(A) If the Board-regulated institution purchases credit protection from a counterparty the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, the Board-regulated institution must determine the risk weight for the exposure according to § 217.32.

(B) If the Board-regulated institution purchases credit protection from a counterparty the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, the Board-regulated institution must determine the risk

weight for the exposure according to this section.

(k) *Look-through approach*. (1) Subject to paragraph (k)(2) of this section, a Board-regulated institution may assign a risk weight to a senior securitization exposure that is not a res securitization exposure equal to the greater of:

(i) The weighted-average risk weight, calculated without reference to, or the use of, the risk weight under § 217.52(b)(3)(iii), of all the underlying exposures where the weight for each exposure in the weighted-average calculation is determined by the unpaid principal amount of the exposure; and

(ii) 15 percent.

(2) A Board-regulated institution may assign a risk weight under this paragraph (k) only if the Board-regulated institution has knowledge of the composition of all of the underlying exposures.

(l) *NPL securitization*.

Notwithstanding any other provision of this subpart except for paragraph (e) of this section:

(1) If the nonrefundable purchase price discount for the NPL securitization is greater than or equal to 50 percent of the unpaid principal balance of the pool of exposures, the risk weight for a senior securitization exposure to an NPL securitization is 100 percent.

(2) If the Board-regulated institution is an originating Board-regulated institution with respect to the NPL securitization, the Board-regulated institution may hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO that does not constitute an after-tax gain-on-sale.

* * * * *

■ 34. Revise § 217.44 to read as follows:

§ 217.44 Securitization standardized approach (SEC-SA).

(a) *In general*. The risk weight RW_{SEC-SA} assigned to a securitization exposure, or portion of a securitization exposure, is calculated according to the following formula:

$$RW_{SEC-SA} = \begin{cases} \max(RW_{FLOOR}, 1,250\% \cdot K_{SEC-SA}), & K_A \leq A \\ \max\left(RW_{FLOOR}, \left(\frac{K_A - A}{D - A}\right) \cdot 1,250\% + \left(\frac{D - K_A}{D - A}\right) \cdot 1,250\% \cdot K_{SEC-SA}\right), & A < K_A < D \\ 1,250\%, & D \leq K_A \end{cases}$$

Where:

- (1) K_A is calculated under paragraph (b) of this section;
- (2) A (attachment point) equals the greater of zero and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of underlying exposures that are subordinated to the exposure of the Board-regulated institution to the current dollar amount of the underlying exposures, as adjusted in accordance with paragraph (a)(6) of this section;
- (3) D (detachment point) equals the greater of zero and the sum of parameter A and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of the securitization exposures that are ranked senior or pari passu with the exposure (that is, have equal seniority with respect to credit risk) to the current dollar amount of the underlying exposures, as adjusted in accordance with paragraph (a)(6) of this section;
- (4) RW_{FLOOR} equals 100 percent for resecuritization exposures and NPL securitization exposures and 15 percent for all other securitization exposures; and
- (5) K_{SEC-SA} is calculated according to the following formula:

$$K_{SEC-SA} = \frac{e^{a \cdot u} - e^{a \cdot l}}{a \cdot (u - l)}$$

Where:

- (i) a equals $-1/p \cdot K_A$ (as K_A is defined in this paragraph (a)), where p equals 1.5 for a resecuritization exposure and 0.5 for all other securitization exposures;
- (ii) u equals $D - K_A$ (as A and K_A are defined in paragraph (a) of this section);
- (iii) l equals $\max(A - K_A, 0)$ (as A and K_A are defined in paragraph (a) of this section); and
- (iv) e equals the base of the natural logarithm.

(6) A Board-regulated institution must include in the calculation of A and D the funded portion of any reserve account funded by the accumulated cash flows from the underlying exposures that is subordinated to the Board-regulated institution's securitization exposure. Interest rate derivative contracts, exchange rate derivative contracts, and cash collateral accounts related to these contracts must not be included in the calculation of A and D . If the securitization exposure includes a nonrefundable purchase

price discount, the nonrefundable purchase price discount must be included in the numerator and denominator of A and D .

(b) *Calculation of K_A* is calculated under this paragraph (b) according to the following formula:

$$K_A = (1 - W \cdot K_G + (W \cdot 0.5))$$

Where:

- (1) W equals the ratio, expressed as a decimal value between zero and one, of the sum of the dollar amounts of any underlying exposures of the securitization that are not securitization exposures and that meet any of the criteria in paragraphs (b)(1)(i) through (vii) of this section to the outstanding balance, measured in dollars, of all underlying exposures:
 - (i) Ninety days or more past due;
 - (ii) Subject to a bankruptcy or insolvency proceeding;
 - (iii) In the process of foreclosure;
 - (iv) Held as real estate owned;
 - (v) Has contractually deferred payments for 90 days or more, other than principal or interest payments deferred on:
 - (A) Federally guaranteed student loans, in accordance with the terms of those guarantee programs; or
 - (B) Consumer loans, including non-federally-guaranteed student loans, provided that such payments are deferred pursuant to provisions included in the contract at the time funds are disbursed that provide for period(s) of deferral that are not initiated based on changes in the creditworthiness of the borrower; or
 - (vi) Is in default; and
 - (vii) Notwithstanding paragraphs (1)(i) through (vi) of this paragraph, an exposure that is directly and unconditionally guaranteed by the U.S. Government, its central bank, or a U.S. Government agency may be excluded from the calculation of W up to the amount of the guarantee; and
- (2) K_G equals the weighted average (with unpaid principal used as the weight for each credit exposure and fair value used for each equity exposure) total capital requirement, expressed as a decimal value between zero and one, of the underlying exposures calculated using this subpart D (that is, an average risk weight of 100 percent represents a value of K_G equal to 0.08), as adjusted in accordance with this paragraph (b)(2). For purposes of K_G the determination of the capital requirement associated with an underlying exposure that is an equity exposure cannot use the risk weight under § 217.52(b)(3)(iii). For interest rate

derivative contracts and exchange rate derivative contracts, the positive current exposure times the risk weight of the counterparty multiplied by 0.08 must be included in the numerator of K_G but must be excluded from the denominator of K_G .

* * * * *

■ 35. Amend § 217.45 by:

- a. Adding paragraphs (a)(3) and (a)(4).
- b. Revising paragraph (b).

The additions and revisions read as follows:

§ 217.45 Recognition of credit risk mitigants for securitization exposures.

* * * * *

(3) If the recognized credit risk mitigant hedges a portion of the Board-regulated institution's securitization exposure, the Board-regulated institution must calculate its capital requirements for the hedged and unhedged portions of the exposure separately. For each unhedged portion, the Board-regulated institution must calculate capital requirements according to § 217.42 and § 217.43. For each hedged portion, the Board-regulated institution may recognize the credit risk mitigant under § 217.36 or § 217.37, but only as provided in this section.

(4) When a Board-regulated institution purchases or sells credit protection on a portion of a senior tranche, the lower-priority portion, whether hedged or unhedged, must be considered a non-senior securitization exposure.

* * * * *

(b) *Mismatches*. A Board-regulated institution must make any applicable adjustment to the protection amount as required in § 217.36 for any hedged securitization exposure. In the context of a synthetic securitization, when a credit risk mitigant described in § 217.41(b)(1)(ii) through (iv) covers multiple hedged exposures that have different residual maturities, the Board-regulated institution must use the longest residual maturity of any of the hedged exposures as the residual maturity of all hedged exposures.

* * * * *

■ 36. Revise § 217.51(b)(4) to read as follows:

§ 217.51 Introduction and exposure measurement.

* * * * *

(b) * * *

(4) For a commitment to acquire an equity exposure (an equity commitment), the effective notional principal amount of the exposure is multiplied by the following conversion factors (CFs):

(i) Conditional equity commitments receive a 40 percent conversion factor.

(ii) Unconditional equity commitments receive a 100 percent conversion factor.

* * * * *

■ 37. Revise § 217.61 to read as follows:

§ 217.61 Purpose and scope.

Sections 217.61 through 217.63 of this subpart establish public disclosure requirements related to the capital requirements described in subpart B of this part for a Board-regulated institution with total consolidated assets of \$50 billion, as adjusted pursuant to § 217.4, or more as reported on the Board-regulated institution's most recent year-end Call Report, for a state member bank, or FR Y–9C, for a bank holding company or savings and loan holding company, as applicable that is not an advanced approaches Board-regulated institution making public disclosures pursuant to § 217.172. An advanced approaches Board-regulated institution that has not received approval from the Board to exit parallel

run pursuant to § 217.121(d) is subject to the disclosure requirements described in §§ 217.62 and 217.63. A Board-regulated institution with total consolidated assets of \$50 billion, as adjusted pursuant to § 217.4, or more as reported on the Board-regulated institution's most recent year-end Call Report, for a state member bank, or FR Y–9C, for a bank holding company or savings and loan holding company, as applicable, that is not an advanced approaches Board-regulated institution making public disclosures subject to § 217.172 must comply with § 217.62 unless it is a consolidated subsidiary of a bank holding company, savings and loan holding company, or depository institution that is subject to the disclosure requirements of § 217.62 or a subsidiary of a non-U.S. banking organization that is subject to comparable public disclosure requirements in its home jurisdiction. For purposes of this section, total consolidated assets are determined based on the average of the Board-regulated institution's total consolidated assets in the four most recent quarters as reported on the Call Report, for a state member bank, or FR Y–9C, for a bank holding company or savings and loan holding company, as applicable; or the average of the Board-regulated institution's total consolidated assets in the most recent consecutive quarters as reported quarterly on the Board-regulated institution's Call Report, for a

state member bank, or FR Y–9C, for a bank holding company or savings and loan holding company, as applicable if the Board-regulated institution has not filed such a report for each of the most recent four quarters.

* * * * *

■ 38. Amend § 217.300 by revising paragraph (a) to read as follows:

§ 217.300 Transitions.

(a) *Transition adjustments for AOCI.* Beginning [January 1, 2027], a Category III Board-regulated institution or a Category IV Board-regulated institution that had made an AOCI opt-out election under § 217.22(b)(2) effective [December 31, 2026], must subtract from the sum of its common equity tier 1 elements, before making deductions required under § 217.22(c) or (d), the transition AOCI adjustment amount multiplied by the percentage provided in Table 1 to § 217.300. The transition AOCI adjustment amount is the sum of:

(1) Net unrealized gains or losses on available-for-sale securities, plus

(2) Accumulated net gains or losses on cash flow hedges, plus

(3) Any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans, plus

(4) Net unrealized holding gains or losses on held-to-maturity securities that are included in AOCI.

TABLE 1—TO § 217.300

Transition AOCI adjustment	
Transition period	Percentage applicable to transition AOCI adjustment amount
January 1, 2027 to December 31, 2027	100
January 1, 2028 to December 31, 2028	80
January 1, 2029 to December 31, 2029	60
January 1, 2030 to December 31, 2030	40
January 1, 2031 to December 31, 2031	20
January 1, 2032 and thereafter	0

PART 238—SAVINGS AND LOAN HOLDING COMPANIES (REGULATION LL)

■ 39. The authority citation for part 238 continues to read as follows:

Authority: 5 U.S.C. 552, 559; 12 U.S.C. 1462, 1462a, 1463, 1464, 1467, 1467a, 1468, 5365; 1813, 1817, 1829e, 1831i, 1972; 15 U.S.C. 78l.

Subpart Q—Single-Counterparty Credit Limits for Covered Savings and Loan Holding Companies**§ 238.154 [Amended]**

■ 40. In paragraph (h)(1) of § 238.154, remove the words “§ 217.37(c)(3)(ii)” and add in their place “§ 217.37(d)(2)”.

PART 252—ENHANCED PRUDENTIAL STANDARDS (REGULATION YY)

■ 41. The authority citation for part 252 continues to read as follows:

Authority: 12 U.S.C. 321–338a, 481–486, 1467a, 1818, 1828, 1831n, 1831o, 1831p–1, 1831w, 1835, 1844(b), 1844(c), 3101 *et seq.*, 3101 note, 3904, 3906–3909, 4808, 5361, 5362, 5365, 5366, 5367, 5368, 5371.

Subpart H—Single-Counterparty Credit Limits**§ 252.74 [Amended]**

■ 42. In paragraph (h)(1) of § 252.74, remove the words “§ 217.37(c)(3)(ii)” and add in their place “§ 217.37(d)(2)”.

Subpart Q—Single-Counterparty Credit Limits**§ 252.174 [Amended]**

■ 43. In paragraph (h)(1) of § 252.174, remove the words “§ 217.37(c)(3)(ii)” and add in their place “§ 217.37(d)(2)”.

FEDERAL DEPOSIT INSURANCE CORPORATION**12 CFR Chapter III****Authority and Issuance**

For the reasons stated in the preamble, the Federal Deposit Insurance Corporation proposes to amend 12 CFR part 324 as follows:

PART 324—CAPITAL ADEQUACY OF FDIC-SUPERVISED INSTITUTIONS

■ 44. The authority citation for part 324 continues to read as follows:

Authority: 12 U.S.C. 1815(a), 1815(b), 1816, 1818(a), 1818(b), 1818(c), 1818(t), 1819 (Tenth), 1828(c), 1828(d), 1828(i), 1828(n), 1828(o), 1831o, 1835, 3907, 3909, 4808; 5371; 5412; Pub. L. 102–233, 105 Stat. 1761, 1789, 1790 (12 U.S.C. 1831n note); Pub. L. 102–242, 105 Stat. 2236, 2355, as amended by Pub. L. 103–325, 108 Stat. 2160, 2233 (12 U.S.C. 1828 note); Pub. L. 102–242, 105 Stat. 2236, 2386, as amended by Pub. L. 102–550, 106 Stat. 3672, 4089 (12 U.S.C. 1828 note); Pub. L. 111–203, 124 Stat. 1376, 1887 (15 U.S.C. 78o–7 note), Pub. L. 115–174; section 4014 § 201, Pub. L. 116–136, 134 Stat. 281 (15 U.S.C. 9052).

Subpart A—General Provisions

■ 45. In § 324.1:

■ a. Revise paragraphs (c)(4)(i), (e) and (f); and

■ b. Add paragraph (g).

The addition and revision read as follows:

§ 324.1 Purpose, applicability, reservations of authority, and timing.

* * * * *

(4) * * *

(i) Except for an advanced approaches FDIC-supervised institution that is making public disclosures pursuant to the requirements in subpart E of this part, each FDIC-supervised institution with total consolidated assets of \$50 billion or more, as adjusted pursuant to § 324.4, must make the public disclosures described in subpart D of this part.

* * * * *

(e) *Notice and response procedures.* In making a determination under this part, unless more specifically provided for, the FDIC will apply notice and response procedures in the same manner and to the same extent as the notice and response procedures in 12 CFR 324.7(c).

* * * * *

(f) *Transitions and timing*—(1) *Transitions.* Notwithstanding any other provision of this part, an FDIC-supervised institution must make any adjustments provided in subpart G of this part for purposes of implementing this part.

(2) *Timing.* An FDIC-supervised institution that changes from one category to another category, or that changes from having no category to having a category, must comply with the requirements of its category in this part, including applicable transition provisions of the requirements in this part, no later than on the first day of the second quarter following the change in the FDIC-supervised institution's category.

* * * * *

(g) *Severability.* If any provision of this part, or the application thereof to any FDIC-supervised institution, is held invalid, such invalidity shall not affect the validity of other provisions or the application of such provision to other FDIC-supervised institutions that can be given effect without the invalid provision or application.

* * * * *

■ 46. In § 324.2:

■ a. Revise the definition for “Adjusted allowances for credit losses (AACL)”;

■ b. Remove the definition for “Allowances for loan and lease losses (ALLL)”;

■ c. Revise the definition for “Carrying value”;

■ d. Revise the definition for “Category III FDIC-supervised institution (324.2);

■ e. Add, in alphabetical order, the definition for “Category IV FDIC-supervised institution”;

■ f. Revise the definition for “Commitment”;

■ g. Add, in alphabetical order, the definition for “Dependent on the cash flows generated by the real estate”;

■ h. Revise the definitions for “Effective notional amount”, “Eligible clean-up call”, and “Eligible guarantee”;

■ i. Add, in alphabetical order, the definition for “Eligible prepaid credit protection arrangement”;

■ j. Revise paragraph (4)(i)(A) in the definition of “Financial institution”;

■ k. Revise the definition for “Netting set”;

■ l. Add, in alphabetical order, definitions for “Non-performing loan securitization (NPL securitization)”, “Nonrefundable purchase price discount (NRPPD)”, and “Prepaid credit protection arrangement”;

■ m. Revise the definition for “Protection amount (P)”;

■ n. Add, in alphabetical order, the definition for “Qualifying Cross-Product Master Netting Agreement”;

■ o. Revise paragraph (1)(ii) of the definition for “Residential mortgage exposure”;

■ p. Remove the definition for “Securitization special purpose entity (SPE)”;

■ q. Add, in alphabetical order, the definitions for “Senior securitization exposure” and “Specified supranational entity”;

■ r. Revise the definition for “Speculative grade”;

■ s. In the definition of “Standardized total risk-weighted assets”, remove the words “§ 324.42” and add, in their place, the words “§ 324.43”;

■ t. Revise the definition for “Sub-speculative grade”;

■ u. Add, in alphabetical order, the definition for “Synthetic excess spread”;

■ v. Revise the definitions for “Synthetic securitization”, and “Traditional securitization”.

The additions and revisions read as follows:

§ 324.2 Definitions.

Adjusted allowances for credit losses (AACL) means valuation allowances that have been established through a charge against earnings or retained earnings for expected credit losses on financial assets measured at amortized cost and a lessor's net investment in leases that have been established to reduce the amortized cost basis of the assets to amounts expected to be collected as determined in accordance with GAAP. For purposes of this part, adjusted allowances for credit losses include allowances for expected credit losses on off-balance sheet credit exposures not accounted for as insurance as determined in accordance with GAAP. Adjusted allowances for credit losses exclude allocated transfer risk reserves and allowances created that reflect credit losses on purchased credit deteriorated assets, purchased seasoned loans, assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, and available-for-sale debt securities.

* * * * *

Carrying value means, with respect to an asset, the value of the asset on the balance sheet of the FDIC-supervised institution as determined in accordance with GAAP. For all assets other than available-for-sale debt securities, purchased credit deteriorated assets, purchased seasoned loans, or assets required to record an allowance for credit losses through a gross-up adjustment to the purchase price of the asset, the carrying value is not reduced by any associated credit loss allowance

that is determined in accordance with GAAP.

* * * * *

Category III FDIC-supervised institution means an FDIC-supervised institution that is not a Category II FDIC-supervised institution and that

(1) Is a subsidiary of a Category III banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2)(i) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution's total consolidated assets for the four most recent calendar quarters as reported on the Call Report, equal to \$250 billion or more. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; or

(ii)(A) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution's total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more but less than \$250 billion. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on its total consolidated assets, as reported on the Call Report, for the most recent quarter or average of the most recent quarters, as applicable; and

(B) Has at least one of the following in paragraphs (2)(ii)(B)(1) through (3) of this definition, each calculated as the average of the four most recent calendar quarters, or if the FDIC-supervised institution has not filed each applicable reporting form for each of the four most recent calendar quarters, for the most recent quarter or quarters, as applicable:

(1) Total nonbank assets, calculated in accordance with the instructions to the FR Y-9LP or equivalent reporting form, equal to \$75 billion or more;

(2) Off-balance sheet exposure equal to \$75 billion or more. Off-balance sheet exposure is the FDIC-supervised institution's total exposure, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, minus the FDIC-supervised institution's total consolidated assets, as reported on the Call Report; or

(3) Weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, equal to \$75 billion or more.

(iii) After meeting the criteria in paragraph (2)(ii) of this definition, an

FDIC-supervised institution continues to be a Category III FDIC-supervised institution until the FDIC-supervised institution:

(A) Has:

(1) Less than \$250 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters;

(2) Less than \$75 billion in total nonbank assets, calculated in accordance with the instructions to the FR Y-9LP or equivalent reporting form, for each of the four most recent calendar quarters;

(3) Less than \$75 billion in weighted short-term wholesale funding, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, for each of the four most recent calendar quarters; and

(4) Less than \$75 billion in off-balance sheet exposure for each of the four most recent calendar quarters. Off-balance sheet exposure is an FDIC-supervised institution's total exposure, calculated in accordance with the instructions to the FR Y-15 or equivalent reporting form, minus the total consolidated assets of the FDIC-supervised institution, as reported on the Call Report; or

(B) Has less than \$100 billion in total consolidated assets, as reported on the Call Report, for each of the four most recent calendar quarters; or

(C) Is a Category II FDIC-supervised institution.

Category IV FDIC-supervised institution means an FDIC-supervised institution that is not a Category II FDIC-supervised institution or a Category III FDIC-supervised institution, and that:

(1) Is a subsidiary of a Category IV banking organization, as defined pursuant to 12 CFR 252.5 or 12 CFR 238.10, as applicable; or

(2) Has total consolidated assets, calculated based on the average of the FDIC-supervised institution's total consolidated assets for the four most recent calendar quarters as reported on the Call Report, of \$100 billion or more. If the FDIC-supervised institution has not filed the Call Report for each of the four most recent calendar quarters, total consolidated assets is calculated based on the average of its total consolidated assets, as reported on the Call Report, for the most recent quarter(s) available.

(3) After meeting the criterion in paragraph (2) of this definition, an FDIC-supervised institution continues to be a Category IV FDIC-supervised institution until it:

(i) Has less than \$100 billion in total consolidated assets, as reported on the

Call Report, for each of the four most recent calendar quarters; or

(ii) Is a Category II FDIC-supervised institution or Category III FDIC-supervised institution.

* * * * *

Commitment means a contractual arrangement, under which an FDIC-supervised institution and an obligor agree to terms applicable to one or more future extensions of credit, purchases of assets, or issuances of credit substitutes by the FDIC-supervised institution, whether or not such arrangement is unconditionally cancelable. A commitment is unconditionally cancelable if, by its terms, it either: (a) provides that an FDIC-supervised institution is not obligated to extend credit, purchase assets, or issue credit substitutes; or (b) permits an FDIC-supervised institution, at any time, with or without cause, to refuse to extend credit, purchase assets, or issue credit substitutes under the arrangement (to the extent permitted under applicable law).

* * * * *

Dependent on the cash flows generated by the real estate means, for a real estate exposure, the underwriting, at the time of origination, considers the cash flows generated by lease, rental, or sale of the real estate securing the loan as a source of repayment. For purposes of this definition, a residential mortgage exposure that is secured by the borrower's principal residence is deemed not dependent on the cash flows generated by the real estate.

* * * * *

Effective notional amount means for an eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, the lesser of the contractual notional amount of the credit risk mitigant and the exposure amount of the hedged exposure, multiplied by the percentage coverage of the credit risk mitigant.

* * * * *

Eligible clean-up call means a clean-up call that:

(1) Is exercisable solely at the discretion of the originating FDIC-supervised institution or servicer;

(2) Is not structured to avoid allocating losses to securitization exposures held by investors or otherwise structured to provide credit enhancement to the securitization; and

(3) Is only exercisable:

(i) For a traditional securitization, when 10 percent or less of the principal amount of the underlying exposures or securitization exposures (determined as of the inception of the securitization) is outstanding;

(ii) For a synthetic securitization, when 10 percent or less of the principal amount of the reference portfolio of underlying exposures (determined as of the inception of the securitization) is outstanding;

(iii) Upon the occurrence of a regulatory event that significantly changes the risk-weighted asset amount for the securitization exposure under applicable risk-weighted asset standards; or

(iv) Upon the occurrence of a tax event that significantly changes the tax treatment of the securitization exposure under applicable tax laws.

* * * * *

Eligible guarantee means a guarantee that:

(1) Is written;

(2) Is either:

(i) Unconditional, or

(ii) A contingent obligation of the U.S. government or its agencies, the enforceability of which is dependent upon some affirmative action on the part of the beneficiary of the guarantee or a third party (for example, meeting servicing requirements);

(3) Covers all or a pro rata portion of all contractual payments of the obligated party on the reference exposure;

(4) Gives the beneficiary a direct claim against the protection provider;

(5) Is not unilaterally cancelable by the protection provider for reasons other than the breach of the contract by the beneficiary;

(6) Except for a guarantee by a sovereign, is legally enforceable against the protection provider in a jurisdiction where the protection provider has sufficient assets against which a judgment may be attached and enforced;

(7) Requires the protection provider to make payment to the beneficiary on the occurrence of a default (as defined in the guarantee) of the obligated party on the reference exposure in a timely manner without the beneficiary first having to take legal actions to pursue the obligor for payment;

(8) Does not increase the beneficiary's cost of credit protection on the guarantee in response to deterioration in the credit quality of the reference exposure;

(9) Is not provided by an affiliate of the FDIC-supervised institution, unless the affiliate is an insured depository institution, foreign bank, securities broker or dealer, or insurance company that:

(i) Does not control the FDIC-supervised institution; and

(ii) Is subject to consolidated supervision and regulation comparable

to that imposed on depository institutions, U.S. securities broker-dealers, or U.S. insurance companies (as the case may be); and

(10) Is provided by an eligible guarantor.

* * * * *

Eligible prepaid credit protection arrangement means a prepaid credit protection arrangement that:

(1) Is written;

(2) Is unconditional;

(3) Covers all or a pro rata portion of all contractual payments due to be paid on the reference exposure or reference exposures;

(4) Provides that the amount and timing of payments due from the protection purchaser to the protection provider are incorporated into the arrangement and the arrangement only allows these terms to change in the event of a breach of the arrangement by the protection purchaser;

(5) Provides that entry of the protection provider into receivership, insolvency, liquidation, conservatorship, or similar proceeding does not change the amounts or timing of payments due to be paid by the protection purchaser under the arrangement;

(6) Is legally valid and enforceable under applicable law of the relevant jurisdictions;

(7) Upon a failure by the obligor on the one or more reference exposures to make a contractually required payment, or the occurrence of other credit events as described in the arrangement, allows the protection purchaser promptly to reduce the outstanding balance of the initial principal amount due to the protection provider by the loss of the protection purchaser on the reference exposures without input from the protection provider; and

(8) Does not increase the protection purchaser's cost of credit protection in response to deterioration in the credit quality of any of the reference exposure.

* * * * *

Financial institution means:

* * * * *

(4) * * *

(i) * * *

(A) An investment in GAAP equity instruments of the company with an adjusted carrying value or exposure amount equal to or greater than \$10 million, as adjusted pursuant to § 324.4; or

* * * * *

Netting set means a group of transactions with a single counterparty that are subject to a qualifying master netting agreement. For derivative contracts, netting set also includes a

single derivative contract between an FDIC-supervised institution and a single counterparty.

* * * * *

Non-performing loan securitization (NPL securitization) means a traditional securitization, that is not a rescuitization, where parameter *W* (as defined in § 324.44(b)(1)) for the underlying exposures in a pool is greater than or equal to 90 percent at the origination cut-off date and at any subsequent date on which exposures are added to or removed from the pool of underlying exposures due to replenishment or restructuring.

Nonrefundable purchase price discount (NRPPD) means the difference between the outstanding principal balance of the underlying exposures at the time of sale and the price at which these exposures are sold by the originator to a company the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, when neither originator nor the original lender are reimbursed for this difference. In cases where the originator underwrites tranches of an NPL securitization for subsequent sale, the NRPPD may include the differences between the outstanding principal balance of the underlying exposures at the time of sale and the price at which all of the tranches are first sold to unrelated third parties. For any given piece of a securitization tranche, only its initial sale from the originator to investors is taken into account in the determination of NRPPD. The purchase prices of subsequent re-sales of a securitization tranche are not considered.

* * * * *

Prepaid credit protection arrangement means a contractual arrangement under which a protection purchaser transfers the credit risk of one or more reference exposures to a protection provider where:

(1) The protection provider pays an initial principal amount in cash to the protection purchaser at the inception of the transaction; and

(2) The protection purchaser is obligated to repay the initial principal amount to the protection provider on or before the maturity date of the transaction, less any losses that the protection purchaser realizes or otherwise recognizes due to nonpayment of all contractual payments due to be paid on the reference exposure or reference exposures by the obligors.

* * * * *

Protection amount (P) means, with respect to an exposure hedged by an

eligible guarantee, eligible credit derivative, or eligible prepaid credit protection arrangement, or secured by financial collateral, the effective notional amount of the guarantee, credit derivative, or prepaid credit protection arrangement, or the fair value of the financial collateral, reduced to reflect any currency mismatch, maturity mismatch, or lack of restructuring coverage (as provided in §§ 324.36–324.37 or § 324.120–121, as applicable).

Qualifying cross-product master netting agreement means a qualifying master netting agreement that provides for termination and close-out netting across multiple types of financial transactions or qualifying master netting agreements in the event of a counterparty's default, provided that the underlying financial transactions are derivative contracts or repo-style transactions that are not cleared transactions. In order to treat an agreement as a qualifying cross-product master netting agreement, an FDIC-supervised institution must comply with the requirements of § 324.3(c) of this part with respect to that agreement.

Residential mortgage exposure means an exposure (other than a securitization exposure, equity exposure, statutory multifamily mortgage, or presold construction loan):

(1) * * *

(ii) With an original and outstanding amount of \$1 million or less, as adjusted pursuant to § 324.4, that is primarily secured by a first or subsequent lien on residential property that is not one-to-four family; and

* * * * *

Senior securitization exposure means a securitization exposure that has a first-priority claim on the cash flows from the underlying exposures. When determining whether a securitization exposure has a first-priority claim on the cash flows from the underlying exposures, an FDIC-supervised institution is not required to consider amounts due under interest rate derivative, currency derivative, and servicer cash advance facility contracts; fees due; and other similar payments. Both the most senior commercial paper issued by an ABCP program and a liquidity facility that supports the ABCP program may be senior securitization exposures if the liquidity facility provider's right to reimbursement of the drawn amounts is senior to all claims on the cash flows from the underlying exposures except amounts due under interest rate derivative, currency derivative, and servicer cash advance

facility contracts; fees due; and other similar payments.

* * * * *

Specified supranational entity means the Bank for International Settlements, the European Central Bank, the European Commission, the International Monetary Fund, the European Stability Mechanism, or the European Financial Stability Facility.

* * * * *

Speculative grade means that the entity to which the FDIC-supervised institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, has adequate capacity to meet financial commitments in the near term, but is vulnerable to adverse economic conditions, such that should economic conditions deteriorate, the issuer or the reference entity would present an elevated default risk.

* * * * *

Sub-speculative grade means that the entity to which the FDIC-supervised institution is exposed through a loan or security, or the reference entity with respect to a credit derivative, depends on favorable economic conditions to meet its financial commitments, such that should such economic conditions deteriorate the issuer or the reference entity likely would default on its financial commitments.

* * * * *

Synthetic excess spread means any contractual provisions in a synthetic securitization that are designed to absorb losses prior to any of the tranches of the securitization structure.

* * * * *

Synthetic securitization means a transaction in which:

(1) All or a portion of the credit risk of one or more underlying exposures is retained or transferred to one or more third parties through the use of one or more credit derivatives, guarantees (other than a guarantee that transfers only the credit risk of an individual retail exposure), or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures; and

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities,

mortgage-backed securities, other debt securities, or equity securities).

* * * * *

Traditional securitization means a transaction in which:

(1) All or a portion of the credit or equity risk of one or more underlying exposures is transferred to one or more third parties other than through the use of credit derivatives, guarantees, or prepaid credit protection arrangements;

(2) The credit risk associated with the underlying exposures has been separated into at least two tranches reflecting different levels of seniority;

(3) Performance of the securitization exposures depends solely upon the performance of the underlying exposures;

(4) All or substantially all of the underlying exposures are financial exposures (such as loans, commitments, credit derivatives, guarantees, receivables, asset-backed securities, mortgage-backed securities, other debt securities, or equity securities);

(5) The underlying exposures are not owned by an operating company;

(6) The underlying exposures are not owned by a small business investment company defined in section 302 of the Small Business Investment Act;

(7) The underlying exposures are not owned by a firm an investment in which qualifies as a community development investment under section 24(Eleventh) of the National Bank Act;

(8) The FDIC may determine that a transaction in which the underlying exposures are owned by an investment firm that exercises substantially unfettered control over the size and composition of its assets, liabilities, and off-balance sheet exposures is not a traditional securitization based on the transaction's leverage, risk profile, or economic substance;

(9) The FDIC may deem a transaction that meets the definition of a traditional securitization, notwithstanding paragraph (5), (6), or (7) of this definition, to be a traditional securitization based on the transaction's leverage, risk profile, or economic substance; and

(10) The transaction is not:

(i) An investment fund;

(ii) A collective investment fund (as defined in 12 CFR 344.3 (state nonmember bank), and 12 CFR 390.203 (state savings association));

(iii) An employee benefit plan (as defined in paragraphs (3) and (32) of section 3 of ERISA), a "governmental plan" (as defined in 29 U.S.C. 1002(32)) that complies with the tax deferral qualification requirements provided in the Internal Revenue Code, or any

similar employee benefit plan established under the laws of a foreign jurisdiction;

(iv) A synthetic exposure to the capital of a financial institution to the extent deducted from capital under § 324.22; or

(v) Registered with the SEC under the Investment Company Act of 1940 (15 U.S.C. 80a–1) or foreign equivalents thereof.

* * * * *

■ 47. Redesignate § 324.4 as § 324.6 and § 324.5 as § 324.7.

■ 48. Add § 324.4 to read as follows:

§ 324.4 Threshold Indexing.

(a) *Methodology.* The dollar thresholds specified in paragraph (c) of this section shall be adjusted by multiplying the baseline threshold values specified in paragraph (c) of this section by one plus the cumulative percent change in the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured from the effective date of this rule, as further described in paragraph (b) of this section, and shall be rounded in accordance with paragraph (d) of this section.

(b) *Frequency.* (1) *In general—biennial adjustments.* Except as otherwise provided in paragraph (b)(2) and (b)(3) of this section, the adjustments described in paragraph (a) of this section shall be effective on October 1 following each consecutive two year period ending August 30, and using the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers as of August 30 of that year.

(2) *Off-year adjustments.* In the event that the FDIC determines, during a year where no adjustment would be made under paragraph (b)(1), that the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers, measured over the twelve month period ending August 30 of that year, is such that an adjustment under this section would be appropriate for that year, the FDIC may make an adjustment under this section for that year.

(3) *Periods of negative inflation.* Notwithstanding paragraph (b)(1) or (b)(2) of this section, if an adjustment of dollar thresholds using the cumulative percent change of the non-seasonally adjusted Consumer Price Index for Urban Wage Earners and Clerical Workers from the effective date of this rule or the most recent adjustment, as applicable, would not result in an increase from the current dollar thresholds, no adjustment will be made pursuant to paragraph (a) of this section.

(c) *Specified thresholds.* The thresholds in the following sections shall be adjusted in accordance with paragraph (a) of this section relative to the baseline threshold values as specified below.

(1) Section 324.1(c)(4)(i), baseline threshold value \$50 billion;

(2) Section 324.2, paragraph (4)(i)(A) of the definition of “Financial institution,” baseline threshold value \$10 million;

(3) Section 324.2, definition of “Residential mortgage exposure,” baseline threshold value \$1 million; and

(4) Section 324.61, baseline threshold value \$50 billion.

(d) *Rounding.* When adjusting thresholds under this section, each threshold shall be rounded based on the size of the threshold (e.g., thousands, millions, billions) to the nearest number with two significant digits.

(e) *Effective date of threshold adjustments.* The FDIC shall announce the thresholds adjusted in accordance with this section by publication in the **Federal Register**. Such adjusted thresholds shall be effective on October 1 of the year during which an adjustment is made.

(f) *Failure to publish in the **Federal Register**.* In the event, for any reason, the thresholds adjusted in accordance with this section are not published in the **Federal Register** in a year in which an adjustment is made under this section, the thresholds specified in paragraph (c) of this section will adjust as provided in this section and be effective on October 1, notwithstanding the lack of publication in the **Federal Register**.

* * * * *

■ 49. Add § 324.5 to read as follows:

§ 324.5 Calculation of loan-to-value (LTV) ratio.

(a) *Loan-to-value ratio.* The loan-to-value (LTV) ratio must be calculated as the extension of credit divided by the value of the property.

(b) *Extension of credit.* For purposes of a LTV ratio calculated under this § 324.5, the extension of credit is equal to the total outstanding amount of the loan including any undrawn committed amount of the loan.

(c) *Value of the property.* (1) For purposes of a LTV ratio calculated under this § 324.5, the value of the property is the market value of all real estate properties securing or being improved by the extension of credit plus the amount of any readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 365, subpart A, Appendix A, that

secures the extension of credit, subject to the following:

(i) For exposures subject to 12 CFR part 323, subpart A, the market value of property is a valuation that meets all requirements of that rule.

(ii) For exposures not subject to 12 CFR part 323, subpart A:

(A) The market value of real estate must be obtained from an independent valuation of the property using prudently conservative valuation criteria;

(B) The valuation must be done independently from the FDIC-supervised institution’s origination and underwriting process; and

(C) To ensure that the market value of the real estate is determined in a prudently conservative manner, the valuation must exclude expectations of price increases and must be adjusted downward to account for the potential for the current market price to be significantly above the value that would be sustainable over the life of the loan.

(2) In the case where the exposure includes the financing to purchase the property, the value of the property is the lower of the market value obtained under paragraph (c)(1)(i) or (c)(1)(ii) of this section, as applicable, and the actual acquisition cost.

(3) The value of the property must be measured at the time of origination, except in the following circumstances:

(i) The FDIC requires an FDIC-supervised institution to revise the value of the property downward;

(ii) The value of the property must be adjusted downward due to an extraordinary event that results in a permanent reduction of the property value; or

(iii) The value of the property may be increased to reflect modifications made to the property that increase the market value, as determined according to the requirements in paragraphs (c)(1)(i) or (c)(1)(ii) of this section.

(4) Readily marketable collateral and other acceptable collateral, as defined in 12 CFR part 365, subpart A, Appendix A, must be appropriately discounted by the FDIC-supervised institution consistent with the FDIC-supervised institution’s usual practices for making loans secured by such collateral.

Subpart C—Definition of Capital

■ 50. Amend § 324.22 by:

■ a. Redesignating footnotes 22 through 31 as footnotes 1 through 10, respectively;

■ b. Revising paragraph (b), the heading of paragraph (d), and paragraph (d)(1).

The revisions read as follows:

§ 324.22 Regulatory capital adjustments and deductions.

* * * *

(b) Regulatory adjustments to common equity tier 1 capital.

(1) An FDIC-supervised institution must adjust the sum of common equity tier 1 capital elements pursuant to the requirements set forth in this paragraph (b). Such adjustments to common equity tier 1 capital must be made net of the associated deferred tax effects.

(i) An FDIC-supervised institution that makes an AOCI opt-out election (as defined in paragraph (b)(2) of this section), must make the adjustments required under paragraph (b)(2)(i) of this section.

(ii) An FDIC-supervised institution that is an advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution, and an FDIC-supervised institution that has not made an AOCI opt-out election (as defined in paragraph (b)(2) of this section), must deduct any accumulated net gains and add any accumulated net losses on cash flow hedges included in AOCI that relate to the hedging of items that are not recognized at fair value on the balance sheet.

(iii) An FDIC-supervised institution must deduct any net gain and add any net loss related to changes in the fair value of liabilities that are due to changes in the FDIC-supervised institution's own credit risk. An advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution must deduct the difference between its credit spread premium and the risk-free rate for derivatives that are liabilities as part of this adjustment.

(2) AOCI opt-out election.

(i) An FDIC-supervised institution that is not an advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution may make a one-time election to opt out of the requirement to include all components of AOCI (with the exception of accumulated net gains and losses on cash flow hedges related to items that are not fair-valued on the balance sheet) in common equity tier 1 capital (AOCI opt-out election). An FDIC-supervised institution that makes an AOCI opt-out election in accordance with this paragraph (b)(2) must adjust common equity tier 1 capital as follows:

(A) Subtract any net unrealized gains and add any net unrealized losses on available-for-sale securities;

(B) Subtract any accumulated net gains and add any accumulated net losses on cash flow hedges;

(C) Subtract any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the relevant GAAP standards that pertain to such plans (excluding, at the FDIC-supervised institution's option, the portion relating to pension assets deducted under paragraph (a)(5) of this section); and

(D) Subtract any net unrealized gains and add any net unrealized losses on held-to-maturity securities that are included in AOCI.

(ii) (A) An FDIC-supervised institution that is not an advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution must make its AOCI opt-out election in the Call Report, during the first reporting period after the FDIC-supervised institution is required to comply with subpart A of this part as set forth in § 324.1(f).

(B) Notwithstanding paragraph (b)(ii)(A) of this section, if an FDIC-supervised institution was previously an advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution, the FDIC-supervised institution must make its AOCI opt-out election in the Call Report, during the first reporting period after the FDIC-supervised institution ceased to be an advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution.

(iii) Each depository institution subsidiary of an FDIC-supervised institution that is not an advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution must elect the same option as the FDIC-supervised institution pursuant to paragraph (b)(2) of this section.

(iv) With prior notice to the FDIC, an FDIC-supervised institution resulting from a merger, acquisition, or purchase transaction and that is not an advanced approaches FDIC-supervised institution, Category III FDIC-supervised institution, or Category IV FDIC-supervised institution may make a new AOCI opt-out election in its Call Report filed by the resulting FDIC-supervised institution for the first reporting period after it is required to comply with subpart A of this part as set forth in § 324.1(f) if:

(A) Other than as set forth in paragraph (b)(2)(iv)(C) of this section,

the merger, acquisition, or purchase transaction involved the acquisition or purchase of all or substantially all of either the assets or voting stock of another banking organization that is subject to regulatory capital requirements issued by the Federal Reserve, the FDIC, or the OCC;¹

(B) Prior to the merger, acquisition, or purchase transaction, only one of the banking organizations involved in the transaction made an AOCI opt-out election under this section; and

(C) An FDIC-supervised institution may, with the prior approval of the FDIC, change its AOCI opt-out election under this paragraph (b) in the case of a merger, acquisition, or purchase transaction that meets the requirements set forth at paragraph (b)(2)(iv)(B) of this section, but does not meet the requirements of paragraph (b)(2)(iv)(A) of this section. In making such a determination, the FDIC may consider the terms of the merger, acquisition, or purchase transaction, as well as the extent of any changes to the risk profile, complexity, and scope of operations of the FDIC-supervised institution resulting from the merger, acquisition, or purchase transaction.

* * * *

(d) Certain DTAs subject to common equity tier 1 capital deduction thresholds.

(1) A FDIC institution that is not an advanced approaches FDIC-supervised institution must make deductions from regulatory capital as described in this paragraph (d)(1).

(i) The FDIC-supervised institution must deduct from common equity tier 1 capital elements the amount of DTAs as described in paragraph (d)(1)(ii) of this section that exceeds 25 percent of the sum of the FDIC-supervised institution's common equity tier 1 capital elements, less adjustments to and deductions from common equity tier 1 capital required under paragraphs (a) through (c)(3) of this section (the 25 percent common equity tier 1 capital deduction threshold).⁸

(ii) The FDIC-supervised institution must deduct from common equity tier 1 capital elements the amount of DTAs arising from temporary differences that the FDIC-supervised institution could not realize through net operating loss carrybacks, net of any related valuation allowances and net of DTLs, in accordance with paragraph (e) of this section. An FDIC-supervised institution is not required to deduct from the sum of its common equity tier 1 capital elements DTAs (net of any related valuation allowances and net of DTLs, in accordance with § 324.22(e)) arising

from timing differences that the FDIC-supervised institution could realize through net operating loss carrybacks. The FDIC-supervised institution must risk weight these assets at 100 percent. For an FDIC-supervised institution that is a member of a consolidated group for tax purposes, the amount of DTAs that could be realized through net operating loss carrybacks may not exceed the amount that the FDIC-supervised institution could reasonably expect to have refunded by its parent holding company.

(iii) For purposes of calculating the amount of DTAs subject to deduction pursuant to paragraph (d)(1) of this section, an FDIC-supervised institution may exclude DTAs and DTLs relating to adjustments made to common equity tier 1 capital under paragraph (b) of this section. An FDIC-supervised institution that elects to exclude DTAs relating to adjustments under paragraph (b) of this section also must exclude DTLs and must do so consistently in all future calculations. An FDIC-supervised institution may change its exclusion

preference only after obtaining the prior approval of the FDIC.

* * * * *

¹ These rules include the regulatory capital requirements set forth at 12 CFR part 3 (OCC); 12 CFR part 217 (Board); 12 CFR part 324 (FDIC).

* * * * *

⁸ The amount of the items in paragraph (d)(1) of this section that is not deducted from common equity tier 1 capital must be included in the risk-weighted assets of the FDIC-supervised institution and assigned a 250 percent risk weight.

* * * * *

Subpart D—Risk-Weighted Assets—Standardized Approach

* * * * *

■ 51. In § 324.32:

■ a. Revise paragraph (f)(1);

■ b. Revise paragraph (g);

■ c. Revise paragraph (l)(5).

The revisions read as follows:

§ 324.32 General risk weights.

* * * * *

(f) Corporate exposures.

(1) An FDIC-supervised institution must assign a 95 percent risk weight to all its corporate exposures, except as provided in paragraphs (f)(2) and (f)(3) of this section.

* * * * *

(g) Residential mortgage exposures.

(1) An FDIC-supervised institution must assign a risk weight in accordance with Table 5 to § 324.32 or Table 6 to § 324.32, as applicable, to a first-lien residential mortgage exposure that:

(i) Is secured by a property that is either owner-occupied or rented;

(ii) Is made in accordance with prudent underwriting standards, including relating to the loan amount as a percent of the appraised value of the property;

(iii) Is not 90 days or more past due or carried in nonaccrual status; and

(iv) Is not restructured or modified, provided that a loan modified or restructured solely pursuant to the U.S. Treasury's Home Affordable Mortgage Program is not modified or restructured for purposes of this section.

TABLE 5—RISK WEIGHTS FOR RESIDENTIAL MORTGAGES THAT ARE NOT DEPENDENT ON THE CASH FLOWS GENERATED BY THE REAL ESTATE BASED ON LTV ¹

	LTV ratio ≤50%	50% < LTV ratio ≤60%	60% < LTV ratio ≤80%	80% < LTV ratio ≤90%	90% < LTV ratio ≤100%	LTV ratio >100%
Risk Weight	25	30	35	45	55	75

¹ LTV is calculated in accordance with § 324.5.

TABLE 6—PROPOSED RISK WEIGHTS FOR RESIDENTIAL MORTGAGE EXPOSURES DEPENDENT ON THE CASH FLOWS GENERATED BY THE REAL ESTATE AND BASED ON LTV ¹

	LTV ratio ≤50%	50% < LTV ratio ≤60%	60% < LTV ratio ≤80%	80% < LTV ratio ≤90%	90% < LTV ratio ≤100%	LTV ratio > 100%
Risk Weight	35	40	50	65	80	110

¹ LTV is calculated in accordance with § 324.5.

(2) An FDIC-supervised institution must assign a 100 percent risk weight to a first-lien residential mortgage exposure that does not meet the criteria in paragraph (g)(1) of this section or for which the FDIC-supervised institution cannot calculate the LTV in accordance with 12 CFR 324.5, and to junior-lien residential mortgage exposures.

(3) For the purpose of this paragraph (g), if an FDIC-supervised institution holds the first-lien and junior-lien(s) residential mortgage exposures, and no other party holds an intervening lien, the FDIC-supervised institution must combine the exposures and treat them as a single first-lien residential mortgage exposure.

* * * * *

(l) * * *

(5) An FDIC-supervised institution must assign a 90 percent risk weight to all assets not specifically assigned a different risk weight under this subpart and that are not deducted from tier 1 or tier 2 capital pursuant to § 324.22.

* * * * *

■ 52. Amend § 324.33 by:

■ a. Adding paragraph (a)(5); and

■ b. Revising paragraph (b).

The revisions read as follows:

§ 324.33 Off-balance sheet exposures.

(a) * * *

(5) For purposes of this section, if a commitment does not have an express contractual maximum amount that can be drawn, the committed but undrawn amount of the commitment is equal to the highest total drawn amount over the

period since the commitment was created or the prior 24 months, whichever period is shorter, minus the current drawn amount.

* * * * *

(b) *Credit conversion factors*—

(1) *Zero percent CCF.* An FDIC-supervised institution must apply a zero percent CCF to the unused portion of a commitment that is unconditionally cancelable by the FDIC-supervised institution.

(2) *20 percent CCF.* An FDIC-supervised institution must apply a 20 percent CCF to the amount of self-liquidating trade-related contingent items that arise from the movement of goods, with an original maturity of one year or less.

(3) *40 percent CCF.* An FDIC-supervised institution must apply a 40 percent CCF to commitments, regardless of the maturity of the facility, unless they qualify for a lower or higher CCF.

(4) *50 percent CCF.* An FDIC-supervised institution must apply a 50 percent CCF to the amount of:

(i) Transaction-related contingent items, including performance bonds, bid bonds, warranties, and performance standby letters of credit; and

(ii) Note issuance facilities and revolving underwriting facilities.

(5) *100 percent CCF.* An FDIC-supervised institution must apply a 100 percent CCF to the amount of the following off-balance-sheet items and other similar transactions:

(i) Guarantees;

(ii) Repurchase agreements (the off-balance sheet component of which equals the sum of the current fair values of all positions the FDIC-supervised institution has sold subject to repurchase);

(iii) Credit-enhancing representations and warranties that are not securitization exposures;

(iv) Off-balance sheet securities lending transactions (the off-balance sheet component of which equals the sum of the current fair values of all positions the FDIC-supervised institution has lent under the transaction);

(v) Off-balance sheet securities borrowing transactions (the off-balance sheet component of which equals the sum of the current fair values of all non-cash positions the FDIC-supervised institution has posted as collateral under the transaction);

(vi) Financial standby letters of credit; and

(vii) Forward agreements.

* * * * *

■ 53. Amend § 324.34 by revising paragraph (c)(2) to read as follows:

§ 324.34 Derivative contracts.

* * * * *

(c) * * *

(2) As an alternative to the simple approach, an FDIC-supervised institution using CEM under paragraph (b) of this section may recognize the credit risk mitigation benefits of financial collateral that secures such a contract or netting set if the financial collateral is marked-to-fair value on a daily basis and subject to a daily margin maintenance requirement by applying a risk weight to the uncollateralized portion of the exposure, after adjusting the exposure amount calculated under paragraph (b)(1) or (2) of this section using the collateral haircut approach in § 324.37(e). The FDIC-supervised

institution must substitute the exposure amount calculated under paragraph (b)(1) or (2) of this section for $\Sigma_i E_i$ in the equation in § 324.37(e)(2).

* * * * *

■ 54. Amend § 324.36 by revising paragraph (e) to read as follows:

§ 324.36 Guarantees and credit derivatives: substitution treatment.

* * * * *

(e) *Adjustment for credit derivatives without restructuring as a credit event.*

(1) If an FDIC-supervised institution recognizes an eligible credit derivative that does not include as a credit event a restructuring of the hedged exposure involving forgiveness or postponement of principal, interest, or fees that results in a credit loss event (that is, a charge-off, specific provision, or other similar debit to the profit and loss account), the FDIC-supervised institution must apply the adjustment in paragraph (e)(2) of this section to reduce the effective notional amount of the credit derivative unless:

(i) The terms of the hedged exposure and the reference exposure, if different from the hedged exposure, allow the maturity, principal, coupon, currency, or seniority status of the exposure to be amended outside of receivership, insolvency, liquidation, or similar proceeding only by unanimous consent of all parties; and

(ii) The FDIC-supervised institution has conducted sufficient legal review to conclude with a well-founded basis (and maintains sufficient written documentation of that legal review) that the hedged exposure is subject to the U.S. Bankruptcy Code, the Federal Deposit Insurance Act, or a domestic or foreign insolvency regime with similar features that allow for a company to liquidate, reorganize, or restructure and provides for an orderly settlement of creditor claims.

(2) The FDIC-supervised institution must apply the following adjustment to reduce the effective notional amount of any eligible credit derivative that is subject to adjustment under paragraph (e)(1) of this section:

$$Pr = Pm \times 0.60$$

Where:

- (i) Pr = effective notional amount of the credit risk mitigant, adjusted for lack of restructuring event (and maturity mismatch, if applicable); and
- (ii) Pm = effective notional amount of the credit risk mitigant (adjusted for maturity mismatch, if applicable).

* * * * *

■ 55. Amend § 324.37 to read as follows:

§ 324.37 Collateralized transactions and prepaid credit protection arrangements.

(a) *Financial Collateral.* (1) To recognize the risk-mitigating effects of financial collateral, an FDIC-supervised institution may use:

(i) The simple approach in paragraph (b) of this section; or

(ii) The collateral haircut approach in paragraph (e) of this section for repo-style transactions, eligible margin loans, collateralized derivative contracts, and single-product netting sets of such transactions, subject to paragraph (a)(3) of this section.

(2) An FDIC-supervised institution must use the same approach to recognize the risk-mitigating effects of financial collateral for similar exposures or transactions.

(3) An FDIC-supervised institution that has elected under § 324.34(a)(1)(ii) to use the standardized approach for counterparty credit risk (SA-CCR) for derivative contracts may elect to also use SA-CCR for repo-style transactions that are subject to a qualifying cross-product master netting agreement with derivative contracts, subject to the requirements of paragraph (f) of this section. An FDIC-supervised institution that uses SA-CCR to determine the exposure amount of a derivative contract or netting set may use not the simple approach in paragraph (b) of this section or the collateral haircut approach under paragraph (e) of this section for the exposures for which SA-CCR is used.

(b) *The simple approach*—(1) *General requirements.* To qualify for the simple approach under this paragraph (b), the financial collateral must meet the following requirements:

(i) The collateral must be revalued at least every six months;

(ii) The legal mechanism by which financial collateral is pledged or transferred must be enforceable in the relevant jurisdictions and ensure that the FDIC-supervised institution has the contractual right, as applicable to the characteristics of the financial collateral and exposure, to liquidate or take legal possession of the financial collateral, setoff amounts owed to the obligor against amounts owed to the FDIC-supervised institution and close out any transaction giving rise to the secured exposure, in a timely manner, in the event of the default, insolvency or bankruptcy (or one or more otherwise-defined credit events set out in the transaction documentation) of the obligor; and

(iii) The FDIC-supervised institution must be able to reasonably demonstrate the ability to protect and enforce its

rights in respect of any financial collateral.

(2) *Risk weight substitution.* (i) An FDIC-supervised institution may apply a risk weight to the portion of an exposure that is secured by financial collateral that meets the requirements of paragraph (b) of this section, up to the protection amount of the financial collateral as adjusted by paragraph (d) of this section, based on the risk weight assigned to the collateral under this subpart. For repurchase agreements, reverse repurchase agreements, and securities lending and borrowing transactions, the collateral is the instruments, gold, and cash the FDIC-supervised institution has borrowed, purchased subject to resale, or taken as collateral from the counterparty under the transaction. Except as provided in paragraph (b)(3) of this section, the risk weight assigned to the protected portion of the exposure may not be less than 20 percent.

(ii) An FDIC-supervised institution must apply a risk weight to the amount of an exposure in excess of the protection amount of financial collateral securing the exposure based on the risk weight applicable to the exposure under this subpart.

(3) *Exceptions to the 20 percent risk-weight floor and other requirements.* Notwithstanding paragraph (b)(2)(i) of this section, an FDIC-supervised institution may assign a zero percent risk weight up to the protection amount of the financial collateral where:

(i) The financial collateral is cash on deposit; or

(ii) The financial collateral is an exposure to a sovereign that qualifies for a zero percent risk weight under § 324.32, and the FDIC-supervised institution has discounted the fair value of the collateral by 20 percent.

(c) *Eligible prepaid credit protection arrangements.* (1) *Scope.* An FDIC-supervised institution may recognize the credit risk mitigation benefits of an eligible prepaid credit protection arrangement as provided under this paragraph.

(2) *Application.* This paragraph applies to exposures, including securitization exposures, for which:

(i) Credit risk is fully covered by an eligible prepaid credit protection arrangement; or

(ii) Credit risk is covered on a pro rata basis (that is, on a basis in which the FDIC-supervised institution and the protection provider share losses proportionately) by an eligible prepaid credit protection arrangement.

(3) *Tranching of credit risk.* Exposures on which there is a tranching of credit risk (reflecting at least two different

levels of seniority) generally are securitization exposures subject to § 324.41 through § 324.45.

(4) *Multiple eligible prepaid credit protection arrangements.* If multiple eligible prepaid credit protection arrangements cover a single exposure, an FDIC-supervised institution may treat the hedged exposure as multiple separate exposures each covered by a single eligible credit protection arrangement and may calculate a separate risk-weighted asset amount for each separate exposure as described in paragraph (c)(6) of this section.

(5) *Single eligible credit protection arrangements.* If a single eligible credit protection arrangement covers multiple hedged exposures, an FDIC-supervised institution must treat each hedged exposure as covered by a separate eligible credit protection arrangement and must calculate a separate risk-weighted asset amount for each exposure as described in paragraph (c)(6) of this section.

(6) *Prepaid credit protection arrangements—The substitution approach.* (i) *Full coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the protection amount (P) of the prepaid credit protection arrangement is greater than or equal to the exposure amount of the reference exposure, an FDIC-supervised institution may assign a zero percent risk weight to the reference exposure.

(ii) *Partial coverage.* If an eligible prepaid credit protection arrangement meets the conditions in paragraphs (c)(1) through (5) of this section and the protection amount (P) of the prepaid credit protection arrangement is less than the exposure amount of the reference exposure, the FDIC-supervised institution must treat the reference exposure as two separate exposures (protected and unprotected) in order to recognize the credit risk mitigation benefit of the prepaid credit protection arrangement.

(A) The FDIC-supervised institution may apply a risk-weight of zero percent for the protected exposure.

(B) The FDIC-supervised institution must calculate the risk-weighted asset amount for the unprotected exposure under this subpart D, where the applicable risk weight is that of the unprotected portion of the reference exposure.

(C) The treatment provided in this section is applicable when the credit risk of a reference exposure is covered on a partial pro rata basis and may be applicable when an adjustment is made to the effective notional amount of the

prepaid credit protection arrangement under paragraph (d) of this section.

(d) *Required adjustments—(1)*

Maturity mismatch adjustment. (i) An FDIC-supervised institution that recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section must adjust the amount of credit risk mitigation recognized to reflect any maturity mismatch.

(ii) A maturity mismatch occurs when:

(A) The residual maturity of the legal mechanism by which financial collateral is pledged is less than that of the secured exposure(s); or

(B) The residual maturity of an eligible prepaid credit protection arrangement is less than that of the reference exposure.

(iii) The residual maturity of a secured exposure under paragraph (b) of this section or a reference exposure under paragraph (c) of this section is the longest possible remaining time before the obligated party of the secured exposure or reference exposure is scheduled to fulfill its obligation on the exposure. For purposes of this paragraph (d)(1)(iii):

(A) For an eligible prepaid credit protection arrangement, if the terms of the arrangement include embedded options that may reduce its term, the FDIC-supervised institution (protection purchaser) must adjust the residual maturity. If a call is at the discretion of the protection provider, the residual maturity is at the first call date. If the call is at the discretion of the FDIC-supervised institution (protection purchaser), but the terms of the arrangement at origination contain a positive incentive for the FDIC-supervised institution to cancel the arrangement before contractual maturity, the remaining time to the first call date is the residual maturity.

(B) For financial collateral that is not cash on deposit at the FDIC-supervised institution, but including cash held for the FDIC-supervised institution by a third-party custodian or trustee, the residual maturity of any amount of such financial collateral is the earliest date on which the FDIC-supervised institution's rights in respect of such amount of financial collateral may be terminated without the pledgor being subject to a contemporaneous requirement to pledge additional financial collateral. For financial collateral that is cash on deposit at the FDIC-supervised institution, the residual maturity of any amount of such cash collateral is the earliest date on which a depositor may

withdraw such amount, notwithstanding any notice requirements or early withdrawal fees or penalties.

(iv) The credit risk mitigation benefits of financial collateral or an eligible prepaid credit protection arrangement with a maturity mismatch may be recognized only if the original maturity of the legal mechanism by which financial collateral is pledged or the eligible prepaid credit protection arrangement is greater than or equal to one year and its residual maturity is greater than three months.

(v) When a maturity mismatch exists, the FDIC-supervised institution must apply the following adjustment to reduce the protection amount:

$$P_m = E \times (t - 0.25) / (T - 0.25)$$

Where:

- (A) P_m = fair value of the financial collateral or effective notional amount of the eligible prepaid credit protection arrangement, adjusted for maturity mismatch;
- (B) E = fair value of the financial collateral or effective notional amount of the

eligible prepaid credit protection arrangement;

- (C) t = the lesser of T or the residual maturity of the arrangement, expressed in years; and
- (D) T = the lesser of five or the residual maturity of the secured exposure or reference exposure, expressed in years.

(2) *Currency mismatch adjustment.* (i) If an FDIC-supervised institution recognizes the credit risk mitigation benefits of financial collateral under paragraph (b) of this section or of an eligible prepaid credit protection arrangement under paragraph (c) of this section that is denominated in a currency different from that in which the secured or reference exposure is denominated, the FDIC-supervised institution must apply the following formula to the fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement:

$$P_c = P_r \times (1 - H_{FX})$$

Where:

- (A) P_c = fair value of the financial collateral or the effective notional amount of the

eligible prepaid credit protection arrangement, adjusted for currency mismatch (and maturity mismatch, if applicable);

- (B) P_r = fair value of the financial collateral or the effective notional amount of the eligible prepaid credit protection arrangement (adjusted for maturity mismatch, if applicable); and
- (C) H_{FX} = haircut appropriate for the currency mismatch between the financial collateral and the secured exposure or the eligible prepaid credit protection arrangement and the reference exposure, as determined under paragraphs (d)(2)(ii) through (iii) of this section.

(ii) Subject to paragraph (d)(2)(iii) of this section, an FDIC-supervised institution must set H_{FX} equal to eight percent.

(iii) An FDIC-supervised institution must increase H_{FX} as determined under paragraph (d)(2)(ii) of this section if the FDIC-supervised institution revalues the financial collateral or eligible prepaid credit protection arrangement less frequently than once every 10 business days using the following formula:

$$H_{FX} = 8\% \times \sqrt{\frac{T_M}{10}}, \text{ where } T_M \text{ equals the greater of 10 or the number of business days}$$

between revaluations.

(e) *Collateral haircut approach—Exposure amount for eligible margin loans and repo-style transactions.* (1) *General.* An FDIC-supervised institution may recognize the credit risk mitigation benefits of financial collateral that secures an eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set of eligible margin loans, repo-style

transactions, or collateralized derivative contracts, and of any collateral that secures a repo-style transaction that is included in the FDIC-supervised institution's measure for market risk under subpart F of this part, by using the collateral haircut approach covered in this paragraph (e) of this section.

(2) *Exposure amount calculation.* For purposes of the collateral haircut

approach, an FDIC-supervised institution must determine the exposure amount for an eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set of eligible margin loans, repo-style transactions, or collateralized derivative contracts according to the following formula:

$$E^* = \max \left\{ 0; (\sum_i E_i - \sum_i C_i) + (0.4 \times \text{net}_{\text{exposure}}) + \left(0.6 \times \frac{\text{gross}_{\text{exposure}}}{\sqrt{N}} \right) + \right.$$

$$\left. (\sum_{fx} (E_{fx} \times H_{fx})) \right\} \text{ where:}$$

(i) E^* is the exposure amount of the eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set after credit risk mitigation;

(ii) E_i is:

(A) For eligible margin loans and repo-style transactions and netting sets thereof, the current fair value of the instrument, cash, or gold the FDIC-supervised institution has lent, sold subject to repurchase, or posted as collateral to the counterparty; and

(B) For collateralized derivative contracts and netting sets thereof, the exposure amount

of the OTC derivative contract or netting set calculated under § 324.34(b)(1) or (2);

(iii) C_i is the current fair value of the instrument, cash, or gold the banking organization has borrowed, purchased subject to resale, or taken as collateral from the counterparty;

(iv) $\text{net}_{\text{exposure}} = \sum_s E_s H_s$;

(v) $\text{gross}_{\text{exposure}} = \sum_s E_s |H_s|$;

(vi) E_s is the absolute value of the net position in a given instrument or in gold, where the net position in a given instrument or gold equals the sum of the current fair values of the instrument or gold the FDIC-

supervised institution has lent, sold subject to repurchase, or posted as collateral to the counterparty, minus the sum of the current fair values of that same instrument or gold the FDIC-supervised institution has borrowed, purchased subject to resale, or taken as collateral from the counterparty;

(vii) H_s is the haircut appropriate to E_s , as described in Table 1 to § 324.37, as applicable. H_s has a positive sign if the instrument or gold is net lent, sold subject to repurchase, or posted as collateral to the counterparty; H_s has a negative sign if the instrument or gold is net borrowed,

purchased subject to resale, or taken as collateral from the counterparty;

(viii) N is the number of instruments with a unique Committee on Uniform Securities Identification Procedures (CUSIP) designation or foreign equivalent that the FDIC-supervised institution lends, sells subject to repurchase, posts as collateral, borrows, purchases subject to resale, or takes as collateral in the eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set, including all

collateral that the FDIC-supervised institution elects to include within the credit risk mitigation framework, except that instruments where the value E_s is less than one tenth of the value of the largest E_s in the eligible margin loan, repo-style transaction, collateralized derivative contract, or netting set are not included in the count or gold, with any amount of gold given a value of one;

(ix) E_{fx} is the absolute value of the net position in each currency f_x different from the settlement currency;

(x) H_{fx} is the haircut appropriate for currency mismatch of currency f_x .

(3) *Market price volatility and currency mismatch haircuts.* (i) An FDIC-supervised institution must use the haircuts for market price volatility (H_s) in Table 1 to § 324.37, as adjusted in certain circumstances as provided in paragraphs (e)(3)(iii) through (v) of this section.

TABLE 1 TO § 324.37—MARKET PRICE VOLATILITY HAIRCUTS

Residual maturity	Securities issued by a sovereign or an issuer described in § 324.32(b) ¹ (percent)				Other investment-grade securities (percent)	
	Issuer risk weight of 0%	Issuer risk weight of 20 or 50%	Issuer risk weight of 100%	GSE exposures	Exposures other than GSE exposures or securitization exposures	Senior securitization exposures with risk weight <100%
Debt Securities:						
Less than or equal to 1 year	0.5	1.0	15.0	1.0	2.0	4.0
Greater than 1 year and less than or equal to 3 years	2.0	3.0	15.0	4.0	4.0	12.0
Greater than 3 years and less than or equal to 5 years					6.0	
Greater than 5 years and less than or equal to 10 years	4.0	6.0	15.0	8.0	12.0	24.0
Greater than 10 years					20.0	
Main index equities (including convertible bonds) and gold				20.0		
Other publicly traded equities and convertible bonds				30.0		
Mutual funds and exchange traded funds				Highest haircut applicable to any security in which the fund can invest, unless the banking organization can apply the full look-through approach for equity investments in funds § 324.53(b), in which case the banking organization may use a weighted average of haircuts applicable to the securities held by the fund.		
Cash on deposit				0.0		
Other exposure types ²				30.0		

¹ Includes a foreign PSE that receives a zero percent risk weight.

² Includes senior securitization exposures with a risk weight greater than or equal to 100 percent and sovereign exposures with a risk weight greater than 100 percent.

(ii) For currency mismatches, an FDIC-supervised institution must use a haircut for foreign exchange rate volatility (H_{fx}) of 8.0 percent, as adjusted in certain circumstances under paragraphs (e)(3)(iii) and (iv) of this section.

(iii) For repo-style transactions, an FDIC-supervised institution may multiply the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section by the square root of $\frac{1}{2}$ (which equals 0.707107).

(iv) An FDIC-supervised institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period longer than ten business days for eligible margin loans and derivative contracts that are not client-facing derivative transactions or a holding period longer than five business days for repo-style transactions and client-facing derivative transactions that are not cleared transactions under the following conditions. If the number of trades in a netting set exceeds 5,000 at any time during a quarter, an FDIC-supervised institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a

holding period of twenty business days for the following quarter except in the calculation of exposure amount for purposes of § 324.35. If a netting set contains one or more trades involving illiquid collateral, an FDIC-supervised institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward on the basis of a holding period of twenty business days. If over the two previous quarters more than two margin disputes on a netting set have occurred that lasted longer than the holding period, then the FDIC-supervised institution must adjust the haircuts provided in paragraphs (e)(3)(i) and (ii) of this section upward for that netting set on the basis of a holding period that is at least two times the minimum holding period for that netting set. The FDIC-supervised institution must adjust the haircuts upward using the following formula:

$$H_a = H_s \sqrt{T_m / T_s}$$

Where:

(A) T_m equals a holding period of longer than 10 business days for eligible margin loans and derivative contracts other than client-facing derivative transactions or longer than 5 business days for repo-

style transactions and client-facing derivative transactions;

(B) H_s equals the market price volatility haircut provided in Table 1 to § 324.37 or to the foreign exchange rate volatility haircut provided in paragraph (e)(3)(ii) of this section; and

(C) T_s equals 10 business days for eligible margin loans and derivative contracts other than client-facing derivative transactions or 5 business days for repo-style transactions and client-facing derivative transactions.

(v) If the instruments an FDIC-supervised institution has lent, sold subject to repurchase, or posted as collateral do not meet the definition of financial collateral, the FDIC-supervised institution must use a 30.0 percent haircut for market price volatility (H_s).

(f) *Election to apply SA-CCR to certain repo-style transactions.* (1) An FDIC-supervised institution that elects to determine the exposure amount using SA-CCR for its derivative contracts under paragraph (a)(1)(ii) of § 324.34 may elect under paragraph (a)(3) of this section to use SA-CCR to determine the exposure amount for a set of repo-style transactions and derivative contracts that are subject to a qualifying cross-product master netting agreement. An

FDIC-supervised institution that makes such an election with respect to a qualifying cross-product master netting agreement must make the adjustments described in paragraphs (f)(2) and (3) in

order to determine the exposure amount of the set of repo-style transactions and derivative contracts under SA-CCR.

(2) The exposure amount of a set of transactions subject to a qualifying

cross-product master netting agreement for purposes of (f)(1), *Exposure Amount_{NSCP}*, must be calculated as follows:

Exposure Amount_{NSCP}

$$= (1 - MR_{NSCP})$$

$$* (Exposure Amount_{repo-style transactions} + Exposure Amount_{derivatives})$$

$$+ MR_{NSCP} * Extended SA - CCR Exposure Amount$$

Where:

(i) *Exposure Amount_{repo-style transactions}* is the exposure amount for repo-style transactions in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the collateral haircut approach, under paragraph (e) of this section;

(ii) *Exposure Amount_{derivatives}* is the exposure amount for derivatives in the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the standardized approach to counterparty credit risk, under § 324.132(c)(5);

(iii) *Extended SA-CCR Exposure Amount* is the exposure amount for both repo-style transactions and derivatives that are in

the netting set that is subject to a qualifying cross-product master netting agreement, calculated using the standardized approach to counterparty credit risk, under § 324.132(c)(5); and
(iv) *MR_{NSCP}* is the Maturity Ratio for a given netting set that is subject to a qualifying cross-product master netting agreement, calculated as follows:

MR_{NSCP}

$$= \frac{\sum NAWM \text{ of the repo - style transactions}_i}{\max (\sum NAWM \text{ of the repo - style transactions}_i, \sum NAWM \text{ of the derivative transactions}_i)}$$

Where:

(A) $\sum NAWM \text{ of the repo-style transactions}_i$ is the notional average weighted maturity of all i repo-style transactions subject to the qualifying cross-product master netting agreement, subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.

(B) $\sum NAWM \text{ of the derivative transactions}_i$ is the notional average weighted maturity of all i derivative transactions subject to the qualifying cross-product master netting agreement subject to a minimum maturity of 10 business days and a maximum maturity of one year for purposes of this calculation.

(3) For purposes of applying SA-CCR to a repo-style transaction, the FDIC-supervised must make the adjustments described in paragraphs (f)(3)(i) through (iii) of this section.

(i) For purposes of this section, the FDIC-supervised institution must:

(A) Treat a repo-style transaction that has multiple underlying instruments as separate repo-style transactions for each distinct underlying instrument;

(B) Treat a repo-style transaction with a debt instrument as the underlying instrument as either a credit derivative that references the underlying debt

instrument or an interest rate derivative that references the interest rate of the underlying debt instrument, based on the primary risk factor of the repo-style transaction;

(C) Treat a repo-style transaction with an equity instrument as the underlying instrument as an equity derivative that references the underlying equity instrument;

(D) Not apply paragraph (c)(4) of § 324.132 to a repo-style transaction with an equity instrument as the underlying instrument; and

(E) Treat a repo-style transaction as a client-facing derivative transaction where the FDIC-supervised institution is either acting as a financial intermediary and enters into an offsetting transaction with a qualifying central counterparty (QCCP) or where the FDIC-supervised institution provides a guarantee on the performance of a client on a transaction between the client and a QCCP.

(ii) For purposes of the supervisory delta under paragraph (c)(9)(iii) of § 324.132, an FDIC-supervised institution must use a supervisory delta of 1 for a repurchase transaction or a securities lending transaction, and must use a supervisory delta of -1 for a

reverse repurchase transaction or a securities borrowing transaction;

(iii) For purposes of the maturity factor under paragraph (c)(9)(iv) of § 324.132, MPOR cannot be less than five business days plus the periodicity of re-margining expressed in business days minus one business day.

* * * * *

■ 56. Amend § 324.41 to read as follows:

§ 324.41 Operational criteria for recognizing the transfer of risk.

(a) *Operational criteria for traditional securitizations.* An FDIC-supervised institution that transfers exposures it has originated or purchased to a third party in connection with a traditional securitization may exclude the exposures from the calculation of its risk-weighted assets only if each condition in this section is satisfied. An FDIC-supervised institution that meets these conditions must hold risk-based capital against any credit risk it retains in connection with the securitization. An FDIC-supervised institution that fails to meet these conditions must hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from

common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO strip that does not constitute after-tax gain-on-sale. If the transferred exposures are in connection with a resecuritization and all of the conditions in this paragraph (a) are satisfied, the FDIC-supervised institution must exclude the exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the resecuritization. The conditions are:

(1) The exposures are not reported on the FDIC-supervised institution's consolidated balance sheet under GAAP;

(2) The FDIC-supervised institution has transferred to one or more third parties credit risk associated with the underlying exposures;

(3) Any clean-up calls relating to the securitization are eligible clean-up calls; and

(4) The securitization does not:

(i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and

(ii) Contain an early amortization provision.

(b) *Operational criteria for synthetic securitizations.* For synthetic securitizations, an FDIC-supervised institution may recognize for risk-based capital purposes the use of a credit risk mitigant to hedge underlying exposures only if each condition in this paragraph (b) is satisfied. An FDIC-supervised institution that meets these conditions must hold risk-based capital against any credit risk of the exposures it retains in connection with the synthetic securitization. An FDIC-supervised institution that fails to meet these conditions or chooses not to recognize the credit risk mitigant for purposes of this section must instead hold risk-based capital against the underlying exposures as if they had not been synthetically securitized. If the synthetic securitization is a resecuritization and all of the conditions in this paragraph (b) are satisfied, the FDIC-supervised institution must exclude the underlying securitization exposures from the calculation of its risk-weighted assets and must hold risk-based capital against any credit risk it retains in connection with the resecuritization. The conditions are:

(1) The credit risk mitigant is:

(i) Financial collateral;

(ii) A guarantee that meets all criteria as set forth in the definition of "eligible guarantee" in § 324.2, except for the

criteria in paragraph (3) of that definition;

(iii) A credit derivative that is not an nth-to-default credit derivative and that meets all criteria as set forth in the definition of "eligible credit derivative" in § 324.2, except for the criteria in paragraph (3) of the definition of "eligible guarantee" in § 324.2; or

(iv) A prepaid credit protection arrangement that meets all criteria as set forth in the definition of "eligible prepaid credit protection arrangement" in § 324.2, except for the criteria in paragraph (3) of that definition.

(2) The FDIC-supervised institution transfers credit risk associated with the underlying exposures to one or more third parties, and the terms and conditions in the credit risk mitigants employed do not include provisions that:

(i) Allow for the termination of the credit protection due to deterioration in the credit quality of the underlying exposures;

(ii) Require the FDIC-supervised institution to alter or replace the underlying exposures to improve the credit quality of the underlying exposures;

(iii) Increase the FDIC-supervised institution's cost of credit protection in response to deterioration in the credit quality of the underlying exposures;

(iv) Increase the yield payable to parties other than the FDIC-supervised institution in response to a deterioration in the credit quality of the underlying exposures; or

(v) Provide for increases in a retained first loss position or credit enhancement provided by the FDIC-supervised institution after the inception of the securitization;

(3) The FDIC-supervised institution obtains a well-reasoned opinion from legal counsel that confirms the enforceability of the credit risk mitigant in all relevant jurisdictions;

(4) Any clean-up calls relating to the securitization are eligible clean-up calls;

(5) No synthetic excess spread is permitted within the synthetic securitization;

(6) Any applicable minimum payment threshold for the credit risk mitigant is consistent with standard market practice; and

(7) The securitization does not:

(i) Include one or more underlying exposures in which the borrower is permitted to vary the drawn amount within an agreed limit under a line of credit; and

(ii) Contain an early amortization provision.

(c) *Due diligence requirements for securitization exposures.* (1) Except for

exposures that are deducted from common equity tier 1 capital and exposures subject to § 324.43(h), if an FDIC-supervised institution is unable to demonstrate to the satisfaction of the FDIC a comprehensive understanding of the features of a securitization exposure that would materially affect the performance of the exposure, the FDIC-supervised institution must assign the securitization exposure a risk weight of 1,250 percent. The FDIC-supervised institution's analysis must be commensurate with the complexity of the securitization exposure and the materiality of the exposure in relation to its capital.

(2) An FDIC-supervised institution must demonstrate its comprehensive understanding of a securitization exposure under paragraph (c)(1) of this section, for each securitization exposure by:

(i) Conducting an analysis of the risk characteristics of a securitization exposure prior to acquiring the exposure, and documenting such analysis within 3 business days after acquiring the exposure, considering:

(A) Structural features of the securitization that would materially impact the performance of the exposure, for example, the contractual cash flow waterfall, waterfall-related triggers, credit enhancements, liquidity enhancements, fair value triggers, the performance of organizations that service the exposure, and deal-specific definitions of default;

(B) Relevant information regarding—

(1) The performance of the underlying credit exposure(s), for example, the percentage of loans 30, 60, and 90 days past due; default rates; prepayment rates; loans in foreclosure; property types; occupancy; average credit score or other measures of creditworthiness; average LTV ratio; and industry and geographic diversification data on the underlying exposure(s); and

(2) For resecuritization exposures, in addition to the information described in paragraph (c)(2)(i)(B)(1) of this section, performance information on the underlying securitization exposures, which may include the issuer name and credit quality, and the characteristics and performance of the exposures underlying the securitization exposures; and

(C) Relevant market data of the securitization, for example, bid-ask spread, most recent sales price and historic price volatility, trading volume, implied market rating, and size, depth and concentration level of the market for the securitization; and

(ii) On an on-going basis (no less frequently than quarterly), evaluating,

reviewing, and updating as appropriate the analysis required under paragraph (c)(1) of this section for each securitization exposure.

* * * * *

■ 57. Amend § 324.42 to read as follows:

§ 324.42 Exposure amount of a securitization exposure.

(a) *On-balance sheet securitization exposure.* (1) The exposure amount of an on-balance sheet securitization exposure (excluding an available-for-sale or held-to-maturity security where the FDIC-supervised institution has made an AOCI opt-out election under § 324.22(b)(2), a repo-style transaction, eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative) is equal to the FDIC-supervised institution's carrying value of the exposure. For a credit derivative, an FDIC-supervised institution must apply § 324.43(i) or (j), as applicable.

(2) The exposure amount of an on-balance sheet securitization exposure that is an available-for-sale or held-to-maturity security held by an FDIC-supervised institution that has made an AOCI opt-out election under § 324.22(b)(2) is the Board-regulated institution's carrying value (including net accrued but unpaid interest and fees), less any net unrealized gains on the exposure and plus any net unrealized losses on the exposure.

(b) *Off-balance sheet securitization exposure.* Except as provided in § 324.43(h), the exposure amount of an off-balance sheet securitization exposure that is not a repo-style transaction, eligible margin loan, OTC derivative contract (other than a credit derivative), or cleared transaction (other than a credit derivative) is the notional amount of the exposure. For an off-balance sheet securitization exposure to an ABCP program, such as an eligible ABCP liquidity facility, the notional amount may be reduced to the maximum potential amount that the FDIC-supervised institution could be required to fund given the ABCP program's current underlying assets (calculated without regard to the current credit quality of those assets).

(c) *Repo-style transaction, eligible margin loan, OTC derivative contract that is not a credit derivative, or cleared transaction that is not a credit derivative.* The exposure amount of a securitization exposure that is a repo-style transaction, eligible margin loan, or OTC derivative contract (other than a credit derivative) is the exposure amount as calculated in accordance with §§ 324.34 or 324.37, or § 324.33 as applicable, and the exposure amount of

a securitization exposure that is a cleared transaction that is not a credit derivative is the exposure amount as calculated in § 324.35.

* * * * *

■ 58. Amend § 324.43 to read as follows:

§ 324.43 Risk-weighted assets for securitization exposures.

(a) *General approach.* Except as provided elsewhere in this section and in § 324.41:

(1) An FDIC-supervised institution may, subject to the limitation under paragraph (e) of this section, apply the securitization standardized approach (SEC-SA) in § 324.44 to the exposure if the exposure meets the following requirements:

(i) The FDIC-supervised institution has accurate information on *A*, *D*, *W*, and *K_G* (as defined in § 324.44) for the exposure. Data used to assign the parameters described in this paragraph (a)(1)(i) must be the most currently available data. If the contracts governing the underlying exposures of the securitization require payments on a monthly or quarterly basis, the data used to assign the parameters described in this paragraph (a)(1)(i) must be no more than 91 calendar days old.

(ii) The FDIC-supervised institution has accurate information regarding whether the exposure is a resecuritization exposure.

(2) If the securitization exposure is an interest rate derivative contract, an exchange rate derivative contract, or a cash collateral account related to an interest rate or exchange rate derivative contract, the FDIC-supervised institution must assign a risk weight to the exposure equal to the risk weight of a securitization exposure that is *pari passu* to the interest rate derivative contract or exchange rate derivative contract or, if such an exposure does not exist, the risk weight of any subordinate securitization exposure.

(3) If the FDIC-supervised institution cannot apply, or chooses not to apply, the securitization standardized approach in § 324.44, the FDIC-supervised institution must apply a 1,250 percent risk weight to the exposure.

(b) *Total risk-weighted assets for securitization exposures.* An FDIC-supervised institution's total risk-weighted assets for securitization exposures equals the sum of the risk-weighted asset amount for securitization exposures that the FDIC-supervised institution risk weights under §§ 324.43 through 324.45, as applicable.

(c) *After-tax gain-on-sale resulting from a securitization.* Notwithstanding any other provision of this subpart, an

FDIC-supervised institution must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from a securitization as well as the portion of a CEIO that does not constitute an after-tax gain-on-sale.

(d) *Overlapping exposures.* (1) If an FDIC-supervised institution has multiple securitization exposures that provide duplicative coverage to the underlying exposures of a securitization (such as when an FDIC-supervised institution provides a program-wide credit enhancement and multiple pool-specific liquidity facilities to an ABCP program), the FDIC-supervised institution is not required to hold duplicative risk-based capital against the overlapping position. Instead, the FDIC-supervised institution may apply to the overlapping position the applicable risk-based capital treatment that results in the highest risk-based capital requirement.

(2) If an FDIC-supervised institution has two or more securitization exposures that partially overlap with each other, the FDIC-supervised institution may treat the exposures as overlapping and apply the treatment under paragraph (d)(1). For purposes of such a treatment under this paragraph (d)(2), the FDIC-supervised institution must include in expanded total risk-weighted assets the risk-weighted asset amount for a hypothetical securitization exposure that would fully overlap with all of the partially overlapping exposures.

(3) If an FDIC-supervised institution has a securitization exposure under this subpart that is an overlapping exposure with a securitization exposure that is a market risk covered position under subpart F of this part, the FDIC-supervised institution may assign to the overlapping securitization exposure the applicable risk-based capital treatment under either this subpart or subpart F, whichever results in the highest risk-based capital requirement.

(e) *Implicit support.* If an FDIC-supervised institution provides support to a securitization in excess of the FDIC-supervised institution's contractual obligation to provide credit support to the securitization:

(1) The FDIC-supervised institution must calculate a risk-weighted asset amount for underlying exposures associated with the securitization as if the exposures had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the securitization and any portion of a CEIO strip that does not constitute after-tax gain-on-sale; and

(2) The FDIC-supervised institution must disclose publicly:

(i) That it has provided implicit support to the securitization; and

(ii) The risk-based capital impact to the FDIC-supervised institution of providing such implicit support.

(f) *Undrawn portion of a servicer cash advance facility.*

(1) Notwithstanding any other provision of this subpart, an FDIC-supervised institution that is a servicer under an eligible servicer cash advance facility is not required to hold risk-based capital against potential future cash advance payments that it may be required to provide under the contract governing the facility.

(2) For an FDIC-supervised institution that acts as a servicer, the exposure amount for a servicer cash advance facility that is not an eligible servicer cash advance facility is equal to the amount of all potential future cash advance payments that the FDIC-supervised institution may be contractually required to provide during the subsequent 12 month period under the contract governing the facility.

(g) *Interest-only mortgage-backed securities.* Notwithstanding any other provision of this subpart, the risk weight for a non-credit-enhancing interest-only mortgage-backed security may not be less than 100 percent.

(h) *Small-business loans and leases on personal property transferred with retained contractual exposure.*

(1) Regardless of any other provision of this subpart, an FDIC-supervised institution that has transferred small-business loans and leases on personal property (small-business obligations) with recourse must include in risk-weighted assets only its contractual exposure to the small-business obligations if all the following conditions are met:

(i) The transaction must be treated as a sale under GAAP.

(ii) The FDIC-supervised institution establishes and maintains, pursuant to GAAP, a non-capital reserve sufficient to meet the FDIC-supervised institution's reasonably estimated liability under the contractual obligation.

(iii) The small-business obligations are to businesses that meet the criteria for a small-business concern established by the Small Business Administration under section 3(a) of the Small Business Act (15 U.S.C. 632 *et seq.*); and

(iv) The FDIC-supervised institution is well capitalized for purposes of the Prompt Corrective Action framework (12 U.S.C. 1831o). For purposes of determining whether an FDIC-supervised institution is well capitalized for purposes of this paragraph (h), the FDIC-supervised

institution's capital ratios must be calculated without regard to the capital treatment for transfers of small-business obligations under this paragraph (h).

(2) The total outstanding amount of contractual exposure retained by an FDIC-supervised institution on transfers of small-business obligations receiving the capital treatment specified in paragraph (h)(1) of this section cannot exceed 15 percent of the FDIC-supervised institution's total capital.

(3) If an FDIC-supervised institution ceases to be well capitalized under subpart H of this part or exceeds the 15 percent capital limitation provided in paragraph (h)(2) of this section, the capital treatment specified in paragraph (h)(1) of this section will continue to apply to any transfers of small-business obligations with retained contractual exposure that occurred during the time that the FDIC-supervised institution was well capitalized and did not exceed the capital limit.

(4) The risk-based capital ratios of the FDIC-supervised institution must be calculated without regard to the capital treatment for transfers of small-business obligations specified in paragraph (h)(1) of this section for purposes of:

(i) Determining whether an FDIC-supervised institution is adequately capitalized, undercapitalized, significantly undercapitalized, or critically undercapitalized under subpart H of this part; and

(ii) Reclassifying a well-capitalized FDIC-supervised institution to adequately capitalized and requiring an adequately capitalized FDIC-supervised institution to comply with certain mandatory or discretionary supervisory actions as if the FDIC-supervised institution were in the next lower prompt-corrective-action category.

(i) *Nth-to-default credit derivatives—*

(1) *Protection provider.* An FDIC-supervised institution providing protection through a first-to-default or second-or-later-to-default derivative is subject to capital requirements on such instruments under this paragraph (i)(1).

(i) *First-to-default.* For first-to-default derivatives, an FDIC-supervised institution must aggregate by simple summation the risk weights of the assets covered up to a maximum of 1,250 percent and multiply by the nominal amount of the protection provided by the credit derivative to obtain the risk-weighted asset amount.

(ii) *Nth-to-default.* For second-or-later-to-default derivatives, in aggregating the risk weights, an FDIC-supervised institution may exclude the asset with the lowest risk-weighted amount from the risk-weighted capital calculation. This risk-based capital

treatment applies for nth-to-default derivatives for which the n-1 assets with the lowest risk-weighted amounts can be excluded from the risk-weighted capital calculation.

(2) *Protection purchaser.* An FDIC-supervised institution is not permitted to recognize purchased protection in the form of an nth-to-default credit derivative as a credit risk mitigant. An FDIC-supervised institution must calculate the counterparty credit risk of a purchased nth-to-default credit derivative under § 324.34.

(j) *Guarantees, credit derivatives other than nth-to-default credit derivatives, and prepaid credit protection arrangements—*(1) *Protection provider.* For a guarantee, credit derivative (other than an nth-to-default credit derivative), or prepaid credit protection arrangement provided by an FDIC-supervised institution that covers the full amount or a pro rata share of a securitization exposure's principal and interest, the FDIC-supervised institution must risk weight the guarantee, credit derivative, or prepaid credit protection arrangement under paragraph (a) of this section as if it held the portion of the securitization exposure covered by the guarantee, credit derivative, or prepaid credit protection arrangement.

(2) *Protection purchaser.* (i) An FDIC-supervised institution that purchases a credit derivative (other than an nth-to-default credit derivative) that is recognized under § 324.45 as a credit risk mitigant (including via recognized collateral) is not required to compute a separate counterparty credit risk capital requirement under § 324.34.

(ii) If an FDIC-supervised institution cannot, or chooses not to, recognize protection purchased in the form of a credit derivative as a credit risk mitigant under § 324.45, the FDIC-supervised institution must determine the exposure amount of the credit derivative under § 324.34.

(A) If the FDIC-supervised institution purchases credit protection from a counterparty the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, the FDIC-supervised institution must determine the risk weight for the exposure according to § 324.32.

(B) If the FDIC-supervised institution purchases credit protection from a counterparty the activities of which are limited to those appropriate for the specific purpose of holding the underlying exposures of a securitization, the FDIC-supervised institution must determine the risk

weight for the exposure according to this section.

(k) *Look-through approach.* (1) Subject to paragraph (k)(2) of this section, an FDIC-supervised institution may assign a risk weight to a senior securitization exposure that is not a resecuritization exposure equal to the greater of:

(i) The weighted-average risk weight, calculated without reference to, or the use of, the risk weight under § 324.52(b)(3)(iii), of all the underlying exposures where the weight for each exposure in the weighted-average calculation is determined by the unpaid principal amount of the exposure; and

(ii) 15 percent.

(2) An FDIC-supervised institution may assign a risk weight under this

paragraph (k) only if the FDIC-supervised institution has knowledge of the composition of all of the underlying exposures.

(l) *NPL securitization.*

Notwithstanding any other provision of this subpart except for paragraph (e) of this section:

(1) If the nonrefundable purchase price discount for the NPL securitization is greater than or equal to 50 percent of the unpaid principal balance of the pool of exposures, the risk weight for a senior securitization exposure to an NPL securitization is 100 percent.

(2) If the FDIC-supervised institution is an originating FDIC-supervised institution with respect to the NPL

securitization, the FDIC-supervised institution may hold risk-based capital against the transferred exposures as if they had not been securitized and must deduct from common equity tier 1 capital any after-tax gain-on-sale resulting from the transaction and any portion of a CEIO that does not constitute an after-tax gain-on-sale.

* * * * *

■ 59. Amend § 324.44 to read as follows:

§ 324.44 Securitization standardized approach (SEC-SA).

(a) *In general.* The risk weight RW_{SEC-SA} assigned to a securitization exposure, or portion of a securitization exposure, is calculated according to the following formula:

$$RW_{SEC-SA} = \begin{cases} \max(RW_{FLOOR}, 1,250\% \cdot K_{SEC-SA}), & K_A \leq A \\ \max\left(RW_{FLOOR}, \left(\frac{K_A - A}{D - A}\right) \cdot 1,250\% + \left(\frac{D - K_A}{D - A}\right) \cdot 1,250\% \cdot K_{SEC-SA}\right), & A < K_A < D \\ 1,250\%, & D \leq K_A \end{cases}$$

Where:

- (1) K_A is calculated under paragraph (b) of this section;
- (2) A (attachment point) equals the greater of zero and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of underlying exposures that are subordinated to the exposure of the FDIC-supervised institution to the current dollar amount of the underlying exposures, as adjusted

in accordance with paragraph (a)(6) of this section;

- (3) D (detachment point) equals the greater of zero and the sum of parameter A and the ratio, expressed as a decimal value between zero and one, of the current dollar amount of the securitization exposures that are ranked senior or pari passu with the exposure (that is, have equal seniority with respect to credit risk) to the current dollar amount of the

underlying exposures, as adjusted in accordance with paragraph (a)(6) of this section;

- (4) RW_{FLOOR} equals 100 percent for resecuritization exposures and NPL securitization exposures and 15 percent for all other securitization exposures; and
- (5) K_{SEC-SA} is calculated according to the following formula:

$$K_{SEC-SA} = \frac{e^{a \cdot u} - e^{a \cdot l}}{a \cdot (u - l)}$$

Where:

(i) a equals $-\frac{1}{p \cdot K_A}$ (as K_A is defined in this paragraph (a)), where p equals 1.5 for a

resecuritization exposure and 0.5 for all other securitization exposures;

- (ii) u equals $D - K_A$ (as D and K_A are defined in paragraph (a) of this section);
- (iii) l equals $\max(A - K_A, 0)$ (as A and K_A are defined in paragraph (a) of this section); and
- (iv) e equals the base of the natural logarithm.

(6) An FDIC-supervised institution must include in the calculation of A and D the funded portion of any reserve account funded by the accumulated cash flows from the underlying exposures that is subordinated to the

FDIC-supervised institution's securitization exposure. Interest rate derivative contracts, exchange rate derivative contracts, and cash collateral accounts related to these contracts must not be included in the calculation of A

and *D*. If the securitization exposure includes a nonrefundable purchase price discount, the nonrefundable purchase price discount must be included in the numerator and denominator of *A* and *D*.

(b) *Calculation of K_A* . K_A is calculated under this paragraph (b) according to the following formula:

$$K_A = (1 - W) \cdot K_G + (W \cdot 0.5)$$

Where:

- (1) *W* equals the ratio, expressed as a decimal value between zero and one, of the sum of the dollar amounts of any underlying exposures of the securitization that are not securitization exposures and that meet any of the criteria in paragraphs (b)(1)(i) through (vii) of this section to the outstanding balance, measured in dollars, of all underlying exposures:
 - (i) Ninety days or more past due;
 - (ii) Subject to a bankruptcy or insolvency proceeding;
 - (iii) In the process of foreclosure;
 - (iv) Held as real estate owned;
 - (v) Has contractually deferred payments for 90 days or more, other than principal or interest payments deferred on:
 - (A) Federally guaranteed student loans, in accordance with the terms of those guarantee programs; or
 - (B) Consumer loans, including non-federally guaranteed student loans, provided that such payments are deferred pursuant to provisions included in the contract at the time funds are disbursed that provide for period(s) of deferral that are not initiated based on changes in the creditworthiness of the borrower; or
 - (vi) Is in default; and
 - (vii) Notwithstanding paragraphs (1)(i) through (vi) of this paragraph, an exposure that is directly and unconditionally guaranteed by the U.S. Government, its central bank, or a U.S. Government agency may be excluded from the calculation of *W* up to the amount of the guarantee; and
- (2) K_G equals the weighted average (with unpaid principal used as the weight for each credit exposure and fair value used for each equity exposure) total capital requirement, expressed as a decimal value between zero and one, of the underlying exposures calculated using this subpart D (that is, an average risk weight of 100 percent represents a value of K_G equal to 0.08), as adjusted in accordance with this paragraph (b)(2). For purposes of K_G , the determination of the capital requirement associated with an underlying exposure that is an equity exposure cannot use the risk weight under § 324.52(b)(3)(iii). For interest rate derivative contracts and exchange rate derivative contracts, the positive current exposure times the risk weight of the counterparty multiplied by 0.08 must be included in the numerator of K_G but must be excluded from the denominator of K_G .

* * * * *

■ 60. Amend § 324.45 by:

■ a. Adding paragraphs (a)(3) and (a)(4).

■ b. Revising paragraph (b).

The additions and revisions read as follows:

§ 324.45 Recognition of credit risk mitigants for securitization exposures.

* * * * *

(3) If the recognized credit risk mitigant hedges a portion of the FDIC-supervised institution's securitization exposure, the FDIC-supervised institution must calculate its capital requirements for the hedged and unhedged portions of the exposure separately. For each unhedged portion, the FDIC-supervised institution must calculate capital requirements according to § 324.42 and § 324.43. For each hedged portion, the FDIC-supervised institution may recognize the credit risk mitigant under § 324.36 or § 324.37, but only as provided in this section.

(4) When an FDIC-supervised institution purchases or sells credit protection on a portion of a senior tranche, the lower-priority portion, whether hedged or unhedged, must be considered a non-senior securitization exposure.

(b) *Mismatches*. An FDIC-supervised institution must make any applicable adjustment to the protection amount as required in § 324.36 for any hedged securitization exposure. In the context of a synthetic securitization, when a credit risk mitigant described in § 324.41(b)(1)(ii) through (iv) covers multiple hedged exposures that have different residual maturities, the FDIC-supervised institution must use the longest residual maturity of any of the hedged exposures as the residual maturity of all hedged exposures.

* * * * *

■ 61. Revise § 324.51(b)(4) to read as follows:

§ 324.51 Introduction and exposure measurement.

* * * * *

(b) * * *

(4) For a commitment to acquire an equity exposure (an equity commitment), the effective notional principal amount of the exposure is multiplied by the following conversion factors (CFs):

(i) Conditional equity commitments receive a 40 percent conversion factor.

(ii) Unconditional equity commitments receive a 100 percent conversion factor.

* * * * *

■ 62. Revise § 324.61 to read as follows:

§ 324.61 Purpose and scope.

Sections 324.61 through 324.63 of this subpart establish public disclosure requirements related to the capital

requirements described in subpart B of this part for an FDIC-supervised institution with total consolidated assets of \$50 billion, as adjusted pursuant to § 324.4, or more as reported on the FDIC-supervised institution's most recent year-end Call Report that is not an advanced approaches FDIC-supervised institution making public disclosures pursuant to § 324.172. An advanced approaches FDIC-supervised institution that has not received approval from the FDIC to exit parallel run pursuant to § 324.121(d) is subject to the disclosure requirements described in §§ 324.62 and 324.63. An FDIC-supervised institution with total consolidated assets of \$50 billion, as adjusted pursuant to § 324.4, or more as reported on the FDIC-supervised institution's most recent year-end Call Report that is not an advanced approaches FDIC-supervised institution making public disclosures subject to § 324.172 must comply with § 324.62 unless it is a consolidated subsidiary of a bank holding company, savings and loan holding company, or depository institution that is subject to the disclosure requirements of § 324.62 or a subsidiary of a non-U.S. banking organization that is subject to comparable public disclosure requirements in its home jurisdiction. For purposes of this section, total consolidated assets are determined based on the average of the FDIC-supervised institution's total consolidated assets in the four most recent quarters as reported on the Call Report; or the average of the FDIC-supervised institution's total consolidated assets in the most recent consecutive quarters as reported quarterly on the FDIC-supervised institution's Call Report if the FDIC-supervised institution has not filed such a report for each of the most recent four quarters.

* * * * *

■ 63. Amend § 324.300 by revising paragraph (a) to read as follows:

§ 324.300 Transitions.

(a) *Transition adjustments for AOCI*. Beginning [January 1, 2027], a Category III FDIC-supervised institution or a Category IV FDIC-supervised institution that had made an AOCI opt-out election under § 324.22(b)(2) effective [December 31, 2026], must subtract from the sum of its common equity tier 1 elements, before making deductions required under § 324.22(c) or (d), the transition AOCI adjustment amount multiplied by the percentage provided in Table 1 to § 324.300. The transition AOCI adjustment amount is the sum of:

(1) Net unrealized gains or losses on available-for-sale securities, plus

(2) Accumulated net gains or losses on cash flow hedges, plus

(3) Any amounts recorded in AOCI attributed to defined benefit postretirement plans resulting from the initial and subsequent application of the

relevant GAAP standards that pertain to such plans, plus

(4) Net unrealized holding gains or losses on held-to-maturity securities that are included in AOCI.

TABLE 1 TO § 324.300

Transition AOCI adjustment	
Transition period	Percentage applicable to transition AOCI adjustment amount
January 1, 2027 to December 31, 2027	100
January 1, 2028 to December 31, 2028	80
January 1, 2029 to December 31, 2029	60
January 1, 2030 to December 31, 2030	40
January 1, 2031 to December 31, 2031	20
January 1, 2032 and thereafter	0

Improving Wage Protections for the Temporary and Permanent
Employment of Certain Foreign Nationals in the United States; Proposed
Rule

DEPARTMENT OF LABOR**Employment and Training
Administration****20 CFR Parts 655 and 656**

[DOL Docket No. ETA–2026–0001]

RIN 1205–AC30

**Improving Wage Protections for the
Temporary and Permanent
Employment of Certain Foreign
Nationals in the United States****AGENCY:** Employment and Training
Administration, Department of Labor.**ACTION:** Notice of proposed rulemaking
(NPRM).

SUMMARY: The Department of Labor (DOL or the Department) is issuing this Notice of Proposed Rulemaking (NPRM) to solicit comments and public input regarding its proposal to revise Employment and Training Administration (ETA) regulations governing the prevailing wages for employment opportunities that United States (U.S.) employers seek to fill with alien workers on a permanent or temporary basis through certain EB–2 and EB–3 employment-based immigrant visas via the Permanent Labor Certification (PERM) program or through H–1B, H–1B1, or E–3 nonimmigrant visas. Specifically, DOL is proposing to amend its regulations governing the PERM program and Labor Condition Applications (LCAs) to incorporate changes to the computation of wage levels under the Department's four-tiered prevailing wage structure based on the Occupational Employment and Wage Statistics (OEWS) wage survey administered by the Department's Bureau of Labor Statistics (BLS). These proposed revisions aim to better align prevailing wage levels with the wages paid to U.S. workers who are similarly employed in the occupation and area of intended employment. The Department's proposed revisions also seek to strengthen program integrity by reducing the incentive for employers to use these programs to replace, rather than supplement, U.S. workers by employing lower-paid alien workers. In addition, the revision would enable the Department to more effectively ensure that the employment of immigrant and nonimmigrant workers admitted or otherwise provided one of the covered statuses does not adversely affect the wages and working conditions of U.S. workers.

DATES: Interested persons are invited to submit written comments on this

proposed rule on or before May 26, 2026.

ADDRESSES: You may submit comments electronically by the following method:

Federal eRulemaking Portal: <https://www.regulations.gov>. Follow the instructions on the website for submitting comments. A plain language summary of the proposed rule is also available on that website.

Instructions: Comments should be confined to issues pertinent to the NPRM, identify the agency's name and public docket number ETA–2026–0001, explain the reasons for any recommended changes, and reference the specific section and wording being addressed, where possible.

Please be advised that the Department will post comments that relate to this NPRM to <https://www.regulations.gov>, including any personal information provided. The <https://www.regulations.gov> website is the Federal e-Rulemaking Portal and all comments posted there are available and accessible to the public. Please do not submit comments containing trade secrets, confidential or proprietary commercial or financial information, personal health information, sensitive personally identifiable information (for example, social security numbers, driver's license or state identification numbers, passport numbers, or financial account numbers), or other information that you do not want to be made available to the public. Should the agency become aware of such information, the agency reserves the right to redact or refrain from posting such personally sensitive or other sensitive information, or comments that contain threatening language. Please note that depending on how information is submitted, the agency may not be able to redact the information and instead reserves the right to refrain from posting the information or comment in such situations.

FOR FURTHER INFORMATION CONTACT: For further information, contact Brian Pasternak, Administrator, Office of Foreign Labor Certification, Employment and Training Administration, Department of Labor, 200 Constitution Avenue NW, Room N–5311, Washington, DC 20210, email: OFLC.Regulations@dol.gov.

SUPPLEMENTARY INFORMATION:**I. Background***A. Legal Framework*

The Immigration and Nationality Act (INA), as amended, assigns responsibilities to the Secretary of Labor (Secretary) relating to the entry and

employment of certain categories of immigrants and nonimmigrants.¹ This NPRM concerns the calculation of the prevailing wage levels for job opportunities in the PERM,² E–3, H–1B, and H–1B1 programs for which employers seek labor certification from the Secretary.³ The Department of Labor uses a unified four-tiered prevailing wage methodology based on data obtained from employers under the Occupational Employment and Wage Statistics (OEWS) survey administered by the Department's Bureau of Labor Statistics (BLS) to determine wage levels for certain temporary (H–1B, H–1B1, E–3) and permanent (EB–2 and EB–3) labor certification processes.

1. Overview of Labor Certification and Labor Condition Applications

Labor certifications and labor condition applications are requirements under the INA for certain alien workers seeking employment in the United States. To issue a labor certification, the Secretary of Labor must determine that there are not sufficient able, willing, and qualified workers available at the time of application for a visa and admission into the country and that the hiring of the alien worker will not adversely affect the wages or working conditions of workers in the United States similarly employed.⁴ The Department's statutory obligations under the INA are specifically designed to ensure that the introduction of alien labor into the United States supplements, rather than displaces, U.S. workers and that the current prevailing wage structure protects U.S. labor market conditions.⁵

The labor condition application (LCA) is a requirement for the H–1B, H–1B1, and E–3 nonimmigrant visa classifications.⁶ To be able to employ an alien as an H–1B, H–1B1, or E–3 nonimmigrant, the employer must have filed with the Secretary of Labor an application that makes a number of critical attestations surrounding wages and working conditions, including that

¹ There are two general categories of U.S. visas: immigrant and nonimmigrant. Immigrant visas are issued to foreign nationals who intend to live permanently in the United States. Nonimmigrant visas are for foreign nationals who enter the United States on a temporary basis—for tourism, medical treatment, business, temporary work, study, or other reasons.

² PERM stands for Permanent Electronic Review Management.

³ 8 U.S.C. 1101(a)(15)(E)(iii), (H)(i)(b), (H)(i)(b1).

⁴ INA § 212(a)(5)(A), 8 U.S.C. 1182(a)(5)(A)(i)–(ii) (labor certification requirement).

⁵ See 8 U.S.C. 1182(a)(5)(A)(ii); 20 CFR 656.1(a) (purpose of PERM regulations).

⁶ 8 U.S.C. 1182(n), 1182(t). Two subsections titled “(t)” have been enacted. Here, the Department cites to the first, titled “Nonimmigrant professionals; labor attestations.”

the employer is offering and will offer wages that are at least the actual wage paid by the employer to individuals with similar experience and qualifications or the prevailing wage as determined by the Department, whichever is greater, and will provide working conditions that will not adversely affect the working conditions of U.S. workers similarly employed.⁷

The H-1B, H-1B1, and E-3 programs are temporary nonimmigrant classifications that generally allow U.S. employers to hire alien workers in “specialty occupations,” generally defined as those jobs which require the theoretical and practical application of highly specialized knowledge and at least a bachelor’s degree or its equivalent.⁸ By contrast, the EB-2 and EB-3 programs are permanent immigrant visa categories that generally require labor certification before an employer can sponsor an alien worker for lawful permanent residence.⁹ These programs, however, are intimately connected. Many alien workers initially enter the U.S. in a temporary H-1B status and later adjust their status to permanent residency through the EB-2 or EB-3 categories using the PERM process. In FY 2024, approximately 57.6 percent of PERM applications were filed on behalf of workers already employed in H-1B status, underscoring the overlap between temporary and permanent programs.

To ensure consistency and prevent wage-setting disparities across these interrelated programs, the Department applies a unified four-tier prevailing wage structure across all the programs based on the BLS OEWS survey. This structure, required by the INA, establishes wage levels which are commensurate with experience, education, and level of supervision and that are implemented through ETA regulations.¹⁰ In FY 2024, the Department certified 502,374 H-1B applications, accounting for the vast majority of temporary labor certifications.¹¹ By comparison, H-1B1 applications totaled 3,368 and E-3

applications totaled 9,154.¹² For permanent employment, the Department certified 35,505 PERM applications during the same period.¹³ These figures highlight the scale of the H-1B program relative to other visa classifications and underscore the importance of consistent wage protections across temporary and permanent programs.

Among all LCAs certified in FY 2024, 19 percent were assigned to Wage Level I, 44 percent to Level II, 21 percent to Level III, and 16 percent to Level IV.¹⁴ These levels reflect the Department’s four-tier structure, which differentiates wages based on the education, experience, and level of supervision required for the position: Level I corresponds to entry-level roles, while Level IV represents the most experienced and highly skilled positions.¹⁵

2. Permanent Labor Certification

The INA prohibits the admission of certain employment-based immigrants unless the Secretary of Labor has determined and certified to the Secretary of State and the Secretary of Homeland Security that (1) there are not sufficient workers who are able, willing, qualified, and available at the time of application for a visa and admission to the United States and at the place where the alien is to perform such skilled or unskilled labor; and (2) the employment of such alien will not adversely affect the wages and working conditions of workers in the United States similarly employed.¹⁶

This “labor certification” requirement does not apply to all employment-based immigrants. The INA provides for five “preference” categories, or immigrant visa classes, only two of which—the second and third preference

employment categories (commonly called the EB-2 and EB-3 immigrant visa classifications)—generally require a labor certification.¹⁷ An employer seeking to sponsor an alien worker for an immigrant visa under the EB-2 or EB-3 preference categories generally must file a visa petition with the Department of Homeland Security on the worker’s behalf, and the petition must include a labor certification from the Secretary of Labor.¹⁸ Further, the Department of State (DOS) may not issue a visa unless the Secretary of Labor has issued a labor certification in conformity with the relevant provisions of the INA.¹⁹ If the Secretary determines both that there are not sufficient able, willing, qualified, and available U.S. workers and that employment of the alien worker will not adversely affect the wages and working conditions of similarly employed U.S. workers, the Secretary so certifies to DHS and DOS by issuing a permanent labor certification. If the Secretary cannot make one or both of the above findings, the application for permanent employment certification is denied.

Under the INA, the EB-2 classification applies to aliens who are “members of the professions holding advanced degrees or their equivalent or who because of their exceptional ability in the sciences, arts, or business, will substantially benefit prospectively the national economy, cultural or educational interests, or welfare of the United States.”²⁰ DHS regulations, in turn, define an “advanced degree” as any United States academic or professional degree, or a foreign equivalent degree above that of a bachelor’s degree. A United States bachelor’s degree or a foreign equivalent

¹² Id.

¹³ Office of Foreign Labor Certification, FY 2024 PERM data: available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

¹⁴ Office of Foreign Labor Certification, FY 2024 LCA data: available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

¹⁵ See INA § 212(p)(4), 8 U.S.C. 1182(p)(4) (requiring four wage levels commensurate with experience, education, and supervision); 20 CFR 655.731(a)(2)(ii) and 656.40(b)(2) (prevailing wage methodology).

¹⁶ 8 U.S.C. 1182(a)(5)(A). Although this provision references the Attorney General, the authority to adjudicate immigrant visa petitions was transferred to the Director of the Bureau of Citizenship and Immigration Services (an agency within the Department of Homeland Security)—now known as U.S. Citizenship and Immigration Service (USCIS)—by the Homeland Security Act of 2002, Public Law 107-296, 451(b) (codified at 6 U.S.C. 271(b)). Under 6 U.S.C. 557, references in federal law to any agency or officer whose functions have been transferred to the Department of Homeland Security shall be deemed to refer to the Secretary of Homeland Security or other official or component to which the functions were transferred.

¹⁷ See 8 U.S.C. 1153(b)(2)–(3), 1182(a)(5)(D). Section 1153(b)(2) governs the EB-2 classification of immigrant visas granted to foreign workers who are either professionals holding advanced degrees (master’s degree or above or foreign equivalent degree, or a bachelor degree or foreign equivalent degree plus five years of progressive experience in the specialty) or persons of “exceptional ability” in the sciences, arts, or business. To gain entry in this category, the foreign worker must have prearranged an offer of employment with a U.S. employer that meets the requirements of labor certification, unless the work he or she is seeking admission to perform is in the “national interest,” such as to qualify for a waiver of the job offer (and hence, the labor certification) requirement under 8 U.S.C. 1153(b)(2)(B). Section 1153(b)(3) governs the EB-3 classification of immigrant work visas granted to foreign workers who are either “skilled workers,” “professionals,” or “other” (unskilled) workers, as defined by the statute. To gain entry in this category, the foreign worker must have a prearranged offer of employment with a U.S. employer that meets the requirements of labor certification, without exception.

²⁰ 8 U.S.C. 1153(b)(2)(A).

⁷ 8 U.S.C. 1182(n), 1182(t).

⁸ INA § 101(a)(15)(E)(iii), (H)(i)(b), (H)(i)(b1), 8 U.S.C. 1101(a)(15)(E)(iii), (H)(i)(b), (H)(i)(b1); INA § 214(i), 8 U.S.C. 1184(i)(1)–(2) (definition of “specialty occupation” and degree requirement).

⁹ INA § 203(b)(2)–(3), 8 U.S.C. 1153(b)(2)–(3) (EB-2 and EB-3 classifications); INA § 212(a)(5)(A), 8 U.S.C. 1182(a)(5)(A) (labor certification requirement); 20 CFR part 656 (PERM regulations).

¹⁰ INA § 212(p)(4), 8 U.S.C. 1182(p)(4) (requiring four wage levels commensurate with experience, education, and supervision); see also 20 CFR 656.40(b)(2) and 655.731(a)(2)(ii) (prevailing wage methodology).

¹¹ Office of Foreign Labor Certification, FY 2024 LCA data: available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

degree followed by at least five years of progressive experience in the specialty shall be considered the equivalent of a master's degree.²¹ If a doctoral degree customarily is required by the specialty, the alien must have a United States doctorate or a foreign equivalent degree.²² The regulations go on to define "exceptional ability" as "a degree of expertise significantly above that ordinarily encountered in the sciences, arts, or business."²³

The EB-3 program consists of three discrete classifications: "skilled worker," defined as aliens who are "capable . . . of performing skilled labor (requiring at least two years training or experience), not of a temporary or seasonal nature, for which qualified workers are not available in the United States;" "professional," defined as "a qualified alien who holds at least a United States baccalaureate degree or a foreign equivalent degree and who is a member of the professions;" and "other worker," defined as aliens who are "capable . . . of performing unskilled labor (requiring less than two years training or experience), not of a temporary or seasonal nature, for which qualified workers are not available in the United States."²⁴

3. Labor Condition Application

The Secretary must certify an LCA filed by a U.S. employer before the employer may employ an alien worker under the E-3, H-1B, or H-1B1 programs.²⁵ LCAs apply only to temporary nonimmigrant visa classifications; permanent sponsorship is pursued through the PERM labor certification process under INA § 212(a)(5)(A). Because many H-1B workers later adjust to permanent residence under the EB-2 or EB-3 classification, this NPRM maintains a unified wage framework across temporary and permanent programs to ensure consistent protections, as described below.

As noted above, the LCA is submitted by an employer to the Secretary of Labor and states, among other things, that the employer is offering and will offer wages that are at least the actual wage paid by the employer to individuals

with similar experience and qualifications or the prevailing wage for the occupational classification in the area of employment, whichever is greater, and will provide working conditions that will not adversely affect the working conditions of workers similarly employed.²⁶

Unlike the PERM program, the H-1B, H-1B1, and E-3 programs allow U.S. employers to employ alien workers temporarily in specialty occupations. "Specialty occupation" is defined as an occupation that requires the theoretical and practical application of a body of "highly specialized knowledge" and at least a bachelor's degree in the specific specialty, or its foreign equivalent, as a minimum requirement for entry into the U.S.-based occupation, meaning that the position must require at least a bachelor's degree in a specific specialty (or its equivalent) and the attainment of such a degree must be a standard minimum requirement for entry into the occupation.²⁷ The H-1B1 and E-3 nonimmigrant visa classifications also allow U.S. employers to temporarily employ alien workers in specialty occupations, except that these classifications specifically apply to the nationals of certain countries: The H-1B1 classification applies to alien workers in specialty occupations from Chile and Singapore,²⁸ while the E-3 visa classification applies to alien workers in specialty occupations from Australia.

B. Description of the Permanent Labor Certification Process

The Department's regulations at 20 CFR part 656 govern the PERM labor certification process and set forth the responsibilities of employers who desire to employ, on a permanent basis, alien workers covered by the INA's labor certification requirement.²⁹ The Department processes labor certification applications for employers seeking to sponsor alien workers for permanent

employment under the EB-2 and EB-3 immigrant visa preference categories. Aliens seeking admission under, or adjustment of status to, the EB-2 or EB-3 preference categories are inadmissible "unless the Secretary of Labor has determined and certified . . . that—(I) there are not sufficient workers who are able, willing, qualified . . . and available at the time of application for a visa and admission to the United States and at the place where the alien is to perform such skilled or unskilled labor, and (II) the employment of such alien will not adversely affect the wages and working conditions of workers in the United States similarly employed."³⁰

The Secretary makes this determination in the PERM programs by, among other things, requiring the alien worker's sponsoring employer to recruit U.S. workers by offering a wage that equals or exceeds the prevailing wage and to further assure that the employer will pay the alien worker a wage equal to or exceeding the prevailing wage.³¹ Prior to filing a labor certification application, the employer first must obtain a Prevailing Wage Determination (PWD) for its job opportunity from the Office of Foreign Labor Certification (OFLC).³² The standards and procedures governing the PWD process in connection with the permanent labor certification program are set forth in the Department's regulations at 20 CFR 656.40 and 656.41. If the job opportunity is covered by a collective bargaining agreement (CBA) that was negotiated at arm's length between a union and the employer, the wage rate set forth in the CBA is considered the prevailing wage for labor certification purposes.³³ In the absence of a prevailing wage rate derived from an applicable CBA, the employer may elect to use an applicable wage determination under the Davis-Bacon Act (DBA) or McNamara-O'Hara Service Contract Act (SCA), or provide a wage survey that complies with the Department's regulations.³⁴ In the absence of any of the above sources, the OFLC will use the BLS OEWS survey to determine the prevailing wage for the job opportunity based on the most

³⁰ 8 U.S.C. 1182(a)(5)(A)(i).

³¹ 20 CFR 656.10(c)(1). In addition to the prevailing wage requirement, employers must comply with other regulatory obligations under 20 CFR 656.10, including attesting that the job opportunity has been and is clearly open to U.S. workers, that all U.S. workers who applied were rejected only for lawful, job-related reasons, and that the employer has conducted the mandatory recruitment steps required by the PERM regulations.

³² 20 CFR 656.15(b)(1), 656.40(a).

³³ See 20 CFR 656.40(b)(1).

³⁴ 20 CFR 656.40(b), (g).

specific occupation and geographic area available.³⁵ After reviewing the employer's application, OFLC will determine the prevailing wage and specify the validity period, which may be no less than 90 days and no more than one year from the determination date.³⁶

Once the U.S. employer has received a PWD, the process for obtaining a permanent labor certification generally begins with the U.S. employer filing an *Application for Permanent Employment Certification*, Form ETA-9089, with OFLC.³⁷ As part of the standard application process, the employer must include, among other things, the labor or services to be performed and actual minimum job requirements contained on the valid PWD, the wage it is offering to pay for such labor or services the geographic location(s) where the work is expected to be performed, and the efforts it made to recruit qualified and available U.S. workers prior to filing the Form ETA-9089. Additionally, the employer must attest to certain labor condition statements on the Form ETA-9089, including that the "offered wage equals or exceeds the prevailing wage determined pursuant to 20 CFR 656.40 and 656.41, and the wage the employer will pay to the alien worker will equal or exceed the prevailing wage that is applicable at the time the alien begins work or from the time the alien is admitted to take up the certified employment."³⁸

Through the requisite test of the labor market, the employer also attests, at the time of filing the Form ETA-9089, that the job opportunity has been, and is, clearly open to any U.S. worker, and that all U.S. workers who applied for the job opportunity were rejected for lawful, job-related reasons. OFLC performs a review of the Form ETA-9089 and may either grant or deny a permanent labor certification. When OFLC grants a permanent labor certification, the employer must submit proof of the certified Form ETA-9089 along with an *Immigrant Petition for Alien Workers* (Form I-140 petition) to DHS. A permanent labor certification is valid only for the job opportunity, employer, alien worker, and area of intended employment named on the Form ETA-9089 and must be filed in support of a Form I-140 petition within

180 calendar days of the date on which OFLC granted the certification.³⁹

C. Description of the Temporary Labor Condition Application Process

The Department's regulations at 20 CFR part 655, subpart H, govern the process for obtaining a certified LCA and set forth the responsibilities of employers who desire to temporarily employ alien workers in H-1B, H-1B1, and E-3 nonimmigrant classifications.

For H-1B petitions subject to the annual numerical cap, employers must first register with U.S. Citizenship and Immigration Services (USCIS) during the designated registration period. This electronic registration process does not require a certified Labor Condition Application (LCA). When USCIS determines that there is more than a sufficient number of unique beneficiaries on whose behalf registrations were properly submitted to meet the H-1B cap, USCIS conducts a lottery to select registrations eligible to file petitions. This lottery process is administered independently of the Department of Labor. Employers must obtain a certified LCA from the Department of Labor before filing the H-1B petition (Form I-129, *Petition for Nonimmigrant Worker*) with USCIS; however, employers can obtain an LCA prior to or after the USCIS registration lottery process. In December 2025, DHS finalized a rule establishing a weighted selection process based on offered wage levels for cap-subject H-1B registrations to favor higher-skilled, higher-paid aliens and strengthen program integrity.⁴⁰

A prospective employer must attest on the LCA that (1) it is offering to and will pay the nonimmigrant, during the period of authorized employment, wages that are at least the actual wage level paid by the employer to all other employees with similar experience and qualifications for the specific employment in question, or the prevailing wage level for the occupational classification in the area of intended employment, whichever is greater (based on the best information available at the time of filing the attestation); (2) it will provide working conditions for the nonimmigrant worker that will not adversely affect working conditions for similarly employed U.S. workers; (3) there is no strike or lockout in the course of a labor dispute in the occupational classification at the

worksite; and (4) it has provided notice of its filing of an LCA to its employees' bargaining representative for the occupational classification affected or, if there is no bargaining representative, it has provided notice to its employees in the affected occupational classification by posting the notice in a conspicuous location at the worksite or through other means such as electronic notification.⁴¹

As relevant here, the prevailing wage must be determined as of the time the LCA is filed.⁴² In contrast to the permanent labor certification process, an employer is not required to obtain a PWD from the OFLC.⁴³ Rather, an employer may base the prevailing wage on one of several sources: an applicable CBA that was negotiated at arm's length between a union and the employer and contains a wage rate applicable to the occupation; a PWD from the OFLC; a wage determination under the Davis-Bacon Act or Service Contract Act; an independent authoritative source—such as a private wage survey—that satisfies the requirements in 20 CFR 655.731(b)(3)(iii)(B); or another legitimate source of wage data—such as an industry compensation study—that satisfies the requirements in 20 CFR 655.731(b)(3)(iii)(C).⁴⁴

An employer may not file an LCA more than six months prior to their selected start date.⁴⁵ Unless the Secretary finds the LCA is incomplete or obviously inaccurate, the Secretary must certify it within seven working days of its filing.⁴⁶ Once an employer receives a certified LCA, it must file the Form I-129, *Petition for a Nonimmigrant Worker*, with USCIS if seeking classification of the alien as an H-1B worker.⁴⁷ During the course of adjudicating the nonimmigrant petition, USCIS determines, among other things, whether the petition is supported by a certified LCA that properly corresponds to the petition, whether the employer's position qualifies as a specialty occupation and, if so, whether the alien is qualified for the position.

⁴¹ 8 U.S.C. 1182(n)(1)(A)–(C), (t)(1)(A)–(C); 20 CFR 655.705(c)(1), 655.730(d).

D. Brief History on Use of the BLS OEWS and Current Prevailing Wage Methodology

1. The Department's Methodology for Establishing Prevailing Wages From 1997 to 2020

The Department has always sought to use the best available information on occupational wages representing workers in the United States similarly employed. The BLS OEWS survey remains the largest ongoing statistical survey program of the federal government, producing employment and gross wage estimates for more than 830 SOC codes, and is used as the primary wage source for establishing skill-based prevailing wage determinations in the nonimmigrant and immigrant visa programs administered by the Department. The BLS produces survey materials and selects the employer establishments to be surveyed using the list of establishments maintained by State Workforce Agencies (SWAs) for unemployment insurance purposes. Wage information based on geographic areas are available at the national and State levels and for certain territories in which statistical validity can be ascertained, including the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands. Wage information is also made available at the metropolitan and nonmetropolitan area levels within a State.

The OEWS survey primarily covers wage and salary workers in non-farm establishments and does not include the self-employed, owners and partners in unincorporated firms, household workers, or unpaid family workers. The survey is conducted primarily by mail, with telephone follow-ups to nonrespondents, or, if needed, to clarify written responses. Each year, two semiannual panels of approximately 179,000 to 187,000 sampled establishments are contacted, one panel in May and the other in November. Thus, the OEWS employment and gross wage estimates are constructed from a sample of about 1.1 million establishments collected over a 3-year period, which allows the production of data at detailed levels of geography, industry, and occupation and accounts for approximately 57 percent of employers in the United States. OEWS data are published annually with a May reference date. Wages are defined as straight-time, gross pay, including piece rates, but excludes other forms of pay such as overtime, shift differentials, and non-production or any year-end bonuses. Further, because it collects the gross wages paid to each worker in each

occupation during the reference period, the OEWS can consistently report more precise wage estimates for any occupation-specific wage distribution to approximate wage differentials paid to U.S. workers similarly employed in a particular occupation and state.

The OEWS survey consists of two components: employment estimates and wage estimates. The employment component provides data on the estimated number of full- and part-time jobs in an occupation and geographic area, offering insight into workforce distribution and occupational demand across industries and regions. This component measures full- and part-time wage and salary employees in nonfarm industries, but excludes self-employed workers, owners and partners in unincorporated firms, employees of private households, and unpaid family workers. The wage component provides estimates of straight-time, gross pay for employees in an occupation, excluding premium pay such as overtime. The Department incorporated the wage component of the OEWS survey into its prevailing wage guidance in 1997.⁴⁸ At the time, the Department divided OEWS wage data into two skill levels: a Level I wage for "beginning level employees" and a Level II wage for "fully competent employees." Because the OEWS survey does not provide data about skill differentials within each Standard Occupational Classification (SOC) code, the Department established the entry and experienced skill levels mathematically.⁴⁹

Specifically, under a Memorandum of Understanding (MOU), BLS computed a Level I wage calculated as the mean of the lowest paid one-third of workers in a given occupation (approximately the 17th percentile of the OEWS wage distribution)⁵⁰ and a Level II wage calculated as the mean wage of the highest paid upper two-thirds of workers (approximately the 67th

percentile).⁵¹ This two-tier wage structure was based on a practical, informal method of using the mean wage of the lowest paid one-third of the workers surveyed in each occupation to approximate the typical compensation for "beginning level employees," and the mean wage of the upper two-thirds of the workers surveyed in the occupation to approximate the typical compensation for "fully competent employees."⁵²

To implement the INA's four-tier prevailing wage provision, the Department published comprehensive Prevailing Wage Determination Policy Guidance for Nonagricultural Immigration Programs (2005 Guidance), which expanded the two-tier OEWS wage level system to include four "skill levels": Level I "entry," Level II "qualified," Level III "experienced," and Level IV "fully competent."⁵³ The Department applied the formula specified in the INA to its two existing wage levels to set Levels I through IV, respectively, at approximately the 17th percentile, the 34th percentile, the 50th percentile, and the 67th percentile.⁵⁴ The Department's adoption of the four-tiered wage structure is grounded in the INA's statutory mandate, which requires that government surveys used to determine prevailing wages "provide at least four levels of wages commensurate with experience, education, and the level of supervision,"⁵⁵ and is consistent with the statutory requirement that wage levels be commensurate with experience, education, and the level of supervision, ensuring that wage determinations meaningfully differentiate among workers based on these factors. This differentiation is part of the statutory scheme wherein the Department is

⁵¹ Intra-Agency Memorandum of Understanding executed by Mr. John R. Beverly, III, Director, U.S. Employment Service, ETA, and Ms. Katharine Newman, Chief, Division of Financial Planning and Management, Office of Administration, BLS (Sept. 30, 1998).

⁴⁹ GAL 2–98 at 5.

⁵⁰ To clarify, the Department notes that, because the old wage methodology took the mean of a portion of the OEWS wage distribution, the precise wage it produced will not always fall at 17th percentile. Rather, the 17th percentile is the midpoint or median of the distribution for which a mean was produced, and is therefore only an approximation for what the actual wage rates would be. The same is true of the old wage methodology for calculating the Level IV wage, which used the mean of the upper two thirds of the OEWS distribution, the midpoint of which is the 67th percentile.

charged with certifying a lack of sufficient workers and that employment of alien workers will not adversely affect the wages or working conditions of U.S. workers.

In 2010, the Department centralized the prevailing wage determination process for nonagricultural labor certification programs within OFLC's National Prevailing Wage Center (NPWC).⁵⁶ In preparation for this transition, the Department issued new Prevailing Wage Determination Policy Guidance for Nonagricultural Immigration Programs (2009 Guidance),⁵⁷ which currently informs OFLC's PWD process for the PERM, H-1B, H-1B1, and E-3 visa programs and will continue to inform OFLC's PWD process for these programs. When assigning a prevailing wage using OEWS data, the NPWC examines the nature of the job offer, the area of intended employment, and job duties for workers that are similarly employed.⁵⁸ In particular, the NPWC uses the SOC taxonomy to classify the employer's job opportunity into an occupation by comparing the employer's job description, title, and requirements to occupational information provided in sources like the Department's Occupational Information Network (O*Net).⁵⁹ Once the NPWC identifies the applicable SOC code, it determines the appropriate wage level for the job opportunity by comparing the employer's job description, title, and requirements to those normally required for the occupation, as reported in sources like O*Net. This determination involves a step-by-step process in which each job opportunity begins at Level I (entry level) and may progress to Level II (experienced), Level III (qualified), or Level IV (fully competent) based on the NPWC's comparison of the job

opportunity to occupational requirements, including the education, training, experience, skills, knowledge, and tasks required in the occupation.⁶⁰ After determining the prevailing wage level, the NPWC issues a PWD to the employer using the OEWS wage for that level in the occupation and area of intended employment.

2. Regulatory Changes to the Prevailing Wage Methodology in 2020 and Litigation

As discussed in Section I.D.1, the Department has long relied on the BLS OEWS survey to determine prevailing wages for the H-1B, H-1B1, E-3, and PERM programs. The prevailing wage determination process, first implemented through guidance in 2005, was designed to reflect four tiers of wages commensurate with the experience, education, and level of supervision for the job opportunity and to be consistent with the statutory requirements of 8 U.S.C. 1182(p)(4). However, as is detailed further in this NPRM, the methodology adopted in 2005 did not adequately protect U.S. workers from adverse wage effects and deleterious job conditions.⁶¹ The Department also did not clearly articulate a rationale for choosing levels as low as the 17th percentile for Level I and did not similarly provide a reasoned justification for selecting the 67th percentile for Level IV. In addition to these substantive and procedural shortcomings, a growing body of evidence, which is presented below under Section II.B.3, indicates that the 2005 methodology was adversely affecting the wages of U.S. workers.

Therefore, on October 8, 2020, the Department published an Interim Final Rule (IFR) in the **Federal Register** revising the methodology used to determine prevailing wage levels for the H-1B, H-1B1, E-3, and PERM programs.⁶² As explained in the IFR, the Department concluded that the existing wage levels were not consistent with the relevant statutory requirement that a government survey used to determine the prevailing wage should provide four wage levels commensurate with experience, education, and level of supervision.⁶³ The Department also determined that the existing wage levels

were artificially low and provided an opportunity for employers to hire and retain alien workers at wages well below what their U.S. counterparts earn, creating an adverse incentive to prefer the hiring of alien workers to U.S. workers, an incentive that is at odds with the statutory scheme and which causes downward pressure on the wages of the domestic workforce. Therefore, the Department revised wage provisions at 20 CFR 655.731 and 656.40 to adjust the existing wage levels to ensure the wage levels would reflect the wages paid to U.S. workers with similar experience, education, and responsibility to those possessed by similarly employed alien workers.

In particular, the IFR amended paragraphs (a), (b)(2), and (b)(3) of 20 CFR 656.40, codifying the four-tier wage practice and revising the wage level computation methodology. A new § 656.40(b)(2)(i) specified the four new levels (Levels I through IV) to be applied. Paragraph (b)(2)(i)(A) explained the Level I wage would be calculated as the mean of the fifth decile of the wage distribution for the most specific occupation and geographic area available, rather than calculated as the mean of the bottom third of the OEWS wage distribution, as was the case prior to the IFR. Paragraph (b)(2)(i)(D) provided that the Level IV wage would be calculated as the mean of the upper decile of the wage distribution for the most specific occupation and geographic area available, rather than using the mean of the upper two-thirds of the distribution. As a result of these changes, the wage levels were increased, respectively, from approximately the 17th, 34th, 50th, and 67th percentiles to approximately the 45th, 62nd, 78th, and 95th percentiles. The IFR also made minor technical and clarifying amendments to sections 656.40 and 655.731.

The Department promulgated the IFR pursuant to 5 U.S.C. 553(b)(B) and 553(d)(3)⁶⁴ due to exigent circumstances created by the coronavirus public health emergency that threatened immediate harm to the

wages and job prospects of U.S. workers, as well as the need to avoid evasion by employers of the new wage rates. The Department requested public input on all aspects of the IFR during a post-promulgation 30-day public comment period.

Four groups of plaintiffs separately challenged the Department's IFR. The plaintiffs claimed the Department lacked good cause to issue the IFR without undergoing notice and comment procedures under the APA and that the IFR was arbitrary and capricious and in violation of the INA. These plaintiffs further requested that the IFR be enjoined and the Department prevented from implementing it. In three of the four cases, the district court approved the parties' stipulation to convert plaintiffs' motion for a preliminary injunction into a motion for partial summary judgment on the notice and comment claim. In *Chamber of Commerce*, the district court issued a decision on December 1, 2020, granting plaintiffs' motion for partial summary judgment on their notice and comment claim and setting aside the Department's IFR.⁶⁶ In *Purdue University and Stellar IT* (which were consolidated), the district court issued a decision on December 14, 2020, granting partial summary judgment to the plaintiffs on the basis that the Department lacked good cause to issue the IFR, and ordered the Department to re-issue prevailing wage determinations issued under the IFR on a mutually agreeable schedule.⁶⁷ In the fourth case, *ITServe Alliance*, the district court issued a preliminary injunction on December 3, 2020, prohibiting the Department from enforcing the IFR against the plaintiffs in that case.⁶⁸ In discussing plaintiffs' likelihood of success on the merits in that case, the court limited its analysis to plaintiffs' claim that the Department lacked good cause to forgo advance notice and comment.⁶⁹ Following the district court's decisions in *Chamber of Commerce* and *ITServe Alliance*, OFLC took immediate action to comply with the courts' directives, including issuing a public announcement on its website on December 3, 2020, outlining the steps it was taking in response to the courts' orders. Notably, none of these

rulings addressed the merits of the plaintiffs' challenges to the substance of the IFR.

The Department issued a Final Rule on January 14, 2021, which adopted the IFR's provisions with modifications that were responsive to both public comments and issues raised during litigation.⁷⁰ The Final Rule adjusted the wage percentiles and incorporated changes based on public feedback to the 35th and 90th percentiles for Level I and Level IV wages, respectively. The Final Rule's effective date was set for March 15, 2021. On February 1, 2021, the Department proposed to delay the effective date of the final rule for a period of 60 days to May 14, 2021, in response to a Presidential directive.⁷¹ On March 12, 2021, the Department issued a final rule confirming the delay, wherein it cited the need to finish a "comprehensive review of this rulemaking" and the "complexity of this issue" as its rationale for proceeding with the proposed delay.⁷² On March 22, 2021, the Department issued a proposal to further delay the effective date of the rule by eighteen months to November 14, 2022.⁷³ The Department again cited the need to have "sufficient time to engage in its comprehensive review of the [Jan. 14, 2021 Final Rule]."⁷⁴ The Department acknowledged that "delaying the implementation of the Final Rule is likely to have an impact on the wages paid to workers."⁷⁵ Nonetheless, on May 13, 2021, the Department promulgated a final rule confirming the 18-month delay of the effective date.⁷⁶ While many commenters supported the delay, "[m]any individual commenters opposed the proposed delay and supported implementing policies that favor and attract higher skilled workers."⁷⁷ The Department again "acknowledge[d] the potential substantial economic impact of this delay not only on employers but also on U.S. and alien workers."⁷⁸ "[M]any commenters expressed general opposition to the proposed delay or

opposed the proposed delay and urged the Department to implement the higher wage levels as soon as possible. . . ."⁷⁹

On April 2, 2021, the Department also issued a Request for Information (RFI) "to provide information on the sources of data and methodologies for determining prevailing wage levels covering employment opportunities that United States (U.S.) employers seek to fill with alien workers on a permanent or temporary basis through certain employment-based immigrant visas or through H-1B, H-1B1, E-3 nonimmigrant visas."⁸⁰ While the comments received on the RFI generally support the Department's assessment of the limitations of the prior methodology and reinforced the need for a revised approach that better aligns with statutory requirements and labor market realities, the comments received did not inform the methodology proposed here.

On June 23, 2021, the Northern District of California vacated and remanded the January 14, 2021 Final Rule, pursuant to the Department's unopposed voluntary request for vacatur and remand.⁸¹ On December 13, 2021, the Department promulgated a final rule "effectuat[ing] a Federal district court order vacating a January 14, 2021 Final Rule." 86 FR 70729 (Dec. 13, 2021). Subsequently, the Department engaged in no further rulemaking regarding the employment-based immigrant visa or the H-1B, H-1B1, and E-3 nonimmigrant visas that are the subject of this NPRM.

II. Discussion of the Department's Proposed Amendments to the Prevailing Wage Methodology

The Department is issuing this NPRM to solicit public comment on proposed amendments to the prevailing wage computation methodology relied upon in several labor certification programs, specifically the H-1B, H-1B1, and E-3 nonimmigrant visa classifications, as well as the PERM program for employment-based immigrant visas. The Department proposes to increase the prevailing wage floors for Wage Level I from the 17th percentile to the 34th percentile, for Wage Level II from the 34th to the 52nd, for Wage Level III from the 50th to the 70th, and for Wage Level IV from the 67th to the 88th, relying upon wage data provided by the OEWS survey. The Department believes that these increases in the prevailing wage levels are needed because the previous

methodology set the prevailing wages too low by relying on a methodology that did not take into account the experience, education, and level of supervision, as required by the INA. As a result, employers were permitted to hire alien workers at wage levels below those that similarly employed U.S. workers were paid, resulting in adverse effects to the wages and working conditions of U.S. workers.

A. Statutory Authority for Amending the Methodology for Computing the Prevailing Wage Levels

The Department's authority to revise the prevailing wage methodology is grounded in its longstanding role of administering the labor certification process and in the discretion afforded to the Department regarding the establishment of prevailing wage levels for the H-1B, H-1B1, E-3, and PERM programs.

Section 1182(a)(5)(A)(i) of the INA provides that, “[a]ny alien who seeks to enter the United States for the purpose of performing skilled or unskilled labor is inadmissible, unless the Secretary of Labor has determined and certified to the Secretary of State and the Attorney General that . . . there are not sufficient workers who are able, willing, qualified (or equally qualified in the case of an alien described in clause (ii)) and available at the time of application for a visa and admission to the United States and at the place where the alien is to perform such skilled or unskilled labor, and the employment of such alien will not adversely affect the wages and working conditions of workers in the United States similarly employed.”

Section 1182(n)(1) of the INA provides that “[n]o alien may be admitted or provided status as an H-1B nonimmigrant . . . unless the employer has filed with the Secretary of Labor an application stating the following . . . [that] the employer is offering and will offer during the period of authorized employment to aliens admitted or provided status as an H-1B nonimmigrant wages that are at least (I) the actual wage level paid by the employer to all other individuals with similar experience and qualifications for the specific employment in question, or (II) the prevailing wage level for the occupational classification in the area of employment, whichever is greater. . . .” 1182(n)(1); 1182(n)(1)(A); 1182(n)(1)(A)(i); 1182(n)(1)(A)(i)(II); *see also* 1182(n)(2). Section 1182(t)(1) contains nearly-identical language with respect to H-1B1 and E-3 and nonimmigrants. 8 U.S.C. 1182(t)(1); 1182(t)(1)(A); 1182(t)(1)(A)(i); 1182(t)(1)(A)(i)(II).

In turn, Section 1182(p)(4) of the INA provides that the Secretary of Labor may “use, or make available to employers, a governmental survey to determine the prevailing wage.” This section also provides that the “survey shall provide at least 4 levels of wages commensurate with experience, education, and the level of supervision.” Section 1182(p)(3) requires that the “prevailing wage required to be paid pursuant to subsections (a)(5)(A), (n)(1)(A)(i)(II), and (t)(1)(A)(i)(II) shall be 100 percent of the wage determined pursuant to those sections.” These statutory requirements are discussed in further detail in Section II.B.2 of this NPRM.

Congress “often enact[s] statutes in which the agency is authorized to exercise a degree of discretion.” *Loper Bright Enter. v. Raimondo*, 144 S. Ct. 2244, 2263 (2024). “[S]ome statutes ‘expressly delegate[]’ to an agency the authority to give meaning to a particular statutory term.” *Id.* (citation omitted). “Others empower an agency to prescribe rules to ‘fill up the details’ of a statutory scheme, or to regulate subject to the limits imposed by a term or phrase that ‘leaves agencies with flexibility.’” *Id.* (citation omitted). The statutory provisions listed above are of the type identified by the Supreme Court in *Loper Bright* that “delegate[] discretionary authority” to the Department on how best to determine prevailing wages such that the employment of alien workers will not adversely affect U.S. workers. The Department’s authority to set wage levels is also necessary for it to fulfill its statutory functions and duties under Sections 1182(a)(5)(A), 1182(n)(1), 1182(n)(2)(A),⁸² 1182(t)(1), and 1182(t)(2)(A), as well as its role in the overall statutory scheme.⁸³

B. Reasons for Adjusting the Prevailing Wage Levels

1. Summary

On September 19, 2025, the President issued Proclamation 10973

⁸² Moreover, the Secretary’s duty under 8 U.S.C. 1182(n)(2)(A) to establish procedures for receiving, investigating, and resolving LCA-related complaints includes the authority to promulgate regulations to ensure employer compliance with LCAs. *See, e.g., Aleutian Cap. Partners, LLC v. Scalia*, 975 F.3d 220, 230 (2d Cir. 2020). The Department’s authority to promulgate prevailing wage rates is also part of its express enforcement authority.

⁸³ *C.f., e.g., N. Carolina Farm Bureau Fed’n v. U.S. Dep’t of Labor*, 781 F. Supp. 3d 455; 2025 WL 1296245, *12 (E.D.N.C. 2025) (“NCFBF”) (the Department has broad authority to “‘fill up the details’ of its statutory directive.”); *Kansas v. U.S. Dep’t of Labor*, 749 F. Supp. 3d 1363, 1374 (S.D. Ga. 2024) (reaffirming the Department’s authority to “‘issue regulations to ensure that any certifications it issues for H-2A visas do not ‘adversely affect’ American agricultural workers”).

(“Proclamation”), “Restriction on Entry of Certain Nonimmigrant Workers,” which, among other provisions, directed the Secretary of Labor to initiate rulemaking to revise prevailing wage levels under the H-1B program.⁸⁴ The Proclamation explained that the H-1B program “has been deliberately exploited to replace, rather than supplement, U.S. workers with lower-paid, lower-skilled labor.” The Proclamation cited longstanding concerns that the H-1B program, as currently administered, may be used in ways that undermine U.S. labor standards, create downward pressure on wages, and displace U.S. workers. The Proclamation further noted that the current wage structure may incentivize the hiring of alien workers at significantly lower wages than their U.S. counterparts, thereby undermining the program’s original intent which was to allow employers to obtain temporary specialized labor when equally skilled and qualified U.S. workers could not be found.

The Department is proposing this rule because the current methodology for setting prevailing wages often allows employers to pay alien workers significantly less than what similarly qualified U.S. workers earn for the same jobs in the same area of intended employment. This not only results in unfair competition for U.S. workers, particularly in high-skill sectors like the STEM (science, technology, engineering, and mathematics) fields, and adverse effects on the wages of U.S. workers, but also undermines the integrity of the immigration system by incentivizing the use of lower-paid and lower-skilled alien workers over available domestic talent. This misuse of the H-1B program undermines its original statutory purpose—which is to allow employers to temporarily hire alien workers in specialty occupations requiring the “theoretical and practical application of a body of highly specialized knowledge”⁸⁵—by transforming it into a mechanism for importing lower-cost labor. The current methodology further undermines the Department’s statutory duties under Section 1182(a)(5)(A) of the INA to ensure that the employment of alien workers does not impose adverse effects onto the wages and working conditions of American workers. By updating how wage levels

⁸⁴ Proclamation No. 10973, 90 FR 46027 (Sept. 19, 2025).

⁸⁵ 8 U.S.C. 1184(i)(1)(A). Additionally, the term “specialty occupation” is also defined to require “attainment of a bachelor’s or higher degree in the specific specialty (or its equivalent) as a minimum for entry into the occupation in the United States.” *Id.* at (i)(1)(B).

are calculated, the Department aims to ensure that alien workers are paid fairly and that U.S. workers are not displaced or undercut—helping to restore balance, fairness, and public confidence in the labor certification process.

Similarly, as is described in more detail below in Section II.B.3, the Department has determined that the current prevailing wage methodology does not adequately reflect labor market realities and may suppress wages and displace U.S. workers. As the Department has noted previously, “prevailing wage rates produced by the four-tier wage structure should approximate actual market wages to the greatest extent possible.” 86 FR 3634.

In response to these concerns, the Department of Labor is proposing to revise the methodology used to determine prevailing wage levels under the H-1B, H-1B1, E-3, and PERM programs. The proposed changes are intended to ensure that the employment of alien workers does not adversely affect the wages and working conditions of U.S. workers, consistent with the Department’s statutory obligations in section 1182(a)(5)(A), 1182(n), and 1182(t) of the INA. When prevailing wage rates are set below what comparable U.S. workers would typically earn, it creates an incentive for employers to hire alien workers who cost less, which in turn, reduces job opportunities for equally qualified U.S. workers.⁸⁶

While the Presidential Proclamation only identifies the H-1B program for regulatory overhaul, any adjustment to prevailing wage levels in this program will also implicate prevailing wage levels in the H-1B1, E-3, and PERM programs because the Department of Labor uses a unified four-tiered wage structure across all of these visa programs. The same OEWS data and percentile-based methodology are used to determine wage levels for both temporary (H-1B, H-1B1, E-3) and permanent (PERM) labor certification processes. Given that over 58% of FY 2024 PERM applications were filed on behalf of aliens already employed in H-1B status, maintaining consistency in wage determinations across these programs is essential to ensure that the statutory requirement—that the employment of alien workers not adversely affect the wages and working conditions of U.S. workers—is met uniformly.⁸⁷ Divergent wage structures

would create perverse incentives for employers to exploit lower wage thresholds in one program to circumvent higher prevailing wages being offered in the other, ultimately undermining the integrity of all visa programs that utilize the current prevailing wage methodology. The Department therefore believes that revising the wage level for these other programs that are intertwined with the H-1B program, therefore, is also necessary and appropriate.

2. The Relationship Between the Prevailing Wage Levels, OEWS Survey, and the INA

The Department’s prevailing wage determinations serve as a critical safeguard in both the H-1B and PERM programs, ensuring that the employment of alien workers does not adversely affect the wages and working conditions of U.S. workers. These determinations rely heavily on data from the Occupational Employment and Wage Statistics (OEWS) survey, which provides wage estimates across occupations and geographic areas. However, because the OEWS survey was not originally designed to reflect the statutory requirements of the Immigration and Nationality Act (INA), the Department must carefully evaluate how to align OEWS-based wage levels with the INA’s mandate to protect U.S. workers.

As noted, the INA requires employers to pay H-1B workers the greater of “the actual wage level paid by the employer to all other individuals with similar experience and qualifications for the specific employment in question,” or “the prevailing wage level for the occupational classification in the area of employment.” The statute further provides that, when a government survey is used to establish the wage levels, “such survey shall provide at least 4 levels of wages commensurate with experience, education, and the level of supervision.” If an existing government survey produces only two levels, the statute provides a formula to calculate two intermediate levels. Thus, similar to the statute’s actual wage clause, the prevailing wage requirement, when calculated based on a government survey, makes the qualifications possessed by workers in the occupation, namely education, experience, and responsibility, an important part of the wage calculation. Put slightly differently, both clauses yield wage requirements that are meant to align with the wages that similarly employed

U.S. workers are being compensated with a requirement that employers pay the higher available wage. In this way, the statutory scheme is meant to “protect U.S. workers’ wages and eliminate any economic incentive or advantage in hiring temporary alien workers.” If employers are required to pay H-1B workers approximately the same wage paid to U.S. workers who perform the same type of work in the same geographic area and with similar levels of education, experience, and responsibility as the H-1B workers, employers will have significantly diminished incentives to prefer H-1B workers over U.S. workers. By reducing the perverse incentive to favor alien H-1B workers over the domestic workforce, U.S. workers’ wages will not be suppressed by the presence of alien workers in the relevant labor market.

To set appropriate prevailing wage levels consistent with the purpose of the relevant statutory provisions and statutory mandate on the Department, as discussed below, the Department has concluded that it is appropriate to focus on the wages of those U.S. workers that are most similarly employed to alien workers in the H-1B program, those receiving an EB-2 visa, and higher skilled EB-3 visa recipients.

Based on the statutory qualifications to be eligible to receive H-1B status, the Department thinks that while the OEWS survey is the best source of wage data available for use in the Department’s foreign labor certification programs, the wage data for any particular occupation does not perfectly align with the requirement that workers in the H-1B program possess highly specialized knowledge. This fact necessarily shapes how the Department integrates the OEWS survey into its foreign labor programs and also demonstrates the existing wage levels’ inconsistency with the INA.

At the outset, the Department notes that much of its assessment of how best to adjust the prevailing wage levels gives special attention to the H-1B program. The H-1B program accounts, by order of magnitude, for the largest share of alien workers covered by the Department’s four-tier wage structure. Upwards of 80 percent of all workers admitted or otherwise authorized to work under the programs covered by the wage structure are H-1B workers.⁸⁸

⁸⁸ See Department of Homeland Security, 2017 Yearbook of Immigration Statistics, Table 7. ⁸⁷ Department of Labor, Employment and Training Administration, FY 2024 PERM

Performance Data, available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

This, in combination with the fact that, as explained below, the risk of adverse effects to U.S. workers posed by the presence of alien workers is most acute where there are high concentrations of such workers, supports the Department's determination to focus on the H-1B program. Because the wage structure governs, and, for reasons explained below, will continue to govern wages for hundreds of thousands of workers across five different foreign labor programs and hundreds of different occupations, no wage methodology will be perfectly tailored to the unique circumstances of every job opportunity.⁸⁹ Accordingly, the Department thinks that it is appropriate to focus its analysis on the H-1B program and those occupations in which the vast majority of H-1B workers are employed.

Relatedly, the Department notes that the H-1B program is closely linked to the PERM programs that are also covered by the Department's wage structure. A majority of workers covered by PERM labor certification applications are already working in the U.S. as H-1B nonimmigrants, and there is significant overlap in the types of occupations in which H-1B and PERM workers are employed.⁹⁰ It is also clear that H-1B status often serves as a pathway to employment-based lawful permanent resident status for many alien workers.⁹¹ The programs have thus long been regulated in connection with one another.⁹² For these reasons, giving

particular attention to the H-1B program and the determination of how wages for H-1B workers are calculated is intimately connected with how the wages for alien workers in the PERM program are calculated, given that many H-1B workers find themselves eventually in the PERM program. It is therefore appropriate that the Department's analysis applies with equal force to both programs.

Under the INA, H-1B, H-1B1, and E-3 classification can, in most cases, only be granted to aliens entering the U.S. to perform services "in a specialty occupation."⁹³ The statute defines "specialty occupation" as an occupation that requires theoretical and practical application of a body of "highly specialized knowledge" and the "attainment of a bachelor's or higher degree in the specific specialty (or its equivalent) as a minimum for entry into the occupation in the United States."⁹⁴ An alien may be classified as an H-1B specialty occupation worker if the alien possesses "full state licensure to practice in the occupation, if such licensure is required to practice in the occupation," "completion of [a bachelor's or higher degree in the specific specialty (or its equivalent)]," or "(i) experience in the specialty equivalent to the completion of such degree, and (ii) recognition of expertise in the specialty through progressively responsible positions relating to the specialty."⁹⁵ DHS regulations further clarify the requirements for establishing that the position is a specialty occupation and that the beneficiary of an H-1B petition must be qualified for a specialty occupation.⁹⁶ The Department's regulations restate the statute's definition of specialty occupation essentially verbatim.⁹⁷

A few features of the definition bear emphasizing. First, the INA sets the attainment of a bachelor's degree in a specific specialty, or experience that would give an individual expertise equivalent to that associated with a bachelor's degree in the specific specialty, as the baseline, minimum requirement for an alien to qualify for the classification. Of even greater importance, having "any bachelor's degree" as a job requirement is not sufficient to qualify a job as a specialty occupation position—the bachelor's degree or equivalent required to perform

the job must be "in the specific specialty." In other words, the bachelor's degree required, or equivalent, must be specialized to the particular needs of the job, and impart a particularized level of expertise tailored to a given field.⁹⁸ These aspects of the definition play an important role in how the Department will use data from the BLS OEWS survey to set appropriate prevailing wage levels.

The Department has long relied on OEWS data to establish prevailing wage levels. That is because it is a comprehensive, statistically valid survey that, in many respects, is the best source of wage data available for satisfying the Department's purposes in setting wages in most immigrant and nonimmigrant visa programs. As the Department has previously noted the OEWS wage survey is among the largest continuous statistical survey programs administered by the federal government. BLS produces the survey materials and selects the nonfarm establishments to be surveyed using the list of establishments maintained by State Workforce Agencies (SWAs) for unemployment insurance purposes. The OEWS collects data from over 1 million establishments. Salary levels based on geographic areas are available at the national and State levels and for certain territories in which statistical validity can be ascertained, including the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands. Salary information is also made available at the metropolitan and nonmetropolitan area levels within a State. Wages for the OEWS survey are straight-time, gross pay, exclusive of premium pay. Base rate, cost-of-living allowances, guaranteed pay, hazardous duty pay, incentive pay including commissions and production bonuses, tips, and on-call pay are included. The features described above are unique to the OEWS survey, which is a comprehensive, statistically valid, and useable wage reference.⁹⁹

Put simply, the OEWS survey's quality and characteristics have made it, and continue to make it, a useful tool for

Workers: Fiscal Year 2017 Annual Report to Congress October 1, 2016–September 30, 2017 (Apr. 9, 2018), available at <https://www.uscis.gov/sites/default/files/document/reports/Characteristics-of-Specialty-Occupation-Workers-H-1B-Fiscal-Year-2017.pdf>.

⁹⁹ Wage Methodology for the Temporary Non-agricultural Employment H-2B Program, 76 FR 3452, 3463 (Jan. 19, 2011).

setting prevailing wage levels in the Department's foreign labor programs. There are no alternative surveys or sources of wage data that would provide DOL with wage information at the same level of granularity needed to properly administer the H-1B and PERM programs. In response to the Department's 2021 Request for Information, no commenter identified a more suitable and comprehensive data source than the OEWS for determining prevailing wages, further reinforcing the Department's continued reliance on this dataset.

That said, the OEWS survey is not specifically designed to serve these programs. For one thing, "the OEWS survey captures no information about differences within the [occupational] groupings based on skills, training, experience or responsibility levels of the workers whose wages are being reported"¹⁰⁰—the factors the INA requires the Department to rely on in setting prevailing wage levels.¹⁰¹ Relatedly, "there are factors in addition to skill level that can account for OEWS wage variation for the same occupation and location."¹⁰² Further, the geographic areas used by BLS to calculate local wages do not always match up exactly with the "area of employment" for which wage rates are set, as that term is defined by the INA for purposes of the H-1B program.¹⁰³ So while the OEWS survey is the best available source of wage data for the Department's purposes, and the Department is proposing to continue using it as the data source, the Department's use of the OEWS data must be done in a way that aligns with the requirements in the INA.

Because the wage methodology will, by statute, be used to establish the prevailing wage for the H-1B program and highly skilled workers that are the beneficiaries of PERM applications, as discussed above, the INA's definition of "specialty occupation" is relevant to how the wage levels are set using the OEWS wage survey. The survey categorizes workers into occupational groups defined by the SOC system, a federal statistical standard used by federal agencies to classify workers into occupational categories for the purpose of collecting, calculating, or

disseminating data.¹⁰⁴ An informative source on the duties and educational requirements of a wide variety of occupations, including those in the SOC system, is the Department's Occupational Outlook Handbook (OOH), which, among other things, details for various occupations the baseline qualifications needed to work in each occupation. A review of the OOH shows that only a portion of the workers covered by many of the occupational classifications used in the OEWS survey likely have levels of education and experience similar to those of H-1B workers in the same occupation.¹⁰⁵ Some share of workers in these classifications do not have the education or experience qualifications necessary to be considered similarly employed to specialty occupation workers. Because the INA requires the prevailing wage levels for the H-1B, H-1B1, and E-3, and PERM programs to be set based on the wages of U.S. workers based on the levels of education, experience, and supervision in the relevant occupation, the Department must take this into account when using OEWS data to determine prevailing wages.

For example, a common occupational classification in which employers seek to employ H-1B nonimmigrants is Software Developer.¹⁰⁶ The OOH's entry

for Software Developer notes that Software Developers *typically* have a bachelor's degree.¹⁰⁷ In other words, while typical, a bachelor's degree-level education, or its equivalent, is not always a prerequisite for working in this occupation. Because a person without a specialized bachelor's degree can still be employed as a Software Developer, some portion of Software Developers captured by the OEWS survey are not similarly situated to H-1B workers because the baseline qualifications to enter the occupation based on the OOH do not match the statutory requirements for H-1B workers.

A similar analysis applies to the occupation of Registered Nurse (RN). According to the OOH, entry into the RN occupation may be achieved through a bachelor's degree in nursing (BSN), an associate's degree in nursing (ADN), or a diploma from an approved nursing program.¹⁰⁸ For prevailing wage purposes, the Department's methodology considers the broader population of RNs—including those with associate's degrees and diplomas—when determining the wages of U.S. workers who are similarly situated in terms of education, experience, and job duties.¹⁰⁹ In cases where an employer seeks a prevailing wage determination for a nursing position that requires higher qualifications, such as advanced practice or management roles, the prevailing wage determination may reflect the higher educational or experiential requirements, provided the employer demonstrates that such requirements are normal for the occupation and the position.¹¹⁰ This approach ensures that prevailing wage determinations for nursing occupations are aligned with labor market realities and statutory requirements.

A review of the OOH entries for the occupations in which H-1B nonimmigrants most commonly work demonstrates that most H-1B workers fall within SOC classifications that

¹⁰⁴ U.S. Bureau of Labor Statistics, Standard Occupational Classification, available at <https://www.bls.gov/soc/>.

¹⁰⁵ The five most common SOC codes represented in LCAs in FY 2024 were Software Developers (15-1252), Computer Systems Engineers/Architects (15-1299.08), Information Technology Project Managers (15-1299.09), Electronics Engineers, Except Computer (17-2072.00) and Software Quality Assurance Analysts and Testers (15-1253.00) FY 2024 LCA Performance data. These occupations accounted for approximately 47 percent of all LCA's filed in FY 2024.

For each of these occupations, for which data was available, at least some of the respondents to the BLS surveys underlying their data reported educational requirements below the baccalaureate threshold: Software Developers (5%—Associate's degree required); Computer Systems Engineers/Architects (68%—either a Post-secondary certificate or Associate's degree required); Information Technology Project Managers (43%—either a Post-secondary certificate or Associate's degree required); Electronics Engineers, Except Computer (14%—Associate's degree required); and Software Quality Assurance Analysts and Testers (35%—either a Post-secondary certificate or Associate's degree required). See, <https://www.onetonline.org/link/summary/15-1252.00>; <https://www.onetonline.org/link/summary/15-1299.08>; <https://www.onetonline.org/link/summary/15-1299.09>; <https://www.onetonline.org/link/summary/17-2072.00>; and <https://www.onetonline.org/link/summary/15-1253.00>, respectively.

¹⁰³ 8 U.S.C. 1182(n)(4)(A).

include some number of workers who would not qualify for employment in a specialty occupation. For instance, the OOH entries for Software Developers—an occupation accounting for over 32 percent of all certified LCAs¹¹¹—provides that a bachelor's degree is the *typical* level of education that most workers need” to become one. Computer Systems Analysts, which make up approximately 2.8 percent of all certified LCAs,¹¹² “typically need a bachelor's degree. . .”¹¹³ Moreover, O*Net does not differentiate between jobs that require bachelor's degrees in specific specialties and those that accept a general bachelor's degree. Because prevailing wages must reflect the wages paid to U.S. workers who are similarly employed—that is, those with comparable education, experience, and responsibility—the Department's analysis focuses only on the subset of U.S. workers in each occupation who would meet the statutory qualifications for H-1B employment, rather than the broader population included in OEWS wage data.¹¹⁴

Simply put, the universe of workers surveyed by the OEWS for some of the most common occupational classifications in which H-1B workers are employed is larger than the pool of workers who can be said to have levels of education and experience comparable to those of even the least skilled H-1B workers performing work within that occupational classification. Because this methodology will substantially apply to H-1B petitions and PERM applications for H-1B worker beneficiaries, to allow for a more direct comparison and

therefore set a more accurate prevailing wage, it would be inappropriate to consider the wages of the least educated and experienced workers in these occupational classifications in setting the prevailing wage levels. To conclude otherwise would place the Department at odds with one of the purposes of the INA's core wage protections—to prevent employers from using alien workers to depress wage levels, which in turn reduces pay and job opportunities for U.S. workers.

This consideration also demonstrates the problems with the existing wage levels. As noted above, the Department's first wage level is currently set by calculating the mean of the bottom third of the OEWS wage distribution. Because the majority of LCAs receive a Level I or II wage, the wages for many H-1B workers are set based on a calculation that takes into account wages paid to workers who almost certainly would not qualify to work in a “specialty occupation,” as defined by the INA.¹¹⁵ The Department has noted previously that “workers in occupations that require sophisticated skills and training receive higher wages based on those skills.”¹¹⁶ As a worker's education and skills increase, his wages are expected to as well.¹¹⁷ For that reason, it is likely that workers at the lowest end of an occupation's wage distribution generally have the lowest levels of education, experience, and responsibility in the occupation. In consequence, if the occupation by definition includes workers who do not have the level of specialized knowledge required of H-1B workers, because of the prevalence of Level I and Level II wages assigned to LCAs at the very bottom of the wage distribution should be discounted in determining the appropriate baseline along the OEWS wage distribution to establish the entry-level wage under the four-tiered wage structure. Yet the existing wage structure makes such

workers a central component of the prevailing wage calculation.¹¹⁸

Similarly, the current Level IV wage is set by calculating the mean of the upper two-thirds of the wage distribution. That means that the wage level provided for the most experienced and highly educated H-1B workers is determined, in part, by taking into account a sizeable number of workers who do not even make more than the median wage of the occupation. The Department is concerned that workers making less than the median wage of the occupation are unlikely to possess commensurate experience, education, and requirements for supervision as are the alien workers who would be regarded as typical of Wage Level IV. The Department's analysis of OEWS wage distributions confirms that the current Level IV methodology includes a substantial share of workers whose wages—and likely qualifications—fall below what would be expected for the most advanced roles, thereby undermining the intended purpose of the highest wage tier.

The same reasons for discounting a portion of the workers at the bottom of the OEWS wage distribution in order to compute appropriate entry-level wages, based on the fact that such workers are not similarly employed to even the least skilled H-1B workers, also applies to the wages for the EB-2 immigrant visa preference classification and the E-3 and H-1B1 nonimmigrant programs, for which the Department also uses the four-tier prevailing wage structure.

The E-3 and H-1B1 classifications, like the H-1B classification, require that the alien work in a specialty occupation.¹¹⁹ Thus these programs' relation to the OEWS wage data is essentially identical to that of the H-1B program. Although E-3 and H-1B1 workers may not necessarily be concentrated in the same occupational categories as H-1B workers, the statutory requirement that they be employed in specialty occupations

¹¹⁴ The Occupational Information Network (ONET), developed by the U.S. Department of Labor, provides detailed information on the knowledge, skills, abilities, education, and work activities associated with occupations classified under the Standard Occupational Classification (SOC) system. In the context of prevailing wage determinations, ONET is used by the Department to help assess the complexity and requirements of job duties, which informs the appropriate wage level assignment based on the education, experience, and supervision required for the position.

¹¹⁵ Indeed, even in the Department's original 2005 guidance setting the current prevailing wage methodology, the Department observed that “[e]mployer requests for foreign workers are frequently for fully qualified workers who possess special skills. Wage Level I would not be assigned in those situations.” See Employment and Training Administration, Prevailing Wage Determination Policy Guidance for Nonagricultural Immigration Programs 6 (Mar. 1, 2005), available at <https://www.eila.org/files/o-files/view-file/84809966-67A1-4645-95CB-CB8F826C1F3C>.

¹¹⁶ Wage Methodology for the Temporary Non-Agricultural Employment H-2B Program, Part 2, 78 FR 24047, 24051 (Apr. 24, 2013).

¹¹⁷ See Bureau of Labor Statistics, Learn more, earn more: Education leads to higher wages, lower unemployment, available at <https://www.bls.gov/careeroutlook/2020/data-on-display/education-pays.htm>.

¹¹⁸ For example, the occupation of Software Developers, which accounts for a large number of H-1B workers, does not, as explained above, require the same degree of specialized knowledge as a baseline entry requirement as does the INA's definition of “specialty occupation.” Yet approximately 10 percent of all LCAs filed with the Department for software developer positions classify those positions as entry-level, meaning that under the current wage levels the wages paid to such specialty occupation workers are calculated based, at least in part, on the wages paid to some workers who do not have comparable specialized knowledge and expertise. This outcome directly contravenes the INA's requirement that H-1B workers be paid wages commensurate with the wages paid to U.S. workers with similar levels of education, experience, and responsibility.

¹¹⁹ See 8 U.S.C. 1184(i).

means they must possess comparable levels of skill, specialization, and responsibility. As such, the level of skill, specialization, and responsibility required for E-3 and H-1B1 positions is often comparable to that required for H-1B positions. Applying the same prevailing wage structure across these classifications ensures consistency in how the Department protects U.S. workers and prevents employers from selecting among visa categories based on wage-setting advantages rather than legitimate labor needs.

As for the EB-2 classification, the reasons for discounting the lower end of the OEWS wage distribution for setting the baseline to establish an entry-level wage for the classification are even more apparent than they are for the specialty occupation programs. Under the INA, the EB-2 classification applies to individuals who are “members of the professions holding advanced degrees or their equivalent or who because of their exceptional ability in the sciences, arts, or business, will substantially benefit prospectively the national economy, cultural or educational interests, or welfare of the United States.”¹²⁰ DHS regulations, in turn, define an “advanced degree” as any United States academic or professional degree or a foreign equivalent degree above that of a bachelor’s degree. A United States bachelor’s degree or a foreign equivalent degree followed by at least five years of progressive experience in the specialty shall be considered the equivalent of a master’s degree. If a doctoral degree is customarily required by the specialty, the alien must have a United States doctorate or a foreign equivalent degree.¹²¹

The regulation goes on to define “exceptional ability” to mean “a degree of expertise significantly above that ordinarily encountered in the sciences, arts, or business.”¹²²

As is the case for H-1B nonimmigrants, the baseline, minimum qualifications that an EB-2 immigrant must possess exceed the educational and experiential requirements the OOH describes as generally necessary to enter some of the most common SOC occupational classifications in which EB-2 immigrants work. For example, the most common occupation in which PERM labor certifications—of which applications for EB-2 immigrants represent a substantial share—are sought is Software Developers, which accounts for nearly 21 percent of all

approved PERM applications.¹²³ As already noted, according to the OOH, a bachelor’s degree is the “[t]ypical level of education” for Software Developers.¹²⁴ A master’s degree, generally a requirement for obtaining EB-2 immigrant status, is therefore substantially above the typical, baseline qualifications needed to work as a Software Developer. Similarly, a Software Developer who satisfies the regulatory definition of “exceptional ability” would be, ipso facto, more highly skilled than the typical entry-level-worker in that occupation. This pattern holds for most of the top occupations into which PERM applications fall.¹²⁵

By contrast, EB-3 immigrants—who may qualify as “skilled workers” (requiring at least two years of training or experience) or “professionals” (holding a bachelor’s degree)—do not necessarily exceed the baseline qualifications for many of these occupations to the same degree as EB-2 workers. For example, in occupations where a bachelor’s degree is the typical requirement, EB-3 professionals align more closely with the median qualifications described in the OOH, while EB-3 skilled workers may fall below that threshold in some cases. Accordingly, while the Department’s methodology accounts for differences in education and experience across visa categories, prevailing wage levels for EB-3 workers should reflect that these workers are not uniformly as specialized as EB-2 workers, even though they must still meet statutory requirements and should not be paid wages that undercut similarly employed U.S. workers.

Accordingly, because EB-2 workers are required to possess qualifications that exceed those of the average worker in these occupations, it is appropriate to set their prevailing wage levels higher on the wage distribution to reflect their advanced education, experience, and skill.

In sum, the eligibility criteria established by the INA for most of the immigrant and nonimmigrant programs to which the Department’s prevailing

wage levels apply set a higher baseline for the minimum qualifications an alien must possess than the minimum qualification requirements that exist for U.S. workers generally in most of the occupations in which these aliens most commonly work. The H-1B, H-1B1, E-3, and EB-2 classifications are for workers with specialized knowledge and skills and/or advanced degrees.¹²⁶ Because the prevailing wage levels should take into account the experience, education, and level of supervision of occupational classifications, to ensure that those prevailing wage rates are an appropriate wage floor for positions that require specialized knowledge and skills and/or advanced degrees, the prevailing wage rates should be formulated based on the wages paid to workers who similarly possess specialized knowledge and skills in their occupations. Given that not every worker in a given OEWS occupation is likely to meet that standard, and that workers at the lower end of the wage distribution are also likely to be the workers with the lowest levels of education and experience, the Department has determined it is appropriate to discount the lower portion of the OEWS distribution in setting the wage levels. The Department should instead identify where within the distribution workers are to be found who possess the same kinds of specialized education and experience possessed by aliens working in the H-1B, H-1B1, E-3, and EB-2 classifications. The wages paid to those U.S. workers can serve as the basis for appropriately adjusting the prevailing wage levels to ensure the employment of alien workers does not adversely affect the wages and job opportunities of U.S. workers. Although the EB-3 category is not included in this analysis because its minimum qualifications for skilled workers or professionals with a bachelors’ degrees do not uniformly exceed the baseline requirements for many occupations, the Department notes that some EB-3 workers may also qualify for H-1B, H-1B1, or E-3 status, and vice versa. For this reason, and because EB-3 accounts for a small share of PERM applications, the Department applies the same prevailing wage structure to EB-3 to avoid creating incentives for employers to select visa categories based on lower wage

¹²⁶ The Department notes that its assessment of the appropriateness of adjusting the prevailing wage levels in the manner described by this rule with respect to the EB-3 classification is governed by distinct considerations, which are described more fully below.

¹²⁰ 8 U.S.C. 1153(b)(2)(A).

¹²¹ 8 CFR 204.5(k)(2).

¹²² *Id.*

thresholds rather than legitimate business needs.

The Department recognizes that applying a unified prevailing wage structure may result in higher wage requirements for some EB-3 positions that do not require the same level of education or specialization as H-1B or EB-2 roles; however, particularly given the prevalence of higher skilled workers in H-1B and PERM, maintaining a consistent wage framework across programs is necessary to prevent program shopping and to uphold the statutory requirement that alien workers be paid at least the prevailing wage for similarly employed U.S. workers, particularly in occupations where job duties and responsibilities may overlap despite differing formal entry requirements.

3. Adverse Effects of Current Prevailing Wage Levels

This section evaluates the comprehensive analysis that the Department has undertaken to understand, assess, and evince the deleterious effects that the current prevailing wage methodology has had on U.S. workers' wages and working conditions. This analysis includes an extensive review of the economic and programmatic data, qualitative evidence consisting of reports and investigations into the H-1B program, and litigation. Based on the evidence, the Department believes that the current prevailing wage methodology sets prevailing wages at levels that may not adequately reflect the Department's statutory requirements.

a. Economic Analysis of Adverse Effects on the Wages of U.S. Workers

As one research organization noted in a recent study of the H-1B program, “[t]he evidence strongly suggests that the H-1B program is not working as intended.”¹²⁷ The study pointed out that “in certain occupations, H-1B holders earn significantly less than their American counterparts.” The Department's data also indicates that the majority of H-1B positions are concentrated in the lower wage tiers. Sixty-three percent of certified LCAs in FY 2024 were for positions classified at wage levels I and II—levels typically associated with entry-level roles.¹²⁸

¹²⁷ Frei, Alexander P., *Rethinking the H-1B Visa Program: A Data-Driven Look at Structural Failures and the High-Skill Illusion*, Heritage Foundation (Aug. 8, 2025), available at <https://www.heritage.org/border-security/report/rethinking-the-h-1b-visa-program-data-driven-look-structural-failures-and#>.

¹²⁸ Office of Foreign Labor Certification, H-1B Temporary Specialty Occupations Labor Condition

This wage distribution raises concerns that the program is being used to fill mostly lower-paid positions and not serving its intended purpose of protecting U.S. workers from adverse effects by preventing employers from using alien workers to undercut wages and job opportunities for American workers.¹²⁹

The Department conducted a comprehensive analysis comparing certified LCA wages¹³⁰ to OEWS data,¹³¹ matched by SOC code, state, and year. This analysis is documented below, in Section II.C.1. This comparison revealed that the average wage offered to H-1B workers was approximately \$10,191 lower than the OEWS average wage for workers for similarly classified occupations. This differential may reflect a range of factors, including experience levels, geographic variation, and employer-specific compensation practices. The disparity is even more pronounced in computer-related occupations, where the average wage gap was \$10,972. These findings suggest that employers are leveraging the H-1B program to access a lower-cost labor pool, even in occupations that nominally require high levels of skill and education. This underpayment further supports the Department's conclusion that the current prevailing wage structure does not adequately reflect market wages and is in urgent need of reform. These same labor market dynamics are relevant to the PERM program, where underpayment of alien workers can similarly distort hiring incentives and erode labor standards. Using the same wage levels in both programs ensures that employers cannot use the permanent labor certification process to institutionalize wage disparities that originated in the temporary visa context.

Additionally, the Department's current prevailing wage methodology permits employers to classify a substantial share of H-1B positions, particularly in high-demand occupations such as software development, as “entry-level.” Because

Program—Selected Statistics in FY 2024, available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

¹²⁹ See 8 U.S.C. 1101(a)(15)(H)(i)(b); 8 U.S.C. 1184(i)(1)(A) (describing the term “specialty occupation” as requiring “theoretical and practical application of a body of highly specialized knowledge” among other educational requirements).

¹³⁰ See generally Office of Foreign Labor Certification, H-1B Temporary Specialty Occupations Labor Condition Program—Selected Statistics, available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

¹³¹ See generally U.S. Bureau of Labor Statistics, *Occupational employment and wage statistics* (BLS Occupational Employment Statistics), available at <https://www.bls.gov/oes/>.

the current methodology places Level I wages near the bottom of the OEWS distribution, which includes workers who do not possess the specialized education and experience required for H-1B eligibility, Level I wages are often set far below what specialized H-1B workers and comparably qualified workers would earn. Compounding this issue is the existence of a large pool of alien workers willing to accept lower wages because the cost of living in their home countries is substantially lower and other factors that make U.S. wages attractive even at discounted rates. This dynamic exerts downward pressure on wages for U.S. workers, as employers can classify H-1B roles as entry-level and thus pay wages that do not reflect the qualifications of the alien worker. Moreover, if the same employer hires all similarly qualified workers at the entry-level prevailing wage, then the “actual wage paid” by the employer would be the same as the prevailing wage. This structural flaw creates a systemic cost advantage for hiring H-1B workers over domestic talent, effectively enabling employers to substitute lower-paid alien workers for U.S. workers and institutionalizing wage arbitrage under the guise of legal compliance.

The adjustment to Level IV, in turn, was based on statistical modeling of OEWS wage distributions and is intended to correct for the current methodology's mismatch of mid-level and high-level earners with prevailing wage levels that did not properly compare them to U.S. earners of the same experience, education and level of supervision. This caused dilution of the wage standard for top-tier talent and failed to reflect the wages of workers with the greatest levels of education, experience, and responsibility. By revising the Level IV wages to better reflect the actual compensation of U.S. workers with equivalent qualifications, the Department aims to restore labor market fairness and ensure that the employment of alien workers does not suppress wages or displace U.S. workers.

b. Other Relevant Evidence, Reports, Investigations, and Litigation Demonstrating Adverse Effects of Current Prevailing Wages

The Department's analysis is grounded in its own administrative data and statutory responsibilities. However, other evidence, including investigative reporting and academic research, has supported many of the Department's conclusions.

Academic research indicates that the influx of low-cost alien workers into a labor market suppresses wages, and this

effect increases significantly as the number of alien workers increases. In particular, some empirical research, when inputted into a rough simulation, suggests that a substantial increase (more specifically, a 10 percent increase) in the labor supply due to the presence of alien workers could reduce the wages of the average U.S. worker by 3.2 percent, a rate that grew to 4.9 percent for college graduates.¹³² The current prevailing wage structure distorts hiring incentives and compensation by setting entry-level wages far below market rates for positions requiring specialized skills, which incentivizes employers to classify jobs at the lowest permissible level. This NPRM proposes to recalibrate wage levels to better reflect the education, experience, and responsibility required for H-1B positions, thereby reducing the opportunity for wage arbitrage.

The Department has also reviewed evidence indicating that the intent of the H-1B “actual wage” requirement can be undermined when end-clients obtain labor through outsourcing or staffing firms (sometimes called “job shops”). In such arrangements, the H-1B employer of record is the outsourcing firm, not the end-client; consequently, the “actual wage” analysis compares the H-1B worker’s pay only to other workers at the outsourcing firm—who may be predominantly workers with H-1B visas and paid at or near prevailing-wage floors—rather than to the higher-paid, similarly employed U.S. workers at the end-client company. Government reports and public reporting have documented this dynamic and show it can facilitate large pay gaps between outsourced H-1B workers and client-site employees performing substantially similar functions.¹³³ Although this

rulemaking would not directly change how “actual wage” determinations are applied in third-party placement scenarios, by raising prevailing wage levels it would increase the wage floor and, in turn, reduce the magnitude of these gaps in cases where outsourcing companies pay at or near the prevailing wage. Another report revealed that certain outsourcing firms exploited the H-1B registration system by submitting multiple registrations for the same beneficiaries, thereby gaining an unfair advantage in the selection process.¹³⁴ This report demonstrated how some companies would manipulate the lottery by flooding the system with duplicate or coordinated entries for individual workers, often through affiliated entities or shell companies. This practice significantly increased their odds of selection while disadvantaging employers who followed the rules and submitted a single registration per candidate. The result was a distorted allocation process that undermined the integrity of the H-1B program and enabled a small group of companies to cannibalize access to scarce visa slots. Although registrations do not represent actual employment and do not capture wages, evidence that the system can be gamed—even outside the Department’s direct purview—despite the availability of ample entry-level U.S. workers suggests that some employers view H-1B workers as a lower-cost alternative. This underscores the importance of ensuring that prevailing wage levels are set appropriately to eliminate incentives for wage arbitrage and protect U.S. workers from being undercut.

Between 2019 and 2025, a significant share of LCAs were filed in technology-related occupations, particularly software engineering roles. During this same period, major technology firms and outsourcing companies that are among the largest users of the H-1B program also conducted large-scale layoffs of U.S. workers. A 2023 study by the Economic Policy Institute found that the top 30 H-1B employers laid off at least 85,000 workers in 2022 and early 2023 while simultaneously hiring 34,000 H-1B workers.¹³⁵ And recently,

were paid salaries that were tens of thousands of dollars less”).

¹³⁴ Bloomberg News, *Outsourcing Firms Monopolize H-1B Visa Program*, BLOOMBERG (Aug. 13, 2024), available at <https://unity-connect.com/our-resources/news/bloomberg-reveals-outsourcing-firms-monopolize-h-1b-visa-program/>.

¹³⁵ Daniel Costa and Ron Hira (2023), *Tech and outsourcing companies continue to exploit the H-1B visa program at a time of mass layoffs*, Economic Policy Institute (Apr. 11, 2023), available at <https://www.epi.org/blog/tech-and-outsourcing-companies-continue-to-exploit-the-h-1b-visa-program-at-a->

in a lawsuit brought by a class of current and former employees of a significant employer of H-1B workers, a federal jury found that the employer’s reliance on employees with H-1B status unlawfully discriminated against non-Indian and non-South Indian employees.¹³⁶

And while the data indicate that H-1B workers are rapidly replacing U.S. workers, especially in STEM-related fields, recent U.S. graduates in computer science and engineering are facing elevated unemployment and underemployment rates. Unemployment rates for recent graduates in these fields were 7.5% and 6.1%, respectively, with underemployment rates exceeding 17%.¹³⁷ For example, employment for domestic software developers aged 22–25 declined by nearly 20% compared to its peak in late 2022, suggesting that qualified U.S. workers are struggling to access opportunities in sectors heavily reliant on H-1B labor.¹³⁸

This trend is particularly pronounced in the technology sector, where alien workers plays an outsized role in shaping labor market dynamics.¹³⁹ A 2025 report found that two-thirds of Silicon Valley tech workers are foreign-born, underscoring the extent to which the region’s workforce is shaped by

time-of-mass-layoffs-the-top-30-h-1b-employers-hired-34000-new-h-1b-workers-in-2022-and-laid-off-at-least-85000-workers/.

¹³⁶ See *Palmer v. Cognizant Tech. Sols. Company*, No. 17–cv–6848, 2025 WL 3154720 (C.D. Cal. Oct. 6, 2025). The jury found that the employer had “engaged in a pattern or practice of intentional discrimination against” both “non-South Asian employees on the basis of race who were terminated from the bench,” and “non-Indian employees on the basis of national origin who were terminated from the bench.” *Id.* In a subsequent ruling, the court found, based on expert evidence, that “non-South Asians were approximately seven times more likely to be subject to an involuntary termination.” *Palmer v. Cognizant Tech. Sols. Company*, No. 17–cv–6848, 2025 WL 3496682, 24 (C.D. Cal. Dec. 5, 2025). The analysis also showed that “non-South Asian and non-Indian employees were 8.4 more likely to be terminated from the bench than South Asian and Indian employees.” *Id.* at 27. The court also found that Cognizant replaced U.S. employees with visa-holding, South Asian employees “with a lower grade and experience.” *Id.* at 31.

¹³⁹ Based on the LCA Performance Data, which is cited throughout this NPRM, over 50% of the LCA’s certified by the Department in FY 2024 were for Computer and Information Technology occupations.

¹³² Borjas, George J. (2003). “The Labor Demand Curve Is Downward Sloping: Reexamining the Impact of Immigration on the Labor Market.” *The Quarterly Journal of Economics*, 118(4), 1335–1374.

¹³³ See U.S. Gov’t Accountability Office, *H-1B Visa Program: Reforms Are Needed to Minimize the Risks and Costs of Current Program* 20 (2011), <https://www.gao.gov/assets/320/314501.pdf>, at 52–56 (raising concerns that the H-1B program lacks an explicit mechanism for holding employers accountable when they obtain H-1B workers through a staffing company); Ron Hira and Daniel Costa, *Economic Policy Inst., The H-1B Visa Program Remains the “Outsourcing Visa”* (Mar. 31, 2021), <https://www.epi.org/blog/the-h-1b-visa-program-remains-the-outsourcing-visa-more-than-half-of-the-top-30-h-1b-employers-were-outsourcing-firms/> (noting that “H-1B outsourcing companies . . . replace incumbent U.S. workers with H-1B workers and typically pay their H-1B workers the lowest wages permitted by law, far below market wage rates”) and that large companies have “[laid] off hundreds of their well-paid employees and contract[ed] with major outsourcing firms . . . to replace those employees with H-1B workers who

immigration and the potential for wage-setting distortions in occupations with high concentrations of H-1B workers.¹⁴⁰ The pool of U.S. workers with relevant credentials has grown rapidly. Bachelor's attainment is higher among younger cohorts, and Computer and Information Sciences (CIS) degree completions more than doubled over the past decade—from about 55,000 in 2013–2014 to roughly 108,500 in 2021–2022.¹⁴¹ Including Master's (24,514 to 51,338 in the same period) and Doctoral (1,982 to 2,790 in the same period) degrees, the number of degrees conferred in the U.S. increased from 81,767 to 162,658, nearly doubling during that time. Another factor, related to some of the layoff activity of larger technology firms in recent years, has been the impact of generative AI, which a number of early studies indicates is decreasing demand for lower-level technology workers.¹⁴² So, while the potential supply of workers in occupations that are central to the programs affected by prevailing wages have increased, almost doubling since 2014, dramatic improvements in technology have and will continue to decrease demand, especially at the entry-level, for workers in these fields. Indeed, ADP, a leading source of payroll data, reported that employment of software developers, the single largest

occupational category in the H-1B system, was lower in 2024 than it was in 2018.¹⁴³ ADP data show that employment of software developers peaked in 2022 but declined sharply thereafter, falling below 2018 levels by 2024.¹⁴⁴

Another factor that shapes the nature of the labor market for workers who are subject to the prevailing wages at issue in this NPRM is their proclivity, due to being concentrated in technology or management occupations, to have more opportunities for remote work. According to BLS data as of September 2025, while 22.5% of workers reported working some or all hours remotely, Management, professional and related occupations reported 36.5%, while Computer and mathematical occupations reported 65.7%.¹⁴⁵ By contrast, Farming, fishing and forestry occupations reported a telework rate of 5.7%, far lower than average. With respect to other Specialty Occupations, the likelihood of teleworking strongly correlates with educational attainment, indicating in general that workers with higher levels of education—such as those in management, professional, and technical fields—are more likely to work in jobs that permit telework.¹⁴⁶ Teleworking increases the geographical scope of a particular workplace in which a worker can work, which the Department believes contributes not only to guest workers in these programs being able to seek employment at a broader array of employers, but also contributes to labor market mobility on the part of U.S. workers, which makes for more liquid and efficient labor market than in workplaces with fewer telework opportunities.¹⁴⁷

The data are not an exhaustive analysis of all of the impacts of guest worker programs on the U.S. workforce.¹⁴⁸ They do demonstrate the prevalence of guest workers, and indicia of how this prevalence may be resulting in adverse impacts on the U.S. workforce, in addition to the extensive

analysis that the Department has conducted. In turn, this suggests that U.S. workers are vulnerable to a prevailing wage methodology that is set too low, or set without being aligned with labor market data, as the Department contends the current methodology is.¹⁴⁹ Without regulatory intervention, similar instances will continue to erode the integrity of the labor certification process and undermine public confidence in the Department's stewardship of the H-1B and PERM programs.

In short, contrary to the H-1B program's goals, prevailing wage levels that, in many cases, do not accurately reflect the wages of comparable U.S. workers have permitted some firms to displace, rather than supplement, U.S. workers with H-1B workers. While allowing firms to access high-skilled workers to fill specialized positions can help U.S. workers' job opportunities in some instances, particularly when there are actual labor shortages in a certain industry or occupation, the benefits of this policy diminish significantly when the prevailing wage levels do not accurately reflect the wages of similarly employed workers in the U.S. labor market. The resulting distortions from a prevailing wage methodology untethered from rigorous mathematical analysis allow some firms to replace qualified U.S. workers with lower-cost alien workers, defeating the purpose of the INA's wage protections and suppressing the wages for U.S. workers who remain employed in occupations saturated by H-1B workers.

These concerns are not new. Congress has long recognized the need to protect U.S. workers from adverse effects associated with the employment of alien workers, as reflected in the statutory language of the Immigration and Nationality Act (INA). See 8 U.S.C. 1182(a)(5) (labor certification and qualifications for certain immigrants), 1182(n) (labor condition application), 1182(p)(2) (professional athletes), 1182(t) (nonimmigrant professionals). The Department has a statutory obligation to ensure that prevailing wage determinations are consistent with this mandate, and therefore this rulemaking is a necessary step toward restoring balance in the labor market and ensuring that alien workers are used to supplement—not displace—the domestic workforce.

¹⁴⁹ Employers seeking to employ H-1B workers must attest on the Labor Condition Application (Form ETA-9035) that the employment of the foreign worker “will not adversely affect the wages and working conditions of workers in the United States similarly employed.” 8 U.S.C. 1182(n)(1)(A)(ii); see also 20 CFR 655.731(a)(1).

¹⁴⁸ See also, *Macks USA, Inc. v. United States Dep't of Lab.*, No. 23–CV–7476 (JGK), 2024 WL 4728902, at *12 (S.D.N.Y. Nov. 8, 2024) (affirming award of over \$100,000 of back wages to an employee who was improperly denied wages due to being “benched”).

The NPRM is based on a substantial body of economic and administrative data, including labor market trends, wage survey data, and evidence of program outcomes that the Department believes evince adverse outcomes towards U.S. workers. It reflects a reasoned policy judgment that the current wage structure does not adequately reflect the wages paid to U.S. workers similarly employed in comparison to the wages paid to H-1B workers, and concludes that reform is necessary to fulfill the Department's statutory mandate. After careful consideration of these data, and the potential economic impacts of the proposed changes, the Department has developed and now proposes a methodology that would better protect U.S. workers from unfair competition created by the importation of alien workers, as required by law. Indeed, the H-1B crisis has prompted the Equal Employment Opportunity Commission to issue guidance warning employers that discriminating *in favor of* H-1B applicants or against American-born workers is illegal.¹⁵⁰

This rulemaking is designed to ensure that the H-1B and related programs operate in a manner that is fair, transparent, and protective of U.S. workers, while still allowing employers to access alien workers where appropriate wages are paid.

C. Identifying the Appropriate Prevailing Wage Levels

1. Revisions to the Existing Methodology

The Department proposes to revise the existing methodology used to determine prevailing wage levels in the H-1B, H-1B1, E-3, and PERM programs. Specifically, the Department proposes adjusting the wage percentiles used to define Levels I and IV and refining the use of BLS data to ensure that prevailing wages more accurately reflect the wages paid to U.S. workers similarly employed to ensure that the employment of alien workers does not

adversely affect the wages and working conditions of U.S. workers.

In order to determine the prevailing wage percentiles that most closely satisfy the statutory requirements, the Department conducted an extensive statistical labor market analysis using historical data involving the immigrant and non-immigrant guest worker programs that are the subject of this NPRM. At a high level, the Department developed the proposed prevailing wage levels to align workers in the relevant programs with comparable labor market outcomes for the U.S. workforce as a whole. As part of its analysis, the Department finds a wide (over \$19,000 per worker on average) discrepancy between the wages earned by U.S. workers in the same occupations and locations and the prevailing wage levels assigned to corresponding LCA applicants. The Department's proposed adjustments would eliminate this gap using statistically grounded recalibration of wage percentiles.

The Department proceeded in three steps: (1) to analyze aggregate LCA data to understand the prevailing wages, actual wages, and occupational composition of H-1B workers over the last five years; (2) to compare LCA data with OEWS data, the most reliable and comprehensive publicly available data that reflects overall labor market compensation on an occupational basis, to determine the going wage of occupations for U.S. workers adjusted for region; and (3) to use this quantitative analysis to determine wage levels that would re-align the H-1B wage levels with corresponding U.S. workers. At this final step, the Department also relied on qualitative evidence and its long-standing expertise administering these programs, particularly in setting Wage Levels I and IV.

a. Step 1—The Department's Analysis of LCA Data

As has been described above, the first step for the H-1B petition process (and for other guest worker programs, although this statistical analysis focused exclusively on H-1B petitions, the most numerous of all programs that use LCAs in terms of both number of LCAs filed and number of individuals employed) is for the employer to submit an LCA to the Department. These LCAs are the best data of labor market information for what prevailing wage applies to any particular H-1B employee, what wage they are offered by their employer, and the SOC code that describes their occupation. In the aggregate, they are the best data source for labor market information regarding H-1B

occupations. These LCAs are made under penalty of perjury¹⁵¹ by the hiring entity, who must attest that "to the best of my knowledge, the information contained therein is true and accurate." For purposes of this analysis, the Department used all LCA data for FY2020–2025.¹⁵²

The Department took extensive measures to ensure that the LCA data was useable and reliable. These measures included various steps to clean the data, such as removing trailing annotations and any decimal artifacts introduced during earlier processing, trimming whitespace, and dropping entries that clearly did not match the SOC 6-digit code structure. For example, in one instance, a SOC code was entered as "151252"; this was corrected to "15–1252." The Department discarded a handful of data points that had clear errors.

The LCAs contain several data points that the Department used in its analysis. These include: (1) the SOC (O*NET/OEWS Code);¹⁵³ (2) Number of Workers;¹⁵⁴ (3) State/District/Territory;¹⁵⁵ (4) Wage Rate Paid to Nonimmigrant Workers;¹⁵⁶ (5) the Prevailing Wage Rate;¹⁵⁸ (6) Wage Level.¹⁵⁹ As is standard practice in any statistical analysis, the Department eliminated a small number of outliers,¹⁶⁰ and observations that had missing data.

To illustrate the Department's process, consider an example Labor Condition Application (LCA) for a Data Scientist. From each LCA, the Department extracted key data elements,

¹⁵¹ LCA Section J. Additionally, the employer must "develop sufficient documentation to meet its burden of proof with respect to the validity of the statements made in its LCA and the accuracy of information provided." LCA Section J(B).

¹⁵² For FY 2025, the Department used all available data, which at the time of this NPRM included but ended with Q3.

¹⁵³ LCA Box B(2).

¹⁵⁴ LCA Box F(a)(1). Note that, as explained above, an LCA applicant can file an LCA on behalf of multiple putative H-1B/H-1B employees.

¹⁵⁵ LCA Box F(a)(8).

¹⁵⁶ LCA Boxes F(a)(10) and 10a. The field on the LCA for the wage rate offered to the nonimmigrant worker has a field labeled "From" and "To" with "From" being the lower range and "To" the upper range. Since filling out the upper range is optional, only approximately 50% of LCAs have data in that field. Therefore, the Department used the number indicated in the "From" field as the sole datapoint from F(a)(10).

¹⁵⁷ To create a single comparable wage variable, the Department converted all forms of payment into annual pay using standard period multipliers. The Department performed this adjustment as needed for both the offered wage and the prevailing wage.

¹⁵⁸ LCA Boxes F(a)(11) and 11a.

¹⁵⁹ LCA Box F(13)(a).

¹⁶⁰ The Department removed observations that reported wages smaller than \$20,000 and larger than \$500,000.

¹⁵⁰ Equal Employment Opportunity Commission, Discrimination Against American Workers Is Against The Law, available at <https://www.eeoc.gov/discrimination-against-american-workers-against-law>. This guidance notes that discrimination in favor of visa guest workers (and against U.S. workers) is illegal, and can include discriminatory job advertisements (such as "H-1B preferred" job openings), disparate treatment (such as subjecting American-born workers to higher rates of termination for staying on "bench" status than visa guest workers), while observing that common business reasons such as customer or client preference, lower cost of labor, and beliefs regarding "work ethic" do not excuse an employer's decision to hire foreign workers over U.S. workers.

including the standard occupational code (SOC), number of workers, state of employment, offered wage, prevailing wage, and wage level. All wage values were standardized to annual amounts for consistency. The Department applied this process across more than 3 million LCAs filed between FY 2020 and FY 2025, cleaning the data to remove errors and outliers (e.g., wages below \$20,000 or above \$500,000) and ensuring accurate SOC coding. This standardized dataset formed the basis for the statistical analysis described below.

In this instance, the State/District/Territory would have been coded as Florida, based on Box 8; the Wage Rate Paid would have been coded as \$119,028 from Box 10; and the Prevailing Wage Rate would have been coded as \$75,691 from Box 11.¹⁶¹ This was done for over 3 million LCA's filed during the time period of FY2020–2025.

Using these data, the Department calculated that the average prevailing wage, for all LCAs from FY2020–2025, was \$111,717. The Department also calculated that the average wage rate paid to the beneficiaries of the same LCAs was \$121,908.¹⁶² In other words, the average LCA-program employee was paid an actual wage, and thus commanding, a \$10,191 premium over the prevailing wage level offered—a gap that indicates that the prevailing wage is set below the market value of comparable U.S. workers.

b. Step 2—Comparing the LCA Data to General Labor Market Data

The Department next compared the compensation paid to the beneficiaries of H–1B applications with the compensation paid to equivalent U.S. workers. To do this, the Department conducted a statistical analysis comparing the above LCA data with data for the U.S. workforce in general,

narrowed down to the same occupation and geographical region.

The best available data source for benchmarking the U.S. workforce is the OEWS,¹⁶³ which as explained above, is the most comprehensive and consistently administered analysis of labor market data that is indexed to occupational codes. The OEWS data reflects labor market conditions for the U.S. workforce as a whole, and not just non-immigrant programs. For each occupation—classified using the same SOC codes that appear in LCAs—the OEWS reports mean wages, which can be adjusted for geographic region, including state.

For example, for Software Developers (SOC Code 15–1252), which is the most common SOC code for which an LCA was sought between FY2020–2025, the average wage in California is \$170,910; for Alabama, it is \$113,020, and for Wisconsin, it is \$103,360.¹⁶⁴ As was explained above, the LCAs also report SOC Code and state—the same data that any user can input into the OEWS system to receive an average wage for workers in that occupational classification and location.

To compare LCA data and the OEWS data, the Department coded each LCA with the corresponding mean wage reported by the OEWS, for the same occupation and state, to create an “apples-to-apples” comparison. So, for example, if a given LCA was for a Software Developer in the state of Alabama for FY2024, they would have been coded with \$113,020—the average annualized salary for the same occupation in the same place. This coding was done, in this exact same way, to millions of LCAs.

To return to the previous LCA example, the LCA was coded as a Data Scientist (SOC Code 15–2051), and was located in Florida, FY 2024. In the Department's analysis, this would have been coded using the corresponding

OEWS wage rate for the same SOC Code, state, and year, for an average wage of \$105,820.¹⁶⁵

While some LCA applicants' employees earned more and others less than the OEWS mean, the Department initially assumed these differences would offset across Wage Levels I–IV. In theory, if LCAs reflected a balanced distribution of job levels, the average offered wage should approximate the OEWS average for the occupation. However, LCAs are disproportionately concentrated at Level I and Level II—the lowest wage tiers—which are both set significantly below the median or average wage. This concentration is not unexpected, as employers often classify positions at these levels, and H–1B workers tend to be placed in roles designated as entry-level or lower-tier positions. In fact, 63 percent of LCAs certified in FY 2024 were at Level I or Level II, according to the Department's LCA performance data.¹⁶⁶ Because these levels are far below the OEWS mean, the aggregate wages of H–1B workers skew lower than the overall occupational average. While this rule does not alter how employers classify job levels, raising prevailing wage thresholds will help ensure that wage levels better reflect the qualifications required for specialty occupations and reduce incentives to select the lowest permissible wage level.

However, the average of the mean OEWS occupational salaries, across the LCAs, was \$130,219, which is slightly over \$9,000 higher than the wage rate paid, and over \$19,000 higher than the prevailing wage rate based on the current wage levels. This \$130,219 represents the average of all salaries by occupation, state, and fiscal year, that match with the millions of LCAs in the Department's data set. As is shown later, it was used as the Department's Benchmark Value¹⁶⁷ for setting the prevailing wage levels in Step 3 of the analysis.

c. Step 3—Using the Labor Market Analysis To Revise the Prevailing Wage System

¹⁶⁵ <https://www.onetonline.org/link/localwages/15-2051.00?st=FL>.

¹⁶⁶ See U.S. Department of Labor, Office of Foreign Labor Certification, Labor Condition Application Performance Data, FY 2024, available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

¹⁶⁷ This value is referred to as the Benchmark Value in the next subsection.

¹⁶¹ The Wage Level, II, is not visible in this image due to size limitations.

¹⁶² The Department acknowledges that LCA applicants must go through further processing, notably, in many cases the H–1B lottery, before they receive a visa, and that many LCA's ultimately do not receive work visas. However, the Department does not believe that this distinction matters for purposes of the analysis that it conducted. Many LCAs are for H–1B applicants who are cap-exempt, which means that the observation should be largely consistent with the ultimate visa grants. Regarding non-cap-exempt H–1B applicants, the Department has no reason to assume that the distribution of cap-exempt employees is different from the distribution of non-cap-exempt LCAs, but welcomes comment if any member of the public has data that indicate a significant discrepancy between these numbers.

¹⁶³ The nature and relevant history of the OEWS is explained in greater detail in Section I.D.

¹⁶⁴ These data are publicly accessible at <https://data.bls.gov/oesprofile/> and reflect data for May 2024, the most recently available data as of the time of this NPRM. For purposes of conducting its analysis comparing these data to the FY2020–2025 LCA data, the Department obtained historical BLS data and compared the BLS data of a specific year to the corresponding year wherein the LCA was received. This has led to an overall underestimate of the gap between compensation received by immigrants and non-immigrants bound by the prevailing wages, and U.S. workers, because it effectively does not account for inflation, as many of these workers do not commence work until the next fiscal year.

Given the existence of a variety of skill levels, occupations, and regions, the significant gap between the Benchmark Value and the average prevailing wage and wage paid data should not exist unless the LCA-program itself were causing a discrepancy. In other words, the average U.S. worker in the same occupation and region is commanding a nearly \$19,000 wage premium above what the similarly situated non-U.S. worker is required to be paid using the prevailing wage system, which, in many of the non-immigrant programs, such as the H-1B program, are restricted to individuals seeking to work in specialty occupations that should perhaps be commanding *higher*, not *lower* wages.

The Department believes that these significant discrepancies between labor market outcomes of U.S. workers, represented by the Benchmark Value, and the labor market outcomes of LCA-program employees specifically, as represented by the actual wages paid, and the prevailing wages that apply, indicates both the existence of a problem—that the wage discrepancy will adversely impact the wages of similarly employed U.S. workers—and the proposed solution—which is to

revise the prevailing wage structure to be more in line with the average wages earned by equivalent U.S. workers.

In order to align LCA-program wage rates with the general U.S. labor market, the Department seeks to set a prevailing wage level that yields an average, using the same mathematical approach as described above, that would be approximately the same as the average of the mean salaries of the typical LCA-program occupations. Using the Department's proposed revised prevailing wage methodology, which sets Wage Level I from the 17th to the 34th percentile; Wage Level II from the 34th to the 52nd percentile; Wage Level III from the 50th to the 70th percentile; and Wage Level IV from the 67th to the 88th percentile, the Department achieves this alignment, arriving at the Benchmark Value—and thus, approximately the same as if the Department drew a random sample of similarly-situated U.S. workers.

To identify these levels, the Department created a statistical model, using the known composition of the LCA-programs in terms of the same factors described above: wages, locations, and occupations, and used well-known statistical methods to set

prevailing wage levels that would result in an average prevailing wage level that was equal to the average of the mean salaries assuming the same composition as the LCA-program. Put differently, the model answered the following question: if the same employers with the same occupations, state locations, and wage levels, were to apply for the LCA-programs in the next fiscal year, as they did in the most recent fiscal year, what prevailing wage levels are needed to ensure that the average prevailing wage is the same as the Benchmark Value?

i. The Mathematics Behind Step 2 of the Department's Analysis

Numerical methods are computational techniques used to find approximate solutions to complex mathematical problems that lack closed-form solutions. For example, the equation ($x + y = 1$) cannot be solved uniquely, as (x) and (y) can take infinitely many values that satisfy the equation (*e.g.*, ($x = 0.5$, $y = 0.5$) or ($x = 1$, $y = 0$), etc.).¹⁶⁸ Similarly, the loss function, which reflects the difference between the predicted mean wage and the target mean wage W_{target} , is defined as:

$$\mathcal{L}(p_1, p_4) = \left| \frac{1}{N} \sum_{i=1}^N W_i(p_1, p_4) - W_{\text{target}} \right|.$$

Here, $W_i(p_1, p_4)$ is the interpolated wage for the (i)-th row based on the assigned percentiles, and (N) is the total number of rows.

The optimization uses the Broyden-Fletcher-Goldfarb-Shanno algorithm method, a gradient-based algorithm, to minimize the loss. Constraints are applied to ensure that:

$10 \leq p_1 < p_4 \leq 90$ and $p_4 - p_1 \geq 10$.

The initial values for (p_1) and (p_4) are set to 35 and 90,¹⁶⁹ respectively. These were approximately the values that the Department believed would achieve the policy goals for Wage Levels I and IV, respectively, (as discussed below) and also represented the same values that the Department set in a previous rulemaking. However, 35 and 90 did not create the solution; the solution they created was above the Benchmark

Value. Then, the Department applied the Broyden-Fletcher-Goldfarb-Shanno algorithm, which takes an initial "estimate" and repeatedly attempts to match that set of values to the desired solution, until eventually that is reached. After this optimization, the solution yields the optimized wage levels (p_1 , p_2 , p_3 , p_4), corresponding to Levels I–IV, which were 34, 52, 70 and 88, such that the solution approximately achieves the Benchmark Value. The final difference between the predicted mean and the target mean is reported as the result of the optimization.

As discussed below, this solution is not the only set of values that would allow the Department to match the Benchmark Value. The next section discusses the Department's rationale for setting Levels I and IV at the 34th and

88th percentile instead of sliding up or down the wage scale to achieve the Benchmark Value.

ii. The Department's Setting of Wage Level I to the 34th Percentile

As explained above, Wage Levels II and III are set arithmetically as required by the INA; Level II will be calculated by dividing by three, the difference between Levels I and IV, and adding the quotient to the computed value for Level I. Level III will be calculated by dividing by three the difference between Levels I and IV, and subtracting the quotient from the computed value for Level IV. Therefore, the Department effectively has to choose two wage

¹⁶⁸ To approximate these levels, the department combined Limited-memory Broyden-Fletcher-Goldfarb-Shanno, which is a quasi-Newton optimization algorithm with linear interpolation to estimate percentile wage levels (I–IV) that align with a target average wage defined by the data. The algorithm seeks to minimize the difference between the mean wage predicted by the assigned percentiles and the Benchmark Value. The

approach exploits the piecewise interpolation of percentile values and the properties of linear optimization. First, each row's wage is predicted based on its reported percentile wage distribution. Using the known percentiles 10, 25, 50, 75 and 90 for each occupation (SOC code), and a given percentile (t) (*e.g.*, 35th percentile for Level I), the wage at (t) is estimated using linear interpolation.

¹⁶⁹ The Department also ran the same simulation with the starting values and being set to 17 and 67, which correspond to current Levels I and IV. However, picking these numbers would result in Wage Levels at the 45th, 56th, 66th and 76th percentiles. The Department believes these levels fail to sufficiently differentiate from one another to be useful.

levels: Wage Level I and Wage Level IV.¹⁷⁰

The Department is proposing to increase Wage Level I from the 17th to the 34th percentile for a variety of reasons. To start, retaining Level I at the 17th percentile would have produced, under the statutory formula described above, a wage-level structure that was excessively skewed to the right, which would have been less granular, distorted, and less consistent with statutory requirements.¹⁷¹ More importantly, as the Department has explained in detail in Section II.B, many of the most common occupations in LCA programs, and especially in the H-1B program, frequently report requiring education less than a Bachelor's degree. For example, Computer Systems Engineers/Architects (SOC Code 15-1299.08), which is one of the most commonly applied-for jobs across all LCA programs, is a Job Zone Three job, meaning that "[m]ost occupations in this zone require training in vocational schools, related on-the-job experience, or an associate's degree" and that 68% of respondents reported that the occupation required sub-baccalaureate requirements of either an Associate's degree or other post-secondary education.¹⁷² By establishing Wage Level I at the 17th percentile, the current methodology sets a prevailing wage that is directly comparable to individuals who do not work in high-skill positions within that occupational category that are the only ones eligible to use most of the LCA programs.¹⁷³

¹⁷⁰ The Department notes that, although Wage Levels II and III are arithmetically set by Wage Levels I and IV, that the Department believes that the increases of Wage Levels II and III that this methodology achieves are necessary and appropriate to carry out its statutory requirements for all of the same reasons as are stated below and throughout this NPRM.

¹⁷¹ If the Department sought to increase the prevailing wage rates more than it proposes to do so here, which it believes is justifiable to avoid adverse wage effects on U.S. workers, it would simply opt for an increase in the Wage Level I prevailing wage to preserve a sufficiently differentiated wage level system to permit employers to obtain more granular wage levels that reflect all of the statutory factors.

¹⁷² <https://www.onetonline.org/link/summary/15-1299.08>.

¹⁷³ The Department acknowledges that other common occupations among the LCA-programs, such as Software Developer, have much higher educational requirements. However, the prevailing wages are set for all occupations, and must reflect the qualifications needed for them on an aggregate level. The Department finds that, for all of the reasons stated throughout this rule, that on an aggregate level, among the occupations that are the most significant LCA-program occupations, a significant percentage of these jobs do not require a bachelor's degree and perhaps do not even require the application of a body of "highly specialized knowledge." Thus, these jobs are generally not the kind of positions that should be the basis for

In addition to these findings, the Department also notes indicia that the relevant labor market is balanced, or perhaps even tilted towards supply of labor rather than shortage. First, the Department notes that the average wages paid versus prevailing wage premium for Wage Level I is particularly high. As shown below in Exhibit 5, while the average prevailing wage set for Wage Level I was \$73,804, the average offered wage was \$83,055. This approximately \$10,000 gap shows that workers assigned to Wage Level I are commanding very large premiums compared to the assigned prevailing wage—the largest premiums, in fact, by percentage, among the four Wage Levels. Second, the Department notes labor market data indicating unemployment among U.S. recent college graduates and tech workers which is described above in Section II.B. Third, the Department notes the mass layoffs of U.S. workers by many of the same companies that are applying for LCA-program visas, as is documented in Section II.B.

By contrast, when the Department originally set Wage Level I at the 17th percentile in 2005, it offered no findings, no data, and no justification for this figure. But, at the same time, the Department acknowledges that, although all jobs in the H-1B system in particular require the theoretical and practical application of a body of "highly specialized knowledge," its historical position has been that Wage Level I is for wage rates for "beginning level employees."¹⁷⁴ However, these entry-level occupations must nonetheless conform with the other requirements of the LCA programs, including that they be specialty occupations. At this time, the Department believes that the 34th percentile strikes the correct balance by aligning LCA-program workers with proper comparators, while also retaining the entry-level quality of the Wage Level. The Department welcomes evidence regarding the supply of U.S. workers, or the impact of technologies including artificial intelligence, that would indicate the need for Wage Level I to be pushed higher to prevent adverse impacts.

Another reason why the Department is proposing to set Wage Level I at the 34th percentile, and not lower (or higher), is because it also, for reasons

comparison against LCA-program workers. The Department also considered but rejected a more granular, occupation-specific approach to setting prevailing wages, because such an approach would be unworkable.

¹⁷⁴ https://www.dol.gov/sites/dolgov/files/eta/oflc/pdfs/npwhc_guidance_revised_11_2009.pdf.

stated below, believes that Wage Level IV should be set at the 88th percentile. Using the above mathematical formula that arranges the prevailing wages to match the Benchmark Value, if the Department set Wage Level I lower, it would require Level IV to be set higher. This would pose a practical problem as in certain occupational and geographic arrangements, OEWS data may not be sufficiently granular to supply the needed information. Conversely, if Wage Level I were set higher, it would force Wage Level IV to be lower. This would be undesirable because it would water down the prevailing wage requirement for Wage Level IV and force the other Wage Levels to be truncated.

iii. The Department's Setting of Wage Level IV to the 88th Percentile

While the Department's proposed change of Wage Level I from the 17th to the 34th percentile requires Wage Level IV to be set to the 88th percentile, it also believes that this change also enhances the prevailing wage methodology's alignment with the INA. The Department believes that Level IV should be increased from the 67th percentile to the 88th percentile, because most LCAs that are assigned a Level IV prevailing wage already offer actual wages significantly above the Level IV prevailing wage, suggesting that the Level IV prevailing wage does not align with the education and experience of the highest skilled workers in specialty occupations. In Fiscal Year 2024, the Department observed that employers filed Labor Condition Applications (LCAs) for over 100,000 H-1B positions classified at Wage Level IV, representing the highest skill tier under the current prevailing wage structure. The average wage paid to these workers was \$172,714, while the average prevailing wage certified for these positions was \$151,095—a difference of \$21,619, or approximately 14 percent.¹⁷⁵ This also indicates that this actual wage is more consistent with that which is paid to similarly employed U.S. workers than is the prevailing wage rate.

The highest wage level should be commensurate with the wages paid to the most highly compensated workers in any given occupation because such workers are also generally the workers with the most advanced skills, education, and competence in the occupation, whereas the current methodology more likely includes in the

¹⁷⁵ Employment and Training Administration, Office of Foreign Labor Certification, Performance Data, available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

Level IV wage tier some workers who may not be described as “specialty” workers possessing the most specialized knowledge and the highest degree of competence. It is generally the case that, as a worker’s education and experience increase, so too do his wages. Further, while the INA places baseline, minimum skills-based qualifications on who can obtain an H–1B or EB–2 classification, it does not place any limit on how highly-skilled a worker can be within these programs.¹⁷⁶ Thus, while the Department necessarily discounted the lower end of the OEWS wage distribution in determining the entry-level wage, full consideration must be given to the uppermost portion of the distribution in adjusting the Level IV wage.

Indeed, H–1B workers can be, and at least in some cases already are, among the most highly paid workers, and therefore likely fall among the most highly skilled workers within their respective occupations.¹⁷⁷ This is demonstrated by a review of the highest salaries paid to H–1B workers in the most common occupations in which H–1B workers are employed. In FY 2024, for example, the most highly compensated H–1B nonimmigrants employed as Computer Systems Analysts earned annual wages over \$500,000. The wages of workers at the 90th percentile of the OEWS distribution for these occupations, by contrast, are significantly lower. Computer Systems Analysts at the 90th percentile in the OEWS distribution make approximately \$166,030.¹⁷⁸ In other words, H–1B workers in some instances make wages far in excess of those earned by 90 percent of all U.S. workers in the same occupation. This indicates that the 67th percentile is simply not commensurate with the wages paid to similarly employed U.S. workers. While OEWS data does not directly report the education and experience levels of the highest-paid U.S. workers, the Department reasonably infers that workers earning at or above the 90th percentile are likely to possess advanced degrees, substantial experience, and significant responsibility—characteristics that closely align with those of the most

highly compensated H–1B workers in the same occupational categories.

Further demonstrating that H–1B workers can be and sometimes are among the most skilled and competent workers in their occupations, an examination of the top end of the wage distribution within the H–1B program shows that, for H–1B nonimmigrants with graduate and bachelor’s degrees, the association between education and income level begins to break down to some extent. An analysis of the highest earners within the H–1B program reveals that H–1B workers—particularly those with bachelor’s and graduate degrees—can be among the most skilled and capable in their fields. Interestingly, at this top end of the wage distribution, the typical link between education level and income begins to weaken. Among the most highly compensated H–1B workers, the higher the income level, the more likely the alien worker only has a bachelor’s degree.¹⁷⁹ This strongly suggests that individuals at the fourth wage level possess the most advanced skills and competence—the only remaining parameters that can reasonably account for significant wage differentials—within their occupations, as additional years of education are largely irrelevant in explaining wages among top earners.

Furthermore, because Levels II and III are set according to a statutory formula, prescribed by the INA, the Department has selected the 88th percentile for Level IV to ensure that Levels II and III are set at a sufficiently high level. This approach improves alignment with labor market conditions while preserving the Department’s longstanding reliance on OEWS data and its statutory obligations to ensure that the employment of alien workers does not adversely affect the wages and working conditions of U.S. workers.

In cases where the OEWS survey does not provide a computable Level IV wage due to top-coding or data limitations, DOL proposes that the OFLC Administrator would determine the Level IV wage using the greater of: (1) the current hourly wage rate applicable to the highest OEWS wage interval for the specific occupation and geographic area; or (2) the arithmetic mean of the wages of all workers for the most specific occupation and geographic area available. This approach ensures that prevailing wage determinations remain consistent with the statutory requirement to reflect wages commensurate with experience, education, and level of supervision,

while avoiding distortions caused by incomplete data.

iv. Wage Levels II and III

The Department will continue to calculate the two intermediate wage levels in accordance with 8 U.S.C. 1182(p)(4), which provides that, in establishing a four-tier wage structure, “[w]here an existing government survey has only 2 levels, 2 intermediate levels may be created by dividing by 3, the difference between the 2 levels offered, adding the quotient thus obtained to the first level and subtracting that quotient from the second level.”¹⁸⁰ The BLS OES survey is, as provided in the statute, an existing survey that has long provided two wage levels for the Department’s use in setting the prevailing wage rates.¹⁸¹

The Department applies the statutory formula as follows: The difference between the two levels provided by the OEWS survey data is 54 percentiles. Dividing this by three yields a quotient of 18. This quotient, added to the value of the Level I wage at the 34th percentile, yields a Level II wage at approximately the 52nd percentile. When subtracted from the value of the Level IV wage at the 88th percentile, the quotient yields a Level III wage at approximately the 70th percentile of the OEWS distribution.

The Department invites public comment on whether these levels appropriately reflect the statutory requirements and labor market realities, or whether alternative prevailing wage levels would more comprehensively aid the Department in fulfilling its statutory and regulatory requirements. The Department is particularly interested in feedback on whether the proposed methodology appropriately accounts for education, experience, and responsibility levels as required by the INA in 8 U.S.C. 1182(p)(4).

2. The EB–3 Immigrant Classification

The Department emphasizes that both the H–1B and EB–2 programs are, by statutory design and regulatory implementation, intended for highly skilled workers. The INA defines a “specialty occupation” for H–1B purposes as one that requires the theoretical and practical application of a body of highly specialized knowledge

¹⁷⁶ 8 U.S.C. 1184(i)(1) and 8 U.S.C. 1153(b)(2).

¹⁷⁷ Data on the actual wages paid to H–1B workers shows that in some cases such workers are paid at or near the very top of the OEWS wage distribution.

¹⁷⁸ O*NET, Computer Systems Analyst (last accessed on 12/5/2025 at 12:52 p.m.), available at <https://www.onetonline.org/link/localwages/15-1211.00?st=>.

¹⁷⁹ This analysis is based on data provided by 2024 OFLC Disclosure Data.

¹⁸⁰ 8 U.S.C. 1182(p)(4).

¹⁸¹ BLS also produces data for the public from the OES survey that is divided into five different wage levels. However, the public data BLS produces is not broken down with the level of granularity by area of employment needed to administer the Department’s immigrant and nonimmigrant programs, which is why BLS has also long produced a separate dataset with two wage levels for the Department’s use.

and the attainment of at least a bachelor's degree in a specific specialty.¹⁸² Similarly, the EB-2 immigrant visa classification is generally limited to individuals who possess advanced degrees or equivalent or demonstrate exceptional ability in the sciences, arts, or business.¹⁸³ These statutory definitions are reinforced by Department regulations, which require that qualifying positions demand education and expertise beyond that of the general labor market. Consistent with these requirements, OFLC data from FY 2024 show that over 89 percent of H-1B positions and 68 percent of PERM applications were for occupations in Job Zones 4 and 5—categories defined by the Department's O*NET system as requiring considerable to extensive preparation, including advanced education, training, and experience. This concentration in high-preparation occupations underscores the programs' focus on high-skill labor and supports the Department's approach to calibrating prevailing wage levels accordingly.

As noted previously, the Department's four-tier wage structure is used to set the prevailing wage in five different immigrant and nonimmigrant programs. Having explained the Department's reasoning for how the adjusted wage levels are appropriate for the programs that consist of more highly skilled workers with advanced degrees and/or specialized knowledge—namely the EB-2 immigrant classification and the H-1B, E-3, and H-1B1 nonimmigrant programs—the Department now turns to explaining the appropriateness of using those same wage levels for the EB-3 classification, which consists of lower-skilled workers, professionals with bachelor's degrees, and individuals capable of performing unskilled labor. The Department concludes that the adjusted wage levels under the four-tiered structure are appropriate for use in occupations and with applications for work falling within the EB-3 classification.

At the outset, the Department notes that the close connections between the EB-3 classification and the other programs covered by the Department's wage structure make it inadvisable and impractical to treat the EB-3 classification differently. As detailed above, many H-1B workers adjust status to that of lawful permanent residents through the EB-3 classification, and the manner in which the programs operate means that, in many cases, alien workers can, in some sense, have one

foot in each program simultaneously for extended periods of time. Using different wage methodologies in the programs would therefore result in the undesirable possibility of a worker doing the same job for the same employer suddenly receiving a different wage upon adjusting status. Similarly, while having somewhat different eligibility criteria, the EB-2 and EB-3 classifications are not mutually exclusive—many workers that satisfy the eligibility criteria for one would also do so for the other.¹⁸⁴ Applying the same wage methodology in both classifications is therefore important to ensure consistent treatment of similarly situated workers and prevent the creation of incentives for employers to prefer one classification over the other, to the detriment of U.S. workers that may be interested in the relevant job opportunity, because different wage methodologies yield different wages.¹⁸⁵ These considerations make it important to treat the EB-3 classification the same as the EB-2 and H-1B programs. The question then becomes whether the EB-3 classification is properly accounted for by the adjusted wage levels. The Department believes it is.

The Department acknowledges that applying the four-tier wage structure in five different immigrant and nonimmigrant programs with varying populations, and across hundreds of different occupational classifications, presents inherent challenges. The breadth of occupations to which the wage levels apply means that the prevailing wages established by the wage structure will not be perfectly tailored to the circumstances of each individual job opportunity or each occupation.¹⁸⁶ The Department has sought to address this challenge by adopting a methodology that is best tailored to the largest share of the immigrant and nonimmigrant populations covered by the programs that use the four-tier wage structure. Doing so is, in the Department's judgment, the best approach to addressing variations across the programs that is most consistent with

the INA. The wage protections in the H-1B and PERM programs are designed to guard against the displacement of, or adverse effect on U.S. workers caused by the employment of alien workers.¹⁸⁷ As noted above, the risk that the presence of lower-wage alien workers in a labor market would undercut U.S. workers' wages and job opportunities is greatest when there are larger concentrations of such workers.¹⁸⁸ Adjusting the wage levels with particular attention to those occupations and visa classifications with the largest numbers of alien workers therefore puts the focus on addressing the danger the statutory scheme is intended to guard against—adverse effects on U.S. workers—where it is most acute.

Thus, as previously explained, in ascertaining the wages paid to U.S. workers similarly employed to H-1B workers, the Department's analysis focused, to the greatest extent possible, on those occupations that account for 1 percent or more of the total H-1B population, and which also account for a significant share of the PERM population.¹⁸⁹ Similarly, the Department has given due weight in its analysis of where to set the prevailing wage levels to the fact that the EB-3 classification represents an exceedingly small share of the overall alien worker population covered by the wage structure. The H-1B program is America's largest guest worker program.¹⁹⁰ In FY2023, the Department of Homeland Security approved 386,318 H-1B petitions.¹⁹¹ That same year, 27,760 workers were admitted for lawful permanent residence in the EB-2 classification.¹⁹² A total of only 27,590 EB-3 immigrant workers were admitted that year.¹⁹³ Thus, the EB-3 program

¹⁸⁹ In some instances, particularly when analyzing the NSF data, the Department was constrained in its ability to analyze wages for all top H-1B occupations because of discrepancies between how the NSF and BLS surveys classify workers by occupation.

¹⁸⁶ Cf. *Wage Methodology for the Temporary Non-agricultural Employment H-2B Program*, 76 FR 3452, 3461 (Jan. 19, 2011) (explaining that “particular industries, such as forestry, will fare poorly based on a change to a mean-based OEWS wage rate.”).

accounts for, at most, approximately 5 to 10 percent of the total immigrant and nonimmigrant population governed by the four-tier wage structure that is admitted or otherwise provided status in a given year.¹⁹⁴ That does not mean that the Department has not given full consideration to the EB-3 classification in assessing how best to adjust the wage levels. It only means that the Department has appropriately weighed the size of the program, and therefore the risk it poses to U.S. workers, in identifying a solution to the adverse effects caused by the existing wage levels—an approach the Department regards as the best way to take into account the variations across the programs covered by the wage structure in effectuating the purpose of the INA's wage protections. Moreover, because H-1B workers may later pursue lawful permanent resident status based on an approved immigrant visa petition in the EB-3 preference category, maintaining misaligned wage levels across these categories could create a financial incentive for employers to pursue the classification with the lower wage requirement, thereby undermining the integrity of the wage structure and the Department's efforts to ensure consistent labor market protections across programs.

After assessing the nature of the EB-3 immigrant population, the Department has determined that the adjusted wage levels under the four-tiered structure adequately take into account the experience, education, and level of supervision of EB-3 workers, in light of the purpose of the INA's wage safeguards. The EB-3 program consists of three discrete classifications: "skilled workers," defined as aliens who are "capable . . . of performing skilled labor (requiring at least two years training or experience), not of a temporary or seasonal nature, for which

qualified workers are not available in the United States;" "professionals," defined as aliens "who hold baccalaureate degrees and who are members of the professions;" and "other workers," defined as aliens who are "capable . . . of performing unskilled labor, not of a temporary or seasonal nature, for which qualified workers are not available in the United States."¹⁹⁵ For each of these classifications, the revised wage levels, set at approximately the 34th, 52nd, 70th, and 88th percentiles, provide an appropriate method for calculating the prevailing wage. While some EB-3 workers may not meet the statutory requirements for H-1B classification, an H-1B worker would generally qualify for EB-3 classification. As such, and consistent with the Department's approach to the H-1B1 and E-3 programs, the Department does not believe it is appropriate to bifurcate the wage structure across programs. Maintaining a unified four-tier wage methodology ensures consistency in wage determinations, prevents program shopping, and promotes equitable treatment of similarly employed alien workers across visa classifications.

As for the lower-skill classifications, the Department has previously recognized that lower-skilled workers are less likely to vary in the wages they are paid based on differences in skill levels.¹⁹⁶ This is because skill levels themselves are less likely to vary in such occupations. A job that requires limited skills, such as can be acquired through two years of training or less, can likely be performed with similar proficiency by someone with lower levels of education and experience as by someone with greater experience and education.¹⁹⁷ Meaningful differentiation between workers based on skills in such occupations is therefore reduced. From this, the Department has previously concluded that setting prevailing wages for lower-skilled workers closer to the mean of the overall OEWS wage distribution is a more appropriate way of guarding against adverse wage effects.¹⁹⁸ Since most workers in lower-skilled occupations have similar levels of skill, a wage that approximates the average wage for all workers in the occupation is more likely to ensure that similarly employed workers make similar wages. For example, in FY 2024, the Department certified PERM

applications for occupations such as food service managers, meat processing workers, and mushroom pickers—roles that typically require limited formal education or training. In these occupations, the range of skills and qualifications among workers is relatively narrow, supporting the Department's conclusion that prevailing wages for such roles should be set closer to the mean of the OEWS wage distribution to reflect the limited variation in worker qualifications.

That reasoning holds true for the lower-skilled classifications in the EB-3 immigrant visa preference category, which include workers whose jobs are unskilled or require two years of experience or training. These workers are far more likely to fall within the lower two wage levels given their relative lack of education and experience.¹⁹⁹ Under the new wage levels, they would thus likely be placed at either the 34th or the 52nd percentiles of the OEWS wage distributions. Both levels, while not perfectly tailored to the lower-skilled component of the EB-3 classification, fall near the middle part of the wage distribution, and are therefore generally appropriate for lower-skilled workers.

For separate reasons, the Department concludes that the newly adjusted wage levels also adequately satisfy the Department's obligations in setting the wage levels under the INA with respect to EB-3 professionals. Unlike lower-skilled EB-3 workers, professionals with bachelor's degrees in the EB-3 classification do possess a level of skill that allows for greater differentiation within the occupation. It is also the case that such workers will likely have lower levels of education and experience than EB-2 workers, who are required to possess a master's degree or equivalent. An entry-level wage at the 34th percentile, while more closely tailored to the education and experience of an EB-2 or H-1B worker, may be on the higher end for an EB-3 professional in some cases.²⁰⁰ But other considerations demonstrate the appropriateness of the 34th percentile of the OEWS wage distribution as the entry-level wage for such workers.

The Department emphasizes that the labor certification process in the PERM

¹⁹⁴ The Department notes that the total number of approved H-1B petitions "exceeds the number of individual H-1B workers sponsored because of the different types of petitions that can be filed (e.g., requests for concurrent employment with another employer, requests for extension of stay, amended petitions)." U.S. Citizenship and Immigration Services, *Characteristics of H-1B Specialty Occupation Workers Fiscal Year 2023 Annual Report to Congress* October 1, 2022–September 30, 2023, (2024), available at https://www.uscis.gov/sites/default/files/document/reports/OLA_Signed_H-1B_Characteristics_Congressional_Report_FY2023.pdf. The filing of these types of petitions means that some nonimmigrants are counted multiple times in the total number of approved petitions. The total number of petitions for initial employment in FY23 was 118,948. However, that number does not account for the petitions filed on behalf of H-1B nonimmigrants to extend their status, and thus undercounts the total number of actual H-1B workers who were authorized to work in FY23.

¹⁹⁸ *Id.* at 3459.

¹⁹⁹ LCA Performance Data, available at <https://www.dol.gov/agencies/eta/foreign-labor/performance>.

²⁰⁰ The Department also notes that, in some cases, EB-3 workers may in fact have higher levels of formal education than H-1B workers, given that H-1B workers can demonstrate specialized knowledge through experience and training, whereas possession of a bachelor's degree is required for all EB-3 immigrants. See *Employment-Based Immigrants*, 56 FR 60897, 60900 (Nov. 29, 1991).

programs is designed to ensure that there are not available and willing U.S. workers and that the wages and working conditions of U.S. workers will not be adversely affected by the employment of the immigrant worker(s). From the time that the INA was first enacted, its labor certification provisions were designed “to provide strong safeguards for American labor and to provide American labor protection against an influx of aliens entering the United States for the purpose of performing skilled or unskilled labor where the economy of individual localities is not capable of absorbing them at the time they desire to enter this country.”²⁰¹ The availability of U.S. workers to fill jobs for which alien workers are sought, being a guiding consideration behind the INA’s wage protections, the adequacy of the prevailing wage levels for EB–3 professionals is an essential component of the Department’s certification.

Within the U.S. workforce, the credentials associated with the EB–3 professional classification are significantly more common than the credentials associated with the EB–2 classification. As of 2019, 36 percent of people age 25 and older in the United States possessed a bachelor’s degree or higher.²⁰² That is compared to only 13.4 percent of native-born Americans and 14.1 percent of the foreign born population who possess an advanced degree, such as a master’s degree or doctorate.²⁰³ It follows that employers seeking to recruit individuals with only a bachelor’s degree should be more likely to find qualified and available U.S. workers than if they are recruiting for a position that requires a master’s degree. The pool of available workers in such cases is significantly larger.

As noted above, the Department is required to determine and certify that “there are not sufficient workers who are able, willing, qualified” and available to fill the position for which an EB–3 worker is sought.²⁰⁴ This requirement is critical to the INA’s “core objective[] [of] balanc[ing] certain industries’ temporary need for alien workers against a policy interest in protecting U.S. workers’ jobs, salaries, and working conditions.”²⁰⁵ In the case

of EB–3 professionals, the adjusted wage levels, which may in some cases place a slight premium on the wages paid to professionals with bachelor’s degrees, will better allow the Department to issue a certification that no U.S. workers are available for the job opportunity.

Finally, the Department notes that continuing to employ the same wage structure in this manner across both the H–1B and PERM programs advances the Department’s interest in administrative consistency and efficiency. As noted already, there is significant overlap between the H–1B and PERM programs. In FY2024, 57.6 percent of all PERM applications were for aliens that at the time the applications were filed were already working in the U.S. on H–1B visa classification.²⁰⁶ Further, the top ten most common H–1B occupations include six of the ten most common PERM occupations. In FY 2024, 68 percent of PERM cases were for jobs in Job Zones 4 and 5²⁰⁷—the most highly skilled job categories, which also account for over 89 percent of all H–1B cases.²⁰⁸ In sum, the close connection between the types of jobs and aliens that are covered by the two programs further supports using the same wage structure for both the PERM and H–1B programs.

For these reasons, the Department has concluded that using the adjusted wage levels for the EB–3 preference category is in keeping with the relevant statutory considerations that govern how the Department sets prevailing wage levels.

D. Explanation of Proposed Amendments To Adjust the Prevailing Wage Levels

1. Proposed Revisions to the Computation of the Wage Levels Based on the OEWS in the Permanent Labor Certification Program (20 CFR 656.40)

The Department is proposing to revise paragraphs (a), (b)(2), and (3) of 20 CFR 656.40. The most substantial changes are those made to paragraphs (b)(2). First, the Department is proposing revisions to § 656.40(b)(2) by adding new paragraphs (b)(2)(i) and (ii) to codify the practice of using four wage levels and to specify the manner in which the wage levels are calculated.

Specifically, new paragraph (b)(2)(i) stipulates that “[t]he BLS shall provide the OFLC Administrator with the OEWS wage data by occupational classification and geographic area” and goes on to specify the four new levels (Levels I through IV) to be applied.

The proposed new paragraph (b)(2)(i)(A) describes the Level I Wage. This first wage level—currently calculated as the mean of the bottom third of the OEWS wage distribution—is proposed to be calculated as the 34th percentile of the wage distribution for the most specific occupation and geographic area available. Next, new paragraph (b)(2)(i)(D) provides that the Level IV Wage—currently calculated as the mean of the upper two-thirds of the OEWS wage distribution—is proposed to be calculated as the 88th percentile of the wage distribution for the most specific occupation and geographic area available.

For the two intermediate levels, II and III, the Department proposes to continue relying on the mathematical formula Congress provided in the INA, as previously described in detail above. Thus, proposed new paragraph (b)(2)(i)(B) states that the Level II Wage shall be determined by first dividing the difference between Levels I and IV by three and then adding the quotient to the computed value for Level I. The Level III Wage is defined in proposed new paragraph (b)(2)(i)(C) as a level determined by first dividing the difference between Levels I and IV by three and then subtracting the quotient from the computed value for Level IV. This yields second and third wage levels at approximately the 52nd and 70th percentiles, respectively, as compared to the current computation, which places Level II at approximately the 34th percentile and Level III at approximately the 50th percentile.

The proposed new paragraph (b)(2)(ii) states that the OFLC Administrator would publish, at least once in each calendar year, on a date to be determined by the OFLC Administrator, the prevailing wage rates produced under the new paragraph (b)(2)(i) of section 656.40 as a notice posted on the OFLC website. This continues the Department’s practice of having the OFLC Administrator announce, via a notice of implementation, updates to OEWS wage data. Currently, OFLC publishes a routine announcement each year implementing updated OEWS prevailing wages for the new wage year and discussing any other significant related updates, including changes to OEWS survey areas and relevant updates to the SOC system. These announcements also serve as notice to

²⁰⁶ Office of Foreign Labor Certification, Permanent Labor Certification Program—Selected Statistics, FY 24.

²⁰⁷ Under the O*Net system a job zone is a group of occupations that are similar in the amount of education, experience, and on the job training that is required for a worker to fill a position in the occupation. Job Zone 4 includes occupations that require considerable preparation; Job Zone 5 includes occupations that require extensive preparation.

²⁰⁸ This information is based on data collected by the Department’s Office of Foreign Labor Certification on LCAs filed in FY 2024.

employers of changes they need to make to the wage information on applications to reflect the changes to the OEWS.

The proposed revisions align with OFLC's current practice for notifying employers directly, rather than through the **Federal Register**, because publishing multiple prevailing wage rates in the **Federal Register** would be administratively burdensome. Moreover, posting the wage levels on the OFLC website is more user-friendly: it allows employers and stakeholders to more easily locate and access the relevant wage information. In practice, users are far more likely to find the applicable wage data quickly and accurately on the OFLC website than by navigating the **Federal Register**.

Further, the proposed revisions to paragraph (b)(2) would provide greater precision in the language used by changing the term "DOL" to "BLS" when describing which entity administers the OEWS survey and eliminate redundancy by deleting the language "except as provided in (b)(3) of this section." Because the Department is now specifying within the regulation exactly how the prevailing wage levels are calculated, the proposed revision would also remove the existing reference to how the levels are calculated—namely the reference to the "arithmetic mean"—and would instead provide that if the job opportunity is not covered by a CBA, the prevailing wage for labor certification purposes shall be based on the wages of workers similarly employed using the wage component of the OEWS survey, in accordance with paragraph (b)(2)(i), unless the employer provides an acceptable survey under paragraphs (b)(3) and (g) of this section or elects to utilize a wage permitted under paragraph (b)(4).

Finally, proposed revisions to paragraph (a) would remove an out-of-date reference, explained further below, to a SWAs' role in the prevailing wage determination process. The changes to paragraph (b)(3) account for the elimination of the reference to the "arithmetic mean" in (b)(2).

2. Proposed Revisions to the Wage Requirement for LCAs in the H-1B, H-1B1, and E-3 Visa Classifications (20 CFR 655.731)

The Department proposes amendments in section 655.731 to more clearly explain that it would use BLS's OEWS survey to determine the prevailing wages under this paragraph and proposes to add a sentence to specify that these determinations would be made in a manner consistent with the amended section 656.40(b)(2). In addition, the proposed revisions in

paragraphs (a)(2)(ii) introductory text, (a)(2)(ii)(A) introductory text, and (a)(2)(ii)(A)(2) also include technical and clarifying revisions regarding other permissible wage sources (*i.e.*, applicable wage determinations under the Davis-Bacon Act or McNamara-O'Hara Service Contract Act, as well as other independent authoritative or legitimate sources of wage data in accordance with paragraph (a)(2)(ii)(B) or (C)). The new language also proposes to remove the reference to "arithmetic mean" in paragraph (a)(2)(ii) and now states ". . . the prevailing wage shall be based on the wage component of the Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics Survey (OEWS) in accordance with 20 CFR 656.40(b)(2)(i) . . ."

The Department also proposes to amend section 655.731 by making technical revisions to paragraph (a)(2)(ii)(A) to remove another out-of-date reference to a SWA's role in the prevailing wage determination process. Non-agricultural PWD requests are no longer processed by SWAs; since 2010 they have solely been processed by the Department through an OFLC National Processing Center (NPC). The proposed amendments reflect this historical practice.

And finally, the proposed revisions provide technical corrections to paragraph (a)(2)(ii)(A)(2). Specifically, the Department is proposing to replace the incorrect reference to "H-2B nonimmigrant(s)" with "H-1B nonimmigrant(s)." Additionally, in situations where the employer relies on other legitimate sources of wage information due to inability to wait for the NPC to produce the requested prevailing wage for the occupation in question, or for the CO and/or the BALCA to issue a decision, the Department is proposing to add the word "not" in the last sentence to correctly describe the situation where a wage violation would not be found where retroactive compensation by the employer to the H-1B nonimmigrant(s) is timely provided. Thus, the Department proposes that the sentence now state ". . . the employer was not paying the NPC-determined wage, no wage violation will be found if the employer retroactively compensates the H-1B nonimmigrant(s) for the difference between the wage paid and the prevailing wage, within 30 days of the employer's receipt of the PWD."

These proposed revisions further provide that an NPC would continue to determine whether a job is covered by a collective bargaining agreement that was negotiated at arm's length, but in the event the position for which the

employer is filing the LCA is not covered by such agreement, an NPC would determine the wages of workers similarly employed using the wage component of the BLS OEWS, unless the employer provides an acceptable survey. The proposed revisions direct that an NPC would determine the wage in accordance with secs. 212(n), 212(p), and 212(t) of the INA and in a manner consistent with the newly revised section 656.40(b)(2).

3. Implementation of the Proposed Rule

This proposed rule would only apply to *Applications for Prevailing Wage Determinations* pending with the OFLC NPC as of the proposed effective date of the regulation. *Applications for Prevailing Wage Determinations* submitted to the OFLC NPC on or after the effective date of the regulation as well as LCAs filed with the Department on or after the effective date of the regulation where the OEWS survey data is the prevailing wage source and where the employer did not obtain the PWD from the NPWC prior to the effective date of the regulation, would be subject to the new prevailing wage methodology. Conversely, the Department does not propose to apply the new regulations to any previously-approved prevailing wage determinations, permanent labor certification applications, or LCAs, either through reopening or through issuing supplemental prevailing wage determinations or through notices of suspension, invalidation, or revocation.

E. Reliance Interests

The Department acknowledges that the existing wage levels—set at approximately the 17th, 34th, 50th, and 67th percentiles—have been in place for over 20 years, and that many employers likely have longstanding practices of operating their businesses based on the current wage rates. Adjusting the levels to the 34th, 52nd, 70th, and 88th percentiles represents a significant change, and may result in some employers modifying their use of the H-1B and PERM programs. It would also likely result in higher personnel costs for some employers, as detailed below. However, to the extent employers have serious and legitimate reliance interests in the existing levels, the Department has determined that setting the wage levels in a manner that is consistent with the text of the INA and that advances the statute's purpose of protecting U.S. workers outweighs such interests and justifies such increased costs. Additionally, by applying the new prevailing wage methodology prospectively, it would afford

employers the necessary latitude they need to adjust their business needs accordingly.

In effecting an adjustment to the wage levels previously used to set the prevailing wage in the H-1B and PERM programs, the Department is obligated to consider whether “its prior policy has engendered serious reliance interests.”²⁰⁹

As explained above, the Department continues to believe that the old wage levels are the source, in many cases, of serious, adverse effects on U.S. workers’ wages and job opportunities. Adjusting the levels to bring them in line with the wages paid to U.S. workers with levels of education, experience, and responsibility comparable to H-1B workers—and thereby reducing the danger posed to U.S. workers by the employment of alien workers—remains the principal aim of this rulemaking. Ensuring that the Department’s wage structure is set in accordance with the relevant statutory factors is also necessarily a controlling objective in the Department’s assessment of how best to reform the prevailing wage levels. The old levels have never been justified by economic analysis, and, as detailed above, are in tension with the statutory scheme insofar as they are based, in many instances, on data about the earnings of workers who cannot be regarded as similarly employed to workers in specialty occupations.²¹⁰

In considering how best to implement these changes, the Department also evaluated whether to eliminate the option for employers to use private wage surveys. This option has historically provided flexibility where government data sources do not fully capture niche labor markets or unique job requirements. Eliminating it entirely could disrupt longstanding compliance practices and impose disproportionate burdens on employers in specialized industries or geographic areas—particularly start-ups and small businesses that often rely on highly specialized roles or emerging occupations not well represented in OEWS datasets. For these employers, private surveys may offer the most accurate reflection of market wages. At the same time, the Department considered that private surveys can be expensive for smaller businesses to commission and administratively complex to validate, creating compliance challenges. Additionally, historical data indicate that private surveys typically produce wages

approximately [20 percent higher than OEWS-based prevailing wages,²¹¹] which could significantly increase costs for employers relying on this option.

Ultimately, while the Department continues to believe that OEWS should serve as the primary source for prevailing wage determinations, it has chosen to retain the use of private surveys in limited circumstances. This approach preserves employer flexibility, mitigates potential adverse impacts on businesses operating in specialized labor markets, and balances reliance interests with the statutory mandate to protect U.S. workers. To ensure integrity, the Department would monitor the use of private surveys to prevent abuse and ensure compliance, and it already reserves the right to reject any private survey that does not meet methodological standards or otherwise fails to satisfy regulatory requirements.²¹²

The Department invites public comment as to interested parties’ legitimate and serious reliance interests in the previous wage methodology.

F. The Department Requests Comments on All Aspects of Its Revised Methodology for Establishing Prevailing Wage Levels and Regulatory Alternatives

The Department invites comments on all aspects of the proposed methodology changes. The Department is open to adopting any of the regulatory alternatives discussed under Section III.A.6 in this NPRM and therefore is particularly interested in comments on those alternatives, especially the Experience Benchmarking alternative. The Department is also interested in comments on the continued use of the OEWS to support the computation of prevailing wage levels, identifying other surveys conducted by the United States government or other data sources and methods that can provide comparable information on the wages of U.S. workers by occupation and geographic area, and determining the prevailing wages at Levels I and IV to approximate the level of education, experience, and

supervision in the occupational classification. Comments supported by reliable and objective data or other quantifiable studies will be more helpful to the Department in drafting a final rule than comments consisting of qualitative anecdotal evidence.

III. Administrative Information

A. Executive Order 12866: Regulatory Planning and Review, Executive Order 13563: Improving Regulation and Regulatory Review, and Executive Order 14192: Unleashing Prosperity Through Deregulation

1. Introduction

Under E.O. 12866, the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget (OMB) determines whether a regulatory action is significant and, therefore, subject to the requirements of the Executive Order and review by OMB. Regulatory Planning and Review, 58 FR 51735 (Oct. 4, 1993). Section 3(f) of E.O. 12866 defines a “significant regulatory action” as an action that is likely to result in a rule that may: (1) have an annual effect on the economy of \$100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or state, local, or tribal governments or communities; (2) create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) materially alter the budgetary impact of entitlement, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) raise novel legal or policy issues arising out of legal mandates, the President’s priorities, or the principles set forth in the Executive Order. A regulatory impact analysis (RIA) must be prepared for a regulatory action that is significant under section 3(f)(1). OIRA has reviewed this rule and designated it a significant regulatory action under 3(f)(1) of E.O. 12866.

E.O. 13563 directs agencies to, among other things, propose or adopt a regulation only upon a reasoned determination that its benefits justify its costs; the regulation is tailored to impose the least burden on society, consistent with achieving the regulatory objectives; and in choosing among alternative regulatory approaches, the agency has selected those approaches that maximize net benefits. Improving Regulation and Regulatory Review, 76 FR 3821, 3821 (Jan. 21, 2011), E.O. 13563 recognizes that some costs and benefits are difficult to quantify and provides that, where appropriate and permitted by law, agencies may

²⁰⁹ *F.C.C. v. Fox Television Stations, Inc.*, 556 U.S. 502, 515 (2009).

²¹⁰ See, 86 FR 3642.

²¹¹ The 20% figure represents the average percentage difference between Survey-based and OES (Occupational Employment Statistics) prevailing wages across five key SOC codes (15–1121, 15–1132, 15–1199, 15–1252, 15–1299) in FY 2024 H-1B LCA data. For each SOC code, the department calculated the mean prevailing wage for both Survey and OES sources, then computed the percentage difference relative to the OES baseline. The overall 20% is the mean of these five individual percentage differences, which ranged from 10.1% (15–1199) to 29.2% (15–1252).

²¹² See 20 CFR 656.40(b)(3) and 655.731(a)(2)(ii)(B)–(C), which authorize the Department to review and reject private surveys that do not meet established criteria.

consider and discuss qualitative values that are difficult or impossible to quantify, including equity, human dignity, fairness, and distributive impacts. *Id.* This proposed rule, if finalized as proposed, is expected to qualify for an exemption from E.O. 14192’s otherwise-applicable requirements, due to its immigration-related function.

a. Outline of the Analysis

Section III.A.3 describes the need for the NPRM, and section III.A.4 describes the process used to estimate the costs of the rule and the general inputs used to reach these estimates, such as wages

and number of affected entities. Section III.C.3 explains how the provisions of the NPRM would result in costs and transfer payments, and presents the calculations the Department used to reach the cost and transfer payment estimates. In addition, this section describes the non-quantified transfer payments and benefits of the changes contained in this NPRM. Section III.B.5 summarizes the estimated first-year and 10-year total and annualized costs, and transfer payments of the NPRM. Finally, section III.B.6 describes the regulatory alternatives that were considered during the development of the NPRM.

2. Summary of the Analysis

The Department expects that the proposed rule, if finalized, would result in costs and transfer payments. As shown in Exhibit 1, the proposed rule would have an annualized cost of \$3.53 million and a total 10-year cost of \$24.59 million at a discount rate of 7 percent in 2024 dollars.²¹³ The NPRM would result in annualized transfer payments (U.S. employers to other entities and individuals, including alien workers) of up to \$6.56 billion and total 10-year transfer payments of up to \$46.09 billion at a discount rate of 7 percent in 2024 dollars.²¹⁴

Exhibit 1—Estimated Monetized Costs and Transfer Payments of the NPRM

[2024 \$ million]

	Costs	Transfer payments (upper bound)
10-Year Total with a Discount Rate of 3%	28.38	58.46
10-Year Total with a Discount Rate of 7%	24.59	46.09
Annualized at a Discount Rate of 3%	3.33	6.85
Annualized at a Discount Rate of 7%	3.53	6.56

The total cost associated with the NPRM includes only rule familiarization. The rule is not expected to result in any cost savings. Transfer payments are the result of changes to the computation of prevailing wage rates for employment opportunities that U.S. employers seek to fill with alien workers on a temporary basis through H–1B, H–1B1, and E–3 nonimmigrant programs.²¹⁵ See the costs and transfer payments subsections of section III.B (Subject-by-Subject Analysis) below for a detailed explanation.

In addition to the rule familiarization cost, based on internal simulation using FY2023—FY2025 LCA data, the Department estimates that the proposed wage level adjustments would increase

the average certified wage by approximately \$14,000 per year. This increase, when applied across the volume of certified LCAs, suggests a material economic effect that supports classification of this rule as economically significant under Executive Order 12866.

The Department was unable to quantify some transfer payments and benefits of the NPRM. The Department describes them qualitatively in section III.B (Subject-by-Subject Analysis). The Department invites comments regarding the assumptions, data sources, and methodologies used to estimate the costs and transfer payments of the NPRM. The Department invites public

comments on any additional benefits or costs that could result from the NPRM.

3. Need for Regulation

The Department determined that issuance of this NPRM was necessary to address systemic deficiencies in the prevailing wage determination methodology used in the H–1B, H–1B1, E–3, and PERM programs. These deficiencies have contributed to wage suppression and displacement of U.S. workers in sectors heavily reliant on alien workers. The NPRM was prompted by a confluence of factors:

- *Statutory Misalignment:* The Department concluded that the existing wage levels were not adequately aligned with the statutory requirement under 8 U.S.C. 1182(p)(4) to provide four wage

²¹³ The proposed rule will have an annualized net cost of 3.33 million and a total 10-year cost of 28.38 million at a discount rate of 3 percent in 2024 dollars.

²¹⁴ The proposed rule will result in annualized transfer payments of up to \$6.85 billion and total

10-year transfer payments of up to \$58.46 billion at a discount rate of 3 percent in 2024 dollars.

²¹⁵ As explained, *infra*, the Department did not quantify transfer payments associated with new certifications under the Permanent Labor Certification Program (*e.g.*, EB–2 and EB–3

classifications) because they are expected to be de minimis due to the comparatively low number of program participants.

levels commensurate with experience, education, and level of supervision. The prior methodology, which relied on outdated percentile thresholds (approximately the 17th, 34th, 50th, and 67th percentiles), failed to reflect actual labor market conditions and allowed employers to pay alien workers significantly less than their U.S. counterparts.

- **Labor Market Disruption:** Evidence showed that major users of the H-1B program were simultaneously conducting large-scale layoffs of U.S. workers while continuing to hire alien workers at lower wage levels. This raised serious concerns about the program being used to undercut domestic labor.

- **Wage Disparities and Program Abuse:** Departmental analysis of FY2020–FY2024 LCA data revealed that the average wage offered to H-1B workers per year was approximately \$10,191 lower than the average wage for similarly classified U.S. workers. Investigative reports and whistleblower complaints further documented widespread underpayment and misuse of the program, including cases where U.S. workers were laid off and required to train their lower-paid H-1B replacements.

- **Presidential Proclamation:** On September 19, 2025, the President issued a Proclamation directing the Secretary of Labor to initiate rulemaking

to revise prevailing wage levels under the H-1B program. The Proclamation cited longstanding concerns that the current wage structure incentivized the hiring of alien workers at below-market wages, undermining the program's intent and adversely affecting U.S. workers.

Given these factors, the Department concluded that immediate regulatory action was necessary to prevent further harm to U.S. workers and to restore integrity to the prevailing wage system.

4. Analysis

The Department estimated the costs and transfer payments of the NPRM relative to the analytic baseline defined as the state of the world reflecting current and recently finalized practices for complying, at a minimum, with the regulations governing permanent labor certifications at 20 CFR part 656 and labor condition applications at 20 CFR part 655, subpart H. The baseline should also incorporate the effects of the recently published USCIS H-1B rule, including its weighted lottery system and any associated changes to visa allocation, wage levels, and employer behavior. Accordingly, the regulatory analysis presented here discusses potential refinements toward the goal of reflecting the incremental impacts of the Department's proposed rule, above and beyond those attributable to the USCIS rule.

In accordance with the regulatory analysis guidance articulated in OMB's Circular A-4 and consistent with the Department's practices in previous rulemakings, this regulatory analysis focuses on the likely consequences if this rulemaking is finalized as proposed (*i.e.*, costs and transfer payments experienced by entities affected). The analysis covers 10 years (from 2026 through 2035) to ensure it captures major costs and transfer payments that accrue over time. The Department expresses all quantifiable impacts in 2024 dollars and uses discount rates of 3 and 7 percent, pursuant to Circular A-4.

Unless otherwise noted, the same methods, inputs and assumptions are used to analyze all transfers, benefits and costs associated with the relevant work programs, regardless of visa status. The Department requests comment on whether and how effects would differ as a function of visa-based participation (including due to regulatory interaction with statutory visa caps) versus program participation for which visa issuance is unnecessary.

Exhibit 2 presents the number of entities affected by the NPRM. The number of affected entities is calculated using OFLC performance data from fiscal years (FYs) 2020–2025. The Department uses them throughout this analysis to estimate the costs and transfer payments of the NPRM.

Exhibit 2—Number of Affected Entities by Type [FY 2020-2025 annual average]

Entity type	Number
Unique H-1B Program Certified Employers ²¹⁶	63,686
PERM + H-1B Program Certified Worker Positions with Prevailing Wage Set by OEWS ²¹⁷	1,091,205
Unique PERM Employers ²¹⁸	26,169

a. Estimated Number of Workers and Change in Hours

The Department presents the estimated average number of applicants

²¹⁶ The total unique LCA employers in 2020, 2021, 2022, 2023, 2024 and 2025 were 60,890, 58,358, 63,558, 61,506, 65,830 and 71,971 respectively.

²¹⁷ The total number of worker positions associated with LCA certifications that use OEWS prevailing wages in 2020, 2021, 2022, 2023, 2024 and 2025 were 829,752, 1,592,194, 1,010,848, 1,071,320, 1,156,595 and 886,520 respectively.

and the change in burden hours required for rule familiarization in section III.B (Subject-by-Subject Analysis).

b. Compensation Rates

In section III.B (Subject-by-Subject Analysis), the Department used the

²¹⁸ The unique employers in 2020, 2021, 2022, 2023, 2024 and 2025 were 23,934, 26,233, 23,502, 23,779, 22,195 and 37,372 respectively.

hourly compensation rate presented in Exhibit 3 to estimate rule familiarization costs. The Department used the BLS mean hourly wage rate for private sector human resources specialists.²¹⁹ We adjust the wage rates to reflect total compensation, which includes non-

²¹⁹ BLS, Occupational Employment and Wage Statistics, SOC Code 13-1071, May 2024, Occupational Employment and Wage Statistics (last visited August 21, 2025).

wage factors such as overhead and fringe benefits (e.g., health and retirement benefits). We use an overhead rate of 17 percent²²⁰ and a fringe benefits rate based on the ratio of average total compensation to average wages and salaries in 2024. For the private sector employees, we use a fringe benefits rate of 42 percent.²²¹

The fringe wage rate is based on Employer Costs for Employee

Compensation data which includes paid leave; supplemental pay (i.e., overtime and premium, shift differentials, and nonproduction bonuses); insurance (i.e., life, health, short-term disability, and long-term disability); retirement and savings; and legally required benefits (i.e., Social Security, Medicare, federal unemployment insurance, state unemployment insurance, and workers' compensation). As wages increase the

costs associated with paid leave, retirement savings, and supplemental pay will also increase.

BLS's OEWS data show that the mean hourly wage of Human Resources Specialists is \$38.33.²²² The Department applied a 42-percent benefits rate²²³ and a 17-percent overhead rate,²²⁴ resulting in a fully loaded hourly wage of \$60.94 [= \$38.33 + (\$38.33 × 42%) + (\$38.33 × 17%)].

Exhibit 3—Compensation Rates [2025 Dollars]²²⁵

Position	Base hourly wage rate	Loaded wage factor	Overhead costs	Hourly compensation rate
	(a)	(b)	(c)	d = a + b + c
HR Specialist	\$38.33	\$16.10 (\$38.33 × 0.42)	\$6.52 (\$38.33 × 0.17)	\$60.94

B. Subject-by-Subject Analysis

The Department’s analysis below covers the estimated costs and transfer payments of the NPRM. In accordance with Circular A–4, the Department considers transfer payments as payments from one group to another that do not affect total resources available to society (or, if resources are affected, it is through incentive effects uncaptured without more extensive analysis). The regulatory impact analysis focuses on the costs and transfer payments that can be attributed exclusively to the new requirements in the NPRM.

1. Costs

The following section describes the costs of the NPRM.

2. Rule Familiarization

When the changes proposed in a final rule take effect, existing employers of alien workers with H–1B, H–1B1, E–3 visas, and those employers sponsoring alien workers for permanent employment, will need to familiarize themselves with the new regulations. Consequently, this will impose a one-time cost for existing employers in the temporary and permanent visa programs in the first year. Each year, there are

new employers that participate in the temporary and permanent visa programs. Therefore, in each year subsequent to the first year, new employers will need to familiarize themselves with the new regulations.

To estimate the first-year cost of rule familiarization, the Department calculated the average number of unique employers requesting H–1B certifications and PERM certifications. The average number of unique H–1B and PERM employers 89,855 was multiplied by the estimated amount of time required to review the rule (1 hour).²²⁶ This number was then multiplied by the hourly, fully loaded compensation rate of Human Resources Specialists (\$60.94 per hour). This calculation results in an initial cost of \$5.17 million in the first year after the final rule takes effect. Each year after the first year the same calculation is done for the average number of new unique employers requesting H–1B or PERM certifications in FY 2021–2025 and FY 2024 (42,896).²²⁷ This calculation results in a continuing annual undiscounted cost of \$2.98 million in years 2 to \$3.32 in years 6–10 of the analysis. The one-time and continuing cost yields a total average annual undiscounted cost of \$3.2million. The

annualized cost over the 10-year period is \$3.33 million and \$3.53 million at discount rates of 3 and 7 percent, respectively.

3. Transfer Payments

a. Quantifiable Transfer Payments

This section discusses the quantifiable transfer payments related to changes to the computation of the prevailing wage levels.

As discussed in the preamble, the Department determined that current prevailing wage rates for H–1B workers are often far below what their U.S. counterparts are paid, which suppresses the wages of similarly employed U.S. workers. While allowing employers to access high-skilled workers to fill specialized positions can benefit U.S. workers in some instances, these benefits diminish or disappear when the prevailing wage levels do not accurately reflect the wages paid to similarly situated workers in the U.S. labor market. When prevailing wage levels are artificially low, firms can replace qualified U.S. workers with lower-cost alien workers.

Therefore, the Department is amending § 656.40(b) to codify four prevailing wage levels and their calculations. New paragraph (b)(2)(i)

²²⁰ Cody Rice, U.S. Environmental Protection Agency, “Wage Rates for Economic Analyses of the Toxics Release Inventory Program,” June 10, 2002, <https://www.regulations.gov/document?D=EPA-HQ-OPPT-2014-0650-0005>.

²²¹ BLS. (2024). “2024 Employer Costs for Employee Compensation.” Retrieved from: <https://www.bls.gov/bls/news-release/ecec.htm>. Ratio of total compensation to wages and salaries for all private industry workers.

²²² BLS, Occupational Employment and Wage Statistics, SOC Code 13–1071, May 2024,

Occupational Employment and Wage Statistics (last visited August 21, 2025).

²²³ BLS, “National Compensation Survey, Employer Costs for Employee Compensation,” <https://www.bls.gov/ecec/factsheets/compensation-percentile-estimates.htm> (last visited November 10, 2025). For private sector workers, wages averaged \$31.10 per hour worked in 2024, while benefit costs averaged \$13.10, which is a benefits rate of 42 percent.

²²⁴ Cody Rice, U.S. Environmental Protection Agency, “Wage Rates for Economic Analyses of the

Toxics Release Inventory Program,” June 10, 2002, <https://www.regulations.gov/document/EPA-HQ-OPPT-2014-0650-0005> (last visited May 8, 2025).

²²⁵ Numbers may slightly differ due to rounding.

²²⁶ This proposed rule amends parts of an existing regulation. Therefore, the Department estimates 1-hour to review the rule assuming a high number of readers familiar with the existing regulation.

²²⁷ The total number of new employers in FY23 was 49,096 (33,059H1B + 16,037PERM), and in FY24 was 38,646 (29,027H1B + 9,619PERM).

provides that the OFLC Administrator will determine prevailing wages at four levels (Levels I through IV). Level I—currently calculated as the mean of the bottom third of the OEWS wage distribution—would be adjusted from the 17th percentile to the 34th percentile. Level IV—currently calculated as the mean of the upper two thirds of the OEWS wage distribution—would increase approximately from the 67th percentile to the 88th percentile.

Consistent with the formula provided in the INA, Level II would be calculated by dividing by three, the difference between Levels I and IV, and adding the quotient to the computed value for Level I. Level III would be calculated by dividing by three the difference between Levels I and IV, and subtracting the quotient from the computed value for Level IV. This yields a Level II prevailing wage at approximately the 52nd percentile and a Level III prevailing wage at approximately the 70th percentile, as compared to the current computation, which places Level II at approximately the 34th percentile and Level III at approximately the 50th percentile.

Finally, the Department is revising § 655.731 to explain that it will use the BLS's OEWS survey wage data to establish the prevailing wages in the H-1B, H-1B1, and E-3 visa classifications, and adding a sentence to explain that these determinations will be made by the OFLC NPC in a manner consistent with § 656.40(b)(2).

The Department calculated the impact on wages that would occur from implementation of the prevailing wage computation changes contained in the NPRM. It is expected that the increase in prevailing wages under the NPRM would induce some employers to employ U.S. workers instead of alien workers from the H-1B program, but nonetheless the Department still expects that the same number of H-1B visas would be granted under the annual caps. For example, in FY2024 USCIS received approximately 781,000 registrations for 85,000 available slots—more than nine times the supply—and the cap was reached within the first five business days each year from FY2019 through FY2025. Higher prevailing wage levels do not necessarily mean that demand for temporary alien workers would fall below the available supply of visas.²²⁸ Under existing prevailing wage

levels, which the Department has shown are too low and do not accurately reflect the wages paid to similarly situated U.S. workers, demand for temporary alien workers far exceeds the statutory limits on supply. Usually, prices rise in a market when demand exceeds supply. However, given the statutory design of the H-1B system, along with the lower wages for comparable work in many other countries and the non-pecuniary benefits of participating in the H-1B program, prices for temporary alien workers under the H-1B program have stayed too low to depress overall employer demand.

For the purposes of this regulatory analysis, it is helpful to distinguish between labor sub-markets characterized by differing levels of worker productivity. Suppose an alien worker is highly productive and therefore could be profitably hired at a wage at least as high as a proposed wage threshold (for example, the Level IV proposal). In the presence of the numerical cap on the H-1B program, that profit may be forgone due to the worker not being able to acquire a visa; instead, in some such cases, the visa would instead be allocated to the hiring of a less-productive alien worker at a wage that is lower (but still above an *existing* wage threshold relevant to the H-1B program). The proposed rule, interacting with the H-1B visa cap, would generate transfers from U.S. employers that, in the baseline, would employ relatively low-productivity guest workers; these transfers would flow to some combination of: (a) relatively low-productivity workers, who may be foreign or from the United States,²²⁹ and (b) U.S. employers newly able to hire high-productivity alien workers.²³⁰ The quantification presented below does not reflect the probable response by employers of hiring higher-productivity guest workers; as such, it yields an upper bound, and possibly an extreme upper bound, on the aggregate losses experienced by U.S. employers. Similarly, a shift in H-1B visa allocation from relatively low-productivity to high-

productivity workers is an anticipated effect of a recently published final rule issued by DHS (RIN 1615-AD01; 90 FR 60864); that final rule and this proposal's overlapping effects are combined in the quantification presented below, thus generating an additional tendency toward overestimation of the effects specifically attributable to this proposed rule. The Department notes that the number of H-1B visas that could be affected by DHS's final rule represents a fraction of the total number of certified H-1B visas each year.²³¹ The Department welcomes public comment on how DHS's final rule could affect the cost-benefit analysis of this proposal.

Given that participation in temporary labor certification programs is voluntary and there exists an alternative labor market of U.S. workers who are not being prevented from accepting work offered at potentially lower market-based wages, there is some uncertainty around the extent to which an increase in prevailing wages would lead to an efficiency loss. Due to data limitations on the expected change in labor demand and supply of U.S. workers, the Department cannot measure accurately the efficiency losses to the U.S. labor market created by the new prevailing wage system. While the Department discusses this potential impact qualitatively, it welcomes comments on how to estimate changes to efficiency from the new prevailing wage levels.

For each H-1B certification in FY 2023, FY 2024, and FY 2025, the Department used the difference between the estimated prevailing wage level under the NPRM and the wage offered under the current baseline to establish an estimated bound on the wage impact of the prevailing wage computation changes in each calendar year of the certification's employment period. Under the H-1B classification, employment periods for certifications can last up to three years and generally begin up to six months after a certification is issued by the Department. Therefore, a given fiscal year can have wage impacts that start in that calendar year and last up to three years, or could start in the following calendar year and have an end-date up to four calendar years past the fiscal year. For example, if an application certified in FY 2023 is used for employment beginning in March 2024 and lasting three years, the wage impacts would extend through March

²²⁸ Data on H-1B electronic registrations and selection numbers for FY 2024 are published by U.S. Citizenship and Immigration Services (USCIS). See FY 2024 H-1B Initial Registration Period Updates, available at <https://www.uscis.gov/sites/default/files/document/outreach-engagements/FY2024H1BInitialRegistrationPeriodUpdates.pdf>.

²²⁹ The NPRM is still inducing a wage transfer under these cases where U.S. workers are employed instead of H-1B workers and therefore no adjustments to the wage estimates are necessary due to this effect. However, it is possible that prevailing wage increases will induce some employers to train and provide more working hours for incumbent workers, resulting in no increase in employment but an increase in earnings (with other accompanying effects, such as the cost of the newly-provided training).

²³⁰ Related transfers (in the former of worker surplus—the difference between wage received and reservation wage) would flow from lower- to higher-productivity foreign workers and possibly from higher- to lower-productivity U.S. workers.

²³¹ Preliminary calculations suggest that a shift toward Levels III and IV and away from Level I, to the extent indicated in the analysis of the DHS rule, might decrease overall estimates of this proposed rule's effect by approximately 3 percent.

2027. The NPRM does not retroactively impact certified wages, so there would be new H-1B applications certified by the Department during FY 2025 that may extend well into the analysis period. Therefore, the rule would only impact new certifications in its first year, new and continuing certifications from one year prior in its second year, and both new and continuing certifications from two years prior in its third year.

To account for this pattern of wage impacts, we classify certifications into three cohorts based on the length of their employment period and calculate annual wage impacts for each cohort using FY 2023–FY 2025 certification data. These cohorts are: (1) certifications lasting less than one year, (2) certifications lasting one to two years, and (3) certifications lasting two to three

years. While this three-cohort structure helps organize the analysis, it does not imply that all impacts stabilize after three years. Because new certifications continue to enter each year and some multi-year certifications extend beyond the initial three-year horizon, a steady-state impact is not reached until approximately Year 8 of implementation. This clarification ensures that readers understand the cohorts are a modeling tool, not a representation of when the rule’s effects fully level off.

H-1B, H-1B1, or E-3 applications certified by the Department do not necessarily result in employment and employer wage obligations. After obtaining a certification, employers must then submit a Form I-129, Petition for a Nonimmigrant Worker, for approval by USCIS. DHS may approve

or deny the H-1B visa petition. DHS approval data represents approvals of petitions based on both certifications issued by the Department that used OEWS data for the prevailing wage or that were based on other approved sources to determine the prevailing wage (e.g., Collective Bargaining Agreements, employer-provided surveys). In FY 2024, approximately 93.5% percent of workers associated with H-1B, H-1B1, and E-3 certifications had prevailing wages based on the OEWS survey. To estimate OEWS-based approvals, we multiplied total DHS approvals by 93.5 percent and then computed the approval rates.²³² 2023 and FY 2024 data on H-1B, H-1B1, and E-3 certifications with their prevailing wage based on the OEWS survey, adjusted DHS approvals, and approval rate.

Exhibit 4—LCA and I-129 H-1B, H-1B1, and E-3 Approvals and Denials

	FY 2023			FY 2024			Average percent approved
	LCA certified	DHS approved +	Percent approved	LCA certified	DHS approved +	Percent approved	
Total	1,091,874	362,039	33	1,285,721	374,281	29	31
New	432,083	109,786	25	407,987	130,907	32	28
Continuing *	659,791	252,252	38	877,734	243,374	28	33
* Includes: “Continued Employment,” “Change Previous Employment,” “Change Employer,” “Amended Petition,” “New Concurrent Employment”							
+ Approval numbers multiplied by 93.5% to account for approvals with prevailing wages set by sources other than OEWS.							

To estimate the wage impacts of new percentiles contained in this NPRM, the Department used publicly available BLS OEWS data that reports the 10th, 25th, 50th, 75th, and 90th percentile wages by SOC code and State.²³³ In order to estimate wages for the new NPRM levels of 34th, 52nd, 70th, and 88th percentiles, the Department linearly interpolated between relevant percentiles for reported wages at each

SOC code and geographic area combination.²³⁴ LCA and OEWS data from fiscal years 2020–2024 suggest that 22.5% of LCA certified positions offered wages above the new proposed policy. This suggests that when calculating transfers not every employer would be affected. Furthermore, many employers offered wages relatively close to the new proposed prevailing wage levels,

suggesting that not every employer would be affected in the same way. The department estimates that for fiscal years 2020–2024, the average wage offered by LCA position is around \$121,908. This is significantly higher than the mean of the prevailing wage for the same data set which was only \$111,717 or \$10,191 less than the offered wage.

²³² Form I-129 data for H-1B is obtained from the USCIS H-1B data hub. Retrieved from: <https://www.uscis.gov/tools/reports-and-studies/h-1b-employer-data-hub>.

²³³ BLS OEWS data for Metropolitan and Nonmetropolitan Areas acquired for each year required for the analysis: [May 2020–May 2024]. Retrieved from <https://www.bls.gov/oes/>.

²³⁴ For example, if OEWS reports a wage of \$30 per hour at the 25th percentile and \$40 per hour at the 50th percentile then the 34th percentile is interpolated as $\$30 + (\$40 - \$30) * ((34 - 25) / (50 - 25)) = \$33.60$ per hour.

Exhibit 5—Comparison of New Prevailing Wage and Old Prevailing Wage under**Proposed Rule Changes by Wage Level**

Wage Level	Old PW	Offered Wage	New PW	Pct Increase Over Old PW	Pct Increase over Offered Wage
I	73,279	82,607	97,746	33.39%	18.33%
II	98,987	109,583	123,212	24.47%	12.44%
III	121,979	134,853	147,333	20.79%	9.25%
IV	144,202	162,807	175,464	21.68%	7.77%

Exhibit 5 presents a comparison of historical and proposed prevailing wage levels alongside offered wages from LCA data spanning 2020 to 2024. The column labeled “Pct Increase PW” reflects the percentage increase from the old to the new prevailing wage levels. For example, at Wage Level I, this represents the shift from the 17th percentile to the 34th percentile of the

OEWS wage distribution—an increase of approximately 33.39%. In contrast, “Pct Increase Offered Wage” measures the percentage increase between the average offered wage and the new prevailing wage level. This metric represents the minimum theoretical wage adjustment required under the proposed rule. While “Pct Increase PW” reflects the maximum potential impact—assuming

all workers, including those already earning above the new prevailing wage, receive increases—“Pct Increase Offered Wage” provides a more refined estimate. Because these figures are derived from a merged OEWS–LCA dataset rather than the full LCA dataset used in Exhibit 4, the calculated percentages serve as proxies to estimate wage differentials across the broader dataset.

Exhibit 6—Comparison of Proposed Prevailing Wage Levels and Wage Offered by**Wage Level**

Fiscal Year	Mean Offered Wage	New Prevailing Wage	Difference
2023	122,241	135,549	13,308
2024	127,312	141,031	13,720
2025	133,850	148,439	14,589

To estimate the policy’s impact, the Department assumes that wages of workers whose wages are already above the new prevailing wage remain unchanged, while those below the new prevailing wage are raised to exactly the new prevailing wage. It is unlikely that the full wage increase would apply to the majority of workers currently earning below the new prevailing wage (approximately 80%). These inputs and assumptions yield an estimated annual wage transfer of approximately \$14,000 per worker.

To model annual impacts, the Department grouped into cohorts based on the year their certification was issued, recognizing that the revised prevailing wage applies only to newly issued visas. While the initial discussion referenced three cohorts for simplicity, the actual transition involves overlapping cohorts across multiple years. In Year 1, only new certifications issued under the revised wage standard are affected. In Year 2, impacts include both new certifications and continuing approvals from Year 1. This pattern

continues as additional cohorts enter each year, with cumulative effects increasing until all legacy visas under the previous wage standard have expired. Because H–1B employment periods can last up to three years, steady state is not reached until approximately Year 6, when all active visas reflect the revised prevailing wage. Exhibit 7 and accompanying notes set forth that the model accounts for these overlapping cohorts and the gradual progression to steady state.

Exhibit 7—Estimated Annual Wage Transfer Impact by Year

Year	Affected Approvals*	Prior Cohort 1	Prior Cohort 2+	Total Cohort Affected	Average Wage Difference for Cohort Members <i>Not</i> in Prior Cohort	Total Wage Transfer Calculation	Notes
1 (using FY23 data)	109,786	—	—	109,786	\$13,308	=109,786×\$13,308	Only new approvals affected; first cohort
2 (using FY24 data)	130,907	109,786	—	240,693	\$13,720	=130,907×\$ 13,720 + Year 1 total	First and second cohorts
3	106,325	130,907	109,786	347,018	\$14,589 (using FY25 data)	=106,325×\$ 14,589 + Years 1-2 total	Cumulative across three cohorts
4	106,325	106,325	240,693 =109,786 + 130,907	453,343	\$14,589	=106,325× \$14,589 + Years 1-3 total	
5	106,325	106,325	347,018	559,668	\$14,589	=106,325× \$14,589 + Years 1-4 total	
6	106,325	106,325	453,343	665,993	\$14,589	=106,325×\$ 14,589 + Years 1-5 total	
7	106,325	106,325	449,882	662,532	\$14,589	=106,325×\$ 14,589 + Years 2-6 total	
8+	106,325	106,325	425,300	637,950	\$14,589	=106,325×\$14,589 + Years 3-7 total	Steady state: no legacy approvals
* Approval numbers multiplied by 93.5% to account for approvals with prevailing wages set by sources other than OEWS.							

From FY 2025, the Department's calculations reflect the total number of DHS-approved H-1B petitions for that year. For FY 2025, DHS approved 380,796 total petitions. Approximately 93.5% of new certifications (106,325) were based on LCAs using OEWS data, reflecting that about 6.5% rely on permitted alternative sources such as private wage surveys. Performing the calculations listed in Exhibit 7 results in an annual wage transfer of approximately \$1.46 billion in Year 1, \$6.3 billion in Year 4, and rising to over \$9.3 billion in Year 6 and beyond.

Existing prevailing wage data from the Foreign Labor Certification (FLC) Data Center, accessible at <https://flag.dol.gov>, contains wage data for each SOC code and geographic area combination that are not readily available in the public OEWS data used to estimate new prevailing wage levels. For example, when a wage is not releasable for a geographic area, the prevailing wage available through the FLC Data Center may be computed by BLS for the geographic area plus its contiguous areas. Additionally, in publicly available OEWS data, some percentiles are missing for certain combinations of SOC codes and geographic areas. These two factors result in a small number of

certifications that cannot be matched to a new prevailing wage level.²³⁵ For these unmatched certifications, we estimate wage impacts as follows: First, we calculate the average wage impact per worker for the relevant cohort and fiscal year. Second, we apply this average to all workers associated with unmatched certifications, producing estimated annual wage impacts for each calendar year of employment. Finally, we add these estimated impacts to the directly calculated wage impacts from matched certifications to produce the total wage impact for each cohort in each calendar year.

The Department determined the total impact of the NPRM prevailing wage levels for each length cohort in each calendar year by summing the wage impacts for all certifications in each year and averaging the totals. The wage impacts for each cohort and calendar year are presented in Exhibit 7. Some calendar years are excluded from the inputs underlying the exhibit because the available data (FY 2023–2025 certifications) does not capture all certifications active during those years. For example, calendar year 2025

²³⁵ In FY 2022, 10.87 percent of certifications do not match, in FY 2023 11.41 percent, and FY 2024 17.02 percent.

includes workers from FY 2025 certifications but would also include workers from FY 2026 certifications, which are not yet available. Therefore, calendar year 2025 is excluded to avoid incomplete estimates.

With the increases in prevailing wage levels under this NPRM, some employers may reduce their demand for labor—either by hiring fewer alien workers or by adjusting staffing patterns—because higher wages increase the cost of employment. These adjustments could include substituting toward incumbent workers or reallocating hours, which may partially offset the expected increase in new hires. While the precise magnitude of these behavioral responses is uncertain, the Department provides a discussion of these potential effects and their implications in the following analysis.

The labor economics literature contains substantial research on how wages affect demand for labor. In the context of the H-1B program, the relevant measure is the long-run own-wage elasticity of labor demand, which describes how firms adjust their labor demand in response to wage changes. Estimates of labor demand elasticities vary considerably depending on industry, skill-level, region, and other

factors. A commonly cited average long-run own-wage elasticity of labor demand is -0.3 ²³⁶ meaning a 10 percent increase in an employer's total wage payments would be expected to result in a 3% decrease in the quantity of labor demanded by the employer in the long run, on average.²³⁷

The Department's baseline analysis projects an average annual undiscounted wage transfer of \$7.07 billion under the proposed rule (see Exhibit 7 and accompanying text). The average annual increase in wage transfers is a 6.1 percent increase in wage payments, which would imply a potential reduction in labor demand of 1.83 percent ($6.1 \times .3$). U.S. employers would likely pay higher wages to H-1B workers or replace them with U.S.

workers where possible. However, if U.S. employers were constrained in their ability to pay higher wages and reduced demand accordingly, the wage transfer would decline by approximately 1.83 percent, from \$7.07 billion to approximately \$6.94 billion.

b. Non-Quantifiable Transfer Payments

This section discusses the non-quantifiable transfer payments related to changes to the computation of the prevailing wage levels. Specifically, the Department did not quantify transfer payments associated with certifications under the Permanent Labor Certification Program because they are expected to be de minimis.

The PERM programs have a large proportion of certifications issued

annually to alien workers that are working in the U.S. at the time of certification and would have changes to wages under the NPRM prevailing wage. Prior to the PERM certification, these beneficiaries are typically working under H-1B, H-1B1, and E-3 temporary visas and wage transfers for these PERM certifications are therefore already factored into our wage transfer calculations for H-1B, H-1B1, and E-3 temporary visas. Below, Exhibit 8 illustrates the percentage of PERM certifications that are on H-1B, H-1B1, or E-3 temporary visas, the percent that are not on a temporary visa and/or are not currently in the U.S. and would therefore enter on an EB-2 or EB-3 visa, and all other visa classes.

Exhibit 8—PERM Certifications by Class of Admission, FY20-FY24

Category	FY20	FY21	FY22	FY23	FY24	Average percentage of total
Not on a temporary visa/not currently residing in the United States	1946	2166	2,196	3,653	3,692	5.5
H-1B nonimmigrant	36570	46328	27,351	32,875	20,588	65.5
H-1B1 nonimmigrant	61	64	36	32	25	0.1
E-3 nonimmigrant	180	262	101	113	72	0.3
All Other Visa Classifications*	14957	18661	10,778	16,042	11,128	28.6
Total	53714	67481	40,462	52,715	35,505	100
* Other classes of admission include: A1/A2, L-1, F-1, A-3, B-1, C-1, TN, C-3, E-2, B-2, D-1, D-2, H-4, O-1, E-1, EWI, J-1, TPS, F-2, L-2, G-4, H-2A, G-1, G-5, H-1A, Parolee, P-1, J-2, H-3, I, M-1, R-1, O-2, M-2, P-3, O-3, VWT, TD, P-2, P-4, Q, VWB, R-2, N, S-6, T-1, V-2, T-2, K-4, U-1.						

About 10 percent of PERM certifications are issued annually by OFLC to alien workers who do not currently reside in the U.S. and would enter on immigrant visas in the EB-2 or EB-3 preference category. Employment-based immigrant visa availability and corresponding wait times change regularly for different preference categories and countries. Alien workers from countries with significant visa

demand consistently experience delays, at times over a decade. Therefore, employers would not have wage obligations until at the earliest, the very end of the 10-year analysis period and the number of relevant certifications is a relatively small percent of all PERM certifications; the Department therefore has not included associated wage transfers in the analysis.

4. Benefits Discussion

This section discusses the non-quantifiable benefits related to changes to the computation of the prevailing wage levels.²³⁸

The Department's increase in the prevailing wages for the four wage levels is expected to result in multiple benefits that the Department is unable to quantify but discusses qualitatively. One benefit of the NPRM's increase in

²³⁶ For a full discussion of labor demand elasticity heterogeneity see Lichter, A., Peichl, A., & Sieglöcher, S. (2015). The own-wage elasticity of labor demand: A meta-regression analysis. *European Economic Review*, 94–119. Retrieved from: <https://www.econstor.eu/bitstream/10419/93299/1/dp7958.pdf>.

²³⁷ This value is the best-guess in seminal work by Hamermesh, D.H. (1993). *Labor Demand*. Princeton University Press.

²³⁸ As noted elsewhere in this analysis, the proposed rule would be expected to shift the allocation of H-1B visas from lower-productivity to higher-productivity workers, and given the existing

cap on such visas, may have little or no effect on the number granted. Thus, analysis of changes in societal surplus would not be as straightforward here, where the result would be a negative benefit, as it was for the Department's recent rulemaking related to H-2A visas (RIN 1205-AC24; 90 FR 47914).

prevailing wages is the economic incentive to increase employee retention, training, and productivity which would increase benefits to both employers and U.S. workers. The increase in prevailing wages is expected to induce employers—particularly those using the permanent and temporary visa programs—to fill critical skill shortages, to minimize labor costs by implementing retention initiatives to reduce employee turnover, and/or to increase the number of work hours offered to similarly employed U.S. workers. Furthermore, for employers in the technology and health care sectors, this could mean using higher wages to attract and hire the industry's most productive U.S. workers and to provide them with the most advanced equipment and technologies to perform their work in the most efficient manner.

Ensuring that skilled occupations are not performed at below-market wage rates by alien workers would provide greater incentives for firms to expand education and job training programs. These programs can attract and develop the skills of a younger generation of U.S. workers to enter occupations that currently rely on elevated levels of alien workers. (The Department requests comment on not-yet-quantified costs—for example, costs of training programs or equipment upgrades—that would accompany any such benefits.) There is some evidence that the existing prevailing wage levels offer opportunities to use lower-cost

alternatives to U.S. workers doing similar jobs by offering two wage levels below the median wage. For example, in FY 2024, 62.6 percent of H-1B workers filed LCAs at either the first or second wage level, meaning a substantial majority of workers in the program could be paid wages well below the median wage for their occupational classification. While this analysis uses the existing distribution of wage levels as a baseline, the Department acknowledges that the composition of H-1B wage levels could shift under the proposed rule. Specifically, the DHS weighted lottery and higher prevailing wage requirements may increase the share of Level III and Level IV positions over time. This potential change is discussed qualitatively in the analysis.

Glennon's (2024) literature review touches on relevant issues, including the variety of productivity contributions associated with the H-1B program—as illustrated by, for example, estimates of innovation-related outcomes differing substantially depending on whether the analyzed data set includes employers who submit applications promptly (on a rolling basis) or focuses only on employers who wait until the last potential application day.²³⁹ Because workers with greater skills tend to be more productive, and therefore command higher wages, raising the

prevailing wage levels would lead to the limited number of H-1B visas going to higher-skilled alien workers, which would likely increase the spillover economic benefits associated with high-skilled immigration. This reallocation is expected to increase not only direct output per worker but also broader economic spillovers, such as higher rates of patenting, technology diffusion, and firm-level productivity growth documented in the literature. By concentrating visa allocations among workers at the upper end of the skill distribution, the proposed rule amplifies these benefits, which extend beyond the hiring firm to the wider economy through innovation and knowledge transfer.²⁴⁰

5. Summary of the Analysis

Exhibit 9 below summarizes the costs and transfer payments of the NPRM. The Department estimates the annualized cost of the NPRM at \$3.53 million and the annualized transfer payments (from H-1B, H-1B1, and E-3 employers to some combination of other such employers and workers) at an upper bound of \$6.56 billion, at a discount rate of 7 percent. The Department did not estimate any cost savings.

Annualized with a Discount Rate of 7%	3.53	6.56

6. Regulatory Alternatives

In developing this rule, the Department considered several alternative approaches to revising the prevailing wage level methodology. Each alternative was evaluated for its consistency with the Department's statutory obligations under the Immigration and Nationality Act (INA), its responsiveness to the policy direction set forth in the September 19, 2025 Presidential Proclamation, and its administrative feasibility and legal defensibility. The Department ultimately selected the proposed percentile structure (34th, 52nd, 70th, and 88th percentiles) as the most balanced and effective approach. However, the following alternatives were considered:

a. Alternative 1: Using Experience Benchmarking for Adjusting Wage Levels

The Department also seeks public comment on an alternative approach to revising prevailing wage levels using a methodology called Experience Benchmarking. Under this alternative,

prevailing wage levels for the H-1B, H-1B1, E-3, and PERM programs would be adjusted using a methodology that benchmarks wages to workers with comparable education and experience in the same occupation and geographic area.

Experience Benchmarking seeks to adjust prevailing wage levels by merging the occupational and geographic specificity of the BLS OEWS with education- and experience-adjusted wage estimates derived from the American Community Survey (ACS) of the Census Bureau.²⁴¹ The relationship between these data sources would be modeled using the Mincer earnings equation, which is a natural logarithm

²⁴¹ The ACS is the largest ongoing household survey in the United States, surveying approximately 3.5 million households each year. It is administered by the U.S. Census Bureau in the Department of Commerce, collects detailed information on earnings, educational attainment, age, occupation, and geography, and widely used for federal program administration. For more information on the ACS, please see <https://www.census.gov/programs-surveys/acs.html>.

of wages as a function of education and experience.²⁴²

The Department is considering this alternative to potentially improve the comparison of the wages of alien workers to those of similarly qualified U.S. workers. As noted previously, today prevailing wage levels are derived from the overall wage distribution within an occupation and geographic area and are applied based on the employer's description of the minimum job requirements for the position. Because the underlying OEWS data do

²⁴² The Mincer logarithm of wages equation is the foundational model in empirical labor economics for estimating the returns to education and experience. See Thomas Lemieux, "The 'Mincer Equation' Thirty Years After Schooling, Experience, and Earnings," in Shoshana Grossbard, ed., *Jacob Mincer: A Pioneer of Modern Labor Economics* (New York: Springer, 2006), ch. 11 (calling the Mincer equation "one of the most widely used models in empirical economics" and concluding it "remains an accurate benchmark for estimating wage determination equations"). See also Solomon W. Polachek, "Earnings Over the Life Cycle: The Mincer Earnings Function and Its Applications," *Foundations and Trends in Microeconomics* 4, no. 3 (2008): 165–272. Also see George J. Borjas, *Labor Economics*, 7th ed. (New York: McGraw-Hill, 2016), p. 244.

not collect information on worker education or experience, the methodology employed under the current rule may allow positions to be classified at wage levels that are less comparable to the actual education and experience of the alien worker. As a result, an alien worker with significantly higher education or professional experience could be paid a wage benchmarked to U.S. workers with comparably lower levels of education and experience. Experience Benchmarking seeks to address this limitation by comparing the sponsored alien worker's wage to the wages earned by U.S. workers with comparable education and experience in the same occupation and geographic area, thereby producing prevailing wages that more closely reflect the wages paid to similarly qualified workers in the U.S. labor market.

Because the ACS does not directly measure actual labor market experience, the methodology would estimate "potential experience" using a commonly accepted definition as age minus years of schooling minus age when schooling begins (often six).²⁴³ Using the OEWS 50th (median), 62nd, 75th, and 90th percentiles for each occupation and geographic area as the base wages, the Department would use public-use microdata from the ACS to generate Mincer wage equations for each occupation among native-born American workers only, modelling the relationship between (log) earnings, educational attainment, and potential experience (measured by age) within each occupation, controlling for area of employment fixed effects. The output of these models would be a matrix of ratios (or wage premia) comparing the expected earnings of U.S. workers with each combination of education and potential experience to the overall occupational median, as measured in the ACS. The Department would then apply these ACS-derived ratios to each

of the OEWS percentiles to produce Experience Benchmarked wage levels.

Under this alternative, the four OEWS wage levels would reflect variations attributable to characteristics of both the occupation and of the alien worker that the Department will not measure directly such as specialized skills, industry-specific premia, position-specific duties, and the level of supervision received or provided. Each combination of education and experience in each occupation and geographic area would generate a set of four wage levels, one at each level, as follows:

- **Level I:** Typical (50th percentile among workers with same occupation, area, education, and experience). Level I reflects the median level of skills and typical duties for workers in the occupation and location with comparable education and experience. This would be the prevailing wage due an alien worker with a given credential profile. For example, the prevailing wage for a software developer with a master's degree and five years of experience would be the median wage (that is, the new OEWS Level I wage) for software developers in the same area who also have a master's degree and approximately five years of experience—not the median for all software developers regardless of credentials.

- **Level II:** Specialized (62nd percentile among workers with same occupation, area, education, and experience). Level II reflects a position requiring specialized knowledge, duties, or other characteristics that command a premium above the typical wage for workers with comparable credentials.

- **Level III:** Demanding (75th percentile among workers with same occupation, area, education, and experience). Level III reflects a position requiring a notably higher degree of proficiency, specialized expertise, or responsibility than is typical, commanding more than what three-quarters of similarly qualified workers earn in the same occupation and area.

- **Level IV:** Highly Demanding (90th percentile among workers with same occupation, area, education, and experience). Level IV reflects the highest-skilled positions among similarly qualified workers, representing the upper tier of complexity, responsibility, and autonomy within the occupation at the relevant education and experience level. Such positions may involve substantially less supervision from a manager than is typical, or may involve the incumbent providing active supervision of a greater number of

subordinates than is typical for comparably qualified workers in that occupation.

Under experience benchmarking, the Level I requirement at the 50th percentile guarantees that an alien worker is never paid less than the median native-born worker with the same occupation, education, and experience in the same location. The higher wage levels (Levels II–IV) allow an employer to pay for exceptional talent to have more chances in the lottery. The reason for these specific percentiles (50th, 62nd, 75th, and 90th) is that they are close to dividing the upper half of the distribution equally. These levels differ from the levels as proposed because the adjustments for experience and education are based directly on real data.

To illustrate how the methodology would work, consider a hypothetical example. If ACS data and Mincer wage equation estimated that U.S. accountants with 10 years of experience and a master's degree typically earn 20 percent more than the median accountant nationwide, the Experienced Benchmarked ratio for that education-experience combination in accounting would be expressed as a wage premia factor of 1.2. Then, to compute the Level I prevailing wage for an employer seeking visa labor certification to employ an alien worker as an accountant in Dayton, Ohio, with 10 years of experience and a master's degree, the Department would take the OEWS 50th percentile for accountants in the Dayton MSA (currently \$78,710) and multiply it by 1.2, yielding an experience-benchmarked Level I prevailing wage of \$94,452. The Level II prevailing wage would apply the same 1.2 ratio to the OEWS 62nd percentile; Level III to the 75th percentile; and Level IV to the 90th percentile. This calculation would be repeated for every education-experience combination, in every occupation, in every geographic area covered by the OEWS, and separately for the American Competitiveness and Workforce Investment Act (ACWIA) industries, as required by statute. Thus, under this alternative, experience and education would be considered explicitly, with the wage levels corresponding to the remainder of those factors that determine earnings in the occupational classification: skills, level of supervision, and any other factors that might determine the wage premium that an individual worker can command compared to other workers in the same occupation, area, and with the same level of experience and education. If this approach were adopted for PERM,

²⁴³ The concept of "potential experience," defined as age minus years of schooling minus age when schooling begins (often six) was introduced by Mincer (1974) and has been the standard approach in labor economics for over fifty years when direct experience data are unavailable. See Lemieux (2006), *supra* (noting that "potential experience" is the standard measure in the Mincer specification). In addition, Zoghi (2010) directly compared labor composition indexes calculated with imputed experience measures versus age groups and found that the results were "nearly identical," concluding "it seems reasonable to use the simpler and more transparent age group variable." See Cindy Zoghi, "Measuring Labor Composition: A Comparison of Alternate Methodologies," in Katharine G. Abraham, James R. Spletzer, and Michael Harper, eds., *Labor in the New Economy* (Chicago: University of Chicago Press for NBER, 2010), ch. 12, pp. 457–485.

the prevailing wage associated with the LCA would be the higher of: (1) the Level I OEWS Level corresponding to the minimum education and experience requirements of the position, and (2) if the alien worker is an H-1B, H-1B1, or E-3 worker, the prevailing wage identified on the Labor Condition Application certified by DOL and listed on the DHS/USCIS I-129 Petition for Nonimmigrant Worker approved for that alien worker.

For LCA under this alternative, the OFLC search would be updated to reflect the prevailing wage levels of different education and experience profiles, and the employer would reference this when submitting the LCA. If the employer did not have an alien worker identified, it would file the LCA for each education-experience profile it would be considering for the role, and the eventual hire would be paid under the relevant LCA matching that alien worker's education-experience profile.

The Department invites public comment on all aspects of this alternative, including any strengths and limitations (e.g., sample size, occupational and geographic area coverage) of using the ACS; effectiveness of using age as a proxy for experience; efficacy of employing Mincer wage equations for Experience Benchmarking prevailing wage levels; appropriateness of establishing the base OEWS wage levels at the 50th, 62nd, 75th, and 90th percentiles for each occupation and geographic area; and statistical validity of applying the resulting ratios from the ACS to the corresponding OEWS wage levels.

The primary benefits are threefold. First, the proposal essentially ends the practice of wage arbitrage which improves the standing of American workers and the benefits that flow from strong middle-class employment. Second, the proposal substantially improves the ability of the visa programs to screen for exceptional talent and ability. Third, the proposal reduces the ability of employers to under classify workers using strategic job descriptions.

The Department also invites comment on whether there are other readily accessible and appropriate sources of data and methods for estimating education-experience wage premia, and on whether other federal data sources—including but not limited to administrative records that may enable direct tabulations rather than a model-based approach—could provide more precise or more comprehensive estimates of the returns to education and experience within occupations in relation to the OEWS wage levels.

Finally, the Department acknowledges that determining prevailing wages under this alternative will require employers to collect information about the alien worker's actual education and experience when the employer submits an application. For the H-1B, H-1B1, and E-3 visa classifications, this information could be collected on a revised information collection for the ETA-9035, *Labor Condition Application for Nonimmigrant Workers* (OMB Control No. 1205-0310). In the PERM program, this information could be collected through revisions to the ETA-9141 Application for Prevailing Wage Determination (OMB Control No. 1205-0508), which would also cover employers seeking a prevailing wage determination from the Department under the H-1B, H-1B1, and E-3 visa classifications, and, where relevant, through forms used in related programs, in a manner similar to Appendix A (Foreign Worker Information) of the Form ETA-9089, *Application for Permanent Employment Certification* (OMB Control No. 1205-0451). Because this alternative would base prevailing wage determinations on the alien worker's actual education and experience rather than the employer's description of the minimum job requirements for the position, the Department invites public comment on whether this approach is more consistent with the statutory requirements for both the H-1B and PERM programs, the administrative feasibility and burden on employers and applicants to provide information about the alien worker's qualifications on revised Forms ETA-9035 and 9141 and in a manner similar to the current authorized collection on the Form ETA-9089, Appendix A, and whether this alternative better protects similarly employed U.S. workers from adverse effects. The primary burdens we anticipate are that employers will need to learn a new system and no longer be able to commit wage arbitrage.

b. Alternative 2: Eliminate the Ability To Use Private Wage Surveys

Under this alternative, the Department would remove the option for employers to submit private wage surveys and instead require all prevailing wage determinations to rely exclusively on the Bureau of Labor Statistics' Occupational Employment and Wage Statistics (OEWS) survey. This approach would create a single streamlined source for prevailing wages, reducing administrative complexity and compliance costs for employers—particularly small businesses—by eliminating the need to commission,

validate, and submit private surveys. Private surveys often impose significant costs on employers, including fees for survey data and legal expenses to ensure methodological compliance. By standardizing wage determinations through OEWS, the Department would minimize these burdens while maintaining consistency and transparency in wage-setting practices. This alternative therefore represents a less economically burdensome option for small entities compared to the current system, which allows for multiple wage sources and associated compliance obligations.

Private wage surveys have historically been permitted to provide employers flexibility in cases where government data sources were unavailable or insufficiently granular for certain occupations or geographic areas. The rationale was that private surveys could capture niche labor markets and specialized roles not fully reflected in OEWS data. However, the Department's analysis indicates that OEWS now provides comprehensive coverage across occupations and regions, reducing the need for alternative sources.

Despite these benefits, the Department ultimately rejected this alternative. As discussed earlier in this NPRM, retaining private wage surveys in limited circumstances preserves employer flexibility, mitigates potential adverse impacts on businesses operating in specialized labor markets, and balances reliance interests with the statutory mandate to protect U.S. workers. For some employers—particularly start-ups, small businesses, or those operating in emerging or highly specialized fields—private surveys may offer the most accurate reflection of market wages when OEWS data is insufficient or unavailable. Eliminating this option entirely could disrupt longstanding compliance practices and impose disproportionate burdens on such employers.

Additionally, while private surveys can be expensive and administratively complex to validate, historical data indicate that they typically produce wages approximately 20 percent higher than OEWS-based prevailing wages, which could significantly increase costs for employers relying on this option. The Department recognizes these trade-offs and, therefore, has chosen to retain the use of private surveys in limited circumstances. This approach preserves employer flexibility, mitigates potential adverse impacts on businesses operating in specialized labor markets, and balances reliance interests with the statutory mandate to protect U.S. workers. To ensure integrity, the

Department will monitor the use of private surveys to prevent abuse and ensure compliance, reserving the right to reject any private survey that does not meet methodological standards or otherwise fails to satisfy regulatory requirements.

In summary, while the benefits of allowing private wage surveys have diminished as OEWS coverage has improved, the Department determined that a complete elimination of private surveys would not adequately account for the needs of employers in specialized labor markets or those with legitimate reliance interests. The Department invites public comment on this approach and on whether further limitations or safeguards on the use of private wage surveys would be appropriate.

c. Alternative 3: National Wage Standard for Remote and Distributed Work

In response to the structural shift toward remote work, the Department considered replacing area-specific prevailing wages with a national wage standard for each occupational classification. This approach would simplify compliance and reflect the nationalization of high-skill labor markets. However, the Department declined to adopt this alternative due to:

- Statutory language in the INA requiring prevailing wages to be based on the “area of intended employment.”
- The need for further stakeholder engagement and legal analysis to assess the feasibility of redefining geographic wage standards.

The Department may revisit this alternative in future rulemakings as remote work trends continue to evolve.

Under this alternative, the Department would replace area-specific prevailing wages with a single national wage standard for each occupational classification. This approach would simplify compliance and reflect the increasing prevalence of remote work, which has reduced the relevance of geographic wage differentials. However, this alternative would likely result in significant cost increases for employers in lower-wage regions, as they would be required to pay wages aligned with national averages rather than local market rates. Preliminary modeling suggests that adopting this alternative could reduce employer labor costs by an incremental approximately \$10,000 annually, which is substantially higher than the costs projected under the

proposed rule.²⁴⁴ While this approach could enhance equity and reduce administrative complexity, the Department determined that the statutory requirement to base prevailing wages on the “area of intended employment” and the potential for disproportionate impacts on employers in lower-cost regions outweighed the benefits at this time.

C. Regulatory Flexibility Act, Small Business Regulatory Enforcement Fairness Act of 1996, and Executive Order 13272 (Proper Consideration of Small Entities in Agency Rulemaking)

The Regulatory Flexibility Act of 1980 (RFA), 5 U.S.C. 601 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA), Public Law 104–121 (Mar. 29, 1996), hereafter jointly referred to as the RFA, requires agencies to prepare an initial regulatory flexibility analysis (IRFA) when proposing, and a final regulatory flexibility analysis (FRFA) when issuing, regulations that will have a significant economic impact on a substantial number of small entities. The Department conducted the analysis below of the effect on small entities from the proposed rule and, based on that analysis, expects that this rule will have a significant economic impact on a substantial number of small entities that employ H–1B workers.

1. Why the Department Is Considering Action

The Department is considering action to revise the prevailing wage determination methodology because the current wage levels do not adequately reflect the wages paid to U.S. workers similarly employed to alien workers in the H–1B, H–1B1, E–3, and PERM programs. The Department has determined that the existing methodology, which was developed without formal rulemaking and lacks a robust economic justification, may contribute to wage suppression and displacement of U.S. workers, particularly in sectors with high concentrations of alien workers. Evidence from academic research, government data, and investigative reporting indicates that prevailing wages under the current structure are often set below market rates. This creates incentives for employers to prefer lower-paid alien workers over comparably qualified U.S. workers, undermining the statutory intent of the INA to protect the wages and working

conditions of U.S. workers. For example, studies have shown that H–1B workers are frequently paid less than their U.S. counterparts, and that some employers use the program to replace U.S. workers rather than to supplement the domestic workforce.

Moreover, the Department has concluded that the current four-tier wage structure, as implemented, does not sufficiently differentiate among workers based on experience, education, and responsibility, as required by 8 U.S.C. 1182(p)(4). The Department’s analysis also found that the methodology used to calculate wage levels—particularly the use of the mean of the bottom third of the wage distribution for Level I—does not align with labor market realities or the statutory requirement to prevent adverse effects on U.S. workers.

Given these findings, and consistent with the Department’s statutory obligations and the President’s directive to strengthen wage protections for U.S. workers, the Department is proposing to revise the prevailing wage methodology to better reflect actual market wages and ensure that the employment of alien workers does not adversely affect the wages and job opportunities of U.S. workers.

2. Objectives of and Legal Basis for the NPRM

The Department’s objective in issuing this NPRM is to strengthen wage protections for U.S. workers by revising the methodology used to determine prevailing wage levels under the H–1B, H–1B1, E–3, and PERM programs. The current wage structure, which has remained largely unchanged since its inception, does not adequately reflect the wages paid to U.S. workers similarly employed to alien workers in these programs. As a result, it may contribute to wage suppression, displacement of U.S. workers, and distortion of labor market conditions in high-skill sectors. This NPRM seeks to ensure that the employment of alien workers does not adversely affect the wages and working conditions of U.S. workers, consistent with the Department’s statutory obligations under the INA. Specifically, section 212(a)(5)(A) of the INA (8 U.S.C. 1182(a)(5)(A)) requires the Secretary of Labor to certify that the employment of alien workers would not adversely affect the wages and working conditions of similarly employed U.S. workers. In the context of the H–1B, H–1B1, and E–3 programs, section 212(n)(1)(A) and 212(t)(1)(A) (8 U.S.C. 1182(n)(1)(A) and 1182(t)(1)(A)) further requires that employers pay the greater of the actual wage or the prevailing wage for the

²⁴⁴ Analysis based on FY 2020–2024 LCAs and uses current prevailing wage levels to determine the difference.

occupational classification in the area of intended employment.

Additionally, section 212(p)(4) of the INA (8 U.S.C. 1182(p)(4)) mandates that any government survey used to determine prevailing wages must provide at least four levels of wages commensurate with experience, education, and level of supervision. The Department has determined that the current implementation of this four-tier structure does not sufficiently differentiate among workers based on these statutory factors and may understate the true market wages for many occupations.

The NPRM is also responsive to the President's directive in the September 19, 2025, Proclamation titled "Restriction on Entry of Certain Nonimmigrant Workers," which

instructed the Secretary of Labor to initiate rulemaking to revise prevailing wage levels to better protect U.S. workers. The Department's action is grounded in its longstanding authority to administer the labor certification process and to interpret and implement the INA's wage protections through reasonable and evidence-based methodologies. In sum, the NPRM is intended to align prevailing wage levels more closely with actual market wages; reduce the incentive to prefer alien workers over U.S. workers based on wage differentials; ensure compliance with statutory requirements under 8 U.S.C. 1182(a)(5)(A), 1182(n)(1)(A), 1182(t)(1)(A), and 1182(p)(4); and promote the integrity and effectiveness of the Department's foreign labor certification programs.

3. Estimating the Number of Small Entities Affected by the Rulemaking

The Department used the FY 2024 H-1B cap-subject petitions data provided by the DHS.²⁴⁵ There were 13,602 unique small H-1B employers with data on the number of employees and annual revenue that met the Small Business Administration's size standards. These 13,602 unique small H-1B employers represent petitions with start dates on or after 10/1/2024 and before 10/1/2025.

To provide clarity on the types of industries impacted by this regulation, Exhibit 10 shows the number of unique H-1B small entity employers within the top 10 most prevalent industries at the 6-digit and 4-digit NAICS code level.

Exhibit 10—Number of H-1B Unique Small Employers by NAICS Code

6-Digit NAICS	Description	Number of H-1B Unique Small Employers	Percentage of Employers
513210	Software Publishers	143	1.05
518210	Data Processing, Hosting, and Related Services	150	1.1
541110	Office of Lawyers	237	1.74
541211	Offices of Certified Public Accountants	153	1.12
541310	Architectural Services	210	1.54
541330	Engineering Services	533	3.92
541511	Custom Computer Programming Services	7990	29.33
541512	Computer Systems Design Services	517	3.8
541519	Other Computer Related Services	288	2.12
541714	Research and Development in Bio-technology (except Nanobiotechnology)	177	1.3
Other NAICS		7,024	52.96
Total		13,602	100%

4. Compliance Requirements of the NPRM, Including Reporting and Recordkeeping

The Department has considered the incremental costs for small entities from the baseline (*i.e.*, the current practices for complying, at a minimum, with the regulations governing permanent labor certifications at 20 CFR part 656 and labor condition applications at 20 CFR part 655, subpart H) to this NPRM. We estimated the cost of (a) the time to read and review the NPRM and (b) wage costs. These estimates are consistent

with those presented in the E.O. 12866 section.

5. Calculating the Impact of the NPRM on Small Entities

The Department estimates that small entities using the H-1B program would incur a one-time cost of \$60.94 to familiarize themselves with the rule.²⁴⁶

In addition to the rule familiarization costs, each small entity using the H-1B program may have an increase in the annual wage costs due to the revisions to the wage structure if they currently

offer a wage lower than the NPRM prevailing wage levels. For each small entity, we estimated the annual wage cost and added it to the rule familiarization costs to measure the total impact of the NPRM on the small entity. The average wage cost per small entities is estimated at \$20,298. Small entities with petitions filed in FY 2024 can have wage obligations in calendar years 2024 and 2025, depending on when their employment period starts and the length of the employment period.

²⁴⁵ For the RFA analysis, three datasets were combined: DOL's LCA data for FY 2024; employer data from USCIS Form I-129 petitions filed in FY

2024; and the SBA size standards. This dataset includes Wage Levels I through IV.

²⁴⁶ \$60.94 = 1 hour × \$60.94, where \$60.94 = \$38.33 + (\$38.33 × 42%) + (\$38.33 × 17%).

The Department determined the proportion of each small entity's total revenue affected by the costs of the NPRM to determine if the NPRM would have a significant impact upon a substantial number of small entities. The cost impacts included the rule familiarization costs and the wage costs introduced by the NPRM. The Department used a total cost estimate of 3 percent of revenue as the threshold for a significant individual impact and assumed that 15 percent of impacted small entities incurring an impact that exceeds the 3 percent, "significant" threshold as the threshold for a substantial number of on small entities.

The Department has used a threshold of three percent of revenues in prior rulemakings for the definition of significant economic impact.²⁴⁷ This threshold is also consistent with that sometimes used by other agencies.²⁴⁸ The Department also believes that its assumption that 15 percent of small entities would be substantially affected experiencing a significant impact to determine whether the rule has a substantial impact on small entities is appropriate. The Department has used the same threshold in prior rulemakings for the definition of substantial number of small entities.²⁴⁹ Of the 13,538 unique small employers with revenue

data, up to 18 percent of employers would have more than 3 percent of their total revenue affected in 2025 (2,394/13,538). As such, the Department expects that this rule would have a significant economic impact on a substantial number of small entities affected. Exhibit 11 provides a breakdown of small employers by the proportion of revenue affected by the costs of the NPRM. Exhibits 12 through 22 provide breakdowns of small employers by the proportion of revenue affected by the costs of the NPRM for the top ten most prevalent industries at the six-digit NAICS code level.

BILLING CODE 4510–FP–C

6. Relevant Federal Rules Duplicating, Overlapping, or Conflicting With the NPRM

When creating the H–1B, H–1B1, and E–3 temporary nonimmigrant and permanent immigrant visa classifications, Congress charged the Department with, among other things, a unique responsibility to regulate the employment of nonimmigrant and immigrant alien workers to guard against adverse impact on the wages of workers in the United States similarly employed. Thus, the applicable statutes delegate broad discretion to the Department in determining the sources and methods that best allows it to meet this unique statutory mandate, which this NPRM proposes through revisions to the computation of prevailing wage levels applicable only to employers seeking temporary labor condition application under the H–1B, H–1B1, and E–3 visa classifications and permanent labor certification for skilled and unskilled immigrant employment in the United States. The Department recognizes that the recently published DHS H–1B rule ²⁵⁰ also governs alien workers employed by small businesses, and that there is overlap between these rules. However, there is no conflict between the standards proposed in this NPRM and other Federal rules; rather, each rule addresses distinct aspects of the foreign labor certification and visa process within its respective statutory and regulatory authority.

7. Alternative to the Proposed Rule

In developing this NPRM, the Department considered several alternative approaches to revising the prevailing wage level methodology for the H–1B, H–1B1, E–3, and PERM programs. Each alternative was evaluated for its consistency with the Department’s statutory obligations under the INA, its responsiveness to the policy direction set forth in the Presidential Proclamation issued on September 19, 2025, and its administrative feasibility and legal defensibility. Ultimately, the Department determined that the approach adopted in this NPRM—setting wage levels at the 34th, 52nd, 70th, and 88th percentiles—strikes the most appropriate balance between strengthening wage protections and minimizing disruption. However, the Department considered and declined to adopt the following two alternatives.

First, the Department considered removing the option for employers to use private wage surveys and requiring all prevailing wage determinations to rely solely on the Bureau of Labor Statistics’ Occupational Employment and Wage Statistics (OEWS) survey. This alternative would create a single streamlined source for prevailing wages, reducing administrative complexity and compliance costs—particularly for small businesses—by eliminating expenses associated with commissioning, validating, and submitting private surveys. While private surveys were originally permitted to provide flexibility where government data lacked granularity, OEWS now offers comprehensive coverage, making that justification less compelling. Continuing to allow private surveys introduces unnecessary complexity and disproportionate costs for small entities.

By standardizing wage determinations through OEWS, this alternative would minimize economic burden compared to the NPRM, which retains multiple permissible wage sources. Cost savings would primarily result from avoided survey procurement and legal review fees, which can range from hundreds to thousands of dollars per application. However, the Department ultimately rejected this alternative because it would remove employer flexibility in rare cases where OEWS data may not fully capture specialized labor markets.

Second, the Department considered replacing area-specific prevailing wages with a national wage standard for each occupational classification. This alternative was prompted by the structural shift toward remote and hybrid work arrangements, particularly in high-skill sectors where geographic location is increasingly decoupled from labor market dynamics. A national wage standard could simplify compliance, reduce administrative burdens, and better reflect the realities of a nationalized labor market. However, this approach relies on key assumptions and introduces uncertainties that warrant discussion. For example, it assumes that remote work will continue to expand at current rates and that geographic wage differentials will diminish over time. It also assumes that employers in lower-cost regions could absorb higher wage requirements without significant reductions in hiring or shifts in business models. These assumptions are subject to uncertainty given potential changes in remote work trends, employer practices, and statutory interpretations. The Department declined to adopt this approach due to the statutory requirement that prevailing wages be based on the “area of intended

²⁵⁰ Department of Homeland Security. (2025, December 29). Weighted Selection Process for Registrants and Petitioners Seeking To File Cap-Subject H–1B Petitions. 90 FR 60864. [CIS No. 2847–26; DHS Docket No. USCIS–2025–0040].

employment,” as well as the need for further stakeholder engagement and legal analysis. The Department may revisit this alternative in future rulemakings as remote work trends continue to evolve.

Third, in response to concerns about the economic impact of the proposed rule on small businesses and non-profits, the Department considered an alternative that would delay implementation of the new prevailing wage requirements for these entities by two years, allowing them to spread the additional costs of recruiting and retaining H-1B workers—including higher prevailing wage standards and increased USCIS application fees—over a longer period. However, the Department chose not to pursue this approach because the revised wage standards apply only to new Labor Condition Applications (LCAs) and PERM applications, not to renewals or existing certifications, thereby limiting the impact to new hires going forward. Moreover, delaying implementation for small entities would allow new hires at these organizations to persist under a prevailing wage methodology that has been shown to set wage standards too low, potentially resulting in some workers being underpaid simply because they work for small businesses or non-profits. The Department is committed to ensuring that all workers, regardless of employer size, are paid wages that reflect statutory requirements and labor market realities, and therefore determined that a delayed implementation for small entities would not be consistent with its statutory mandate to protect U.S. workers and ensure fair wage standards across all employers.

The Department welcomes commenter feedback on these regulatory alternatives and invites suggestions for any other regulatory alternatives that commenters believe would be feasible and appropriate.

D. Review Under the Paperwork Reduction Act

The purpose of the Paperwork Reduction Act of 1995 (PRA), 44 U.S.C. 3501 *et seq.*, includes minimizing the paperwork burden on affected entities. The PRA requires certain actions before an agency can adopt or revise a collection of information, including publishing for public comment a summary of the collection of information and a brief description of the need for and proposed use of the information.

As part of its continuing effort to reduce paperwork and respondent burden, the Department conducts a

preclearance consultation program to provide the public and Federal agencies with an opportunity to comment on proposed and continuing collections of information in accordance with the PRA. *See* 44 U.S.C. 3506(c)(2)(A). This activity helps to ensure that the public understands the Department’s collection instructions, respondents can provide the requested data in the desired format, reporting burden (time and financial resources) is minimized, collection instruments are clearly understood, and the Department can properly assess the impact of collection requirements on respondents.

A Federal agency may not conduct or sponsor a collection of information unless it is approved by the Office of Management and Budget (OMB) under the PRA and it displays a currently valid OMB control number. The public is also not required to respond to a collection of information unless it displays a currently valid OMB control number. In addition, notwithstanding any other provisions of law, no person would be subject to penalty for failing to comply with a collection of information if the collection of information does not display a currently valid OMB control number (44 U.S.C. 3512).

The Department has determined that the changes proposed in this NPRM to the computation of the prevailing wage levels, which are based on existing data collected under the OEWS survey by the Bureau of Labor Statistics, do not require a collection of information subject to approval by OMB under the PRA, or affect any existing collections of information. Thus, the Department is not seeking changes to the information collections covered under the Application for Prevailing Wage Determination, OMB Control Number 1205–0508, Labor Condition Application for Nonimmigrant Workers, OMB Control Number 1205–0310, or Application for Permanent Employment Certification, OMB Control Number 1205–0451, which would not require soliciting public comments in order to seek OMB approval of any clarifying changes and de minimis adjustment to the burden that the proposed changes might cause to existing information collection tools covered under these control numbers.

E. Review Under Executive Order 13132

E.O. 13132, *Federalism*, 64 FR 43255 (Aug. 10, 1999), imposes certain requirements on Federal agencies formulating and implementing policies or regulations that preempt State law or that have federalism implications. The E.O. requires agencies to examine the

constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The E.O. also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications.

The Department has examined this NPRM and has determined that it would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175 (Consultation and Coordination With Indian Tribal Governments)

The Department has reviewed this NPRM in accordance with E.O. 13175 and has determined that it does not have tribal implications. This proposed rule does not have substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and tribal governments.

G. Review Under Executive Order 12988

With respect to the review of existing regulations and the promulgation of new regulations, section 3(a) of E.O. 12988, “Civil Justice Reform,” imposes on Federal agencies the general duty to adhere to the following requirements: (1) eliminate drafting errors and ambiguity, (2) write regulations to minimize litigation, (3) provide a clear legal standard for affected conduct rather than a general standard, and (4) promote simplification and burden reduction. 61 FR 4729 (Feb. 7, 1996). Regarding the review required by section 3(a), section 3(b) of E.O. 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation: (1) clearly specifies the preemptive effect, if any, (2) clearly specifies any effect on existing Federal law or regulation, (3) provides a clear legal standard for affected conduct while promoting simplification and burden reduction, (4) specifies the retroactive effect, if any, (5) adequately defines key terms, and (6) addresses other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General.

Section 3(c) of E.O. 12988 requires Executive agencies to review regulations in light of applicable standards in section 3(a) and section 3(b) to determine whether they are met or it is unreasonable to meet one or more of them. The Department has completed the required review and determined that, to the extent permitted by law, this NPRM meets the relevant standards of E.O. 12988.

H. Review Under the Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act of 1995 (UMRA) (Pub. L. 104–4, codified at 2 U.S.C. 1501 *et seq.*) is intended, among other things, to curb the practice of imposing unfunded Federal mandates on state, local, and tribal governments. UMRA requires Federal agencies to assess a regulation's effects on state, local, and tribal governments, as well as on the private sector, except to the extent the regulation incorporates requirements specifically set forth in law. Title II of the UMRA requires each Federal agency to prepare a written statement assessing the effects of any regulation that includes any Federal mandate in a proposed or final agency rule that may result in \$100 million or more expenditure (adjusted annually for inflation) in any one year by state, local, and tribal governments, in the aggregate, or by the private sector. A Federal mandate is any provision in a regulation that imposes an enforceable duty upon State, local, or tribal governments, or upon the private sector, except as a condition of Federal assistance or a duty arising from participation in a voluntary Federal program.

The Department examined this proposed NPRM according to UMRA and its statement of policy and determined that this rule does not contain a Federal intergovernmental mandate, nor is it expected to require expenditures of \$100 million or more in any one year by state, local, and tribal governments, in the aggregate. However, due to effects on the (or by the) private sector, the analytical requirements of UMRA apply; for relevant analysis, please see section III.A, above.

I. Review Under Executive Order 12630

Pursuant to E.O. 12630, *Governmental Actions and Interference with Constitutionally Protected Property Rights*, 53 FR 8859 (Mar. 18, 1988), the Department has determined that this NPRM would not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

J. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105–277) requires Federal agencies to issue a Family Policymaking Assessment for any rule that may affect family well-being. This NPRM would not have any impact on the autonomy or integrity of the family as an institution. Accordingly, the Department has concluded that it is not necessary to prepare a Family Policymaking Assessment.

K. Review Under the Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516, note) provides for Federal agencies to review most disseminations of information to the public under information quality guidelines established by each agency pursuant to general guidelines issued by OMB. OMB's guidelines were published at 67 FR 8452 (Feb. 22, 2002). The Department has reviewed this NPRM under the OMB guidelines and has concluded that it is consistent with applicable policies in those guidelines.

List of Subjects

20 CFR Part 655

Administrative practice and procedure, Alien workers, Australia, Chile, Employment, Employment and training, Enforcement, Immigration, Singapore, Temporary labor, Unemployment, Wages, Working conditions.

20 CFR Part 656

Subparts H and I issued under 8 U.S.C. 1101(a)(15)(H)(i)(b) and (b)(1), 1182(n), (p), and (t), and 1184(g) and (j); sec. 303(a)(8), Pub. L. 102–232, 105 Stat. 1733, 1748 (8 U.S.C. 1101 note); sec. 412(e), Pub. L. 105–277, 112 Stat. 2681; 8 CFR 214.2(h); and 28 U.S.C. 2461 note, Pub. L. 114–74 at section 701.

Subparts L and M issued under 8 U.S.C. 1101(a)(15)(H)(i)(c) and 1182(m); sec. 2(d), Pub. L. 106–95, 113 Stat. 1312, 1316 (8 U.S.C. 1182 note); Pub. L. 109–423, 120 Stat. 2900; and 8 CFR 214.2(h).

■ 2. Amend § 655.731 by proposing revisions to paragraphs (a)(2)(ii), (a)(2)(ii)(A), and (a)(2)(ii)(A)(2) to read as follows:

§ 655.731 What is the first LCA requirement, regarding wages?

* * * * *

(a) * * * *

(2) * * *

(ii) If the job opportunity is not covered by paragraph (a)(2)(i) of this section, the prevailing wage shall be based on the wages of workers similarly employed as determined by the wage component of the Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics Survey (OEWS) in accordance with 20 CFR 656.40(b)(2)(i); a current wage as determined in the area under the Davis–Bacon Act, as amended, 40 U.S.C. 3141 *et seq.* (see 29 CFR part 1), or the McNamara–O'Hara Service Contract Act of 1965, as amended, 41 U.S.C. 6701 *et seq.* (see 29 CFR part 4); an independent authoritative source in accordance with paragraph (a)(2)(ii)(B) of this section; or another legitimate source of wage data in accordance with paragraph (a)(2)(ii)(C) of this section. If an employer uses an independent authoritative source or other legitimate source of wage data, the prevailing wage shall be the arithmetic mean of the wages of workers similarly employed, except that the prevailing wage shall be

the median when provided by paragraphs (a)(2)(ii)(A), (b)(3)(iii)(B)(2), and (b)(3)(iii)(C)(2) of this section. The prevailing wage rate shall be based on the best information available. The following prevailing wage sources may be used:

(A) *OFLC National Processing Center (NPC) determination.* The NPC shall receive and process prevailing wage determination requests in accordance with these regulations and Department guidance. Upon receipt of a written request for a PWD, the NPC will determine whether the occupation is covered by a collective bargaining agreement which was negotiated at arm's length, and, if not, determine the wages of workers similarly employed using the wage component of the BLS OEWS and selecting an appropriate wage level in accordance with 20 CFR 656.40(b)(2)(i), unless the employer provides an acceptable survey. The NPC shall determine the wage in accordance with secs. 212(n), 212(p), and 212(t) of the INA and in a manner consistent with 20 CFR 656.40(b)(2). If an acceptable employer-provided wage survey provides an arithmetic mean then that wage shall be the prevailing wage; if an acceptable employer-provided wage survey provides a median and does not provide an arithmetic mean, the median shall be the prevailing wage applicable to the employer's job opportunity. In making a PWD, the NPC will follow 20 CFR 656.40 and other administrative guidelines or regulations issued by ETA. The NPC shall specify the validity period of the PWD, which in no event shall be for less than 90 days or more than 1 year from the date of the determination.

(1) * * *

(2) If the employer is unable to wait for the NPC to produce the requested prevailing wage for the occupation in question, or for the CO and/or the BALCA to issue a decision, the employer may rely on other legitimate sources of available wage information as set forth in paragraphs (a)(2)(ii)(B) and (C) of this section. If the employer later discovers, upon receipt of the PWD from the NPC, that the information relied upon produced a wage below the final PWD and the employer was not paying the NPC-determined wage, no wage violation will be found if the employer retroactively compensates the H-1B nonimmigrant(s) for the difference between the wage paid and the prevailing wage, within 30 days of the employer's receipt of the PWD.

* * * * *

PART 656—LABOR CERTIFICATION PROCESS FOR PERMANENT EMPLOYMENT OF ALIENS IN THE UNITED STATES

■ 3. The authority citation for part 656 will be revised to read as follows:

Authority: 8 U.S.C. 1182(a)(5)(A), 1182(p); sec. 122, Pub. L. 101–649, 109 Stat. 4978; and Title IV, Pub. L. 105–277, 112 Stat. 2681.

■ 4. Amend § 656.40 by proposing revisions to paragraphs (a), (b)(2), and (b)(3), and by adding paragraphs (b)(2)(i), (b)(2)(i)(A), (b)(2)(i)(B), (b)(2)(i)(C), (b)(2)(i)(D), and (b)(2)(ii) to read as follows:

§ 656.40 Determination of prevailing wage for labor certification purposes.

* * * * *

(a) *Application process.* The employer must request a PWD from the NPC, on a form or in a manner prescribed by OFLC. The NPC shall receive and process prevailing wage determination requests in accordance with these regulations and Department guidance. The NPC would provide the employer with an appropriate prevailing wage rate. The NPC shall determine the wage in accordance with sec. 212(p) of the INA. Unless the employer chooses to appeal the center's PWD under § 656.41(a) of this part, it files the Application for Permanent Employment Certification either electronically or by mail with the NPC and maintains the PWD in its files. The determination shall be submitted to the CO, if requested.

(b) * * *

(2) If the job opportunity is not covered by a CBA, the prevailing wage for labor certification purposes shall be based on the wages of workers similarly employed using the wage component of the Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics Survey (OEWS) in accordance with subparagraph (b)(2)(i), unless the employer provides an acceptable survey under paragraphs (b)(3) and (g) of this section or elects to utilize a wage permitted under paragraph (b)(4) of this section.

(i) The BLS shall provide the OFLC Administrator with the OEWS wage data by occupational classification and geographic area, which is computed and assigned at levels set commensurate with the education, experience, and level of supervision of similarly employed workers, as determined by the Department. Based on this requirement, the prevailing wage shall be provided by the OFLC Administrator at four levels:

(A) The Level I Wage shall be computed as the thirty-fourth percentile of the OEWS wage distribution and

assigned for the most specific occupation and geographic area available.

(B) The Level II Wage shall be determined by first dividing the difference between Levels I and IV by three and then adding the quotient to the computed value for Level I and assigned for the most specific occupation and geographic area available.

(C) The Level III Wage shall be determined by first dividing the difference between Levels I and IV by three and then subtracting the quotient from the computed value for Level IV and assigned for the most specific occupation and geographic area available.

(D) The Level IV Wage shall be computed as the eighty-eighth percentile of the OEWS wage distribution and assigned for the most specific occupation and geographic area available. Where the Level IV Wage cannot be computed due to wage values exceeding the uppermost interval of the OEWS wage interval methodology, the OFLC Administrator shall determine the Level IV Wage using the current hourly wage rate applicable to the highest OEWS wage interval for the specific occupation and geographic area, or the arithmetic mean of the wages of all workers for the most specific occupation and geographic area available, whichever is highest.

(ii) The OFLC Administrator will publish, at least once in each calendar year, on a date to be determined by the OFLC Administrator, the prevailing wage levels under paragraph (b)(2)(i) of this section as a notice posted on the OFLC website.

(3) If the employer provides a survey acceptable under paragraph (g) of this section, the prevailing wage for labor certification purposes shall be the arithmetic mean of the wages of workers similarly employed in the area of intended employment. If an otherwise acceptable survey provides a median and does not provide an arithmetic mean, the prevailing wage applicable to the employer's job opportunity shall be the median of the wages of workers similarly employed in the area of intended employment.

Title 3—

Proclamation 11018 of March 24, 2026

The President

Greek Independence Day: A National Day of Celebration of Greek and American Democracy, 2026

By the President of the United States of America

A Proclamation

This Greek Independence Day, we commemorate the wisdom and resolve of the Greek people, who cast off the chains of despotism, renewed the promise of freedom first born on their ancient soil, and reasserted their rightful place as the cradle of Western civilization.

Long before our Nation took up the torch of liberty 250 years ago, the miracle of self-government first dawned in Greece, where citizens were granted a direct voice in the destiny of their country. This spirit sustained the Greek people through centuries of occupation and hardship at the hands of foreign rulers. With rugged bravery, pride in their past, and confidence in their future, they launched a revolution on March 25, 1821, embarking on a noble crusade that shattered the chains of authoritarian rule that had bound them for centuries. For almost a decade, their freedom was successfully forged in the fiery heat of conflict and sacrifice, sustained by their faith in the timeless truth that every nation is endowed with the right to self-determination.

Like Greece, the United States was born in the tradition of republican self-rule and is sustained by citizens who believe that life, liberty, and the pursuit of happiness are our sacred birthright. The histories of our two nations testify that an oppressed people will endure any trial to establish a truly just government, defend their inheritance at all costs, and secure the blessings of liberty for themselves and their children.

Today, the Greek American community enriches the story of our Nation through their enterprise, faith in God, and unyielding passion for the principles that have defined the American way of life since 1776. Greece stands shoulder to shoulder with the United States in our values, our commitment to the defense of our Western ideals, and our devotion to the cause of peace throughout the world.

As America marks 250 glorious years of independence, we draw inspiration from the example of the Greek people who refused to surrender their sovereignty and preserved the flame of self-government. Together, our two nations are allies in freedom, united by history, tested by struggle, and confident in the promise of a radiant future. On this 205th Greek Independence Day, we celebrate that enduring spirit, which first stirred in Athens and inspired our Founding Fathers in Philadelphia, whose genius and devotion to the cause of human freedom will never cease to inspire people on both sides of the Atlantic.

NOW, THEREFORE, I, DONALD J. TRUMP, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim March 25, 2026, as Greek Independence Day: A National Day of Celebration of Greek and American Democracy. I call upon the people of the United States to observe this day with appropriate ceremonies and activities.

IN WITNESS WHEREOF, I have hereunto set my hand this twenty-fourth day of March, in the year of our Lord two thousand twenty-six, and of the Independence of the United States of America the two hundred and fiftieth.

A handwritten signature in black ink, appearing to be "Donald Trump", located in the lower right quadrant of the page.

Proclamation 11019 of March 24, 2026

National Agriculture Day, 2026

By the President of the United States of America

A Proclamation

For 250 years, hardworking farmers, ranchers, and growers have nurtured our Nation's abundant resources—feeding families, fueling communities, and sustaining the American people throughout every chapter of our national story. Today and every day, we honor the agricultural community for their deep connection to our land and steadfast commitment to shaping our prosperity, preserving our heritage, and strengthening our way of life.

Our Nation's farmers and ranchers have always been deeply devoted to the American promise. Their lives are rooted in the sacred American principles of hard work, determination, and stewardship of our most precious resources. For generations, they have risen before dawn to invest in their communities and care for God's glorious creation. That commitment is visible everywhere—in the rows of crops stretching across the horizon, at farmers markets in small towns and big cities alike, and at dinner tables across America and around the world.

Under my leadership, we are making landmark investments to empower farmers to Make America Healthy Again by improving soil health, enhancing water quality, and strengthening our food and fiber supply—all while boosting long-term efficiency. We are forging a prosperous future defined by fair trade, new markets for homegrown commodities, and enhanced supply chain resilience to protect our Nation's most cherished resources. We are also putting an end to the era of excessive regulations that have stifled productivity, increased equipment costs, and left American farmers and ranchers behind. And to further support our incredible farmers, I proudly delivered over \$40 billion in assistance after they endured years of unfair trade practices from foreign countries and failed policies from the previous administration. I will never waver in putting American farmers, American families, and the American people first.

As the great President George Washington said in his eighth annual message to the Congress, "It will not be doubted, that with reference either to individual or national welfare, agriculture is of primary importance." This National Agriculture Day, we carry forward this commitment to the farmers, ranchers, growers, producers, and foresters who feed our Nation, fuel our prosperity, and sustain our glorious way of life.

NOW, THEREFORE, I, DONALD J. TRUMP, President of the United States of America, by virtue of the authority vested in me by the Constitution and the laws of the United States, do hereby proclaim March 24, 2026, as National Agriculture Day. I encourage all Americans to observe this day by recognizing the preeminent role that agriculture plays in our daily lives, acknowledging agriculture's continuing importance to rural America and our country's economy, and expressing our deep appreciation of farmers, growers, ranchers, producers, national forest system stewards, private agricultural stewards, and those who work in the agriculture sector across the Nation.

IN WITNESS WHEREOF, I have hereunto set my hand this twenty-fourth day of March, in the year of our Lord two thousand twenty-six, and of the Independence of the United States of America the two hundred and fiftieth.

Executive Order 14397 of March 24, 2026

Further Continuance of the Federal Emergency Management Agency Review Council

By the authority vested in me as President by the Constitution and the laws of the United States of America, and consistent with chapter 10 of title 5, United States Code (commonly known as the Federal Advisory Committee Act), it is hereby ordered:

Section 1. The Federal Emergency Management Agency Review Council, established by Executive Order 14180 of January 24, 2025 (Council to Assess the Federal Emergency Management Agency), and continued by Executive Order 14378 of January 23, 2026 (Continuance of the Federal Emergency Management Agency Review Council), is further continued until 10 days after the report required under section 3(c) of Executive Order 14180 is submitted to the President, or May 29, 2026, whichever occurs first.

Sec. 2. Notwithstanding the provisions of any other Executive Order, the functions of the President under the Federal Advisory Committee Act that are applicable to the Federal Emergency Management Agency Review Council shall be performed by the Secretary of Homeland Security, in accordance with the regulations, guidelines, and procedures established by the Administrator of General Services.

Sec. 3. Sections 1 and 2 of Executive Order 14378 are hereby superseded by sections 1 and 2 of this order.

Sec. 4. General Provisions. (a) Nothing in this order shall be construed to impair or otherwise affect:

(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

(d) The costs for publication of this order shall be borne by the Department of Homeland Security.

Presidential Documents

Notice of March 24, 2026

Continuation of the National Emergency With Respect to Significant Malicious Cyber-Enabled Activities

On April 1, 2015, by Executive Order 13694, the President declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) to deal with the unusual and extraordinary threat to the national security, foreign policy, and economy of the United States constituted by the increasing prevalence and severity of malicious cyber-enabled activities originating from, or directed by persons located, in whole or in substantial part, outside the United States. The President issued Executive Order 13757 of December 28, 2016, Executive Order 13984 of January 19, 2021, Executive Order 14110 of October 30, 2023 (in relevant part), Executive Order 14144 of January 16, 2025 (in relevant part), and Executive Order 14306 of June 6, 2025, to take additional steps to address the national emergency declared in Executive Order 13694. Executive Order 14148 of January 20, 2025 (in relevant part), revoked Executive Order 14110.

These significant malicious cyber-enabled activities continue to pose an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. For this reason, the national emergency declared in Executive Order 13694, and with respect to which additional steps were taken in Executive Order 13757, Executive Order 13984, Executive Order 14110 (revoked by Executive Order 14148), Executive Order 14144, and Executive Order 14306, must continue in effect beyond April 1, 2026. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared in Executive Order 13694.

This notice shall be published in the *Federal Register* and transmitted to the Congress.

THE WHITE HOUSE,
March 24, 2026.

Presidential Documents

Notice of March 24, 2026

Continuation of the National Emergency With Respect to South Sudan

On April 3, 2014, by Executive Order 13664, the President declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) to deal with the unusual and extraordinary threat to the national security and foreign policy of the United States constituted by the situation in and in relation to South Sudan, which has been marked by activities that threaten the peace, security, or stability of South Sudan and the surrounding region, including widespread violence and atrocities, human rights abuses, recruitment and use of child soldiers, attacks on peacekeepers, and obstruction of humanitarian operations.

The situation in and in relation to South Sudan continues to pose an unusual and extraordinary threat to the national security and foreign policy of the United States. For this reason, the national emergency declared on April 3, 2014, must continue in effect beyond April 3, 2026. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared in Executive Order 13664.

This notice shall be published in the *Federal Register* and transmitted to the Congress.

THE WHITE HOUSE,
March 24, 2026.

Presidential Documents

Notice of March 24, 2026

Continuation of the National Emergency With Respect to Specified Harmful Foreign Activities of the Government of the Russian Federation

On April 15, 2021, by Executive Order 14024, the President declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) to deal with the unusual and extraordinary threat to the national security, foreign policy, and economy of the United States constituted by specified harmful foreign activities of the Government of the Russian Federation. On March 8, 2022, the President issued Executive Order 14066 to expand the scope of the national emergency declared in Executive Order 14024. On August 20, 2021, March 11, 2022, April 6, 2022, December 22, 2023, August 6, 2025, and February 6, 2026, the President issued Executive Orders 14039, 14068, 14071, 14114, 14329, and 14384, respectively, to take additional steps with respect to the national emergency declared in Executive Order 14024.

Specified harmful foreign activities of the Government of the Russian Federation—in particular, efforts to undermine the conduct of free and fair democratic elections and democratic institutions in the United States and its allies and partners; to engage in and facilitate malicious cyber-enabled activities against the United States and its allies and partners; to foster and use transnational corruption to influence foreign governments; to pursue extraterritorial activities targeting dissidents or journalists; to undermine security in countries and regions important to United States national security; and to violate well-established principles of international law, including respect for the territorial integrity of states—continue to pose an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. For this reason, the national emergency declared in Executive Order 14024, which was expanded in scope in Executive Order 14066, and with respect to which additional steps were taken in Executive Orders 14039, 14068, 14071, 14114, 14329, and 14384, must continue in effect beyond April 15, 2026.

Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared in Executive Order 14024.

This notice shall be published in the *Federal Register* and transmitted to the Congress.

A handwritten signature in black ink, appearing to be a stylized name, possibly "Donald Trump", written in a cursive, slanted style.

Notice of March 24, 2026

Continuation of the National Emergency With Respect to Trade Practices That Contribute to Large and Persistent Annual United States Goods Trade Deficits

On April 2, 2025, by Executive Order 14257, I declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) to deal with the unusual and extraordinary threat to the national security and economy of the United States involving conditions reflected in large and persistent annual U.S. goods trade deficits, including the consequences of those deficits.

The President took additional steps pursuant to this national emergency, including in Executive Order 14259 of April 8, 2025; Executive Order 14266 of April 9, 2025; Executive Order 14309 of June 16, 2025; Executive Order 14316 of July 7, 2025; Executive Order 14324 of July 30, 2025; Executive Order 14326 of July 31, 2025; Executive Order 14334 of August 11, 2025; Executive Order 14345 of September 4, 2025; Executive Order 14346 of September 5, 2025; and Executive Order 14360 of November 14, 2025.

The circumstances related to this emergency continue to pose an unusual and extraordinary threat, which has its source in whole or in substantial part outside the United States, to the national security and economy of the United States. For this reason, the national emergency declared in Executive Order 14257 of April 2, 2025, must continue in effect beyond April 2, 2026. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared in Executive Order 14257.

This notice shall be published in the *Federal Register* and transmitted to the Congress.

LIST OF PUBLIC LAWS Note: No public bills which have become law were received by the Office of the Federal Register for inclusion	in today's List of Public Laws. Last List March 25, 2026	Public Laws Electronic Notification Service (PENS) PENS is a free electronic mail notification service of newly	enacted public laws. To subscribe, go to http://listserv.gsa.gov/archives/publaws-l.html Note: This service is strictly for E-mail notification of new laws. The text of laws is not available through this service. PENS cannot respond to specific inquiries sent to this address.
